*Abstract.* This report summarizes salinity, temperature, nutrient, and total suspended matter data collected during the NOAA VENTS cruise in September, 1990. These data were collected from September 8 to 29, 1990 over the Juan de Fuca Ridge covering an area from 44°34'N to 45°11'N and 130°06'W to 130°24'W.

## **1.0 INTRODUCTION**

The National Oceanic and Atmospheric Administration (NOAA) VENTS Program was established in 1984 to study the oceanic effects of hydrothermal activity along seafloor spreading centers. VENTS Program scientists from the Pacific Marine Environmental Laboratory (PMEL) have conducted intensive oceanographic research on the Cleft Segment of the Juan de Fuca Ridge spreading center located in the northeast Pacific Ocean basin.

The Juan de Fuca Ridge is a medium rate spreading center, consisting of the Cleft, Vance, Axial, Cobb, Endeavor, and West Valley segments. The ridge is bounded on the south by the Blanco Fracture Zone and on the north by the Sovanco Fracture Zone.

As part of the continuing VENTS Program research effort, a chemical oceanography cruise was conducted in September 1990 aboard the NOAA Ship *Discoverer* with scientists from NOAA, the University of Washington, the Lamont-Doherty Geological Observatory, and the Florida Institute of Technology. This cruise concentrated on physical oceanography and geochemical studies of the nonbuoyant hydrothermal plumes over the Cleft segment (Fig. 1) in order to quantitatively assess the impact of hydrothermal emissions on the seawater chemistry of the northeast Pacific Ocean. This report includes the complete set of hydrographic, nutrient, and total suspended matter data collected on the cruise (Appendix A) and a description of the sampling and analytical methods employed.

# North Cleft Segment Plume Monitoring Experiment VENTS Leg IV 8-29 September 1990

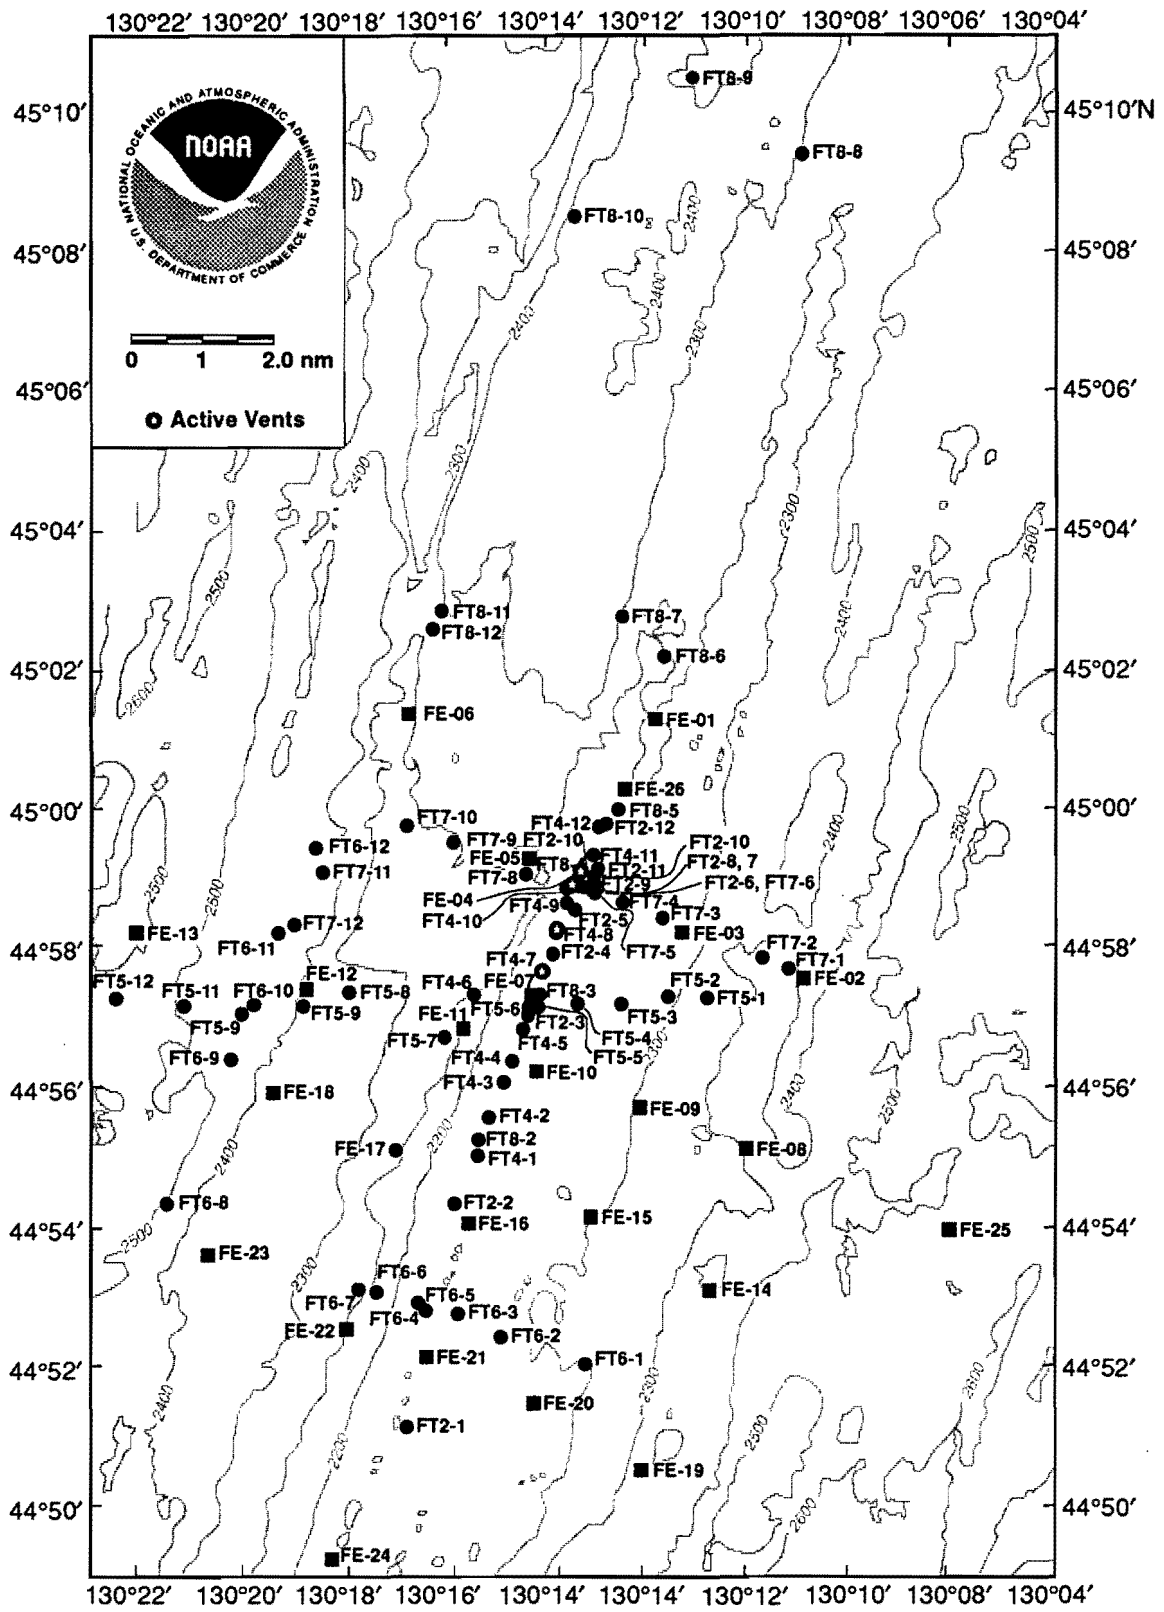

Fig. 1. Station locations for the VENTS 1990 Plume Monitoring Experiment.

## **2.0 SAMPLING METHODS**

### **2.1 Sample and Data Collection**

#### *2.1.1 Seawater Samples*

Seawater samples were collected in standard 30-liter Niskin™ bottles fixed to a 12-position General Oceanics™ sampling rosette. The Niskin™ bottles were internally coated with Teflon and modified with Teflon stopcocks. The sampling rosette was also equipped with a CTD-transmissometer, altimeter, and pinger locator. It was lowered into the water using standard hydrographic cable. The bottles were electronically tripped at pre-determined depths via a signal from the shipboard deck unit and closed by use of silastic tubing. Upon retrieval the Niskin™ bottles were removed from the rosette and placed in a non-contaminating pressure filtration rack for sub-sampling (Feely *et al.*, 1991).

Salinity samples were collected from the Niskin™ bottle in 250 ml citrate bottles.

Nutrient samples were collected from the Niskin™ bottle in HDPE 60 ml bottles prepared using 10% HCL and rinsed with deionized water. Unfiltered nutrient samples were taken directly from the Niskin™ bottle. Filtered nutrient samples were taken downline of the 0.4  $\mu\text{m}$  pore size Nuclepore polycarbonate filter during the total suspended matter pressure filtration of the seawater. All nutrients were analyzed at sea within twelve hours after collection.

Total suspended matter samples were collected by 12 psi nitrogen pressure filtration of the seawater in the Niskin™ bottle through 37 mm diameter, 0.4  $\mu\text{m}$  pore size Nuclepore polycarbonate filters. As described in detail in Feely *et al.* (1991) an air filter was placed in the tygon line connecting the nitrogen gas and the Niskin™ bottle to prevent contamination of the seawater sample from particulates in the gas. To ensure that all particulates were filtered out of the seawater the filtration racks were designed to tilt the Niskin™ bottle at a 45° angle and during filtration the bottle was gently agitated to keep particles in suspension. The seawater filtrate was directed into pre-calibrated 20 L plastic jerricans and volumes were measured to the nearest 100 mL. Depending upon the sample's proximity to the ridge crest it took anywhere from 2 to 8 hours to filter 20 L of seawater. All filters were loaded and unloaded from the teflon savillex holders inside a laminar flow hood. After filtration the particulate samples were rinsed with pH 8.0 deionized water then dried in a desiccator under vacuum.

#### *2.1.2. Conductivity-Temperature-Depth-Transmissometer Data*

CTD-transmissometer data was collected using a Sea-Bird conductivity-temperature-depth (CTD) sensor and a Sea Tech 0.25 m path length beam transmissometer secured to the frame of a General Oceanics™ sampling rosette. CTD information at the sampling depths was recorded shipboard on a MicroVax data acquisition system at trip time by taking a ten second average of the continuously collected one second average data.

## 2.2 Sample Analysis

### 2.2.1. Bottle Salinity

Bottle salinity analysis was conducted by NOAA Ship *Discoverer* personnel on a shipboard Guildline Autosal™. Samples were thermostated to room temperature, 18°C, before analysis. Final salinity was determined by averaging three measurements from each citrate bottle.

### 2.2.2. Nutrients

University of Washington silicic acid analysis was conducted by Kathy Kroglund employing a Technicon Autoanalyzer and the techniques described by Whitley (1981). The average precision of the replicate analyses was  $\pm 0.5 \mu\text{mol/l}$ . Alpha Inorganics™ reagent grade  $\text{Na}_2\text{SiF}_6$  was the standard used for analysis. This standard was calibrated against Lamont-Doherty standards and corrections were applied.

Lamont-Doherty silicic acid analysis was performed by Rick Mortlock employing the manual molybdate blue spectrophotometric method (Fanning and Pilson, 1973). The precision was  $\pm 0.2 \mu\text{mol/l}$ . Standardization was against three sets of fused quartz silica primary standards (20 mmol/l-Si). Secondary and tertiary standards (accurate to  $\pm 0.3\%$ ) were prepared in Sargasso Seawater (35‰) by serial dilution of the primary standard and are traceable to GEOSECS North Pacific Deep Water.

University of Washington phosphate analysis was conducted by Kathy Kroglund of the University of Washington using a Technicon AutoAnalyzer and the techniques described by Whitley (1981). The average precision of replicate analyses was  $\pm 20.0 \text{ nmol/l}$ . Fisher™ certified primary standard  $\text{KH}_2\text{PO}_4$  was used for standardization.

### 2.2.3 Total Suspended Matter

Total suspended matter filters were weighed after desiccation on a Cahn 26™ Automatic Electrobalance which has an accuracy of  $\pm 0.005\%$  of the true sample mass. Corrections for changes in filter weight were determined by re-weighing reference filters, resulting in a net weight of particulate suspended matter. Given the net weight and volume of water filtered, total suspended matter concentrations were determined.

### 2.2.4 Conductivity-Temperature-Depth-Transmissometer Data

Measured conductivity was converted to salinity using standard UNESCO algorithms (Fofonoff and Millard, 1983). The conductivity data was corrected by direct comparison of bottle salinity and CTD salinity values. An average salinity offset was determined for each cast.

Potential temperature was calculated using standard UNESCO algorithms (Fofonoff and Millard, 1983) and the CTD measured values of in situ temperature and salinity.

In situ density was calculated using standard UNESCO algorithms (Fofonoff and Millard, 1983) and the CTD measured values of in situ temperature and salinity.

Potential density was determined using standard UNESCO algorithms (Fofonoff and Millard, 1983) and the CTD measured salinity values.

Attenuation was measured and final values calculated as described in detail in Bartz *et al.* (1978).

The temperature anomaly ( $\Delta\theta$ ) of each cast was calculated relative to ambient water of the same potential density using the method of Lupton *et al.* (1985) with the equation

$$\Delta\theta = ( \theta + m \times \sigma_{\theta} ) - b$$

where  $\theta$  and  $\sigma_{\theta}$  are the potential temperature and potential density, respectively, of the linear equation of the  $\theta$  versus  $\sigma_{\theta}$  trend for water immediately above the hydrothermal plume where the hydrographic effect of the hydrothermal emissions is negligible. The equation used for calculating the temperature anomaly for each individual cast is listed in the bottom left-hand portion of each station table.

### 3.0 STATION DATA

#### 3.1 Station Locations

The data represented in Appendix A were collected from September 8 to 29, 1990 over the Juan de Fuca Ridge covering an area from 44°34'N to 45°11'N and 130°06'W to 130°24'W. LORAN-C was used for shipboard navigation and a listing of each station's latitude, longitude, and date of occupation is given in Table 1.

Vertical CTD profiles were taken at the majority of stations. Additionally, given the dynamic nature of hydrothermal plumes, a limited number of lengthy, horizontal tows, called "to-yos", were also conducted. To-yos were conducted by regularly cycling the CTD rosette package between the top and bottom layers of the hydrothermal plume. The ship's towing speed varied from 2–3 km/hr.

A bathymetric map of the cruise project area overlain with vertical cast positions and tow samples is given in Fig. 1.

#### 3.2 Individual Station Data

The header on the data tables in Appendix A contains the station identification and consecutive cast number, the date the station was occupied, and the latitude and longitude of the station. The data is listed in rows by Niskin™ bottle number and in 19 columns as follows:

- Column 1: Niskin™ bottle number
- Column 2: Depth in meters
- Column 3: Depth in decibars
- Column 4: In situ temperature (°C)
- Column 5: Potential temperature (°C)

- Column 6: Temperature anomaly (°C)
- Column 7: Salinity-CTD (PSU)
- Column 8: Salinity-Bottle (PSU)
- Column 9: Attenuation (1/m)
- Column 10: In situ density calculated using CTD salinity
- Column 11: In situ density calculated using bottle salinity
- Column 12: Potential density calculated using CTD salinity
- Column 13: Potential density calculated using bottle salinity
- Column 14: Unfiltered  $H_4PO_4$  ( $\mu\text{mol/l}$ )
- Column 15: Filtered  $H_4PO_4$  ( $\mu\text{mol/l}$ )
- Column 16: University of Washington unfiltered  $H_4SiO_4$  ( $\mu\text{mol/l}$ )
- Column 17: University of Washington filtered  $H_4SiO_4$  ( $\mu\text{mol/l}$ )
- Column 18: Lamont-Doherty  $H_4SiO_4$  ( $\mu\text{mol/l}$ )
- Column 19: Total suspended matter ( $\mu\text{g/l}$ )

The lower left portion of each table displays the equation used to calculate the station's temperature anomaly and indicates additional samples which were collected from the cast but not included in this data report. For further information on these samples please contact the following individuals at the Pacific Marine Environmental Laboratory, Seattle, Washington.

Helium data: Dr. John Lupton

Particulate trace elements: Dr. Richard A. Feely

Dissolved iron and manganese: Mr. Gary J. Massoth

#### 4.0 ACKNOWLEDGMENTS

This research was supported by the National Oceanic and Atmospheric Administration's VENTS Program. We gratefully acknowledge the assistance and professionalism of the Captain and crew of the NOAA Ship *Discoverer* in the collection of these data.
