CATALOG OF GEOMAGNETIC ACTIVITY
BASED ON SIX CLASS DIVISIONS, 1868-1976

Joseph A. Sutorik

Cheryl M. Cruickshank

A homogeneous set of data describing the average daily state of the geomagnetic field is presented for the period 1868-1976. The daily values are provided in two formats: Bartels rotation (27-day) and calendar.

1. CATALOG DESCRIPTION

The aa and Ap indices are converted into six class divisions (Sutorik and Cruickshank, 1977). This conversion provides a homogeneous data set describing the average daily state of the geomagnetic field for 109 years. Emphasis is placed on active- or storm-days, and five of the classes describe these days. Table 1 shows this classification. The daily class values that are derived by this conversion are presented in two formats in this catalog.

Table 1. Geomagnetic Field Classification

Class	Ap -Index	Definition
0	$0 \leq Ap < 7$	Quiet, usually no K -indices > 2
0	$7 \leq Ap < 15$	Unsettled, usually no K -indices > 3
1	$15 \leq Ap < 30$	Active, a few K -indices of 4
2	$30 \leq Ap < 50$	Minor Storm, K -indices mostly 4 & 5
	$Ap \geq 50$	Major Storm, some K -indices of 6 or greater
3	$50 \leq Ap < 100$	
4	$100 \leq Ap < 200$	
5	$Ap \geq 200$	

In Section A, the daily class values are depicted in a calendar format. Monthly and annual summations for each class are provided below each yearly array. This format will be useful to those individuals who may wish to study the influence that geomagnetic activity has, for instance, on meteorological systems (King, 1975; Roberts and Olson, 1973; Wilcox, 1976; and Willis,

1976). Much information has been discovered; but, indeed how far have we progressed? The following is cited from Bigelow (p. 5, 1898):

A remarkable feature of the history of terrestrial magnetism and also of meteorology is the fact that, in spite of many discussions of an enormous mass of observations, progress toward correlating them in general scientific laws has been very slow, the results in the main being very unsatisfactory.

Section B portrays the daily class values in the Bartels rotation format, with each rotation consisting of 27 days. For continuity purposes, the end of each horizontal row in the catalog array contains the first six days of values for the succeeding rotation. The Bartels rotation numbers are shown in the left column and the last two digits of the appropriate year are appended every fifth rotation. Additionally, the first day of each month is annotated by an upward pointing arrow below the appropriate digit. The months of January (Ja), April (Ap), July (Ju), and October (Oc) are also noted.

A discussion of the significance of recurrent geomagnetic activity (M-regions) and coronal holes is found in Sutorik and Cruickshank (1977). The selection of the days enclosed within a recurrent pattern envelope is subjective. The following guidelines are used by the authors in making the selections:

- (1) Persistency of class 1 and 2 events for a period of sequential days and/or sequential rotations.
- (2) The pattern has to exhibit a semirigid rotation of the recurrent structure, but allowance is made for changes due to evolutionary growth/decay.
- (3) The recurrent nature has to persist for four or more rotations.

From the analysis of the data in the Bartels rotation format, 78 recurrent patterns are selected as most probably coronal hole associated and are outlined by a solid line. Three additional cases, each of whose signature is more doubtful, are outlined by dotted lines. In some cases, a dotted pattern has been appended to the solid line envelope indicating an uncertainty as to the beginning or end of that particular recurrent structure. The numbers that are enclosed by dotted patterns are not counted as recurrent days.

2. RÉSUMÉ

Figures 1 and 2 are graphical summaries, in two different formats, showing the annual distribution for days when the class values are ≥ 1 ($A_p \geq 15$). The annual distribution attributable to recurrent and nonrecurrent days is shown in Figure 1. All class values ≥ 1 found within the solid line envelopes are counted as recurrent days. Obviously flare-related magnetically disturbed days are not removed from the count data depicting recurrent days

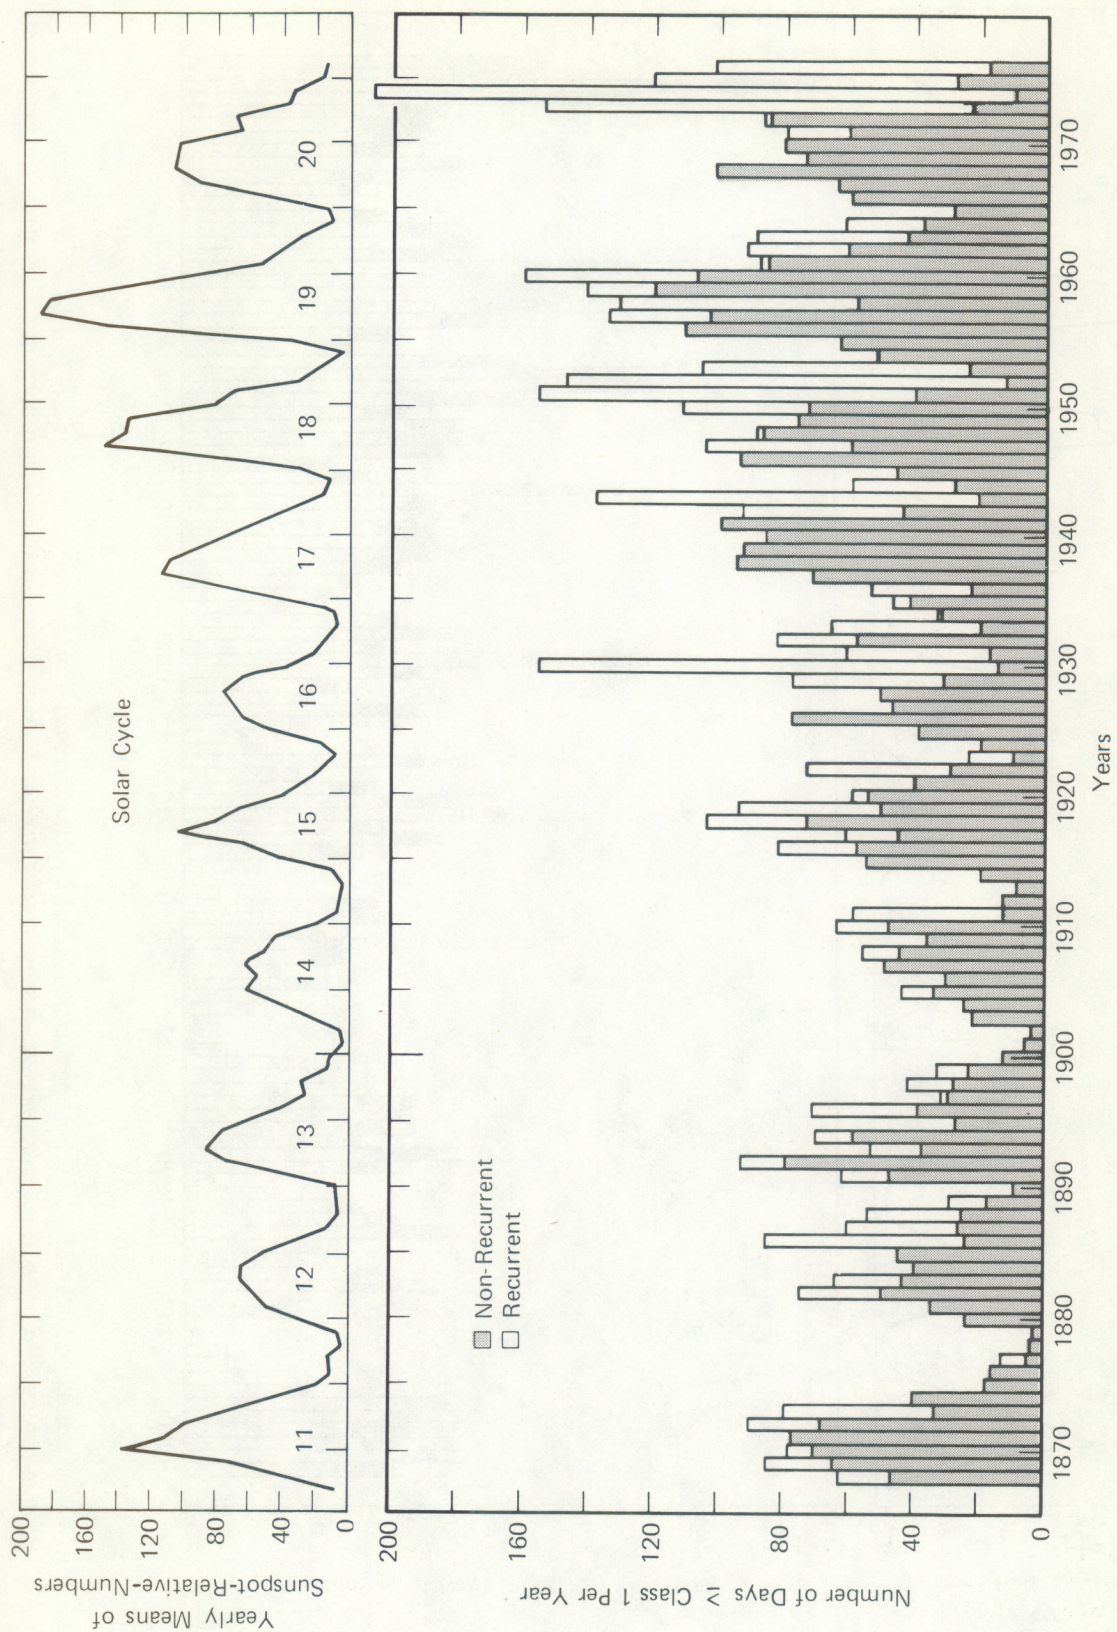

Figure 1. Annual distribution of geomagnetically disturbed days for the period 1868-1976: recurrent and nonrecurrent days. Includes curve of yearly means of sunspot-relative-numbers for the same period.

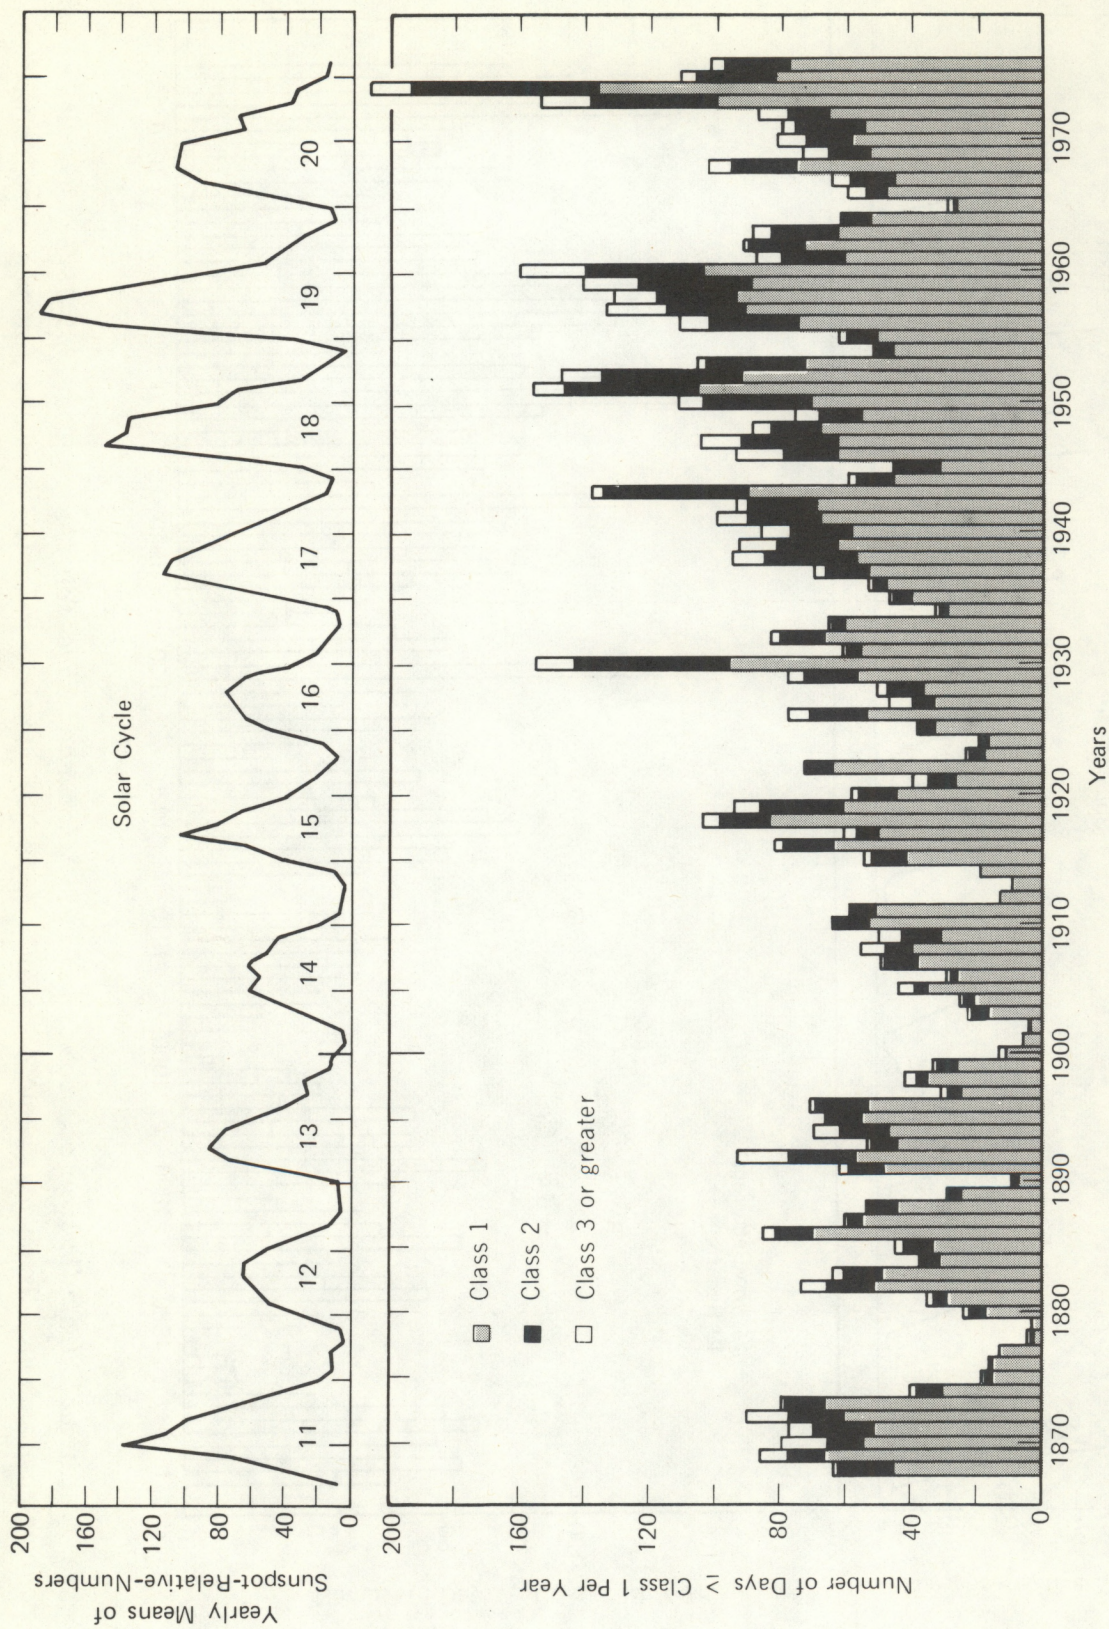

Figure 2. Annual distribution of geomagnetically disturbed days for the period 1868-1976: active (class 1), minor-storm (class 2), and major-storm (class ≥ 3) conditions. Includes curve of yearly means of sunspot-relative-numbers for the same period.

in Figure 1. For example, a class 5 event ($A_p \geq 200$) occurred on Bartels rotation No. 1705 in the midst of an assigned recurrent (coronal hole) pattern. The annual distribution for days when active (class 1), minor-storm (class 2), and major-storm (class ≥ 3) conditions existed is shown in Figure 2. Both figures include the curve of the yearly means of sunspot-relative-numbers (Waldmeier, 1961) for comparison.

The total number of days (class ≥ 1) are totaled for each solar cycle and are shown in Table 2. Cycle 11 began March 1867; therefore, 10 months of magnetic information is missing for cycle 11 summation. Cycle 20 totals include data through June 1976. It is interesting to note the steady increase in the number of occurrences of active- or storm-days per solar cycle since cycle 14: Table 3 lists the dates on which class 5 ($A_p \geq 200$) events occurred during the 109-year record.

Table 2. *Solar Cycle Summary of Geomagnetically Active- or Storm-days*

Solar Cycle	Class					Solar Cycle Total ≥ 1	Solar Cycle Normalized
	1	2	3	4	5		
11	416	98	33	15	0	562	1.33
12	392	74	19	7	3	495	1.17
