

MAR 3 2010

To All Interested Government Agencies and Public Groups:

Under the National Environmental Policy Act, an environmental review has been performed on the following action.

TITLE: Northeast (NE) Multispecies Fishery Management Plan (FMP); Fishing Year (FY) 2010 Sector Operations Plans and Contracts, and Allocation of NE Multispecies Annual Catch Entitlements

LOCATION: Northeastern United States, Northwest Atlantic, Exclusive Economic Zone

SUMMARY: Approval of 17 sector operations plans and contracts for the FY 2010; authorizes the operation of the 17 sectors for FY 2010; allocates NE multispecies annual catch entitlements to 17 sectors, and exempts sector members from various regulations of the NE Multispecies FMP.

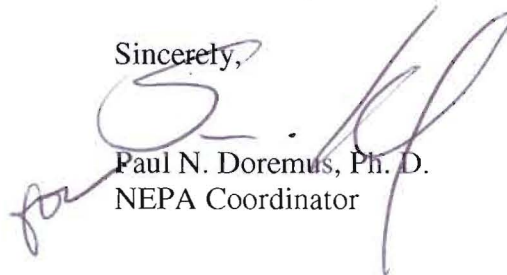

RESPONSIBLE

OFFICIAL: Patricia A. Kurkul
Regional Administrator
National Marine Fisheries Service, National Oceanic and Atmospheric Administration (NOAA)
55 Great Republic Drive, Gloucester, MA 01930
(978) 281-9250

The environmental review process led us to conclude that this action will not have a significant impact on the environment. Therefore, environmental impact statements were not prepared. Copies of the findings of no significant impact (FONSI), including the environmental assessments (EAs), are enclosed for your information.

Although NOAA is not soliciting comments on these completed EAs/FONSI, we will consider any comments submitted that would assist us in preparing future NEPA documents. Please submit any written comments to the Responsible Official named above.

Sincerely,

Paul N. Doremus, Ph. D.
NEPA Coordinator

1.0 INTRODUCTION

The Port Clyde Community Groundfish Sector (PCS) requests approval of the PCS Operations Plan and annual catch entitlement (ACE) of all regulated groundfish species as determined by the final allocation alternative contained in Amendment 16 to the Northeast Multispecies Fishery Management Plan (FMP) for the fishing year (FY) 2010.

A Sector is defined as:

a group of persons holding limited access vessel permits who have voluntarily entered into a contract and agree to certain fishing restrictions for a specified period of time, and which has been granted an annual catch entitlement in order to achieve objectives consistent with applicable FMP goals and objectives. In the formation of a sector, sector participants can select who may participate (NEFMC 2009a).

The analysis in this Environmental Assessment (EA) tiers off the information and analysis contained in the Environmental Impact Statement (EIS) for Final Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a) (Amendment 16). The latter document analyzes measures to achieve mortality targets, provide opportunities to target healthy stocks, mitigate the economic impacts of the measures, and improve administration of the fishery. In that EIS, 19 sectors have been established and criteria were set for developing their operations plans. The impacts associated with the specific actions of each sector are captured in the individual EAs (such as this one), while the impacts associated with Amendment 16 (the regulation authorizing the formation of sectors) are more broadly analyzed in the corresponding EIS. As stated in the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act (NEPA) (40 CFR Part 1502.20), "tiering" is encouraged to eliminate repetitive discussions of the same issues and focuses on the actual issues ripe for decision at each level of environmental review.

The analyses in this EA are based upon the Sector's proposed Operations Plan and the Sector roster submitted on January 22, 2010. The analyses assume all permits remain in the Sector for FY 2010; however, it is possible for permits on the roster to withdraw from the sector through April 30, 2010. A permit not on the roster could be permanently combined with a permit on the roster (through the Days-at-Sea [DAS] Transfer Program), which would result in the potential sector contribution (PSC; a percentage) of both permits being combined permanently and attributed to the permit on the roster (see Section 1.2 for a definition of PSC). Sector vessels may only participate in a DAS transfer with vessels from other sectors or the Common Pool up until May 1, 2010. These changes will not require a supplemental EA. Removal of a permit from the roster will not require a supplemental EA.

Sectors have indicated that no redirection of effort onto other fisheries or consolidation of permits is expected to occur. Based on this response, the overall vessel and gear composition of the groundfishing fleet is not expected to change dramatically as a result of half the fleet potentially moving from the Common Pool to sector management.

1.1 MULTISPECIES FISHERY

In 1986, pursuant to the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), the New England Fishery Management Council (NEFMC or Council) implemented the Northeast Multispecies FMP with the goals of reducing fishing mortality of overfished groundfish stocks and promoting rebuilding of those stocks to sustainable biomass levels. Fifteen species of groundfish are currently managed under this plan. With the implementation of Amendment 16 to the Northeast Multispecies FMP which adds Atlantic wolffish, there will be thirteen species (twelve of which

are large-mesh) managed together based on fish size and type of gear used to harvest the fish: Atlantic cod, haddock, pollock, yellowtail flounder, witch flounder, winter flounder, windowpane flounder, American plaice, Atlantic halibut, redfish, ocean pout, white hake, and Atlantic wolffish. Three species—silver hake (whiting), red hake, and offshore hake—are managed under a separate small-mesh multispecies program pursuant to Amendment 12 to the Northeast Multispecies FMP. Several large-mesh species are managed as two or more separate stocks, based on geographic region. For example, Atlantic cod is managed as two stocks: Georges Bank (GB) cod and Gulf of Maine (GOM) cod. The fishery is managed with a variety of management tools, including DAS, Closed Areas, trip limits, minimum fish sizes, gear restrictions, and sectors (as discussed below).

1.2 SECTORS AS A MANAGEMENT TOOL

The final rule implementing Amendment 13 to the Northeast Multispecies FMP (69 CFR 22906, April 27, 2004) specified a process for the formation of sectors within the Northeast multispecies fishery and for the allocation of a total allowable catch¹ (TAC) of a specific groundfish species or for DAS. This rule also authorized and implemented the first sector (the Georges Bank Cod Hook Sector); established a specific area within which the sector could operate; specified a formula for the allocation of GB cod ACE to future sectors; and implemented regulations that apply to all sectors.

Under the sector management system established in Amendment 13 that remain in effect today, a self-selected group of limited-access groundfish permit holders can agree to form a sector and submit a binding operations plan for management of that sector's allocation of catch. Allocations to a sector are based on total catch of certain managed groundfish species, requiring closure of a fishery upon reaching the ACE.

Annual Catch Limits (ACLs) are the amount of catch allowed for the entire Northeast multispecies fleet. These levels are set to ensure that overfishing does not occur. In the Northeast multispecies fishery, this level is set below the Acceptable Biological Catch (ABC) of the fishery, to account for management and scientific uncertainty. When permit holders join a sector, they bring a Potential Sector Contribution (PSC), which is a share of the ACL for a stock. PSC is based on the fishing history attached to each permit joining that sector in a given year. To determine the weight (in pounds) that a sector can harvest for each stock, all of the sector member's PSCs (a percentage) are multiplied by the ACL. This amount is the sector's Annual Catch Entitlement, or ACE.

Approved sectors are subject to general requirements specified in the regulations as well as any specific requirement for that sector implemented through the framework action or amendment approving such sector (NMFS 2004). Sectors are intended to provide fishermen with greater management flexibility and control of their operations, monitoring, and oversight of the multispecies complex of groundfish in exchange for their agreement to operate within an ACE and otherwise comply with fishing regulations implemented pursuant to the requirements of the Magnuson-Stevens Act (16 U.S.C. § 1801 et. seq).

Amendment 13 and subsequent framework adjustments established requirements for sectors including that sectors must submit an annual Operations Plan and sector contract to the Regional Administrator for approval in order for a sector to be allocated an ACE and authorization to fish. Amendment 16 revises many of these rules and adds additional requirements. The Operations Plan and

¹ TAC is defined as a catch limit set for a particular fishery, generally for a year, or part of a year. This term has been usurped by Annual Catch Limit (ACL) as per the revised 2006 Magnuson-Stevens Act, but is still used in reference to stocks jointly managed by U.S. and Canada and is referenced by older regulations such as Amendment 13 to the Northeast Multispecies FMP.

sector contract must contain certain provisions, including but not limited to, a contract signed by all sector participants, a detailed plan showing how s sector would monitor and enforce its ACE, and a plan containing the management rules that sector participants agree to abide by to avoid exceeding the ACE. An analysis of the environmental impacts of a sector’s proposed operation and harvesting rules is required in order to comply with the NEPA.

Amendments 13 and 16 and the subsequent frameworks (Framework [FW] 40a, 40b, 41, and 42) resulted in DAS cuts, increased trip limits, and differential DAS counting measures for the Common Pool intended to meet the goal of rebuilding stocks and reducing fishing mortality. The Final Amendment 16 was issued on October 16, 2009 including the Final EIS. The proposed rule for Final Amendment 16 was issued on December 31, 2009, and it is expected that the final rule will be issued in Spring 2010. The final rule must be issued on or before May 1, 2010 for Amendment 16 to be enacted for FY 2010.

According to the most recent Groundfish Assessment Review Meeting data (GARM III; NEFSC 2008), reductions in fishing mortality have occurred for some stocks since 2004, but exploitation on several stocks remains above F_{MSY} (F_{MSY} = fishing mortality rate that would produce maximum sustainable yield). A comparison of fishing mortality and biomass levels (relative to their biological reference points) can be found in the GARM III report (NEFSC 2008). This report indicates that moderate to large declines in fishing mortality occurred for the three yellowtail stocks, as well as for GB winter flounder, white hake, and American plaice. Declines that are more modest were observed for the GB and GOM cod stocks and for GB haddock. Fishing mortality of GOM haddock increased slightly. However, moderate to large relative increases in fishing mortality occurred for witch flounder, GOM winter flounder, southern New England/Mid-Atlantic (SNE/MA) winter flounder, redfish, pollock, windowpane flounder, and ocean pout.

1.3 INTENT AND GOALS OF THE PORT CLYDE COMMUNITY GROUND FISH SECTOR

Implementation of the PCS Operations Plan would convey environmental, social, and economic benefits directly to the PCS and the community in which it operates. The PCS would be a group of self-selected fishermen that have come together voluntarily and cooperatively for the purposes of efficiently harvesting an annual allocation of groundfish. The PCS would operate under an ACE for its allocation of regulated groundfish in order to meet the overfishing mandates of the Magnuson-Stevens Act. Further, one of the PCS goals is to foster novel and highly adaptive means of local decision-making, self-monitoring, and Sector management that can serve as a model for the future of sustainable fisheries in New England. Specific goals of the PCS are summarized in Section 2.2.

Implementation of the PCS Operations Plan would mitigate potentially adverse environmental impacts that would accrue if Sector members continued to operate in the Common Pool. By voluntarily restricting themselves to operate under an ACE and increase monitoring levels while committing through an enforceable private agreement to comply with all current regulations, PCS members would employ fishing practices to decrease overfishing, rebuild depleted stocks, reduce discard rates, and limit habitat impacts (see Section 5 for more details.). PCS members are committed to begin to move beyond compliance in FY 2011 in order to achieve Sector goals with additional conservation measures implemented through either the Sector agreement or by increasing PCS membership in the Midcoast Fishermen’s Cooperative (MFC) from its current level of 12 members. In the MFC, members have an economic incentive to take additional conservation and fish handling (product quality) steps due to increased prices resulting from marketing and branding of their environmentally friendly fresh caught product.

Implementation of the PCS Operations Plan would also mitigate potentially adverse economic impacts of Amendment 13, FW 42, and Amendment 16. This has begun to be demonstrated through the

economic benefits already accruing to the Sector members who are members of the MFC and to the Port Clyde community as members have made market-based decisions on when and where to fish in order to take advantage of local markets. These benefits would be amplified through the PCS with Sector members' knowledge that the Sector's ACE would be available and can not be caught by larger vessels and "more-efficient" gear types. As a result, Sector members would have increased opportunity to fish or not fish based on demand and prices. In contrast, the drive to achieve the daily trip limit as often as possible in the Common Pool does not facilitate such behavior modifications, and the lack of ACE does not provide the same assurance that overfishing will be prevented.

1.4 OVERVIEW OF THE PORT CLYDE COMMUNITY GROUND FISH SECTOR

This EA evaluates the impacts of approving the PCS Operations Plan for FY 2010 (Proposed Action) and allocating groundfish ACEs for all stocks as authorized in Amendment 16 in comparison to the No-Action Alternative. The Operations Plan for FY 2010 provides the specific details on how the PCS would function and is required for PCS operations approval.

In FY 2010, PCS would consist of approximately 35 active participating vessels and 43 permits, all of whom would fish in the Gulf of Maine Regulated Mesh Area (RMA) under an ACE for their allocated species. All the vessels would be less than 60 feet in length, and have less than 600 horsepower. The PCS anticipates that approximately one-half of the active vessels would use demersal (otter) trawls as their primary gear and one-half would primarily use sink gillnets. One vessel would use handline gear. Thus, most of the catch and effort are expected to be by trawl and gillnet vessels. Some vessels could also fish on a limited or experimental basis with other approved gears such as hook and line gear (demersal longlines, automated hook, and jigs), Scottish seines, beam trawls, and pots. Many of the PCS trawlers are experimenting with larger mesh nets and different (often lighter) gear configurations as a means to reduce bycatch and discards, and decrease their impact on the ocean bottom. There would be allocation available for further research due to the addition of a specific permit dedicated for research purposes.

Section 3 contains greater detail on the FY 2010 Operating Area (Section 3.1.2) and requested exemptions (Table 3.1-1).

2.0 PURPOSE AND NEED FOR THE PROPOSED ACTION

This section describes the need for approval of the PCS FY 2010 Operations Plan and the purpose of the Sector. It also outlines how the Sector's goals support the Northeast Multispecies FMP's goals and objectives.

2.1 THE NEED FOR SECTOR OPERATIONS PLAN APPROVAL

The need for the action is to provide an opportunity for flexible fisheries management through local decision-making, self-monitoring, and Sector management. The purpose of the action is to approve an Operations Plan and an allocation of ACE of up to 14 stocks of Northeast multispecies for the PCS, consistent with Amendment 16. Operation of the PCS is intended to alleviate social and economic hardships, but would also meet the biological objectives of the Northeast Multispecies FMP through management rules by which the Sector members agree to abide.

2.2 GOALS OF THE SECTOR

The PCS has established a set of goals that are designed to meet many of the goals and objectives set forth by the Northeast Multispecies FMP. The PCS' goals and the relevant goals and objectives of the Northeast Multispecies FMP, as reflected in Amendment 16, are listed below.

PCS Goals:

- **Goal 1:** Sustain a viable coastal groundfish fishery in Maine.
- **Goal 2:** Sustain a viable commercial groundfish fleet based in Port Clyde, Portland Harbor, Kennebunkport, Phippsburg, Boothbay Harbor, Saco, Harpswell, Rockport, Rockland, Friendship, and Monhegan, Maine.
- **Goal 3:** Assure that the coastal Maine fleet will contribute to fisheries sustainability through utilization of an ACE.
- **Goal 4:** Create new opportunities for the fleet, such as opportunities to pursue healthy or rebuilding groundfish stocks.
- **Goal 5:** Retain access for small boat fishermen in Maine.
- **Goal 6:** Promote stewardship of the groundfish resource.
- **Goal 7:** Implement community-based fisheries management in New England.
- **Goal 8:** Create a model for future sectors in the New England groundfish fishery.

PCS Objectives:

- **Objective 1:** For FY 2010, full compliance with all current regulations.
- **Objective 2:** For FY 2011, begin to move beyond compliance to meet Sector goals through additional conservation measures achieved through either the Sector agreement or by increasing PCS membership in the MFC. (MFC members have an economic incentive for additional conservation and fish handling steps due to increased prices resulting from marketing and branding the product).
- **Objective 3:** Land as much of the PCS allocation for each species as possible through limiting bycatch and discards and intra-sector trading of the annual catch entitlement (ACE).
- **Objective 4:** Continue gear research designed to reduce bycatch and limit habitat impacts.
- **Objective 5:** Continue monitoring research and increase monitoring levels above regulatory requirements.

Amendment 16 Goals:

- **Goal 1:** Consistent with the National Standards and other required provisions of the Magnuson-Stevens Act and other applicable law, manage the Northeast multispecies complex at sustainable levels.
- **Goal 2:** Create a management system so that fleet capacity will be commensurate with resource status so as to achieve goals of economic efficiency and biological conservation and that encourages diversity within the fishery.

- **Goal 3:** Maintain a directed commercial and recreational fishery for Northeast multispecies.
- **Goal 4:** Minimize, to the extent practicable, adverse impacts on fishing communities and shore-side infrastructure.
- **Goal 6:** Promote stewardship within the fishery.

Amendment 16 Objectives:

- **Objective 1:** Achieve, on a continuing basis, optimum yield for the United States fishing industry.
- **Objective 3:** Adopt fishery management measures that constrain fishing mortality to levels that are compliant with the Sustainable Fisheries Act (SFA).
- **Objective 4:** Implement rebuilding schedules for overfished stocks, and prevent overfishing.
- **Objective 7:** To the extent possible, maintain a diverse groundfish fishery, including different gear types, vessel sizes, geographic locations, and levels of participation.
- **Objective 9:** Adopt measures consistent with the habitat provisions of the Magnuson-Stevens Act, including identification of Essential Fish Habitat (EFH) and minimizing impacts on habitat to the extent practicable.
- **Objective 10:** Identify and minimize bycatch, which include regulatory discards, to the extent practicable, and to the extent bycatch cannot be avoided, minimize the mortality of such bycatch.

The PCS goals support Amendment 16 goals and objectives in a number of ways. The PCS goals of sustaining a viable coastal groundfish fishery in Maine (Goal 1) through utilization of an ACE (Goal 3) support the goal of managing the Northeast multispecies complex at sustainable levels (Goal 1). PCS Goals 1 and 3 also support Objective 1 of the Northeast Multispecies FMP, which is to achieve (on a continuing basis) optimum yield for the United States fishing industry, and Objective 3 of Northeast Multispecies FMP, which is to adopt fishery management measures that constrain fishing mortality to levels that are compliant with the SFA. The PCS goal of sustaining a viable commercial groundfish fleet in Maine (Goal 2) supports the Northeast Multispecies FMP Goals 3 and 4, and Objective 7 of maintaining a directed fishery for Northeast multispecies, minimizing adverse impacts on fishing communities and shore-side infrastructure, and maintaining a diverse groundfish fishery. The PCS goals of promoting stewardship of the groundfish resource (Goal 6) and implementing community-based fisheries management in New England (Goal 7) support Northeast Multispecies FMP goals of creating a management system so that fleet capacity would be commensurate with resource status (Goal 2) and promoting stewardship within the fishery (Goal 6). Finally, the PCS objectives are consistent with the Northeast Multispecies FMP goals 1 and 6, along with objectives 1, 3, 4, 9, and 10.

3.0 PROPOSED ACTION AND ALTERNATIVES

This section of the PCS EA describes possible fishing alternatives, including details of the Proposed Action and a No-Action Alternative.

3.1 ALTERNATIVE 1 - IMPLEMENTATION OF THE PORT CLYDE COMMUNITY GROUND FISH SECTOR OPERATIONS PLAN FOR FISHING YEAR 2010

Alternative 1, the Proposed Action, is approval of the PCS Operations Plan, including an allocation of groundfish for FY 2010 consistent with the final allocation alternative selected in Amendment 16. PCS vessels would be subject to all applicable fisheries regulations, and the rules established under its Operations Plan.

The Proposed Action and Operations Plan analyzed in this EA have been developed by the prospective PCS members through a series of participant meetings with the assistance of technical staff support. The Operations Plan and EA have been provided to the NMFS for review and approval.

A summary of the PCS Operations Plan (Proposed Action) is presented in Table 3.1-1 and further described in the subsections below.

TABLE 3.1-1 Summary of the Port Clyde Community Groundfish Sector Operations Plan (Fishing Year 2010)	
Sector Parameters	Description
Location	Gulf of Maine Regulated Mesh Area
Timeframe	May 1, 2010–April 30, 2011
Gear	<p><u>Primary gear</u>: Otter trawls and sink gillnets</p> <p><u>Secondary gear</u>: Demersal longlines (limited history exists for the Sector) and handlines (one Sector member primarily uses handlines)</p> <p><u>Potential secondary gear</u>: Any gear allowed by regulations</p>
Allocated target species	<p>All regulated groundfish species for which allocations would be made,* as determined by the final allocation alternative approved in Amendment 16. Note that the PCS would receive small allocations of certain stocks, such as GB cod and GB haddock not found in the Gulf of Maine Regulated Mesh Area, which the Sector would likely seek to transfer to other sectors.</p> <p>* Amendment 16 determined that allocations would not be made for the following stocks and/or they would be subject to other specific regulations including trip limits or no-possession limits: Atlantic halibut, ocean pout, windowpane flounder (Northern and Southern), Atlantic wolffish, and SNE/MA winter flounder (although an allocation of this stock may be made through the biennial specifications/framework process)</p>

TABLE 3.1-1 (continued)
Summary of the Port Clyde Community Groundfish Sector Operations Plan (Fishing Year 2010)

Sector Parameters	Description																						
Other landed species/ bycatch	<p>Primary (frequent): monkfish, skates, spiny dogfish</p> <p>Secondary (infrequent): crabs (snow, jonah, red, spotted), lobster, cusk, red hake, sculpins, octopus, squid (loligo, illex), lumpfish, turbot, sea raven, sea robin, herring</p> <p>Protected Species (infrequent, and gillnet interactions only): Grey Seal, Harbor Seal, Harbor Porpoise, Shearwater, Greater Shearwater, Herring Gull</p>																						
Exemptions requested	<p>In addition to the universal exemptions, the following:</p> <p>1) Gillnet 120-day block out requirement (discussed below)</p>																						
Number of participants	Based on the anticipated final roster.																						
<p><i>Note: Potential active vessels do not include skiffs (which could not fish). The actual number of active vessels is anticipated to be slightly less.</i></p> <p><i>Note: The PCS has limited hook and line history and it is estimated that less than five vessels may fish with hook and line gear on a limited basis.</i></p>	<table> <tr> <td>Permits</td> <td align="right">43</td> </tr> <tr> <td>Potential Active Vessels</td> <td align="right">35</td> </tr> <tr> <td>Active Fishing Vessels</td> <td align="right">28</td> </tr> <tr> <td>Primarily Gillnet Only</td> <td align="right">14</td> </tr> <tr> <td>Primarily Trawl Only</td> <td align="right">11</td> </tr> <tr> <td>Primarily Handlines</td> <td align="right">1</td> </tr> <tr> <td>Trawl and Gillnet</td> <td align="right">2</td> </tr> <tr> <td>Target Groundfish</td> <td align="right">28</td> </tr> </table>	Permits	43	Potential Active Vessels	35	Active Fishing Vessels	28	Primarily Gillnet Only	14	Primarily Trawl Only	11	Primarily Handlines	1	Trawl and Gillnet	2	Target Groundfish	28

Expected catch (including allocated and other landed species)	Assumed to be equal to the allocation.																						

TABLE 3.1-1 (continued)
Summary of the Port Clyde Community Groundfish Sector Operations Plan (Fishing Year 2010)

Sector Parameters	Description
Primary hauling and unloading ports (includes homeports and landing ports)	Portland Harbor, Portland, Maine Port Clyde Harbor, Port Clyde, Maine Cape Porpoise Harbor, Kennebunkport, Maine Kennebunkport Harbor, Kennebunkport, Maine Sebasco Harbor, Phippsburg, Maine Boothbay Harbor, Boothbay Harbor, Maine Camp Ellis, Saco Maine Cundy's Harbor, Harpswell, Maine Gloucester, MA Monhegan Island, ME (Departure Port Only)

The term "allocated target species" refers to the list of groundfish species for which the Sector would receive an ACE (Section 3.1). "Non-allocated target species" refers to species which the Sector member would also be targeting, but for which no ACE is allocated. These other fish species (non-allocated target) may be caught by the same gear while fishing for allocated target species, and brought to shore and sold to dealers (i.e., "landed"), assuming the fisherman has proper authorization or permit(s). These non-allocated target species may also be managed under the Northeast Multispecies FMP (e.g., halibut and whiting) or another FMP (e.g., Monkfish). As defined in the Magnuson-Stevens Act, bycatch refers to "fish which are harvested in a fishery, but which are not sold or kept for personal use, and includes economic discards and regulatory discards." For the purposes of this EA, the discussion of non-allocated target species and bycatch refers primarily to skates, monkfish, and dogfish. These species predominate bycatch (i.e., dogfish) or are the primary alternate species that are landed by groundfishermen (i.e., monkfish and skates).

3.1.1 Number of Participants and Gear Used

There would be 34 Sector members, 35 potentially active vessels, 28 active vessels, and 43 permits in the PCS. The PCS anticipates that approximately half of the active vessels (about 11) would use demersal (otter) trawls as their primary gear and half (about 14) would primarily use sink gillnets. Catch and effort are expected to be divided approximately equally between trawl and gillnet vessels. Two vessels are likely to use both gear types while one vessel, representing a very small percentage of the overall ACE, would use primarily handlines.

3.1.1.1 Consolidation and Redistribution of ACE

In FY 2009, 35 out of 439, or 81 percent of the permits enrolled in the PCS for FY 2010 are attached to vessels actively fishing for Northeast multispecies. For FY 2010, 28 out of 43 permits currently enrolled, or 65 percent are anticipated to actively fish for Northeast multispecies. While these numbers may change, the PCS expects that compared to FY 2009 there will be a minimal net consolidation within the Sector as the share of ACE contributed by member permits is fished by fewer active vessels than DAS fished by those permits in FY 2009. However, it is not clear that this amount of consolidation is greater, equal to, or less than the consolidation that would have taken place if the 43

permits stayed in the Common Pool in FY 2010. This is because the consolidation occurring in the fishery under the DAS system has been significant in recent years and interviews with PCS fishermen indicate that several were considering getting out of the fishery through leasing or retiring if they did not have the opportunity to join the Sector.

It may be anticipated that fewer active fishing vessels would result in job losses for fishing crews (each of the seven vessels employed 1 crew part time for this fishery) and the associated negative impacts may spread to the fishing communities and industries reliant on commercial fishing. While fishermen who remain in the fishery could be better off, there would be fewer active fishermen in the Northeast multispecies fishery. On the other hand, the permit holders who do not intend to fish in this fishery intend to continue to fish and employ crew in other fisheries. Further, the PCS is anticipated to help make the MFC more viable and to help it grow. The MFC has hired workers into fisheries related jobs and if the MFC remains viable and grows it will likely provide additional jobs and benefits to the communities affected by the PCS.

3.1.1.2 Redirection of Effort

The PCS anticipates that up to seven currently active vessels may not participate in the multispecies fishery in FY 2010. Among these seven vessels, five hold permits to fish in the Maine lobster fishery and four hold permits to fish in the Maine shrimp fishery. It is unlikely there would be any shift in effort to these fisheries because the vessels already make maximum use of their opportunities to fish in these fisheries. Four of the seven vessels hold federal herring permits and one vessel holds a federal scallop permit. It is anticipated there could be a minimal shift in effort into these fisheries.

Many of the trawlers in the PCS are experimenting with larger mesh nets and different (often lighter) gear configurations as a means to reduce bycatch and discards, and decrease their impact on the ocean bottom. There is also history in the PCS of a small number of vessels using hook and line gear, and some vessels (less than five) could fish on a limited or experimental basis with federally-approved gears such as demersal longlines, automated hook, jigs, handlines, Scottish seines, beam trawls, or pots. There would be allocation available for further research due to the addition of a specific permit dedicated for research by the Sector.

All the vessels are less than 60 feet in length, and have less than 600 horsepower. The PCS would not be limited, however, to vessels under 60 feet and members could use any gear that complies with federal regulations.

Vessels participating in the PCS would be legally bound to uphold and abide by the Operations Plan and by the Harvesting Rules presented below (Section 3.1.4).

3.1.2 Location and Timeframe of the Port Clyde Community Groundfish Sector

Sector members would fish within the Gulf of Maine RMA. (Figure 3.1.2-1)

Figure 3.1.2-1 Gulf of Maine Regulated Mesh Area

For a description of Closed Areas within the Northeast region, see Section 4.2.4 (and Figure 4.2.4-1).

The timeframe for PCS operations would be FY 2010, from May 1, 2010, to April 30, 2011.

3.1.2.1 Universal Exemptions as specified in Amendment 16

Universal exemptions for sectors and the general effects of sector formation given these universal exemptions are analyzed in Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a). They include the following:

- Exemption from groundfish DAS requirements including DAS reductions and any differential groundfish DAS counting areas implemented as an Accountability Measure including the ability to use groundfish and monkfish DAS for monkfish bycatch (combined monkfish/groundfish DAS) and monkfish directed fishery (monkfish DAS).
- Exemption from trip limits on regulated large-mesh multispecies except for the following:

1. Halibut: trip limit would continue to be one fish per trip;
 2. No vessel, whether in the Common Pool or in any sector, would be allowed to possess any windowpane flounder (both stocks), ocean pout, wolffish, or SNE/MA winter flounder on board at any time. When caught, these species must be discarded.
- Exemption from the Georges Bank Seasonal Closure in May.
 - Exemption from any additional seasonal or year-round closures added in Amendment 16.²
 - Exemption from any additional gear requirements or gear restricted areas added in Amendment 16.
 - Gulf of Maine Rolling Closures in specific blocks as identified in Amendment 16 (specifically Section 4.2.3.9).³
 - 6.5 inch mesh in the cod-end in haddock separator trawl/ Ruhle trawl when targeting haddock (i.e., authorized to use 6 inch mesh in the cod-end).

If additional mortality controls, such as additional seasonal and year-round closed areas, gear requirements, differential DAS counting, and/or restricted gear areas, sectors would not be required to adhere to these additional measures since mortality by PCS vessels would be controlled by an ACE (NEFMC 2009a).

In addition, while not defined as a universal exemption Amendment 16 adopts certain provisions for sector vessels that participate in Special Management Programs. PCS does not intend to participate in these programs at this time because none apply in the Gulf of Maine (e.g., Eastern U.S./Canada Haddock and Yellowtail Special Access Programs [SAP]).

In accordance with the proposed rule for Amendment 16 published December 31, 2009 (74 FR 69634), the requirement for 72-hour pre-trip notification will be reduced to 48 hour observer notification for all groundfish vessels. A minimum of 48-hour notification is necessary because of the additional logistical demands imposed upon the NMFS Observer Program due to the projected increase in demand for at-sea monitoring.

3.1.2.2 Additional Requested Exemptions

In addition to the universal exemptions approved as part of Amendment 16 discussed above, the PCS seeks the following specific regulatory exemption:

1. Gillnet 120 days out requirement: Under this exemption, participating gillnet vessels would not be required to adhere to those provisions of 50 C.F.R. 648.82(j)(1)(ii) requiring that during each fishing year, day gillnet vessels must declare, and take, a total of 120 days out of the non-exempt gillnet fishery. Participating vessels would continue to be required to comply with applicable spawning season restrictions, including the 20-day spawning block (March-May) requirement, and all other gillnet requirements, in accordance with the Northeast Multispecies FMP and NMFS regulations.

² NMFS is granting year-round access to the Eastern U.S./Canada Area for yellowtail flounder as stipulated, but not specified, in Amendment 16.

³ Amendment 16 would exempt sectors from all rolling closures except for: Blocks 124 and 125 in April; Blocks 132 and 133 in April-May; Block 138 in May; Blocks 139 and 140 in May-June; and Blocks 145, 146, 147, and 152 in June.

Sectors provide conservation benefits equivalent to the overall effort reduction and mortality control rationale for originally implementing the 120 days out requirement. These benefits result from several sector requirements designed to control mortality and ensure accountability, including those requiring that sectors fish under an ACE with enhanced monitoring intended to account for all mortality. In addition, rolling closures, the 20-day spawning block requirement, and other measures applicable to this fishery would continue to provide protection for spawning fish. Sector gillnet vessels would also continue to be subject to requirements to protect Harbor Porpoise, including closures and pinger requirements.

If this exemption is approved, there would be different changes in fishing behavior for different PCS gillnet vessels. Eight vessels fish from Boothbay, Cundy's, Portland Harbor, and Camp Ellis harbors in statistical areas 138, 139, 146, and 147. It is anticipated that under this exemption they would continue to fish the same areas but be able to stretch out their effort in fishing areas 146 and 147 earlier into April and May, when they currently take time out of the fishery. The PCS participants would be able to fish during the Spring "flanking season" when markets are likely to be more favorable. For the six vessels that fish from Kennebunkport and Cape Porpoise, which fish primarily only in areas 139 and 140 year-round, the exemption would allow them to fish in these areas during the fall "flanking season," after September 9 when they currently take time out of the fishery. The PCS participants would have the opportunity to take advantage of better markets through this flexibility.

The PCS has conducted considerable mapping of historic effort by Members and the Sector Manager would monitor trends and report to NMFS in writing should a significant and adverse shift in effort occur. The Sector Manager may establish additional area or gear restrictions designed to mitigate the adverse impacts of such shift, including bycatch issues (marine mammal or otherwise) should they occur due to spatial shifts in effort or increases in soak times. The Sector Manager would monitor any redirection of effort as part of the heightened monitoring requirements contained in the PCS Operations Plan and would include that information in the Sector Manager's reports to NMFS. Members that violate related provisions would be subject to penalties in accordance with the PCS Operations Plan. Further, any increase in "equity" issues would be addressed by the Sector Board, which would be comprised of both gillnet and trawl fishermen.

3.1.3 Allocated Target Species and Other Landed Species

The PCS requests an allocation of the regulated groundfish species as determined by the final allocation alternative as described in Amendment 16. This includes cod (GOM and GB), haddock (GOM and GB), yellowtail flounder (GB, SNE/MA, and Cape Cod/GOM), American plaice, witch flounder, winter flounder (GB, GOM, and SNE/MA if an allocation is made determined possible during the biennial specification/framework process), redfish, white hake, and pollock. The PCS acknowledges that certain regulated multispecies species would not be allocated to the Sector and that they could be constrained by the regulations for Atlantic halibut, windowpane flounder, ocean pout, and Atlantic wolffish.

Other anticipated landed species for the PCS, based on the history of its members, include monkfish and limited amounts of skates, spiny dogfish shark, cusk, herring, octopus, squid (loligo, illex), and turbot. For more information on both the allocated target species and non-allocated target species and bycatch, see Sections 4.2 and 4.3.

3.1.4 Fishing Year 2010 (May 1, 2010-April 30, 2011) Port Clyde Community Groundfish Sector Operations Plan Harvesting Rules:

The Members and the Participating Vessels of the Sector agree to be legally bound to follow the Harvesting Rules for FY 2010 as described herein notwithstanding those rules and regulations applicable to Common Pool multispecies vessels.

QUOTA MANAGEMENT

1. Sector ACE Allocation: The National Marine Fisheries Service (“NMFS”) will determine the PCS’s Large-Mesh Multispecies (“Groundfish”) Annual Catch Entitlement (“Sector ACE”) for each species⁴ (Exhibit B of the PCS Operations Plan).

2. Individual ACE Allocation: Each participating Permit and Participating Vessel will receive its “Individual ACE” allocation as set forth in Exhibit B to the Agreement. This allocation will be maintained by each individual Member and the Sector Manager.

3. ACE Limit: The Members agree that they will not harvest more Groundfish than their Individual ACE and that they will not collectively harvest more Groundfish than the Sector ACE for allocated species. Once a Member’s Individual ACE allocation is reached for any species, or if the Sector ACE for any species is reached, such Member or Members shall not fish commercially in that stock area with any fishing gear capable of catching Groundfish unless additional ACE for that species is acquired. Consistent with Amendment 16 and Section 4.09, ACE transfers are allowed within the PCS and between the PCS and other sectors, and carryover of up to 10 percent of the Sector ACE is permitted.

4. Monthly Quota Targets: A percentage of the Sector ACE for each species will be allocated to each month of the fishing year for each Individual and for the Sector as a whole and the cumulative total catch will be monitored on a monthly basis (see Table below) in order to help monitor and control the rate at which ACE is harvested. ACE that is not landed during a month will be rolled over into the next month. If landings exceed the monthly quota, the excess will be deducted from subsequent monthly quotas to help ensure the Sector and its individual Members do not exceed the Sector ACE. The following table, based on the historic catch data for Sector Members, shows the monthly and cumulative monthly quota target percentages.

Target Monthly Quotas

Allocated Groundfish		May	June	July	Aug	Sept	Oct	Nov	Dec	Jan	Feb	March	April
Monthly	%	8	22	21	16	8	5	3	3	2	2	5	5
Cumulative	%	8	30	51	67	75	80	83	86	88	90	95	100

5. Weekly quota targets: In addition to the monthly quota targets, the Manager may impose weekly or trip target quotas to help slow down harvest rates. If such target quotas are, imposed, Sector members agree to adjust their fishing operations to avoid exceeding these quotas.

6. Additional Measures to Prevent Ace Overages: The Sector Manager will provide Sector Members with a monthly report detailing their remaining Individual ACE for each stock and the remaining Sector ACE for each stock for the Sector. In addition, when an individual Member’s remaining Individual ACE reaches less than 50 percent for any stock, or when the Sector’s remaining Sector ACE for a stock reaches less than 50 percent, the Sector Manager will provide Members with a report detailing their remaining Individual ACE and the Sector’s remaining Sector ACE at the conclusion of each trip.

In addition, Sector members will be notified when the Sector ACE reaches 80 percent of the ACE for any stock, or when, for two consecutive weekly reporting periods 20 percent or more of the remaining portion of the Sector ACE is harvested, which ever occurs first. Upon reaching either

⁴ Note that NMFS will not assign ACE for Atlantic halibut, ocean pout, northern windowpane flounder, southern windowpane flounder, Atlantic wolffish, and southern New England winter flounder (see Exhibit B).

such harvest threshold, the reporting due date for the Sector Manager's weekly report to NMFS will be increased to daily. Sector Members agree to adjust their fishing operations to avoid exceeding their Individual ACE and the Sector ACE.

Members shall stop fishing prior to exceeding their allocation (unless they acquire additional Individual ACE). If the Sector ACE for a stock is exceeded, the sector must cease operations in that stock area until it can acquire additional ACE through a transfer with another Sector to balance the catch, and the sector also must comply with other overage penalties that may be applicable.

7. Sector Hails: consistent with the operations Plan, each Participating Vessel must hail in and out to the Manager or his designated representative, and NMFS Office of Law Enforcement prior to departing from or returning to port when using fishing gear capable of catching Groundfish.

8. ACE Transfers and Pooling: Participating Vessels and/or Permits may transfer ACE to other Participating Vessels and/or Permits, or otherwise redistribute or pool ACE to other Participating Vessels and/or Permits, provided that the Manager is notified and provides his consent to such redistribution or pooling. A Participating Vessel and/or Permit may only transfer or lease ACE to or from vessels or permits participating in other sectors with appropriate approval from the Regional Administrator, as required by Amendment 16 and its implementing regulations.

9. Full Retention of Legal-Size Groundfish: All legal size Groundfish harvested during any fishing operation must be retained and counted against the Sector and Individual ACE, unless otherwise accounted for through a sub-ACL, except that ocean pout, northern windowpane flounder, southern windowpane flounder, Atlantic wolffish and southern New England winter flounder shall not be retained, and there will be a 1 fish per trip limit on Atlantic halibut, as required by Amendment 16 and its implementing regulations.

10. Species Trip Limits: Participating vessels are exempt from trip limits on stocks for which the Sector receives an allocation. Participating vessels are subject to any trip limits required by NMFS for non-allocated species.

GEAR RESTRICTIONS

11. Gear Restrictions: While it is anticipated that Sector members will fish primarily with otter trawls and sink gillnets, Participating Vessel may fish for Groundfish with any legal gear including hook and line gear (demersal longlines, automated hook, jigs, and handlines), Scottish seines, beam trawls and pots. All Participating Vessels are subject to the same gear restrictions, such as marking, tagging, mesh size, and number of gillnets, applicable to Common Pool vessels using the same type of gear.

12. Gillnet Block Requirement Exemption: If approved by NMFS, Participating Vessels are not required to adhere to those provisions of 50 CFR 648.82(j)(1)(ii) requiring that during each fishing year, day gillnet vessels must declare, and take, a total of 120 days out of the non-exempt gillnet fishery. Participating Vessels must continue to comply with applicable Spawning Season Restrictions including the 20-day spawning block (March-May) requirement, and other gillnet requirements, in accordance with the groundfish FMP and NMFS regulations.

13. Spawning Season Restrictions: All Participating vessels must continue to comply with the spawning season restrictions, including the 20-day spawning block (March–May) requirement.

14. Closed Areas: Consistent with Amendment 16, Participating Vessels are exempt from portions of the GOM rolling closures. Participating vessels remain subject to all other closed area restrictions, unless additional authorizations are provided by NMFS.

15. *Operating Area: Participating vessels are restricted to fishing in the Gulf of Maine Regulated Mesh Area when using fishing gear capable of catching any regulated species managed under the Groundfish Plan.*

In addition to the Operations Plan, PCS members would be subject to a legally binding membership agreement that would delineate the interaction of members within the PCS, including governance, monitoring, and assessment of penalties for non-compliance. The PCS would operate independent of Common Pool vessels, which would still operate under a soft quota in FY 2010 with input control measures (e.g., DAS limits) as the primary controls for managing mortality.

Table 3.1.4-2 identifies several elements of the PCS Operations Plan (Proposed Action) and compares them to the Common Pool (No Action).

TABLE 3.1.4-2 Comparison of Management Measures for Port Clyde Community Groundfish Sector Vessels Under the Operations Plan and Common Pool Rules		
Management Measures	Operations Plan (Proposed Action)	Common Pool (No Action)
ACE allocation of most groundfish stocks	Yes	No
Monthly quota targets	Yes	No
Weekly quota targets	Yes	No
Days-at-Sea allocations	No	Yes
Sector notification	Yes	No
Hail Requirements	Yes	Yes
Days at Sea leasing	No	Yes
Full retention of allocated legal groundfish	Yes	No
Species trip limits	No	Yes
Gear restrictions (gear type)	Fixed gear and mobile gear	Fixed and mobile
Gear restrictions (net limit)	Yes	Yes
Dedicated research permit	Yes	No
Closed Areas	Yes	Yes
Increased access to rolling closures	Yes	No
Gillnet mortality blocks	No	Yes
Limited to Gulf of Maine Regulated Mesh Area	Yes	No

3.2 ALTERNATIVE 2 - NO-ACTION ALTERNATIVE

Alternative 2, the No-Action Alternative, is the disapproval of the PCS Operations Plan and no allocation of ACE to the PCS. Under the No-Action Alternative, the PCS Operations Plan would not be approved and there would be no allocation of ACE to the PCS. Under this alternative, all PCS vessels and permits would remain in the Common Pool and would be required to fish under the Common Pool regulations. The No-Action Alternative would subject all PCS vessels to the Northeast Multispecies FMP's input control measures, which are intended to control mortality in order to end overfishing and rebuild overfished stocks. The No-Action Alternative would not meet the purpose and need for this action.

The preferred alternatives for Common Pool operations are described in Amendment 16, *Final Amendment 16 to the Northeast Multispecies Fisheries Management Plan, including a Final Supplemental Environmental Impact Statement and Initial Regulatory Flexibility Analysis*, and Framework 44, and are hereby incorporated by reference (NEFMC 2009a).

4.0 AFFECTED ENVIRONMENT

The Valued Ecosystem Components (VECs) affected by the Proposed Action include the physical environment, Essential Fish Habitat (EFH), allocated target species, non-allocated target species and bycatch, protected resources, and human communities, which are described below.

4.1 PHYSICAL ENVIRONMENT/HABITAT/EFH

The Northeast U.S. Shelf Ecosystem (Figure 4.1-1) has been described as including the area from the Gulf of Maine south to Cape Hatteras, North Carolina, extending from the coast seaward to the edge of the continental shelf, including offshore to the Gulf Stream (Sherman et al. 1996). The continental slope includes the area seaward of the shelf, out to a depth of 2,000 meters (m). Four distinct sub-regions comprise the NOAA Fisheries Northeast Region: the Gulf of Maine, Georges Bank, southern New England/Mid-Atlantic Bight, and the continental slope. Since the PCS would only fish in the Gulf of Maine, the description of the physical and biological environment is focused only on this sub-region. Information on the affected environment was extracted from Stevenson et al. (2004).

Figure 4.1-1 Northeast U.S Shelf Ecosystem.

4.1.1 Affected Physical Environment

4.1.1.1 Gulf of Maine

The Gulf of Maine is bounded on the east by Browns Bank, on the north by the Nova Scotian (Scotian) Shelf, on the west by the New England states, and on the south by Cape Cod and Georges Bank (Figure 4.1.1-1). The Gulf of Maine is a boreal environment and is characterized by relatively cold waters and deep basins, with a patchwork of various sediment types. There are 21 distinct basins separated by ridges, banks, and swells. Depths in the basins exceed 250 m, with a maximum depth of 350 m in Georges Basin, just north of Georges Bank. High points within the Gulf of Maine include irregular ridges, such as Cashes Ledge, which peaks at 9 m below the surface.

Figure 4.1.1-1 Gulf of Maine

The Gulf of Maine is an enclosed coastal sea that was glacially derived and is characterized by a system of deep basins, moraines, and rocky protrusions (Stevenson et al. 2004). The Gulf of Maine is topographically diverse from the rest of the continental border of the U.S. Atlantic coast (Stevenson et al.

2004). Very fine sediment particles created and eroded by the glaciers have collected in thick deposits over much of the seafloor of the Gulf of Maine, particularly in its deep basins. These mud deposits blanket and obscure the irregularities of the underlying bedrock, forming topographically smooth terrains. In the rises between the basins, other materials are usually at the surface. Unsorted glacial till covers some morainal areas, sand predominates on some high areas, and gravel,⁵ sometimes with boulders, predominates others. Bedrock is the predominant substrate along the western edge of the Gulf of Maine, north of Cape Cod in a narrow band out to a depth of about 60 m. Mud predominates in coastal valleys and basins that often abruptly border rocky substrates. Gravel, often mixed with shell, is common adjacent to bedrock outcrops and in fractures in the rock. Gravel is most abundant at depths of 20 to 40 m, except off eastern Maine where a gravel-covered plain exists to depths of at least 100 m. Sandy areas are relatively rare along the inner shelf of the western Gulf of Maine, but are more common south of Casco Bay, especially offshore of sandy beaches.

The geologic features of the Gulf of Maine coupled with the vertical variation in water properties (e.g. salinity, depth, temperature) combine to provide a great diversity of habitat types that support a rich biological community. To illustrate this, a brief description of benthic invertebrates and demersal (i.e., bottom-dwelling) fish that occupy the Gulf of Maine is provided below. Additional information is provided in Stevenson et al. (2004), which is incorporated by reference.

The most common groups of benthic invertebrates in the Gulf of Maine reported by Theroux and Wigley (1998) in terms of numbers collected were annelid worms, bivalve mollusks, and amphipod crustaceans. Biomass was dominated by bivalves, sea cucumbers, sand dollars, annelids, and sea anemones. Watling (1998) identified seven different bottom assemblages that occur on the following habitat types:

- Sandy offshore banks: fauna are characteristically sand dwellers with an abundant interstitial component;
- Rocky offshore ledges: fauna are predominantly sponges, tunicates, bryozoans, hydroids, and other hard bottom dwellers;
- Shallow (< 60 m) temperate bottoms with mixed substrate: fauna population is rich and diverse, primarily comprised of polychaetes and crustaceans;
- Primarily fine muds at depths of 60 to 140 m within cold Gulf of Maine Intermediate Water:⁶ fauna are dominated by polychaetes, shrimp, and cerianthid anemones;
- Cold deep water, muddy bottom: fauna include species with wide temperature tolerances which are sparsely distributed, diversity low, dominated by a few polychaetes, with brittle stars, sea pens, shrimp, and cerianthids also present;
- Deep basin, muddy bottom, overlaying water usually 7 to 8°C: fauna densities are not high, dominated by brittle stars and sea pens, and sporadically by tube-making amphipods; and
- Upper slope, mixed sediment of either fine muds or mixture of mud and gravel, water temperatures always greater than 8°C: upper slope fauna extending into the Northeast Channel.

⁵ The term “gravel,” as used in this analysis, is a collective term that includes granules, pebbles, cobbles, and boulders in order of increasing size. Therefore, the term “gravel” refers to particles larger than sand and generally denotes a variety of “hard bottom” substrates.

⁶ Maine Intermediate Water is described as a mid-depth layer of water that preserves winter salinity and temperatures, and is located between more saline Maine bottom water and the warmer, stratified Maine surface water. The stratified surface layer is most pronounced in the deep portions of the western Gulf of Maine.

Two studies (Gabriel 1992, Overholtz and Tyler 1985) reported common⁷ demersal fish species by assemblages in the Gulf of Maine and Georges Bank:

- Deepwater/Slope and Canyon: offshore hake, blackbelly rosefish, Gulf stream flounder;
- Intermediate/Combination of Deepwater Gulf of Maine-Georges Bank and Gulf of Maine-Georges Bank Transition: silver hake, red hake, goosefish (monkfish);
- Shallow/Gulf of Maine-Georges Bank Transition Zone: Atlantic cod, haddock, pollock;
- Shallow water Georges Bank-southern New England: yellowtail flounder, windowpane flounder, winter flounder, winter skate, little skate, longhorn sculpin;
- Deepwater Gulf of Maine-Georges Bank: white hake, American plaice, witch flounder, thorny skate; and
- Northeast Peak/Gulf of Maine-Georges Bank Transition: Atlantic cod, haddock, pollock.

4.1.2 Habitat

Habitats provide living things with the basic life requirements of nourishment and shelter, ultimately providing for both individual and population growth. The fishery resources of a region are influenced by the quantity and quality of available habitat. Depth, temperature, substrate, circulation, salinity, light, dissolved oxygen, and nutrient supply are important parameters of a given habitat which, in turn, determine the type and level of resource population that the habitat supports. Table 4.1.2-1 briefly summarizes the habitat requirements for each of the 13 large-mesh groundfish species managed by the Northeast Multispecies FMP, some of which consist of multiple stocks within the Northeast Multispecies FMP. Information for this table was extracted from the original Northeast Multispecies FMP and profiles available from NMFS (Clark 1998). Essential fish habitat information for egg, juvenile, and adult life stages for these species was compiled from Stevenson et al. 2004 (Table 4.1.2-1). Note that EFH for the egg stage was included for species that have a demersal egg stage (winter flounder and ocean pout); all other species' eggs are found either in the surface waters, throughout the water column, or are retained inside the parent until larvae hatch. The habitats of these species during this life stage are therefore not generally subject to impact by this fishing gear and are not listed in Table 4.1.2-1.

Species	Geographic Region of the Northwest Atlantic	Food Source	Essential Fish Habitat		Commercial Fishing Gear Used
			Water Depth	Substrate	
Atlantic cod	Gulf of Maine, Georges Bank and southward	Omnivorous (invertebrates and fish)	(J): 25-75 m (82-245 ft) (A): 10-150 m (33-492 ft)	(J): Cobble or gravel bottom substrates (A): Rocks, pebbles, or gravel bottom substrate	Otter trawl, longlines, gillnets

⁷ Other species were listed as found in these assemblages, but only the species common to both studies are listed.

TABLE 4.1.2-1 (continued)
Summary of Geographic Distribution, Food Sources, Essential Fish Habitat Features, and Commercial Gear Used to Catch Each Species in the Northeast Multispecies Fishery Management Unit

Species	Geographic Region of the Northwest Atlantic	Food Source	Essential Fish Habitat		Commercial Fishing Gear Used
			Water Depth	Substrate	
Haddock	southwestern Gulf of Maine and shallow waters of Georges Bank	Benthic feeders (amphipods, polychaetes, echinoderms), bivalves, and some fish	(J): 35-100 m (115– 28 ft)	(J): Pebble and gravel bottom substrates	Otter trawl, longlines, gillnets
			(A): 40-150 m (131-492 ft)	(A): Broken ground, pebbles, smooth hard sand, smooth areas between rocky patches	
Acadian redfish	Gulf of Maine, deep portions of Georges Bank and Great South Channel	Crustaceans	(J): 25-400 m (82-1,312 ft)	(J): Bottom habitats with a substrate of silt, mud, or hard bottom	Otter trawl
			(A): 50-350 m (164–1,148 ft)	(A): Same as for (J)	
Pollock	Gulf of Maine, extends to Georges Bank, and the northern part of Mid-Atlantic Bight	Juvenile feed on crustaceans, adults also feed on fish and mollusks	(J): 0-250 m (0-820 ft)	(J): Bottom habitats with aquatic vegetation or substrate of sand, mud, or rocks	Otter trawl, gillnets
			(A): 15-365 m (49-1,198 ft)	(A): Hard bottom habitats including artificial reefs	

TABLE 4.1.2-1 (continued)
Summary of Geographic Distribution, Food Sources, Essential Fish Habitat Features, and Commercial Gear Used to Catch Each Species in the Northeast Multispecies Fishery Management Unit

Species	Geographic Region of the Northwest Atlantic	Food Source	Essential Fish Habitat		Commercial Fishing Gear Used
			Water Depth	Substrate	
Ocean Pout	Gulf of Maine, Cape Cod Bay, Georges Bank, southern New England, middle Atlantic south to Delaware Bay	Juveniles feed on amphipods and polychaetes. Adults feed mostly on echinoderms as well as on mollusks and crustaceans	(E): <50 m (<164 ft)	(E): Bottom habitats, generally hard bottom sheltered nests, holes, or crevices where juveniles are guarded.	Otter trawl
			(L): <50 m (<164 ft)	(L): Hard bottom nesting areas	
			(J): <80 m (262 ft)	(J): Bottom habitat, often smooth areas near rocks or algae	
			(A): <110 m (361 ft)	(A): Bottom habitats; dig depressions in soft sediments	
Atlantic Halibut	Gulf of Maine, Georges Bank	Juveniles feed on annelid worms and crustaceans, adults mostly feed on fish	(J): 20-60 m (66-197 ft)	(J): Bottom habitat with a substrate of sand, gravel, or clay	Otter trawl, longlines
			(A): 100-700 m (328-2,297 ft)	(A): Same as for (J)	
White hake	Gulf of Maine, Georges Bank, southern New England	Juveniles feed mostly on polychaetes and crustaceans; adults feed mostly on crustaceans, squids, and fish	(J): 5-225 m (16-738 ft)	(J): Bottom habitat with seagrass beds or substrate of mud or fine-grained sand	Otter trawl, gillnets
			(A): 5-325 m (16-1,066 ft)	(A): Bottom habitats with substrate of mud or fine grained sand	

TABLE 4.1.2-1 (continued)
Summary of Geographic Distribution, Food Sources, Essential Fish Habitat Features, and Commercial Gear Used to Catch Each Species in the Northeast Multispecies Fishery Management Unit

Species	Geographic Region of the Northwest Atlantic	Food Source	Essential Fish Habitat		Commercial Fishing Gear Used
			Water Depth	Substrate	
Yellowtail flounder	Gulf of Maine, southern New England, Georges Bank	Amphipods and polychaetes	(J): 20-50 m (66-164 ft)	(J): Bottom habitats with substrate of sand or sand and mud	Otter trawl
			(A): 20-50 m (66-164 ft)	(A): Same as for (J)	
American plaice	Gulf of Maine, Georges Bank	Polychaetes, crustaceans, mollusks, echinoderms	(J): 45-150 m (148-492 ft)	(J): Bottom habitats with fine grained sediments or a substrate of sand or gravel	Otter trawl
			(A): 45-175 m (148-574 ft)	(A): Same as for (J)	
Witch flounder	Gulf of Maine, Georges Bank, Mid-Atlantic Bight/southern New England	Mostly polychaetes (worms), echinoderms	(J): 50-450 m (164-1,476 ft)	(J): Bottom habitats with fine grained substrate	Otter trawl
			(A): 25-300 m (82-984 ft)	(A): Same as for (J)	
Winter flounder	Gulf of Maine, Georges Bank, Mid-Atlantic Bight/southern New England	Polychaetes, crustaceans	(E): <5 m (16 ft)	(E): Bottom habitats with a substrate of sand, muddy sand, mud, and gravel	Otter trawl, gillnets
			(J): 0.1-10 m (0.3-32 ft) (1-50 m age 1+) (3.2-164 ft)	(J): Bottom habitats with a substrate of mud or fine grained sand	
			(A): 1-100 m (3.2-328 ft)	(A): Bottom habitats including estuaries with substrates of mud, sand, gravel	

TABLE 4.1.2-1 (continued)
Summary of Geographic Distribution, Food Sources, Essential Fish Habitat Features, and Commercial Gear Used to Catch Each Species in the Northeast Multispecies Fishery Management Unit

Species	Geographic Region of the Northwest Atlantic	Food Source	Essential Fish Habitat		Commercial Fishing Gear Used
			Water Depth	Substrate	
Atlantic wolffish Proposed in Amendment 16	Gulf of Maine & Georges Bank	Mollusks, brittle stars, crabs, and sea urchins	(J): 40-240 m (131.2-787.4 ft) (A): 40-240 m (131.2-787.4 ft)	J): Rocky bottom and coarse sediments (A): Same as for (J)	Otter trawl, longlines, and gillnets
Windowpane flounder	Gulf of Maine, Georges Bank, Mid-Atlantic Bight/southern New England	Juveniles mostly crustaceans; adults feed on crustaceans and fish	(J): 1-100 m (3.2-328 ft) (A): 1-75 m (3.2-574 ft)	(J): Bottom habitats with substrate of mud or fine grained sand (A): Same as for (J)	Otter trawl

Note:

Species life stages are summarized by letter in parentheses following species name. A = adult; E = egg; J = juvenile; m = meter.

4.1.3 Essential Fish Habitat (EFH)

EFH is defined by the SFA as “[t]hose waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity.” The environment that could potentially be affected by the Proposed Action has been identified as EFH for benthic life stages of species that are managed under the Northeast Multispecies FMP; Atlantic sea scallop; monkfish; deep-sea red crab; northeast skate complex; Atlantic herring; summer flounder, scup, and black sea bass; tilefish; squid, Atlantic mackerel, and butterfish; Atlantic surfclam and ocean quahog FMPs. EFH for the species managed under these FMPs includes a wide variety of benthic habitats in state and Federal waters throughout the Northeast U.S. Shelf Ecosystem. EFH descriptions of the general substrate or bottom types for all the benthic life stages of the species managed under these FMPs are summarized in Table 4.1.2-1. Full descriptions and maps of EFH for each species and life stage (except Atlantic wolffish) are available on the NMFS Northeast Region website at <http://www.nero.noaa.gov/hcd/index2a.htm>. In general, EFH for species and life stages that rely on the seafloor for shelter (e.g., from predators), reproduction, or food is vulnerable to disturbance by bottom tending gear. The most vulnerable habitat is more likely to be hard or rough bottom with attached epifauna.

4.1.4 Gear Types and Interaction with Habitat

PCS would use primarily use trawls and gillnet gear to fish for groundfish as part of the FY 2010 operations. In addition, the PCS would use longlines and handlines as secondary gear and has requested approval to fish with any federally authorized gear type (e.g., jigs) in an effort to improve target catch rates while decreasing discards / mortalities. This section discusses the characteristics of each of the

proposed gear types as well as the typical impacts to the physical habitat associated with each of these gear types.

4.1.4.1 Gear Types

The characteristics of typical gear types used by the multispecies fishery are summarized in Table 4.1.4-1.

Gear Type	Trawl	Sink/ Anchor Gillnets	Bottom Longlines	Hook and Line
Total Length	Varies	295 ft long per net	~1,476 ft	Varies
Lines	N/A	Leadline and floatline with webbing (mesh) connecting	Mainline is parachute cord. Gangions (lines from mainline to hooks) are 15 inches long, 3 to 6 inches apart, and made of shrimp twine	One to several with mechanical line fishing
Nets	Rope or large-mesh size, depends upon target Species	Monofilament, mesh size depends on the target species (groundfish nets minimum mesh size of 6.5 inches)	No nets, but 12/0 circle hooks are required	No nets, but single to multiple hooks, "umbrella rigs"
Anchoring	N/A	22 lb (9–11 kg) Danforth-style anchors are required at each end of the net string	20-24 lb (9-11 kg) anchors, anchored at each end, using pieces of railroad track, sash weights, or Danforth anchors, depending on currents	No anchoring, but sinkers used (stones, lead)
Frequency/ Duration of Use	Tows last for several hours	Frequency of trending changes from daily (when targeting groundfish) to semi-weekly (when targeting monkfish and skate)	Usually set for a few hours at a time	Depends upon cast/target species

Trawl Gear

Approximately half of PCS fishing effort would utilize trawl gear. Trawls are classified by their function, bag construction, or method of maintaining the mouth opening. Function may be defined by the part of the water column where the trawl operates (e.g., mid-water or bottom) or by the species that it targets (Hayes 1983). Mid-water trawls are designed to catch pelagic species in the water column and do not normally contact the bottom; however, mid-water trawls are prohibited in the Northeast multispecies fishery. Bottom trawls are designed to be towed along the seafloor and to catch a variety of demersal fish and invertebrate species.

The mid-water trawl is used to capture pelagic species throughout the water column. The mouth of the net typically ranges from 110 m to 170 m and requires the use of large vessels (Sainsbury 1996). Successful mid-water trawling requires the effective use of various electronic aids to find the fish and maneuver the vessel while fishing (Sainsbury 1996). Tows typically last for several hours and catches are

large. The fish are usually removed from the net while it remains in the water alongside the vessel by means of a suction pump. In some cases, the fish are removed from the net by repeatedly lifting the cod-end aboard the vessel until the entire catch is in the hold.

Although there are three general types of bottom trawl used in the Northeast Region, bottom otter trawls account for nearly all commercial bottom trawling activity. There is a wide range of otter trawl types used in the Northeast as a result of the diversity of fisheries and bottom types encountered in the region (NREFHSC 2002). The specific gear design used is often a result of the target species (whether found on or off the bottom) as well as the composition of the bottom (smooth versus rough and soft versus hard). A number of different types of bottom otter trawl used in the Northeast are specifically designed to catch certain species of fish, on specific bottom types, and at particular times of year. Bottom trawls are towed at a variety of speeds, but average about 5.6 kilometer (km)/hour (3 knots). Use of this gear in the Northeast is managed under several federal FMPs. In state waters, bottom trawling is also subject to a variety of state regulations throughout the region.

A flatfish trawl is a type of bottom otter trawl designed with a low net opening between the headrope and the footrope and more ground rigging on the sweep. This type of trawl is designed so that the sweep follows the contours of the bottom, and to get fish like flounders - that lie in contact with the seafloor - up off the bottom and into the net. It is used on smooth mud and sand bottoms. A high-rise or fly net with larger mesh has a wide net opening and is used to catch demersal fish that tend to rise higher off the bottom than flatfish (NREFHSC 2002).

Bottom otter trawls that are used on "hard" bottom (i.e., gravel or rocky bottom), or mud or sand bottom with occasional boulders, are rigged with rockhopper gear. The purpose of the "ground gear" in this case is to get the sweep over irregularities in the bottom without damaging the net. The purpose of the sweep in trawls rigged for fishing on smooth bottoms is to herd fish into the path of the net (Mirarchi 1998).

The raised-footrope trawl was designed to provide vessels with a means of continuing to fish for small-mesh species without catching groundfish. Raised-footrope trawls fish about 0.5 to 0.6 m above the bottom (Carr and Milliken 1998). Although the doors of the trawl still ride on the bottom, underwater video and observations in flume tanks have confirmed that the sweep in the raised-footrope trawl has much less contact with the seafloor than the traditional cookie sweep that it replaces (Carr and Milliken 1998).

Gillnet Gear

Roughly half of the PCS fishing effort would be conducted using individual sink/anchor gillnets. These nets are about 90 m long and are usually fished as a series of 5 to 15 nets attached end-to-end. A vast majority of "strings" consist of 10 gillnets. Gillnets typically have three components: the leadline, webbing, and floatline. In New England, leadlines are approximately 30 kilogram (kg)/net. Webs are monofilament, with the mesh size depending on the species of interest. Nets are anchored at each end using materials such as pieces of railroad track, sash weights, or Danforth anchors, depending on currents. Anchors and leadlines have the most contact with the bottom. For New England groundfish, frequency of tending gillnets ranges from daily to semiweekly (NREFHSC 2002).

A bottom gillnet is a large wall of netting equipped with floats at the top and lead weights along the bottom. Fish are caught while trying to pass through the net mesh. The meshes of a specific gillnet are uniform in size and shape, hence highly selective for a particular size of fish (Jennings et al. 2001). Bottom gillnets are fished in two different ways, as "standup" and "tiedown" nets (Williamson 1998). Standup nets are typically used to catch Atlantic cod, haddock, pollock, and hake and are soaked

(duration of time the gear is set) for 12 to 24 hours. Tiedown nets are set with the floatline tied to the leadline at about 6-foot intervals, so that the floatline is close to the bottom, and the net forms a limp bag between each tie. They are left in the water for 3 to 4 days, and are used to catch flounders and monkfish.

Longline Gear

PCS could use longlines as a secondary gear type on a limited basis. Longlines consist of a long length of line, to which short lengths of line ("gangions") carrying baited hooks are attached. Longlining is undertaken for a wide range of bottom species. Bottom longlines typically have up to six individual longlines strung together for a total length of more than 450 m and are deployed with 9 to 11 kg anchors. The mainline is a parachute cord. Gangions are typically 40 centimeters (cm) long and 1 to 1.8 m apart and are made of shrimp twine. These longlines are usually set for a few hours at a time (NREFHSC 2002).

All hooks must be 12/0 circle hooks. A "circle hook" is, defined as a hook with the point turned back towards the shank and the barbed end of the hook is displaced (offset) relative to the parallel plane of the eyed-end or shank of the hook when laid on its side. The design of circle hooks enables them to be employed to reduce the damage to habitat features that would occur with use of other hook shapes (NREFHSC 2002).

Hook and Line

Hand Lines/Rod and Reel

One PCS vessel would also use handlines. The simplest form of hook and line fishing is the hand line, which could be fished using a rod and reel or simply "by hand." The gear consists of a line, sinker (weight), gangion, and at least one hook. The line is typically stored on a small spool and rack and varies in length and the sinkers vary from stones to cast lead. The hooks can vary from single to multiple arrangements in "umbrella" rigs. An attraction device must be used with the hook, usually consisting of a natural bait or an artificial lure. Hand lines can be carried by currents until retrieved or fished in such a manner as to hit bottom and bounce (Stevenson et al. 2004). Hand lines and rods and reels are used in the Northeast Region to catch a variety of demersal species.

Mechanized Line Fishing

Mechanized line-hauling systems have been developed to allow smaller fishing crews to work more lines, and to use electrical or hydraulic power to work the lines on the spools. The reels, also called "bandits," are mounted on the vessel bulwarks with the mainline wound around a spool. The line is taken from the spool over a block at the end of a flexible arm and each line could have a number of branches and baited hooks.

Jigging machines are used to jerk a line with several unbaited hooks up in the water to snag a fish in its body and is commonly used to catch squid. Jigging machine lines are generally fished in waters up to 600 m deep. Hooks and sinkers can contact the bottom, depending upon the way the gear is used, and could catch a variety of demersal species.

4.1.4.2 Gear Interaction with Habitat

Historically, commercial fishing in the region has been conducted using trawls, gillnets, and longline gear. For decades, trawls have been intensively used throughout the region and have accounted for the majority of commercial fishing activity in the multispecies fishery off New England.

Amendment 13 (NEFMC 2003) describes the general effects of bottom trawls on benthic marine habitats. The primary source document used for this analysis was an advisory report prepared for the International Council for the Exploration of the Seas (ICES) that identified a number of possible effects of beam trawls and bottom otter trawls on benthic habitats (ICES 2000). This report is based on scientific findings summarized in Lindeboom and de Groot (1998), which were peer-reviewed by an ICES working group. The focus of the report is the Irish Sea and North Sea, but it also includes assessments of effects in other areas. Two general conclusions were: (1) low-energy environments are more affected by bottom trawling; and (2) bottom trawling affects the potential for habitat recovery (i.e., after trawling ceases, benthic communities and habitats may not always return to their original pre-impacted state). Regarding direct habitat effects, the report also concluded that:

- Loss or dispersal of physical features such as peat banks or boulder reefs (changes are always permanent and lead to an overall change in habitat diversity, which in turn leads to the local loss of species and species assemblages dependent on such features);
- Loss of structure-forming organisms such as bryozoans, tube-dwelling polychaetes, hydroids, seapens, sponges, mussel beds, and oyster beds (changes may be permanent leading to an overall change in habitat diversity, which could in turn lead to the local loss of species and species assemblages dependent on such biogenic features);
- Reduction in complexity caused by redistributing and mixing of surface sediments and the degradation of habitat and biogenic features, leading to a decrease in the physical patchiness of the seafloor (changes are not likely to be permanent); and
- Alteration of the detailed physical features of the seafloor by reshaping seabed features such as sand ripples and damaging burrows and associated structures that provide important habitats for smaller animals and can be used by fish to reduce their energy requirements (changes are not likely to be permanent).

A more recent evaluation of the habitat effects of trawling and dredging was prepared by the Committee on Ecosystem Effects of Fishing for the National Research Council's Ocean Studies Board (NRC 2002). Trawl gear evaluated included bottom otter trawls and beam trawls. This report identified four general conclusions regarding the types of habitat modifications caused by trawls:

- Trawling reduces habitat complexity;
- Repeated trawling results in discernable changes in benthic communities;
- Bottom trawling reduces the productivity of benthic habitats; and
- Fauna that live in low natural disturbance regimes are generally more vulnerable to fishing gear disturbance.

An additional source of information for various gear types that relates specifically to the Northeast region is the report of a "Workshop on the Effects of Fishing Gear on Marine Habitats off the Northeastern U.S." sponsored by the NEFMC and Mid-Atlantic Fishery Management Council (MAFMC) (NEFSC 2002). A panel of invited fishing industry members and experts in the fields of benthic ecology, fishery ecology, geology, and fishing gear technology convened for the purpose of assisting the NEFMC,

MAFMC, and NMFS with: (1) evaluating the existing scientific research on the effects of fishing gear on benthic habitats; (2) determining the degree of impact from various gear types on benthic habitats in the Northeast; (3) specifying the type of evidence that is available to support the conclusions made about the degree of impact; (4) ranking the relative importance of gear impacts on various habitat types; and (5) providing recommendations on measures to minimize those adverse impacts. The panel was provided with a summary of available research studies that summarized information relating to the effects of bottom otter trawls, bottom gillnets, and longlines. Relying on this information plus professional judgment, the panel identified the effects and the degree of impact of these gears on mud, sand, and gravel/rock habitats.

Additional information is provided in this report on the recovery times for each type of impact for each gear type in mud, sand, and gravel habitats (“gravel” includes other hard-bottom habitats). This information made it possible to rank these three substrates in terms of their vulnerability to the effects of bottom trawling, although other factors such as frequency of disturbance from fishing and from natural events are also important. In general, impacts from trawling were determined to be greater in gravel/rock habitats with attached epifauna. Impacts on biological structure were ranked higher than impacts on physical structure. Effects of trawls on major physical features in mud (deep water clay-bottom habitats) and gravel bottom were described as permanent, and impacts to biological and physical structure were given recovery times of months to years in mud and gravel. Impacts of trawling on physical structure in sand were of shorter duration (days to months) given the exposure of most continental shelf sand habitats to strong bottom currents and/or frequent storms.

According to the panel, impacts of sink gillnets and longlines on sand and gravel habitats would result in low degree impacts (NEFSC 2002). Duration of impacts to physical structures from these gear types would be expected to last days to months on soft mud, but could be permanent on hard bottom clay structures along the continental slope. Impacts to mud would be caused by gillnet lead lines and anchors. Physical habitat impacts from sink gillnets and longlines on sand would not be expected.

The contents of a second expert panel report, produced by the Pew Charitable Trusts and entitled “Shifting Gears: Addressing the Collateral Impacts of Fishing Methods in U.S. Waters” (Morgan and Chuenpagdee 2003), was also summarized in Amendment 13. This group evaluated the habitat effects of 10 different commercial fishing gears used in U.S. waters. The report concluded that bottom trawls have relatively high habitat impacts; bottom gillnets and pots and traps have low to medium impacts; and bottom longlines have low impacts. As in the ICES and National Research Council (NRC) reports, individual types of trawls and dredges were not evaluated. The impacts of bottom gillnets, traps, and longlines were limited to warm or shallow water environments with rooted aquatic vegetation or “live bottom” environments (e.g., coral reefs).

4.2 ALLOCATED TARGET SPECIES

This section describes the species life history and stock population status for each of the 14 fish stocks that are managed under the Northeast Multispecies FMP, which would be harvested by the PCS as allocated target species under provisions of the FMP. The description of species habitat associations described in Section 4.1 provides context for considering the interactions between gear and species. A comparison of depth-related demersal fish assemblages of Georges Bank and the Gulf of Maine is also provided for additional context. The discussion of allocated target species is concluded with an analysis of the interaction between the gear types the PCS intends to use (as described in Section 4.1.6.2) and allocated target species. The following discussions have been adapted from the GARM III report (NEFSC 2008) and can be accessed via the NEFMC website at <http://www.nefmc.org>.

4.2.1 Species and Stock Status Descriptions

The allocated target stocks for the PCS are:

- GOM Cod
- GB Cod
- GOM Haddock
- GB Haddock
- American Plaice
- Witch Flounder
- GOM Winter Flounder
- GB Winter Flounder
- Cape Cod/GOM Yellowtail Flounder
- GB Yellowtail Flounder
- SNE/MA Yellowtail Flounder
- Redfish
- Pollock
- White Hake

Spiny dogfish, skates, and monkfish may also be affected by the Proposed Action and are considered in this EA as “non-allocated target species and bycatch” in Sections 4.3 and 5.1.3. These species are not allocated under the Northeast Multispecies FMP and are managed under their respective FMPs.

Atlantic halibut, ocean pout, windowpane flounder, and SNE/MA winter flounder are non-allocated species that are also managed under the Northeast Multispecies FMP. Sector and Common Pool vessels are permitted to retain 1 halibut per trip. Wolffish have been provisionally added to the list of stocks managed under the Northeast Multispecies FMP. These species stocks are addressed in Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a), and are not considered further within this EA.

4.2.1.1 Gulf of Maine Cod

Life History: The Atlantic cod, *Gadus morhua*, is a demersal gadoid species found on both sides of the North Atlantic. In the western North Atlantic, cod occur from Greenland to North Carolina. In U.S. waters, cod are assessed and managed as two stocks: Gulf of Maine and Georges Bank. GOM cod attain sexual maturity at a later age than GB cod, which is related to differences in growth rates between the two stocks. The greatest concentrations of cod off the Northeast coast of the United States are on rough bottoms in waters between 10 and 150 m and at temperatures between 0 and 10°C. Spawning occurs year-round, near the ocean bottom, with a peak in winter and spring. Peak spawning is related to water temperatures between 5 and 7°C. It is delayed until spring when winters are severe and peaks in winter when mild. Eggs are pelagic, buoyant, spherical, and transparent, and drift for 2 to 3 weeks before hatching. The larvae are also pelagic until reaching 4 to 6 cm in about 3 months, at which point they descend to the seafloor. Most remain on the bottom after this descent, and there is no evidence of a

subsequent diel vertical migration. Adults tend to move in schools, usually near the bottom, but also occurring in the water column. .

Population Status: The inshore GOM stock appears to be relatively distinct from the offshore cod stocks on the banks of the Scotian Shelf and Georges Bank based on tagging studies. GOM cod spawning stock biomass has increased since the late 1990's from 11,100 metric tons (mt) in 1997 to 34,000 mt in 2007, but the stock remains low relative to historic levels. The stock is not overfished, but overfishing is occurring.

4.2.1.2 Georges Bank Cod

Life History: The GB cod stock, *Gadus morhua*, is the most southerly cod stock in the world. The greatest concentrations off the Northeast coast of the United States are on rough bottoms in waters between 10 and 150 m and at temperatures between 0 and 10°C. Spawning occurs year-round, near the ocean bottom, with a peak in winter and spring. Peak spawning is related to water temperatures between 5 and 7°C. It is delayed until spring when winters are severe, and peaks in winter when mild. Eggs are pelagic, buoyant, spherical, and transparent, and drift for 2 to 3 weeks before hatching. The larvae are also pelagic until reaching 4 to 6 cm in about 3 months, at which point they descend to the seafloor. Most remain on the bottom after this descent, and there is no evidence of a subsequent diel, vertical migration. Adults tend to move in schools, usually near the bottom, but also occur in the water column. .

Population Status: GB cod are a transboundary stock that is harvested by both the U.S. and Canadian fishing fleets. The GB cod stock is overfished and overfishing is occurring.

4.2.1.3 Gulf of Maine Haddock

Life History: The GOM haddock, *Melanogrammus aeglefinus*, is a commercially-exploited groundfish found in the North Atlantic Ocean. In the western North Atlantic, this demersal gadoid species is distributed from Cape May, New Jersey to the Strait of Belle Isle, Newfoundland, where a total of six distinct haddock stocks have been identified. Two of these haddock stocks are found in U.S. waters associated with Georges Bank and Gulf of Maine.

Haddock are highly fecund broadcast spawners. Eggs are released near the ocean bottom in batches and fertilized by a courting male. After fertilization, haddock eggs become buoyant and rise to the surface water layer. In the Gulf of Maine, spawning occurs from early February to May, usually peaking in February to April. In the Gulf of Maine, Jeffreys Ledge and Stellwagen Bank are the two primary spawning sites. Haddock spawn over various substrates including rocks, gravel, smooth sand, and mud. Eggs are broadcast and fertilized near the bottom. Fertilized eggs are buoyant and remain in the water column where subsequent development occurs. Larvae metamorphose into juveniles in roughly 30 to 42 days at lengths of 2 to 3 cm. Small juveniles initially live and feed in the epipelagic zone. Juveniles remain in the upper part of the water column for 3 to 5 months. Juveniles visit the ocean bottom in search of food. Once suitable bottom habitat is located, juveniles settle into a demersal existence. Haddock do not make extensive seasonal migrations. In winter, haddock prefer deeper waters and tend to move shoreward in summer.

Population Status: The GOM haddock stock is not overfished and overfishing is not occurring.

4.2.1.4 Georges Bank Haddock

Life History: The general life history of GB haddock, *Melanogrammus aeglefinus*, is comparable to the GOM haddock as described above. On Georges Bank, spawning occurs from January

to June, usually peaking from February to early-April. Georges Bank is the principal haddock spawning area in the Northeast U.S. Shelf Ecosystem. GB haddock spawning is concentrated on the northeast peak of Georges Bank.

Median age and size of maturity differ slightly between the GB and GOM haddock stocks. The GOM haddock have lower weights at age than the GB and the age at 50 percent maturity was also lower for GOM haddock as compared to GB haddock.

Population Status: The GB haddock stock is a transboundary resource, which is co-managed with Canada. According to GARM III, the GOM fishery does not target haddock. Substantial declines have recently occurred in the weights at age due to slower than average growth, particularly of the 2003 year-class. This is affecting productivity in the short-term. The growth of subsequent year-classes is returning to the earlier rates. The stock is not overfished and overfishing is not occurring.

4.2.1.5 American Plaice

Life History: The American plaice, *Hippoglossoides platessoides*, is an arctic-boreal to temperate-marine pleuronectid (righteye) flounder that inhabits both sides of the North Atlantic on the continental shelves of northeastern North America and northern Europe. Off the U.S. coast, American plaice are managed as a single stock in the Gulf of Maine-Georges Bank region. American plaice have been categorized as batch spawners. Eggs are released in batches every few days over the spawning period. Adults spawn and fertilize their eggs at or near the bottom. Buoyant eggs, which lack oil globules, drift into the upper water column after being released. Eggs hatch at the surface and the amount of time between fertilization and hatching varies with the water temperature. Transformation of the larvae and migration of the left eye begins when the larvae are approximately 20 millimeters (mm). Dramatic physiological transformations occur during the juvenile stage. The body shape continues to change, flattening and increasing in depth from side to side. As the migration of the left eye across the top of the head to the right side reaches completion, descent towards the seafloor begins. In U.S. and Canadian waters, American plaice is regarded as a sedentary species migrating only for spawning and feeding.

Population Status: In the Gulf of Maine and Georges Bank area, the American plaice stock is not overfished and overfishing is not occurring.

4.2.1.6 Witch Flounder

Life History: The witch flounder, *Glyptocephalus cynoglossus*, is a demersal flatfish distributed on both sides of the North Atlantic. In the western North Atlantic, the species ranges from Labrador southward, and is closely associated with mud or sand-mud bottom. In U.S. waters, witch flounder are common throughout the Gulf of Maine, in deeper areas on and adjacent to Georges Bank, and along the shelf edge as far south as Cape Hatteras, North Carolina. Witch flounder are assessed as a unit stock.

Witch flounder spawn from March to November, with peak spawning occurring in summer. The general trend is for spawning to occur progressively later from south to north. In the Gulf of Maine-Georges Bank region, spawning occurs from April to November, and peaks from May to August. Spawning occurs in dense aggregations that are associated with areas of cold water. Witch flounder spawn at 0 to 10°C. Spawning occurs at or near the bottom; however, the buoyant eggs rise into the water column where subsequent egg and larval development occurs. The pelagic stage of witch flounder is the longest among the species of the family Pleuronectidae. Descent to the seafloor occurs when metamorphosis is complete, at 4 to 12 months of age. There has been a decrease in both the age and size of sexual maturity in recent years.

Population Status: Witch flounder is overfished and overfishing is occurring.

4.2.1.7 Gulf of Maine Winter Flounder

Life History: The winter flounder, *Psuedopleuronectes americanus*, is a demersal flatfish distributed in the western North Atlantic from Labrador to Georgia. Important U.S. commercial and recreational fisheries for winter flounder exist from the Gulf of Maine to the Mid-Atlantic Bight. In U.S. waters, the resource is assessed and managed as three stocks including the GOM, SNE/MA, and GB stocks. Adult GOM winter flounder migrate inshore in the fall and early winter and spawn from winter through spring, with peak spawning occurring during February and March in Massachusetts Bay and south of Cape Cod, and somewhat later along the coast of Maine, continuing into May. After spawning, adults typically leave inshore areas when water temperatures exceed 15°C although some remain inshore year-round. The eggs of winter flounder are demersal, adhesive, and stick together in clusters. Larvae are initially planktonic but become increasingly bottom-oriented as metamorphosis approaches. Metamorphosis, when the left eye migrates to the right side of the body and the larvae become “flounder-like,” begins around 5 to 6 weeks after hatching, and is completed by the time the larvae are 8 to 9 mm in length at about 8 weeks after hatching. Newly metamorphosed young-of-the-year winter flounder take up residence in shallow water where individuals may grow to about 100 mm within the first year.

Population Status: While the parameters of status determination criteria are presented in Table 12 of Amendment 16, the exact status determination for GOM winter flounder is unknown. Fishing mortality for this stock is likely above the level that would produce maximum sustainable yield, which typically indicates that overfishing is occurring.

4.2.1.8 Georges Bank Winter Flounder

Life History: The life history of the GB winter flounder, *Psuedopleuronectes americanus*, is comparable to the GOM winter flounder as described above.

Population Status: The stock is likely in an overfished condition and overfishing is probably occurring.

4.2.1.9 Cape Cod/Gulf of Maine Yellowtail Flounder

Life History: The yellowtail flounder, *Limanda ferruginea*, is a demersal flatfish distributed from Labrador to Chesapeake Bay generally at depths between 40 and 70 m. Off the U.S. coast, three stocks are considered for management purposes including Cape Cod/GOM, GB, and SNE/MA stocks. In the western North Atlantic, spawning occurs from March through August at temperatures of 5 to 12°C. Spawning takes place along continental shelf waters northwest of Cape Cod. Yellowtail flounder spawn buoyant, spherical, pelagic eggs that lack an oil globule. Pelagic larvae are brief residents in the water column; transformation to the juvenile stage occurs at 11.6 to 16 mm standard length. There are high concentrations of adults around Cape Cod in both spring and autumn. The median age at maturity for females is 2.6 years off Cape Cod.

Population Status: The Cape Cod/GOM yellowtail flounder stock continues to be overfished and overfishing is continuing. However, fishing mortality has been declining since 2004 and was at the lowest level observed in the time series in 2009. Spawning stock biomass has increased the past few years.

4.2.1.10 Georges Bank Yellowtail Flounder

Life History: The general life history of the GB yellowtail flounder, *Limanda ferruginea*, is comparable to the Cape Cod/GOM yellowtail described above. The median age at maturity for females is 1.8 years on Georges Bank. Spawning takes place along continental shelf waters of Georges Bank.

Population Status: The GB yellowtail flounder stock is overfished and overfishing is continuing.

4.2.1.11 Southern New England/Mid-Atlantic Yellowtail Flounder

Life History: The general life history of the SNE/MA yellowtail flounder, *Limanda ferruginea*, is comparable to the Cape Cod/GOM yellowtail described above. The median age at maturity for females is 1.6 years off southern New England.

Population Status: The SNE/MA yellowtail flounder continues to be overfished and overfishing is still occurring. However, fishing mortality has been declining since 2005 and was at the lowest levels observed in the time series in 2009.

4.2.1.12 Redfish

Life History: The Acadian redfish, *Sebastes fasciatus* Storer, and the deepwater redfish, *S. mentella* Travin, are virtually indistinguishable from each other based on external characteristics. Deepwater redfish are less prominent in the more southerly regions of the Scotian Shelf and appear to be virtually absent from the Gulf of Maine where Acadian redfish appear to be the sole representative of the genus *Sebastes*. Acadian redfish inhabiting the waters of the Gulf of Maine and deeper portions of Georges Bank and the Great South Channel are managed as a unit stock in U.S. waters.

The redfish are a slow growing, long-lived, ovoviviparous species with an extremely low natural mortality rate. Redfish eggs are fertilized internally, develop into larvae within the oviduct, and are released near the end of the yolk sac phase. The release of larvae lasts for 3 to 4 months with a peak in late May to early June. Newly spawned larvae occur in the upper 10 m of the water column; at 10 to 25 mm. The post-larvae descend below the thermocline when about 25 mm in length. Young-of-the-year are pelagic until reaching 40 to 50 mm at 4 to 5 months old, at which point moving to the bottom, typically by early fall of their first year. Redfish of 22 cm or greater are considered adults. In general, the size of landed redfish is positively correlated with depth. The reason for this may involve differential growth rates of stocks, confused species identification (deepwater redfish are a larger species), size-specific migration, gender-specific migration (females are larger), or a combination of these factors. Redfish make diurnal vertical migrations linked to their primary euphausiid prey. Nothing is known about redfish breeding behavior, but fertilization is internal and fecundity is relatively low.

Population Status: The redfish stock is not overfished and overfishing is not occurring.

4.2.1.13 Pollock

Life History: Pollock, *Pollachius virens*, occur on both sides of the North Atlantic. In the western North Atlantic, the species is most abundant on the western Scotian Shelf and in the Gulf of Maine. There is considerable movement of the species between the Scotian Shelf, Georges Bank, and the Gulf of Maine. Although some differences in meristic and morphometric characters have been shown, there are no significant genetic differences among areas. As a result, they are assessed as a single unit. The principal pollock spawning sites in the western North Atlantic are in the western Gulf of Maine,

Great South Channel, Georges Bank, and on the Scotian Shelf. Spawning takes place from September to April. Spawning time is more variable in northern sites than in southern sites. Spawning occurs over hard, stony, or rocky bottom. Spawning activity begins when the water column cools to near 8°C, and peaks when temperatures are approximately 4.5 to 6°C. Thus, most spawning occurs within a comparatively narrow range of temperatures.

Pollock eggs are buoyant, rising into the water column after fertilization. The pelagic larval stage lasts for 3 to 4 months, at which time the small juveniles or “harbor pollock” migrate inshore to inhabit rocky subtidal and intertidal zones. Pollock then undergo a series of inshore-offshore movements linked to temperature until near the end of their second year. At this point, the juveniles move offshore where the pollock remain throughout the adult stage. Pollock are a schooling species and are found throughout the water column. With the exception of short migrations due to temperature changes and north-south movements for spawning, adult pollock are fairly stationary in the Gulf of Maine and along the Nova Scotian coast. Male pollock reach sexual maturity at a larger size and older age than females. Age and size at maturity of pollock have declined in recent years, a trend that has also been reported in other marine fish species (e.g., haddock, witch flounder).

Population Status: The stock is overfished and overfishing is occurring.

4.2.1.14 White Hake

Life History: The white hake, *Urophycis tenuis*, occurs from Newfoundland to southern New England and is common on muddy bottom throughout the Gulf of Maine. The depth distribution of white hake varies by age and season; juveniles typically occupy shallower areas than adults, but individuals of all ages tend to move inshore or shoalward in summer, dispersing to deeper areas in winter. The northern spawning group of white hake spawns in late summer (August-September) in the southern Gulf of St. Lawrence and on the Scotian Shelf. The timing and extent of spawning in the Georges Bank - Middle Atlantic spawning group has not been clearly determined. The eggs, larvae, and early juveniles are pelagic; older juveniles and adults are demersal. The eggs are buoyant. Pelagic juveniles become demersal at 50 to 60 mm total length. The pelagic juvenile stage lasts about two months. White hake attain a maximum length of 135 cm and weigh up to 22 kg; females are larger than males.

Population Status: The stock is overfished and overfishing is occurring.

4.2.2 Assemblages of Fish Species

Georges Bank and the Gulf of Maine have been historically characterized by high levels of fish production. Several studies have identified demersal fish assemblages over large spatial scales. Overholtz and Tyler (1985) found five depth-related groundfish assemblages for Georges Bank and the Gulf of Maine that were persistent temporally and spatially. Depth and salinity were identified as major physical influences explaining assemblage structure. Gabriel (1992) identified six assemblages, which are compared with the results of Overholtz and Tyler (1985) in Table 4.2.2-1 (adapted from Amendment 16). The assemblages include allocated target species and non-allocated target species and bycatch. As presented in Table 4.2.2-1, the terminology and definitions of habitat types vary slightly between the two studies. For further information on fish habitat relationships, see Table 4.1.2-1.

Overholtz and Tyler (1985)		Gabriel (1992)	
Assemblage	Species	Species	Assemblage
Slope and Canyon	offshore hake, blackbelly rosefish, Gulf stream flounder, fourspot flounder, goosefish, silver hake, white hake, red hake	offshore hake, blackbelly rosefish, Gulf stream flounder, fawn cusk-eel, longfin hake, armored sea robin	Deepwater
Intermediate	silver hake, red hake, goosefish, Atlantic cod, haddock, ocean pout, yellowtail flounder, winter skate, little skate, sea raven, longhorn sculpin	silver hake, red hake, goosefish, northern shortfin squid, spiny dogfish, cusk	Combination of Deepwater Gulf of Maine/Georges Bank and Gulf of Maine-Georges Bank Transition

Northeast Peak	Atlantic cod, haddock, pollock, ocean pout, winter flounder, white hake, thorny skate, longhorn sculpin	Atlantic cod, haddock, pollock	Gulf of Maine-Georges Bank Transition Zone

4.2.3 Stock Status Trends

Of the 19 groundfish stocks (including all management units of each species) included in the GARM III report (NEFSC 2008), benchmark assessments indicated that six stocks were fished below the fishing mortality rate that would produce maximum sustainable yield (F_{MSY}) (or its proxy) in 2007 and 13 were above (Table 4.2.3-1). The F_{MSY} is the fishing mortality rate (F) that produces the maximum sustainable yield (MSY), defined as the largest long-term average catch or yield that can be taken from a stock or stock complex under prevailing ecological and environmental conditions (National Standards Guidelines 50 CFR 600.310). The most recent information regarding stock assessments is provided by the GARM III Report and can be accessed via the NEFMC website at <http://www.nefmc.org>. The information in this section is largely adapted from that report. The 19 groundfish stocks listed in Table 4.2.3-1 include the 14 target stocks allocated under the Northeast Multispecies FMP that could be impacted to various degrees by PCS fishing activities.

TABLE 4.2.3-1 Status of the Northeast Groundfish Stocks in 2007 (GARM III)	
Stock Status	Stock Status (GARM III)
Overfished and Overfishing Biomass < ½ B _{MSY} and F > F _{MSY}	GB Cod GB Yellowtail Flounder SNE/MA Yellowtail Flounder Cape Cod/GOM Yellowtail Flounder SNE/MA Winter Flounder White Hake Pollock Witch Flounder GB Winter Flounder Northern Windowpane
Overfished but not Overfishing Biomass < ½ B _{MSY} and F < F _{MSY}	Ocean Pout Halibut
Not Overfished but Overfishing Biomass > ½ B _{MSY} and F > F _{MSY}	GOM Cod Southern Windowpane
Not Overfished and not Overfishing Biomass > ½ B _{MSY} and F < F _{MSY}	Redfish Plaice GB Haddock GOM Haddock
Unknown	GOM Winter Flounder

Notes:

B_{MSY} = biomass necessary to produce maximum sustainable yield

F_{MSY} = fishing mortality rate that produces the maximum sustainable yield

The results of GARM III show stocks of ocean pout and Atlantic halibut are being fished at a sustainable level, but the biomass indicates stocks have not yet been rebuilt and are considered to be overfished. The stock of GB haddock is rebuilt, and GOM haddock, Acadian redfish, and American plaice are no longer overfished or experiencing overfishing, which indicates Amendment 13 and FW 42 management actions have had positive effects on certain groundfish stocks. All other groundfish stocks are still experiencing overfishing, indicating the need for additional management measures.

4.2.4 Areas Closed to Fishing in the Northeast Region

Select areas are closed to some level of fishing to protect the sustainability of fishery resources. The designation of long-term closures has resulted in the removal or reduction of fishing effort from important fishing grounds, with an expected result that fishery-related mortalities to stocks utilizing the closed areas may have been reduced.

Figure 4.2.4-1 shows the Closed Areas for:

- A. Northeast Multispecies Closed Areas and U.S./Canada Management Area;
- B. Northeast Multispecies Differential Days-at-Sea Areas, Closed Areas, Special Access Programs, and the U.S./Canada Management Area;
- C. Northeast Multispecies May Seasonal Closures Overlaid on Northeast Multispecies Closed Areas and the U.S./Canada area; and
- D. Essential Fish Habitat Closure Areas.

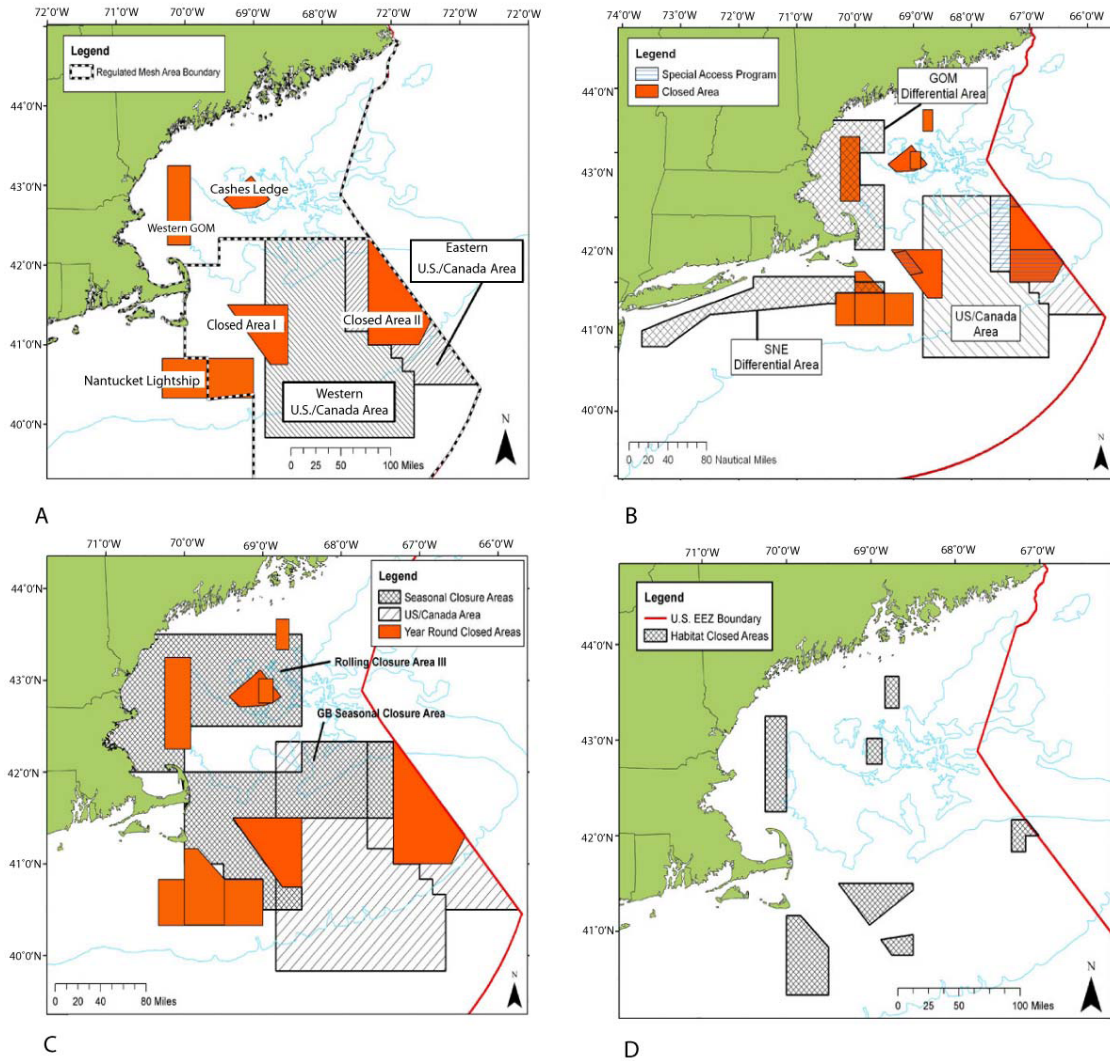

Figure 4.2.4-1 Northeast Multispecies Closed Areas and United States/Canada

4.2.5 Interaction between Gear and Allocated Target Species

The proposed PCS has no history of operations; therefore, the analysis of interactions between gear and allocated target species is based on catch information for the Northeast Multispecies FMP Common Pool fishery from FY 1996 through FY 2006 as presented in GARM III. Historic landings for select target species by gear type from FY 1996 through FY 2006 (Table 4.2.5-1) show that the majority

Notes:

^a as adopted by the NEFMC June, 2009

^b provisionally added to list of stocks not allocated

of fish of all species are caught with trawls. Only cod and white hake are caught in significant numbers by gillnets. Only haddock are caught in significant numbers by hook and line. Approximately half of the vessels in the PCS would use trawls and the other half would primarily use gillnets with some limited use of longlines' handlines and potentially other authorized gear types on an experimental basis.

4.3 NON-ALLOCATED TARGET SPECIES AND BYCATCH

Non-allocated target species and bycatch are defined in Section 1.2 and may include a broad range of species. For purposes of this assessment, and following the convention established in Amendment 16, the non-allocated target species and bycatch most likely to be affected by the PCS Operations Plan include spiny dogfish, skates, and monkfish. As indicated in Table 87 of the Final EIS for Amendment 16, these were the top three non-groundfish species landed by multispecies vessels in FY 2006 and FY 2007 under the Category B (regular) DAS program. These species have no allocation under the Northeast Multispecies FMP and are managed under separate FMPs. Monkfish and skates are commonly landed when caught. Spiny dogfish, which tend to be relatively abundant in catches, may be landed but are often the predominant component of the discarded bycatch. Monkfish could be discarded when regulations or market conditions constrain the amount of the catch that can be landed.

4.3.1 Spiny Dogfish

Life History: Spiny dogfish, *Squalus acanthias*, are distributed in the western North Atlantic from Labrador to Florida and are considered to be a unit stock off the coast of New England. In summer, dogfish migrate northward to the Gulf of Maine-Georges Bank region and into Canadian waters and return southward in autumn and winter. Spiny dogfish tend to school by size and, when mature, by sex. The species bears live young, with a gestation period of about 18 to 22 months, and produce between 2 to 15 pups with an average of 6. Size at maturity for females is around 80 cm, but can vary from 78 cm to 85 cm depending on the abundance of females.

Population Management and Status: The fishery is managed under an FMP developed jointly by the NEFMC and MAFMC for federal waters and a plan developed concurrently by the Atlantic States Marine Fisheries Commission (ASMFC) for state waters. Spawning stock biomass of spiny dogfish declined rapidly in response to a directed fishery during the 1990's. Management measures, initially implemented in 2001, have been effective in reducing landings and reducing fishing mortality. Overfishing is not presently considered to be occurring. Conclusions regarding the overfished and overfishing status of spiny dogfish are strongly dependent on the Northeast Fisheries Science Center (NEFSC) spring survey results in 2006. Future surveys will be closely monitored to determine if the 2006 results signal a true increase in abundance (<http://www.nefsc.noaa.gov/sos/spsyn/op/dogfish/>).

4.3.2 Skates

Life History: The seven species in the Northeast Region skate complex are: little skate (*Leucoraja erinacea*), winter skate (*L. ocellata*), barndoor skate (*Dipturus laevis*), thorny skate (*Amblyraja radiata*), smooth skate (*Malacoraja senta*), clearnose skate (*Raja eglanteria*), and rosette skate (*L. garmani*). The barndoor skate is the most common skate in the Gulf of Maine, on Georges Bank, and in southern New England. In the Northeast Region, the center of distribution for the little and winter skates is Georges Bank and southern New England. The thorny and smooth skates are commonly found in the Gulf of Maine. The clearnose and rosette skates have a more southern distribution, and are found primarily in southern New England and the Chesapeake Bight.

Skates are not known to undertake large-scale migrations. Skates tend to move seasonally in response to changes in water temperature, moving offshore in summer and early autumn and returning

inshore during winter and spring. Members of the skate family lay eggs that are enclosed in a hard, leathery case commonly called a mermaid's purse. Incubation time is 6 to 12 months, with the young having the adult form at the time of hatching.

Population Management and Status: The Skate FMP was implemented in September 2003 with a primary requirement for mandatory reporting of skate landings by species by both dealers and vessels (<http://www.nefmc.org/skates/fmp/fmp.htm>). Possession prohibitions of barndoor, thorny, and smooth skates in the Gulf of Maine were also provisions of the FMP. A trip limit of 10,000 pounds (lbs) was implemented for winter skate, and a Letter of Authorization is needed for the bait fishery (little skate) to exceed trip limits. Amendment 3, which updates the Skate FMP, also serves as a current Stock Assessment and Fishery Evaluation (SAFE) Report (NEFMC 2009b).

Skate landings have been reported to be generally increasing since 2000. Due to insufficient information about the population dynamics of skates, there remains considerable uncertainty about the status of skate stocks. The landings and catch limits proposed by Amendment 3 have been reported to have an acceptable probability of promoting biomass growth and achieving the rebuilding (biomass) targets for thorny skates. Modest reductions in landings and a stabilization of total catch below the median relative exploitation ratio is expected to cause skate biomass and future yield to increase.

4.3.3 Monkfish

Life History: Monkfish, *Lophius americanus*, also called goosefish, are distributed in the western North Atlantic from the Grand Banks and northern Gulf of St. Lawrence south to Cape Hatteras, North Carolina. Monkfish may be found from inshore areas to depths of at least 900 m. Seasonal onshore-offshore migrations occur and appear to be related to spawning and possibly to food availability.

Female monkfish begin to mature at age 4, and 50 percent of females are mature by age 5 (about 43 cm). Males generally mature at slightly younger ages and smaller sizes (50 percent maturity at age 4.2 or 36 cm). Spawning takes place from spring through early autumn, progressing from south to north, with most spawning occurring during the spring and early summer. Females lay a buoyant egg raft or veil that can be as large as 12 m long and 1.5 m wide, and only a few mm thick. The eggs are arranged in a single layer in the veil, and the larvae hatch after about 1 to 3 weeks, depending on water temperature. The larvae and juveniles spend several months in a pelagic phase before settling to a benthic existence at a size of about 8 cm.

Population Management and Status: Monkfish are currently regulated by the Monkfish FMP, which was implemented in 1998 (NEFMC and MAFMC 1998). The FMP was designed to stop overfishing and rebuild the stocks through a number of measures, including: limiting the number of vessels with access to the fishery and allocating DAS to those vessels; setting trip limits for vessels fishing for monkfish; minimum fish size limits; gear restrictions; mandatory time out of the fishery during the spawning season; and a framework adjustment process.

The Monkfish FMP defines two management areas for monkfish (northern and southern), divided roughly by an east-west line bisecting Georges Bank. Monkfish in both management regions are not overfished and overfishing is not occurring.

4.3.4 Interaction between Gear and Non-allocated Target Species and Bycatch

The proposed PCS has no history of operations; therefore, the analysis of interactions between gear and non-allocated target species and bycatch is based on catch information for the Northeast Multispecies FMP Common Pool fishery from FY 1996 to FY 2006.

The Final Supplemental Environmental Impact Statement (FSEIS) to Amendment 2 (NEFMC and MAFMC 2003) evaluated the potential adverse effects of gears used in the directed monkfish fishery for monkfish and other federally-managed species and the effects of fishing activities regulated under other federal FMPs on monkfish. The two gears used in the directed monkfish fishery are bottom trawls and bottom gillnets which are described in detail in Amendment 2 to the Monkfish FMP (NEFMC and MAFMC 2003).

Regionally, vessels tend to catch skates when targeting other species like groundfish, monkfish, and scallops and land them if the price is high enough. Therefore, gear interactions with skate can be expected in the conduct of fishing by the PCS for groundfish. Detailed information about skate fisheries can be found in the recent NEFMC Amendment to the Skate FMP and accompanying FSEIS (NEFMC 2009b).

Of the non-allocated target species and bycatch considered in this EA, dogfish have the potential for interaction with all gear types expected to be used by the PCS. Historic landings for non-allocated target species and bycatch from FY 1996 to FY 2006 (Table 4.3.4-1) show that the majority of fish of all species are caught with trawls. Only cod and white hake are caught in significant numbers by gillnets.

Species	Gear Type								
	Trawl		Gillnet		Dredge		Other Gear ^b	Total	
	Land	Discard	Land	Discard	Land	Discard	Land	Land	Discard
Monkfish	122,700	16,520	7,440	6,526	31,555	16,136	8,811	228,000	35,100
Skates	117,381	189,741	29,711	19,448	38,638	--	4,413	151,505	247,827
Dogfish	24,368	61,914	72,712	39,852	--	--	946	98,026	101,766

4.4 PROTECTED RESOURCES

There are numerous protected species that inhabit the environment within the Northeast Multispecies FMP management unit, and that therefore potentially occur in the operations area of the PCS. These species are afforded protection under the Endangered Species Act of 1973 (ESA; i.e., for those designated as threatened or endangered) and/or the Marine Mammal Protection Act of 1972 (MMPA), and are under NMFS' jurisdiction. As listed in Table 4.4.1-1, 13 marine mammal, sea turtle, and fish species are classified as endangered or threatened under the ESA; the remaining species in Table 4.4.1-1 are protected by the MMPA and are known to interact with the Northeast multispecies fishery. Non ESA-listed species protected by the MMPA that utilize this environment and have no documented interaction with the Northeast multispecies fishery will not be discussed in this statement.

4.4.1 Species Present in the Area

Table 4.4.1-1 lists the species, protected either by the ESA, the MMPA, or both, that may be found in the environment that would be utilized by the PCS.

TABLE 4.4.1-1 Species Protected Under the Endangered Species Act and/or Marine Mammal Protection Act that May Occur in the Operations Area for the Port Clyde Community Groundfish Sector	
Species	Status
Cetaceans	
North Atlantic right whale (<i>Eubalaena glacialis</i>)	Endangered
Humpback whale (<i>Megaptera novaeangliae</i>)	Endangered
Fin whale (<i>Balaenoptera physalus</i>)	Endangered
Sei whale (<i>Balaenoptera borealis</i>)	Endangered
Blue whale (<i>Balaenoptera musculus</i>)	Endangered
Sperm whale (<i>Physeter macrocephalus</i>)	Endangered
Minke whale (<i>Balaenoptera acutorostrata</i>)	Protected
Pilot whale (<i>Globicephala spp.</i>)	Protected
Risso's dolphin (<i>Grampus griseus</i>)	Protected
Atlantic white-sided dolphin (<i>Lagenorhynchus acutus</i>)	Protected
Common dolphin (<i>Delphinus delphis</i>)	Protected
Spotted dolphin (<i>Stenella frontalis</i>)	Protected
Bottlenose dolphin (<i>Tursiops truncatus</i>) ^a	Protected
Harbor porpoise (<i>Phocoena phocoena</i>)	Protected
Sea Turtles	
Leatherback sea turtle (<i>Dermochelys coriacea</i>)	Endangered
Kemp's ridley sea turtle (<i>Lepidochelys kempii</i>)	Endangered
Green sea turtle (<i>Chelonia mydas</i>)	Endangered ^b
Loggerhead sea turtle (<i>Caretta caretta</i>)	Threatened
Hawksbill sea turtle (<i>Eretmochelys imbricate</i>)	Endangered
Fish	
Shortnose sturgeon (<i>Acipenser brevirostrum</i>)	Endangered
Atlantic salmon (<i>Salmo salar</i>)	Endangered

TABLE 4.4.1-1 (continued)
Species Protected Under the Endangered Species Act and/or Marine Mammal Protection Act that May Occur in the Operations Area for the Port Clyde Community Groundfish Sector

Species	Status
Pinnipeds	
Harbor seal (<i>Phoca vitulina</i>)	Protected
Gray seal (<i>Halichoerus grypus</i>)	Protected
Harp seal (<i>Phoca groenlandicus</i>)	Protected
Hooded seal (<i>Cystophora cristata</i>)	Protected

Note:

- ^a Bottlenose dolphin (*Tursiops truncatus*), Western North Atlantic coastal stock is listed as depleted.
- ^b Green turtles in U.S. waters are listed as threatened except for the Florida breeding population which is listed as endangered. Due to the inability to distinguish between these populations away from the nesting beach, green turtles are considered endangered wherever they occur in U.S. waters.

4.4.2 Species Potentially Affected

It is expected that the sea turtle, cetacean, and pinniped species discussed below have the potential to be affected by the operation of the multispecies fishery, and thus the PCS. Background information on the range-wide status of sea turtle and marine mammal species that occur in the area and are known or suspected of interacting with fishing gear (demersal gear including trawls, gillnets, and longline types) can be found in a number of published documents. These include sea turtle status reviews and biological reports (NMFS and USFWS 1995; Marine Turtle Expert Working Group (TEWG) 1998, 2000; NMFS and USFWS 2007a, 2007b; Leatherback TEWG 2007), recovery plans for ESA-listed cetaceans and sea turtles (NMFS 1991, 2005; NMFS and USFWS 1991a, 1991b; NMFS and USFWS 1992), the marine mammal stock assessment reports (e.g., Waring et al. 2006; 2007), and other publications (e.g., Clapham et al. 1999, Perry et al. 1999, Best et al. 2001, Perrin et al. 2002).

4.4.2.1 Sea Turtles

Loggerhead, leatherback, Kemp's ridley, and green sea turtles occur seasonally in southern New England and Mid-Atlantic continental shelf waters north of Cape Hatteras, North Carolina. In general, turtles move up the coast from southern wintering areas as water temperatures warm in the spring (James et al. 2005, Morreale and Standora 2005, Braun-McNeill and Epperly 2004, Morreale and Standora 1998, Musick and Limpus 1997, Shoop and Kenney 1992, Keinath et al. 1987). The trend is reversed in the fall as water temperatures cool. By December, turtles have passed Cape Hatteras, returning to more southern waters for the winter (James et al. 2005, Morreale and Standora 2005, Braun-McNeill and Epperly 2004, Morreale and Standora 1998, Musick and Limpus 1997, Shoop and Kenney 1992, Keinath et al. 1987). Hard-shelled species are typically observed as far north as Cape Cod whereas the more cold-tolerant leatherbacks are observed in more northern Gulf of Maine waters in the summer and fall (Shoop and Kenney 1992, STSSN database <http://www.sefsc.noaa.gov/seaturtleSTSSN.jsp>).

In general, sea turtles are a long-lived species and reach sexual maturity relatively late (NMFS SEFSC 2001; NMFS and USFWS 2007a, 2007b, 2007c, 2007d). Sea turtles are injured and killed by numerous human activities (NRC 1990; NMFS and USFWS 2007a, 2007b, 2007c, 2007d). Nest count data are a valuable source of information for each turtle species since the number of nests laid reflects the

reproductive output of the nesting group each year. A decline in the annual nest counts has been measured or suggested for four of five western Atlantic loggerhead nesting groups through 2004 (NMFS and USFWS 2007a); however, data collected since 2004 suggests nest counts have stabilized or increased (TEWG 2009). Nest counts for Kemp's ridley sea turtles as well as leatherback and green sea turtles in the Atlantic demonstrate increased nesting by these species (NMFS and USFWS 2007b, 2007c, 2007d).

4.4.2.2 Large Cetaceans

The most recent Marine Mammal Stock Assessment Report (SAR) (Waring et al. 2009) reviewed the current population trend for each of these cetacean species within U.S. EEZ waters. The SAR also provided information on the estimated annual human-caused mortality and serious injury, as well as a description of the commercial fisheries that interact with each stock in the U.S. Atlantic. Information from the SAR is summarized below.

The western North Atlantic baleen whale species (North Atlantic right, humpback, fin, sei, and minke whales) follow a general annual pattern of migration from high latitude summer foraging grounds, including the Gulf of Maine and Georges Bank, and low latitude winter calving grounds (Perry et al. 1999, Kenney 2002). However, this is a simplification of species movements, and the complete winter distribution of most species is unclear (Perry et al. 1999, Waring et al. 2009). Studies of some of the large baleen whales (right, humpback, and fin) have demonstrated the presence of each species in higher latitude waters even in the winter (Swingle et al. 1993, Wiley et al. 1995, Perry et al. 1999, Brown et al. 2002). Blue whales are most often sighted along the east coast of Canada, particularly in the Gulf of St. Lawrence, and occur only infrequently within the U.S. EEZ (Waring et al. 2002).

For North Atlantic right whales, the available information suggests that the population increased at a rate of 1.8 percent per year between 1990 and 2003, and the total number of North Atlantic right whales was estimated to be at least 323 animals in 2003 (Waring et al. 2009). The minimum rate of annual human-caused mortality and serious injury to right whales averaged 3.8 per year during 2002 to 2006 (Waring et al. 2009). Of these, an average of 1.4 per year resulted from fishery interactions. Recent mortalities included six female right whales, including three that were pregnant at the time of death (Waring et al. 2009).

The North Atlantic population of humpback whales is estimated to be 11,570, although the estimate is considered to be low (Waring et al. 2009). The best estimate for the GOM stock of humpback whales is 847 whales (Waring et al. 2009). The population trend is considered positive for the Gulf of Maine population, but there are insufficient data to estimate the trend for the larger North Atlantic population. Based on data available for selected areas and time periods, the minimum population estimates for other western North Atlantic whale stocks are 2,269 fin whales, 207 sei whales, 4,804 sperm whales, and 3,312 minke whales (Waring et al. 2009). Insufficient data exist to determine trends for any other large whale species.

The Atlantic Large Whale Take Reduction Plan (ALWTRP) was revised with publication of a new final rule (72 FR 57104, October 5, 2007) that is intended to continue to address entanglement risk of large whales (right, humpback, and fin whales, and acknowledge benefits to minke whales) in commercial fishing gear and to reduce the risk of death and serious injury from entanglements that do occur.

4.4.2.3 Small Cetaceans

Numerous small cetacean species (dolphins, pilot whales, and harbor porpoise) that occur within the area from Cape Hatteras through the Gulf of Maine are known to interact with Northeast multispecies fishing gear. Seasonal abundance and distribution of each species off the coast of the Northeast United

States varies with respect to life history characteristics. Some species primarily occupy continental shelf waters (e.g., white-sided dolphin, harbor porpoise), while others are found primarily in continental shelf edge and slope waters (e.g., Risso's dolphin), and still others occupy all three habitats (e.g., common dolphin and spotted dolphin). Information on the western North Atlantic stocks of each species is summarized in Waring et al. (2009).

4.4.2.4 Pinnipeds

Of the four species of seals expected to occur in the area, harbor seals have the most extensive distribution with sightings occurring as far south as 30° N (Katona et al. 1993, Waring et al. 2009). Gray seals are the second most common seal species in U.S. EEZ waters, occurring primarily off New England (Katona et al. 1993; Waring et al. 2009). Pupping for both species occurs in both U.S. and Canadian waters of the western North Atlantic with the majority of harbor seal pupping likely occurring in U.S. waters and the majority of gray seal pupping in Canadian waters, although there are at least three gray seal pupping colonies in U.S. waters as well. Harp and hooded seals are less commonly observed in U.S. EEZ waters. Both species form aggregations for pupping and breeding off eastern Canada in the late winter/early spring, and then travel to more northern latitudes for molting and summer feeding (Waring et al. 2006). Both species have a seasonal presence in U.S. waters from Maine to New Jersey, based on sightings, stranding, and fishery bycatch (Waring et al. 2009).

4.4.3 Species Not Likely to be Affected

NMFS has determined that the action being considered in the EA (i.e., approval of the PCS Operations Plan) is not likely to adversely affect shortnose sturgeon, the Gulf of Maine distinct population segment (DPS) of Atlantic salmon, hawksbill sea turtles, blue whales, or sperm whales, all of which are listed as endangered species under the ESA. The following discussion provides the rationale for these determinations.

Shortnose sturgeon are benthic fish that mainly occupy the deep channel sections of large rivers. They can be found in rivers along the Atlantic coast from St. Johns River, Florida (although the species is possibly extirpated from this system), to the Saint John River in New Brunswick, Canada. The species is anadromous in the southern portion of its range (i.e., south of Chesapeake Bay), while some northern populations are amphidromous (NMFS 1998). Since the PCS would not operate in or near the rivers where concentrations of shortnose sturgeon are most likely found, it is highly unlikely that the PCS would affect shortnose sturgeon.

The wild populations of Atlantic salmon, whose freshwater range occurs in the watersheds from the Androscoggin River northward along the Maine coast to the Dennys River, are listed as endangered under the ESA. Juvenile salmon in New England rivers typically migrate to sea in spring after a one- to three-year period of development in freshwater streams, and remain at sea for two winters before returning to their U.S. natal rivers to spawn (Kocik and Sheehan 2006). Results from a 2001-2003 post-smolt trawl survey in the nearshore waters of the Gulf of Maine indicate that Atlantic salmon post-smolts are prevalent in the upper water column throughout this area in mid to late May (Lacroix, Knox, and Stokesbury 2005). Therefore, commercial fisheries deploying small-mesh active gear (pelagic trawls and purse seines within 10 m of the surface) in nearshore waters of the Gulf of Maine may have the potential to incidentally take smolts. However, it is highly unlikely that the action being considered will affect the Gulf of Maine DPS of Atlantic salmon given that operation of the multispecies fishery does not occur in or near the rivers where concentrations of Atlantic salmon are likely to be found and multispecies gear operates in the ocean at or near the bottom rather than near the surface. Thus, this species will not be considered further in this EA.

The hawksbill turtle is uncommon in the waters of the continental United States. Hawksbills prefer coral reefs, such as those found in the Caribbean and Central America. Hawksbills feed primarily on a wide variety of sponges, but also consume bryozoans, coelenterates, and mollusks. The Culebra Archipelago of Puerto Rico contains especially important foraging habitat for hawksbills. Nesting areas in the western North Atlantic include Puerto Rico and the Virgin Islands. There are accounts of hawksbills in south Florida and individuals have been sighted along the east coast as far north as Massachusetts; however, east coast sightings north of Florida are rare (NMFS 2009a). Since operation of the PCS would not occur in waters that are typically used by hawksbill sea turtles, it is highly unlikely that its operations would affect this turtle species.

Blue whales do not regularly occur in waters of the U.S. EEZ (Waring et al. 2002). In the North Atlantic region, blue whales are most frequently sighted from April to January (Sears 2002). No blue whales were observed during the Cetacean and Turtle Assessment Program (CeTAP) surveys of the mid- and North Atlantic areas of the outer continental shelf (CeTAP 1982). Calving for the species occurs in low latitude waters outside of the area where the PCS would operate. Blue whales feed on euphausiids (krill) that are too small to be captured in fishing gear. There were no observed fishery-related mortalities or serious injuries to blue whales between 1996 and 2000 (Waring et al. 2002). Given that the species is unlikely to occur in areas where the PCS would operate, and given that the operation of the Sector would not affect the availability of blue whale prey or areas where calving and nursing of young occurs, the Proposed Action would not be likely to adversely affect blue whales.

Unlike blue whales, sperm whales do regularly occur in waters of the EEZ. However, the distribution of the sperm whales in the EEZ occurs on the continental shelf edge, over the continental slope, and into mid-ocean regions (Waring et al. 2007). Typically, sperm whale distribution is concentrated east-northeast of Cape Hatteras in winter and shifts northward in spring when whales are found throughout the Mid-Atlantic Bight (Waring et al. 2006). Distribution extends further northward to areas north of Georges Bank and the Northeast Channel region in summer and then south of New England in fall, back to the Mid-Atlantic Bight (Waring et al. 1999). In contrast, the PCS would operate in continental shelf waters. The average depth over which sperm whale sightings occurred during the CeTAP surveys was 1,792 m (CeTAP 1982). Female sperm whales and young males almost always inhabit open ocean, deep water habitat with bottom depths greater than 1,000 m and at latitudes less than 40° N (Whitehead 2002). Sperm whales feed on large squid and fish that inhabit the deeper ocean regions (Perrin et al. 2002). There were no observed fishery-related mortalities or serious injuries to sperm whales between 2001 and 2005 (Waring et al. 2007). Given that sperm whales are unlikely to occur in areas (based on water depth) where the PCS would operate, and given that the operation of the Sector would not affect the availability of sperm whale prey or areas where calving and nursing of young occurs, the Proposed Action would not be likely to adversely affect sperm whales.

Although marine turtles and large whales may be potentially affected through interactions with fishing gear, NMFS has determined that the continued authorization of the multispecies fishery, and therefore the PCS, would not have any adverse effects on the availability of prey for these species. Sea turtles feed on a variety of plants and animals, depending on the species; however, none of the turtle species are known to feed upon groundfish. Right whales and sei whales feed on copepods (Horwood 2002, Kenney 2002). The multispecies fishery will not affect the availability of copepods for foraging right and sei whales because copepods are very small organisms that will pass through multispecies fishing gear rather than being captured in it. Humpback whales and fin whales also feed on krill as well as small schooling fish (e.g., sand lance, herring, mackerel) (Aguilar 2002, Clapham 2002). Multispecies fishing gear operates on or very near the bottom. Fish species caught in multispecies gear are species that live in benthic habitat (on or very near the bottom) such as flounders versus schooling fish such as herring and mackerel that occur within the water column. Therefore, the continued authorization of the

multispecies fishery will not, nor would the approval of the PCS Operations Plan, affect the availability of prey for foraging humpback or fin whales.

4.4.4 Interactions Between Gear and Protected Resources

Commercial fisheries are categorized by NMFS based on a two-tiered, stock-specific fishery classification system that addresses both the total impact of all fisheries on each marine mammal stock as well as the impact of individual fisheries on each stock. The system is based on the numbers of animals per year that incur incidental mortality or serious injury due to commercial fishing operations relative to a stock's Potential Biological Removal (PBR) level (the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population). Tier 1 takes into account the cumulative mortality and serious injury to marine mammals caused by commercial fisheries while Tier 2 considers marine mammal mortality and serious injury caused by the individual fisheries; Tier 2 classifications are used in this EA to indicate how each type of gear proposed for use in the Proposed Action could affect marine mammals (NMFS 2009b). Table 4.4.4-1 identifies the classifications used in the List of Fisheries (LOF) for FY 2010 (74 FR 58859, November 16, 2009), which are broken down into Tier 2 Categories I, II, and III.

Category	Category Description
Category I	A commercial fishery that has frequent incidental mortality and serious injury of marine mammals. This classification indicates that a commercial fishery is, by itself, responsible for the annual removal of 50 percent or more of any stock's potential biological removal (PBR) level.
Category II	A commercial fishery that has occasional incidental mortality and serious injury of marine mammals. This classification indicates that a commercial fishery is one that, collectively with other fisheries, is responsible for the annual removal of more than 10 percent of any marine mammal stock's PBR level and that is by itself responsible for the annual removal of between 1 percent and 50 percent, exclusive of any stock's PBR.
Category III	A commercial fishery that has a remote likelihood of, or no known incidental mortality and serious injury of marine mammals. This classification indicates that a commercial fishery is one that collectively with other fisheries is responsible for the annual removal of: <ol style="list-style-type: none"> a. Less than 50 percent of any marine mammal stock's PBR level, or b. More than 1 percent of any marine mammal stock's PBR level, yet that fishery by itself is responsible for the annual removal of 1 percent or less of that stock's PBR level. In the absence of reliable information indicating the frequency of incidental mortality and serious injury of marine mammals by a commercial fishery, the Assistant Administrator would determine whether the incidental serious injury or mortality is "remote" by evaluating other factors such as fishing techniques, gear used, methods used to deter marine mammals, target species, seasons and areas fished, qualitative data from logbooks or fisher reports, stranding data, and the species and distribution of marine mammals in the area or at the discretion of the Assistant Administrator.

Interactions between gear and a given species occur when fishing gear overlaps both spatially and trophically with the species' niche. Spatial interactions are more "passive" and involve inadvertent interactions with fishing gear when the gear is deployed in areas used by protected resources. Trophic interactions are more "active" and occur when protected species attempt to consume prey caught in

fishing gear and become entangled in the process. Spatial and trophic interactions can occur with various types of fishing gear used by the multispecies fishery through the year. Large and small cetaceans and sea turtles are more prevalent within the operations area during the spring and summer, although they are also relatively abundant during the fall and would have a higher potential for interaction with Sector activities that occur during these seasons. Although harbor seals may be more likely to occur in the operations area between fall and spring, harbor and gray seals are year-round residents; therefore, interactions could occur year-round. The uncommon occurrences of hooded and harp seals in the operations area are more likely to occur during the winter and spring, allowing for an increased potential for interactions during these seasons.

Although interactions between protected species and gear deployed by the Northeast multispecies fishery would vary, interactions generally include becoming caught on hooks (longlines), entanglement in mesh (gillnets and trawls), entanglement in the float line (gillnets and trawls), entanglement in the groundline (gillnets, trawls, and longlines), entanglement in anchor lines (gillnets and longlines), or entanglement in the vertical lines that connect gear to the surface and surface systems (gillnets, traps/pots, and longlines). The potential for entanglements to occur is assumed to be higher in areas where more gear is set and in areas with higher concentrations of protected species.

Table 4.4.4-2 lists the marine mammals known to have had interactions with gear used by the Northeast multispecies fishery including sink gillnets, traps/pots, bottom trawls, and bottom longlines within the Northeast multispecies region, as excerpted from the LOF for FY 2010 (NMFS 2009b [74 FR 58859, November 16, 2009], also see Waring et al. 2009). Sink gillnets have the greatest potential for interaction with protected resources, followed by bottom trawls. Impacts to protected resources through interaction with bottom longline gear are not known within the operations area; however, interactions between the pelagic longline fishery and both pilot whales and Risso's dolphins led to the development of the Pelagic Longline Take Reduction Plan.

Marine mammals are taken in gillnets, trawls, and trap/pot gear used in the Northeast multispecies area. Of these gear types, gillnets are considered more detrimental to marine mammals such as pilot whales, dolphins, porpoises, and seals, as well as large marine whales. To minimize potential impacts to certain cetaceans, multispecies fishing vessels would be required to adhere to measures in the ALWTRP, which was developed to address entanglement risk to right, humpback, and fin whales, and to acknowledge benefits to minke whales in specific Category I or II commercial fishing efforts that utilize traps/pots and gillnets. The ALWTRP calls for the use of gear markings, area restrictions, and use of weak links, and sinking groundline. Fishing vessels would be required to comply with the ALWTRP in all areas where gillnets were used. The Bottlenose Dolphin Take Reduction Plan (BDTRP) and Harbor Porpoise Take Reduction Plan (HPTRP) would also be complied with within the Northeast multispecies area. The BDTRP would be complied with in the Mid-Atlantic gillnet region and restricts night-time use of gillnets. The HPTRP would be complied with in the Gulf of Maine to reduce interactions between the harbor porpoise and gillnets in New England. The HPTRP implements seasonal area closures and the seasonal use of pingers (acoustic devices that emit a sound) to deter harbor porpoises from approaching the nets.

TABLE 4.4.4-2 (continued)
Marine Mammal Species and Stocks Incidentally Killed or Injured Based on Northeast Multispecies Fishing Areas and Gear Types (based on 2010 List of Fisheries)

Fishery		Estimated Number of Vessels/Persons	Marine Mammal Species and Stocks Incidentally Killed or Injured
Category	Type		
Category II	Mid-Atlantic bottom trawl	>1,000	Common dolphin, WNA ^a Long-finned pilot whale, WNA ^a Short-finned pilot whale, WNA ^a White-sided dolphin, WNA
	Northeast bottom trawl	1,052	Common dolphin, WNA Gray seal, WNA ^b Harbor porpoise, GOM/BOF Harbor seal, WNA Harp seal, WNA Long-finned pilot whale, WNA Short-finned pilot whale, WNA White-sided dolphin, WNA ^a
	Atlantic mixed species trap/pot ^c	unknown	Fin whale, WNA ^d Humpback whale, GOM
Category III	Northeast/Mid-Atlantic bottom longline/hook-and-line	46	None documented in recent years

Notes:

- ^a Fishery classified based on serious injuries and mortalities of this stock, which are greater than 50 percent (Category I) or greater than 1 percent and less than 50 percent (Category II) of the stock's potential biological removal.
- ^b Although not included in the 2010 List of Fisheries, Waring et al. (2009) indicates that nine gray seal mortalities in 2007 were attributed to incidental capture in the northeast bottom trawl.
- ^c This fishery is classified by analogy.
- ^d The fin whale noted as being killed or injured in the Atlantic mixed species trap/pot fishery was later determined to have been impacted by hagfish pot gear and is proposed for removal.

Sea turtles have been caught and injured or killed in multiple types of fishing gear, including gillnets, trawls, and hook and line gear; however, impact due to inadvertent interaction with trawl gear is almost twice as likely to occur than with other gear types (NMFS 2009c). Interaction with trawl gear is more detrimental to sea turtles as they can be caught within the trawl itself and will drown after extended periods underwater. A study conducted in the Mid-Atlantic region showed that bottom trawling accounts for an average annual take of 616 loggerhead sea turtles, although Kemp's ridleys and leatherbacks were also caught during the study period (Murray 2006). Although sea turtles generally occur in more temperate waters than those in the Northeast multispecies area, impacts to sea turtles would likely still occur under the Proposed Action, but would be similar to those in the Common Pool.

4.5 HUMAN COMMUNITIES/SOCIAL-ECONOMIC ENVIRONMENT

This EA considers the formation of the PCS and evaluates the effect the Sector could have on people's way of life, traditions, and community. These "social impacts" could be driven by changes in fishery flexibility, opportunity, stability, certainty, safety, and/or other factors. Although it is possible that social impacts would be solely experienced by individual PCS participants, it is more likely that impacts would be experienced across communities, gear cohorts, and/or vessel size classes.

The remainder of this section reviews the Northeast multispecies fishery and describes the human communities potentially impacted by the Proposed Action. This includes a description of the PCS participants themselves and the ports which they could frequent.

4.5.1 Overview of New England Groundfish Fishery

New England's fishery has been identified with groundfishing both economically and culturally for over 400 years. Broadly described, the Northeast multispecies fishery includes the landing, processing, and distribution of commercially important fish that live on the sea bottom. In the early years, the Northeast multispecies fishery related primarily to cod and haddock. Today, the Northeast Multispecies FMP (large-mesh and small-mesh) includes a total of 13 large-mesh species of groundfish (Atlantic cod, haddock, pollock, yellowtail flounder, witch flounder, winter flounder, windowpane flounder, American plaice, Atlantic halibut, redfish, ocean pout, white hake, and wolffish) harvested from three geographic areas (Gulf of Maine, Georges Bank, and southern New England/Mid-Atlantic Bight) representing 19 distinct stocks. Fourteen of these stocks are considered allocated target stocks as described in Section 4.2.1, and are addressed in this EA.

Prior to the industrial revolution, the groundfish fishery focused primarily on cod. The salt cod industry, which preserved fish by salting them while still at sea, supported a hook and line fishery that included hundreds of sailing vessels and shore-side industries including salt mining, ice harvesting, and boat building. Late in the 19th century, the fleet also began to focus on Atlantic halibut with landings peaking in 1896 at around 4,900 tons.

From 1900 to 1930, the fleet transitioned to steam-powered trawlers and increasingly targeted haddock for delivery to the fresh and frozen fillet markets. With the transition to steam-powered trawling, it became possible to exploit the groundfish stocks with increasing efficiency. This increased exploitation resulted in a series of boom and bust fisheries from 1930 to 1960 as the North American fleet targeted previously unexploited stocks, depleted the resource, and then transitioned to new stocks.

In the early 1960's, fishing pressure increased with the discovery of haddock, hake, and herring off of Georges Bank and the introduction of foreign factory trawlers. Early in this time period, landings of the principal groundfish (cod, haddock, pollock, hake, and redfish) peaked at about 650,000 tons. However, by the 1970's, landings decreased sharply to between 200,000 and 300,000 tons as the previously virgin GB stocks were exploited (NOAA 2007).

The exclusion of the foreign fishermen by the Magnuson-Stevens Act in 1976, coupled with technological advances and some strong classes of cod and haddock, caused a rapid increase in the number and efficiency of U.S. vessels participating in the Northeast groundfish fishery in the late 1970's. This shift resulted in a temporary increase in domestic groundfish landings; however, overall landings (domestic plus foreign) continued to trend downward from about 200,000 tons to about 100,000 tons through the mid 1980's (NOAA 2007).

In 1986, NEFMC implemented the Northeast Multispecies FMP with the goal of rebuilding stocks. From that time, the multispecies fishery has been administered as a limited access fishery managed through a variety of effort control measures including DAS, area closures, trip limits, minimum size limits, and gear restrictions. Partially in response to those regulations, landings decreased throughout the latter part of the 1980's until reaching a more or less constant level of around 40,000 tons annually since the mid 1990's.

In 2004, the final rule implementing Amendment 13 to the Northeast Multispecies FMP allowed for self-selected groups of limited access groundfish permit holders to form sectors. These sectors were allowed to develop a legally binding Operations Plan and operate under an ACE. While approved sectors were subject to general requirements specified in Amendment 16 in exchange for operating under an ACE, sector members were exempt from DAS and some of the other effort control measures that tended to limit the flexibility of fishermen. The 2004 rule also authorized implementation of the first sector, the Georges Bank Cod Hook Sector, and in 2006 a second sector, the Georges Bank Cod Fixed Gear Sector, was authorized.

Through Amendment 16, NEFMC sought to rewrite groundfish sector policies with a scheduled implementation date of May 1, 2009. When that implementation date was delayed until FY 2010, the NMFS Regional Administrator announced that, in addition to a previously announced 18 percent reduction in DAS, interim rules would be implemented to reduce fishing mortality during FY 2009. These interim measures generally reduced opportunity among groundfish vessels through differential DAS counting, elimination of the SNE/MA winter flounder Special Access Program (SAP), elimination of the state waters winter flounder exemption, revisions to incidental catch allocations, and a reduction in some groundfish allocations (NOAA 2009a).

In 2007, the Northeast multispecies fishery included 2,515 permits, about 1,500 of which were limited access, and about 690 active fishing vessels. Those vessels include a range of gear types including hook, bottom longline, gillnet, and trawlers (NEFMC 2009a). In FY 2009, between 40 and 50 of these vessels were members of the Georges Bank Cod Sectors. The remaining vessels were Common Pool groundfishing vessels.

There are over 100 communities that are homeport to one or more Northeast groundfishing vessels. These ports are distributed throughout the coastal northeast and in New Jersey. Vessels from these ports pursue stocks in three geographic regions: Gulf of Maine, Georges Bank, and southern New England. In 2007, the estimated dockside value of these landings was less than \$60 million and represented approximately ½ of the total revenue received on trips where groundfish were landed.

Many groundfish captains and crew are second- or third-generation fishermen who hope to pass the tradition on to their children. This occupational transfer is an important component of community continuity as fishing represents an important occupation in many of the smaller port areas.

There is little hard socio-economic data upon which to evaluate the regional or community specific importance of the multispecies fishery. In addition to the direct employment of captains and crew, the industry is known to support ancillary businesses such as gear, tackle, and bait suppliers; fish processing and transportation; marine construction and repair; and restaurants. The perceived importance of these economic interrelationships is reflected by the creation of the Cape Cod regional competitiveness council, government recommendations that NEFMC begin compiling the data necessary to evaluate the importance of the fishery to the regional economy, and the inclusion of social and economic impact analysis in the NEFMC research priorities and data needs 2009-2013.

4.5.2 Overview of the Port Clyde Community Groundfish Sector

In FY 2010, PCS would consist of approximately 34 permit holders who hold 43 permits and operate 35 active vessels, all of whom would fish in the Gulf of Maine RMA under an ACE for their allocated species. Approximately half of the active vessels would use demersal (otter) trawls as their primary gear and other half would primarily use sink gillnets. One vessel would use handline gear. If approved, FY 2010 would be the first year PCS would operate.

Port Clyde Community Groundfish Sector fishermen would primarily land their catch in ports throughout Maine and Massachusetts including but not limited to Boothbay Harbor, Cape Porpoise, Cundy's Harbor, Kennebunkport (including Camp Ellis), Phippsburg (Sebasco), Port Clyde, and Portland Harbor, Maine; and Gloucester, Massachusetts. A description of each of the primary ports is provided below (in alphabetic order) largely based on information provided in the *Community Profiles for Northeast US Fisheries*, by NEFSC (2009). Please refer to the source documents for a list of references as all of the in-text citations in this section are implied to be 'as cited in' NEFSC (2009).

4.5.2.1 Boothbay Harbor, Maine

The city of Boothbay Harbor, Maine (43.50°N, 69.38°W) is located in Lincoln County. Boothbay Harbor covers an area of 5.7 square miles of land area (State of Maine 2004a).

History

The Boothbay Regional Historical Society reports that, in the early 1600's, local fishermen supplied Pilgrim settlements, which exported "salt fish, timber and furs, until the Indian Wars wiped them out." Settlements of Scottish-Irish families followed in the early 1700's relying on trade and lumber. Boothbay was incorporated as a town in 1764. After the Revolutionary War and War of 1812, Boothbay vessels fished on the offshore banks for cod and inshore for mackerel. Shipbuilding, farming, ice-cutting, and brick-making flourished.

By 1881, Boothbay Harbor supported the fisheries community including an ice company, two marine railways, and a factory for canning lobsters (Varney 1886a). Fresh fish and lobsters were sent by steamer and rail to the Boston market. By the World Wars, Boothbay shipyards built military vessels including minesweepers (Boothbay Region Historical Society 2007). The boatyards now specialize in yachts, fishing vessels, ferries, and tugs (Boothbay Region Historical Society 2007).

Commercial Fishing

Boothbay Harbor has several seafood retailers and wholesalers such as Atlantic Edge Lobster, Boothbay Region Fish Market, Boothbay Lobster Wharf, and Bristol Lobster Sales (Boothbay Harbor Region Chamber of Commerce 2005). Lobsters are sold year-round, to as far as Boston and New York. Fresh Maine shrimp is sold in the winter (Maine Dept of Agriculture 2003).

Like many other coastal towns in Maine, lobster is the highest value species in Boothbay Harbor (Table 4.5.2-1). Other significant fisheries are small compared to lobster, but include "Other," large-mesh groundfish, and monkfish. The value of fishing for homeported vessels has fluctuated between the years 2001 to 2006, while the number of vessels whose owner's city was Boothbay Harbor stayed relatively consistent (Table 4.5.2-2).

TABLE 4.5.2-1 Dollar Value of Federally Managed Groups Landed in Boothbay Harbor

2005	40	26
2006	43	26

4.5.2.2 Cape Porpoise, Maine

Cape Porpoise (43.37°N, 70.44°W) is a village located in the town of Kennebunkport in York County in the State of Maine. The village occupies the mainland adjacent to Cape Porpoise Harbor, north of Kennebunkport Village, and south of Goose Rocks Beach on the southern coast of Maine (KBA 2007). Cape Porpoise is about 30 miles from Portland Harbor and 32 miles from Portsmouth, New Hampshire.

History

The town was first incorporated as “Cape Porpus” under the government of Massachusetts in 1653. During King Phillips War in 1689, Indians forced the settlers off the mainland and onto Stage Island until rescued by the English (Nonantum Resort 2006). The Cape Porpoise area was known for its dangerous rocks near Goat Island. The area claimed 46 vessels between 1865 and 1920; however, there were no deaths, partly due to the keepers at Goat Island Light picking up survivors near the island (D’Entremont 1997). Today Cape Porpoise is a bustling community that works to balance traditional lobster fishing and tourism (KCT 2007).

Commercial Fishing

Cape Porpoise supports a small fleet of lobster fishermen and draggers with protected docks and moorings as well as bait and gear storage houses and a lobster and seafood market. Cape Porpoise is also home to tuna vessels and some fishermen switch seasonally to rod and reel (Hall-Arber et al. 2001). The highest value landings in Cape Porpoise for the 1997-2006 average were lobster, large-mesh groundfish, and those species in the “Other” category (Table 4.5.2-3). Lobster values were significantly higher than any other species landed in the town. Both the number of vessels homeported in Cape Porpoise and those whose owner’s city was Cape Porpoise decreased steadily between 1997 and 2006 (Table 4.5.2-4).

TABLE 4.5.2-3 Dollar Value of Federally Managed Groups Landed in Cape Porpoise

2006	35	7

4.5.2.3 Cundy's Harbor, Maine

The Village of Cundy's Harbor (44.40° N, 69.89° W) is located on Casco Bay within the town of Harpswell, in Cumberland County, Maine. The town of Harpswell is made up of a 10-mile peninsula extending into Casco Bay. It also includes three large islands, Bailey Island, Orr Island, and Great (Sebascodegan) Island, and over 200 small islands, creating over 216 miles of coastline for the town (TPL 2007). Cundy's Harbor is located on the tip of Great Island (USGS 2008).

History

The town of Harpswell is geographically spread out, and is divided into five main villages: Cundy's Harbor, Harpswell, South Harpswell, Bailey Island, and Orr Island. Cundy's Harbor is the oldest lobstering community in Maine (TPL 2007). Harpswell was incorporated as a town in 1758, under what was then the Massachusetts Bay Colony. Many tall ships, sloops, and schooners were built there during the 1800's, and fishing has been an important economic activity for the town for centuries. Today the town is often considered to have three populations: commuters, who reside there but work in Portland, Bath, or Brunswick; retirees who have moved to Harpswell; and "working townfolk," many of whom earn their income from fishing (Hall-Arber et al. 2001).

Commercial Fishing

There are multiple commercial wharves including Cundy's Harbor, Holbrook's, Hawkes, Mill's Ledge Seafood, Watson's, and Oakhurst Island. Overall, lobster dominates the landings in Cundy's Harbor, worth more than \$2.5 million in 2006 (Table 4.5.2-5). Landings in the "Other" species grouping were also significant. The level of landings in Cundy's Harbor overall varied during this time period between about \$1.5 million and over \$3.4 million, with no discernible pattern (Table 4.5.2-6). The level of homeport fishing for Cundy's Harbor was consistently lower than the level of landings there overall, indicating that fishermen from other harbors land their catch there. The level of fishing for homeported values was also variable. The number of homeported vessels in Cundy's Harbor showed somewhat of a declining trend from 1997 to 2006, while the number of vessels with owners living in Cundy's Harbor declined sharply, from 11 in 1997 to three in 2006.

TABLE 4.5.2-5 Commercial Fishing Trends in Cundy's Harbor				
Year	Number of vessels with Cundy's Harbor homeport	Number of vessels whose owner receives mail in Cundy's Harbor	Value of landings among vessels homeported in Cundy's Harbor^a	Value of fisheries landed in Cundy's Harbor^a
1997	28	11	\$2,053,625	\$2,595,709

^c Small-mesh multispecies: red hake, ocean pout, mixed hake, black whiting, silver hake (whiting).

^d All values are reported in nominal U.S. dollars.

4.5.2.4 Gloucester, Massachusetts

The City of Gloucester (42.62°N, 70.66°W) is located on Cape Ann, along the northern coast of Massachusetts in Essex County. It is 30 miles northeast of Boston and 16 miles northeast of Salem. The area encompasses 41.5 square miles of territory, of which 26 square miles is land (USGS 2008).

History

The history of Gloucester has revolved around the fishing and seafood industries since its settlement in 1623. By the mid 1800's, Gloucester was regarded by many to be the largest fishing port in the world. The construction of memorial statues and an annual memorial to fishermen demonstrates that the historic death tolls in commercial fisheries are still in the memory of the town's residents. The town is well-known as the home of Gorton's frozen fish packaging company, the nation's largest frozen seafood company. Enactment of the Magnuson-Stevens Act prevented foreign vessels from fishing within the EEZ, and Gloucester's fishing fleet soon increased along with other communities -- only to decline with the onset of major declines in fish stocks and subsequent strict catch regulations. For more detailed information regarding Gloucester's history, see Hall-Arber et al. (2001).

Commercial Fishing

Although there are threats to the future of Gloucester's fishery, the fishing industry remains strong in terms of recently reported landings. Gloucester's commercial fishing industry had the 13th highest landings in the United States (over 39,000 tons) and the nation's ninth highest landing value in 2002 (\$41.2 million). Gloucester's federally managed group with the highest landed value was large-mesh groundfish worth nearly \$20 million in 2006 (Table 4.5.2-7). Lobster landings were second in value, bringing in more than \$10 million in 2006, a significant increase from the 1997-2006 average value of just over \$7 million. Monkfish and herring were also valuable species; both had more valuable landings in 2006 than the 10-year average value. The number of vessels homeported (federal) decreased slightly from 1997 to 2006 (Table 4.5.2-8).

**TABLE 4.5.2-7
Dollar Value of Federally Managed Groups Landed in Gloucester**

Federal Group	Average from 1997-2006 ^d	2006 only ^d
Large-mesh Groundfish ^a	\$17,068,934	\$19,577,975
Lobster	\$7,036,231	\$10,179,221

4.5.2.5 Kennebunkport, Maine

Kennebunkport (43.34° N, 70.34° W) is located in York County, on the southern Maine Coast. It is located at the mouth of the Kennebunk River (Town of Kennebunkport 2008), and consists of a total area of 3.2 square miles (3.1 square miles of land; and 0.1 square mile of water (State of Maine 2004b). Camp Ellis is within about 10 miles of the Kennebunkport.

History

Kennebunkport, part of the Kennebunks, began with a settlement at Cape Porpoise (Cape Porpus) in 1610. In 1653, Kennebunk was established under the control of the Massachusetts Bay Colony, but was a target of Native hostility. In 1719, the area of present-day Kennebunkport was re-colonized and named Arundel (Kennebunkport Historical Society 2006). Throughout the 17th and 18th centuries, the location was defined by its offshore fishing waters, lumber resources, shipbuilding, and as an entry port for foreign trade (Nonantum Resort 2006). In 1821, the town was established under its current name of Kennebunkport (Kennebunkport Historical Society 2006).

The shipbuilding era of the Kennebunks reached its peak in the 19th century. As shipbuilding declined towards the latter part of the century, the presently thriving tourism industry emerged.

Commercial Fishing

The most valuable landings in Kennebunkport in 2006 were lobster, followed by species in the “Other” category (Table 4.5.2-9). Overall, the values of landings in 2006 were lower than the 10-year averages for those species. The total landings in Kennebunkport have declined in recent years from a

high of over \$3.6 million in 1999 down to less than a million in 2005. The level of homeport fishing has remained relatively steady over this same period of time, with some variability but no clear trend. At the same time, the number of vessels listing Kennebunkport as their homeport declined. Likewise, the number of vessels with owners living in Kennebunkport declined. The data show that in most years, most vessels landing in Kennebunkport do not list it as their homeport, and there are more vessels with owners living there than there are vessels homeported there (Table 4.5.2-10).

TABLE 4.5.2-9 Dollar Value of Federally Managed Groups Landed in Kennebunkport

Note:

^a All values are reported in nominal U.S. dollars.

4.5.2.6 Phippsburg (Sebasco), Maine

Sebasco (43.78° N and 69.85° W) is a small village within the town of Phippsburg which is a subdivision of Sagadahoc County. Sebasco was formerly known as “Sebasco Estates,” after the Sebasco Harbor Resort. The town of Phippsburg also includes the villages of Phippsburg, Parker Head, Popham, West Point, Sebasco, Winnegance, the Center, Small Point, Meadowbrook and Ashdale.

History

At Small Point Harbor, on the south-west side of the town, is the site of a fishing settlement established in 1716. A fort was erected in the settlement to protect the settlers. A sloop named “Pejepscot” transported lumber and fish to Boston and returned with merchandise and settlers from there (Varney 1886b). The settlement was destroyed during Lovewell’s War (1722-1725) (State of New Hampshire 2007). In 1734 Colonel Arthur Noble built a strong garrison on the north side of the peninsula near Fiddler’s Reach and by 1737 re-settlement of the area began. Phippsburg was then an annex of Georgetown, but on January 25, 1814 Phippsburg was separated from Georgetown and incorporated under the name “Phippsburgh,” which was later changed to “Phippsburg” (Varney 1886b).

From the time of the original settlement to present day, fishing has been a mainstay of Phippsburg’s and is vital to the economy of the community today (Town of Phippsburg 2006). Historically ice harvesting and wooden ship building were also important industries, although their importance has greatly diminished (Sebasco Harbor Resort 2008). Because of its location on a peninsula and proximity to large cities such as Boston, tourism has played, and continues to play, a major role in

Phippsburg’s economy. For decades, the area has been home to a number of large hotels catering to summer vacationers from the larger northeastern cities (Town of Phippsburg 2006).

Commercial Fishing

Landings data are combined for Phippsburg and Sebasco Estates, and vessel data includes data from Phippsburg, Sebasco, and Sebasco Estates. The area where many landings occur is still referred to as “Sebasco Estates.” Many of these landings and vessels are likely interchangeable among these three community names.

Lobster was the most important species landed for 1997 to 2006 in Sebasco Estates and Phippsburg (Table 4.5.2-11). There were more vessels homeported in Sebasco Estates than Phippsburg or Sebasco in all years; generally the combined number of homeported vessels declined from 1997 to 2006 (Table 4.5.2-12). The number of vessels with owners living in Phippsburg, Sebasco, or Sebasco Estates increased to 52 in 2003, and dropping to 45 in 2006. The number of vessel owners living in Sebasco, Sebasco Estates, or Phippsburg far exceeded the number of homeported vessels, meaning many vessel owners keep their vessels in another port.

4.5.2.7 Port Clyde, Maine

The village of Port Clyde, Maine (43.92°N, 69.25°W) is located in Knox County, in the town of St. George. Port Clyde is a small fishing village located at the end of St. George Peninsula, which is a point of land between the towns of Thomaston and Rockland (St. George, Maine No Date).

History

The first permanent European settlers in St. George, of which Port Clyde is a component, arrived in the 1760's and 1770's, from neighboring Cushing. In 1789, St. George and Cushing were incorporated together as the Town of Cushing, but were divided again in 1803 along the river. The original industries in the towns included timber and small-scale farming. Later granite quarries and shipyards employing hundreds of men developed. However, the "fishing industry has always been a mainstay for the people of St. George, and the industry is still going strong and provides jobs for local residents" (Watts No Date). Summer tourism began almost 100 years ago and today over half of the town is owned by non-residents. Port Clyde has several seasonal restaurants, a general store, and numerous galleries. In addition, the ferry for Monhegan Island leaves from Port Clyde.

Commercial Fishing

Lobster was by far the most significant fishery in Port Clyde for the 1997-2006 period. Large-mesh groundfish had the second highest landed value averaged for the 10-year period; however, herring landings in 2006 far exceeded those of groundfish (Table 4.5.2-13). The level of landings in Port Clyde increased considerably between 1997 and 2003, with the 2003 landing values almost three times the 1997 landing values, and then declining subsequently. At the same time, the level of homeport fishing remained relatively static during the same period, as did the number of homeported vessels (Table 4.5.2-14). This suggests that this increase in landings is a result of vessels from other communities landing their catch in Port Clyde.

4.5.2.8 Portland Harbor, Maine

The city of Portland, Maine (43.66 N, 70.2 W) has a terrestrial area of 54.9 square miles, and 31.4 square miles of water. It is located in Cumberland County on Casco Bay, and is adjacent to South Portland, Westbrook, and Falmouth. Portsmouth and Manchester, New Hampshire are the closest large cities. Portland is the largest city in Maine and has the highest population in New England north of Boston.

History

Portland was destroyed four times by various sources including Native American attacks, the British Navy during the American Revolution, and a fire. Each time it was rebuilt and now it is well-known for its preservation of Victorian-style architecture.

The city's port industries have driven its economy since its settlement. From the mid-1800's until World War I, Portland provided the only port for Montreal, Canada. Railroads from the south to the north fed through the city, facilitating trade and travel. Although Canada developed its own ports, and other cities in southern New England states built larger ports, the city remained tied to its maritime roots by depending on the fishing industry. More recently, it has become a popular cruise ship destination and functions as the second largest oil port on the east coast of the United States.

Commercial Fishing

Portland's landings come primarily from the large-mesh groundfish species and from lobster, with over \$14 million and \$12 million respectively over the 10-year average (Table 4.5.2-15). Monkfish and herring are also important species. There were also a variety of species landed in Portland between the years 1997 to 2006. Both the number of vessels homeported and number of vessels registered with owner's living in Portland slightly decreased between 1997 and 2006. The level of fishing homeport value increased until 2006, where there was a drop from over \$18 million in the previous year to over \$13 million. The level of landings experienced a similar trend, with a dip from 2005 to 2006 of over \$6 million (Table 4.5.2-16).

**TABLE 4.5.2-15
Dollar Value of Federally Managed Groups Landed in Portland Harbor**

5.0 IMPACTS OF THE PROPOSED ACTION AND ALTERNATIVES

Prior to the advent of sectors, input controls (gear restrictions, area closures, and trip limits) were imposed on fishermen, which affected the amount of fish that could be caught in a day. Those restrictions, along with binding limits on the total number of days each fisherman could fish (DAS), were used to control fishing mortality for each of the groundfish stocks. Under this system, Common Pool members were allocated a portion of the target allowable fishing mortality for each species by (1) establishing a specific number of DAS, and (2) regulating Common Pool fishermen so fishing occurs in a manner that controls catch per day.

The advent of sectors does not change that overall process. Common Pool members would still be assigned DAS based on a total allowable fishing mortality. However, sector members are allocated the remaining portion of the total allowable fishing mortality. But, rather than being assigned DAS, sectors are allotted ACE in pounds for the majority of the groundfish stocks and allowed more flexibility as to when and how sector members fish for those stocks through an approved Operations Plan. A sector's ACE for each stock is determined by multiplying the sector's proportional share of a stock based upon catch history, by the established ACL for the stock. The catch history is based upon the permits held by a sector.

If sectors were being introduced into a fishery that focused on a single stock, the introduction would almost certainly result in a reduction in the total amount of gear fished per pound of fish harvested. This is because sector fishermen would have increased flexibility with respect to when and how fishing occurs relative to Common Pool members and sector fishermen would likely be motivated to fish in a manner that increases their expected daily catch rate. As a result, the total amount of gear

deployed over a year to target a fixed quantity of a single stock would be expected to decrease somewhat relative to the levels that would have existed under the Common Pool.

However, Northeast multispecies fishermen generally do not pursue a single stock. Instead fishermen simultaneously target and/or catch several species, each of which has its own acceptable level of fishing mortality. As such, the introduction of sectors allows for the possibility that fishermen could be able to coordinate their fishing to ensure that the sector does not reach its ACE for a single stock well before it reaches its ACE for the other allocated stocks. This coordinated effort could result in (1) increased harvest levels for stocks that typically were not fully exploited to their allowable limit under Common Pool operations, (2) an increase or decrease in the total amount of gear fished by sector fishermen over the course of a year and (3) changes to the way gear is fished in order to increase gear selectivity.

In summary, the increased flexibility granted to sectors through their approved Operations Plan should increase catch per unit effort (CPUE), which would tend to decrease the number of days with gear in the water (gear days). However, the ability to target specific stocks could allow sectors to more fully exploit previously under-exploited stocks, which would tend to increase gear days. Because multispecies sectors are relatively recent to the Northeast groundfish fishery, there exists little Northeast specific data to quantitatively determine the net effect of multispecies sector participation on gear days. However, after reviewing theory and available information from Pacific fisheries management (Sanchirico et al. 2006), and discussing the issue with sector representatives and fishermen, it appears likely that the overall change in gear days would conservatively be a slight increase based on going from the DAS approach to the ACE approach of fisheries management.

Further evaluation of potential impacts to physical resources, allocated target species, non-allocated target species and bycatch, protected resources, and human communities is discussed further in Section 5.1. Cumulative impacts of the Proposed Action in combination with other past, present, and reasonably foreseeable actions are discussed in Section 5.2.

5.1 DIRECT AND INDIRECT IMPACTS OF THE PROPOSED ACTION AND NO-ACTION ALTERNATIVES

Amendments 13 and 16 to the Northeast Multispecies FMP, and associated framework adjustments and NEFMC decisions have defined the needs of sector management and associated universal exemptions that would be applicable to all approved sectors. The amendments and adjustments also identify the requirements for a sector's Operations Plan. The potential impacts of the universal exemptions and general requirements of sector operation (e.g., Operations Plan) are evaluated in the Amendment 16 Final EIS in accordance with NEPA requirements (NEFMC 2009a). A detailed discussion of potential impacts of requested Sector-specific exemptions is provided in Sections 5.1.1 through 5.1.5.

Universal Exemptions

Universal exemptions were approved for sectors by the NEFMC in June 2009 (NEFMC 2009a). These universal exemptions would be granted for all sector participants upon adoption of Amendment 16 to the Northeast Multispecies FMP. The general effects of sector formation given these universal exemptions are analyzed in the Final EIS for Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a). As such, these universal exemptions were considered as part of the overall impacts of proposed sectors for FY 2010.

Specific universal exemptions approved for all approved sectors upon adoption of Amendment 16 are identified in Table 5.1-1.

Operations Plan

Amendment 16 identified the requirements of any proposed sector Operations Plan including quota management, monitoring, administrative, and gear restriction measures. The various provisions of any sector Operations Plan must be reviewed and approved by NMFS prior to implementation. The primary requirements of any sector Operations Plans associated with potential environmental impacts include:

- Identification of ACE thresholds based on permit history of sector participants; and
- ACE allocation and discard monitoring.

Additional information on the components of the Operations Plan prepared by the PCS is provided in Section 3.1. Amendment 16 also allows for proposed sectors to identify sector-specific exemptions that a sector wants to integrate into their Operations Plan to maximize harvest efficiency while minimizing potential environmental impacts. Requested Sector-specific exemptions are identified in Section 3.2 and the potential impacts are described in Sections 5.1.1 through 5.1.5.

Summary of Conclusions of the Proposed Action

Table 5.1-1 provides a summary of conclusions regarding direct and indirect impacts that would occur as a result of universal exemptions, general sector operations, and Sector-specific exemptions. General impacts of the requirements in Amendment 16, including universal exemptions and the general requirements of Operations Plan, would vary from positive to low negative relative the Common Pool. Impacts of Sector-specific exemptions would vary from low positive to low negative (see Table 5.1-1). Additional discussion on potential impacts to the physical habitat/EFH, allocated target species, non-allocated target species and bycatch, protected resources, and human communities is provided in Sections 5.1.1 through 5.1.5.

**TABLE 5.1-1

Low (L, as in low positive or low negative)	To a lesser degree		
High (H; as in high positive or high negative)	To a substantial degree		
Likely	Some degree of uncertainty associated with the impact		

5.1.1 Physical Environment/Habitat/EFH

5.1.1.1 Proposed Action

For the purpose of this EA, the physical habitat is defined as the sub-regions comprised of the Gulf of Maine, Georges Bank, the southern New England/Mid-Atlantic areas, and the continental slope. EFH is defined by the SFA as “[t]hose waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity.”

This section identifies impacts to the physical habitat, both positive and negative, associated with the Proposed Action. Impacts to the physical habitat/EFH associated with Amendment 16 universal exemptions, Operations Plan requirements, and the proposed Sector-specific exemption are detailed below.

Amendment 16 – Universal Exemptions

Universal exemptions would be granted to all sector participants upon adoption of Amendment 16 to the Northeast Multispecies FMP. The general effects of sector formation given these universal exemptions are analyzed in Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a). The effects of specific universal exemptions are summarized below.

No Days-At-Sea Needed when Groundfishing

The purpose of Northeast multispecies DAS accounting is to control groundfish mortality by limiting fishing effort to a set number of days per groundfish vessel. Since PCS members would be operating under an ACE, which clearly defines the amount of fish caught, it is no longer necessary to apply DAS to this group of fishermen to control groundfish mortality. It is expected that this universal exemption would allow vessels to successfully target select species. This would likely result in an increase in overall fishing time, as compared to the amount of time permitted under the DAS program, which would still apply to vessels in the Common Pool. Successful targeting of stocks with greater ACEs (e.g., GB haddock) would allow sector vessels to spend more time fishing for more abundant stocks whose catch was artificially constrained by DAS allocations designed to reduce effort on stocks that are overfished and/or experiencing overfishing (e.g., SNE/MA winter flounder). An overall reduction in the 2010 groundfish mortality under Amendment 16 would result in reduced habitat impacts fleetwide compared to previous years but because of an ACE controlling fishing efforts of sector members instead of DAS, sector members could have more bottom contact time and more impacts to the physical habitat compared to the Common Pool. Therefore, under the Proposed Action, it is expected that this exemption would result in a low negative impact to the physical habitat and EFH.

No Trip Limits

Trip limits are designed to limit the number of fish caught per trip. Trip limits on allocated target species may result in regulatory discards of fish that exceed relevant daily trip limits. An exemption from this restriction would result in increased landings and CPUE by PCS members, which would result in less bottom contact time compared to the Common Pool. Conversely, the ability to continue to catch and retain groundfish could increase gear days. While this could result in a slight increase in overall gear days, it is expected that this exemption would likely result in a negligible impact to the physical habitat and EFH since the gear mix in this Sector is approximately split evenly between gillnet gear, which would result in little impact, and trawl gear, which would result in greater impact to the seafloor than fixed gear.

Seasonal Closed Area on Georges Bank in May

This universal exemption would allow fishing within an area that is otherwise closed to groundfishermen for the month of May. It is expected that this exemption would not increase overall bottom contact time since overall fishing effort would likely have occurred elsewhere if this exemption were not granted. Previously, many chose to begin their 20-day block out of the fishery at this time. Under this universal exemption, the time out of the fishery could shift away from May, but would still need to be taken (unless specifically exempted). In addition, there would be no access to Habitat Areas of Particular Concern (HAPC). Therefore, this exemption would result in a negligible impact on the physical habitat and EFH.

Gulf of Maine Rolling Closures

This universal exemption would allow fishing within areas that are otherwise closed to groundfishermen during specific time periods. Amendment 16 (Section 4.2.3.9) would exempt sectors

from all rolling closures except for: Blocks 124 and 125 in April; Blocks 132 and 133 in April-May; Block 138 in May; Blocks 139 and 140 in May-June; and Blocks 145, 146, 147, and 152 in June. These areas do not include any HAPC. It is expected that this exemption would not increase overall bottom contact time since overall fishing effort would likely occur elsewhere if this exemption were not granted. Previously, many fishermen would shift to other locations during these times. Since PCS members would be operating under an ACE, which clearly defines the amount of fish caught, the result would be that fish were caught in these locations and during times when they previously were not. Given that these areas are fished during other times of the year, it is expected that this exemption would result in a negligible impact to physical habitat and EFH.

Six-inch Cod-end Exemption on Georges Bank if using Haddock Separator or Ruhle Trawl

This exemption would only apply to sector members fishing on Georges Bank using either a haddock separator trawl or a Ruhle trawl. Because these modified trawls do not contact the seafloor, it is expected that this exemption would not increase bottom contact time. Therefore, it is expected that there would be a negligible impact on physical habitat and EFH from this exemption.

Operations Plan under the Proposed Action

Each sector Operations Plan is unique. However, the harvest rules for all sector Operations Plans tend to fall into one of four broad categories: quota management, monitoring, administrative, and gear restriction. In addition, the harvest rules within each category tend to have similar impacts.

Section 3.1.4 provides a description of the harvest rules of the PCS Operations Plan and groups them within four categories. The summary category for each of these harvest rules and their likely impacts are provided in Table 5.1.1-1.

TABLE 5.1.1-1 Port Clyde Sector Harvest Rules Summary for Physical Habitat		
Summary Category	Harvest Rules Assigned to the Summary Category	Impacts
Quota Management	<ul style="list-style-type: none"> ▪ Quota Management Harvest Rule ▪ Full Retention of Legal Sized Fish ▪ Additional Measures to Prevent ACE Overages ▪ ACE Transfers and Pooling 	Harvest rules assigned to this category are largely administrative, and include actions that are taken to ensure a Sector's ACE is not exceeded. They are not expected to affect the number of gear days fished and would result in a negligible impact to physical habitat/EFH.
Monitoring	<ul style="list-style-type: none"> ▪ Not Applicable 	Harvest rules assigned to this category relate to the collection of data. These efforts would not be expected to affect the number of gear days fished and would result in a negligible impact to physical habitat/EFH.
Administrative	<ul style="list-style-type: none"> ▪ Not Applicable 	Harvest rules assigned to this category relate to strictly administrative issues (e.g. transmitting data). They are not expected to affect the number of gear days fished and would result in a negligible impact to physical habitat/EFH.
Gear Restriction	<ul style="list-style-type: none"> ▪ Not Applicable 	Not Applicable

Port Clyde Community Groundfish Sector-Requested Exemption

In addition to the universal exemptions for all sectors under Amendment 16, the PCS has requested an additional exemption to rules that apply to Common Pool fishermen. Potential impacts to the physical environment from this exemption are described below.

1) Exemption from the 120-day block out of the fishery for gillnet vessels

The 120-day block out rule was imposed as a means of controlling mortality by reducing gillnetting effort. Exempting the PCS members from the 120-day block out could increase the CPUE and because the Sector would operate under an ACE, decrease fishing time and bottom contact for the fishing gear. Alternatively,, if the exemption allowed the PCS to target previously under-utilized stocks, the exemption could result in an increase in gear days.

For the purposes of this EA it was conservatively assumed that this exemption would result in a minor increase in gear days. However, because gillnets result in low impacts to the physical habitat, it is expected this exemption would likely result in a negligible impact to physical habitat/EFH with implementation of the PCS Operations Plan.

Summary of Direct and Indirect Impacts of the Proposed Action to Physical Habitat/EFH

Under the Proposed Action, PCS would generally have a negligible impact on the physical environment and habitat (including EFH) relative to the vessels operating under the Common Pool (Table 5.1-1).

The effects of specific universal exemptions on the physical environment and habitat (including EFH) would generally be negligible. It is expected that universal exemptions to allow fishing in previously closed areas would not increase bottom contact time but would result in the transfer of effort from one area to another. In addition, it is expected that the exemption to allow the use of a 6-inch cod-end would not increase bottom contact time. Therefore, impacts to the physical habitat/EFH associated with universal exemptions would be negligible.

The harvest rules for the PCS would also generally have a negligible impact on the physical habitat/EFH since the majority of the harvest rules are not expected to affect the number of gear days fished.

As discussed in Section 4.1.6, trawls have relatively high habitat impacts and bottom gillnets and longlines have low impacts (Morgan and Chuenpagdee 2003). The PCS anticipates that approximately one-half of the active vessels would use demersal (otter) trawls as their primary gear and one-half would primarily use sink gillnets. One vessel would use handline gear. Since roughly half of the PCS vessels would use gillnets or handline gear, any habitat impacts from use of this gear would be low, and the difference in the impacts of the Sector and those same vessels operating in the Common Pool (i.e., the No-Action Alternative) would be negligible. The rest of the vessels in the Sector would be trawls, which would be primarily fishing in the same areas whether or not these vessels were in the sector or in the Common Pool resulting in negligible impacts as compared to impacts from No Action.

Trawls result in a greater impact to the seafloor than fixed gear. However, the Common Pool would also utilize trawl gear and would primarily fish in the same areas as the PCS.

In addition, the PCS would be assigned an ACE for each of the Northeast multispecies stocks, which would require the Sector to stop fishing once their ACE has been reached, or they obtain additional ACE. It is expected that the requested exemption would result in an increase in CPUE by increasing the flexibility of Sector vessels to fish when most efficient throughout the year. This would result in less fishing days and thereby a reduction in impacts to the physical habitat/EFH. However, this reduction could be offset by a slight increase in gear days due to the ability to target specific stocks. For the purpose of this EA, it appears that the overall change in gear days would conservatively be a slight increase based on going from a DAS approach to the ACE approach of fisheries management. However, it is expected that a minor increase in gear days would not have a measurable impact on the physical habitat/EFH. Thus, the overall impact of universal exemptions, harvest rules, and the Sector-specific exemption would be negligible.

5.1.1.2 No-Action Alternative

The No-Action Alternative is the disapproval of the Operations Plan. As part of this alternative, all PCS vessels would remain in the Common Pool under the regulations of Amendments 13 and 16, and framework adjustments to the Northeast Multispecies FMP. The PCS would not have an allocated ACE for Northeast multispecies stocks and would fish under FY 2010 Common Pool rules.

Allocations in the Common Pool are controlled by DAS that are based on historic (FY 1996 through FY 2001) maximum annual DAS allocation per permit (described in Amendment 13; FW 42). DAS allocations are input controls, setting an annual maximum on the effort that the Common Pool can expend. Under measures proposed by Amendment 16, Common Pool vessels are subject to a 50 percent reduction in DAS from their FW 42 allocation. Participating vessels in the Common Pool are regulated by an established daily trip limit. Vessels in the Common Pool are not constrained by individual allocations and consequently have little incentive to stop fishing upon reaching their daily possession limit for some allocated target stocks if they are still catching other marketable allocated target stocks within possession limits.

Unlike the Proposed Action, the No-Action Alternative would not result in an increase in gear days. However, for the purposes of this EA it was conservatively assumed that Sector participation under the Proposed Action would result in a minor increase in gear days. Thus, if the No-Action Alternative were adopted, habitat impacts, which are already negligible, would be reduced to a minor degree relative to the level that would exist if the PCS were approved. If approved for FY 2010, more quantifiable information on actual fishing effort, specifically trawling effort, would be available to refine impacts to physical habitat associated with sectors relative to the Common Pool.

5.1.2 Allocated Target Stocks

This section addresses the likely impacts of the Proposed Action and No-Action Alternative on allocated target fish stocks managed under the Northeast Multispecies FMP.

5.1.2.1 Proposed Action

The PCS would operate under an ACE for 14 groundfish stocks (see Section 4.2). The PCS anticipates that half of the active vessels would use trawls and half would use gillnets as their primary gear. Two additional vessels may use both trawls and gillnets, and one additional vessel would use handlines. Therefore, the large majority of the catch and effort are expected to be by trawl and gillnet vessels.

In recent years, participants in the proposed PCS fished in the Common Pool and were managed under the Northeast Multispecies FMP. Common Pool management strategies control fishing effort (e.g., DAS) as a means to prevent overfishing. Table 5.1.2-1 displays select catch data resulting from implementation of the Northeast Multispecies FMP from FY 2005 to FY 2008. These data illustrate the variability in catch resulting from annual changes in fishing effort and stock management. For example, 3,193 mt of GB yellowtail were caught in 2005, as opposed to only 753 mt caught in 2007 by the entire fleet. Over the 4-year period, the catch varies for each species from slightly decreasing, stable, to slightly increasing.

Amendment 16 - Universal Exemptions

Universal exemptions would be granted to all sector participants upon adoption of Amendment 16 to the Northeast Multispecies FMP. The general effects of sector formation given these universal exemptions are analyzed in Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a). The effects of specific universal exemptions are summarized below.

No Days-At-Sea Needed when Groundfishing

The purpose of Northeast multispecies DAS accounting is to control groundfish mortality by limiting fishing effort to a set number of days per groundfish vessel. Since sector members would be operating under an ACE that clearly defines the maximum amount of groundfish stock that could be caught, it is no longer necessary to apply DAS to this group of fishermen to control groundfish mortality. It is expected that this universal exemption would allow vessels to target select species, and could result in an increase in overall fishing time, as compared to the amount of time permitted under the DAS program, which would still apply to vessels in the Common Pool. Successful targeting of stocks with greater ACEs (e.g., GB haddock) would allow sector vessels to spend more time fishing for more abundant stocks whose catch was artificially constrained by DAS allocations designed to reduce effort on stocks that are overfished and/or experiencing overfishing (e.g., SNE/MA winter flounder). An overall reduction in the 2010 groundfish mortality under Amendment 16 would result in reduced impacts to

stocks fleetwide compared to previous years. Overall, the effect of this exemption, regardless of any changes in fishing effort, would be a negligible impact on allocated target stocks.

No Trip Limits

Trip limits are designed to limit the number of fish caught per trip. When Common Pool fishermen reach a trip limit for a certain species, they are obligated to discard any additional, marketable catch of that stock from that trip in order to comply with trip limits. This is referred to as “regulatory discard.” Since sector members’ catch would be regulated by the sector’s ACE, trip limits are not needed as an effort control on mortality. An exemption from trip limits would eliminate the regulatory discard of allocated target species resulting in a higher proportion of the catch being retained compared to the Common Pool, and would likely have a low positive effect on allocated target stocks because all catch would count against sector members’ ACE thereby eliminating regulatory discards and related mortality.

Seasonal Closed Area on Georges Bank in May

This restriction was intended to reduce fishing mortality on GB stocks, particularly GB cod. This universal exemption would allow fishing on Georges Bank during a month that may have a higher abundance of fish. Because the PCS would be fishing under ACEs for allocated target stocks, the intended goal of the seasonal closed area to limit mortality of GB stocks would be achieved. Overall, the effect of this exemption relative to vessels operating within the Common Pool would not change mortality and would result in a negligible impact on allocated target stocks.

Gulf of Maine Rolling Closures

Gulf of Maine rolling closures were adopted primarily to reduce catches of GOM cod; however, these closures have also served to reduce fishing activity on cod spawning aggregations. Allowing fishing activities in these areas closed to Common Pool groundfishermen within the Gulf of Maine would result in a loss of this protection for spawning fish. Although ACEs provide the overall control on allocated target stock mortality, there is a potential for low negative impacts from fishing on spawning aggregations. Therefore, this exemption is expected to result in a low negative impact on allocated target stocks when compared with vessels operating within the Common Pool.

Six-inch Cod-end Exemption on Georges Bank when using Haddock Separator or Ruhle Trawl

This exemption would allow the use of a six-inch mesh cod-end when sector vessels fish with selective trawl gear, which would facilitate selective fishing for haddock by PCS vessels. This exemption would not be expected to substantially change mortality since the catch would be controlled by ACE, likely resulting in a negligible impact on allocated target species. It is possible that the exemption could increase harvest of sub-legal size fish; however, this is less likely to affect species that swim closest to the bottom (e.g., cod) because of the nets design. The impact of increased retention of sub-legal catch may be shifts in stock composition. Therefore, the impacts from this exemption would likely be negligible since overall mortality would be controlled by the ACE, but could result in a low negative impact on allocated target stocks if it results in an increase in sub-legal sized fish caught

Operations Plan under the Proposed Action

Each sector Operations Plan is unique. However, the harvest rules for all sector Operations Plans tend to fall into one of four broad categories: quota management, monitoring, administrative, and gear restriction. In addition, the harvest rules within each category tend to have similar impacts.

Section 3.1.4 provides a description of the harvest rules of the PCS Operations Plan. The summary category for each of these harvest rules and their likely impacts on allocated target stocks are provided in Table 5.1.2-2.

TABLE 5.1.2-2 Port Clyde Sector Harvest Rules Summary for Allocated Target Stocks		
Summary Category	Harvest Rules Assigned to the Summary Category	Impacts
Quota Management	<ul style="list-style-type: none"> ▪ Quota Management Harvest Rule ▪ Full Retention of Legal Sized Fish ▪ Additional Measures to Prevent ACE Overages ▪ ACE Transfers and Pooling 	Harvest rules assigned to this category relate to actions that would ensure a sector's ACE is not exceeded. Port Clyde Community Groundfish Sector - Requested Exemption

Because the PCS would not be constrained by the DAS reduction for groundfish (from FY 2009) that the Common Pool is being subjected to in FY 2010, the amount of fishing effort, gear days, and related impacts could increase or decrease relative to the Common Pool. However, for the purposes of this analysis overall fishing effort and gear days are assumed to increase slightly. It remains a matter of implementation and monitoring to quantify exact changes to fishing efficiency or fishing effort as the result of PCS operations. Sector self-management, flexibility, and accounting systems as embodied in Amendments 13 and 16 and supporting documents are expected to facilitate the ability of the PCS to fully utilize and manage their allocations, avoid overfishing, and focus their efforts on filling their ACE for allocated target stocks.

PCS members would implement all monitoring and reporting requirements as mandated in Amendment 16 and any additional requirements developed by the PCS. An expected effect is the reduction in the potential to exceed target mortality rates through real-time management by PCS. Another effect of Sector operations is expected to be the conversion of more vessel catch into landings and less discard than would otherwise occur in the Common Pool. Conversely, vessels operating within the Common Pool (the No-Action Alternative) would continue to allow varying impacts on allocated target stocks because of less conversion of catch into landings (greater proportion discarded) resulting from trip limits without the allocation constraints imposed by ACE. This Sector represents a small proportion of

the fleet. So in the context of biological effects, the impacts of the Sector Operations Plan, as compared to operations within the Common Pool, would represent a negligible change to a small proportion of the entire groundfish fleet.

The PCS requests one Sector-specific exemption, and a description of the potential effects from this exemption is provided below.

1) Exemption from the 120-day block out of the fishery for gillnet vessels

This block out requirement was implemented to reduce the possibility that gillnet vessels could compensate for other effort reduction measures by extending soak time between trips. The requirement to take time out during the summer months was intended to apply the time out requirement when gillnet activity is highest. These gillnet regulations were authorized under various frameworks as a means to limit fishing mortality by vessels using gillnets to the same extent that vessels using other gear types were restricted by cuts in allocated DAS and specific gear requirements.

The result of this exemption would be to allow gillnet vessels within the PCS to redistribute fishing effort over the year, both spatially and temporally. For the purposes of this analysis, it is assumed that increases in fishing effort may occur. However, the magnitude of the impact of this exemption is controlled predominantly by the ACEs for each allocated target stock. In addition, the PCS Manager would monitor trends and report to NMFS in writing should a significant and adverse shift in effort occur. The Sector Manager may establish additional area or gear restrictions designed to mitigate the adverse impacts of such shift, should they occur due to spatial shifts in effort or increases in soak times. Furthermore, the PCS is not requesting exemption for the spawning block (20 days between March 1 and May 31) which would lessen the potential for harvest impacts to spawning fish.

The resulting effect of Sector operations with exemption from the block out, relative to those vessels operating within the Common Pool, would be a negligible impact on allocated target species due to responsible Sector management actions and the overarching constraint on mortality imposed by the ACE. The PCS represents a small proportion of the fleet. So in the context of biological effects, the impacts of this exemption, as compared to operations within the Common Pool, would represent a negligible change to a small proportion of the entire fleet.

Summary of Direct and Indirect Impacts of the Proposed Action on Allocated Target Species

The anticipated effect of PCS formation and operation in FY 2010 is to convert vessel catch into more landing and less discard while not exceeding ACEs. The potential to exceed ACEs would be reduced through real-time management by the PCS. The impact of Sector operations and requirements under Amendment 16 are expected to be negligible.

The PCS requested exemption from the 120-day block out of the fishery for gillnet vessels is expected to result in a redistribution of fishing effort over the year, potential increases in fishing effort, and potential increases in mortality of target stocks due to longer soak times. This exemption would result in negligible impacts to allocated target stocks. The overall impact of PCS operations to allocated target stocks is expected to be negligible.

5.1.2.2 No-Action Alternative

Under the No-Action Alternative, these vessels would remain in the Common Pool and would therefore operate under the regulations applicable to the Common Pool. The No-Action Alternative would subject these vessels to the input control measures implemented by Amendment 13, subsequent

framework adjustments, and Amendment 16 to rebuild overfished stocks and end overfishing on those stocks where it is occurring. Through these framework adjustments, trip limits for overfished stocks would be attuned and ACLs and AMs would be implemented.

Under the No-Action Alternative, the PCS would not have an ACE allocation for groundfish. The primary difference between operation in the Common Pool or in a sector is the method of addressing stock mortality that is established annually and allocated as sub-components of ACLs (NEFMC 2009a). Allocations in the Common Pool are controlled by DAS that are based on historic maximum annual DAS allocation per permit (described in Amendment 13; FW 42). DAS allocations are input controls, setting an annual maximum on the effort that the Common Pool can expend. Under measures proposed by Amendment 16, Common Pool vessels are subject to a 50 percent reduction in DAS from their FW 42 allocation. Participating vessels in the Common Pool are regulated by an established trip limit. Daily limit is per 24 hours of DAS or any portion thereof. Vessels in the Common Pool are not constrained by individual allocations and consequently have little incentive to stop fishing upon reaching their daily possession limit for some allocated target stocks if they are still catching other marketable stocks within possession limits. Under the No-Action Alternative, vessels would continue to fish under regulations that restrict fishing effort and methods and rates of discard and trip limitations in the Common Pool would continue at historic levels, or otherwise mandated by Amendment 16.

It is therefore reasonable to expect that these vessels fishing within the Common Pool (No-Action) would have a negligible impact on allocated target stocks when compared to the proposed PCS operations (Proposed Action).

5.1.3 Non-allocated Target Species and Bycatch

5.1.3.1 Proposed Action

Under the Proposed Action, the PCS would receive an ACE, which would set absolute maximum poundage of each allocated target stock that the PCS would be allowed to catch. Monkfish, skates, and spiny dogfish are the predominant non-allocated target species (i.e., or bycatch expected to be caught by sectors and are managed under separate FMPs, as described in Section 4.3. Non-allocated target species and bycatch would be components to the landings accruing to the PCS as they conduct groundfishing activities.

In general, the catch of non-allocated target species and bycatch could theoretically go down under Sector management if the increased flexibility in the magnitude, timing, and location of fishing efforts, and access to fishing areas increase the harvest of allocated target species relative to non-allocated target species and bycatch. If increased flexibility by the PCS improves the harvest of target species similarly to non-allocated target species, then the relative catch rate of non-allocated target species and bycatch would be controlled by ACE. If this increased flexibility does not substantially enhance selectivity, and catch rates of allocated and non-allocated target species and bycatch are not related, the catch of non-allocated target species and bycatch could be highly variable as a result of PCS operations.

In accounting for discards for vessels operating in the Common Pool, a discard rate by gear type is determined and applied to the landings for each trip (NEFMC 2009a). NMFS applies this discard approximation in one of two ways: either based on the total landings of a stock by gear, or on a trip-by-trip basis. The first approach is easier to administer, but does not ascribe discards for each vessel on an individual basis. Conversely, for vessels operating within PCS, both landings and discards of allocated target species must be accurately monitored to ensure that Sector catches are actually limited to the ACE. Sectors would be required to develop a monitoring system that meets NMFS standards and adequately

monitors discards by Sector vessel (NEFMC 2009a). Beneficially, more accurate information on discard rates can be expected from vessels operating within the PCS.

Ratios of target species to bycatch are variable between gear types used. For example, gillnets using appropriate mesh are generally more selective than either trawls or hooks, and mobile gears tend to have the highest overall discard rates (NOAA 2003). Sector vessels are not proposing to change general gear types from that which they currently operate under the Common Pool, and thus are not expected to alter the ratio of discards to allocated target species experienced within the Common Pool. It is also reasonable to assume for purposes of this analysis that Sector vessel effort resulting in a high proportion of non-allocated target species and bycatch would be rare, is not economically sustainable, and would result in shifts in fishing strategy to improve allocated target stock catches. Therefore, non-allocated target species and bycatch are expected to be caught in a relatively constant proportion to allocated target stocks. The proportion of allocated target stocks to non-allocated target species and bycatch is also not expected to differ among vessels operating within PCS or operating within the Common Pool.

Because sectors are relatively new to the Northeast multispecies fishery, there is little empirical evidence upon which to evaluate the ability of sector fishermen to target specific stocks or redirect fishing effort to another fishery. Although possible, it is unlikely that sector participants would target other species (e.g., lobster, summer flounder, etc.) under sector management more often than under Common Pool regulations. Under sector management, a sector participant⁹ would have all groundfish catch (including calculated discards) counted against the sector's ACE. Thus, a sector vessel fishing¹⁰ for lobsters with non-trap gear, skates, monkfish, or dogfish would have any groundfish catch counted against the sector's ACE. In addition, when the sector reaches the individual ACE for a stock, all sector members must cease all fishing activities¹¹ within that stock area. This disincentive would likely outweigh any potential gains from redirecting to other fisheries for the majority of sector members.

For example, if a sector participant were to target lobsters with non-trap gear (e.g., trawl gear), such activity would be considered as fishing for groundfish and the sector's ACEs would be reduced by the vessel's groundfish catch (including calculated discards) for each allocated species in the area. The participant would risk reaching their sector's ACE for any stock in that area and therefore be prohibited from fishing in that area for the remainder of the fishing year. Therefore, there is a low potential for adverse impacts to other fisheries, such as lobster, as a result of displaced fishing effort. The extent to which a directed lobster fishery will emerge under the Northeast multispecies fishery as an indirect effect from the implementation of sectors is speculative at this point. NMFS will review harvest data to monitor for these concerns and if there appears to be an alarming increase in the harvest of lobster by sector vessels, NMFS will coordinate with the Council and the Atlantic States Marine Fisheries Commission to more specifically address these issues.

In contrast to the Common Pool, the PCS would operate under an ACE for 14 Northeast groundfish stocks (see Section 4.2). Once the PCS achieves an ACE for any allocated target stock, commercial fishing with gear capable of catching groundfish in that stock area must cease unless the Sector is able to acquire additional ACE. Sector management is expected to facilitate the ability of the PCS to fully utilize and manage their multiple allocations, avoid overfishing, and focus their efforts on catching their ACE for allocated target stocks. This would also limit the catch of non-allocated target species and bycatch in these stock areas. Conversely, vessels fishing in the Common Pool are controlled

⁹ Fishing with non-exempt gear (that is, any gear capable of catching Northeast multispecies) outside of an exempted fishery (for example, Dogfish and Monkfish Gillnet Fishery in the GOM/GB Dogfish and Monkfish Gillnet Fishery Exemption Area)

¹⁰ outside an exempted fishery

¹¹ with non-exempt gear and outside exempted fisheries (excluding recreational fishing)

by effort (DAS) and trip limits, and landings are affected by an ACL allocated to the entire fleet. The PCS represents a small proportion of the entire groundfish fleet. So in the context of biological effects, PCS operations would exert a negligible change compared to overall operations of the multispecies fishery.

The anticipated effect of PCS formation and operation under allocations constrained by ACEs (as described in Amendment 16) would be to convert vessel catch into more landings and less discard than if those same vessels were to fish within the Common Pool. In contrast, vessels operating within the Common Pool (the No-Action Alternative) would receive trip limits without the allocation constraints imposed by ACEs. This would continue to allow varying impacts on non-allocated target species and bycatch because of less conversion of allocated target stock catches into landings (greater proportion discarded) in the Common Pool.

Amendment 16 - Universal Exemptions

Universal exemptions would be granted to all sector participants upon adoption of Amendment 16 to the Northeast Multispecies FMP. The general effects of sector formation given these universal exemptions are analyzed in Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a). The effects of specific universal exemptions are summarized below.

No Days-At-Sea Needed when Groundfishing

The purpose of Northeast multispecies DAS accounting is to control groundfish mortality by limiting fishing effort to a set number of days per groundfish vessel. Since PCS members would be operating under an ACE that clearly defines the maximum amount of each groundfish stock that could be caught, it is no longer necessary to apply DAS to this group of fishermen to control groundfish mortality. It is expected that this universal exemption would allow vessels to target select species, and could result in an increase in overall fishing time, as compared to the amount of time permitted under the DAS program, which would still apply to vessels in the Common Pool. Successful targeting of stocks with greater ACEs (e.g., GB haddock) would allow sector vessels to spend more time fishing for more abundant stocks whose catch was artificially constrained by DAS allocations designed to reduce effort on stocks that are overfished and/or experiencing overfishing (e.g., SNE/MA winter flounder). An overall reduction in the 2010 groundfish mortality under Amendment 16 would result in reduced impacts to stocks fleetwide compared to previous years but because of an ACE controlling fishing efforts of sector members instead of DAS, sector members would have more impacts to allocated stocks compared to the Common Pool. The Sector would be fishing under ACEs for allocated target stocks, which would provide the predominant control over impacts to non-allocated target and bycatch species. Overall, the effect of this exemption relative to these vessels operating within the Common Pool, regardless of any changes in fishing effort, would be a negligible impact on non-allocated target and bycatch species.

No Trip Limits

Trip limits are designed to limit the number of fish caught per trip. When Common Pool fishermen reach a trip limit for a certain species, they are obligated to discard any additional, marketable catch of that stock from that trip in order to comply with trip limits. This is referred to as “regulatory discard.” Since PCS members’ catch would be regulated by a sector’s ACE, trip limits are not needed as an effort control on mortality. An exemption from trip limits would eliminate the regulatory discard of allocated target stocks resulting in a higher proportion of the catch being retained compared to the Common Pool, and would likely have a low positive effect on allocated target stocks because all catch would count against sector members’ ACE thereby eliminating regulatory discards and related mortality. This universal exemption would likely result in an increased CPUE, which would potentially decrease the

levels of discard of non-allocated target species and bycatch if that increase caused ACE to be achieved in a shorter period of time. An overall reduction in discard resulting from this exemption would have a low positive effect on non-allocated target and bycatch species.

Seasonal Closed Area on Georges Bank in May

This restriction was intended to reduce fishing mortality on allocated GB stocks, particularly GB cod. This universal exemption would allow fishing for allocated target stocks on Georges Bank during a month that may have a higher abundance of fish and allow targeting of allocated target stocks where fish effort has previously focused on other fisheries in this area in May. During the May closure, other fisheries have been allowed in the area, so fishing activity is not completely excluded and groundfishing has been allowed in other areas during this timeframe. Therefore, this exemption would result in a negligible impact on allocated target species and, thus, non-allocated target species and bycatch when compared with these vessels operating within the Common Pool.

Gulf of Maine Closures

Gulf of Maine rolling closures were adopted primarily to reduce catches of allocated target species, particularly GOM cod; however, these closures have also served to reduce fishing activity on cod spawning aggregations. Allowing fishing activities in these areas otherwise closed to Common Pool groundfishermen within the Gulf of Maine would remove a mortality control in place to protect spawning fish and allow targeting of allocated target fisheries when fishing effort has been more likely to focus on other fisheries. During the closure, other types of fisheries have been allowed in to the area, so fishing activity is not completely excluded. Therefore, this exemption would result in a negligible impact on non-allocated target and bycatch when compared with these vessels operating within the Common Pool.

Six-inch Cod-end Exemption on Georges Bank if using Haddock Separator or Ruhle Trawl

This exemption would allow the use of a six-inch mesh cod-end when sector vessels fish with selective trawl gear, which would facilitate selective fishing for haddock by PCS vessels. Because the primary non-allocated target species and bycatch tend to be large, reducing the mesh size of the cod-end would not likely change bycatch rates. This exemption would result in a negligible impact on non-allocated target and bycatch species when compared with these vessels operating within the Common Pool.

Operations Plan under the Proposed Action

Each sector Operations Plan is unique. However, the harvest rules for all sector Operations Plans tend to fall into one of four broad categories: quota management, monitoring, administrative, and gear restriction. In addition, the harvest rules within each category tend to have similar impacts.

Section 3.1.4 provides a description of the harvest rules of the PCS Operations Plan. The summary category for each of these harvest rules and their likely impacts are provided in Table 5.1.3-1.

**TABLE 5.1.3-1
Port Clyde Sector Harvest Rules for Non-allocated Target Species and Bycatch**

Summary Category	Harvest Rules Assigned to the Summary Category	Impacts
Quota Management	<ul style="list-style-type: none"> ▪ Quota Management Harvest Rule ▪ Full Retention of Legal Sized Fish ▪ Additional Measures to Prevent ACE Overages ▪ ACE Transfers and Pooling 	Harvest rules assigned to this category relate to actions that would ensure a sector's ACE is not exceeded. Harvest rules assigned to this category are not expected to affect the landings of non-allocated target species and bycatch and would result in a negligible impact to non-allocated target species and bycatch.
Monitoring	<ul style="list-style-type: none"> ▪ Not Applicable 	Harvest rules assigned to this category relate to the collection of data. Although these activities would not have a direct affect on non-allocated target species and bycatch, the overall result would be positive as monitoring would provide better data on fishing practices and catch composition and distribution, thereby improving management.
Administrative	<ul style="list-style-type: none"> ▪ Not Applicable 	Harvest rules assigned to this category relate to strictly administrative issues (e.g. transmitting data). They are not expected to affect the fishing effort or CPUE, and would result in a negligible impact to non-allocated bycatch stocks.
Gear Restriction	<ul style="list-style-type: none"> ▪ Not Applicable 	Not Applicable

Port Clyde Community Groundfish Sector – Requested Exemption

For purposes of this analysis, overall fishing effort and gear days are assumed to increase slightly based on moving from DAS to sector management. It remains a matter of implementation and monitoring to quantify exact changes in fishing efficiency or fishing effort as the result of Sector operations. As analyzed for allocated target stocks, Sector self-management, flexibility, and accounting systems through Amendments 13 and 16 and supporting documents are expected to facilitate the ability of the PCS to fully utilize and manage their multiple allocations, avoid overfishing, and focus their efforts on filling their ACEs for allocated target stocks, which would control the catch of non-allocated target species and bycatch.

PCS members would implement all monitoring and reporting requirements as mandated in Amendment 16 and any additional requirements developed by the Sector. An expected effect is the reduction of the potential to exceed target mortality rates, and therefore also non-allocated target species and bycatch through real-time management by PCS. Vessels operating within the Common Pool (the No-Action Alternative) would receive trip limits without the allocation constraints imposed by ACEs.

In addition to the universal exemptions, the PCS requests one exemption, as outlined in Section 3.1.4. The general discussion of the proposed exemption presented in Section 5.1.2.1 (Allocated Target Stocks) is also applicable to non-allocated target species and bycatch as described below.

1) Exemption from the 120-day block out of the fishery for gillnet vessels

This exemption would allow gillnet vessels within the PCS to redistribute fishing effort over the year, both spatially and temporally, as opposed to adhering to the block out. For the purpose of this assessment, we assume the exemption would result in a fishing effort increase. However, the magnitude of the potential effort increase is controlled predominantly by the ACEs for each allocated target species. Based on the assumption of a relatively constant ratio of non-allocated target species and bycatch to allocated target species, ACEs would also function as a dominant control to limit impacts to non-allocated target species and bycatch. In addition, the PCS Manager would monitor trends and report to NMFS in writing should a significant and adverse shift in effort occur. The Sector Manager may establish additional area or gear restrictions designed to mitigate the adverse impacts of such shift, including potential impacts to non-allocated target species and bycatch should they occur, due to spatial shifts in effort or increases in soak times.

The resulting effect of Sector operations with exemption from the 120-day block relative to vessels operating within the Common Pool, would be a negligible impact on non-allocated target species and bycatch due to responsible Sector management actions and the overarching constraint on mortality imposed by the ACE.

Summary of Direct and Indirect Impacts of the Proposed Action to Non-allocated Target Species and Bycatch

In general, it is expected that the impacts on non-allocated target species and bycatch would be directly related to operations conducted for allocated target species under allocations controlled by ACEs, and there would be little if any increase in impacts to non-allocated target species and bycatch under Sector management relative to the Common Pool. Real time management by PCS is expected to reduce the potential to exceed ACEs and therefore impacts to non-allocated target species and bycatch. The impact of Sector operations and requirements under Amendment 16 are expected to be negligible for non-allocated target species and bycatch.

The exemption from the 120-day block out is expected to result in a redistribution of fishing effort over the year and potential increases in mortality of target stocks due to longer soak times. The effect of Sector operations, relative to vessels operating within the Common Pool, would be a negligible impact on non-allocated target species and bycatch. The overall impact of PCS operations to non-allocated target species and bycatch is expected to be negligible.

5.1.3.2 No-Action Alternative

Under the No-Action Alternative, these vessels would remain in the Common Pool. The No-Action Alternative would subject these vessels to the input control measures implemented by Amendment 13, subsequent framework adjustments, and Amendment 16 to rebuild overfished stocks and end overfishing on those stocks where it is occurring. Through these framework adjustments, trip limits for overfished stocks would be attuned and ACLs and AMs would be implemented.

Under the No-Action Alternative, the PCS would not have an ACE allocation of groundfish. The primary differences between operation in the Common Pool or in a Sector are the methods of addressing stock mortality that is established annually and allocated as sub-components of ACLs (NEFMC 2009a). Allocations in the Common Pool are DAS based on historic maximum annual DAS allocation per permit (described in Amendment 13; FW 42). DAS allocations are input controls, setting an annual maximum on the effort that the Common Pool can expend. Under measures proposed by Amendment 16, Common Pool vessels would be subject to a 50 percent reduction in DAS from their FW 42 allocation and having

all DAS counted at a rate of 24-hours. Participating vessels in the Common Pool are regulated by an established daily trip limit. Daily limit is per 24 hours of DAS or any portion thereof. Participating vessels in the Common Pool are not constrained by ACE allocations and consequently have little incentive to stop fishing upon reaching their daily possession limit for some allocated target stocks if they are still catching other marketable stocks within possession limits. Vessels would continue to fish under regulations that restrict fishing effort and methods and rates of discard and trip limitations in the Common Pool would continue.

Considering all factors, the overall effect of these vessels fishing in the Common Pool (No-Action) is expected to be negligible for non-allocated target species and bycatch compared to the proposed PCS operations (Proposed Action).

5.1.4 Protected Resources

This section addresses the likely impacts of the Proposed Action and No-Action Alternative on protected resources that occur within the Northeast multispecies fishing area.

5.1.4.1 Proposed Action

The PCS would be predominantly comprised of trawlers and gillnetters with some use of longlines, hook and line gear. In addition, the Sector proposes the use of various types of trawls, lines, or traps/pots on an experimental basis if approved. As described in Section 4.4.4, these gear types are each considered Tier 2 fisheries (gillnets are Category I [frequent incidental mortality/injury], trawls and traps/pots are Category II [occasional incidental mortality/injury], and longlines and hook and line gear are Category III [incidental mortality/injury is unlikely]). The primary determinant of how potential impacts of sectors could differ from the Common Pool is based on whether gear days would tend to increase, decrease, or remain consistent. It is possible that Sector vessels could spend fewer days at sea under the Proposed Action as Sector ACEs could be reached within a shorter period of time due to the elimination of trip limits.

Conversely, the PCS would no longer be limited by DAS, and it is feasible that the Sector could have more fishing days (before reaching their ACEs) than it would if the vessels were in the Common Pool (with limited DAS). More fishing days could result in increased impacts to sea turtles and potentially other protected resources than those participants operating under Common Pool rules. Even if gear days increased as a result of the proposed measures in Amendment 16 and Sector-specific measures, the resulting gear days would be less than historical levels due to reduced harvest levels. Therefore, impacts to the protected resources from a potential increase in gear days would not be expected to exceed historic impact levels associated with the Northeast multispecies fisheries.

Amendment 16 - Universal Exemptions

Universal exemptions would be granted to all sector participants upon adoption of Amendment 16 to the Northeast Multispecies FMP. The general effects of sector formation given these universal exemptions are analyzed in Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a). The effects of specific universal exemptions are summarized below.

No Days-At-Sea Needed when Groundfishing

The purpose of Northeast multispecies DAS accounting is to control groundfish mortality by limiting fishing effort to a set number of days per groundfish vessel. Since PCS members would be operating under an ACE that clearly defines the maximum amount of groundfish stocks that could be

caught, it is no longer necessary to apply DAS to this group of fishermen to control groundfish mortality. It is expected that this universal exemption would allow vessels to target select species, and could result in an increase in overall fishing time, as compared to the amount of time permitted under the DAS program, which would still apply to vessels in the Common Pool. An overall reduction in the 2010 groundfish mortality under Amendment 16 would result in reduced impacts to protected resources fleetwide compared to previous years but because of an ACE controlling fishing efforts of sector members instead of DAS, sector members would have more impacts to protected resources compared to the Common Pool. An increase in fishing time would potentially result in an increased number of interactions between protected resources and deployed gear compared to the Common Pool. Therefore, it is expected that this exemption would result in a low negative impact to protected resources.

No Trip Limits

Trip limits are designed to limit the number of fish caught per trip. When Common Pool fishermen reach a trip limit for a certain species, they are obligated to discard any additional, marketable catch of that stock from that trip in order to comply with trip limits. This is referred to as “regulatory discard.” Since sector members’ catch is regulated by the sector’s ACE, trip limits are not needed as an effort control on mortality. While CPUE may increase within a sector, the ability to selectively target abundant stocks may increase overall gear days relative to the Common Pool. This would increase fishing time leading to the potential for interactions. Therefore, it is expected that this exemption would likely result in a low negative impact to protected resources.

Seasonal Closed Area on Georges Bank in May

Georges Bank seasonal closures were adopted primarily to reduce catches of GB cod; however, these closures have also served to reduce fishing activity on cod spawning aggregations. This exemption would allow fishing activities in these areas otherwise closed to Common Pool groundfishermen within the Georges Bank during a period that may have a higher abundance of fish. In May, other fisheries are allowed in to the area, so fishing activity is not completely excluded. It is expected that this exemption could result in an increased number of interactions between deployed gear and protected resources as the protected resources may occur in higher concentrations in areas of abundant fish. Therefore, it is expected that this exemption would result in a low negative impact on protected resources.

Gulf of Maine Closures

Allowing sector fishing activities in areas otherwise closed to Common Pool groundfishermen within the Gulf of Maine would likely result in an increased number of interactions between deployed gear and protected resources should any protected species occur in a higher abundance in these areas. Although the ALWTRP, which includes such measures as pinger use, would be implemented in these areas, the measures are not 100 percent effective at avoiding interactions with protected resources. Therefore, this exemption would likely result in a low negative impact on protected resources.

Six-inch Cod-end Exemption on George’s Bank if using Haddock Separator or Ruhle Trawl

The use of a smaller mesh size on haddock separators or Ruhle trawls would have a negligible effect on protected resources as the minor reduction in mesh size would not alter the expected rate of entanglement.

Operations Plan under the Proposed Action

Each sector Operations Plan is unique. However, the harvest rules for all sector plans tend to fall into one of four broad categories: quota management, monitoring, administrative, and gear restriction. In addition, the harvest rules within each category tend to have similar impacts.

Section 3.1 provides a description of the harvest rules of the PCS Operations Plan. The summary category for each of these harvest rules and their likely impacts are provided in Table 5.1.4-1.

Summary Category	Harvest Rules Assigned to the Summary Category	Impacts
Quota Management	<ul style="list-style-type: none"> ▪ Quota Management Harvest Rule ▪ Full Retention of Legal Sized Fish ▪ Additional Measures to Prevent ACE Overages ▪ ACE Transfers and Pooling 	Harvest rules assigned to this category relate to actions that would ensure a sector's ACE is not exceeded. Harvest rules assigned to this category and are largely administrative. They are not expected to affect the number of gear days fished and would result in a negligible impact to protected resources.
Monitoring	<ul style="list-style-type: none"> ▪ Not Applicable 	Harvest rules assigned to this category relate to the collection of data. Although these activities would not have a direct affect on protected resources, the overall result would be positive as monitoring would provide better data on protected resources/fishing interaction to allow for better management.
Administrative	<ul style="list-style-type: none"> ▪ Not Applicable 	Harvest rules assigned to this category relate to strictly administrative issues including methods of transmitting data and proof of sector membership. They are not expected to affect the number of gear days fished and would likely result in a negligible impact to protected resources.
Gear Restriction	<ul style="list-style-type: none"> ▪ Not Applicable 	Not Applicable

Port Clyde Community Groundfish Sector-Requested Exemption

In addition to the universal exemptions, the PCS requests one specific exemption, as outlined in Section 3.1.4 and discussed below.

1) Exemption from the 120-day block out of the fishery for gillnet vessels

Under current regulations, gillnet vessels are required to refrain from fishing for a total of 120 days out of each fishing year. Each period of time taken must be a minimum of 7 consecutive days, and at least 21 days of this time must be taken between June and September of each fishing year, a time when sea turtles and whales are more prevalent in the Northeast multispecies area. The requirement to take time out during the summer months was intended as an allocated target species mortality control measure by vessels using gillnets. As PCS members would be constrained by the ACE allocation, the 120-day block out is no longer warranted to limit mortality to allocated target species. If fishing throughout the period increases CPUE resulting in more efficient achievement of the ACE, this

exemption would be expected to reduce the overall gear days, and thus reduce potential impacts to protected resources. However, if the PCS targets one stock with increased selectivity to increase overall catch of the previously under utilized stock, the number of gear days could increase. Although there is a potential for gear days to increase or decrease, it is conservatively assumed for the purposes of this EA that this exemption would result in a minor increase in gear days due to the ability to utilize an additional 120 days if ACE were not attained. In addition, this exemption would allow fishing effort to shift so that additional days were fished between June and September, resulting in a low negative impact to protected resources when compared to the Common Pool. Although the potential shift in temporal effort would result in a low negative impact to protected resources, the forecasted overall reduction in the ACL for the entire multispecies fishery in FY 2010 would likely result in less overall potential interactions between protected resources and multispecies gear, regardless of whether the fishermen are in the Sector or the Common Pool.

Summary of Direct and Indirect Impacts of the Proposed Action to Protected Resources

The PCS would be largely comprised of bottom trawlers and gillnetters and one handliner. In addition, it may fish on an experimental basis with other types of trawls, handlines, or trap/pots to assess methods to reduce fishing impacts. Impacts to cetaceans and pinnipeds from the use of gillnets and traps/pots would be minimized by use of the Take Reduction Plans, as discussed in Section 4.4.4. Trawling is generally considered to have low impacts on most protected resources with the possible exception of sea turtles, pilot whales, and common and white-sided dolphins. Impacts to sea turtles would not be expected to be substantial due to the general distribution of sea turtles in more temperate areas. Impacts to small cetaceans and pinnipeds could occur but at present are unlikely to rise above the level of PBR. Bottom longlines are generally considered to have a low impact on protected resources.

Upon approval of a sector, provisions of Amendment 16 would exempt that sector from some measures that would apply to the Common Pool such as the requirements for DAS limits, trip limits, area closures, and mesh size. These exemptions would generally allow for an increased chance of interactions between sector vessels and protected resources due to fishing activities in previously closed areas and an increase in gear days. The additive effect of the Universal Exemptions on protected resources would likely be low negative.

Each sector would also have a unique Operations Plan that includes multiple harvest rules. Harvest rules that would be implemented by the PCS are administrative and would thereby result in negligible direct impacts to protected resources (see Table 5.1.4-1 for justification).

In addition to the exemptions granted to approved sectors by Amendment 16, the PCS has requested exemption to one additional regulation which would have a low negative impact to protected resources due to a likely increase in gear days. Cumulatively, if the PCS is approved, impacts to protected resources from exemptions granted under Amendment 16, the PCS Operations Plan, and the specific exemption requested by PCS would likely result in a low negative impact due to an increase in gear days.

5.1.4.2 No-Action Alternative

Under the No-Action Alternative, the PCS Operations Plan would not be approved and these vessels would remain within the Common Pool. If the PCS was approved, the number of days that a vessel spent fishing could increase if the CPUE was low, thereby increasing the potential for interaction with protected resources. It should also be noted that ready attainment of ACE by the PCS by increasing the flexibility to target stocks could result in fewer gear days, which would decrease expected impacts to protected resources relative to the Common Pool; however, for purposes of this analysis, gear days are

assumed to increase slightly. Since the ACLs for groundfish stocks will be greatly reduced by Amendment 16 to the Northeast Multispecies FMP, overall the impacts from the No-Action Alternative are likely to be low positive to protected resources relative to the PCS Operations Plan.

5.1.5 Human Communities/Social/Economic Environment

The PCS would be a group of self-selecting fishermen that have come together voluntarily and cooperatively for the purpose of efficiently harvesting an annual allocation of Northeast groundfish stocks. Under the Proposed Action, PCS members have developed a legally binding Operations Plan and would fish under a Sector-specific ACE in FY 2010. While still subject to general requirements specified in Amendment 16 in exchange for operating under an ACE, PCS members would be exempt from DAS and other effort control measures that limit the flexibility and opportunities available to fishermen. Under the No-Action Alternative, fishermen would remain part of the Common Pool and would operate under Common Pool rules.

Human community and economic impacts could be associated with PCS fishermen and/or ports. Impacts are driven by changes in fishery flexibility, opportunity, stability, certainty, and safety.

Section 5.1.5.1 discusses the impacts associated with the Proposed Action. Section 5.1.5.2 discusses the impacts of the No-Action Alternative.

5.1.5.1 Proposed Action

This section identifies the human community and economic impacts, both positive and negative, associated with the Proposed Action. These impacts were identified by reviewing the available literature including the recent performance of the existing Georges Bank Cod Sectors and by considering the theoretical implications of sector formation. Potential impacts are broken into four broad categories: general impacts associated with moving from DAS based regulation to sectors-based regulation, impacts associated with Amendment 16 universal exemptions, impacts associated with specific components of the Operations Plan, and impacts associated with each of the proposed Sector-specific exemptions.

Moving from DAS-based Regulation to Sector-based Regulation

Increased Vessel Profits and Opportunity

Measures designed to re-build groundfish stocks would likely reduce the revenue of individual fishermen and have negative impacts on communities that rely heavily on the Northeast multispecies fishery for the next several years. These negative impacts could also extend to other regional fishing communities. The flexibility and cooperation associated with Sector formation would allow sector members to become more efficient and to time fishing to correspond with higher market prices. This increased efficiency coupled with the ability to time markets in a limited access fishery would allow PCS participants to retain a higher profit margin than Common Pool participants. This, in turn, could promote resource stewardship and increase fishing opportunities for future generations.

Changing Shore-side Economic Activity

Any potential increase in vessel profitability associated with sector formation would help ensure that ancillary businesses such as gear, tackle, and bait suppliers; fish processing and transportation; marine construction and repair; and restaurants remain viable. This general increase in the level of economic activity would, in turn, help stabilize fishing communities and maintain their viability and cultural fabric. In addition, the opportunity to target previously under-utilized stocks because of the

removal of DAS limits may increase landings, which would increase economic activity in the port of landing. Finally, the overall number of gear days (and by extension vessels days and economic activity within the homeport) would increase slightly as the result of sector participation.

While the net effect of sector participation on shore-side economic activity is difficult to predict, it is likely to be negligible in ports that are relatively less dependent on commercial fisheries and generally positive among ports that are more dependent on commercial fishing.

Increased Safety

At Impact Informational Meetings held in 2007, fishermen reported that regulations have “boxed them in” to particular fisheries making it difficult or impossible for the fishermen to maximize their opportunities and or adjust to changing conditions. When combined with the inherent limitations of the relatively small vessels that characterize the Northeast groundfish fleet, fishermen report that regulations have reduced fishing opportunities to the point that it is difficult to guarantee a year-round income for fishery participants. This can result in captains feeling pressure to fish in inclement weather or in an unsafe manner.

Through participation in a sector, fishermen would be insulated from many of the pressures identified above. For example, DAS limits and differential DAS counting combined with trip limits could discourage a return to port in inclement weather. These pressures would not exist under sector-based management.

Uncertainty Reduction

Vessels within the Common Pool could be affected by highly variable conditions such as bad weather during designated fishing windows or fish concentrations occurring in locations made inaccessible by area closures. These variable conditions make it difficult to predict revenue streams and implement business and community plans. The allocation of an ACE to sectors combined with increased fishing flexibility would allow sector fishermen and communities to more accurately estimate the revenue flows that could be expected from sector participation. This uncertainty reduction is important to both fishermen and communities for planning purposes.

Focused Fishing Effort

The flexibility granted to sector members coupled with an ACE for each groundfish species would encourage sector participants to target their fishing efforts. By focusing effort on stocks that are traditionally under-utilized under the DAS system while remaining within established limits for the more fully utilized stocks, sector fishermen could be able to increase landings of specific stocks relative to what would have been achieved through their participation in the Common Pool. This would increase vessel profits which could, in turn, promote resource stewardship and increase fishing opportunities for future generations.

Cooperative Decision Making

Allowing fishermen to voluntarily organize and make decisions that impact all sector members and communities would foster interconnectedness among fishermen and fishing communities and promote resource stewardship within the community. By more closely aligning the profit incentive of individual fishermen with the goal of optimal fisheries management, sector formation could also promote resource stewardship within the community.

Consolidation within the Sector

As stated in the Amendment 16 Environmental Impact Statement (Section 4.2.3), sector vessels “would be allowed to pool harvesting resources and consolidate operations in fewer vessels if they desired...They [sectors] also provide a mechanism for capacity reduction through consolidation.” Fishery management plans that allocate a quota and consolidate fleet capacity are often controversial because policies designed to increase efficiency in the fishery can reduce the number of fishing boats and fishermen. The issue of consolidation and the concern that excessive consolidation could occur due to sectors is addressed within the NEFMC sector goals, two of which are to (1) provide a mechanism for economics to shape the fleet rather than regulations (while working to achieve fishing and biomass targets) and (2) prevent excessive consolidation that would eliminate the day boat fishery.

In FY 2009, 81 percent of the permits enrolled in the PCS were attached to vessels that actively fished for Northeast multispecies. For FY 2010, the PCS has 43 permits currently enrolled. Of those 43 permits, 81 percent are anticipated to actively fish for Northeast multispecies. While these numbers may change, the PCS expects that compared to FY 2009 there would be little change from the consolidation rate that previously occurred under the DAS Leasing Program or the consolidation rate that may take place in the Common Pool in FY 2010.

Redirection of Effort

If CPUE among PCS vessels increases some Sector vessels that historically fished for Northeast multispecies may redirect fishing effort to another fishery. Fishing effort could be redirected using different gear types and/or redirected into different fishing areas, or the fleet composition could change. Effort shifts may result in increased competition among fishermen, increased catch levels of certain stocks, and changing revenue streams.

The PCS anticipates that up to two currently active vessels may not participate in the multispecies fishery in FY 2010. One of these vessels holds permits to fish in the Maine lobster and shrimp fisheries and it is unlikely there will be any shift in effort to these or other fisheries by that vessel. The second vessel holds federal herring and scallop permits and there could be a minimal shift in effort into those fisheries. The increased revenue to PCS vessels would represent a positive impact however the increased competition among vessels already in the fisheries to which effort may be redirected could have a low negative impact on ports.

Increased Precision in Mortality Control

By agreeing to fish under an ACE, sector members are making a legally binding commitment to directly comply with measures designed to be consistent with NMFS’ annual determination of allowable fishing mortality. Moreover, sector members would be granted increased flexibility that should provide incentive for sector fishermen to more fully exploit previously under-exploited stocks. As such, the actual stock-specific sector catch should be fairly consistent with stock-specific levels of allowable fishing mortality as determined by NMFS. In contrast, the incentive among Common Pool vessels is to maximize revenue as constrained by DAS, input control regulation, market prices, and at-sea conditions. Because NMFS has a limited ability to predict market and at-sea conditions, their ability to identify a set of DAS limits and input controls that simultaneously results in the optimal harvest of multiple stocks is limited. At the end of any fishing year, Common Pool vessels could have fishing mortality considerably higher or lower than the stock-specific allowable fishing mortality. The more precise regulation of stock-specific catch levels under sector operation would be beneficial to the vessels, ports, and Northeast multispecies fishery.

Amendment 16 – Universal Exemptions

Universal exemptions would be granted to all sector participants upon adoption of Amendment 16 to the Northeast Multispecies FMP. The general effects of sector formation given these universal exemptions are analyzed in Amendment 16 to the Northeast Multispecies FMP (NEFMC 2009a). The effects of specific universal exemptions are summarized below.

No Days-At-Sea Needed when Groundfishing

The purpose of Northeast multispecies DAS accounting is to control groundfish mortality by limiting fishing effort to a set number of days per groundfish vessel. Since PCS members would be operating under an ACE that clearly defines the maximum amount of each groundfish stock that could be caught, it is no longer necessary to apply DAS to this group of fishermen to control groundfish mortality. The increased flexibility afforded by this universal exemption is likely to increase revenues, allow fishermen to more fully exploit previously under-exploited stocks, and reduce incentive to fish in unsafe conditions resulting in a positive effect on both sector participants and ports.

No Trip Limits

This universal exemption allows sector participants the flexibility to extend fishing efforts to realize a higher return on those efforts during high harvest periods. This increased flexibility is likely to increase revenues, allow fishermen to more fully exploit previously under-exploited stocks, and reduce incentive to fish in unsafe conditions resulting in a positive effect on both sector participants and ports.

Seasonal Closed Area on Georges Bank in May

The primary intent of excluding groundfishing vessels from Georges Bank in May has been to reduce cod catch; the closure has also served to reduce fishing activity on cod spawning aggregations. However, vessels not actively targeting allocated target stocks are still allowed on Georges Bank in May to fish in other fisheries, so disturbance to cod spawning aggregations is not completely avoided.

This exemption would allow sector vessels to actively pursue groundfish in Georges Bank in May, which may reduce pressure on other fisheries and may allow vessels to more fully exploit previously under-exploited stocks. In addition the universal exemption should increase CPUE resulting in increased vessel profits, likely positive effects on sector participants, and positive effects on ports.

Gulf of Maine Closures

The primary intent of excluding groundfishing vessels from the Gulf of Maine in the spring and fall has been to reduce cod catch; the closure has also served to reduce fishing activity on cod spawning aggregations. However, vessels not actively targeting groundfish but fishing for other species are still allowed in the GOM closure areas in May, so disturbance to cod spawning aggregations is not completely avoided.

Allowing sector vessels increased access to the GOM fishing grounds during spring and fall should increase CPUE and may allow vessels to more fully exploit previously under-exploited stocks. It also provides sector vessels access during a time when few grounds are open leading to increased opportunities. This would in turn lead to increased vessel profits likely resulting in a positive effect on both sector participants and ports. However, if the threshold of harbor porpoise take is exceeded, closures may be triggered for all groundfish vessels (i.e., Common Pool and sectors alike).

Six-inch Cod-end Exemption on Georges Bank if using Haddock Separator or Ruhle Trawl

Exempting sector vessels from the requirement to use a six-inch cod-end when fishing Georges Bank with a Haddock Separator or Ruhle trawl should increase the amount of haddock caught per unit of trawling effort because both the separator and Ruhle trawls increase the proportion of haddock caught compared to cod. Few impacts are expected to the cod stock. This would increase profit margins and allow fishermen to more fully exploit previously under-exploited stocks resulting in a positive effect on both sector participants and ports.

Operations Plan under the Proposed Action

Each sector Operations Plan is unique. However, the harvest rule for all sector Operations Plans tend to fall into one of four broad categories: quota management, monitoring, administrative, and gear restriction. In addition, harvest rules within each category tend to have similar impacts.

Section 3.1 provides a description of the harvest rules of the PCS Operations Plan. The summary category for each of these harvest rules and their likely impacts are provided in Table 5.1.5-1.

TABLE 5.1.5-1 Port Clyde Sector Harvest Rules Summary for Human Communities		
Summary Category	Harvest Rules Assigned to the Summary Category	Impacts
Quota Management	<ul style="list-style-type: none"> ▪ Quota Management Harvest Rule ▪ Full Retention of Legal Sized Fish ▪ Additional Measures to Prevent ACE Overages ▪ ACE Transfers and Pooling 	Harvest rules assigned to this category relate to actions that would ensure a sector's ACE is not exceeded. These harvest rules allow sector participants' the flexibility to time fishing efforts to correspond with optimal market and or environmental conditions. This increased flexibility is likely to increase revenues, allow fishermen to more fully exploit previously under-exploited stocks, and reduce incentive to fish in unsafe conditions. This would result in a positive effect on both sector participants and ports.
Monitoring	<ul style="list-style-type: none"> ▪ Not Applicable 	In the longer term, these harvest rules will provide a better understanding of discard rates which will reduce under-fishing of some stocks. The result would be a positive impact on both sector participants and ports.
Administrative	<ul style="list-style-type: none"> ▪ Not Applicable 	These harvest rules shift the burden of reporting from individual sector members to the Sector Manager. This represents a positive impact on sector members and a negligible impact to ports.
Gear Restriction	<ul style="list-style-type: none"> ▪ Not Applicable 	Not Applicable

Port Clyde Community Groundfish Sector - Requested Exemption

In addition to the universal exemptions for all sectors under Amendment 16, the PCS has requested one additional exemption from rules that apply to Common Pool fishermen. The potential

social and economic impacts of the exemption are assessed relative to the Sector vessels and the fishing community in this section.

1) Exemption from the 120-day block out of the fishery for gillnet vessels

The 120-day block rule was imposed as a means of controlling mortality and inter-vessel conflict by reducing gillnetting effort. Because PCS members would operate under an ACE, an exemption would increase the operational flexibility of Sector vessels while maintaining the mortality control rationale for the measure. This would increase the expected profit margins of PCS fishermen. The increased revenue would represent a low positive impact on PCS participants and ports relative to the Common Pool.

Summary of Direct and Indirect Impacts of the Proposed Action to Human Communities

Experience with the existing Georges Bank Cod Fixed Gear and Hook Sectors, continued receipt of applications for sector development during the development of Amendment 16, assessment of the universal exemptions, and assessment of the Sector-specific harvest rules and exemption requests all indicate that the Proposed Action would generally have a low positive social and economic impact on both Sector participants and ports.

5.1.5.2 No-Action Alternative

Under the No-Action Alternative, these vessels would remain in the Common Pool and would operate under the FY 2010 Common Pool rules. These rules, which include measures designed to rebuild groundfish stocks over the near-term by reducing fishing mortality, would likely reduce the revenue of individual fishermen and have negative impacts on communities that rely heavily on the Northeast multispecies fishery compared to sectors. Those negative impacts could include reduction or possible elimination of vessels from some ports, reduced activity for some shore-based businesses, and reduced economic viability of some piers, wharves, and docks. Such outcomes would diminish the probability that these communities would participate in the fishery once stocks have rebuilt. It is also possible that negative impacts could extend to other regional fishing communities that are less dependent on the groundfish fishery.

5.2 CUMULATIVE EFFECTS ANALYSIS

The need for a cumulative effects analysis (CEA) is referenced in the CEQ regulations implementing NEPA (40 CFR Part 1508.25). CEQ regulations define cumulative impacts as “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other action.” The purpose of a CEA is to consider the effects of the Proposed Action and the combined effects of many other actions on the human environment over time that would be missed if each action were evaluated separately. CEQ guidelines recognize that it is not practical to analyze the cumulative effects of an action from every conceivable perspective, but, rather, the intent is to focus on those effects that are truly meaningful. The CEA baseline in this case consists of the combined effects of the other sectors, and the past, present, and reasonably foreseeable future fishing and non-fishing actions which are described in Sections 5.2.2 through 5.2.4, and summarized in Table 5.2.5-1.

This CEA assesses the combined impact of the direct and indirect effects of this Sector with the impact from the operation of other sectors, and the past, present, and reasonably foreseeable future fishing actions, as well as factors external to the multispecies fishery that affect the physical, biological, and socioeconomic resource components of the groundfish environment. The analysis is focused on the VECs (see below) and compares the impacts of fishing under the Sector (Proposed Action) with the

impacts of fishing under the Common Pool (No-Action Alternative) as currently regulated by Amendment 13 to the Northeast Multispecies FMP and subsequent actions. The impacts of Common Pool fishing were previously assessed in the EIS and EAs associated with these actions. At the time this document was written, the proposed rule for Amendment 16 to the Northeast Multispecies FMP had been issued and the rule-making would be finalized on or before May 1, 2010. The impacts of Common Pool fishing have been addressed in the Final EIS accompanying Amendment 16.

Valued Ecosystem Components (VECs): The CEA focuses on VECs specifically including:

- Physical environment/habitat (including EFH);
- Regulated stocks (allocated target groundfish stocks);
- Non-allocated target species and bycatch;
- Protected resources/endangered species; and
- Human communities (ports of sector operation and sector members).

Temporal and Geographic Scope of the Analysis: The temporal range that will be considered for habitat, allocated target species, non-allocated target species and bycatch, and human communities, extends from 2004, the year that Amendment 13 was implemented, through May 1, 2011, the beginning of the FY 2011. While the effects of actions prior to Amendment 13 are considered (see Amendment 13 for a full cumulative effects analysis), the cumulative effects analysis for this action is focused primarily on Amendment 13 and subsequent actions because Amendment 13 implemented the sector process and included major changes to management of the groundfish fishery, including substantial effort reductions. Much emphasis is placed on the implementation of proposed measures from Amendment 16, since this action would approve up to 19 additional sectors, revise sector management regulations, and added stricter management measures that apply to the Common Pool.

The temporal range considered for endangered and other protected species begins in the 1990's when NMFS began generating stock assessments for marine mammals and developed recovery plans for sea turtles that inhabit waters of the U.S. EEZ. In terms of future actions, the analysis examines the period of approval for this action through May 1, 2011, which is the beginning of the subsequent fishing year. All sectors have requested approval for one year, and the cumulative effects will need to be reassessed following the implementation of Amendment 16 management measures and operation of sectors.

The geographic scope considered for cumulative effects to habitat, allocated target species, and non-allocated target species and bycatch consists of the range of species, primary ports, and geographic areas (habitat) discussed in Section 4.0 (Affected Environment). The range of each endangered and protected species as presented in Section 4.4 will be the geographic scope for that VEC. The geographic scope for the human communities will consist of those primary port communities from which Sector vessels originate.

Impact Category Definitions and Qualifiers: The following definitions and qualifiers are used in the narratives and tables of this CEA:

Impact Definition			
VEC	Direction		
	Positive (+)	Negative (-)	Negligible (Negl)
Habitat	Actions that improve the quality or reduce disturbance of habitat	Actions that degrade the quality or increase disturbance of habitat	Actions that have no positive or negative impact on habitat quality
Allocated Target Species, Non-allocated Target Species & Bycatch, Protected Resources	Actions that increase stock/population health	Actions that decrease stock/population health	Actions that have little or no positive or negative impact on stocks/populations
Human Communities	Actions that increase revenue and social well being of fishermen and/or associated businesses	Actions that decrease revenue and social well being of fishermen and/or associated businesses	Actions that have no positive or negative impact on revenue and social well-being of fishermen and/or associated businesses.
Impact Qualifiers:			
Low (L; as in low positive or low negative):	To a lesser degree		
High (H; as in high positive or high negative):	To a substantial degree		
Likely	Some degree of uncertainty associated with the impact		
ND	Impacts could not be determined at time of this writing		

NEGL = Negligible

5.2.1 Summary of Direct and Indirect Impacts of the Proposed Action

The direct and indirect effects on the VECs from the FY 2010 PCS operations (Proposed Action) compared to what the impacts would be if the same vessels operated in the Common Pool (No-Action Alternative) are summarized in Table 5.1-1.

The effects of specific universal exemptions on the physical environment and habitat (including EFH) would generally be negligible to low negative. In addition, the harvest rules for the PCS would also generally have a negligible impact on the physical habitat/EFH since the majority of the harvest rules are not expected to affect on the number of gear days fished.

The PCS anticipates that approximately one-half of the active vessels would use demersal (otter) trawls as their primary gear and one-half would primarily use sink gillnets. One vessel would use handline gear. As discussed in Section 4.1.6, trawls have relatively high habitat impacts and bottom gillnets and longlines have low impacts (Morgan and Chuenpagdee 2003). Trawls result in a greater impact to the seafloor than fixed gear. However, the Common Pool would also utilize trawl gear and would primarily fish in the same areas as the PCS.

In addition, the PCS would be assigned an ACE for each of the Northeast multispecies stocks, which would require sectors to stop fishing once their ACE has been reached. Figure 5.2.1-1 below indicates the PSC of the permits in the PCS, from which the ACE (in pounds) would be derived. It is expected that the universal exemptions, harvest rules, and requested exemption would tend to increase CPUE, which would result in less fishing days and thereby a reduction in impacts to the physical habitat/EFH. However, the ability to target specific stocks would tend to increase gear days and therefore a slight increase in impacts to the physical habitat/EFH. For the purposes of this assessment, it is anticipated that there would be a slight increase in overall gear days. It is expected that a minor increase in gear days would not have a measurable impact on the physical habitat/EFH. For these reasons, under the Proposed Action, PCS operations would generally have an overall likely negligible impact on the physical environment and habitat (including EFH) relative to the vessels operating under Common Pool requirements.

PCS operations and the requested exemption are expected to convert more vessel catch into landings and less discard than would otherwise occur in the Common Pool. The magnitude of impacts to allocated target species would be controlled predominately by the ACEs for each allocated stock. It is also expected that real-time management as proposed by the PCS would reduce the potential to exceed ACEs. Therefore, under the Proposed Action, the PCS Operations Plan would generally have an overall negligible impact on allocated target species relative to the vessels operating under Common Pool requirements.

It is expected that impacts from PCS operations and the requested exemption on non-allocated target species and bycatch would be directly related to operations conducted for allocated target stocks under allocations controlled by ACEs, and there would be little, if any, increase in impacts to non-allocated target species and bycatch under Sector management relative to the Common Pool. Real time management by the PCS is expected to reduce the potential to exceed ACEs and therefore control impacts to non-allocated target species and bycatch. For these reasons, under the Proposed Action, PCS operations would generally have an overall negligible impact on non-allocated target species and bycatch relative to the vessels operating under the Common Pool requirement.

Provisions of Amendment 16 would exempt the PCS from measures that would apply to the Common Pool such as the requirements for DAS limits, trip limits, area closures, and mesh size. These exemptions would generally allow for an increased chance of interactions between Sector vessels and protected resources due to fishing activities in previously closed areas and an increase in gear days. Although Universal Exemptions would result in positive or negligible impacts to physical habitat/EFH, fish stocks, and human communities, the additive effect of these exemptions on protected resources would likely be low negative. In addition, the PCS's Operations Plan would include multiple harvest rules. These harvest rules are generally administrative and would thereby result in negligible direct impacts to protected resources (see Table 5.1.4-1 for justification).

The PCS has requested one exemption which would have a low negative impact to protected resources due to a likely increase in gear days. Cumulatively, if the PCS is approved, impacts to protected resources from exemptions granted under Amendment 16, the PCS Operations Plan, and the specific exemption requested by PCS would likely result in a low negative impact due to a slight increase in gear days.

Experience with the existing Georges Bank Cod Fixed Gear and Hook Sectors, continued receipt of applications for sector formation during the development of Amendment 16, and theoretical considerations all indicate that the Proposed Action would generally have low positive social and economic impacts on PCS participants and ports.

Figure 5.2.1-1 Port Clyde Sector Potential Sector Contribution Compared to all Other Sectors and the Common Pool

5.2.2 Effects from All Other Sectors

In order to estimate the impacts of all sectors, the direct and indirect effects associated with each one must be weighed in context with the entire fleet. The individual sectors' impacts are analyzed in detail in each sector's EA, and are summarized in Table 5.2.2-1. Following Table 5.2.2-1, there are descriptions of each sector, and a brief discussion of the impacts associated with each sector. The aggregate sector impacts include matters that apply to all sectors and must be considered from a cumulative perspective. The impacts from individual sectors, as well as the aggregate impacts from these matters that are common to all sectors are captured in the summary of impacts row in Table 5.2.2-1. The summary of impacts is carried forward to Table 5.2.5-1 to be considered in the final summary of cumulative effects.

Notes: 1. Individual sector impacts are derived from each sector's EA. 2. EFH = essential fish habitat; NEFS = Northeast Fishery Sector								

5.2.2.1 Individual Sector Impacts

The impacts from each individual sector were analyzed in the corresponding EA. The paragraphs below briefly describe each sector, the proportion of ACL, and the impacts. Detailed discussion of each sector can be found in the corresponding EA.

Northeast Fishery Sector II

Members of this Sector would primarily operate out of the port of Gloucester, Massachusetts, although fish may also be landed in Boston, New Bedford, Provincetown, Falmouth, Newburyport, and Rockport, Massachusetts; and Seabrook and Portsmouth, New Hampshire. The primary gear for NEFS-II would be trawl gear, although a limited amount of gillnets (≤ 10 percent) may also be utilized. Based on the January 2010 Operations Plan, the NEFS-II would consist of up to 81 permits; however, it is anticipated that 43 active vessels would fish these permits. This Sector's PSC represents 16 to 20 percent of the total ACL for GOM cod, GOM haddock, Cape Cod/GOM yellowtail flounder, redfish, and GOM winter flounder. This Sector's PSC represents 11 to 14 percent of the total ACL for GB haddock, pollock, and witch flounder. PSC's for all other stocks are less than 10 percent of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector III

Members of this Sector would primarily operate out of the port of Gloucester, Massachusetts, although fish may also be landed in Marblehead and New Bedford, Massachusetts; and Point Judith, Rhode Island. The primary gear for NEFS-III would be gillnet, although a limited amount of trawl and longline gear (≤ 5 percent each) may also be utilized. Based on the January 2010 Operations Plan, NEFS-III would consist of 81 permits; however, it is anticipated that 50 active vessels would fish these permits. This Sector's PSC represents 10 to 17 percent of the total ACL for GOM cod, GOM haddock, and GOM winter flounder. This Sector's PSC represents 5 to 9 percent of the total ACL for Cape Cod/GOM yellowtail flounder, pollock, and white hake. PSC's for all other stocks are less than 5 percent of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources, and low positive impacts to human communities.

Northeast Fishery Sector IV

NEFS-IV would be based in Gloucester, Massachusetts and would be a lease only sector, which means there would be no active vessels fishing these permits. Based on the January 2010 Operations Plan, the NEFS_IV would consist of up to 48 permits, which are held by 3 permit owners, including the Gloucester Fishing Community Preservation Fund. While it is anticipated that the majority of the quota held by these permit holders would be available to sector vessels operating out of Gloucester, specifically NEFS-II and NEFS-III, the quota may be leased to other sectors as needed, depending on market conditions. NEFS-II would primarily utilize trawl gear, with limited use of gillnets and NEFS-III would primarily utilize gillnets, and to a limited extent, trawl and hook gear. This Sector's PSC represents less than 10 percent of the total ACL for all multispecies stocks; the stocks for which this sector would have the most ACE are GOM cod, American plaice, and witch flounder (each approximately 9 percent of the

total ACL). It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector V

Members of this Sector would land their catch primarily in the ports of Point Judith and Newport, Rhode Island; New Bedford, Massachusetts; and Montauk, New York. Secondary ports may include Belford, Cape May, Bay, and Point Pleasant, New Jersey; Boston, Gloucester, and Woods Hole, Massachusetts; Greenport, Hampton, and Shinecock, New York; and Stonington, Connecticut. The primary gear for this Sector would be trawl, although a limited amount (≤ 10 percent) of gillnet gear may also be utilized. Based on the January 2010 Operations Plan, the NEFS-V would consist of 41 permits; however, it is anticipated that 37 active vessels would fish these permits. This Sector's PSC represents 16 percent of the total ACL for SNE/MA yellowtail flounder. This Sector's PSC represents 10 percent of the total ACL for GB yellowtail flounder and 6 percent of the total ACL for GB haddock. PSC's for all other stocks are approximately 3 percent or less of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector VI

Members of this Sector would land their catch in the ports of Boston, Gloucester, and New Bedford, Massachusetts; however, Hyannis, Massachusetts may also be used. The primary gear for the NEFS-VI would be trawl, and some vessels (≤ 10 percent) may periodically use gillnets. Based on the January 2010 Operations Plan, the NEFS-VI would consist of 18 permits; however, it is anticipated that only 8 active vessels would fish these permits. This Sector's PSC represents approximately 4 to 6 percent of the total ACL for SNE/MA yellowtail flounder, redfish, and witch flounder. PSC's for all other stocks are less than 4 percent of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector VII

Members of this Sector would primarily land their catch in New Bedford, although Chatham, Fall River, Gloucester, and Provincetown, Massachusetts; Portland Harbor, Maine; and Montauk, New York would be secondary landing ports. The primary gear for NEFS-VII would be trawl gear (90 percent or more), although a limited amount of gillnet gear (≤ 10 percent) could also be utilized. Based on the January 2010 Operations Plan, the NEFS-VII would consist of 27 permits; however, it is anticipated that 21 active vessels would fish these permits. This Sector's PSC represents 17 percent of the total ACL for GB winter flounder, and 16 percent of the total ACL for GB yellowtail flounder. This Sector's PSC represents between 3 and 6 percent of the total ACL for GB cod, GB haddock, Cape Cod/GOM yellowtail flounder, SNE/MA yellowtail flounder, American plaice, GOM winter flounder, and witch flounder. PSC's for all other stocks are less than 1 percent of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target

species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector VIII

Members of this Sector would primarily land their catch in New Bedford, Massachusetts, although Point Judith, Rhode Island and Provincetown, Massachusetts would be secondary ports. The primary gear for NEFS-VIII would be trawl gear, although a limited amount of gillnets (≤ 10 percent) may also be utilized. Based on the January 2010 Operations Plan, the NEFS-VIII would consist of up to 22 permits; however, it is anticipated that only 16 active vessels would fish these permits. This Sector's PSC represents 21 percent of the total ACL for GB winter flounder, and 16 percent of the total ACL for GB yellowtail flounder. This Sector's PSC represents approximately 6 to 8 percent of the total ACL for GB cod, GB haddock, Cape Cod/GOM yellowtail flounder, and SNE/MA yellowtail flounder. PSC's for all other stocks are 4 percent or less of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector IX

Members of this Sector would primarily land their catch in New Bedford, Massachusetts, and secondary ports would include Provincetown, Massachusetts and Point Judith and Newport, Rhode Island. The primary gear for NEFS-IX would be trawl gear, although a limited amount of gillnets (≤ 10 percent) may also be utilized. Based on the January 2010 Operations Plan, the NEFS-IX would consist of 51 permits; however, it is anticipated that only 22 active vessels would fish these permits. This Sector's PSC represents 34 percent of the total ACL for GB winter flounder, 19 percent of the total ACL for GB yellowtail flounder, and 13 percent of the total ACL for GB cod. PSC's for all other stocks are approximately 10 percent or less of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector X

Members of this Sector would primarily land their catch in the ports of Green Harbor, Marshfield, Provincetown, Scituate, North River, Plymouth, Sandwich, Brant Rock, and Gloucester, Massachusetts. Secondary land ports include Chatham, Hyannis, New Bedford, Woods Hole, and Falmouth, Massachusetts. The primary gear for this Sector would be trawl gear, although some permits (≤ 5 percent) would be for gillnets and longlines (≤ 5 percent). Based on the January 2010 Operations Plan, the NEFS-X would consist of 44 permits; however, it is anticipated that 34 active vessels would fish these permits. This Sector's PSC represents 16 percent of the total ACL for GOM winter flounder, 12 percent of the total ACL for Cape Cod/GOM yellowtail flounder, and 4 percent of the total ACL for GOM cod. PSC's for all other stocks are 3 percent or less of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector XI

Members of this Sector would land their catch primarily in Gloucester, Hampton, and Newburyport, Massachusetts; Portland Harbor, Maine; and Rye, Hampton, Portsmouth and Seabrook, New Hampshire. In addition, they may land in York, Maine and New Bedford, Massachusetts. The primary gear for NEFS-XI would be gillnets (≥ 85 percent) although a limited amount of trawl gear (≤ 10 percent) and longline or hook gear (≤ 5 percent) may also be utilized. Based on the January 2010 Operations Plan, the NEFS-XI would consist of up to 48 permits; however, it is anticipated that 38 active vessels would fish these permits. This Sector's PSC represents approximately 14 percent of the total ACL for GOM cod, and 9 percent of the total ACL for pollock. PSC's for all other stocks are 5 percent or less of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector XII

Members of this Sector would primarily land their catch in Gloucester, Hampton, and Newburyport, Massachusetts; Portland Harbor, Maine; and Rye, Portsmouth and Seabrook, New Hampshire. In addition, they may land in York, Maine and New Bedford, Massachusetts. The primary gear for this Sector would be trawl gear, although a limited amount of gillnets (≤ 10 percent) may also be utilized. Based on the January 2010 Operations Plan, the NEFS-XII would consist of up to 8 permits; however, it is anticipated that 4 active vessels would fish these permits. This Sector's PSC represents 1.3 percent of the total ACL for GOM cod; PSC's for all other stocks are less than 0.6 percent of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Fishery Sector XIII

Members of this Sector would primarily land their catch in New Bedford, Massachusetts and Point Judith, Rhode Island. Secondary landing ports include Provincetown, Boston, and Gloucester, Massachusetts; Stonington, Connecticut; and Greenport, New York. The gear utilized by NEFS-XIII would be composed of approximately 90 percent trawl gear and 10 percent gillnet gear. Based on the January 2010 Operations Plan, the NEFS-XIII would consist of 35 permits; however, it is anticipated that 29 active vessels would fish these permits. This Sector's PSC represents 14 to 16 percent of the total ACL for GB yellowtail flounder and GB haddock, 10 to 12 percent of the total ACL for GB winter flounder and SNE/MA yellowtail flounder and 8 percent of the total ACL for GB cod. PSC's for all other stocks are less than 5 percent of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Georges Bank Cod Fixed Gear Sector

Members of this Sector primarily operate out of the ports of Allen's Harbor, Aunt Lydia's Cove, Saquatucket Harbor, and Stage Harbor, Massachusetts. The primary gear for this Sector would be fixed

gear, specifically hook-and-line gear (jigs and longlines) and sink gillnets. Based on the January 2010 Operations Plan, the Fixed Gear Sector would consist of 95 permits; however, it is anticipated that 49 active vessels would fish these permits. This Sector's PSC represents 28 percent of the total ACL for GB cod. PSC's for all other stocks are 8 percent or less of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH and allocated target species, non-allocated target species and bycatch, likely low negative impacts to protected resources, and low positive impacts to human communities.

Sustainable Harvest Sector

Members of this Sector would primarily land their catch primarily in the ports of Boston, Chatham, Gloucester, Hyannis, New Bedford, Provincetown, and Scituate, Massachusetts; Kennebunkport surrounding communities, Cundy's Harbor, Portland Harbor, Rockland, and Sebasco Harbor, Maine; Portsmouth and Rye, New Hampshire; and Newport and Point Judith, Rhode Island. The primary gear for this Sector would be trawl, although a limited amount (10 percent) of gillnet and/or hook gear may also be utilized. Based on the January 2010 Operations Plan, the Sustainable Harvest Sector would consist of up to 129 permits; however, it is anticipated that 44 active vessels would fish these permits. This Sector's PSC for several stocks represents approximately one-third or more of the total amount permitted for harvest by the fleet (white hake [50 percent], redfish [49 percent], GOM haddock [41 percent], American plaice [40 percent], pollock [38 percent], and witch flounder [34 percent]). This Sector's PSC represents 30 percent of GB haddock, 18 percent of GOM cod and 17 percent of GB cod. PSC's for all other stocks comprise between 7 and 12 percent of the amount permitted for harvest by the fleet.

Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Tri-State Sector

Members of this Sector would operate out of Beverly, Chatham, Gloucester, Harwichport, New Bedford, Provincetown, Salem and Scituate, Massachusetts. The primary gear type in this Sector would be trawl gear, although gillnets and hook-and-line gear would be used as well. Based on the January 2010 Operations Plan, the Tri-State Sector would consist of 22 permits; however, it is anticipated that 10 active vessels would fish these permits. This Sector's PSC represents roughly 7 percent of the total ACL for GB yellowtail flounder and 3 percent of the total ACL for GOM winter flounder. PSC's for all other stocks are less than 2 percent of the amount permitted for harvest by the fleet. Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

Northeast Coastal Communities Sector

Members of this Sector would homeport and/or land their catch in one of several ports in Maine and Massachusetts. Primary landing ports would include Beal's Island, Jonesport, Port Clyde, Southwest Harbor, Stonington, and Winter Harbor, Maine; and Menemsha, New Bedford, Oak Bluffs, Sandwich,

and Vineyard Harbor, Massachusetts. Secondary ports would include Buck's Harbor, Eastport, Matinicus, Northeast Harbor, and Swan's Island, Maine; and Gloucester and Provincetown, Massachusetts. The primary gear for this Sector would be longline, trawls, and traps/pots. Based on the January 2010 Operations Plan, the Northeast Coastal Communities Sector would consist of 19 permits, fished by 19 active vessels. PSC's for stocks are less than 1 percent of the amount permitted for harvest by the fleet; however, the stocks for which the allocation is highest is white hake (0.009 percent) and GB yellowtail flounder (0.008 percent). Impacts associated with this Sector's operation reflect consideration of universal exemptions, Sector harvest rules, and Sector-specific exemptions. It is anticipated that this Sector's operation would result in negligible impacts to the physical environment/habitat/EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to human communities.

5.2.2.2 Aggregate Sector Impacts

The sector-specific harvest rules, universal exemptions granted by Amendment 16, Sector-specific harvest rules, and additional requested Sector-specific exemptions have been discussed in Section 5.1 and incorporated into the Sector-specific impacts represented in Table 5.2.2-1. While the direct and indirect effects of additional exemptions have been incorporated into individual sector impacts above, it is important to look at the potential aggregate impacts of allowing these exemptions to go forward. In aggregate, the requested exemptions would have or would likely have negligible impacts on habitat/EFH, allocated target species, and non-allocated target species and bycatch. By design, all requested exemptions would have low positive effects to sector members and usually ports. Several of the Amendment 16 universal exemptions may result in an increased potential for gear interactions with protected resources, possibly resulting in low negative impacts as discussed in Section 5.1.4 of each sector's EA. In addition, several sectors with gillnet vessels requested exemptions from gillnet-related restrictions. This may result in an increased number of nets or time the nets would be in the water. Based on the reported gear mix and number of active vessels in the January 2010 Operations Plans and associated EAs, roughly half the gillnet vessels in the commercial multispecies fleet would be operating under sector rules (i.e., exemptions, harvest rules, ACE, etc.). Many of these sector gillnet vessels would be exempted from the 120-day gillnet block, if approved. When compared to the No-Action Alternative (i.e., if these gillnet vessels were operating under Common Pool rules), there would be more gear days under the Proposed Action(s), resulting in low negative impacts to protected resources.

Additionally, there are matters that are related to general sector operations, and are considered in aggregate below and also summarized in Table 5.2.2-1 above.

Proportion of ACL

The total amount of groundfish that is permitted to be caught by the commercial multispecies fleet is called the ACL. FY 2010 is the first year in which ACLs have been set for most stocks, in order to be in compliance with revisions to the Magnuson-Stevens Act in 2006. Proposed management measures in Amendment 16 to the Northeast Multispecies FMP have been set to reduce exploitation rates of managed stocks by roughly 40 to 60 percent (Table 4 of Amendment 16) from FY 2008 in order to achieve the ACLs for the multispecies stocks. AMs have been put into place to ensure that fishing by the Common Pool does not exceed the ACL. Based on the sector rosters which were submitted January 2010, approximately half the permits in the Northeast multispecies fishery would be enrolled in sectors, while the other half would remain in the Common Pool. The proportion of ACL that is linked to the permits enrolled in sectors (i.e., potential sector contribution) would be more than 90 percent for all Northeast groundfish stocks, with the exception of SNE/MA yellowtail flounder (more than 70 percent in sectors) and GOM winter flounder (more than 80 percent in sectors). The ACE for each sector is determined by multiplying the summed PSC of all members by the overall ACL for each stock. The

proportion of ACLs in sectors and the Common Pool is illustrated in Figure 5.2.2-1. The potential impacts of the proportion of ACL in sectors is negligible or likely to be negligible to physical environment/EFH, allocated target stocks, non-allocated target species and bycatch, and protected resources, since there would likely be little potential for change in the potential amount of catch, which would be controlled by ACEs for each sector. However, the catch may increase for abundant stocks such as haddock because of the increased flexibility to selectively target these stocks with gear specifically designed for this purpose. Sector participants would likely benefit from the ability to fish their ACE, which represents the majority of the ACL for the fleet, without effort control restrictions. This would in turn, result in low positive impacts to the sectors' ports.

Figure 5.2.2-1 Percentage of Allocated Stocks in All Sectors and the Common Pool

Inter-Sector Transfer of ACE

Inter-sector transfer of ACE is discussed in Amendment 16 to the Northeast Multispecies FMP (Sections 4.2.3.7, 5.2.3.7, and 7.2.1.2.3.4), which would allow sectors to adjust allocations “to account for unusual circumstances or to take advantage of other opportunities.” These ACE transfers may occur during the fishing year and up to two weeks after the end of the fishing year in order to “provide[s] a limited opportunity for a sector to quota balance in the instances that ACE was inadvertently exceeded. This provision is not intended to allow sectors to exceed their ACE.” These provisions do not provide for the permanent transfer of sector shares, but allow sectors to avoid inadvertent overages and avoid potential enforcement action or penalties if ACE is exceeded. The ability to transfer ACE within an allotment period results in a net increase of zero, having no impact on achieving target mortality rates. In addition, this provision provides a disincentive to discard catches that may exceed the ACE, and the ability to carry-over ACE into the following fishing year discourages fishing right up to the maximum amount allowed (Sanchirico et al. 2006). This provision would have a low positive impact on human communities because it would allow some flexibility in covering inadvertent overages of a sector’s ACE and provides an option to avoid enforcement actions and/or penalties, and greater utilization of allocations, resulting in more landings. The impacts to the physical and biological environments are likely negligible, since this provision would allow for minor deviations from a sector’s given ACE.

Consolidation of Permits

Most sectors have indicated that some of their sector members would not actively fish. Of the 812 individual permits currently enrolled in a sector, 465 of those permits are linked to “active” vessels that would fish. While it initially appears that fewer vessels would be fishing as a result of sectors, many of these permits/vessels were previously inactive because of the DAS Leasing Program. In FY 2004, Amendment 13 brought the opportunity for fleet consolidation through the implementation of the DAS Leasing Program and, to a lesser extent, from the DAS Transfer Program. Accordingly, additional fleet-wide consolidation would take place only to the extent that additional consolidation occurs beyond that which resulted from the leasing/transfer programs in past years or would happen under those programs in FY 2010.

The severities of social implications that result from sectors are difficult to predict. Because members currently enrolled in sectors are still able to withdraw to the Common Pool through April 30, 2010, the exact consolidation cannot be predicted. Depending on the fleet composition of the sectors and the distribution of ACE amongst sectors, it is possible that specific gear types or geographic regions could be disproportionately impacted. However, sectors predict that there would be no further consolidation of permits as a result of sector operations. Because sectors claim that there would be no further consolidation of permits as a result of sector operations, it is anticipated that there would be negligible impacts to all VECs associated with consolidation of permits.

Redistribution of Effort

On a related note, expansion of sectors may result in some fishing effort being redistributed from the Northeast multispecies fishery into other fisheries due to improved fishing efficiency, selectivity, or consolidation among vessels that historically fished for Northeast multispecies. Under this scenario, it is possible that fishing effort could be redistributed amongst different gear types and/or different fishing areas, or that the fleet composition could change. It is likely that effort would shift towards fisheries that are managed under effort controls, or are less regulated and/or less competitive, or into fisheries that are not overfished or undergoing overfishing. Two examples to illustrate these scenarios are provided:

- If gillnetters are able to successfully target haddock, an increase in gillnet effort may result because of the abundance of haddock and the replacement of broad effort controls with stock-specific mortality controls.
- Vessels within sectors that also have lobster permits could decide to lease their multispecies quota to larger vessels and instead target American lobster stocks with gear not capable of catching Northeast multispecies.

It is difficult to predict how the social, economic, and biological impacts of effort shifts caused by sectors would compare to, or interact with, the social, economic, and biological impacts of effort shifts from the increased effort controls on the Common Pool under Amendment 16. The opportunity for this type of effort redistribution has existed since implementation of the DAS Leasing/Transfer Program was implemented in Amendment 13 (as described in Section 3.4.7 of that document). Accordingly, additional redistribution of effort is likely only to the extent that additional consolidation occurs beyond that which resulted from the DAS Leasing Programs. In other words, it is likely that higher rates of consolidation would lead to a greater redistribution of effort. How much effort is redistributed by individuals enrolled in a sector compared to what is anticipated within the Common Pool is difficult to predict. Sectors predict that there would be no additional consolidation of permits as a result of sector operations, and consequently there would be no redistribution of effort. Based on this prediction, it is anticipated that there would be negligible impacts to all VECs associated with redistribution of effort.

Monitoring

Because the primary control to regulate fishing by sectors would be the ACE for each stock, sectors must monitor landings to ensure that the sector allocation is not exceeded. Sectors must comply with the new system of at-sea and dockside catch monitoring, which provide information on both landings and discards. Since the majority of the allowed catch for the fishery would belong to sectors, a greater proportion of the groundfish stocks would be monitored. More monitoring data would be generated, covering a larger percentage of the groundfish stocks, which would be a positive contribution for stock assessments and future regulation that rely on these assessments. Allocated target stocks, non-allocated target species and bycatch, and protected resources would experience a low positive cumulative impact since additional monitoring would provide information for more effective management of the fishery and a better understanding of interactions between fisheries and protected species. There would be a negligible effect on habitat, and a low negative impact on human communities due to the increased monitoring and enforcement costs.

5.2.2.3 Summary of Impacts from Sector Operations

Overall, the cumulative impacts associated with all other sector operations (except the PCS) are as follows: negligible impacts to physical environment/habitat and EFH, allocated target species, and non-allocated target species and bycatch; likely low negative impacts to protected resources; and low positive impacts to the human communities.

5.2.3 Other Fishing Effects: Past, Present and Reasonably Foreseeable Future Groundfish and Related Management Actions

Table 5.2.3-1 is a summary of the past, present, and reasonably foreseeable future fishing actions and effects, with the exception of anticipated effects from the operations of the other sectors, which are described in Section 5.2.2 and outlined in Table 5.2.3-1. The impact assessment terms (i.e., positive, negative, negligible) are for the impacts associated with the action on the VECs discussed in Section 4. Specifically, the VECs include: the physical environment and habitat; allocated target species; non-allocated target species and bycatch; protected resources such as marine mammals and sea turtles; and the human communities of ports as well as the Sector participants.

TABLE 5.2.3-1 Summary of Effects on VECs from Past, Present, and Reasonably Foreseeable Future FMP and Other Fishery Related Actions with the Exception of Sector Operations						
Fishing Actions	Physical Impacts	Biological Impacts			Human Community Impacts	
	Habitat/EFH	Allocated Target Species	Non-allocated Target Species and Bycatch	Protected Resources	Ports	Sector Participants
Past and Present Fishing Actions						
Amendment 13 (2004) – Implemented requirements for stock rebuilding plans and dramatically cut fishing effort on groundfish stocks. Implemented the process for creating sectors and established the Georges Bank Cod Hook Gear Sector	L(+) Reductions in fishing effort expected to reduce contact time and aerial extent of fishing gear on Essential Fish Habitat	H(+) Fishery Management Plan action further addresses overfished and overfishing status of allocated target species by reducing mortality through additional effort reductions.	(+) Reduction in fishing effort results in reduction of bycatch for many species. Reduced fishing effort also reduces mortality on other non-allocated target species.	L(+) Further reductions in fishing effort via Days-at-Sea cuts when combined with previously established Closed Areas reduce the potential for gear interactions	H(-) short-term, L(+) long-term. Regulations negatively impacted fishing communities in the short-term Reductions expected to lead to more robust stocks in the long-term	H(+) Created sectors and increased efficiency of Sector members, decreased overhead costs. Community initiative resulted in conservation effort.
FW 40A (2004) – allowed additional fishing on Georges Bank haddock for Sector and non-Sector hook gear vessels, created the Georges Bank haddock Special Access Pilot Program, and created flexibility by allowing vessels to fish inside and outside the United States/Canada Area on the same trip	Negl Due to limited impact of hook gear	L(-) Increased mortality, for Georges Bank haddock Designed not to compromise Amendment 13 mortality objectives	L(-) Increased effort results in slight incidental mortality Incidental catch minimized by time/area/bait type limitations.	Negl Gear interactions not expected to increase in any significant way	(+) Provided increased revenue to homeports of hook vessels Enhanced importance of industry involvement	(+) Increased revenue to Hook Sector members NEGL For non-hook vessels or non-Sector members Participation in collaborative research that brought about sustainable fishing opportunities

TABLE 5.2.3-1 (continued)						
Summary of Effects on VECs from Past, Present, and Reasonably Foreseeable Future FMP and Other Fishery Related Actions with the Exception of Sector Operations						
Fishing Actions	Physical Impacts	Biological Impacts			Human Community Impacts	
	Habitat/EFH	Allocated Target Species	Non-allocated Target Species and Bycatch	Protected Resources	Ports	Sector Participants
Past and Present Fishing Actions						
FW40B (2005) – Allowed Hook Sector members to use Georges Bank cod landings caught while using a different gear during the landings history qualification period to count toward the share of Georges Bank cod that will be allocated to the Sector, revised Days-at-Sea leasing and transfer programs, modified provisions for the Closed Area II yellowtail flounder SAP, established a Days-at-Sea credit for vessels standing by an entangled whale, implemented new notification requirements for Category I herring vessels, and removed the net limit for trip gillnet vessels.	Negl – L(+) Potential for decreased impacts because a larger portion of the Georges Bank cod stock will be taken with hook gear which has been shown to have negligible impacts to habitat	L(-) Short-term increase in effort; minor increase in mortality on Georges Bank haddock; not expected to threaten Amendment 13 mortality objectives.	L(-) Increased effort results in slight incidental mortality. Incidental catch minimized by time/area/bait type limitations	Negl	L(+) Minor benefits gained through relaxed leasing and transfer rules and improvements to the management of the yellowtail flounder SAP that were intended to reduce derby fishing conditions	L(+) Minor benefits gained through increased revenues resulting from a greater allocation of the Georges Bank cod total allowable catch based on historical catch landings with gear other than hook gear. Increased revenue due to the removal of gillnet limits on trip vessels.

TABLE 5.2.3-1 (continued)						
Summary of Effects on VECs from Past, Present, and Reasonably Foreseeable Future FMP and Other Fishery Related Actions with the Exception of Sector Operations						
Fishing Actions	Physical Impacts	Biological Impacts			Human Community Impacts	
	Habitat/EFH	Allocated Target Species	Non-allocated Target Species and Bycatch	Protected Resources	Ports	Sector Participants
Past and Present Fishing Actions						
FW41 (2005) – Allowed for participation in the Hook Gear Haddock SAP by non-Sector vessels	Negl	Negl Extended access to Haddock SAP for non-Sector vessels which encourages effort on Georges Bank haddock, a healthy stock, and thus away from stocks of greater concern.	Negl– L (-) Allows for a small overall effort increase which could allow for higher bycatch/discard rates	Negl	L(+) Provided non-Hook Sector community members the opportunity to participate in the Haddock SAP, but capped SAP effort	L (-) Economic benefits to sectors would be less than non-Sector participants because the incidental cod catch limit for sectors is smaller than it is for non-sector vessels.
FW42 (2006) – Implemented further reductions in fishing effort based upon stock assessment data and stock rebuilding needs, implemented Georges Bank Cod Fixed Gear Sector	L(+) Effort reductions may have positive impacts due to less bottom time	(+) Implemented further reductions in fishing mortality for groundfish species, put further catch limits on Georges Bank cod	(+) Reduced mortality on target species through effort reductions results in a reduced rate of bycatch/discards	L(+) Further effort reductions likely resulted in lower risks of gear interaction	(-) short-term, L(+) long-term Disproportionate effects on these groundfish-dependent ports. Long-term benefits from reduced mortality	(+) Allowed additional gear type to gain the efficiencies and other benefits of Sector membership.

5.2.3.1 Physical Environment/Habitat/EFH

The analysis of past, present, and reasonably foreseeable future fishing actions that affect habitat in the region in which the PCS would operate is limited to the area described in Section 3.1.1.

Past, Present Actions: Amendment 13 and FW 42 are regulations that have reduced fishing effort. Amendment 16 would also reduce fishing effort. Reduction in fishing effort results in less gear interaction with bottom habitat, effectively resulting in low positive effects to the physical environment. Other management actions that do not increase or decrease gear interaction with habitat have a negligible effect on habitat. FW 40B was implemented in 2005 and allowed previously non-hook vessels to join the Georges Bank Cod Hook Sector, which resulted in more cod caught with hook gear. This action had a negligible to low positive effect on habitat because hook gear has minimal impacts to bottom habitat.

The ALWTRP requires the use of sinking groundlines, which may have a negligible to low negative impact on habitat due to associated bottom sweep by the groundline. In addition, required use of weak links in gillnets may result in floating “ghost gear,” which could snag on and damage bottom habitat.

Because one of the primary bycatch species in the Northeast multispecies fishery is spiny dogfish, the spiny dogfish FMP is discussed in more detail in Section 5.2. 3. The spiny dogfish FMP was developed in response to classification of the spiny dogfish stock as overfished in 1998. The overall goal of the FMP is to conserve spiny dogfish in order to achieve optimum yield from the resource in the western Atlantic Ocean. Measures to rebuild the stock and to achieve optimum yield have included quotas and trip limits. Quotas and trip limits control the amount of fish that can be harvested. Prior to FY 2009, spiny dogfish trip limits were low, allowing retention of spiny dogfish caught incidentally to other target fisheries while rebuilding the spiny dogfish stock. The quota was tripled in FY 2009 to 12 million pounds, and the daily trip limit was increased from 600 to 3,000 pounds. Despite the increases in quota and trip limit, the spiny dogfish fishery in Federal waters has generally been an incidental fishery to other fisheries; therefore an increase in the quota has likely caused an increased proportion of the catch to be landed, rather than discarded. Furthermore, most of the landed catch has historically been with bottom gillnets, not bottom trawls. Since gillnets have a low impact on vulnerable benthic habitats and no appreciable amount of additional trawling was expected, this FMP has likely had a negligible effect on habitat.

Future Actions: Reasonably foreseeable future actions that will likely affect habitat include the EFH Omnibus Amendment (under development at this time). The EFH Omnibus Amendment will provide for a review and update of EFH designations, identify Habitat Areas of Particular Concern (HAPCs), as well as provide an update on the status of current knowledge of gear impacts. It will also include new proposals for management measures for minimizing the adverse impact of fishing on EFH that will affect all species managed by the NEFMC, in a coordinated and integrated manner. These measures are likely to modify the boundaries of the existing habitat closed areas and/or replace them with entirely new – and smaller – areas that are more specifically designed to protect the most vulnerable habitats. Given the large-scale reductions in fishing effort that have taken place as a result of regulatory changes during the last decade, habitat protection measures in this amendment could result in a reduction in the total area that is closed to mobile, bottom-tending fishing gear. However, a more systematic approach to identifying the most vulnerable habitat areas should result in more effective habitat protection, (i.e., more protection per unit area closed). Areas that are presently closed year-round to limit fishing mortality on groundfish stocks – which overlap to a large extent with the existing habitat closures – would remain closed until resource management measures are implemented in future amendments to the multispecies, scallop, and monkfish FMPs that could affect their size or location. The net effect of new

EFH and HAPC designations and more targeted habitat management measures should be positive for EFH.

The Strategy for Sea Turtle Conservation and Recovery in Relation to Atlantic Ocean and Gulf of Mexico (“Strategy”) is a gear-based approach to addressing sea turtle bycatch, and is discussed in more detail in Section 5.2.3.4. NMFS is currently considering proposing changes to the regulatory requirements for trawl fisheries to protect sea turtles. As described in a Notice of Intent (NOI) to prepare an EIS for Sea Turtle Conservation and Recovery in Relation to the Atlantic Ocean and Gulf of Mexico Trawl Fisheries (74 FR 88 May 8, 2009), NMFS is considering increasing the size of the escape opening for Turtle Excluder Devices (TEDs) in the summer flounder fishery, expanding the use of TEDs to other trawl fisheries, and modifying the geographic scope of the TED requirements. Since TED requirements may decrease the catch retention of some target species, vessels may tow longer to offset this loss of catch, likely resulting in negative impacts to habitat and EFH.

Skates are currently managed under an FMP, and Amendment 3 to the FMP is expected to go into effect on or before May 1, 2010. The purposes of Amendment 3 to the Skate FMP are to reduce discards and landings sufficiently to rebuild stocks of winter, thorny, and smooth skates, and to prevent other skates from becoming overfished. The new management measures in Amendment 3 result in a reduction in fishing effort to rebuild biomass. Reductions in fishing effort generally result in fewer habitat and gear interactions, a likely positive impact to the physical environment.

Framework Adjustment 44 (FW 44) to the Northeast Multispecies FMP would implement ACLs in FY 2010 for all Northeast multispecies stocks and make adjustments to the management measures to address stocks of concern and to manage the fishery in a more precautionary manner. This action is intended to work closely with and augment Amendment 16 to the Northeast Multispecies FMP, which is scheduled to be implemented on May 1, 2010. Although analysis is not complete, this action would potentially reduce fishing effort and consequently gear interactions; therefore, positive impacts to habitat/EFH are likely.

Summary of Impacts: As indicated in Table 5.2.3-1, management measures in Amendment 13, FW 42, Amendment 16, Amendment 3 to the Skate FMP, and FW 44 have (or would likely have) positive effects on habitat due to reduced fishing efforts, consequently reducing gear interaction with habitat. FW 40A and 40B resulted in negligible to low positive effects on habitat due to decreasing impacts to the bottom as more cod is caught with low impact fixed gear. The ALWTRP resulted in low negative to negligible effects on habitat due to the possibility of groundline sweep on the bottom and “ghost gear.” The FMPs that reduce fishing effort generally result in fewer habitat and gear interactions, resulting in low positive effects on habitat. The proposed TED requirements would likely have negative effects on habitat due to potentially increased towing time. Overall, the cumulative effect of past, present, and reasonably foreseeable future fishing actions have resulted in positive effects on habitat.

5.2.3.2 Allocated Target Species

Past and Present Actions: Although management measures for groundfish were first enacted for the EEZ in 1977 under the original Groundfish FMP, the dramatic increase in larger vessels, bigger gear, and electronic aids such as fish finders and navigation equipment contributed to a greater efficiency and intensity of fishing, which in turn resulted in a precipitous drop in landings during the 1980’s to an all-time low in the early 1990’s. The following discussion is limited to past actions beginning with the implementation of Amendment 13. However, it should be noted that in general, management actions taken prior to Amendment 13 reduced effort on managed groundfish stocks, decreased impacts to habitat, reduced gear interactions with protected species, and had a negative impact on human communities.

However, because actions prior to Amendment 13 did not rebuild overfished stocks to sustainable levels, greater effort reductions were necessary.

Management actions that affect allocated target species have been reviewed with some detail in the FSEIS of Amendment 13, the EA for FW 42, and the Final EIS of Amendment 16. Amendment 13, FW 42, and Amendment 16 have implemented (or would implement) restrictions on fishing effort in order to rebuild groundfish stocks. These restrictions were designed to have positive effects on groundfish, and they have indirectly had positive effects on non-allocated target species and bycatch caught in conjunction with the allocated target species. In contrast, FW 40A and 40B allowed for minor increases in fishing effort on cod and haddock, which is considered a low negative impact on these species.

As discussed in Section 4.3, the results of the GARM III show stocks of ocean pout and Atlantic halibut are being fished at a sustainable level, but the biomass indicates stocks have not yet been rebuilt and are considered to be overfished. The stock of GB haddock is rebuilt, and GOM haddock, Acadian redfish, and American plaice are no longer overfished or experiencing overfishing, which indicates Amendment 13 and FW 42 management actions have had positive effects on certain groundfish stocks. All other groundfish stocks are still experiencing overfishing, which the proposed management measures in Amendment 16 to the Northeast Multispecies FMP address.

As discussed in Section 4.3, vessels operating under the Category B DAS program for multispecies reports indicate the top three species (by weight) other than multispecies that were landed in FYs 2006 and 2007 were skates, monkfish, and spiny dogfish. Since skates, monkfish, and spiny dogfish are managed by FMPs other than the Northeast Multispecies FMP, the impacts of these management measures are briefly discussed below.

The spiny dogfish FMP has resulted in an increase in stock biomass such that the most recent data indicates that the female spawning stock biomass is likely to be above the most recently calculated maximum sustainable yield biomass (B_{MSY}). This development has resulted in increases in both quota and trip limits for this species set by the FY 2009 specifications (MAFMC 2009). The specifications for FY 2010 are likely to maintain similar quota limits. With this increase in quotas and trip limits, it is likely that there will be an increase in the amount of spiny dogfish caught and landed by vessels fishing for groundfish. If the spiny dogfish stock remains at or above B_{MSY} , the dogfish fishery may reduce fishing effort on groundfish stocks, resulting in a low positive effect on allocated target groundfish species.

Monkfish is commonly caught along with groundfish and is considered one of the top target species that is not allocated to sectors by an ACE. Monkfish are currently regulated by the Monkfish FMP, which was implemented in 1999. The FMP was designed to stop overfishing and rebuild the stocks through a number of measures, including: limiting the number of vessels with access to the fishery and allocating DAS to those vessels; setting trip limits for vessels fishing for monkfish; minimum fish size limits; gear restrictions; mandatory time out of the fishery during the spawning season; and a framework adjustment process. As of February 2010, Amendment 5 to the Monkfish FMP will focus on completion of monkfish annual catch limits and accountability measures, and it also will include both days-at-sea and trip limits associated with the new catch targets based on updated stock information. The Monkfish FMP and subsequent amendments and framework actions have reduced fishing effort over the last decade, which has resulted in positive impacts for groundfish and non-groundfish stocks (including bycatch). Amendment 5 to the Monkfish FMP will either maintain the current level of fishing effort or allow for additional fishing above the current level, since both stocks of monkfish (North and South) are rebuilt.

Future Actions: The provisions in the EFH Omnibus Amendment could result in greater habitat protection for areas that are highly vulnerable to the adverse effects of fishing, resulting in a likely positive effect on groundfish. Further, NMFS is currently in a rule-making process to propose changes to the HPTRP which are intended to reduce harbor porpoise mortalities (74 FR 36058, July 21, 2009). This action would likely result in vessels facing additional restrictions, possibly resulting in positive impacts to groundfish and other species taken incidentally.

The sea turtle Strategy is a gear-based approach to addressing sea turtle bycatch, and is discussed in more detail in Section 5.2.3.4. NMFS is currently considering proposing changes to the regulatory requirements for trawl fisheries to protect sea turtles. As described in an NOI to prepare an EIS (74 FR 88 May 8, 2009), NMFS is considering increasing the size of the escape opening for TEDs in the summer flounder fishery, expanding the use of TEDs to other trawl fisheries, and modifying the geographic scope of the TED requirements. Since the sectors operate under an ACE, and assuming that the ACE is met, the TED requirements would likely have a negligible effect on the target species as the same quantity of targeted fish would be landed.

As indicated in Table 87 of the Final EIS for Amendment 16 to the Northeast Multispecies FMP, skates comprised nearly half the landings by weight for FY 2006 and 2007, under the Category B DAS (multispecies) program. Skates are currently managed under an FMP, and Amendment 3 to the FMP is expected go into effect on or before May 1, 2010. The purposes of Amendment 3 to the Skate FMP are to reduce discards and landings sufficiently to rebuild stocks of winter, thorny, and smooth skates, and to prevent other skates from becoming overfished. The new management measures in Amendment 3 result in a reduction in fishing effort to rebuild biomass. Therefore, the likely future impacts would be positive for the allocated multispecies stocks, which are simultaneously targeted with skates.

Atlantic wolffish was recently determined to likely be overfished. The species is occasionally caught along with groundfish in the Gulf of Maine and Georges Bank areas. Although not currently managed under an FMP, in response to the population decline, the NEFMC recommended as part of Amendment 16 that wolffish be included in the groundfish management unit under the Northeast Multispecies FMP and that neither commercial or recreational vessels be allowed to retain wolffish on board vessels. In addition, on October 1, 2008, the Conservation Law Foundation (CLF) submitted a petition to NMFS to list Atlantic wolffish as endangered under the Endangered Species Act. Previously, wolffish was listed as a "Species of Concern" in 2004 due to declining biomass which was attributed to commercial fishing, degradation of bottom habitat by trawls, and capture as bycatch by fisheries using otter trawls. On November 6, 2009 NMFS determined that listing of the Atlantic wolffish as threatened or endangered under ESA was not warranted.

FW 44 to the Northeast Multispecies FMP would implement ACLs in FY 2010 for all Northeast multispecies stocks and make adjustments to the management measures to address concerns and to manage the fishery in a more precautionary manner. Specifically, this action would implement catch specifications for all stocks for FYs 2010, 2011, and 2012, and implement modified trip limits and/or differential days-at-sea rules, as well as provide authority for the Regional Administrator to adjust such measures in-season. This action is intended to work closely with and augment Amendment 16 to the Northeast Multispecies FMP, which is scheduled to be implemented on May 1, 2010. The analysis indicates that this action would potentially reduce fishing effort; therefore, positive impacts on allocated species are likely, as the proposed management measures are designed to promote sustainability of these stocks.

Summary of Impacts: Amendment 13, FW 42, Amendment 16, and FW 44 have had (or would be expected to have) positive effects on allocated target species. Other FMPs that affect other species landed by groundfish sectors have also resulted in positive effects on allocated target species. Future

measures that will likely restrict fishing effort (EFH Omnibus, HPTRP) will also have positive effects on allocated target species. Future measures such as the TED requirements would likely result in negative effects to allocated target species because lower catch retention would result in an increase in fishing effort. Actions that increase fishing effort (i.e., FW 40A and 40B) had low negative effects on allocated target species. Overall, the cumulative effect of past, present, and reasonably foreseeable future fishing actions have resulted in positive effects on allocated target species.

5.2.3.3 Non-allocated Target Species and Bycatch

Past, Present Actions: "Non-allocated target species" refers to species which the sector members could also be targeting, but for which no ACE is allocated. As defined in the Magnuson-Stevens Act, bycatch refers to "fish which are harvested in a fishery, but which are not sold or kept for personal use, and includes economic discards and regulatory discards." For the purposes of this EA, the discussion of non-allocated target species and bycatch refers primarily to skates, monkfish, and dogfish. These species dominate bycatch (i.e., dogfish) or are the primary alternate species that are landed by groundfishermen (i.e., monkfish and skates). Management actions that reduce fishing effort (i.e., Amendment 13, FW 42, and Amendment 16) have or will likely have positive effects on both landed species and on bycatch. Conversely, actions that increase fishing effort (i.e., FW 40A and FW 40B) have low negative effects on both landed species and bycatch.

Spiny dogfish was one of the top non-groundfish species landed by multispecies vessels under the Category B (regular) DAS program (Table 87 of Amendment 16 Final EIS). This species primarily interacts with gillnet and hook and line gear, and represented over 90 percent of the bycatch reported by the Georges Bank Cod Fixed Gear and Hook Sectors in previous years. Since the spiny dogfish stock is managed under a FMP separate from the Northeast Multispecies FMP, the impacts of the spiny dogfish FMP are briefly discussed. The spiny dogfish FMP was implemented in 2000 in response to a decline in the female spawning stock biomass, and it initiated stock rebuilding measures. Included among the approved management measures in the FMP was the requirement that the MAFMC and NEFMC jointly develop annual specifications, which include a commercial quota to be allocated on a semi-annual basis, and other restrictions to assure that fishing mortality targets will not be exceeded. As presented to the NEFMC in November 2009, the 2009 stock assessment update indicates that the female spawning stock biomass is estimated to be 16 percent lower than in 2008. Despite this decline, the assessment update indicates that this species is not overfished and overfishing is not occurring. The results of a new spiny dogfish benchmark assessment through the Transboundary Resource Assessment Committee (TRAC) will likely be available in March 2010. The dogfish FMP has resulted in a positive impact to the dogfish stock, the primary bycatch species of the groundfish fleet.

Monkfish is commonly caught along with groundfish and is considered one of the top target species that is not allocated to sectors by an ACE (i.e., non-allocated target species). Monkfish are currently regulated by the Monkfish FMP, which was implemented in 1999. The Monkfish FMP and subsequent amendments and framework actions have reduced fishing effort over the last decade, which has resulted in positive impacts for groundfish and non-groundfish stocks (including bycatch).

Future Actions: Implementation of the EFH Omnibus Amendment may also result in additional habitat protections for which there is an indirect positive effect to bycatch species, as they would also receive protection. As with allocated target species, if revisions are made to the HPTRP, vessels could face additional restrictions, possibly resulting in positive impacts to bycatch through effort reductions. Amendment 5 to the Monkfish FMP will either maintain the current level of fishing effort or allow for additional fishing above the current level, since both stocks of monkfish (North and South) are rebuilt.

The sea turtle Strategy is a gear-based approach to addressing sea turtle bycatch, and is discussed in more detail in Section 5.2.3.4. NMFS is currently considering proposing changes to the regulatory requirements for trawl fisheries to protect sea turtles. As described in an NOI to prepare an EIS (74 FR 88 May 8, 2009), NMFS is considering increasing the size of the escape opening for TEDs in the summer flounder fishery, expanding the use of TEDs to other trawl fisheries, and modifying the geographic scope of the TED requirements. TED requirements would likely have a positive effect on bycatch and discards as they would likely exclude some of these species from capture in the cod-end.

As indicated in Table 87 of the Final EIS for Amendment 16 to the Northeast Multispecies FMP, skates comprised nearly half the landings by weight for FY 2006 and 2007, under the Category B DAS (multispecies) program. Skates are currently managed under an FMP, and Amendment 3 to the FMP is expected to go into effect on or before May 1, 2010. The purposes of Amendment 3 to the Skate FMP are to reduce discards and landings sufficiently to rebuild stocks of winter, thorny, and smooth skates, and to prevent other skates from becoming overfished. The new management measures in Amendment 3 result in a reduction in fishing effort to rebuild biomass. Therefore, the likely future impacts would be positive for skates, which in this assessment is considered to be a non-allocated target species.

FW 44 to the Northeast Multispecies FMP would implement ACLs in FY 2010 for all Northeast multispecies stocks and make adjustments to the management measures to address stocks of concern and to manage the fishery in a more precautionary manner. This action is intended to work closely with and augment Amendment 16 to the Northeast Multispecies FMP, which is scheduled to be implemented on May 1, 2010. Although analysis is not complete, this action would potentially reduce fishing effort; therefore, positive impacts to non-allocated target species and bycatch are likely.

Summary of Impacts: As indicated in Table 5.2.3-1, actions that reduce fishing effort have had positive effects on non-allocated target species and bycatch because in general, less fishing effort results in less impacts to non-allocated target species and bycatch. Conversely, actions that increase fishing effort (i.e., FW 40A and FW 40B) are considered to have low negative effects on non-allocated target species and bycatch because more fishing generally results in more non-allocated target species and bycatch. TEDs requirements would likely have a positive effect on non-allocated target species and bycatch and discards as they would likely exclude some of these species from capture in the cod-end. Overall, the cumulative effect of past, present, and reasonably foreseeable future fishing actions have resulted in positive effects on non-allocated target species and bycatch.

5.2.3.4 Protected Resources

This section includes discussion of protected resources management actions that are relevant to groundfish and/or the PCS.

Past and Present Actions: Reductions in fishing effort through the implementation of management actions such as Amendment 13, FW 42, Amendment 16, and FMPs have generally had (or are expected to have) positive effects on protected resources by limiting the amount of fishing gear used in their geographic range during the fishing year, which may result in reductions in the rates of gear interaction with endangered species and other protected resources.

In addition to these actions, NMFS has implemented specific regulatory actions to reduce injuries and mortalities from gear interactions. The ALWTRP, implemented in 1999 with subsequent rule modifications, restrictions, and extensions, includes time and area closures for trap/pot fisheries (e.g., lobster and black sea bass) and gillnet fisheries (e.g., anchored gillnet and shark gillnet fisheries); gear requirements, including a general prohibition on having line floating at the surface in these fisheries; a prohibition on storing inactive gear at sea; and restrictions on setting shark gillnets off the coasts of

Georgia and Florida and drift gillnets in the Mid-Atlantic. This plan also contains non-regulatory aspects, including gear research, public outreach, scientific research, a network to inform mariners when right whales are in an area, and increasing efforts to disentangle whales caught in fishing gear. The intent of the ALWTRP is to positively affect large whales by reducing injuries and deaths of large whales (North Atlantic right, humpback, and fin) in waters off the U.S. East Coast due to incidental entanglement in fishing gear.

Future Actions: The likely impacts of the EFH Omnibus Amendment on protected resources cannot be determined at this time. The HPTRP for the Gulf of Maine and Mid-Atlantic Coasts was originally implemented in 1998, and NMFS published a proposed rule in July 2009 indicating additional management restrictions for gillnetters. Future measures of this plan may be implemented if take reduction goals are not met, which could further reduce fishing effort. Amendment 3 to the Skate FMP may also require a reduction in fishing effort, resulting in low positive effects to protected resources.

The sea turtle Strategy is a gear-based approach to addressing sea turtle bycatch. Under the Strategy, NMFS has identified reducing impacts of trawl gear as a priority for reducing sea turtle bycatch and is considering proposing changes to the TED requirements in the trawl fisheries. TED requirements are designed to have a positive effect on protected resources, specifically by allowing most turtles caught in trawl nets to escape. NMFS is working to develop and implement bycatch reduction measures in all trawl fisheries in the Atlantic and Gulf of Mexico when and where sea turtle takes have occurred or where gear, time, location, fishing method, and other similarities exist between a particular trawl fishery and sea turtle takes have occurred by trawls (72 FR 7382, February 15, 2007). On February 15, 2007, NMFS issued an advance notice of proposed rulemaking to announce that it is considering amendments to the regulatory requirements for TEDs (72 FR 7382). On May 8, 2009, NMFS issued an NOI to prepare an EIS (74 FR 88 May 8, 2009), and held public scoping meetings throughout the East coast.

Although not currently managed under an FMP, in response to the apparent population decline, the NEFMC recommended as part of Amendment 16 that wolffish be included in the groundfish management unit under the Northeast Multispecies FMP and that neither commercial or recreational vessels be allowed to retain wolffish on board vessels. In addition, on October 1, 2008, CLF submitted a petition to NMFS to list Atlantic wolffish as endangered under the Endangered Species Act. Previously, wolffish was listed as a "Species of Concern" in 2004 due to declining biomass which was attributed to commercial fishing, degradation of bottom habitat by trawls, and capture as bycatch by fisheries using otter trawls. On November 6, 2009 NMFS determined that listing of the Atlantic wolffish as threatened or endangered under ESA was not warranted.

FW 44 to the Northeast Multispecies FMP would implement ACLs in FY 2010 for all Northeast multispecies stocks and make adjustments to the management measures to address stocks of concern and to manage the fishery in a more precautionary manner. This action is intended to work closely with and augment Amendment 16 to the Northeast Multispecies FMP, which is scheduled to be implemented on May 1, 2010. Although analysis is not complete, this action would potentially reduce fishing effort and correlate opportunities for interactions with protected species; therefore, positive impacts to protected resources are likely.

Summary of Impacts: As indicated in Table 5.2.3-1, management actions that reduce fishing effort also reduce gear interaction with protected resources, resulting in positive effects. FW 40A and 40B allowed minor increases in fishing with fixed gear, which has negligible impacts on protected resources. With the exception of the EFH Omnibus Amendment, all other management actions described were designed to benefit protected resources; therefore, these actions are all considered to have positive effects on this VEC. Overall, the cumulative effect of these past, present, and reasonably foreseeable future fishing actions have resulted in positive effects on protected resources.

5.2.3.5 Human Communities

The following discussion focuses on the general area of the homeports of PCS. Discussion of impacts to Sector members refers to the participants in the Sector, which is the focus of this EA.

Past and Present Actions: Past and present actions that have had negative short-term and low positive long-term impacts to the port communities and positive impacts to future members of the PCS include Amendment 13, FW 42, and Amendment 16. These actions both substantially cut fishing effort in order to rebuild stocks by mandated timeframes, resulting in economic losses in the short-term. Because these actions are designed to rebuild the groundfish stocks and stabilize the fishing industry, these actions are expected to have long-term positive effects on the human communities. Amendment 13 also created a sector management option and implemented the Georges Bank Cod Hook Sector, while FW 42 implemented the Georges Bank Cod Fixed Gear Sector. Because FW 42 implemented further reductions in fishing on groundfish, this action caused substantial negative impacts in the short-term to groundfish-dependent ports. In the long-term, these ports are expected to experience positive effects as groundfish stocks rebuild to sustainable levels. Amendment 16 will result in more restrictive effort control measures and reductions in ACLs for all groundfish stocks regulated by the Northeast Multispecies FMP, which will result in revenue declines for Common Pool vessel operators and their ports.

FW 40A implemented the Closed Area I Hook Gear Haddock SAP which allowed increased opportunities for the Georges Bank Cod Fixed Gear and Hook Sectors to fish healthy haddock stocks using hook gear only, resulting in a low positive effect for members of these sectors. FW 41 allowed non-sector vessels to participate in the Closed Area I Hook Gear Haddock SAP, which extended the positive economic effects to non-sector vessels and increased revenue for the port communities, resulting in a low positive effect.

FW 40B allowed vessels with no hook history to join the Georges Bank Cod Hook Sector and contribute their historical cod landings to the Sector's allocation based on landings made with gear types other than hook gear, resulting in a low positive impact to the Sector participants.

As discussed in Section 5.2.1.4, the ALWTRP had impacts on the human community ranging from low negative to negligible, primarily because these measures required minor gear modifications for gillnet gear to reduce impacts to protected resources.

In the short-term, the spiny dogfish FMP has had a low negative effect on human communities because of the implementation of quotas and trip limits, therefore, reducing revenue. However, the FY 2009 specifications increased the quota and trip limits because the species is no longer considered overfished nor is overfishing occurring. This increase in quota and the rebuilding goal of the FMP will likely have a positive impact on the human communities because there will be a sustainable fishery available for harvest.

Future Actions: Amendment 3 to the Skate FMP will likely have negative economic impacts on the ports and Sector members because of the expected restrictions on fishing effort. Similarly, the future actions of the HPTRP could have negative impacts, particularly if the impacts from this plan compound reductions implemented via Amendment 16. Cumulative effects of the EFH Omnibus Amendment cannot easily be determined, but if additional effort restrictions were implemented, or if new areas are closed for habitat protection that further restrict access to fishing grounds (while the existing groundfish closed areas remain in place), this action too would likely have a negative impact.

The sea turtle Strategy is a gear-based approach to addressing sea turtle bycatch, and is discussed in more detail in Section 5.2.3.4. NMFS is currently considering proposing changes to the regulatory requirements for trawl fisheries to protect sea turtles. As described in an NOI to prepare an EIS (74 FR 88 May 8, 2009), NMFS is considering increasing the size of the escape opening for TEDs in the summer flounder fishery, expanding the use of TEDs to other trawl fisheries, and modifying the geographic scope of the TED requirements. TED requirements would likely have a negative economic effect on Sector members that trawl because of the costs associated with adding and/or modifying TEDs to comply with the new regulation and the costs associated with a decrease in landed species if vessels would not offset a loss in catch.

FW 44 to the Northeast Multispecies FMP would implement ACLs in FY 2010 for all Northeast multispecies stocks and make adjustments to the management measures to address stocks of concern and to manage the fishery in a more precautionary manner. This action is intended to work closely with and augment Amendment 16 to the Northeast Multispecies FMP, which is scheduled to be implemented on May 1, 2010. Although analysis is not complete, this action would potentially reduce fishing effort and consequently reduce revenue; therefore, negative impacts ports and sector members are likely.

Summary of Impacts: As indicated in Table 5.2.3-1, the effects of past, present, and reasonably foreseeable future fishery management actions have been positive on nearly all VECs with the exception of human communities. Mandated reductions in fishing effort have resulted in negative economic impacts to human communities. Management measures designed to benefit protected resources and restrict fishing effort have low negative effects on the human communities. However, the establishment of sectors and the ultimate goal of rebuilding groundfish stocks to sustainable levels will benefit the human communities eventually. Overall, the cumulative effect of past, present, and reasonably foreseeable future fishing actions have resulted in negative effects on human communities.

5.2.4 Non-Fishing Effects: Past, Present, and Reasonably Foreseeable Future Actions

Non-fishing activities that occur in the marine nearshore and offshore environments and their watersheds can cause the loss or degradation of habitat and/or affect the species that reside in those areas. Table 5.2.4-1 provides a summary of past, present, and reasonably foreseeable non-fishing activities and their expected effects on VEC's in the affected environment. The following discussions of impacts are based on past assessments of activities and assume these activities will likely continue into the future as projects are proposed. More detailed information about these and other activities and their impacts are available in the publications by Hansen (2003) and Johnson et al. (2008).

Construction/Development Activities and Projects: Construction and development activities include, but are not limited to, point source pollution, agricultural and urban runoff, land (roads, shoreline development, wetland loss) and water-based (beach nourishment, piers, jetties) coastal development, marine transportation (port maintenance, shipping, marinas), marine mining, dredging and disposal of dredged material and energy-related facilities, all of which are discussed in detail in Johnson et al. (2008). These activities can introduce pollutants (through point and non-point sources), cause changes in water quality (temperature, salinity, dissolved oxygen, suspended solids), modify the physical characteristics of a habitat or remove/replace the habitat altogether. Many of these impacts have occurred in the past and present and their effects would likely continue in the reasonably foreseeable future. It is likely that these projects would have negative impacts caused from disturbance, construction, and operational activities in the area immediately around the affected project area. However, given the wide distribution of the affected species, minor overall negative effects to offshore habitat, protected resources, allocated target stocks, and non-allocated target species and bycatch are anticipated since the affected areas are localized to the project sites, which involve a small percentage of the fish populations and their habitat. Thus, these activities for most biological VECs would likely have an overall low negative effect due to limited

exposure to the population or habitat as a whole. Any impacts to inshore water quality from these permitted projects, including impacts to planktonic, juvenile, and adult life stages, are uncertain but likely minor due to the transient and limited exposure. It should be noted that wherever these activities co-occur, they are likely to work additively or synergistically to decrease habitat quality and, as such, may indirectly constrain the sustainability of the allocated target stocks, non-allocated target species and bycatch, and protected resources.

Similar to the discussion above on non-fishing impacts to fish habitat, generally the closer the proximity of groundfish stocks to the coast, the greater the potential for impact (although predation, a non-fishing impact, would be one threat that would occur everywhere). Many groundfish species reside in both inshore and offshore areas at different stages of their lives and during different seasons throughout the year. However, some species, such as SNE/MA winter flounder, spend a large portion of their lives closer to shore and may likely be impacted by inshore threats to a greater degree than some of the other groundfish species. In the offshore areas, such effects would likely be low because the localized nature of the effects would minimize exposure to organisms in the immediate area.

These projects are permitted by other federal and state agencies that conduct examinations of potential biological, socioeconomic, and habitat impacts. In addition to guidelines mandated by the Magnuson-Stevens Act, and the Fish and Wildlife Coordination Act, NMFS, the Councils, and the other federal and state regulatory agencies review these projects through a process required by the Clean Water Act; Rivers and Harbors Act; and the Marine Protection, Research, and Sanctuaries Act for certain activities that are regulated by federal, state, and local authorities. These reviews limit and often mitigate the impact of these projects. The jurisdiction of these authorities is in the “waters of the U.S.” and ranges from inland riverine to marine habitats offshore in the EEZ.

Restoration Projects: Other regional projects that are restorative or beneficial in nature include estuarine wetland restoration; offshore artificial reef creation, which provides structure and habitat for many aquatic species; and eelgrass (*Zostera marina*) restoration, which provides habitat for, among other things, juvenile Atlantic cod. These types of projects improve habitats, including nursery habitats for several commercial groundfish species. Due to past and present adverse impacts from human activities on these types of habitat, restorative projects likely have slightly positive effects at the local level.

Protected Resources Rules: The NMFS final Rule on Ship Strike Reduction Measures (73 FR 60173, October 10, 2008) is a non-fishing action in the United States-controlled North Atlantic that is likely to affect endangered species and protected resources. The goal of this rule is to significantly reduce the threat of ship strikes on North Atlantic right whales and other whale species in the region. Ship strikes are considered the main threat to North Atlantic right whales; therefore, NMFS anticipates this regulation will result in population improvements to this critically endangered species.

Energy Projects: Cape Wind Associates (CWA) proposes to construct a wind farm on Horseshoe Shoal, located between Cape Cod and Nantucket Island in Nantucket Sound, Massachusetts. The CWA project would have 130 wind turbines located as close as 4.1 miles off the shore of Cape Cod in an area of approximately 24 square miles with the turbines being placed at a minimum of 1/3 of a mile apart. The turbines would be interconnected by cables, which would relay the energy to the shore-based power grid. If constructed, the turbines would preempt other bottom uses in an area similar to oil and natural gas leases. The potential impacts associated with the CWA offshore wind energy project include the construction, operation, and removal of turbine platforms and transmission cables; thermal and vibration impacts; and changes to species assemblages within the area from the introduction of vertical structures.

TABLE 5.2.4-1 Summary of Effects from Past, Present and Reasonably Foreseeable Non-fishing Actions in the Affected Environment						
Non-Fishing Actions	Physical Environment Impacts	Biological Environment Impacts			Human Community Impact	
	Habitat	Allocated Target Species	Non-allocated Target Species and Bycatch	Protected Resources	Ports	Sector Participants
Past, Present, and Reasonably Foreseeable Future Actions						
General Construction and Development Activities	(-) in nearshore Likely L(-) in offshore	Likely L(-)	Likely L(-)	Likely L(-)	Negl	Negl
Point and non-point source (agricultural/urban runoff) pollution	(-) in nearshore L(-) in offshore	Likely L(-)	Likely L(-)	Likely L(-)	Negl	Negl
Offshore disposal of dredged materials	L(-)	Likely L(-)	Likely L(-)	Likely L(-)	Negl	Negl
Beach Nourishment	L(-)	Likely L(-)	Likely L(-)	Negl	Negl	Negl
Installation of offshore wind farm and infrastructure	Likely L(-)	Likely L(-)	Likely L(-)	Likely L(-)	Likely L(-)	Likely L(-)
Installation of infrastructure associated with liquefied natural gas terminals	Likely L(-)	Likely L(-)	Likely L(-)	Likely L(-)	Likely L(-)	Likely L(-)
Restoration Activities (wetland restoration, artificial reefs, eelgrass, etc...)	(+)	(+)	(+)	(+)	(+)	(+)
Implementation of National Marine Fisheries Service Final Rule on Ship Strike Reduction Measures	Likely Negl	Likely Negl	Likely Negl	Likely (+)	Likely Negl	Likely Negl
Summary of Impacts	(-) to L(-)	L(-)	L(-)	L(-)	Negl to L(-)	Negl to L(-)
Note: Unless noted otherwise, the impacts of most of these actions are localized and although considered negative at the site, they have an overall low negative or negligible effect on each VEC due to limited exposure of action to the population or habitat as a whole						

Other offshore projects that can affect VECs include the construction of offshore liquefied natural gas (LNG) facilities such as the project “Neptune.” The first phase of this project construction was completed in September 2008, which includes the installation of a 13-mile subsea pipeline. The second phase will connect the new pipeline to an existing pipeline network called HubLine east of Marblehead, Massachusetts, and will install the two off-loading buoys 10 miles off the coast of Gloucester, Massachusetts. Upon completion, the LNG facility will consist of an unloading buoy system where specially designed vessels will moor and offload their natural gas into a pipeline, which will deliver the product to customers in Massachusetts and throughout New England. As it related to the impacts of the Proposed Action, the Neptune project is expected to have small, localized impacts where the pipelines and buoy anchors contact the bottom.

Summary of Impacts: Most of the impacts from these aforementioned activities are uncertain but would likely range from negative to low negative in the immediate areas of the project site. However, on a larger-scale population level, these activities are likely to have a low negative to negligible impact on a population level, considering that the large portion of the populations have a limited or negligible exposure to these local non-fishing perturbations and that existing regulatory requirements would likely mitigate the severity of many impacts (see Table 5.2.4-1).

5.2.5 Summary of Cumulative Effects

The cumulative effects resulting from the implementation of the FY 2010 PCS Operations Plan and the CEA Baseline are summarized in Table 5.2.5-1, and discussed by VEC in the following sections.

5.2.5.1 Physical Environment/Habitat/EFH

The operation of vessels in all other sectors would have negligible impacts on benthic/demersal habitat, since these vessels, under the No-Action Alternative, would be in the Common Pool and would have fished in the same areas. Generally, management measures that have reduced fishing effort are thought to have had a positive impact on habitat and EFH since the repeated use of trawls/dredges reduces bottom habitat complexity, ultimately decreasing the value of habitat for demersal fish. The effects from non-fishing actions are also expected to be negative to low negative as the potential for localized harm to VECs exists. Since half of the vessels in the Port Clyde Sector would be fixed gear, any habitat impacts associated with this gear would be low. The other half of the vessels in the Port Clyde Sector would use trawls, and the difference in the impacts from the vessels operating in the Sector and those same vessels operating in the Common Pool (i.e., the No-Action Alternative) would be negligible. The summary of impacts for physical environment/habitat/EFH from Sector operations and CEA Baseline is expected to be negligible and not significant due to these above stated reasons.

5.2.5.2 Allocated Target Species

The operation of vessels in all other sectors would have negligible impacts on allocated target species, due to the imposition of an ACE for each allocated target species. A major goal of the Northeast Multispecies FMP is to allow for the rebuilding of stocks; therefore, continued management actions should have a positive impact on allocated target species. The effects from non-fishing actions are expected to be low negative as the potential for localized harm to VECs exists. The approval of the PCS would have negligible impacts on allocated target species, since fishing mortality would be controlled by an ACE for each multispecies stock. The summary of impacts for allocated target species from Sector operations and CEA Baseline is expected to be negligible and not significant due to these above stated reasons.

5.2.5.3 Non-allocated Target Species and Bycatch

The operation of vessels in all other sectors would have negligible impacts on non-allocated target species and bycatch, because the catch rate for non-allocated target stocks are likely linked to that of allocated target stocks, the allocations of which are controlled by ACEs. The end result would be little if any increase in impacts to non-allocated target species and bycatch under Sector management relative to the Common Pool. One of the mandates of FMPs is to minimize bycatch and discard species. Therefore, with continued management actions, FMPs should have a positive impact on bycatch and discard species. The effects from non-fishing actions are expected to be low negative as the potential for localized harm to VECs exists. In general, the anticipated effect of the PCS formation and operation in FY 2010 is to convert vessel catch into more landing and less discard while not exceeding ACEs, resulting in negligible impacts to non-allocated target species and bycatch relative to the actions of vessels in the Common Pool. The summary of impacts for non-allocated target species and bycatch species from Sector operations and CEA Baseline is expected to be negligible and not significant due to these above stated reasons.

5.2.5.4 Protected Resources

The operation of all other sectors may increase the potential for gear interactions with protected species, relative to the vessels operating in the Common Pool, due to the universal exemptions that would be granted to sectors by Amendment 16, along with several Sector-specific exemptions. This potential increase in gear interaction due to operation of vessels in all other sectors would likely have low negative impacts on protected resources. The implementation of FMPs and sectors have resulted in reductions in fishing effort and as a result, past fishery management actions are thought to have had a slightly positive impact on strategies to protect protected species. Gear entanglement continues to be a source of injury or mortality, resulting in some adverse effects on most protected species to varying degrees. One of the goals of future management measures will be to decrease the number of marine mammal interactions with commercial fishing operations. Measures proposed by Amendment 16 to the Northeast Multispecies FMP will substantially reduce the overall commercial fishing effort and the amount of groundfish that can be caught, relative to historical amounts that have been harvested by the commercial multispecies fleet. The cumulative result of these actions to meet mortality objectives will be positive for protected resources. The effects from non-fishing actions are also expected to be low negative as the potential for localized harm to VECs exists. The PCS has requested exemptions from the 120-day gillnet block. This measure may increase the number of gear days and/or the amount of gear in the water during seasons when marine mammals and sea turtles are more abundant, which may result in increased gear interactions relative to the No-Action Alternative and would likely result in low negative impacts to protected resources. While the PCS would retain approximately 6 percent or less of the total ACL for all managed groundfish stocks, the exploitation rates for all groundfish stocks managed by the Northeast Multispecies FMP will be reduced by roughly 40 to 60 percent, and the overall summary of impacts from Sector operations and CEA Baseline on protected resources would likely be low negative, but not significant due to these above stated reasons.

5.2.5.5 Human Communities and Social and Economic Environment

The operation of vessels in all other sectors would have low positive impacts on human communities, including ports and sector participants, due to the flexibility that sector management provides. Past management actions have had a negative impact on communities that depend on the groundfish fishery. Although special programs implemented through Amendment 13 and subsequent framework actions have provided the industry additional opportunities to target healthier groundfish stocks, substantial increases in landings and revenue will likely not take place until further stock rebuilding occurs under the Amendment 16 rebuilding plan. The effects from non-fishing actions are also

expected to be negligible to low negative as the potential for localized harm to VECs exists. The PCS would allow sector members to achieve maximum efficiency and flexibility while at the same time remaining consistent with the rebuilding programs for stocks. Economic benefits can be accrued to the sector members because they are given the flexibility to make market-based decisions on when and where to fish. Operating under sector management also would allow for fishing to occur when weather conditions were safest. The summary of impacts from implementation of sector operations is expected to be low positive for human communities. However, within the context of the region and the fishery as a whole, these benefits would be insignificant as determined under criteria of the Regulatory Flexibility Act (see Section 8.10). The summary of impacts from sector operations and CEA Baseline on human communities would be low positive and not significant due to these above stated reasons.

Conclusion

In conclusion, the summary of impacts from PCS operations and CEA Baseline would be negligible on habitat, allocated target species, and non-allocated target species and bycatch, likely low negative to protected resources, and low positive to human communities (Table 5.2.5-1). These impacts would not be significant due to the reasons stated in this assessment.

TABLE 5.2.5-1 Cumulative Effects Resulting from Implementation of the Fishing Year 2010 Port Clyde Sector Operations Plan and CEA Baseline							
		Habitat Impacts	Biological Impacts			Human Community Impacts	
		Habitat	Allocated Target Species	Non-allocated Target Species and Bycatch	Endangered/Protected Species	Ports Chatham/Harwich	Sector Participants
Cumulative Effect Baseline	Effects of Future Operations of all other sectors (see Table 5.2.2-1)	Negl	Negl	Negl	Likely L(-)	L(+)	L(+)
	Effects of Past, Present, and Reasonably Foreseeable Future Non-Fishing Actions (see Table 5.2.4-1)	(-) to L(-)	L(-)	L(-)	L(-)	Negl to L(-)	Negl to L(-)
	Effects of Past, Present, and Reasonably Foreseeable Future Fishing Actions (see Table 5.2.3-1)	(+)	(+)	(+)	(+)	(-)	(-)
Direct and Indirect Effects of Proposed Sector Operations (see Table 5.1-1)		Negl	Negl	Negl	Likely L(-)	L(+)	L(+)
Cumulative Effects Sum of Effects from implementation of Sector operations and Cumulative Effect Baseline		Negl	Negl	Negl	Likely L(-)	L(+)	L(+)

6.0 LIST OF PREPARERS AND POINTS OF CONTACT

This document was prepared with contributions by members of the Midcoast Fishermen's Association (MFA); Port Clyde Community Groundfish Sector (PCS); the Island Institute; Earthjustice; the Cape Cod Commercial Hook Fishermen's Association (CCCHFA); the Gulf of Maine Research Institute (GMRI); and the National Marine Fisheries Service (NMFS).

Copies of this EA may be obtained by contacting Jim Frank, Sector Manager at (207) 845-2709 or james@fairpoint.net. Copies may also be obtained by writing to Jim at the Port Clyde Community Groundfish Sector, PO Box 223, Port Clyde Maine, 04855 or by calling the PCS at (207) 372.0628.

7.0 PERSONS AND AGENCIES CONSULTED

The Northeast Regional Office (NERO) of the National Marine Fisheries Service (NMFS), National Oceanic & Atmospheric Administration (NOAA) and the New England Fishery Management Council (NEFMC) Staff were consulted in preparing this Environmental Assessment (EA).

8.0 COMPLIANCE WITH APPLICABLE LAWS AND EXECUTIVE ORDERS

8.1 MAGNUSON-STEVENSON FISHERY CONSERVATION AND MANAGEMENT ACT

The Proposed Action would comply with all elements of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), including the National Standards, and the Northeast (NE) Multispecies Fishery Management Plan (FMP). This action is being taken in conformance with the NE Multispecies FMP, which requires that an Environmental Assessment (EA) of the Port Clyde Community Groundfish Sector operations plan be prepared in compliance with National Environmental Protection Act (NEPA), Magnuson-Stevens Act, and other applicable laws and Executive Orders. Amendment 13 to the FMP established the sector operations plan approval process and was approved on April 27, 2004. Amendment 16 to the FMP authorizes up to 17 additional sectors, including the Sustainable Harvest Sector, Port Clyde Community Groundfish Sector, Tri-State Sector, Northeast Coastal Communities Sector, and Northeast Fishery Sectors I through XIII. Nothing in this action changes the findings in Amendment 16 that this action complies with the provisions of the Magnuson-Stevens Act.

Section 301 of the Magnuson-Stevens Act requires that FMPs contain conservation and management measures that are consistent with the ten National Standards. The most recent FMP changes in Amendment 16 address how the proposed management actions comply with the National Standards. Under Amendment 16, the NEFMC adopted conservation and management measures that would end overfishing and rebuild NE multispecies stocks to achieve, on a continuing basis, the optimum yield for NE multispecies stocks and the U.S. fishing industry using the best scientific information available (National Standard 2), managing all 20 stocks (13 species) throughout their range (National Standard 3). The NEFMC specifies in Amendment 16 that the management measures do not discriminate among residents of different states (National Standard 4), do not have economic allocation as their sole purpose (National Standard 5), account for variations in these fisheries (National Standard 6), avoid unnecessary duplication (National Standard 7), take into account fishing communities (National Standard 8), address bycatch in fisheries (National Standard 9), and promote safety at sea (National Standard 10). By proposing to meet the National Standards requirements of the Magnuson-Stevens Act through future FMP amendments and framework actions, the NEFMC will ensure that overfishing ends, overfished stocks are rebuilt, and the maximum benefits possible accrue to the ports and communities that depend on these fisheries and the Nation as a whole. Annual review of sector operations plans ensures that proposed sector activities are consistent with the rebuilding plan for NE multispecies stocks.

An EFH assessment and EFH consultation are not required as determined by a Habitat Conservation Division Review (October 29, 2009).

8.2 ENDANGERED SPECIES ACT (ESA)

Formal consultation under Section 7 of the ESA is has been reinitiated and is ongoing for the NE Multispecies Fishery Management Plan (FMP). NMFS has determination that continued operation of the FMP during the consultation period, as authorized by NMFS, will neither jeopardize the continued existence of endangered and threatened species, nor destroy or adversely modify designated critical habitat. Allowing the fishery to continue during the consultation period will not result in any irreversible or irretrievable commitment of resources that would have the effect of foreclosing the formulation or implementation of reasonable and prudent alternatives in the completion of the consultation and biological opinion. NMFS has also determined that the Proposed Action to approve and implement regulations for Amendment 16 would not cause an effect to ESA-listed species not considered in previous consultations on the FMP; and, therefore, does not trigger the need to reinitiate consultation.

8.3 MARINE MAMMAL PROTECTION ACT (MMPA)

NMFS has reviewed the impacts of the FY 2010 Port Clyde Community Groundfish Sector operations plan on marine mammals and concluded that the management actions proposed are consistent with the provisions of the MMPA and would not alter existing measures to protect the species likely to inhabit the management unit of the NE multispecies FMS. For further information on the potential impacts of the proposed management action, see Section 5.1.4.1.

8.4 NATIONAL ENVIRONMENTAL POLICY ACT (NEPA)

National Oceanic and Atmospheric Administration (NOAA) Administrative Order 216-6 (NAO 216-6) (May 20, 1999) contains criteria for determining the significance of the impacts of a Proposed Action. In addition, the Council on Environmental Quality (CEQ) regulations at 40 C.F.R. 1508.27 states that the significance of an action should be analyzed both in terms of “context” and “intensity.” The Proposed Action in this Environmental Assessment is outlined in the Sector’s Operations Plan as approved by the National Marine Fisheries Service. Each criterion listed below is relevant in making a finding of no significant impact and has been considered individually, as well as in combination with the others. The significance of this action is analyzed based on the NAO 216-6 criteria and CEQ’s context and intensity criteria. These include:

1. *Can the proposed action reasonably be expected to jeopardize the sustainability of any target species that may be affected by the action?*

Response: The Proposed Action would not jeopardize the sustainability of any of the target species (cod [GB and GOM stocks], haddock [GB and GOM stocks], yellowtail flounder [GB, GOM, SNE stocks], American plaice, witch flounder, winter flounder [GB and GOM stocks], redfish, white hake, and pollock) affected by the action, because the Port Clyde Sector has an Allowable Catch Entitlement (ACE) for each stock listed above that is a portion of the Annual Catch Limit (ACL) established by the Northeast (NE) Multispecies FMP and that would be adhered to on an annual basis. The biological impacts of the Proposed Action on the allocated target species are analyzed in Section 5.1.2.1.

2. *Can the proposed action reasonably be expected to jeopardize the sustainability of any non-target species?*

Response: The Proposed Action is not expected to jeopardize the sustainability of any non-allocated target species. If increased flexibility by Port Clyde Sector improves the harvest of target species similarly to non-allocated target species and bycatch, then the relative catch rate of non-allocated target species and bycatch would be controlled by ACE. Once an ACE has been reached, fishing must cease. If Sector members are able to successfully target certain allocated species, the amount of bycatch would decline relative to historical catch. The anticipated effect of Port Clyde Sector formation and operation under allocations constrained by ACEs (as described in Amendment 16) would be to convert more vessel catch into landings and less into discards than if those same vessels were to fish within the Common Pool (Section 5.1.3.1).

3. *Can the proposed action reasonably be expected to cause substantial damage to the ocean and coastal habitats and/or essential fish habitat as defined under the Magnuson-Stevens Act and identified in FMPs?*

Response: The Proposed Action is not expected to allow substantial damage to the ocean and coastal habitats and/or Essential Fish Habitat (EFH) as defined under the Magnuson-Stevens Act and

identified in the FMP. Further, since Port Clyde Sector will continue to use traditional fishing gear and maintain current fishing practices, the Proposed Action will have the same impacts on marine habitats or EFH as common pool vessels using similar gear and largely fishing in the same areas (Section 5.1.1.1).

4. *Can the proposed action be reasonably expected to have a substantial adverse impact on public health or safety?*

Response: The Proposed Action is not expected to have a substantial adverse impact on public health and safety. The proposed Port Clyde Sector would involve routine fishing operations and would not affect safety at sea. Because of fishing effort would be controlled by species-specific ACE rather than Days-At-Sea, sector members would have increased flexibility to decide when to fish. This flexibility would likely increase revenues, allow fishermen to more fully exploit previously under-exploited stocks, and reduce incentive to fish in unsafe conditions (Section 5.1.5.1).

5. *Can the proposed action reasonably be expected to adversely affect endangered or threatened species, marine mammals, or critical habitat of these species?*

Response: The Proposed Action is not expected to have an adverse impact on endangered or threatened species, marine mammals, or critical habitat of these species. Port Clyde Sector members would primarily use trawls and gillnets, the same gear utilized by the common pool. Impacts to cetaceans and pinnipeds from the use of gillnets would be minimized by use of the Take Reduction Plans, as discussed in Section 4.4.4. Trawl gear is generally considered to have low impacts on most protected resources. Provisions of Amendment 16 would exempt sectors from effort control measures (e.g., DAS limits, trip limits, area closures, and mesh size) which generally allow for an increased chance of interactions between sector vessels and protected resources due to fishing activities in previously closed areas and a potential increase in gear days. Overall, impacts to protected resources associated with operation of the sector would likely be low negative, but not significant (Section 5.1.4.1).

6. *Can the proposed action be expected to have a substantial impact on biodiversity and/or ecosystem function within the affected area (e.g., benthic productivity, predator-prey relationships, etc.)?*

Response: The Proposed Action is not expected to have a substantial impact on biodiversity and ecosystem function within the affected area. Implementation of the Port Clyde Sector Operations Plan would limit the amount of groundfish the sector would be allowed to catch and land. Once the ACE has been reached, sector vessels would no longer be able to expend effort on catching groundfish.

7. *Are significant social or economic impacts interrelated with natural or physical environmental effects?*

Response: There are no significant social and economic impacts of the Proposed Action that are interrelated with natural or physical environmental effects. The Proposed Action would allocate ACE to Port Clyde Sector for 14 stocks of groundfish, which sets a limit on the amount of groundfish that Port Clyde Sector can catch. Port Clyde Sector members would be exempt from several restrictions of the FMP, however, Port Clyde Sector members will primarily use trawl and gillnet gear and maintain traditional fishing practices which will have no greater impact on habitat, protected species, and limit bycatch species as compared to the common pool and the groundfish fishery before sectors (Sections 5.1.2 through 5.1.4). The operation of Port Clyde Sector would continue to mitigate the negative economic impacts that result from the current suite of regulations that apply to the groundfish fishery as well as meet the conservation requirements of the FMP. The operations plan allows flexibility and economic opportunity to the Sector members and their communities. However, within the context of the

region and the fishery as a whole, these benefits would be insignificant as determined under criteria of the Regulatory Flexibility Act (see Section 8.10). Further, while the Sector members benefit socially and economically by the ability to self-regulate, this opportunity is not related with any impacts associated with the biological or physical environment. Therefore, the social and economic impacts of the Proposed Action are not interrelated with significant natural or physical environmental effects.

8. *Are the effects on the quality of the human environment likely to be highly controversial?*

Response: The effects of the Proposed Action on the quality of human environment are not expected to be highly controversial. Implementation of the sectors was approved by a majority of the New England Fishery Management Council (NEFMC), and membership in a sector is voluntary. The Proposed Action would not modify rebuilding plans and specifications adopted by Amendment 16 and Framework 44, which are needed to rebuild groundfish stocks. While there has been some debate over how quickly to rebuild those stocks and the desired biomass for each stock, legal requirements established by the Magnuson-Stevens Act render these discussions moot. The Proposed Action is not expected to negatively impact habitat, allocated target species, non-allocated target species and bycatch, protected resources as described in Sections 5.1.2 through 5.1.4.

9. *Can the proposed action reasonably be expected to result in substantial impacts to unique areas, such as historic or cultural resources, parkland, prime farmlands, wetlands, wild and scenic rivers or ecologically critical areas?*

Response: No, the Proposed Action cannot be reasonably expected to result in substantial impacts to unique areas or ecological critical areas. There are no known parkland, prime farmlands, wetlands, or wild scenic rivers in the study area. Vessel operations around the unique historical and cultural resources encompassed by the Stellwagen Bank National Marine Sanctuary would not likely be altered by this action. The trawl and gillnet gear used by Port Clyde Sector are traditional gears used in the groundfish fishery. As a result, no substantial impacts are expected from this action.

10. *Are the effects on the human environment likely to be highly uncertain or involve unique or unknown risks?*

Response: The effects of the Proposed Action on the human environment are not expected to be highly uncertain or involve unique or unknown risks. The Final Rule approving the 2010 Operations Plan would allocate ACE to Port Clyde Sector, which sets a limit on the amount of each the 14 groundfish species that Port Clyde Sector can catch, while minimizing regulatory discards, resulting in positive benefits to the allocated target species, non-allocated target species, and bycatch species. Port Clyde Sector members would be exempt from several restrictions of the FMP, however, Port Clyde Sector will primarily use trawl and gillnet gear and maintain traditional fishing practices which will have no greater impact on habitat, protected species, and limit bycatch species as compared to the common pool and the groundfish fishery before sectors (Sections 5.1.2 through 5.1.4). Implementation of the Final Rule would mitigate impacts of Amendment 13, Framework 42, and Amendment 16 to the NE Multispecies FMP on human communities by conveying environmental, social, and economic benefits directly to Port Clyde Sector members and thereby to the communities of Portland, Port Clyde, Kennebunkport, Phippsburg, Boothbay Harbor, Saco, Harpswell, and Monhegan Island Maine, and Gloucester, Massachusetts, while at the same time meeting the conservation requirements of the FMP. Sectors have been in operation in the New England groundfish fishery since 2004; therefore, the effects on the human environment are not uncertain or involve unique or unknown risks.

11. Is the proposed action, related to other actions with individually insignificant, but cumulatively significant impacts?

Response: The cumulative effects analysis presented in Section 5.2 of this document considers the impacts of the Proposed Action in combination with relevant past, present, and reasonably foreseeable future actions and concludes that no significant cumulative impacts are expected from the implementation of Port Clyde Sector. The Proposed Action is related to Amendment 16 to the NE Multispecies FMP. The Record of Decision for Amendment 16 states the measures being implemented are the environmentally preferred alternatives and all means to avoid, minimize, or compensate for environmental harm have been adopted. Since none of the cumulative impacts of the Proposed Action are considered significant and the measures under Amendment 16 are environmentally preferred, Section 5.2 of this document concluded there are no significant cumulative impacts among these related actions. Further, the Proposed Action would not have any significant impacts when considered individually or in conjunction with any of the other actions presented in Section 5.2 (fishing related and non-fishing related).

12. Is the proposed action likely to adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural or historical resources?

Response: The fishing operations of the Proposed Action would take place on ocean waters and would not affect any human communities on the adjacent shorelines. There are no known districts, sites, or highways in the area of the Proposed Action. The Proposed Action is not likely to affect objects listed in the National Register of Historic Places or cause significant impact to scientific, cultural, or historical resources. The only object in the fishery area that is listed in the National Register of Historic Places is the wreck of the steamship *Portland* within the Stellwagen Bank National Marine Sanctuary. The current regulations allow fishing within the Stellwagen Bank National Marine Sanctuary. The Proposed Action would not regulate current fishing practices within the sanctuary. However, vessels typically avoid fishing near the wreck to avoid tangling gear on the wreck. Therefore, this action would not result in any adverse affects to the wreck of the *Portland*. Due to the minimal impact on the human environment, the Port Clyde Sector Operations Plan would not adversely affect scientific, cultural, or historical resources.

13. Can the proposed action reasonably be expected to result in the introduction or spread of a non-indigenous species?

Response: No non-indigenous species would be introduced during the Proposed Action because operation of Port Clyde Sector is confined to traditional fishing practices, and no non-indigenous species would be used or transported during the Sector's activities. Therefore, the Proposed Action would not be expected to result in the introduction or spread of a non-indigenous species.

14. Is the proposed action likely to establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration?

Response: The NEFMC has authorized the formation of multiple sectors under Amendment 16 to the NE Multispecies FMP and has set forth criteria for establishing sectors in this action. The Proposed Action was initiated in response to Amendment 16 and does not set a precedent because it abides by the criteria set forth in that Amendment. However, it should be noted that while Amendment 16 established multiple sectors and the process of their allocation, each sector proposal and each Operations Plan and allocation is considered individually on its own merits and expected impacts, and includes a specified process for public comment and consideration. Further, each sector must submit their Operations Plan annually for approval. Therefore, the Proposed Action is not likely to establish a precedent for future actions with significant effects or represent a decision in principle about a future consideration.

15. Can the proposed action reasonably be expected to threaten a violation of federal, state, or local law or requirements imposed for the protection of the environment?

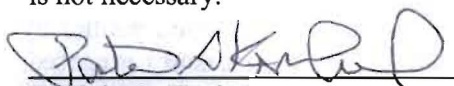

Response: The Proposed Action is not expected to threaten a violation of federal, state, or local law or requirements imposed for the protection of the environment. In addition to the Port Clyde Sector harvest rules, Port Clyde Sector would comply with all local, regional, and national laws and permitting requirements.

16. Can the proposed action reasonably be expected to result in cumulative adverse effects that could have a substantial effect on the target species or non-target species?

Response: The Proposed Action is not expected to result in cumulative adverse effects that could have a substantial effect on target or non-target species. As stated in Sections 5.1.2 and 5.1.3, impact on resources encompassing groundfish and other stocks is expected to be minimal.

DETERMINATION

In view of the information presented in this document and the analysis contained in the supporting EA prepared for the approval of the FY 2010 Port Clyde Sector Operations Plan, it is hereby determined that the approval of the FY 2010 Port Clyde Sector Operations Plan will not significantly impact the quality of the human environment as described above and in the supporting EA. In addition, all beneficial and adverse impacts of the Proposed Action have been addressed to reach the conclusion of no significant impacts. Accordingly, preparation of an Environmental Impact Statement (EIS) for this action is not necessary.

Patricia A. Kurkul
Regional Administrator Northeast Region, NMFS

Date

FEB 24, 2010

8.5 ADMINISTRATIVE PROCEDURE ACT (APA)

Section 553 of the APA establishes procedural requirements applicable to rulemaking by Federal agencies. The purpose of these requirements is to ensure public access to the federal rulemaking process and to give the public adequate notice and opportunity for comment. At this time, no abridgement of the rulemaking process for this action is being requested.

8.6 PAPERWORK REDUCTION ACT (PRA)

The purpose of the PRA is to control and, to the extent possible, minimize the paperwork burden for individuals, small businesses, nonprofit institutions, and other persons resulting from the collection of information by, or for, the Federal Government. PRA for data collections relating to sectors will be considered and evaluated with Amendment 16 to the FMP. This action does not propose to modify any existing collections or to add any new collections; therefore, no review under the PRA is necessary for this action.

8.7 COASTAL ZONE MANAGEMENT ACT (CZMA)

Section 307(c)(1) of the CZMA requires that all Federal activities which affect any coastal use or resource be consistent with approved state coastal zone management programs (CZMP) to the maximum extent practicable. NMFS has reviewed the relevant enforceable policies of each coastal state in the NE

region for this action and has determined that this action is incremental and repetitive, without any cumulative effects, and is consistent to the maximum extent practicable with the enforceable policies of the CZMP of the following states: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Pennsylvania, Maryland, Virginia, and North Carolina. NMFS finds this action to be consistent with the enforceable policies to manage, preserve, and protect the coastal natural resources, including fish and wildlife, and to provide recreational opportunities through public access to waters off the coastal areas. Pursuant to the general consistency determination provision codified at 15 CFR 930.36(c), NMFS sent a general consistency determination applying to the current NE Multispecies FMP, and all routine Federal actions carried out in accordance with the FMP, to the following states: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Pennsylvania, Maryland, Virginia, and North Carolina on October 21, 2009. In accordance with that determination, NMFS will send a letter advising those states of this action following the publication of the final rule.

8.8 INFORMATION QUALITY ACT (IQA)

Pursuant to NOAA guidelines implementing Section 515 of Public Law 106-554 (the Data Quality Act), all information products released to the public must first undergo a Pre-Dissemination Review to ensure and maximize the quality, objectivity, utility, and integrity of the information (including statistical information) disseminated by or for federal agencies. The following section addresses these requirements.

Utility

The information presented in this EA is helpful to the intended users (the affected public) by presenting a clear description of the purpose and need of the Proposed Action, the measures proposed, and the impacts of those measures. A discussion of the reasons for selecting the Proposed Action is included so that intended users may have a full understanding of the Proposed Action and its implications.

This EA is the principal means by which the information contained herein is available to the public. The information provided in this EA is based on the most recent available information from the relevant data sources. The development of this EA and the decisions made by NMFS to propose this action are the result of a multi-stage public process.

The Federal Register notice that announces the proposed Port Clyde Community Groundfish Sector Operations Plan and Agreement is available in printed publication and on the NMFS NE Regional Office website. Instructions for obtaining a copy of this EA are included in the Federal Register notice.

Integrity

Prior to dissemination, information associated with this action, independent of the specific intended distribution mechanism, is safeguarded from improper access, modification, or destruction, to a degree commensurate with the risk and magnitude of harm that could result from the loss, misuse, or unauthorized access to or modification of such information. All electronic information disseminated by NMFS adheres to the standards set out in Appendix III, "Security of Automated Information Resources," of OMB Circular A-130; the Computer Security Act; and the Government Information Security Act. All confidential information (e.g., dealer purchase reports) is safeguarded pursuant to the Privacy Act; Titles 13, 15, and 22 of the United States Code (confidentiality of census, business, and financial information); the Confidentiality of Statistics provisions of the Magnuson Act; and NOAA Administrative Order 216-100, Protection of Confidential Fisheries Statistics.

Objectivity

For the purposes of the Pre-Dissemination Review, this EA is considered to be a “Natural Resource Plan.” Accordingly, the document adheres to the published standards of the Magnuson-Stevens Act; the Operational Guidelines, Fishery Management Plan Process; the EFH Guidelines; the National Standard Guidelines; and NOAA Administrative Order 216-6, Environmental Review Procedures for Implementing the NEPA.

This information product uses information of known quality from sources acceptable to the relevant scientific and technical communities. Stock status (including estimates of biomass and fishing mortality) reported in this product are based on either assessments subject to peer-review through the Stock Assessment Review Committee or on updates of those assessments prepared by scientists from the Northeast Fisheries Science Center. Landing information is based on information collected from the GARM III report. These reports are developed using an approved, scientifically valid sampling process. In addition to these sources, additional information is presented that has been accepted and published in peer-reviewed journals or by scientific organizations. Original analyses in this EA were prepared using data from accepted sources, and the analyses have been reviewed by NOAA.

Despite current data limitations, the measures proposed for this action were selected based upon the best scientific information available. The analyses conducted in support of the Proposed Action were conducted using information from the most recent complete fishing year, through FY 2007. The data used in the analyses provide the best available information on the state of each species regulated under the FMP (i.e., GARM III, September 2008), species and EFH data from NOAA, and fishery landings through FY 2007. Specialists (including professional members of plan development teams, technical teams, committees, and Council staff) who worked with these data are familiar with the most current analytical techniques and with the available data and information relevant to the state of the regulated fisheries under the FMP, fishing techniques in the Port Clyde Community Groundfish Sector and the socio-economic impacts of the fisheries on impacted communities.

The policy choices are clearly articulated in Section 3 of this EA, as the management alternatives considered in this action. The supporting science and analyses, upon which the policy choices are based, are summarized and described in Sections 4 and 5 of this EA. All supporting materials, information, data, and analyses within this EA have been, to the maximum extent practicable, properly referenced according to commonly accepted standards for scientific literature to ensure transparency.

The review process used in preparation of this EA involves the Northeast Fisheries Science Center, the Northeast Regional Office, and NMFS Headquarters. The Center’s technical review is conducted by senior level scientists with specialties in population dynamics, stock assessment methods, demersal resources, population biology, and the social sciences. Review by staff at the Regional Office is conducted by those with expertise in fisheries management and policy, habitat conservation, protected species, and compliance with the applicable law. Final approval of the action proposed in this EA and clearance of any rules prepared to implement resulting regulations is conducted by staff at NMFS Headquarters, the Department of Commerce, and the United States Office of Management and Budget.

8.9 REGULATORY FLEXIBILITY ACT (RFA)

The RFA requires agencies to assess the impacts of their proposed regulations on small entities. The Regulatory Flexibility Act Analysis (RFAA) determines whether the Proposed Action would have a significant economic impact on a substantial number of small entities. The SBA size standards define whether a business entity is small and, thus, eligible for Government programs and preferences reserved for “small business” concerns. Size standards have been established for all for-profit economic activities

or industries in the North American Industry Classification System (NAICS). The SBA defines a small business in the commercial fishing and recreational fishing sector, as a firm with receipts (gross revenues) of up to \$4 million.

This section provides an assessment and discussion of the potential economic impacts of the Proposed Action, as required of the RFA. The objective of the RFA is to require consideration of the capacity of those affected by regulations to bear the direct and indirect costs of regulation. The Final Regulatory Flexibility Analysis (FRFA) must identify the number and types of businesses that would be regulated, indicate how many of these entities are small businesses, explain the expected economic impact of the regulation on small businesses, and describe any feasible alternatives that would minimize the economic impacts. The number of regulated entities for this action was 812 permits as of the January 22, 2010, deadline for permit holders to join a sector and at the time this FRFA was completed. The economic impact resulting from this action on these small entities is positive since the action would mitigate the disproportionate negative impacts to non-sector vessels proposed in Amendment 16.

Description of the Reasons Why Action by Agency is Being Considered

The flexibility afforded to sectors includes exemptions from certain specified regulations as well as the ability to request additional exemptions. Sector members will no longer have groundfish catch limited by DAS allocations and trip limits and will instead be limited by their available ACE. In this manner the economic incentive changes from maximizing the value of throughput of all species on a DAS to maximizing the value of the sector ACE. This change places a premium on timing of landings to market conditions as well as changes in the selectivity and composition of species landed on fishing trips. Further description of the purpose and need for the ACEs is contained in Sections 2.1 and 2.2.

The Objectives and Legal Basis for the Proposed Action

The objective of the Proposed Action is to authorize the operation of the Port Clyde Community Groundfish Sector in FY 2010, and to allow the benefits of sector operations to accrue to 43 proposed permits and the New England communities where they dock and land. The legal basis for the Proposed Action is the NE Multispecies FMP and promulgating regulations at 50 CFR § 648.87.

Estimate of the Number of Small Entities

Under the SBA size standards for small fishing entities (\$4 million), all permitted and participating vessels in the groundfish fishery are considered to be small fishing entities. Gross sales by any one entity (vessel) do not exceed this threshold. The maximum number of entities that could be affected by the proposed ACEs is 1,477 permits: the number of vessels in New England with eligible limited access multispecies permits. The number of permits who anticipate participating in the Port Clyde Community Groundfish Sector in FY 2010 is 43. Permit holders have until April 30, 2010, to withdraw from a sector and fish in the common pool.

Reporting, Recordkeeping and Other Compliance Requirements

Data collections relating to sectors are considered and evaluated with Amendment 16 to the FMP. This action does not propose to modify any existing collections or to add any new collections.

Duplication, Overlap or Conflict with other Federal Rules

The Proposed Action is authorized in Amendment 16 to the NE Multispecies FMP. It does not duplicate, overlap, or conflict with other Federal rules.

Alternatives which Minimize any Significant Economic Impact of Proposed Action on Small Entities

The Proposed Action would create a positive economic impact for the participating sector vessels because it would mitigate the negative impacts under Amendment 16. Little quantitative data on the precise economic impacts is available because sector management is relatively new to New England groundfish management. It is anticipated that switching from effort controls of the current management regime to operating under a sector ACE, sector members would remain economically viable while adjusting to changing economic and fishing conditions. Thus, the Proposed Action provides benefits to sector members that they would not have under the No Action Alternative.

Economic Impacts on Small Entities Resulting from Proposed Action

The EIS for Amendment 16 compares economic impacts of sector vessels with common pool vessels and analyzes costs and benefits of the universal exemptions. This rule provides further discussion on economic impacts of additional exemptions requested by sectors.

Port Clyde Community Groundfish Sector requests one additional exemption that could provide economic incentives to enroll in the sector. All exemptions are requested by the sector to generate positive social and economic effects, to sector members and ports.

The Port Clyde Community Groundfish Sector is requesting an exemption from the Day gillnet 120-day block requirement out of the fishery. Existing regulations require that vessels using gillnet gear remove all gear from the water for 120 days. Since the time out is up to the vessel owner to decide, to provide for sustained fishing income many affected vessel owners have purchased more than one vessel that may be used while the other is taking its 120 days out of the groundfish fishery. Acquiring a second vessel brings the additional expense of outfitting another vessel with gear. The exemption from the 120-day block would allow sector members to realize the cost savings associated with retiring the redundant vessel.
