Public Hearing Draft

Bethel Coastal Management Plan

City of Bethel
Bethel, Alaska

February 1983

US Department of Commerce
NOAA Coastal Services Center Library
2234 South Hobson Avenue
Charleston, SC 29405-2413

The preparation of this document was financed in part by funds from the Alaska Coastal Management Program and the Office of Coastal Zone Management, National Oceanic and Atmospheric Administration, U.S. Department of Commerce. It was administered by the Division of Community Planning, Department of Community and Regional Affairs. It was prepared by the Planning Department of the City of Bethel, with assistance from Environmental Sciences and Engineering, Inc. (Chapters 2, 3, 4, and 5), and Kasprisin Pettinari Design (Chapter 4).

HOW TO USE THIS DOCUMENT

This public hearing draft of the Bethel Coastal Management program both presents information and sets down guidelines to be followed. The information presented in chapters 1 through 6 is of interest to persons living in Bethel or working on projects involving Bethel. Chapters 4 and 5 address specific areas of concern, riverfront redevelopment and wetlands, and may be of special interest to the reader.

The second function - the setting down of guidelines - is what makes this a working document. Since the plan applies to the entire city, chapters 7 and 8 are of importance to anyone developing a project in Bethel and to local, state and federal decision makers. Please note that for the purposes of this plan, the term "developer" means any individual or organization with a construction project in Bethel. If you are going to build a new house, for example, you are a developer. If you are going to put in a new commercial venture, you are a developer. If you are going to put in a new subdivision, you are a developer.

Chapter 7, the Coastal Management Plan, contains a discussion of the issues, goals and objectives of the program which will provide the reader a sense of what the plan hopes to accomplish. It contains a list of "subject uses" which identifies the kinds of developments that are subject to the

standards and policies in this plan. Also included in this chapter are the standards and policies that must be met by developments subject to this plan. The standards and policies section is the single most important part of this document: it provides the measuring sticks that decision makers will use when considering any individual project that comes up for their review.

Both developers and decision makers should be familiar with the standards and policies of this coastal management plan. Developers are urged to consider these criteria while designing their projects, as it will aid them in dealing with local (and any other) review processes.

Chapter 8, Implementation, outlines how the standards and policies will be used in the review and approval of development projects. Developers should read this chapter carefully to gain an understanding of the steps and timing of review procedures. Decision makers can use this chapter to see how coastal management policies and standards will be incorporated into their existing review activities.

Appendices and other materials are included in this draft for persons wishing detailed information on specific aspects of the coastal management program. The Planning Department of the City of Bethel also welcomes any questions the reader may have about coastal management in Bethel.

INTRODUCTION

CHAPTER 1

INTRODUCTION TO COASTAL MANAGEMENT

Coastal areas of what is now the State of Alaska have been important to people since the first inhabitants began arriving, searching for the resources to live. The early residents, few in number, were often nomadic, travelling from place to place in search of what they needed to maintain life. During recent times this has changed - permanent communities have been established. Resources are taken not only to meet local need, but to meet demands created by the growing populations of the United States and other countries.

As the demands increase, can the coastal areas continue to provide the resources? Certainly not without good management.

It was the recognition of the need for proper management, balancing supply and demand, that led to the creation of the coastal management process. The federal government enacted the Coastal Zone Management Act in 1972. This act set up a process for coordinating management between governmental units at federal, state and local levels.

The Alaska Coastal Management Act of 1977 is similar to the federal act, but also takes another step toward solving the controversy between use and non-use of the land and water of Alaska's coastal areas. By setting up coastal districts, it provides localities, such as the City of Bethel, with the opportunity to develop coastal management plans for their particular areas.

A pair of coastal districts have developed in the Yukon-Kuskokwim Delta area. The Yukon-Kuskokwim Coastal Resource Service Area was initiated in May of 1979 to develop policy for an area incorporating the Lower Yukon and Lower Kuskokwim School Districts, excluding the City of Bethel. (See Figure 1).

The Bethel City Council authorized the city's participation in the Alaska Coastal Management Program (ACMP) in 1980. Using the ACMP allows a local jurisdiction, such as the City of Bethel, to address coastal issues and provides it with the tool of "consistency." Within the context of Coastal Management, consistency refers to activity occurring after a plan is developed and accepted on local, state and federal levels. The actions of all three governmental levels must be in agreement and consistent with the accepted Coastal Management Plan.

The process for plan development and approval is lengthy and controlled by regulation (refer to A.S. 46, 40 and ACMP regulations). However, it does allow for considerable leeway in the actual issues addressed, presuming that different districts will have different needs.

Who Is Involved

There are several major participants in the coastal management process. Foremost is the local jurisdiction, the City of Bethel in this case, which produces the actual plan. Local participation is described in the chapter entitled "Public Participation." The Department of Community and Regional Affairs, Division of Community Planning provides technical assistance

and administration of planning grants. Another important participant is the Alaska State Coastal Policy Council (CPC), a sixteen member body composed of nine regional public representatives and seven state agency representatives. The major role of the CPC is to review and approve Coastal Management Plans making sure that the plans adequately address environmental concerns along with the needs of the population affected by the Plan. The CPC review also insures that the plan meets state guidelines.

The Office of Coastal Management (OCM) is staff to the Coastal Policy Council. OCM prepares information for the CPC. They also coordinate the activities of other state agencies participating in the process. A primary responsibility of OCM is the consistency review on all proposed actions in coastal areas.

Other state and federal agencies participate by reviewing and commenting on the plans and draft documents circulated to them. These agencies normally are concerned that local planning efforts take into account the needs and mandates of their agencies.

What The Process Is

The process of preparing a coastal management plan has many procedural steps that must be followed in order to insure that all interested parties have ample opportunity to participate. The steps following the publication of a Public Hearing Draft include:

1. Circulating the draft for comment, and holding a public hearing.
2. Revising the Public Hearing Draft according to the comments received.
3. City Council review and approval of the revised draft. This approval is referred to as "conceptual approval."
4. The conceptually approved draft is then forwarded to the state Coastal Policy Council. The CPC has ninety days to review the plan, hold meetings for plan discussion, and to take action either recommending changes or accepting the plan.
5. After the plan is accepted by the CPC, the City Council adopts the plan by ordinance.
6. The state adopts the plan (signaled by Coastal Policy Council approval), and forwards it to the U.S. Department of Commerce, Office of Coastal Zone Management for federal acceptance.

What the Plan Must Address

The Alaska Coastal Management Program outlines ten specific elements that have to be included for the plan to be accepted by the State (6 AAC 85.010-110).

1. Needs, objectives, and goals (6 AAC 85.020)
Bethel must include a statement of overall needs, objectives, and goals for Coastal Management.

2. Organization (6 AAC 85.030)

Bethel must include a description of the district program organization and include budgetary and staff needs and a schedule for reorganization as necessary to implement and carry out the Coastal Management Program.

3. Boundaries (6 AAC 85.040)

Bethel must map and delineate the boundaries of the coastal area within the district subject to the district program.

4. Resource Inventory (6 AAC 85.050)

Bethel must include a comprehensive resource inventory which described natural resources, land use, and land status in a manner sufficient for program development and implementation.

5. Resource Analysis (6 AAC 85.060)

Bethel must include a resource analysis sufficient in detail for program development and implementation.

6. Subject Uses (6 AAC 85.070)

Bethel must include a description of the land and water uses and activities which are subject to the district program. Uses which must be included, if applicable, are: (a) coastal management, (b) geophysical hazard areas, (c) recreation, (d) energy facilities, (e) transportation and utilities, (f) fish and seafood processing, (h) mining and mineral processing, and (i) subsistence.

7. Proper and Improper Uses (6 AAC 85-080)

Bethel's district program must include a description of the uses and activities, including uses of state concern, that will be considered proper and improper within the coastal area, including land and water use designation.

8. Policies (6 AAC 85.090)

Bethel's district program must include a statement of the policies that will be applied to land and water uses and activities subject to the district program and the process which was used to determine whether specific proposals for land and water uses and activities will be allowed.

9. Implementation (6 AAC 85.100)

Bethel's district program must include a description of the methods and authority which will be used to implement the district program.

10. Public Participation (6 AAC 85.110)

Bethel's district program must include evidence of effective and significant opportunities for public participation in program development.

In addition to the ten specified program elements, the ACMP requires, in some instances, that districts specifically address other important aspects. These include: (1) uses and activities subject to the Coastal Management Act; (2) areas meriting special attention; (3) federal consistency/federal

exclusion/ Federal agency participation; (4) uses of state concern; and (5) energy facility siting.

Other ACMP Standards

The ACMP also identified nine major uses or activities that are to be dealt with in the development of district plans. For each of these uses or activities the Alaska Coastal Policy Council has established standards which bind local districts and state agencies. They are: (1) coastal development; (2) recreation; (3) historic, prehistoric, and archaeological resources; (4) energy facilities; (5) transportation and utilities; (6) fish and seafood processing; (7) timber harvesting and processing; (8) mining and mineral processing; and (9) subsistence. (6 AAC 80.040, 6 AAC 80.060-120, 6 AAC 80.140)

The Council has set two standards which apply to all the uses and activities listed above. These policies cover: (1) geophysical hazards; and (2) air, land, and water quality. (6 AAC 80.050, 6 AAC 80.140)

The Alaska Coastal Policy Council also identified and set standards for eight major habitat types. These standards are designed to protect and reserve these habitats, regardless of the use or activity which takes place within them.

Therefore, in addition to satisfying an applicable use standard, a use or activity in a specified habitat must meet the relative habitat standard. Habitats include: (1) offshore areas; (2) estuaries; (3) wetlands and tide flats; (4) rocky islands and sea cliffs; (5) barrier islands and lagoons;

(6) exposed high energy coast; (7) rivers, streams, and lakes; and (8) important upland habitats. (6 AAC 80.130)

The guidelines and standards cited above can be obtained from the Office of Coastal Management, the Department of Community and Regional Affairs, or the City of Bethel Planning Department.

RELATIONSHIP BETWEEN BETHEL AND YUKON-KUSKOKWIM COASTAL RESOURCE SERVICE AREA

Two coastal management plans are being developed in this region: one for the City of Bethel and one for the greater Yukon-Kuskokwim Delta. (See Figure 1). The two districts have very different concerns, yet the two plans must work well together. The coastal habitats and resources in the two are a single system, in delicate balance. This balance must be recognized and accounted for in the two plans.

It is also a requirement of the Alaska Coastal Management Program that adjacent districts coordinate their plans. The City has met this requirement in several ways. Two Ceñaliulriit staff members (staff to the Yukon-Kuskokwim Coastal Resource Service Area Board) participate in the coastal management working group that has been guiding the development of the Bethel plan. Copies of all drafts and documents have been circulated to Ceñaliulriit staff and Board members for their review and comment. Meetings have been held with Ceñaliulriit staff specifically to discuss coordination of the two plans.

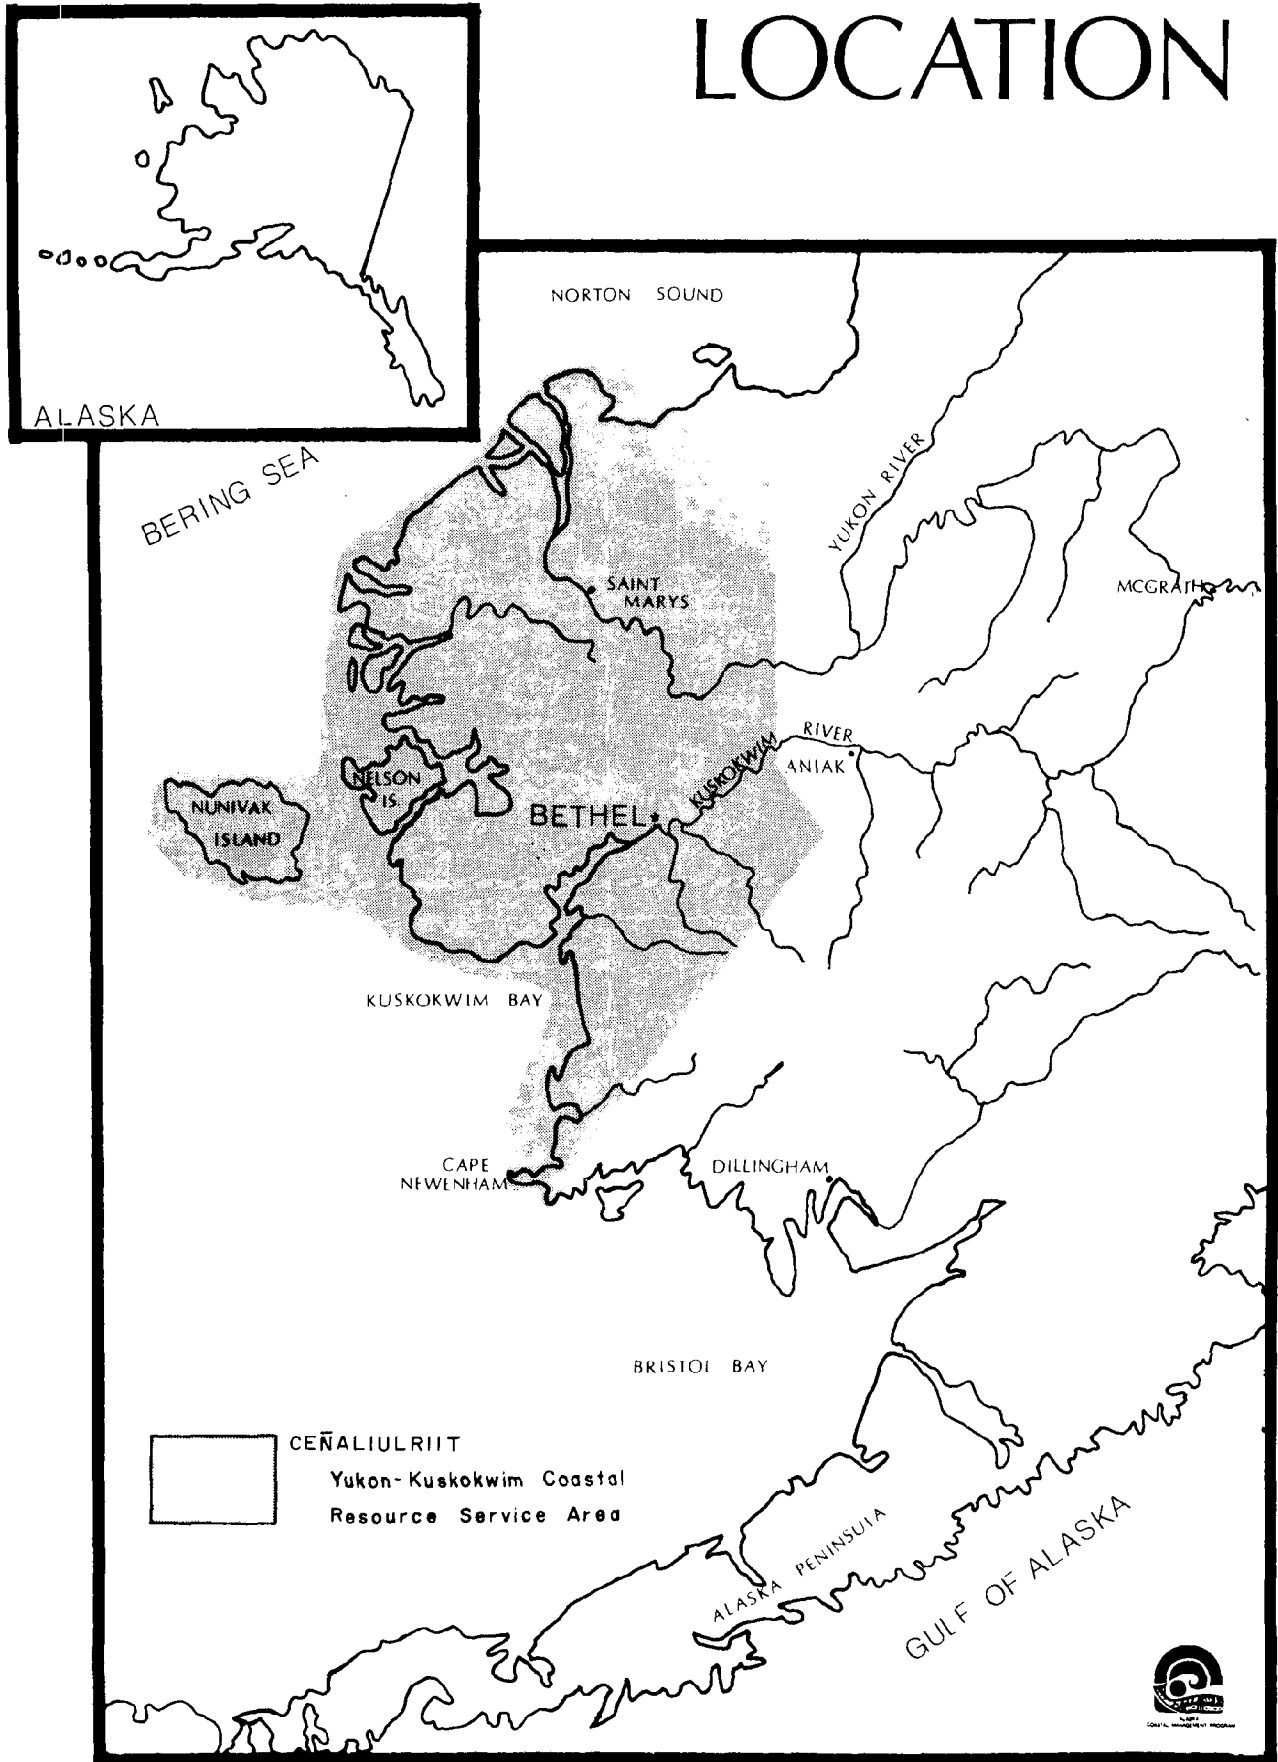

Bethel residents also have an interest in the Ceñaliulriit plan, particularly since most subsistence activities take place outside the city limits. For this reason, both the City and Ceñaliulriit plans are recommending that a special management district be established for the area used most heavily by Bethel residents for subsistence. This district, referred to as an Area Meriting Special Attention or AMSA, is discussed more fully

in Chapter 6 of this document. Briefly, it would run along the Kuskokwim River from the Johnson River on the south to the Gweek River on the north.

Also, the City will be participating in the public review process for the Cēnaliulriit plan, which is now out in Public Hearing Draft form.

FIGURE 1

LOCATION

RELATIONSHIP BETWEEN COASTAL MANAGEMENT AND COMPREHENSIVE PLAN

The City of Bethel 1980 Comprehensive Plan and the Coastal Management Plan serve complimentary purposes. The Comprehensive Plan, through a survey process, identified problems and alternative solutions. In general, these problems and solutions have not dealt directly with resource management or the lay of the land. The coastal management process provides an opportunity to broaden the community's planning base and the ability to move towards managing and protecting important environmental aspects while recognizing development needs.

The Bethel Coastal Management Plan is intended to build on the framework of the Comprehensive Plan and to compliment it.

Development issues facing the Bethel community, as defined by the Comprehensive Plan, include:

- . continued development of social services
- . improvement of general housing conditions, water/sewer service, energy efficiency
- . senior citizen activity and care
- . preservation and improvement of community aspects relating to subsistence activities
- . increase of park and playground areas
- . city regulation of land use
- . subdivision and zoning regulations
- . clean-up and repair of hazard areas, including roads, old buildings, and the riverfront
- . concentration of industrial activities

- . building of a small boat harbor
- . development allowing a continued cultural identity and opportunity to mix traditional and modern activities.

Through the coastal management process the City of Bethel will receive recommendations on additional planning and regulatory elements. These include:

- . riverbank erosion control measures, access and use controls
- . land use controls, with review of environmental, density, and service delivery concerns
- . sewage and garbage disposal measures
- . provisions for improved techniques dealing with dust and windblown sand resulting from development
- . controls on surface water drainage
- . development of transportation and circulation elements, including city roads, trails, and pedestrian walkways.

The coastal management program represents a refinement of planning issues facing the Bethel community. It is not a substitute for the Comprehensive Plan, but an addition to the Plan.

BOUNDARIES

The guidelines for District Coastal Management Programs adopted by the Alaska Coastal Policy Council state that "initial boundaries must be based on Biophysical Boundaries of Alaska's Coastal Zone"... "and must include the zone of direct interaction and the zone of direct influence." (6 AAC 85.040)

All of the City of Bethel lies within the coastal area as defined in the Biophysical Boundaries. Since the municipality exercises jurisdiction over the entire city in other matters, it was decided to use the same boundaries for the coastal management plan. Thus the coastal management boundaries include the entire city limits, as shown below in Figure 2.

The study area use in the resource inventory and analysis is larger than the planning area. It encompasses the resources of freshwater and terrestrial environments that are important to Bethel in terms of potential economic development and resource planning.

Bethel's function as a regional center will play an increasingly important role with the development of economic activities such as forest development in the middle Kuskokwim area, mining and on-shore oil development and the expansion of the commercial fishing industry. Although the City of Bethel cannot regulate any development beyond the city limits, an understanding of the region's resource base is vital to local planning, and will allow greater coordination with the regional

coastal management plan. Areas of particular importance to the city residents that lie outside city boundaries are discussed in Chapter 6, which proposes the creating of a special management district (AMSA) for the Bethel subsistence use area.

FIGURE 2

RESOURCE ASSESSMENT

CHAPTER 2

NATURAL RESOURCES

CLIMATE

Bethel is located in a transitional climate zone. The major influences on climate are the storms and weather patterns originating from the Bering Sea, 86 miles to the west. Bethel is also influenced by the inland continental climate, resulting in the warm mid-summer temperatures and the very cold midwinter temperatures. Bethel has a mean July temperature of 54.7° F and a mean January temperature of 6.0° F, with recorded temperature extremes ranging from

90° F to -52° F. The warmer summer winds are predominantly SSW, shifting to a cool NNE winds from October through March, then shifting to predominantly NW winds from April through June. Bethel has an average growing season of 101 days, the average last freezing temperature being recorded on May 30 and the average first freezing temperature being recorded on September 9. Detailed climatic data for Bethel is recorded in the following tables and figures.

SOILS, PERMAFROST AND GEOLOGY

Soils

The most recent soil survey of the Bethel area was completed in 1966. The total map area is 11,465 acres (including 1020 acres of water area), or about one-third of the area within the city limits. Most Bethel soils are silty, acidic, poorly drained, have a low shrink-swell potential, and have variable to high frost action. Most soils are not suitable for agricultural or urban uses. Figure 4 illustrates the Bethel soil survey map and table 3 summarizes the characteristics of each soil type. Figure 5 depicts the soil areas suitable for urban development. Urban suitability was determined by evaluating a combination of soil characteristics including: internal drainage, bearing capacity, and subjectivity to ponding and flooding.

Permafrost

Permafrost is defined as: 1) permanently frozen material underlying the solum (upper soil horizons), or 2) a permanently frozen soil horizon (Brady). Permafrost underlies most of Bethel but is absent from localized areas close to large water bodies. The permafrost begins 12 to 40 inches below the surface, has an average depth of 400 feet, and a

maximum depth of 600 feet. The temperature of the permafrost at depths just below the one of seasonal variation ranges from -5°C to -1°C (23° to 30°F).

Geology

The geology beneath Bethel is very young, composed almost entirely of flood plain alluvium and silt deposits (Figure 6). Northeast of Hanger Lake is an area of reworked silt. Flood plain alluvium is composed of recent deposits of mud, silt, sand, gravel, boulders, and intermixed wood, peat, and other vegetal material. Silt deposits contain abundant permafrost, and are composed of organic "mulch" which becomes sandier with depth and contains areas of pebbles and wood fragments. Silt deposits probably originated from the river but some areas may include wind and marine deposits. Reworked silt is a plain, transitional with or slightly above younger flood-plain deposits and separated from older silt deposits by an erosional scarp 10 to 50 feet high. The scarp suggests that the plain is an erosional feature formed by dissection and almost complete removal of the upper part of older silt deposits (U.S.G.S).

GEOPHYSICAL HAZARDS

Natural phenomena such as flooding, erosion, volcanoes, earthquakes, and tsunamis are called geophysical hazards. The most predominant hazards in the Bethel area are flooding and erosion. Earthquakes and tsunamis near Bethel are possible, but not a real concern. The nearest volcano is 250 miles southeast, on the Alaska Peninsula.

Flooding

The primary cause of flooding in Bethel is ice jams. The magnitude of the flood is influenced by several factors including snowmelt, winter and spring temperatures, precipitation, and ice thickness. The greatest flooding usually occurs in the spring when a thick river-ice buildup experiences rapid warming before breakup. Flooding is also common in late summer and early fall when Bethel experiences its heaviest rainfall of the year.

Most of the developed part of Bethel is located within the 100-year flood plain (Figure 7). 80% of the major residential and commercial areas have been inundated by floods in the past. The lower Brown Slough area and Louse-town are flooded to some degree almost every year.

A major flood can create a maximum river velocity of ten feet per second (f.p.s.), as compared to an average velocity

Riverbank Erosion

Documentation of the Bethel riverbank erosion began in 1939. Erosion now averages eight feet per year along the town front and twenty-five feet per year in front of the old PHS hospital and the Chevron tank farm. The channel on the east side of the island in front of Bethel is becoming the main channel of the river. The erosion rate should increase in the east channel and decrease in front of Bethel. Figures 8 and 9 depict the projected erosion advance of the Kuskokwim based on a decreasing erosion rate and the historic erosion rate.

The bank erosion process begins when wind and boat traffic drive waves into the bank, eroding the toe. The southeast exposure to the sun and rain along the high bank melts the permafrost and saturates the soil. The soil saturation combined with the toe erosion creates bank instability, which results in the bank sliding into the river. The eroded material is carried away by the river and exposes more of the bank to the erosional process. Erosion is further compounded by removal of vegetation along the top of the river bank and ice gouging.

Bank Stabilization Efforts

Past bank stabilization efforts have included a timber bulkhead, submarine netting, and the infamous junked cars. All past efforts have failed and many buildings have been destroyed, with many more in immediate danger. The U.S.

The preparation of this map document, etc. was financed in part by funds from the Alaska Coastal Management Program and the Office of Coastal Zone Management, National Oceanic and Atmospheric Administration, U.S. Department of Commerce, administered by the Division of Coastal Planning, Department of Community and Regional Affairs.

Army Corps of Engineers Bank Stabilization Study recommended three alternatives for further study: 1) Articulated concrete mattress, at a cost of \$20,300,000 and estimated maintenance costs of \$600,000 every five years over the fifty year lifespan; 2) Rock riprap, at a cost of \$11.9 million and maintenance costs of \$250,000 every five years over the fifty year lifespan; 3) River diversion structure with bank stabilization, at a cost of \$17.7 million and no estimate of the maintenance costs. Other options that were rejected because of expense, public acceptance, or engineering feasibility included; steel wall with articulated concrete mattress toe protection, steel wall and sloped bank, river diversion dike, river diversion channel, and a nonstructural alternative of intensive riverfront land use management. The City of Bethel has immediate plans for construction of steel cells and a seawall at the Chevron tank farm and expanding the seawall at the general cargo dock. The city plans to stabilize the remainder of the bank between the general cargo dock and the tank farm with a combination of steel bulkhead and articulated concrete mattress. Total estimated expenditures between 1981 and 1990 for bank stabilization is close to \$30 million (Galliett and Silides).

Onshore Erosion

The primary cause of onshore erosion is improper construction of buildings and roads. Many buildings are

constructed on sandpads, and in the past water erosion and ponding problems have resulted from little consideration of natural drainage when siting buildings. Road construction has resulted in similar drainage problems. Road and building construction also often results in a large quantity of unconsolidated sand and silt. The sand and silt clogs culverts and drainage pipes and is picked up by the wind which aggravates the dusty air conditions common in Bethel during the summer.

Earthquakes and Tsunamis

Although Bethel is located 300 miles from the Aleutian Islands, one of the most seismically active areas in the world, little seismic activity is noticeable in Bethel. The nearest known major geologic fault is in the Kuskokwim Mountains, 100 miles to the southseast. Alaska Regional Profiles identifies the region surrounding Bethel as having a moderate potential (4.5-6.0 magnitude) for damage to buildings by earthquake. The Great Alaska Earthquake of 1964 was felt very strongly in Bethel, although the epicenter was over 400 miles to the east (James Hoffman).

Tsunamis (seismic sea waves) are common in the Aleutian Islands but rarely impact western Alaska. The Kuskokwim River at Bethel does have a small tidal influence, so theoretically a large tsunami directed at Kuskokwim Bay could be felt in Bethel. However, the probability is very low.

HYDROLOGY

The Kuskokwim River

The Kuskokwim River begins in the glaciers of Mt. Foraker, in the Mt. McKinley National Park. The river flows 540 miles to its mouth in Kuskokwim Bay. Near Bethel, the river meanders extensively forming ponds, sloughs, and oxbow lakes. Severe erosion problems are caused by the river constantly changing course (refer to Geophysical Hazards section). The river is very murky because of a high glacial flour concentration. Table 6 summarizes physical characteristics of the river.

TABLE 6

Physical Characteristics of the Kuskokwim River at Bethel

Length	540 miles
Total Drainage Area	50,000 sq miles
Drainage Area Upstream From Bethel	42,800 sq miles
Summer Discharge Range	50,000-200,000 c.f.s.
Average Discharge	60,000 c.f.s.
Maximum Spring Flood Discharge	600,000 c.f.s.
Velocity (During discharge of 95,000 c.f.s.)	High Tide - 0.8 f.p.s. Low Tide - 2.2 f.p.s.
Temperature Range	32° F to 44° F
Average Freeze-up Date	October 29
Average Break-up Date	May 15

The Kuskokwim River has an average diurnal tidal range of five feet. The maximum tidal effect is felt when the river discharge is lowest. The maximum tidal range is estimated at +7 MLLW (Mean Lower Low Water) to -3 MLLW. As the river discharge increases, the tidal range decreases, until the tidal effect disappears when the river discharge reaches the magnitude of a twenty-year frequency flood.

Drainage

The natural drainage system on which the developed portion of Bethel is located is known as Brown Slough (technically a stream). The general direction of drainage is from the north and northwest throughout the city and emptying into the Kuskokwim River. Several other tributaries of a shorter length flow into the Kuskokwim, but, with the exception of Lousetown Slough, do not drain the developed area.

Approximately two-thirds of this area within the city limits is a low profile undulating topography. No dominant

stream system has been able to develop due to topographic conditions and the presence of permafrost. Thus, the entire area is imperfectly drained and is characterized by numerous potholes (384 according to a 1977 U.S. Geologic Survey Map). The remaining one-third of Bethel's corporate area is fresh-water marsh. This includes land both north and south of the river bend.

Within the developed area of the City, the combination of localized irregular topography, saturated soil, permafrost and near level position with the river results in extensive areas of standing water. The surface water problem will expand as development continues over time, being influenced by increasing amounts of impervious cover and land alteration which can interfere with surface flow. Large scale maps (1":100') have been prepared for the City to illustrate local drainage direction.

Groundwater

All of Bethel's potable water is supplied by groundwater. The water that is extracted from the wells is very cold and water supplied by the city is treated with chlorine. Almost all of the successful wells must drill below the permafrost before an aquifer is found. Location of recharge areas and estimates of aquifer size are very difficult due to the presence of the permafrost.

HABITATS

Habitats in the Bethel planning area which are subject to the Alaska Coastal Management Program are wetlands and tideflats; rivers, lakes and streams; and uplands. These habitats are depicted in Figure 10. These habitats support a wide range of terrestrial and aquatic life forms, and therefore should be managed in a manner which maintains or enhances the physical and biological characteristics of these habitats. A brief discussion of the habitat types follows.

Wetlands and Tideflats

A recent field study conducted by the Bethel City planning staff, Environmental Science and Engineering and the U.S. Army Corps of Engineers determined that almost the entire area found within the Bethel city limits was technically wetlands. Based on this study, two groups of wetlands were identified; significant wetlands and nonsignificant wetlands. The significant wetlands include streamways and areas subject to periodic inundations. The nonsignificant wetlands include areas that are not subject to flooding and are better drained. Wetlands are characterized by tundra vegetation such as grasses, sedges, herbs, and mosses; and by freshwater flora such as diatoms, algae and

seed plants. Wetlands are extremely important to resident and migratory bird species for resting, nesting, rearing, and foraging areas. They also provide habitats for furbearers such as fox, hare, weasels, mink, muskrat, beaver, and other mammals like lemmings and voles. Wetland habitats can be easily disrupted by urban development, thus careful management of these areas is essential.

Rivers, Lakes, and Streams

Rivers, lakes, streams and other freshwater habitats such as sloughs and the shallow tundra lakes and ponds are well represented in the Bethel planning area. The Kuskokwim River system provides a migration route and important spawning, feeding, rearing, and overwintering habitats for resident and anadromous fish species. The riparian and high brush vegetation types bordering the rivers and sloughs provide habitats for waterfowl, game birds, and several species of passerines. Small furbearing animals associated with the aquatic environments are beaver, muskrat, mink, and land otter.

The shallow tundra lakes are abundant throughout the planning area and are integral with the freshwater wetlands. Diatoms, blue green algae, and both submerged and emerged forms of aquatic seed plants occur in these habitats, providing important feeding areas for fish populations. These habitats are equally important to waterfowl, shorebirds, and various animals as resting and foraging areas.

Uplands

The wetlands study found that those areas not technically qualifying as wetlands, based on examination of soil characteristics, hydrology and vegetation type, were extremely small sites (usually no more than a few hundred square feet) found on south facing slopes in the nonsignificant wetland area. Plant life is less dense and a predominance of lichen is found in these areas. No species exclusively adapted to uplands are found in the areas except on a seasonal basis, i.e., snowshoe rabbits, arctic hares, and ptarmigan. The animal and bird species of the upland areas are influenced by the lowlying freshwater habitats, and are generally well dispersed throughout the planning area.

VEGETATION

Vegetation in the Bethel area can be described as primarily wet and moist tundra, characterized by low growing grasses, sedges, and shrubs, rooted in a mat of lichens and mosses. Alaska Regional Profiles has grouped vegetation in and around Bethel into the following communities (Figure 11).

Wet Tundra

Characterized by an almost continuous cover of grasses and sedges rooted in mosses and lichens. On slightly raised ridges dwarf shrubs may be found, while in standing water rooted aquatic plants, such as horsetail, pondweed, and bur reed are found.

Characteristic species: Bog orchid, Cotton grass, Sphagnum moss.

Moist Tundra

Characterized by wide-variety of low-growing shrubs, herbs, grasses, and sedges rooted in a continuous mat of mosses and lichens. Cotton grass may be most obvious in depressions, and the abundant grasses and sedges are accented by numerous colorful flowers during summer.

Characeristic species: Crowberry, Sedge, Hair Moss, Reindeer lichen.

High Brush

Characterized by dense thickets of willow, alder, and birch with an understory of a wide variety of lower shrubs, herbs, grasses, ferns, and mosses.

Characteristic species: Felt leaf willow, Littletree willow, Thin leaf alder.

Freshwater Flora

Characterized by phytoplankton, seed plants, and small algae. Phytoplankton and small algae commonly grow in the top few inches of soft bottom sediments in ponds and shallow lakes. Both submerged and emergent forms of aquatic seed plants occur in shallow ponds and lakes.

Characteristic species: Horsetail, Pondweed, various species of diatoms, and algae.

Additional species and their scientific names for each type of plant community is listed in Appendix I.

VEGETATION

Vegetation in the Bethel area can be described as primarily wet and moist tundra, characterized by low growing grasses, sedges, and shrubs, rooted in a mat of lichens and mosses. Alaska Regional Profiles has grouped vegetation in and around Bethel into the following communities (Figure 11).

Wet Tundra

Characterized by an almost continuous cover of grasses and sedges rooted in mosses and lichens. On slightly raised ridges dwarf shrubs may be found, while in standing water rooted aquatic plants, such as horsetail, pondweed, and bur reed are found.

Characteristic species: Bog orchid, Cotton grass, Sphagnum moss.

Moist Tundra

BIRD LIFE

Bethel is located on the eastern margin of one of the largest and most productive avifauna habitats on the continent, the Yukon-Kuskokwim Delta. Many species of waterfowl, shorebirds and songbirds have been observed around Bethel, however the extent to which the bird species utilize the river, sloughs, lakes, and tundra habitats is not well documented.

Waterfowl

Diving and surface feeding ducks are the most abundant of the waterfowl, with pintail, greater scaup and oldsquaw the most prevalent. Other important species include mallard, green winged teal, common scoter and widgeon. Nesting of ducks occurs throughout the study area, with the most extensive nesting sites occurring in areas characterized by a high density of lakes and ponds. Observed nesting species in the Bethel planning area are pintail, mallard, greater scaup, green winged teal, and canvasback (ADF&G).

The delta habitats are equally important to geese and swan populations. Whistling swans are common around Bethel and throughout the delta. They are the most conspicuous of the waterfowl, due to their enormous size, and are frequently seen flying overhead or foraging on the tundra

vegetation. Small flocks of black brant and some geese such as white-fronted, and lesser Canada also appear on the tundra to rest and forage on crowberries prior to their fall departure. Nesting of black brant, cackling, and emperor geese is generally confined to coastal and estuarine habitats and are fairly uncommon in the Bethel study area. White-fronted and lesser Canada geese nesting habitats are more well dispersed throughout the study area. High density nesting is found in areas supporting a dense complex of lakes and ponds.

The first waterfowl arrive on the delta in late April to early May, with some species arriving in the coastal nesting habitats through June. Nesting begins in late May with the breakup of the river. Most broods of geese and duck are fledged by mid-August. Fall departure of waterfowl in the Bethel area appears to peak in late September and may extend through October if warm weather persists. Waterfowl are most commonly observed during spring and fall migrations. Special bird habitats are identified in figure 12: none fall within the city itself.

Shorebirds and Other Waterbirds

Common shorebirds found throughout the study area include Wilson snipe, western sandpipers, American golden plovers, northern phalaropes, and Arctic terns. Other common waterbirds include red-necked grebes, Arctic and common loons, sandhill cranes, and mew, sabbine and glaucous

winged gulls. Hangar Lake has been indentified as a popular nesting and foraging site for waterbirds as well as waterfowl. Preferred nesting habitats appear to be a fair distance from town and around the periphery of lakes and ponds.

The majority of waterbirds arrive on the tundra as soon as the snow melts and immediately disperse onto nesting habitats. Common and Arctic loons, Arctic terns, snipes, phalaropes, and gulls are known nesting species in the study area. Waterbirds migrate to the delta from all over the world and are the most abundant of the bird species inhabiting the area during the spring and early fall.

Upland

Raptors are fairly uncommon on the lowland tundra habitats, however the study area is frequented by marsh hawks and gryfalcon which prey on ptarmigan and small rodents. Willow ptarmigan are year-round residents and are most commonly observed in higher, better drained tundra habitats. Spruce grouse are wintering residents of the study area. Short-eared owls are also observed on the tundra and occur in greater abundance as rodent populations increase.

Passerine (songbirds) birds commonly observed throughout the study area include lapland longspurs, parasitic and longtailed jaegers, yellow wagtails, tree and bank swallows, rusty blackbirds, boreal chickadees, robins, snow

buntings, and common redpolls. Ravens are abundant throughout the region.

A nesting site of the endangered Peregrine falcon has been identified near the Upper Falls of the Kisaralik River (U.S. Fish and Wildlife Service). Peregrine falcons arrive in Alaska in late April and depart for their wintering grounds during September, following their nesting season. They are thought to winter from Central to South America. Peregrines may not utilize the same next year after year, but they traditionally use the same area. Peregrines feed primarily on waterfowl, shorebirds, and various small birds.

MAMMALS

Few big game species occur in the immediate vicinity of Bethel. Moose, wolf and wolverine are found primarily in the forested upland sections of the Yukon and Kuskokwim River drainages. Black bear are common throughout the open upland forest areas but are rarely observed on the lowland tundra of the delta (ADFandG). Small fur bearers occur in greater numbers in the study area and are of primary importance to the village winter economy. The more valuable small fur bearers are mink, beaver, muskrat, land otter, and red fox. Special mammal habitats in the Bethel study area are identified in Figure 12.

The "tundra" mink of the Yukon-Kuskokwim Delta are of the highest quality and command top prices in world fur markets. The highest recorded mink densities occur near Chevak, east of Hooper Bay, and in the larger water bodies east of Nelson Island, including Baird Inlet and Dall Lake. Moderate mink densities occur in the southern portion of the Yukon-Kuskokwim Delta east of the foothills of the Kilbuck Mountains including the Johnson River drainage and adjacent tundra areas. Areas of low mink abundance include areas where relative relief exceeds 100 feet and areas immediately adjacent to the coast and the Yukon and Kuskokwim Rivers.

Mink are associated with lakes, ponds, and slow moving waterways and are commonly trapped with a "taluyuk", a home-made cylindrical fish trap. Between 10,000 and 14,000 mink are taken on the delta annually. A large percentage of the "tundra" mink are trapped in early November before the ice has formed a thick layer.

Beavers are common throughout the delta region, particularly in deepwater streams and tributaries. A moderate beaver trapping effort exists on the delta. The average number of sealed beaver is about 1,300 per year (ADFandG). The 1980-81 catch recorded in the Yukon-Kuskokwim Game Management area (see appendix) was considerably higher than the average takes, approximately 2,396 beavers were sealed.

Muskrats are also common throughout the delta region, although populations may fluctuate widely due to unfavorable weather conditions. Preferred habitats by muskrats are slow moving waterways such as lakes, marshes, ponds, and sloughs. The majority of muskrat are trapped in early spring, immediately after break-up. Actual harvests were not available.

Arctic and red fox are present on the delta, although arctic foxes occur commonly only in the coastal regions of the delta. The red fox is abundant throughout the study area and is associated with riparian willow along the river and neighboring sloughs. Fox populations are to a large extent dependent on the abundance of prey species. Increasing numbers of fox are taken on the delta with the

aid of snow machines. In 1980-81 approximately 2000-2500 fox were taken in the Yukon-Kuskokwim Delta Game Management Area (ADFandG).

Land otters are found on the tundra in and around streams and river drainages. Otters of the Yukon-Kuskokwim Delta are of high quality and continue to bring top prices to the trappers. The 1981 game management report recorded 638 sealed otters for the entire region, with the majority trapped along the Kuskokwim River drainage between from Eek and Kalskag and along the lower Yukon Drainage between Mountain Village and Russian Mission (Dinneford).

Other small animals found in the study area include shrews, hares, lemmings, voles, squirrels, ermines, weasels, and occasionally lynx.

Additional species and their scientific names are listed in Appendix I.

FISHES

The freshwater habitats of the Kuskokwim area support a wide range of anadromous and freshwater fish species. The major fish species are: all five species of Pacific salmon, whitefish (including sheefish and cisco), burbot or "lush", northern pike, blackfish, boreal and pond smelt, arctic lamprey, arctic char, grayling, rainbow trout, long-nose sucker, slimy sculpin, three-spine and nine-spine stickleback. The fish resources of the Kuskokwim River system historically have been used for subsistence needs, and more recently, support an important commercial fishery and a limited sport fishery.

The waters of the study area (see Figure 13) include the Kuskokwim River, from Eek Island to Aniak, and major streams and rivers draining the Kilbuk and Ahkum Mountain Ranges and flowing west and north into the main river. Throughout the study area there are numerous lakes, ponds, and shallow waterways which are important to the ecology of many fish species.

The map in Figure 13 is based on Alaska Department of Fish and Game personnel field observations, as provided by Rae Baxter and Glenn Seamen. Only the major tributaries and lakes are delineated; there are many lesser streams and ponds, some that exist only intermittently, that are

not illustrated on the map. The nonanadromous species are particularly found in the lesser tributaries. All species, except the rainbow trout and the boreal smelt, are found in the Kuskokwim.

Salmon

The main river serves as an important migration route for all five species of Pacific salmon. King salmon are the earliest to arrive to the Kuskokwim area, ascending the river in early May. By mid June the salmon are entering the spawning streams and rivers in the study area. The distribution and spawning areas for the five species of Pacific Salmon are delineated in Figure 13 (ADFandG). The major river tributaries provide excellent spawning habitats (ADFandG). King salmon spawning occurs in July and August. Fry emerge in the spring and the young salmon remain in freshwater until the following summer before migrating to the sea.

Chum salmon are the most abundant salmon species in the Kuskokwim River, ascending the river shortly after the arrival of the king salmon run. During July and August chum salmon migrate upstream to their spawning areas. There are sixteen known chum spawning tributaries in the Kuskokwim River system, however they have not been well documented due to insufficient funds necessary to survey all areas. Unfavorable weather conditions for surveying further limits the Department of Fish and Game in their

surveying efforts (ADF&G). Fry emerge from gravel beds in spring and begin their seaward migration. Chum salmon spend two to four years in the sea before returning to the river system.

Pink and red salmon are more abundant in rivers and streams of the Kuskokwim Bay area. The majority of red salmon are anadromous, although some may become "lake locked" and remain in freshwater habitats. These fish are referred to as "kokanee". In the Yukon-Kuskokwim area kokanee are fairly uncommon. Preferred spawning habitats are swift rivers with medium fine gravel bottoms; and some lakes. Fry emerge in April and May and the young remain in freshwater habitats one to two years before migrating to coastal areas.

Pink salmon spawning usually occurs in the tributaries of the lower Kuskokwim River. However spawning has occurred in tributaries further up river as far as the Holitna River (ADF andG). Spawning has not been documented in the Kuskokwim River itself but limited evidence suggests it may occur in the river above Kalskag. Pink salmon spawn in July and August, and by the following spring the young pink salmon are migrating downstream to spend summer months in nearshore waters. Pink salmon are abundant only in even years (i.e., 1980, 1982, 1984).

Coho Salmon are abundant and present throughout the study area. They enter spawning rivers and streams in early fall, and spawning occurs between September and

January. Coho juveniles rear in lakes, ponds, and streams; and remain in freshwater from one to three years before they migrate downstream to coastal areas.

All five species of Pacific salmon are utilized primarily for subsistence and commercial purposes, with a slight fishing pressure from sports fishermen.

Whitefish

Several species of whitefish are found throughout the study area. These are: broad whitefish, humpback whitefish, round whitefish, sheefish or "iconncu", Bering cisco commonly called arctic cisco, and least cisco. Bering cisco are more commonly found in the estuarine and lowland tundra habitats, while least cisco are found in freshwater habitats throughout the area. Round whitefish prefer the swift flowing sections of streams and are found in all the major tributaries of the Kuskokwim River from Eek River to the headwater. They seldom occur in the lower reaches of the Kuskokwim River, except for a short duration immediately following break-up. The two species of major importance to subsistence fishermen in the lower Kuskokwim River are broad and humpback whitefish.

Several whitefish species of the Kuskokwim River drainage, including least cisco, broad whitefish and humpback whitefish, exhibit seasonal movements between the Kuskokwim River and outlying tundra streams, lakes, and ponds. During the summer and early fall the whitefish

disperse and feed in the shallow tundra aquatic habitats of the delta. From August to December the whitefish migrate downstream to preferred spawning and overwintering habitats in the Kuskokwim River. Spawning occurs during the fall in the deep waters of the Kuskokwim River. Humpback spawning has been observed in the main river near Bethel and over 400 miles upriver from the mouths of summer feeding streams of the lower Kuskokwim River. From December to May the main river is an important overwintering habitat, due to the unavailability of free water and the near anerobic conditions of the shallow tundra lakes and ponds. By mid-spring nonspawners and juvenile whitefish leave their overwintering habitats and return to their summer feeding habitats (Baxter).

Sheefish appear to spawn in alternate years with only one half of the population breeding in any year. Many of the non-breeders do not move upstream with the spawners but instead disperse in the delta in the shallow, slow moving tundra streams, lakes, and ponds to feed. The upstream migration of breeding individuals is protracted and occurs from at least April to June (ADF&G). Sheefish are fall spawners and prefer habitat with a swift current and deep pools. Suitable spawning habitats are outside the study area (Baxter).

The Kuskokwim River whitefish fishery is predominately utilized for subsistence needs. The main river, from Johnson River to Akiachak, is an area of intensive whitefish harvest

by Bethel residents (see Figure 13). During the fall and winter whitefish are taken under the ice with gill nets or with a hook and line method of fishing, locally known as "jigging." Other important species harvested along with whitefish include northern pike, burbot, lamprey, and blackfish. As smelt ascend the river in spring, subsistence fishing is done by means of dip-nets.

The commercial utilization of whitefish occurs incidentally to the August coho season, and in a limited fall and whitefish fishery conducted by the Fish and Game Department in Bethel.

Sport fishing

Rainbow trout is the principal fish specie sought by sports fishermen. Rainbow trout are year round stream residents and are found in all major tributary streams of the lower Kuskokwim River, with the exception of Eek, Tuluksak, and Johnson Rivers. Rainbow trout have not been documented in the Holitna River or farther upstream in the Kuskokwim drainage (ADFandG). Other species valuable to sports fishermen are sheefish, arctic char, grayling, northern pike, and all five species of Pacific salmon. The Kisaralik River receives the greatest sport fishing pressure from Bethel residents and area fishermen. The river is navigable approximately seventy miles and thus, is preferred by many sports fishermen. The Kwethluk and Kasigluk river systems receive moderate sports fishing pressure from residents of Bethel (ADFandG).

HISTORY OF BETHEL

The history of Bethel began with the establishment of the permanent Eskimo village of Mumtrekhtagamute, which means "smokehouse village" in the Yupik language. The date has not been determined when the settlement first originated. Across the river from the village the first trading post was established by Reinhold Seppare in the early 1870's. The settlement was known as Mumtrekhtagamute Station. A second trading post owned by the Alaska Commercial Company was established at the upriver end of the

settlement, near Brown Slough. The inventory of goods was owned by Separe, however the store was operated by Edward Lind (Oswalt). Moravian missionaries arrived at Mumtrekhl-agamute Station in 1884 in search of a place to establish a mission. The following year John Kilbuck and William Weinland founded a mission one-half mile west of the trading post. The first school was opened in 1886, and by the turn of the century the Bethel Mission was well established.

Reindeer herding and fur farms were among the early industries in Bethel. The first reindeer were introduced to Alaska in 1892 in an effort to revitalize the Alaskan economy. In 1901 the Moravian mission received 175 reindeer. By the early 1930's approximately 43,000 reindeer grazed along the Kuskokwim River. The population of reindeer gradually diminished and in 1946 only 600 remained. During the 1930's several residents of Bethel owned fur farms where mink and fox were raised. Remnants of an early fur farm can still be seen near the present site of the Chevron oil storage tanks.

As a result of the commercial activities associated with early industries and river uses, Bethel emerged as an economic and trade center for the surrounding region. Its role as a regional center was further reinforced with the development of transportation facilities and extensive capital projects financed by the government. Government and social services grew considerably during the 1960's and

soon became the dominant force in Bethel's economy. Although many economic changes have occurred in Bethel since its beginnings, the traditional lifestyle and culture of the Yupik people remains visible today.

Historic Sites

The Alaska Heritage Resources Survey, maintained by the Alaska Division of Parks, has identified three historic sites in Bethel. (See Figure 14).

St. Sophia - the St. Sophia Church is owned by the Russian Orthodox Church in Sitka. The Church was Built in 1967 and the foundation of the Church was blessed on August 9, 1968. Records of Communion of the Sergie Mission in 1906 reveals the early influence of the Russian Orthodox Church in Bethel (Emphanka).

The First Settler's Cabin - This cabin is the first home built by a white settler in Bethel. The building is still standing but is threatened by the erosion of the riverbank.

The Moravian Church - The Moravian Church was built in 1885 by John Kilbuck and William Weinland. The building has been relocated from its original site.

Much of Bethel's early history was lost due to erosion along the waterfront. However, there are several older homes along Mission Road and in other parts of town. Nerby's store, built in 1927, has been moved back from the river three times (Hoffman).

There are two old cemetery sites in Bethel known as Lousetown cemetery and Orutsararmuit (Hoffman). (Figure 14.) The oldest burial ground was at the original site of Mumtrekhlagamute or Bethel. Excavations at this site were made in 1926 by Dr. Ales Hrdlicka, an anthropologist of the Smithsonian Institute (Schwalbe).

RECREATION

Bethel supports a variety of indoor and outdoor recreation activities. Several recreation facilities are new, with more facilities planned for the near future. The City Department of Parks and Recreation (Parks and Rec) coordinates most of the facilities and activities in town. The department consists of five full-time employees, five part-time employees, several volunteers, and occasional contracted employees for special programs.

The focal point of outdoor summer activities is 21 Acre Park (Pinky's Park), located on the north side of the city subdivision. The park complex consists of a six-lane bowling alley, a baseball field, a childrens' playground and a 3/4 mile boardwalk encircling the park. A combination outdoor tennis/ basketball court with lights is being constructed at the park. The court is planned for completion by the end of summer, 1982. The park also serves as the center of the city's Fourth of July activities.

The city plans to establish a series of neighborhood "mini-parks". One of the planned parks is in the Alaska State Housing Authority (ASHA) housing area, two are in the Ptarmigan Subdivision and one is near the Russian Orthodox Church in Lousetown. Mini-parks have also been proposed near Mission Lake and near Dull Lake. Parks and

Rec has hopes of eventually constructing a boardwalk system from the Ptarmigan mini-parks through the ASHA mini-park to 21 Acre Park and possibly connecting with the P.H.S. Hospital.

A popular recreation area, that is predominantly private property, is H-Marker Lake. The lake is used for swimming and by seaplanes. The land surrounding the lake is used for a variety of recreation activities.

Other popular recreation areas include Hanger Lake, Arthur Dull Lake, and the Kuskokwim River. The City hopes to eventually secure land for a riverfront park.

Outdoor recreation during the winter is restricted to cross-country skiing, snowmobiles, and dogsleds. All three activities use trails that wind through the city and out to surrounding villages. (Figure 14). Dogsled racing, known as "mushing" has become very popular. The "Kuskokwim 300", a 300-mile race to Aniak and back, is the highlight of community activity in the winter. Bethel also holds the Yukon-Kuskokwim State Fair during the winter, which includes dog and snow machine races, several arts and craft events, and Eskimo dances.

Facilities used for indoor recreation include the bowling alley, the high school gym, the National Guard Armory, the Kilbuck Elementary School, the Senior Citizens Center, and the Parks and Rec Building. A Teen Center is under construction and is scheduled for completion in the spring of 1982. The city has been trying, without success,

to secure funding for construction of a swimming pool. Efforts are being made by Parks and Rec to create an ice skating rink on one of the lakes during the winter.

Parks and Rec cooperates with the high school, the Armory and the elementary school to sponsor regular activities in basketball, volleyball, soccer, aerobic dancing, exercise classes, weightlifting and open gym. Nonathletic programs include Boy Scouts, Girl Scouts, Cub Scouts, Senior Citizens and children's activities, and various arts and crafts skills. Occasionally Parks and Rec programs are pre-empted by activities of the building's owners. In order to avoid such cancellations, Parks and Rec is hoping to construct a multi-purpose recreation center. Figure 15 identifies recreation areas and facilities.

SUBSISTENCE

The Yupik Eskimos inhabiting the Yukon-Kuskokwim Delta historically have depended on the abundance of fish and wildlife resources for their existence. Although there have been significant economic changes within the region, subsistence continues to be the economic mainstay of many Native communities and an integral part of the Yupik culture. Subsistence may play an increasingly important role in the Yukon-Kuskokwim Delta region with respect to potential changes in Federal and State government policies affecting employment, the management of resources, and economic development.

A community attitude survey relating to the culture and lifestyle of Bethel residents was conducted by Darbyshire and Associates in 1980. The results of the survey found that 60% of those surveyed participated in at least one subsistence activity. The major types of subsistence activities pursued were fishing, hunting, and berry picking. Outside of the survey local residents have expressed the importance of subsistence uses as a necessary supplement to their food supply.

The land and waters within the City's boundaries is extremely important to the community for subsistence activities (see Figure 16). Throughout the year fish are

taken in the main river and its neighboring sloughs. Many tundra lakes and ponds also support fish populations, particularly blackfish, which provides a major source of food to some Bethel residents during several months of the year. Fox, muskrat, hare, ptarmigan, and waterfowl are obtained by various means of trapping and hunting throughout the Bethel area. While the fish and wildlife resources in the City of Bethel are used by many, some local residents prefer to hunt and fish further distances from town. With improved means of transportation more remote areas are accessible to subsistence users. Because moose and other big game species are found in forested areas upriver many individuals charter planes to those areas.

The following section summarizes the predominant seasonal subsistence activities in Bethel and the surrounding area.

Subsistence Activities

SUMMER

Pink Salmon
Red salmon
Coho salmon
Chum salmon

Drift and set gill nets are used to harvest large numbers of salmon from the Kuskokwim River. The many fish camps located along the main river reflect the abundance of salmon resources in the Kuskokwim area.

AUTUMN

Whitefish
Burbot or "lush"
Pike
Blackfish
Coho salmon

After the salmon fishing season the salmon nets are set again and vast quantities of whitefish, pike, and blackfish are secured. Whitefish and other fish species are harvested in the tundra streams during their fall downstream migration.

Waterfowl

Ducks and geese are available during the early part of the season.

Berries

In early autumn blueberries, salmonberries, crowberries and low bush cranberries are abundant throughout the region.

Small furbearers

The hunting and trapping of fur bearing animals begins with the first heavy frost of autumn. A large number of mink and muskrat are taken in streams and creeks on the delta using a "taluyuk" or small wicker fish trap. These traps are used primarily to trap blackfish in the tundra lakes and ponds of the delta. Hares, fox, beaver and land otter also receive subsistence trapping and hunting pressures during the fall and autumn.

WINTER

Small furbearers

The hunting and trapping of small furbearers continues until the short cold days of mid-winter. Around February trapping and hunting activities are resumed until late March and early April. The furs of small animals are valuable and represent an important source of income to village communities. In addition much of the clothing of the people of the Yukon-Kuskokwim is made from various skins.

- Whitefish
- Pike
- Burbot of "lush"
- Blackfish

During the winter months whitefish are a principal source of food to the people of the delta. Whitefish are harvested intensely in the main river with set gill nets under the ice or with the use of an "ice jigger." In the sloughs and tributaries of the Kuskokwim River subsistence fishing also occurs. Above the mouth of the Johnson River is particularly a popular area for subsistence whitefish fishing.

Ptarmigan

Ptarmigan are taken during the winter principally by hunting with rifles, although snares are occasionally used.

SPRING

Muskrat

Muskrat are abundant throughout the delta and are hunted primarily in the spring. In early spring the tundra lakes and ponds are still frozen and muskrat are commonly taken by trapping the "push-up" habitats. As the lakes and ponds begin to thaw most muskrats are hunted with rifles.

SPRING

Blackfish
Whitefish
Smelt
King salmon

Immediately following breakup whitefish are moving back into the summer feeding habitats outlying the Kuskokwim River. Fish fences are set across streams and whitefish are removed with dip nets. There is a large subsistence effort for harvesting sheefish as they migrate up the main river to spawning locations. Great quantities of smelt are taken in the main river with dip nets during an annual spring run. Throughout the region blackfish are taken by means of wicker fish traps ("taluyuks") which are set in small streams and shallow lakes and ponds on the tundra. The king salmon run commences in early May and continues to be predominately utilized for subsistence needs.

Waterfowl
Ptarmigan

Spring hunting of migratory waterfowl plays a significant role in the economy of most villages. While fishing is the principal source of food in the villages, waterfowl hunting and egg gathering is practiced every spring. Bethel is physically distant from the best waterfowl hunting areas, more intensive hunting occurs near the villages.

Wood gathering

Immediately following breakup many residents of Bethel travel upriver to gather wood on shore or floating in the river. This has become an increasingly important activity as the price of heating fuels increase.

SCALE

POPULATION

Bethel has experienced tremendous population growth over the past two decades. Much of the population growth in the 1960's was attributable to a high birth rate. As the birth rate declined in the late 60's and early 70's, immigration to Bethel from surrounding villages and from the outside became the dominant source of population growth. As the number of outsiders coming to Bethel increased, Bethel changed from a predominantly native community (90%) in 1960, to a community comprised of 1/3 non-natives by 1980. The following two tables illustrate population growth and birth rate of Bethel for the past 20 years.

TABLE 9

Bethel Population Growth, 1960-1980

	1960	(Fraction of Total)	1970	% Change	1980*	% Change

Darbyshire and Associates

The federal census of 1980 was disputed by the City. In early 1982 the City conducted a census to re-check population numbers. Preliminary results show that the growth in Bethel may be leveling off, as the population count was very close to the federal census. (City 1982: 3,494 people. Federal 1980: 3576.) The city survey also indicates that there has been a shift in the percentages of Native (51%) and non-native (49%) residents. Table 10 indicates that the sharp decline of the Bethel birth rate has leveled off and is rising again. The phrase "baby-boom" is once again quite popular in Bethel.

Bethelites are less crowded today than in 1970. The average number of persons per housing unit fell from 4.5 in 1970 to 3.26 in 1980.

The age and sex distribution of Bethel is atypical when compared to Alaska as a whole. Table 11 illustrates the differences.

TABLE 11

Bethel Median Age and Sex Distribution as Compared to State

* Source: Darbyshire and Associates

Population Growth

Since 1950, Bethel has experienced a substantial increase in population, with the number of people nearly quadrupling between 1950 and 1980. The period between 1970 and 1980 saw an additional increase of nearly 50%. More recently, population growth has slowed.

TABLE 12
Population Growth

<u>Year</u>	<u>Population</u>	<u>% Increase</u>
1950	650	
1960	1258	93.24
1970	2416	92.05
1980	3576	48.01
*1982	3494	-2.00

*Preliminary results, City of Bethel Census
Source: U.S. Bureau of the Census

The major factor influencing growth in Bethel is job opportunities. To a lesser degree, the availability of government services, particularly health care, is another factor that brings people to Bethel.

The 1980 population, determined by the U.S. Bureau of the Census, is 3576. This is a relatively small population base and is subject to significant increases or declines as the result of external factors. These include changes in government policy, namely support for CETA, service agencies, the PHS Hospital and capital projects; major regional development, which potentially includes forest

and agricultural products and mining and petroleum activity (largely predicated on the proposed Yukon-Kuskokwim crossing); and the normal growth that is occurring in the region, for which Bethel serves as a commercial center.

The City conducted its own census in 1982. Preliminary results show a leveling off of the growth rate, with a total population of 3494. However, statistical analysis shows that no valid statistical population prediction can be made from the city census information.

Given the lack of strong emerging trends to use as a base for population forecasts, until such indicators become firm, Bethel must be considered to be at a "cross-roads" in time. Some qualified assumptions have been postulated to represent a forecast base, which are provided in the following table. These represent a range of non-enumerated possibilities that could occur depending on the degree of influence from the factors cited in the above paragraph.

TABLE 13
Population forecasts - 1990

Assumptions	1990 Population
Substantial Federal budget reductions without supplemental State funding or private sector investment - 25% growth for the decade	4470
Government funding and private sector investment remain constant with the previous decade - 48% growth for the decade*	5293
Government funding remains constant but a moderate increase in private sector investment - 78% growth for the decade**	6365
Government funding is moderately increased but private sector investment doubles - 96% growth for the decade***	7009
Government funding is substantially increased in conjunction with private activities and private sector investment quadruples - 200% growth for the decade	10728

* The same growth rate as occurred between 1970 and 1980

** The growth rate that occurred between 1950 and 1980

*** Double the growth rate that occurred between 1970 and 1980

LABOR

Several state and private sources were studied while attempting to determine accurate employment figures for Bethel. Alaska Department of Labor employment figures have shortcomings in that they are extrapolations based on 1978 population estimates for the entire southwest region, and estimates of unemployment are invariably low in rural areas. Because distribution of population and employment varies widely within the southwest region, the state figures were deemed inaccurate. A 1980 survey by Alaska Consultants contacted every business in town, and is felt to be the most accurate representation of present employment levels in Bethel.

Employment

Table 14 illustrates 1980 average annual fulltime employment. Highly seasonal industries such as fishing, construction, and manufacturing (mostly fish processing) are concentrated in a 2 - 3 month span so that the actual peak employment in these industries is several times greater than the average for the entire year. Seasonal employment has been estimated to have a summer peak of 117% of the average annual employment and a winter low of 78% of the average annual employment (Darbyshire and Associates).

TABLE 14

1980 Average Annual Full-time Employment

<u>Industry</u>	<u>Employment</u>	<u>% of Total</u>
Fishing	30	1.8
Construction	93.5	5.5
Manufacturing	14	0.8
Transp., Comm., and Util.	240.5	14.2
Retail Trade	238	14.1
Finance, Insurance, and Real Estate	24	1.4
Service	255	15.1
Total Government	796	47.1
Federal	303	17.9
State	200.5	11.9
Local	292.5	17.3
TOTAL EMPLOYMENT	1691.0	100.0

Source: Alaska Consultants

The most significant change in Bethel employment since 1980 has been in the government sector. Federal budget cuts have been responsible for the loss of at least 120 jobs, largely in the state and federal CETA programs (Refer to Government Analysis section).

The 1980 Alaska Consultants survey did not estimate total work force or unemployment. The Bethel Comprehensive Plan estimated 1978 unemployment at 15% (Darbyshire and Associates). The Alaska Department of Labor estimated unemployment for the Bethel census division in September, 1981 at 10%. However, a January, 1981 survey conducted by the Association of Village Council Presidents of the Wade Hampton census division (directly north of Bethel) discovered an unemployment rate of 24.7% as compared to the official Department of Labor estimate of 13.2% (ADOL). The same

survey estimated the size of the labor force based on a broad definition that included "discouraged" workers, and estimated unemployment at 48.8%. The survey emphasizes the shortcomings of the Department of Labor estimates.

Income

The Bethel census division (about 10,000 people) has a far higher cost of living and a far lower per capita income than the rest of Alaska or the United States.

TABLE 15

LAND OWNERSHIP

Land ownership in Bethel has changed dramatically with the passage of Alaska Native Claims Settlement Act (ANCSA) in 1971. 1982 land ownership is depicted in Figure 17 and in the pocket fold-out. Under section 12(a) of ANCSA the Bethel Native Corporation was authorized to 160,280 acres of "unreserved and unappropriated federal lands" within the immediate area of the village townsite. On January 12, 1979 the Bethel Native Corporation received interim conveyance to 130,323 acres in the Bethel area. This amount included 14,421 acres within the corporate city limits, approximately forty four percent of the community's total land area (Darbyshire and Associates).

The Bethel Native Corporation has completed a land management study encompassing the village corporation lands within the city limits, and is presently addressing the ANCSA section 14(c) reconveyances. Section 14(c) provides that the village corporation reconvey ANCSA conveyed lands that were occupied prior to the December 18, 1971 settlement of the Native land claims.

Under section 14(c) 1 and 2, the village corporation is required to reconvey land to individuals and non-profit organizations who utilized village corporation selection lands, prior to ANCSA, as a primary place of residence,

business, subsistence camp, headquarters for reindeer husbandry, or nonprofit uses. The Bethel Native Corporation Board of Directors have recently established February 26, 1982 as the deadline for filing an application for the reconveyance of land under the provisions of 14(c) 1 and 2.

Section 14(c) 3 provides that the village corporation reconvey not less than 1,280 acres to the municipality. As amended by the Alaska National Interests Lands Conservation Act (ANILCA) of December 2, 1980, the amount of land received by the city may be less than 1,280 acres if an agreement can be achieved between the city and the Bethel Native Corporation. The two parties are just beginning to negotiate the municipal reconveyance.

The second major land ownership category is the Native allotment lands, held in trust by the Federal government. Prior to ANCSA Alaskan Natives who had applied and were eligible under the provisions of the Native Allotment Act of 1906 and subsequent amendments were granted up to 160 acres of land. When it became apparent that section 18(a) of ANCSA would repeal the Native Allotment Act, thousands of Native allotment applications were filed to the Department of Interior, Bureau of Land Management (BLM). Because of the enormity of Native allotment applications, the process to approve the applications was incredibly slow. To expedite the process Congress approved a Native allotment amendment, under section 905 of ANILCA.

With the passage of ANILCA all uncontested Native allotment applications were automatically approved. An approved allotment is an allotment held in trust by the Federal government. The land may not be developed, sold or leased without the authorization of the Secretary of Interior, and is not subject to State and local jurisdiction including property taxes.

The majority of Native allotments in Bethel have been legislatively approved under the Native Allotment Act or under section 905 of ANILCA. However, there are still several Native allotment applications which have been protested and are pending approval. The Bethel Native Corporation is responsible for the protest of fourteen Native allotment applications to which Bethel Native Corporation is seeking title under ANCSA. The City is also protesting one Native allotment application. The approval or denial of the disputed Native allotments is the decision of the BLM.

When the allotments have been legislatively approved they must still be verified by a BLM adjudicator to make sure the allotment boundaries are correct and there hasn't been any overfiling. Once the property has been adjudicated and approved the land deed is "certified" by the BIA who transfers the restricted title to the individual. The definition of "restricted" asserts that the property is held by the individual and pursuant to Federal codes and

regulations. The land is exempt from property taxes, although Bethel presently does not have property taxes.

The title status may be modified to "unrestricted" or fee simple with the approval of BIA or once the property has been sold to a non-native. An unrestricted title allows the owner to develop the property in the same manner as private property, which means property is subject to State and local jurisdiction including property taxes.

The certification of Native allotments has been at a snails pace and at this time only ten Native allotments have received a certificate of title (AVCP Realty). As much of the Native allotments encompass suitable lands for development, the certification of future allotments will have considerable implications on the permanent land use patterns in Bethel.

In addition to the certified allotments, other privately owned lands include all land held in unrestricted status and restricted Native townsite deed properties. Private land ownership comprises 2,609 acres, approximately eight percent of the community's total land area (not including BNC's land).

According to Darbyshire and Associates, State and Federal governments own 1,099 and 600 acres of land, respectively. The 1,055 acre airport site comprises the major portion of State owned lands. Federal lands include the Federal Aviation Administration site, Public Health Service hospital site, Bureau of Indian Affairs site, and the old

BIA headquarters. In addition, the Federal government owns the surface rights of all navigable waterways. The bottom surface rights of navigable waters are retained by the State. There are approximately 3,389 acres of navigable waters in Bethel. (Darbyshire and Associates).

The City of Bethel presently owns approximately 985 acres of land within the City limits (Stigall). The City anticipates the acquisition of additional lands from the Bethel Native Corporation under section 14(c) 3 of ANCSA. The City is also negotiating with a Native allotment holder for the conveyance of some 88 acres west of the City subdivision (Stigall). A summary of the land ownership in Bethel is provided in the following table:

TABLE 17

Summary of Bethel Land Ownership *, 1982

<u>Land Ownership</u>	<u>Acres</u>	<u>Percent</u>
Bethel Native Corporation	14,200	43.5
Native Allotment Applications (pending certification)	9,758	29.9
City of Bethel	985	3.0
Other Private (including certified Native allotments)	2,609	8.0
Federal	600	1.8
State	1,099	3.4
Navigable Waters	<u>3,389</u>	<u>10.4</u>
Total Bethel City Limits	32,640	100.0 %

* The land ownership figures are approximate as land ownership is presently undergoing change.

LAND USE

The three major determining factors of land use in Bethel are the terrain, the Kuskokwim River, and land ownership. Most of Bethel is located on moist or wet tundra and few areas are suitable for urban-type development. Land users along the Kuskokwim River must be constantly aware of river movement and erosion. Land ownership in Bethel is very unclear with over one-third of the land area in Bethel classified as pending native allotment applications.

Urban land uses have been grouped into the following categories, as defined by the 1980 Bethel Comprehensive Plan (Darbyshire and Associates).

Commercial - Includes all types of businesses that provide services or sell goods, but do not manufacture the items they sell. This includes private offices, and public offices whose land use is similar to private offices. Alaska Department of Health and Social Services, Yukon-Kuskokwim Health Corporation, and the Association of Village Council Presidents offices would be considered a commercial use, while the city center complex is considered a public institutional use.

Industrial - Uses that require complete use of the land for their own purposes, do not mix well with other uses, require transport of goods and materials by heavy truck, air, or barge, create physical hazards if open to public access, and may have some negative noise, dust, drainage, and visual impacts on adjacent property. Some industrial uses include manufacturing and construction, docks, warehouses, storage yards, fish processing and cold storage plants, the power plant, the sewage plant, and the airport.

Residential - Includes homes, duplexes, apartments, and mobile homes.

Public Institutional - Public or government uses not defined as commercial uses. Examples include the hospital, schools, churches, the city center complex, and the solid waste disposal site.

Public Open Space - Open areas with few if any structures that have been designated for a public use or purpose. Includes parks, cemeteries, greenbelts, or drainage easements.

Often land use is mixed, such as a store with apartments above it or a business operating out of a person's home. In such cases, the land use was designated as what was judged to be the primary use. E.S.E. has updated the 1980 land use survey by Darbyshire and Associates. Land use, as of February, 1982, is summarized in Table 18.

TABLE 18

Bethel Land Use - 1982

<u>Land Use</u>	<u>Acres</u>	<u>% of Total</u>	<u>% of Developed</u>
Commercial	39	0.1	1.9

UTILITIES

Electrical Utility

The electrical power in Bethel is generated by Bethel Utilities Corporation, a privately owned utility. The power facility, located behind the Public Health Service Hospital, operates four 2,100 Kw diesel generators which have a combined installed load capacity a 8,400 Kw. Bethel Utilities Corporation serves approximately 1,416 customers, an annual increase of 10% since January 1981. The average load during the summer is 2,500 Kw and 2,700 Kw during the winter. The power facility is capable of handling the existing peak load and could easily accommodate 50% increase in demand. The power lines are fairly new and are reported to be in good condition with the exception of a few short spans in the older parts of town.

Recently, Bethel Utilities initiated a waste heat project which will deliver the waste heat generated by the power plant to the Public Health Service Building and its housing. Construction of the project will begin in January (1982) and completion of the project is anticipated in September. It is also very likely that Bethel Utilities will include the City Complex, KYUK and Kuskokwim Community College in their waste heat plans, however a final agreement must be achieved between the City and Bethel Utilities.

Water Utilities

The water supply in Bethel is derived from wells drilled 350-450 feet through permafrost (Darbyshire and Associates). At the present time the ground water sources are the only reliable potable water supply due to the extensive treatment necessary for surface water sources in the area. Although several service organizations and residences obtain water from private wells, the majority of the water supplied to the community is derived from the City-owned wells. Water is distributed in the community by a piped system and a hauled system.

The City owns and operates two wells located at the Bethel Heights utility building and adjacent to the City complex. The Bethel Heights well supplies water to the Bethel Heights piped system and the City hauled system. The average consumption is 23,000 gallons per day for the hauled system and 60,000 gallons per day for the piped system. Peak water consumption is 30,000 gallons per day for the hauled system and 70,000 gallons per day for the piped system (Bethel Public Works). The well has an estimated pumping capacity of 350 gallons per minute. The pumphouse contains two tanks with a storage capacity of 120,000 gallons.

The well adjacent to the City complex supplies water to the Municipal buildings in the immediate area. The City does not meter water consumption from this well. The pumping capacity of the well is reported to be 150 gallons

per minute. Water is stored in a 130,000 gallon tank with 60,000 gallons on reserve for a fire protection system.

Water derived from both wells is treated with chlorine and samples are tested every week and a half to ensure good water quality (Bethel Public Works).

The Bethel Heights piped system was originally constructed underground. In 1975 a fire destroyed the Bethel Utilities power plant which eliminated the heating source to the piped system and caused the pipes to freeze and break. Bethel was declared a "National Disaster" area and the Army Corps of Engineers rebuilt the system above ground for \$6,000,000. While the Bethel Heights and City complex piped systems appear to work well, the exorbitant construction and maintenance costs of the system preclude further expansion. The present system serves two hundred hook-ups (Bethel Public Works).

The majority of Bethel residents will continue to depend on the hauled water system. The Bethel Public Works Department operates four water trucks, each with a 3,500 - 4,000 gallon water holding capacity. Water is delivered on an average of once per week, although service is available up to four times per week. The Public Works Department has indicated that the service rates are subject to change due to increasing maintenance costs, and the Department will be initiating a rate study this year.

Sewage Utility

The sewage disposal system provided by the Bethel Public Works Department consists of a piped system and a hauled system. The sewage collected by these systems is treated at the sewage lagoon, located north of the regional high school.

The main piped system originates at the Public Health Hospital (PHS) and extends approximately 9,000 feet to the sewage lagoon (Darbyshire and Associates). Connected to the main line are several tributary lines which serve the City complex, Kuskokwim Community College (KCC), Kilbuck Elementary School, the Bethel Native Corporation apartments and dormitory, and the regional high school.

The piped system is an above-ground arctic insulated utilidor with six lift stations. The lift stations are located at the Kilbuck Elementary School, PHS Hospital, Bethel Heights subdivision, City subdivision, and the pump-house (Figure 18). The piped system is in fair condition, however the lift stations are subject to corrosion and there are occasional "freeze-ups" in the sewer line (Bethel Public Works).

The Bethel Sewage lagoon was constructed in 1969 by the U.S. Public Health Service to serve the Bethel Heights subdivision. The volume of the lagoon is 3,397,700 cubic feet from its operating depth and the water surface area is approximately twenty-one acres (Darbyshire and Associates).

Darbyshire and Associates, in 1980, estimated the hydraulic load on the sewage lagoon as 124,300 gallons per day. This figure included both piped and hauled sewage collection. According to the Bethel Public Works Department the sewage lagoon is projected to meet the community's needs through 1990.

Additional sewage treatment systems in Bethel are privately owned and operated by the Bureau of Indian Affairs (BIA), Kuskokwim Inn, Federal Aviation Administration (FAA), Wein Airlines and the trailer court (Alaska Consultants).

The City's hauled system consists of honey bucket collection and "septic tank" (holding tank) evacuation. The holding tank system is utilized in conjunction with honey buckets, chemical and flush toilets. The Bethel Public Works Department operates two honey bucket and two septic evacuation trucks, each with an estimated holding capacity of 25,000 gallons. Honeybucket service is provided at least once a week. Holding tank evacuation can be provided weekly, and many customers receive service "on call". In November 1981 the Public Works Department provided honey bucket collection for 420 customers and sewage evacuation for eighty-three customers (Bethel Public Works). As the piped sewer system is extremely costly to construct, Bethel residents will continue to depend on the hauled system. The increasing demand for services will necessitate the hiring of additional personnel.

The remaining businesses and residences who choose not to be serviced by the City, employ other methods of sewage disposal. These methods include private collection and sewage treatment systems, chemical toilets, and the dumping of honey buckets into the lagoon or along the river bank.

Solid Waste

The Public Works Department provides refuse collection and maintains the solid waste landfill site. The refuse collection service consists of a dumpster program and a limited street collection for private residences and businesses.

The Dumpster program was initiated in 1980 in an effort to reduce the cost of refuse collection in the community and control the use of the landfill site. At present there are approximately sixty dumpsters provided for residential and commercial users throughout the City. All residential users are charged \$7.50 per month for the dumpster service. Dumpsters may also be individually leased on a weekly, monthly or yearly basis. An additional twenty-five dumpsters are scheduled to arrive this year (Bethel Public Works).

The limited collection service is provided to approximately thirty homes and several businesses. Refuse is collected twice a week and the cost of the service is fifteen dollars for residences and thirty dollars per month

SOURCE: ENVIRONMENTAL SCIENCE AND ENGINEERING

ESE ENVIRONMENTAL SCIENCE
AND ENGINEERING, INC.

The information on this report was prepared by the Environmental Science and Engineering, Inc. (ESE) under contract to the U.S. Environmental Protection Agency. The U.S. Environmental Protection Agency is not responsible for the accuracy or completeness of the information contained in this report.

for commercial use. The Bethel Public Works Department operates two trucks for refuse collection and dumpster containers.

The Bethel sanitary landfill site is a ten-acre open site located directly east of the sewage lagoon. To avoid unnecessary burning and scattering of waste, the land fill site has been closed to the public with the exception of fifteen permit holders who are authorized to use the site. Maintenance of the landfill site is provided by the City and consists of spreading and covering the refuse with a small track dozer.

The Bethel Department of Public Works intends to eliminate the major problems with operating a landfill site through the use of a thermal incinerator. The thermal incinerator would be installed subsequent to construction of the new public utilities maintenance facility (Bethel Public Works).

Public Works

The Public Works Department, located in the Braund building, consists of the utility office and utility maintenance shop. The quonset hut, located behind the Braund building, houses the road maintenance shop and provides storage space for equipment. At present the existing facilities are not adequate for the current services provided to the community. The construction of a new utility maintenance facility has been approved by Bethel voters

and construction is scheduled to begin in Fall, 1982.

In addition to the utility services, the Bethel Public Works Department provides for the construction and maintenance of streets, roads, boardwalks, drainage improvements and parks; and the maintenance of vehicular and stationary equipment and overhaul of all city-owned facilities. The Public Works Department is also responsible for the management and operation of the dredge and tender, which was acquired last summer. Dredging operations will be provided to the villages along the river as well as Bethel.

Local roads and streets in Bethel are constructed of sands, silts and gravels and are generally 20-30 feet wide. The maintenance of streets and roads is difficult due to unfavorable weather conditions, and consequently roads and streets are generally in poor condition. The need to upgrade and maintain local streets and roads is prevalent throughout the City, with major problems occurring at Fifth Avenue, Sixth Avenue, Seventh Avenue, Ptarmigan and Tundra Ridge roads (Bethel Public Works).

The six mile paved road or "Airport Road" is maintained by the State Department of Transportation and Public Facilities.

Natural drainage patterns are invariably disrupted with the construction of roads and other urban land uses. Major drainage problems occur at Fifth Avenue, Ptarmigan and City subdivisions (Bethel Public Works). To divert runoff away from subdivisions and off local streets, the Public Works

Department installed several culverts last summer. Additional culverting is planned throughout the City.

During the summer, favorable weather conditions permit the Public Works Department to accomplish new construction and repairs to roads, streets and boardwalks. To accommodate the increased work load during the summer, the hiring of additional personnel is essential.

GOVERNMENT POLICY ANALYSIS

There are numerous government policies at the local, State and Federal levels that have a potential effect on Bethel. Listed below are the policy categories that are most likely to influence life in Bethel, either through the continuance or withdrawal of the policy. All but two of the policy categories represent funding programs. The two exceptions are subsistence use and home rule charter for Bethel, though these have major economic considerations.

Housing

The Office of Management and Budget has recommended the termination of HUD funds which financed Indian, public housing, and housing assistance payments. However, the House must make its own recommendation which may include to maintain funding at its present level. If the HUD funding is approved 4,000 homes will be constructed nationwide. Funding for the construction of 600 homes will be appropriated to the State of Alaska. The Association of Village Council Presidents (AVCP) Regional Housing Authority has submitted applications to HUD for the construction of 250 homes within the AVCP region. Bethel is listed as the number one priority in the region, and if funding is maintained the construction of seventy homes will begin next year.

HUD loan insurance programs are available but due to uncompetitive business rates and extensive application requirements (for lending institutions), these are not being utilized.

The Alaska Housing Finance Corporation (AHFC) has a low income and regular loan insurance program which is currently in effect and is expected to remain so in the future. Through the AVCP Regional Housing Authority between sixty and seventy homes have been assisted by the AHFC program since its initiation in the summer of 1979. Seventy percent of the homes financed were new construction.

The BIA Housing Improvement Program (HIP) is currently providing funds for renovations and upgrading existing homes. The Bureau is no longer financing the construction of new homes through HIP. Services to Natives are provided through BIA and AVCP. While HIP is funded through FY-83, future funding is uncertain at this time.

The Farm Home Administration low income housing program is also still available for single-family residences.

Employment

The Federal government has withdrawn funds for its CETA (Comprehensive Employment Training Act) program which has affected both the State CETA and AVCP employment training programs considerably. The AVCP program has received a 72% reduction in authorized funds, and further reductions are anticipated.

Although the State is continuing its CETA program, the program has made major revisions due to the federal reductions, resulting in a 62% funding decrease. It is difficult to determine how the State CETA program will be supported in the future, though it is likely that without the legislative approval of the proposed State Jobs bill the State CETA program will be terminated in Bethel. The impact of the discontinuance of the CETA program has been a considerable loss of badly needed employees for public agencies and non-profit organizations in the community.

A major employer in Bethel is the PHS hospital. Federal support has already been reduced at this facility and further cuts may be made in the future. Not only will this result in a loss of jobs for residents, but it will also reduce the level of commerce for Bethel businesses, which is generated from both local people and outsiders who work or use the hospital.

Economic Development

The major federal economic program that supported community economic development projects was administered by the Economic Development Administration (EDA). This program has subsequently been terminated by the Federal government. A Federal program still in effect is the River and Harbor Improvements Program, which is administered by the U.S. Army Corps of Engineers. With the exception of annual allocations for maintenance, each capital project

requires a Congressional appropriation. Furthermore, these projects are prioritized on a list provided by the District Engineer, which means it might take years or decades for a project to be funded. Funds for proposed capital projects in Bethel such as the seawall, cultural convention center, recreation center, and transshipment dock may have to come mostly from State legislated appropriations, or combinations of State and private funding.

In addition to community development projects, Federal and State policies and funding programs influence major regional economic developments. Policies and programs which will likely affect Bethel's economy include petroleum exploration and development, mining activities, and reindeer husbandry.

Additional oil-related revenues to be gained by the State will depend on the successful exploration and development of oil reserves through Federal and State lease sales. Resource development in lease areas close to Bethel will undoubtedly impact the Bethel economy, however the degree of the impact depends on the recoverable resource which is highly speculative at the present time. Further analysis of Outer Continental Shelf petroleum exploration is provided in the economic section of this report.

Future State policies that encourage the exploration and development of mineral and alternative energy resources, such as coal, may increase mining activities in the Yukon-Kuskokwim region. If mining activities dramatically increase

in the Kuskokwim area, Bethel would likely become a major transportation and service center for the export of raw mineral products.

There has been a growing interest in the development of reindeer husbandry in the Yukon-Kuskokwim region. Orutsararmuit, the Traditional Village Council in Bethel, is currently seeking funds from the State to finance a study on the economic viability of reindeer herding in the Calista region.

Environmental Quality

The major issue in Bethel concerning environmental quality is sewage disposal. Federal money provided through the U.S. Environmental Protection Agency has mostly been eliminated. Again the only probable source of funding will come from a State legislated appropriation. However, the U.S. Farm Home Administration has limited funds for community water and sewer systems. A related State policy in the form of enforcement of standards is found in the Alaska Department of Environmental Conservation (ADEC). ADEC has informally notified the City of Bethel that a more acceptable means of sewage treatment disposal will have to be provided in the future. This situation will undoubtedly have to be addressed in the near future.

Another environmental policy issue is found in the U.S. Army Corps of Engineers responsibility to issue permits for development in wetlands. The entire area within the City's

boundary is considered wetlands. See wetlands discussion for more details on this issue.

Subsistence

The Alaska State Subsistence Law (1978) established that the State's fish and game resources were to be managed to give subsistence use the highest priority when the resource cannot satisfy all uses. An initiative has been put on the fall 1982 ballot to repeal the subsistence priority law. If the initiative is passed then, subsistence use will no longer have legal priority of fish and game resources under the State law. This would mean that commercial and sport users would have equal legal right to resources under the State law. In many cases the competing influence on resources would lead to hardship for local residents who rely heavily on fish and game as a food source.

Home Rule

A policy concern that has become a local issue is the proposed change from a second class city to a home rule city. In summary, the following changes would result:

1. The City would have to assume responsibility for public education. (It is assumed that State funds are adequate for public school support for the next five years.)
2. The City would have increased taxing powers.
3. The City would be required to adopt a comprehensive plan, zoning ordinance, and subdivision ordinance.

4. The City could exercise eminent domain by ordinance.
5. Should a borough be formed, the City would automatically have a representative on the assembly.

Home rule would provide with more flexibility and autonomy in governing its affairs, but it would also mean accepting new responsibilities.

ECONOMIC ACTIVITIES

TRANSPORTATION

Air Transport

Three areas in Bethel are used for aviation activities: the Bethel Airport, Hanger Lake, and the Kuskokwim River. Some air taxi and charter operators maintain offices on the riverfront as well as at the airport. The river is preferred by many passengers because of the convenient location next to town. Delaire Charter Service and Bush Air conduct most of the aviation business on the river. The two company's estimates of total flights and percent of operations that occur on the river is as follows:

TABLE 19

Selected Aircraft Activity on Kuskokwim River

	<u>Total Flight Operations</u>	<u>Estimated % of Operations on the River</u>
Delaire	3000	45%
Bush Air	1600	75%

Hanger Lake is preferred by many operators during inclement weather when tying down on the river becomes hazardous (Alaska Department of Transportation and Public Facilities).

The Bethel Airport is located approximately three miles west of the center of Bethel. The state owns the 1055 acre site, half of which is in use. The main runway is a hard

surface, precision instrument runway, with a length of 6400 feet and width of 150 feet. The gravel cross-wind runway used by small aircraft is 1850 feet by 75 feet. Short-term plans exist for paving the apron adjacent to the cross-wind runway. Long-term development plans include extension of the cross-wind runway, paving several aprons, expanding the passenger terminal, designating an area for fuel storage, and designating a transient parking area for light aircraft. The new control tower is not yet operational because of the shortage of air traffic controllers that resulted from the 1981 strike.

Passenger service from Anchorage is provided twice daily by Wien Air Alaska and five times weekly by Sea Airmotive. In addition, Alaska International Air operates cargo flights five times weekly and several air charter and air taxi services operate in Bethel.

The Bethel airport currently ranks third in Alaska in total flight services and in civilian airport operations by certificated route air carriers. Table 23 summarizes activity at the Bethel airport.

TABLE 20

1980 Bethel Airport Activity

		<u>% Increase</u> <u>1978-1980</u>
Total Flight Services	257,249 (1981)	11.1 (1977-1981)
Airport Operations	8,729	28.0

In 1979, the Alaska Department of Transportation and Public Facilities (DOTPF) projected growth of Bethel air traffic based on the growth rate from 1972 to 1976. The accuracy of the projections was mixed. Table 21 compares the DOTPF projections with the actual growth rate from 1978 to 1980.

TABLE 21

Bethel Air Traffic Growth and Growth Projections

	<u>1979 DOTPF</u> <u>Projection</u>	<u>Actual Annual Growth:</u> <u>1978-1980</u>
Total Flight Services	17.6	2.7 (1977-1981)
Airport Operations	9.0	13.1
Enplaned Passengers	7.5	5.3
Total Cargo and Mail	9.7	14.1

WATER TRANSPORT

Present Port Facility

The Bethel port facility is owned by the State of Alaska, leased by the City of Bethel, and operated by United Transportation, a private company. The general cargo dock and staging area is constructed of four circular sheet steel pile cells, providing a working frontage of 240 feet (Galliet and Silides). The dock can accommodate only one ocean-going barge at a time. The dock limitation forces some barges to unload at other riverfront locations, which adds rehandling costs. Other barges are forced to wait, as are many transshipment barges. The time lost waiting is a serious problem, especially on a river that has only a five-month shipping season.

Four commercial barge companies deliver to Bethel: Foss Alaska, Pacific Alaska Lines, Northland Services, and Southeast Alaska Barge Line. In addition, an occasional government barge delivers cargo to Bethel. Bulk petroleum is delivered to Bethel by Chevron U.S.A. and is redistributed by United Transportation and Northwest Navigation. Table 22 summarizes port activity in Bethel during 1981.

TABLE 22

General Cargo and Bulk Petroleum Shipped Through Bethel - 1981

	General Cargo (Tons)	Bulk Petroleum (Gallons)
Total Delivered to Bethel	18,000	13.5 million
Total Transshipped	4,183	6.0 million

Sources: Chevron U.S.A.
United Transportation

Port Construction Plans

Construction of a mooring facility and staging area for transshipment barges is planned to begin in March 1982. The

transshipment dock will be located on Brown Slough, adjacent to the general cargo dock. The Army Corps of Engineers is discussing with the City and United Transportation plans for extending the general cargo dock. The planned expansion would enable the general cargo dock to accommodate two ocean-going barges at a time. United Transportation is also studying sites to construct badly needed warehouse facilities.

The City plans to stabilize the river bank by the Chevron tank farm by constructing a sixty-foot diameter sheet steel cell, flanked on each side by a seawall (Boyette). The City hopes to have construction completed by Fall 1982. Comprehensive bank stabilization efforts are examined in the geophysical hazard section.

Small Boat Harbor

Proper moorage for small boats is non-existent in Bethel. Boatowners currently use the shores of Brown Slough or the Kuskokwim River. The design for the planned small boat harbor will dredge Lousetown Slough and three berthing basins (Figure 20). The basin area will require twelve acres and the basin clearance area will require twenty-five acres. Total area affected by the project, including a dredge disposal area is forty-two acres. Boats will be moored by tying bow lines to cables anchored along the shores of the basins. The planned capacity of the harbor is approximately 1200 boats. The estimated number of boats berthing in Bethel in 1980 (based on a 1975 boating count) equals the design capacity of the harbor. However, a number of boaters are expected to continue using Brown Slough or the river. Table 23 illustrates the projections of number of boaters using Bethel.

DESIGN TOTAL	850	1196	1737	2587

Source: U.S. Army Corps of Engineers

The total project cost estimate is \$4,241,000. The harbor will provide benefits from reduced weather damage, reduced theft and vandalism, improved subsistence, commercial fishing, travel and freight savings and employment. The benefit/cost ratio has been estimated at 1.21.

The most significant environmental impact of the proposed harbor project is the destruction of forty-two acres of wetlands (Corps of Engineers), which is contrary to federal policy. Possible specific impacts include loss of some waterfowl and muskrat habitats, disruption of fish habitat and changes in the benthic community (Corps of Engineers). The entire forty-two acre site is located in the floodplain, contrary to federal policy. The Corps of Engineers notes that economically feasible alternatives to harbor development on the floodplain or on wetlands do not exist in Bethel. Localized drainage would also be affected. The U.S. Environmental Protection Agency has expressed concern that pollutants may accumulate in the berthing basins as a result of inadequate flushing. However, the Corps of Engineers feels that flushing in the basins will be adequate. The greatest danger to the Kuskokwim River from the proposed harbor project is the possibility of dredged material being washed into the river during flood conditions. The harbor plan calls for surrounding the disposal area with fifteen-foot high dikes that would protect the dredge disposal against all but the largest floods.

Two areas on the boat harbor site have been designated commercial. The existence of the boat harbor would likely encourage other commercial development in the Lousetown area.

Land Transport

The Automobile

Traditionally, the automobile has not been an important mode of transportation in Bethel. Bethel has only approximately sixteen miles of roads and no definite plans of adding any major roads. But as Bethel has spread out over the past decade, the automobile has increased in importance. With new housing being built a couple of miles west and northwest of town, the importance of the auto will likely continue to increase. Table 24 specifies vehicle registration for calendar year 1980.

TABLE 24

(2) Registration of snow machines is optional.

Source: Alaska Department of Public Safety, Division of Motor Vehicles, Bethel.

Bethel has extensive taxi cab service with fifty-seven registered cabs as of December 1981. A private bus service called "Hustlebuggy" has been operating for the past couple of years with a single 19-seat bus. In mid-January 1982, "Hustlebuggy" began operating two new 21-seat buses and developed two routes and schedules.

Proposed Roads

A road from Bethel to Napakiak has been discussed for several years. The road is not likely to be built due to high cost estimates (\$20 million) and low benefits. The Alaska Department of Transportation and Public Facilities does not plan to seek funding for the road in the near future (Edwards).

Engineers Galliett and Silides have prepared a report on the Yukon-Kuskokwim Crossing for the Alaska State Legislature. The study emphasized the economic benefits of constructing a year-round haul road connecting the Yukon and Kuskokwim Rivers. The termini of the crossing would be Paimiut Slough on the Yukon and Kalskag on the Kuskokwim. The study noted that the Y-K crossing would allow the Yukon market to utilize the better access and better port at Bethel. The crossing would also open the Bethel market to Yukon mineral, timber, and agricultural resources. The construction of the crossing would undoubtedly increase the importance of the port of Bethel and expand the role of Bethel as a regional center.

Other Motorized Transport

Snow machines and 3-wheel vehicles are popular modes of transport during the winter. 3-wheelers are also used during the summer. Both vehicles usually travel on the web of trails that wind through the City. As the popularity of snow machines and 3-wheelers increase, and as more housing is constructed, conflicts are likely to increase between landowners that have trails crossing their property and the users of the trails.

United Transportation (UT) has conducted tests over the past couple of years assessing the feasibility of air cushion vehicle operation on the Kuskokwim River. UT has decided that the air cushion vehicle is not economically feasible to operate during the summer because of inexpensive competition from boats. UT is undecided about the economic feasibility of air cushion vehicle operation during the winter (Hoffman).

Pedestrian

A large portion of Bethel residents walk as their primary means of transport. Pedestrians use many of the same trails used by snow machines and 3-wheelers. Foot traffic during the summer is hindered by the many lakes and sloughs and the muddy condition of the trails and road shoulders. Winter movement is usually easier than summer because the lakes, sloughs, and mud are frozen and covered with snow. However, walking becomes hazardous in the winter when the

temperature warms above freezing, creating a very slippery surface. Boardwalks are constructed alongside some of the major roads. Many of the boardwalks are in poor shape due to severe weathering and poor maintenance.

ENERGY

Energy Supply and Demand

Electricity

Electricity is supplied by Bethel Utilities Corporation (B.U.C.), a private company. All electricity is supplied by four 2100 kilowatt diesel generators with a combined power capacity of 8400 Kw. Peak loads in 1981 were approximately 3200 Kw in the summer and 4000 Kw in the winter. In 1981, 1416 customers used a total of 21,068,096 kilowatt-hours. Following is a breakdown of electrical consumption by consuming section, including the cost to the consumer based on the rate structure as of December 1981.

TABLE 25

Bethel Electrical Consumption - 1981

	<u>Bulk</u>	<u>Commercial</u>	<u>Residential</u>	<u>Other</u>
Number of Customers	3	209	1,199	5
Combined Annual Consumption (Kwh)	2,694,425	13,276,836	5,059,340	37,495
Average Monthly Consumption/ Customer (Kwh)	74,845	5,294	352	625
Average Cost, not including surcharge and tax (¢/Kwh)	12.8	14.3	17.2	NA
Average Cost including surcharge and tax (¢/Kwh)	15.9	17.2	21.8	NA

NA = Not Applicable

Source: Bethel Utilities Corporation

Bethel Utilities Corporation has reached an agreement with Alaska Power Authority that will allow B.U.C. to participate in the state's power cost assistance program. The program should reduce electrical costs by about 4.5¢/Kwh for eligible (non-commercial) B.U.C. customers.

Petroleum

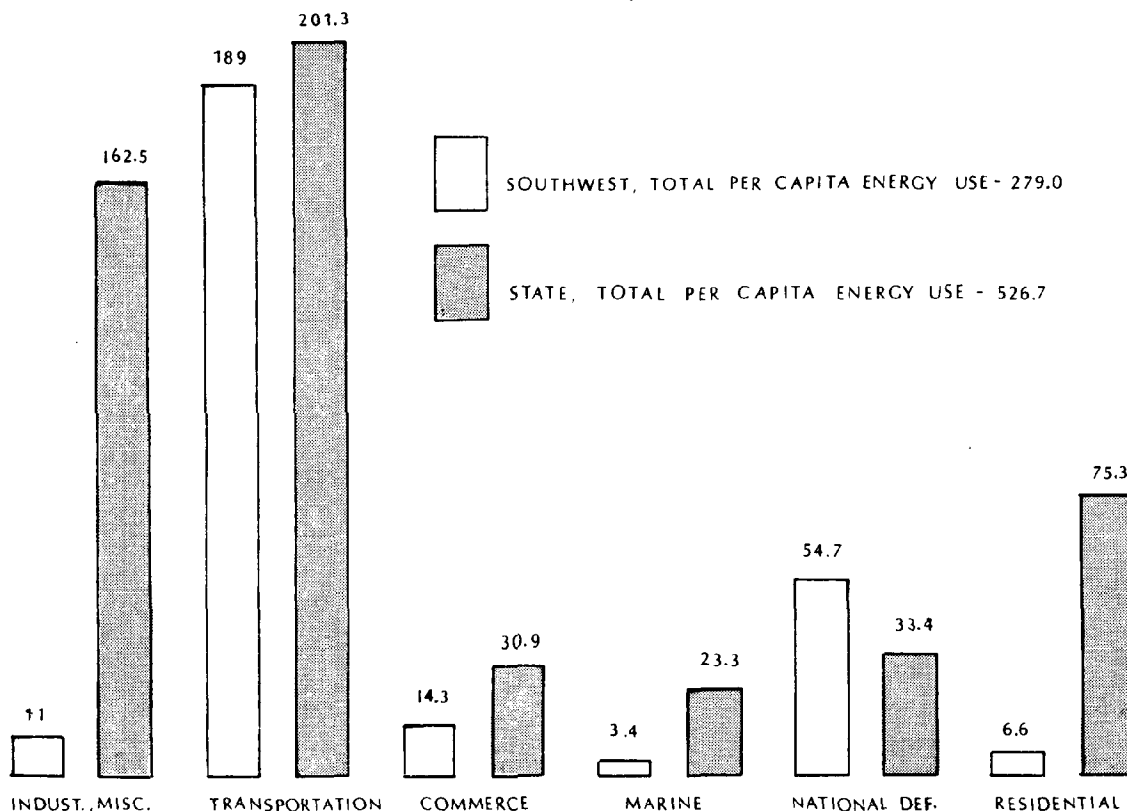

Chevron U.S.A. owns and operates the bulk petroleum distributorship in Bethel. The Chevron tank farm has a bulk storage capacity of 8 million gallons. 13.5 million gallons of petroleum was delivered to Bethel in 1981 with about 6 million gallons redistributed throughout the Yukon-Kuskokwim Region.

Regional Energy End Use

Energy end use analysis illustrates the quantities of energy used by various consuming sectors. End-use data are not available for Bethel, but data are available for the Southwest region. The following figures compare regional energy end use with statewide energy end use.

FIGURE 22

1979 Per Capita Energy End Use (Million BTU)

SOURCE: ALASKA LONG TERM ENERGY PLAN - DRAFT

Figure 22 illustrates that per-capita energy use in the southwest region is just over half (53%) of per-capita energy use in the state as a whole. The southwest region contains 7.5% of the state's population, but uses only 4.0% of the state's energy.

Figure 23 emphasizes the stark difference in energy end use in the southwest region as compared to the rest of the state. Transportation is proportionately a far larger energy user in the southwest than the state as a whole,

while residential and industrial uses use a far smaller share of southwest energy than in the state as a whole.

FIGURE 23

SOURCE: STATE OF ALASKA LONG TERM ENERGY PLAN- DRAFT

Regional Energy Supply

End use energy (energy in a usable form) in the southwest region is supplied almost totally by petroleum products, with the balance being supplied by electricity. State-wide, a large proportion of energy is supplied by natural gas. Regional and state energy supplies are illustrated in Figure 24.

FIGURE 24

1979 Energy Supply (percent)

SOURCE: STATE OF ALASKA LONG TERM ENERGY PLAN - DRAFT

Potential Energy Sources

Hydro

The hydroelectric dam proposed near Bethel that has been most thoroughly studied and is considered most economically feasible is the lower falls site on the Kisaralik River. The proposed project would consist of two 15,000 Kw generators and would be able to produce 131,400,000 Kwh per year. Electricity would be delivered to Bethel via a 69-mile transmission line. Power would be distributed from Bethel to 11 surrounding villages. Busbar Cost (cost at the power plant) estimates are compared in Table 26.

TABLE 26

Estimates of Busbar* Electricity Costs
Busbar Cost of Electricity (¢/Kwh)

	<u>1980</u>	<u>1990</u>	<u>2000</u>
Continued use of diesel (Bethel)	12.6	21.0	35.8
Small communities local diesel	32.7	62.0	102.1
Intertied system diesel only	14.7	20.8	35.1
Intertied system with Kisaralik hydro	----	30.6	17.8

Source: Retherford Associates

*Busbar is cost of electricity produced at the power plant, not cost to consumer.

The Kisaralik hydro project does not appear to be close to becoming reality, as several unanswered questions remain concerning the economic feasibility of the project and potential environmental damages. The Alaska Power Authority

commissioned a study that began early in 1982 to reassess the potential of a regional power system centered in Bethel and to serve as a follow-up to the reconnaissance study of the Kisaralik Hydro Project and alternate sources conducted by Robert W. Retherford Associates in 1980.

Wind

The potential for tapping wind as an energy source is very good in the Bethel area. The average annual wind speed at a height of 20 feet (the anemeter height) is 11.2 mph and at 60 feet (a good tower height) is 13.9 mph. Average monthly wind velocities are shown in Table 27.

TABLE 27

Average Monthly Wind Velocity (MPH)

<u>Month</u>	<u>H=20 ft</u>	<u>H=60 ft</u>	<u>Month</u>	<u>H=20 ft</u>	<u>H=60 ft</u>
Jan	12.2	13.9	Jul	10.0	12.5
Feb	13.1	15.2	Aug	10.5	13.1
Mar	12.3	16.3	Sep	10.6	13.2

Jun	10.2	12.7	Dec	<u>11.3</u>	<u>14.1</u>
			ANNUAL	<u>11.2</u>	<u>13.9</u>

Only one wind generator is currently operational in Bethel. The National Guard Armory installed an Enertech 2 Kw-rated system in early November 1981 and tied the system into the Armory's electrical system in early December 1981. So far, tests have been encouraging. The system has been producing an average of 8.4 Kwh per day, (including

low wind days), almost enough to power one house at current Bethel consumption levels. Table 28 summarizes the characteristics of the system.

TABLE 28

Summary of National Guard Armory Wind System

Make:	Enertech	Power Rating:	2 Kw
Tower Height:	60 Feet		
Wind Required for Start up:	14 mph (at 60 ft.)		
Primary or Secondary Electrical Source:	Secondary Source. No battery storage, provides electricity via A.C. generator.		
Average Electrical Production Per Day:	8.4 Kwh		

The Armory wind system had an initial cost of over \$10,000. The high investment cost of a small (2 Kw) wind system is too large for the average homeowner. The long-term payoff of a small wind system is becoming economically competitive with diesel generated electricity. The Lower Kuskokwim School District has plans to install a 4 Kw Enertech wind system near the high school during the summer of 1982.

Coal

Nunivak Island is known to contain small coal deposits, although the volume is undetermined (Prince). Another known coal deposit is the Nulato Coal Field, 300 miles to the northeast on the Yukon River. The deposit is not considered economically recoverable due to steep topography and thin coal seams. A large peat resource likely exists but perma-

frost precludes extraction (Retherford Associates).

Waste Heat

Bethel Utilities Corporation plans to begin construction in January, 1982, on a project that will tap waste heat from its generators and supply heat to the PHS Hospital and PHS housing. A good chance exists of hookup agreements being reached in 1982 between B.U.C. and the City of Bethel, Kuskokwim Community College, and KYUK Radio and TV. B.U.C. estimates that the power plant loses an average 12 million BTU/hour as waste heat, theoretically enough to heat one-third of the buildings in Bethel (E.S.E. estimate).

Geothermal

Three geothermal sites are known to exist within 100 miles of Bethel. The three sites are 1) Mitchell in the Chilmuck Mountains; 2) Tuluksak Hot Springs near Nyac; 3) Ophir Creek Hot Springs near White Bear Lodge. The Ophir Creek site is used to heat a home and a lodge. None of the sites have temperatures or flow rates sufficient for commercial use (Retherford Associates).

Solar

Bethel has a good potential for passive solar space heating and for solar hot water heating. A 1978 study on solar energy potential in Alaska (Seifert and Zarling) concluded that active solar hot water heating was economically

competitive with electric hot water heating (at 10¢/Kwh), but not quite competitive with oil fired hot water heating when oil cost 53¢/gallon. Residential electricity now costs 21¢/Kwh and oil costs \$1.31/ gallon so the cost comparisons are likely to be significantly different.

Passive solar heated buildings have been proven cost-effective in Alaska (Alaska Department of Commerce and Economic Development, 1981). A passive solar building design has little or no extra construction costs when compared to conventional buildings. The solar insolation data in Table 29 was applied in Table 30 to illustrate the effectiveness of passive solar heating in a typical Bethel home design.

Assumptions

House Size: 20 feet x 30 feet x 8 foot-high walls
 Insulation: Floor and Ceilings = R-31; Walls = R-19
 Windows: Two 3 foot x 4 foot south facing; one 3
 foot x 4 foot each, facing west and east.
 All windows are doublepane, insulation
 value = R-2

Assume proper placement and volume of thermal storage
 mass.

* When calculating annual % solar heated, average daily heat
 gain cannot be greater than the average daily heat loss.

Wood

Use of wood for space heating is very common in Bethel.
 Individuals travel up the Kuskokwim to cut trees, or gather
 wood on shore or floating in the river. Wood is usually
 used as a secondary heat source, although some people heat
 primarily with wood. The decentralized nature of acquisition

and use of wood make estimation of quantities used in Bethel very difficult, but a rough estimate of wood use in Bethel is as follows:

Estimate of Wood Heat Use in Bethel - 1981

1970 Census estimate of Bethel households that use wood	11% (79 houses)
1982 ESE estimate	20% (250 houses)
Amount of wood used to completely heat home	8 - 10 cords/year
Amount of wood used by average home	4 cords/year
Total amount of wood used in Bethel	1,000 cords/year (4 x 250)

Conservation

A multitude of state conservation programs exist, many a result of the Alaska Energy Conservation Act of 1980. Examples of programs active in Bethel include inexpensive residential audits, weatherization grants, emergency fuel assistance loans and grants, and seminars. The Division of Energy and Power Development estimates six trillion BTU's saved statewide in 1980 from the low income weatherization program alone (DCED, 1981). The Bethel Utilities waste heat project will conserve electrical consumption and provide a source of heat less expensive than oil. Another possible source of waste heat could be a thermal reduction plant for solid waste. Subterranean housing

is an energy efficient construction style that has some historical roots in the lower Yukon-Kuskokwim region (Angaiak, Personal Communication).

Exploration for Petroleum and Natural Gas

Exploration and testing activities have indicated that a moderate potential exists for natural gas and petroleum reserves in the Bethel area. Tests in 1959-61 near Numavakpak Lake, 30 miles west of Bethel, resulted in a dry hole but some indications of oil. Etolin Strait, between Nelson Island and Nunivak Island about 100 miles west of Bethel, has a high potential for oil deposits (Alaska Regional Profiles).

Calista Corporation owns subsurface rights to all native corporation lands in the region. Calista contracted with AMOCO to conduct seismic surveys for oil and gas potential in the region. To date, Calista has not released the results of the AMOCO surveys, amid considerable speculation that oil and gas deposits exist.

COMMERCIAL FISHING AND FISH PROCESSING

Commercial Fishing

Commercial fishing in the Kuskokwim area was reported as early as 1913, yet the Kuskokwim River salmon fishery remained virtually undeveloped prior to Alaska Statehood in 1959. The commercial salmon fishery has grown considerably since statehood and represents an important source of income to the people of the Kuskokwim area. Bethel has

become a major center for area fishermen with the establishment of several fish buying operations and reliable transportation facilities.

The most valuable commercial fish species in the Kuskokwim River are the five species of Pacific salmon: king, coho or "silver", chum or "dog", red or "sockeye", and pink or "humpback". Although all five species of salmon occur in the Kuskokwim River, the king, coho and chum salmon are present in commercial quantities. Red and pink salmon are more abundant in the Kanektok and Goodnews River drainages. Other important fishery resources include whitefish, sheefish, burbot or "lush", pike and blackfish.

Traditional methods of fishing are employed by local fishermen, although modern materials have replaced fishing gear made from local materials. Both drift and set gill nets are legal types of commercial fishing gear, however set gill nets are more commonly utilized by subsistence fishermen. Fishing is conducted by setting the gill net from the fishing vessel and then drifting with the river current. The fishing vessels of the Kuskokwim River are typically long, narrow skiffs and are operated by a two-man crew.

The Kuskokwim River management area includes all waters of the Kuskokwim River drainage, and all waters from Cape Newenham to the Kaskonet Peninsula (ADFG). Commercial fishing is permitted in four districts: the Middle Kuskokwim River, the Lower Kuskokwim River, Goodnews Bay and the

Quinhagak area. The Lower Kuskokwim District, from Eek Island to Mishevik Slough below Tuluksak, encompasses the largest area and supports the greatest commercial fishing effort. The Lower Kuskokwim River fishing effort from 1965-81 is presented in Table 31.

1/ Number of actual fishing vessels in Lower Kuskokwim District

Source: Alaska Department of Fish and Game.

The management of the commercial salmon fishery is conducted by the Department of Fish and Game in Bethel. Due to increased fishing efforts and gear efficiency in recent years, the Kuskokwim River commercial fishing regulations have been fairly restrictive. Conservative management of the commercial fishing industry has insured sufficient

salmon to satisfy subsistence needs and meet salmon escapement requirements.

The king salmon season is regulated by emergency order and is generally a short season due to the intensity of the run and increased fishing efforts. The 1981 Kuskokwim River catch was 47,663, a 21% increase from the previous five-year average. Although the commercial utilization of king salmon has increased, the subsistence king salmon fishing remains predominant in the Kuskokwim River districts.

The chum salmon season is conducted from July 26-31, and is generally permitted only in the lower Kuskokwim River fishing district below Bethel. Commercial chum salmon fishing is also allowed in the middle Kuskokwim district, but fishing effort and harvest is low compared to the lower Kuskokwim district. The commercial utilization of chum salmon has increased steadily since its initiation in 1971. In 1981 the chum salmon run was exceptionally strong corresponding with a high effort and the Kuskokwim River catch was reported as 418,677. This was the second longest catch recorded and was 32% above the previous five-year average.

After July 31, the commercial coho fishery is conducted by emergency order due to the variability of the coho run. The length of the coho season has decreased in the last few years from 108 hours in 1978 to fifty-four hours in 1981. Again, the short fishing periods are conducted in response

to the intensity of the present fishing effort.

Despite the short salmon season the 1981 Kuskokwim River catch was 726,258 salmon, the second largest catch recorded (the 1980 catch was 742,297 salmon). A breakdown of the catch is presented in Table 32.

TABLE 32

Kuskokwim River Catch Data, 1976-1981

^{1/} Kuskokwim River includes the middle and lower Kuskokwim Districts

Source: Alaska Department of Fish and Game

The economic value of the 1981 Kuskokwim area catch to the area fishermen was estimated at \$3,767,000. The economic value represents the gross dollar value of catch to fishermen, plus wages earned by processing plant employees and tender boat operators. Approximately twenty percent of the 826 permit holders were residents of Bethel (ADFG).

Besides salmon the commercial utilization of whitefish has increased in recent years. The major commercial whitefish fishery occurs incidental to the August coho season

and the majority of whitefish are sold to Bethel stores to satisfy a local market. In addition, a limited fall and winter whitefish fishery is conducted by the Department of Fish and Game. In 1981 three whitefish permits were issued in Bethel.

A commercial herring fishery has recently developed in the Kuskokwim area. In Security Cove, Goodnews Bay and Cape Romanzof, the development of a herring fishery was initiated in 1978. The herring fishery in these areas has grown significantly since its initiation, producing over 1000 metric tons in 1980. (Table 33). Projections of the herring catch and fishing effort in the Kuskokwim area during the years 1980-2000 were estimated by authors of the Sea Grant Study. The projections indicate that the herring harvest is expected to remain constant, while the fishing effort may increase moderately (see Table 34).

Fish Processing

Fish processing in Bethel is limited to three major fish buying operations: Kemp & Paulucci Seafoods of Duluth, Minnesota, Elm Fisheries, Inc., and J.B. Crow and Sons. All three fish buyers operate facilities capable of cleaning and dressing fish. The fish is then iced and transported out of the area by air or by sea. Both Elm Fisheries and Kemp and Paulucci have the facilities to freeze fish which enables them to utilize water transportation. Processing operations take place from June to September.

J.B. Crow and Sons began their fish buying operation in the Bethel area in 1966. The processing facility consists of two small freezers with a combined estimated storage capacity of 25,000-30,000 pounds. The freezers are used for the storage of heads, roe, and seconds. Crow exports up to one million pounds of fresh salmon annually.

The largest portion of the Kuskokwim River salmon catch is purchased by Kemp and Paulucci. The company works in agreement with the Kuskokwim Fishermen Cooperative who conduct the processing operation on the co-op barge, the Upiat. The barge facility has two freezers, each with a 35,000 pound capacity. In addition, the barge contains freezer holds for the storage of frozen salmon pallets. The capacity of the freezer holds is 450,000 pounds. The frozen fish are transferred to a Japanese tramp in Bethel and shipped to Japan.

Processing capabilities were further increased in Bethel with the completion of the Elm Fisheries freezer facility. The facility is capable of freezing 200,000 pounds of salmon within a twenty-four hour period. In the past, Elm Fisheries has handled approximately twenty-five percent of the Kuskokwim River catch. With the new facility, Elm hopes to handle a larger portion of the commercial catch and are exploring the economic viability of other potential commercial resources in the area.

In a report titled A Technical Appraisal and Assessment of the Bethel Fishing Industry, the development of additional processing facilities was unadvisable. The two major constraints were the cost of constructing a tender facility and the limited salmon resource supply to accommodate an additional major fish buyer.

More likely, the expansion of the commercial fishing industry will be dependent on the local processors' ability

to integrate the processing of other commercial resources into the existing plant capacities.

In recent years, the local demand for whitefish has stimulated the development of a small commercial whitefish fishery. An important consideration for further development of this fishery is the relatively low-cost investment to adapt the present processing facilities for the processing of whitefish. However, several major factors limit the economic viability of a large scale whitefish fishery including the following.

- . the subsistence utilization of the Kuskokwim whitefish fishery,
- . uncertain marketability of whitefish products,
- . high transportation costs,
- . the absence of trained labor, and
- . the high overhead associated with the operation of a year-round processing facility.

A small whitefish operation may be economically viable for two reasons. First, the market for whitefish exists in most of the large Native communities in the region as well as Bethel. Second, the overhead associated with operating a small freezer facility would be greatly reduced.

The bottomfish industry is just beginning to develop in Southwestern Alaska. Based on a study entitled The Growth of the Nunam Kitlutsisti Region: A Projection 1981 to 2000, the bottomfishing efforts in the Bering Sea will

require the development of land-based processing facility by 1995. The processing facility will be located in Goodnews Bay and employment will be allocated to the coastal and Kuskokwim regions and Bethel (Husky).

FOREST DEVELOPMENT POTENTIAL

Resource Potential

Reid, Collins, Inc. released a study in June, 1981 of the forest development potential in the Middle Kuskokwim. The study, prepared for the Kuskokwim Native Association, concluded that a sufficient quantity and quality of timber resources exist to supply the demand of the Kuskokwim villages and Bethel, as well as support a timber export facility. The study maintained that a mill supplying only local demand would not be an efficient use of the available resource and recommended a mill and export facility that would supply Japanese demand. A major source of North American log exports to Japan is private lands in the Pacific Northwest. The Northwest supply faces immediate contraction and the Kuskokwim resource should become more attractive to Japan (Reid, Collins). Bethel has an advantage over Northwest ports in that Bethel is four to five sailing days closer to Japan.

Reid, Collins suggested that a cost effective timber operation would export raw logs to Japan and try to capture 50% of the local market for finished lumber (lumber is now imported from Washington). The suggested operation would have an annual output of 7514 million board feet (mbf). A local market-only mill would have an annual output of 1750

mbf. In contrast, the only sawmill still operating on the Kuskokwim produces seventy mbf per year (Reid, Collins, Inc.). The Kuskokwim Corporation is investigating the possibility of establishing a local market-only mill in the near future. Such a mill would likely be located adjacent to the resource, probably near Sleetmute (Cook, personal communication). An export facility is considered a long term possibility that may become feasible if the Japanese market becomes available. Bethel is considered a good location for an export facility.

Potential Impacts on Bethel

The Reid, Collins export mill site example would require 10.3 acres of land. Shoreline property would be necessary for loading operations. Log booms would add to the demand of the riverfront as a transportation corridor. Reid, Collins noted that modern log ships are usually in the range of 20,000 to 30,000 dead weight long tons (DWT) and require a draft of twenty to twenty-five feet. The Bethel port has an estimated capacity of 12,000 DWT and a draft of eighteen feet. Dredging of Oscarville Channel could increase draft capacity to twenty-two feet (Galliet and Silides).

The Reid, Collins export mill example would employ eleven people per shift with total wages of \$1500 per shift. Kuskokwim River timber would compete with Washington timber, resulting in an increase in local dollars spent on

local products. The fuel demand of the mill example would be 22.5 gallons per hour or 180 gallons per shift.

MINING

The mining industry currently does not provide any direct employment in Bethel and has an insignificant impact on the Bethel economy. The quantity of services provided to mining is impossible to determine, although Bethel probably provides some services such as transportation and retail sales.

The Bethel region is considered to have good deposits of several metallic and non-metallic minerals, although mining activities do not exist within 25 miles of Bethel. Some active mining sites in the region include: Goodnews Bay, 115 miles to the south; Quinhagak, 85 miles to the south; Canyon Creek, 80 miles to the southeast; Columbia Creek, 40 miles to the southeast; Akulikautak River, 25 miles to the southeast; Cripple Creek, 90 miles to the east; and the Tuluksak River near Nyac, 70 miles to the east. Minerals extracted include gold, platinum, antimony, mercury, copper, tin, tungsten, beryllium, chromite, and molybdenum. Silver has also been reported. Most of the Yukon-Kuskokwim Delta, including Bethel, is located in a sedimentary basin that is considered to have uranium potential. Coal, oil, and natural gas potential are discussed in the Energy section.

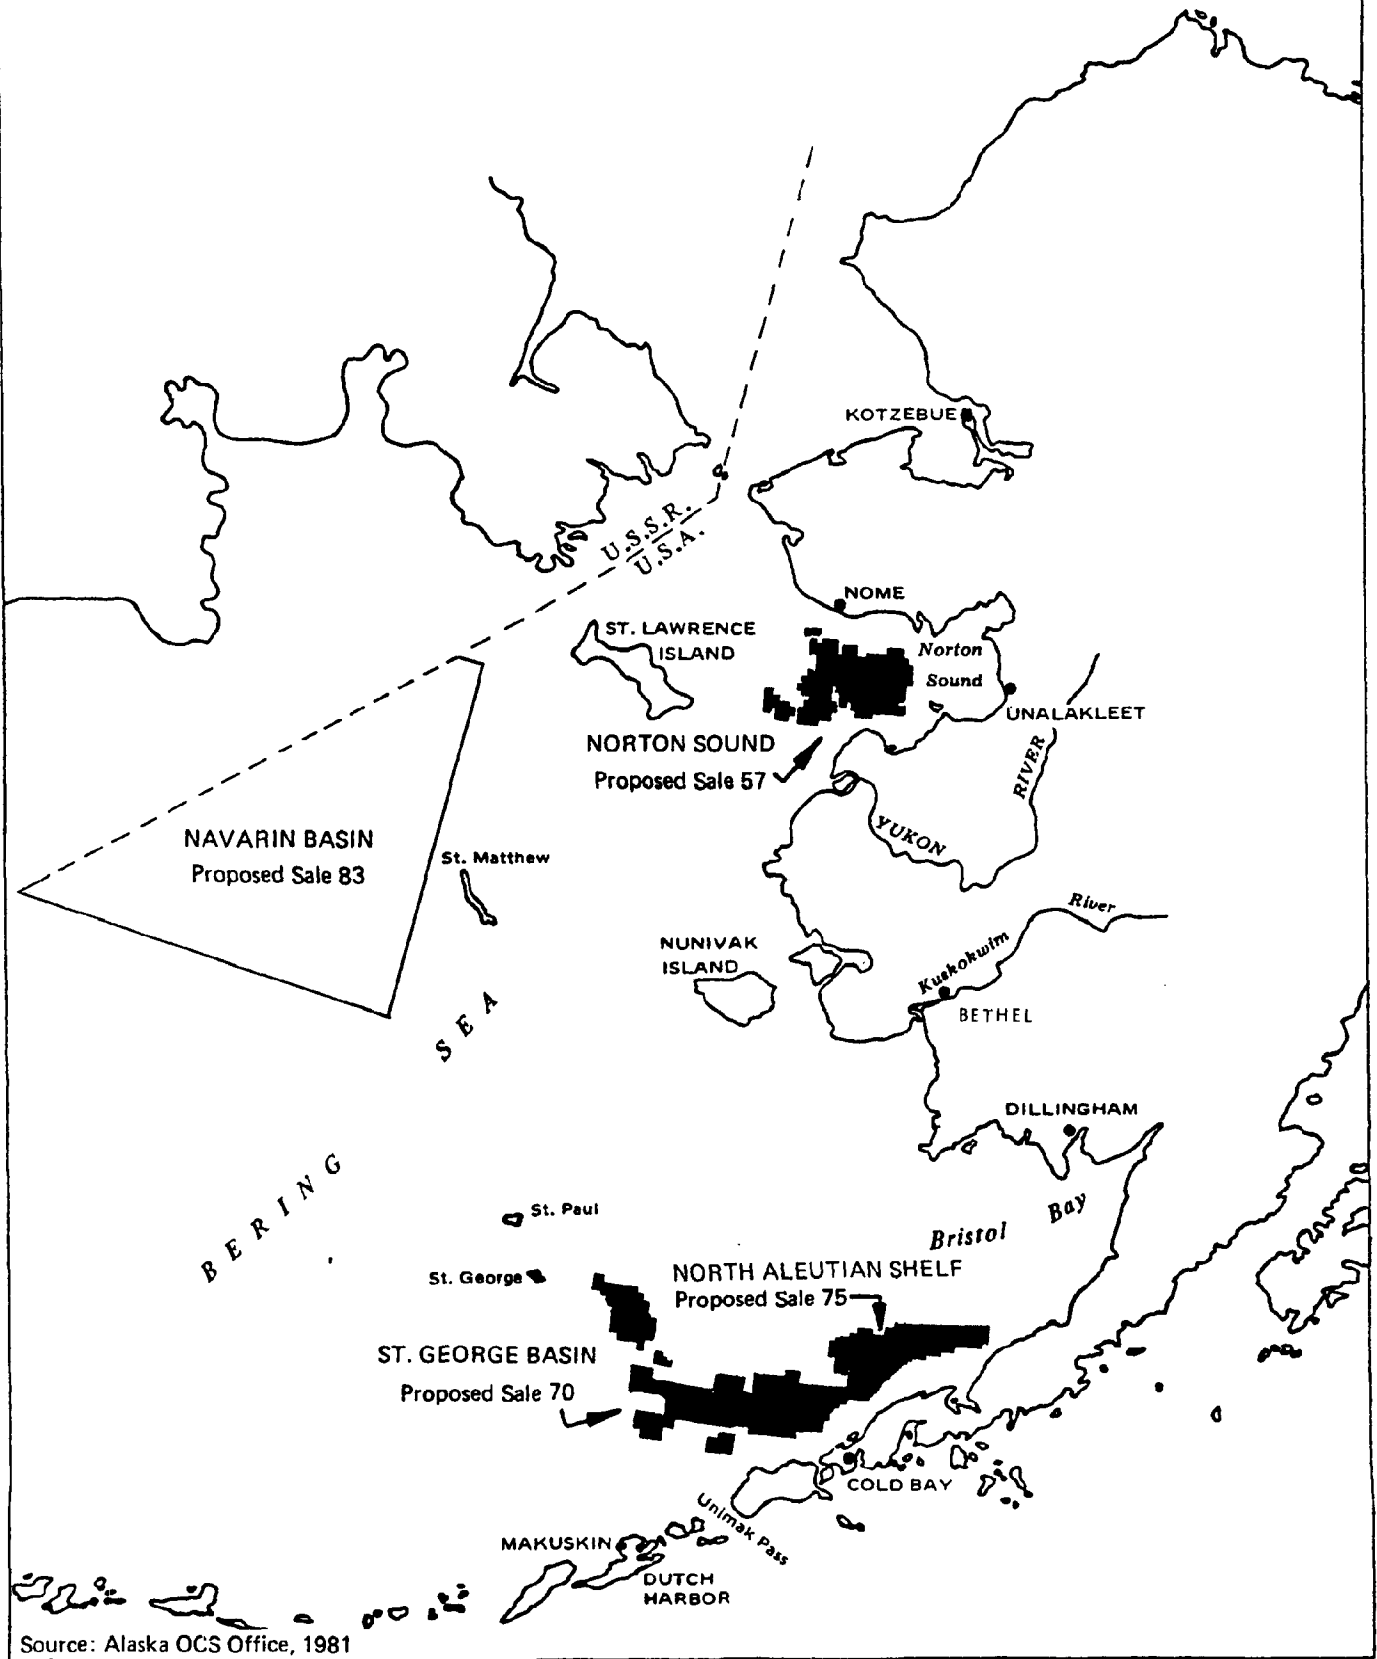

OUTER CONTINENTAL SHELF IMPACT ASSESSMENT

OCS Resource Potential

Outer Continental Shelf (OCS) petroleum exploration in the Bering Sea has shown moderate development potential. Figure 25 shows proposed lease sale areas in the Bering Sea. The North Aleutian Shelf and St. George Basin lease areas are considered the easiest areas to develop because of lack of substantial amounts of sea ice and close proximity to potential support facilities at Cold Bay and Dutch Harbor. However, hazards of the Aleutian lease areas include seismicity, volcanism and tsunamis. The Norton Basin experiences a substantial amount of sea ice, but is close to a potential regional support center at Nome. The Navarin Basin has formidable barriers to development that include sea ice, deep water and a long distance to an existing support facility (Tremont). The lease area closest to Bethel is St. Matthew-Hall. The waters of the area are too shallow for tankers and the area has recoverable resource estimates of virtually zero. St. Matthew-Hall is not scheduled for a lease sale.

Table 35 summarizes resource estimates and proposed sale dates of the proposed federal lease areas in the Bering Sea, and Table 36 summarizes petroleum potential of proposed state onshore areas in Southwest Alaska.

A 1981 U.S. Geological Survey open-file report has estimated undiscovered oil and gas resources for the Yukon-Koyukuk Basin, a large area that includes the Bethel Basin. The estimate for crude oil is zero, and the mean estimate (50% probability) for natural gas is 0.1 trillion cubic feet with a high estimate (5% probability) of 0.6 trillion cubic feet.

Sources of Potential OCS Impacts on Bethel

Any OCS-related impacts on Bethel are likely to originate from Norton Basin development. The Norton Sound region would absorb the bulk of the cultural, economic, and environmental impacts. The lower Yukon region is adjacent to southern Norton Sound and would likely experience a direct impact from OCS development in the Norton Basin (Husky). The lower Yukon is also part of the Bethel service area.

Impacts on Bethel from Norton Basin OCS development would be indirect, via the impacts on the lower Yukon villages. A "high find scenario" in the Norton Basin would probably create a "moderate impact" on Bethel. Potential impacts from onshore resource development near Bethel are still highly speculative but would likely be more direct and more substantial than OCS imports.

Potential Economic Impacts

The industries in Bethel most likely to be impacted by OCS development are the transportation and construction sectors. Offshore and onshore OCS facilities require shipments of cargo and people. If Bethel were to experience a "moderate-impact" scenario, its role as regional transportation center would be significantly expanded. A "moderate-impact" scenario would also increase the demand for Bethel construction services due to construction needs in the lower Yukon region.

Most of the labor required to fill direct OCS jobs would be imported. Table 37 illustrates projections of local and imported labor requirements for Norton Basin lease sale 88.

As Table 38 indicates, direct OCS employment impacts on Bethel are likely to be small. Most employment impacts are likely to be indirect.

Population Impacts

Significant population increases are often a function of increased employment opportunities. Employment opportunities resulting from Norton Basin OCS activities will concentrate in the Norton Sound Region, therefore OCS population impacts will also concentrate in Norton Sound. A "high-find" or "moderate find" scenario in the Norton Basin is likely to indirectly increase employment opportunities in Bethel, which may result in a small population increase.

Potential OCS-Related Facilities

A variety of facilities are associated with OCS development. Bethel is not likely to become a marine service base for OCS-related activities due to the long distance to any lease area. However, Bethel is likely to serve as an air support facility due to its position as the major air transportation hub for southwest Alaska.

A Bering Sea refinery would be economical if lease sales in the Bering Sea are successful (Alaska Research Service). Bethel could be attractive as a small refinery site because of a good port facility, availability of level land, availability of electricity and Bethel's role as the regional hub for transportation and commerce. Major obstacles to transporting crude oil by barge to Bethel include the short shipping season and the distance to Norton Sound. An alternative to moving crude oil by barge is moving it by pipeline. A short pipeline could deliver oil from Norton Sound to Bethel year-round and make a refinery feasible. However, obstacles to construction of a Norton-Bethel pipeline include the high investment costs of a pipeline, the presence of the Yukon Delta National Wildlife Refuge, and complex land ownership.

Bethel is incapable of becoming a major petroleum staging area or the terminus of a major pipeline. Tankers needed to supply such facilities require a draft of 66 feet (Alaska Department of Community and Region Affairs),

but Bethel is only capable of accommodating an 18-foot draft ship. The shallow draft capability of the Bethel port would also preclude location of a Liquefied Natural Gas (LNG) conversion plant, which requires a draft capability of 46 feet (Alaska DCRA).

Potential Socio-Cultural Impact

If a "medium-find" scenario becomes reality in the southern Norton Sound, the impact on the socio-cultural systems of the lower Yukon villages would be dramatic. A sudden influx of "outsiders" would bring large numbers of non-natives to a predominately native culture. Resource development and support facility construction would likely interfere with subsistence activities. In contrast the socio-economic impact on Bethel would likely be small due to Bethel's distance from Norton Sound. However, many municipal and cultural services are already strained due to Bethel's rapid population growth. Bethel may be incapable of accommodating even a small population growth.

Potential Environmental Impacts

Potential environmental impacts on Bethel from Norton Basin development are likely to be minimal. The location of OCS-related facilities in Bethel faces either physical or economic constraints. An unlikely exception could be the construction of a refinery in Bethel. The environmental impacts of refineries are diverse, affecting air quality, water quality, soil stability and aesthetics.

TOURISM

A 1979 survey by Darbyshire and Associates for the Bethel Comprehensive Plan seems to indicate that Bethel residents do not favor the development of a tourist industry (some residents doubt the accuracy of the survey). 46% of the survey respondents felt tourism was undesirable, 16% felt tourism was desirable, and 22% had mixed feelings. Despite the apparent negative public sentiment towards tourism, Bethel contains some resources that could support a significant tourist industry.

The resources that could be most easily developed for tourism in Bethel would be sport fishing and hunting. These two sports currently provide a small amount of tourist activity in Bethel. Rainbow trout is common in most of the streams along the lower Kuskokwim River. The average size of King salmon in the Kanektok River (on Kuskokwim Bay) is among the largest in the state, with 30-40 pound fish common. Hunting and fishing camps combined for over 25% of the 17,400 total visitors in 1978 to the towns of Barrow, Prudhoe Bay, Nome, and Kotzebue. The average charge for a guide was \$300.00 per person per day and the average charge for a hunting or fishing camp was \$75.00 per person per day (Berger and Assoc.). Tourism in these four western and

northern towns is dominated by packaged tours. Packaged tours do not currently operate in Bethel. The extensive tourist industry in other western and northern towns as compared to Bethel, and the attractive hunting and fishing resources in Bethel, combine to illustrate the potential for a tourist industry in Bethel. However, a major obstacle to expansion of the sport fishing and hunting industry would be competition with subsistence activities.

Another potential tourist attraction is the Kuskokwim 300 Dog Sled Race. The race is well known in Alaska and increasing in popularity each year. Currently, visitors are almost always directly connected to the race and volunteers in Bethel provide most of the visitors' accommodations.

The employment industries usually affected by tourism are, in order of impact; transportation, retail trade including eating and drinking places, hotel and lodging places, and amusement and recreation services. Bethel is served by an extensive transportation industry that could probably easily accommodate an influx of tourists. The retail trade, lodging, and recreation industries would likely have to expand to accommodate an influx of tourists.

RESOURCE ANALYSIS

CHAPTER 3

RESOURCE ANALYSIS

Under section 6 AAC 85.060 of the guidelines of the Alaska Coastal Management Program each district is required to include a resource analysis which describes the following:

- 1) Significant anticipated changes in the matters identified under the Resource Inventory;
- 2) An evaluation of the environmental capability and sensitivity of resources and habitats, including cultural resources, for land and water uses and activities; and
- 3) An assessment of the present and anticipated needs and demands for coastal habitats and resources.

The analysis is divided into four sections. Natural, economic and cultural resource analyses follow the lines developed in the previous sections. Also a land use compatibility matrix is provided to be used as a decision-making tool, with the caution that land use compatibility is only one of many factors to be considered in the decision-making process.

Two issues, wetlands and riverfront land use, are considered in separate chapters. These two have been singled out for more in-depth analysis since the issues are quite complex and important to the future development of Bethel.

NATURAL RESOURCES

Significant changes to the natural resources in the Bethel area are likely to originate from either intensified human activities or natural occurrences of the Kuskokwim River. The human activities include increased urban development or increased resource utilization. Natural occurrences of the Kuskokwim River include flooding and bank erosion.

Past urban development has occurred without consideration to natural drainage patterns in the area. Basically all of the Bethel area is wetlands, and most has poor drainage. Any obstruction of the natural drainage patterns intensifies ponding, flooding, and erosion problems. A comprehensive drainage study is needed that will include proper locations for culverts, drainage easements, and the development of subdivision standards. Wetlands management should be addressed in depth.

Most of the soils in the Bethel area are not suitable for urban development, a condition that is compounded by the fragility of the permafrost that underlies Bethel. Construction of roads and buildings which exposes the permafrost causes it to melt, which in turn causes slumping and buckling. Melted permafrost is very unstable and is a major factor in drainage problems in Bethel. The Kuskokwim bank erosion is a natural example of how melting permafrost

accelerates erosion. Better construction practices may
be helpful in reducing damage to the permafrost.

Most of the fish and wildlife habitats surrounding Bethel can be classified as either freshwater habitat or as wetlands. Both habitats are very sensitive to human caused disturbances. Wetlands and freshwater habitats are crucial for fish, waterfowl, and furbearers. The habitats surrounding Bethel are experiencing increasing pressure from urban expansion, and intensified hunting and fishing pressures from subsistence, commercial, and sport users. Detailed studies and careful management of the fish and wildlife resources in the Bethel area are needed in order to insure the sustainability of the resources. Nomination of the area used most heavily for subsistence by Bethel residents as an AMSA (area meriting special attention) would be a good way of focusing attention on these resources.

The Kuskokwim River is the most vital and most dynamic natural resource in Bethel. The river is not only a vital fish and wildlife habitat, but is a dominant feature in determining the future development of Bethel. The gradual movement of the river channel is resulting in an erosion problem that is threatening many businesses and homes on the waterfront. There are plans to begin the initial phase of a bank stabilization project that will consist of seawall and articulated concrete mat. Flooding is a natural phenomenon of the Kuskokwim River that occasionally drastically alters the physical appearance of Bethel. Most of

the developed portion of Bethel lies within the flood plain.
Efforts need to be made to discourage future construction
in the flood plain.

CULTURAL RESOURCES

The City of Bethel has experienced tremendous population growth over the past two decades. Bethel's role as a service, transportation, and economic center for the Yukon-Kuskokwim Delta region suggest that the community's population will continue to grow. However, the rate of growth will depend on many external factors including changes in government policies, particularly those which affect Federal and State expenditures for the support of social service agencies, employment assistance programs, the PHS hospital, and capital projects; and major regional economic developments, including forest products, mining, and petroleum activities.

Future population growth in Bethel will necessitate increased city utility services and the expansion of community facilities. Current methods of waste disposal including solid waste, sewage, and grey water runoff will not be adequate as the community continues to grow. The construction of the new public utility facility will alleviate the immediate problems; however, the development of a comprehensive long range utility plan is badly needed.

Increased community growth will also demand the construction and development of facilities and areas for cultural and recreational pursuits. Funding for such facilities has mostly come from State legislated appropriations which will continue to be the only reliable source of

funding in the near future. While the State appropriations for capital projects finance the construction costs, the City is responsible for the projects' operation and maintenance costs. To insure that the cost of capital projects incurred by the City is not excessive, feasibility studies that include a cash flow analysis of the capital project should be required.

The City's development of community and neighborhood parks, the maintenance of adequate open space, and the expansion of community facilities is contingent on the availability of land to the City. At present the City owns only three percent of the land within the entire city limits, and is limited in its ability to provide the basic city services and recreational and cultural amenities demanded by the community. The City is entitled to receive not more than 1,280 acres of land for municipal expansion purposes from the Bethel Native Corporation under Section 14(c)(3) of ANCSA. In deciding which lands might be conveyed the City should identify areas in which municipal expansion would be the most appropriate, and consistent with the City's long range planning efforts. The conveyance of municipal lands will not be completed until the status of other lands selected by the Bethel Native Corporation have been resolved.

Another concern expressed by the city regarding municipal expansion is the land use implications of the certification of pending native allotments, which encompass a

major portion of the developable land surrounding the town. In light of the eventual certification of these properties it would behoove the City to seek cooperation with landowners, developers, and federal agencies, namely the BIA, in their planning efforts.

An additional area where land use is of particular importance to the community is along the riverfront. The factors of erosion, economic activities, and intense multiple use combine to warrant special attention to riverfront land use.

As the City of Bethel experiences increased community development the potential for conflicting land uses is certain to arise. Because of the importance of the natural resources of the Kuskokwim River to residents of Bethel for subsistence, recreation, transportation, and economic activities, an evaluation of existing and potential conflicting land and water uses and activities is provided in the Land and Water Use Compatibility Matrix.

ECONOMIC ACTIVITIES

Over the past two decades Bethel has experienced tremendous economic growth concurrent with its population growth. The growth has been directly related to the expanding role of Bethel as the center of transportation, government, and services for southwest Alaska. Recent governmental cutbacks have severely impacted government and social services, and will likely have a negative effect on the Bethel economy for at least the short term. However, several other factors have the potential for contributing to rapid economic growth in the future including energy development, tourism, and expansion of the transportation industry.

Electricity is produced in Bethel and all the surrounding villages by expensive diesel generators. The Kisaralik River Hydro project has been proposed as a source of inexpensive electricity, but many economic and environmental questions remain unanswered. The Bethel National Guard Armory has a small wind generator that is operating, but investment costs are still too prohibitive for the average homeowner. Other energy alternatives being explored and developed include increased use of wood, solar technologies, and conservation.

The potential for impact from Outer Continental Shelf (OCS) activities has caused considerable concern in Bethel. Bethel's role as the transportation and service center for

southwest Alaska may attract OCS activities, despite the long distance to lease sale areas. The municipal and social services in Bethel are already strained due to rapid population growth and a sudden influx of OCS-related population may overload the services. Bethel needs more specific information concerning potential OCS impacts.

The transportation needs of Bethel have expanded significantly in the past and are expected to continue growing in the future. Plans for the immediate future include construction of a badly needed transshipment dock and construction of a small boat harbor. The small boat harbor has

caused some consternation because it will be built in the flood plain, will destroy forty-two acres of wetlands, and the site is adjacent to some cautious neighbors. The proposed Yukon-Kuskokwim crossing would have a significant impact on port activity and would increase availability of some consumer products in Bethel.

Commercial fishing (primarily salmon) is a major component of the Bethel economy during the summer. The industry thrives on a fragile and limited resource, therefore educated and careful management is essential. The development of a whitefish or bottomfish industry has some potential but more detailed biological and market research is needed.

The tourist industry is practically non-existent in Bethel. However, a considerable potential exists to develop fishing and hunting tours or promotion of the Kuskokwim 300 Sled Dog Race.

CONFLICTING LAND AND WATER USE DEMANDS

In the planning and approval of future land uses and activities along coastal areas, development which may adversely affect the natural environment and preservation of resources and which would be incompatible with existing surrounding land uses should be avoided. The following figure illustrates the degree of compatibility that exists among selected land uses. An explanation of the parameters is provided below.

Weighting Values

The degree of compatibility is weighted as being of high, moderate, or low compatibility. High compatibility represents a condition when, in most cases, the land use is compatible with another selected use (as represented by the other parameters). A moderate weighting refers to a condition where the land use is partially compatible with another use and can be mitigated for further compatibility. Low compatibility refers to a situation when, in most cases, two selected land uses would produce major negative impacts or simply could not be carried out at the same location. The evaluation of compatibility between the selected parameters is fairly subjective. The matrix should be considered only as a guide for the district's coastal plan.

Parameters

The parameters on the y-axis (land and water uses and activities) are grouped according to 1) water dependent, 2) water related, and 3) non-water dependent. (The Coastal Management Standards require that districts and state agencies give first priority to water-dependent uses, second priority to water-related uses, and final priority to uses that are neither water-dependent or water-related, when planning for the development of coastal areas.) The x-axis of the matrix represents future or potential coastal uses and activities that are subject to the district program. The matrix is to be read horizontally so that the parameters on the y-axis are evaluated with the potential coastal uses on the x-axis.

Subsistence - refers to the use of the river for subsistence hunting and fishing. The concern for subsistence in this case is as much subsistence use outside the City boundary as it is inside the boundary.

Commercial Fishing - refers to the use of the river to take commercial fish harvests.

Seafood Process - refers to canneries and freezer processing plants and associated dock facilities.

River Transportation - includes public and private day use boat docks.

Cargo docks - refers to commercial docks as required for transshipment exchange and temporary storage.

Boat Harbor - pertains to docking/marina facilities for the continuous moorage of small boats, plus support facilities such as fuel sales, haul out areas and gear storage.

Sea Plane Transportation Facility - pertains to sea plane ports.

Oil and Gas Facilities - refers to petroleum storage tanks, docking and pumping facilities.

Air Cushion Vehicular Transport - pertains to the use of the river as a transportation corridor by hovercraft.

Tourism - pertains to facilities and services, such as restaurants, motels and boat tours, that are primarily designed to attract tourists.

Forestry - pertains to the use of the river for rafting, shipment or onshore storage.

Mining - refers to the use of the river as a means for shipping equipment and/or ore and on-shore storage.

Residential Development - refers to private housing.

RIVERFRONT LAND USE STUDY

CHAPTER 4

RIVERFRONT LAND USE STUDY

Early discussion on the coastal management issues facing Bethel revolved around the riverfront, the way it was being used now and what the future land and water use needs would be. Riverfront land use was identified as a major concern, and in need of some indepth study. This chapter is the first step in developing a riverfront land use plan. It presents background information on current uses, and considerations for redevelopment of the area.

The background information was prepared by the Planning Department. The design considerations for riverfront revitalization are taken from a report prepared for the City by ESE/Kasprisin Pettinari Design. The full report, entitled "Bethel Waterfront Revitalization Study: A Conceptual Report" is available from the City Planning Department.

Background Information

Bethel, the service and trade center for the Yukon-Kuskokwim Delta, is a community with a population of 3,500. When the community was initially settled, it occupied ground along what was a side stream of the Kuskokwim River. At that time (late 1800's), Bethel's waterfront was protected by a series of small islands. Those islands have long since eroded away along with several hundred feet of riverbank. The Army Corps of Engineers' draft, "Bank Stabilization Environmental

Statement and Feasibility Report", April 1981, indicates an erosion rate of eight feet per year along the town front and twenty-five feet per year near Public Health Service lands and the Petroleum Tank Farm.

Throughout its history, Bethel's ties to the Kuskokwim have remained extremely strong. The river is a primary lifeline for the community. The river provides much of the subsistence resources utilized by area residents. A high percentage of incoming freight for the entire region arrives by way of ocean going barges.

The river provides one of the few avenues for personal travel throughout the year. During summer, over 1,000 privately owned river skiffs and boats are utilized as residents engage in activities ranging from subsistence and commercial fishing to wood gathering. During winter, individuals using snowmachines, automobiles, and dog teams travel on the river ice.

The river helps sustain the community as a livelihood source, but also threatens the community. Spring floods are an expected occurrence. Floods and erosion have caused a movement to develop areas of higher ground away from the riverfront and flood plain.

Bethel residents agree that improvements to the riverfront are a great need. Current land usage does not meet the community's demands. As the community continues to develop, a river front strategy must be brought into existence.

This background report on Bethel's waterfront reviews current land use and ownership. Also reviewed is access. Originally the community developed in such a way that access was not questioned. Use and access to the river was an integral part of life. Today, access has become a problem due to private river front land ownership and the stop-gap erosion control method of placing old automobile bodies against the riverbank.

Current Land Use

There are ten miles of riverfront property within Bethel City limits. Only two miles of this frontage are currently developed. This area begins at what is known as "Lousetown" near Brown Slough and extends downriver to the Petroleum Tank Farm area; and the construction dock and staging area known as "Hately's Old Fox Farm Area." (Figure 28)

Current waterfront land use falls into four (4) primary categories: residential, commercial, industrial, and undeveloped. For purposes of this report, the properties under review are those immediately adjacent to the river or those that will be impacted by port development, continued erosion, or seawall construction.

Eighty-two (82) parcels fall into this category. As of early 1982, 58 were primarily residential, 31 were primarily industrial and 11 were primarily commercial. Some had large areas of undeveloped space on them. In addition to these parcels, there was a large tract of undeveloped property

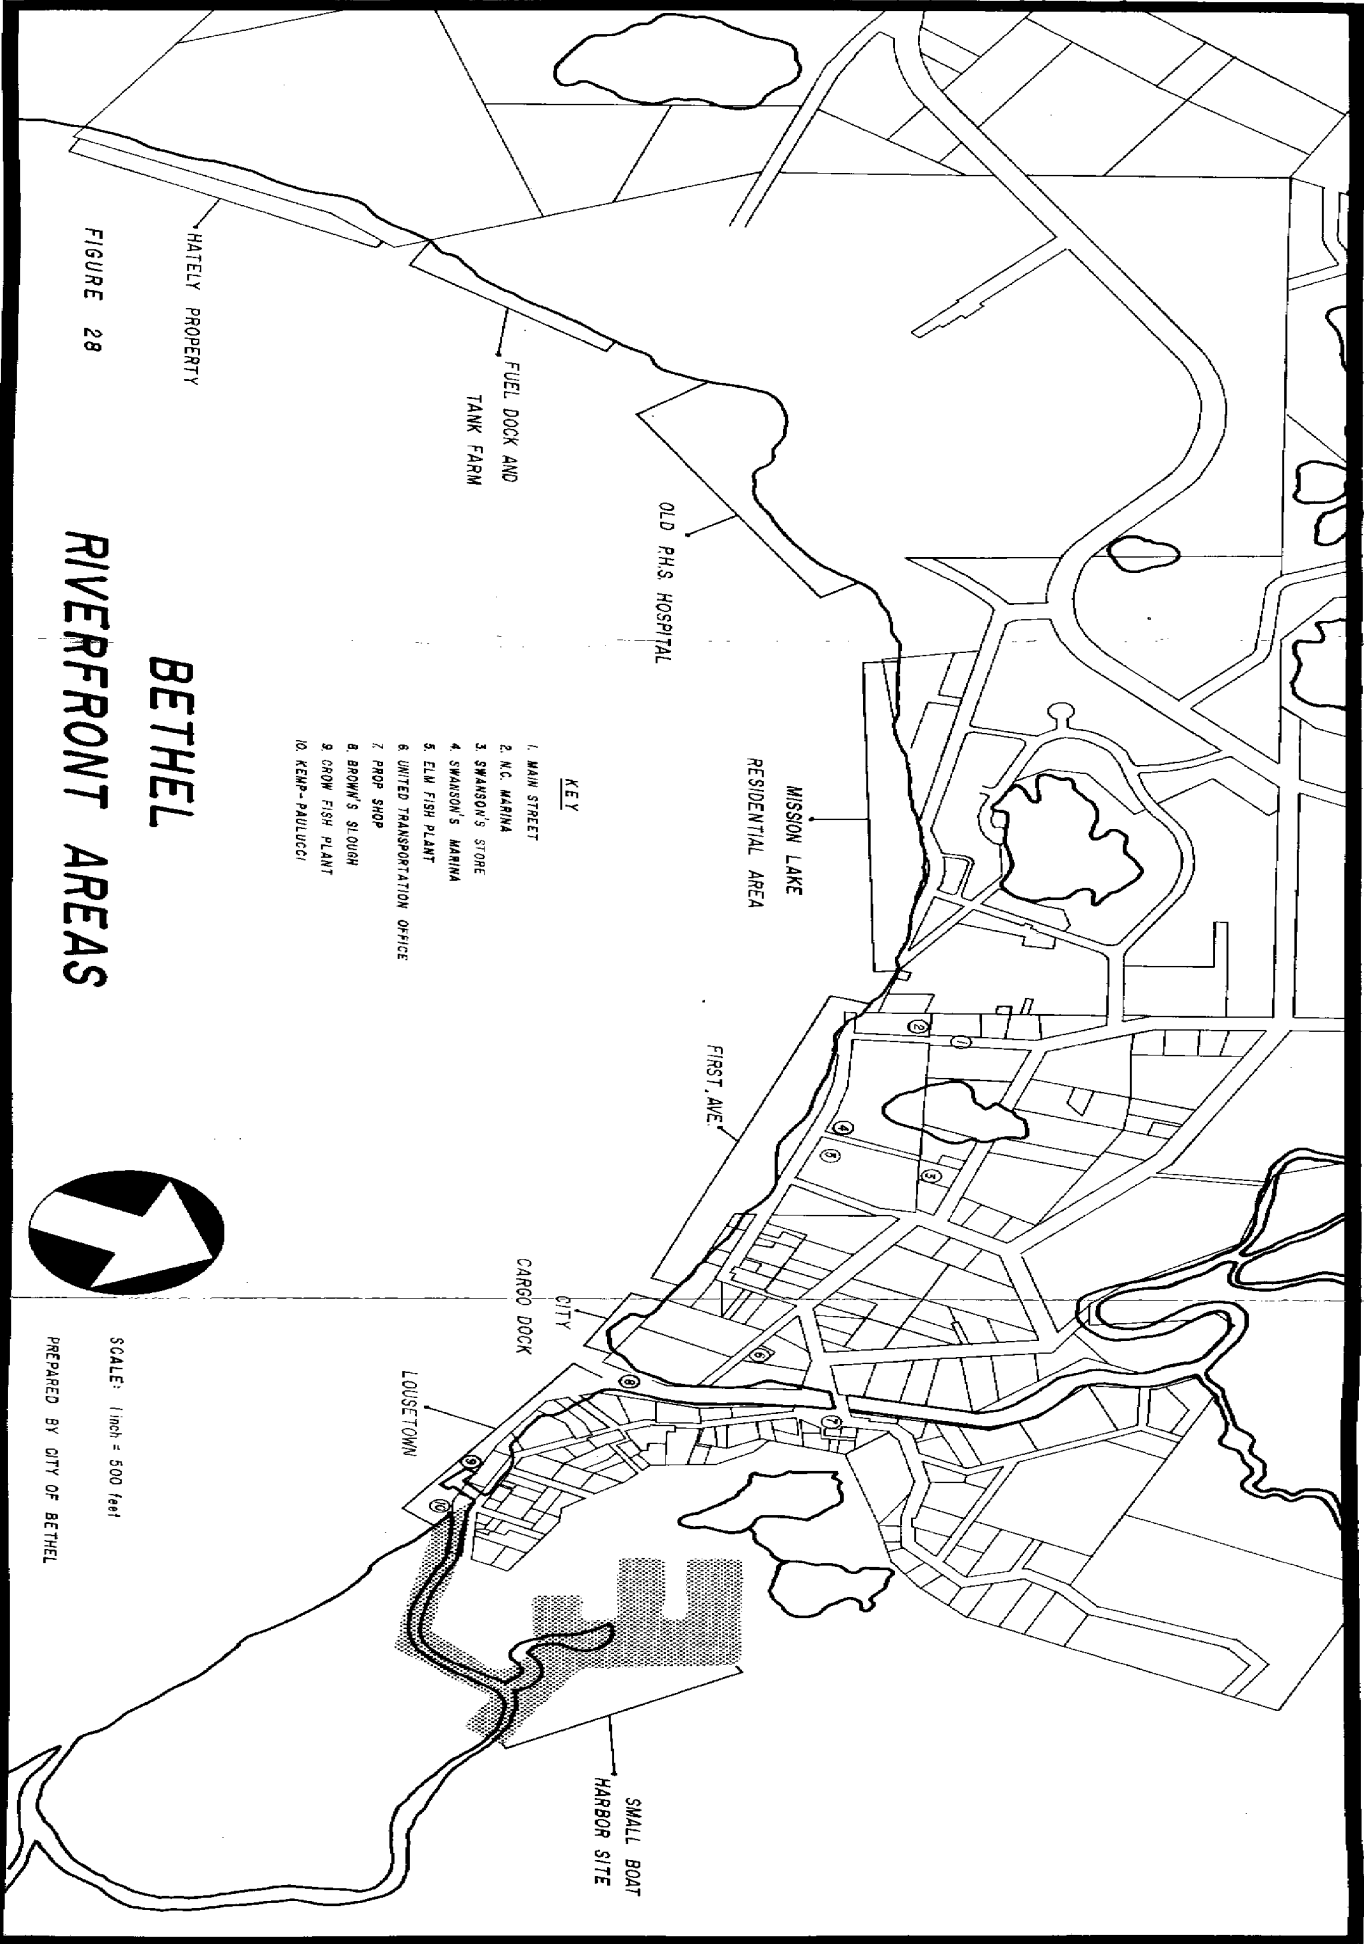

FIGURE 28

BETHEL RIVERFRONT AREAS

SCALE: 1 inch = 500 feet

PREPARED BY CITY OF BETHEL

extending from Mission Road south behind the old Public Health Service (PHS) Hospital. This property has 5,000 feet of river frontage.

Since the lots and parcels of riverfront land vary greatly in size, it is necessary to look at land use percentages. The figures shown in tables 39 and 40 were developed by using the Land Use and Land Ownership maps located in the pocket of this report. (Figures 32 and 33). The maps were prepared in early 1982. The percentages given are approximate.

TABLE 39

Riverfront Land Use by Category

<u>Use</u>	<u>Percent of Total</u>
Industrial	35%
Residential	27%
Undeveloped	27%
Commercial	<u>11%</u>
	100%

TABLE 40

Riverfront Land Ownership by Category

<u>Ownership</u>	<u>Percent of Total</u>
Private	49%
City of Bethel	22%
Federal	19%
Certified Native Allotment	<u>10%</u>
	100%

It is instructive to look at uses of riverfront land that are water-dependent or water-related. The ACMP defines water-dependent uses as those which require access to the

water body. Water-related uses do not require access to water but provide goods or services directly associated with water-dependence and which, if not located adjacent to water, would result in a public loss of quality in the goods or services offered.

Industrial activities that are water-dependent include: the City Dock; United Transportation Offices and Operations area; Binkley Co./Northwest Navigation; J.B. Crow and Sons Fish Processing Plant; Elm Fish Processing Plant; Kuskokwim Fishermen's Co-op Warehouse; Alaska Commercial Warehouses (currently leased as Fish Processing Plant); Standard Oil Petroleum Tank Farm; Knik's Construction, equipment loading and staging area (Hately property).

Other industrial activities occurring in the waterfront area that are not water-dependent include private warehousing along Brown Slough and the Public Health Service Maintenance yard.

Water-dependent commercial operations include: Hoffman's Fuel Distribution (summer gasoline sales) and Dull's Gasoline Sales. Water-related commercial operations include four marinas: P.J.'s Cat House, Swansons Marina, A.C. Marina, and the Prop Shop.

Commercial activities that are neither water-dependent nor water-related include: The Wild Goose (eatery); the Kuskokwim Native Valley Association Building and Nunam Kitlutsisti offices; the Adult Educational Center; Buck Rogers

Disco; City Parks and Recreation Building; Swanson's Store and Lumber Sales; First National Bank; Riverfront Restaurant; and Tundra Drums Newspaper/Tundra Press. Swanson's business, while not water-related, benefit from their proximity to the river, as residents from outlying areas often use Swanson's services due to the ease of transferring purchased goods from the store to their sleds or boats.

Current residential use is primarily single-family, with many residences located between various commercial and industrial operations. There are at least fifteen residential lots in the Mission Lake neighborhood (United States Survey (USS) 870) that will be affected either by continued erosion or erosion control methods, i.e., continued dumping of wrecked automobiles or permanent seawall construction.

Current Development

Immediate riverfront needs being addressed by the City include the seawall, a small boat harbor and dock/port expansion.

Seawall construction has begun along the waterfront. Construction completed includes the city dock and the western bank of Brown Slough adjacent to the dock. Underway is construction along the frontage of the Petroleum Tank Farm.

Also underway is testing of a steel pipe system for building the remainder of the seawall. The City is currently seeking funds for seawall construction.

Work is slated to begin on the small boat harbor project

in the near future. The City acquired approximately 50 acres from the Bethel Native Corporation for the small boat harbor. The primary site will be located on 40 acres, the remaining 10 will be used for disposal of dredged and excavated materials.

The City dock/port was build in 1975. Initial construction created 240 feet of docking frontage: construction in 1982 increased docking frontage an additional 900 feet along the western bank of Brown Slough.

Access

Access parallel to the river and actual access on to the river are both current problems. Bethel residents, since the earliest days of community development, have desired to live near the river. Up until recent years, work and home were much the same as many residents gained their livelihood through what is now commonly known as "subsistence."

During the past decade Bethel has grown beyond a subsistence community. This change has occurred due to the growth of the region and Bethel's role as the hub of much regional activity. This growth has provided occupational and cash opportunity. Even with this growth, 70% of the local residents surveyed in 1979 indicated that they obtain some form of food through subsistence activity; one third (30%) of those surveyed obtain 50% or more of their food through subsistence.

Presently this food and resource gathering activity

(subsistence) is hampered by poor access to the river. During summer, the Brown Slough area is jammed with river skiffs. The ability to load and unload supplies or goods is hindered by vessels that are parked sometimes as many as three deep, leaving only a narrow navigation channel. Other access points are limited, and usually present difficulties for loading/unloading of boats.

During winter, snowmachines and other forms of transportation use the river heavily. Similar access problems occur during winter with access conditions being generally poor.

A major concern of the community is the retention and improvement of multiple use of the river including subsistence, commercial fishing, commercial and private transportation. The issue of access is at the heart of this multiple use concern.

Future Development Needs

The existing port is inadequate to handle existing and projected cargo volumes. Current problems are the lack of storage and warehousing facilities and the conflicts between small river boats and larger ocean going vessels. As stated in the Comprehensive Plan, "The City of Bethel needs to make a commitment for the expansion and upgrading of the existing port in order to maintain its role as a distribution center for the region."

The Comprehensive Plan also points out the need for additional land for industrial development and estimates

seventy acres will be needed by 1990. Possible areas for industrial expansion include lands adjacent to the existing dock (U.S.S. 3230) and lands within the old PHS Hospital site (U.S.S. 4000).

The seawall is the most pressing future development need. When seawall construction occurs, the nature of the riverfront will be greatly affected. Access and multiple use considerations will be paramount in seawall design. During seawall construction, the need for construction access/easements will begin the change in the riverfront.

Riverfront Land Use

The next step, given the critical importance of the riverfront to city inhabitants, is to develop a land use plan for the riverfront to ensure that the needs and interests of all residents are taken into account in riverfront redevelopment. To that end, the "Bethel Waterfront Revitalization Study" was undertaken. It presents concerns and concepts as an initial step toward a land use plan. It is not a land use plan as it now stands, but a working document to be discussed and used when developing the plan itself. The following is excerpted from the "Bethel Waterfront Revitalization Study: A conceptual Report" prepared by ESE/Kasprisin. pettinari design. The full report can be obtained from the City Planning Department.

bethel waterfront revitalization study

a conceptual report

seawall/port requirements

- o Seawall requirements
 - deep enough penetration to withstand undermining;
 - strong enough to withstand ice action;
 - tight enough for heavy barges;
 - high enough for erosion/inundation control;
 - appurtenant bank stabilization;
 - capacity enough for two (2) ocean going barges or one (1) ocean going barge plus loading of two smaller river vessels;
 - dock height for most vessels should be 10-12 feet above mean level low water.

- o Ship sizes
 - barge requirements range from 260 feet to 300 feet in length and 76 feet to 100 feet in width;
 - draft (loaded) equals twelve to sixteen (12-16) feet.
- o Operations
 - existing situation consists of a pass/pass system comprised of a double handling system where an article is picked up, deposited, picked up, and redeposited due to a lack of ramp facility;
 - ramp additions will permit a roll on/roll off system where a vehicle (forklift) picks up an object once (rolls on) and rolls-off to deposit it in the storage yard, thus reducing labor, time, machinery;
 - portable ramps are desired by the major barge operators along with significant improvements in the on-shore land conditions, particularly in the spring thaw period;
 - ramp capability should be fifteen (15) feet.
- o Transportation components/requirements
 - day use boat docks for river transportation;
 - cargo docks for transshipment exchange/temporary storage;
 - boat harbor, 1,200 continuous slips and support facilities;
 - sea plane transportation facility;

- oil and gas facility;
- Hovercraft transportation;
- tourism boat tours, guides;
- forestry use of river via rafting/shipment/storage;
- mining river transport;
- access via river to outlying residences.

- o Generalized port objectives
 - stabilize the bank with 1,200 feet of bulkhead between Main Street and Lot 11, Block 20;
 - City acquires all of Block 19 and Lots 3 through 8 of Block 20;
 - develop a Southwest Alaska deep water port;
 - in conjunction with the Yukon-Kuskokwim haul road, develop a major transportation system servicing timber, grain and meat from Nenana, oil from Fairbanks, fuel service to Bristol Bay and Norton Sound;
 - provide separate mooring facilities and additional staging area for transshipping vessels;
 - provide facilities for ocean-going barges and tugs;
 - provide necessary warehousing.

IMPACTS OF RIVERFRONT EROSION

- By 1985, up to and including portion of First Avenue;
- by 2000, all of First Avenue and

approaching the edge of Mission Lake;

- by 2030, all of Mission Lake, approaching Honey Bucket Lake and taking the majority of the general cargo dock.

determinants

ENGINEERING DETERMINANTS

A seawall design developed by the City of Bethel and Galliett & Silides Engineers is providing the basis for a staged improvement of the waterfront. Based on factors of cost, installation techniques, and material availability, the engineers have proposed a system which accomplishes the following:

- o establishes an immediate yet long term beachhead against erosion with a seawall considered economic compared to other recommended engineering options;
- o permits improvements on land to be staged according to the successive phases of the seawall construction;
- o provides an opportunity to assess in detail future amenity options for public access to the waterfront.

The engineering aspects of the seawall are detailed in the River Bank Erosion Protection Conceptual Plan for the Port of Bethel, developed by Galliett & Silides Engineers.

Highlights of that plan, and the basis for conceptual design recommendations, include the following:

- o a two (2) foot diameter steel pipe pile wall driven into the ground two-thirds the length of the pipe;
- o a runoff intercepting embankment and drainage system to prevent surface runoff from eroding the back side or land side of the seawall;
- o threadbar tie back rods to secure the seawall to the land side;
- o a pedestrian bridge connecting the seawall to finished grade on the land side;
- o a gangway and float;
- o backfill material.

LAND USE DETERMINANTS

The significant uses along the seawall will include cargo loading and unloading; subsistence activity such as access to the water, load/unload facilities, and boat service; resident use for access, circulation, recreation; and commercial and industrial uses which are water-dependent or water related. Primary conflicts occur

between subsistence use of the waterfront and cargo operations. Below are listed pertinent determining factors for waterfront facilities by the major use.

Cargo Handling Facilities

- capability to handle two ocean-going barges and one river barge at one time;
- space on-land for long term open storage as well as semi-enclosed storage;
- "roll-on/roll-off" system, defined as a vehicle such as a forklift rolling onto a barge, picking up cargo and rolling off the barge to store the cargo with only one handling operation;
- mud-free work areas and forklift service roads;
- heated warehouse space;
- fifteen (15) foot wide ramps connecting the seawall to vessels;
- storage yard lighting for night shifts.

Subsistence Facilities

- public access to and from the water;
- boat moorage, floats;
- float plane moorage;
- small goods load/unload apparatus;
- on-land temporary storage areas;
- pick-up/drop-off facilities for taxi cabs and private vehicles;
- information points for visitors needing orientation to Bethel area facilities;
- winter vehicle access to river.

Resident Use of Waterfront

- open space buffer along riverfront;
- recreation facilities such as viewing, walking, jogging, skiing, access to water;
- view access to river;
- access for water oriented transportation.

Commercial/Industrial Water-Dependent/Related

- fuel line access for float planes;
- load/unload facilities and access;
- product and supply storage space;
- berthing facilities;
- expansion space on-land and dock space.

land use concepts

The conceptual land use diagram and accompanying circulation diagram highlight the area from the river front to Third Avenue and the State Highway. The intent of the diagrams is to depict a conceptual overview of land use organization as it relates to waterfront issues.

The area receiving the more intense waterfront use, from Browns Slough west to Mission Lake Road, is highlighted in three-dimensional sketches as examples of physical development based on the conceptual land use plan.

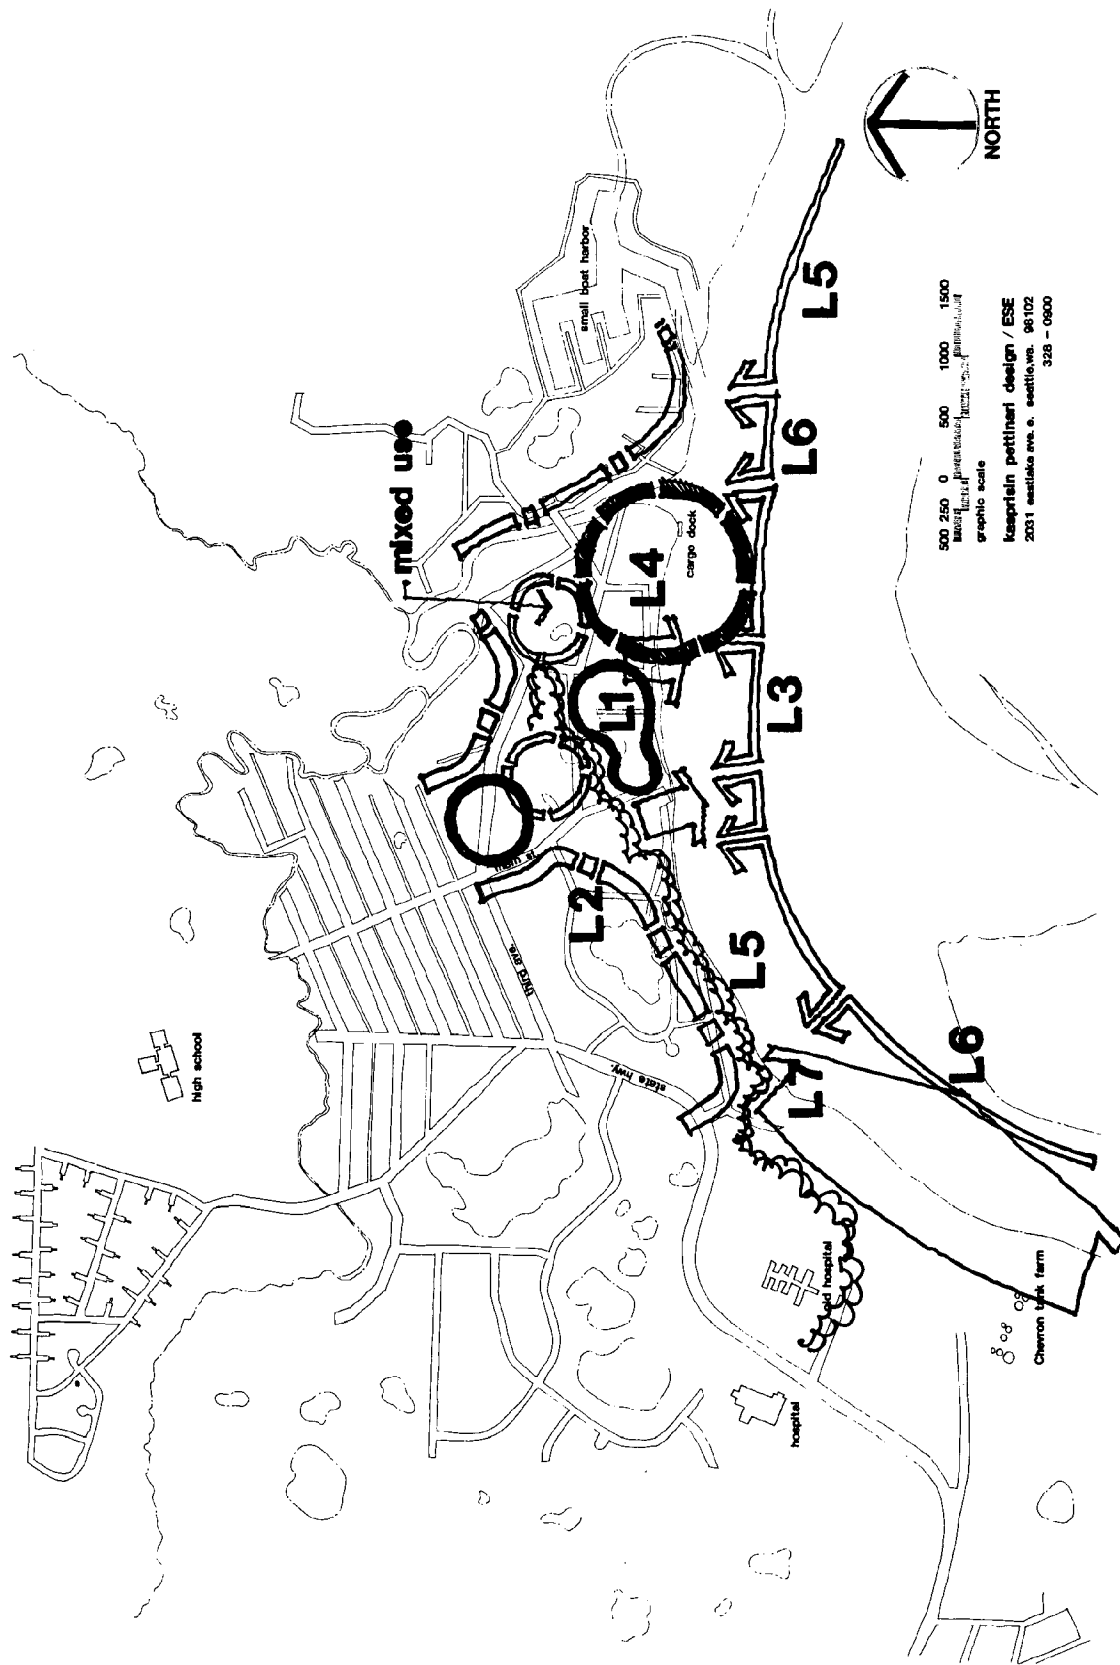

FIGURE 29a

policy guidelines

o Land Use

L1. Define the size and extent of the Main Street-Elm Street general commercial use;

L2. Identify and strengthen the edge of existing and future residential districts and neighborhoods;

L3. allocate sufficient lands along the waterfront for subsistence support activities;

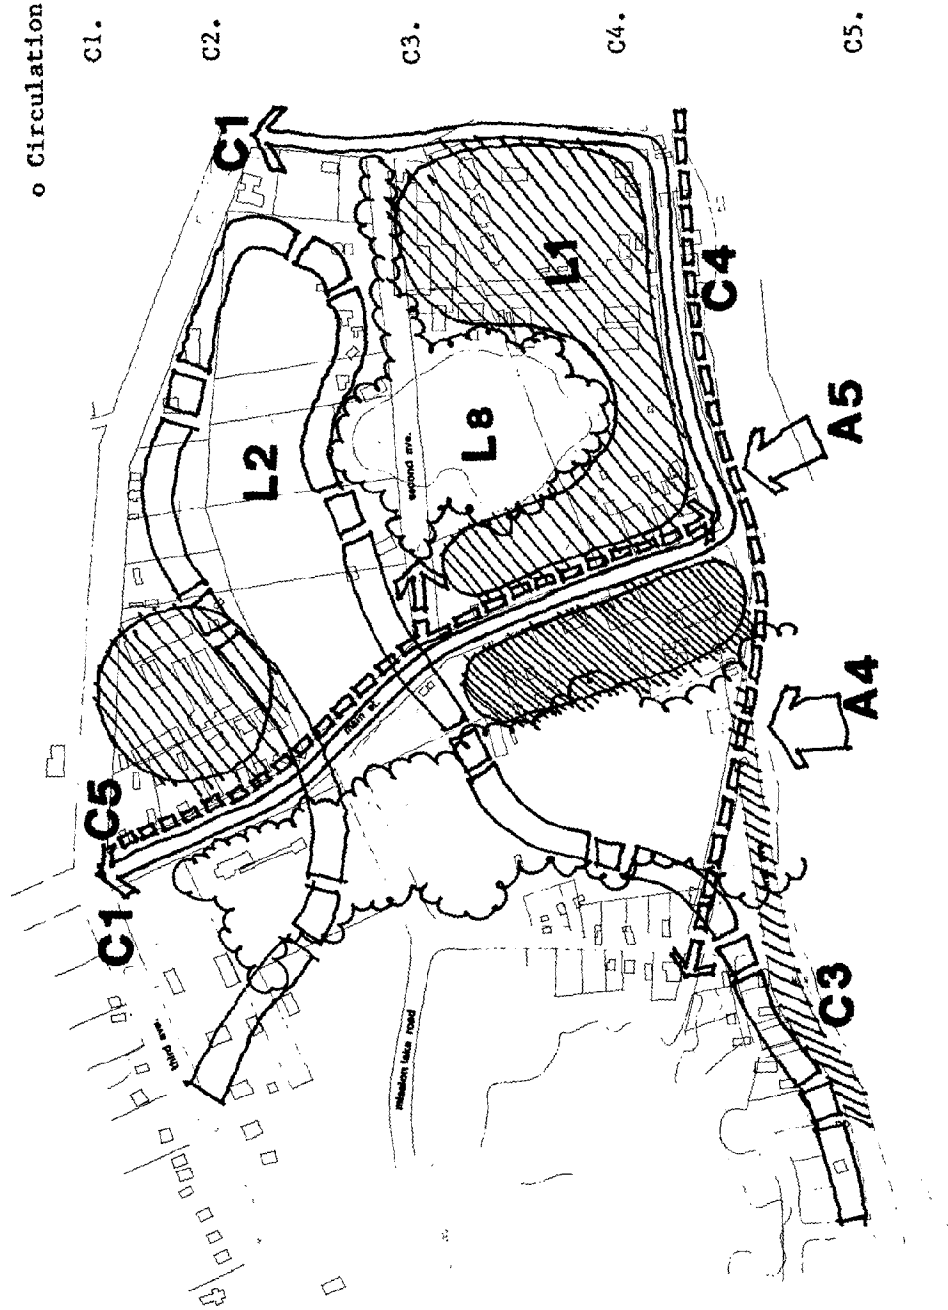

L4. allocate sufficient lands for existing and future general cargo dock facilities, to be developed in a phased manner over time;

L5. in residential districts adjacent to the river, preserve the waterfront for access and use by neighborhood residents;

L6. allocate waterfront areas for water/dependent/water related commercial and industrial future uses;

L7. set aside public lands for public waterfront access and future industrial water dependent use;

L8. designate wetlands, pond areas and adjacent buffer strips as open space; utilize this open space as edges and boundaries for residential, commercial and industrial land use;

o Circulation

- C1. Establish Main Street-First Avenue-Elm Street as a collector street; develop a lime rock or hard surfaced service-work road through the general cargo dock area in an alignment parallel to the seawall;
- C2. abandon First Avenue west of Main Street from future consideration as a through street;
- C3. designate a pedestrian trail system throughout the waterfront area coordinated with a seawall walkway segregated from motorized vehicles;
- C4. establish an easement along the eastern edge of Main Street right-of-way for a pedestrian walkway connecting the waterfront to the center of Bethel;
- C5.

FIGURE 29d

design concepts by phase

Summary of Design Concepts by Construction Phase

Phase I-II: Main Street

Initial Seawall Construction

- Construct seawall for a length of approximately 2000 feet west of the general cargo dock to the Mission Lake Road/First Avenue juncture;
 - construct intercepting drainage berm along the full length of the seawall;
 - expand drainage berm at critical locations to provide staging pads for subsistence and general cargo handling facilities; suggested pad locations include:
 - immediately east of Main Street/First Avenue juncture for subsistence activity;
 - at USS 319 for fish processing;
 - at general cargo dock at spaced intervals allowing two or more vessels to be handled simultaneously;
- provide floats and gangways for small boat and fishing boat tie-up (short term);
- provide short term parking and drop-off/pick-up lanes for subsistence related vehicle load/unload along First Avenue just east of Main Street;
- provide open storage areas for subsistence related activities along First Avenue;
- protect the wetland periphery of pond areas from development;
- initiate the planning process for detailed design and community approval for a community-wide trail system which will connect the riverfront to the community centers;
- establish a pedestrian way on top of the intercepting drainage berm the length of the seawall;
- segregate motorized vehicles from designated pedestrian ways, particularly the top of the intercepting drainage berm;
- clearly designate all conflict areas between pedestrian and load/unload activities;
- provide a medium duty crane or hoist for subsistence related load/unload activities;
- establish open storage areas for water dependent/water related cargo.

FIGURE 29e

bethel waterfront main st./east - phase IV-V
Kamprisin pattinani design / ESE

Phase III-IV-V: Main Street/East

- Complete backfill between drainage berm and seawall;
- establish hard surface staging and work areas to eliminate or reduce mud and spring thaw conditions;

- develop public and private warehouse districts which are coordinated with open storage and truck circulation patterns;
- expand floats and gangways to handle peak

- loads of summer subsistence and fishing craft. Investigate the configuration of float systems to minimize disruption from southerly storms;
- expand and hard-surface parking areas along

First Avenue, complete with load and unload areas for subsistence related activities;

- provide community shelters which contain information areas and facilities for visitors from the villages; such a "village annex" could

include village news boards, locked storage areas for clothes and personal items while people are visiting Bethel, shower and restroom facilities and a caretaker;

- provide community shelters which permit

weather protected viewing areas for local residents of the general cargo handling activities along the waterfront;

- depending on engineering constraints regarding currents and water movement around dock extensions, investigate

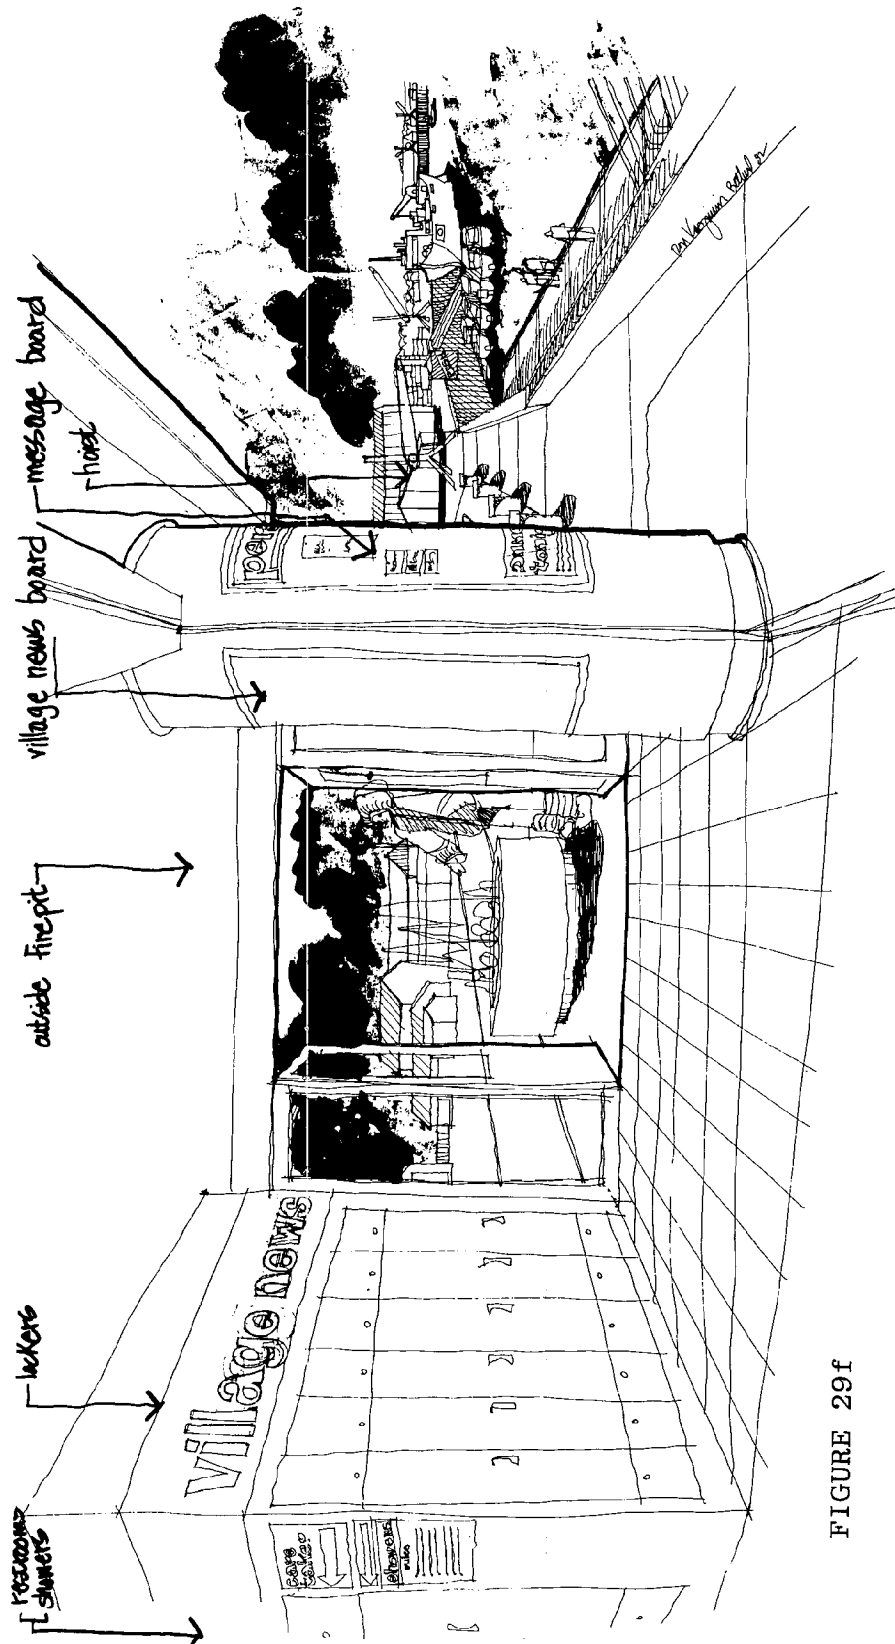

FIGURE 29f

the types of extensions and seawall expansions capable of increasing the shoreline work

areas for cargo;

- provide open and enclosed secured storage

areas for subsistence related goods along First Avenue.

bethel waterfront browns slough - phase I

Kasprisin pettinari design / ESE

FIGURE 29g

Phase I-II: Browns Slough

- Construct a seawall along the east side of the slough;
- construct a small boat pull-up slope just south of the bridge;
- establish a pedestrian way along the seawall from the bridge to Kuskokwim Way;
- provide area and secur-

- ity lighting;
- allocate a staging area for subsistence and visitor activities along the east bank;
- Provide floats and gangways along seawall for visitor and subsistence small boat access;
- establish community and neighborhood shelters for neighborhood activities (B2a) and port area viewing (B2b);
- set aside land for commercial supply stores for subsistence activity and village residents near boat pull-up.

- Establish community and neighborhood shelters for neighborhood activities
- Provide floats and gangways along seawall for visitor and subsistence small boat access;
- Establish community and neighborhood shelters for neighborhood activities

Phase III-IV-V: Browns Slough

bethel waterfront browns slough - phase IV

FIGURE 291

Phase IV-V: Cargo Dock

Initial phases of the cargo dock are already in operation.

- Establish an interior circulation system for forklifts and other cargo handling vehicles which is hard-surfaced and capable of providing a work base during muddy periods and spring thaws;
- provide adequate staging and maneuvering area along the seawall;
- provide open and bulk storage areas accessible

by forklift on hard surfaced service roads;

- develop heated and non-heated warehouse complexes on the periphery of the open and bulk storage area;
- provide a minimum of two ramps or transfer spans for simultaneous roll on/roll off cargo handling;
- provide area lighting for night shift and security purposes.

WETLANDS STUDY

CHAPTER 5

WETLANDS STUDY

Wetlands management was one of the first issues identified when the City began developing this coastal management plan.

Two goals have been set relating to wetlands:

- . to develop a management strategy, and
- . to facilitate local compliance with federal law regarding wetlands.

(See Chapter 7 for full statement of goals, objectives, etc.)

In order to meet these goals it became clear that more detailed information was needed. A precise delineation of what areas within the city limits fell into the federal definition of wetlands was needed as well as an assessment of the relative importance of these wetlands. It was also necessary to review the applicable federal laws and regulations.

A study was undertaken by Environmental Sciences and Engineering, Inc. (ESE) to provide the City and other interested parties with this informat. (Study prepared by James R. Newman, Gil Peterson, and Edward N. West of ESE.) Following is an excerpt from the Wetland Study prepared by ESE. The full study can be obtained from the City of Bethel Planning Department.

* * * * *

STATEMENT OF THE PROBLEM

Three separate but related activities have required a wetland evaluation for the City of Bethel.

1. Community growth; over 400 new housing units during the past ten years.
2. U.S. Army Corps of Engineers (COE) made comments regarding the proposed City of Bethel Coastal Management program, particularly the COE's desire for refinement of the vegetation map to indicate the extent and quality of Bethel's wetland areas.
3. The COE's intention to issue a general permit (General Permit #81-4) for the Association of Village Council President's (AVCP) Regional Housing Authority pursuant to Section 404 of the Clean Water Act. This application does not include the area contained in the city limits of Bethel.

Since wetlands fall under COE jurisdiction of permitting authority and since the wetland and non-wetland areas of the City of Bethel had not been described, the following study was undertaken. This study represents the first formal evaluation of wetlands within the City of Bethel and involves two parts: a wetland evaluation of the City of Bethel and a description of the COE permitting process as applicable to the City of Bethel.

METHOD

The criteria used by the Corps for defining wetlands is as follows: (a) a predominance of vegetation characterized as wetland plants; (b) soil with evidence of mottling (streaks) in the upper soil layers (horizons) and a chroma (soil color scale)

of two or less; and (c) the presence of water (free) in the soil. All three of these criteria must be present to classify the locale as a wetland.

A color infrared enlargement (1:30,000) was made from imagery of the Bethel area flown on 17 June 1977 by the U.S. Bureau of Land Management. From this enlargement, color patterns, produced by vegetation types and density, were selected for field checking and establishing field sites. Numerous sites were examined for vegetation type and wetness. A transect through the city from low to high elevation was identified. Six sites were qualitatively investigated for applying all three Corps criteria. These are located on the accompanying map (Figure 30).

The field work was carried out on August 17 and 18. Participants were Steve Gabor (planner), City of Bethel; Dr. James Newman (ecologist), ESE; Dr. Gil Peterson (environmental planner), ESE; Dr. Edward West (ecologist), ESE; and Joe Williamson (environmental engineer), U.S. Army Corps of Engineers.

FINDINGS

Based on the field work, virtually the entire area qualifies as wetlands and, therefore, comes under COE permitting jurisdiction. All sites contained wetland vegetation; only sites two and six did not qualify in all three criteria categories. These sites did not exhibit the appropriate soil and hydrology characteristics for wetland classification. However, sites of the type like number two and six are mostly confined to slopes with

 SIGNIFICANT WETLANDS

 TEST SITES

FIGURE 30

Wetland Delineator

a southerly exposure which occupy very little surface area. These locations, being small in area and irregular in shape, do not lend themselves for serving as a determinant for classifying land for urban use.

The field investigation and other data indicates that the amount of non-wetlands is not large enough for permitting considerations. Therefore, an evaluation was made as to the general areas of the city likely to contain wetlands of importance. The following discussion and conclusions are based on the general survey, discussions with COE personnel, interpretation of the high altitude photography and review of topographic maps.

Section 320.4(b) of the COE's general regulatory policies (Federal Register Vol. 47, No. 141, Thursday, July 22, 1982, p. 31804) states that some wetlands are vital areas that constitute a productive and valuable public resource. Those wetlands that are considered to perform functions important to the public interest include the following characteristics:

1. Serve significant natural biological function, i.e., food chain production, habitate, etc.;
2. Are set aside for special study;
3. Alteration of such wetlands would affect detrimentally natural drainage and other hydrological characteristics;
4. Shield other areas from wave action;
5. Serve as valuable storage areas for storm and flood waters;

6. Are prime natural recharge areas; and
7. Provide significant natural water filtration functions.

Characteristics numbers 3, 5, and 7 are of particular importance to Bethel. To date, no wetland areas within the city limits have been formally set aside for special study of the aquatic environment or as sanctuaries or refuges.

The Alaska Department of Fish and Game and the U.S. Fish and Wildlife Service have both maintained research stations in Bethel for a number of years. Interviews with biologists representing both agencies resulted in the conclusion that although various fish and wildlife populations do exist in the city limits, there were no significant wildlife populations in Bethel proper. In addition, they felt that the wetlands within the city limits did not provide significant natural biological functions to the area's fish and wildlife populations. The shallow tundra lakes and ponds, depending upon accessibility to streams, can contain fish. However, anaerobic conditions occur in these water bodies during the winter which limit the importance of these aquatic habitats. Nesting waterfowl do occur in these habitats. This waterfowl habitat, however, is not considered highly productive because of low number of nesting birds and the intense hunting pressure on these lakes and ponds.

The field survey showed that the wetlands within the 100 year flood plain contained a much greater amount of surface water and soil saturation, making development more costly and hazardous for human occupancy. This same area, when undisturbed,

provides a much greater variety and density of vegetation. In close proximity to the river, streams and sloughs, the wetlands have a greater likelihood of exhibiting COE defined characteristics 1, 3, 4, 5, and 7. By contrast, the wetland area outside of the 100 year flood plain, though relatively level, has a primitive drainage pattern, less dense vegetation and a lower likelihood of exhibiting wetland functions important to the public interest. The investigation team defined two types of wetlands, significant and non-significant. Significant wetlands are major drainage ways, sloughs and lakes (including a 20 foot set back from the high water mark) and the undisturbed areas of the flood plain. All undisturbed land below thirty-two feet elevation (mean sea level) or 17.8 feet elevation mean lower low water is within the 100 year flood plan (FEMA, 1981, p.5), and is considered significant wetlands. Land located above this level is considered non-significant wetlands (broken line on map, Figure 30).

The COE's permitting process is used to obtain approval for a category or categories of activities in a given area. This approval is obtained through issuance of a "general" permit for a category of projects anticipated to be proposed for a given area or an "individual" permit for specific project proposed for a given area. The permitting process has definite procedural steps and a fairly fixed time frame for review and decision. For general permits, 6 to 7 months is likely to be required for approval. Without an approved wetlands management

plan a longer time frame (up to 1 years) is possible. For individual permits, a minimum of 2 to 3 months should be allowed for approval. Unnecessary delays can be avoided by proper documentation and follow-up.

The City is applying for a General Permit for individual residential development in non-significant wetlands. All property owners desiring to develop lands in significant wetland areas will be required to apply for an individual permit from the COE.

DESCRIPTION OF COE JURISDICTION

The regulatory programs of the U.S. Army Corps of Engineers (COE) have recently been issued as interim final rules (Federal Register 47, No. 141, Thursday, July 22, 1982). The COE has statutory authority to regulate certain activities "on navigable waters of the United States" (under Section 10 of Rivers and Harbors Act of 1899) and "in waters of the United States" (Section 404 of the Clean Water Act). Navigable waters are defined as freshwater, marine and estuarine waters that have been or may be used for interstate or foreign commerce (see 33 CFR part 329). Waters of the U.S. include all navigable waters and also all tributaries, strams, lakes and adjacent wetlands on public and private property. Adjacent wetlands are defined as bordering, contiguous or neighboring areas that are inundated or saturated by surface or ground water at a frequency and duration to support and that under normal circumstances support a prevalence of vegetation typically adapted for life in saturated

soil conditions (see 33 CFR Part 323). The activities regulated by this jurisdiction include construction of structures, excavation or dredging, and fill activities.

The jurisdiction of the two laws overlap. The permitting process including the application for a permit, however, is the same for both laws.

The purpose of the COE's jurisdiction is to protect and maintain the quality of our nation's water resources by protecting rivers, lakes or wetlands and other similar water resources, to prevent alteration or obstruction of a navigable water of the U.S. and to control dumping of dredge materials into ocean waters.

APPLICATION OF THE COE'S JURISDICTION TO THE CITY OF BETHEL

Based on qualitative evaluation of vegetation communities, most of the land area of the City of Bethel contains vegetation that would likely be classified as wetland vegetation. Small areas widely scattered through the city have vegetation which would be considered transition or non-wetland areas. These areas are too small to be considered important for planning purposes.

The wetlands of the city are also likely to be designated as adjacent wetlands for the existing lakes, streams, sloughs and the Kuskokwim River.

Any project or development proposed within the city limits of Bethel (and likely for miles beyond the city limits) would

come under COE jurisdiction. Approval from the COE will, therefore, be required for dredge and fill activities associated with these projects.

OTHER JURISDICTION

Although the COE has primary jurisdiction for activities in "navigable waters of the U.S." and "Waters of the U.S.", there are a number of other regulations and policies which the COE must adhere to in its permitting authority. Alaska Department of Environmental Conservation (ADEC) must review the project to assure that it does not violate state water quality standards and other state laws. This review is covered in its issuance of a "401 certificate" at the time COE permit is issued. In addition, a Coastal Management Plan "consistency determination" is made by Alaska Division of Policy Development and Planning or by the City of Bethel once the Coastal Management program is adopted.

Besides these formal approvals, a number of agencies are requested by the COE for their review and comment on the permit application. Minimally, these agencies include:

U.S. Environmental Protection Agency

Concerns regarding compliance with Clean Water Act and alternative analysis.

U.S. Fish and Wildlife Service

Concerns regarding efforts to endangered species, migratory bird, fisheries resources and mammals.

National Marine Fisheries Service

Concerns regarding effects to marine fish, shellfish
and mammals.

Alaska Department of Fish and Game

Concerns regarding effects to anadromous fish and
game animals and their habitat.

* * * * *

The ESE report continues in some detail on the procedural steps for obtaining wetlands permits from the Corps of Engineers, and also describes existing nation-wide permits for specific activities.

With the above information on the nature and extent of the wetlands in the city limits, the City has begun discussion with the COE toward obtaining a general permit for individual residential construction in non-significant wetlands. Most construction in Bethel is residential, and the considerations for residential development are similar enough to allow a generalized approach. Other types of development have such different considerations (size, traffic, impact on drainage, etc.) that a generalized approach is not desirable.

If granted, the general permit would cover activities related to individual residential construction in non-significant wetlands. It will contain specifications for things such as sand pad size, culverting, or set-backs from waterways. The specifics are currently being negotiated between the COE and the City, as is the method for administering the permit.

Any other development will require that the developer obtain his or her own wetlands permit from the COE. The City will provide developers with general assistance in this process, but it will be their responsibility to secure the required permits.

The following summarizes the coverage of the general permit being applied for.

To be covered:

- . Individual residential construction in non-significant wetlands.

Not covered:

- . Residential development of 4 or more units
- . Subdivisions
- . Commercial development
- . Industrial development
- . Public Institutional development
- . Individual residential development in significant wetlands.

The general thrust of the wetlands strategy being developed is to discourage further development in the significant wetlands, and to develop standards for construction in non-significant wetlands so as to minimize negative impacts from the development. The standards and policies for this strategy are contained in Chapter 7 of this document, and the methods for implementation are discussed in Chapter 8.

BETHEL

SUBSISTENCE USE AREA:

Proposing an Area

Meriting

Special Attention

(AMSA)

CHAPTER 6

BETHEL SUBSISTENCE USE AREA: proposing an Area Meriting Special Attention

Subsistence activities - fishing, hunting, berrying - are an important element of the way of life of many Bethel residents. A survey performed in 1979 showed that over 70% of Bethel residents used some form of subsistence foods. Preserving opportunities to continue subsistence activities has been identified as a goal of the coastal management plan, and is reflected in many of the issues addressed in the plan. One way of recognizing the importance of subsistence and providing for its continuing practice is to develop a special management plan for the area used most heavily for subsistence by Bethel residents.

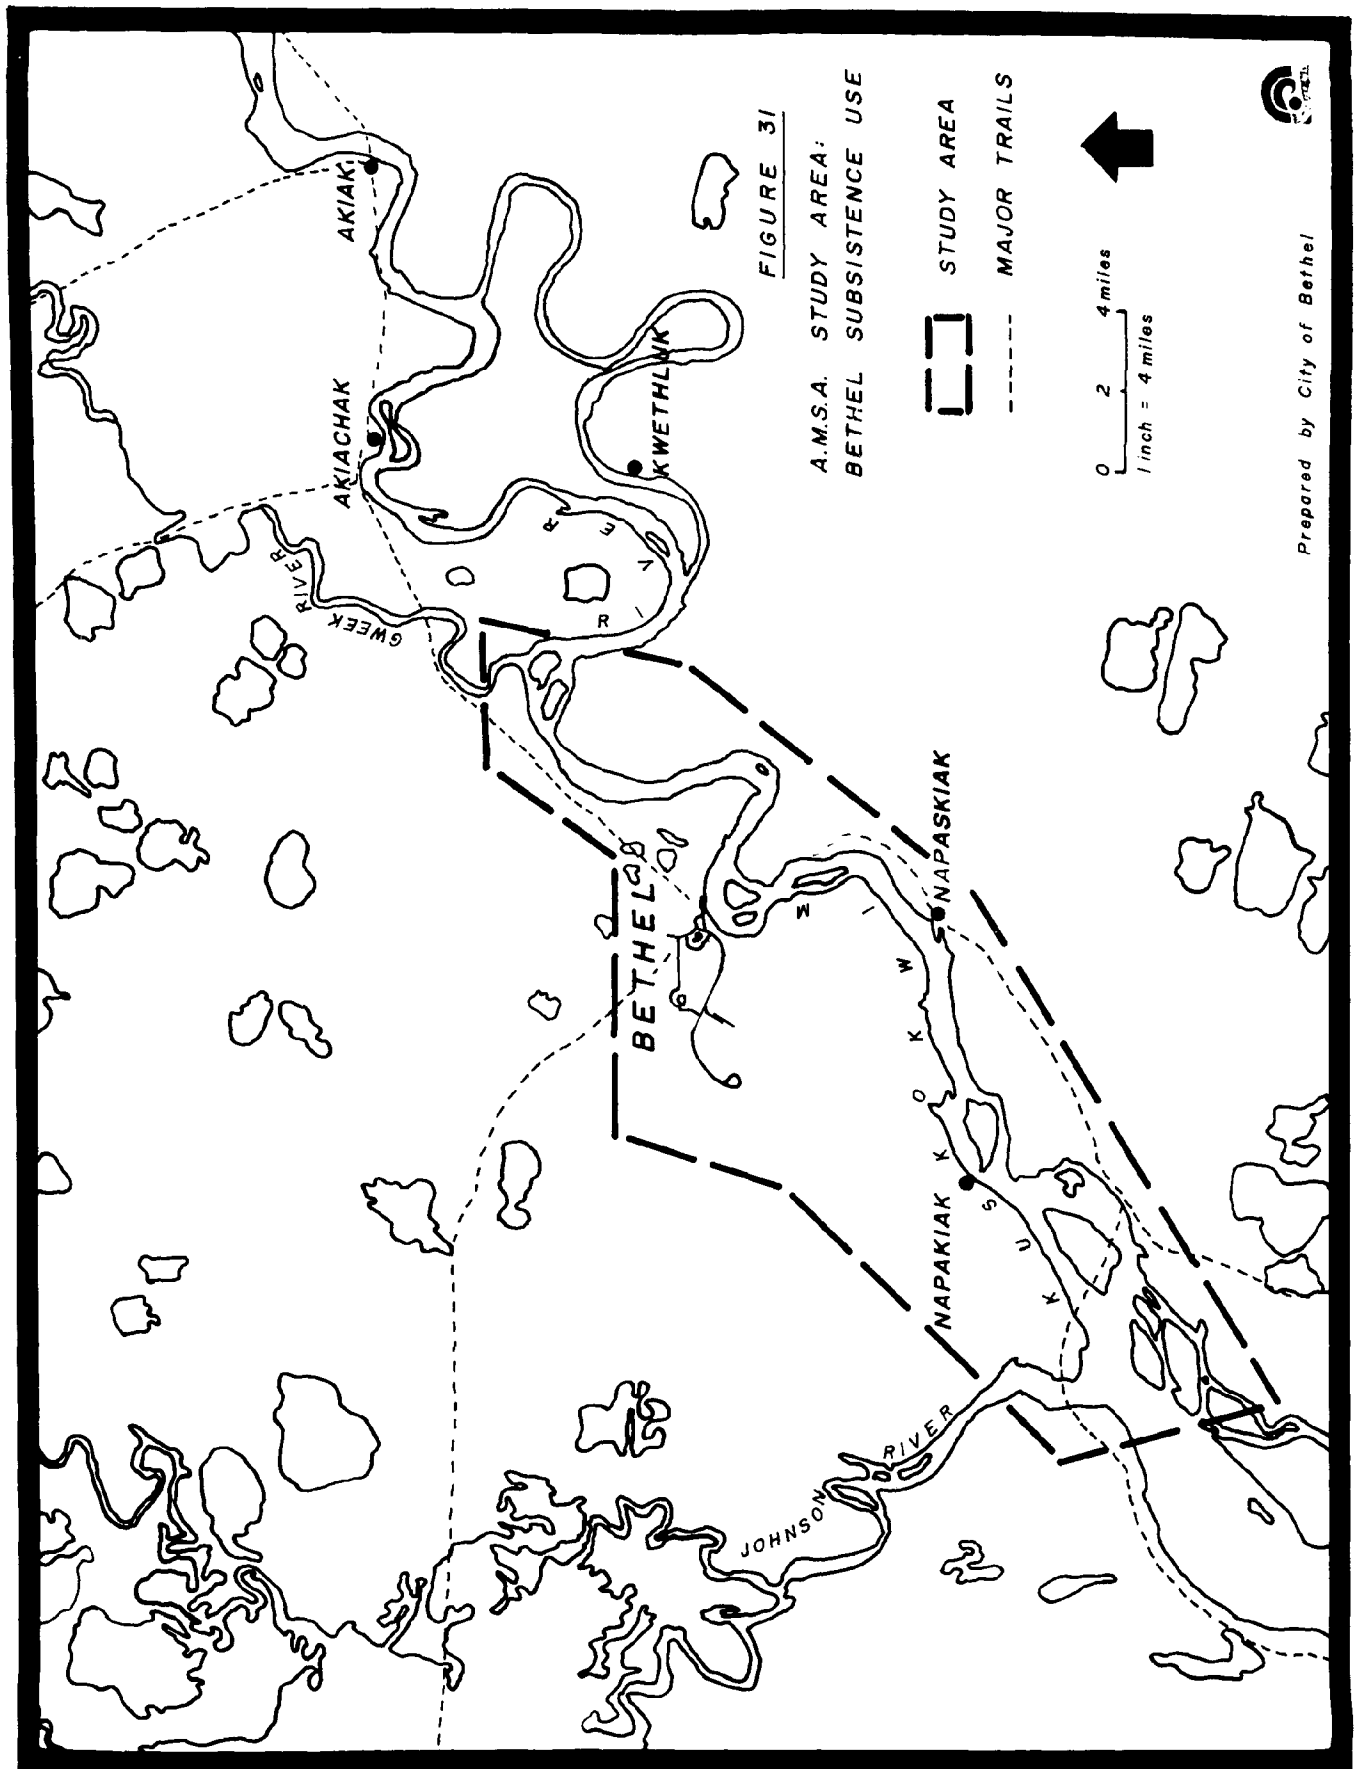

Most of the area used for subsistence lies outside city limits, and is therefore not subject to this coastal management plan. However, the Alaska Coastal Management Program recognized that there would be some areas needing attention that would not fall into local jurisdictions, or would need special management plans above and beyond the basic coastal management plan. The ACMP set up a category and process for "Areas Meriting Special Attention" that will allow the development of a management plan for the Bethel subsistence use area.

The first step in the process is to nominate an area to be designated as an Area Meriting Special Attention (AMSA). That is the purpose of this chapter. The ACMP guidelines provide

criteria for judging whether or not an area qualifies as an AMSA. Generally, an area can be considered meriting special attention if it has outstanding value to the general public, is particularly sensitive to change, or because plans for the area or claims upon its resources could preclude other uses. One of the specific criteria for AMSA designation, the one being used for this nomination, is "areas important for subsistence hunting, fishing, food gathering, and foraging." (6 AAC 80.160)

The area in and around Bethel which receives the heaviest use for subsistence fishing, including placement of fish camps, extends along the Kuskokwim River, from the Johnson River on the south, to the Gweek River on the north. (See Figure 31). It also receives use for hunting, trapping, berrying, gathering of firewood, and recreation. More study is needed to provide exact boundaries for the AMSA.

The need for an Area Meriting Special Attention in the vicinity of Bethel has also been recognized in the draft coastal management plan for Ceñaliulriit, the Yukon-Kuskokwim Coastal Resource Service Area. The Ceñaliulriit plan notes that "The land surrounding Bethel is used extensively for recreation, subsistence, and sport hunting and fishing. Because Bethel is rapidly growing into one of Alaska's largest cities, this land and water area must be managed to preserve the natural values that attract public use." (p 7-5, Public Hearing Draft, Ceñaliulriit Coastal Management Plan).

The terrain included in the AMSA is moist tundra, with lakes and rivers. Current management responsibility and ownership is mixed, with a variety of state and federal agencies, local municipalities, native corporations and private owners.

The City of Bethel anticipates coordinating the development of the management plan. In this process, it will work closely with Cēnaliulriit and all other affected parties. Further details on the process for developing the AMSA plan are yet to be finalized.

COASTAL MANAGEMENT PLAN

CHAPTER 7

ISSUES, GOALS, OBJECTIVES, POLICIES & IMPLEMENTATION

Issues, goals, objectives, policies and implementation measures, if well developed, will represent an integrated system for bringing about positive community change or maintaining desirable existing conditions. Issue statements represent a definition of community problems and community resources; goals are expressed community standards which are derived from shared ideals; objectives are identified to formulate programs or targets to direct categoric community change or retain the status quo in order to fulfill the goals; policies are guidelines for public officials so as to ensure that decision making is in keeping with the stated goals and objectives; and implementation represents the various public and private actions necessary to realize the goals and objectives.

The purpose for establishing issues, goals, objectives, policies, and implementation is to provide a statement of existing conditions, a vision of what the community wants in the future and the steps necessary to bring the vision into reality.

The following issues, goals, objectives, policies, and implementation measures were developed by the Bethel Coastal Management Working Group, a local group enpaneled to provide guidance for the development of coastal management program. The issues represent the broad concerns of environmental, social and quality of life interests.

RIVERBANK EROSION

Issue:

- . An issue of major concern to most of the residents of Bethel is the rapid rate at which the riverbank is eroding, between eight and twenty-five feet per year, depending on location. Through the years, numerous buildings have fallen victim to the river and many structures have been moved more than once to escape the advancing water. Attempts at stabilizing the bank have not been successful, and has resulted in creating an ugly scene in the form of hundreds of wrecked auto bodies lining the riverbank. In addition to the auto bodies creating somewhat of a hazard, it also makes access and general use of the riverfront very difficult.

Goal:

- . Eliminate bank erosion that is threatening the City.

Objectives:

- . The City shall pursue funding to provide shore defense works along the north bank of the river.
- . Erosion control measures shall provide adequate access to/from the river.
- . Erosion control measures shall allow for adequate commercial and industrial use of the river.

Policies:

- . Adequate access shall be a determinant in the design process for erosion control measures.
- . Adequate space for commercial and industrial use shall be a determinant in the design process for erosion control measures.

Implementation:

- . The City shall petition U.S. Army Corps of Engineers to get the proposed shore defense works on their capital projects list.
- . The City shall seek other Federal and State funds (existing programs) for the above project.
- . The City shall seek capital appropriations from the Alaska legislature for the above project.
- . The City shall include "adequate access" as a determinant in the design process for erosion control measures.
- . The City shall include adequate commercial and industrial use as a determinant in the design process and erosion control measures.

RIVER & WATERFRONT USE

Issue:

- . The lifeline of Bethel is the Kuskokwim River. It represents a resource with many opportunities, which in turn have produced conflicting demands for the use of the

river and the waterfront. Without planning based on the articulation of community preferences in a spirit of goodwill and compromise, the use of the river and adjacent waterfront will grow into a larger problem than it is at the present time. Conflicting concerns to be resolved include providing enough waterfront land for water oriented industry, particularly transportation and fish processing, without destroying the river's resource value for subsistence. The competition for location along the river has resulted in mixed land use, traffic congestion and associated problems. In addition, development has spread into the 100-year flood plain and is subject to annual flooding and ice damage.

Goals:

- . Retain multiple use of the river, including subsistence, recreation, commercial fishing, shipping, private conveyance (transportation), and private boat use.
- . Protect and enhance subsistence use of the river.
- . Protect and enhance public access to/from river for water and land vehicles.
- . Urban growth shall be restricted from encroaching into significant wetlands.

Objectives:

- . Space shall be provided for river use facilities, including public and private docks, haul out areas, launch ramps,

- commercial cargo handling facilities and floatplane ports.
- . The Comprehensive Plan shall be revised to exclude presently underdeveloped areas of significant wetlands from future growth.

Policies:

- . Priority shall be given to waterfront uses which are water-dependent and water-related.
- . Adequate opportunities for subsistence use of the river shall be provided.
- . Increased public access to the river for land and water vehicles shall be provided.
- . Development along the waterfront shall allow for adequate public access.
- . The river, including tributaries and sloughs, shall be kept free of navigation hazards.

Implementation:

- . A riverfront study shall be initiated that will identify needs and alternative sites for water-dependent and water-related uses such as: the off-loading of fish; float plane bases; subsistence use.
- . The City shall develop and adopt a land use plan for the riverfront area.
- . The City shall amend the Comprehensive Plan to address future urban development in significant wetlands.

- . The City shall provide funds to accomplish the above. When necessary the City shall also seek federal, state or other sources of implementation funds.

COMMUNITY GROWTH

Issue:

- . Bethel has grown in the absence of a comprehensive plan, which has produced a pattern of mixed land use as well as a problem of providing services to new residential areas. The cost of providing services, particularly water, sewer and road maintenance, to new development should be a factor in future decision making.

Goal:

- . Growth in Bethel shall occur in an orderly manner.

Objectives:

- . Provide adequate land for future types of land use which are compatible with surrounding uses.
- . Permit development at a rate and location in which it is possible to provide public services.
- . Develop a strategy whereby future capital service expansion costs for the private sector, incurred by the City, can be recovered.

Policies:

- . Future physical growth shall be developed in accord with the City's Comprehensive Plan.
- . Development shall take place at a rate and location in which it is possible to provide public services.
- . All future capital projects shall be consistent with the City's Comprehensive Plan.
- . Developers shall be required to reimburse the City for their share of capital costs for utilities.

Implementation:

- . The City shall update the Comprehensive Plan to include a land use element.
- . The City shall develop a utilities plan which shall include a schedule for the providing of services to newly developing areas.
- . The Planning Commission shall consider findings of the utilities plan in approving any new subdivisions. (This does not preclude the developer from providing services.)
- . The City subdivision regulations shall include a requirement that all new development be approved by the Planning Commission after being certified by Public Works as being within their capacity to service.
- . The City shall require feasibility studies that include life cycle and operation and maintenance costs for all capital projects. They shall also include cost recovery projections.

- . The City shall impose a user's fee to recover any costs incurred in future capital service expansion.
- . The City shall undertake a long range capital service expansion study, and develop a plan to control such expansion.
- . The City shall initiate the ANCSA 14(c)(3) selection process for public use property.
- . The City shall develop a five year capital improvements plan, which will be incorporated into the Comprehensive Plan.
- . The City shall provide funds to accomplish the above. When necessary the City shall also seek federal, state or other sources of implementation funds.

SUBSISTENCE

Issue:

- . A 1980 community survey indicated that approximately 70% of Bethel residents acquire some form of their food supply through subsistence activity. Subsistence is a way of life for many and is considered an important part of the Bethel lifestyle. Subsistence concerns must be taken into account as further community development occurs.

Goal:

- . Subsistence shall be recognized as an important dimension of the lifestyle of Bethel residents.

Objective:

- . Develop an open space system and other features of the Comprehensive Plan that will facilitate the pursuit of subsistence activities.
- . Designate the area most intensively used for subsistence activities by Bethel residents as an Area Meriting Special Attention (AMSA) and develop an appropriate management plan for it.

Policies:

- . Drainageways, ponds, and significant wetlands shall be kept free from encroaching development.
- . A trail system shall be integrated into future development patterns.
- . Development shall be confined within the city limits of Bethel, therefore preventing encroachment on surrounding subsistence areas.

Implementation:

- . Moorage and launch areas for small boats shall be provided.
- . The Comprehensive Plan shall be amended to address the subsistence resource use pattern.
- . An open space system and/or other means to facilitate land and water based subsistence activities.
- . The City shall nominate the area used most intensively by Bethel residents for subsistence activities as an Area Meriting Special Attention (AMSA).
- . The City shall provide funds to accomplish the above. When necessary, the city shall seek additional federal, state or other funds for implementation.

HABITAT

Issues:

- . Residential and commercial development in Bethel alters vegetation and topography through the creation of sand

pads and use of other construction techniques. Site development sensitive to critical habitat characteristics can reduce the impact on wildlife.

Goal:

- . A variety of habitats shall be maintained within the Bethel City limits.

Objective:

- . Provide an open space system that will preserve the different habitat types.

Policy:

- . Drainageways, ponds and significant wetlands shall be kept free from encroaching development.
- . The preservation of other habitat types, such as moist tundra, shall be in accordance with the Comprehensive Plan.

Implementation:

- . The City shall establish appropriate setbacks.
- . The Comprehensive Plan shall be amended to set forth mechanisms for maintaining open space in various habitats.
- . The City shall provide funds for the above. When necessary, federal, state or other funds shall be sought for implementation.

WETLANDS MANAGEMENT

Issue:

- . The area in and around the City of Bethel contains extensive wetlands. Some wetlands experience annual flooding from the Kuskokwim River, while other wetland locations serve as drainageways or temporary water holding areas. The significance of these wetlands varies and development policy needs to be formulated for future growth. (See wetlands section for more details.)

Goal:

- . Develop a wetlands management strategy that will reduce the impact of flooding on structures and properties in the city.

- . Facilitate local compliance with federal law.

Objectives:

- . Obtain general permit for residential development from the U.S. Army Corps of Engineers.
- . Facilitate permit application process for other types of development in wetlands in the City.
- . Develop information for area wetlands that meets Corps and other agency criteria.
- . Develop a comprehensive wetlands inventory and plan.

Policies:

- . Development within the City shall be consistent with Section 404 of the Clean Water Act, and Corps of Engineers regulations.
- . New urban development shall not be allowed in significant wetlands.

Implementation:

- . The City shall seek a general permit for residential development from the U.S. Army Corps of Engineers.
- . The City shall develop a permit review process (subdivision, building, etc.) that shall encourage development compatible with wetlands.
- . The City shall provide citizens with information and general assistance on the C.O.E. permit process for wetlands.
- . The Comprehensive Plan shall be revised to eliminate urban development within significant wetlands.

- . The City shall provide funds to accomplish the above. When necessary the City shall also seek federal, state or other sources of funds for implementation.

SURFACE DRAINAGE

Issue:

- . Development has occurred with little understanding of the overall drainage pattern within the City. Consequently, the natural drainageway has been disrupted, crossings have been inadequately culverted and inundation and erosion problems have been created. The City needs an overall drainage plan as a prelude for future development.

Goal:

- . Provide for adequate surface drainage.

Objective:

- . Develop a drainage element as part of the Comprehensive Plan.

Policies:

- . Development in the City shall not interfere with natural drainage patterns.
- . Drainageways and ponds shall be kept free from encroaching development.
- . No development shall take place without adequate measures to provide for natural surface drainage.
- . Natural drainageways and catchment basins shall be the preferred use for managing surface drainage.
- . Roads shall be properly ditched and culverted.

Implementation:

- . The City shall initiate a surface drainage study.
- . The City shall assist citizens and require that they meet drainage standards.
- . The City shall act to provide adequate drainage across/through city streets and properties.
- . Adequate surface drainage shall be a determinant in the design review and permit processes for any new subdivisions.
- . Setbacks shall be established for streams and ponds.

- . Oversize culverts with thaw pipes shall be installed in future development.
- . Road banks shall be seeded to reduce erosion.
- . The City shall provide funds to accomplish the above. When necessary the City shall also seek federal, state or other sources of funds so that these will be accomplished.

WASTE DISPOSAL

Issue:

- . Approximately one-third of the City is on a sewer system which is dumped into a lagoon, and the lagoon is estimated to be at capacity by 1990. The remainder of the City receives a honey bucket or vacuum pump collection service. However, a significant amount of sewage finds its way into the streams or the river. A solution is needed for the City's waste disposal problems.

Goals:

- . Strive for unpolluted ponds, sloughs, streams and the Kuskokwim River.
- . Provide a litter free city and adequate disposal of solid waste.

Objectives:

- . Develop adequate sewage collection measures for the City.
- . Develop adequate sewage treatment measures for the City.

- . Develop solid waste disposal system adequate for City needs.
- . Study the actual impact of gray water runoff, and develop any necessary strategies to lessen negative effects.
- . Initiate a study to determine the effects of and alternatives for fish processing by-product disposal.

Policies:

- . A waste disposal plan for the City shall be developed and incorporated into the Comprehensive Plan. All actions shall be consistent with that plan.
- . Sewage, waste and gray water disposal in Bethel shall meet the Alaska Department of Environmental Conservation standards.

Implementation:

- . The City shall initiate a study to examine alternative methods of sewage collection in the City.
- . The City shall initiate a study to examine alternative methods of sewage treatment in the City.
- . The City shall initiate a study to identify and evaluate means of collection and disposal of solid waste.
- . The City shall initiate a study to identify and evaluate the impact of gray water runoff. The study shall also identify alternative means of lessening negative effects.
- . The City shall seek funds for a fish by-product disposal study.

- . The City shall use ANCSA 14(c)(3) process to secure future waste disposal sites.
- . The City shall provide funds to accomplish the above. When necessary the City shall also seek federal, state or other sources of implementation funds.

AIR QUALITY

Issue:

- . Blowing sand and silt represent a problem during the summer months. Not only does it irritate the eyes and get into the home and damage machinery, but it eventually gets into the streams in the form of sediment. Exposed cover needs to be seeded where possible.

Goal:

- . Minimize blowing sand and silt.

Objective:

- . Control the release source of the wind-borne material.

Policies:

- . The City shall develop standards to control the release of wind-borne sand and silt from roads, sand pads and sand pits.
- . Development shall be carried out in a manner which keeps blowing sand and silt under reasonable control.
- . Roads shall be covered with gravel.

Implementation:

- . The City shall encourage property owners to establish vegetation on sand pads.
- . The Comprehensive Plan shall be amended to address the reclamation (revegetation) of lands so that appropriate action is taken.
- . The City shall seed roadbanks and encourage vegetation on private roads.
- . The City shall provide funds to accomplish the above. When necessary the City shall also seek federal, state or other sources of implementation funds.

PEDESTRIAN WALKWAYS & TRAILS FOR OFF—ROAD VEHICLES

Issue:

- . A conflict exists between automobile, other motorized, and pedestrian traffic. The Bethel road system does not provide for transportation other than automobiles. Community growth has brought about a need to define a trail system that will improve the safety of pedestrians and the operators of snowmachines and other off-road vehicles.

Goal:

- . Minimize pedestrian and vehicular conflicts by providing a safe city-wide trail system.

Objectives:

- . Develop a trail system element as part of the Comprehensive

- Plan which addresses pedestrian and vehicular circulation.
- . Design and construct a trail system that minimizes pedestrian and vehicular conflict.
 - . Improve pedestrian access.

Policies:

- . The City trail system shall be integrated with future development.
- . Future development shall take place in such a way as to minimize pedestrian and vehicular conflict.
- . Future development shall be compatible with the city-wide trail system.

Implementation:

- . Maps shall be drawn of existing trails within the City.
- . The trail element of the Comprehensive Plan shall be completed and adopted.
- . The trail system shall be designed.
- . The City shall acquire and designate land or easements for trails. The ANCSA 14(c)(3) process may be used to acquire these lands and/or easements.
- . The City shall provide adequate safety measures on trails.
- . Boardwalks and trails shall be repaired or constructed where needed.
- . The City shall provide funds to accomplish the above. When necessary, state, federal or other funds shall be sought to implement the above.

RELATIONSHIP OF ISSUES TO RESOURCE ASSESSMENT

Riverbank Erosion

The Geophysical Hazards section discusses erosion rates of the Kuskokwim River and explains the erosional process at Bethel. Maps are included that predict the advance of the riverfront based on a historic and decreasing rate. The Geophysical Hazards section also discusses the City of Bethel's comprehensive bank stabilization program. The Transportation section discusses seawall projects at the cargo dock and fuel dock and illustrates the importance of the River as a transportation corridor. The Subsistence section emphasizes the importance of the river as a subsistence resource. The Recreation section mentions the use of the river as a popular recreation area. All important uses of the riverfront must be considered when planning for bank stabilization projects.

Use of the River and Riverfront

The physical characteristics of the Kuskokwim River are discussed in the Hydrology section. The actions of the river often determine the time of year, the length, and the type of activity that occurs on the river. The primary concern of use of the river is the availability of proper access. Access needs to be insured for a variety of uses that are specifically discussed in this report. The uses include: subsistence, transportation, commerce, commercial fishing,

and recreation. Riverbank stabilization projects need to consider the many uses of the river so that none are prevented by seawall construction. Future planning of riverfront use must consider existing land ownership and existing land use. Pocket fold-out maps of land ownership and land use are provided in the back of this report. Potential future economic activities that may need to be considered when planning for riverfront use includes outer continental shelf activities, forest development, mining, and tourism.

Community Growth

Bethel's rapid population growth in recent decades has had profound effects on the economy and lifestyle of Bethel. A generation ago the culture was almost totally Native and the economy predominantly subsistence. Now Bethel is at least one-third non-Native and the cash economy is dominant. The Alaska Native Claims Settlement Act (ANCSA) awarded land allotments to eligible Natives. ANCSA has created an interesting planning situation for Bethel in that 30% of the land within the City limits is pending native allotment applications and are not subject to state or local jurisdiction.

The direct cause of Bethel's rapid population growth has been economic growth particularly in the government, transportation and service sectors. Benefits of economic growth have been increased per capita income and better community and utility services. However, negative impacts caused by overly rapid growth include a severe housing shortage and heavy strain

on community services. The economy of Bethel is in a vulnerable position because of an overdependence on government and support industries such as transportation and service. Continued large government cutbacks could have a devastating impact on the Bethel economy. The economy may potentially expand from the development of a tourist industry, upriver forest development, or outer continental shelf activities.

Subsistence

The patterns of subsistence use are identified in the Cultural Resources section of the Resource Assessment. The importance of subsistence is noted throughout the Assessment. Access to the river and riverfront for subsistence purposes is discussed in the Riverfront Land Use chapter and Transportation section of the Assessment.

Discussions of Habitat, Bird Life, Vegetation, Mammals, and Fishes are all pertinent to the issue of subsistence, as is the discussion of Commercial Fishing. The chapter which proposes that an Area Meriting Special Attention (AMSA) be established for the area used most intensively for subsistence activities by Bethel residents provides additional information on this topic.

Habitat

The discussions of Hydrology, Habitats, Vegetation, Bird Life, Mammals and Fishes all pertain to the issue of habitat and indicate a need to maintain a system of open space within

the city. Related issues include Subsistence, Recreation, Drainage and Wetlands.

Future planning for open space must refer to current land use and ownership as well as economic activities. Of particular importance is the matter of city owned land and/or easements, and the negotiations currently underway with the Bethel Native Corporation for ANCSA 14(c)(3) lands. See Land Use and Land Ownership sections.

Wetland Management

Wetland habitats, subject to the Alaska Coastal Management Program, have been defined in the Coastal Habitat section. The importance of wetland habitats to fish and wildlife resources and the continuance of a subsistence lifestyle and commercial and sport utilization of these resources is implicit throughout the report. Specific mention of environmental concerns associated with future development in wetland areas is found in the discussion of the small boat harbor, contained in the section on Transportation.

Surface Drainage

Surface drainage is discussed in the Hydrology section. Due to low profile, undulating topography, and the presence of permafrost, no dominant stream systems have been able to develop. A major portion of the area is imperfectly drained which results in extensive areas of standing water. The impact of increased urban development without consideration

of natural drainage is discussed in the Geophysical Hazards and Public Works sections. Large scale maps (1":100') have been prepared for the City to illustrate local surface water movement. The maps will be useful in the siting of new roads and sites for location of sand pad foundations. However, a more comprehensive drainage study is recommended.

Waste Disposal

The City of Bethel's existing methods of waste disposal are identified in the Utilities section. This section includes some discussion on the limitations of the City to provide conventional waste disposal services to the entire community. The need for expanded services and the development of a comprehensive utility plan is implicit.

Air Quality

The major air quality concern expressed by residents of Bethel is the blowing of sand and silt. The level of wind borne materials may be reduced with improved construction methods, the seeding of sand pads, and revegetation of exposed areas which would prevent or mitigate further onshore erosion. Onshore erosion is addressed in the Geophysical Hazards section.

Pedestrian Walkways and Trails for Winter Off Road Vehicles

The designation of a city-wide winter trail system in Bethel would greatly benefit the community. With the increased utilization of 3-wheelers and snow machines for transport, problems are certain to arise as new developments obstruct

commonly used trails (see Transportation section). The major local and regional trails have been identified and are illustrated in figure 14.

In spite of the recent increases in the numbers of cars in Bethel, a large portion of the community still uses foot travel as the primary mode of transport. Safe pedestrian walkways are at a minimum and need expansion. Boardwalks are discussed in the Transportation subchapter. See also the Recreation discussion.

MANAGEMENT AUTHORITY

One of the principles of the coastal management program is to use - to the greatest extent possible - existing governmental authorities and agencies to implement local coastal management plans. Within state and federal government, a number of cabinet level departments, as well as divisions and agencies within those departments, have statutory responsibilities that relate directly or indirectly to matters of concern in the coastal area. Local ordinances and actions also affect matters of concern in the coastal management plan.

The Alaska Coastal Management Act did not bestow new legal authority on municipalities. It did create the mechanism of "consistency" to ensure the implementation of coastal management plans. That means that although agencies do not lose their management responsibility or authority within a coastal district, they do have to ensure that their actions are consistent with the approved coastal management plan.

Appendix IV lists existing state and federal management authorities that directly or indirectly affect implementation of the coastal management plan in Bethel. Persons wishing to develop projects within Bethel are also required to see that pertinent state/federal requirements are met. Satisfying concerns of this plan as stated in policies and standards does not exempt the developer from meeting other federal/state requirements that may exist.

USES & ACTIVITIES SUBJECT TO THE COASTAL MANAGEMENT PLAN

The State of Alaska Coastal Management Program guidelines specify several uses subject to the coastal management program, and allows local districts to add other uses that will be subject to their plans.

The City of Bethel plan sets standards for all new development and construction in the city limits. Specific activities covered include, but are not limited to:

- . Construction of residential, commercial, industrial, or public facilities.
- . Subdivisions
- . Development in wetlands
- . Development along the waterfront
- . Development in hazardous areas
- . Erosion control measures
- . Subsistence Use
- . Trails
- . Recreation
- . Energy Facilities
- . Transportation and Utilities
- . Fish & Seafood Processing
- . Timber Harvest & Processing
- . Mining and Mineral Processing

Uses of State Concern

Land uses that significantly affect the long term public interest have been singled out in the Alaska Coastal Management Program (ACMP) for special treatment. They are called "uses of state concern", and include:

- . Coastal land uses "of national interest", specifically,
 - . ports that contribute to meeting national energy needs;
 - . facilities that contribute to meeting national energy needs;
 - . navigational facilities and systems;
 - . development of resources on federal lands;
 - . national defense and security facilities.
- . Land uses of more than local concern, including those that confer significant environmental, social, cultural or economic benefits or burdens beyond a single coastal management district;
- . Major energy, industrial, or commercial facilities, that, because of their magnitude or the magnitude of their effect on the state's economy or the regional economy, are issues of more than local significance;
- . Transportation or communications facilities that serve statewide or interregional needs;
- . State parks, state recreational areas, state game refuges, state game sanctuaries, or critical habitat areas established by statute.

ACMP guidelines state that these uses must be treated fairly in local plans, and not be unreasonably excluded or restricted. Policies in the Bethel plan generally reflect state coastal management objectives, and do not unreasonably exclude or restrict these uses.

Proper and Improper Uses

Uses that are consistent with the standards and policies set forth in the coastal management plan are to be considered proper uses. Uses not consistent with the policies and standards are improper uses.

The standards and policies for the Bethel Coastal Management program are set out below.

POLICIES AND STANDARDS

The state guidelines for the coastal management program specify a number of uses that must be addressed in a local coastal management plan, in addition to any issues the local jurisdiction may want to include in the plan. This section lists all the uses that will be covered by the Bethel coastal management plan, and tells the developer what standards must be met for any of those uses. To make this document easier to use, most of the detailed standards are included in the appendices to this report, rather than in the text. A few, such as the city riverfront land use plan, are not complete at the time of this printing so the reader will have to obtain them separately from the City of Bethel Planning Department.

GENERAL POLICIES WHICH APPLY TO ALL DEVELOPMENT IN CITY LIMITS

Community Growth

- . Future physical growth shall be developed in accord with the City's Comprehensive Plan.
- . Future subdivisions shall comply with the City's Land Subdivision Regulations, (City Ordinance #135).
- . Development shall take place at a rate and location in which it is possible to provide public services.
- . All future capital projects shall be consistent with the City's Comprehensive Plan.

- . Developers shall be required to reimburse the City for their share of capital costs for utilities.
- . Future development shall take place in such a way as to minimize vehicular and pedestrian conflict.
- . Future development shall be compatible with the city-wide trail system.

Wetlands Development

- . New urban development shall not be allowed in significant wetlands.
- . Development in the City shall be consistent with Section 404 of the Clean Water Act, and Corps of Engineers regulations.

Drainage

- . All future development shall meet drainage standards being developed by the City. These standards will be based on the following principles:
 - Development in the city shall not interfere with natural drainage patterns.
 - Drainageways and ponds shall be kept free from encroaching development.
 - No development shall take place without adequate measures to provide for natural surface drainage.
 - Natural drainageways and catchment basins shall be the preferred use for managing surface drainage.

- Roads shall be properly ditched and culverted.

Until such time as a specific ordinance regulating drainage is adopted, these general principles shall be used.

- . Subdivisions shall meet drainage standards as outlined in the City's Land Subdivision Regulations.

Habitat

- . All drainageways, ponds and significant wetlands shall be kept free from future encroachment.
- . The preservation of other habitat types, such as moist tundra, shall be in accord with the Comprehensive Plan.

Waste Disposal

- . A waste disposal plan for the City shall be developed and incorporated into the Comprehensive Plan. All actions shall be consistent with that plan.
- . Sewage, waste and gray water disposal in Bethel shall meet the Alaska Department of Environmental Conservation standards.

Air Quality

- . The City shall develop standards to control the release of wind-borne sand and silt from roads, sand pads and sand pits.
- . Development shall be carried out in a manner which keep blowing sand and silt under reasonable control.

- . Roads shall be covered with gravel.

Development along the Waterfront

- . Development along the riverfront shall be consistent with the City Riverfront Land Use Plan, which is being written. The plan will be based on the following policies, and until such time as the plan is adopted by ordinance these general policies shall apply:

- Priority for development along the waterfront shall be given to water dependent and water related uses and activities.
- Other uses will also be allowed if adequate space is provided for water dependent and related uses.
- Adequate opportunities for subsistence use of the river shall be provided.
- Increased public access to the river for land and water vehicles shall be provided.
- Land shall be provided for recreational use.
- Development along the riverfront shall allow for adequate public access.
- The river, including tributaries and sloughs, shall be kept free of navigation hazards.

Geophysical Hazards (Development in Hazardous Areas)

- . New urban development shall not be allowed in areas of the 100 year flood plain designated as significant wetlands.

- . Residential construction in already platted and developed flood plain areas not in the significant wetlands shall be allowed if it meets the requirements of the National Flood Insurance Program.
- . Development in areas threatened by erosion shall not be permitted unless siting, design and construction standards for minimizing property damage and protecting against loss of life are met.

Subsistence Use

- . Drainageways, ponds, and significant wetlands shall be kept free from encroaching development.
- . Adequate opportunities for subsistence use of the river shall be provided.
- . A trail system shall be integrated into future development patterns.
- . Development shall be confined within the city limits of Bethel, therefore preventing encroachment on surrounding subsistence areas.

POLICIES WHICH APPLY TO SPECIFIC USES AND ACTIVITIES

Erosion Control Measures

- . Adequate access shall be a determinant in the design process for erosion control measures.

- . Adequate space for commercial and industrial use shall be a determinant in the design process for erosion control measures.

Trails

- . A trail system shall be integrated into future development patterns.

Recreation

- . Adequate recreational facilities shall be provided.
- . Municipal properties shall be designated for recreational purposes. This includes open space, boardwalks, and other facilities.
- . A long range park and recreational facilities plan shall be developed.

Energy Facilities

Any energy facility necessary for future development shall be sited according to the standards included in the A.C.M.P.

Transportation and Utilities

- . Transportation and utility development shall meet the standards in the City's Land Subdivision Regulation Ordinance, and drainage plan.
- . Transportation and utility routes and facilities shall comply with the A.C.M.P. standards.

Fish and Seafood Processing

- . Development of new facilities for commercial fishing and fish processing shall meet the general standards in this plan.
- . The riverfront land use plan shall identify sites suitable for expansion of this industry.

Timber Harvest and Processing

- . The riverfront land use plan shall identify possible sites for timber processing.
- . Timber harvest and processing shall meet A.C.M.P. standards.

Mining and Mineral Processing

- . Mining and mineral processing shall meet A.C.M.P. standards.

IMPLEMENTATION

CHAPTER 8

IMPLEMENTATION

Implementing a plan is both the most difficult and the most important task facing a planner. Unless the ideas in a plan are put into action, it remains a mere collection of papers, collecting dust on a shelf.

This plan is no exception. Fortunately, the design of the Alaska Coastal Management Program provides several tools for this. One, "consistency", allows the plan to affect actions beyond those of the City proper. This is described in the section titled "Policies and Standards: How they will be implemented by State and Federal agencies."

For purely local actions, the City will use existing authorities to implement the policies as allowed for in Title 29. How this will be done is discussed in the following section.

Policies and Standards: How they will be implemented locally

The crux of this plan is the many policies and standards identified in the previous chapter. These can be considered the "rules" of the coastal management program. Whether backed by City ordinance (such as the subdivision ordinance), federal law (such as wetlands permitting), or a statement of policy (such as the directive to integrate future development with a trail system), these are the guidelines which shall be followed

once this plan is adopted. In all cases, developers should plan their projects with these guidelines in mind. Decision makers, such as Planning Commissioners, or state and federal agencies, will use these guidelines in deciding whether or not to grant approval to a proposed project.

This plan does not establish any new review procedures or new layers of bureaucracy. It relies on existing procedures, such as the building permit system or subdivision approval. It does add new standards to these procedures. It also gives new responsibilities to the decision makers, such as the Planning Commission, as they must ensure their actions are in conformance with this plan.

For routine local actions, such as the granting of building permits, the Planning Department will add the coastal management policies to the criteria used in granting a permit. For example, one of the criteria now used in issuing a building permit is whether or not the new structure meets the yard requirement for distance from the property line. When this plan is adopted, the Planning Department will, as part of the routine processing of a building permit, also check to see, e.g., that adequate drainage measures are taken. This may add some time to the processing of a building permit, but developers can continue to expect a 2 to 3 day processing time on routine permits.

For actions that go before Planning Commission for review, such as subdivision approval, the Planning Department will

prepare a written statement on the proposed development, its impact on coastal resources, and how it meets the coastal management policies and standards. This, in essence, will be a local "consistency" determination. The Planning Commission will then use this analysis in its review of the project.

If the project does not meet coastal management policies and standards, informal steps will be taken by the Planning Department to resolve the differences. If these are not successful, the analysis provided to the Commission will note the discrepancies and provide suggestions for taking care of them. If a project does not meet these policies the Planning Commission will deny approval, as they would if it did not meet the requirements of any other applicable ordinance.

Adding the consistency analysis to projects going before Planning Commission will increase the time needed for processing, as the staff shall prepare the written analysis prior to the Planning Commission meeting. If a developer presents a proposed project to the Planning Department a minimum of three weeks prior to the Commission meeting, this will usually provide adequate time to perform and prepare the consistency review. Developers are advised to contact the Planning Department in the early stages of their planning, to provide for adequate consideration and discussion of the project, and avoid unnecessary delays.

Many projects will also need state or federal permits. Wetlands permits from the U.S. Army Corps of Engineers are

currently required by federal law for all construction in Bethel. (If a general permit for residential construction is granted to the City, most residential development will be exempt from this requirement: see chapter 5.) The City is not responsible for issuing these permits but does have a role in reviewing them for consistency with the local coastal management plan. Developers are responsible for applying for any needed permits for their projects.

When agencies or clearinghouses send the Planning Department a notice of pending permit action on a project that will affect Bethel, the proposed project will be reviewed for consistency with coastal management policies and standards. The Planning Department will prepare this analysis, and send a copy of its findings to the permitting agency (or clearinghouse) and the applicant.

City response to permit notifications will be within the time limits imposed. Developers should be aware that the time required for processing state and federal permits varies, but is usually quite lengthy.

All consistency analyses will be prepared by the Planning Department. If a development does not meet coastal management standards, informal attempts will be made to resolve the problem. If no resolution is possible, a recommendation to deny approval will be made. In some instances, the analysis may recommend specific stipulations be included in the permit which would bring the project into conformance with the policies and standards.

Field checks will be carried out through observation by a planning department staff member trained in the coastal management standards and policies.

Enforcement, when necessary, will be carried out according to existing local ordinances and/or pursuant to existing state/federal regulations. No new mechanisms are being established by this plan.

Developers are encouraged to discuss their projects with the Planning Department in the early planning stages. This way the Department can ensure that the developer is aware of requirements the project will have to meet early enough to avoid delays or extensive modification of a project. Also, Planning Department staff can provide suggestions on how to best meet relevant requirements.

Policies and Standards: How they will be implemented by State and Federal Agencies

The mechanism of "consistency" means that once this plan is adopted by the Alaska Coastal Policy Council, and, later, the Federal Department of Commerce, both state and federal agencies must ensure that their actions are consistent with this plan. This affects agency actions: any projects they may plan in Bethel must meet the policies and standards.

Probably more importantly, their decisions on permits must be based on local coastal management policies and standards, as well as their own criteria. Local review and comments on permit action will influence agency decisions.

In the case of federally initiated activities, the agency charged with making the federal consistency determination must contact the local district and must give "great weight" to the views of the district regarding the project's consistency with the district program. ("Great weight" means shifting the burden of proof to the deciding agency to reach a contrary decision.)

For state initiated or regulated activities, Bethel requests notification for any state activity or permit action within the city limits or that will have an impact on the city for any use or activity subject to the coastal management program. Upon notification of a pending action or permit decision by the state agency, the Planning Department will submit its written analysis of the project's consistency with the local coastal management plan. This will be done within the time limits imposed. The state agency must give "great weight" to the views of the district.

Meeting Goals and Objectives

Another aspect of implementing the plan involves the follow through on the goals and objectives listed in Chapter 7. Most of these activities will be the responsibility of the Planning Department: for example, amending the Comprehensive Plan or developing a drainage plan. Planning Department will pursue these objectives as aggressively as possible given staff and budget constraints.

Once adopted, this plan becomes City policy and will guide City actions. In some instances, activities listed as implementation steps in chapter 7 are appropriate to a City department other than Planning. In such cases, City Administration will be responsible for seeing that the follow-through is made. Planning Department will assist in that process to the extent possible. Of course, it is ultimately the responsibility of City Council to see that the coastal management plan is followed.

Organization and Staffing

Throughout this chapter reference has been made to the Planning Department as the City entity responsible for local implementation of coastal management policies and standards, and the contact for state and federal decision-makers. As staff to the Planning Commission and the City department charged with planning responsibilities, this is the most appropriate department to handle these tasks.

Current staffing includes a Planning Director, Planner, Planning Technician, and Coastal Management Coordinator. The Planner is currently responsible for performing consistency reviews. Given the uncertainty of continued funding for coastal management, it is not possible to project department staffing levels. Therefore all correspondence related to coastal management should be addressed to the Planning Department and it will be routed internally as appropriate.

PUBLIC PARTICIPATION SUBSTANTIATION

CHAPTER 9

PUBLIC PARTICIPATION SUBSTANTIATION

The Alaska Coastal Management Program requires that a district program include "evidence of effective and significant opportunities for public participation" in development of the coastal management program (6 AAC 85.110).

This chapter summarizes the efforts made by the City of Bethel to involve and inform local residents of the coastal management planning process. Considerable energy has gone into this effort, based on the belief that this plan should address issues identified by citizens, and use their opinions and wisdom in fashioning solutions to existing problems.

The basic element in the effort to ensure the representation of different viewpoints in the planning process has been the formation of the "coastal management working group". Representation from various organizations was sought, including the Bethel Native Corporation, Orutsaramuit Native Council, Lousetown Development Association, Cenaliulriit (Yukon Kuskokwim Coastal Resource Service Area Board), private individuals, and City of Bethel Parks and Recreation Committee, Planning Commission and City Council.

The working group met frequently in the development of this draft, providing coastal management staff with considerable guidance and feedback, particularly regarding issues, goals, objectives, implementation, and policies. Working group meetings

were also open to the public. (Notes and/or tapes of all public meetings are available in the City's record of public meetings for coastal management.)

Additionally, two general public meetings and one public hearing have been held prior to the publication of this draft. The public meetings were held in October, 1981 and February, 1982. Both were widely advertised in the local newspaper, The Tundra Drums, and announced over radio KYUK. The October meeting was an introduction to coastal management and an opportunity for the public to identify issues. The February meeting was held to review the Preliminary Report, published that month. Also shown at the February public meeting was a slide show, developed by coastal management staff, entitled "Coastal Management: A Local Perspective". The slide show has also been shown over KYUK television (channel 4), the local public T.V. station.

At the public hearing in March (1982), the City Council accepted the Preliminary Report. Prior to this hearing, the Coastal Management Coordinator reviewed the planning efforts to that point on "Yuk to Yuk", an hour long local radio talk show.

Other efforts to inform the public include columns in the local newspaper, a summary of the preliminary report which was published as an insert to the newspaper (February 1982) with extra copies distributed around town, and an update on coastal management planning efforts which was mailed to all boxholders (October 1982).

Opportunity for public comment on this Public Hearing Draft is being provided according to the cover letter to reviewers, and will meet A.C.M.P. requirements.

APPENDICES

APPENDIX I

PLANTS, MAMMALS & FISH IN STUDY AREA

IMPORTANT PLANTS OF THE WET TUNDRA COMMUNITY

Characteristic Species

Bog orchid	<u>Platauthera dilatata</u>
Cotton grass	<u>Eriophorum angustifolium</u> ssp. <u>subarcticum</u>
Sphagnum moss	<u>Sphagnum rubellum</u>

Additional Species

Shrubs

Dwarf birch	<u>Betula nana ssp. exilis</u>
Blueberry	<u>Vaccinium uliginosum</u>
Labrador tea	<u>Ledum palustre ssp. decumbens</u>
Willow	<u>Salix fuscescens</u>

Herbs

Bistort	<u>Polygonum bistorta ssp. plumosum</u>
Bur reed	<u>Sparganium sp.</u>
Bog cranberry	<u>Oxycoccus microcarpus</u>
Mare's tail	<u>Hippuris vulgaris</u>
Marsh Marigold	<u>Caltha palustris ssp. arctica</u>
Pond weed	<u>Potamogeton sp.</u>
Wild flag	<u>Iris setosa ssp. setosa</u>

Grasses and Sedges

Beach rye grass	<u>Elymus arenarius ssp. mollis</u>
March arrowgrass	<u>Triglochin palustris</u>
Oat grass	<u>Hordeum brachyantherum</u>
Rush	<u>Luzula wahlenbergii ssp. piperi</u>
Sedge	<u>Carex pluriflora</u>
Spear rye grass	<u>Poa eminens</u>

Fern Relatives

Fir clubmoss	<u>Lycopodium selago ssp. selago</u>
Quilwort	<u>Isoetes muricata ssp. maritima</u>

Lichens, mosses and liverworts

IMPORTANT PLANTS OF THE MOIST TUNDRA COMMUNITY

Characteristic Species

Crowberry	<u>Empetrum nigrum</u> ssp. <u>nigrum</u>
Sedge	<u>Carex saxatilis</u>
Hair Moss	<u>Dicranum</u> sp.
Reindeer lichen	<u>Cladonia</u> sp.

Additional Species

Shrubs

Arctic willow	<u>Salix arctica</u> ssp. <u>crassijulis</u>
Blueberry	<u>Vaccinium uliginosum</u>
Cranberry	<u>V. vitis-idaea</u> ssp. <u>minus</u>
Drawf birch	<u>Bethula nana</u> ssp. <u>exilis</u>

Herbs

Aster	<u>Aster sibiricus</u>
Bistort	<u>Polygonum bistorta</u> ssp. <u>plumosum</u>
Buttercup	<u>Ranunculus Eschscholtzii</u>
Goldthread	<u>Coptis trifolia</u>
Lousewort	<u>Pedicularis Kanei</u> ssp. <u>Kanei</u>
Monkshood	<u>Aconitum delphinifolium</u> ssp. <u>delphinifolium</u>
Violet	<u>Viola epipsila</u> ssp. <u>repens</u>

Grasses and Sedges

Bentgrass	<u>Agrostis borealis</u>
Bluejoint reed grass	<u>Calamagrostis canadensis</u>
Cotton grass	<u>Eriophorum angustifolium</u> ssp. <u>subarcticum</u>
Hair grass	<u>Deschampsia caespitosa</u>
Mountain timothy	<u>Phleum commutatum</u>
Wood rush	<u>Luzula parviflora</u>
Sedge	<u>Carex pluriflora</u>

Fern Relatives

Alpine clubmoss	<u>Lycopodium alpinum</u>
Fir clubmoss	<u>L. Selago</u> ssp. <u>selago</u>

Lichens and Mosses

IMPORTANT PLANTS OF THE HIGH BRUSH COMMUNITY

Characteristic Species

Felt leaf willow	<u>Salix alaxensis</u>
Littletree willow	<u>S. arbusculoides</u>
Thin leaf alder	<u>Alnus tenuifolia</u>

Additional Species

Shrubs

Alpine azalea	<u>Loiseleuria procumbens</u>
Green alder	<u>Alnus crispa ssp. Crispa</u>
Narrow leaf Labrador tea	<u>Ledum palustre ssp. decumbens</u>
Prickly rose	<u>Rosa acicularis</u>
Dwarf birch	<u>Betula nana</u>

Herbs

Alpine pyrola	<u>Pyrola asarifolia</u>
Bluebell	<u>Mertensia paniculata</u>
Geranium	<u>Geranium erianthum</u>
Lupine	<u>Lupinus nootkatensis</u>
Twinflower	<u>Linnaea borealis</u>

Grasses

Bentgrass	<u>Agrostis scabra</u>
Bluejoint reedgrass	<u>Calamagrostis canadensis</u>
Fescue	<u>Festuca ovina</u>

Ferns and Fern Relatives

Naked fern	<u>Gymnocarpium dryopteris</u>
Grown cedar	<u>Lycopodium complanatum</u>
Horsetail	<u>Equisetum arvense</u>

Lichens and Mosses

MAMMALS OF THE BETHEL STUDY AREA

<u>Scientific Name</u>	<u>Common Name</u>
<u>Sorex arancus</u>	Arctic Shrew
<u>Sorex caecutiens</u>	Mask Shrew
<u>Sorex palustris</u>	Water Shrew
<u>Sorex obscurus</u>	Dusky Shrew
<u>Microsorex hoyi</u>	Pigmy Shrew
<u>Lepus americanus</u>	Snowshoe Hare
<u>Lepus othus</u>	Arctic Hare
<u>Castor canadensis</u>	Beaver
<u>Dicrostonyx groenlandicus</u>	Collared Lemming
<u>Sunaptomys borealis</u>	Bog Lemming
<u>Lemmus trimucronatus</u>	Brown Lemming
<u>Clethrionomys rutilus</u>	Red-backed Vole
<u>Microtus miurus</u>	Tundra Vole
<u>Microtus oeconomus</u>	Meadow Vole
<u>Ondatra zibethicus</u>	Muskrat
<u>Zapus hudsonius</u>	Meadow Jumping Mouse
<u>Mustela rixosa</u>	Least Weasel
<u>Mustela uison</u>	Mink
<u>Alopex lagopus</u>	Arctic Fox
<u>Vulpes Vulpes</u>	Red Fox
<u>Lutra canadensis</u>	Land Otter
<u>Ursus americanus</u>	Black Bear
<u>Alces alces</u>	Moose
<u>Canus lupes</u>	Wolf
<u>Gulo gulo</u>	Wolverine

FISHES OF THE KUSKOKWIM RIVER

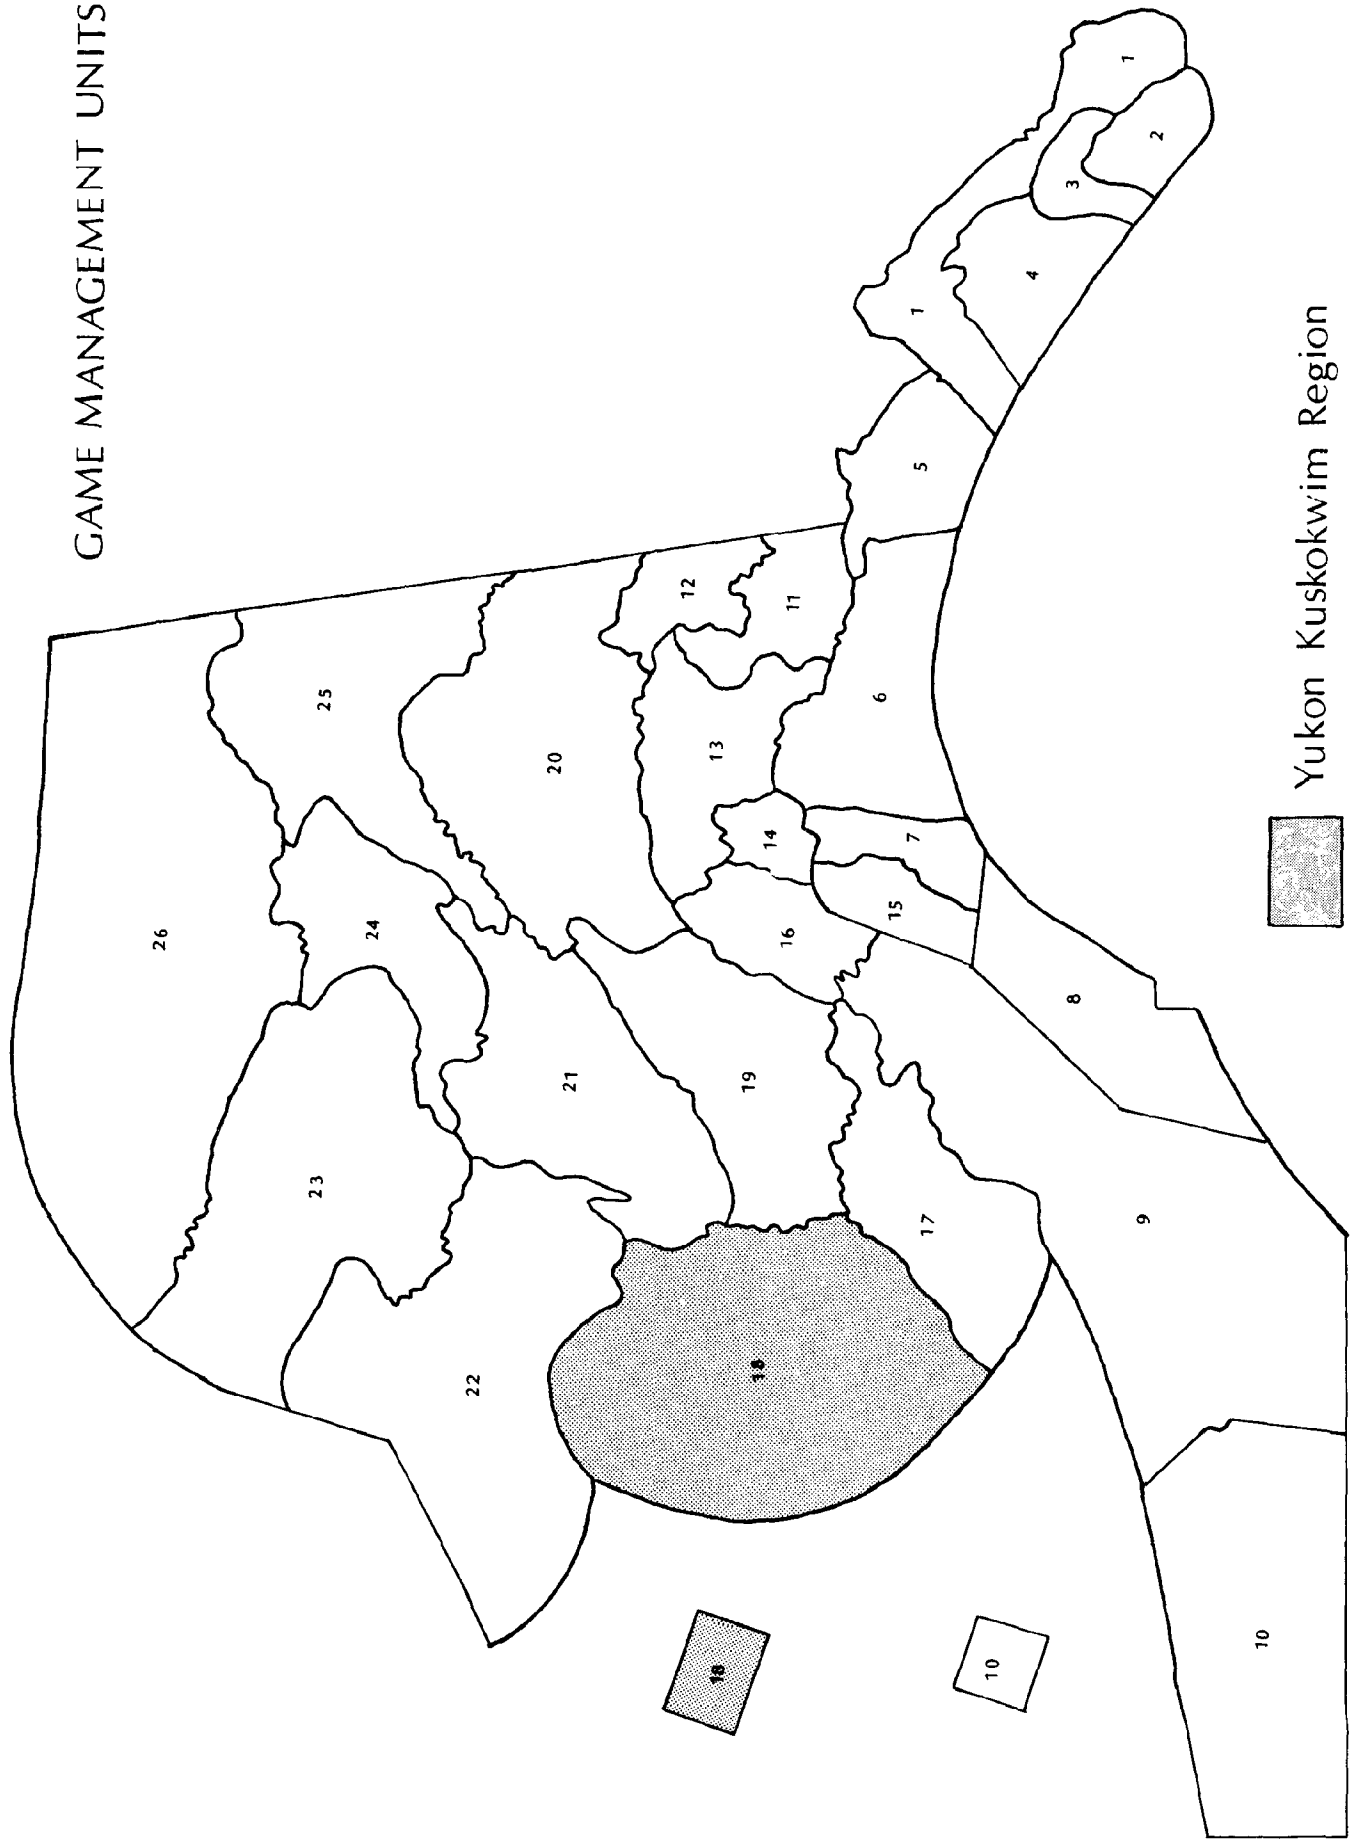

<u>Scientific Name</u>	<u>Common Name</u>
<u>Lampetra japonica</u>	Arctic Lamprey
<u>Stenodus leucichthys</u>	Sheefish
<u>Coregonus nasus</u>	Broad Whitefish
<u>Coregonus pidschian</u>	Humpback Whitefish
<u>Coregonus albula</u>	Least Cisco
<u>Coregonus autumnalis</u>	Arctic Cisco
<u>Prosopium cylindraceum</u>	Round Whitefish
<u>Oncorhynchus tshawytscha</u>	King Salmon
<u>Oncorhynchus nerka</u>	Red Salmon
<u>Oncorhynchus kisutch</u>	Coho Salmon
<u>Oncorhynchus gorbuscha</u>	Pink Salmon
<u>Oncorhynchus keta</u>	Chum Salmon
<u>Salmo gairdnerii</u>	Rainbow Trout
<u>Salvelinus alpinus</u>	Arctic Char
<u>Salvelinus namaycush</u>	Lake Trout
<u>Thymallus arcticus</u>	Grayling
<u>Osmerus eperlanus</u>	Boreal Smelt
<u>Lypomesus olidus</u>	Pond Smelt
<u>Dallia pectoralis</u>	Blackfish
<u>Esox lucius</u>	Northern Pike
<u>Lota lota</u>	Burbot
<u>Catostomus catostomus</u>	Longnose Sucker
<u>Cottus cognatus</u>	Slimy Sculpin
<u>Pungitius pungitius</u>	Ninespine Stickleback
<u>Gasterosteus aculeatus</u>	Threespine Stickleback

APPENDIX IV

MANAGEMENT AUTHORITIES

APPENDIX IV

Existing Federal, State and Local Authorities

<u>Entity</u>	<u>Legislative Title</u>	<u>Responsibility</u>
Federal:		
<u>U.S. Coast Guard</u>	Ports & Waterways Safety Act 1972 33 USC 1221 46 USC 391A	Regulate marine transportation for safety and protection of environment.
	Steamboat Inspection Act, Tank Vessel Act 46 USC 391A	Inspect carriers of hazardous material.
	Permit for Private Aids to Navigation 33 CFR 66	Control placement & operation of navigational aids.
	Permit for Bridges Over Navigable Waters 33 CFR 114 33 CFR 115	Approve construction or alterations of bridges over navigable waters.
	High Seas Intervention Act 1975 33 USC 1471, et. seq.	Attempt to control spillage of oil from ships if oil threatens coastline.
	Permit for Facilities & Vessels to Handle Hazardous Material 33 CFR 125 33 CFR 126 33 CFR 154 33 CFR 155 33 CFR 156	Waterfront facilities & vessels handling hazardous material.
<u>U.S. Army Corps of Engineers</u>	Marine Protection, Research & Sanctuaries Act	Regulate ocean dumping, initiate program to establish marine sanctuaries.
	Permit for Ocean Dumping of Dredged Material 33 USC 1413 33 CFR 324	Regulate transporting dredges material for purposes of dumping in territorial seas or contiguous zone.

<u>Entity</u>	<u>Legislative Title</u>	<u>Responsibility</u>
<u>U.S. Army Corps of Engineers (cont'd)</u>		
	Permit for Structures or Work Affecting Navigable Waters 33 USC 403 33 USC 323	Regular construction of structures or work such as dredging affecting navigable waters of the U.S.
	Permit for the Discharge of or Fill Materials 33 USC 1344 33 CFR 323	Regulate fill or dumping dredge spoils in or adjacent to tidelands, submerged lands, rivers and wetlands.
<u>Council on Environmental Quality</u>		
	National Environment Policy Act of 1969 42 USC 4321 et.seq.	Require preparation of EIS for federal action affecting the quality of the environment.
<u>U.S. Fish and Wildlife</u>		
	National Wildlife Refuge Special Use Permit 16 USC 668 50 CFR 26 50 CFR 29	Govern activities on lands of national wild- life range.
	Migratory Bird Treaty 16 USC 703-711	Protect migratory birds.
	Marine Mammals Protection 16 USC 1361-1407 50 CFR 18 50 CFR 216 PL 92-522	Provide conservation & protection of marine mammals.
<u>Environmental Protection Agency</u>		
	Federal Water Pollution Control Act 1972 33 USC 1251, et.seq. 33 USC 1321 33 USC 1288	Provide funds for states to identify & write regu- lations governing non- point pollution control discharges of pollutants into the navigable waters.

<u>Entity</u>	<u>Legislative Title</u>	<u>Responsibility</u>
<u>Environmental Protection Agency (cont'd)</u>		
	Pollution Discharge Elimination System Permit 33 USC 1341,1342 40 CFR 125	Regulate wastewater discharge into waters of U.S.
	Canned & Preserved Seafood Processing Point Source Category 40 CFR 408	Approves point-source wastewater discharge into waters of U.S. This permit is often adopted as the ADEC wastewater disposal permit.
State:		
<u>Commercial Fisheries Entry Commission</u>		
	Limited Entry Permits AS 16.43.100	Regulate commercial fishing by means of species, gear & geographical region.
<u>Alaska Department of Fish and Game</u>		
	Critical Habitat Area Permit AS 16.20.220-270	Regulate projects or actions affecting critical habitat.
	Protection of Anadromous Fish Permit AS 16.05.870 5 AAC 95.010	Review projects or actions affecting rivers, lakes or streams for spawning of anadromous fish.
	Board of Fish and Game AS 16.05.251 AS 16.10.010-620 AS 16.05.221-320	Determine rules and regulations for hunting and fishing.
<u>Alaska Department of Environmental Conservation</u>		
	Pesticide Control AS 46.03.020 AS 46.03 320 18 AAC 90	Regulate use of pesticides and herbicides in public places.

<u>Entity</u>	<u>Legislative Title</u>	<u>Responsibility</u>
<u>Alaska Department of Environmental Conservation (cont'd)</u>		
	Certificate of Risk Avoidance AS 30.25.040 AS 30.25.070 18 AAC 20	Regulate certification of oil tank vessel as to potential for oil pollution within state.
	Oil Discharge Contingency Plan AS 30.25.040 AS 30.25.070 AS 30.020(10)(a) 18 AAC 75.310-340	Require oil spill contingency be prepared by oil terminals and oil tank vessels operating within state.
	Civil Penalties for Discharge of Oil AS 46.03.758 18 AAC 75.520	Establish fines for persons who discharge oil into waters of state.
	Surface Oiling Permit AS 46.03.020 AS 46.03.740 18 AAC 75	Regulate oil treatment of roads.
	Wastewater Disposal Permit AS 46.03.020 AS 46.03.100 AS 46.03.050 AS 46.03.090 AS 46.03.720 18 AAC 72 18 AAC 70	Regular discharges of liquid wastes into waters or onto land of state, except for domestic sewage into approved sewage system.
	Solid Waste Management AS 46.03.020 AS 46.03.100 18 AAC 60	Regulate disposal of solid wastes except on premises of single-family residence, duplex, farm, or small incinerator.
	Air Quality Control AS 46.030.010 AS 46.03.140 AS 46.03.170 18 AAC 50	Govern quality of air within state.

<u>Entity</u>	<u>Legislative Title</u>	<u>Responsibility</u>
<u>Alaska Department of Environmental Conservation (cont'd)</u>		
	Oil Terminal and Transfer Procedures AS 30.15.070 18 AAC 25	Establish standards for transfer of oil between terminals, tank vessels and tank barges.
	Subdivision Plan Review AS 46.03.020 AS 46.03.050 AS 46.03.090 18 AAC 72.065	Review subdivision of land resulting in greater than 5 lots.
<u>Office of Coastal Management</u>		
	Alaska Coastal Management Program AS 46.40.010 AS 46.40.180 6 AAC 80 & 85	Provide standards & guidelines for land and water planning affecting federal, state, and local activities; provide funding.
<u>Alaska Department of Natural Resources</u>		
	Tideland Permit AS 38.05.330 11 AAC 62	Regulate temporary use of state owned tide and submerged lands (less than five years).
	Tideland Lease AS 38.05.070 11 AAC 62	Regulate use of state- owned tide and submerged lands more than five years.
	Miscellaneous Land Use Permit AS 38.05.205 AS 38.05.250 AS 38.05.275 AS 38.05.020 AS 38.05.035 11 AAC 96.010	Regulate activities including installation of roads and utilities on state-owned lands.
	Permit to Appro- priate Water AS 46.15.010 11 AAC 72	Regulate withdrawal of fresh water from source reserved for public use.

<u>Entity</u>	<u>Legislative Title</u>	<u>Responsibility</u>
<u>Alaska Department of Natural Resources (cont'd)</u>		
	Material Sales AS 38.05.110 11 AAC 76	Regulate sale of sand, gravel, rock, pumice, clay and other materials on state owned lands, tidelands and submerged lands.
	Gas and Oil Leasing AS 38.05.185-184 11 AAC 82.100-805 11 AAC 8.1.00-630 11 AAC 88.100-185	Regulate leasing of subsurface oil and gas resources.
	Land Classification AS 38.05.300 11 AAC 52	Classify state lands, similar to zoning.
	Subsistence Act HB 960 SL 151	Amend fish and game status to give subsistence use highest priority.
	Land Lease AS 38.05.070 11 AAC 58	Regulate long-term use of state-owned uplands.

Alaska Department of Public Safety

Fire Prevention AS 18.70.080 13 AAC 50.027	Establishes standards to protect life and property from fire & explosion and to set fire & safety criteria for commercial, industrial, and business structures.

City of Bethel

Land Subdivision Regulations Ordinance #135	Regulate land subdivision, sets minimum design standards for subdivisions, describes procedures for subdivision approval.
--	---

<u>Entity</u>	<u>Legislative Title</u>	<u>Responsibility</u>
	Building Permit System, Ordinance #114	Establishes a building permit system for improvements, sets minimum design standards and defines encroachment rules and regulations.
	Yard Requirement Regulations Ordinance #138	Establishes minimum setbacks from property lines for all structures and commercial parking lots.
	Port Facility Regulation Ordinance #97	Regulates operations of Bethel's medium draft port facility.
	Port & Transportation Commission Ordinance #137	Establishes a port and commission, and defines its powers.

APPENDIX V

CITY ORDINANCE SUMMARIES

**WHICH APPLY TO THE COASTAL
MANAGEMENT PROGRAM AS OF THIS
PRINTING (FEBRUARY 1983)**

APPENDIX V

ORDINANCE #114

Establish a building permit system for improvements on lots within the City of Bethel and defining encroachment rules and regulations for all streets, roads, alleys and easements that are under the jurisdiction of the City of Bethel.

Summary: A person is required to obtain a building permit for any improvement made on any land recorded or platted within the City.

A building permit may not be issued if the lot improvement:

- a) encroaches on any right of way;
- b) causes the placement of fill on any City right of way when the width of the fill is greater than 20 feet at its widest point;
- c) does not provide for adequate drainage as determined by Planning Department;
- d) does not include a water/sewer system conforming to minimum requirements. It must not be a potential hazard or nuisance to neighbors. Water and sewage holding tanks must be at least 300 gallons with an additional 200 gallons per bedroom.

ORDINANCE #135

Regulating the subdivision of land in the City of Bethel: requiring and regulating the preparation of preliminary and

final plats for such purposes; establishing minimum subdivision design standards; providing minimum improvements to be made or guaranteed to be made by subdivider; setting forth procedures to be followed by Planning Commission in applying rules, regulations and standards; and prescribing penalties for the violation of its provisions.

Summary: Subdivision and platting powers and authorities are vested in the Planning Commission. This applies to all lands in the City limits.

Subdividers must submit and get approvals on preliminary and final plats, and then record the plats with the District Recorder.

The ordinance describes the procedures for submitting preliminary plats, what they should contain, and the public hearing and approval process. It also describes the contents and process for a final plat, including a description of the improvements the subdivision must guarantee.

It sets standards for improvements, roads, street lights, etc., with regard to the character of the land, access, compliance with the Comprehensive Plan, etc.

It discusses easements, drainage, waste disposal, water supply, sizing and arrangement of lots and blocks, dedication of open space for recreation, etc.

It establishes procedures for resubdivision of land and vacation of plats. It sets procedures for variances and waivers and appeals.

It also sets penalties for conveying land before plat approval and recording or recording a plat without Planning Commission approval.

ORDINANCE #138

Establishing the location for structures, improvements, and structural alterations within property boundaries, as measured from designated property lines, and providing penalties for violation of its provisions.

Summary: Minimum yard requirements for all buildings, structures and improvements are:

- Front - 15 feet from property line;
- Side - 10 feet except when adjacent to street,
then 15 feet;
- Rear - 10 feet.

Exceptions to this include:

- the front yard for commercial, professional, or institutional buildings may be reduced to 10 feet if adequate parking is provided;
- commercial or residential buildings may be "zero lot line" if they meet certain conditions;
- existing structures are exempt unless there is proof of public nuisance or hazard.

A procedure is set for dealing with violations, and misdemeanor penalties are outlined (fines of \$25 to \$500 or imprisonment of up to 10 days).
