REPORT UAG-100

WORLD DATA CENTER A
for
Solar-Terrestrial Physics

Catalog
of Solar Filament Disappearances
1964-1980

February 1991

NATIONAL GEOPHYSICAL DATA CENTER

WORLD DATA CENTER A

National Academy of Sciences
2101 Constitution Avenue, NW
Washington, DC 20418 USA

World Data Center A consists of the Coordination Office and the following eight Subcenters:

COORDINATION OFFICE
World Data Center A
National Academy of Sciences
2101 Constitution Avenue, NW
Washington, DC 20418 USA
[Telephone: (202) 334-3368]

GLACIOLOGY (Snow and Ice)
World Data Center A: Glaciology
(Snow and Ice)
Cooperative Inst. for Research in
Environmental Sciences
University of Colorado
Boulder, Colorado 80309 USA
Telephone: (303) 492-5171

MARINE GEOLOGY AND GEOPHYSICS
(Gravity, Magnetics, Bathymetry,
Seismic Profiles, Marine Sediment,
and Rock Analyses):
World Data Center A for Marine
Geology and Geophysics
NOAA, E/GC3
325 Broadway
Boulder, Colorado 80303-3328 USA
Telephone: (303) 497-6487

METEOROLOGY (and Nuclear Radiation)
World Data Center A: Meteorology
National Climatic Data Center
NOAA, E/CC
Federal Building
Asheville, North Carolina 28801 USA
Telephone: (704) 259-0682

OCEANOGRAPHY
World Data Center A: Oceanography
National Oceanographic Data Center
NOAA, E/OC
1825 Connecticut Avenue, NW
Universal Building, Room 406
Washington, DC 20235 USA
Telephone: (202) 673-5594

ROCKETS AND SATELLITES
World Data Center A: Rockets and
Satellites
NASA/Goddard Space Flight Center
Code 630.2
Greenbelt, Maryland 20771 USA
Telephone: (301) 286-7354

ROTATION OF THE EARTH
World Data Center A: Rotation
of the Earth
U.S. Naval Observatory
Washington, DC 20392-5100 USA
Telephone: (202) 653-1529 or 1527

SEISMOLOGY
World Data Center A: Seismology
U.S. Geological Survey
Branch of Global Seismology
and Geomagnetism
Box 25046, Mail Stop 967
Denver Federal Center
Denver, Colorado 80225 USA
Telephone: (303) 236-1500

SOLAR-TERRESTRIAL PHYSICS (Solar and
Interplanetary Phenomena, Ionospheric
Phenomena, Flare-Associated Events,
Geomagnetic Variations, Aurora,
Cosmic Rays, Airglow):
World Data Center A
for Solar-Terrestrial Physics
NOAA, E/GC2
325 Broadway
Boulder, Colorado 80303-3328 USA
Telephone: (303) 497-6324

SOLID-EARTH GEOPHYSICS (Seismicity,
Earthquake Strong Motion, Tsunamis,
Gravimetry, Earth Tides, Recent
Movements of the Earth's Crust,
Magnetic Measurements, Paleomagnetism
and Archeomagnetism, Volcanology,
Geothermics):
World Data Center A
for Solid-Earth Geophysics
NOAA, E/GC1
325 Broadway
Boulder, Colorado 80303-3328 USA
Telephone: (303) 497-6521

World Data Centers conduct international exchange of geophysical observations in accordance with the principles set forth by the International Council of Scientific Unions. WDC-A is established in the United States under the auspices of the National Academy of Sciences. Communications regarding data interchange matters in general and World Data Center A as a whole should be addressed to World Data Center A, Coordination Office (see address above). Inquiries and communications concerning data in specific disciplines should be addressed to the appropriate subcenter listed above.

Catalogue of Solar Filament Disappearances 1964 – 1980

C. S. Wright
Electronics Research Laboratory
Defence Science and Technology Organisation
Salisbury SA 5108
Australia.

List of Figures

1 Schematic of filaments viewed in projection against the chromospheric disk. Position measurements "•" are made at the base of the filament sheet at natural points of inflection. The "Projected Width", w, is the mean width measured at right angles to the filament axis. The "Magnetic Polarity" of the southern filament is defined as positive, or "N", whilst that of the northern, "curved" filament is undefined (see text). 4

2 The direction to the Earth in the reference frame of a solar filament. 6

3 A data-flow diagram showing the manipulations performed on the original data to produce the tabulated parameters shown in Appendix B. 8

4 The variation of mean (uncorrected) filament length, $\overline{\ell_{uc}}$, with angular distance from disk center, ϕ, for three ranges of the angle, α between the filament sheet and the line-of-sight to the Earth (• — $0° \leq \alpha < 20°$, × — $20° \leq \alpha < 40°$, ○ — $40° \leq \alpha < 60°$). 10

5 The variation of mean corrected filament length, $\bar{\ell}$, with angular distance from disk center, ϕ, for three ranges of the angle, α, between the filament sheet and the line-of-sight to the Earth (see Figure 4). The trend in $\bar{\ell}$ as a function of latitude, λ, for filaments near central meridian is also shown (◇) for comparison. 11

6 The variation of mean computed height, $\bar{h}$, for small values of α before (•) and after (○) a correction is applied. 13

7 The variation with longitude in the number of filaments of all sizes. East limb is $-90°$, west limb is $90°$. 16

8 The estimated daily rate of disappearance from the visible solar hemisphere of filaments with corrected areas greater than $10^{\square}$, averaged over yearly intervals, from 1964 to 1980. The estimate is determined from the rate of disappearance between longitudes E45 and W45. 17

9 A superposed epoch showing the distribution of flares of importance 1B and greater surrounding the disappearance of 1030 filaments from 1968 to 1978. The horizontal line shows the number expected by chance and the zero epoch (TOD) is marked by a vertical line. The flares are binned in 3-hour intervals from 5 days before to 5 days after the TOD. 18

10 Diagram for calculating the contribution to the measured width, W_h, due to filament height, h, (see text). ABOZ is the plane of the filament sheet facing the observer on Earth and viewing from the direction of OD extended. $A'B'FO$ is the plane of the solar disk (which is also the plane of the sky) and XOY is the "plane" of the solar surface. 21

1 Introduction

Solar filaments are readily detected in Hα observations of the Sun as either extended, dark features seen above the disk, or as bright prominences seen above the limb. They vary enormously in size, from fine, dark features of a few heliographic degrees in length, within active regions for instance, to very large structures exceeding 60 heliographic degrees which overlie the quiet chromosphere or the spotless remnants of active regions. Filaments always lie above *magnetic inversion lines*, which separate regions of opposite magnetic polarity in the photosphere, although not all inversion lines are marked by visible filaments. Therefore they enable the broad features of the large-scale magnetic fields at photospheric and chromospheric levels to be mapped from routine Hα photographs (McIntosh, 1979).

It has long been known that filaments sometimes become unstable and disappear (eg. d'Azambuja and d'Azambuja, 1948). The most dramatic examples of this process take place on time-scales of a few tens of minutes to a few hours. Seen at the limb, this phenomenon is called an "eruptive prominence on the limb", or EPL. Seen against the disk it is called either a "sudden disappearing filament" (SDF) or "disparition brusque" (DB) — see, for example, Bruzek and Durrant (1977).

Like solar flares, DBs are readily detectable by routine, full-disk, Hα observations. However, unlike Hα flares, for which detailed and extensive published lists are available, published information on DBs is seriously incomplete. There may be several reasons for this, but probably the most important is that, until the last decade, DBs were not generally thought to be associated with disturbances to the interplanetary and terrestrial environments. Since Skylab, clear associations have been found between DBs and coronal mass ejections (eg. Munro et al., 1979; Webb and Hundhausen, 1987), solar particle events (eg. Kahler et al., 1986), interplanetary shocks and disturbances (Wright, 1983; Cane et al., 1986; Wright, 1990; Wright and Webb, 1990) and geomagnetic storms (Joselyn and McIntosh, 1981; McNamara and Wright, 1982; Wright and McNamara, 1983).

Like Hα flares, the DB may be treated as the easily observable *proxy* of an energetic solar event. Thus, large lists of carefully classified DBs would provide valuable information, not only about the evolution of the large-scale solar magnetic field, but also about processes which ultimately are of importance in the interplanetary and terrestrial environments.

The primary motivation for compiling this catalogue was to examine the relationship between filament disappearances, interplanetary disturbances and geomagnetic storms. Initially the need was for a large, internally consistent list of events, and completeness was of secondary importance. The first tabulation fulfilled this purpose (Wright and McNamara, 1983), but it was incomplete and did not provide a very satisfactory description of the filaments. The present catalogue is more complete, extends over a greater time-span and contains more information about each event.

It is important to emphasise at this point that the filament disappearances tabulated in this catalogue are, in general, *not associated* with active regions or with flares within active regions (Section 3, Section 8). They predominantly lay over the quiet chromosphere and were generally much larger than active region filaments. Therefore they should not be confused with the small, dark, inversion-line filaments which frequently erupt as part of the flare process (eg. Svestka, 1976) within active regions.

2 Data Sources

Two primary sources of data were used in compiling the catalogue. For the period 1974 to 1980, daily Hα photographic prints (18 cm disk diameter) from the Culgoora Solar Observatory, NSW, Australia were used. For the period 1964 to 1973, daily Hα photographs (12 cm disk diameter) from Boulder, Co, USA were used. Data gaps were partially filled by reference to the daily Hα prints (6 cm diameter) published in *Solar-Geophysical Data* (SGD) from 1967 to 1980. This procedure was particularly useful for the Culgoora time sequence, but was of limited usefulness for the Boulder sequence since most of the photographs in SGD were obtained from Boulder and therefore contained the same gaps.

In addition to the daily Hα photographs, reference was made to the Hα cinematographic films from Culgoora for the period 1974 to 1980 to establish accurate times of disappearance. However scanning the original films is very time consuming. Accurate times were therefore determined only for some of the largest events, and then only in the context of another study (Wright, 1983).

Reference was also made to the *Annotated Atlas of Hα Synoptic Charts* (McIntosh, 1979) which was based on Boulder and Sacramento Peak data and in which filament disappearances were reported. However there is not a one-to-one relationship between disappearances reported in the *Annotated Atlas* and in this catalogue. Some disappearances reported by McIntosh (1979) did not meet the criteria for inclusion here, and other events were found which were not recorded in the *Annotated Atlas*.

3 Detection and Selection Criteria

Filament disappearances were detected by comparing consecutive Hα photographs. Usually the photographs were at approximately daily intervals, but sometimes larger gaps in observations occurred. Disappearances could be readily detected during longer data gaps, especially for large filaments, but the timing of these events is more uncertain and disappearances near the east and west limbs are systematically excluded on these occasions (Section 7.2).

A filament which was visible on one photograph was deemed to have disappeared if it was absent, or a substantial portion of it was absent, from the following photograph on which it should have appeared. Sometimes filaments disappear without trace. In other cases, substantial portions of a filament may remain. The relatively poor time resolution permits the possibility of confusing more-or-less abrupt disappearances with normal day-to-day evolution in the size, shape and darkness of filaments. This effect is likely to be more serious for small rather than for large filaments. The only way to improve the reliability of detection is to improve the time resolution of the Hα photographs (Section 4.1). It follows that many of the disappearances listed in this catalogue may not resemble the classic SDF, or EPL, in which most of the filament erupts within a few tens of minutes. Instead, some recorded events may involve slow dissipation with no eruption of material. For this reason, the events are referred to here as "disappearing filaments", or DFs.

Selection of events to be included within the catalogue was made on the basis of filament size alone. However a difficulty arose in choosing an adequate definition of filament size. The overall length of a filament may be readily measured at most disk locations, but filaments of the same length may differ greatly in height and mass content. Measurement of area is not straightforward since the absorbing material in filaments predominantly occupies thin, vertical sheets with any orientation with respect to an observer on Earth (eg. Tandberg-Hanssen, 1974). Thus, a filament viewed near disk center or "end-on" near the limb may appear as a thin, dark, strip of small area whereas the same filament viewed "side-on" and well away from disk center may appear as a broad, dark band with relatively large area. Hence the apparent area of a filament depends upon its position and its orientation with respect to the observer.

Also, observations of filaments made with high angular resolution show them to be comprised of many individual fibrils which collectively make up the body of the filament (eg. Bruzek and Durrant, 1977). This is very apparent in prominences at the limb where filaments are frequently seen as arcades of loops with (visual) voids beneath. Hence, although the body of the filament may lie within a thin, vertical envelope (called the filament sheet), the envelope does not have uniform height, thickness or density.

It follows that the specification of a lower-limit of filament-size for inclusion within the catalogue is somewhat subjective. Generally, filaments with lengths $\gtrsim$ 10 heliographic degrees were included, although sometimes shorter filaments were included if they were very distinct and their projected widths were $\gtrsim$ 0.5 heliographic degrees. In addition to being subjective, the lower threshold for inclusion may have varied systematically from year to year, since the catalogue was compiled over several years from Hα photographs of various sizes and qualities. Although these difficulties may impose limitations on some uses of the catalogue involving small filaments, size thresholds can be identified above which the catalogue is internally consistent over all years (Section 6.1).

Most of the events listed involve filaments which overlie quiet chromospheric regions, or the spotless remnants

of active regions. Selection was made on the basis of size alone, and the proximity to active regions was not considered. However, many of the low-latitude events may have occurred near active regions, on portions of the same magnetic inversion lines which separate the magnetic polarities within the active regions. Although it is well known that active-region filaments may erupt as part of the flare process in active regions, such filaments are nearly always much smaller than the minimum size threshold considered here. Hence, the events listed in the catalogue are seldom, if ever, associated with Hα flares in active regions. This is further supported by a cross correlation analysis of the filament disappearances and energetic Hα flares (Section 8). On the other hand, many of the listed events may have been accompanied by nearby Hα flare-like brightenings in the quiet chromosphere. Seldom are such brightenings intense and their evolution is usually gradual rather than impulsive (see Kahler et al., 1986 for an example). Thus they often go undetected in observations of the Sun.

4 Characterisation

Each event was parameterised initially by quantities measured from the two Hα photographs bounding the event in time. These were its time, position, projected width and darkness. In addition, the magnetic polarity of the photosphere on each side of the filament was determined from the full-disk magnetograms or the synoptic charts published in SGD. From these measurements, other quantities were computed, so that the final parameterisation of each filament, as presented in the table of Appendix B, consists of both measured and computed quantities. These quantities are described below. Further details relating to the derivation and correction of these quantities are discussed in later sections.

4.1 Time of Disappearance — *Date, Time* and *Err.*

In most cases filament disappearances were not observed in progress, so that accurate times were generally unavailable. However, limits on the times of disappearance were provided by the Hα photographs bounding the events. The dates and times listed in the first two columns of the table are the averages of these times. They represent the "best-estimate" times of disappearance (TOD). For example, a listing of "66 927 234 1158" indicates that a DF occurred on 27 September 1966 at 0234 UT $\pm$ 11 hr 58 min. The column marked "Err" lists the errors, or uncertainties, in the TOD and correspond to half the time interval between the bounding photographs. Thus the timing of filament disappearances in this catalogue differs from the usual "Start"/"End" tabulation that applies to most listings of solar events. Both the TOD and the uncertainty are given in hours and minutes. The date is given in years, months and days.

Between 1974 and 1980, times were determined using Culgoora Hα photographs, supplemented by the photographic record in SGD which consisted mostly of photographs from Boulder. (Daily Culgoora photographs were obtained, on average, around 2200 UT, whilst daily Boulder photographs were obtained, on average, around 1600 UT.) Thus the uncertainty in the TOD is systematically less during this period than it is between 1964 and 1973 when photographs were available from Boulder alone. In addition, the timing of some events was accurately determined from the Culgoora cinematographic Hα patrol film. Those which have accurate beginning *and* end times are qualified with the letter "A" in the "Err" column. Those which have accurate beginnings but uncertain endings are qualified with the letter "B", and those that have accurate endings but uncertain beginnings are qualified with the letter "E".

The durations of gaps in the data are also indicated in these columns (denoted by "GAP" in the last column of the table). Data gaps longer than about 48 hours were tabulated. In these cases, entries under "Date" and "Time" correspond to the last available photograph. The entry under "Err" is the time (in hours and minutes) of the photograph marking the end of the gap, and the following single-digit figure indicates the advance in calendar date spanned by the gap.

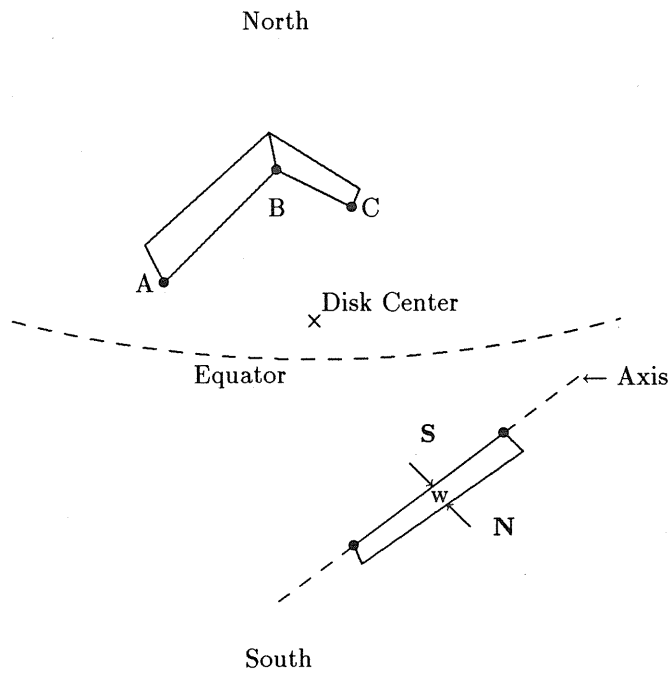

Figure 1: Schematic of filaments viewed in projection against the chromospheric disk. Position measurements "•" are made at the base of the filament sheet at natural points of inflection. The "Projected Width", w, is the mean width measured at right angles to the filament axis. The "Magnetic Polarity" of the southern filament is defined as positive, or "N", whilst that of the northern, "curved" filament is undefined (see text).

4.2 Positions of Filaments — *Positions*

The location of a filament was indicated by tabulating a number of heliographic positions along its length. For most filaments, a reasonable estimate of both their locations and orientations was provided by specifying just two points, corresponding to the heliographic positions of the ends of the filament. If a filament was severely contorted, so that its orientation changed significantly along its length, then three or (at most) four points were tabulated, with intermediate points chosen at natural inflections along the filament. All positions were measured at the base of the filament sheet, where it appeared to join the chromosphere (Figure 1). This procedure is particularly important for filaments near the limb where measurements from the top of the filament sheet would yield significant errors in position (Section 5.4.1).

Two columns of the table are reserved for position measurements. When three or more positions are given for one event, its description spans two lines in the table and intermediate positions along the filament are enclosed in parentheses. The positions given in the table were corrected for the time-difference between the last observation of the filament and the estimated TOD by assuming a latitude-independent rotation rate of 13 degrees per day. The positions are arranged with the eastern-most endpoint to the left.

Uncertainty in the measurement of position is usually only a few heliographic degrees near disk-center. However, near the limb the uncertainty may exceed 10-15 degrees, especially for filaments that lie partly beyond the limb.

4.3 Projected Width — W

The average width of a filament, seen projected onto the solar disk, was determined in heliographic degrees (1 degree = 1.22×10^7 meters). The projected width was measured at right angles to the filament axis, or the curve defining the projection of the base of the filament onto the chromosphere. It represents the average width of an envelope surrounding the body of the filament (Figure 1). In many cases the measurement is quite crude, especially for faint filaments. In the first section of the catalogue to be compiled (spanning the period 1974–1980), the projected width was tabulated only to the nearest 0.6 degrees, which corresponds to 1 mm on an 18 cm disk image. For the latter section (spanning the period 1966–1973), the width was tabulated more accurately to the nearest 0.2 degrees.

4.4 Darkness — D

The darkness of the filament was measured on a scale of 1 (faint) to 3 (dark); similar to the method of assigning brightness to Hα flares. Filaments of darkness level 1 had low contrast and were usually diffuse. Often they had little visible internal structure, through which the background chromosphere was discernible. Filaments of darkness level 3 were compact, usually with clearly visible internal structure. Filaments of darkness level 2 were intermediate. The darkness parameter is very subjective, depending upon the quality and size of the photograph, proximity to the limb (due to limb darkening), as well as upon the orientation of the filament with respect to the line-of-sight from the Earth.

4.5 Magnetic Polarity — P

This parameter indicates the photospheric magnetic polarity astride the filament. It was determined from the full-disk Kitt Peak or Mt Wilson magnetograms in *Solar-Geophysical Data*, or inferred from the synoptic charts if magnetograms were unavailable for an extended period surrounding an event. The polarity is specified as either north "N" or south "S", and indicates the polarity to the west of the filament (Figure 1). Filaments which were oriented east-west have the magnetic polarity on their *southern* side listed. The symbol "U" indicates that the polarity was either unavailable or undefined, as in the case of a greatly curved filament. The symbol "V" indicates that no attempt was made to determine the polarity, which was frequently so for small filaments after 1973. Errors in assigning the polarity are minimal.

4.6 Length — L

The length of a filament was measured in heliographic degrees. For a "straight" filament, which lies approximately on the arc of a great circle, the length is the angular distance between the endpoints. For strongly curved filaments, it is the sum of the angles subtended by the filament segments, or the great circle arcs connecting the tabulated positions along the filament.

Two kinds of errors affect the length measured in this way. First, filaments seldom lie precisely on great circles, so the great-circle length is a lower limit to the integrated length along the actual filament. Errors from this cause should usually be less than about 20%. Secondly, large errors may occur in the measured positions of filaments near the limb, due to projection effects. In some cases, one or both endpoints may lie beyond the limb. The tabulated length includes a correction for projection effects which is described in Section 5.4.1.

4.7 Height — H

The average height of a filament in heliographic degrees was computed from the average projected width in the manner described in Section 5.3. Errors in this parameter may be large if the angle between the line-of-sight and the plane of the filament sheet is small. This applies to all filaments near disk center and also to those

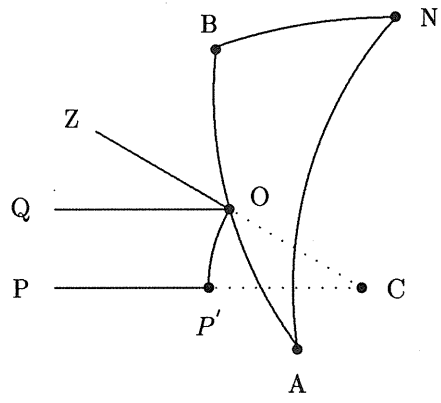

Figure 2: The direction to the Earth in the reference frame of a solar filament.

seen "end-on" at any disk location. In these cases corrections are applied (Section 5.4.2). Additional errors arise from the difficulty in defining and measuring the average projected width and from the unknown thickness of the filament sheet. Also, it was necessary to impose an arbitrary lower limit to the height of 0.3 heliographic degrees (Section 5.4.2).

4.8 Area — A

The calculated area of the filament sheet was determined from the product of the corrected length and corrected height, and is measured in square heliographic degrees. The corrected area is probably the best available measure of filament size.

4.9 Orientation of Line-of-Sight — ξ, ϕ and α

Xi and phi are angles, defined in Figure 2, which describe the orientation in the filament reference frame of the line-of-sight from the observer (on the Earth) to the filament. The angles xi and phi permit the height and area of the filament sheet to be estimated from the measured projected width.

In Figure 2, the filament is assumed to lie along a great circle arc AB. O lies on the solar surface at the midpoint of arc AB. C is the center of the Sun and Z is the zenith above O. Q lies on the line of sight from O to the Earth. P' is the center of the solar disk as seen from the Earth which lies on OP extended. OP' is a great circle arc onto which the line-of-sight, OQ, is projected. In the filament reference frame, the line-of-sight from the Earth to the filament is defined by the "zenith" angle $\widehat{ZOQ} = \phi$ and the "azimuth" angle $\widehat{AOP'} = \xi$. Alpha (not shown) is the angle between the line-of-sight and the plane of the filament sheet.

The calculation of xi, phi and alpha includes the variation of B_0 (heliographic latitude of disk center) with time. Phi and alpha are zero for all filaments at disk center. Phi is 90° for filaments at the limb. Xi and alpha are zero for filaments seen "end-on" at any disk location and are undefined for curved filaments. Xi is also undefined at disk center.

Xi and phi are confined to the range 0–90 degrees. It should be noted that filaments with fixed values of xi and phi may have either of *two* mirror-image, orientations on the disk. This ambiguity can be resolved by examining the tabulated positions.

4.10 Midpoint of Filament — *Midpt*

The midpoint is listed to provide a convenient summary of a filament's location. For the majority of filaments, which are "straight", the midpoint is the center of the great circle arc connecting the two endpoints. However, where three or four positions are required to define the location of a filament, the position of the midpoint is estimated by averaging the latitudes and longitudes over all positions. While this procedure does not yield the centroid of the filament, it is sufficiently accurate for the present purpose.

4.11 Comments — *Com*

Comments are usually restricted to the indication of data gaps.

5 Computed Parameters

All tabulated parameters in Appendix B, except the darkness, projected width and magnetic polarity, have been computed using measurements taken from the original Hα photographs. The *Date, Time, Err* and *Position* entries involve simple manipulations of the measured data (Sections 4.1 and 4.2 above). However, determination of the length, height, area and line-of-sight to the Earth is more involved. In addition, corrections have been applied in some cases to the computed values of length and height.

The manipulations which have been carried out on the original data to produce the entries in Appendix B are summarised in the data-flow diagram (de Marco, 1979), Figure 3. The calculations and corrections involved are described in detail in the following sections.

5.1 Line-of-Sight

Filament positions are specified in heliographic longitude, L, and latitude, λ. The angles ξ and ϕ define the orientation of the line-of-sight, in the filament reference frame, from the observer to the filament sheet. Referring to Figure 2, points A and B with coordinates (L_A, λ_A) and (L_B, λ_B) lie on a great circle on the solar surface and define the endpoints of a filament. $P'(0, B_0)$ marks the center of the disk seen from the Earth at CP extended, and $O(L_O, \lambda_O)$ marks the midpoint of the great-circle arc AB. C lies on PP$'$ extended, at the center of the Sun, and N is the north pole. Z lies on CO extended and marks the zenith with respect to the midpoint of the filament. P$'$O lies within the plane PCO and is therefore a great-circle arc defining the projection of the line-of-sight to the filament, OQ, onto the solar surface.

The angle $\widehat{ZOQ}$, ϕ, is the "zenith" angle of the line-of-sight from the filament to the Earth. Since PP$' \gg$ P$'$C, QO is approximately parallel to PP$'$ and the spherical angle OP$'$ is approximately equal to ϕ. The angle, ξ, between great circles OP$'$ and OA is the "azimuthal" angle of the line-of-sight from the filament to the Earth. The angles ξ and ϕ can be determined in the following manner.

From the Cosine Law of spherical trigonometry (Smart, 1944), the spherical angle BA is given by,

$$BA = \cos^{-1}\left\{\sin\lambda_B \sin\lambda_A + \cos\lambda_B \cos\lambda_A \cos\left(L_A - L_B\right)\right\}. \tag{1}$$

Then, in terms of BA, the angle $\widehat{NBA}$ can be expressed,

$$\widehat{NBA} = \cos^{-1}\left\{\frac{\sin\lambda_A - \cos BA \sin\lambda_B}{\sin BA \cos\lambda_B}\right\}, \tag{2}$$

and the co-latitude of O is given by,

$$\cos NO = \cos\frac{BA}{2}\sin\lambda_B + \sin\frac{BA}{2}\cos\lambda_B \cos\widehat{NBA}, \tag{3}$$

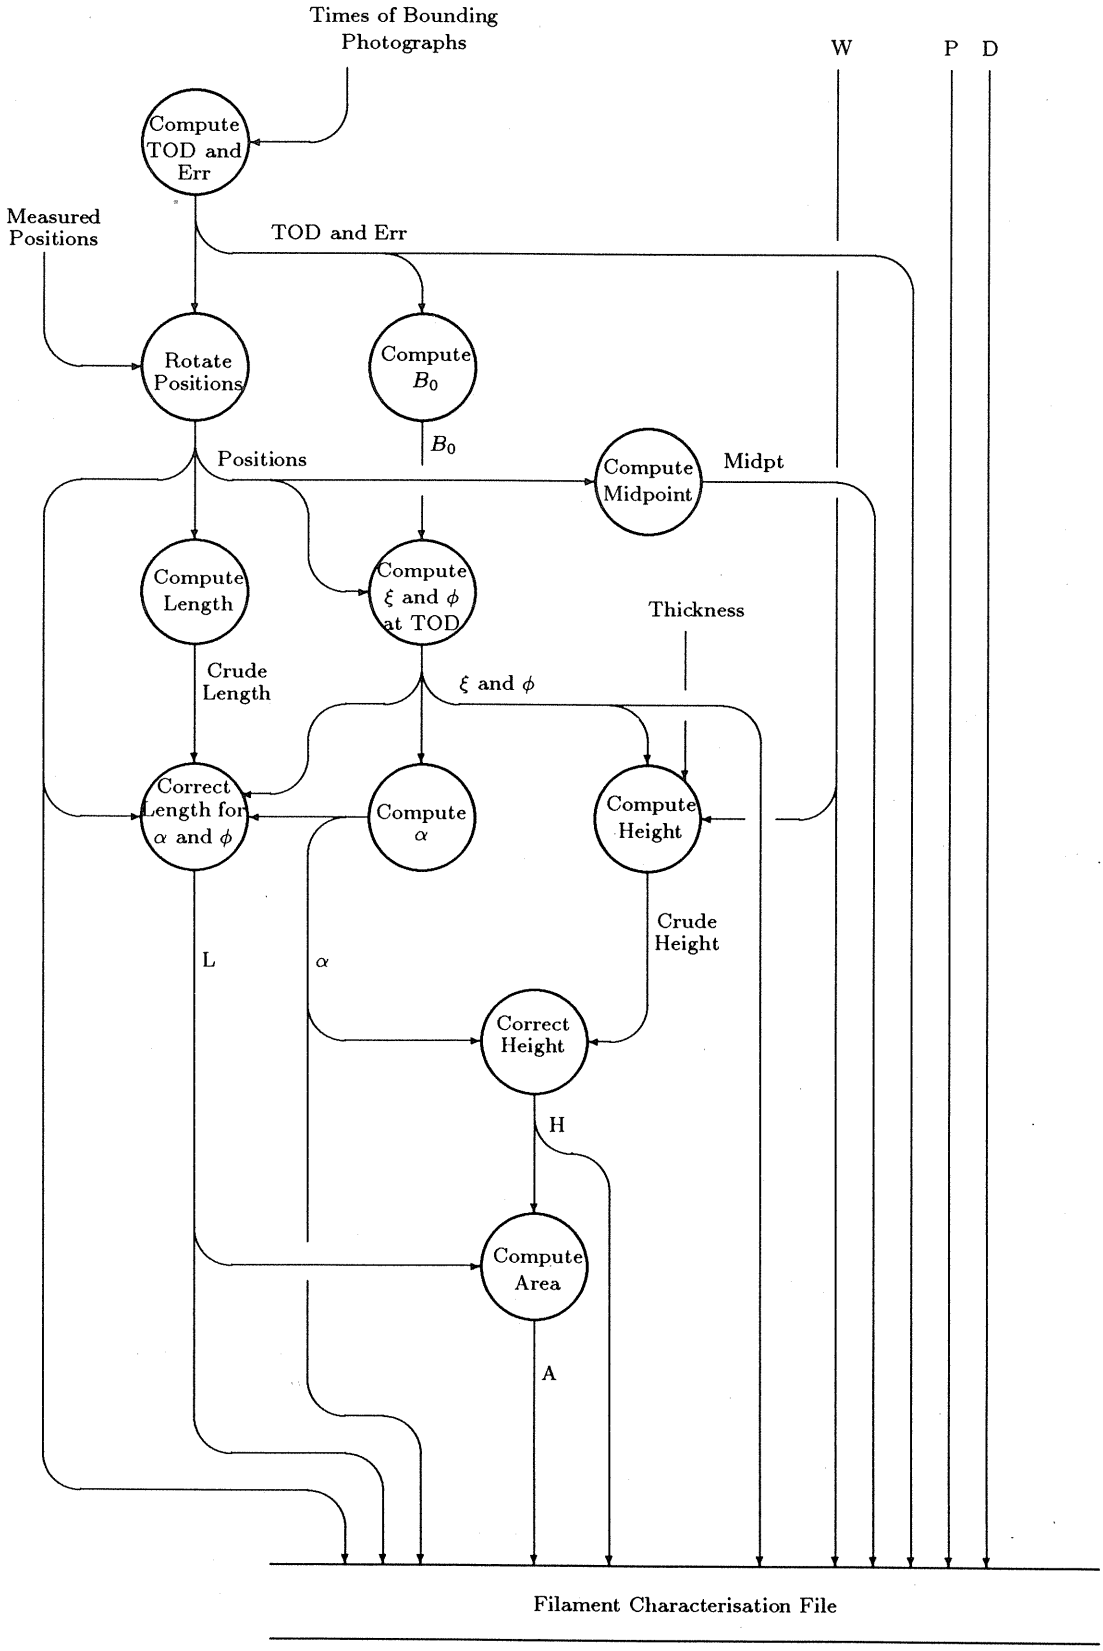

Figure 3: A data-flow diagram showing the manipulations performed on the original data to produce the tabulated parameters shown in Appendix B.

so that,

$$\cos \widehat{BNO} = \frac{\cos \frac{BA}{2} - \sin \lambda_B \cos NO}{\cos \lambda_B \sin NO}. \tag{4}$$

Hence, the latitude and longitude of the midpoint, O, of the arc AB can be determined from the relations,

$$L_O = L_B + \widehat{BNO} \tag{5}$$

and

$$\lambda_O = \frac{\pi}{2} - NO, \tag{6}$$

and therefore, ϕ, which is approximately equal to $P'O$, is given by,

$$\phi = \cos^{-1} \left\{ \sin \lambda_{P'} \sin \lambda_O + \cos \lambda_{P'} \cos \lambda_O \cos L_O \right\}. \tag{7}$$

Also,

$$P'A = \cos^{-1} \left\{ \sin \lambda_{P'} \sin \lambda_A + \cos \lambda_{P'} \cos \lambda_A \cos L_A \right\}, \tag{8}$$

so that ξ, the angle $\widehat{AOP'}$, is given by,

$$\xi = \cos^{-1} \left(\frac{\cos P'A - \cos \phi \cos \frac{BA}{2}}{\cos \phi \sin \frac{BA}{2}} \right). \tag{9}$$

For any filament arc AB, the angles defining the line-of-sight in the reference frame of the filament sheet can be computed by sequentially evaluating the Equations 1 through 9. In principle, an analytical expression for ξ and ϕ could be determined from these equations in terms of λ_A, L_A, λ_B, L_B and $\lambda_{P'}$. However, with a computer, it is simpler to evaluate Equations 1 through 9, arriving eventually at the numerical values of ξ and ϕ for each filament. In this algorithm the heliographic latitude of disk center was modelled by the expression,

$$B_0 \simeq -7.25 \sin (d + 23), \tag{10}$$

where B_0 is in degrees and d is the number of days into the year.

Finally, it can be shown that the angle α between the line-of-sight and the filament sheet, in terms of ξ and ϕ, is given by,

$$\alpha = \cos^{-1} \left(\sin^2 \phi \cos^2 \xi + \cos^2 \phi \right)^{1/2}. \tag{11}$$

5.2 Filament Length

The uncorrected length of the filament is the arc length AB in Figure 2, which may be determined from,

$$\ell_{AB} = \cos^{-1} \left\{ \sin \lambda_B \sin \lambda_A + \cos \lambda_B \cos \lambda_A \cos (L_A - L_B) \right\}. \tag{12}$$

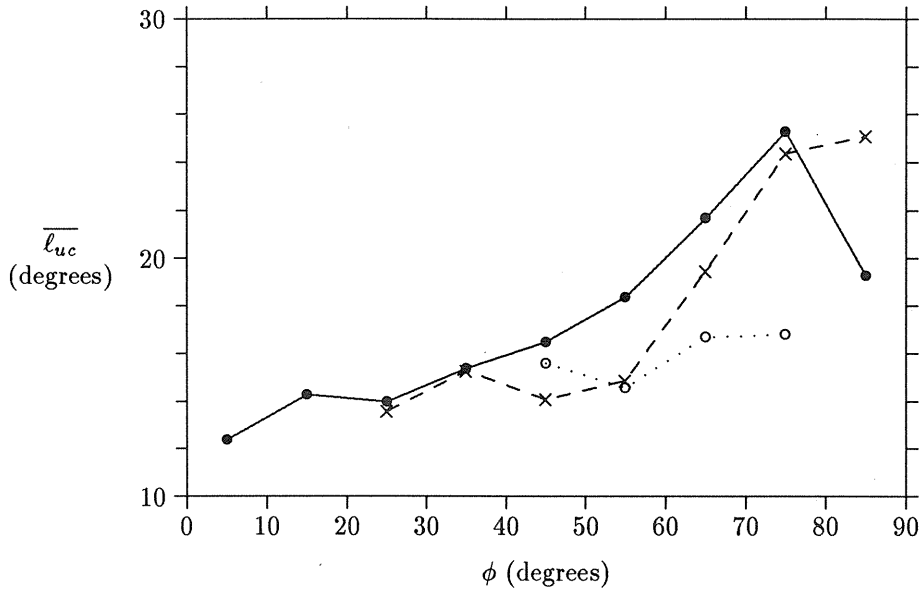

Figure 4: The variation of mean (uncorrected) filament length, $\overline{\ell_{uc}}$, with angular distance from disk center, ϕ, for three ranges of the angle, α between the filament sheet and the line-of-sight to the Earth (• — $0° \leq \alpha < 20°$, × — $20° \leq \alpha < 40°$, o — $40° \leq \alpha < 60°$).

5.3 Filament Height

Assuming a filament to be a thin, vertical sheet with thickness t, its height, h, can be determined from the measured value of the projected width, W, by the following formula (Appendix A),

$$h = \frac{\sqrt{1 - \sin^2\phi\cos^2\xi}}{\sin\phi\sin\xi}\left(W - t\cos\phi\sqrt{\frac{1 - \sin^2\phi\sin^2\xi}{\cos^2\phi + \sin^4\phi\sin^2\xi\cos^2\xi}}\right). \tag{13}$$

This expression assumes a flat solar surface. However, it is a good approximation for filaments at all heliographic positions, even close to the limb, providing $\ell \gg h$.

By rearranging Equation 13, it is clear that the projected width, W, as measured from the Hα photographs, consists of components due to both the height and the thickness of the filament sheet, with the magnitude of each component depending upon the viewing angle. Thus, determination of the filament height effectively involves the removal of the component of projected width arising from the thickness of the filament sheet.

A major source of error in the computed height stems from uncertainties in the measurement of projected width and, ultimately, from the unknown physical form of the filament. Modelling filaments as uniform, flat, vertical sheets is clearly a gross simplification. In addition, determination of the height from Equation 13 requires knowledge of the filament sheet thickness, which is unknown and cannot be measured from the Hα photographs. Thus, a constant thickness of 0.6° was chosen for all filaments. Some justification for choosing this value was that it appeared representative of the projected widths of filaments viewed near disk center, since on these occasions the sheet thickness of an ideal filament is equivalent to the projected width. Also, Bruzek and Durrant (1977) quote typical filament sheet thicknesses of 4 – 15 Mm, which are equivalent to 0.34° – 1.23°. An additional reason for settling on this value was that 0.6° was the minimum value assigned to the projected width for the period 1974 – 1980.

While the derived values for filament height in Appendix B agree favourably with the range 15 – 100 Mm (1.2° – 8.2°) quoted by Bruzek and Durrant (1977), the assumption of constant sheet thickness leads to extreme estimates of filament height under some conditions. Methods used to compensate for these extreme estimates are discussed in Section 5.4.2.

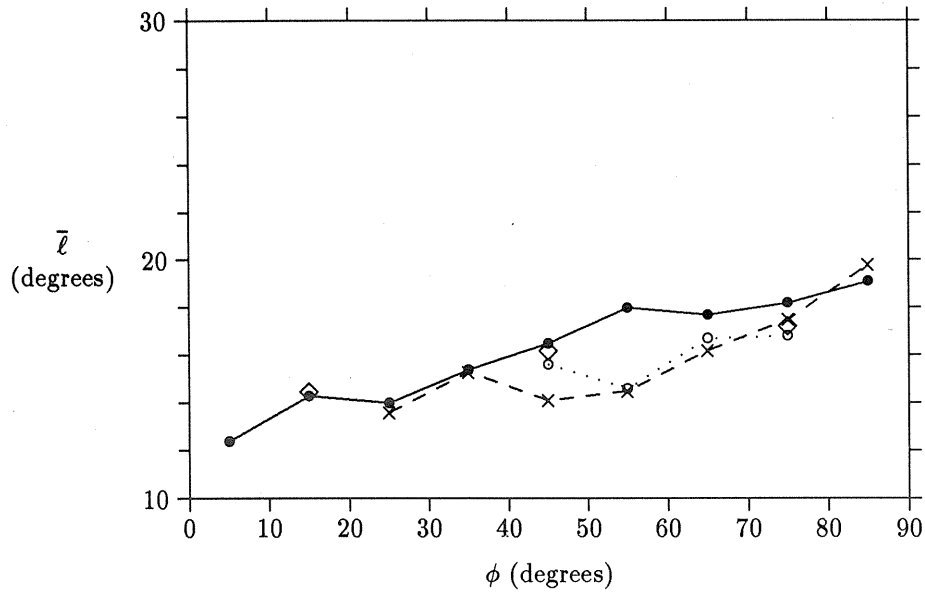

Figure 5: The variation of mean corrected filament length, $\bar{\ell}$, with angular distance from disk center, ϕ, for three ranges of the angle, α, between the filament sheet and the line-of-sight to the Earth (see Figure 4). The trend in $\bar{\ell}$ as a function of latitude, λ, for filaments near central meridian is also shown ($\diamond$) for comparison.

5.4 Corrections to Computed Length and Height

The physical form of filaments imposes severe restrictions upon the definitions of parameters such as "length" and "height". This is compounded by the variety of orientations that filaments may have with respect to an observer on Earth. Ignoring difficulties associated with the physical form of a filament, the two main factors which contribute to errors in length and height (and therefore area) are limb proximity, specified by the angle ϕ, and the orientation of the line-of-sight with respect to the filament sheet, specified by the angle α.

5.4.1 Corrections to Computed Length

The length computed in Section 5.2 contains errors due to the uncertainties in the measurement of the filament endpoints. These mainly arise from "viewing" effects and are most serious near the limb, especially when the angle, α, between the line-of-sight and the filament sheet is small (filament viewed end-on). Under these circumstances it may be difficult to determine the position on the chromospheric image of the base of the filament sheet. If the position measurement is erroneously made from the projection of the top of the filament sheet, then the recorded position will be closer to the limb than it should be, resulting in an erroneously large value of ℓ.

Figure 4 shows a plot of mean uncorrected length, $\bar{\ell}$, as a function of ϕ for three ranges of α. For values of α less than 40°, there is a marked increase in $\bar{\ell}$ near the limb ($\phi > 60°$), most probably due to the effect described above. However, filaments very close to the limb and for which $\alpha < 20°$ show a decrease in $\bar{\ell}$, due to "occulting" of many filaments by the limb. Occulting is not so severe for filaments viewed in broadside for which $\alpha \sim 90°$.

The occulting effect is more pronounced near the east limb than it is near the west limb for the following reason. Filaments which are partially occulted by the east limb on a particular photograph can be readily detected on a later photograph since they appear nearer to central meridian. The disappearance of a filament that is partially occulted by the east limb can therefore be readily detected. However its length, as measured from the earlier photograph, will be underestimated. On the other hand, it often cannot be decided if filaments near the west limb have erupted or have merely become prominences which are indistinguishable because of the poor contrast of limb features on Hα disk photographs. Filaments whose disappearance are detected near the west limb usually have been parameterised from photographs on which they were well away from the limb and

therefore not strongly occulted. It follows that the class of DF events detected near the west limb will have greater average length than their eastern counterparts.

In addition to the viewing and occulting effects, there appears to be a general increase in $\bar{\ell}$ with ϕ for all ranges of α. This is probably an artifact of a genuine increase in $\bar{\ell}$ with *latitude* which is apparent when filaments are sorted into latitude bands. This trend is shown in Figure 5. It is not possible to accurately compensate for viewing and occulting effects. However, it is reasonable to apply a statistical correction for the increase in $\bar{\ell}$ when α is small, whilst preserving the general increase of $\bar{\ell}$ with ϕ, due to the latitudinal gradient in $\bar{\ell}$. This was accomplished by dividing the apparent lengths of all filaments in the range defined by $\phi > 50°, \alpha < 40°$ by 0.34ϕ, where ϕ is in degrees. The correction was not applied for $\phi > 80°$ in the eastern hemisphere since, in this regime, $\bar{\ell}$ is significantly reduced due to severe occulting. Figure 5 shows the dependence of $\bar{\ell}$ upon ϕ for the three ranges of α after this correction has been applied. Superimposed on these plots is the latitudinal trend of $\bar{\ell}$ computed from the uncorrected lengths of filaments near central meridian, for which viewing and occulting errors are negligible and for which $|\lambda|$ is approximately equivalent to ϕ.

5.4.2 Corrections to Computed Height

The assumption of constant filament sheet thickness of 0.6° leads to very small values of the computed heights for some filaments. Even *negative* values can arise when the second term in parentheses in Equation 13 is greater than the measured projected width. To cope with these conditions, an arbitrary minimum height of 0.3° was imposed on the relatively few filaments in this class.

Under other conditions, Equation 13 may lead to unrealistically large computed heights. This mainly arises for filaments seen near disk center, and "end-on" at other disk locations, which implies that the angle, α, between the line-of-sight and the filament sheet is small. Under these conditions, the measured value of projected width should arise mainly from the sheet thickness, with only a small component from the sheet height. However, if the measured value of the projected width is much larger than 0.6° (the assumed sheet thickness), then a very large sheet height is implied.

Figure 6 shows that this is indeed the case. The mean calculated height is nearly constant at 1.5 degrees when $\alpha > 12$ degrees, but increases rapidly as $\alpha \rightarrow 0$. Figure 6 also shows the dependence of $\bar{h}$ upon α after a correction factor of 0.0875α (α in degrees) has been applied to the computed height of each filament in the sample for which $\alpha < 9°$. The form of this factor was chosen to preserve the nearly constant value of the mean corrected height over all values of α.

5.4.3 Ramifications

The corrections described above attempt to remove statistical bias introduced during detection and specification of filaments within certain viewing-angle regimes. Consequently, the tabulated values of length, height and area are likely to be less accurate inside than outside of those regimes. This is important if the sizes of individual filaments wish to be compared, although it is probably of lesser importance to studies of a statistical nature.

Values of length were altered only in the regime where $\phi > 50°$ and $\alpha < 40°$, which relates to filaments seen roughly "end-on" at more than 50° from disk center. Values of height were altered only in the regime where $\alpha < 9°$, which relates to all filaments within 9° of disk center and those seen nearly "end-on" at any other location. Recorded areas are affected by corrections to either length or height.

The tabulated values of α and ϕ in Appendix B permit identification of those filaments with corrected values of length, height and area.

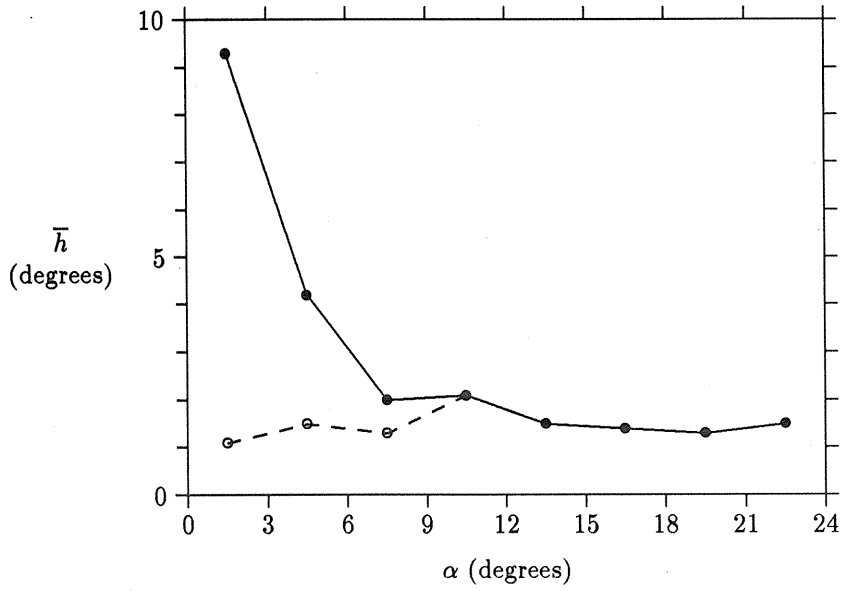

Figure 6: The variation of mean computed height, $\bar{h}$, for small values of α before (•) and after (o) a correction is applied.

6 Internal Consistency

The catalogue was compiled over a period of several years, from several kinds of Hα records of varying quality. Entries for the period 1974 through 1980 were compiled first over a period of about one year. Later the catalogue was extended backwards in time to 1964. During this extension, some improvements were made in the measurement and tabulation procedures and additional information about each event was recorded. These changes then forced a revision of the 1974–1980 entries, but due to the effort involved, it was not possible to completely revise the entries for all events. Some minor discrepancies therefore exist between the two time periods 1964–1973 and 1974–1980. These, and other inconsistencies, are described below.

6.1 Minimum Size Threshold

Of major concern is the possible variation over time of the minimum size threshold governing inclusion of events within the catalogue. Since the number of filaments increases with decreasing size, a variation in this size threshold would produce large errors in the estimated rate of disappearance of filaments over time.

This problem can be readily addressed by dividing the data into sequential time intervals and examining the size distribution of filaments within each time interval. Tables 1 and 2 show the number distribution of "straight" filaments vs corrected length and area for each year. There is clearly a large year-to-year fluctuation in the apparent number of disappearances of very small filaments. Also, most of the yearly distributions display well-defined peaks, in the length range $10° < \ell \leq 15°$ and in the area range $0^{\square} < A \leq 10^{\square}$, but with some variation from year to year.[1] The peak, or *turn-over* point for a particular year (bold numbers in Tables 1 and 2), defines a size threshold below which events are likely to be excluded from the catalogue for that year. Year-to-year consistency in the number of disappearances can reasonably be assured by confining attention to filaments with lengths (or areas) above the highest turn-over point for any year.

It is clear from these distributions that estimates of the rate of disappearances should be restricted to filaments with corrected lengths $\gtrsim 15°$, or areas $\gtrsim 10^{\square}$.

[1] The $\square$ superscript indicates "square degrees".

Table 1: Filament Numbers Distributed by Length and Year

Year	Number in Length Range										Total
	0-5°	5-10°	10-15°	15-20°	20-25°	25-30°	30-35°	35-40°	40-45°	> 45°	
1965	3	**15**	14	7	9	0	2	0	0	0	50
1966	10	**36**	24	11	6	5	1	0	2	1	96
1967	7	35	**51**	36	15	13	7	5	1	3	173
1968	4	29	**46**	28	21	15	8	1	0	0	152
1969	1	13	**36**	29	16	10	4	3	0	2	114
1970	0	11	**21**	20	15	5	2	3	0	1	78
1971	0	10	**25**	16	13	7	1	1	0	2	75
1972	4	12	**23**	22	12	13	2	3	0	1	92
1973	0	10	**17**	5	6	2	2	2	0	0	44
1974	10	**25**	23	12	7	4	0	0	1	0	82
1975	5	**33**	17	13	6	4	0	0	1	0	79
1976	4	17	**24**	11	5	1	1	0	0	1	64
1977	1	15	**26**	13	9	6	2	1	2	0	75
1978	2	38	**39**	28	11	8	6	3	0	0	135
1979	4	40	**46**	26	14	8	5	1	0	0	144
1980	1	32	**36**	27	10	8	5	3	1	2	125

6.2 Projected Width

The average projected width of filaments in the period 1974 through 1980 were measured in relatively coarse units of 0.6 heliographic degrees (which corresponded to 1 mm on a solar image of 18 cm diameter). This was refined to 0.2 heliographic degrees for the period from 1964 through 1973. The coarse width measurement influences the computed heights and is therefore reflected in the calculated areas of filaments. Larger errors are therefore expected in the calculated height and area of events in the 1974–1980 period.

The minimum projected width of 0.6 degrees assigned to the filaments in the period 1974–1980 also probably accounts for the lower turn-over points in the area distributions for these years (Table 2), because the heights (and therefore the areas) of thin filaments will be systematically underestimated.

The inconsistency in measured width is probably of little importance for most statistical studies. However it is clearly of great importance in assessing the relative sizes of individual events.

6.3 Magnetic Polarity

The magnetic polarity, as defined in Section 4.5, was recorded for all events during the period 1964 through 1973, except when it was not possible to do so because of breaks in the magnetogram records. Such breaks were more common during the early years. Magnetic polarity was not recorded at all during the initial compilation of 1974–1980. During the subsequent revision, polarity was recorded only for relatively large filaments. The qualifying letter "V" indicates events whose polarities were not assessed during revision.

6.4 Variation in Data Source

Several minor inconsistencies arose from the use of four kinds of primary data (Section 2) in the compilation. The most important are the differences in timing and time resolution described in Section 4.1. The record of events is more complete after 1973, when Hα photographs from *Solar-Geophysical Data* as well as Culgoora were available. Other variations, such as the accuracy of extracting position and projected width from the different primary data sources, are expected to be insignificant.

Table 2: Filament Numbers Distributed by Area and Year

Year	Number in Area Range										Total
	0-5$^\square$	5-10$^\square$	10-15$^\square$	15-20$^\square$	20-25$^\square$	25-30$^\square$	30-35$^\square$	35-40$^\square$	40-45$^\square$	$> 45^\square$

1980	**23**	17	14	9	17	10	6	4	3	22	125

7 Completeness

The main factors controlling completeness were the continuity and quality of the primary data sources. Some disappearances may have been overlooked on poor quality Hα records, and many small events were consciously ignored. It is unlikely that many large events were missed during periods for which records were available; providing they occurred within about 60° of disk center. However there is no doubt that many events were overlooked near the limbs, (particularly the west limb), and during large data gaps.

7.1 Detection Near the Limbs

In addition to limb darkening, which reduces the detection of events near the limbs generally, data gaps (Section 7.2) also contribute to a deficit in the recorded number of events near the east and west limbs. Furthermore, there is a subtle, systematic difference between the east and west limbs in the probability of detecting filament disappearances using photographs obtained at daily intervals.

Some disappearances near the east limb may have been overlooked due to the difficulty in estimating the filament size. Nonetheless, if a filament is observed on or near the east limb in one photograph and it is absent from the next, there is no doubt that it constitutes an event. It is more difficult to detect true disappearances near the west limb because it is frequently unclear whether a filament has erupted, passed over the limb, or has become an indistinguishable prominence. Since events were not recorded if there was doubt about their authenticity, fewer detections were recorded near the west limb than near the east limb (see also Section 5.4.1).

Figure 7 shows the number of filaments (both curved and "straight") of all sizes in 15° ranges of longitude (lunes). The midpoint, corrected for rotation, was used to assign filaments to appropriate lunes. The distribution of events is approximately flat within 45° of central meridian, but falls steeply towards the east and west limbs. The east/west asymmetry appears as a 129:85 ratio in the number of events within 30° of the respective limbs. (The fact that there are fewer events within 15° of the east limb than within 15° of the west limb is a consequence of the rotation correction, which transfers many events from a given lune into the adjoining western lune.)

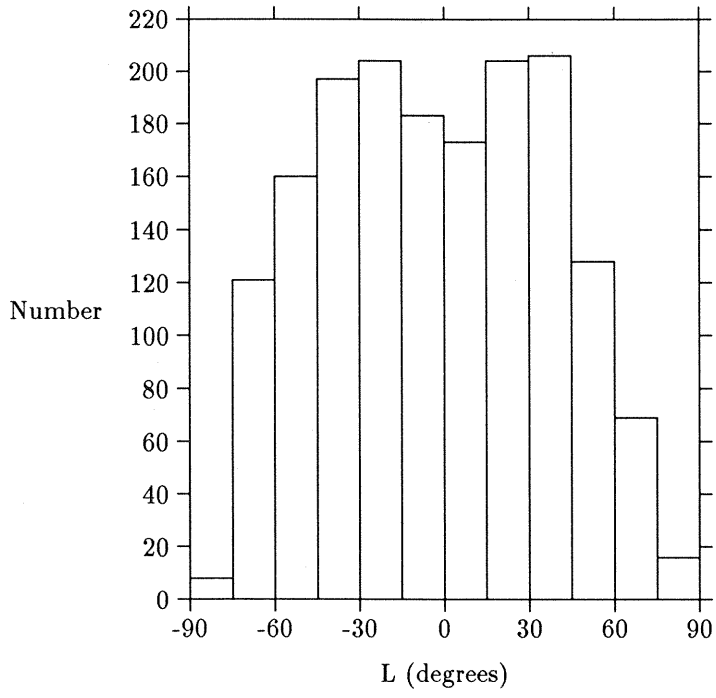

Figure 7: The variation with longitude in the number of filaments of all sizes. East limb is $-90°$, west limb is $90°$.

7.2 Data Gaps

Many filaments may have disappeared during gaps in the photographic record. Gaps $\gtrsim$ 48 hours were usually recorded, but efforts were not made to recover events which occurred within these gaps. The number of events missed under these circumstances is independent of longitude and is simply proportional to the duration of the data gap.

In contrast, most events that occurred in data gaps of less than about 48 hours could be recovered from the photographic record, albeit with increased uncertainty in their times of disappearance. The exceptions include:

1. Events whose locations near the west limb precluded detection on subsequent photographs.
2. Filaments which appeared on the disk from beyond the east limb during the data gap, and which disappeared before they could be detected on subsequent photographs.
3. Filaments which both formed and disappeared on the disk at any location during the data gap.

The events at 1 and 2 above contribute to the deficit near the limbs. The events at 3 contribute to an overall deficit in the number of observed disappearances which is independent of longitude and which is assumed to be small.

7.3 Filament Disappearance Rate

It is easier to estimate the absolute rate of disappearance than it is to separately estimate the proportions of events that were undetected because of data gaps and the limb effects described above. This can be done by considering only those filaments that disappeared from centrally located lunes. In this domain, few events will be missed during data gaps of $\lesssim$ 48 hours, and the number of events missed during longer gaps is simply proportional to the duration of the gaps (Section 7.2). Hence, after correcting for the longer data gaps, the only error in the

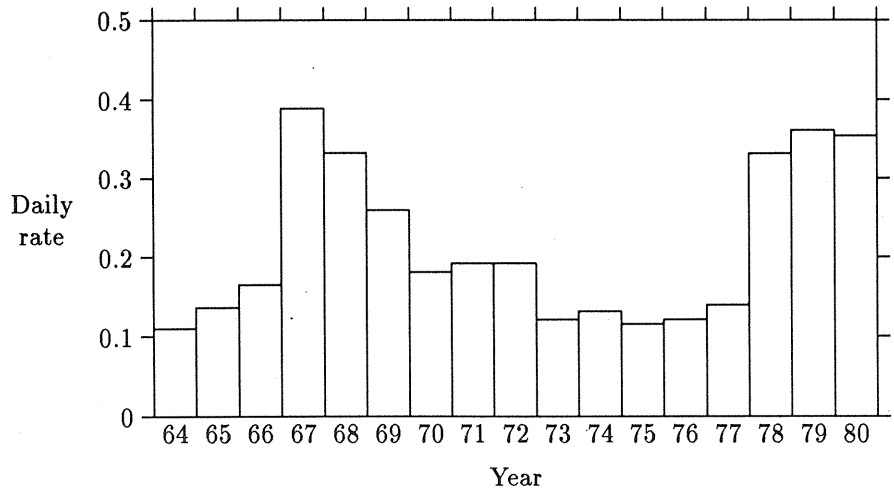

Figure 8: The estimated daily rate of disappearance from the visible solar hemisphere of filaments with corrected areas greater than $10^{\square}$, averaged over yearly intervals, from 1964 to 1980. The estimate is determined from the rate of disappearance between longitudes E45 and W45.

number of events located in the central lunes is due to those few events that were overlooked while scanning the photographs, and to those unseen near the poles because of limb darkening.

The average daily disappearance rate of filaments from the disk, uncorrected for data gaps longer than 2 days, is simply $2N/t$, where N is the total number of disappearances between longitudes E45 and W45 (Figure 7) during some sufficiently large time interval t days. After correcting for data gaps, the mean daily rate of disappearance $\bar{q}_t$ over the entire disk is given by,

$$\begin{aligned} \bar{q}_t &= 2\frac{N}{t} + 2\frac{N\tau}{t(t-\tau)} \\ &= \frac{2N}{t-\tau} \end{aligned} \tag{14}$$

where τ is the summed durations of gaps longer than two days within the time interval t. t must be long compared with typical data gaps. Implicit in this estimate is the assumption that the number of filaments that both form and disappear in a time $\lesssim 2$ days is small.

Figure 8 shows the estimated daily rate of disappearance from the visible solar hemisphere of filaments with corrected areas greater than $10^{\square}$, averaged over yearly intervals ($t = 1$ year), from 1964 to 1980. The estimated rate of disappearance from the entire Sun is double this rate.

8 Association of DFs with Flares and Active Regions

It is important to emphasise that the DF events in this catalogue are, in general, not associated with active regions or with flares within active regions. Although some were close to active regions, often on common inversion lines, they predominantly lay over the quiet chromosphere and were generally much larger than active region filaments. Therefore they should not be confused with the small, dark, inversion-line filaments which frequently erupt as part of the flare process (eg. Svestka, 1976) within active regions.

Figure 9 shows the number of flares of importance 1B and greater that occurred within each 3-hour time interval, from five days before to five days after a DF, summed over all 1030 DF events during the period 1968 to 1978. The flares were from the *Solar-Geophysical Data* group reports and occurred, almost entirely, within active regions. A causal connection between the flares and the DFs would appear as a broad excess above the number expected by chance near zero delay. This is not observed in Figure 9, nor does such an excess appear

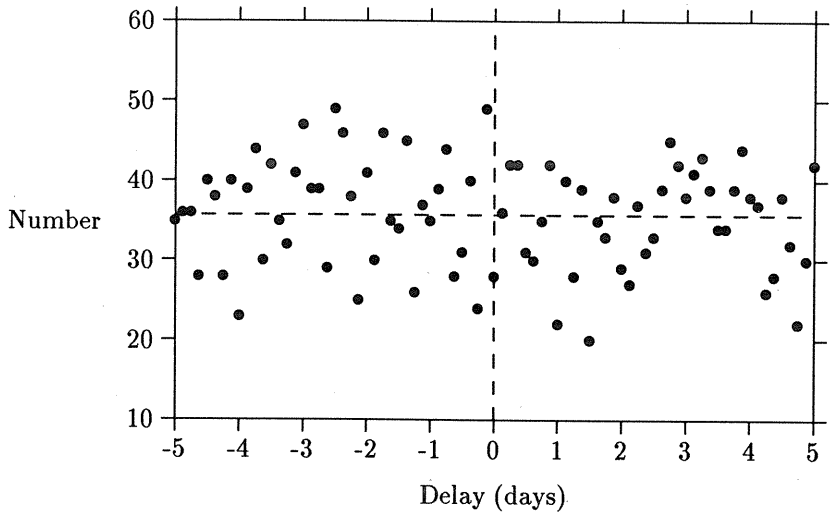

Figure 9: A superposed epoch showing the distribution of flares of importance 1B and greater surrounding the disappearance of 1030 filaments from 1968 to 1978. The horizontal line shows the number expected by chance and the zero epoch (TOD) is marked by a vertical line. The flares are binned in 3-hour intervals from 5 days before to 5 days after the TOD.

when the flare and filament size thresholds are varied, or when the integration interval is varied between 3-hours and 1-day. Assuming the delay between the postulated flare/filament interaction to be short ($\lesssim$ 3 hours), most genuine interactions should be clustered within $\pm$12 hours of zero delay, which corresponds to the approximate uncertainty in the TOD of filaments. A consideration of the scatter about the chance level (after the data have been integrated over 24 hours) indicates that a total of about 40 genuine interactions in this delay range should lead to a pronounced (3σ) peak. It is therefore very unlikely that there are more than about 40 *genuine* interactions of this kind in the 1030 events considered here. Therefore any association between the DFs in this catalogue and flares in active regions is very weak.

9 Acknowledgements

Assistance in the early compilation of this catalogue was provided by Mr Peter Davies and Mrs Wendy Place at IPS Radio and Space Services, Sydney, Australia. I am greatly indebted for the support of the Space Physics Division of the Geophysics Laboratory, Hanscom AFB, MA., under contract AF19628-87-K-0033. I am also indebted to Mr Pat McIntosh, Space Environment Laboratories, Boulder, Co., USA, for providing Hα photographs for the period 1964–1973. Helpful discussions with Peggy Shea and Don Smart at GL(AFSC), are acknowledged. David Webb at Boston College and Richard Thompson at IPS, Sydney, kindly provided critical comments on the manuscript.

A Calculation of Filament Height

It is necessary to derive an expression for the height of a filament in terms of the angles ξ and ϕ, and the measurement of projected width, W. The projected width consists of components due to the filament sheet height, h, and thickness, t. Therefore the individual contributions of height and thickness to the measured width must be calculated before h can be determined. The following derivation assumes the filament to be an infinitely long rectangular slab on a flat solar surface (inset Figure 10). It is sufficiently accurate at all disk locations; even near the limb, providing $\ell \gg h$.

A.1 Contribution to Measured Width Due to Sheet Height

An expression for the component of the measured width, W_h, due to the sheet height, can be derived from Figure 10, which is constructed in the following way. O lies on the solar surface at the base of the of the filament sheet. Let D lie at an arbitrary location on the line of sight to the Earth from O. OX extended is the base of the filament sheet on the surface of the Sun. X$'$O is the projection of XO into the plane perpendicular to DO at O – the plane of the solar disk. In this plane, construct OA$'$ $\perp$ X$'$O so that $\widehat{X'OA'} = \pi/2$. The line-of-sight to A$'$ intersects the facing plane of the filament sheet at A, so that AA$'$ $\perp$ OA$'$. Construct AB $\perp$ OX at B and extend it to the point F where it intersects the plane B$'$OA$'$. FB$'$A$'$ is the projection of FBA in the plane of the solar disk, so that F, B$'$ and A$'$ are colinear. Also, the plane of the filament sheet intersects the solar disk in the line FO. Construct AZ || BO in the plane ABO such that OZ $\perp$ BO at O. In the plane ABO, construct OE $\perp$ FO to meet AB at E. Construct OY $\perp$ XO and ZO. Plane XOY is the plane of the solar surface. Thus $\widehat{FOY} = \widehat{EOY} = \pi/2$. Since $\widehat{EOF} = \pi/2 = \widehat{DOF}$, then the plane EDO is perpendicular to the plane of the filament sheet and contains OY. Now, if D is positioned on the line-of-sight such that ED || OY, then $\widehat{DEO} = \pi/2$. Finally, construct DC $\perp$ plane XOY at C, join C to O and C to B.

In this construction, X$'$B$'$O is the projection of the base of the filament onto the plane of the solar disk and is referred to in the text as the "filament axis". Also, A may be considered to lie at the top of the filament, so that $AB = h$ is the filament height. OA$'$ corresponds to the portion of the *projected width*, measured perpendicular to the filament axis on the solar disk, due to the filament height, AB. Hence, $OA' = W_h$. Furthermore, OC is the perpendicular projection of the line-of-sight, OD, onto the plane of the solar surface, so that the *azimuthal angle* $\xi = \widehat{XOC}$ and the *zenith angle* $\phi = \widehat{ZOD}$. It is necessary to determine the value of AB in terms of ϕ, ξ and W_h.

Since ED || CB || OY, then $\widehat{CBO} = \pi/2$. Also $\widehat{BOC} = \xi$, and since DC || AB || OZ, then $\widehat{ZOD} = \widehat{ODC} = \widehat{FBB'} = \phi$. Therefore,

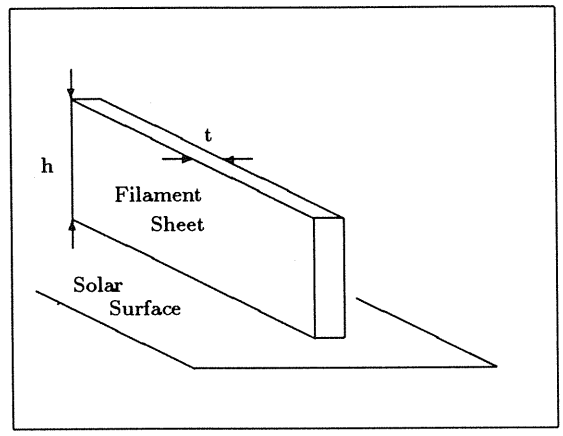
$$\begin{aligned} OC &= OD\sin\phi, && (15)\\ CD &= OD\cos\phi, && (16)\\ OB &= OC\cos\xi, \\ &= OD\sin\phi\cos\xi, && (17)\\ \tan\widehat{EOB} &= EB/OB, \\ &= CD/OB, \\ &= \frac{\cos\phi}{\sin\phi\cos\xi}. && (18) \end{aligned}$$

Since $\widehat{EOF} = \pi/2$, then $\widehat{BOF} = \pi/2 - \widehat{EOB}$. Therefore $\widehat{BFO} = \widehat{EOB}$. Also,

$$\begin{aligned} \cos\widehat{B'BO} &= \cos\widehat{DOB}, \\ &= OB/OD, \\ &= \sin\phi\cos\xi, && (19) \end{aligned}$$

after substituting for OB from Equation 17, and since B, B$'$, O and D are coplanar and BB$'$ || DO. Also, A$'$B$'$ is the projection of AB onto the solar disk, and since AB || OZ,

$$A'B' = h\sin\phi. \qquad (20)$$



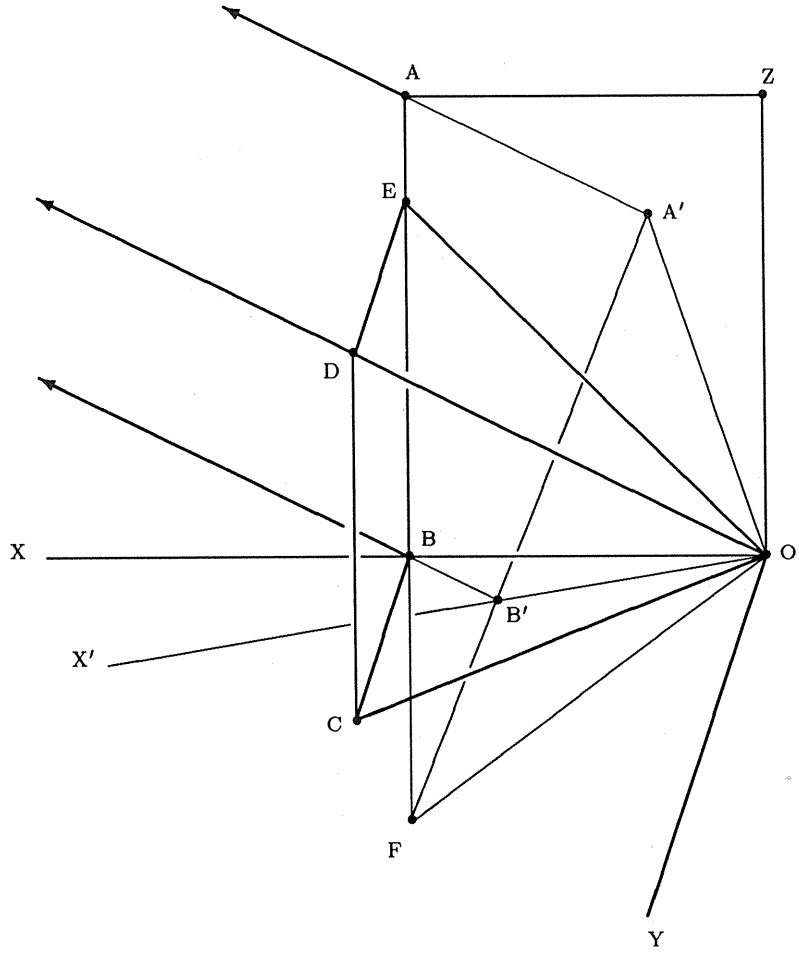


Figure 10: Diagram for calculating the contribution to the measured width, W_h, due to filament height, h, (see text). ABOZ is the plane of the filament sheet facing the observer on Earth and viewing from the direction of OD extended. A′B′FO is the plane of the solar disk (which is also the plane of the sky) and XOY is the "plane" of the solar surface.

Furthermore,

$$\begin{aligned} B'O &= OB \sin \widehat{B'BO}, \\ &= OB\sqrt{1 - \sin^2\phi\cos^2\xi}, \end{aligned} \tag{21}$$

$$\begin{aligned} BB' &= OB \cos \widehat{B'BO}, \\ &= OB \sin\phi\cos\xi, \end{aligned} \tag{22}$$

from Equation 19. Hence,

$$\begin{aligned} B'F &= BB' \tan\phi, \\ &= OB \sin\phi\cos\xi\tan\phi, \end{aligned} \tag{23}$$

from Equation 22. Also,

$$\begin{aligned} OF &= \frac{OB}{\sin \widehat{BFO}}, \\ &= \frac{OB}{\sin \widehat{EOB}}. \end{aligned}$$

Therefore, from Equation 18,

$$OF = \frac{OB\sqrt{\cos^2\phi + \sin^2\phi\cos^2\xi}}{\cos\phi}. \tag{24}$$

Now, from the cosine law,

$$\cos \widehat{FB'O} = \frac{B'F^2 + B'O^2 - OF^2}{2.B'F.B'O},$$

so that,

$$\begin{aligned} \cos \widehat{A'B'O} &= -\cos \widehat{FB'O}, \\ &= \frac{OF^2 - B'F^2 - B'O^2}{2.B'F.B'O}, \end{aligned}$$

which becomes,

$$\cos \widehat{A'B'O} = \frac{\cos\xi\cos\phi}{\sqrt{1 - \sin^2\phi\cos^2\xi}}, \tag{25}$$

after substituting from Equations 21, 23 and 24 and evaluating. Finally,

$$\begin{aligned} W_h &= OA', \\ &= A'B' \sin \widehat{A'B'O}, \\ &= \frac{h\sin\phi\sin\xi}{\sqrt{1 - \sin^2\phi\cos^2\xi}}, \end{aligned} \tag{26}$$

after substituting from Equations 20 and 25 and evaluating.

This expression can be tested for certain limiting viewing angles:

$$\begin{aligned} \phi &= \pi/2 \implies W_h = h, \\ \phi &= 0 \implies W_h = 0, \\ \xi &= \pi/2 \implies W_h = h\sin\phi, \\ \xi &= 0 \implies W_h = 0, \end{aligned}$$

which correspond respectively to filaments viewed at the limb, at disk center, broadside on the disk, and end-on.

A.2 Contribution to Measured Width Due to Sheet Thickness

The contribution to the measured width, W_t, due to the sheet thickness, t, can be derived in a similar way,

$$W_t = \frac{t\cos\phi\sqrt{1 - \sin^2\phi\sin^2\xi}}{\sqrt{\cos^2\phi + \sin^4\phi\sin^2\xi\cos^2\xi}}. \tag{27}$$

This expression can also be tested for certain limiting viewing angles:

$$\begin{aligned} \phi &= \pi/2 \implies W_t = 0, \\ \phi &= 0 \implies W_t = t, \\ \xi &= \pi/2 \implies W_t = t\cos\phi, \\ \xi &= 0 \implies W_t = t, \end{aligned}$$

which correspond respectively to filaments viewed at the limb, at disk center, broadside on the disk, and end-on.

A.3 Expression for Sheet Height

The total projected width,

$$W = W_h + W_t, \tag{28}$$

so that, from Equations 26, 27 and 28,

$$h = \frac{\sqrt{1-\sin^2\phi\cos^2\xi}}{\sin\phi\sin\xi}\left(W - t\cos\phi\sqrt{\frac{1-\sin^2\phi\cos^2\xi}{\cos^2\phi+\sin^4\phi\sin^2\xi\cos^2\xi}}\right). \tag{29}$$

B Tabulation of Filament Disappearances 1964–1980

The following table lists all DF events detected between 26 October 1964 and 31 December 1980. The tabulation has 50 lines per page. Note that leading zeros are suppressed. A summary of the columnar entries from left to right is provided by the following list. A full description of the format is described in Section 4.

Date: Estimated date of disappearance in year, month, day format.

Time: Estimated time of disappearance in hours and minutes (or start of data gap).

Err: Uncertainty in time of disappearance in hours and minutes (or end of data gap).

$\sim$ An unlabelled column indicating the number of day transitions spanned by data gaps.

Position: The locations of filament end-points and points of inflection (in parentheses).

W: The projected width in heliographic degrees.

D: The darkness on a scale of 1 (faint) to 3 (dark).

P: The photospheric magnetic polarity west of the filament, or south of the filament in the case of filaments parallel to the equator. N = north polarity, S = south polarity and U = polarity undetermined.

L: The computed length in heliographic degrees.

H: The computed height in heliographic degrees.

A: The computed area of the filament sheet in square heliographic degrees.

ξ: The azimuthal angle of the line-of-sight in degrees.

ϕ: The zenith angle of the line-of-sight in degrees.

α: The angle between the line-of-sight and the filament sheet in degrees.

Midpt: The calculated mid-point of the base of the filament sheet.

Com: Comments, usually restricted to the indication of data gaps.

UAG SERIES OF REPORTS

Fewer than four UAG Reports are published at irregular intervals each year. Copies of these publications may be purchased through the NATIONAL GEOPHYSICAL DATA CENTER, Solar-Terrestrial Physics Division (E/GC2) 325 Broadway, Boulder, Colorado 80303, USA. Please note that some reports are available on microfiche only at $4.00 a copy and that a $10.00 handling charge will be added. In this case orders must include check or money order payable in U.S. currency to Commerce, NOAA/NGDC.

UAG- 1 IQSY NIGHT AIRGLOW DATA, by L.L. Smith, F.E. Roach, and J.M. McKennan, ESSA Aeronomy Laboratory, Boulder, CO, July 1968, 305 pp.

UAG- 2 A REEVALUATION OF SOLAR FLARES, 1964-1966, by Helen W. Dodson and E. Ruth Hedeman, McMath-Hulbert Observatory, University of Michigan, Pontaic, MI, August 1968, 28 pp.

UAG- 3 OBSERVATIONS OF JUPITER'S SPORADIC RADIO EMISSION IN THE RANGE 7.6-41 MHZ, 6 JULY 1966 THROUGH 8 SEPTEMBER 1968, by James W. Warwick and George A. Dulk, University of Colorado, Boulder, CO, October 1968, 35 pp.

UAG- 4 ABBREVIATED CALENDAR RECORD 1966-1967, by J. Virginia Lincoln, Hope I. Leighton and Dorothy K. Kropp, ESSA [now NOAA], Aeronomy and Space Data Center, Boulder, CO, January 1969, 170 pp.

UAG- 5 DATA ON SOLAR EVENT OF MAY 23, 1967, AND ITS GEOPHYSICAL EFFECTS, compiled by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA [now NOAA], Boulder, CO, February 1969, 120 pp.

UAG- 6 INTERNATIONAL GEOPHYSICAL CALENDARS 1957-1969, by A.H. Shapley and J. Virginia Lincoln, ESSA Research Laboratories [now NOAA], Boulder, CO, March 1969, 25 pp.

UAG- 7 OBSERVATIONS OF THE SOLAR ELECTRON CORONA: FEBRUARY 1964 - JANUARY 1968, by Richard T. Hansen, High Altitude Observatory, NCAR, Boulder, CO, and Kamuela, HI, October 1969, 12 pp.

UAG- 8 DATA ON SOLAR-GEOPHYSICAL ACTIVITY OCTOBER 24 - NOVEMBER 6, 1968, Parts 1 and 2, compiled by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA [now NOAA], Boulder, CO, March 1970, 312 pp, (includes Parts 1 and 2).

UAG- 9 DATA ON COSMIC RAY EVENT OF NOVEMBER 18, 1968, AND ASSOCIATED PHENOMENA, compiled by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA [now NOAA], Boulder, CO, April 1970, 109 pp.

UAG-10 ATLAS OF IONOGRAMS, edited by A.H. Shapley, ESSA Research Laboratories [now NOAA], Boulder, CO, May 1970, 243 pp.

UAG-11 [Superseded by UAG-30]

UAG-12 SOLAR-GEOPHYSICAL ACTIVITY ASSOCIATED WITH THE MAJOR GEOMAGNETIC STORM OF MARCH 8, 1970, Parts 1, 2 and 3, compiled by J. Virginia Lincoln and Dale B. Bucknam, World Data Center A, Upper Atmosphere Geophysics, ESSA [now NOAA], Boulder, CO, April 1971, 466 pp, (includes 3 parts).

UAG-13 DATA ON THE SOLAR PROTON EVENT OF NOVEMBER 2, 1969, THROUGH THE GEOMAGNETIC STORM OF NOVEMBER 8-10, 1969, compiled by Dale B. Bucknam and J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA [now NOAA], Boulder, CO, May 1971, 76 pp.

UAG-14 AN EXPERIMENTAL, COMPREHENSIVE FLARE INDEX AND ITS DERIVATION FOR 'MAJOR' FLARES, 1955-1969, by Helen W. Dodson and E. Ruth Hedeman, McMath-Hulbert Observatory, University of Michigan, Pontiac, MI, July 1971, 25 pp.

UAG-15 [Superseded by UAG-30]

UAG-16 TEMPORAL DEVELOPMENT OF THE GEOPHYSICAL DISTRIBUTION OF AURORAL ABSORPTION FOR 30 SUBSTORM EVENTS IN EACH OF IQSY (1964-65) AND IASY (1960), by F.T. Berkey, University of Alaska, Fairbanks, AK; V.M. Driatskiy, Arctic and Antarctic Research Institute, Leningrad, USSR; K. Henriksen, Auroral Observatory, Tromso, Norway; D.H. Jelly, Communications Research Center, Ottawa, Canada; T.I. Shchuka, Arctic and Antarctic Research Institute, Leningrad, USSR; A. Theander, Kiruna Geophysical Observatory, Kiruna, Sweden; and J. Yliniemi, University of Oulu, Oulu, Finland, September 1971, 131 pp, $4.00 (microfiche only).

UAG-17 IONOSPHERIC DRIFT VELOCITY MEASUREMENTS AT JICAMARCA, PERU (JULY 1967 - MARCH 1970), by Ben B. Balsley, NOAA Aeronomy Laboratory, Boulder, CO, and Ronald F. Woodman, Jicamarca Radar Observatory, Instituto Geofisico del Peru, Lima, Peru, October 1971, 45 pp, $4.00 (microfiche only).

UAG-18 A STUDY OF POLAR CAP AND AURORAL ZONE MAGNETIC VARIATIONS, by K. Kawasaki and S.-I. Akasofu, University of Alaska, Fairbanks, AK, June 1972, 21 pp.

UAG-19 REEVALUATION OF SOLAR FLARES 1967, by Helen W. Dodson and E. Ruth Hedeman, McMath-Hulbert Observatory, University of Michigan, Pontiac, MI, and Marta Rovira de Miceli, San Miguel Observatory, Argentina, June 1972, 15 pp.

UAG-20 [Superseded by UAG-30]

UAG-21 PRELIMINARY COMPILATION OF DATA FOR RETROSPECTIVE WORLD INTERVAL JULY 26 - AUGUST 14, 1972, by J. Virginia Lincoln and Hope I. Leighton, World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO, November 1972, 128 pp.

UAG-22 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES (AE) FOR 1970, by Joe Haskell Allen, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, November 1972, 146 pp.

UAG-23 U.R.S.I. HANDBOOK OF IONOGRAM INTERPRETATION AND REDUCTION, Second Edition, November 1972, edited by W.R. Piggott, Radio and Space Research Station, Slough, UK, and K. Rawer, Arbeitsgruppe fur Physikalische Weltraumforschung, Freiburg, GFR, November 1972, 324 pp.

UAG-23A U.R.S.I. HANDBOOK OF IONOGRAM INTERPRETATION AND REDUCTION, Second Edition, Revision of Chapters 1-4, edited by W.R. Piggott, Radio and Space Research Station, Slough, UK, and K. Rawer, Arbeitsgruppe fur Physikalische Weltraumforschung, Freiburg, GFR, November 1972, 135 pp.

UAG-24 DATA ON SOLAR-GEOPHYSICAL ACTIVITY ASSOCIATED WITH THE MAJOR GROUND LEVEL COSMIC RAY EVENTS OF 24 JANUARY AND 1 SEPTEMBER 1971, Parts 1 and 2, compiled by Helen E. Coffey and J. Virginia Lincoln, World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO, December 1972, 462 pp, (includes Parts 1 and 2).

UAG-25 OBSERVATIONS OF JUPITER'S SPORADIC RADIO EMISSION IN THE RANGE 7.6-41 MHZ, 9 SEPTEMBER 1968 THROUGH 9 DECEMBER 1971, by James W. Warwick, George A. Dulk and David G. Swann, University of Colorado, Boulder, CO, February 1973, 35 pp.

UAG-26 DATA COMPILATION FOR THE MAGNETOSPHERICALLY QUIET PERIODS FEBRUARY 19-23 AND NOVEMBER 29 - DECEMBER 3, 1970, compiled by Helen E. Coffey and J. Virginia Lincoln, World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO, May 1973, 129 pp.

UAG-27 HIGH SPEED STREAMS IN THE SOLAR WIND, by D.S. Intriligator, University of Southern California, Los Angeles, CA, June 1973, 16 pp.

UAG-28 COLLECTED DATA REPORTS ON AUGUST 1972 SOLAR-TERRESTRIAL EVENTS, Parts 1, 2 and 3, edited by Helen E. Coffey, World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO, July 1973, 932 pp.

UAG-29 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(11) FOR 1968, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, October 1973, 148 pp.

UAG-30 CATALOGUE OF DATA ON SOLAR-TERRESTRIAL PHYSICS, prepared by NOAA Environmental Data Service, Boulder, CO, October 1973, 317 pp. Supersedes catalogs UAG-11, 15 and 20.

UAG-31 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(11) FOR 1969, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, February 1974, 142 pp.

UAG-32 SYNOPTIC RADIO MAPS OF THE SUN AT 3.3 MM FOR THE YEARS 1967-1969, by Earle B. Mayfield, Kennon P. White III, and Fred I. Shimabukuro, Aerospace Corp., El Segundo, CA, April 1974, 26 pp.

UAG-33 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(10) FOR 1967, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, May 1974, 142 pp.

UAG-34 ABSORPTION DATA FOR THE IGY/IGC AND IQSY, compiled and edited by A.H. Shapley, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO; W.R. Piggott, Appleton Laboratory, Slough, UK; and K. Rawer, Arbeitsgruppe fur Physikalische Weltraumforschung, Freiburg, GFR, June 1974, 381 pp.

UAG-35 [Superseded by UAG-92]

UAG-36 AN ATLAS OF EXTREME ULTRAVIOLET FLASHES OF SOLAR FLARES OBSERVED VIA SUDDEN FREQUENCY DEVIATIONS DURING THE ATM-SKYLAB MISSIONS, by R.F. Donnelly and E.L. Berger, NOAA Space Environment Laboratory; Lt. J.D. Busman, NOAA Commissioned Corps; B. Henson, NASA Marshall Space Flight Center; T.B. Jones, University of Leicester, UK; G.M. Lerfald, NOAA Wave Propagation Laboratory; K. Najita, University of Hawaii; W.M. Retallack, NOAA Space Environment Laboratory and W.J. Wagner, Sacramento Peak Observatory, October 1974, 95 pp.

UAG-37 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(10) FOR 1966, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, December 1974, 142 pp.

UAG-38 MASTER STATION LIST FOR SOLAR-TERRESTRIAL PHYSICS DATA AT WDC-A FOR SOLAR-TERRESTRIAL PHYSICS, by R.W. Buhmann, World Data Center A for Solar-Terrestrial Physics, Boulder, CO; Juan D. Roederer, University of Denver, Denver, CO; and M.A. Shea and D.F. Smart, Air Force Cambridge Research Laboratories, Hanscom AFB, MA, December 1974, 110 pp.

UAG-39 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(11) FOR 1971, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, February 1975, 144 pp.

UAG-40 H-ALPHA SYNOPTIC CHARTS OF SOLAR ACTIVITY FOR THE PERIOD OF SKYLAB OBSERVATIONS, MAY 1973 - MARCH 1974, by Patrick S. McIntosh, NOAA Space Environment Laboratory, Boulder, CO, February 1975, 32 pp.

UAG-41 H-ALPHA SYNOPTIC CHARTS OF SOLAR ACTIVITY DURING THE FIRST YEAR OF SOLAR CYCLE 20 OCTOBER 1964 - AUGUST 1965, by Patrick S. McIntosh, NOAA Space Environment Laboratory, Boulder, CO, and Jerome T. Nolte, American Science and Engineering, Inc., Cambridge, MA, March 1975, 25 pp.

UAG-42 OBSERVATIONS OF JUPITER'S SPORADIC RADIO EMISSION IN THE RANGE 7.6-80 MHZ, 10 DECEMBER 1971 THROUGH 21 MARCH 1975, by James W. Warwick, George A. Dulk and Anthony C. Riddle, University of Colorado, Boulder, CO, April 1975, 49 pp.

UAG-43 CATALOG OF OBSERVATION TIMES OF GROUND-BASED SKYLAB-COORDINATED SOLAR OBSERVING PROGRAMS, compiled by Helen E. Coffey, World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO, May 1975, 159 pp.

UAG-44 SYNOPTIC MAPS OF SOLAR 9.1 CM MICROWAVE EMISSION FROM JUNE 1962 TO AUGUST 1973, by Werner Graf and Ronald N. Bracewell, Stanford University, Stanford, CA, May 1975, 183 pp.

UAG-45 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(11) FOR 1972, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, May 1975, 144 pp, $4.00 (microfiche only).

UAG-46 INTERPLANETARY MAGNETIC FIELD DATA 1963-1964, by Joseph H. King, National Space Science Data Center, NASA Goddard Space Flight Center, Greenbelt, MD, June 1975, 382 pp.

UAG-47 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(11) FOR 1973, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, June 1975, 144 pp, $4.00 (microfiche only).

UAG-48 [Superseded by UAG-48A]

UAG-48A SYNOPTIC OBSERVATIONS OF THE SOLAR CORONA DURING CARRINGTON ROTATIONS 1580-1596 (11 OCTOBER 1971 - 15 JANUARY 1973), [Re-issue of UAG-48 with quality images], by R.A. Howard, M.J. Koomen, D.J. Michels, R. Tousey, C.R. Detwiler, D.E. Roberts, R.T. Seal, and J.D. Whitney, U.S. Naval Research Laboratory, Washington, DC; and R.T. Hansen and S.F. Hansen, C.J. Garcia and E. Yasukawa, High Altitude Observatory, NCAR, Boulder, CO, February 1976, 200 pp. Supersedes UAG-48.

UAG-49 [Superseded by UAG-92]

UAG-50 HIGH-LATITUDE SUPPLEMENT TO THE URSI HANDBOOK ON IONOGRAM INTERPRETATION AND REDUCTION, edited by W.R. Piggott, British Antarctic Survey, c/o Appleton Laboratory, Slough, UK, October 1975, 294 pp.

UAG-51 SYNOPTIC MAPS OF SOLAR CORONAL HOLE BOUNDARIES DERIVED FROM HE II 304A SPECTROHELIOGRAMS FROM THE MANNED SKYLAB MISSIONS, by J.D. Bohlin and D.M. Rubenstein, U.S. Naval Research Laboratory, Washington, DC, November 1975, 30 pp.

UAG-52 EXPERIMENTAL COMPREHENSIVE SOLAR FLARE INDICES FOR CERTAIN FLARES, 1970-1974, by Helen W. Dodson and E. Ruth Hedeman, McMath-Hulbert Observatory, University of Michigan, Pontiac, MI, November 1975, 27 pp.

UAG-53 DESCRIPTION AND CATALOG OF IONOSPHERIC F-REGION DATA, JICAMARCA RADIO OBSERVATORY (NOVEMBER 1966 - APRIL 1969), by W.L. Clark and T.E. Van Zandt, NOAA Aeronomy Laboratory, Boulder, CO, and J.P. McClure, University of Texas at Dallas, Dallas, TX, April 1976, 10 pp.

UAG-54 [Superseded by UAG-85]

UAG-55 EQUIVALENT IONOSPHERIC CURRENT REPRESENTATIONS BY A NEW METHOD, ILLUSTRATED FOR 8-9 NOVEMBER 1969 MAGNETIC DISTURBANCES, by Y. Kamide, Cooperative Institute for Research in Environmental Sciences, University of Colorado, Boulder, CO; H.W. Kroehl, Data Studies Division, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO; M. Kanamitsu, Advanced Study Program, National Center for Atmospheric Research, Boulder, CO; Joe Haskell Allen, Data Studies Division, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO; and S.-I. Akasofu, Geophysical Institute, University of Alaska, Fairbanks, AK, April 1976, 91 pp, $4.00 (microfiche only).

UAG-56 ISO-INTENSITY CONTOURS OF GROUND MAGNETIC H PERTURBATIONS FOR THE DECEMBER 16-18, 1971, GEOMAGNETIC STORM, Y. Kamide, Cooperative Institute for Research in Environmental Sciences, University of Colorado, Boulder, CO, April 1976, 37 pp.

UAG-57 MANUAL ON IONOSPHERIC ABSORPTION MEASUREMENTS, edited by K. Rawer, Institut fur Physikalische Weltraumforschung, Freiburg, GFR, June 1976, 302 pp.

UAG-58 ATS-6 RADIO BEACON ELECTRON CONTENT MEASUREMENTS AT BOULDER, JULY 1974 - MAY 1975, by R.B. Fritz, NOAA Space Environment Laboratory, Boulder, CO, September 1976, 61 pp.

UAG-59 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(11) FOR 1974, by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, December 1976, 144 pp.

UAG-60 GEOMAGNETIC DATA FOR JANUARY 1976 [AE(7) INDICES AND STACKED MAGNETOGRAMS], by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, July 1977, 57 pp.

UAG-61 COLLECTED DATA REPORTS FOR STIP INTERVAL II 20 MARCH - 5 MAY 1976, edited by Helen E. Coffey and John A. McKinnon, World Data Center A for Solar-Terrestrial Physics, Boulder, CO, August 1977, 313 pp.

UAG-62 GEOMAGNETIC DATA FOR FEBRUARY 1976 [AE(7) INDICES AND STACKED MAGNETOGRAMS], by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, September 1977, 55 pp.

UAG-63 GEOMAGNETIC DATA FOR MARCH 1976 [AE(7) INDICES AND STACKED MAGNETOGRAMS], by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, September 1977, 57 pp.

UAG-64 GEOMAGNETIC DATA FOR APRIL 1976 [AE(8) INDICES AND STACKED MAGNETOGRAMS], by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO, February 1978, 55 pp.

UAG-65 THE INFORMATION EXPLOSION AND ITS CONSEQUENCES FOR DATA ACQUISITION, DOCUMENTATION, PROCESSING, by G.K. Hartmann, Max-Planck-Institut fur Aeronomie, Lindau, GFR, May 1978, 36 pp.

UAG-66 SYNOPTIC RADIO MAPS OF THE SUN AT 3.3 MM 1970-1973, by Earle B. Mayfield and Fred I. Shimabukuro, Aerospace Corp., El Segundo, CA, May 1978, 30 pp.

UAG-67 IONOSPHERIC D-REGION PROFILE DATA BASE, A COLLECTION OF COMPUTER-ACCESSIBLE EXPERIMENTAL PROFILES OF THE D AND LOWER E REGIONS, by L.F. McNamara, Ionospheric Prediction Service, Sydney, Australia, August 1978, 30 pp, $4.00 (microfiche only).

UAG-68 A COMPARATIVE STUDY OF METHODS OF ELECTRON DENSITY PROFILE ANALYSIS, by L.F. McNamara, Ionospheric Prediction Service, Sydney, Australia, August 1978, 30 pp, $4.00 (microfiche only).

UAG-69 SELECTED DISTURBED D-REGION ELECTRON DENSITY PROFILES. THEIR RELATION TO THE UNDISTURBED D REGION, by L.F. McNamara, Ionospheric Prediction Service, Sydney, Australia, October 1978, 50 pp, $4.00 (microfice only).

UAG-70 ANNOTATED ATLAS OF H-ALPHA SYNOPTIC CHARTS FOR SOLAR CYCLE 20 (1964-1974) CARRINGTON SOLAR ROTATIONS 1487-1616, by Patrick S. McIntosh, NOAA Space Environment Laboratory, Boulder, CO, February 1979, 327 pp.

UAG-71 MAGNETIC POTENTIAL PLOTS OVER THE NORTHERN HEMISPHERE FOR 26-28 MARCH 1976, A.D. Richmond, NOAA Space Environment Laboratory, Boulder, CO; H.W. Kroehl, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO; M.A. Henning, Lockheed Missiles and Space Co., Aurora, CO; and Y. Kamide, Kyoto Sangyo University, Kyoto, Japan, April 1979, 118 pp.

UAG-72 ENERGY RELEASE IN SOLAR FLARES, PROCEEDINGS OF THE WORKSHOP ON ENERGY RELEASE IN FLARES, 26 FEBRUARY - 1 MARCH 1979, CAMBRIDGE, MASSACHUSETTS, U.S.A., edited by David M. Rust, American Science and Engineering, Inc., Cambridge, MA; and A. Gordon Emslie, Harvard-Smithsonian Center for Astrophysics, Cambridge, MA, July 1979, 68 pp, $4.00 (microfiche only).

UAG-73 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(11-12) FOR JANUARY - JUNE 1975, by Joe Haskell Allen, Carl C. Abston, J.E. Salazar and J.A. McKinnon, National Geophysical and Solar-Terrestrial Data Center, NOAA, Boulder, CO, August 1979, 114 pp, $4.00 (microfiche only).

UAG-74 ATS-6 RADIO BEACON ELECTRON CONTENT MEASUREMENTS AT OOTACAMUND, INDIA, OCTOBER - JULY 1976, by S.D. Bouwer, K. Davies, R.F. Donnelly, R.N. Grubb, J.E. Jones and J.H. Taylor, NOAA Space Environment Laboratory, Boulder, CO; and R.G. Rastogi, M.R. Deshpande, H. Chandra and G. Sethia, Physical Research Laboratory, Ahmedabad, India, March 1980, 58 pp.

UAG-75 THE ALASKA IMS MERIDIAN CHAIN: MAGNETIC VARIATIONS FOR 9 MARCH - 27 APRIL 1978, by H.W. Kroehl and G.P. Kosinski, National Geophysical and Solar-Terrestrial Data Center, Boulder, CO; S.-I. Akasofu, G.J. Romick, C.E. Campbell and G.K. Corrick, University of Alaska, Fairbanks, AK; and C.E. Hornback and A.M. Gray, NOAA Space Environment Laboratory, Boulder, CO, June 1980, 107 pp.

UAG-76 AURORAL ELECTROJET MAGNETIC ACTIVITY INDICES AE(12) FOR JULY - DECEMBER 1975, by Joe Haskell Allen, Carl C. Abston, J.E. Salazar and J.A. McKinnon, National Geophysical and Solar-Terrestrial Data Center, NOAA, Boulder, CO, August 1980, 116 pp.

UAG-77 SYNOPTIC SOLAR MAGNETIC FIELD MAPS FOR THE INTERVAL INCLUDING CARRINGTON ROTATIONS 1601-1680, MAY5, 1973 - APRIL 26, 1979, by J. Harvey, B. Gillespie, P. Miedaner and C. Slaughter, Kitt Peak National Observatory, Tucson, AZ, August 1980, 66 pp.

UAG-78 THE EQUATORIAL LATITUDE OF AURORAL ACTIVITY DURING 1972-1977, by N.R. Sheeley, Jr. and R.A. Howard, E.O. Hulbert Center for Space Research, U.S. Naval Research Laboratory, Washington, DC and B.S. Dandekar, Air Force Geophysics Laboratory, Hanscom AFB, MA, October 1980, 61 pp.

UAG-79 SOLAR OBSERVATIONS DURING SKYLAB, APRIL 1973 - FEBRUARY 1974, I. CORONAL X-RAY STRUCTURE, II. SOLAR FLARE ACTIVITY, by J.M. Hanson, University of Michigan, Ann Arbor, MI; and E.C. Roelof and and R.E. Gold, The Johns Hopkins University, Laurel, MD, December 1980, 43 pp.

UAG-80 EXPERIMENTAL COMPREHENSIVE SOLAR FLARE INDICES FOR 'MAJOR' AND CERTAIN LESSER FLARES, 1975-1979, compiled by Helen W. Dodson and E. Ruth Hedeman, The Johns Hopkins University, Laurel, MD, July 1981, 33 pp.

UAG-81 EVOLUTIONARY CHARTS OF SOLAR ACTIVITY (CALCIUM PLAGES) AS FUNCTIONS OF HELIOGRAPHIC LONGITUDE AND TIME, 1964-1979, by E. Ruth Hedeman, Helen W. Dodson and Edmond C. Roelof, The Johns Hopkins University, Laurel, MD, August 1981, 103 pp.

UAG-82 INTERNATIONAL REFERENCE IONOSPHERE - IRI 79, edited by J. Virginia Lincoln and Raymond O. Conkright, National Geophysical and Solar-Terrestrial Data Center, NOAA, Boulder, CO, November 1981, 243 pp.

UAG-83 SOLAR-GEOPHYSICAL ACTIVITY REPORTS FOR SEPTEMBER 7-24, 1977 AND NOVEMBER 22, 1977, Parts 1 and 2, compiled by John A. McKinnon and J. Virginia Lincoln, World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO, February 1982, 553 pp.

UAG-84 CATALOG OF AURORAL RADIO ABSORPTION DURING 1976-1979 AT ABISKO, SWEDEN, by J.K. Hargreaves, C.M. Taylor and J.M. Penman, Environmental Sciences Department, University of Lancaster, Lancaster, UK, July 1982, 69 pp.

UAG-85 [Superseded by UAG-91]

UAG-86 [Superseded by UAG-92]

UAG-87 CHANGES IN THE GLOBAL ELECTRIC FIELDS AND CURRENTS FOR MARCH 17-19, 1978, FROM SIX IMS MERIDIAN CHAINS OF MAGNETOMETERS, by Y. Kamide, Kyoto Sangyo University, Kyoto, Japan; H.W. Kroehl, National Geophysical Data Center, NOAA, Boulder, CO; and A.D. Richmond, NOAA Space Environment Laboratory, Boulder, CO, November 1982, 102 pp.

UAG-88 NUMERICAL MODELING OF IONOSPHERIC PARAMETERS FROM GLOBAL IMS MAGNETOMETER DATA FOR THE CDAW-6 INTERVALS, by Y. Kamide, Kyoto Sangyo University, Kyoto, Japan; H.W. Kroehl, National Geophysical Data Center, NOAA, Boulder, CO; and B.A. Hausman, National Geophysical Data Center, NOAA, Boulder, CO, November 1983, 197 pp.

UAG-89 ATMOSPHERIC HANDBOOK: ATMOSPHERIC DATA TABLES AVAILABLE ON COMPUTER TAPE, by V.E. Derr, NOAA Environmental Research Laboratories, Boulder, CO, July 1984, 56 pp.

UAG-90 EXPERIENCE WITH PROPOSED IMPROVEMENTS OF THE INTERNATIONAL REFERENCE IONOSPHERE (IRI): CONTRIBUTED PAPERS, MAINLY FROM THE URSI-COSPAR WORKSHOP HELD IN BUDAPEST IN 1980, edited by K. Rawer, University of Freiburg, Federal Republic of Germany, and C.M. Minnis, International Union of Radio Science (URSI), Brussels, Belgium, May 1984, 233 pp.

UAG-91 COMBINED CATALOG OF IONOSPHERE VERTICAL SOUNDINGS DATA, compiled by Raymond O. Conkright and Marcus O. Ertle, National Geophysical Data Center, NOAA, Boulder, CO, December 1984, 174 pp.

UAG-92 INTERNATIONAL CATALOG OF GEOMAGNETIC DATA, compiled by C.C. Abston, National Geophysical Data Center, NOAA, Boulder, CO; N.E. Papitashvili, Academy of Sciences of the USSR, World Data Center B2, Moscow, USSR; and V.O. Papitashvili, IZMIRAN, Moscow Region, USSR, August 1985, 291 pp. Supersedes UAG-35, 49, and 86.

UAG-93 IONOGRAM ANALYSIS WITH THE GENERALIZED PROGRAM POLAN, by J.E. Titheridge, University of Auckland, New Zealand, December 1985, 194 pp.

UAG-94 THE SOLAR MAGNETIC FIELD--1976 THROUGH 1985: AN ATLAS OF PHOTOSPHERIC MAGNETIC FIELD OBSERVATIONS AND COMPUTED CORONAL MAGNETIC FIELDS FROM THE JOHN M. WILCOX SOLAR OBSERVATORY AT STANFORD, by J. Todd Hoeksema and Philip H. Scherrer, Center for Space Science and Astrophysics, Stanford University, Stanford, CA, January 1986, 370 pp.

UAG-95 SUNSPOT NUMBERS: 1610-1985, (based on THE SUNSPOT-ACTIVITY IN THE YEARS 1610-1960, by Prof. M. Waldmeier, Copyright 1961, Swiss Federal Observatory, Zurich, Switzerland), revised by John A. McKinnon, National Geophysical Data Center, NOAA, Boulder, CO, January 1987, 112 pp.

UAG-96 SOLAR-GEOPHYSICAL ACTIVITY REPORTS FOR STIP INTERVAL XV, 12-21 February 1984 Ground Level Event, AND STIP INTERVAL XVI, 20 April - 4 May 1984 Forbush Decrease, compiled by Helen E. Coffey and Joe H. Allen, National Geophysical Data Center, NOAA, Boulder, CO, July 1987, 418 pp.

UAG-97 NUMERICAL MODELING OF POLAR IONOSPHERIC ELECTRODYNAMICS FOR JULY 23-24, 1983, UTILIZING IONOSPHERIC CONDUCTANCES DEDUCED FROM DMSP X-RAY IMAGES, by B.-H. Ahn, Kyungpook National University, Taegu, Korea; E. Friis-Christensen, Division of Geophysics, Danish Meteorological Institute, Copenhagen, Denmark; D.J. Gorney, Space Sciences Laboratory, The Aerospace Corporation, Los Angeles, CA; Y. Kamide, Kyoto Sangyo University, Kyoto, Japan; and H.W. Kroehl, National Geophysical Data Center, NOAA, Boulder, CO, April 1988, 133 pp.

UAG-98 TYPE II SOLAR RADIO BURSTS RECORDED AT WEISSENAU 1966-1987, by H.W. Urbarz, Astronomical Institute of Tubingen University, Weissenau Station, 7980 Rasthalde, Ravensburg, GFR, February 1990, 86 pp.

UAG-99 PROCEEDINGS OF THE WORKSHOP ON GEOPHYSICAL INFORMATICS, MOSCOW, AUGUST 14-18, 1988, edited by J.H. Allen, National Geophysical Data Center, NOAA, Boulder, CO; and V.A. Nechitailenko, Soviet Geophysical Committee, Academy of Sciences of the USSR, Moscow, USSR, January 1991, 304 pp.

UAG-100 CATALOGUE OF SOLAR FILAMENT DISAPPEARANCES 1964-1980, by C.S. Wright, Electronics Research Laboratory, Defence Science and Technology Organisation, Salisbury, South Australia 5108, Australia, February 1991, 62 pp.

☆U.S. GOVERNMENT PRINTING OFFICE: 1991 - 573-002/21034
