NOAA Ship Okeanos Explorer Program

MAPPING DATA REPORT

CRUISE EX0909 Leg 3

Mapping Field Trials Hawaiian Islands

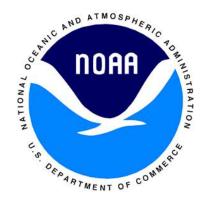

October 1 - 21, 2009 Honolulu, HI to Honolulu, HI

Report Contributors:

Mashkoor Malik, LT Nicola VerPlanck, Elaine Stuart, Lillian Stuart, Kelly Elliot, Melissa Johnson, LTJG Megan Nadeau and Adam Lemire

NOAA Office of Ocean Exploration and Research 1315 East-West Hwy, SSMC3, #10210 Silver Spring, MD 20910

1. Introduction

Commissioned in August 2008, the NOAA Ship *Okeanos* Explorer is the nation's only federal vessel dedicated to ocean

exploration. With 95% of the world's oceans left unexplored, the ship's combination of scientific and technological tools uniquely positions it to systematically explore new areas of our largely unknown ocean. These exploration cruises are explicitly designed to generate hypotheses and lead to further investigations by the wider scientific community.

Using a high-resolution multibeam sonar with water column capabilities, a deep water remotely operated vehicle, and telepresence technology, *Okeanos Explorer* provides NOAA the ability to foster scientific discoveries by identifying new targets in real time, diving on those targets shortly after initial detection, and then sending this information back to shore for immediate near-real-time collaboration with scientists and experts at Exploration Command Centers around the world. The subsequent transparent and rapid dissemination of information-rich products to the scientific community ensures that discoveries are immediately available to experts in relevant disciplines for research and analysis

Through the *Okeanos Explorer* Program, NOAA's Office of Ocean Exploration and Research (OER) provides the nation with unparalleled capacity to discover and investigate new oceanic regions and phenomena, conduct the basic research required to document discoveries, and seamlessly disseminate data and information-rich products to a multitude of users. The program strives to develop technological solutions and innovative applications to critical problems in undersea exploration and to provide resources for developing, testing, and transitioning solutions to meet these needs.

Okeanos Explorer Management – a unique partnership within NOAA

The Okeanos Explorer Program combines the capabilities of the NOAA Ship Okeanos Explorer with shore-based high speed networks and infrastructure for systematic telepresence-enabled exploration of the world ocean. The ship is operated, managed and maintained by NOAA's Office of Marine and Aviation Operations, which includes commissioned officers of the NOAA Corps and civilian wage mariners. OER owns and is responsible for operating and managing the cutting-edge ocean exploration systems on the vessel (ROV, mapping and telepresence) and ashore including Exploration Command Centers and terrestrial high speed networks. The ship and shore-based infrastructure combine to be the only federal program dedicated to systematic telepresence-enabled exploration of the planet's largely unknown ocean.

2. Report Purpose

The purpose of this report is to briefly describe the mapping data collection and processing methods, and to report the results of the cruise. For a detailed description of the *Okeanos Explorer* mapping capabilities, see appendix B and the ship's readiness report, which can be obtained by contacting the ships operations officer (ops.explorer@noaa.gov).

This report provides details about mapping operations of EX0909 Leg 3 field trial cruise conducted from Oct 1 - 21, 2009.

3. Cruise Objectives

The objectives of the cruise have been outlined in the cruise instructions [2] which included primary objectives to test, troubleshoot, refine and evaluate EX mapping systems, sensors, protocols and procedures to support systematic exploration and secondary objective to map the areas in the vicinity of the Hawaiian Islands which are of national and regional interest.

4. Participating personnel

| NAME | ROLE | AFFILIATION |
|---------------------|--|----------------------|
| CDR Joseph Pica | Commanding Officer | NOAA Corps |
| LT Nicola VerPlanck | Field Operations Officer | NOAA Corps |
| Mashkoor Malik | Expedition Coordinator/Mapping Team Lead | NOAA OER (ERT, Inc.) |
| Elaine Stuart | Senior Survey Technician | NOAA OMAO |

5. Cruise Statistics

| Dates | 10/1/09 - 10/21/2009 |
|-------------------------------|--------------------------|
| Weather delays | 0 |
| Total non-mapping days | 5 |
| Total survey mapping days | 15 |
| Total transit mapping days | 2 |
| Line kilometers of survey | 5855 |
| Beginning draft | 13'11"(fwd)14'3.5" (aft) |
| Average ship speed for survey | 8.7 Kts |

6. Mapping sonar setup

NOAA *Okeanos Explorer* (EX) is equipped with a 30 kHz Kongsberg EM 302 multibeam sonar and a 3.5 kHz Knudsen sub-bottom profiler (SBP 3260). During this cruise EM 302 bottom bathymetric and backscatter data were collected. Additionally, water column data logging for EM 302 was turned on where interesting features were observed in the water column, however no notable water column targets were picked up during this cruise.

The ship used a POS MV ver. 4 to record and correct the multibeam data for any motion. C-NAV GPS system provided DGPS correctors with position accuracy expected to be better than 2.0 m.

All the corrections (motion, sound speed profile, sound speed at sonar head, draft, sensor offsets) are applied during real time data acquisition in SIS ver. 1.04. XBT casts (Deep Blue, max depth 760 m) were taken every 6 hours (0000, 0600, 1200 and 1800 local time). XBT cast data were converted to SIS compliant format using NOAA Velocwin ver. 8.92 Plus. When the time allowed, CTD casts up to 800 m were also conducted to provide training to the deck, bridge and survey departments in lieu of the 1200 XBT cast. Complete list of XBT and CTD casts conducted is provided in Section 10.

During July 2009 the ship reported one of the transmit boards defective (TX 36 # 16). The board was replaced on 4 Sept, 2009 with a spare board sent in by Kongsberg, Inc. However, the same board (TX 36 # 16) failed a BIST on 3 October, 2009. The EM 302, in spite of one defective transmit board, provided good quality data during the initial tests soon after departing Honolulu, HI. Based on these initial tests, it was decided that ship will continue its mapping mission. The

affects of the defective transmit board on the data quality was assessed through out the cruise by comparing this cruise data with earlier cruises. In presence of heavy seas, the data showed residual motion artifacts but it could not be determined conclusively if these artifacts are due to the defective transmit board. The ship expects to receive the replacement board once back in Honolulu, HI and further tests are being planned to ensure that these data quality issues are addressed after replacement of the defective TX board.

7. Data acquisition summary

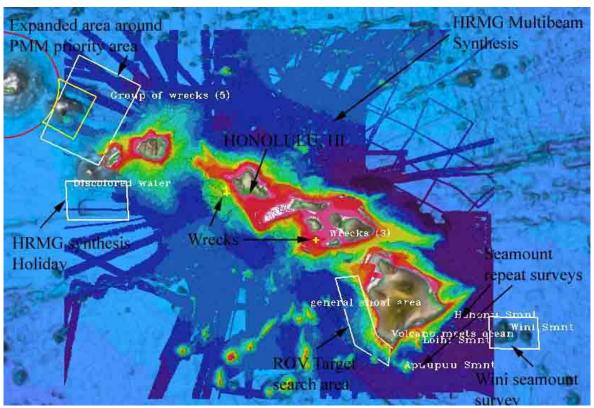

Figure 1. Over view of planned mapping areas during EX0909_Leg 3 cruise (shown as white boxes). Image compiled in Fledermaus using Sandwell and Smith as the background data and HRMG synthesis data.

The ship departed Honolulu, HI on 1 October, 2009. The data were collected during the transit from Honolulu, HI to the working grounds (Oct. 1 - 3) in the vicinity of Wini Seamount. During the transit the ship collected data over the Hawaii Mapping Research Group (HMRG) identified holidays. The ship worked around Wini Seamount from Oct. 3 – 6 mapping the extent of Wini Seamount. The weather in this area provided some serious challenges to the data quality. The lines were being run ~ 30 degrees off the swell and still a lot of bubble sweep down episodes were degrading the bathymetric and backscatter data quality severely. It was decided to devote some time to determine the best possible course for the multibeam operations. On Oct. 4, a star line pattern was run over Wini Seamount which enabled the ship to collect the multibeam data in several different directions with respect to swell. The details of the results are provided in the following sections. Four distinct peaks were mapped around Wini Seamount. No craters were observed on the Wini seamount. The ship then transited to the west of the Big Island (Hawai'i). During the transit, several seamounts including Apuupu, Loihi and Hononu seamounts were

mapped. The ship reached west of the Big Island mapping area on Oct. 7 and started collecting data in support of future ROV dives. The ship conducted mapping operations in this area till Oct 10. On Oct. 11 the ship started a 72 hour long dynamic positioning (DP) test to test the endurance of DP system and its ability to hold station and conduct maneuvers necessary in support of ROV operations. A separate report is being generated for these tests [7]. While holding station, ~ 1 hour of multibeam sonar data was collected to help identify the variability of multibeam bathymetric and backscatter data on 11 October. However, due to several factors including large seafloor slope and variations in ship's heading the preliminary processing of these data indicate that this experiment will need to be repeated again with more favorable conditions (most importantly - relatively flat seafloor)

The ship concluded DP test on Oct. 14 ~ 1200 and anchored off Kona waiting for the steering pump spare part. The ship stayed at anchor from Oct. 14 1500 –Oct. 15 1530 off Kona, HI. During this time the spare part for the steering pump was picked up and also the crew enjoyed a few hours of liberty in Kona, HI. The ship commenced her transit to the Papahanaumokuakea Marine National Monument (PMNM) working grounds. During the transit, a wreck site was investigated to detect the wreck of the USS Blue Gill (SS- 242). In spite of detecting several features both in backscatter and bathymetric data, with comparable sizes to the reported size of the wreck, the multibeam data was not able to conclusively detect the wreck. More work with the ROV is recommended to determine the location of this wreck. The ship arrived in the working areas around PMNM on Oct. ~ 2300.

As a result of the addition of a DP evolution (~ 4 days) in the cruise schedule, planned mapping of HMRG holidays off Kauai Island. (use Island or add 'Is." To the acronym list) was cancelled and also the PMNM expanded mapping area was reduced to cover only the PMNM priority area. The shallow regions in this area showed a depth separation between 65-600 m, therefore due to time constrains, not all the holidays were covered in the shallow area. EM 302 suffered a malfunction where it stopped forming received beams on Oct. 19 for ~ 4 hours. Several restarts of the SIS computer and the TRU did not bring back the multibeam system. The problem was resolved as the system was put in simulator mode and angular coverage settings were changed. Kongsberg is being contacted to record this problem. The ship wrapped up mapping operations in PMNM area on Oct. 20 at 0730 and commenced transit towards Honolulu, HI. The ship arrived in Honolulu, HI on Oct. 21, 2009 at ~ 1000.

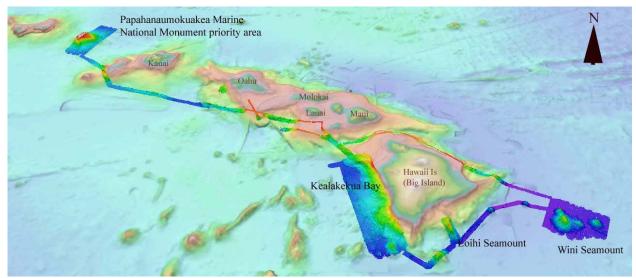

Figure 2. Over view of the EX0909 Leg mapping areas (50 m grid) overlaid with bathymetry from ETOPO 1 [8]. Image compiled in Fledermaus.

8. Data processing

Angular offsets used during this cruise in the multibeam system are tabulated below. For complete processing unit setup (PU Setup) utilized for the cruise, please refer to Appendix A.

Table 1. Angular offsets for Transmit (TX) and Receive (RX) transducer

| | Roll | Pitch | Heading |
|---------------|------|-------|---------|
| Tx Transducer | 0.0 | 0.0 | 359.98 |
| Rx Transducer | 0.0 | 0.0 | 0.03 |
| Attitude | 0 | -0.7 | 0.0 |

Onboard processing of bathymetric data was done in CARIS HIPS ver. 6.1 where the data were cleaned in 'Swath Editor' and 'Subset Editor'. No tidal corrections were applied during post processing; however, no appreciable differences were observed between different lines by not applying tidal corrections.

Onboard processing of bottom backscatter data were conducted using UNH research tool 'Geocoder'. The results obtained during fair weather were encouraging but during the days when the weather was choppy, a lot of bubble sweep down episodes degraded bottom backscatter data quality severely. At the time this report was filed, it was unclear whether the weather effects could be taken care of during post processing. The ship is also expected to contact Kongsberg, Inc. regarding these backscatter artifacts. Please note that only limited processing of backscatter data was completed during the cruise.

9. Results

This section describes briefly the results of the data collected during this cruise. This section has been divided into three main sub-sections: (1) Mapping areas (2) System analysis and (3) Wreck investigation.

Mapping Areas

HMRG multibeam sonar synthesis holiday mapping

The University of Hawaii, Hawaii Mapping Research Group (HMRG) has compiled a synthesis of multibeam sonar data around the Hawaiian Islands [5], however, there are a few areas around the islands where there are only minimal multibeam data available. During the transit from Honolulu, HI to Wini Seamount, the transit line was planned to pass over several of the HMRG holidays passing north of the Hawaii Island (Big Island). Major data holidays in HMRG multibeam synthesis that were targeted during this cruise are tabulated below:

Table 2. HMRG multibeam data synthesis holidays.

| Latitude (N) | Longitude (W) | Depth (m) |
|--------------|---------------|-----------|
| 20.871 | 157.811 | -529.55 |
| 20.418 | 157.044 | -676.20 |
| 20.251 | 156.393 | -3013.54 |
| 20.396 | 155.670 | -1251.46 |
| 19.951 | 155.073 | -339.75 |

The following images show the data holiday areas that were filled by EM 302 data.

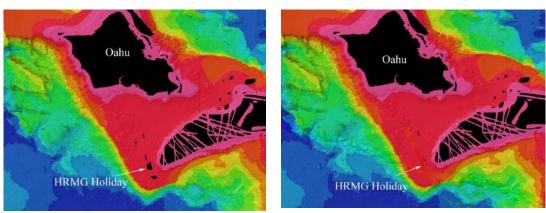

Figure 3. (Left) HRMG holiday (Right) EM 302 track line (50 m grid) over the HRMG holidays in vicinity of Oahu. Image compiled in Fledermaus.

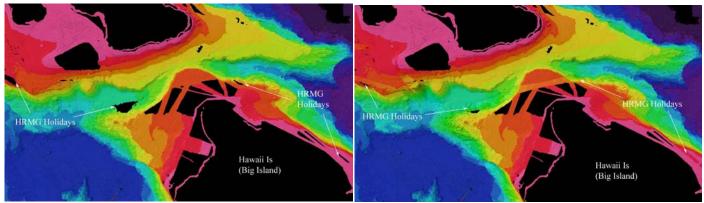

Figure 4. (Left) Image showing HRMG holidays in vicinity of the Big Island (Right) EM 302 track lines (50 m grid) over the HRMG holidays in vicinity of the Big Island. Image compiled in Fledermaus.

Wini and adjacent seamounts

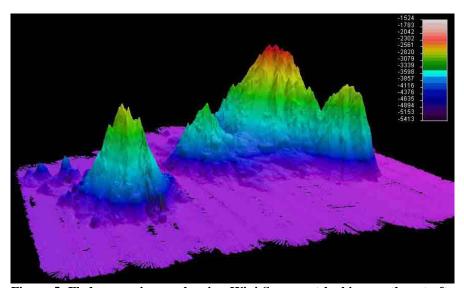

Figure 5. Fledermaus image showing Wini Seamount looking southwest after preliminary processing of the raw data. The 50 m grid image shows the three pinnacles in the background that form the Wini seamount. The seamount in the foreground is Alexander Seamount.

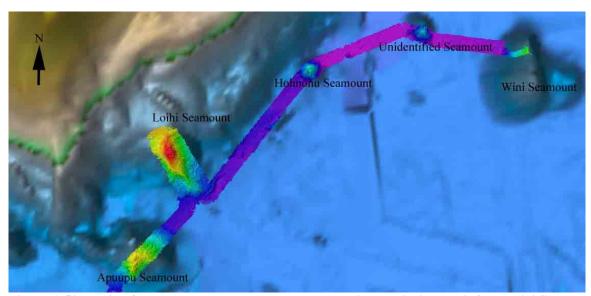

Figure 6. 50 m grid of the seamounts that were mapped partially while in transit from Wini Seamount to the mapping area west of the Big Island. The seamounts which were mapped included an unidentified (but known) seamount, and Hohnonu, Loihi and Apuupu Seamounts. Background data from Sandwell and Smith. Image compiled in Fledermaus.

During the transit from Wini Seamount to the west of the Big Island, a few lines were run over Loihi seamount. The data appears to show detailed structure over Loihi Seamount including three distinct calderas on top of Loihi Seamount. No water column targets were picked up on top of Loihi Seamount.

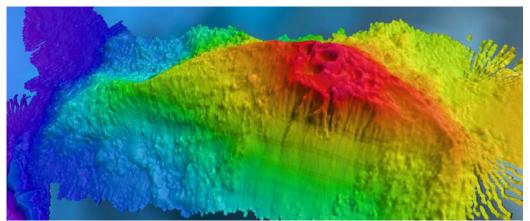

Figure 7. Bathymetric 50 m grid results over Loihi Seamount. Background data from Sandwell and Smith. Image compiled in Fledermaus.

Kealakekua Bay mapping area

This area has been well mapped and documented in the literature [e.g. 4] and provides a good opportunity to test the EM 302 performance against existing data sets. For the 2010 planned

engineering dives for the ship's ROV, this area also provides a good test bed in relatively protected waters.

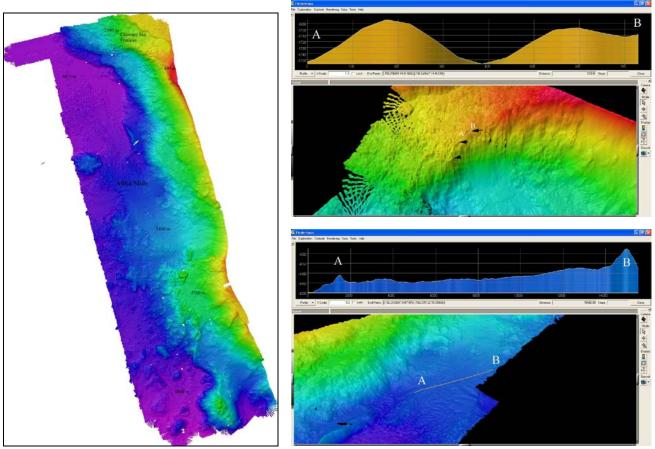

Figure 8. Left: Over view of the area mapped in the area west of the Big Island. Right top: Chimney-like features observed in the northern section of mapping area, provided with a depth profile across one of these features showing a crater with depth of 60 m with a diameter of ~ 200 m. Right bottom: Debris flow from the shallow part to the deeper regions forms a well defined region of ~ 9 km width which is very smooth with its boundary clearly marked (Alika slide [4]). All images are 50 m grids compiled in Fledermaus.

PMNM priority area mapping

Papahanaumokuakea Marine National Monument (PMNM) area was mapped from Oct. 18 – Oct. 20, 2009. The preliminary processing of the data show a shallow feature of \sim 65m with several slides visible around the feature. The depths fall off to \sim 4500 on the side of the feature.

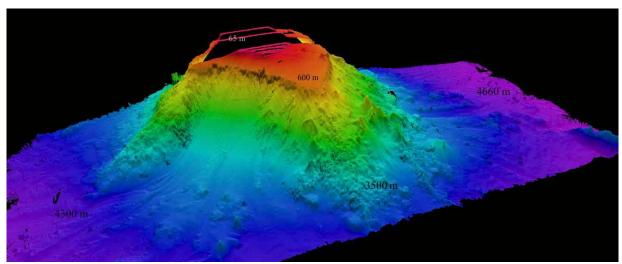

Figure 9. Preliminary results of the EM 302 bathymetric data over the PMNM priority—50 m grid, compiled in Fledermaus.

System analysis

Evaluation of best course for optimal EM 302 data collection

It has been realized that EM 302 multibeam sonar seems to perform better when the ship is not heading into the swell/sea right ahead. This experiment was meant to provide data to quantitatively analyze the effect of ship heading with respect to the sea waves and swells.

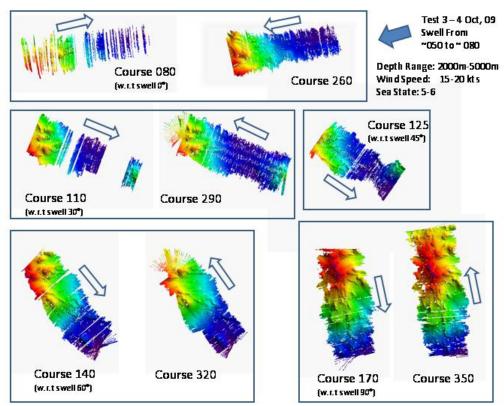

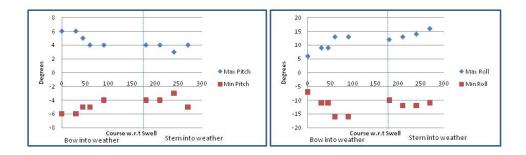

Figure 10. Image showing mapping results with lines run over Wini Seamount in different directions. Data compiled in ArcMap with 50 m grids created in Fledermaus.

Track lines over ~ 10 miles were collected while running the ship in directions of 000, 180, 030, 210, 060, 240, 090 and 270, with respect to the swell. The results indicate that the best direction to run the survey lines is beyond 30 degrees from the swell. However, for the lines perpendicular to the swell, although the data quality was observed to be the best, the ship rolled violently.

Apart from serious design modifications, the ship is expected to continue to have the bubble sweep down issues. It is suggested that weather conditions should be considered while laying out the mapping plan to avoid track directions less than 30 degrees with respect to swell to avoid severe bubble sweep down related degradation of data.

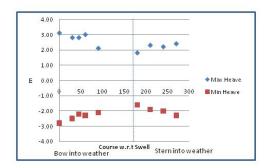

Figure 11. Results of heave, roll and pitch observed while running mapping lines in different directions with respect to swell.

Evaluation of multibeam bathymetric data variability during DP test

Dynamic Positioning (DP) system onboard enables the ship to hold station within few meters with the help of a bow thruster and two stern thrusters. Three sets of 100 pings were collected over a period of ~ 1 hour. In ideal conditions (calm conditions, no heading and position variations), the same beam is expected to be sampled over 100 pings and therefore enables a computation to infer uncertainty due to the sonar system itself. Field evaluations of multibeam sonar bathymetric data variability by holding station using DP system has been attempted by de Moustier [6]. A strict requirement described by [6] is to have a relatively flat seafloor so as to enable ping to ping comparison in presence of small variations in ship's heading. EM 302 system compensates for ship's motion (pitch and roll stabilization) therefore the same beam may not be falling over the same part of the seafloor in presence of ship motion. If the seafloor is relatively flat these variations will have minimal impact but during this experiment the seafloor depth varied (across track) by more than 1000 m. It is expected that further processing of these results will be carried on shore and it is recommended that this experiment be repeated to assess uncertainty of the EM 302 bathymetric data which is an essential component of over sonar uncertainty.

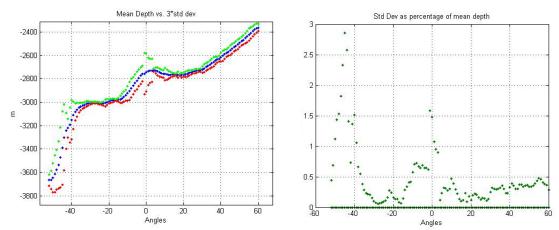

Figure 12. (Left) Mean depth plotted against transmit angle (Blue). Red and green points show the 3 x Std deviations of bathymetric data. (Right) Standard deviation plotted as percentage of mean depth plotted against transmit angle. Please note that the plot on the right is not symmetrical. Also the percentage of std deviation seems to be exceptionally large beyond 40 degrees transmit angle.

Wreck investigation

Three wrecks' location was provided by KayleenKeller (http://papahanaumokuakea.gov/). The locations of these wrecks are listed below:

Table 3. WWII submarine wreck locations.

| Ship Name | Latitude | Longitude | Depth (m) | Dimensions* |
|------------------|----------|------------|-----------|----------------------------|
| SS 133 – S-28 | 21.3333 | -158.333 | 2300 | 66.8 (L), 6.3 (B), 4.9 (D) |
| SSk 242 Bluegill | 20.59166 | -156.90829 | 500 | 95 (L), 8.3 (B), 5.2 (D) |
| SS 393 Queenfish | 21.43167 | -158.345 | 2600 | 94.9 (L), 8.3 (B), 5.1 (D) |

^{*} L – Length; B – Beam, D- Draft. Source: wikipedia.org

All of these wrecks are WWII submarines.

USS SS-28 and USS Queenfish

The USS SS-28 and USS Queenfish wrecks were investigated during EX0909-Leg 2 (Sept. 2009). The wreck sites were mapped for several hours running several lines over the wreck sites; however, no features mimicking wrecks were observed in the bathymetric and backscatter data. Images showing the bathymetric data collected over these expected wreck sites are provided below:

NOTE: These two wrecks were explored during EX0909-Leg 2. For a complete list of multibeam lines that were collected over these features, please consult the cruise report for EX0909-Leg 2 cruise [3].

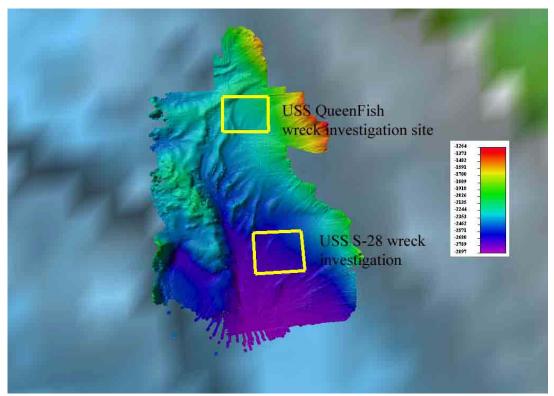

Figure 13. : Overview of the EM 302 data (50 m grid) collected in vicinity of wreck sites of SS-133 and USS Queenfish. Background data from Sandwell and Smith, images compiled in Fledermaus.

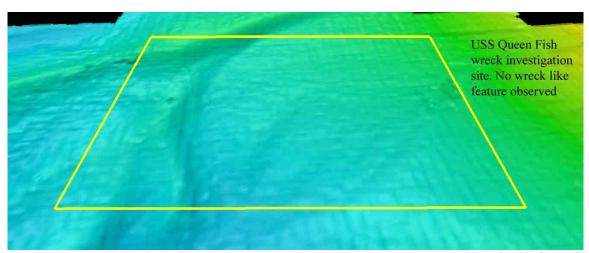

Figure 14. An oblique view of bathymetric data collected over reported wreck site of USS Queenfish (50 m grid). The area is marked with a square with 3000 m dimensions. Image compiled in Fledermaus.

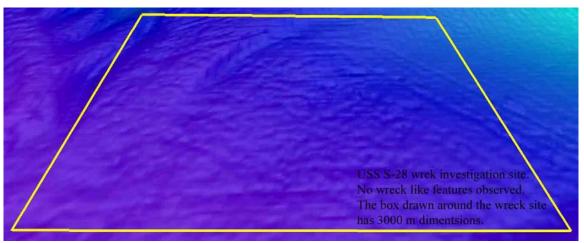

Figure 15. An oblique view looking north over the expected wreck site of USS S-28. No wreck-like features were observed in the EM 302 bathymetric (50 m grid) and backscatter data. Image compiled in Fledermaus.

USS Bluegill

The ship investigated the USS Bluegill wreck site location during the night of 15/16 October, 2009. A total of four passes were made in an area ~ 2-3 km around the reported position of the wreck. Several features with comparable sizes to the wreck were discernable in both bathymetric and backscatter data. Due to a large number of geological features around the reported position of the wreck, on the seafloor it was not possible to conclusively determine the location of the wreck by the EM 302 data alone. Future work using the ROV is recommended to investigate the targets detected by the EM 302. The following images show the results of EM 302 data around the wreck location.

Figure 16. Over view of the EM302 USS Bluegill 50 m grid wreck investigation site. Background data from Sandwell and Smith, images compiled in Fledermaus.

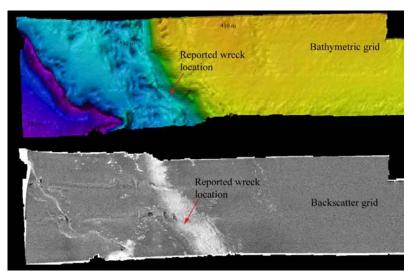

Figure 17. Bathymetric and backscatter grid around the USS Bluegill wreck site.

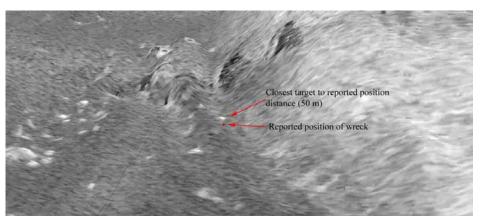

Figure 18. Zoomed in view from Geocoder around the reported wreck position of USS Bluegill. Several bathymetric and backscatter targets were identified close to the reported wreck position with closest backscatter target ~ 50 m from the reported wreck position.

11. Daily Cruise Log

(ALL TIMES LOCAL HDT)

October 1, 2009

Departed from Honolulu, HI \sim 1500. Got into heavy weather with lot of pitching and heaving during the night. The multibeam was not performing well due to a lot of bubble sweep down problems.

October 2, 2009

Continue transit towards Wini seamount covering HMRG holidays west and north of the Big Island. Weather conditions are sea-state 5-6 with 6-8 feet of swell. Multibeam performance remains degraded due to heavy weather.

October 3, 2009

Arrived Wini Seamount working grounds \sim 0700. Started the main scheme lines. Sea-state is 4-5 with wind 15-20 kts. Swell direction: From \sim 050 \sim 080.

Plan to run a star pattern to find out the best course in heavy weather. It has been realized that multibeam seem to perform better when the ship is not heading into the swell/sea right ahead. This experiment is meant to provide data to quantitatively analyze the effect of ship heading with respect to the sea waves and swells.

The ship stopped to fix the CNAV comport connection. ETts physically removed the com port and tightened the connection. During this stop the multibeam was stopped also and a BIST test showed that transmit board # 16 is bad. The board was then swapped with board # 18 and another BIST showed that board # 18 is now bad – confirming that it is the board and not the slot. Upon verification from OPSO it was learnt that the same board (Board # 16) failed in August and was replaced by a spare sent in from Kongsberg. The boards were then placed in their respective places (non-functioning board is now at slot # 16 again).

October 4, 2009

Continue to run the main scheme lines. Finished acquisition of star pattern lines 04 Oct 0100. Collected lines in directions of 000, 180, 030, 210, 060, 240, 090 and 270 with respect to the swell. The results indicate that the best direction to run the survey lines is beyond 30 degrees from the swell. However, for the perpendicular to the swell lines, although the data quality was observed to be best but the ship rolled violently.

October 5, 2009

Continue running lines over Wini Seamount. CTD cast conducted 1215-1300 to train survey, deck and bridge to a depth of 800 m.

October 6, 2009

Finished running main scheme lines over Wini Seamount in the morning. Transiting towards other seamounts.

1210-1325 - Conducted CTD cast

The ship transited to the west of Big Island mapping area over night going over the seamounts which were identified in the existing satellite derived and HMRG data sets.

The ship also transited over features which appear to have a shape of horse shoe. These features rise ~ 45 - 60 m above the seafloor and have a diameter of ~ 800 - 1100 m.

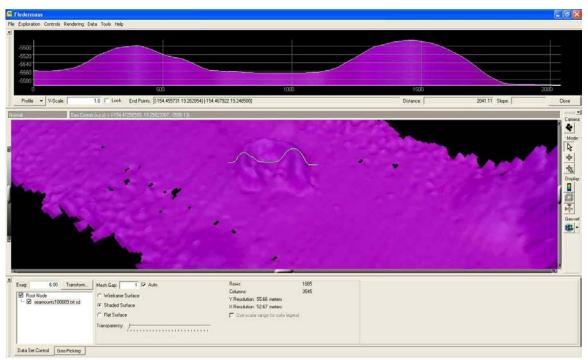

Figure 19. Horseshoe-like feature (50 m grid) observed on October 6 in Fledermaous.

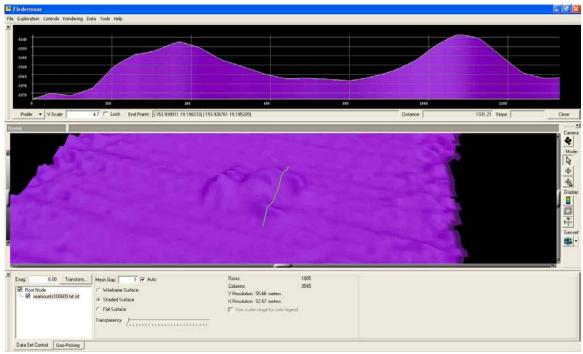

Figure 20. Horseshoe-like feature (50 m grid) observed on October 6 in Fledermaus.

The information about these features was sent to Dr. Hammond which initiated following reply:

"* "Stephen R. Hammond" <Stephen.R.Hammond@noaa.gov> [Fri 09 Oct 2009 01:23:55 AM EDT]:

> Craig (and Mashkoor),

\

The first feature, and possibly the second, look like small, sedimented volcanic cones of the type I discussed in that paper I sent to you a while back. The breached crater/caldera morphology is very common along the Juan de Fuca Ridge as well as elsewhere along the East Pacific Rise. I suspect these are quite old features that are roughly the age of the crust on which they lie, i.e., that they formed on, or in close proximity, to a spreading center. ----Steve"

October 7, 2009

The ship started running main scheme line in the area west of Big Island. A CTD cast was conducted to 800 m of water depth at 1215.

October 8, 2009

The ship continued running main scheme lines in the Kealakekua Bay area west of Big Island. CTD cast up to 800 m water depth conducted at 1215.

October 9, 2009

The ship continues to run the lines over Kealakekua Bay area. Lavolvo was contacted today to provide input for the mapping areas to find suitable targets for ROV engineering dives.

October 10, 2009

Small boat operations were conducted to run the small boat to break in the engine. CTD cast was conducted to 800 m water depth. Continue mapping ops in Kealeakekua Bay.

October 11, 2009

72 hrs DP test continues. \sim 45 minutes of data while the ship held station (in water depths of 2400-3600 m) were collected to assess the variability of bathymetric and backscatter data. The preliminary results however indicate that further processing will be required to determine the usability of these data sets for assessing the variability of multibeam bathymetric data.

October 12-14, 2009

72 hrs DP test concluded on 14 Oct \sim 1500. The ship then transited towards Kona to anchor from 14 Oct 1500 – 15 Oct 1500.

October 15, 2009

The ship commenced transit towards the USS Bluegill wreck \sim 1530 and reached the reported location \sim 2300. The ship then ran 3 track lines around the wreck. But the multibeam sonar was not able to positively identify the location of the wreck. More details about the data processing are provided in the data acquisition and processing section.

October 16, 2009

Continue transit towards PMNM mapping area west of Kauai.

October 17, 2009

Arrived PMNM working grounds ~ 0130. Commenced mapping in the area.

October 18, 2009

Secured TSG pump due to large swells. Multibeam performance also degraded. Continue working in PMNM priority area. The area gets very shallow near the boundary of PMNM and swath coverage decreases to ~ few hundred meters. Therefore the top of the shallow feature was not covered to full extent leaving considerable holidays. Several small lines were run over the feature but it is inevitable that there will be holidays on top of the feature. The reported least depth (on the NOAA chart) is 19 fathoms (~ 40 m). The least depth observed during the mapping over the feature was observed to be ~ 65 m.

October 19, 2009

Ship continues to work in PMNM priority area. EM 302 suffered a major failure \sim 1800 when it stopped forming receive beams. The system (TRU, HWS) was restarted several times. This problem happened earlier during mapping season in May 2009 while working in similar depths (\sim 1000 - 2000 m). A BIST test did not show any thing malfunctioning. It is thought that this problem is related to the overloading of SIS computer while working in shallower waters where

the ping rate is high enough to overload the SIS computer. The system restarted working after putting the system in PU simulator mode and also changing the minimum and maximum angular coverage.

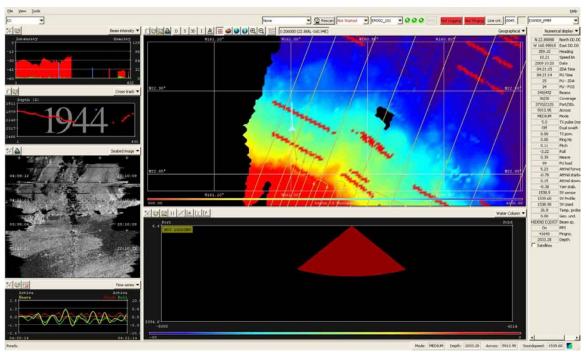

Figure 21. SIS screen shot of EM 302 malfunction showing a red triangle in the water column data indicating that no receive beam are being formed.

Overnight ship wrapped up mapping operations around PMNM working area and started transit towards Honolulu, HI.

October 20, 2009

Continued transit towards Honolulu, HI. Last science watch 1600 - 0000. Multibeam was left on unattended from 21 Oct 0000 - 0730. Arrived off Honolulu, HI ~ 0730 and multibeam operations were ceased.

October 21, 2009

Arrived Honolulu, HI.

12. Acknowledgements

Several personnel and organizations contributed heavily towards successful completion of this cruise. The efforts of ship board mapping team and ship's staff and crew is greatly appreciated in running day to day operations effectively, efficiently and most importantly safely. The Mapping Team would especially like to thank the CO (CDR Pica), OPS Officer (Lt VerPlanck) and crew of the NOAA Ship *Okeanos Explorer* for their guidance, help and assistance in running the mapping operations during this cruise. The contributions of Margo Edwards (University of Hawaii, Hawaii Mapping Research Group), Joyce Miller (Joint Institude for Marine and Atmospheric Research), John Rooney (Pacific Islands Benthic Habitat Mapping Center), Kayleen Keller (Papahānaumokuākea Marine National Monument) and Jonathan Weiss (University of Hawaii) toward identification of the areas that were mapped during this cruise are appreciated. Steve Hammond (NOAA), Jim Gardner (University of New Hampshire) and Meme Lobecker (NOAA) provided necessary shore support.

Appendix B: EM302 description and operational specs

EM 302 : Ideal for Ocean Exploration

There are several features of the Okeanos Explorer's 30 kHz multibeam that make it an excellent tool for ocean exploration. The following is a brief description of these features.

Depth Range

The system is designed to map the seafloor in water depths of 10 to 7000 meters. This leaves only the deepest parts of the deeper ocean trenches out of the EM 302's reach. Moreover, operational experience on the *Okeanos Explorer* has shown consistent EM 302 bottom detection at depth ranges in excess of 8000m.

High Density Data

In multibeam data, the denser the data, the finer resolution maps you can produce. The system can operate in dual swath, or multiping mode, which results in increased along track data density. This is achieved by detecting two swaths per ping cycle, resulting in up to 864 beams per ping.

The Okeanos Explorer mapping team typically operates the multibeam in high density equidistant ping mode, which results in up to 864 soundings on the seafloor per ping.

Full Suite of Data Types Collected

The system collects seafloor backscatter data, which provides information about the character of the seafloor in terms of bottom type.

The system also collects water column backscatter data, which has the ability to detect gaseous plumes in the water column. The full value of this feature is still being realized.

FM chirp mode is utilized in water depths greater than 1000 meters, and allows for the detection of the bottom further out from nadir than with previous 30 kHz systems.

Multibeam Primer

The area of the seafloor covered, or ensonified, by a single beam within a pulse of sound, or ping, is called the beam footprint. This beam footprint is defined in terms of the across track and along track values. Both of these values are dependent on water depth and the beam width at which the sound pulse is transmitted and received. The across track beam width value is also dependent on the receive angle, or "listening" angle, of the system, and the angle from nadir which it is received from. The receive angle for the receive transducer on the Okeanos Explorer EM302 is 1°, which is the smallest possible angle currently available for the EM302 system. The further out from nadir a sounding occurs, the larger the footprint will be. For example, as seen in Table 1 below, in 2000 meters of water, a beam footprint will have a radius of 18 meters at nadir but 25 meters by the time it hits the seafloor at an angle 140 degrees out from nadir.

| Calculated acrosstrack acoustic beam footprint for EM 302 | | | | |
|---|------------------------------|--|--|--|
| (high density ping | mode, 432 soundings/profile) | | | |
| Water depth (m) | Angle from nadir | | | |

| | | 90 | 120 | 140 |
|------|-----------------|-----|-----|-----|
| 50 | 1 deg RX center | deg | deg | deg |
| 100 | 1 | 0.5 | 1 | 1 |
| 200 | 2 | 1 | 2 | 3 |
| 400 | 4 | 2 | 3 | 5 |
| 1000 | 7 | 4 | 6 | 10 |
| 2000 | 18 | 9 | 16 | 25 |
| 4000 | 35 | 19 | 32 | - |
| 6000 | 70 | 37 | - | - |
| 7000 | 105 | 56 | - | - |

Table 4. Calculated across track EM 302 beam footprint. Reference: Kongsberg Product description, Kongsberg document 302675 Rev B, Date 14/06/06, p. 17.

| Calculated acrosstrace (high density ping mod | • | _ | |
|---|---------|---------|---------|
| Water depth (m) | Swath W | Vidth | |
| 50 | 90 deg | 120 deg | 140 deg |
| 100 | 0.2 | 0.4 | 0.9 |
| 200 | 0.5 | 0.8 | 1.7 |
| 400 | 0.9 | 1.6 | 3.5 |
| 1000 | 1.9 | 3.2 | 6.9 |
| 2000 | 4.6 | 8.1 | 17.4 |
| 4000 | 9.3 | 16.2 | - |

Table 5. Calculated across track EM 302 sounding density. Reference: Kongsberg Product description, Kongsberg document 302675 Rev B, Date 14/06/06, p. 17.

Acrosstrack sounding density describes the spacing between individual soundings on the seafloor in the acrosstrack direction. The maximum swath of the EM 302 is 150 degrees. At this swath, the sounding density will be the least dense, since the beams will be spread out over a larger horizontal distance over the seafloor. As the swath angle (width) is decreased, the sounding density will increase, as the same number of beams are now spread out over a smaller horizontal distance over the seafloor.

| Calculated ping rate and alongtrack resolution for EM 302 | | | | | | | |
|---|-------------------------------------|----------------|--|--------|---------|--|--|
| 140 deg swath | 140 deg swath, one profile per ping | | | | | | |
| | | | Alongtrack distance between profiles (m) | | | | |
| Water depth | Swath Width | Ping Rate | | | | | |
| (m) | (m) | (pings/second) | @4 kts | @8 kts | @12 kts | | |
| 50 | 275 | 3.2 | 0.7 | 1.2 | 1.9 | | |

| 100 | 550 | 1.8 | 1.1 | 2.2 | 3.3 |
|------|------|------|------|------|------|

Appendix D: List of acronyms

BIST – Built In System Test

CO – Commanding Officer

CIMS – Cruise Information Management System

CTD – conductivity temperature and depth

CW - continuous wave

dB – decibels

DGPS –Differential Global Positioning System

DTM – digital terrain model

ECS – Extended Continental Shelf

ET – Electronics Technician

EX – NOAA Ship *Okeanos Explorer*

FM – frequency modulation

FOO – Field Operations Officer

Hr - hour

kHz - kilohertz

Km – kilometers

KM – Kongsberg Maritime AS

Kt(s) - knots

Ma – megaannum

MBES - multibeam echosounder

NCDDC - National Coastal Data Development Center

NGDC - National Geophysical Data Center

NOAA – National Oceanic and Atmospheric Administration

NODC – National Oceanographic Data Center

OER – Office of Ocean Exploration and Research

OMAO – Office of Marine and Aviation Operations

OPS – Operations Officer

PMNM – Papahanaumokuakea Marine National Monument

ROV – remotely operated vehicle

SST – Senior Survey Technician

SV – sound velocity

TRU – transmit and receive unit

TSG - thermosalinograph

UNCLOS – United Nations Convention on the Law of the Sea

UNH-CCOM/JHC – University of New Hampshire Center for Coastal and Ocean Mapping/Joint Hydrographic Center

UPS – uninterruptable power supply

US EEZ – United States Exclusive Economic Zone

USBL – ultra-short base line

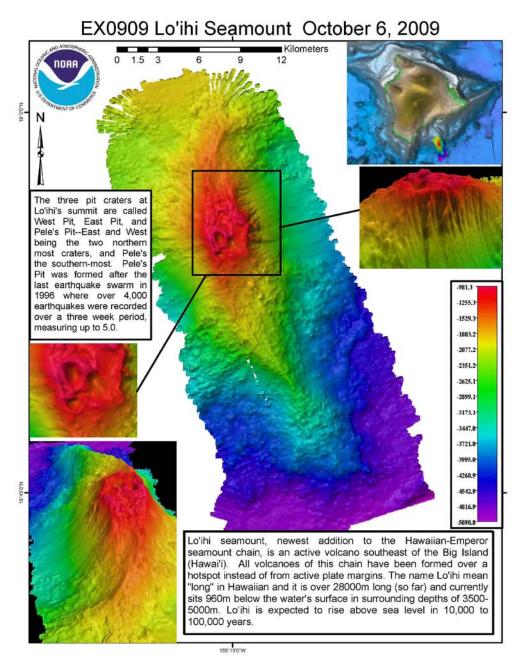

WD – water depth

w.r.t. – with respect to

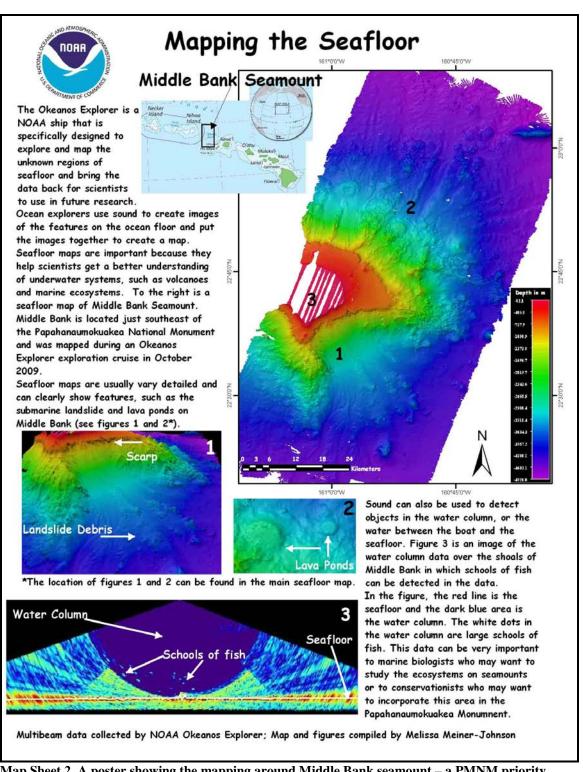

XBT – expendable bathythermograph

Appendix E: Field products generated during the cruise

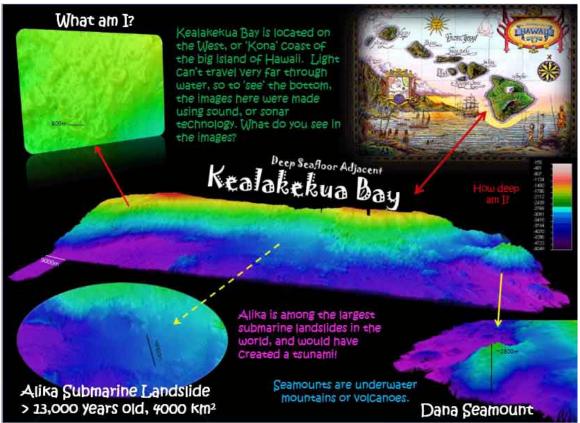

Several products were constructed based on the data collected during this cruise to provide a synopsis of mapping activities. The map sheets are provided below:

Map Sheet 1. Loihi Seamount. Data credit: NOAA Ship *Okeanos Explorer*. Map sheet created by Elaine Stuart with ArcMap.

Map Sheet 2. A poster showing the mapping around Middle Bank seamount – a PMNM priority area. Data credit: NOAA Ship *Okeanos Explorer*. Map sheet created by Melissa Johnson with ArcMap.

Map Sheet 3. A map sheet with audience focus on school going children showing few of interesting features in vicinity of Kealakekua Bay mapping area. Data credit: NOAA Ship *Okeanos Explorer*. Map sheet created by Kelley Elliott and Lillian Stuart.
