## GREAT LAKES STATES MONTHLY AVERAGE TEMPERATURE DATA —BEGINNING OF RECORD TO 1990

### R.A. Assel<sup>1</sup>, C. E. Sellinger, D. E. Meyer, R.N. Kelly, and P. Grimm<sup>2</sup>

ABSTRACT. Monthly average temperature data were digitized from the National Climatic Data Center (NCDC) publication *Climatological Data* from beginning of record to 1930 for the states bordering the Great Lakes. Monthly temperature data from 1931 to 1947 for all Great Lakes states (except New York) were combined with previously digitized NCDC monthly data (Tape Deck 3220). New York State's monthly temperature data from 1931 to 1947 were not available from NCDC for this period, and so these data were digitized from *Climatological Data*. The monthly temperature data prior to 1948 for all Great Lakes states were combined with NCDC Tape Deck 3200 temperature data from 1948 to 1990 (monthly average temperatures were calculated for the TD 3200 daily data). A list containing station name, latitude, longitude, elevation, and period of record is given as an appendix. Data reduction, verification, quality control, and analysis methods are summarized. The spatial and temporal distribution patterns of the number of stations is presented. The digital data are available from NCDC.

### 1. INTRODUCTION

Much of the historical National Weather Service (NWS) temperature data for the eight Great Lakes states prior to 1930 are available only in paper copy or microfiche, making them virtually unusable for most computer applications. The Great Lakes Environmental Research Laboratory (GLERL), under the Environmental Research Laboratories' Endangered Data and Increased Access Program funded under the National Environmental Satellite and Data Information Service's (NESDIS) Earth System Data and Information Management Program, digitized these data to make them more accessible for our own ongoing research programs, for use by other researchers, and for use by the public at large. Monthly temperature data from NWS stations in Minnesota, Wisconsin, Illinois, Indiana, Michigan, Ohio, and Pennsylvania, were digitized from beginning of record to 1930, and for New York from beginning of record to 1947. These data were quality controlled for typographical errors (but not for observer or metadata errors) and then combined with existing National Climatic Data Center (NCDC) digital temperature data from 1931 (from 1948 for New York) to 1990. The annual maximum number of stations when including the 1948-1990 period is 1,045. The station number and name, latitude, longitude, and elevation changes for each station were abstracted from Assel et al. (1995) and from U.S. Department of Commerce (1956).

This report documents sources of the monthly temperature data and describes procedures used to abstract, reduce, and quality control these data. The spatial and temporal distribution

<sup>&</sup>lt;sup>1</sup>GLERL Contribution No. 978

<sup>&</sup>lt;sup>2</sup>NESDIS, 1825 Connecticut Ave. NW, Washington, DC

patterns of the temperature stations are illustrated and discussed. A complete tabular summary of the monthly temperature data for this study is not included with this report, but a listing of these stations is included along with their location (latitude, longitude, elevation) and period of record as Appendix A. Missing data is indicated by 99.999 for latitude, 999.999 for longitude, and -999 for elevation. A complete set of computer files of the temperature data and station history data has been made available to NCDC for archiving.

### 2. DATA

### 2.1 Data Sources

Microfiche of historical temperature data (U.S. Dept. of Commerce, 1976) were copied by NCDC from sources listed in the microfiche themselves.

"Climatological data was first published by the Weather Bureau of the U.S. Department of Agriculture in 1896 as the CLIMATE AND CROP SERVICE bulletin. Climatological data was published under this title through January 1906. In February 1906 the title was changed to CLIMATOLOGICAL REPORT of the Weather Bureau's Climatological Service. These CLIMATOLOGICAL REPORTS were published as monthly issues from February 1906 to June 1909 only. Annual issues were published under that title for the years 1906 through 1913. Beginning with July 1909, and continuing through December 1913, the monthly data were only published as a part of the MONTHLY WEATHER REVIEW, and were presented on a river Drainage District basis. These monthly data from July 1909 through December 1913 are available on microfiche by district. Beginning with January 1914 CLIMATOLOGICAL DATA has been published, monthly and annually, under that title and has continued as CLIMATOLOGICAL DATA to date."

These microfiche were the source of digitized monthly temperatures from beginning of record to 1930. The NCDC Tape Decks (TDs) 3220 and 3200 were the sources of temperature data for the years 1931-1947 and 1948-1990, respectively. New York stations were not on TD 3220; temperature data for those stations between 1931 and 1947 were digitized from the microfiche source noted above. Additionally, data for stations in other states were not digitized (TD3220) but were available on the microfiche, while other stations were present in TD3220 but not on microfiche (Table 1). A preliminary analysis was made of the total number of stations each year on TD 3220 or on the microfiche but not on TD 3200 and then to digitize those stations that were exclusively on the microfiche for the 1931-47 period. The rationale for this decision was that the average of the annual differences was relatively small for each state (ranging from 0.6 to 3.6 stations, Table 1), and for some years, TD 3220 had more stations than the microfiche.

Year	IL	IN	MI	MN	OH	PA	WI	Average
1931	1	1	7	8	9	12	4	6.0
1932	1	0	7	5	11	7	3	4.8

Table 1.— Difference\* in the number of stations on microfiche and TD3220.

\* Negative values indicate more stations on TD 3220.

#### 2.2 Procedures

Published temperature data were manually entered into a computer. ASCII files were created for each station from beginning of record to 1930 for all states, and from 1931 to 1947 for New York. These files were edited using programs written in FORTRAN to identify data entry errors and suspected errors in the original data, details are given in section 2.3 below. Stations with data prior to 1930 (that extended past 1930) were combined with the corresponding temperature data from NCDC TD 3220, and stations that began after 1930 were added as 'new' stations. Station metadata were used to identify stations.

Monthly data, from 1948 to 1990, were computed from NCDC TD 3200 Summary of the Day data, which contains separate means for the maximum and minimum temperatures. Some stations on TD3200 had pre-1948 digitized daily data. If a station's data inventory showed it to be one of these stations, then the previously digitized data were used, and the published data were used to fill in periods without data. These stations were the exception and not the rule. We calculated the monthly mean and combined these data with the pre-1948 digital data to form a continuous record for stations that started prior to 1948 and continued after that year. The monthly mean air temperatures for stations on TD 3200 were calculated from the means of the daily maximum and minimum. For stations with months where there were less than 10 days of missing data, the monthly mean was calculated from the available data. If there were 10 or more days with missing data, the mean was not calculated, and a code for missing data (-99.9) was entered.

### 2.3 Quality Control

The digitized temperature data were quality controlled for data entry errors and outliers. For manually entered data, annual averages were calculated from the monthly means and compared to the published annual averages. If the averages did not match, the program flagged that year for that station, and corrections were made to the monthly data as needed. After these data were quality controlled for these inconsistencies with the published data, they were combined with the digitized data from TDs 3220 and 3200, and the entire data set was checked in the following manner: The mean and standard deviation for each month for the entire period of record was calculated, then monthly values were compared to this mean to see if they fell within +/- two standard deviations of the mean. Monthly values that were not within two standard deviations of the long-term monthly mean were then checked with other published data to verify their value. First, the annual summary of the Climatological Data was checked. If the value in the file and the value in the annual summary agreed, no change was made. If these values differed, the monthly summary of the Climatological Data was checked. If the value in the file and the value in the monthly summary agreed, no change was made. If the monthly summary and annual summary agreed, then the file value was replaced by that in the *Climatological Data*. If none of the values were the same, the value in the annual summary was used. The entire data set was also checked for duplication of data between two or more stations. Each year of each station was checked with each year of every other station in that state and with adjacent states. If the data for a year were the same at another station, with the exception of all missing, the stations and year(s) were listed in a separate file (Appendix B), but no effort was made to determine which station had the redundant data.

### 3.0 RESULTS

### 3.1 Computer File Documentation

A separate computer file was created for each station containing tabular summaries of monthly temperature data. A description of this file follows. The name of a station's data file is based on that station's identification number assigned by NCDC. All file names follow the format of T<state #> <station #>.DAT. For example, (Table 2) Springfield is station number 8179 in Illinois, state number 11, thus giving the file name T118179.DAT. For stations that have not been assigned a NCDC station number, an in-house number was assigned pending assignment by NCDC. The in-house numbering system placed '99' in the state number position, the first two numbers of the station number being the state number (01-Illinois, 02-Indiana, 03-Michigan, 04-Minnesota, 05-New York, 06-Ohio, 07-Pennsylvania, and 08-Wisconsin), and the last two numbers being sequential numbers of stations, without NCDC numbers in that state, in alphabetical order. These stations will be assigned numbers by NCDC at a later date.

The first three lines of each data file contain the header information. The first line tells the type of data (temperature). The second line gives the NCDC station number, decimal latitude and longitude, most recent station name, and elevation in feet above sea level. The third line shows the period covered. The fourth line is blank. Following the header are data for each year covered. The order of these data is by year and month (January through December). The FOR-

-99.9 = MISSING OR INSUFFICIENT DATA IDENTICAL DATA FOR STATION 118179: 118184 1955 TRAN format is (1X,I4,1X,12(1x,f5.1)). Following the data is a blank line followed by a footer. The footer contains notes regarding the data. The first two lines of the footer give the data codes for missing values. This information is followed by station identifier and period for redundant temperature data for those stations listed in Appendix B.

### 3.2 Spatial and Temporal Coverage of Temperature Stations

The temporal distribution of the number of stations in the data set for each year is given in Figure 1. In that figure, a station is counted as active for a given year if it has at least 1 month with data in that year. The temporal distribution is divided into 13 decades, starting from 1861-70 and ending with 1981-90, with the number of stations given at the decade ending year in Figure 1. The decades fall into three periods of relatively little change in the number of stations (1861-1890, 1901-1940, and 1951-1990), and two periods of large increases in the number of stations (1891-1900 and 1941-1950). The number of stations for selected years during the two periods when the number of stations was increasing rapidly are also shown in Figure 1. The spatial distribution of stations for specific years is given in Figures 2-12.

There were only seven stations in 1886, located in Illinois, Michigan, and Indiana (Figure 2). The number of stations almost tripled by 1888 (Figure 3) and tripled again by 1890 (Figure 4). The number of stations in 1890 increased by a factor of 2.5 by 1895 (Figure 5). Most of these additional stations were located in Illinois, Indiana, and New York, with the rest scattered in Ohio, Michigan, and Minnesota. It is not known if these additional stations were not established prior to 1890 or if the data from them was not published until 1890. The number of stations increased by a factor of approximately 1.8 between 1895 (195) and 1896 (353). Most of this increase occurred in Minnesota, Wisconsin, and Pennsylvania (Figures 5 and 6). Annual increases of a little less than 100 stations occurred over the next 2 years, 1897 (Figure 7) and 1898 (Figure 8), due primarily to an increase in the number of stations for Ohio (1897) and for Michigan (1898). The distribution of stations in 1898 makes possible spatial analysis of temperature patterns over all eight Great Lakes states, and while the number of stations would come close to doubling by the late 1940s, it is questionable if the increase in station spatial density would significantly change the large-scale pattern of any spatial analysis, although details may have significant changes. The variation in the number of stations between 1901 and 1940 is less than 100 stations [578 (1901), 659 (1940)], a typical distribution pattern is portrayed in Figure 9 (622 stations). A large increase in stations during the decade ending 1950 occurred between 1947 and 1948, (Figures 10 and 11, 196 stations). This increase is attributed to the opening of new stations after World War II. The number of stations over the last four decades (1951-1990) ranged from 953 in 1951 to 1045 in 1971. Because of the relatively small variation in the annual number of stations between 1951 and 1990, the distribution pattern in 1990 (Figure 12) can be taken as typical of this entire period.

### 4. DISCUSSION

These data have not been corrected for instrumental change, observer error, or changes in instrument location or exposure. Thus, care must be taken in using the monthly temperature in their present form. Future work will include a statistical analysis of station homogeneity and an

examination of the spatial and temporal distribution pattern of monthly and annual temperature. The objective of this analysis will be to identify regional and seasonal trends and changes in long-term means over the period of record, similar to the work described in Bolsenga and Norton (1993) but updated to include the long period of record and expanded to include finer spatial resolution.

# 5. ACKNOWLEDGEMENTS

This work was funded by NOAA's National Environmental Satellite and Data Information Service's Earth System Data and Information Management Program. The cooperation of the state climatologists of the eight Great Lakes states and of Pam Hughes of NCDC in providing information and data on various aspects of this task is appreciated. The review of a draft copy of this report by Karen Andsager of the Midwestern Climate Center and by Roger Tanner of NCDC is appreciated as is the technical edit by Cathy Darnell of GLERL. The assistance of Alan Shrum of GLERL in the data entry phase of this project is appreciated. This work was completed while Don Meyer was with the Cooperative Institute of Limnological and Ecosystems Research (CILER) at NOAA/GLERL in Ann Arbor.
