PREFACE

World Data Centers conduct international exchange of geophysical observations in accordance with the principles set forth by the International Council of Scientific Unions (ICSU). They were established in 1957 by the International Geophysical Year Committee (CSAGI) as part of the fundamental international planning for the IGY program to collect data from the numerous and widespread IGY observational programs and to make such data readily accessible to interested scientists and scholars for an indefinite period of time. WDC-A was established in the U.S.A.; WDC-B, in the U.S.S.R.; and WDC-C, in Western Europe, Australia, and Japan. This new system for exchanging geophysical data was found to be very effective, and the operations of the World Data Centers were extended by ICSU on a continuing basis to other international programs; the WDC's were under the supervision of the Comite International de Geophysique (CIG) for the period 1960 to 1967 and since then have been supervised by the ICSU Panel on World Data Centers. In each country, the WDC's are variously supported by different sponsoring agencies. Some are directly funded and others are operated as adjuncts to national data centers or research institutions.

The current plans for continued international exchange of geophysical data through the World Data Centers are set forth in the "Fourth Consolidated Guide to International Data Exchange through the World Data Centres", and are currently under revision.

Functions and Responsibilities of WDC's

The World Data Centers collect data and publications for the following: Glaciology; Meteorology; Oceanography; Rockets and Satellites; Solar-Terrestrial Physics (Solar and Interplanetary Phenomena, Ionospheric Phenomena, Flare Associated Events, Geomagnetic Phenomena, Aurora, Cosmic Rays, Airglow); Solid-Earth Geophysics (Seismology, Tsunamis, Marine Geology and Geophysics, Gravimetry, Earth Tides, Recent Movements of the Earth's Crust, Rotation of the Earth, Magnetic Measurements, Paleomagnetism and Archeomagnetism, Volcanology, Geothermics). In planning for the various scientific programs, decisions on data exchange were made by the scientific community through the international scientific unions and committees. In each discipline the specialists themselves determined the nature and form of data exchange, based on their needs as reasearch workers. Thus the type and amount of data in the WDC's differ from discipline to discipline.

The objectives of establishing several World Data Centers for collecting observational data were: (1) to ensure against loss of data by the catastrophic destruction of a single center, (2) to meet the geographical convenience of, and provide easy communication for, workers in different parts of the world. Each WDC is responsible for: (1) endeavoring to collect a complete set of data in the field or discipline for which it is responsible; (2) safekeeping of the incoming data; (3) correct copying and reproduction of data, maintaining adequate standards of clarity and durability; (4) supplying copies to other WDC's of data not received directly; (5) preparation of catalogs of all data in its charge; and (6) making data in the WDC's available to the scientific community. The WDC's conduct their operation at no expense to ICSU or to the ICSU family of unions and committees. The addresses for the WDC's are listed on page 1 of Section 1.

I. INTRODUCTION

This catalog is a first attempt to consolidate the inventories of the four World Data Centers which hold ionospheric vertical soundings data. Many inconsistancies resulting from the compilation of information from various sources have been resolved. Anyone detecting errors is encouraged to notify the editors so that future catalogs are more accurate. This catalog covers the discipline Ionosphere Vertical Soundings, summarizes all data held at World Data Centers, at the addresses listed below, and all vertical sounding stations known to have operated.

Each World Data Center strives to provide the best data possible. However, most data in the archives is contributed by non-WDC agencies; therefore, the WDC's cannot be held responsible for the condition, quality, and completeness of data under its management. Every effort will be made to provide the user with data from the cooperative-ionosonde network.

The information in this catalog is stored on computer files at WDC-A, Boulder. Updates from the World Data Centers, in the form of magnetic tapes, are incorporated into the catalog as they arrive. Contact WDC-A, Boulder for information on accessing this data remotely.

The information given here for WDC-C1, Chilton is identical with the vertical sounding section of WDC-C1 Catalogue No. 27 (published December 1983). This listed all vertical incidence data received at Chilton from the time of International Geophysical Year (1957/58) to December 1982. More up-to-date information is given in Catalogue No. 28 (published March 1984) and in the WDC-C1 on-line catalogue (see below). The Pre-IGY held at WDC-C1 is listed in the "Catalogue of pre-IGY ionospheric data held at WDC-C1", published June 1982.

The WDC-C1 catalogue of vertical incidence data is held in an interactive database which can be accessed via the UK Joint Academic computer Network (JANET). This network, in turn, can be accessed via the various international packet-switched networks (e.g. TELENET) or via the international telephone network using CCITT standard modems. For futher information please contact WDC-C1 at the address shown below.

This catalog is designed for the user and provides the kind of detail normally needed. However, if more details are required than are given in this publication, one should contact any of the World Data Centers at the address listed below for further information.

In section II are listings, sorted several ways for the convenience of the users, of all ionosphere vertical sounding stations known to have existed regardless of whether a station is open, closed, or the data held in the World Data Center system. Section III is a map showing the location of these stations. Section IV gives a description of the data types and formats with an explanation of the symbols in the catalog. Section V is the catalog of ionosphere vertical soundings data held in the WDC system. In section VI the Regular World Days are listed. The user will find the RWD listing useful as these are the times of most intense observation and exchange for all STP disciplines.

These ionospheric data are available to users without restriction, but some World Data Centers must recover their cost of data preparation, reproduction, and postage. Inquiries and requests for data or additional information can be sent to any of the World Data Centers with addresses shown below.

Although data copies are available by mail, working visits to the Data Centers are strongly encouraged. Such visits enable the user to seek advice from WDC staff, browse through the archives, and to have access to all the facilities of the Centers. Calculators, copying machines, microfilm readers and reader-printers are available; it is usually possible to minimize copying costs. Special arrangements may be made for the use of computers and other equipment. Arrangements for visits should be made in advance with the appropriate WDC.

We wish to acknowledge the support, input, and advice of the staffs of each of the World Data Centers. Roxie Sands, Doris Stansell, and George Talarski were primarily responsible for the WDC-A catalog updates; Alan Shapley provided technical advice; Joe Allen and Bill Winkler proof-read the manuscripts.

The ability to exchange information between data centers was enhanced through the use of a computerized communications network. Carl Abston, WDC-A; Yuri Tyupkin, WDC-B; the Soviet National Center for Automated Data Exchange (Institute for Automated Syustems, Moscow); and Mike Hapgood, WDC-C1 were instrumental in establishing this system.

II. LIST OF STATIONS

Five separate tables listing the ionosphere stations are presented to help the user find needed information. The first three are the basic lists giving all stations known to have existed, unlike the main catalog (section V) which gives only the data held in the WDC system. The last two tables are specialized-use tables believed to be helpful in some investigations.

Table 1. presents, in alphabetical order, the station name; station code; geographic north or south (+ or -) latitude; geographic east or west (+ or -) longitude; geographic co-latitude and geographic east longitude; and geomagnetic dipole latitude and longitude.

Table 2. presents station information sorted by geographic co-latitude.

Table 3. presents station information sorted by geomagnetic dipole co-latitude.

Table 4. presents station divided into regions then sorted by geographic co-latitude within the regions. The regions selected are 330-30 deg. E, 30-95 deg. E, 95-195 deg. E and 195-330 deg. E.

Table 5. presents a geographical latitude sort of all ionosphere stations known to have existed both by primary name and most used alternate names. Station information is repeated for each name that a station has had. Often the users and the WDCs are confused by different names for the same station (Kennington, Medows, Beltsville, Belvoir, Fort Belvoir, and Sterling have been used for Washington), names of nearby stations (Boulder, Erie and Platteville) and names that describe the general area approximately (Boston). [It should be noted that orginally the three letter station code was established so as to inform users of the approximate geographical coordinates of ionosphere stations. Refer to UAG-23 for details.] This table should enable the user to quickly locate most ionosphere stations.

MAP OF ALL IONOSPHERE VERTICAL SOUNDING STATIONS KNOWN TO HAVE EXISTED

IV. DESCRIPTION OF THE DATA AND EXPLANATION OF THE CATALOG

Section V is a summary of the data held in the World Data Center System and an indication of its location. Each station is listed in alphabetical order along with the station code (two character station code and three character computer code), geographic coordinates (north or south latitude and east longitude), reporting meridian time zone, format (ionograms, f-plots, manuscript, and computer-compatible medians and hourly values), month and year of the data and where archived. The WDC is indicated as follows: A = WDC-A, Boulder, Colorado, U.S.A.; B = WDC-B, Moscow, U.S.S.R.; X = WDC-C1, Chilton, U.K.; Y = WDC-C2, Tokyo, Japan. The use of the JFMAMJJASOND code indicates which of the 12 months are held by a data center.

The standard ionosonde of the past 40 years produces analog ionogram records on film. These ionograms show the variation of virtual height of reflection as a function of the radio frequency, normally from about 1 MHz to 20 MHz. The ionograms are the raw data and actually show the time of travel of the signal from the ionosonde to the ionosphere and back. From these raw data, the scaled, plotted and digitized data are generated - resulting in the several different data formats archived by the WDCs.

In recent years the data centers have started to receive data generated by modern ionosondes with the ionograms recorded directly on magnetic tape. In addition to the data recorded by the analog ionosondes, the digital equipment records phase, amplitude, polarization, direction of arrival, doppler phase shift, etc. The indication is that many of these digital ionosondes will be operating in the near future and depositing data in the WDC system.

The column headings in Section V are:

IONOGRAMS - the raw data recorded at the sounder (most analog data are recorded on 35mm film but a small percentage are on 16mm film; digital data indicated by an asterisk (*) are held on magnetic tape).

F-PLOTS - daily plots, generally each 15 minutes, of frequency parameters (originally recorded on paper - some of these data have been copied to microfiche or microfilm).

MANUSCRIPT - tables of daily/hourly values and monthly summary data sorted by characteristic - an asterisk (*) indicates that the data center only archives the daily worksheets (characteristics listed by hour).

COMPUTER FORMAT - daily/hourly values and monthly summary data (or only monthly summary data) characteristics held on computer magnetic tape. Contents may vary depending on the number of characteristics and the type of monthly summary (medians, counts, quartiles, or deciles) calculated from the station data.

VI. DATES OF REGULAR WORLD DAYS

A table of the Regular World Days for each year since 1957, selected first by CSAGI and now by IUWDS, is presented below. Beginning in 1961 these are sequences of three days, with the middle day, the Priority Regular World Day, always on a Wednesday.
