Meteorologist

## INTRODUCTION

During January and March of 1995, much of California was struck by extremely heavy precipitation, causing extensive property damage and loss of life. Estimates now show over \$3 billion in damages and 27 lives claimed by the flooding. The American Red Cross estimates that over 10,000 homes were damaged or destroyed. This report provides a brief review of the storms which caused the flooding, details of some of the damage, and precipitation statistics and maps for the events.

## SYNOPTIC SITUATION

A much stronger than normal Pacific jet stream was displaced well south of its normal position during much of the winter and early spring of 1995. This 'funneled' moisture and major storm systems directly into California. In fact, the jet core and average storm track were displaced 15-20 degrees latitude south of their normal locations during January. During January and March, the state was struck repeatedly by very strong storm systems laden with Pacific moisture.

Much has been written about the Tropical/Northern Hemisphere (TNH) teleconnection pattern as it relates to El Nino. Therefore, this report will not venture into this aspect in great detail. However, numerous studies have noted that a moderate to strong El Nino event, such as occurred this past winter, usually results in a stronger than normal Pacific subtropical jet stream, and a very active storm track along its path. This, in turn, creates above normal precipitation in areas along the path of the major storm systems. However, the 'mean' location of this jet stream and resulting storm track varies considerably when comparing historical El Nino events.

During January and March of this year (but not during February), this storm track was a major influence in steering strong storm systems into California. In previous El Nino events, this has not always been the case, as some 'El Nino winters' have produced below normal California precipitation. Therefore, El Nino certainly does not guarantee above normal precipitation for California, but it does seem to increase the likelihood of an extended period of unusually heavy precipitation (and potential flooding) as occurred this year.

## DISCUSSION

The January storms resulted in 42 California counties being declared federal disaster areas. Then, the March storms caused a total of 57 counties to be declared disaster areas (all but one of the counties in the state). Pacific Gas & Electric (PG&E) reported electrical outages for 1.4 million customers during January, and for 1.2 million customers during March. Thunderstorms, sometimes severe, accompanied many of the storm systems, and even produced a few tornadoes. In both months, flooding on many of the smaller streams was caused by very heavy precipitation during short time intervals, with amounts that sometimes exceeded 100-year 24-hour event records. Then, flooding on larger rivers ensued as they were fed by their overwhelmed tributaries.

For example, the Salinas River at Chular reached a peak flow of about 96,000 cubic feet per second (cfs)--nearly double its prior record established in 1983. Other record flows included:

- Del Puerto Creek near Patterson--6000 cfs vs previous record of 1800 cfs in 1959.
- Cache Creek near Yolo--41,800 cfs vs previous record of 41,400 cfs in 1958.
- The Guadalupe River near San Jose--10,500 cfs vs previous record of 9150 cfs in 1958.
- The Carmel River near Carmel--12,200 cfs vs previous record of 9560 cfs in 1983.

The January storms more severely affected northern California, while the March storms concentrated more of their impact on central California. However, both months showed much above normal precipitation over most of the state. Since most of the storms occurred within relatively cool, unstable air masses, much of the precipitation above 5000 feet elevation fell and accumulated as snow. Although this somewhat lessened the immediate impact of the storms in terms of flooding, it heightened fears of later flooding due to melting and runoff. Water content of snowpack exceeded 150% of normal in much of the Sacramento Basin and Sierra Nevada mountains at the end of March. During one storm (Jan 8-10), up to 12 feet of snow fell on parts of the Sierra Nevada range. Some locations reported snow depths exceeding 40 feet by late March.

One of the obvious impacts of the unusually heavy precipitation was to agriculture. The inability to either

harvest or plant severely affected crops such as lettuce, spinach, artichokes, almonds, oranges, cabbage, cauliflower, cherries, and plums. Thousands of acres of Monterey County farmland were flooded. More than 3000 people, mostly farm workers, had to be evacuated from the town of Pajaro, which was almost entirely flooded due to a levee break.

The state's roads also suffered extensive damage from the deluge. A bridge collapse on Interstate 5 in Fresno County killed 6 people. A 150-mile stretch of I-5 remained closed for over a week. Other severely affected areas included:

- San Jose--portions of downtown flooded by Guadalupe River.
- Castroville--Salinas River forced thousands to evacuate.
- Monterey--Salinas River forced the closure of highways leading to the peninsula.
- Watsonville--more than 2700 people evacuated.
- Malibu--Mudslides destroyed homes and blocked the Pacific Coast Highway.

#### SIGNIFICANT EVENTS AND STATISTICS

Following are some of the more interesting statistics concerning the unusually heavy precipitation:

##### JANUARY 1995:

- Brandy Creek: 17.36 inches for 48-hour period ending Jan 9.
- Mount Shasta: 5.76 inches for 24-hour period ending Jan 9.  
22.81 inches for Jan 1-16.
- Blue Canyon: 5.05 inches for 24-hour period ending Jan 10.  
20.64 inches for week of Jan 8-14.  
28.16 inches for Jan 1-16.
- Santa Maria: 7.52 inches for 24-hour period ending Jan 10.
- Sacramento: 4.45 inches for 24-hour period ending Jan 10.  
9.39 inches for Jan 1-16.
- Los Angeles: 9.36 inches for Jan 1-15.
- Santa Barbara: 16.89 inches for Jan 1-15.

- Marin Civic Center: 18.08 inches for Jan 1-16.
- Redding: 14.87 inches for Jan 1-16.
- Eel River at Fernbridge: Crested 5 feet above flood stage.
- Sacramento River at Tehama: Crested 5 feet above flood stage.
- Russian River at Guerneville Bridge: Crested 16 feet above flood stage.
- Wettest month on record for:
 

Santa Maria	- 11.78
Los Angeles Intl.	- 12.71
Lompoc	- 15.37
Santa Barbara	- 24.20
Gibraltar Dam	- 34.52

MARCH 1995:

- Mt. Palomar: 8.57 inches for 24-hour period ending Mar 5.  
14.58 inches for 48-hour period ending Mar 6.
- Mt. Wilson: 4.07 inches for 24-hour period ending Mar 5.
- Idyllwild: 6.00 inches for 24-hour period ending Mar 5.  
10.34 inches for 48-hour period ending Mar 6.
- Marin Civic Center: 8.27 inches for Mar 7-11.
- Santa Rosa: 6.21 inches for Mar 7-11.
- Blue Canyon: 10.72 inches for Mar 7-11.  
7.59 inches for Mar 19-23.
- Mt. Shasta: 8.31 inches for Mar 7-11.
- Wrightwood: 7.73 inches for 48-hour period ending Mar 11.
- Napa River at Napa: Crested 6 feet above flood stage.
- Salinas River at Bradley: Crested 11 feet above flood stage.
- Russian River at Hacienda Bridge: Rose 32 feet in 24 hours on Mar 8-9.

## TABLES AND FIGURES

Table 1 provides precipitation statistics for all available reporting stations in California for January 1995, March 1995, and the cumulative totals for October 1994 through March 1995. These statistics are then presented in the form of maps (plotted and contoured) in Figures 1-9. Precipitation amounts are rounded to the nearest inch. Values for percent of normal precipitation are based on the 1961-1990 normals. Precipitation amounts for January exceeded 40 inches for four locations: De Sabla, Juncal Dam, Strawberry Valley, and Whiskeytown Reservoir. Also, four stations reported over 100 inches for October through March: Bowman Dam, Bucks Creek, Lake Spaulding, and Strawberry Valley.

Figure 10 provides contours of the reporting stations' elevations (i.e., not an actual terrain map). This illustrates the orographic effects of the California mountains, as higher elevation sites generally received greater precipitation amounts. For lower elevation areas, the heavier amounts generally fell closer to the coast. Figures 7 and 8 show nine rather distinct maximas for October through March precipitation--five in the north and four in the south. Three are over inland mountainous areas, with the remainder generally in coastal highland areas. The desert areas are also quite apparent, as some locations there received less than 10 inches for the 6-month period. However, these areas were still far above the seasonal normal.

## REFERENCES

NCDC obtained some of the information for this report from the California Department of Water Resources, the Climate Prediction Center, and the National Weather Service. We greatly appreciate their contributions. Readers can obtain additional information and data directly from NCDC (phone: 828-271-4800, fax: 828-271-4876, email: [orders@ncdc.noaa.gov](mailto:orders@ncdc.noaa.gov), www homepage: <http://www.ncdc.noaa.gov>).

\* Indicates data obtained entirely from California Department of Water Resources, not an official NWS cooperative station.

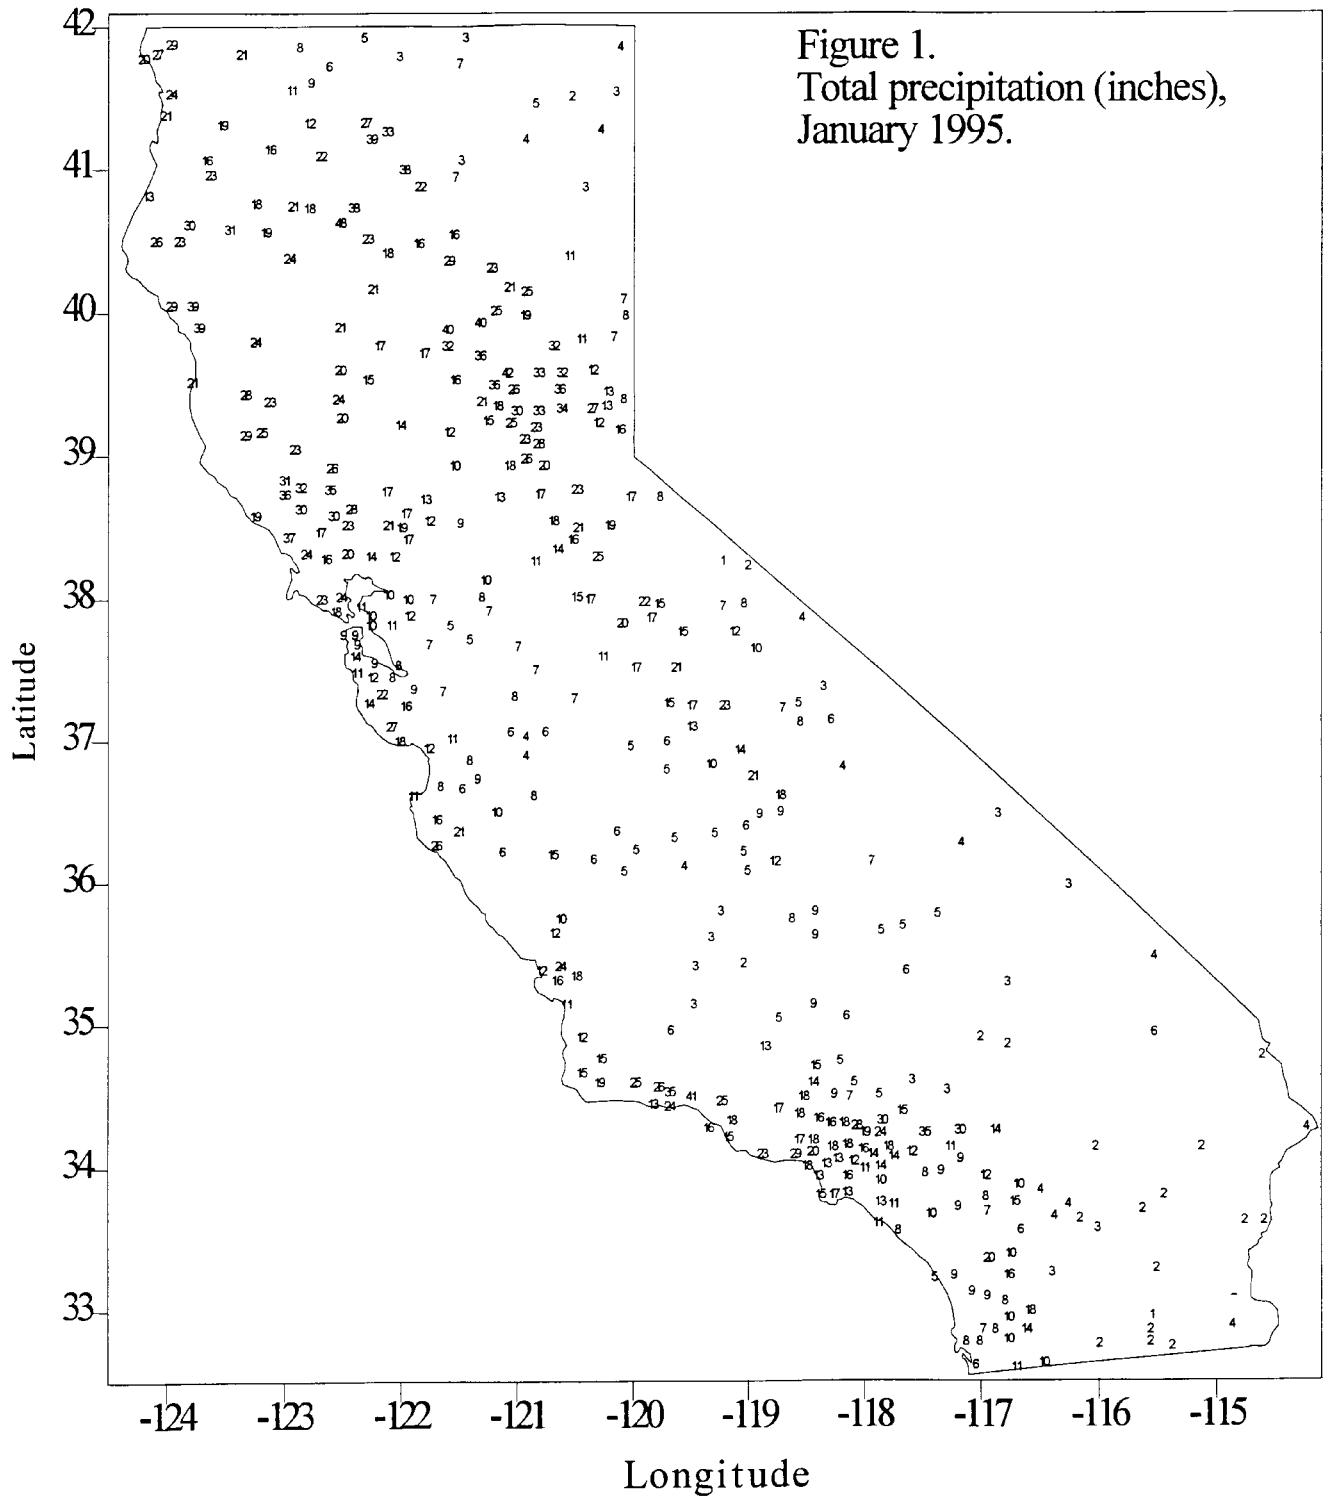

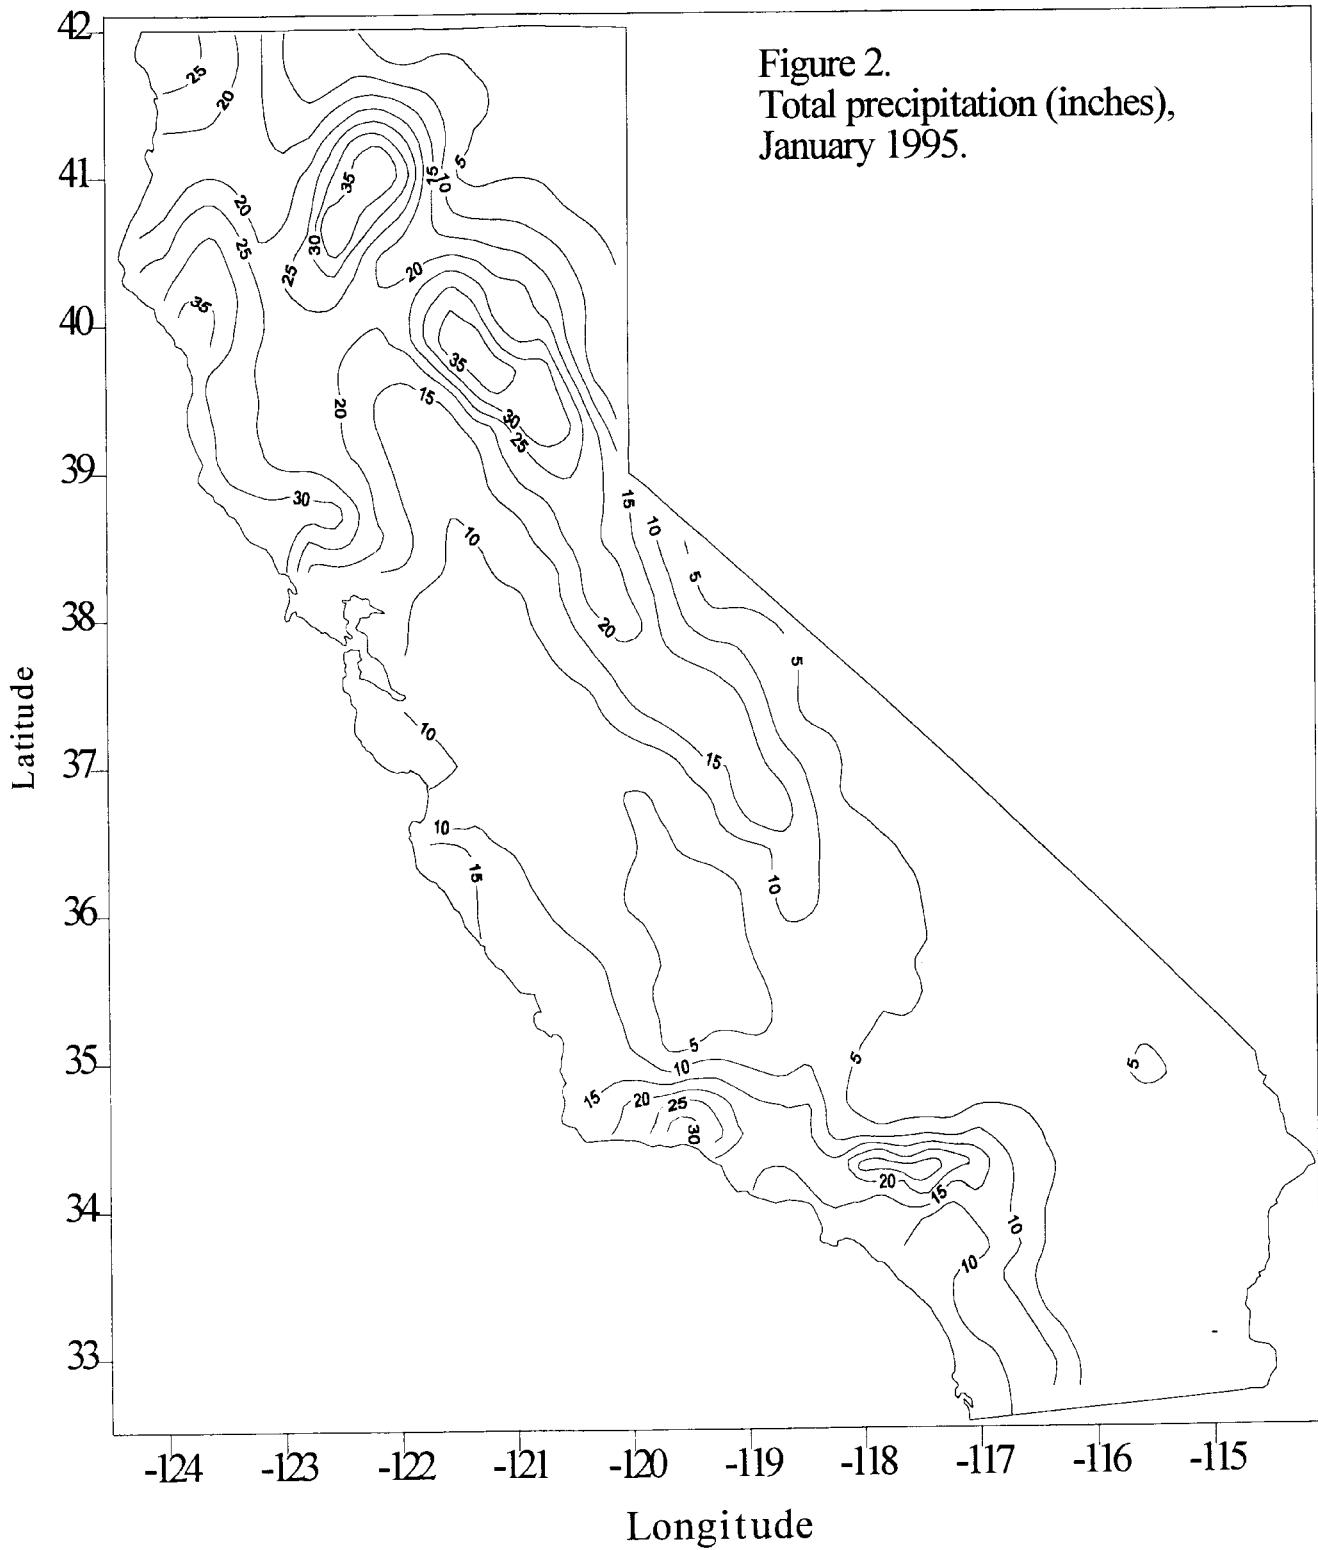

Figure 1.  
Total precipitation (inches),  
January 1995.

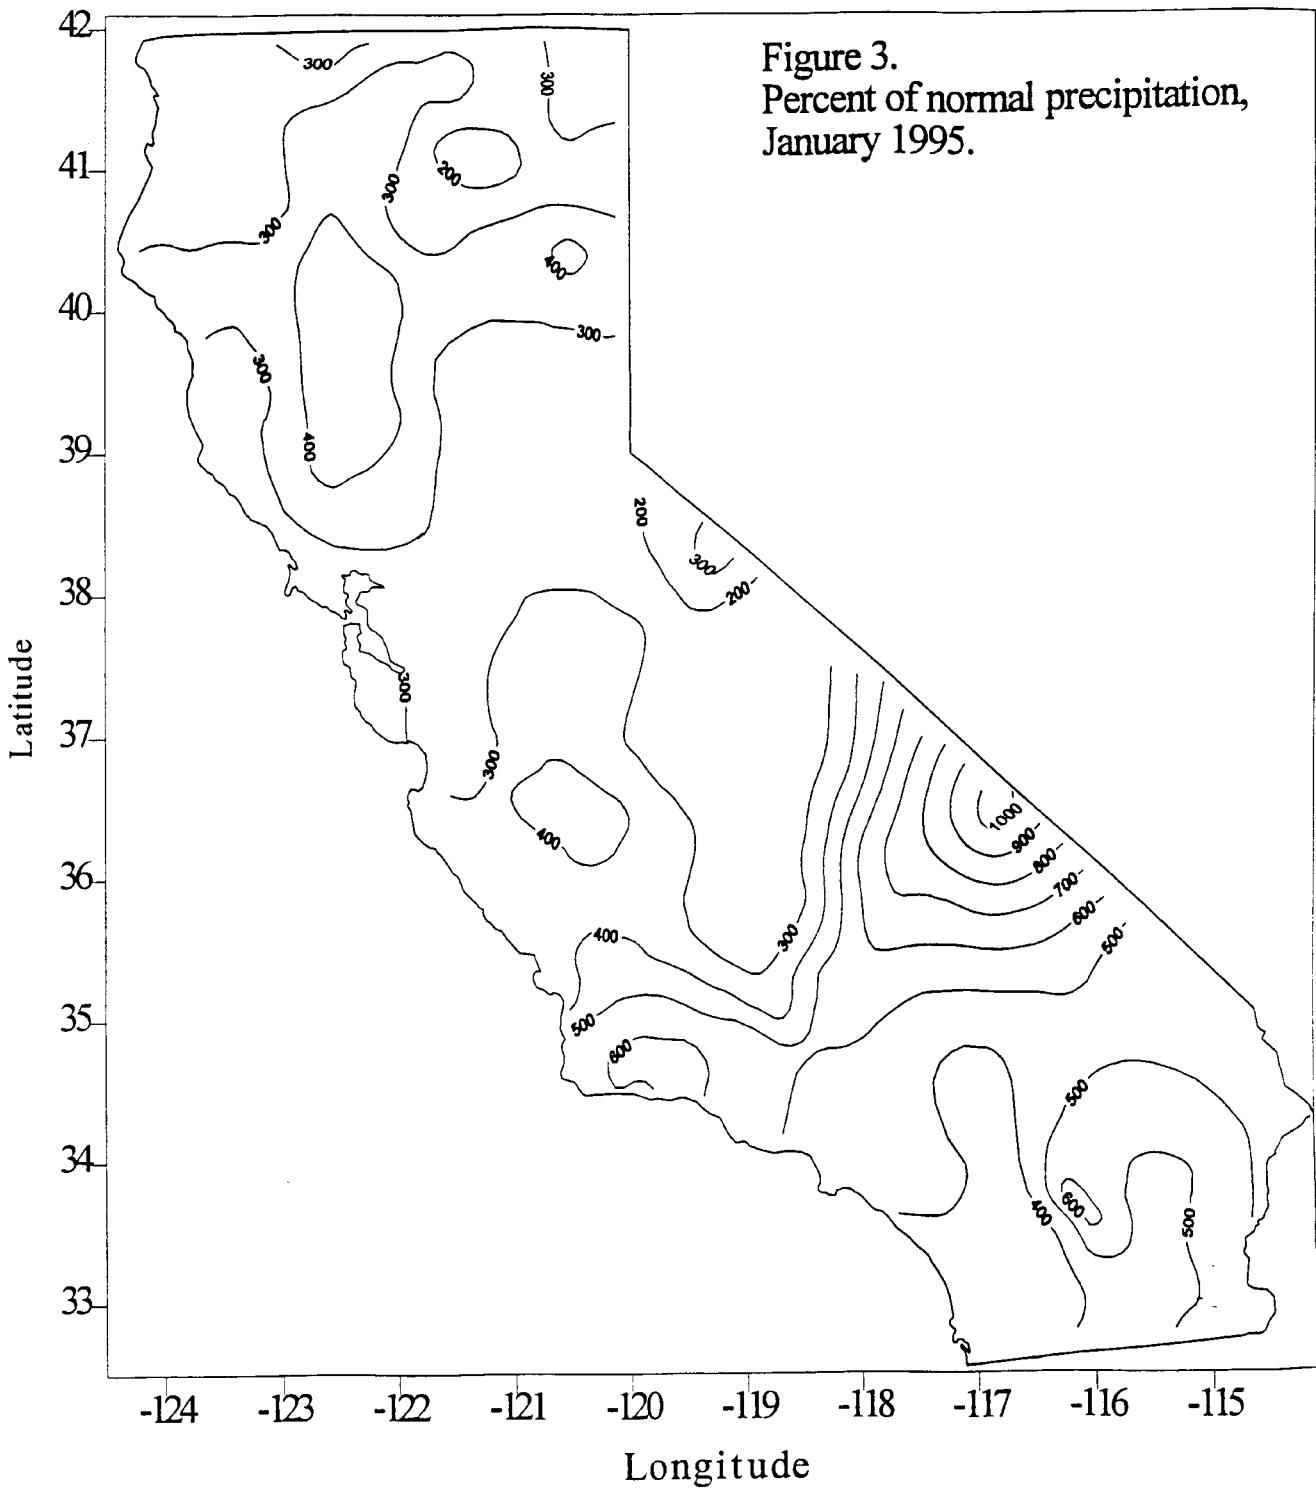

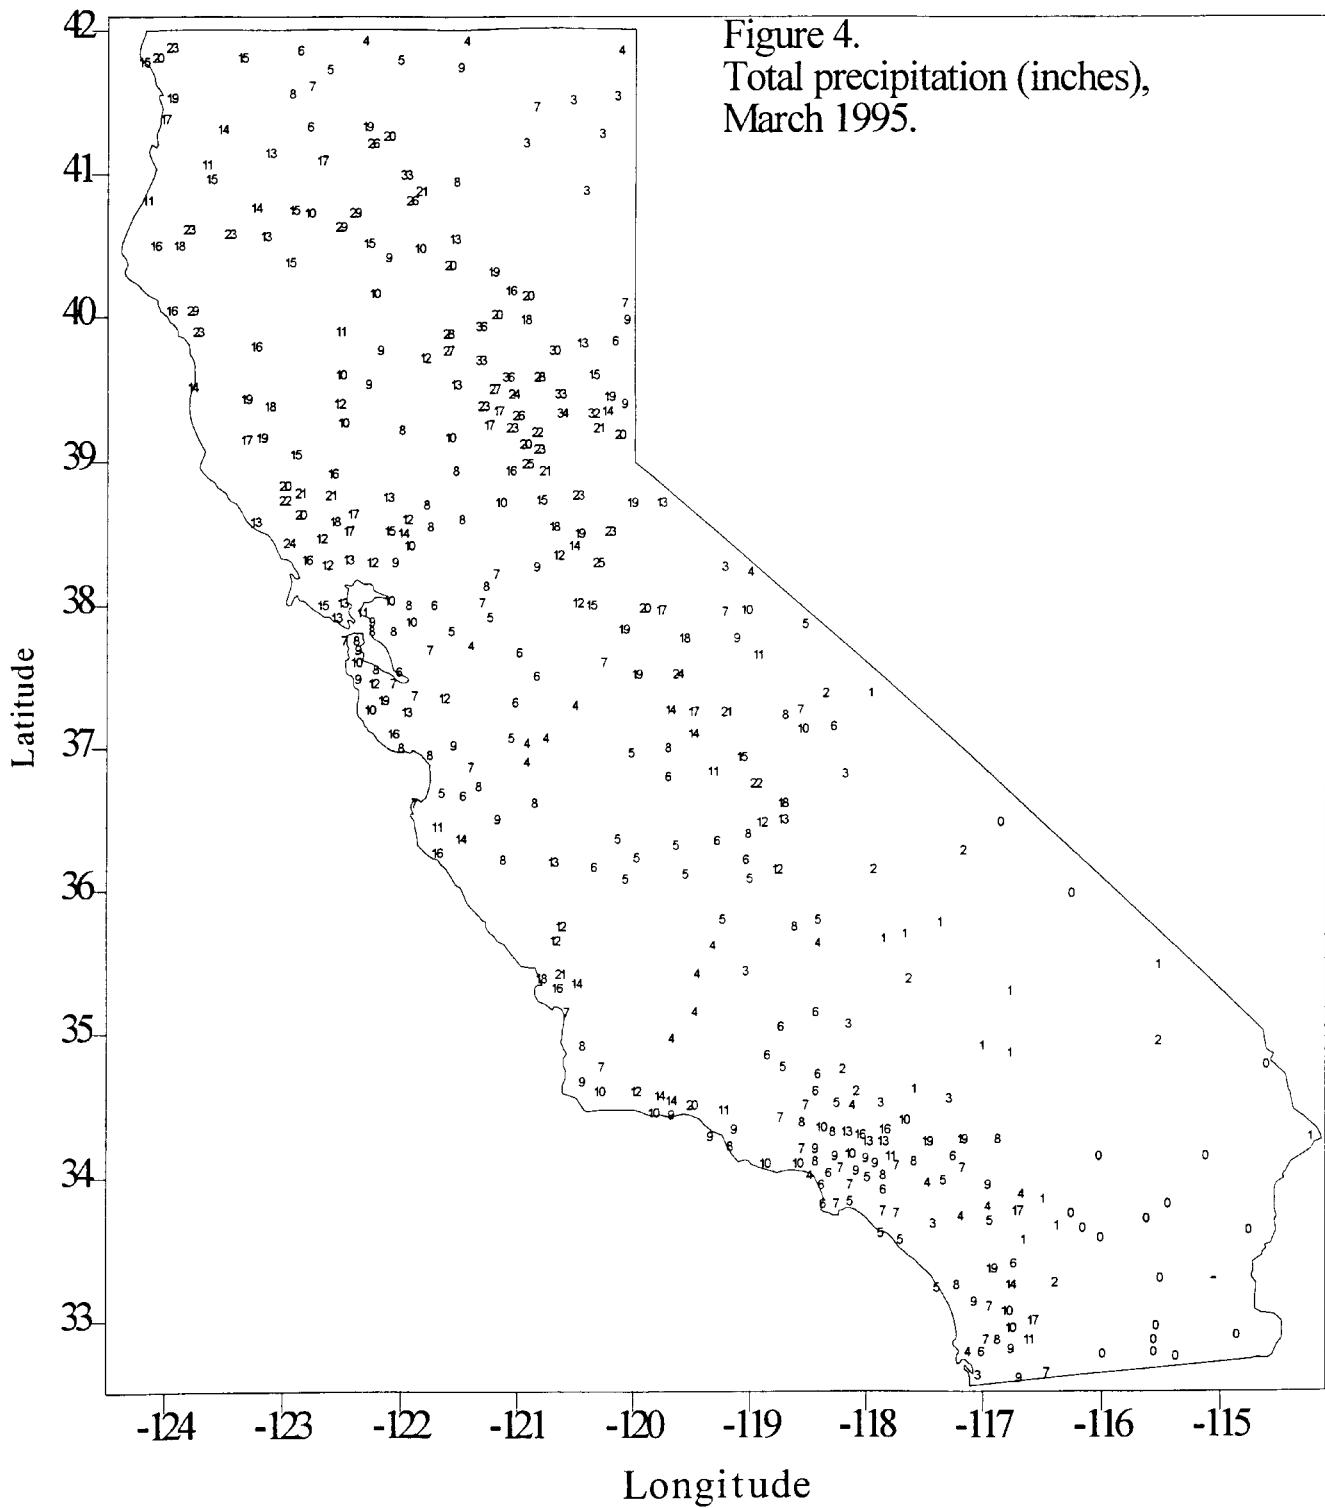

Figure 3.  
Percent of normal precipitation,  
January 1995.

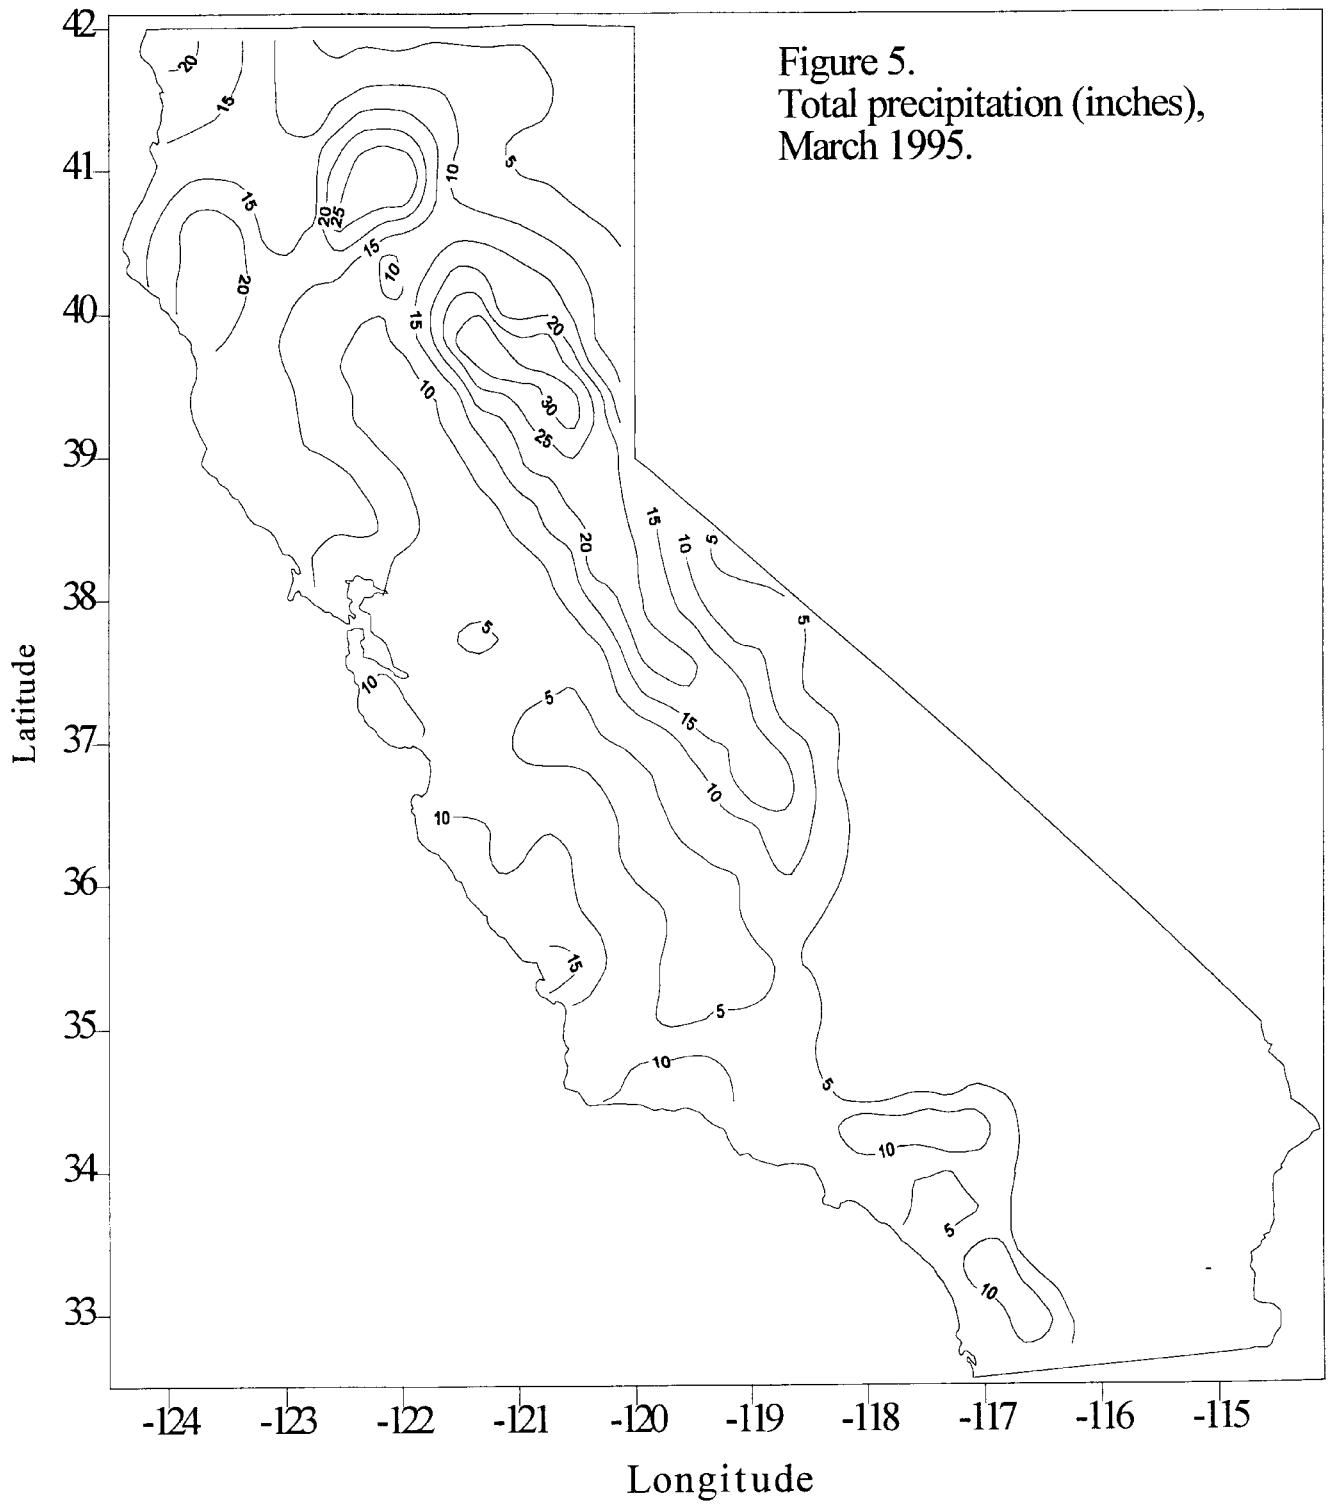

Figure 5.  
Total precipitation (inches),  
March 1995.

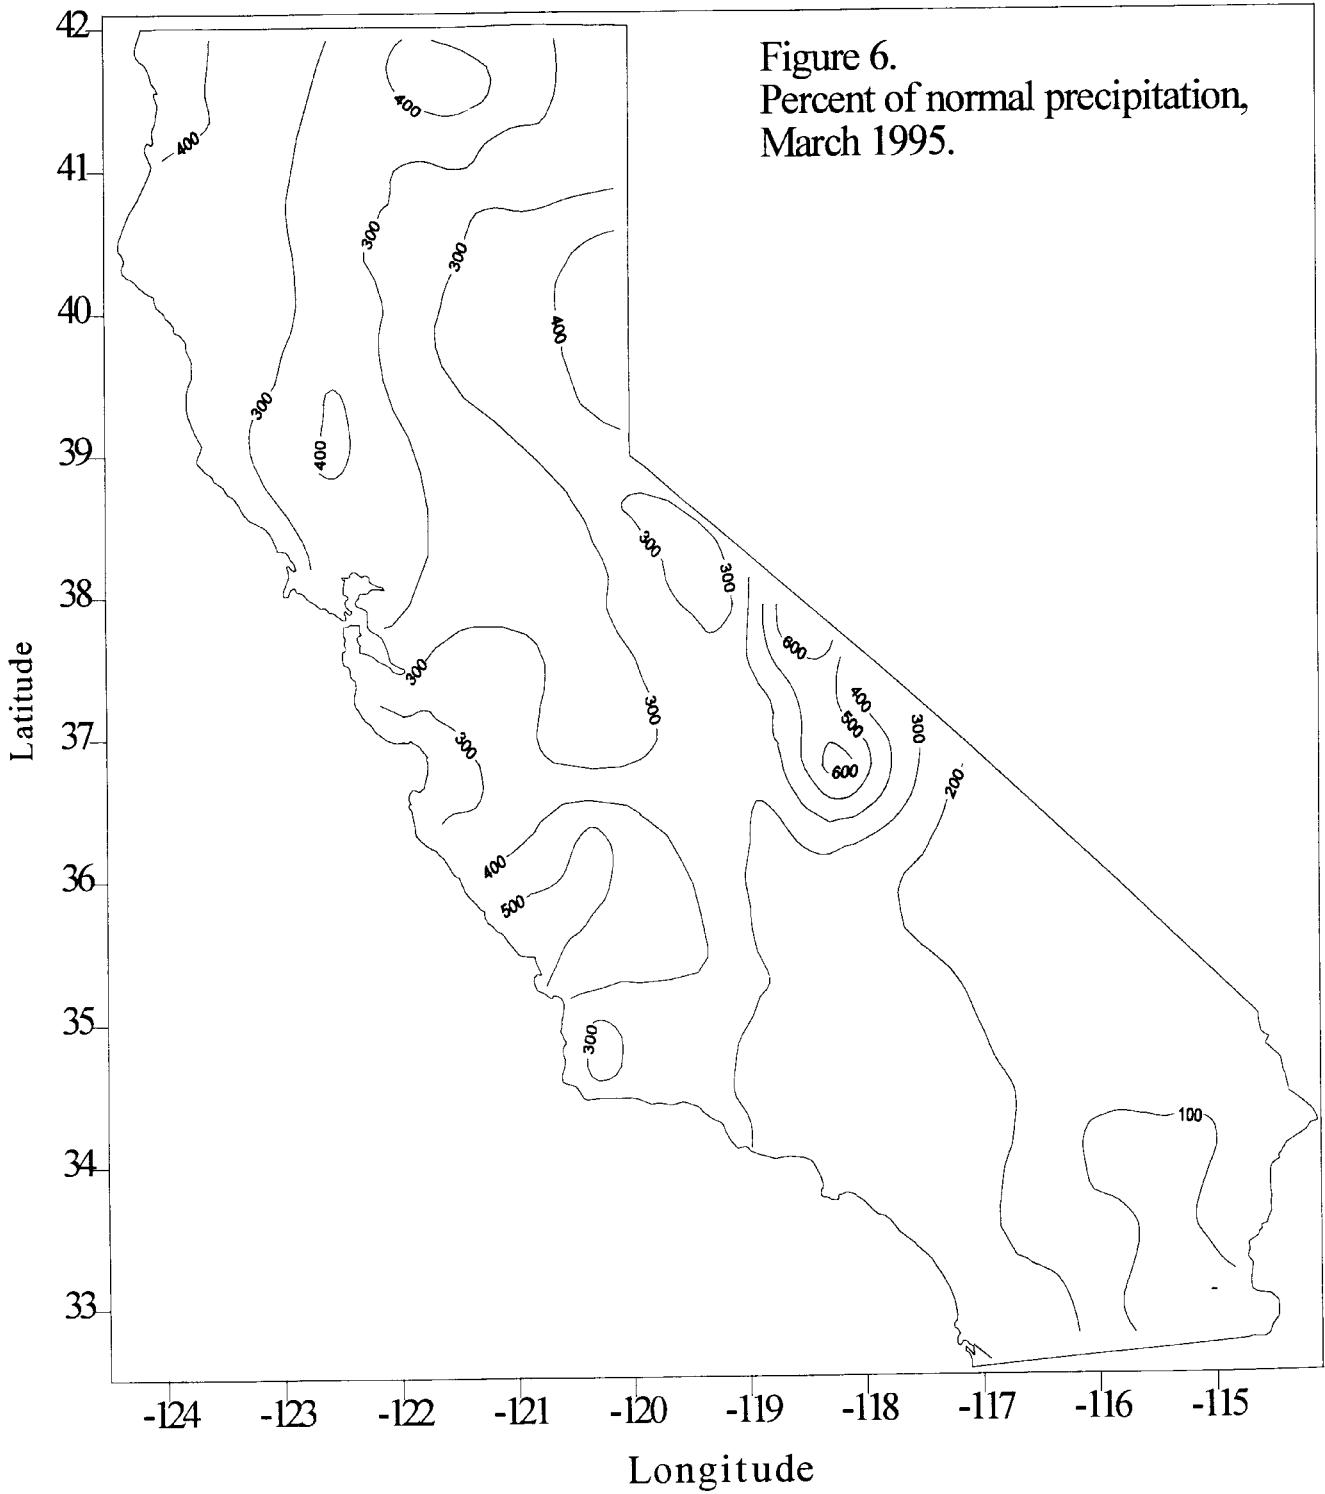

Figure 6.  
Percent of normal precipitation,  
March 1995.

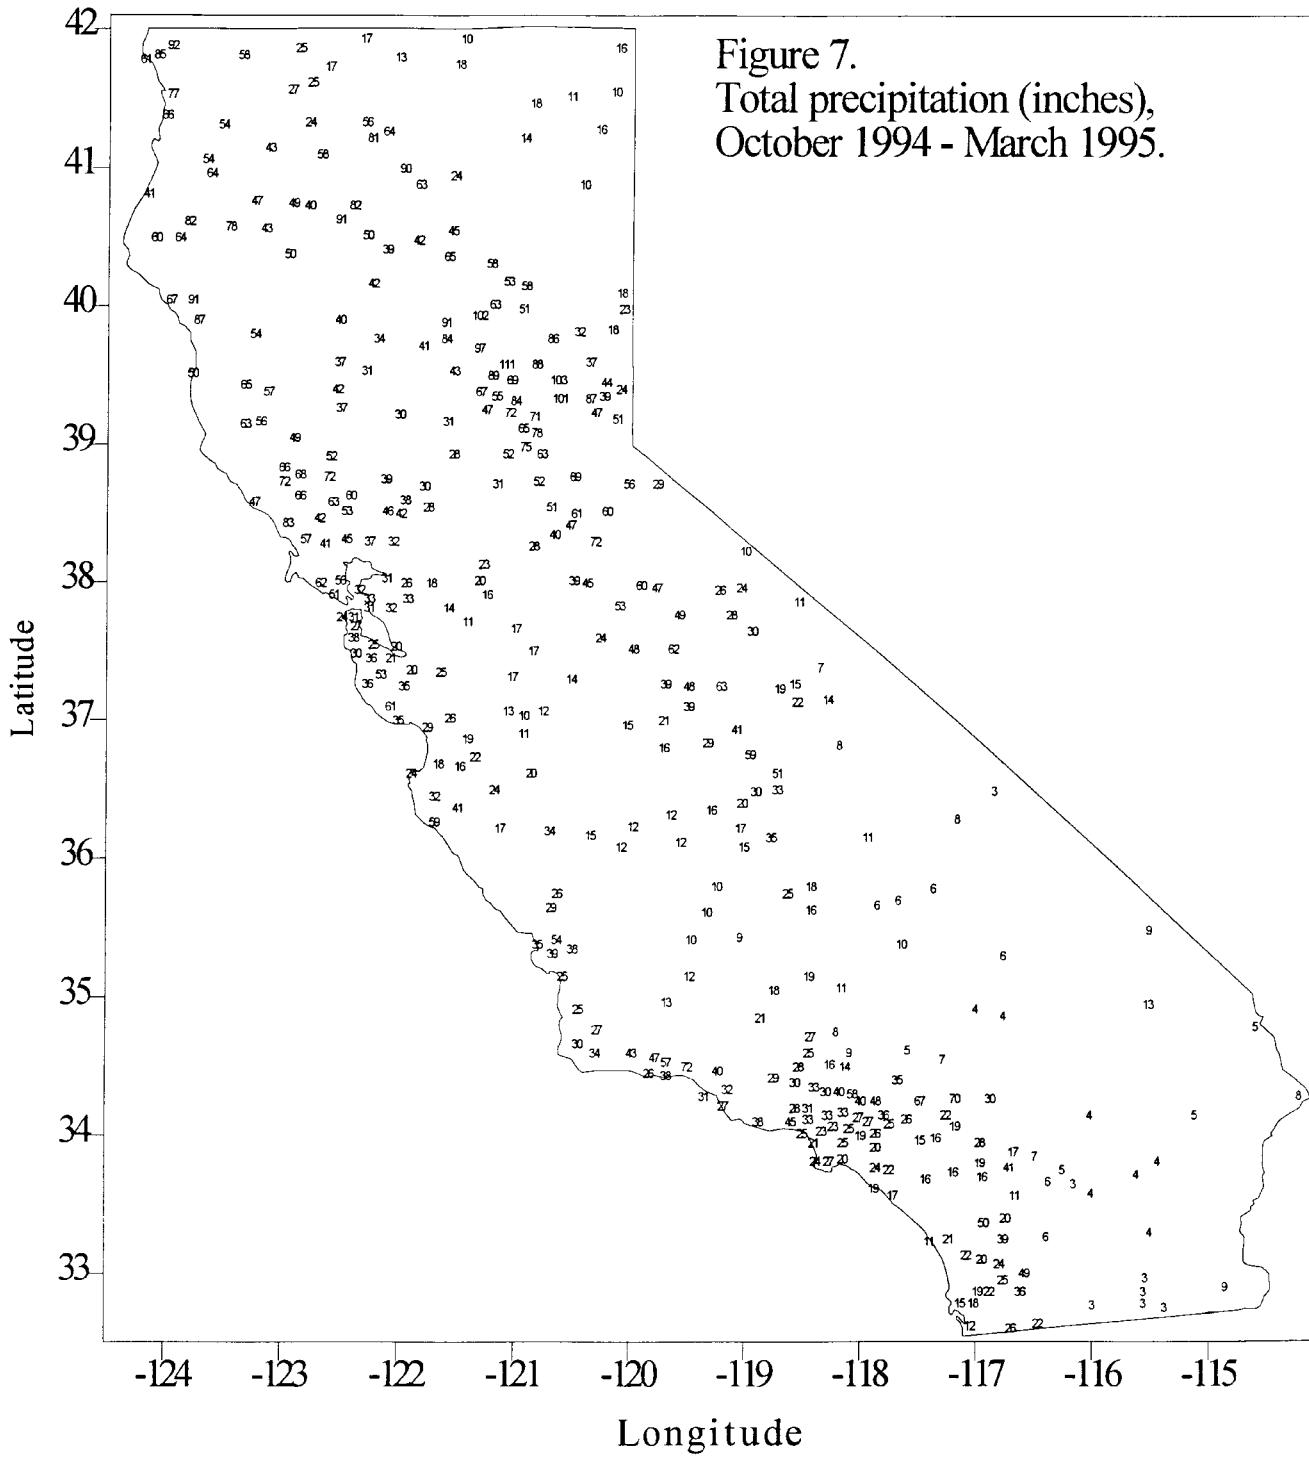

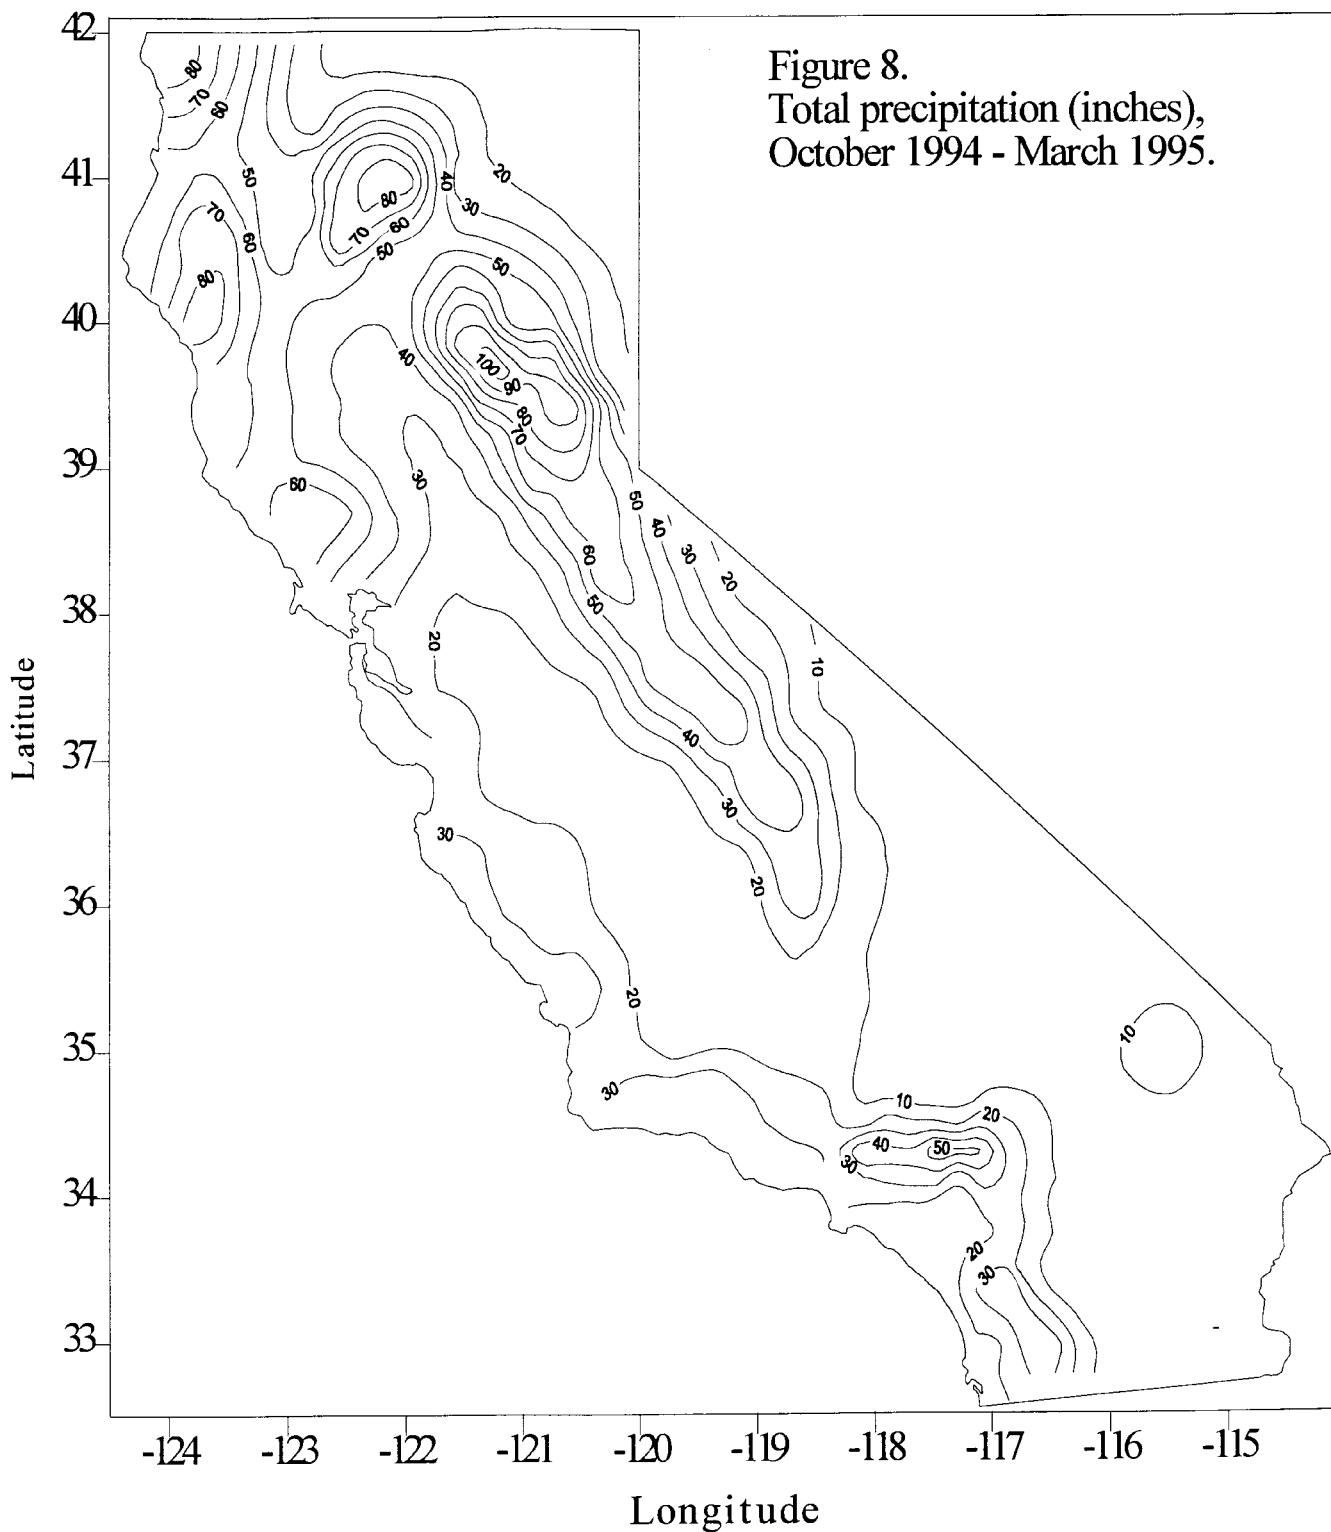

Figure 7.  
Total precipitation (inches),  
October 1994 - March 1995.

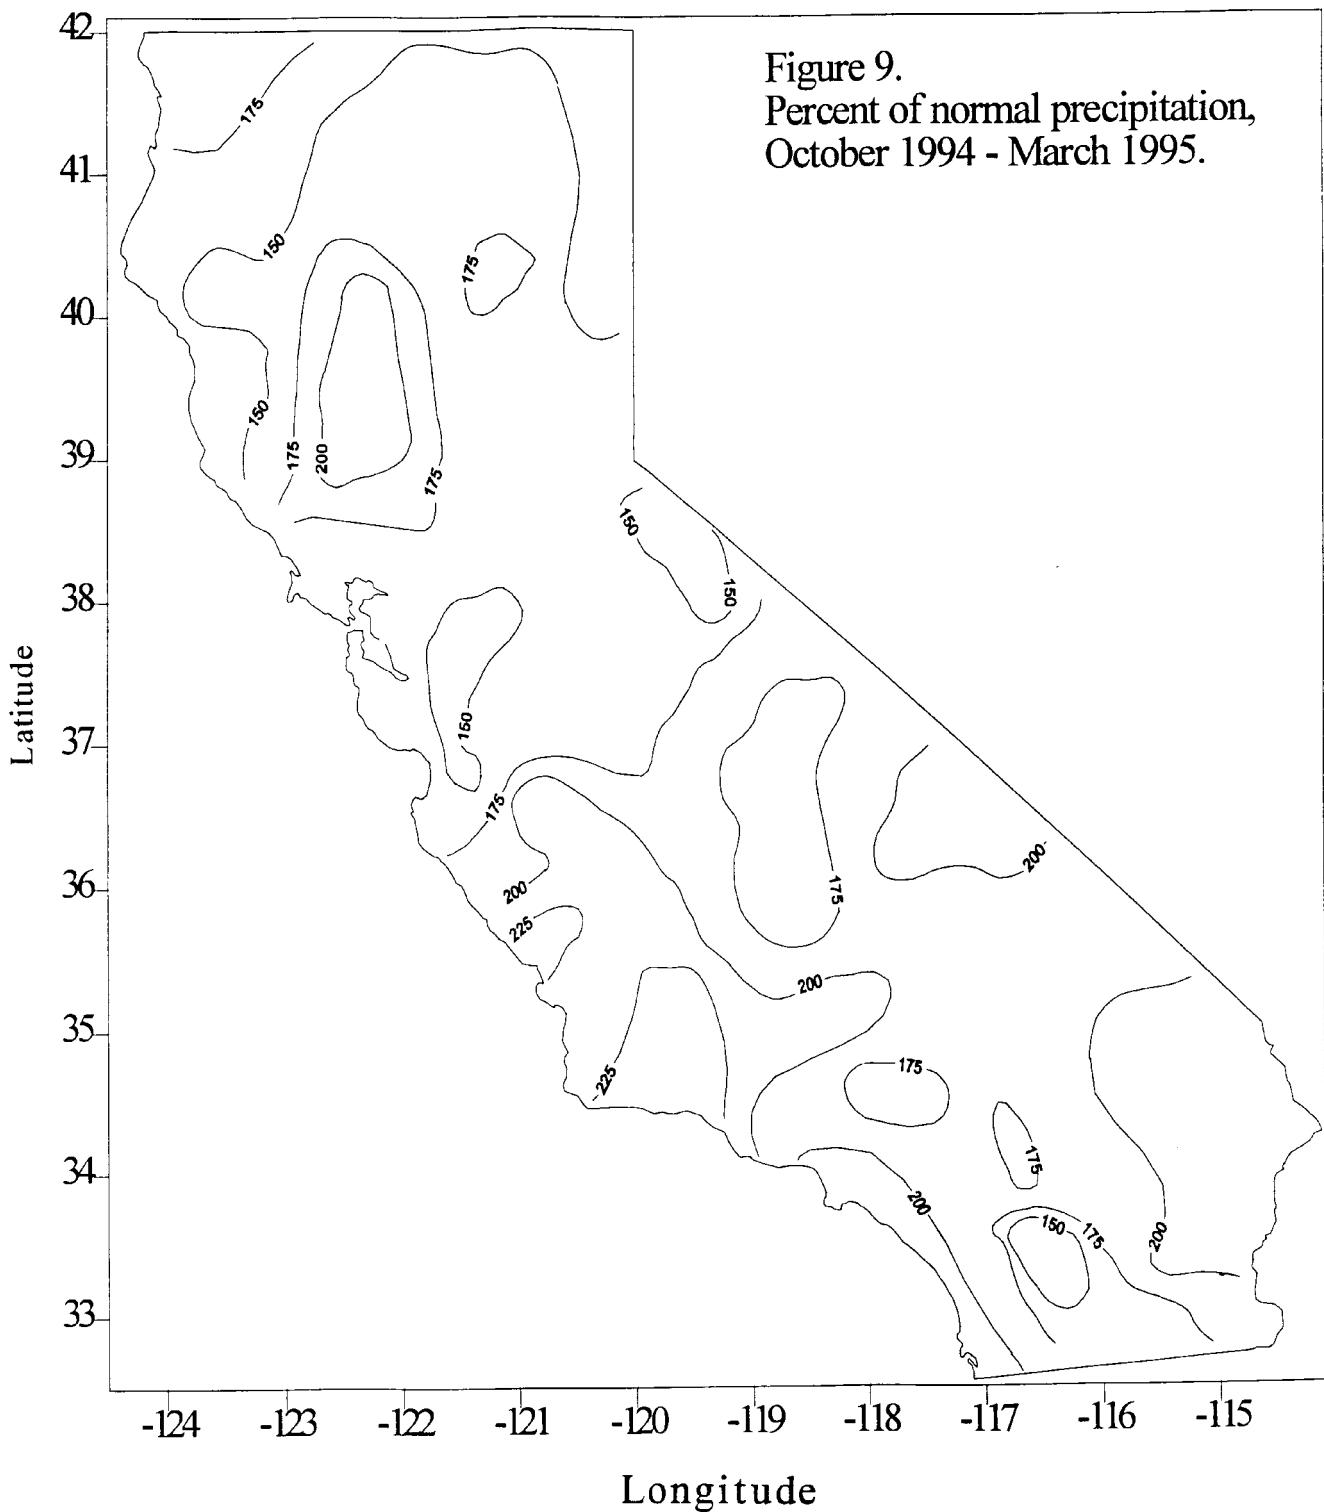

Figure 9.  
Percent of normal precipitation,  
October 1994 - March 1995.
