ABSTRACT

The Resource Assessment and Conservation Engineering Division of the Alaska Fisheries Science Center conducts annual bottom trawl surveys to monitor the condition of the demersal fish and crab stocks of the eastern Bering Sea continental shelf. The standard study area, surveyed each year since 1979, encompasses a major portion of the eastern Bering Sea shelf between the 20-m and the 200-m isobaths and from the Alaska Peninsula north to approximately the latitude of St. Matthew Island ($60^{\circ} 50' N$). In 1999, this area was again surveyed by two chartered trawlers, the 40-m F/V *Arcturus* and the 40-m F/V *Aldebaran*.

Demersal populations were sampled by trawling for 30 minutes at stations centered in a 20×20 nautical mile grid covering the survey area. At each station, species composition of the catch was determined and commercially important species were sampled to obtain length distributions and age structure samples.

Survey results presented in this report include relative fishing powers of the survey vessels, abundance estimates for fish and invertebrates, geographic distributions of important fish species, size composition of principal fish species, and age and growth information for selected species. Surface and bottom temperatures recorded at each sampling station are also presented.

Appendices provide station data, species listings, and detailed results of analyses of abundance and biological data of the sampled populations.

INTRODUCTION

The eastern Bering Sea continental shelf supports one of the most productive groundfish fisheries in the world (Bakkala 1993). Since 1970, annual commercial catches of groundfish have ranged from 1.2 to 2.2 million metric tons (t) (North Pacific Fishery Management Council 1998). Although many species are caught commercially, the most abundant has been walleye pollock (*Theragra chalcogramma*), which, since 1970, has comprised more than 70% of the total landings. The next most abundant species have been yellowfin sole (*Limanda asper*) and Pacific cod (*Gadus macrocephalus*) which have comprised 8% and 5%, respectively, of the commercial landings.

Since 1971, the Resource Assessment and Conservation Engineering (RACE) Division of the Alaska Fisheries Science Center (AFSC) has conducted annual bottom trawl surveys of the eastern Bering Sea continental shelf. In 1975, the first large-scale survey of the eastern Bering Sea shelf was conducted under contract from the Bureau of Land Management in response to a need for baseline data to assess the potential impact of proposed offshore oil exploration and development on fishery resources (Pereyra et al. 1976). During this baseline survey, sampling was conducted over the eastern Bering Sea shelf between the 20-m and 200-m isobaths and from the Alaska Peninsula north to approximately 62°N. In subsequent years, the areal coverage of the annual surveys was reduced, until 1979 when the most comprehensive survey of the Bering Sea shelf was undertaken in cooperation with the Japan Fisheries Agency (Bakkala and Wakabayashi 1985). The 1979 survey encompassed the entire region sampled in the 1975 baseline study, and in addition, the continental slope waters between the Aleutian Islands and the U.S.-U.S.S.R. Convention Line, and the shelf region between St. Matthew and St. Lawrence Islands. A

hydroacoustic survey was also conducted in 1979 to assess the midwater component of the walleye pollock population. Subsequent annual bottom trawl surveys have essentially resampled the stations established during the 1975 survey, with slight modifications each year. This region encompasses the major portion of economically important eastern Bering Sea groundfish populations, except those primarily located in continental slope waters. Every third year, through 1991 (1979, 1982, 1985, 1988, 1991) an extended survey was conducted, including hydroacoustic assessment of midwater pollock, bottom trawl sampling of the continental slope (the continental slope was not surveyed in 1994 or 1997), and bottom trawl sampling in the region between St. Matthew and St. Lawrence Islands. The information gathered by the annual surveys serves to: 1) provide the North Pacific Fishery Management Council with annual fishery-independent estimates of abundance and biological condition of commercially exploited stocks, 2) provide distribution and abundance information to commercial fishermen, and 3) develop a time-series database contributing to our understanding of the population dynamics and interactions of groundfish species.

This report presents information collected by the AFSC in the eastern Bering Sea during the 1999 bottom trawl survey. The groundfish/crab survey and several ancillary projects were conducted from 19 May to 24 July by two U.S. vessels. Detailed information on principal crab species can be found in a report by Stevens et al. (2000).

METHODS

Survey Area and Sampling Design

The standard station pattern for the eastern Bering Sea survey is based on a systematic 20 × 20 nautical mile grid. In areas surrounding St. Matthew and the Pribilof Islands, grid block corners were also sampled to better assess blue king crab (*Paralithodes platypus*) concentrations. The survey design pattern called for 356 stations. In 1999, 353 standard stations and 20 additional stations northwest of the standard pattern were successfully sampled (Fig. 1 and Appendix A).

Starting with the eastern stations, the two vessels fished alternate north/south lines of stations such that coverage of the survey area was similar for each vessel. This sampling design facilitated the computation of relative fishing powers (or catch efficiencies) of the two vessels. The progression from east to west was established to prevent multiple encounters of yellowfin sole, Alaska plaice (*Pleuronectes quadrituberculatus*), and perhaps other species which may be migrating eastward during the course of the survey (Smith and Bakkala 1982). Tows were usually 30 minutes in duration and fishing was limited to daylight hours. For data analysis, the survey region was divided into six subareas bounded by the 50-m, 100-m, and 200-m isobaths and by a line separating the northwest and southeast portions of the study area (Fig. 1). This stratification scheme was designed to reduce the variances of population and biomass estimates by conforming to oceanographic domains which seem related to distributions of Bering Sea fishes (Bakkala 1993). The presence of high-density sampling for blue king crab in subareas 3, 4, and 6 necessitated a further division of these subareas into high-density and standard-density

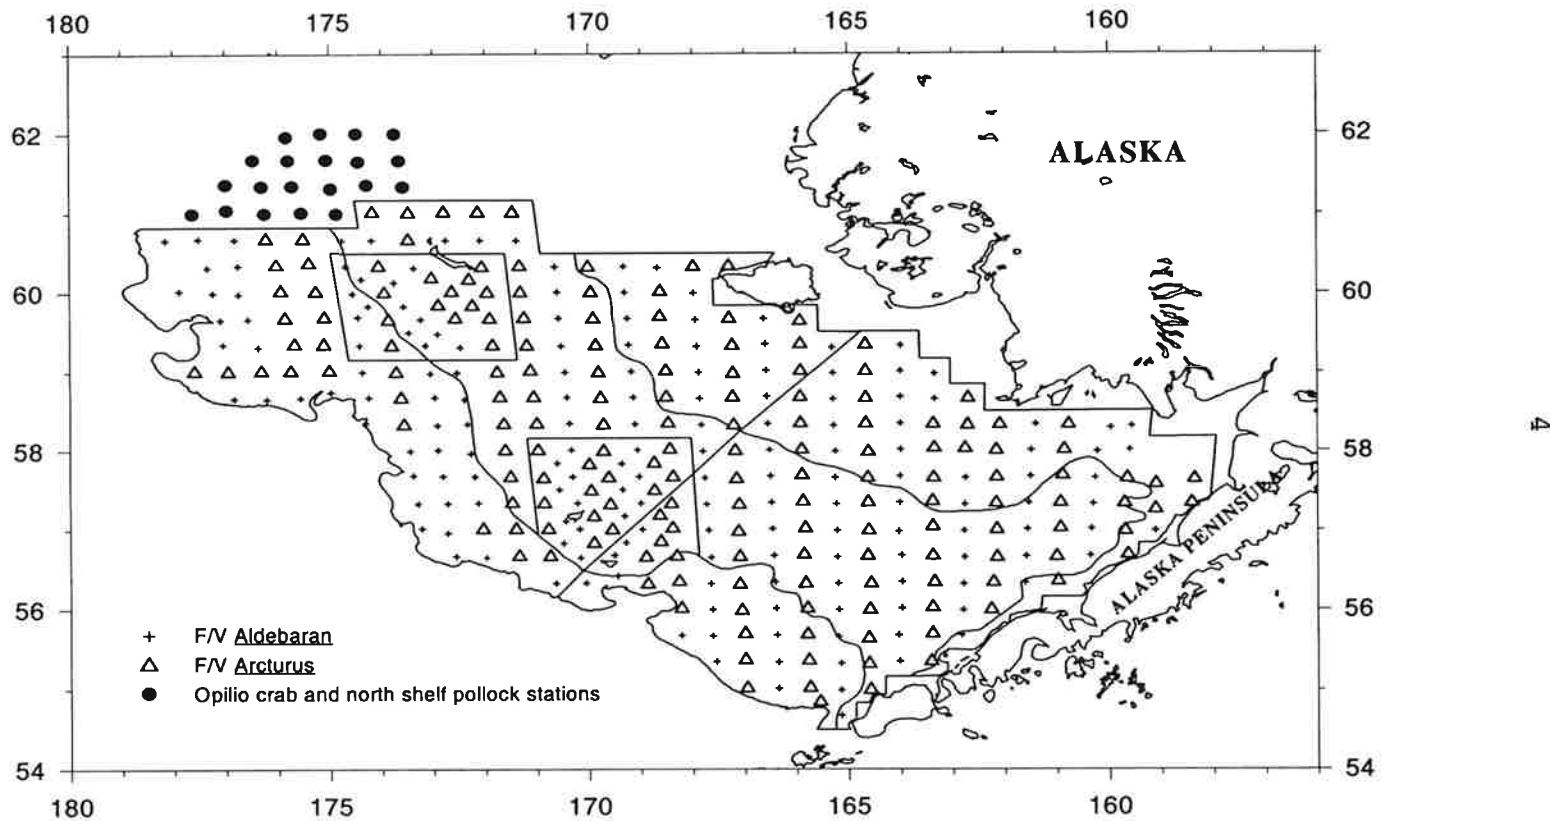

Figure 1.--Standard and special study stations sampled during the 1999 eastern Bering Sea bottom trawl survey, and stratifications used for the analysis of data.

sample strata, resulting in a total of 10 geographic strata. The overall sampling density for the entire survey area was one station per 1,313 km² (Table 1). However, because of the high-density sampling in subareas 3, 4, and 6, and the irregular subarea boundaries, sampling density among the six subareas varied from one station per 1,123 km² to one per 1,552 km².

Table 1.--Size of subareas and strata, and sampling densities for the 1999 eastern Bering Sea bottom trawl survey (See also Fig. 1).

Vessels and Fishing Gear

The 1999 eastern Bering Sea bottom trawl survey was conducted aboard the 40-m fishing vessels F/V *Arcturus* and F/V *Aldebaran* (Table 2). As in previous years, both vessels were equipped with 83-112 eastern otter trawls which have 25.3-m (83 ft) headropes and 34.1-m (112 ft) footropes (Fig. 2). These nets were attached to tail chains with 54.9-m (30 fathoms) paired dandylines. Each lower dandyline had a 0.61-m chain extension connected to the lower wing edge to improve bottom tending characteristics. Steel "V"-doors measuring 1.8 × 2.7 m and weighing 816 kg were used.

Table 2.--Characteristics of vessels used during the 1999 eastern Bering Sea bottom trawl survey.

Vessel	Overall length (m)	Horsepower	<u>Survey period</u>	
			Start	Finish
F/V <i>Arcturus</i>	40	1,525	19 May	24 July
F/V <i>Aldebaran</i>	40	1,525	19 May	24 July

SCANMAR¹ net mensuration systems were used aboard each vessel to measure net height and width. Net width was measured by the distance between two sensors attached to the upper starboard and port dandylines, about 0.61 m in front of the net. Mean net widths were calculated from observations recorded within each tow. These data were then used to establish a net width-scope (wire-out) relationship for each vessel to enable prediction of net width for tows where net width data were not available (Fig. 3) as described by Rose and Walters (1990). Estimates of net width were used in area-swept calculations.

Data Collection

Sampling procedures used in RACE eastern Bering Sea assessment surveys are described in detail by Wakabayashi et al. (1985). A brief summary follows.

Samples were collected by trawling at the center of each 20 × 20 nautical mile grid block (or corner station, in the case of high-density strata) for 30 minutes (timed after the net had settled on the bottom), towing at a speed of 1.54 m/sec (3 knots). If the bottom appeared to be untrawlable at the specified location, the nearest trawlable site within the same grid square was used. If the net was ripped or "hung up" on some object on the bottom during the tow, the catch was discarded and a new sample obtained.

Catches of less than approximately 1,150 kg (2,500 lb) were processed entirely and larger catches were subsampled. Economically important fish and invertebrates were sorted to species with the exception of two species of flatfish. Similar features between flathead sole (*Hippoglossoides elassodon*) and Bering flounder (*Hippoglossoides robustus*), made identification of these species (*Hippoglossoides* spp. in text and tables) difficult within the time constraints of the survey; thus, these species were grouped by genus for purposes of this report. Minor species of fish and invertebrates were sorted to the lowest taxonomic level practicable. Catch weights and numbers by species or species group were estimated directly or, when subsampled, estimated by extrapolating the proportion in the subsample to that of the entire catch weight. Pacific halibut (*Hippoglossus stenolepis*) and crab species of the genera *Paralithodes* (red and blue king crabs, *P. camtschaticus* and *P. platypus*, respectively), *Chionoecetes* (snow and Tanner crabs, *C. opilio* and *C. bairdi*, respectively), and *Erimacrus isenbeckii* (hair crab) were usually weighed and enumerated from the entire catch.

Size composition data were collected for each commercially important species and many co-habiting species (Table 3). Pacific halibut were measured immediately upon capture and returned to the sea in an effort to reduce sampling mortality for this species. Random samples of the remaining species of up to approximately 200 individuals (300 in the case of walleye pollock) were sexed and measured to the nearest centimeter from the tip of the snout to the end of the middle rays of the caudal fin (fork length).

Sagittal otoliths were collected from nine fish species (Table 4). In both the northwestern and southeastern divisions of the survey area, three otolith pairs per sex/centimeter interval were collected for Pacific cod and rock sole spp. (*Lepidopsetta* spp.; two species are now recognized from the Bering Sea: *L. bilineata* and *L. polyxystra* Orr and Matarese (2000)), and five otolith pairs per sex/centimeter interval for all other species. Scales as well as otoliths were taken from Pacific cod to aid in age determination of young fish. Individual fish weight data were collected for all species for which otoliths were taken. In the case of *Hippoglossoides* spp., otoliths were collected only from individuals that were identified with certainty as flathead sole. Age structures for roundfish were preserved in 50% ethanol; flatfish otoliths were preserved in 50% glycerol.

Temperature profiles were taken at each station using a micro-bathythermograph (MBT) attached to the head rope of the net; surface temperatures were taken by bucket thermometer.

^aSome age structures were collected outside the standard survey area.

^bScales were also taken.

Data Analysis

A brief description of the procedures used in the analysis of RACE Bering Sea survey data follows (for a detailed description see Wakabayashi et al. 1985). Some of the species collected were grouped by family for data analysis because of their insignificant commercial value or questionable identification.

Relative fishing powers between the two vessels were determined using the methods of Kappenman (1992). Three hundred twelve stations sampled by the two vessels during the standard survey (Fig. 1) were used in that analysis (see Appendix A).

Mean catch per unit effort (CPUE) values for each species were calculated in kilograms per hectare and number per hectare for each of the 10 strata; area swept (hectares) was computed as the distance towed multiplied by the mean net width (Alverson and Pereyra 1969). Mean CPUE values, weighted by strata areas, were calculated for individual subareas and for the overall survey area. Biomass and population estimates were derived for each stratum by multiplying the stratum mean CPUE by the stratum area. Stratum totals were then added together to produce estimates for each subarea and for the total survey area.

In estimating the size composition of populations of principal commercial species, length-frequency data obtained at each station were expanded to the station catch by proportion and then extrapolated to the stratum population by the weighted CPUE. Stratum estimates were summed to derive the estimated size composition by subarea and for the overall survey area.

Otolith and scale samples collected during the survey were read by staff of the Age and Growth Program of the AFSC's Resource Ecology and Fisheries Management (REFM) Division. From these age samples, stratified by sex and length, an age-length key was produced that

showed the distribution of ages by sex at each centimeter interval. Population age composition was estimated by apportioning ages to the estimated population number at each length interval. Only species whose age samples have been read by the time of writing of this publication have been included in the age analyses. Species completed at a later date will be presented in subsequent publications.

Growth characteristics of principal species were described with von Bertalanffy (1938) growth curves fitted to age-length data collected in this survey.

Special Studies

Stomach samples from several of the most prevalent commercial species in each haul were collected and preserved in 10% formalin for later examination by REFM's Food Habits Task (Table 5).

Additional biological information including age and growth, sex ratio, feeding ecology/morphology, and habitat preference were collected for rex sole (*Errex zachirus*).

Specimens of bigmouth sculpin (*Hemitripterus bolini*) egg masses and ovaries were collected to further describe the species' development and life history.

Additional activities included collecting specimens for observer training programs, collecting samples for fish and crab pathology studies (Table 5), and fulfilling collection requests from academic institutions.

Table 5.--Biological fish samples collected for special studies during the 1999 eastern Bering Sea bottom trawl survey.

Blue king crab		40

RESULTS

Station Data

Station data from the 1999 survey are listed in Appendix A. Relevant information such as position, tow parameters, time, and environmental measurements are listed for each vessel for all standard bottom trawl stations used in the analyses.

Environmental Conditions

Sea surface temperatures recorded during the survey ranged from -0.3° to 7.7° C (Fig. 4). As in most previous years, surface temperature increased from east to west across the shelf, probably reflecting the progression of summer warming as the survey proceeded from east to west.

Bottom temperatures ranged from -1.7° to 3.6° C (Fig. 5). The warmest temperatures (above 3° C) occurred in shallow waters along the northern portion of Bristol Bay, the southern central shelf, and north of St. George's Island. The coldest bottom temperatures observed were in the northern portion of the mid-shelf at depths between 50 and 100 m.

The mean bottom water temperature for the total survey area in 1999 was 0.8° C (Fig. 6). Historically, this was well below the values recorded for mean summer bottom water temperatures in the standard survey area since 1981 (annual mean temperatures range from 1.7° to 5.1° C; average of annual means is 2.7° C). Mean bottom temperatures observed over a more limited region of the southeast Bering Sea, which has been sampled annually since 1971, have ranged from 1.2° to 4.8° C; the 1999 value for this area was 1.5° C, one and a half degrees below the long-term average (3.1° C) (Fig. 6).

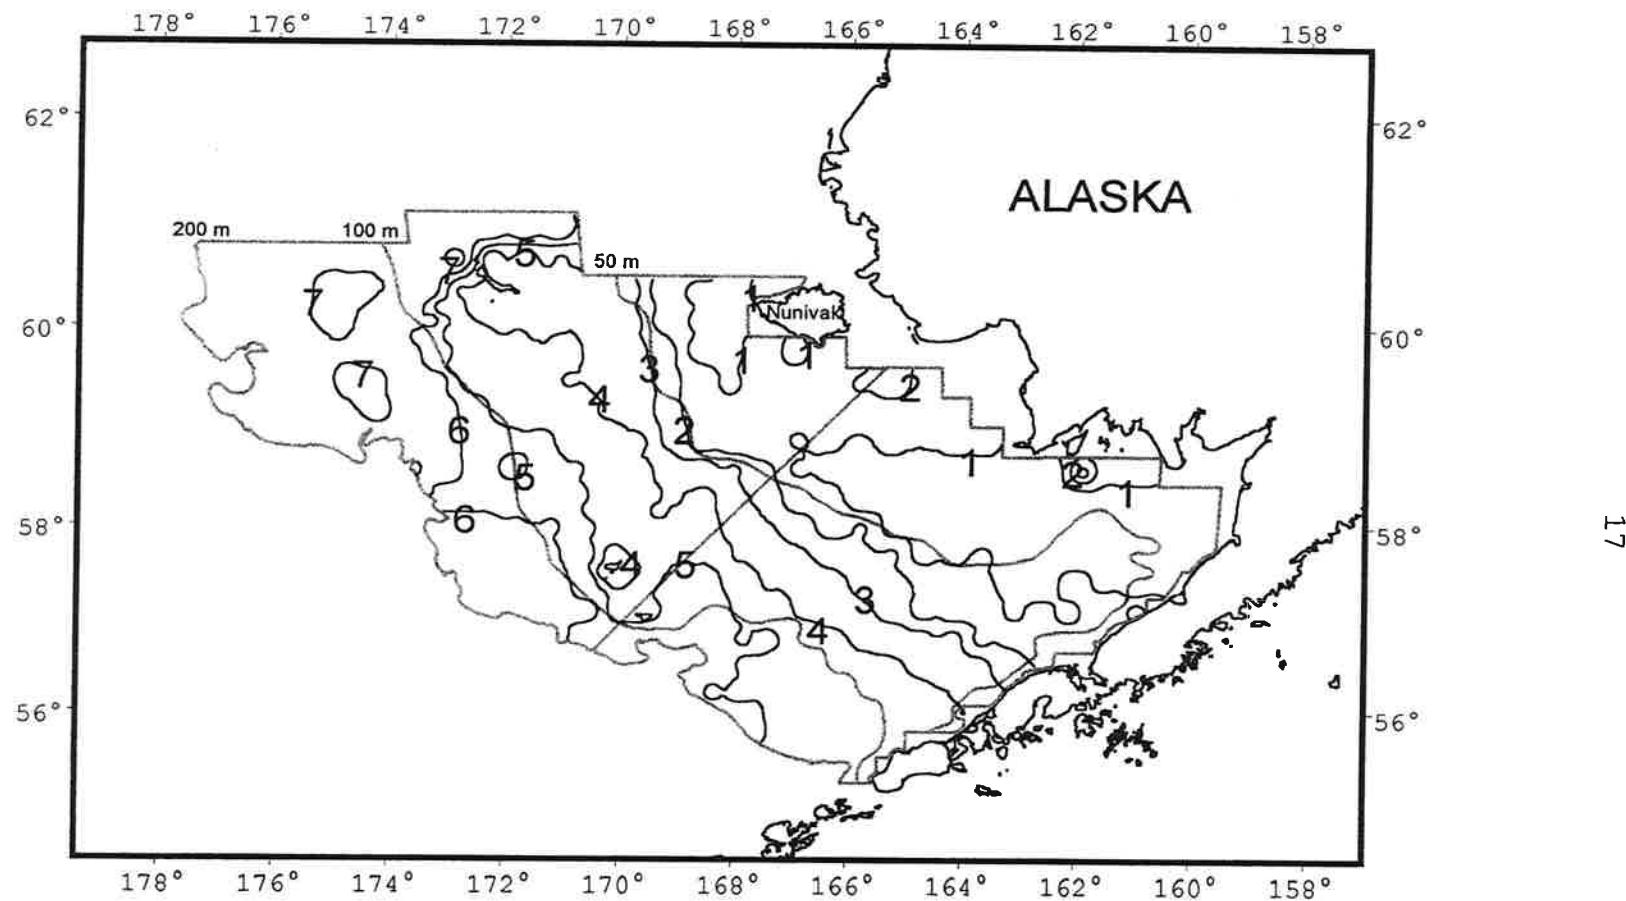

Figure 4.--Distribution of surface water temperatures ($^{\circ}\text{C}$) observed during the 1999 eastern Bering Sea bottom trawl survey.

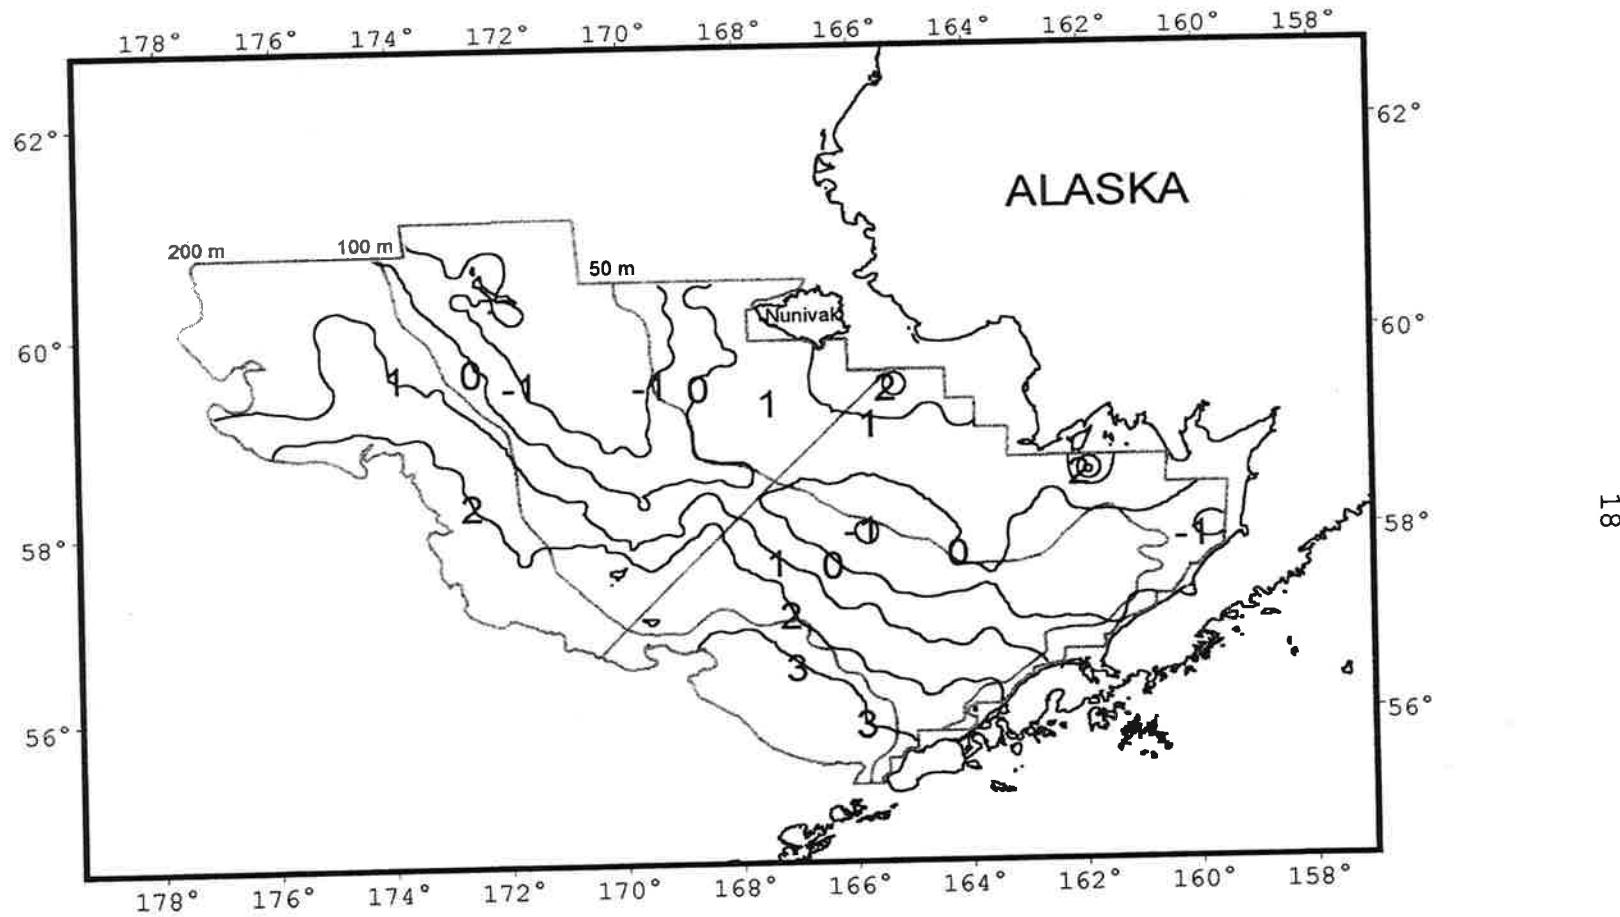

Figure 5.--Distribution of bottom water temperatures ($^{\circ}\text{C}$) observed during the 1999 eastern Bering Sea bottom trawl survey.

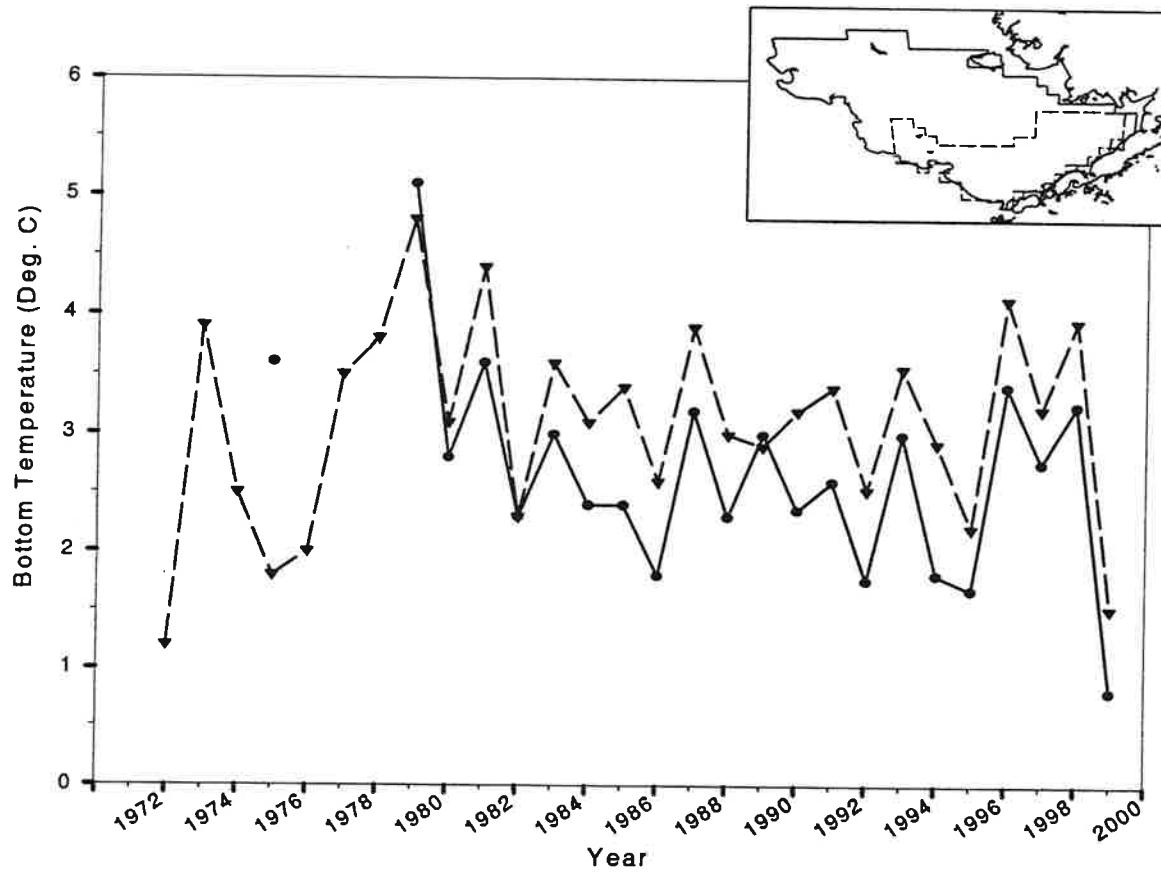

Figure 6.--Mean summer bottom water temperatures based on expendable bathythermograph casts or micro-bathythermographs attached to the net headrope during Alaska Fisheries Science Center bottom trawl surveys. The 1971-99 means (dashed line) are from the southeast Bering Sea (see insert) and the 1975 and 1979-99 means are from the larger survey area outlined on the inset. The 1975 data point for the overall survey area is based on data collected from August through September, while those in all other years and areas were collected from May through early August.

Relative Fishing Powers of Survey Vessels

A total of 312 alternate-row tows were used in the comparison of vessel catch rates with the methods developed by Kappenman (1992). Based on this analysis, the F/V *Aldebaran* was more efficient than the F/V *Arcturus* at capturing skates, yellowfin sole, *Lepidopsetta* spp., Alaska plaice, *Myoxocephalus* spp., and Pacific cod. Fishing power corrections were applied to catches (by species) of the less efficient vessel (Table 6).

Table 6.--Species for which fishing power corrections were applied in 1999, and scaling factors determined by the method of Kappenman (1992) based on 312 total hauls.

Species	Hauls with catch		Catch multiplier	
	F/V <i>Arcturus</i>	F/V <i>Aldebaran</i>	F/V <i>Arcturus</i>	F/V <i>Aldebaran</i>
skate unident.	161	166	1.24	1.00
yellowfin sole	118	117	1.09	1.00
<i>Lepidopsetta</i> spp.	134	135	1.09	1.00
Alaska plaice	118	114	1.30	1.00
<i>Myoxocephalus</i> spp.	180	145	1.08	1.00
Pacific cod	138	131	1.06	1.00

Estimated Biomass of Major Fish and Invertebrate Groups

Total demersal animal biomass for the overall survey area was estimated at 11.8 million t, of which fish species accounted for 78% (9.2 million t, Table 7), and invertebrates 22% (2.6 million t, Table 8). Concentrations of fish biomass were located in Bristol Bay and along the Alaska Peninsula, around the Pribilof Islands, and northwest of the Pribilofs (Fig. 7). Although 21 families and 102 species of fish were identified in the catches (Appendix B), the fish biomass was dominated by flatfishes (Pleuronectidae, 4.4 million t) and cods (Gadidae, 4.2 million t) (Table 7). The biomass of invertebrates was comprised primarily of the phyla Echinodermata (0.95 million t), Crustacea (0.50 million t), and Mollusca (0.26 million t). A total of 204 invertebrate species from 9 phyla were identified in the survey (Table 8, Appendix B).

Relative Abundance of Individual Fish Species

Relative abundance (not weighted by area) of the 11 most abundant species and species groups of fish are shown in Figure 8. These taxa accounted for 76% (190.5 kg/ha) of total animal mean CPUE (251.1 kg/ha) and 97% of total fish mean CPUE (196.3 kg/ha). Overall, but particularly in water deeper than 50 m, walleye pollock was the dominant species in the catch with a mean CPUE of 76.4 kg/ha. Pacific cod were consistently abundant in the 50-100m depth zone with an overall mean CPUE of 13.2 kg/ha. Yellowfin sole and *Lepidopsetta* spp., with overall mean catch rates of 27.8kg/ha and 36.6 kg/ha, respectively, dominated catches in water less than 50 m. Yellowfin sole and rock sole were also prominent on the mid-shelf waters between the 50-m and the 100-m isobaths along with Alaska plaice and *Hippoglossoides* spp. See Appendix C for a descending rank of all organisms caught.

Table 7.--Biomass estimates in metric tons (t) for major fish species and fish groups taken during the 1999 eastern Bering Sea bottom trawl survey.

Taxon	Estimated total biomass (t) ^a and 95% confidence interval	Proportion of total animal biomass ^b	Estimated biomass (t) by subarea

^bProportion of total estimated biomass, fish and invertebrates combined, for the total survey area. Total estimated biomass=12,911,100t.

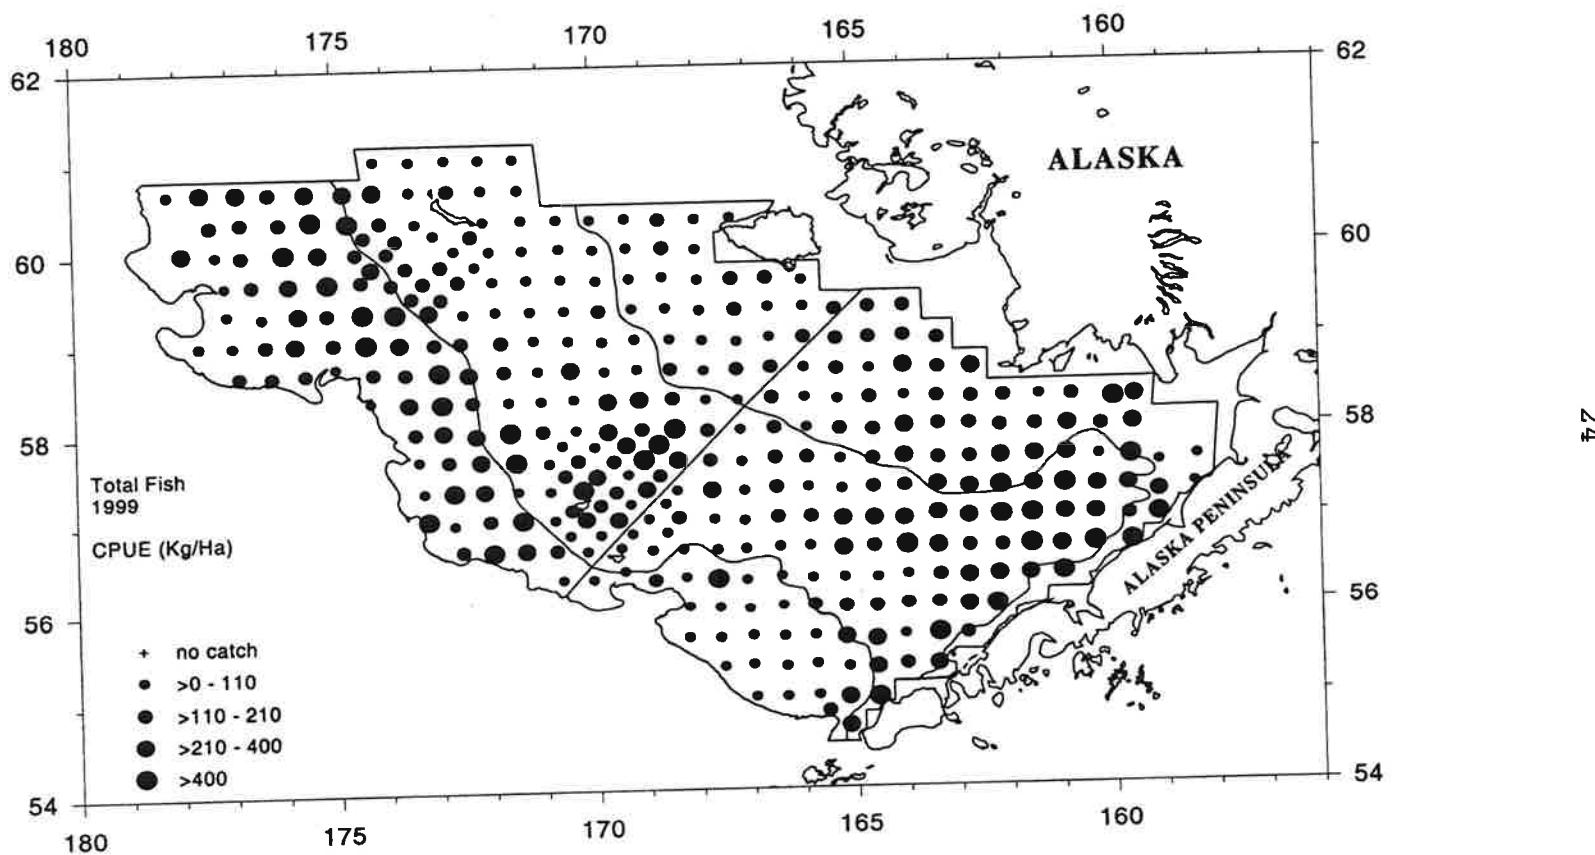

Figure 7.--Distribution and relative abundance of total fish, 1999 eastern Bering Sea bottom trawl survey.

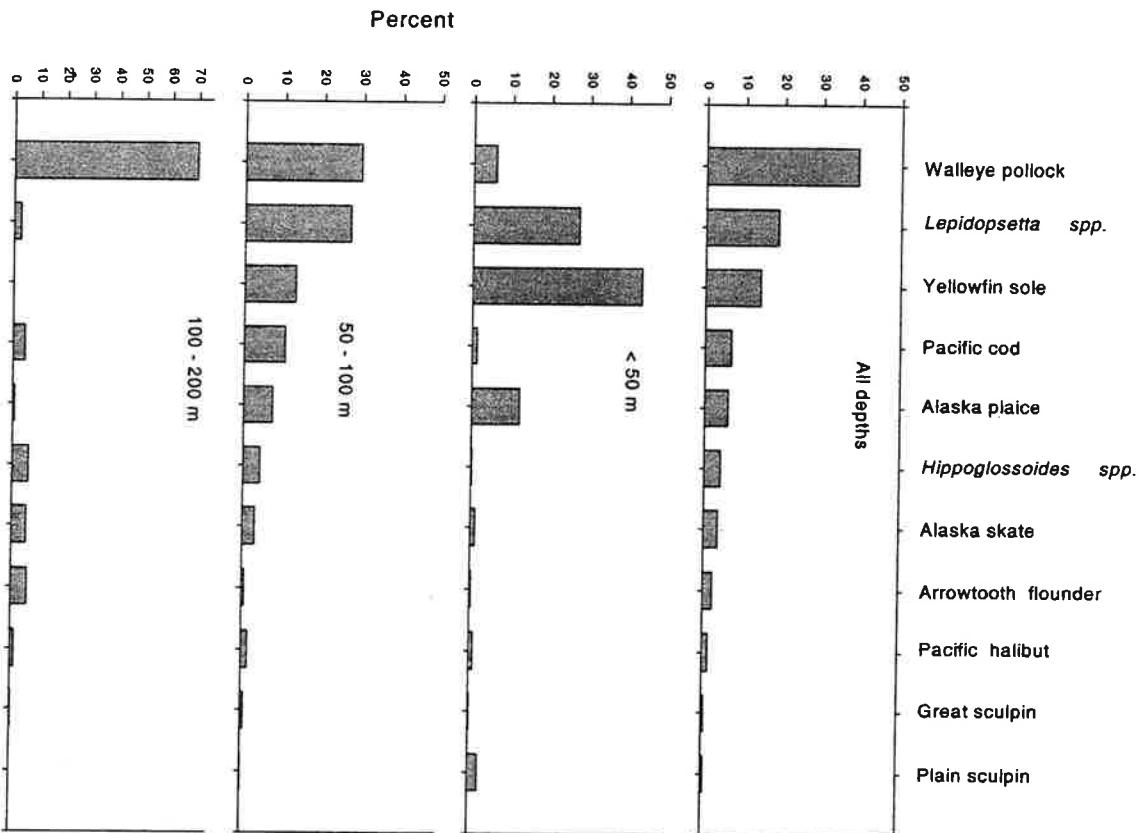

Figure 8.--Relative abundance (% CPUE in kg/ha) of principal groundfish species (top 11 for all depths combined) by depth zones and for all depths combined, 1999 eastern Bering Sea bottom trawl survey.

Abundance, Distribution, and Size and Age Composition of
Principal Species and Species Groups

Geographical distributions, population numbers, biomass estimates, and size composition are presented for each of the following commercially important eastern Bering Sea groundfish: walleye pollock, Pacific cod, yellowfin sole, *Lepidopsetta* spp., *Hippoglossoides* spp., Alaska plaice, Greenland turbot (*Reinhardtius hippoglossoides*), arrowtooth flounder, Kamchatka flounder, and Pacific halibut. Estimated biomass, population numbers, and mean size (by length and weight) are summarized by subarea and for the entire survey area. Size composition data are illustrated in histograms relating the population percentage of length by centimeter interval for each subarea and in population numbers for the total survey area. Age composition and von Bertalanffy growth parameters are given for walleye pollock. Age data and growth parameters for Pacific cod, yellowfin sole, and *Lepidopsetta* spp. will be presented in a separate report.

Geographical distributions for some common, but generally noncommercial fish species are presented. These are Bering skate (*Bathyraja interrupta*), Alaska skate (*B. parmifera*), warty sculpin (*Myoxocephalus verrucosus*), great sculpin (*M. polyacanthocephalus*), plain sculpin (*M. jaok*), bigmouth sculpin (*Hemitripterus bolini*), wattled eelpout (*Lycodes palearis*), shortfin eelpout (*L. brevipes*), marbled eelpout (*L. raridens*), sturgeon poacher (*Podothecus acipenserinus*), Bering poacher (*Occella dodecaedron*), eulachon (*Thaleichthys pacificus*), capelin (*Mallotus villosus*), and Pacific herring (*Clupea pallasi*). Biomass and population estimates as well as mean weight are given by subarea and total area. These tables are not given for the pelagic species such as eulachon, capelin, and Pacific herring due to the bottom sampling

nature of the survey. We do not believe these species are adequately represented in the samples; however, plots are shown to give some idea of geographic distribution.

Appendices to the report contain detailed results of the analysis. CPUE, population, and biomass estimates as well as the variances and confidence limits for each species by stratum are given in Appendix D. Population estimates by sex and size class for the total survey area are listed in Appendix E.

APPENDIX A

Station Data, 1999 Eastern Bering Sea Bottom Trawl Survey

Appendix A contains station data by vessel for the 353 successfully completed standard survey stations. In using the tables, the following should be noted:

1. Time represents the nearest hour at the start of the tow.
2. Haul numbers are not always sequential because special study and unsatisfactory hauls were omitted.
3. All longitudes are in Western Hemisphere, latitudes in Northern Hemisphere.
Geodetic positions are displayed as degrees and decimal minutes.
4. Width codes are as follows:

M = Net width was measured by mensuration gear.

F = Net width was estimated from a function of wire out or wire out and net height.

5. Hauls marked with an "*" were used for the FPC analysis.

APPENDIX B**List of Species Encountered**

Appendix B contains a listing of all fish and invertebrate species taken during the 1999 eastern Bering Sea bottom trawl survey.

List of Tables

<u>Table</u>	<u>Page</u>
Appendix B Table 1.--Fish species encountered during the 1999 eastern Bering Sea bottom trawl survey.	103
Appendix B Table 2.--Invertebrate species encountered during the 1999 eastern Bering Sea bottom trawl survey.	107

Appendix B Table 1.--Fish species encountered during the 1999 eastern Bering Sea bottom trawl survey.

Family	Scientific name	Common name
Petromyzontidae	Petromyzontidae	lamprey unident.
Squalidae	<i>Somniosus pacificus</i>	Pacific sleeper shark
Rajidae	<i>Rajidae</i> unident. <i>Bathyraja</i> sp.	skate unident. big skate
	<i>Raja binoculata</i>	Bering skate
	<i>Bathyraja interrupta</i>	Alaska skate
	<i>Bathyraja parmifera</i>	Okhotsk skate
	<i>Bathyraja violacea</i>	
Pleuronectidae	<i>Atheresthes stomias</i>	arrowtooth flounder
	<i>Atheresthes evermanni</i>	Kamchatka flounder
	<i>Reinhardtius hippoglossoides</i>	Greenland turbot
	<i>Hippoglossus stenolepis</i>	Pacific halibut
	<i>Hippoglossoides</i> sp.	
	<i>Hippoglossoides elassodon</i>	flathead sole
	<i>Hippoglossoides robustus</i>	Bering flounder
	<i>Microstomus pacificus</i>	Dover sole
	<i>Glyptocephalus zachirus</i>	rex sole
	<i>Limanda asper</i>	yellowfin sole
	<i>Limanda proboscidea</i>	longhead dab
	<i>Limanda sakhalinensis</i>	Sakhalin sole
	<i>Platichthys stellatus</i>	starry flounder
	<i>Lepidotetta polyxystra</i>	northern rock sole
	<i>Lepidotetta bilineata</i>	southern rock sole
	<i>Isopsetta isolepis</i>	butter sole
	<i>Pleuronectes quadrituberculatus</i>	Alaska plaice
Agonidae	<i>Pallasina barbata</i>	tubenose poacher
	<i>Sarritor leptorhynchus</i>	longnose poacher

Appendix B Table 1.--Continued.

Family	Scientific name	Common name
	<i>Sarritor frenatus</i>	sawback poacher
	<i>Bathyagonus alascanus</i>	gray starsnout
	<i>Bathyagonus infraspinatus</i>	spinycheek starsnout
	<i>Podothecus acipenserinus</i>	sturgeon poacher
	<i>Podothecus veterinus</i>	vetrans poacher
	<i>Aspidophoroides bartoni</i>	Aleutian alligatorfish
	<i>Occella dodecaedron</i>	Bering poacher
Ammodytidae	<i>Ammodytes hexapterus</i>	Pacific sand lance
Anarhichadidae	<i>Anarhichas orientalis</i>	Bering wolffish
Anoplopomatidae	<i>Anoplopoma fimbria</i>	sablefish
Bathymasteridae	<i>Bathymaster signatus</i>	searcher
Clupeidae	<i>Clupea pallasi</i>	Pacific herring
Cottidae	Cottidae	sculpin unident.
	<i>Gymnophanths pistilliger</i>	threaded sculpin
	<i>Gymnophanths galeatus</i>	armorhead sculpin
	<i>Artediellus pacificus</i>	Pacific hookear sculpin
	<i>Malacocottus</i> sp.	
	<i>Malacocottus zonurus</i>	darkfin sculpin
	<i>Hemilepidotus</i> sp.	Irish lord
	<i>Hemilepidotus hemilepidotus</i>	red Irish lord
	<i>Hemilepidotus jordani</i>	yellow Irish lord
	<i>Hemilepidotus papilio</i>	butterfly sculpin
	<i>Triglops forficata</i>	scissortail sculpin
	<i>Triglops scepticus</i>	spectacled sculpin
	<i>Triglops pingeli</i>	ribbed sculpin
	<i>Triglops macellus</i>	roughspine sculpin
	<i>Myoxocephalus verrucosus</i>	warty sculpin
	<i>Myoxocephalus polyacanthocephalus</i>	great sculpin
	<i>Myoxocephalus jaak</i>	plain sculpin

Family	Scientific name	Common name
	<i>Myoxocephalus</i> sp.	
	<i>Leptocottus armatus</i>	Pacific staghorn sculpin
	<i>Enophrys diceraus</i>	antlered sculpin
	<i>Dasycottus setiger</i>	spinyhead sculpin
	<i>Blepsias bilobus</i>	crested sculpin
	<i>Nautichthys pribilovius</i>	eyeshade sculpin
	<i>Nautichthys oculofasciatus</i>	sailfin sculpin
	<i>Hemitripterus bolini</i>	bigmouth sculpin
	<i>Icelus spiniger</i>	thorny sculpin
	<i>Icelus spatula</i>	spatulate sculpin
Trichodontidae	<i>Trichodon trichodon</i>	Pacific sandfish
Gadidae	<i>Gadus macrocephalus</i>	Pacific cod
	<i>Boreogadus saida</i>	Arctic cod
	<i>Eleginus gracilis</i>	saffron cod
	<i>Theragra chalcogramma</i>	walleye pollock
Hexagrammidae	<i>Pleurogrammus monopterygius</i>	Atka mackerel
	<i>Hexagrammos stelleri</i>	whitespotted greenling
	<i>Hexagrammos decagrammus</i>	kelp greenling
Cyclopteridae	<i>Aptocyclus ventricosus</i>	smooth lump sucker
	Liparidinae	snailfish unident.
	<i>Liparis</i> sp.	
	<i>Liparis gibbus</i>	dusky snailfish
	<i>Crystallichthys cyclospilus</i>	blotched snailfish
	<i>Careproctus</i> sp.	
	<i>Careproctus cypselurus</i>	blackfin snailfish
	<i>Careproctus rastrinus</i>	salmon snailfish
Osmeridae	<i>Thaleichthys pacificus</i>	eulachon
	<i>Mallotus villosus</i>	capelin
	<i>Osmerus mordax</i>	rainbow smelt

Appendix B Table 1.--Continued.

Family	Scientific name	Common name
Salmonidae	<i>Oncorhynchus tshawytscha</i>	chinook salmon
Stichaeidae	<i>Lumpenus maculatus</i>	daubed shanny
	<i>Lumpenus medius</i>	stout eelblenny
	<i>Lumpenus sagitta</i>	snake prickleback
	<i>Poroclinus rothrocki</i>	whitebarred prickleback
Zaproridae	<i>Zaprora silenus</i>	prowfish
Zoarcidae	Zoarcidae	eelpout unident.
	<i>Lycodes ravidens</i>	marbled eelpout
	<i>Lycodes palearis</i>	wattled eelpout
	<i>Lycodes polaris</i>	Canadian eelpout
	<i>Lycodes turneri</i>	polar eelpout
	<i>Lycodes brevipes</i>	shortfin eelpout
	<i>Gymnelus viridis</i>	fish doctor
Scorpaenidae	<i>Sebastes aleutianus</i>	rougheye rockfish
	<i>Sebastes alutus</i>	Pacific ocean perch
	<i>Sebastes ciliatus</i>	light dusky rockfish

Appendix B Table 2.--Invertebrate species encountered during the 1999 eastern Bering Sea bottom trawl survey.

Phylum	Species name	Common name
Cnidaria	Scyphozoa (class)	jellyfish unident.
	<i>Gersemia</i> sp.	sea raspberry
	<i>Gersemia rubiformis</i>	
	Gorgonacea (order)	gorgonian coral unident.
	<i>Paragorgia arborea</i>	Kamchatka coral
	Pennatulacea (order)	sea pen or sea whip unident.
	<i>Virgularia</i> sp.	smoothstem seawhip
	Actiniaria (order)	sea anemone unident.
	<i>Metridium</i> sp.	
	<i>Urticina</i> sp.	
	<i>Liponema brevicorne</i>	tentacle-shedding anemone
Annelida	Polychaeta (class)	polychaete worm unident.
	Aphroditidae	sea mouse unident.
	<i>Aphrodita negligens</i>	
	<i>Nereis</i> sp.	
	<i>Cheilonereis cylurus</i>	
	Polynoidae	scale worm unident.
	<i>Eunoe nodosa</i>	giant scale worm
	<i>Eunoe depressa</i>	depressed scale worm
	Hirudinea unident.	leech unident.
	<i>Carcinobdella cyclostomum</i>	striped sea leech
Arthropoda	Isopoda (order)	isopod unident.
	Thoracica (order)	barnacle unident.
	<i>Balanus evermanni</i>	giant barnacle
	<i>Balanus rostratus</i>	beaked barnacle
	<i>Pandalus borealis</i>	northern shrimp
	<i>Pandalus goniurus</i>	humpy shrimp

Appendix B Table 2.--Continued.

Phylum	Species name	Common name
	<i>Pandalus hypsinotus</i>	coonstripe shrimp
	<i>Eualus</i> sp.	
	<i>Lebbeus</i> sp.	
	<i>Crangonidae</i>	crangonid shrimp unident.
	<i>Crangon</i> sp.	
	<i>Crangon communis</i>	twospine crangon
	<i>Crangon dalli</i>	ridged crangon
	<i>Argis</i> sp.	
	<i>Argis dentata</i>	Arctic argid
	<i>Sclerocrangon boreas</i>	sculptured shrimp
	<i>Argis lar</i>	kuro argid
	<i>Cancer oregonensis</i>	Oregon rock crab
	<i>Oregonia gracilis</i>	graceful decorator crab
	<i>Chionoecetes bairdi</i>	Tanner crab
	<i>Hyas coarctatus</i>	circumboreal toad crab
	<i>Hyas lyratus</i>	Pacific lyre crab
	<i>Chionoecetes opilio</i>	snow crab
	<i>Chionoecetes hybrid</i>	tanner crab
	<i>Telmessus cheiragonus</i>	helmet crab
	<i>Paguridae</i>	hermit crab unident.
	<i>Pagurus</i> sp.	
	<i>Pagurus brandti</i>	sponge hermit
	<i>Pagurus aleuticus</i>	Aleutian hermit
	<i>Labidochirus splendescens</i>	splendid hermit
	<i>Pagurus confragosus</i>	knobbyhand hermit
	<i>Pagurus ochotensis</i>	Alaskan hermit
	<i>Elassochirus tenuimanus</i>	widehand hermit crab
	<i>Pagurus capillatus</i>	hairy hermit crab

Appendix B Table 2.--Continued.

Phylum	Species name	Common name
	<i>Elassochirus cavimanus</i>	purple hermit
	<i>Hapalogaster grebnitzkii</i>	
	<i>Paralithodes camtschaticus</i>	red king crab
	<i>Paralithodes platypus</i>	blue king crab
	<i>Placetron wosnessenskii</i>	scaled crab
	<i>Erimacrus isenbeckii</i>	horsehair crab
Mollusca	Mollusca (phylum)	mollusk unident.
	Nudibranchia unident.	nudibranch unident.
	<i>Tritonia</i> sp.	
	<i>Tritonia diomedea</i>	rosy tritonia
	Gastropod unident.	snail unident.
	<i>Natica</i> sp.	
	<i>Natica clausa</i>	Arctic moonsnail
	<i>Natica aleutica</i>	Aleutian moonsnail
	<i>Polinices</i> sp.	
	<i>Polinices pallidus</i>	pale moonsnail
	<i>Crepidula</i> sp.	slipper shell
	<i>Crepidula grandis</i>	great slippersnail
	<i>Colus</i> sp.	
	<i>Colus herendeenii</i>	thin-ribbed whelk
	<i>Colus roseus</i>	rosy whelk
	<i>Colus spitzbergensis</i>	thick-ribbed whelk
	<i>Colus halli</i>	shrew whelk
	<i>Volutopsius</i> sp.	
	<i>Pyrulofusus deformis</i>	warped whelk
	<i>Volutopsius fragilis</i>	fragile whelk
	<i>Volutopsius castaneus</i>	volute whelk
	<i>Pyrulofusus melonis</i>	

Appendix B Table 2.--Continued.

Phylum	Species name	Common name
	<i>Volutopsius middendorffii</i>	tulip whelk
	<i>Beringius</i> sp.	
	<i>Beringius kennicottii</i>	
	<i>Beringius frielei</i>	
	<i>Beringius beringii</i>	
	<i>Beringius stimpsoni</i>	
	<i>Beringius crebricostatus</i>	thick-cord whelk
	<i>Neptunea</i> sp.	
	<i>Neptunea pribiloffensis</i>	Pribilof whelk
	<i>Neptunea borealis</i>	
	<i>Neptunea lyrata</i>	lyre whelk
	<i>Neptunea ventricosa</i>	fat whelk
	<i>Neptunea heros</i>	
	<i>Neptunea magna</i>	helmet whelk
	<i>Plicifusus</i> sp.	
	<i>Plicifusus kroyeri</i>	
	<i>Aforia circinata</i>	keeled aforia
	<i>Oenopota</i> sp.	
	<i>Boreotrophon muriciformis</i>	
	<i>Boreotrophon</i> sp.	
	<i>Fusitriton oregonensis</i>	Oregon triton
	<i>Fusitriton</i> sp.	
	<i>Buccinum</i> sp.	
	<i>Buccinum angulosum</i>	angular whelk
	<i>Buccinum plectrum</i>	sinuous whelk
	<i>Buccinum scalariforme</i>	ladder whelk
	<i>Buccinum polare</i>	polar whelk
	<i>Buccinum solenum</i>	

Appendix B Table 2.--Continued.

Phylum	Species name	Common name
	<i>Arctomelon stearnsii</i>	Alaska volute
	<i>Bivalvia unident.</i>	bivalve unident.
	<i>Mytilidae</i>	mussel unident.
	<i>Modiolus modiolus</i>	northern horse mussel
	<i>Mytilus edulis</i>	blue mussel
	<i>Pectinid unident.</i>	scallop unident.
	<i>Chlamys</i> sp.	
	<i>Patinopecten caurinus</i>	weathervane scallop
	<i>Hiatella arctica</i>	Arctic hiatella
	<i>Yoldia</i> sp.	
	<i>Yoldia scissurata</i>	crisscrossed yoldia
	<i>Nuculana</i> sp.	
	<i>Musculus discors</i>	discordant mussel
	<i>Cyclocardia crebricostata</i>	many-rib cyclocardia
	<i>Cyclocardia</i> sp.	
	<i>Clinocardium</i> sp.	
	<i>Clinocardium nuttallii</i>	Nuttall cockle
	<i>Clinocardium ciliatum</i>	hairy cockle
	<i>Mactromeris</i> sp.	
	<i>Mactromeris polynyma</i>	Arctic surfclam
	<i>Tellina</i> sp.	
	<i>Tellina lutea</i>	Alaska great-tellin
	<i>Macoma</i> sp.	
	<i>Macoma nasuta</i>	bent-nose macoma
	<i>Siliqua</i> sp.	
	<i>Siliqua alta</i>	Alaska razor
	<i>Serripes</i> sp.	
	<i>Serripes groenlandicus</i>	Greenland cockle

Appendix B Table 2.--Continued.

Phylum	Species name	Common name
Echinodermata	<i>Serripes laperousii</i>	broad cockle
	<i>Pododesmus macroschisma</i>	Alaska falsejingle
	<i>Cephalopoda</i> unident.	cephalopod unident.
	<i>Rossia pacifica</i>	eastern Pacific bobtail
	<i>Asteroidea</i> unident.	starfish unident.
	<i>Evasterias</i> sp.	
	<i>Evasterias troschelii</i>	
	<i>Evasterias echinosoma</i>	
	<i>Leptasterias hylodes</i>	
	<i>Pycnopodia helianthoides</i>	
	<i>Lethasterias nanimensis</i>	
	<i>Pedicellaster magister</i>	
	<i>Henricia</i> sp.	
	<i>Henricia leviuscula</i>	
	<i>Henricia tumida</i>	
	<i>Leptasterias polaris</i>	
	<i>Leptasterias arctica</i>	
	<i>Leptasterias</i> sp.	
	<i>Gephyreaster swifti</i>	
	<i>Pseudarchaster parello</i>	
	<i>Ceramaster</i> sp.	
	<i>Ceramaster patagonicus</i>	orange bat star
	<i>Solaster</i> sp.	
	<i>Crossaster borealis</i>	
	<i>Crossaster papposus</i>	rose sea star
	<i>Pteraster</i> sp.	
	<i>Pteraster tessellatus</i>	
	<i>Pteraster obscurus</i>	

Appendix B Table 2.--Continued.

Phylum	Species name	Common name
	<i>Diplopteraster multipedes</i>	
	<i>Asterias</i> sp.	
	<i>Asterias amurensis</i>	purple-orange seastar
	<i>Ctenodiscus crispatus</i>	common mud star
	<i>Dipsacaster borealis</i>	
	Echinacea unident.	sea urchin unident.
	<i>Strongylocentrotus droebachiensis</i>	green sea urchin
	<i>Strongylocentrotus pallidus</i>	white sea urchin
	<i>Echinarachnius parma</i>	Parma sand dollar
	Ophiuroid unident.	brittlestarfish unident.
	<i>Gorgonocephalus eucnemis</i>	basketstarfish
	<i>Ophiura</i> sp.	
	<i>Ophiura sarsi</i>	
	Holothuroidea unident.	sea cucumber unident.
	<i>Cucumaria fallax</i>	
	<i>Psolus</i> sp.	
Porifera	Porifera	sponge unident.
	<i>Suberites ficus</i>	hermit sponge
	<i>Mycale loveni</i>	tree sponge
	<i>Halichondria panicea</i>	barrel sponge
Sipuncula	Sipuncula (phylum)	sipunculid worm unident.
Bryozoa	Bryozoa unident.	bryozoan unident.
	<i>Flustra serrulata</i>	leafy bryozoan
	<i>Porella compressa</i>	flattened bryozoan
	<i>Escharopsis sarsi</i>	
	<i>Rhamphostomella costata</i>	ribbed bryozoan
	<i>Cellepora ventricosa</i>	coral bryozoan
Chordata	Ascidian unident.	tunicate unident.

Appendix B Table 2.--Continued.

Phylum	Species name	Common name
	<i>Thaliacea unident.</i>	salps unident.
	<i>Styela</i> sp.	
	<i>Styela rustica</i>	sea potato
	<i>Boltenia</i> sp.	
	<i>Boltenia ovifera</i>	
	<i>Halocynthia</i> sp.	sea peach unident.
	<i>Halocynthia aurantium</i>	sea peach
	<i>Aplidium</i> sp.	sea glob
	<i>Molgula griffithsii</i>	sea grape

APPENDIX C**Rank Order of Relative Abundance of Fish and Invertebrates**

Appendix C ranks all fish and invertebrates caught during the 1999 eastern Bering Sea bottom trawl survey by descending unweighted CPUE (kg/ha).

Appendix C Table 1.--Rank of fish and invertebrate taxa by unweighted total CPUE (kg/ha) from the 1999 eastern Bering Sea bottom trawl survey.

Rank	Species	Mean CPUE	Variance	95 Percent Confidence Limits		Proportion	Cumulative Proportion	Name
		(kg/ha)						
1	21740	76.37074	98.415	56.92672	95.81477	0.30418989	0.30418989	<i>Theragra chalcogramma</i>

APPENDIX D**Abundance Estimates for Principal Fish Species**

Appendix D presents estimates of area weighted catch-per-unit-effort (CPUE), population numbers and biomass for the principal fish species. Estimates of variance and confidence intervals do not incorporate variation associated with fishing power corrections or measurements of effort. CPUE is measured in kilograms (kg) and numbers (no.) per hectare. Estimates are given separately for each of the 10 geographic strata used in the analysis; estimates for each of the six standard subareas are presented as subtotals of the component strata. Stratum codes correspond to subareas as follows:

Subarea Stratum

1 10

2 20

3 31

32 (Pribilof Islands high density)

4 41

42 (Pribilof Islands high density)

43 (St. Matthew Island high density)

5 50

6 61

62 (St. Matthew Island high density)

APPENDIX E

**Population Estimates by Sex and Size
Groups for Principal Fish Species**

Appendix E presents estimates of the numbers of individuals within the overall survey area by sex and size group for principal fish species.
