# 6. Assessment of the Rex Sole Stock in the Gulf of Alaska

Carey R. McGilliard and Wayne Palsson November 2018

### **Executive Summary**

#### Introduction

The Gulf of Alaska rex sole stock is assessed every four years and was last assessed in 2017. In between the full assessment years, we present an executive summary to recommend harvest levels for the next two years. Please refer to the 2017 full stock assessment report for further information regarding the assessment model (McGilliard and Palsson, 2017, available online at <a href="https://www.afsc.noaa.gov/REFM/Docs/2017/GOArex.pdf">https://www.afsc.noaa.gov/REFM/Docs/2017/GOArex.pdf</a>). A full stock assessment document with updated assessment and projection model results will be presented in 2021.

Rex sole is assessed using an age-structured model and Tier 3 determination within the context of a two-area model. The Western-Central GOA and Eastern GOA are modeled as separate areas with distinct growth patterns estimated by area. Thus, the single species projection model was run separately for the two areas using parameter values from the accepted 2017 rex sole assessment model (McGilliard and Palsson 2017), together with updated catch information for 2017-2018, to predict stock status for rex sole in 2019 and 2020 and to make ABC recommendations for those years. Projections are conducted using numbers-at-age for rex sole from age 3-20+ by area and historical recruitment of age 3 individuals by area to calculate OFL's and ABC's.

# **Summary of Results**

Based on the updated projection model results, the recommended ABC's for 2019 and 2020 in the Western-Central GOA are 11,308 t and 11,327 t, and the OFL's are 13,755 t and 13,788 t. The new ABC recommendation and OFL for the Western-Central GOA in 2019 are similar to those developed in 2018 (11,145 t and 13,558 t). The recommended ABC's for 2019 and 2020 in the Eastern GOA are 3,384 t and 3,398 t, and the OFL's are 4,134 t and 4,154 t. The new ABC recommendation and OFL for the Eastern GOA in 2019 are exactly the same as those developed in 2018 because realized and projected catches as estimated last year and this year were less than 2 t. The principal reference values are shown in the following three tables. The first table shows quantities for the entire GOA, the second table shows quantities for the Western-Central GOA, and the third table shows quantities for the Eastern GOA. The Western-Central and Eastern GOA are based on a Tier 3a approach, and the entire GOA table is simply the sum of the two areas.

<sup>\*</sup> Projections are based on the final catch of 2017 from the Western and Central GOA of 1,483 t and estimated catches of 1,673 t and 2,494 t that were used in place of maximum permissible ABC for 2018 and 2019, respectively. The 2018 projected catch was calculated as the current catch of GOA rex sole in the Western and Central GOA as of October 6, 2018 added to the average October 6 – December 31 GOA rex sole catches over the 5 previous years. The 2019-2020 projected catch was calculated as the average catch over the previous five years.

Status	As determined <i>last</i> year for:		As determined this year for:	
Status	2016	2017	2017	2018
Overfishing	no	n/a	no	n/a
Overfished	n/a	no	n/a	no
Approaching overfished	n/a	no	n/a	no

<sup>\*</sup> Projections are based on the final catch of 2017 from the Eastern GOA of 1.8 t and estimated catches of 1.8 t and 1.2 t that were used in place of maximum permissible ABC for 2018 and 2019, respectively. The 2018 projected catch was calculated as the current catch of GOA rex sole in the Eastern GOA as of October 6, 2018. The 2019-2020 projected catch was calculated as the average catch over the previous five years. In many years catches from the Eastern GOA are small and confidential.

#### **Area Apportionment**

The table below shows apportionment of the 2019 and 2020 ABCs among areas. The ABCs calculated for the Western-Central area (based on model estimates) are apportioned based on random effects model predictions of the proportion of Western-Central survey biomass in the Western and Central areas, respectively, in 2019-2020. Likewise, the ABC calculated for the Eastern area (based on model estimates) are apportioned based on random effects model predictions of the proportion Eastern survey biomass in the West Yakutat and Southeast areas, respectively.

Quantity	Western	Central	Total Western- Central	West Yakutat	Southeast	Total Eastern
Area Apportionment	26.10%	73.90%	100.00%	48.96%	51.04%	100.00%
2019 ABC (t)	2,951	8,357	11,308	1,657	1,727	3,384
2020 ABC (t)	2,956	8,371	11,327	1,664	1,734	3,398

# **Figures**

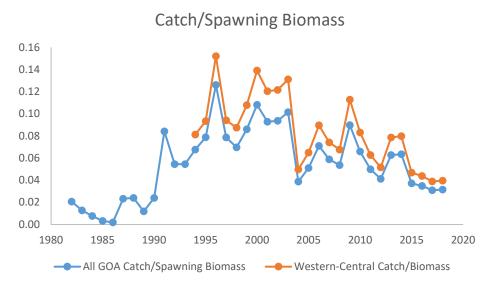

Figure 1. GOA rex sole catch: female spawning biomass ratio using spawning biomass for the entire GOA (blue line) and for the Western-Central region (orange line).
