NOAA Technical Memorandum NMFS

The National Marine Fisheries Service's Alaska Fisheries Science Center uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series reflect sound professional work and may be referenced in the formal scientific and technical literature.

The NMFS-AFSC Technical Memorandum series of the Alaska Fisheries Science Center continues the NMFS-F/NWC series established in 1970 by the Northwest Fisheries Center. The NMFS-NWFSC series is currently used by the Northwest Fisheries Science Center.

Abstract

The National Marine Fisheries Service (NMFS) is required under the Marine Mammal Protection Act (MMPA) to estimate the annual human-caused mortality and serious injury of marine mammal stocks by source. Revisions to NMFS' guidelines and methods for distinguishing serious from non-serious injuries pursuant to the MMPA were implemented in 2013. Data from documented interactions between humans and Alaska pinnipeds and cetaceans under the jurisdiction of the NMFS were compiled for the 5-year period from 2009 through 2013. Details regarding each human-marine mammal interaction were reviewed for evidence of human-caused injury or mortality, and criteria were applied in order to assign injuries to categories and determine the severity (serious or non-serious). A total of 603 unique interactions with potential evidence of human-caused injury and mortality were closely reviewed and are summarized in this report. Injury determination details regarding the injury source, type, and severity are presented, along with the injury category and criteria supporting the determination. Mortality and injury values were assigned (0, 1, or prorated) to each event for comparison with the calculated Potential Biological Removal levels for each stock.

Introduction

The Marine Mammal Protection Act (MMPA, 1972) requires the National Marine Fisheries Service (NMFS) to estimate the annual human-caused mortality and serious injury of marine mammal stocks by source (Section 117) and to monitor the incidental mortality and serious injury of marine mammals during the course of commercial fishing operations (Section 118). In assessing each marine mammal stock, NMFS evaluates the mean annual level of human-caused mortality and serious injury from all sources, as well as from specific commercial fishing operations, relative to the Potential Biological Removal (PBR) levels calculated under the MMPA (Wade 1998). Section 118 of the MMPA mandates commercial fisheries to reduce the incidental mortality and serious injury of marine mammals from commercial fishing operations to insignificant levels, approaching a zero mortality and serious injury rate, and to continually strive for a zero mortality rate goal. Commercial fisheries are classified under the annual NMFS List of Fisheries (LOF) based on their level of incidental mortality and serious injury of marine mammals.

Estimating human-caused mortality rates for marine mammal stocks is relatively straightforward; events of confirmed human-caused deaths can be summed and mean annual mortality estimates calculated. However, the severity of human-caused injuries can be more challenging to assess and quantify. Information about the biology of the animal (e.g., species, age, size, anatomy), the severity of the injury (e.g., wound size, depth, location; overall body condition of animal), and the injury source (e.g., vessel size, speed; gear type; configuration of entanglement) all need to be considered during injury assessments. Thorough examination of injuries may not be possible in some cases, or detailed information may be lacking.

In order to accurately estimate the number of serious injuries occurring to each stock, NMFS developed a regulatory definition of “serious injury” (SI) and established a process for distinguishing non-serious from serious injuries. A serious injury is defined in regulations as “*any injury that will likely result in mortality*” (50 CFR 229.2¹). In 2012, NMFS clarified its interpretation of the definition of “likely” as any injury that is “*more likely than not*” (i.e., greater than a 50% chance) to result in death (77 Federal Register 3233, 23 January 2012; NMFS 2012a). NMFS also revised the process for distinguishing a serious injury from “non-serious injury” (NSI) pursuant to the MMPA to establish a consistent and transparent process within NMFS for making injury determinations, applying these criteria to injury cases, and documenting pertinent information considered in making injury determinations (77 Federal Register 3233, 23 January 2012; NMFS 2012a,b). In addition to NSI and SI categories, a third

¹ 50 CFR 229.2. Code of Federal Regulations. Title 50: Wildlife and Fisheries. (Available at: http://cfr.regstoday.com/50CFR229.aspx#50_CFR_229p2).

category of prorated serious injury (SI Prorate) is used for large whales. Prorated SI categories are determined from large whale records where the outcome is known, based on a review of historical large whale injury cases (NMFS 2012b). For example, 25 large whale cases with vessel strike lacerations with known outcomes were reviewed and 13 (52%) resulted in a decline in health status or death of the animal (NMFS 2012b). These data are used to inform decision-making in situations where severity of the laceration (superficial vs. deep) is unknown. The rate of serious injury for this category is prorated by multiplying the number of events assigned to this criterion by 0.52 to reflect known outcomes of the 25 cases with vessel strike lacerations (NMFS 2012b).

This report is a continuation of Allen et al. (2014) and consists of records assessed for human-caused mortality and injury to cetaceans and pinnipeds occurring in Alaska and U.S. West Coast waters and assessed within the Alaska Marine Mammal Stock Assessment Reports (SARs). If deaths or injuries to marine mammals assessed in the U.S. Pacific Marine Mammal SARs are reported in Alaska waters, the records are sent to the Southwest Fisheries Science Center (SWFSC) for inclusion in the report summarizing mortality and injury for U.S. Pacific West Coast marine mammal stocks (Carretta et al. 2014). Sources of marine mammal injury and mortality data include, but are not limited to, marine mammal stranding network responders, fishery observer programs, disentanglement network teams, opportunistic observations, and self-reporting of entanglements and vessel collisions. Injuries and mortalities to marine mammals resulting from subsistence hunts and harvests are not reported in this document unless circumstances are unique, but these are available in the SARs (Muto and Angliss in prep). Human-caused mortality and injury data for the 5-year period from 2009 to 2013 were compiled, and each injury record assessed to determine whether it was a NSI, SI, or SI Prorate. All information pertinent to decisions of NSI, SI, or SI Prorate is presented in this report. Mortality and serious injury data were summarized by stock, source, and year for estimates reported in the 2015 SARs (Muto and Angliss in prep).

Methods

Thousands of human-marine mammal interaction records for the 2009 to 2013 period were initially reviewed for evidence of human-caused injury or mortality to the marine mammal(s) involved in the interaction. Multiple records documenting a single human-related injury or mortality were identified, when possible, and the relevant information from each source was consolidated into a single record. Follow-up information for a previously documented event, from additional sightings of an injured animal or reports from carefully coordinated intervention attempts (e.g., disentanglement teams) of an injured animal, was added to the existing record. A separate record was added for any calves or pups of injured animals, and the offspring were assessed as unique, but associated, events. Of those records initially reviewed, 603 records were deemed to potentially document a human-caused injury or mortality to the marine mammal. These records are summarized in this report (Appendix Table 1-7). Data were acquired

primarily from databases and archives maintained by NMFS' Alaska Regional Office, the Northwest Regional Office, the Alaska Fisheries Science Center, and the Alaska Department of Fish and Game (ADFG). Data were entered and compiled into a single Microsoft Access database for review. All available documentation (e.g., written and verbal reports, images, re-sight information) was considered to assess human interactions, make injury determinations, and attribute injuries and mortalities to a source.

Only cases of confirmed human interaction were included in this summary of human-caused deaths and injuries. Each injury event was evaluated under NMFS' new injury determination criteria (NMFS 2012b). Different sets of criteria, specific to three taxonomic groups (large cetaceans: mysticetes and sperm whales; small cetaceans: all odontocetes except sperm whales; and pinnipeds), were used to evaluate each injury event and assign it to the most appropriate injury category (NMFS 2012b; Appendix Tables 2-1 to 2-3). Some events fit more than one injury category; in these cases, the most severe injury category and associated value was used in the injury determination.

For each record reviewed for injury severity, an initial and final injury determination was made. The initial and final determinations were the same for events in which the animal was only observed over a brief period of time and no intervention effort was made. Initial and final determinations may differ in cases where the animal was observed over an extended period of time or sighted on multiple occasions—during which subsequent assessments of injuries (e.g., change in configuration of gear, or animal self-released) or body condition (e.g., obvious health decline, or animal later found dead) could be made—or in cases where human intervention resulted in a change of injury assessment (e.g., disentanglement attempts, or animal rehabilitated and released without serious injuries). The reason for both initial and final determinations is two-fold: 1) cases in which there was no human intervention and yet the determination changed over time may be informative for further development of injury categories in future reviews measuring the effectiveness of this policy; and 2) cases where a change from initial to final determination occurred due to human intervention efforts may be treated differently in SAR reporting versus their use for the purposes of marine mammal conservation management regimes. For example, a large whale with a constricting wrap in a commercial gillnet would initially be considered SI. However, if an experienced disentanglement team responded and successfully removed all gear from the animal, the final determination would be NSI. This injury would not be counted in the mortality and serious injury estimates reported in the SAR for the fishery, since the human intervention activities mitigated the likely removal of the animal from the population. However, for the purposes of categorizing commercial fisheries for the NMFS LOF, based on levels of mortality and serious injury resulting from fishery interactions, the whale would be considered SI and included in estimates of mortality and serious injury for that specific commercial fishery. For management purposes, NMFS assesses the impact of commercial fisheries on marine mammal populations; without intervention, the impact of that fishery on that large whale stock would have resulted in a serious injury.

Results

Of the 603 human - marine mammal interactions summarized in this report, 529 were found to have caused mortality, SI, or SI Prorate to the marine mammal involved in the interaction. The remaining 74 interactions were either found to have resulted in a NSI to the marine mammal or after further review, it was determined that there was not enough evidence to assign the injury or mortality to a human source. Overall across all interactions, entanglements in fishing gear or marine debris (n = 340), interactions with trolling gear (n = 126), and vessel collisions (n = 25) comprised the majority of confirmed cases of human-caused mortality and injuries to marine mammals in Alaska.

Of the 217 interactions provided by the NOAA Alaska Regional Office's marine mammal stranding network, the most prevalent cause of injury and mortality to marine mammals were entanglements in fishing gear or marine debris (n = 56), followed by injuries caused by the ingestion of fishing gear (n = 33), and circumferential neck entanglements (n = 32). Fisheries observers associated with the federal groundfish fishery reported 140 interaction events which were reviewed for mortality, SI, and SI Prorate, the majority of which resulted in mortalities (n = 132) with relatively small amount of SI (n = 3), SI Prorate (n = 4) and one NSI. An additional ~ 600 observations of Steller sea lion entanglements and fishery interactions, many of which were repeat sightings, were documented and reviewed by ADFG based on standardized annual summer surveys conducted at nearly every sea lion haulout and rookery in Southeast Alaska, Prince William Sound, the Barren Islands, and Bristol Bay. From these 600 observations, 188 were determined to be unique seriously injured animals. Entanglements in fishery and marine debris (n = 97) and fishery gear ingestion (n = 91) were most prevalent.

Pinnipeds

Steller sea lions were the predominant pinniped species in reports of human-related serious injuries and deaths between 2009 and 2013 (n = 352). Within the range of the Eastern U.S. Steller sea lion stock, most cases of serious injuries involved ingestion of gear from the commercial and recreational salmon troll fisheries followed by circumferential neck entanglements in various marine debris (e.g., packing bands, rubber bands, fishing gear). Steller sea lion interactions with troll fishery gear, sometimes referred to as “flashers”, often result in ingestion of the hook. For the 129 flasher ingestion cases (126 of which resulted in SI) reported during this 5-year period, differentiation between commercial and recreational troll gear has not been made. Based on 13 years of annual summer surveys of Steller sea lions, ADFG documented 11 marked individual Steller sea lions out of 6,093 individual animals marked in Alaska since 1994 that have interacted with troll fisheries as evidenced by a flasher present at the edge of the mouth. Of these 11 marked animals, at least four eventually lost the flasher (perhaps by inadvertently biting through the monofilament line that connects the swallowed hook to the flasher) and survived one or more years after the initial fishery interaction. One marked animal

was known to die from ingestion of the gear, one animal was shot in a subsistence harvest, and the fate of the remaining five marked animals is unknown (ADFG unpublished data). The ADFG will attempt to estimate survival of Steller sea lions that have ingested trolling gear, once the sample of marked, entangled individuals is large enough. Internal exams of dead animals typically revealed a hook lodged in the esophagus, penetrating the pleural cavity or pericardium.

Most documented records of serious injury and mortality involving the Western U.S. stock of Steller sea lion were due to interactions with the groundfish fisheries, primarily trawl fisheries (n = 66) and some longline fisheries (n = 3). These interactions, reported by fisheries observers, typically result in death, not injuries (Breiwick 2013). The majority of serious injuries and deaths involving northern fur seals (n = 28) were due to circumferential neck entanglements caused by unidentified marine debris, packing bands, and various components of fishing gear. Of the phocids, most cases of serious injury and mortality involved ringed (n = 22) and harbor seals (n = 21), with some reports of bearded (n = 6), ribbon (n = 3), and spotted seals (n = 5). Some pinniped injury and mortality events could not be identified to species and were reported as unidentified pinnipeds (n = 4).

Small Cetaceans

Very few instances of human-caused injury or mortality of small cetaceans (n = 21) were reported by fishery observers or stranding responders in Alaska. Between 2009 and 2013, there were reports of serious injuries and mortalities occurring incidental to commercial and subsistence gillnet fisheries for all three stocks (Bering Sea, Gulf of Alaska, and Southeast Alaska) of harbor porpoise (n = 8). Mortalities of beluga whales (n = 4) were primarily due to interactions with subsistence gillnets, which killed two Bristol Bay beluga and one Eastern Bering Sea beluga. Another beluga was killed in a Bering Sea - Aleutian Islands pollock trawl. It is unknown whether this beluga belonged to the Bristol Bay, Eastern Bering Sea, or Eastern Chukchi Sea stock. Mortalities and serious injuries of Dall's porpoises (n = 3) occurred in gillnet, trawl, and longline fisheries.

Large Cetaceans

Human-caused injury and mortality was reported during the 5-year period from 2009 to 2013 for humpback whales, sperm whales, fin whales, minke whales, and bowhead whales; gray whale records were sent to the SWFSC and reported in Carretta et al. (2014). Entanglements in fishing gear were reported for humpback, sperm, and bowhead whales, while vessel strikes were documented for humpback whales. Entanglements and vessel strikes were also reported for four unidentified large whales.

Entanglements of humpback whales comprised the majority of the large whale injuries and mortalities (n = 41 events) between 2009 and 2013, followed by vessel strikes of humpbacks,

(n = 16 events). Humpbacks tend to occur in nearshore waters, where there is a higher occurrence of human activities (e.g., vessel traffic, deployed fishing gear), and the whales' feeding behaviors, as well as their anatomy (e.g., long flippers), may make them more susceptible to interactions with these activities. There were four reports of multiple humpback whales involved in a single entanglement event (most involving females and calves): in three events, two whales were entangled in the same fishing gear. In these cases, each whale was assessed for injuries individually and entered as a separate record. Several reports of large whale entanglements and vessel collisions also noted human safety concerns (e.g., entangled whales dragging a gillnet and associated vessel towards rocks; and vessel occupants being ejected from the boat after colliding with a whale); this was also reported in Nielson et al. (2012).

In cases lacking details necessary for assignment to a more specific injury category (L6b,c; L7a,b; L10-L12), a SI Prorate value was assigned which is described in detail in NMFS (2012b). Many of the records of large whale entanglements were assigned to injury category L10, in which an entanglement was known to have occurred, but not enough information was available on the configuration of the entanglement to determine whether the gear was constricting the body. Better details on the configuration of entanglements (such as written descriptions from observations or aerial, underwater, and surface images), as well as follow-up information from resights of injured or disentangled whales are needed to make accurate injury determinations.

Discussion

Most reports of human-caused marine mammal injury and mortality in Alaska are obtained either through commercial fisheries observer programs, opportunistic reports from stranding networks, researchers, or at-sea sightings from vessel and aircraft operators, or from ongoing agency research and monitoring programs. Given that not all injured or dead animals are detected or wash ashore, opportunistic reports likely represent minimum values for human-caused injury and mortality of marine mammals in Alaska. Actual levels of anthropogenic impact to Alaska pinniped and cetacean stocks are almost certainly greater than the minimum values reported in this summary, although the amount greater is uncertain.

Various types of information aid in distinguishing serious from non-serious injuries, and the quality and quantity of data available for each injury and mortality record were highly variable. Some records (e.g., live whale entanglement events) consisted of images of the configuration of entanglement from multiple perspectives (e.g., underwater, aerial, and surface images). Records that included images from multiple perspectives reinforced the importance of reviewing all data available before making an assessment in order to fully examine the configuration of the entanglement. Different perspectives can confirm or rule out the presence of any constricting wraps of line or fishing gear, reducing the number of L10 (evidence of entanglement) classifications, where not enough information is known about the configuration of the entanglement to differentiate between L2 (SI) and L3 (NSI) injury categories. Stranding

responders, disentanglement teams, and fisheries observers should be encouraged to provide as many details as possible regarding entanglement configurations when documenting injured marine mammals. NMFS should also ensure that those typically responding to or reporting on injured marine mammals are informed of key information that needs to be assessed and recorded (e.g., constricting wrap vs. loose wrap, bridled or draped gear) in order to distinguish serious from non-serious injuries. For management purposes, individuals reporting fishery interactions should also be encouraged to include details, if known, that can aid in assigning injuries and deaths to specific fisheries, as well as differentiate between commercial, recreational, and subsistence fishing gear.

Acknowledgments

We thank NMFS' Alaska and Northwest Regional Offices. The AFSC's Fisheries Monitoring and Analysis (FMA) Division's Observer Program, and Alaska Department of Fish and Game staff and volunteers, as well as the stranding responders, fishers, fishery observers, vessel operators, and other individuals, who report and respond to injured marine mammals in the Alaska and Northwest regions. Kaili Jackson and Aleria Jensen provided access to the Alaska Marine Mammal Stranding Network database, in addition to other opportunistic reports. Kaili, Aleria, and Bridget Mansfield helpfully responded to additional inquiries and request regarding details about data records. Jeff Breiwick provided data obtained from the AFSC's FMA Observer Program. Allison Henry and Jim Carretta, the Alaska Scientific Review Group, and Alaska Regional Office staff reviewed the injury determinations. Lowell Fritz and Jim Carretta provided helpful comments in reviewing this manuscript.

Appendix Table 1-7. -- Human / marine mammal interaction records reviewed for serious injury and mortality. Records sorted by year, species, stock, and date.

Animal ID	Date	Year	Location	Area	Common Name	Stock	Age	Sex	Source of Information	NMML Determination Details	Initial Assessment NSI, SI, DEAD, CBD	Final Determination NSI, SI, DEAD, CBD	SI Criteria Supporting Designation	Initial Prorate Value	Final Prorate value	Cause of Injury	Fishery Name
779	7/30/2009	2009	Eastern Bering Sea	WAK	Bearded Seal	Alaska	U	U	Observer	A bearded seal was killed in AK BSAI trawl gear. Three pictures were taken by the observer.	DEAD	DEAD	N/A	1	1	Caught in AK BSAI pollock trawl	AK BSAI pollock trawl
2009026	6/8/2009	2009	Dillingham	WAK	Beluga Whale	Bristol Bay	SA	M	AKRO	A beluga whale caught in subsistence king salmon set net at Kanakanak Beach, Dillingham. Animal died in net, was butchered, and distributed to Dillingham residents for subsistence purposes.	DEAD	DEAD	S7a	1	1	Caught in Bristol Bay subsistence king salmon set gillnet	Bristol Bay king salmon set gillnet - subsistence
794	2/23/2009	2009	Eastern Bering Sea	WAK	Dall's Porpoise	Alaska	U	U	Observer	The head of a Dall's porpoise was found dangling from the first part of AK BSAI pollock trawl net. The haul back was paused and the head was collected. Head was retained for ID confirmation.	DEAD	DEAD	N/A	1	1	Caught in AK BSAI pollock trawl	AK BSAI pollock trawl
795	8/30/2009	2009	Eastern Bering Sea	WAK	Dall's Porpoise	Alaska	U	U	Observer	A Dall's porpoise was hooked by the tail in AK BSAI Pacific cod longline gear during an observer's off haul. It was found dead. The porpoise fell from the line before being brought aboard.	DEAD	DEAD	N/A	1	1	Caught on AK BSAI Pacific cod longline	AK BSAI Pacific cod longline
2009022	6/1/2009	2009	Valdez	SCAK	Fin Whale	Northeast Pacific	U	U	AKRO	A fin whale was found dead on the bulbous bow of an oil tanker in Valdez Arm. The whale became a 'homeland security issue' and was sunk without a necropsy conducted. The animal was determined to be a fin whale following photo evaluations.	DEAD	DEAD	L6a	1	1	Ship strike	
2009059	7/14/2009	2009	Chignik	WAK	Harbor Porpoise	Gulf of Alaska	CALF	U	AKRO	A harbor porpoise calf was found in the surf and put it in a tote. Attempts to transfer to the ASLC were unsuccessful and the porpoise was released near other porpoise. Unlikely interaction resulted in injuries beyond those associated with porpoise washing ashore.	NSI	NSI	N/A	N/A	N/A	Handled by human	
2009008	4/20/2009	2009	Yakutat	SEAK	Harbor Porpoise	SE Alaska	U	U	AKRO	A fisherman found a porpoise that drowned in his set net. He attached the porpoise by line to a stone weight and sank it in five fathoms of water.	DEAD	DEAD	S7a	1	1	Caught in Yakutat salmon set gillnet	AK Yakutat salmon set gillnet
2009017	5/8/2009	2009	Yakutat	SEAK	Harbor Porpoise	SE Alaska	A	M	AKRO	A harbor porpoise was caught and killed in a subsistence king salmon gillnet at Yakutat. The porpoise was reported and surrendered by the fisherman for future necropsy.	DEAD	DEAD	S7a	1	1	Caught in Yakutat subsistence king salmon set gillnet	Yakutat King salmon set gillnet - subsistence
2009038	6/23/2009	2009	Ketchikan	SEAK	Harbor Seal	Undet.	PUP	U	AKRO	A baby harbor seal was recovered in Herring Cove, Ketchikan. The seal was dead with severe damage to its head, but otherwise the animal looked healthy. A review of photos, necropsy results, and other details indicate this harbor seal was killed a ship strike.	DEAD	DEAD	N/A	1	1	Ship strike	

Appendix Table 1-7. -- Continued.

Animal ID	Date	Year	Location	Area	Common Name	Stock	Age	Sex	Source of Information	NMML Determination Details	Initial Assessment NSI, SI, DEAD, CBD	Final Determination NSI, SI, DEAD, CBD	SI Criteria Supporting Designation	Initial Prorate Value	Final Prorate value	Cause of Injury	Fishery Name
2009162	7/4/2009	2009	Valdez	SCAK	Harbor Seal	Undet.	U	U	AKRO	A fisherman was fishing at Allison Point with a lure and bait-less treble hook when he caught a harbor seal. The fisherman cut the line when the seal was at the surface. The hook location is unknown, but given that the animal was released trailing line this interaction qualifies as a SI under P6.	SI	SI	P6	1	1	Trailing recreational fishing gear	
2009128	9/8/2009	2009	Cook Inlet	SCAK	Harbor Seal	Undet.	A	M	AKRO	A harbor seal was recovered by NOAA Office of Law Enforcement after receiving a report of vessels shooting into the water in Cook Inlet. A necropsy was conducted and the animal was determined to be shot with a .22 or .223.	DEAD	DEAD	P9	1	1	Shot	
2009015	5/13/2009	2009	Wrangell	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback in Zimovia Strait, ten miles south of Wrangell, was seen trailing 15-20 feet of line and a buoy behind fluke. The whale was observed close to shore shaking its tail, perhaps trying to shake gear off. The entanglement was possibly life-threatening according to entanglement report.	Prorate	Prorate	L10	0.75	0.75	Entangled in unidentified marine debris / gear	
2009040	6/5/2009	2009	Gustavus	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale surfaced underneath an anchored Zodiac that was sport fishing for halibut. The whale lifted the boat three feet out of the water. The engines were off but three fishing lines began to whizz out. The boat operator quickly cut the lines. The whale surfaced 200 yards away, too far away to see if any gear was hooked in the whale. Due to vessel size and speed, interaction classified as L6c, NSI. May also qualify as L3 (fishing gear), and L4.	NSI	NSI	L6c	0	0	Ship strike	
2009170	7/3/2009	2009	Cross Sound	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A 32 foot vessel was underway at seven knots. The operator felt a thump, thought he hit a log, shut down the engine to investigate, and heard a whale breathing astern, heading away from the boat. He found a gob of whale tissue on his anchor 4 ft above the water. The vessel operator thinks the whale surfaced ahead of the boat and immediately dove hitting the boat and anchor with its fluke. Due to vessel size and speed this interaction is classified as L6c, NSI.	NSI	NSI	L6c	0	0	Ship strike	
2009046	7/5/2009	2009	Valdez	SCAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A humpback whale, outside of Valdez was hit by a 56 ft tour boat while underway at 18.5 knots. There was a bump on the port side that sounded like a log and about 20 seconds later a humpback whale surfaced behind the boat. The crew observed four complete dive-cycles and did not notice any injuries or unusual behavior. Observation of whales in the same area on subsequent days revealed no apparent injuries. Interaction is classified as L6b and prorated at 0.2.	Prorate	Prorate	L6b	0.2	0.2	Ship strike	
2009048	7/14/2009	2009	Juneau	SEAK	Humpback Whale	Central North Pacific	CALF	U	AKRO	A humpback whale calf outside of Juneau was observed entangled in a gillnet on 7/14/09. The next day a response was mounted and the animal was assessed. Some gear was observed to remain on the animal, including gillnet draped across the calf's back. Interaction is classified as L10 and prorated at 0.75.	Prorate	Prorate	L10	0.75	0.75	Entangled in unspecified gillnet	

Appendix Table 1-7. -- Continued.

Animal ID	Date	Year	Location	Area	Common Name	Stock	Age	Sex	Source of Information	NMML Determination Details	Initial Assessment NSI, SI, DEAD, CBD	Final Determination NSI, SI, DEAD, CBD	SI Criteria Supporting Designation	Initial Prorate Value	Final Prorate value	Cause of Injury	Fishery Name
2009063	7/20/2009	2009	Skagway	SEAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A humpback whale was observed entangled in locally set pot gear. A red polyball was seen trailing 50-60 feet behind animal. Over the next few days the whale shed some gear and two weeks later was observed to be free of all gear. Interaction was initially classified as L10 but considered NSI after the whale shed gear.	Prorate	NSI	L10	0.75	0	Entangled in unspecified pot gear	
2009080	8/4/2009	2009	Pt. Adolphus	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	The operator of a 17 foot skiff travelling at 35 mph believes the skiff likely hit humpback whale. There were numerous humpbacks in area. Subsequent surveys of the area revealed no injured or dead animals. Due to vessel size and speed interaction classified as L6b and prorated at 0.2.	Prorate	Prorate	L6b	0.2	0.2	Ship strike	
2009098	8/9/2009	2009	Angoon	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	An operator of a charter fishing vessel out of Angoon, AK reported striking a humpback whale in Chatham Strait. Reportedly the whale surfaced underneath the vessel while the vessel was underway. There were no apparent injuries to the whale and the whale seemed to behave normally. No info available regarding speed and size of vessel, thus interaction classified as L12 and prorated at 0.36.	Prorate	Prorate	L12	0.36	0.36	Ship strike	
2009143	9/1/2009	2009	Icy Strait	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A vessel strike of a humpback whale was reported in confidence to a National Park Service creel clerk, no other details were provided. Due to a lack of information this interaction is classified as L12 and prorated at 0.36.	Prorate	Prorate	L12	0.36	0.36	Ship strike	
2009130	9/21/2009	2009	Glacier Bay	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	Humpback whale in Glacier Bay was seen dragging an orange buoy determined to be recreational shrimp pot gear. A telemetry buoy was deployed by a disentanglement team to track the whale. Later, it became apparent animal had shed gear. Responders located the telemetry buoy along with 75-85 fathoms of line. Interaction qualifies as L10 and is prorated at 0.75 due to uncertainty regarding remaining gear.	Prorate	Prorate	L10	0.75	0.75	Entangled in recreational shrimp pot gear	
2009141	9/22/2009	2009	Tenakee	SEAK	Humpback Whale	Central North Pacific	A	U	AKRO	A humpback whale was entangled in recreational shrimp gear in Tenakee Inlet. The whale was reported to be entangled in 600 ft of buoy line with two floats, a small recreational shrimp pot, a 35-50 lb weight bag, and 150 ft – 200 ft of ground line. Whale was not resighted. The entanglement was possibly life threatening according to entanglement report. Interaction is classified as L2 and considered a serious injury due to indications that the whale was heavily weighted with gear.	SI	SI	L2	1	1	Entangled in recreational shrimp pot gear	
2009166	11/7/2009	2009	Haines	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	An entangled humpback whale was spotted from the NOAA ship <i>Fairweather</i> . The animal was entangled with one or two floating buoys and some attached line. It was headed in a southerly direction very slowly and appeared fatigued or resting. The whale was not seen again. Interaction is classified as L10 and prorated at 0.75 due to lack of detailed entanglement information.	Prorate	Prorate	L10	0.75	0.75	Entangled in unidentified marine debris / gear	

Appendix Table 1-7. -- Continued.

2010061	7/6/2010	2010	Benjamin Island	SEAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A juvenile humpback whale was reported entangled in multiple sets of gillnet. The animal was partially released from gear, but mesh and cork line remained around the tailstock and trailed about 50 ft. A response was attempted, but the animal was not relocated. This entanglement is possibly life threatening according to stranding database. Due to lack of information on this entanglement this interaction is classified as L10 and prorated at 0.75.	Prorate	Prorate	L10	0.75	0.75	Caught in SEAK salmon drift gillnet	AK SE salmon drift gillnet
2010066	7/8/2010	2010	Juneau	SEAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A humpback was reported to be entangled in gear. There were two wraps of line around the whale's head with line potentially running through the mouth. A red polyball trailed alongside the animal's mouth. The whale's thrashing and breaching behavior suggests a recent entanglement. Timing, location, and description indicate the whale was entangled in crab gear. No response was mounted and the whale was not seen again. Due to lack of information on this entanglement this interaction is classified as L10 and prorated at 0.75.	Prorate	Prorate	L10	0.75	0.75	Entangled in unspecified pot gear	
2010080	7/13/2010	2010	Juneau	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale was reported with line draped over its dorsal fin. A response was mounted but the whale was not found. The stranding report indicated the entanglement was possibly life threatening and due to lack of information on this entanglement this interaction is classified as L10 and prorated at 0.75. 2010108.1	7/27/2010	2010	Petersburg	SEAK	Humpback Whale	Central North Pacific	A	F	AKRO	Residents of Pt. Baker reported that cow and calf humpback whales swam twice through a gillnet and become entangled with each other. Whales thrashed, became motionless, and after a couple hours separated themselves. NMFS responders arrived and assessed the scene. The cow was observed to be free of gear and the calf was observed to be shedding what little gear remained. Originally classified under criteria L2, but changed to NSI after self-disentanglement. This entry is the cow.	SI	NSI	L2	1	0	Entangled in unspecified gillnet	
2010108.2	7/27/2010	2010	Petersburg	SEAK	Humpback Whale	Central North Pacific	CALF	U	AKRO	Residents of Pt. Baker reported that cow and calf humpback whales swam twice through a gillnet and become entangled with each other. Whales thrashed, became motionless, and after a couple hours separated themselves. NMFS responders arrived and assessed the scene. The cow was observed to be free of gear and the calf was observed to be shedding what little gear remained. Originally classified under criteria L2, but changed to NSI after self-disentanglement. This entry is the calf.	SI	NSI	L2	1	0	Entangled in unspecified gillnet	
2010089	7/28/2010	2010	Juneau	SEAK	Humpback Whale	Central North Pacific	A	F	AKRO	A humpback whale was found wedged onto a ship's bulbous bow. According to the necropsy report this whale was believed to have its right fore flipper severed in a previous ship strike, died, was fed on by orcas, and then was struck and wedged onto the bow of a cruise ship.	DEAD	DEAD	L5a	1	1	Ship strike	
2010219	8/14/2010	2010	Juneau	SEAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A subadult humpback whale was observed with multiple wraps of line and a red and white sponges buoy alongside its body. No response was mounted, and the entanglement was reported to be possibly life-threatening. Due to lack of information on this entanglement this interaction is classified as L10 and prorated at 0.75.	Prorate	Prorate	L10	0.75	0.75	Entangled in unidentified marine debris / gear	
2010200	8/16/2010	2010	Tracy Arm	SEAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A subadult humpback whale was reported to be entangled in a gillnet at Tracy Arm. The net was strung across the animal's back like a sash, stretching underneath the left pectoral flipper and over to the animal's right side with float line visible. The animal did not appear to be in distress and exhibited normal behavior. No response mounted. Due to lack of information on this entanglement this interaction is classified as L10 and prorated at 0.75.	Prorate	Prorate	L10	0.75	0.75	Entangled in unspecified gillnet	
2010147	8/18/2010	2010	Tenakee	SEAK	Humpback Whale	Central North Pacific	SA	M	AKRO	A humpback whale carcass was observed offshore and reported by Tenakee locals. NMFS towed the whale to shore and a team conducted the necropsy. It was determined the whale was most likely killed due to respiratory injuries caused by a ship strike.	DEAD	DEAD	N/A	1	1	Ship strike

2010172	8/31/2010	2010	Hoonah	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A 79 ft vessel travelling at ten knots hit a humpback whale. No blood was observed in the water and the whale's behavior appeared normal during the next 20 minutes. Due to size and speed of the vessel this interaction is classified under L6c, and considered a non-serious injury.	NSI	NSI	L6c	0	0	Ship strike	
2010220	9/1/2010	2010	Chatham Strait	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale was observed entangled in unidentified gear / marine debris. The reporting party provided very few details. Due to lack of information on this entanglement this interaction is classified as L10 and prorated at 0.75.	Prorate	Prorate	L10	0.75	0.75	Entangled in unidentified marine debris / gear	
2010212	9/2/2010	2010	Tenakee	SEAK	Humpback Whale	Central North Pacific	CALF	U	AKRO	A humpback whale calf was observed entangled and a two day response effort was launched. The whale was successfully disentangled, though it did have some lacerations associated with severe wrapping, including one abrasion into the muscle on the upper caudal peduncle. Originally this interaction was considered L2 but is considered a non-serious injury following disentanglement.	SI	NSI	L2	1	0	Caught in SE AK commercial dungeness crab pot gear	SEAK commercial dungeness crab pot fishery (inshore)
2010190	9/6/2010	2010	Juneau	SEAK	Humpback Whale	Central North Pacific	A	U	AKRO	On 9/6/2010 a humpback whale was spotted with crab line wrapped around its rostrum. The whale was trailing line and a buoy. On 9/9/2010 the entangled animal was seen near North Island. While a response team was enroute to the whale the whale reportedly shed the gear it was entangled in. This interaction was originally classified as L10 and prorated at 0.75 due to an unknown gear configuration, but this was changed to a non-serious injury following observed self-disentanglement.	Prorate	NSI	L10	0.75	0	Entangled in crab pot gear	
2010191	9/6/2010	2010	Juneau	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale became entangled in crab pot gear. The entanglement was reported originally via hotline, but subsequent sightings by the reporting party indicate the whale shed the gear. Originally classified as L10 and prorated at 0.75 due to unknown gear configuration, this was changed to a non-serious injury following the observed self-disentanglement.	Prorate	NSI	L10	0.75	0	Entangled in crab pot gear	
2010201	9/9/2010	2010	Sitka	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale became entangled in an active gillnet and the fisherman coordinated with another vessel to free the whale. Although the whale damaged the net, no gear was missing and the whale was entirely free of gear. Originally this entanglement was classified as L10 and prorated at 0.75 due to the unknown gear configuration but this was changed to a non-serious injury following observed self-disentanglement.	Prorate	NSI	L10	0.75	0	Entangled in unspecified gillnet	
2010040	6/18/2010	2010	Whittier	SCAK	Humpback Whale	Western North Pacific / Central North Pacific	U	U	AKRO	A humpback whale was observed trailing four buoys with a line thought to be wrapped around the whale's tail stock. The whale was later seen with no buoys present. Originally classified as L3 and changed later changed to a non-serious injury following self-release.	NSI	NSI	L3	0	0	Entangled in unidentified marine debris / gear

2011074	7/6/2011	2011	Hoonah	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback struck a 34 foot sailing vessel that was idling near feeding whales. The whale surfaced under the vessel, lifted it four feet out of the water. The keel was ripped off and the vessel sunk. The whale initially appeared stunned and then what was thought to be the same whale was observed breaching. This interaction is considered a NSI under criteria L6c.	NSI	NSI	L6c	0	0	Ship strike	
2011079	7/17/2011	2011	Ketchikan	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale swam into active gillnet and the whale began pulling the fishing vessel towards shore. The fisher pulled in as much net as possible before cutting it. At the time of release webbing was observed over the whale's rostrum. The fisher observed the whale again the next morning and the whale was still entangled.	SI	Prorate	L10	1	0.75	Caught in SEAK salmon drift gillnet	AK SE salmon drift gillnet
2011115	8/8/2011	2011	Craig	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale was observed entangled with six wraps of line around its peduncle and a single taut line extending from head to tailstock. The whale exhibited labored breathing and wheezing. A team disentangled the line entirely from the whale's tail, although the team was uncertain if line remained forward. The whale swam away in apparently good condition.	SI	Prorate	L10	1	0.75	Entangled in unspecified longline gear	
2011107	8/17/2011	2011	Juneau	SEAK	Humpback Whale	Central North Pacific	CALF	U	AKRO	A humpback whale was observed entangled with a single wrap of line around the tip of the rostrum, a single twist near the right pectoral flipper, and a pot line trailed deeper into water. A buoy line trailed along the right side of the animal. The animal was partially disentangled and the gear that remained is believed to have been shed by the animal. Animal appeared to be in good condition.	SI	NSI	L3	1	0	Entangled in crab pot gear	
2011125	8/19/2011	2011	Juneau	SEAK	Humpback Whale	Central North Pacific	A	U	AKRO	A humpback whale was entangled with a large, oblong and bright-orange buoy. The buoy was observed on the whale's left side and no trailing lines were noted. The whale was noted to be travelling at a fast speed.	Prorate	Prorate	L10	0.75	0.75	Entangled in unidentified marine debris / gear	
2011158	8/31/2011	2011	Glacier Bay	SEAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A small humpback whale was struck by a 79 foot catamaran traveling 13-14 knots. Following the ship strike there was an obvious abrasion on the left flank below dorsal fin. No other open wounds or blood was observed. Afterwards the whale appeared stressed as it was observed for the next hour.	SI	SI	L6a	1	1	Ship strike	
2011160	9/7/2011	2011	Juneau	SEAK	Humpback Whale	Central North Pacific	CALF	U	AKRO	A humpback whale calf was struck by the underside of an 80 foot fiberglass catamaran that was travelling at approximately 23 knots. The calf surfaced with a cow and remained breathing on the surface for approximately three minutes. A small gash was observed near the calf's blowhole.	SI	SI	L6a	1	1	Ship strike

AMMOP2012 01	8/5/2012	2012	Steamer Bay	SEAK	Dall's Porpoise	Alaska	U	U	AMMOP	A Dall's porpoise was entangled in SEAK Salmon drift gillnet. The observer reported the animal was entangled for about 2 minutes. In order to free the animal the fisherman had to haul the net out of the water and cut the animal free about one and a half meters above the water's surface. The porpoise was noted to be bleeding from the tail fluke and dorsal fin. It did not appear to be trailing any gear once released and swam away rapidly. This interaction is considered a serious injury as the process of hauling this porpoise out of the water could have caused stress and increased the likelihood of capture myopathy or hidden injuries.	SI	SI	S7b	1	1	Caught in SEAK Salmon drift gillnet	SE AK salmon drift gillnet
2012017	4/17/2012	2012	Kodiak	Kodiak	Fin Whale	Northeast Pacific	U	U	AKRO	A fin whale was foraging mid-water when it caught an anchor cable from a fishing vessel in its mouth and became entangled in the ground tackle. The whale pulled the boat for a while but did not resurface and the captain cut and lost the cable. Nine days later the carcass floated to the surface and Kate Wynne captured photographs.	SI	DEAD	L2	1	1	Entangled in ground tackle	
2012162	8/1/2012	2012	Nome	WAK	Harbor Porpoise	Bering Sea	A	U	AKRO	A harbor porpoise was found dead and entangled in a subsistence gillnet offshore from Nome. It was then used for subsistence purposes.	DEAD	DEAD	S7a	1	1	Entangled in subsistence salmon gillnet	
OB201283	2/16/2012	2012	Eastern Bering Sea	WAK	Harbor Seal	Undet.	U	U	Observer	A harbor seal was caught and killed in a haul.	DEAD	DEAD	N/A	1	1	Caught in AK BSAI flatfish trawl	AK BSAI flatfish trawl
2012009	3/15/2012	2012	Glacier Bay	SEAK	Harbor Seal	Undet.	U	M	AKRO	A male harbor seal skeleton was found on a beach west of Gustavus dock. The skull and fore flippers were missing and some remaining flesh contained straight cut marks, indicating animal was harvested for subsistence purposes.	DEAD	DEAD	N/A	N/A	N/A	Subsistence take	
OB201284	3/16/2012	2012	Eastern Bering Sea	WAK	Harbor Seal	Undet.	U	F	Observer	A pinniped which was later determined to be a female harbor seal was found dead in a vessel's live tank and determined to be killed by gear.	DEAD	DEAD	N/A	1	1	Caught in AK BSAI flatfish trawl	AK BSAI flatfish trawl
2012113	8/9/2012	2012	Petersburg	SEAK	Harbor Seal	Undet.	U	U	AKRO	A NOAA Law Enforcement vessel struck a harbor seal while travelling at 35 knots. The seal was observed slowly swimming away from a large patch of blood in the water. The seal was observed twice on the surface, but was not seen again. The SI criterion for pinniped-related ship strikes is P15 This interaction is rated SI given the vessel's speed and the quantity of blood observed in the water.	SI	SI	P15	1	1	Ship strike	
2012027	5/1/2012	2012	Juneau	SEAK	Humpback Whale	Central North Pacific	CALF	U	AKRO	A seaplane pilot reported sighting a humpback whale calf that was towing an orange buoy between Horse and Colt Islands. The whale appeared to be moving rapidly. A disentanglement team arrived and attached a telemetry buoy to the calf. The calf subsequently shed all gear. The initial injury determination was to prorate under L10, however, all gear was shed and the final determination is NSI.	Prorate	NSI	L10	0.75	0	Entangled in unspecified pot gear

2012035	5/14/2012	2012	Juneau	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale became entangled in a drift gillnet in Taku River. The fisher tried to free the whale, but had to cut the net. The entanglement was thought to consist of 30 fathoms of net, a 36 inch orange poly buoy, and a high flier with light. The entanglement was believed to consist of multiple wraps of gillnet and heavy line around the rostral portion of the whale's body. The animal became entangled at 2300 on 5/14/2012 and its location was observed via high flier through 0230 on 5/15/2012. Subsequent searches of the area failed to turn up entangled whale. Due to multiple wraps of netting and line around the animal's head this will be considered a serious injury under criteria L2.	SI	SI	L2	1	1	Caught in SEAK Salmon Drift Gillnet	AK SE salmon drift gillnet
2012056	6/7/2012	2012	Icy Strait	SEAK	Humpback Whale	Central North Pacific	A	U	AKRO	A 294 meter vessel struck a humpback whale while travelling at 14 knots. The whale was reported to be observed swimming normally after the incident. The final outcome is a SI per criteria L6a due to vessel's size and speed.	SI	SI	L6a	1	1	Ship strike	
2012053	6/22/2012	2012	Frederick Sound	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A captain self-reported a ship strike of a humpback whale. The vessel was a 41 foot pilot vessel that was travelling at 23 knots. The captain turned hard and backed down in attempt to avoid whale, but the starboard side of the vessel struck the whale. The whale was then seen swimming normally following the strike. This interaction meets criteria L6b and was prorated accordingly.	Prorate	Prorate	L6b	0.2	0.2	Ship strike	
2012064	7/2/2012	2012	Pt Baker	SEAK	Humpback Whale	Central North Pacific	SA	U	AKRO	A subadult humpback whale became entangled in a drift gillnet. Two fishing vessels tensioned the net on either end and the whale broke free. The whale was then seen swimming away from the fishing. There was no report of trailing gear or gear missing from the net.	Prorate	NSI	L10	0.75	0	Caught in SEAK Salmon Drift Gillnet	AK SE salmon drift gillnet
2012079	7/13/2012	2012	Freshwater Bay	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale surfaced under an 18 foot small boat whose occupants were engaged in recreational halibut fishing. The boat was capsized and people were thrown into the water. This is considered an NSI under L6c due to lack of evidence of injury and the small size of the boat.	NSI	NSI	L6c	0	0	Ship strike	
2012078	7/17/2012	2012	Haines	SEAK	Humpback Whale	Central North Pacific	CALF	U	AKRO	A humpback whale calf swam into a subsistence drift gillnet. The fisher was able to apply tension to buoy line and the whale rolled out of net, appearing unharmed. The net was damaged but no gear appeared to be missing. This interaction is considered a NSI due to final outcome.	Prorate	NSI	L10	0.75	0	Caught in SEAK Subsistence Salmon Drift Gillnet	SEAK subsistence salmon drift gillnet

AMMOP2013 02	7/8/2013	2013	LeConte Bay	SEAK	Harbor Porpoise	SE Alaska	U	U	AMMOP	A harbor porpoise was entangled repeatedly in a salmon drift gillnet. It had a deep laceration on its fluke and some smaller lacerations on its lower jaw and pectoral fin. It was cut free and no gear remained. When it was finally released it swam away strongly. This interaction will be considered under criteria S7b (case specific injury value). Although the lacerations alone would not be considered serious, the entire interaction is considered a serious injury because 1) the animal was entangled repeatedly, 2) it was lifted out of the water by its tail fluke, and 3) this species is known to be sensitive to capture myopathy during handling/entanglements. As with criterion S4 (animal brought on deck of vessel; a serious injury), lifting porpoises out of the water by their tail fluke would cause substantial stress to the individual and subjects the individual to a high risk of later death due to capture myopathy or hidden injuries.	SI	SI	S7b	1	1	Caught in SEAK salmon drift gillnet	SEAK salmon drift gillnet
AMMOP2013 01	7/9/2013	2013	Petersburg	SEAK	Harbor Porpoise	SE Alaska	U	U	AMMOP	The observer reported a porpoise was briefly entangled in a salmon drift gillnet before the permit holder was able to free the animal. The animal was released quickly, without apparent injury, and was not trailing gear.	SI	NSI	S7b	1	0	Caught in SEAK salmon drift gillnet	SEAK salmon drift gillnet
AMMOP2013 04	7/31/2013	2013	Zarembo Island	SEAK	Harbor Porpoise	SE Alaska	U	U	AMMOP	A harbor porpoise became entangled in a salmon drift gillnet. The harbor porpoise was released after a couple minutes and was reportedly able to breathe at the surface during this time. It became re-entangled but was successfully disentangled without any apparent injury to the observer. It swam away rapidly, free of gear. This interaction qualifies as S7b (case specific injury value). Given the lack of any apparent injury, the conditions of entanglement, and the short entanglement period this is considered a non-serious injury.	SI	NSI	S7b	1	0	Caught in SEAK salmon drift gillnet	SEAK salmon drift gillnet
AMMOP2013 03	8/26/2013	2013	Zarembo Island	SEAK	Harbor Porpoise	SE Alaska	U	U	AMMOP	A harbor porpoise was entangled in a SEAK salmon drift gillnet. The porpoise was pulled most of the way out the water, cut free, and reportedly swam away free of gear. No large lacerations were observed and observer believed any injuries were minimal. This interaction will be considered criteria S7b (case specific injury value). Although the lacerations alone would not be considered serious, the entire interaction is considered a serious injury because 1) it was lifted out of the water, 2) this species is known to be sensitive to capture myopathy during handling/entanglements. As with criterion S4 (animal brought on deck of vessel; a serious injury), lifting porpoises out of the water by their tail fin would cause "substantial stress to the individual and subjects the individual to a high risk of later death due to capture myopathy or hidden injuries. 2013040	6/25/2013	2013	Gustavus	SEAK	Humpback Whale	Central North Pacific	A	U	AKRO	A captain and owner of a fishing vessel reported an incident where three humpback whales swam through and broke off a set of his trolling gear. A Glacier Bay National Park biologist was surveying that area the same day and believed the whales to be #535, #235, and #465. The reporting party was unable to confirm whether whales were actually entangled. A subsequent observation of suspected whales provided no evidence of entanglements. This interaction is a NSI under criteria L4.	NSI	NSI	L4	0	0	Entangled in unspecified trolling gear	
2013061	7/16/2013	2013	Pelican	SEAK	Humpback Whale	Central North Pacific	A	U	AKRO	A vessel operator called the USCG to report a collision with a humpback whale. The reporting party stated that he was traveling at four knots on autopilot when he felt the boat lift out of the water. He then observed a humpback surface ahead of the bow. The reporting party saw no sign of injury and the whale appeared to exhibit normal behavior for two dive cycles. The boat was 56' long. Due to the slow speed of the vessel and lack of any apparent injury to the whale this interaction is classified as a non-serious injury under criteria L6c.	NSI	NSI	L6c	0	0	Ship strike	
2013057	7/17/2013	2013	Haines	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A humpback whale swam into an actively fishing gillnet. The whale could not be disentangled and was hogtied so the fisherman towed the whale back to port and began cutting gear off. A disentanglement team attempted to depart from Juneau, but experienced engine trouble and never arrived. The whale was then released trailing 50-75 feet of gear. As time went on fisherman were able to remove more and more gear from the whale as it rested and ultimately only a little mesh and six to seven corks remained on the whale. This interaction initially qualified as a serious injury, but due to human intervention the severity of the entanglement was reduced and this interaction can be classified under criteria L10 due to a lack of better information.	SI	Prorate	L10	1	0.75	Caught in SEAK salmon drift gillnet	SEAK salmon drift gillnet
2013155	9/1/2013	2013	Petersburg	SEAK	Humpback Whale	Central North Pacific	U	U	AKRO	A number of photos were taken of a concentration of humpback whales observed to be feeding on the surface. Upon review of the photos it was noted that one of the humpback whales was to some extent entangled in a line. The reporting party noted that there was no indication of any animal in distress at the time of the observation. Interaction was prorated using criteria L10 due to a lack of information.	Prorate	Prorate	L10	0.75	0.75	Entangled in unidentified marine debris / gear

MMD-13-05	9/5/2013	2013	Chatham Strait	SEAK	Humpback Whale	Central North Pacific	A	U	Disentanglement Network Database	A humpback whale was originally entangled on 8/23/2013 near Haines in gillnet. The whale was cut away with gear remaining. Numerous disentanglement attempts were made in subsequent weeks with varying success. The last time the whale was observed on 9/5/2013 a likely life threatening gear configuration remained. The last observed configuration showed a bridle style entanglement with 24 fathoms of trailing gear. This is considered a serious injury under category L2 due to amount of gear and observed tail distortion on the animal.**Note: this interaction was originally recorded by an AMMOP observer - however, the whale disentanglement network database provided weeks' worth of follow up information on the entanglement.	SI	SI	L2	1	1	Caught in SEAK salmon drift gillnet	SEAK salmon drift gillnet
2013008	4/15/2013	2013	Kodiak	Kodiak	Humpback Whale	Western North Pacific / Central North Pacific	U	U	AKRO	A humpback whale became entangled in an anchor cable of a commercial mechanical cod jigging vessel that was anchored for the night. The crew discovered the dead humpback the next morning. The whale was cut loose and one photo was taken. This photo shows the anchor cable wrapped and knotted around the flukes and tail stock multiple times.	DEAD	DEAD	L2	1	1	Entangled in ground tackle	
2013039	6/19/2013	2013	Kodiak	Kodiak	Humpback Whale	Western North Pacific / Central North Pacific	U	U	AKRO	A couple was fishing for halibut in their 22 foot boat near Kodiak. The boat was at anchor and the motor was off. A whale was initially observed about 300 yards away. Shortly afterwards a whale surfaced immediately beneath the boat. The boat was lifted out of the water and the halibut lines then began to stream out as the whale submerged. The lines were cut. There was damage reported to the boats prop and a 4" piece of black skin was found on the vessels keel. The interaction was determined to result in a non-serious injury using criteria L6c and L5b. L4 could also be considered to be a secondary injury criteria.	NSI	NSI	L6c	0	0	Ship strike	
OB201340	7/5/2013	2013	Bering Sea	WAK	Killer Whale	Alaska Resident / BSAI, GOA Transient	A	M	Observer	A killer whale was caught in the opening of a net during an AK BSAI flatfish trawl. The whale was thought to be a male. The net's webbing was cut away, but some still remained around the animal's dorsal fin and tail. After being freed the whale remained on the surface for a while, appearing shook up, and then swam off in the direction of the other killer whales. It is unknown whether the killer whale was brought on deck, but it was brought up in the haul and out of the water. The closest criteria is S4, a serious injury. Whale was also noted to be acting unusual at the surface following the interaction.	SI	SI	S4	1	1	Caught in AK BSAI flatfish trawl	AK BSAI flatfish trawl

A review of photos at NMML was resulted in a change to species identification to unidentified pinniped.	DEAD	DEAD	N/A	1	1	Caught in AK BSAI Pacific cod trawl	AK BSAI Pacific cod trawl

Appendix Table 1-7. -- Continued.

Animal ID	Date	Year	Location	Area	Common Name	Stock	Age	Sex	Source of Information	NMML Determination Details	Initial Assessment NSI, SI, DEAD, CBD	Final Determination NSI, SI, DEAD, CBD	SI Criteria Supporting Designation	Initial Prorate Value	Final Prorate value	Cause of Injury	Fishery Name
2013028	6/14/2013	2013	Aleutians	WAK	Unident. Whale	N/A	U	U	AKRO	A container ship reported discovering an unidentified dead whale on the ship's bulbous bow. The reporter believed the strike occurred during the night. The whale was removed by maneuvering the ship. It could not be determined whether the ship killed whale. The report indicated the whale was probably a fin or sei whale.	DEAD	DEAD	N/A	0	0	Ship strike	

Appendix 2

Appendix Tables 2-1 through 2-3 summarize the large cetacean, small cetacean, and pinniped injury categories and criteria, which are copied from Appendix Tables 1-3 in the “Guidelines for Distinguishing Serious from Non-Serious Injury of Marine Mammals Pursuant to the Marine Mammal Protection Act” (NMFS 2012b). (Available at: <http://www.nmfs.noaa.gov/op/pds/documents/02/238/02-238-01.pdf>).

Appendix Table 2-1: Summary of Large Cetacean Injury Categories and Criteria

Appendix Table 2-2: Summary of Small Cetacean Injury Categories and Criteria

Appendix Table 2-3: Summary of Pinniped Injury Categories and Criteria

Appendix Table 2-1 -- Summary of large cetacean¹ injury categories and criteria.

Instructions: Each large cetacean injury event is recorded to the appropriate injury/information category using all available information and scientific judgment, as described in the Procedural Directive Criteria L10 - L12 accommodate events that lack details necessary for assignment to a more specific category. For a single injury event to which several categories apply, the injury determination with the highest level of severity is assigned. More detailed information or extended observation on an individual case/animal may justify a determination differing from the guidance of this table. An animal that is fully disentangled would generally be considered not seriously injured, unless there is additional evidence of a serious injury. Any injury leading to apparent significant health decline (e.g., skin discoloration, lesions near the nares, fat loss, increased cyamid loads) is a serious injury.

Category	Injury/ Information	Injury Determination	Criteria
L1	Ingested gear ² or hook(s)	SI ³	Swallowed, not simply draped through mouth
L2	Constricting wrap	SI	Tightly wrapped line anywhere on body that indents the skin or does not shift with whale's movement, or line that is likely to become constricting as the whale grows. Indication that a whale that is heavily weighted, anchored or has a discolored appendage is sufficient evidence of constricting gear
L3	Loose wrap, bridled or draped gear	NSI ⁴	Loosely wrapped gear that moves or shifts freely with whale's movement. Absence of constricting gear must be confirmed
L4	External hook	NSI	Fishing hook of any size on any part of the body (i.e., not ingested)
L5a	Deep laceration ⁵	SI	Laceration with the potential to affect major artery (e.g., laceration or severing at insertion of flipper/fluke), penetrating body cavity, or cutting bone
L5b	Superficial laceration	NSI	Laceration not deeper than blubber layer, does not affect major artery, or cut bone
L6a	Vessel much greater in size than whale or vessel $\geq 65'$ and >10 knots	SI	Struck by vessel much greater in size than the whale and traveling greater than 10 knots, or struck by vessel equal or greater than 65' and traveling greater than 10 knots, and no information on injury to the whale
L6b	Vessel smaller in size than whale or vessel $<65'$ and >10 knots	Prorate ⁶ : 0.20	Struck by vessel smaller in size than the whale and traveling greater than 10 knots, or struck by vessel less than 65' and traveling greater than 10 knots, and no information on injury to the whale. A strike to a calf by a vessel of any size and traveling greater than 10 knots will be considered a serious injury

¹ For the purposes of this table, "large cetaceans" include all mysticetes and sperm whales.

² For the purposes of this table, "gear" is defined as any portion of fishing gear excluding the hook, which is considered separately.

³ SI = Serious Injury.

⁴ NSI = Non-Serious Injury.

⁵ For the purposes of this table, "laceration" is defined as a ragged incision or a tearing of the skin. Lacerations are caused by trauma that results in stretching, tearing, crushing, shearing, or avulsion of the tissue. Trauma, including blunt and sharp force trauma, includes a wound or bodily harm caused by an extrinsic agent.

⁶ "Prorate" means the number of events assigned to a given category within the assessment period is multiplied by the prorate number provided for that category.

Appendix Table 2-1. -- Cont.

L6c	Vessel any size ≤ 10 knots	NSI	Struck by vessel of any size traveling at equal or less than 10 knots and no information on injury to the whale
L7a	Vessel much greater in size than whale or vessel $\geq 65'$ and speed unknown	Prorate: 0.56	Struck by vessel much greater in size than the whale traveling at an unknown speed, or struck by vessel equal or greater than 65' and traveling at unknown speed, and no information on injury to the whale. A strike to a calf by a vessel of any size when speed is unknown will be considered a serious injury
L7b	Vessel smaller in size than whale or vessel $< 65'$ and speed unknown	Prorate: 0.14	Struck by vessel smaller than the whale traveling at an unknown speed, or struck by vessel less than 65' and traveling at unknown speed, and no information on injury to the whale. A strike to a calf by a vessel of any size when speed is unknown will be considered a serious injury
L8	Dependent ⁷	SI	Dependent calf of a dead or seriously injured mother
L9	Brought on deck	SI	Whale removed from water and brought on deck
L10	Evidence of entanglement	Prorate: 0.75	Confirmed entanglement but insufficient information available to place in any of the L1-L4 criteria with a high degree of certainty
L11	Vessel strike laceration	Prorate: 0.52	Whale confirmed with non-entanglement related laceration but lacking details to place in either criteria L5a or L5b with a high degree of certainty. Includes observation of blood in water
L12	Vessel strike observed	Prorate: 0.36	Confirmed vessel strike report where there is insufficient detail to assign event to criteria L6a – L7b with a high degree of certainty. A strike to a calf by a vessel of unknown size traveling at an unknown speed will be considered a serious injury

⁷ “Dependent” for a large cetacean means a non-weaned calf. Weaned calves and juvenile large cetaceans are no longer dependent on their mothers.

Appendix Table 2-2. -- Summary of small cetacean¹ injury categories and criteria.

Instructions: Each small cetacean injury event is recorded to the appropriate injury/information category using all available information and scientific judgment, as described in the Procedural Directive. For a single injury event to which several categories apply, the injury determination with the highest level of severity is assigned. More detailed information or extended observation on an individual case/animal may justify a determination differing from the guidance of this table. Any injury leading to apparent significant health decline (e.g., skin discoloration, fat loss) is a serious injury.			
Category	Injury/Information	Injury Determination ²	Additional factors for evaluating whether “case specific” injuries are serious or non-serious (additional factors at end of table) *
S1	A free-swimming animal observed at a date later than its human interaction, exhibiting signs of declining health believed to be resulting from initial injury (e.g., a marked skin discoloration, fat loss)	SI ³	
S2	Ingested gear ⁴ or hook(s)	SI	
S3	Visible blood loss	Case specific ⁵	Amount of blood, location of the bleeding injury, duration of bleeding
S4	Animal brought on vessel deck following entanglement/entrapment (excluding scientific research targeting marine mammals and authorized as such under a NMFS scientific research permit, where the animal is brought on and placed on the vessel deck in a controlled manner)	SI	
S5a	Hook(s) in head (excluding criterion S5b), regardless of the presence of gear	SI	
S5b	Hook(s) confirmed in lip only, external tissue outside of teeth, no trailing gear	Case specific	Prolonged restraint or struggle that could lead to capture myopathy, size of hook, depth of hooking, impairing ability to feed, presence of other injuries
S5c	Hook(s) in any body part, but hook(s) is removed or pulls out	Case specific	Prolonged restraint or struggle that could lead to capture myopathy, depth of hook, hook pulls out cleanly vs. causes further injury during dehooking, method used to remove hook, length of time hooked
S5d	Hook(s) in appendage or body (excluding criterion S5a), without trailing gear or with trailing gear that does not have the potential ⁶ to: 1) become a constricting wrap on animal; 2) be ingested; 3) accumulate drag; or 4) become snagged on something in the environment, anchoring the animal	Case specific	Prolonged restraint or struggle that could lead to capture myopathy, depth and location of hook, type and amount of gear attached

¹ For the purposes of this table, small cetaceans include all odontocetes except sperm whales.

² This table includes on only those criteria determined to be serious injuries or case specific based on expert opinion at the 2007 Workshop (Andersen *et al.*, 2008) and by small cetacean experts on the NMFS Determination Staff working group. For the purposes of streamlining the information for the reader, criteria determined to be non-serious injuries are not included in this table.

³ SI = serious injury.

⁴ For the purposes of this table, gear is defined as any portion of fishing gear excluding the hook, which is considered separately. Lures are considered gear. Gear also generally refers to any type of debris entangling or attached to the animal.

⁵ Case specific = Could be a serious or non-serious injury, but either 1) there is insufficient information about the impact of a particular injury, or 2) additional factors must be considered on a case-by-case basis to determine the severity

⁶ For the purposes of this table, “potential” as it relates criterion S5d indicates that the trailing gear IS NOT capable of leading to any of the situations listed.

Appendix Table 2-2. -- Cont.

S6	Gear attached to free-swimming animal with potential ⁷ to: 1) become a constricting wrap on animal; 2) be ingested; 3) accumulate drag; or 4) become snagged on something in the environment, anchoring the animal	SI	
S7a	Anchored, immobilized, or entrapped and not freed	SI	
S7b	Anchored, immobilized, entangled, or entrapped before being freed without gear attached	Case specific	Duration of entanglement/entrapment, prolonged restraint or struggle that could lead to capture myopathy, gear type, where/how gear is attached to animal, associated injury (i.e., where directly or indirectly caused by initial entanglement), response of individual animal, method used by human to remove gear from animal
S8a	Gear wrapped and constricting on any body part or is likely to become constricting as the animal moves or grows	SI	
S8b	Gear wrapped and loose on any body part	Case specific	Gear type, amount of gear, potential for snag, potential to lead to criterion S8a, animal body size relative to gear (e.g., because of species or age), effect on animal movement, species sensitivity (e.g., frightens easily)
S9	Body trauma ⁸ not covered by any other criteria	Case specific	Location of wound, depth (e.g., superficial or to the bone, penetrating muscle or organs), length, number of lacerations, cleanliness (i.e., compression vs. tearing)
S10	Visible fracture(s), excluding pectoral fins (see criterion S13d for pectoral fin fractures)	SI	
S11	Vertebral transection, including fully severed flukes	SI	
S12	Body cavity penetration ⁹ by foreign object or body cavity exposure	SI	
S13a	Loss or disfigurement of dorsal fin	Case specific	Cleanliness (i.e., compression vs. tearing), nature of injury causing the loss, extent of fin loss (i.e., full or partial), amount and duration of blood loss
S13b	Partially severed flukes, transecting midline	SI	

⁷ For the purposes of this table, potential as it relates criterion S6 indicates that the trailing gear IS capable of leading to any of the situations listed.

⁸ For the purposes of this table, “trauma” is defined as a wound or bodily harm caused by an extrinsic agent. Blunt trauma is an injury (abrasion, laceration, contusion or skeletal fracture) produced by a blunt object striking the body or impact of the body against a blunt object or surface. Sharp force trauma is an injury caused by a sharp or pointed object creating a penetrating (stab, chop or incision) wound. Laceration is defined as a ragged incision or a tearing of the skin. Lacerations are caused by blunt trauma that results in stretching, tearing, crushing, shearing, or avulsion of the tissue.

⁹ For the purposes of this table, “penetration” is defined as a wound occurring when a foreign object punctures the body. Penetrating wounds can be characterized as one of three types: stab (small external wound that is greater in length into the body than is apparent on the skin surface), incised (clean cuts into the skin which are longer on the skin surface than they are deep), or chop wounds (incised wounds that penetrate deep to the bone, leaving a groove or cut in the bone).

Appendix Table 2-2. -- Cont.

S13c	Partially severed flukes, not transecting midline	Case specific	Cleanliness (i.e., compression vs. tearing), nature of injury causing the loss, amount and duration of blood loss
S13d	Partially or completely severed or fractured pectoral fin(s)	Case specific	Cleanliness (i.e., compression vs. tearing), nature of injury causing the loss, extent of fin loss (i.e., full or partial), amount and duration of blood loss, opened or closed fracture
S14	Social animal separated from group and/or released alone post-interaction (excluding criterion S15)	Case specific	Species (e.g., sensitivity, offshore vs. inshore), location of release (e.g., likelihood of animal locating its conspecifics)
S15	Dependent animal (i.e., calf, juvenile) released alone post-interaction or dependent animal left with a seriously injured or dead mother	SI	
S16	Observed or reported collision with vessel	Case specific	Speed of vessel, size of vessel, hull shape, part of vessel to strike the animal, size of animal compared to size of vessel, behavior of animal after collision, extent and location of wound(s) on animal

* Factors listed in the far right column of Appendix Table 2 -2 are unique to the associated injury type. In addition to those listed in this column, the factors that should be considered, if available, when reviewing all case specific injury events in Appendix Table 2-2 include, but are not limited to:

- Species
- Age or age class (e.g., calf, juvenile, adult)
- Sex
- Size of animal
- Overall health (e.g., nutritional status, body condition, pre-existing disease state, pre-existing injuries)
- Behavior during and/or after injury-causing interaction (e.g., dorsal arching, listlessness)
- Reproductive status (e.g., pregnant, lactating, has dependant calf)
- Natural history (e.g., indigenous, migratory)
- Location of injury (e.g., mouth, head, body, fin, tail, internal)
- Size of injury
- Duration of injury (e.g., single event, repeated, chronic)
- Depth of injury (e.g., superficial or to the bone, penetrating muscle or organs)
- Cleanliness of injury (e.g., compression, tearing)
- Environmental condition (e.g., individuals out of their normal habitat, climate stressors)
- Social stressors (e.g., social structure of species, separation of social individuals from the group, cow/calf separation)
- Cumulative effects of repeated exposures
- Compounding effects of multiple injuries obtained during a single event
- Availability of data on multiple sequential events involving the same individual over time
- Susceptibility of the species to capture myopathy (spinner dolphins and porpoises notoriously sensitive; bottlenose dolphins robust; many others fall in between, with some unknown)
- Ability of rehabilitated animal to be released
- Relative effect of blood loss on different species

In addition to those factors listed above, the factors that apply to all fishery-interaction related case specific injuries include, but are not limited to:

- Entanglement type (e.g., hooked, anchored, entrapment)
- Amount and size of gear (e.g., size, length and number of branches of line; number of buoys, traps or anchors; volume of netting)
- Entanglement constriction (e.g., tight, loose, multiple wraps)
- Habitat where animal is located (e.g., an animal with trailing gear areas of dense gear or an area with vegetation is more likely to risk snagging the gear and becoming anchored)
- Entanglement duration
- Existence, type and amount of any trailing gear
- Method of handling the animal during disentanglement

Appendix Table 2-3. -- Summary of pinniped¹ injury categories and criteria.

Instructions: Each pinniped injury event is recorded to the appropriate injury/information category using all available information and scientific judgment, as described in the Procedural Directive. For a single injury event to which several categories apply, the injury determination with the highest level of severity is assigned. More detailed information or extended observation on an individual case/animal may justify a determination differing from the guidance of this table. Any injury leading to apparent significant health decline (e.g., skin discoloration, fat loss) is a serious injury.			
Category	Injury/Information	Injury Determination ²	Additional factors for evaluating whether “case specific” injuries are serious or non-serious (additional factors at end of table) *
P1	A free-swimming animal observed at a date later than its human interaction, exhibiting signs of declining health believed to be resulting from initial injury (e.g., a marked change in body condition, tissue necrosis, emaciation, gangrene).	SI ³	
P2	Ingested gear ⁴ or hook(s)	SI	
P3	Visible blood loss	Case specific ⁵	Amount of blood, location of the bleeding injury, duration of bleeding
P4	Animal brought on vessel deck following entanglement/entrapment (excluding scientific research targeting marine mammals and authorized as such under a NMFS scientific research permit, where the animal is brought on and placed on the vessel deck in a controlled manner)	Case specific	Manner in which animal is brought on deck, length of time animal is on deck, environmental conditions (e.g., temperature)
P5a	Hook(s) in mouth (excluding criterion P5b), regardless of the presence of gear	SI	
P5b	Hook(s) confirmed in head (excluding criterion P5a), or in lip only (external tissue outside of teeth), no trailing gear	Case specific	Location on head (e.g., eye), depth of penetration, type of hook, prolonged restraint or struggle that could lead to capture myopathy, size of hook, impairing ability to feed
P5c	Hook(s) in any body part, but hook(s) is removed or pulls out	Case specific	Prolonged restraint or struggle that could lead to capture myopathy, location of hooking on the body, depth of hook, hook pulls out cleanly vs. causes further injury during dehooking, method used to remove hook, length of time hooked

¹ For the purposes of this table, pinnipeds include all pinniped species except walrus.

² This table includes on only those criteria determined to be serious injuries or case specific based on expert opinion at the 2007 Workshop (Andersen *et al.*, 2008) and by pinniped experts on the NMFS Determination Staff working group. For the purposes of streamlining the information for the reader, criteria determined to be non-serious injuries are not included in this table.

³ SI = serious injury.

⁴ For the purposes of this table, gear is defined as any portion of fishing gear excluding the hook, which is considered separately. Lures are considered gear. Gear also generally refers to any type of debris entangling or attached to the animal.

⁵ Case specific = Could be a serious or non-serious injury, but either 1) there insufficient information about the impact of a particular injury, or 2) additional factors must be considered on a case-by-case basis to determine the severity.

Appendix Table 2-3. -- Cont.

P5d	Hook(s) in appendage or body (excluding criteria P5a-c and P12), without trailing gear or with trailing gear that does not have the potential ⁶ to: 1) become a constricting wrap on animal; 2) be ingested, 3) accumulate drag; or 4) become snagged on something in the environment, anchoring the animal	NSI ⁷	
P6	Gear attached in any manner to free-swimming animal with potential ⁸ to: 1) become a constricting wrap on animal; 2) be ingested; 3) accumulate drag; or 4) become snagged on something in the environment, anchoring the animal	SI	
P7a	Anchored/immobilized and not freed	SI	
P7b	Anchored, immobilized, or entangled before being freed without gear attached	Case specific	Duration of entanglement, prolonged restraint or struggle that could lead to capture myopathy, type of fishing gear, where/how gear immobilized animal, associated injury (where directly or indirectly caused by initial entanglement), response of individual
P8a	Gear wrapped and constricting any body part or likely to become constricting as the animal moves or grows	SI	
P8b	Gear wrapped loosely on any body part	Case specific	Type and amount of fishing gear, animal body size relative to gear (species, age), effect on movement, species sensitivity
P9	Body trauma ⁹ not covered by any other criteria	Case specific	Location of trauma on body, depth (superficial or to the bone, penetrating muscle or organs) length of laceration(s), number of lacerations, cleanliness (compression vs. tearing), amount and duration of blood loss, risk of infection or disease transmission (e.g., dog bites)
P10	Visible fracture(s), excluding broken appendages (see criterion P13 for broken appendages)	SI	
P11	Vertebral transection or fully severed flipper(s)	SI	
P12	Body cavity penetration ¹⁰ by foreign object or body cavity exposure	SI	

⁶ For the purposes of this table, potential as it relates to criterion P5d indicates that the trailing gear IS NOT capable of leading to any of the situations listed.

⁷ NSI = non-serious injury.

⁸ For the purposes of this table, potential as it relates to criterion P6 indicates that the trailing gear IS capable of leading to any of the situations listed.

⁹ For the purposes of this table, “trauma” is defined as a wound or bodily harm caused by an extrinsic agent. Blunt trauma is an injury (abrasion, laceration, contusion or skeletal fracture) produced by a blunt object striking the body or impact of the body against a blunt object or surface. Sharp force trauma is an injury caused by a sharp or pointed object or a bullet from a gunshot creating a penetrating (stab, chop or incision) wound. Laceration is defined as a ragged incision or a tearing of the skin. Lacerations are caused by blunt trauma that results in stretching, tearing, crushing, shearing, or avulsion of the tissue.

¹⁰ For the purposes of this table, “penetration” is defined as a wound occurring when a foreign object punctures the body, such as a bullet from a gunshot. Penetrating wounds can be characterized as one of three types: stab (small external wound that is greater in length into the body than is apparent on the skin surface), incised (clean cuts into the skin which are longer on the skin surface than they are deep), or chop wounds (incised wounds that penetrate deep to the bone, leaving a groove or cut in the bone).

Appendix Table 2-3. -- Cont.

P13	Partially severed or fractured flipper(s)	Case specific	Cleanliness (clean cut vs. tear), nature of injury causing the loss, extent of fin or flipper loss, opened or closed fracture, dislocation, amount/duration of blood loss
P14	Dependent animal (i.e., pup, juvenile) released alone post-interaction or dependent animal left with a seriously injured or dead mother	SI	
P15	Observed or reported collision with vessel	Case specific	Speed of vessel, size of vessel, hull shape, part of vessel to strike the animal (e.g., propeller, hull), size of animal compared to size of vessel, location of strike on animal's body, extent and location of wound(s) to animal

* Factors listed in the far right column of Appendix Table 2-3 are unique to the associated injury type. In addition to those listed in this column, the factors that should be considered, if available, when reviewing all case specific injury events in Appendix Table 2-3 include, but are not limited to:

- Species
- Age or age class (e.g., calf, juvenile, adult)
- Sex
- Size of animal
- Overall health (e.g., nutritional status, body condition, pre-existing disease state, pre-existing injuries)
- Behavior during and/or after injury-causing interaction (e.g., listlessness)
- Reproductive status (e.g., pregnant, lactating, has dependant pup)
- Natural history (e.g., small home range, large home range)
- Location of injury (e.g., mouth, head, body, flipper/fin, internal)
- Size of injury
- Duration of injury (e.g., single event, repeated, chronic)
- Depth of injury (e.g., superficial or to the bone, penetrating muscle or organs)
- Cleanliness of injury (e.g., compression, tearing)
- Environmental condition (e.g., individuals out of their normal habitat, environmental stressors)
- Social stressors (e.g., social structure of species, separation of social individuals from the group, mother/pup separation)
- Cumulative effects of repeated exposures
- Compounding effects of multiple injuries obtained during a single event
- Availability of data on multiple sequential events involving the same individual over time
- Susceptibility of the species to capture myopathy (some sensitive, others robust, some unknown)
- Ability of rehabilitated animal to be released
- Relative effect of blood loss on different species

In addition to those factors listed above, the factors that apply to all fishery or marine-debris interaction-related case-specific injuries include, but are not limited to:

- Entanglement type (e.g., hooked, anchored, entrapment)
- Amount and size of gear (e.g., size, length and number of lines; number of buoys, traps or anchors; volume of netting; material of gear)
- Method of handling the animal during disentangling
- Entanglement constriction (e.g., tight, loose, multiple wraps)
- Habitat where animal is located (e.g., an animal with trailing gear in areas of dense gear or an area with vegetation or on shore is more likely to risk snagging the gear and becoming anchored)
- Entanglement duration
- Existence, type and amount of any trailing gear

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167 (web site: www.ntis.gov). Paper and electronic (.pdf) copies vary in price.
