ABSTRACT

Procedures for beach and purse seine sampling of juvenile salmon, *Oncorhynchus* spp., and steelhead, *Salmo gairdneri*, in the Columbia River estuary and ocean plume are described. Sampling effort and catch data from 1977 through 1983 are listed and summarized. Included are data summarizing fork lengths of each salmonid species, catches of species incidental to the program, water temperatures, and river flow.

INTRODUCTION

Natural runs of salmonids in the Columbia River basin have decreased for the past 4 decades or more, as a result of hydroelectric development, poor forest management, and overfishing (Raymond 1979; Netboy 1980). This has necessitated increased salmon culture to augment the numbers of returning adults. Hatcheries are now the primary source of salmon and steelhead for the Columbia River. By the late 1970s, they annually produced about 100 million fall chinook salmon, *Oncorhynchus tshawytscha*; 21 million spring and summer chinook salmon; 30 million coho salmon, *O. kisutch*; and 10 million steelhead, *Salmo gairdneri*.[1/] Even with hatchery production at this level, management agencies agree that, in general, yields of Columbia River salmonids have deteriorated.

Hatchery procedures and facilities are continually being modified to improve the efficiency of production and the quality of juveniles produced to compensate for the loss of natural fish. Various marking techniques were adopted to identify different hatchery fish or experimental groups at ports of landing, back at the hatchery, and on natural spawning grounds. Fish were marked by the excision of combinations of fins and the rear portion of a maxillary bone (Cleaver 1967), freeze branding (Mighell 1969), and implantation of coded wire tags (CWT) (Bergman et al. 1968). A regional marked fish processing center was established to help coordinate marking and recovery programs by various fishery agencies throughout the Pacific Northwest (Johnson 1984).

1/ Unpublished documents from Environmental and Technical Services Division, National Marine Fisheries Service, P.O. Box 4332, Portland, OR 97208.

Initial efforts to evaluate changes in hatchery procedures were dependent upon adult contributions to the fishery and returns to the hatchery. Unfortunately, variations in survival of fish groups occur during ocean residence which sometimes overshadows less significant, but possibly positive, changes resulting from new culture techniques.

To provide observations of survival benefits prior to fish encountering the variable ocean environment, the Northwest and Alaska Fisheries Center, sampled juvenile migrants at the upstream extent of the Columbia River estuary from 1977 through 1983 and at various sites in the lower estuary and nearshore ocean plume from 1978 through 1980. These studies were partially funded by the Pacific Northwest Regional Commission and the Bonneville Power Administration. The sampling provided recovery of marked fish within a few weeks of hatchery release, and thereby an early evaluation of cultural techniques -- an evaluation which would require several years using adult data. In addition, variables that influenced survival during migration to the estuary were isolated from variables that influenced survival in the ocean. The objectives of the sampling were to: 1) define the migrational characteristics of juvenile salmonids to and through the estuary, 2) make various biological observations of migrants, 3) examine the relative survival of marked fish migrating through the Columbia River, and 4) correlate juvenile catch data with adult recovery information to assist in evaluating hatchery production techniques and procedures.

This report, the first of two volumes, describes procedures for beach and purse seine sampling of juvenile salmonids and lists and summarizes sampling effort and catch data from 1977 through 1983. The second volume (Dawley et al. 1985b) lists and summarizes data obtained from marked juvenile salmonids recovered during the same period. Analyses of the data relating to the above objectives are contained in a report entitled: "Migrational

characteristics, biological observations, and relative survival of juvenile salmonids entering the Columbia River estuary, 1977-1983" (Dawley et al. 1985a).

STUDY AREA

The primary sampling site was Jones Beach near Woodson, Oregon, at Columbia River Kilometer (RKm) 75 (Fig. 1). This site is at the upper extent of the estuary, where the river is approximately 1.6 km wide, with a central ship channel maintained at approximately a 14 m depth (Fig. 2). The gradually sloped sandy beach and debris-free channel make the site ideal for sampling. Tidal effects are semidiurnal (roughly 7.5 hours of ebb and 5.0 hours of flood tide); throughout most of the year, water flow reversal occurs during flood tides.

Secondary sampling sites were near the downstream extent of the estuary, at Rkm 16, 9, and 7, where saltwater intrusion occurs. Incidental sites, sampled intermittently, were scattered throughout the estuary and ocean plume (within 24 km of the river mouth) (Fig. 1).

Weekly average water temperatures at Jones Beach during the sampling period are listed in Table 1. Weekly mean Columbia River flows for 1977, 1978-1981 (averaged), 1982, and 1983 are presented in Figure 3.

METHODS

Sampling procedures were consistent between years and sites within the restraints dictated by river and weather conditions. Generally, sampling began at sunrise and continued for about 7 hours. The beach seine was 95 m long and 5 m deep with 1- to 2-cm (stretch measure) webbing (Sims and Johnsen 1974). At Jones Beach, the bunt end of the net was towed upstream at the 1 m

depth contour then arced downstream and back to shore; at lower estuary sites, towing direction was reversed on incoming tides due to high water velocity. The effective fishing depth was about 3 m. The purse seine was 206 m long and 11 m deep with 1- to 2-cm (stretch measure) webbing (Durkin and Park 1967). It was towed upstream in a "U" configuration for 5 minutes prior to closing the net bottom (pursing). The effective fishing depth was about 6 m. Variation in the amount of water strained by the purse seines was minimized in relation to water velocity fluctuations by maintaining constant towing power and allowing the nets to move upstream or downstream with the water flow as each set was made.

Fish captured were processed comparably at all sites; the catch from each set was anesthetized with a 50-mg/liter solution of ethyl p-aminobenzoate (the concentration was varied depending upon water temperature and fish size), enumerated by species, and examined for physical conditions and marks. Fork lengths were generally measured 3 days/week for all sockeye salmon, O. nerka, and chum salmon, O. keta, and 100-fish subsamples of coho salmon, steelhead, yearling chinook salmon, and subyearling chinook salmon.

Subyearling chinook salmon are predominantly fall and summer races; yearling chinook salmon are predominantly a spring race (Van Hyning 1973). Chinook salmon were separated into subyearling and yearling categories on the basis of fork length, with the separation point adjusted upward through the season to compensate for growth (Table 2). Errors in separation were estimated from the proportion of tagged fish which were misclassified; error rates in 1982 and 1983 were 0.7 and 0.0% for yearling and 3.3 and 3.7% for subyearling chinook salmon, respectively. The greatest error was associated with larger sized subyearling chinook salmon reared in warm water. Yearling chinook salmon were not well represented by tags, and the error rate may be conservative for smaller sized fish emanating from the upper reaches of the

Columbia River basin (generally cooler water). Because of the low percentage of error, no adjustment was made to catch and catch/set data; corrections were made for misclassification of marked fish.

Adjustments for variation of sampling efficiency resulting from changes in river flow were not made except for the between-group comparisons presented by Dawley et al. (1985a). Increased river flow did decrease catch rates but measurements of the magnitude varied widely. Based on available data, catch rates decreased an average of 8.5% for each 1000 m^3/s increase of flow.

SAMPLING EFFORT AND CATCHES

Throughout the spring migration of salmonids, sampling at the Jones Beach site (Rkm 75) was conducted 5 days/week or more. In 1977, beach seining was conducted consistently, but purse seining was intermittent. From 1978 through 1983, both beach and purse seines were used consistently during the migration period. Daily effort in the spring was generally 10 sets with the beach seine and 5 sets with the purse seine; less effort was expended at other times of the year. Extensive effort was also expended in the winter and early spring of 1982-1983. Weekly sampling effort and mean catch/set for subyearling chinook salmon, yearling chinook salmon, coho salmon, and steelhead are listed in Tables 3 and 4. Weekly mean fork lengths are presented in Figures 4-10.

Sampling in the lower estuary and ocean plume was conducted 5 days/week during the spring migration from 1978 through 1980. Purse seining at McGowan (RKm 16) was conducted 1 to 3 days/week in 1978 and 3 to 5 days/week during 1979 and 1980; weekly effort and catch per/set for juvenile salmonids are listed in Table 5. Beach seining at Sand Island (RKm 9) or Clatsop Spit (RKm 7) was conducted 1 to 3 days/week in 1978. Weekly effort and mean catch/set for juvenile salmonids are listed in Table 6. Incidental sites throughout

the estuary were sampled intermittently with the purse seine during 1978 and 1979; weekly effort and catch/set of juvenile salmonids are listed in Table 7. Various ocean sites within 24 km of the river mouth were sampled with the purse seine from 1978 through 1980 on an intermittent basis (as permitted by weather and personnel commitments); weekly effort and catch/set of juvenile salmonids are listed in Table 8.

Monthly catches of salmonids and species incidental to sampling objectives, from 1978 through 1983, are summarized in Tables 9-27.

Daily effort and catch of juvenile salmonids by set for beach and purse seine sampling at each site are presented in the Appendix.

a/ Median recapture.

b/ Initial effects from Mount St. Helens

c/ Primarily spring chinook and fall chinook salmon, which were released in the fall as subyearlings, 6-24/lb.

APPENDIX

DAILY EFFORT AND CATCH OF SALMONIDS FOR BEACH AND PURSE SEINES AT VARIOUS LOCATIONS IN THE COLUMBIA RIVER ESTUARY AND OCEAN PLUME

Codes and Definitions for Data Columns in Tables

Gear:	3 = purse seine, 4 = beach seine
Date:	year, month, day
Set:	number of sequential seine effort by day
Chin 0's:	number of subyearling chinook salmon captured
Chin 1's:	number of yearling chinook salmon captured
Steelhead:	number of steelhead captured
Coho:	number of coho salmon captured
Sockeye:	number of sockeye salmon captured
Chum:	number of chum salmon captured
Time:	starting time of seine set
Hi Lo tide:	time of nearest high and low tides at recovery site

APPENDIX TABLES

No.		Page
1	Effort and catch of salmonids from purse seining at Jones Beach (Rkm 75), 1977.	51
2	Effort and catch of salmonids from beach seining at Jones Beach (Rkm 75), 1977.	52
3	Effort and catch of salmonids from purse seining in marine water, 1978.	71
4	Effort and catch of salmonids from purse seining at incidental sites, 1978.	72
5	Effort and catch of salmonids from beach seining in the lower estuary (Rkm 7 & 9), 1978	74
6	Effort and catch of salmonids from purse seining in the lower esttuary (Rkm 16), 1978	78
7	Effort and catch of salmonids from beach seining at Jones Beach (Rkm 75), 1978.	82
8	Effort and catch of slamonids from beach seining at Jones Beach (Rkm 75), 1978.	90
9	Effort and catch of salmonids from purse seining in marine water, 1979.	109
10	Effort and catch of salmonids from purse seining at incidental sites, 1979.	111
11	Effort and catch of salmonids from purse seining in the lower estuary (Rkm 16), 1979.	113
12	Effort and catch of salmonids from purse seining at Jones Beach (Rkm 75), 1979.	116
13	Effort and catch of salmonids from beach seining at Jones Beach (Rkm 75), 1979.	124
14	Effort and catch of salmonids from purse seining in marine water, 1980.	140
15	Effort and catch of salmonids from purse seining in the lower estuary (Rkm 16), 1980.	141
16	Effort and catch of salmonids from purse seining at Jones Beach (Rkm 75), 1980.	145

17 Effort and catch of salmonids from beach seining at Jones Beach (Rkm 75), 1980. 152

18 Effort and catch of salmonids from purse seining at Jones Beach (Rkm 75), 1981. 169

19 Effort and catch of salmonids from beach seining at Jones Beach (Rkm 75), 1981. 177

20 Effort and catch of salmonids from purse seining at Jones Beach (Rkm 75), 1982. 194

21 Effort and catch of salmonids from beach seining at Jones Beach (Rkm 75), 1982. 205
