COASTAL PELAGICS SURVEY RESEARCH

BACKGROUND INFORMATION

The Marine Fisheries Commission enacts management plans to ensure the conservation of marine species. These management plans include background data and reports, a findings of fact document, and other documents required for agency rulemaking. The policies and standards of the Commission (Section 370.025, F.S.) establish conservation as the paramount goal. However, Commission rule making is also to provide for optimum sustained benefits and use to all the people of the state.

Fishery management regulations for the coastal pelagic species, the mackerels, were first prepared by the federal councils in 1982. In retrospect the management plan did not address any of the real problems of overfishing which began to occur during the mid-seventies off the coast of Florida. During 1984 the newly created Florida Marine Fisheries Commission enacted rules regulating the taking of king mackerel. By 1986 the State had enacted substantial harvest restrictions for Spanish mackerel and succeeded in convincing the two federal councils to enact an emergency rule to stop fishing in the federal zone (exclusive economic zone) once the state quota was attained. The following year, federal plan amendment two was in place. The effect of the plan amendment was to establish federal quotas over the entire range of the various fisheries; these quotas in turn were derived from range and point estimates of acceptable biological catch (ABC) and total allowable catch (TAC), respectively. The result was to reverse the emerging management regime which allowed Florida to regulate the pace and allocation of the fishery. The fact that Florida representatives were leaders in the call for regulation of the pelagic fishery is not salutary. In spite of their wide ranging migrations along the continental shelf, hence the sobriquet coastal pelagic, the fishery and the problems in the fishery were, at that time, largely of Florida's making.

The problems of overfishing of the coastal pelagic species are not unusual. The species group includes king and Spanish mackerel, cobia, cero mackerel, Little tunny and dolphin with bluefish included in the Gulf of Mexico. The first two species have long been sought by recreational and commercial fishers. The now familiar **tragedy of the commons** described by G. Hardin also operates in the realm of fisheries. The technical explanation is that overexploitation of public resources occur because the factor cost to the individual firm does not equal the opportunity cost to society. Common property resources are nevertheless scarce goods to society but they are free goods, there for the taking, to individuals; this usually results in overexploitation since the usual leveling of demand and supply does not occur since one of the factors of production, i.e., natural resources such as land or

fish, labor, capital and entrepreneurial skill, is without a price or that price is limited to the cost of a license or permit.

Most of the management decisions made to date have been based on biological information which demonstrated growth overfishing or recruitment overfishing of a species or species complex. This approach has emphasized conservation, but has generally ignored the issue of optimum sustained benefits and use. Instead, allocation was established based on some average of the historical distribution of landings between recreational and commercial fishermen and between the various commercial fisheries. The concept of optimum benefit is a socio-economic concept which included consideration of the distribution of fishery resources. For any given species, there are a variety of demands: reproduction and growth (maximum sustained yield), aesthetics, food chain contribution, and commercial and recreational harvest. Man's uses can be further subdivided into nearshore versus offshore, directed versus bycatch, frozen versus fresh, tourist versus resident, etc. This distribution of the resource is referred to in fisheries management jargon as the allocation of the resource. In an economic sense, allocation to each sector (use) based on the highest marginal value would result in optimum sustained benefits and use.

Unfortunately, much of the information necessary to make allocation decisions is either unavailable or dated. Therefore, the need for timely social and economic data is critical to Commission decision making. Such information is not generally available from other sources, but must be specifically collected to determine social and economic impacts, economic values placed on the resource by different groups, market demand for different product forms, and the identification of import and export channels. This project will use survey research to address allocation questions for the coastal pelagics, specifically the mackerels: Spanish and kings.

East Coast Spanish mackerel provide some examples of not only the typical recreational-commercial allocation conflict, but also a north-south geographical allocation problem. During the 1950's, Spanish mackerel were abundant during winter all along the Southeast Coast, and Dade County was the leading commercial producer. However, the fisheries leapfrogged northward to Jupiter during the 1960's, and then to Ft. Pierce in the 1970's, probably because northern-most fishermen had a locational advantage intercepting the southbound migration moving along the narrow corridor between mainland Florida and the Gulf Stream current. There has been a dearth of Spanish mackerel from Palm Beach to Dade County during the last 15 to 20 years. recent Commission regulation will try to solve that problem by controlling fishing pressure early in the season to allow some fish to pass the intensive fisheries around Ft. Pierce.

Another allocation problem became apparent following the imposition of quotas three years ago, the problem being that the quotas have put the fishery in a "hurry up" mode as fishermen intensify their efforts to ensure that they get their fair share of the quota. In each of the last four years, the entire Southeast Coast quota has been taken in about two weeks of intensive fishing (Figure 1). Fifteen years ago, the same fishery took five or six months. The two week fishery results in a glut production that strains fish house and results in most of the product going to the freezer at the expense of the traditional fresh markets.

SURVEY RESULTS

Florida's management plan for Gulf king mackerel is framed by the federal quota established for the Eastern Zone of the Gulf group. Federal management is based on a quota that allocates 68% to the recreational fishery and 32% to the commercial fishery. Those amounts are then further divided into the Eastern (Florida) and Western zones. This results in 1,270,000 pounds of commercial quota for the Eastern Zone for the 1991-92 fishing year.

The commercial and recreational fisheries for king mackerel have been described in a number of sources. The trends in commercial landings of king mackerel in Florida over the past 40 years are evident as was the case in Spanish mackerel, i.e., three epochs of fishing. The first, until the late sixties, the second, pre-regulation, and finally, landings under a system of quotas.

Information about landings by gear type has been estimated by NMFS for the entire period of record. However the NMFS data is not sufficient to provide price information by gear type or season. The East Coast fishery is predominately a hook and line fishery and was an important component of the charterboat fisheries annual income, whereas West Coast landings were dominated by gill net fisheries and are centered in Monroe County.

Statistics on the origin of commercial catches indicate that the fishery is predominately in Florida, while 84% of the catch is taken in the area beyond three nautical miles from shore. Estimates of the number of watercraft in the fishery lack precision due to the multi-species nature of the pelagics fishery. Therefore, numbers and levels of effort are difficult to gauge. However, the number of hook and line vessels in the industry have shown a marked decline. The decline occurred prior to the imposition of quotas, which allows speculation of whether anticipated quotas or declining fishing conditions were the cause.

Because of the aggregating behavior of the fish, hook and line fishermen have had the advantage of a longer season than gill net fisherman. When price flexibility equations were estimated, in an

attempt to gauge the effects of regulatory catch reductions on revenues, only East Coast data was significant. The inference is that, aside from the mainstream markets that have historically shipped 60% of Florida landings to Fulton Fish Market, N.Y., N.Y. well-established markets (so-called efficient markets) do not exist. The establishment of quotas exacerbated this situation because large catches close the quota prior to the historical end of the fishery, which further attenuates the supply of an already seasonal fishery.

Recently developed survey information suggests that the markets still exist, but that the market channels have shifted to imported products. Trends for comparing landings and imports indicate that imports from 1980 until 1983 were less than 500,000 pounds. It appears that imports are being used to supplement declining landings and that imports are used during the season when quotas have closed.

The current management controversy is the result of two basic issues: (1) annual changes in the amount of allowable harvest that result from estimates of annual yield consistent with the long-term recovery of the fishery and (2) problems that occurred last year in monitoring the East Coast quota.

The commercial fishery is largely a Florida fishery. It has been characterized both historically and contemporarily by numerous reports. The latest estimates of the stock assessment panel concluded that both stocks are still below the biomass targets deemed necessary to ensure recovery from historical recruitment overfishing.

The East Coast fishery was centered in the Northeast U.S. during the latter nineteenth and early twentieth centuries, but by 1920 the fishery was concentrated in south Florida. Gill nets are the predominate gear form, while Florida landings account for over 85% of the total harvest.

The recent history of the fishery has been characterized by Williams as a leapfrogging of the industry toward Cape Canaveral from south Florida in an attempt to gain a locational advantage to first intercept the migrating fish. This has resulted from the introduction of deep water gill nets, 300 meshes deep, from vessels with a hold capacity in excess of 50,000 pounds. The introduction of such vessels during the 1970's moved the fishery further offshore, created a freezer fillet industry, and further contributed to recruitment overfishing.

Management measures to reverse the declines in spawning stock biomass were first initiated in the 1986-87 fishing year. The commercial fishery was managed through the use of quotas which further exacerbated the pace of fishing effort as each firm

attempted to garner the largest possible portion of the quota. Testimony during the January workshop in Ft. Pierce described 14 large vessels and 150 small watercraft (20-34 feet). However, an estimate of small boats based on trip tickets concluded that 58 were active on the East Coast.

The West Coast of Florida landed over 95% of the Gulf of Mexico catch during the 1989-90 season. Commercial harvest was below both the state and federal quotas for the first time. In fact, in prior years, quotas were landed in the Southwest Region prior to any significant Northwest Region harvest. Lack of demand from Florida Keys markets were cited. However, testimony from some wholesalers indicated ex-vessel prices of \$.75/lb. for fresh fish in whole form.

Annual quota changes are based on the decisions made by the South Atlantic and Gulf of Mexico Federal Fishery Management Councils. These harvest limits are imposed to ensure stock recovery and sustained yield.

Problems in the management of the East Coast fishery were identified during the 1989/90 fishing season. The Spanish mackerel Rule (46-23, F.A.C.) approved by the Commission in September 1989 attempted to reserve 10% (260,000 lbs.) of the East Coast quota (2,600,000 lbs.) to be harvested at the end of the season under 1,500 lb. daily vessel limits. The basis of the 10% reserve was: (1) to slow down commercial harvest and allow the Department of Natural Resources (DNR) to close the fishery in an orderly manner without exceeding the quota; (2) to reserve a small amount of fish to small-scale harvesters; and (3) to reserve some fish for fresh markets.

The rule did not achieve its intention of reserving the last 10%, and virtually the entire quota was captured during the unlimited phase of harvest. On December 20, DNR determined that 90% of the quota had been captured following a catch of 458,000 pounds on December 19, and they then issued an order to close the fishery to unlimited harvest effective 12:01 AM on December 21, 1989. However, on December 20, as they were calculating the previous day's catch and obtaining an order to reduce harvest to 1,500 lbs. per day, the fishery produced an additional 474,000 lbs. By the morning of December 21, it was apparent that the 90% of the quota (2.34 million pounds), as well as the 2.6 million pound quota, had been reached. DNR then closed the 1,500 lb. segment at noon on December 21. Thus, the 1,500 lb. daily vessel limit applied for only 12 hours, after which time boats became subject to the state's 500 lb. exception.

The lack of a 1,500 lb. daily vessel limit season has generated considerable anger within the commercial sector. Smaller boat operators in particular claim to have suffered excessively during

each of the four seasons since the quota has been in place. Small boat operators' incomes depended on a smaller unit of effort applied over a longer time period, compared to the large vessels which have very high harvest capacity (up to 50,000 lbs./trip) and needed fewer fishing days to have a good income. Since the advent of the quota, the winter season has only lasted about two weeks once the mackerel migration arrives south of Cape Canaveral. In each of the last three years, the season has been closed in December, three months before the historical end of the season.

There were 819 commercial permits issued for Gulf Spanish mackerel in 1988-89. The comparable number for Atlantic group was 1,242. The total watercraft in the fishery include 47 vessels and up to 237 smaller craft in all states. Of the total licenses in the fishery, 513 were active in the East Coast region, 256 in the Northwest, and 945 in Southwest Florida. During 1987/88, 374 SPLs accounted for 91% of the harvest. A detailed breakdown of landings by region, by trip size, by season for the 1989/90 fishing year.

A tabulation of wholesale dealers used to derive the survey questionnaires is also attached, the chart lists the number of wholesalers categorized by the number of purchases that included king mackerel with a second for Spanish mackerel.

The recreational fishery occurs on both coasts. Socio-economic characteristics of such fishermen were evaluated in Hiatt, 1983 and have been described by others. Preliminary MRFSS data indicate catches by all modes of fishing: private boat (70%), shore (18%), party/charter (12%), in the south Atlantic and 81%, 17% and 2% respectively in the Gulf of Mexico. Florida catch rates show a great deal of variability. Reported catch and harvest in numbers of fish totalled 304,000 and 279,000 by East Coast anglers and 2,159,000 and 1,437,000 for Gulf Coast anglers. During the last fishing year, East Coast anglers exceeded the quota, while Gulf Coast anglers did not reach their quota limit.

There are 1,100 charter and party boats in Florida in addition to the support services that are indirectly affected by management decisions. The number of anglers who target or catch mackerel range from 100,000 to 300,000 anglers taking 700,000 trips. These figures are based on a three year average. The recreational fishery was not included in the survey analysis aside from the charter/head boat portion of the questionnaire. The distribution of anglers who target and catch mackerels is such that using the recreational fishing license file to canvass anglers who result in biased results. Therefore the MFC has contracted separately with researchers from the University of Florida in order to obtain a regionally stratified random sample of all anglers, using the information obtained from the MRFSS telephone survey of 40,000 Florida households.

During the last fishing year, the Gulf quota has not been reached. However, during the previous fishing year, the quota was caught before the spring fishing season in southwest Florida, so the NWR did not receive an equitable allocation of the Gulf quota. The size of the benefit will be at least 56% of the NWR quota or \$94,000, ex-vessel.

This proposed measure would enact a landing law for the NWR so trip limits could be enforced regardless of the origin of the catch, i.e., state or federal waters. This is consistent with previous Commission action in the other regions. Table 3.03 provides an extensive tabulation of landings by trip size, by region, and by season. While no single fishing year can be considered representative, the data does indicate the preponderance of smaller trip size production in that region.

The benefit of the measure is considered to be twofold: (1) an enforceable 1,500 pound trip limit will enable quota monitoring to keep pace with landings, and (2) the trip limit will spread the quota to more fishermen for a longer time period. Harvests beyond the established quotas create regional allocation problems and extend the long-term catch reductions necessary to reach spawning stock biomass goals. Benefit/cost figures cannot be associated with this measure because time periods for stock recovery at various levels of ABC are not available.

The cost of the measure will be to the harvesting sector, when the federal quota is open and the state landing law is 1,500 pounds. Then craft with capacity in excess of 1,500 pounds will have higher costs per return, then if they were only regulated by quotas. From 1985 to 1990, 93% of all trips and 34% of landings have been from 1,500 pound or smaller trips, while the landing for the East and Southwest regions were 9% and 19%, respectively.

State quota numbers are derived from federal commercial quotas. Therefore, benefits or costs cannot be based on an unregulated alternative, since harvest limits are necessary to assure stock recovery and the long-term benefit of sustained yield. The estimate of MSY at recovery is 18 million pounds. Current TAC is 10.25 million pounds. The benefit of recovery would be as much as a 92% increase in commercial quotas.

The ECR commercial quota is being reduced by 500,000 pounds (20%) from the previous year, while the SWR is being increased by 20,000 pounds (1%) and the NWR is being increased by 80,000 pounds (20%). The result is a net reduction of 400,000 pounds, or \$140,000 ex-vessel (\$.35/lb.).

The Marine Fisheries Commission is considering changes to the Spanish and king mackerel rules in order to create the maximum resource. Records indicate you catch king or Spanish mackerel. To help ensure that your interests are considered please complete and re-

1. If you hold more than one SPL you will receive several questionnaires. Please only complete one survey for each fishing craft you use. What is the state or Coast Guard number for this boat/vessel:

2. How many craft do you use to fish for King or Spanish mackerel: _____

3. Please list the fish species from which you earn at least 20% of your gross income from fishing (check all that apply)

a. Spanish, b. king, c. pompano, d. grouper, e. amberjack, f. mullet, g. seatrout, h. sheephead, _____ other (name)

4. Are you the owner _____, captain _____, both _____ (check one)

5. How long have you owned _____ captained _____ (yrs/mos)

6. Please describe your craft: _____ (ft)
a. how old is the craft: _____ (years) b. what is the length (LOA) _____ (ft)

c. the displacement _____ (tons)

d. the hold capacity _____ (lbs)

e. the powerplant _____ manuf. _____ HP

f. what is the homeport _____ (city)

7. How many trips did you take _____ (1989) _____ (1990).

8. Did you land your catch in other than your homeport during: _____ (1989) _____ (1990) _____ (1991) (yes or no)

9. If yes were those ports: _____ out of state _____ SE_FL _____ SW_FL

E_Cen_FL W_Cen_FL NE_FL Big Bend Parhandle (check all that apply)
10. Do you target king or Spanish mackerels or do you consider them to be an incidental bycatch (less than 15%)? Please circle correct answer.

Kings target bycatch
Spanish target bycatch

11. Please rank your recent fishing experience for mackerel on a scale of one to ten (one = very bad, 10 = excellent):
1989 1990 1991

Spanish _____
Kings _____

12. Please describe the gears you use to target mackerel:
amount of gear trip length crew size (excluding capt.)

hook and line

amount of gear trip length

gillnet

trammel net

Other (essential)

13. Please provide an estimate of your costs for 1989/1990

a. insurance \$ _____ %

b. license fees \$ _____ %

c. business expense \$ _____ %

d. loan payment \$ _____ %

e. other costs \$ _____ %

f. unloading cost/per lb \$ _____ %

g. fuel/oil costs \$ _____ %

h. ice costs \$ _____ %

i. bait costs \$ _____ %

j. vessel repair \$ _____ %

k. gear repair \$ _____ %

l. grocery \$ _____ %

m. crew shares \$ _____ %

n. total \$ _____ %

14. What was the most common number of crew employed during 1989/1990 _____

15. Have you targeted new species, other than _____ during quota closures. P

a. _____ b. _____
c. _____ d. _____

16. Did targeting these new species require the _____ (yes/no) DESCRIBE _____

MARINE FISHERIES COMMISSION

NO POSTAGE STAMP NECESSARY
 POSTAGE HAS BEEN PREPAID BY

17. What time of the year (month) did you receive the best price per pound:
 1989 _____ 1990 _____ 1991 _____
 month & \$/lb.

for kings
 for Spanish

18. Why do you think you got that price (check all that apply): do not
 know, good quality, limited supply, large demand,
 relationship with dealer, other, please describe

19. If you answered good quality for number 18 please describe what
 the circumstances were that provided better quality during that
 time of year:

CHARTERBOATS AND HEADBOATS ONLY:

20. Is the vessel a headboat or charterboat (check one only)

21. Did you begin catch and release fishing for king and Spanish mackerel after
 quotas/bag limits went into effect? (yes or no)

22. Did the regulation of king and Spanish mackerel fisheries cause you to lose
 charters: yes/no number lost/ % lost
 1989/90 king _____
 Spanish _____

23. What is your charter rate?
 in season: half day full day
 off season: _____

WHOLESALE/RETAIL DEALERS QUESTIONNAIRE The FMFC wants to update information about the state's mackerel resources to improve the management of the fishery. Please complete and return this form so your views will be considered.

1. What percentage of your sales come from Florida seafood? _____ %

2. Do mackerels account for a significant portion of your sales:
 king yes _____ no _____ Spanish yes _____ no _____ zero yes _____ no _____

3. If you could obtain fresh mackerels during periods when supplies are limited, which months would you choose and what quantities could you sell:
 king 1. _____ (month, lb/2) 2. _____ (month, lb/2)

4. What other species do you try to obtain when you cannot buy mackerel:
 Spanish 1. _____ (month, lb/2) 2. _____ (month, lb/2)

a. substitutes for king: _____ b. substitutes _____

for Spanish _____ (name or species code #)

4b. Are these from out of state _____ or from Florida? _____ (year, no) _____ (year, no)

4c. Can you substitute large Spanish for king? _____ (year, no)

5. What price range did you pay per pound during 1989/90? _____
 high \$/lb _____ low \$/lb _____

king mackerel (year, no and month) _____

Spanish (year, no and month) _____

6. What percentage of the mackerel is caught by net or hook and line?
 King mackerel _____ Spanish mackerel _____

hook and line _____ % _____ %
 gill net _____ % _____ %

7. Do you pay more for hook and line caught mackerel?
 King mackerel _____ Spanish mackerel _____

cents/lb _____ (enter 0 if no difference)

8. What percentage of your catch is from boats versus vessels:
 King mackerel _____ Spanish mackerel _____

boats (less than 30 feet) _____ % _____ %
 vessels (30+ feet in length) _____ % _____ %
 charter/party boats _____ % _____ %

9. Please estimate the percentage of your sales to:

secondary wholesalers	_____ %	Spanish mackerel	_____ %
processors	_____ %	King mackerel	_____ %
fish markets	_____ %		
other	_____ %		

10. Please estimate the percentage of your geographical sales to:
 King mackerel _____ Spanish mackerel _____

southeast Florida _____ % _____ %
 Tampa Bay area _____ % _____ %

other Florida _____ % _____ %
 New York _____ % _____ %

other U.S. _____ % _____ %

Caribbean _____ % _____ %

other export _____ % _____ %

11. Please estimate the percentage of your mackerel which are sold in each of the following product forms: King mackerel _____ Spanish mackerel _____

round fresh _____ % _____ %

round frozen _____ % _____ %

fillet frozen _____ % _____ %

steaked _____ % _____ %

12. Are you able to receive a premium markup margin for a particular product form? Please identify the product form and the percentage of the premium.
 King mackerel _____ Spanish mackerel _____

13. If you identified a premium product form, what is the maximum monthly supply you could handle on a sustained basis (permanently)?
 King mackerel _____ lbs.
 Spanish mackerel _____ lbs.

14. We would like to interview some of your wholesale/processor customers to further investigate market demands. Please provide the mailing addresses of some customers.

15. How important were the following attributes in your decision to purchase

Spanish mackerel. *Please circle the number corresponding to the*

level of importance for each attribute listed below:

	not important		Very important		
a. relationship with fishermen	1	2	3	4	5
b. lack of substitutes	1	2	3	4	5
c. relative price	1	2	3	4	5
d. mark up margin	1	2	3	4	5
e. reliable supply	1	2	3	4	5
f. existing capital investment	1	2	3	4	5
g. tie-in sales	1	2	3	4	5
h. seasonal availability	1	2	3	4	5
i. demand exceeds supply	1	2	3	4	5
j. unimportant product	1	2	3	4	5
k. other	1	2	3	4	5

This file describes the DBase III files that contain the responses to the commercial fishing surveys sent to harvesters and dealers who reported fishing for coastal pelagics during the 1989/90 fishing year. The accompanying disk contains a copy of this file and the following DBase III files:

1. Mackfish.dbf - this contains 'label' data. Specifically, this file contains all names and addresses of fishermen that received the survey.
2. Mackfish.ndx - this is the matching index file.
3. Mackdeal.dbf - this file also contains 'label' data. This contains all names and addresses of dealers and wholesalers that received the survey. This also contains the 'snowball dealer' names and addresses.
4. Mackdeal.ndx - this is the matching index file.
5. Fisherma.dbf - this is part one of the main database, and consists of all data edited from the surveys received from fishermen. This file contains all questions on the survey up to and including question #15.
6. Fisherma.ndx - this is the matching index file.
7. Fisher2.dbf - this is part two of the main database, and consists of the remaining data concerning surveys sent in by fishermen, and starts at question #16.
8. Fisher2.ndx - this is the matching index file.
9. Dealer.dbf - this is part one of the second database, and consists of all data edited from the surveys received from wholesalers, dealers, and 'snowball dealers'. This file contains all questions on the dealer survey up to and including question #14.
10. Dealer.ndx - this is the matching index file.
11. Dealer2.dbf - this is part two of the second database, and consists of all remaining data concerning surveys sent in by dealers, wholesalers, etc., and starts at question #15.
12. Dealer2.ndx - this is the matching index file.
13. Tempfish.dbf - this is a duplicate file that matches Mackfish.dbf, consisting of addresses and names concerning fishermen, and also containing the 'fisherid' numbers, which identify each individual record. Note that access to these records depends on the fisherid number, and not the record number.

14. Tempfish.ndx - this is the matching index file.
15. Tempdeal.dbf - this is a duplicate file that matches Mackdeal.dbf, consisting of addresses and names concerning dealers, wholesalers, and 'snowball dealers', and also containing the 'dealerid' numbers, which identify each individual record. Note that access to these records depends on the dealerid number, and not the record number.
16. Tempdeal.ndx - this is the matching index file.
17. Marine.exe - this is one of the software programs.

GEAR

1. "Hook & Line":

101. Wire Line & Spoons
102. Rods & Reels
103. Paraveins
104. Bottom Fishing Gear
105. Terminal Tackle
106. Manuals
107. Electric Reel
108. Poles
109. Trolling Cigar minnows
110. Trolling 30# class tackles
111. Cable & Hooks
112. Outriggers
113. Bug Reels
114. Piano wire
115. Monofilament Handlines
116. Downriggers
117. Deep drop reels
118. Surf equipment
119. Light spinning
120. Deepwater reels & tackle
121. Live bait wells
122. Planers
123. Bandit reels and gear
124. Jigging
125. Small jigs & reels
126. Spinning or light conventional trolling
127. Hooks & sinkers
128. Yo Yo's
129. Spin cast & troll
130. Electric bottom reels
131. Jerk lines
132. Electramates
133. Tackle
134. Lures
135. Reels
136. Line and hooks
137. Snaps mono
138. Swivels
139. Hooks
140. Rods

2. "Gillnets":

201. Bigger size mesh gillnets
202. Stab gillnet
203. Spot, jack, trammel, mullet, drift, pompano, bluefish net
204. Shark net
205. New net
206. Smaller size mesh gillnet

3. "Other":

- 301. Seine
- 302. Longline spool
- 303. Rakes
- 304. Traps
- 305. Sponge hooks
- 306. Shrimp gear
- 307. Scuba gear
- 308. Dive & trap gear
- 309. Wing nets
- 310. 4 x 8' Butterfly trawls
- 311. Castnets
- 312. Wood traps
- 313. Long line for groupers
- 314. Larger nets
- 315. Crawfish/Lobster traps
- 316. Trap hauler
- 317. Drift line
- 318. Shark Line & Reel

4. "Miscellaneous":

- 401. Lead
- 402. Electronics
- 403. Hydraulics
- 404. Seabass Traps
- 405. Ropes
- 406. Twin
- 407. Dip
- 408. Chemicals & Nets
- 409. Longer Anchor Line/Anchor
- 410. Tanks & Pumps for Bait
- 411. Fish Finder
- 412. Trammel Lines
- 413. Bigger Fishboxes
- 414. Heavier equipment
- 415. Trailer
- 416. Nets (other than gill)
- 417. Crimp pliers
- 418. Line cablecutters
- 419. Cable
- 420. Colorscope
- 421. Clam boat
- 422. Insulated box
- 423. Knives
- 424. Net boat

OPTIONS FOR #18

1. "Limited Supply":

10. Time of year
11. Limited supply of fish
12. Season just beginning
13. Gulf was closed/Closure of season in the Gulf
14. The nets weren't set
15. Low availability
16. Scarcity of Fish
17. Panic buying
18. Quota filled
19. Bad weather

2. "Quality":

21. Keep on ice
22. Fresh fish
23. Properly iced down
24. Ice & salt water
25. No net marks
26. Firm fish
27. Careful handling

3. "High Demand":

31. Maximum price from buyer
32. Lent/Easter

4. "Excess Demand":

41. Plenty of supply = less money
42. Commercial net boats determine price of kings
43. Poor price due to imports

5. "Miscellaneous":

50. "That's all they pay"
51. Dealer sold fish from his own store
52. Large fish
53. Dealer is a crook
54. Price fixing
55. Dealer sets price
56. Dealer knew quota was going to be filled early
57. Fast off-loading
58. Going rate
59. Demise of gill nets

OPTIONS FOR #19

1. "Icing Practices":

- 1A. Cooler water temperature
- 1B. Kept in ice
- 1C. Fish were very fresh
- 1D. Cool weather
- 1E. Brined fish
- 1F. Put immediately into chill box
- 1G. Full shade
- 1H. Fish still alive when iced
- 1I. Fish spread out

2. "Gutting Practices":

- 2A. Gutted properly
- 2B. Cleaned and dressed immediately
- 2C. Immediate removal of fish from net

3. "Non-sequitur":

- 3A. High demand & low supply
- 3B. Short season
- 3C. Lots of fish
- 3D. Price fixing
- 3E. Market controls price
- 3F. Less fish on market
- 3G. King mackerel quota filled
- 3H. Best price before gillnets set
- 3I. Fish migrate back north
- 3J. Politics
- 3K. Plenty of feed
- 3L. Because you are lucky
- 3M. Beds of mackerel not hit as hard by big boats/smaller boats could catch some
- 3N. Hand line fish only

4. "Miscellaneous":

- 4A. Picky chefs
- 4B. Lack of worms
- 4C. Fat fish
- 4D. Good winter migration from north
- 4E. Large nets
- 4F. Short half to one day trips/Sold on same day
- 4G. Size/Smokers
- 4H. Hook and line not nets
- 4I. Caught at night
- 4J. Less weight stacked on fish at the market
- 4K. Lack of netting
- 4L. Steaked for Cuban market
- 4M. Catch small quantities of fish at a time
- 4N. Caught and sold the same day
- 4O. Limited competition from other fishermen

PRODUCT FORMS

1. Round fresh
2. Round frozen
3. Fillet frozen
4. Steaked
5. Smoked
6. Fresh fillet
7. Whole fresh
8. Processed for bait
9. Other, unknown

Mr. Robert Palmer, Economic Analyst
Marine Fisheries Commission
Koger Executive Center, 106 Douglas
3900 Commonwealth Boulevard
Tallahassee, Florida 32399

Dear Bob:

Please find enclosed the mackerel mailing labels that you requested and a diskette containing the dBase IV files from which they were generated. I have also made a tape back-up of the SAS files containing the information about each dealer and fisherman.

The tape is number 1781 and should be labelled: MACKEREL MAILING LABELS. I used the CMS, TAPE DUMP command to write these files to the tape. So, you should use TAPE LOAD *filename*, to copy the files from the tape. TAPE SCAN will show you that there are two SAS data files: MACKFISH LIC89 and MACKDEAL LIC89. MACKFISH LIC89 contains the informations about each fishermen, including their SPL. MACKDEAL LIC89 contains the dealer number and the information about each dealer. I have tried to eliminate redundant entries when possible, but I am sure that some remain. There also appear to be a number of SPL's for which there was no matching name or other information. Most are probably misrecorded numbers of fishermen already included in the file. I have removed those records from the tape file. An example record from each file is included with this letter to show the format of each. Most of the fields are self-explanatory; a few, however, are somewhat cryptic. EFFDATE is the effective starting date for the license. EXPDATE is the expiration date for the license. INDVES indicates whether the license is for an individual or vessel. K_TRIPS is the number of trips on which king mackerel were landed. KINGS is the total weight of king mackerel landed. LMNUM is simply the numeric part of the SPL. RESIDENT contains one of three codes; R = Florida resident, N = non-resident US citizen, and A = non-resident alien. RESTRSPP indicates restricted species status. SP_TRIPS is the number of trips on which Spanish mackerel were landed. SPANISH is the total weight of Spanish mackerel landed.

Mr. Robert Palmer
Page Two
April 2, 1991

The dBase IV files are saved on a high density 3.5" diskette. There are three database files on the diskette, MACK89.DBF, MACKFISH.DBF, and MACKDEAL.DBF. MACKDEAL.DBF contains the dealer addresses, MACKFISH.DBF contains the fishermen addresses, and MACK89.DBF contains both. Copies of the structure of each file are enclosed. The SPL field in the MACKDEAL.DBF file actually contains the dealer number. The SPPLAB field contains the species code. REPS contains the number of duplicates of that license in the original file. DEAL_FISH contains the code for whether the record is for a fisherman (F) or a dealer (D). Other support files are also on the diskette, including the label format files. To print or view the mailing labels in zipcode order, enter the following commands from the dBase dot prompt:

```
USE MACKFISH (or MACKDEAL, depending on the desired data)
SET ORDER TO ZIPCODE
MODI LABEL MACK89
```

You will be presented with a menu screen showing the format of the labels and allowing alterations as well as printing. You gain access to the menus at the top of the screen by pressing F10.

I used nearly two full boxes of mailing labels during the printing. There are three copies each of the dealers and the fishermen list. Each label has the full name and address, and a code (xx-x) in the upper right corner describing if that record is a fisherman (F) or dealer (D), and whether they caught Spanish mackerel (S), king mackerel (K), or both (SK). Each strip of labels is separate and sorted in zip code order. Some of the stacks are broken in the middle as well, where printing mistakes were corrected. There is also a fourth large stack at the bottom of one of the boxes, which is an incomplete list of the fishermen in alphabetical order. You might find that useful for your second wave.

Call me if you have any problems using or locating any of the files. Good luck with the survey. We will be interested to see the results.

Sincerely,

DIVISION OF MARINE RESOURCES

James E. McKenna, Jr.
