CTD Measurements Collected on a Climate and Global Change Cruise Along 170°W During February–April 1990

K. McTaggart¹, D. Wilson², and L. Mangum¹

ABSTRACT. Summaries of Neil Brown Instrument System CTD measurements and hydrographic data acquired on a Climate and Global Change (CGC) cruise during the spring of 1990 aboard the NOAA ship *Malcolm Baldrige* are presented. The majority of these data were collected along 170°W from 5°N to 60°S. Additional data collected along a trackline from 60°S, 170°W to 46.3°S, 179.5°E, and along 32.5°S from 179°W to 170°W are also presented. Data acquisition and processing systems are described and calibration techniques are discussed. Station location, meteorological conditions, abbreviated CTD data listings, profiles, and potential temperature-salinity diagrams are shown for each cast. Section plots of oceanographic variables and hydrographic data listings are also given.

1. INTRODUCTION

In support of NOAA's Climate Program, PMEL scientists have been measuring the growing burden of greenhouse gases in the thermocline waters of the Pacific Ocean and the overlying atmosphere since 1980. During leg 1 of this cruise, hydrographic and chemical measurements were made in a detailed section along 170°W in the southwestern Pacific Ocean. Goals included the assessment of the change in inventory of CFC-11, CFC-12, and anthropogenic CO₂ since the first observations in the southwestern Pacific during 1984; observation of freons and other tracers in several crossings of the Deep Western Boundary Current; and observation of tracers in the bottom waters of the deep basin of the southwestern Pacific. During leg 2 of this cruise, measurements were made in the deep passages between the North and South Pacific Basins, across the Deep Western Boundary Current at 32.5°S, and across the equator. Figures 1 and 2 show the cruise track and station locations. In Figure 2, leg 1 stations are indicated by a circle and leg 2 stations are marked by a triangle. Table 1 provides a summary of cast information.

2. STANDARDS AND PRE-CRUISE CALIBRATIONS

The Neil Brown Mark IIIb CTD profiler is designed to make precise, high resolution measurements of conductivity, temperature, and pressure in the ocean environment. Electrical conductivity of sea water is obtained using a miniature four-electrode ceramic cell and highly precise and stable interface electronics; temperature is determined using a platinum resistance thermometer. Pressure is determined using a high performance strain gage pressure transducer. A thermistor within the pressure sensor housing corrects pressure values for the effects of temperature changes on the sensor itself.

Data from the underwater unit is transmitted in real time to a shipboard data terminal through a 3-conductor electro-mechanical cable. The data is in TELETYPE (TTY) format and uses a frequency shift key (FSK) modulated signal superimposed on the DC power supplied to the underwater unit.

The EG&G conductivity sensor has a range of 1 to 65 mmho, an accuracy of ± 0.005 mmho, resolution of 0.001 mmho, and stability of 0.003 mmho/month. The Rosemount platinum thermometer has a range of -32 to 32°C , an accuracy of $\pm 0.005^{\circ}\text{C}$ (-3 to 32°C), resolution of 0.0005°C , and stability of $0.001^{\circ}\text{C}/\text{month}$. The Paine pressure sensor has a range of 0 to 6500 db, an accuracy of ± 6.5 db, resolution of 0.1 db, and stability of 0.1%/month.

Pre-cruise calibrations were done at Northwest Regional Calibration Center (NRCC) in Bellevue, Washington. The CTD was placed in a temperature controlled bath and compared against a calibration standard at nine different temperatures ranging from 0 to 30°C . A linear fit was calculated for the platinum thermometer. A calibrated piston gauge was used to determine separate third-order fits for the pressure sensor at four temperatures for increasing pressure (a range of seven pressure values from 0 to 6300 db) and decreasing pressure (a range of six values from 6300 to 0 db). Temperature and pressure calibrations were crudely checked at sea by comparing values with those from deep reversing thermometers, but the stability of the temperature and pressure sensors is such that the sensors are more accurate than the reversing thermometers. The conductivity sensor, on the other hand, is not as stable relative to water sample values and is more accurately calibrated using water sample salinities. Immediately prior to tripping the rosette, values of pressure, temperature, and conductivity were recorded from the CTD deck unit. These upcast CTD values were used for comparison with the water sample values.

3. DATA ACQUISITION

The CTD was deployed off the starboard platform of the *Malcolm Baldrige* using an Interocean winch throughout both legs of the cruise. A total of 64 CTD profiles were collected at 36 stations on leg 1 along 170°W from 15°S to 60°S , and along a trackline from 60°S , 170°W to 46.3°S , 179.5°E , including 21 deep casts to within 50 db of the bottom and 6 test/freon calibration casts. Cast 63 and 64 were freon calibration casts. CTD data from cast 63 is included in the data set although no bottle salts were drawn, but CTD data from cast 64 was not processed. A total of 46 CTD profiles were collected during leg 2 along 32.5°S from 178.8°W to 171.5°W , and along 170°W from 30°S to 5°N , including 13 deep casts to within 50 db of the bottom.

PMEL's Neil Brown CTD/O₂ S/N 2044 (sampling rate 31 Hz) and a General Oceanics 24-bottle rosette were used for casts 0–10. Eight-hundred pounds of lead weight were attached to the frame to reduce the effects of surging. AOML's Neil Brown CTD S/N 2043 (sampling rate 31 Hz) and a General Oceanics 12-bottle rosette with 400 pounds of lead weight were used for

casts 11–64 of leg 1 and throughout leg 2. Casts to within 50 meters of the bottom were made using a Benthos acoustic pinger mounted low and opposite the CTD sensor arm on the frame. The position of the package relative to the bottom was monitored on the ship's Precision Depth Recorder. Ten-liter Niskin bottles were used to collect water samples for salinity, oxygen, nutrients, CFC, helium, total CO₂, alkalinity, and dissolved inorganic carbon. Reversing thermometers were mounted on several Niskin bottles on each cast and were used to verify rosette trip sequence and monitor the CTD temperature sensor for calibration shifts.

The package entered the water and was lowered at a rate of 30 m/min for the first 50 meters. To reduce the chance of contamination in the bottles, the package was not stopped just beneath the surface on its descent. Speed was increased at 50 meters to 45 m/min, and increased again at 200 meters to 60 m/min. Ship roll sometimes caused substantial variation about these mean lowering rates.

A Neil Brown Mark III deck unit received the FSK signal from the CTD and displayed pressure, temperature, and conductivity values. An analog signal was forwarded from the deck unit to an 'XYY' recorder which monitored the data acquisition in real-time for signal spiking and problems with the electrical termination. An audio signal was forwarded to a video cassette recorder as a backup. The digitized data were forwarded to a microVAX and written directly to a disk file. Digitized data were also recorded on 9-track magnetic tape as an additional backup. The acquisition microVAX was equipped with Scientific Computer System (SCS) data acquisition software modified from PMEL/AOML source code. The disk files were transferred to a processing microVAX where PMEL's standard processing and plotting software were installed. Plots were generated after each cast to check for problems and monitor sensor drift. Backups of the raw and processed data were made on TK50 cartridge tapes and returned to PMEL.

3.1 Data Acquisition Problems

Early into leg 1, patches of deteriorated cable were identified from near-surface to greater than 5000 meters. Efforts were made to reinforce damaged areas in order to continue with CTD operations.

The oxygen sensor on CTD S/N 2044 started losing sensitivity before the cap was inadvertently left on during a deep cast which ruptured the sensor's membrane. Before the sensor could be replaced, the entire underwater package was lost during cast 10 when the cable parted with approximately 600 meters of cable out. An additional 4100 meters of cable was discarded and operations continued with the 12-bottle package. Multiple casts were made at selected stations to adequately sample the water column. CTD oxygen data were not processed.

Problems existed throughout the cruise with the rosettes and the rosette deck units of both packages. Several deck units were tried. A strip chart recorder connected to the rosette deck units to monitor the signal voltages was helpful in determining misfires. Bottle salinity, oxygen and

nutrient data were also used in an effort to determine the actual depth of each bottle fired. No bottles closed during cast 63 owing to a nicked connector.

3.2 Salinity Analyses

Bottle salinity analyses were performed by survey personnel in a climate-controlled van using two Guildline Autosal Model 8400A inductive salinometers and IAPSO Standard Seawater from Wormley batch P112. The commonly accepted precision of the Autosal is 0.001 psu, with an accuracy of 0.003 psu. The Autosals were standardized before each run and either at the end of each run or after no more than 48 samples. The drift during each run was monitored and individual samples were corrected for the drift during each run by linear interpolation. Bottle salinities were compared with computed CTD salinities to identify leaking bottles, as well as to monitor the conductivity sensor performance and drift.

Problems developed with both autosals midway through the cruise but were fixed by ship's personnel. Generally, there was good agreement between preliminary CTD data and bottle salinities, with a standard error near .005 psu. Calibrated CTD salinities replace problem bottle salinities in the hydrographic data listing and are indicated by an asterisk.

4. POST-CRUISE CALIBRATIONS

Pressure and temperature values for both CTDs were corrected using pre-cruise calibration coefficients. Reversing thermometer data showed no shifts in temperature and pressure calibrations within the resolution of these measurements. The new International Temperature Scale of 1990 (ITS-90) was not applied to the temperature values of this data set.

Final calibrations for conductivity were determined by reading uncalibrated CTD upcast and sample salinity data and calculating a least squares linear fit between CTD and water sample conductivity, weighting all data equally. When the difference between CTD and water sample conductivity exceeded 2.8 times the standard deviation of the calculated fit, the calibration pair was thrown out. Another fit was then calculated with these points omitted and the process repeated until no calibration pairs are discarded. This cruise was separated into three groups:

	BIAS	SLOPE	MAXIMUM RESIDUAL	STANDARD DEVIATION
Casts 0–10:	-2.0077199E-02	0.9993219	-0.019	0.0068 mmho/cm
Casts 11–63:	-0.7075790E-02	0.9987081	-0.010	0.0038 mmho/cm
Casts 65–110:	-1.4587455E-02	0.9986109	-0.010	0.0039 mmho/cm
Casts 0–10:	16 values were discarded from a total of 122 in 6 repetitions.			
Casts 11–63:	36 values were discarded from a total of 555 in 8 repetitions.			
Casts 65–110:	49 values were discarded from a total of 510 in 7 repetitions.			

Deep potential temperature-salinity diagrams for each cast were used to check the quality of the fits. Where leg 1 stations were revisited on leg 2 (32.5°S, 30°S, 25°S, 20°S, and 15°S), overplots were generated. At reoccupied stations on leg 2, deep potential temperature-salinity diagrams of CTD and bottle data showed good correlation, however there was a difference of approximately 0.002 psu at two of the five reoccupied stations, 25°S and 30°S.

Historical data from 1967 Scorpio, 1987 TEW, and 1974 GEOSECS cruises were examined and there also existed differences between these cruises in salinity of the deepest water masses of about 0.002 psu. Comparing the 1990 data set with these historical data, leg 1 salinity data was within this 0.002 psu difference. Therefore leg 2 data at stations 25°S and 30°S along 170°W (casts 77–84) were corrected. This was done by regridding leg 1 and leg 2 data at these two stations according to potential temperature. The range of potential temperature was around 0.6 to 0.8°C, with a grid size of 0.01°C. The mean difference in salinity between leg 1 and leg 2 casts was computed. For the station at 25°S, this value was 0.0018 psu; for the station at 30°S, it was 0.0021 psu. For each regridded scan of leg 2 data, a new conductivity was calculated using the value of salinity plus delta-salinity. The differences between the old and new conductivities were averaged (25°S = 0.0014 mmho/cm, 30°S = 0.0018 mmho/cm) and added to the conductivity calibration bias applied. Corrections were linearly interpolated over casts 77–84.

5. PROCESSING

Raw CTD data files were restored from TK50 cartridge tapes and processed on PMEL microVAX node NBVAX. In order to eliminate anomalous excursions in the raw temperature and conductivity data associated with reversals in the direction of movement of the CTD package, as well as when the package decelerates due to ship roll, program DPDNB was used to read the SCS LOGGER raw data files and compute a fall rate every 60 scans (about 2 seconds). Fall rate was then carried along with the original unprocessed data.

Program DLAGAV read the raw data files with fall rates and applied pre-cruise calibrations. Window outliers (acceptable ranges were -12 to 6500 db for pressure, -2 to 33°C for temperature, and 24 to 68 mmho/cm for conductivity) and first-differencing outliers (acceptable differences between scans were 1.0 db for pressure, 0.07°C for temperature, and 0.1 mmho/cm for conductivity) were removed. Gaps in the data were filled by linear interpolation. DLAGAV lagged conductivity, edited data exceeding the fall rate criteria (minimum fall rate acceptable was 0.5 db/60 scans or about 15 meters per minute and pressure interval to skip beyond the point of failure was 1.2 db as determined at sea), and computed 1-decibar data files.

First-differencing outliers were tentatively flagged if the differences between two scans were greater than the above mentioned preset values. If the difference between the next scan and the last good scan exceeded twice the allowable difference between scans, it too was flagged. If five scans in a row failed in this manner it was assumed that there was a gap in the data record and

all scans were retained. Or if the next, third, fourth or fifth scan had values close enough to the last good scan, then the flagged scans were rejected.

The filter applied to conductivity to account for the response time difference between the conductivity sensor and the slower platinum thermometer is described in Fofonoff *et al.* (1974). The conductivity is lagged as follows:

$$C(n) = (1-A) CM(n) + A \cdot C(n-1)$$

where C is the lagged conductivity, CM is the measured conductivity, n is the scan number, and A is a constant empirically determined (Horne and Toole, 1980) to best match temperature and conductivity (A = 0.87).

Program EPCTD read calibrated pressure, calibrated temperature, and raw conductivity data output from DLAGAV. EPCTD corrected raw conductivity for thermal and pressure effects, applied conductivity calibrations, and computed salinity using the 1978 Practical Salinity Scale (UNESCO, 1981). Single-point spikes were eliminated using maximum allowable gradients of 0.05°C for temperature and 0.025 psu for salinity above 200 db, and 0.01°C for temperature and 0.01 psu for salinity below 200 db. Additional salinity spikes were omitted from casts 12, 24, 51, 58, 70, and 95 as specified by the processor. Missing data were filled by linear interpolation for a value to exist every whole decibar. Final conductivity values were recomputed from salinity.

The conductivity cell dependence on temperature and pressure was corrected using the following (Fofonoff *et al.*, 1974):

$$C = CR \cdot (1-ALPHA \cdot (T-15.) + BETA \cdot (P/3.))$$

where CR is lagged conductivity, ALPHA is 6.5E-06, and BETA is 1.5E-08.

EPCTD then calculated potential temperature, sigma-t, and sigma-theta using the 1980 equation of state algorithms described by Fofonoff and Millard (1983). Dynamic height in dynamic meters was calculated by integrating from the sea surface. When the uppermost pressure was not equal to 0 db, surface values of temperature and salinity were filled with the values associated with the shallowest pressure for which values did exist (provided this pressure was less than 10 db). EPCTD output finalized CTD data in PMEL's Equatorial Pacific Information Collection (EPIC) format (Soreide and Hayes, 1988).

6. DATA PRESENTATION

The final calibrated data in EPIC format were used to produce the plots and listings which follow. The majority of the plots were produced using Plot Plus Scientific Graphics System (Denbo, 1992). Tables 2-6 define the abbreviations and units used in the CTD data summary

listings. Plots and summary listings of the CTD data follow for each cast. Hydrographic bottle data at discrete depths are listed in the final section.

8. ACKNOWLEDGMENTS

The assistance of the officers and crew of the NOAA ship *Malcolm Baldrige* is gratefully acknowledged. The survey department (Dennis Sweeney and Tom Lantry), under the supervision

of Chief Survey Technician Robert Hopkins, provided valuable assistance in operations during this cruise.

We wish to thank Margie McCarty for the acquisition and preliminary calibration of leg 2 CTD data, as well as Jeff Benson and Dana Greeley for their help with the rosette, bottles, and CTD operations.

Funds for this program were provided to S. Hayes and D. Wilson by the Office of Global Programs.

TABLE 2. Weather condition code used to describe each set of CTD measurements.

Code	Weather Condition
0	Clear (no cloud)
1	Partly cloudy
2	Continuous layer(s) of cloud(s)
3	Sandstorm, dust storm, or blowing snow
4	Fog, thick dust or haze
5	Drizzle
6	Rain
7	Snow, or rain and snow mixed
8	Shower(s)
9	Thunderstorms

TABLE 3. Sea state code used to describe each set of CTD measurements.

Code	Height (meters)	Description
0	0	Calm-glassy
1	0-0.1	Calm-rippled
2	0.1-0.5	Smooth-wavelet
3	0.5-1.25	Slight
4	1.25-2.5	Moderate
5	2.5-4	Rough
6	4-6	Very rough
7	6-9	High
8	9-14	Very high
9	>14	Phenomenal

TABLE 4. Visibility code used to describe each set of CTD measurements.

Code	Visibility
0	<50 meters
1	50–200 meters
2	200–500 meters
3	500–1,000 meters
4	1–2 km
5	2–4 km
6	4–10 km
7	10–20 km
8	20–50 km
9	50 km or more

TABLE 5. Cloud type.

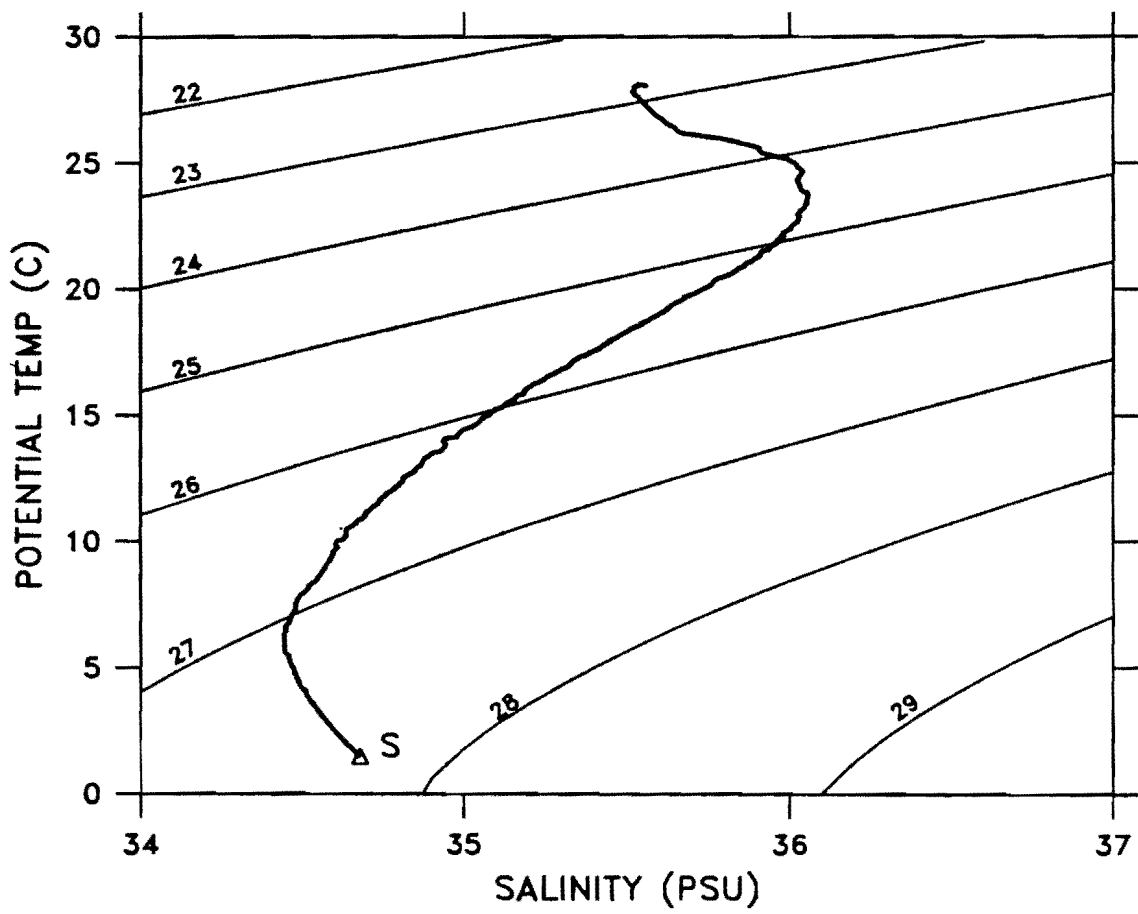

Code	Cloud Types
0	Cirrus
1	Cirrocumulus
2	Cirrostratus
3	Alto cumulus
4	Altostratus
5	Nimbostratus
6	Stratocumulus
7	Stratus
8	Cumulus
9	Cumulonimbus
X	Clouds not visible

TABLE 6. Cloud Amount.

Code	Cloud Amount
0	0
1	1/10 or less but not zero
2	2/10-3/10
3	4/10
4	5/10
5	6/10
6	7/10-8/10
7	9/10
8	10/10
9	Sky obscured or not determined
