ACKNOWLEDGEMENTS

Acknowledgements for assistance in this project are due to Ms. Lee Hutchinson-Neff and Ms. Laura Clifford, the USF graduate research team, who spent countless hours in Florida's hot summer sun locating and surveying the archaeological sites. In addition, their research of previous archaeological surveys conducted in the Tampa Bay Region and the abstract of the prehistory and history of the Region was invaluable to the project. Without their dedication and energy, this project would never have become a reality.

Acknowledgements are also due to the members of the Tampa Bay Region Historical and Archaeological Preservation Committee. Their concern for the protection of the Region's cultural resources, their direction and helpful suggestions, as well as their tremendous expertise in the field is unique and priceless to the program. Their participation in this project is acknowledged with genuine and sincere appreciation. In particular, Dr. Roger Grange and Dr. Ray Williams of the University of South Florida, and Mr. Bill Burger are recognized for their report review and comments.

In addition, the Tampa Bay Regional Planning Council would like to thank Dr. James Stoutamire of the Department of Environmental Regulation and Dr. Louis Tesar of the Florida Department of State, Division of Historical Preservation, for their guidance and assistance in this project.

EXECUTIVE SUMMARY

The Tampa Bay Region Coastal Archaeological Survey Project was prepared by the Tampa Bay Regional Planning Council for the Florida Department of Environmental Regulation, Office of Coastal Management using funds made available through the National Oceanic and Atmospheric Administration under the Coastal Zone Management Act of 1972, as amended. The project focused on the location of known archaeological sites in the four-county Tampa Bay Region. The purpose of the project was to identify and quantify the impact of development on these known archaeological resources. As data was gathered and analyzed, particular attention was paid to the sites located on or near the coast as well as inland wetland areas.

The study was conducted through a teamwork effort by an archaeological survey team consisting of graduate interns from the University of South Florida (USF), Department of Anthropology and the Tampa Bay Regional Planning Council (TBRPC) Development of Regional Impact (DRI) Review and Historical Preservation Program staff. All study findings and recommendations were reviewed by the Tampa Bay Region Historic/Archaeological Preservation Committee.

The project involved (1) developing an inventory of existing sites in the region identifying the type of site and the highlighting those located along the coast, (2) attempting to locate known archaeological sites to determine the "condition" or "degree of disturbance" as well as the current land use, (3) entering this data on the regional geographic information system (GIS) data files, and (4) preparing a report which quantifies the impact of development on the cultural resources in the region. This information was then used to provide recommendations on how we can better protect the remaining archaeological resources and preserve the treasures of the past for future generations.

The report includes a description of the project (Chapter I), a methodology statement (Chapter II), a brief synopsis of the prehistory and history of the Tampa Bay Region (Chapter III), the summary of survey findings which quantifies the impacts of development activities on archaeological sites (Chapter IV), and recommendations for strategies to better protect cultural resources through the development review process (Chapter V). The report also contains a printout of all the archaeological sites by county. This indicates whether the site was visited during this project effort, the condition of the site and the current land use and is provided as Appendices A, B, C, and D.

Of the 1275 recorded archaeological sites in the Tampa Bay Region, 704 were visited by the survey team. Of these sites, a total of 306 have been totally destroyed, 82 have undergone major disturbance, 139 have

undergone moderate disturbance and 177 have experienced only minor damage. Very few archaeological sites located in coastal areas, and particularly along the Gulf Coast, are still in existence. The predominate factor of this destruction is the residential and commercial development without mitigation which has occurred along the coast and other water bodies.

In addition, unauthorized digging or "pot-hunting" on undeveloped rangelands and agricultural property, as well as the public property managed by the Southwest Florida Water Management District has led to moderate-to-major disturbance of many sites within the more rural areas of the region. This was particularly evident in Pasco County.

By the year 2000 the population of the region will reach nearly 2.5 million people (Future of the Region: A Comprehensive Regional Policy Plan, 1988). It is predicted that the tremendous expansion into presently undeveloped land will be responsible for the destruction of a large number of irreplaceable archaeological resources unless protective policies and procedures are implemented to conserve the remaining resources.

Chapter V evaluates the regional review process and policies and makes specific recommendations regarding strategies to enhance the protection of the archaeological resources. The recommendations are summarized below:

- Strengthen existing policies,
- Require development review by the local preservation commissions or boards,
- Consider the provision of protective buffers or greenlines within Council policy,
- Consider the provision of educational and interpretive exhibits when excavation for mitigation does occur,
- Enhance coordination between the DHR and TBRPC in the early phases of development review,
- Coordinate with state, regional and local agencies and commissions and boards to address the concept of "significance" in resources protection,
- Require additional information collection, survey and mitigation activities earlier in the development review process,
- Strengthen development order conditions regarding resource protection and mitigation,
- Continue to update and enhance the site-prediction models currently used at the regional and local levels.

In addition, Appendix E provides a listing and description of the current federal legislation and state statutes which can be used to protect sig-

nificant sites. (It was recommended by the Committee that this list be circulated to local governments and that local governments are surveyed to determine whether existing provisions may be under-utilized.)

Finally, it is recognized that both avoidance and mitigation strategies can benefit the public and the private sector if the importance of cultural resource preservation is recognized early in the development review process. By careful planning, it is possible to avoid unnecessary destruction of our cultural resources. In addition there are examples in the region, where cooperation and initiative has resulted in an advantage to both the developer and the public, not only from the preservation of the resource, but also from the public education contributions.

INTRODUCTION

Located on the west central coast of the Florida peninsula, the Tampa Bay Region is comprised of four counties: Hillsborough, Manatee, Pasco and Pinellas (See Figure 1). In 1989, the population of the region was estimated at 1.9 million which represents a 50 percent increase since 1975. Eighty percent of the new growth occurs in the coastal areas of the region contributing to the fact that Pinellas County is the most densely populated county in the State of Florida.

The natural shoreline of the region consists of many small bays and inlets with marshlands adjacent to the tributaries. The bay system, principally shallow estuarine areas, averages less than nine feet in depth and covers in excess of 500 square miles with almost 750 miles of shoreline including inlets. The primary bays of this system include: Old Tampa Bay, Hillsborough Bay, Tampa Bay, Boca Ciega Bay, Clearwater Harbor and Sarasota Bay.

A chain of barrier islands lines the coast from Anclote Key in Pasco County south to Longboat Key in Sarasota. With the exception of Caladesi Island, a state park, all barrier islands are extensively developed with commercial as well as residential units.

For thousands of years, people have been attracted to the coastal areas of Florida, like the Tampa Bay Region. The abundant natural resources in the coastal locations and wetlands have drawn people today, as in the past, to the environmentally sensitive areas of the state. Archaeological evidence has demonstrated that these regions are prime locations for archaeological sites.

At one time, spectacular sites were located in the Tampa Bay Region, particularly along the coast. Ancient shell middens and burial mounds dotted the Gulfshore and riverbanks in testimony of the civilizations which lived and traveled through the region. Many of these archaeological sites have since been destroyed and their contribution to our understanding of early life lost forever.

The fact that fewer sites exist makes those remaining increasingly valuable. Although the information lost through development without mitigation cannot be recovered, the careful examination of those sites which remain intact and the survey of potential sites before development occurs can give us needed information about prehistoric coastal lifeways.

Funds for the Tampa Bay Region Coastal Archaeological Survey Project were provided by the Florida Department of Environmental Regulation (FDER), Office of Coastal Management using funds made available through the National Oceanic and Atmospheric Administration under the Coastal Zone Management Act of 1972, as amended. The goal was to provide recommendations on how we can better protect these nonrenewable resources and preserve the treasures of the past for future generations.

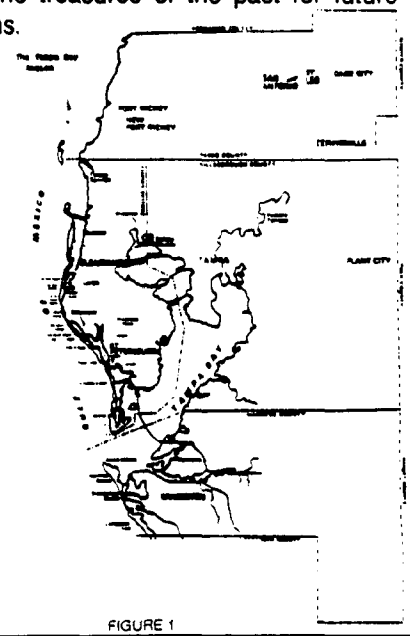

FIGURE 1

CHAPTER I

PROJECT DESCRIPTION

The Tampa Bay Region Coastal Archaeological Site Survey Project focused on the location of known archaeological sites in the four-county Tampa Bay Region. The purpose of the project was to identify and quantify the impact of development on these known archaeological resources. As data was gathered and analyzed, particular attention was paid to the sites located on or near the coast as well as inland wetland areas.

The study was conducted through a teamwork effort by a archaeological survey team consisting of graduate interns from the University of South Florida (USF) Department of Anthropology and the Tampa Bay Regional Planning Council (TBRPC) Development of Regional Impact (DRI) Review and Historic Preservation Program staff. All study findings and recommendations were reviewed by the Tampa Bay Region Historic/Archaeological Preservation Committee.

The project involved the following major tasks:

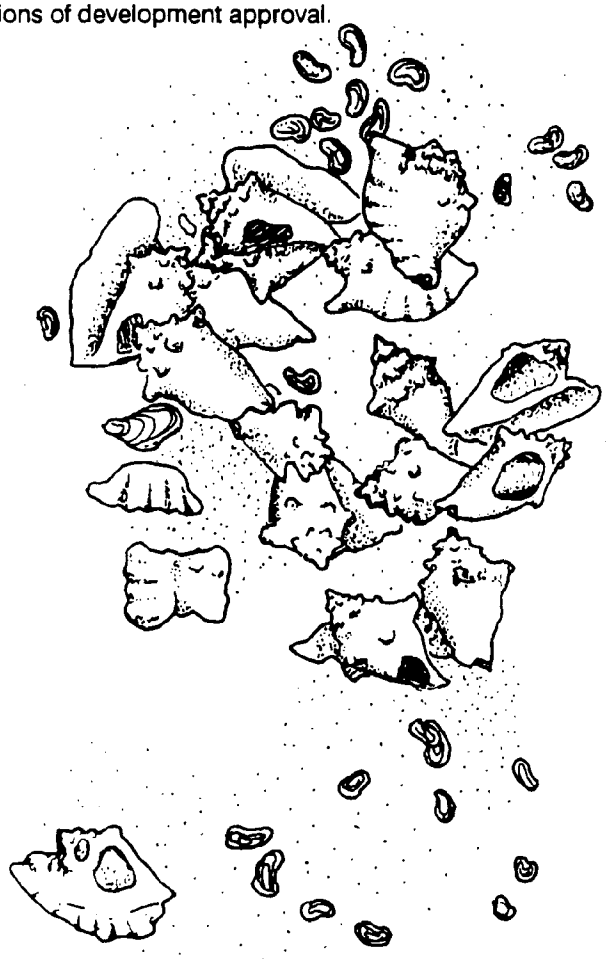
1. Developing an inventory of existing sites in the region, identifying the type of site and highlighting those known sites along the coast and in wetland areas.

2. Attempting to locate known archaeological sites using aerial photography or site visitation in order to determine the "degree of disturbance" and current land use.

3. Entering this data on the regional geographic information system (GIS) data files.

4. Preparing a report which quantifies the impact of development on the cultural resources in the region, especially along the coastal areas.

5. Reviewing the avoidance and mitigation strategies available to protect cultural resources in the Region currently used in the DRI process and make recommendations for the revisions to the Tampa Bay Comprehensive Regional Policy Plan, the DRI review process and appropriate recommendations for conditions of development approval.



CHAPTER II

METHODOLOGY STATEMENT

GENERAL

In order to provide the reader with an understanding of the importance of our archaeological resources and a more comprehensive knowledge of the area, a brief prehistory and history of the Tampa Bay Region is included in this report. The prehistory describes, in general, what we know of the lifestyles of the earliest inhabitants of the state of Florida and the Tampa Bay Region. It includes a description of the culture period categories, which will be used in this report, from the early Paleo-Indian period through the historic culture periods beginning with the Post-Spanish contact.

A section which addresses site types is also provided. The description of site types includes examples of the types found in the region. Maps of the region were generated. These include the site type by reference number. The prehistory and history of the Tampa Bay Region and the description of cultural periods and site types is provided in Chapter III.

TASK 1.

The first task of the project was to develop a comprehensive inventory of existing archaeological sites in the Tampa Bay Region. Information was obtained from the Florida Master Site File through the Department of State, Division of Historical Resources (DHR) in Tallahassee. This computerized data was updated using information from the published and unpublished documentation of archaeological survey work that has been conducted in the four-county region. The survey areas of these reports are delineated on Figures 2, 3, 4, and 5. (It should be noted that additional areas within the region have been surveyed, although this data has not as yet been aggregated by the DHR.)

In addition, the project survey team incorporated data from the DHR sites files which were not on the computerized Florida Master Site File inventory. This required several working days in Tallahassee which yielded important information that could be merged with existing data on the computerized inventory.

Critical information from the surveys and DHR data files was added to the Master Site File inventories to provide a more complete and up-to-date data base for analysis. This information included site location coordinates (Universal Transfer Mercator or UTMs), essential for mapping and site verification. The "enhanced" Master Site Files were used as the non-image data files for the computerized mapping system.

TASK 2.

Using the UTM coordinates from the "enhanced" Master Site Files, which included data gleaned from the survey reports and the DHR files in Tallahassee, the Council's Geographic Information System (GIS), a computerized mapping program was used to generate county maps identifying archaeological site locations. The GIS is a computer-based mapping facility which enables both image and non-image

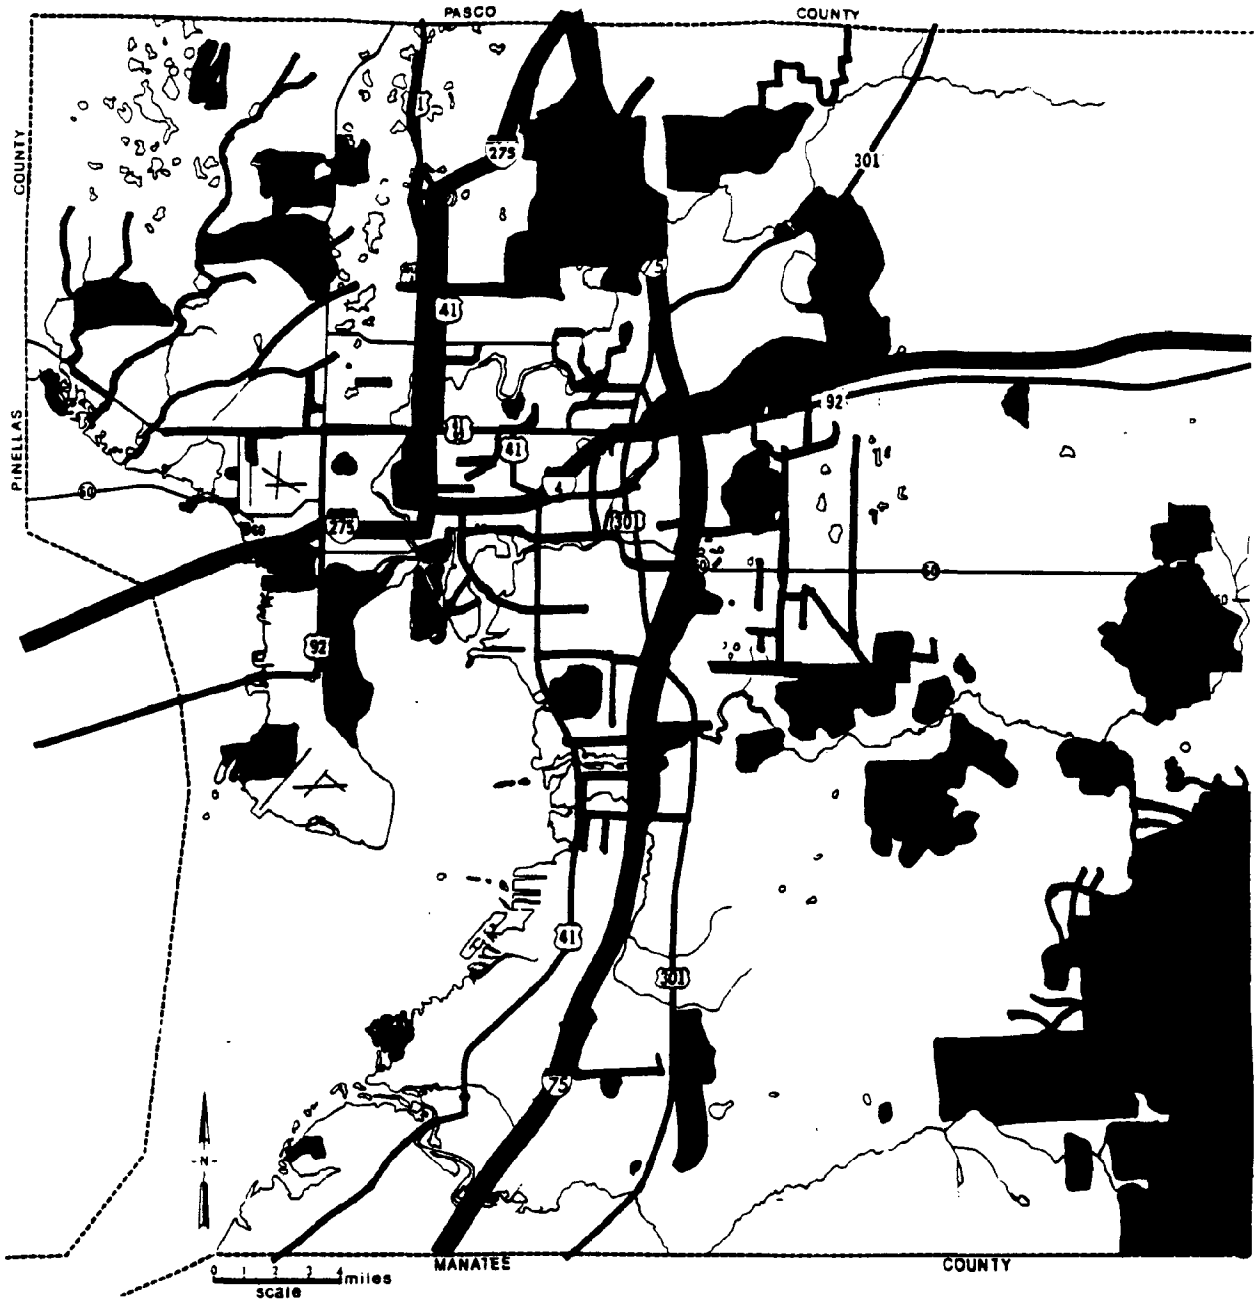


FIGURE 2

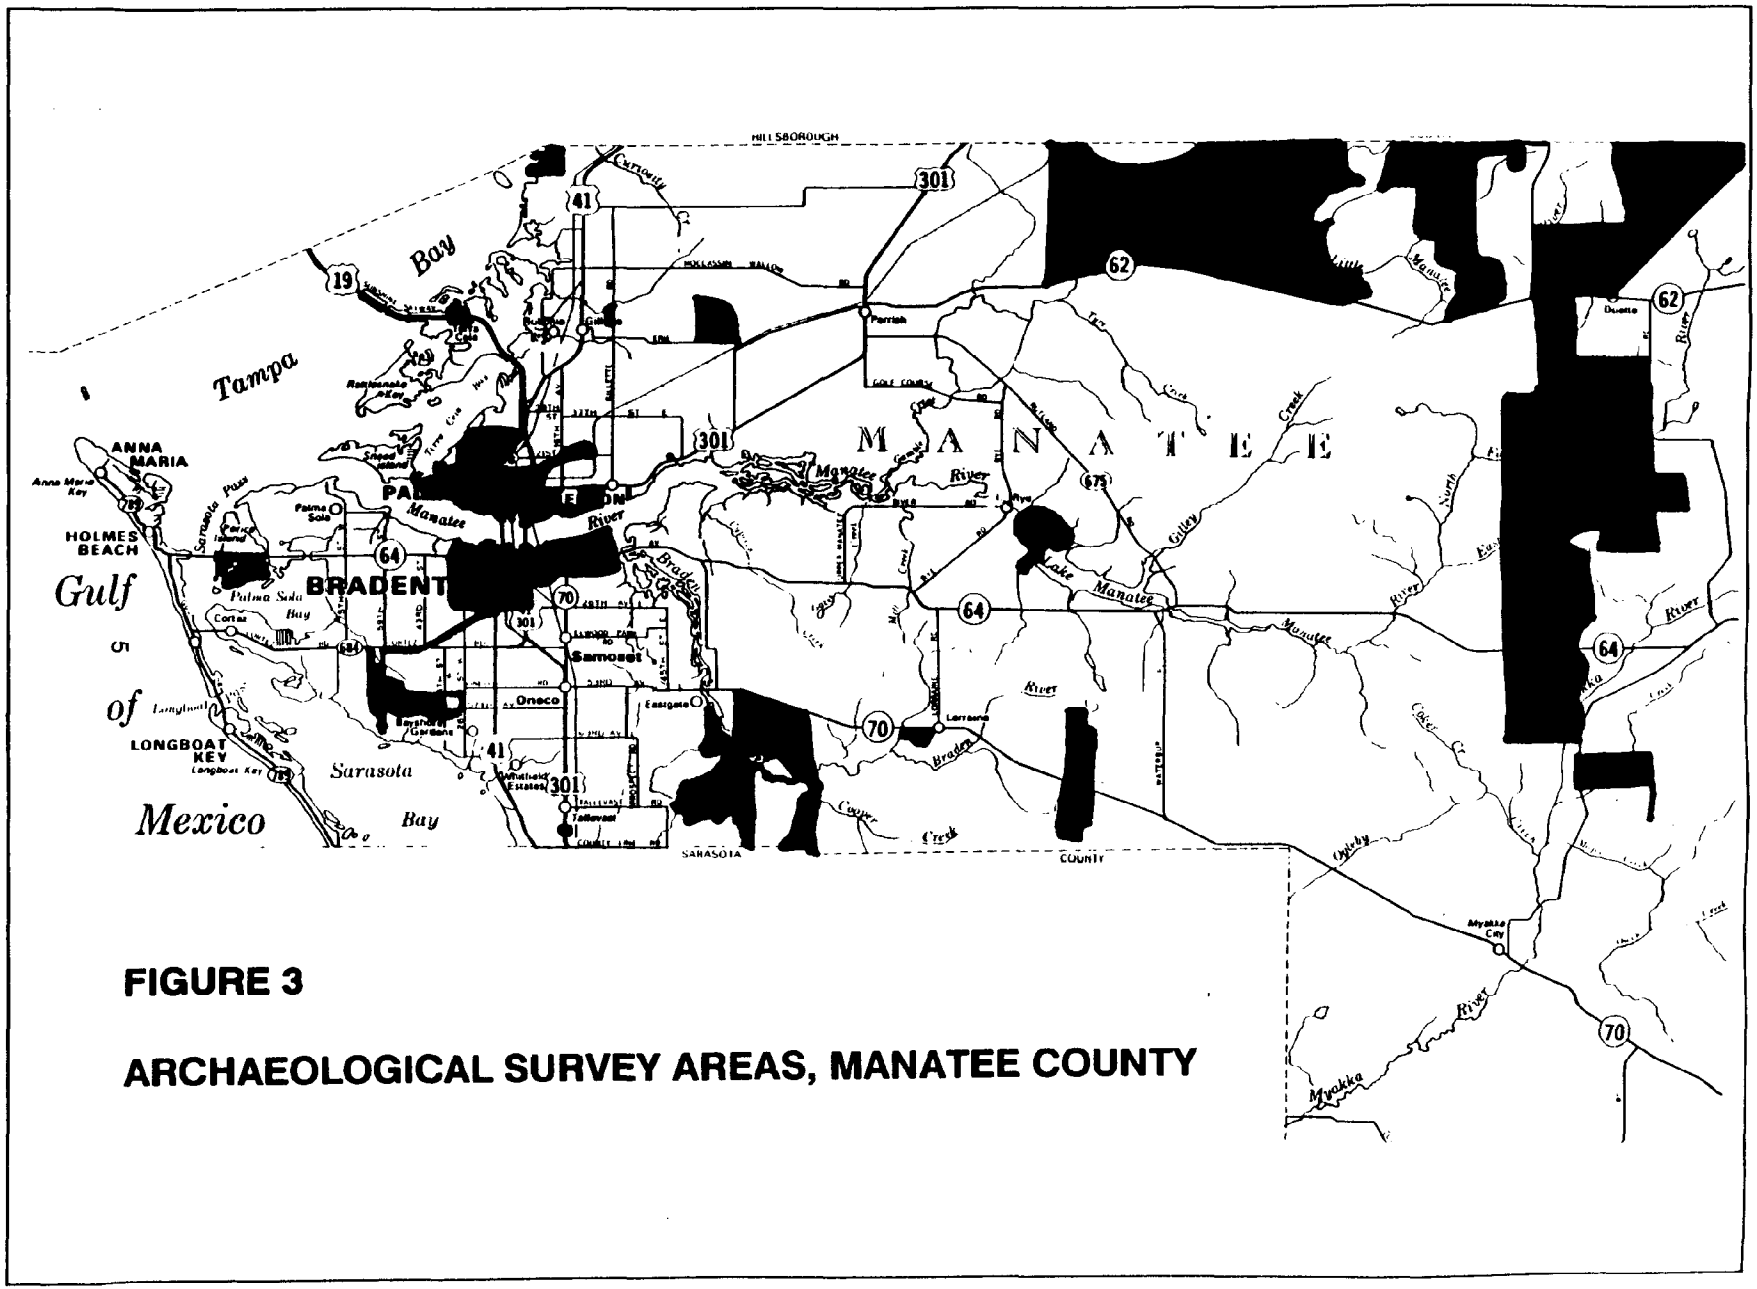

FIGURE 3

ARCHAEOLOGICAL SURVEY AREAS, MANATEE COUNTY

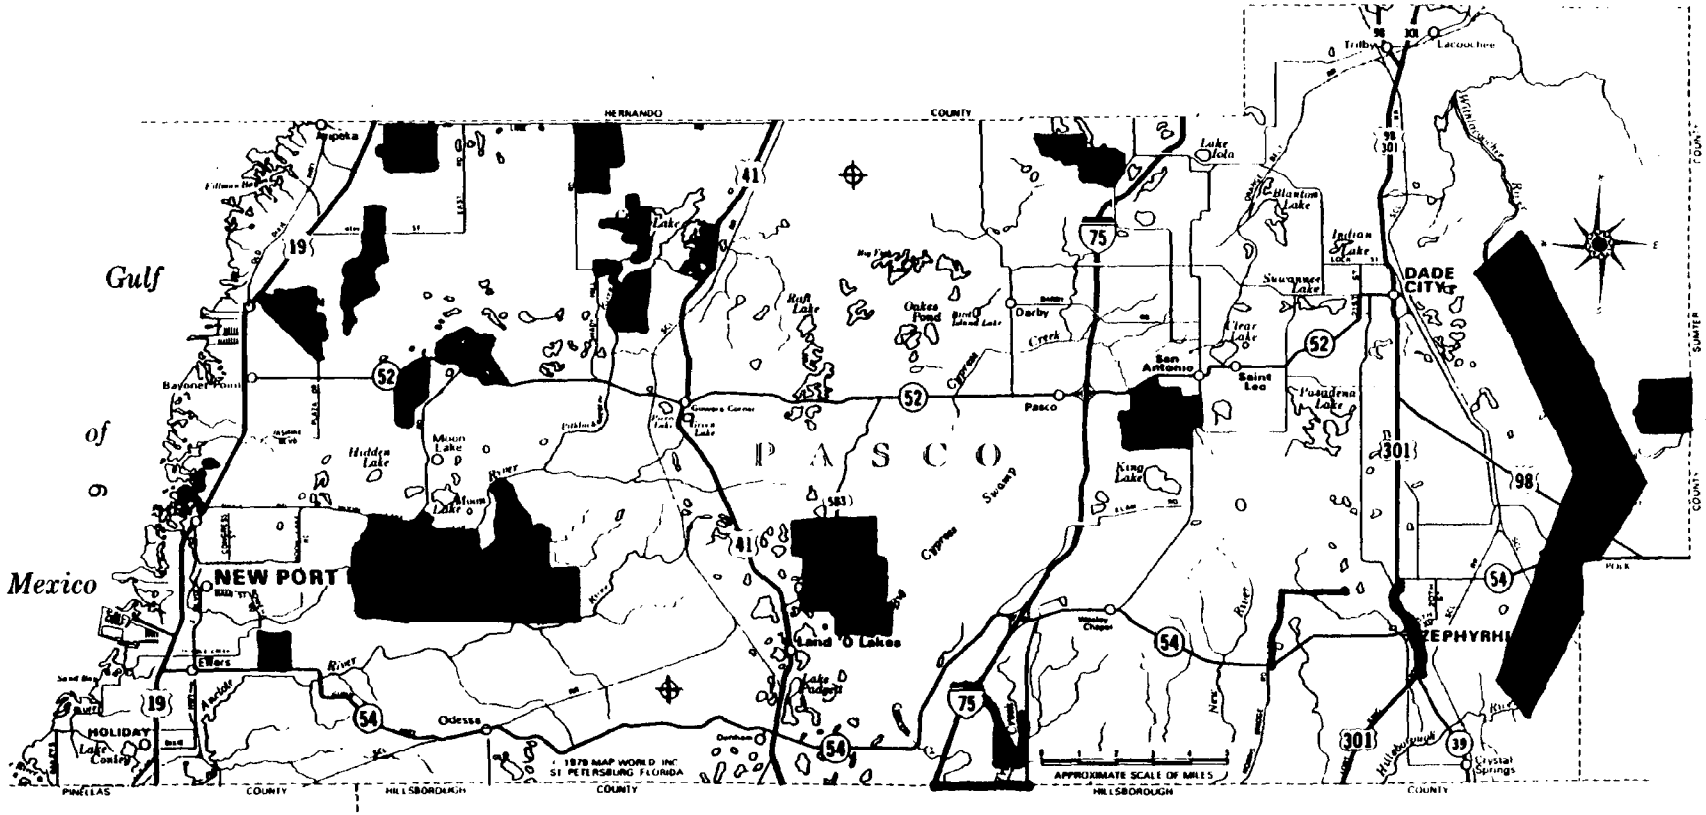

FIGURE 4

ARCHAEOLOGICAL SURVEY AREAS, PASCO COUNTY

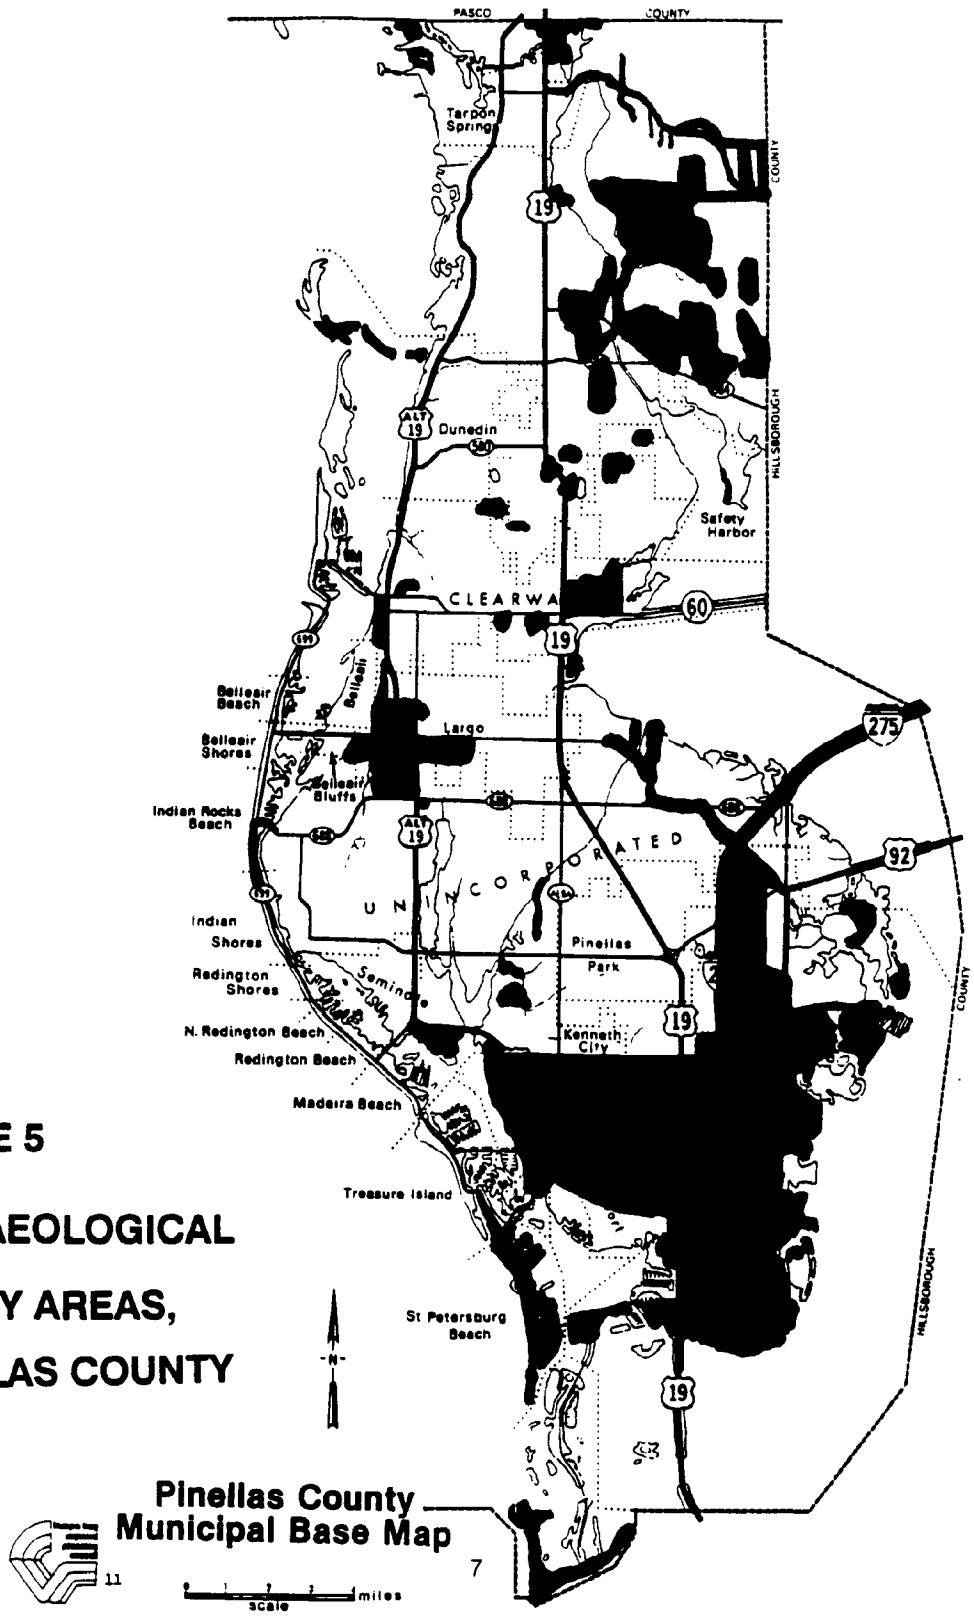

FIGURE 5

ARCHAEOLOGICAL SURVEY AREAS, PINELLAS COUNTY

geographic information to be recorded in a digital format (See Figure 6). The System supports a large number of registered mapping levels or planes, each of which may be assigned a specific map feature (i.e. vegetative, topographic, soil classification, drainage characteristics, rivers, shoreline, highway networks, 100-year flood plain, archaeological sites). Once polygons and their descriptive information have been entered, the data may be retrieved in the form of a map (along with non-graphic data reports). This type of facility differs from the common map drafting facility in that the map product may be directly linked and correlated with a land use or other type data base. This allows for the conduct of quantitative analysis with the "map", something which could not have been easily accomplished in the past.

The archaeological survey team, using the maps generated by the GIS, which included a detailed street network and sites by SITE ID (See Glossary), were able to locate many of archaeological sites. In addition, maps were developed which depict the archaeological site type.

Where feasible, the known archaeological sites were visited to confirm location, determine the current land use and to determine the condition of the site, i.e. the "degree of disturbance". In some cases, sites were first identified on recent aerials before an actual site visit was made.

It should be noted that not all of the 1275 known archaeological sites were visited during this research project due to the lack of time and resources. In some cases the archaeological survey team was not able to obtain permission to inspect sites on private property. In some cases the location of the site could no longer be verified because either UTM coordinates were not available from any of the data sources or the sites no longer existed. While not all sites in the region were visited, all of those within a mile of the coast were site-verified. In addition, a committed and good faith effort was made as the survey team moved inland to verify as many sites as possible especially those in the coastal areas, in wetland areas and in those areas which are under current development pressures. (When the site was visited by the survey team, it was noted on the site file under a newly-created field called "visited?". If the site was not visited during this project effort, this field was marked 'no'.)

It should also be recognized that in order for this project to be 100% accurate, it would require that each site be exactly located and that subsurface testing be performed. This was not within the scope of this project, however, the necessary subjectivity involved in the process of determination of condition is important to note for the record.

The survey team visited as many sites as time and resources allowed and evaluated them according to the following land use categories and condition criteria:

Land Use Categories:

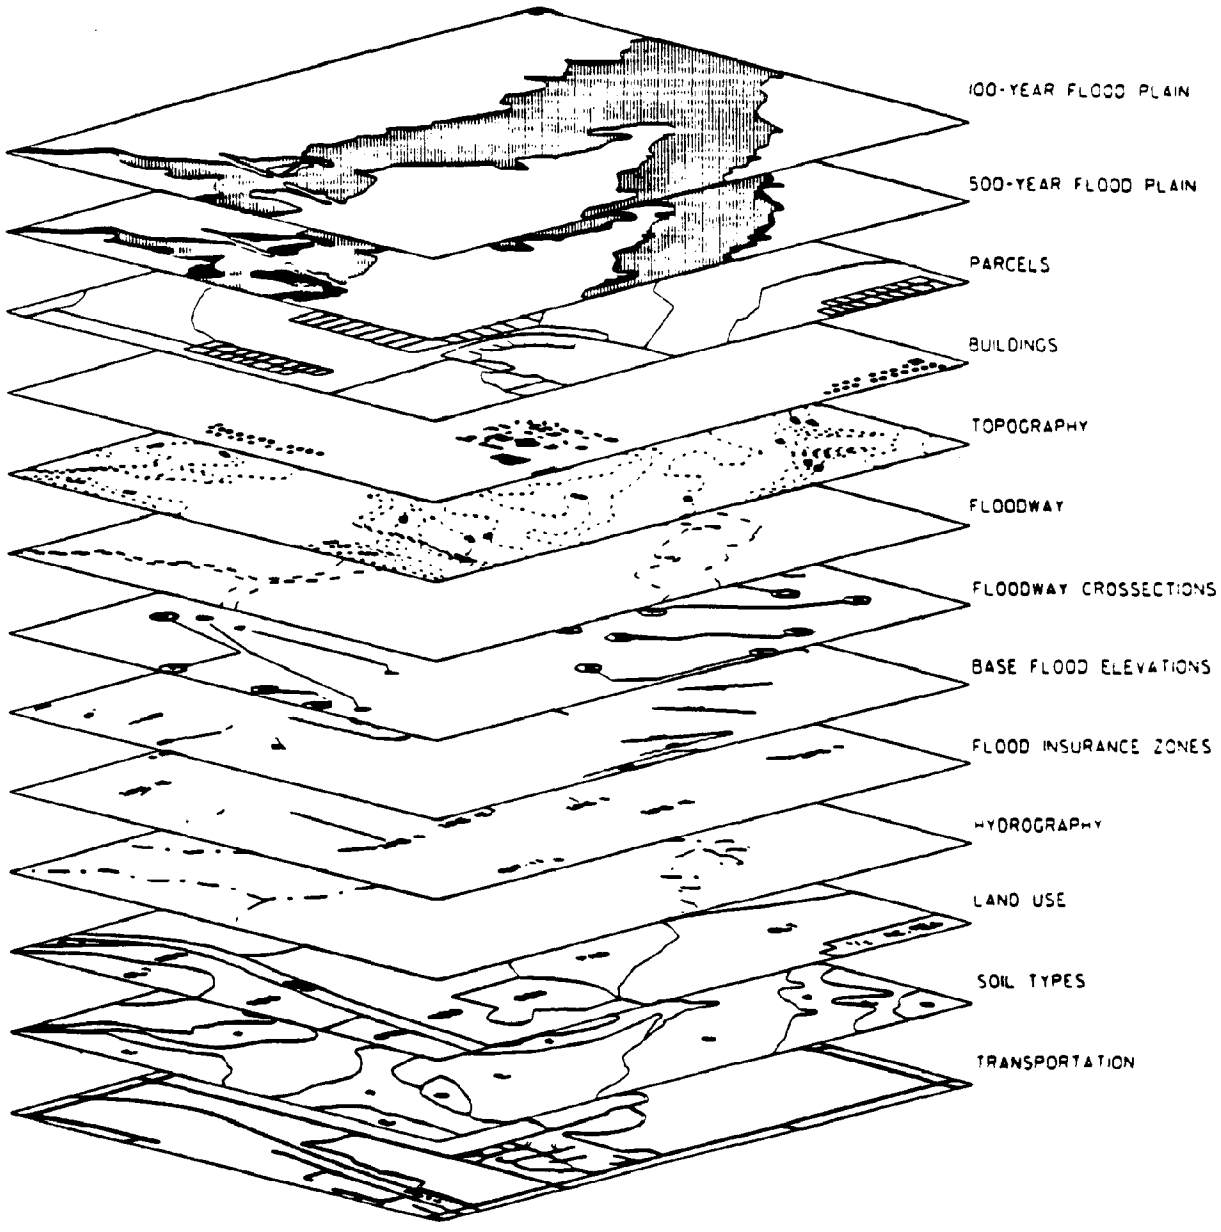
- Residential
- Commercial
- Residential
- Industrial
- Recreation
- Institutional/Public/Semi-Public
- Vacant/Residential
- Vacant/Commercial
- Vacant/Industrial
- Agricultural/Undeveloped/Rangelands
- SWFWMD/Public Land

Site Condition:

- Minor Disturbance
- Moderate Disturbance
- Major Disturbance
- Destroyed

FIGURE 6

THE GEOGRAPHIC INFORMATION SYSTEM (GIS)



Land Use Categories

Class definitions from The Florida Land Use, Cover and Land Form Classification System were used to determine the current land use at the known archaeological sites. These classifications included the following:

Residential:

Residential land uses range from high-density urban housing developments to low-density rural areas characterized by a relatively small number of homes per acre. The variation extends from the multi-family apartment complexes to those single-family houses sometimes having lot sizes of more than one acre.

Commercial:

Commercial areas are predominantly associated with the distribution of products and services. This category is composed of a large number of individual types of commercial land uses which often occur in complex mixtures.

The Commercial and Services category includes all secondary structures associated with an enterprise in addition to the main building and integral areas assigned to support the base unit. Included are sheds, warehouses, office buildings, driveways, parking lots and landscaped areas.

Other types of commercial areas include shopping centers and commercial strip developments.

Industrial:

The Industrial category embraces those land uses where manufacturing, assembly or processing of materials and products are accomplished. Industrial areas include a wide array of industry types ranging from light manufacturing and industrial parks to heavy manufacturing plants. Also included are those facilities for administration and research, assembly, storage and warehousing, shipping and associated parking lots and grounds.

Typical examples of industrial types found in Florida are pulp and lumber mills, oil refineries with tank farms, chemical plants and brick-making plants. Stockpiles of raw materials, large power sources and solid waste product disposal areas are visible industrial features.

Vacant/Residential: Vacant property within a predominately residential neighborhood/subdivision.

Vacant/Commercial: Vacant property within a predominately commercial area.

Vacant/Industrial: Vacant property within a predominately industrial area.

Extractive:

Extractive areas encompass both surface and subsurface mining operations. Included are sand, gravel and clay pits, phosphate mines, limestone quarries plus oil and gas wells. Industrial complexes where the extracted material is refined, packaged or further processed, are also included in this category. The recognizable impacts of these activities on the landscape will vary from the unmistakable giant pit mines covering vast acreage to oil wells which cover only a few square feet.

- Strip Mines
- Sand and Gravel Pits
- Rock Quarries
- Oil & Gas Fields
- Reclaimed Land
- Holding Ponds

Recreational:

Recreational areas are those areas whose physical structure indicates that active user-oriented recreation is or could be occurring within the given physical area. This category

would include golf courses, parks, swimming beaches and shores, marinas, fairgrounds, etc. Swimming Beach

- Golf Courses
- Race Tracks (Horse, dog, car, motorcycle)
- Marinas and Fish Camps
- Parks and Zoos
- Community Recreational Facilities
- Stadiums (Those facilities not associated with high schools, colleges or universities.)
- Historical Sites (Prehistoric or historic)
- Other Recreational (Riding stables, go-cart tracks, skeet ranges, etc.)

Institutional/Public/Semi-Public:

Educational, religious, health and military facilities are typical components of this category. Included within a particular institutional unit are all buildings, grounds and parking lots that compose the facility. Those areas not specifically related to the purposes of the institution should be excluded. For example, agriculture areas not specifically associated with correctional, educational or religious institutions are placed in the appropriate Agricultural categories.

Educational institutions encompass all levels of public and private schools, colleges, universities, training centers, etc. The entire areas enclosing buildings, campus open space, dormitories, recreational facilities and parking lots are included into this category.

Military facilities are characterized by a wide variety of features including training camps, missile sites, etc. Administration, storage, repair, security and other functional military buildings plus the practice ranges, storage areas, equipment storage lots and buffer zones compose the institutional military facilities. Auxiliary land uses, particularly residential, commercial and other supporting uses located on a military base, are included in the Institutional category.

- Educational
- Religious
- Military
- Medical & Health Care
- Governmental
- Correctional
- Other
- Commercial Child Care

Agriculture:

In a broad sense, agricultural lands may be defined as those lands which are cultivated to produce food crops and livestock. The subcategories of Agriculture are as follows: Cropland, Pastureland, Orchards, Groves (except Citrus), Vineyards, Nurseries, Ornamental Horticulture Areas, Citrus Groves, Confined Feeding Operations, Specialty Farms and Other Agriculture.

Undeveloped/Rangelands:

Historically, rangelands has been defined as land where the potential natural vegetation is predominantly grasses, grasslike plants, forbs or shrubs and is capable of being grazed. Management practices may include brush control, regulation of grazing intensity and season of use. If revegetated to improve the forage cover, it is managed like native vegetation. Generally, this land is not fertilized, cultivated or irrigated.

Although these small areas can not support cattle, they are never the less included in this category. However, such areas may be used extensively as wildlife forage areas.

Undeveloped/Rangelands (SWFWMD)

These are public lands owned and managed by the Southwest Florida Water Management District (SWFWMD).

Degree of Disturbance / Condition of Site

The current land use describing the location of the archaeological sites, was a major criteria used to determine the present condition of archaeological sites. The land use categories included residential, commercial, industrial, vacant, public and semi-public/institutional, recreational, agricultural and undeveloped/rangelands. These categories help define whether the archaeological sites experienced minor disturbance, moderate disturbance or major disturbance, or had been completely destroyed. Based upon site verification, the "condition" or "degree of disturbance" of each site was coded on the data base.

Minor Disturbance:sites which had suffered little disturbance (code 2).

Moderate Disturbance:sites which had been obviously disturbed, but only slightly (code 3).

Major Disturbance:sites which had undergone serious disruption (code 4).

Destroyed:sites that have been completely destroyed (code 1).

"Impact agents" (see Glossary) can either directly or indirectly impact archaeological resources. Directly impacting a site means that an impact is caused by an action which occurs at the same time and place. For example, removal of archaeological sediments by sheet erosion may be the direct result of an intense summer rainstorm (Wildesen 1982:54). An indirect impact of a site is caused by an action which occurs later in time or farther removed in space. For example, the removal of upslope vegetation due to road construction which ultimately causes severe erosion is an indirect impact. Impact agents can be classified as to type. The major classifications are burial, removal, transferal, and alteration. (Wildesen 1973).

When property is developed, using modern site preparation and construction techniques, for residential, commercial or industrial purposes, archaeological resources are usually destroyed. Development requires heavy equipment to be used for the removal of layers of dirt to build the foundation. The ground is disturbed to put in water, sewer and utility lines. The heavy equipment and construction vehicles that pass back and forth across the area contribute to the destruction of archaeological resources.

However, prior to the 1950's, most development and construction activities were not as ground altering, thus, leaving many archaeological site remains relatively undisturbed below the upper 6-12" of soil. therefore, site destruction cannot be presumed for older developed areas. The Fort Brooke site in Tampa provides an example of such site preservation.

Current development activities can destroy many aspects of an archaeological site. In addition to the artifacts lost through removal or damage by the machines and vehicles, the integrity of the site can be lost due to the removal or re-deposal of the soil where the site or an artifact is located. If the vegetation is cleared away, this may expose the area to erosion by wind and rain.

Institution land uses such as hospitals, schools, churches and police and fire stations, like other development, often destroy archaeological sites. The impact or degree of disturbance depends on the location of the structures and construction activities relative to the archaeological site.

Archaeological sites located in areas currently undeveloped, or developed for recreational purposes such as golf courses, city or county parks, swimming pools, etc., may experience different disruptive effects. The development can destroy the sites or leave them relatively

undisturbed. For example, the development of a golf course can result in minor or major damage depending on whether site locations are known and avoided. Passive parks may leave a site relatively undisturbed. For example, the Safety Harbor Mound located in Phillippe Park has experienced only minor disturbance because there were measures taken to preserve it. Archaeological sites in recreational areas can fall into any of the other categories of disturbance depending on where they are located in the recreational area. For example, if sites are on or near a hiking path, or picnic area, they may experience major disturbance due to looting or vandalism, which has become a serious problem on public lands and sites thought to be preserved.

Many sites located in undeveloped rangelands and forested areas in the Tampa Bay Region are destroyed as a result of vandalism and unauthorized digging. The Southwest Florida Water Management District (SWFWMD) has initiated "stepped-up" security of District-owned lands to protect the archaeological sites on those locations. Many looters or "pot-hunters" have been arrested and prosecuted in the last several months. Through interviews, it is recognized that there is an "underground" network of pot-hunters who often have more information than preservationists concerning site location and significant site locations.

Sites in undeveloped areas also can experience moderate to major disturbance due to other "natural" impact agents. For example, tree roots can transfer artifacts from place to place. If an archaeological site was located in a marshy area, the site could have experienced moderate-to-major disturbance as a result of the water eroding away at the site. The water, however, could also protect the site by keeping it covered thus minimizing the threat from looters.

Figure 7 illustrates different impact agents (Uses of District-Owned Lands: A Compatibility Analysis, Christianson, 1986) and defines their effects on archaeological resources as typically low, medium, or high (Snapp 1988). This list is not exhaustive but it does provide some examples of activities that affect archaeological sites.

Another consideration that must be examined when utilizing these levels of impact or degree of disturbance is the fact that a shallow archaeological deposit, which may be rich with archaeological data, can potentially be destroy completely by an activity categorized as a low level of impact activity (Snapp 1988:40)

TASK 3

The information verified by site visitation including land use and condition of the site was added to the regional geographic information system data files. The data, in non-cartographic form is presented in Appendices A, B, C, and D. Maps illustrating the condition of sites are presented in Chapter IV.

TASK 4

This report seeks to quantify the impact of growth and development on the cultural resources in the Tampa Bay Region, especially within the coastal areas. A summary of these impacts, by county, is provided in Chapter IV. The Appendices A, B, C, and D provide a more detailed description of each site.

TASK 5

The importance of our cultural resources is reflected in the goals, objectives and policies within the State and local comprehensive plans as well as within the Future of the Region: A Comprehensive Policy Plan for the Tampa Bay Region (FRCRPP).

As part of this project, TBRPC staff and the Tampa Bay Region Historic/Archaeological Preservation Committee, reviewed the avoidance and mitigation strategies to protect cultural resources within the FRCRPP. These policies are used to review developments of regional impact (DRIs) as well as determine consistency with federal, state and local government actions. Recommendations for revision to the comprehensive regional policy plan and the review process are presented in Chapter V.

CHAPTER III

PREHISTORY OF THE TAMPA BAY REGION

For more than one hundred years, prehistorians have struggled to provide a complete picture of Florida's past. This endeavor has been both long and difficult, and although it is far from being complete, significant strides have been made. In their efforts, prehistorians have discovered that Florida's prehistory parallels the pattern of prehistoric human occupation throughout the Western Hemisphere.

Human prehistory in the Western Hemisphere began when people followed large herds of animals migrating from Asia to North America via an exposed land bridge. As horticulture developed, nomadic lifeways eventually gave way to more sedentary ones. The more stable food base provided by horticulture led to an increase in the human population. This population increase led to the development of more complex social organizations.

In Florida, the progression of cultural change mirrored these trends. It is understandable that in order to process the huge volume of data resulting from the 3 or 4 millions of years of human existence, differing methods of study have evolved.

Archaeology, a sub-field of anthropology, is one approach to the study of human history and diversity. Archaeologists divide human history and prehistory into periods of cultural development. The distinction between history and prehistory is necessary in the study of human cultural development because the methods used to study the two major classifications are different. Human historical development is studied mostly through written documents. Human prehistory is studied largely through archaeological methods. Archaeologists study the way in which cultural changes manifest themselves in the archaeological record through artifacts, the spacial arrangement of artifacts, and other indicators of human habitation such as soil discoloration. It is in this way that archaeologists are able to reconstruct human prehistory.

Archaeologists pay careful attention to Florida's past climate and environment. Since the very first prehistoric people entered Florida, the environment has changed significantly several times. These fluctuations are the result of advancing and retreating ice sheets. The Wisconsin glacial age ended only 10,000 years ago.

The planet has a fixed amount of water which exists in three states: liquid, gaseous, and solid. This may seem elementary, but when you consider the huge amount of water that has been taken away from our oceans and stored in the form of ice, it becomes clear that the environment has undergone terrific (although relatively slow) change. During the Wisconsin glacial age, peninsular Florida was twice its current geographic size and there was twice as much area for people to inhabit and exploit. Because the glaciers have melted and ocean levels have risen, the archaeological evidence of many past peoples is hidden beneath the ocean (See Figure 8).

Archaeologists have developed descriptions of cultural periods as they existed in Florida. (See Figure 9). The state has been divided into nine geographic areas, each of which exhibits a distinct cultural pattern. Although each area

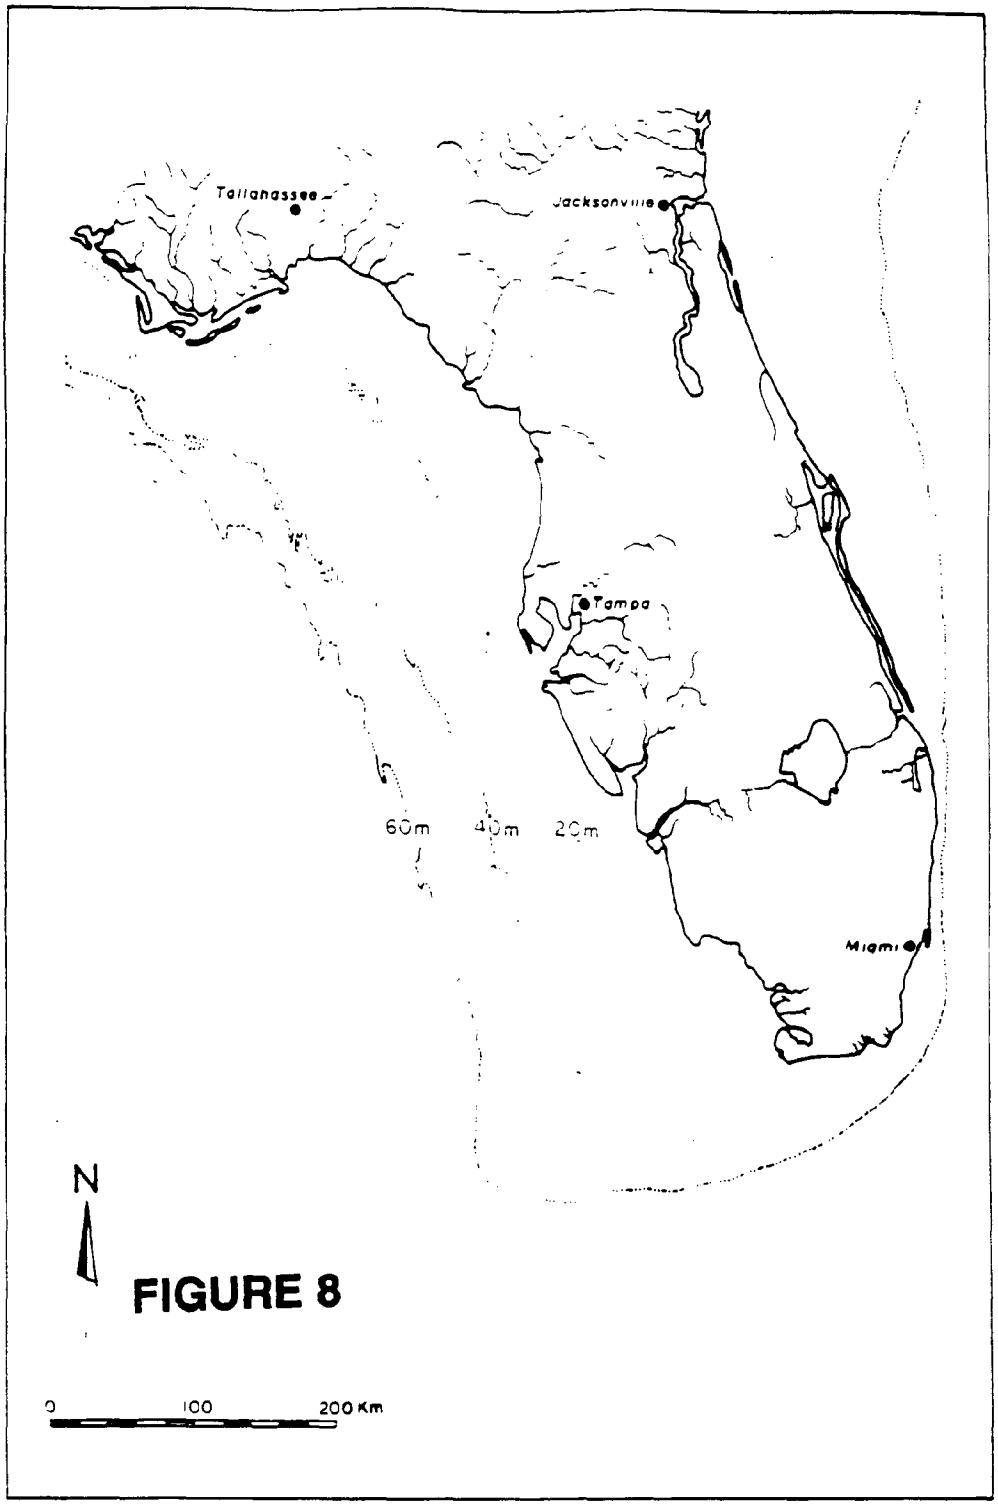

FIGURE 8

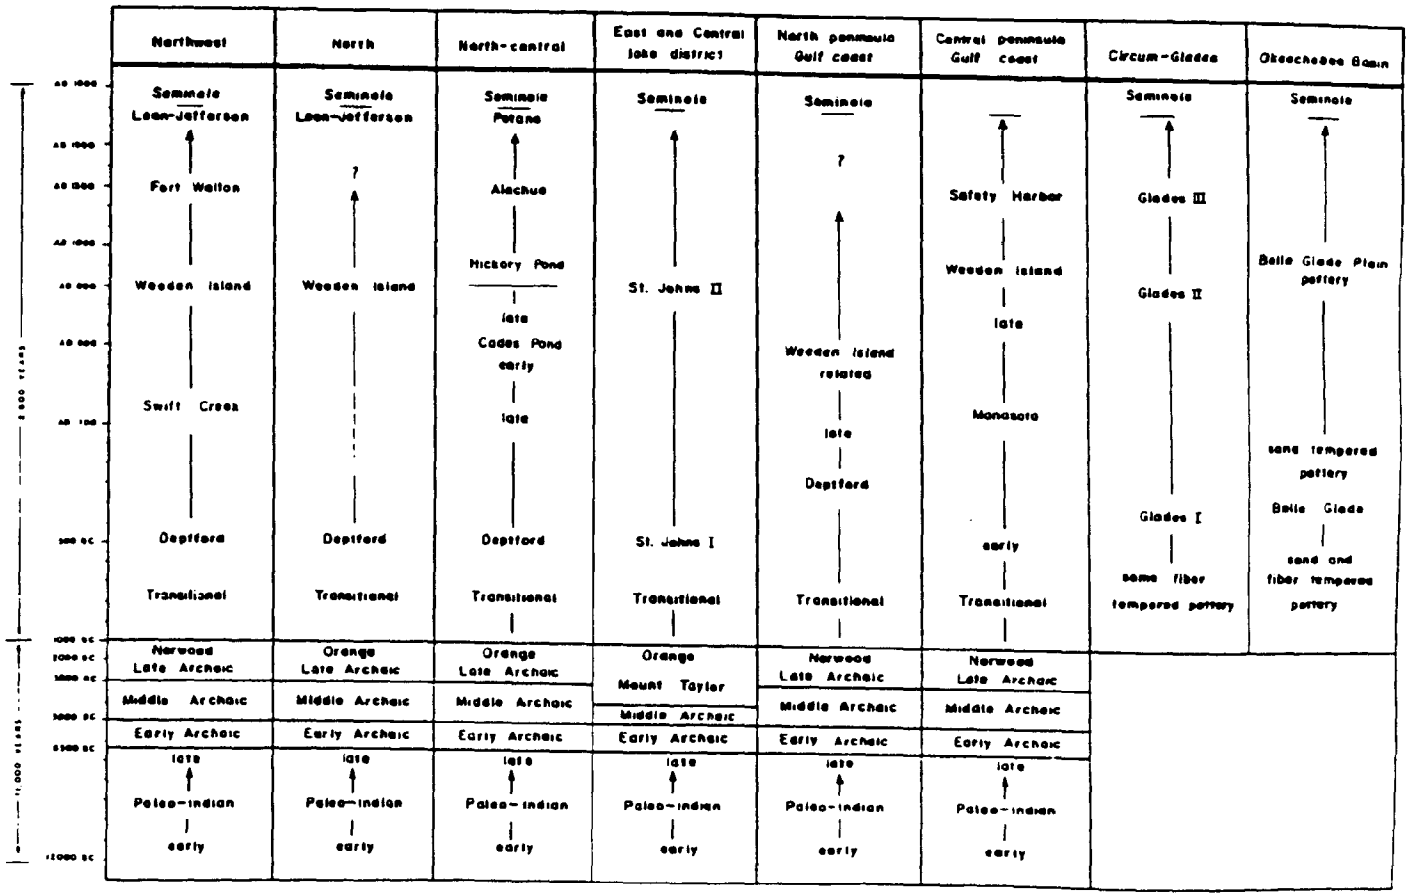
LATE PLEISTOCENE/EARLY HOLOCENE SEA LEVEL

FIGURE 9

CULTURAL PERIODS IN FLORIDA



has experienced its own unique progression of cultural development, the close geographic proximity of these areas resulted in significant cultural overlap.

The Pinellas, Hillsborough, Manatee, and Pasco county study area is located in geographic areas two, three, and six (See Figure 10). They are located primarily within the Peninsula Gulf Coast Region which is further divided into the North and Central Peninsula Gulf Coast areas (See Figure 11). All of the cultural periods that have been identified in each of these counties will be described in the following pages. A more complete description of Florida's prehistory can be found in Florida Archaeology (Milanich and Fairbanks 1987).

CULTURE PERIOD CATEGORIES

Each culture period included in the Florida Master Site Files in Tallahassee, Florida has been assigned a numerical code. Each culture period and its assigned code are listed below (They are listed in the order they appear in the report).

Paleo-Indian #53
Archaic #4-6
Transitional #78
St. Johns #61-70
Deptford #17
Late Deptford #7
Early Weeden Island #81-84
Manasota #49
Swift Creek #75-77
Glades #28-38
Weeden Island #85-88
Perico Island #55
Santa Rosa-Swift Creek #117
Weeden Island I #82
Weeden Island II #83
Safety Harbor #58
Alachua #1
Apalachee #46 and #7
Seminole #71
Unknown #25
Indeterminate #43
Spanish #72

PREHISTORIC CULTURES

Paleo-Indian (12,000 TO 6,500 B.C.)
(Geographic Areas 1-7)

The earliest confirmed date of human existence in Florida is approximately 12,000 B.C., although it is probable that people lived in Florida as long ago as 15,000 B.C.. The water table in Florida was much lower during this time which increased the value placed on water sources such as rivers, streams, and sinkholes. The Paleo-Indian people lived nomadic lives, following both large and small game, and foraging for plant foods. Now extinct, the mammoth, horse, giant land tortoise, sloth, saber cat, bison, and some varieties of turtles, rabbits, and snakes provided the Paleo-Indian with a fairly broad subsistence base. The Paleo-Indian also hunted panther, opossum, raccoon, frog, and various species of turtle. As the climate continued to warm, the big-game animals either migrated to the north or died out. By approximately 6,500 B.C.,the environment was warmer and wetter facilitating plant growth. Accordingly, plant resources and small animals became increasingly important to the Paleo-Indian.

Although little is known about the social organization of the Paleo-Indian, ethnographic analogy suggests that these people lived in family groups which may have joined together with other family groups in order to hunt.

Archaic
Early Archaic (6,500 to 5,000 B.C.)
Middle Archaic (5,000 to 3,000 B.C.)
Late Archaic (3,000 to 1,000 B.C.)
(Geographic Areas 1-7)

During the Archaic, the subsistence patterns of people began to change in accordance with the rapidly changing environment. The climate was warm, less moist, and water was more readily available. Small animals and plant foods such as acorns, nuts, and berries continued to be important. Shellfish, fresh water fish, and

CULTURAL GEOGRAPHIC AREAS OF THE STATE OF FLORIDA

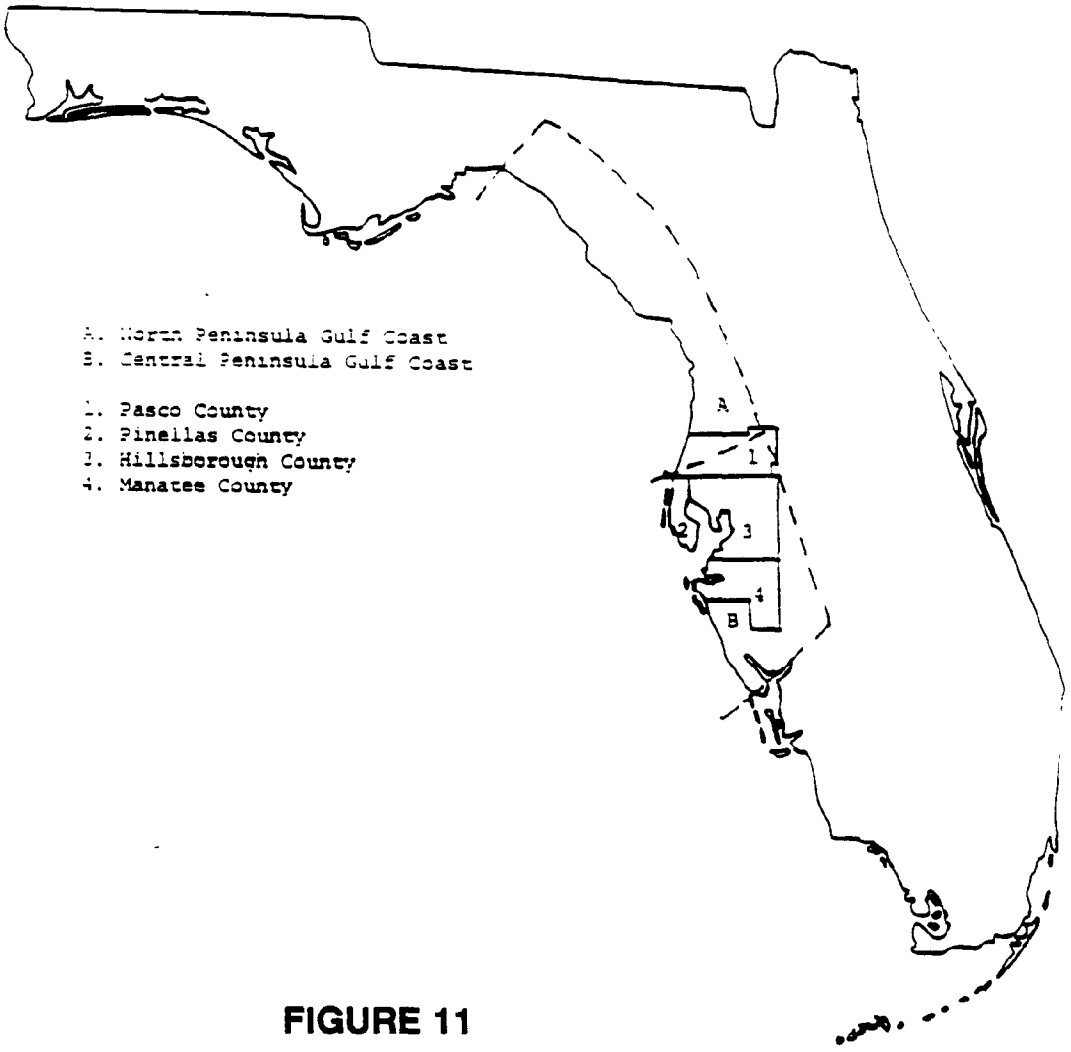

FIGURE 11

THE PENINSULA GULF COAST

oysters were also added to the diet of Archaic peoples. The shift away from big-game hunting can be seen in changed tool forms and new patterns of settlement and environmental exploitation.

The Archaic people probably lived in extended family groups and moved seasonally to best exploit their environment. Extended family groups may have banded together to facilitate hunting and safety. The predominate site type during the Early and Middle Archaic was the special use, or small camp site. Little is known about the Late Archaic period in Florida.

By 3,000 B.C., Florida began to undergo its most recent major environmental change. The resulting environment included pine forests, hammocks, marshes, and swamps that still exist today in Florida. It is during the next cultural period that dramatic changes occurred among Florida natives.

Transitional (1,000 TO 500 B.C.)
(Geographic Areas 1-7)

During the Transitional period a shift occurred away from gathering and hunting and some experimentation with horticulture began. The importance of this change cannot be over-emphasized. The advent of horticulture led to a broader and more dependable food base. In order for horticulture to be successful, it is necessary for people to remain in one location for an extended period of time. People settling in one place for long periods leads to stability and technological specialization. This allows crafts-persons the necessary time to develop specializations. The culture develops a wider variety of material culture which in turn reinforces the development of trade routes. It is through trade networks that new ideas and technologies are introduced.

It is presumed that the shell middens on the coast that were built during the Archaic period were seasonally abandoned in favor of inland soils where horticulture could be more easily practiced. The number of different pottery types increased dramatically during this period. Influences from other parts of North America, South America, and Meso-america can be seen in the new pottery types. By the end of the Transitional period, maize horticulture probably existed in the Lake Okeechobee basin.

It is also presumed that the Transitional period people also practiced canoe travel which attributed to the flow of information between Meso-america and Florida. As a result of all of these changes, larger sedentary communities evolved which led to the development of social stratification. "By 500 B.C., distinct regional adaptations had developed in Florida. Several major sites in the Lake Okeechobee basin were occupied year-round. The Gulf coast, north of Tampa Bay, abounded in resources related to the salt marshes, bays, and hardwood hammocks. This environment spawned a different culture than the mangrove swamps and barrier islands south of Tampa Bay to the Caloosahatchee River and Charlotte Harbor area" (Russell 1982:24).

St. Johns (500 B.C. TO A.D. 1700)
(Geographic Area 6)

The St. Johns culture period extends over a very long period of time. The earliest part of the period is characterized by projectile points with stems and triangular blades. By 200 B.C. pottery had appeared. During this period flat bottom, fiber tempered bowls were among the pottery types. More complex bowls appeared later, along with ceremonial burial mounds and villages.

Deptford (500 B.C. TO 100 A.D.)
(Geographic Areas 1-5)

During the Deptford period, people once again made a shift back to marine and estuarine resource exploitation. The Deptford culture period is marked by a distinct subsistence pattern, as well as, a distinct type of pottery. Pot-

tery made during this period was tempered with sand and grit, and occasionally with quartz. Decorative techniques included paddle-stamping, brushing and punctulating. Some of the patterns on the pottery of this period indicate the use of netted material, basketry, and rope.

People living during this period occupied live oak and magnolia hammocks on the Gulf coast. Diverse ecological niches such as salt marshes, tidal streams, lagoons, bay, and the Gulf were all exploited. Deptford peoples' diets included rabbit, bobcat, tortoise, racoon, opossum, white-tailed deer, panther, birds, fish, shellfish, sea mammals, and turtles. Plant resources included acorns, palm berries, hickory nuts, blueberries, persimmon, and cassia. Small shell middens characterize this culture period. Shelters were built parallel with the water's edge, and as the sea rose, many of these sites were inundated. Between approximately 100 B.C. and 200 A.D., people once again moved inland, possibly to exploit the better soils. It has been theorized that sites were occupied by large groups of interrelated families (Milanich and Fairbanks 1980:75). Sites such as Crystal River, suggest that complex religious and political systems were in existence during this period. Such growth is attributed to influences from the north.

Late Deptford (A.D. 100 TO 300)
(Geographic Areas 2 and 5)

This period is a transitional one between the Deptford and Weeden Island culture periods. It is speculated that during this period, the coastal zones were exploited on a year-round basis, while inland sites were occupied seasonally. Paddle-stamped pottery gave way to undecorated pottery types. Human burial in mounds continued.

Early Weeden Island (A.D. 200 TO 800)
(Geographic Areas 1-4)

Divisions made within the Weeden Island period are based on pottery types. Early Weeden Island pottery types are limestone-tempered and sand-tempered. Effigy pottery is found to be associated during this period with ceremonial sites and burial mounds. The Weeden Island culture period was named after the archaeological site in Pinellas County located on Weeden Island, but the characteristics of this period are evident throughout the central Gulf coast, as well as the Heartland site in northwest Florida and certain sites in South Georgia.

Manasota (500 B.C. TO A.D. 800)
(Geographic Area 3)

Shell tools and sand-tempered pottery characterize this culture period. (Although, as in all periods, highly degradable artifacts such as netting, basketry, and wooden tools were undoubtedly produced as well.) People living during the Manasota period lived along the edges of waterways, depending on the well-drained soils for horticulture. A well-known site from this period that exists in the Tampa Bay area is the Perico Island Site in Manatee County.

Swift Creek (A.D. 100 TO 800)
(Geographic Area 1)

The Swift Creek Culture preceded the Weeden Island Culture in the northwest. The Swift Creek period coincides temporally with the occurrence of the early Manasota Period in the Central Peninsular Gulf Coast area. There were three basic types of settlement patterns that developed during the Swift Creek culture period. These were the inland village, the coastal village, and the alternation of inland and coastal habitation. The period is marked by bone tools (such as awls and pins), stone tools (such as a distinctive projectile point that has come to be known as the Swift Creek point), and scrapers. Horseshoe-shaped shell middens with adjacent villages and burial mounds are also characteristic of this period. Food resources were procured from hunting and collecting in the tidal marshes. Deer, turkey, turtle, and rabbit were hunted from other nearby areas.

Glades Cultural Period
Glades I (500 B.C. to A.D. 750)
Glades II (A.D. 750 to 1200)
Glades III (A.D. 1200 to 1700)
(Geographic Area 9)

At the same time the Manasota, Weeden Island, and Safety Harbor culture periods were progressing through the Central Peninsula Gulf Coast, the Glades culture period was developing in the area of the Everglades. Several of the sites in the four county study area have been assigned this culture period due to prolonged contact with the Glades culture. "A very few potsherds of Weeden Island origin have turned up at Glades sites as have a few locally made shards bearing copies of Weeden Island designs (Milanich and Fairbanks 1980:233).

The Glades Culture Period is characterized by villages at the mouths of rivers and near coastal lagoons. Inland sites were occupied on a seasonal basis. Marine shells, hammers, picks, chisels, bone points, and bone pins are all representative of the Glades Culture Period. Both the ocean and the lagoons provided a variety of food resources. Turtle, sailfish, stingray, dolphins, shark, and manatee were all part of the food base. The basic subsistence pattern and lifeway of the Glades people remained the same throughout all of the stages of the Glades Culture Period. The sub-divisions of Glades Period are based on slight changes in pottery construction and decoration. It is theorized that the Tequesta Indians were the descendants of the Glades people.

Weeden Island Cultural Period (A.D. 800 TO 1400)
(Geographic Areas 1 and 3-4)

Most of the information archaeologists have recovered about this period are the result of excavations in burial mounds. Such artifacts as ornaments, shell beads, wood tools, bone tools, and elaborately decorated pottery have been found in burial mounds. Objects that are clearly ceremonial, such as effigy vessels and figures, jars, bowls and cups, have also been found. Food resources exploited in earlier periods of Florida's prehistory continued to be used during the Weeden Island period. Deer, bear, shellfish, fish, turtle, raccoon, opossum and wild plants were relied upon. An increase in population may have been the result of horticulture, but no concrete evidence for such practices exists. During this culture period, the settlement pattern of central-based villages largely gave way to villages being grouped around central burial mounds. During this period, the most intensely populated areas were along the coast. Shell middens containing a high percentage of oyster shells are commonly found.

Perico Island (A.D. 600 TO 1000)
(Manatee County Only)

This culture period is no longer used. It has been incorporated into the more broadly defined Weeden Island culture period. If a site is described as belonging to this period, it was recorded before much was known about the Manatee County area. The type of archaeological site that fell under this cultural description was characterized by high percentages of Glades Plain and Perico Plain pottery. Large, simple bowls were the most common ceramic type found in these sites. Both shell and bone were used to make tools, and projectile points were common. People from this culture exploited marine resources, as well as, hunted and collected plant foods. Burial mounds and shell middens were associated with large villages. This culture period was originally thought to be the earliest in Manatee County.

Santa Rosa-Swift Creek (A.D. 800 TO 1000)
(Hillsborough, Pasco, and Pinellas Counties)

This culture period is no longer used. It has been incorporated into the Weeden Island culture period. Sites assigned to this category were recorded several decades ago. This culture period was characterized by complicated stamped pottery. Villages were located near

water, and usually had sand burial mounds associated with them.

Weeden Island I (A.D. 1000 TO 1250)
Weeden Island II (A.D. 1250 TO 1500)
(Pinellas, Hillsborough, Pasco, and Manatee Counties)

These two culture periods are no longer used. They have instead been incorporated into the more broadly defined Weeden Island culture period. If a site is listed as belonging to one of these culture periods it was recorded a long time ago. Weeden Island I was characterized by complicated-stamped pottery. Weeden Island II was characterized by check-stamped pottery.

Safety Harbor (A.D. 900 TO HISTORIC PERIOD)
(Geographic Area 2-3)

Tampa Bay was the hub of Safety Harbor Culture. This culture is closely related to the Mississippian cultures of the American Southeast. Safety Harbor sites are typically mound-village complexes. It has been suggest that the development of the Safety Harbor period culture was a result of a growing population (Marshall 1982:30). Once again, the bulk of archaeological information gathered concerning this period was obtained from the excavation of burial mounds. Very few of the related village sites have been studied. Elaborate surface decorations appear on pottery from this period. Pottery was still being tempered with sand and/or grit. A new, small triangular projectile point, which first appeared in the Late Weedon Island Period also emerged. The basic subsistence strategies remained the same, so there was no need to make drastic changes in the tool kit. Although centered around Tampa, evidence of the Safety Harbor culture period extends from the Withlacoochee River to Charlotte Harbor. The culture was focused on the marine environment, although some sites are found inland. The temple mound is the most prominent feature of this period. The temple mound had a long ramp which extended down the mound toward a plaza. An associated burial mound was placed away from both the temple mound and the village area. The historic Tocobaga Indians lived at the Safety Harbor site type.

Alachua (A.D. 700 TO 800)
(Geographic Area 2 and 5)

While the Safety Harbor period was in full swing in the Central Peninsular Gulf Coast region, the Alachua culture was dominating North-Central Florida. The Alachua culture period is characterized by villages located on high ground near lakes, ponds, sinkholes, or streams. Common animal food sources included turtle, fish, shellfish, eel, alligator, deer, opossum, bird, rabbit, brown bear, skunk, and squirrel. Palm berries, acorns, and hickory nuts were also exploited, and there is evidence of horticulture. Pots were cylindrical, small, sand tempered, and frequently contained clay lumps. There is very little remaining from this period relating to ceremonial practices. Only two burial mounds have been located.

HISTORIC CULTURES: PEOPLE OF THE POST SPANISH CONTACT PERIOD

Apalachee (A.D. 1500 TO 1700)
(Geographic Areas 1, 2 and 4)

Subsistence patterns for the Apalachee included horticulture combined with gathering and hunting. Fishing was also important in the Apalachee economy. Cows and pigs were introduced by the Spanish. Archaeological sites dating to this period show a mixture of Native American technology and Spanish technology. The Spanish attempted to establish missions among these Indians.

Seminole (A.D. 1700 - Present)
(Geographic Areas 1-9)

Creek Indians and the English from Georgia attacked most of the North Florida tribes, and they eventually cleared a path on which they could enter Florida. As they moved southward, the Seminole culture evolved. Archaeological sites that date to the Seminole period include a mix of artifacts. An aboriginally-designed ceramic bowl may be found laying near a gun flint. Both cultures adopted artifacts and customs from the other.

Spanish Cultural Period

This category applies to cultures that had contact with the Spanish Mission Sites.

Spanish/Cuban Fishing Cultural Period (A.D. 1700-1800)
(Geographic Areas 3, 7 and 9)

This cultural period includes the "spanish indians" and such sites as the Rocky Point Site in Hillsborough County and part of the Terra Ceia Site in Manatee County.

Unknown

There were many archaeological sites that had no culture- period listed on the many documents that were looked at. This could be due to a lack of diagnostic artifacts, that aids in determining a culture-period, or an oversight on the recorders part.

Indeterminate

Archaeological sites whose culture period were questionable are assigned to this category.

Multiple Components

Sites which exhibit the characteristics of more than one culture period are assigned to this category. This would occur when a site either was abandoned and inhabited by another group later or evolved through introduction of different technology.

DESCRIPTION OF SITE TYPES

Archaeological sites on the Florida Master Site File are also identified by the site type. This refers to the classification of the site. Listed below are the prehistoric archaeological site types which are located within the Tampa Bay Region. (Note: This list does not include the types of historic sites within the region.)

Unknown
#2
This site type designation refers to a location at which there is a possibility that human habitation or occupation existed, but for which there is no conclusive evidence.

Indeterminate
#1
This site type designation refers to a location at which there is definite evidence of human habitation such as midden refuse, but it is unclear as to what type of artifacts are present or function the site represents.

Single Artifact
#3
This site type designation refers to a location at which only one artifact was found. This designation may or may not constitute an archaeological site. (Non-site locus)

Artifact Scatter (Fairly Low Density)
#4
This site type designation applies to a site in which fewer than two artifacts (of any kind) are located within one acre. (Two artifacts found over 1/4 mile apart are typically categorized as isolated finds.

Lithic Scatter
#5
This site type designation refers to archaeological sites that contain only lithic (stone)

material. The stone material may be in the form of complete objects, or it may be the by-products of making or refinishing stone tools (waste flakes).

Ceramic Scatter
#63
This site type designation refers to a site that contains only ceramic material.

Shell Scatter (Prehistoric)
#8
This site type designation applies to sites containing a scatter of shell with the most common occurring type being oyster shell in coastal areas.

Aboriginal Boat
#16
This site type designation refers to any water craft designed, built, or used by a Native American. The most common aboriginal boat found in Florida is the canoe.

Anchorage
#58
This site type designation refers to an accumulation of artifacts, such as shell or rock anchors, associated with locations where boats anchored or moored.

Campsite (Prehistoric)
#48
This site type designation refers to sites that were used by Native Americans as limited activity areas. These sites were probably used as temporary campsites as aboriginal groups migrated seasonally.

Midden (Prehistoric)
#9
This site type designation refers to large piles of refuse. Midden is the Swedish word for "garbage", and the term is used frequently in archaeology. In Florida the most common midden type is a shell midden, but other piles of refuse are also called middens.

Shell Midden (Prehistoric)
#10
This site type designation refers to a deposit of shellfish remains often mixed in with other garbage. A midden is an area where people buried and disposed of their garbage.

Lithic Quarry
#62
This site type designation applies to sites where there is evidence of lithic extraction and preliminary reduction. A quarry is an area located near an outcropping of silicified coral or chert in limestone. Quarries were used by Native Americans as sources of material which could be used to make stone tools.

Mound (Prehistoric)
#12
This site type designation refers to a sand, shell, or earthen mound that cannot be more specifically isolated as being ceremonial, burial, etc.. Mounds usually fall into one of four basic type categories. They are either ceremonial in function, a foundation for a structure, refuse piles, or burial mounds.

Burial Mound (Prehistoric)
#13
This site type designation applies to mounds which contain human skeletal material. A burial mound is usually made of one of three types of materials or any combination of these materials: sand, soil, and/or refuse. An archaeological site that falls into this category generally was built exclusively for human burial.

Platform/Temple Mound (Prehistoric)
#14
This site type designation refers to mounds that were built with ceremonial purposes in mind. Ceremonial mound building was brought to Florida about 2,000 years ago. Large flat topped mounds were built to accommodate a structure on their tops.

Earthworks (Prehistoric)
#18
This site type designation refers to massive earthworks created by Native Americans. These earthworks are larger than earthen mounds, and they were created in patterns that today can sometimes be seen from the air.

Cemetery (Prehistoric)
#19
This site type designation refers to Native Americans sites with individuals buried in arrangements of non-consecutive single burials rather than in burial mounds.

Prehistoric Village
#49
This site type designation applies to sites that contain permanent or semi-permanent human settlement.

Palentological
#7
This site type designation is not archaeological. A paleontological site contains prehistoric animal remains, and no evidence of human activity.

Redeposited Site
#24
This site type designation refers to a site which has been dug up or other wise drastically disturbed by being moved to a new location.

Maps depicting the archaeological sites by type within each county are presented on Figures 12, 13, 14 and 15.

The number of recorded archaeological sites by type within each county is presented on the following tables.

CHAPTER IV

SUMMARY OF SURVEY FINDINGS:THE EFFECT OF DEVELOPMENT ON TAMPA BAY'S ARCHAEOLOGICAL RESOURCES

Florida's first Indians came from the north following the migration of large game animals thousands of years ago. Their exact number isn't known. However, based upon increases in site density and size through time, their population increased to several thousands by the time European exploration began in 1513. By the early eighteenth century, the Florida aborigines had been nearly destroyed (Milanich and Fairbanks 1987:216). Some fell victim to slave traders; others to warfare among the differing tribes and with the Europeans.

Many more fell victim to the diseases bought over by the Europeans.

The quick demise of the Florida aborigines is unfortunate. Since they were discovered and disappeared so quickly, there wasn't much written information recorded about their culture. However, they left behind material remains of their culture which enables people today to learn about them.

Since each archaeological site is unique, once it is destroyed, all that it can tell us about an extinct people is lost forever. Even today many of the archaeological sites, irreplaceable sources of information about extinct peoples and their ways of life, are destroyed before they can be studied.

As of June 1989, there were 1275 recorded archaeological sites in the Tampa Bay Region. Of those which remain, particular concern are those sites along the coast, near large water bodies and those presently located in the path of eminent development pressures. Archaeological sites within the quadrangle sheet maps developed by the United States Geographic Society (USGS) located along the coast or major water bodies, were considered coastal for the purpose of this study. The sites within these areas were highlighted on the inventories as well (See Appendices A, B, C, and D).

The existing population of the Tampa Bay Region is heavily concentrated in the coastal corridor with a continuous blend of primarily residential and commercial development extending from Hudson in Pasco County to the southern boundary of Manatee County. It is not surprising that many of today's developments are in the same area where prehistoric settlements existed (Jones 1981:10). Today, the beaches and the desire to live near water attract people to the coast. Hundreds of years ago, people were drawn to coastal areas for other reasons. The water bodies offered a supply of water, an easy means of travelling, and a plentiful supply of food resources. The aborigines were drawn to the coast because of the abundance of shellfish (particularly conchs and oysters) and other food that the Gulf of Mexico and Tampa Bay had to offer. Dependence upon these resources reinforced a more sedentary lifestyle.

With more and more people settling closer to the Gulf and Bay, permanent residences began to take shape. Small villages, probably occupied by individuals with blood ties, were

usually located near the Gulf or other important water bodies. Communities also began to cooperate for the purpose of building ceremonial sites or burial mounds (Willey 1949:530). This and other cooperative activities led to the formation of chiefdoms with a stratified socio-politico-religious organization. There are various types of mounds found along the coast: burial, ceremonial, temple/platform, and shell mounds. A couple of the outstanding mounds are the Weeden Island Mound, and Safety Harbor Mound on the western edge of Tampa Bay. The Bickel Temple Mound is located in Manatee County on Terra Ceia Bay.

Another type of site common to coastal areas are shell middens. Village sites along the Gulf consist of shell middens which were deposited beside or adjacent to houses (Milanich & Fairbanks 1980:115). Shell middens are also found along fresh water bodies. Shell middens are refuse heaps of shell composed of marine shellfish. Some are small, presumably the refuse from one individual household. Others are much larger and possibly from multiple households or villages. Sometimes when a group would leave, new arrivals would camp at the same place and would throw their shellfish remains on the same pile.

Very few archaeological sites located in coastal areas, and particularly along the Gulf Coast, are still in existence. The predominate factor of this destruction is the development without mitigation which has occurred along the coast and other water bodies.

Unfortunately, inundation, a natural factor that can't be controlled, also takes its tolls on the archaeological resources. The rise in sea level since the close of the Pleistocene has inundated many sites located along the coast (See Figure 8). The rise in sea level isn't only a problem unique to the coast, but it also occurs along inland water bodies. The flooding is damaging to many archaeological sites located near water sources. Those sites not covered by water may be damaged or destroyed by tidal action (which erodes away archaeological sites). Those not destroyed by tidal action are often covered by sediments (Horvath 1986:31), an action which serves to seal and protect sites while at the same time making them more difficult to locate and identify. With these two factors at work, many irreplaceable archaeological resources are lost (through destruction and through being difficult to find).

The data collected through survey data collection and site verification was analyzed using the computer DATA BASE IV program. Sites were inventoried correlating the land use and degree of disturbance by county. The tables on the following pages summarize this data.

In Hillsborough County, there are 490 recorded sites. There are 460 sites for which there are UTM coordinates. Of the known located sites, 111 or 24% are considered coastal; that is, they are located within the USGS 7.5 minute quadrangles which are situated along Tampa Bay. Approximately 21% or 37 of those sites have been destroyed. A total of 98 or 20% of the total recorded archaeological sites have been destroyed, 13% have experienced minor disturbance, 9% were moderately damaged, and 3% have experienced major damage. Seven percent of the recorded sites have no coordinates and could not be located. An additional 47% of the sites (located primarily in the rural eastern section of the county) were not surveyed as part of this project. (Approximately 46% were visited by the archaeological survey team.)

Residential and commercial development has had the most detrimental effect on the archaeological resources of the county. Seventy-three percent of the sites destroyed are now within this type of land use. In addition, 17% of the sites destroyed are the result of unauthorized digging or "pot-hunting" on public property.

In Manatee County, there are 207 recorded archaeological sites of which 183 have coor-

* Of the 571 sites where the condition is "unknown", 109 or 19% have no recorded coordinates and could no longer be located or verified.

dinates available. Of the located sites, 116 or 63% are coastal. Of the recorded coastal sites, 25 have been destroyed. Of the total recorded sites (including those which are considered coastal), 13% have been totally destroyed, only 1% has experienced minor disturbance, 8% were moderately damaged, and 10% have experienced major damage. Over twelve percent of the recorded sites have no coordinates and could not be located. An additional 56% of the sites (located primarily in the rural eastern section of the county) were not surveyed as part of this project. (Approximately 36% were surveyed.)

Residential development has had the most detrimental effect on the archaeological resources of the county. Sixty-eight percent of the sites destroyed are now within this type of land use. In addition, unauthorized digging or "pothunting" on undeveloped rangelands and agricultural property has led to the moderate or major disturbance of 13% of the total recorded sites.

In Pasco County, there is a total of 318 recorded sites, 298 of which were located geographically. Of the located sites, only 54 or 18% are coastal although many are located along sources of freshwater including the Pithlachascotee, the Anclote, the Hillsborough and the Withlacoochee rivers. Only 7% of the recorded archaeological sites have been totally destroyed, however, this includes 33% of the coastal sites. Approximately 31% of the sites have experienced minor disturbance, 17% were moderately damaged, and 7% have experienced major damage. Approximately 6% percent of the recorded sites have no coordinates and could not be located. An additional 32% of the sites (located primarily in the rural eastern section of the county) were not surveyed as part of this project.

Residential development has had the most detrimental effect on the archaeological resources of the county. Seventy-four percent of the sites destroyed are now within this type of land use. In addition, unauthorized digging or "pothunting" on undeveloped rangelands and agricultural property as well as property belonging to the Southwest Florida Water Management District has led to the moderate or major disturbance of 18% of the total recorded sites.

In Pinellas County, there are 260 recorded sites. Of these sites, 219 or 84% have coordinates and were located on maps. Of the 219 sites, 117 or 53% are coastal. Most (61%) of the recorded archaeological sites have been totally destroyed. This includes 67 (57%) coastal sites. Only 4% have experienced minor disturbance, 9% were moderately damaged, and 9% have experienced major damage. Approximately 14% percent of the recorded sites have no coordinates and could not be located. An additional 3% of the sites could not be verified as part of this project.

Residential development has had the most detrimental effect on the archaeological resources of the county. Seventy-four percent of the sites destroyed are now within this type of land use. In addition, commercial development has resulted in the destruction of 13% of the destroyed sites. Institutional land uses including public and semi-public used has led to the loss of 9% of the destroyed sites. The development of recreational land uses in the County have resulted in the destruction and moderate to major disturbance of 8% of the total recorded sites.

Maps depicting the Condition or Degree of Disturbance of the archaeological resources in each county are presented on Figures 16, 17, 18, and 19.

An inventory of the recorded sites, including site number (SITEID), site name, coordinates (UTMs), site type, culture period, condition (destroyed, minor, moderate, major disturbance), and land use is presented by county in Appendices A, B, C, and D.

CHAPTER V

PROTECTION OF CULTURAL RESOURCES AND DEVELOPMENT REVIEW

By the year 2000 the population of the Region will reach nearly 2.5 million people (Future of the Region: A Comprehensive Regional Policy Plan, 1988). The construction of homes, schools, infrastructure including roads, water and sewage plants, utilities, etc. must precede this anticipated growth. It is predicted that the tremendous expansion into presently undeveloped land will be responsible for the destruction of a large number of irreplaceable archaeological resources (Andrea LeVasseur, 1981) unless protective policies and procedures are implemented to conserve the remaining resources.

THE COMPREHENSIVE REGIONAL POLICY PLAN

The tremendous population growth in the Tampa Bay Region and the state of Florida as a whole, prompted the Florida Legislature in June 1985 to take an historic step by passing the Growth Management Act, which amended Chapters 163, 186, and 187, Florida Statutes. This action opened a new era for Florida and the Region as state government decided that the time had come for some key statewide, future-oriented goals and policies to be articulated in law.

The Florida Legislature established an integrated planning process designed to manage Florida's future growth. At the very top of the planning process pyramid is the State Comprehensive Plan (Chapter 187, F.S.). The next step are the comprehensive regional policy plans which were adopted by the state's 11 regional planning councils in 1987 (in accordance with the provisions of Chapter 186, F.S., to implement the provisions of Chapter 187, F.S.). At the foundation of the pyramid are the local government comprehensive plans and the implementing development regulations (developed in accordance with Chapter 163, F.S., and Rule 9J-5, FAC).

The purposes of the Comprehensive Regional Policy Plan include:

1. To implement, further and accurately reflect the goals and policies of the State Comprehensive Plan;

2. To provide long-range guidance for the physical, economic and social development of a region;

3. To enunciate public policy for the resolution of regional issues through the establishment of regional goals and policies;

4. To enumerate minimum policies, standards and criteria for developments of regional impact and other regional overview and comment functions;

5. To assist in state determination of consistency of local comprehensive plans with regional and state comprehensive plans;

6. To identify the bases for decisions by the regional planning council;

7. To provide a regional basis and perspective for the coordination of governmental activities and the resolution of problems and issues that are of greater- than-local concern or scope;

8. To guide application of federal, state, regional and local agency functions in the region to the extent provided by law;

9. To identify significant regional resources, infrastructure needs or other issues of importance to the region; and

10. To assure, where required by law, that all actions taken by governmental officials within the region shall be consistent with the adopted plan.

COUNCIL POLICY REGARDING CULTURAL RESOURCES

The Tampa Bay Regional Planning Council is guided in its functions by the adopted policy statement, Future of the Region, A Comprehensive Regional Policy Plan for the Tampa Bay Region (FRCRPP). This document, as amended, is used by the Council to ensure consistent review of Developments of Regional Impact, Local Government Comprehensive Plans, applications for federal assistance and other activities of regional importance.

Goal 18 of the FRCRPP pertains to access to cultural resources (Regional Issue #61) and the development of cultural resource programs (Regional Issue #62). The goals and policies which most directly refer to archaeological and historical resources are presented below:

18.4 **REGIONAL GOAL:**

BY 1990, EFFORTS TO PROMOTE AND PRESERVE THE RICH CULTURAL, HISTORICAL, AND ARCHAEOLOGICAL RESOURCES OF THE REGION WILL BE INCREASED FOR THE BENEFIT AND EDIFICATION OF THE REGION'S RESIDENTS.

18.4.1 Policy
Local governments are encouraged to take positive steps to promote and preserve their rich cultural, historical, and archaeological sites and resources.

18.4.2 Policy
Local governments in the region are encouraged to develop and establish cultural, historical, and archaeological policies consistent with other government priorities.

18.4.3 Policy
Historical and archaeological sites are considered to be preservation areas if they are of regional historical or archaeological significance and shall be protected from any further development except in extreme cases of overriding public interest.

a. Programs shall be designed to identify and preserve all significant sites.

b. Programs shall be implemented to increase public awareness of the value and significance of historical and archaeological sites.

c. Nothing in the above stated policies shall prohibit the excavation of archaeological sites by appropriately trained archaeologists, using methods in conformance with generally accepted standards.

18.4.4 Policy
Historical and archaeological sites considered conservation areas are those resources of lesser significance. These areas should be protected from further development, wherever possible, and will be excavated and documented in accordance with generally accepted standards and practices.

Review of the current Council policies by the Historic/Archaeological Preservation Committee and TBRPC staff indicate that there are limitations to the policies as written. First, it is imperative that future plan amendments include

more specific definitions of key terms. These terms include the following:

- archaeological site,
- historical site,
- cultural resources,
- locally significant sites,
- regionally significant sites, and
- resources of lesser significance.

The policies themselves could be both strengthened and clarified. For example, within Council policy 18.4.3, the term "significance" could be stated as those resources eligible for listing in the National Register of Historic Places. Also, "appropriately trained archaeologists" should be clarified to require that professional standards be met such as Society of Professional Archaeologists (SOPA) standards, or those contained in 36 CFR 61, Appendix A. In addition, it may be advisable to recognize the amateur archaeologist and their role in survey and mitigative work.

Council policy 18.4.4 is ineffective until the term, "resources of lesser significance," is defined. The Florida Department of State, Division of Historical Resources (DHR) provides no support for such a policy, since their letters referring to sites determined not to be regionally significant indicate that development can proceed "without further involvement with DHR" with no mitigation or protection of existing archaeological or historical resources. (NOTE: The DHR significance determination use National Register eligibility criteria. A property of "National, State or Local significance under National Register criteria is considered by DHR to be regionally significant. Where DHR has problems of support is for sites considered not to meet National Register eligibility criteria.) A clarification of "significance" addressing regional and local perspectives is essential to justify the value judgments made prior to development approval.

In general, the Committee indicated a need to strengthen existing policy and to require, where feasible, development review by the local preservation commissions or boards. Protective buffers also need to be addressed in Council policy, as well as the provision of educational and interpretive exhibits when excavation for mitigation does occur. Also, classes of use (such as stilt houses), which minimize site disturbance, should be considered and ranked to assist planners and project reviewers in evaluating potential adverse impacts, and measures to avoid, minimize or mitigate such impacts. Specific proposed plan amendments will be prepared for Council review. These recommendations are subject to the review and adoption procedures identified in Chapter 120, Florida Statutes.

DRI REVIEW AT TBRPC

Developments of Regional Impact, or DRIs, are development projects which reach the DRI thresholds as defined by Florida Statutes (Section 380.06, Florida Statutes). These thresholds are based on location, number of dwelling units, square footage of structures and other appropriate criteria. The DRI review is intended to assess impacts on the environment and public facilities from development projects.

Included in the DRI review is an assessment of the impacts on historical and archaeological sites. Development applications are reviewed for consistency with the Council's adopted comprehensive policy plan, FRCRPP (Goal 18: Cultural and Historical Resources), the State Comprehensive Plan and the local government comprehensive plans. The process of identifying impacts and appropriate mitigation/preservation techniques is critical to the protection of the cultural resources in the Tampa Bay Region.

ADA Questions

The questions which the developer/applicant must answer in the basic Application for Development Approval (ADA) are presented below:

1. Are there any historical or archaeological sites in the development property? If so, describe and locate them on Map D. Documentation may be attached in the form of a letter from the Secretary of State's Office, Division of Historical Resources, stating the need for, or results of, an archaeological or historical survey.

2. If any historical or archaeological sites were listed under (1.) above, provide a statement as to the steps that will be taken to protect them and to provide public access, where appropriate.

The purpose of these questions is to solicit information which can be used to 1) determine what resources are present on the property, 2) determine whether the resources that are present will be impacted by the proposed development, 3) determine if impacts on the resources should be permitted, 4) determine the necessary mitigation if the resources will be impacted by the proposed development, and 5) determine the proper protective and preservative measures for any resources present and not threatened by development impacts.

The Review Process

There are some limitations to the current review practice with respect to the protection of cultural resources. The following concerns were identified by committee members and TBRPC staff:

- Frequently, the developer/applicant does not completely address the question of archaeological or historical resources on-site until after the submittal of the ADA. Thus, the reviewer may not be aware of the location of recorded resources on or near the project site. In addition, the results of an archaeological survey, if required, are not presented until later in the review.

- Delays in conducting site survey and analysis results in time pressures on the archaeologist/consultant who must conduct the survey, and on the reviewers at local, regional and state levels. In addition, delays may have serious financial impacts on the developer.

- If resources are discovered at the final stage of DRI review, or during construction, changes to the site plan are more difficult.

- Another limitation includes the omission of local government historical commissions/societies in the DRI review process. These organizations could provide a vital resource to both the Regional Planning Council as well as the local governments.

- The definition of "significance" needs to be clarified addressing the local, state, regional and national perspectives. This definition is essential to the incorporating the strategies of resource protection and mitigation at these different levels.

The ADA questions are brief and do not seem to illicit the amount of information required for a proper review. In addition, TBRPC has developed an archaeological resource site-prediction model which allows for the determination of the necessity of a survey at a regional rather than state level.

Site-Prediction Models

The site-prediction model is an extremely valuable tool in the Tampa Bay Region. With the development of the site-prediction model, more coordination between the Regional Planning Council and the State Division of Historical Resources is necessary to ensure the preservation of known sites as well as the identification of areas where sites are likely to occur.

There are several predictive models used for determining the likelihood of the existence of archaeological sites in specific areas. Models are used as mechanisms to condense the archaeological data into forms which are easier to conceptualize (Horvath 1986:5). It should be noted that these models are developed to predict where sites are located, not why they are situated where they are (Williams, et al, 1973). Models provide a cost-effective means of examining the archaeological potential of a given area.

Marion Almy (1976) used soil types as a predictive model for archaeological sites in Sarasota County. Results from statistical analysis revealed that sites occurred most frequently on well-drained soils on slight elevations.

Joe Jones (1981) developed a predictive model that included vegetation associations. Pine flatwoods, hardwood hammocks, and freshwater marshes were the three critical associations given value in the model (Pope 1984:9). Catherine Pope (1984) used subsistence resources as a predictive model for archaeological sites. Around water bodies, such as ponds, rivers, swamps, etc., food resources were abundant. Ponds and streams would have provided species of plants, reptiles, and fish year round.

Andrea LeVesseur (1981) used distance to water as a predictive model for archaeological sites. Water is such a universal basic human necessity that it often dictates whether an area will be utilized. Water also attracts animals; so people are also attracted by the abundant food resources available near water.

However, it should be noted that nearly all of the above models are based on recent (the past 500 years) environments, and other factors must be considered to account for the paleo-environment and the changes which have occurred with rising sea levels. For instance, Tampa Bay was once a river valley.

The model developed by the Tampa Bay Regional Planning Council under a grant from the Florida Department of State, Division of Historical Resources, utilizes a geographic information system to combine many of the factors described above. It should be noted, however, that the model is still under development. The continual improvement of site location predictive models is dependent upon the supplementation of the data base with additional site recordings, improved micro-environmental data, resource availability (food and water sources, quarries, etc.) from the surrounding locales, and the examination of the co-occurrence of the environmental features (Horvath 1986:22). These factors will help to better predict where archaeological sites are located so that they may be better protected or preserved.

In addition to the regional model, county-specific models may add even more insight in the site prediction theory. Site prediction models have been developed for Manatee County (Burger), Pinellas and Pasco Counties (DeMontmollin), and Hernando County (Horvath).

Based upon the information requirements and data available from the TBRPC, it is recommended that an addendum questionnaire with the following requests be included in the ADA form:

3. Based upon the most current site-prediction model map, delineate the archaeological sensitivity zone(s) on the property. Does TBRPC require a survey as discussed at the Preapplication Conference? If a survey has been required by TBRPC and/or DHR, please submit the final survey report for approval to DHR, TBRPC, and the local government. The final survey report should be consistent with DHR field methodology and report guidelines.

4. What measures will be taken to protect any historical or archeological resources should

they be discovered during project development activities? Buffers or "green-lines" shall be required around significant resources identified prior to construction or during development activities. Who will the applicant contact to ensure that the significance of such finds are evaluated?

5. If there are found to be archaeological or historical resources on-site, what contributions to public education concerning cultural resources will be provided? (Include any educational, interpretive, or instructional exhibits, displays, museums, etc.)

6. If it is determined that a site will be preserved, how will such preservation be accomplished? If project impacts are to be mitigated through archaeological data recovery, when will such work be initiated? How will the applicant ensure that DHR field methodology and report guidelines will be met?

Recommendations for Conditions of Approval

The final DRI report includes recommendations for conditions of development approval. The recommended conditions are usually included in the Development Order which is issued by the local government. Development Order conditions identify specific provisions which must be acknowledged and accomplished by the developer. Any violation of the Development Order conditions can result in suspension of the Development Order and a halt to development activities.

Typically, conditions regarding the protection or mitigation of archaeological and historical resources seek to 1) provide protection or mitigation measures should resources be discovered during development activities, 2) keep construction activities away from archaeological and historical resources during site development, 3) identify provisions for sites of unknown significance, and 4) provide protection of sites known to be regionally significant. Below are examples of potential Development Order conditions.

A recommendation for a condition providing for the protection of resources discovered during development activities:

- Any historical or archaeological resources discovered during development activities of the proposed project shall be immediately reported to the Florida Department of State, Division of Historical Resources, and treatment of such resources shall be determined in cooperation with the Division of Historical Resources, TBRPC, and the local government.

- Treatment will consist first of evaluating site significance; and, second, if determined to be significant, either modifying plans to ensure site preservation or undertaking archaeological excavation to mitigate site damage through data recover, analysis and report preparation. If human remains are encountered the provisions of s. 872.05, F.S. will be followed. The UTM coordinates of the site(s) shall be calculated and preservation/mitigation of the resources must be completed before resource-disturbing activities are allowed to continue.

A recommendation for a condition keeping construction activities away from resources during development:

- No equipment or activities shall be allowed at the location of the resources during project development.

Recommendations for conditions identifying provisions for sites of unknown significance:

- If any historical or archaeological resources of unknown significance are to be impacted through project

activities, archaeological test excavations by professional archaeologist(s) shall be conducted to provide sufficient data to make a determination of significance prior to the commencement of ground-disturbing activities at the site. The final determination of significance shall be made in conjunction with the Florida Department of State, Division of Historical Resources, TBRPC, and the local government. The resulting project report shall be submitted to the Division of Historical Resources, TBRPC, and the local government for approval. These sites shall be included on the Master Site Plan (Map H of the ADA).

- If any site subsequently found to be significant is scheduled to be impacted by project activities which cannot be avoided, excavation of the site by professional archaeologist(s) shall be undertaken in accordance with the guidelines established by the Florida Department of State, Division of Historical Resources **prior** to the commencement of any ground-disturbing activities at the significant site. The resulting project report shall be submitted to the Division of Historical Resources, TBRPC, and the local government for review and approval.

Recommendations for conditions providing protection of known regionally significant sites:

- Significant sites shall be designated as preservation areas pursuant to Council policy 18.4.3, FRCRPP, with surrounding buffers of 30 feet. These preservation areas shall be included on an updated Master Site Plan (Map H), indicating their location. Development shall be prohibited in preservation areas.

- A description of compliance with each of the archaeological and historical resources conditions shall be included in the annual reports. These reports shall be submitted to the Florida Department of State, Division of Historical Resources, TBRPC, and the local government. Their review will include a review of compliance with Development Order conditions regarding historical and archaeological resources. Non-compliance with any of these conditions shall lead to a temporary suspension of the Development Order. Suspension shall remain in effect until compliance occurs.

- Excavation of significant sites will occur only as a last resort if the development impacts are unavoidable.

Avoidance and Mitigation

Avoidance of archaeological and historical resources is preferable over mitigation of impacts, when feasible. Included in the avoidance strategies must be the establishment of buffers in order to protect existing sites. Significant sites should be designated as preservation areas. In addition, other preservation and protection measures may be necessary in order to stabilize and protect sites from erosion, vandalism, and other impacts. These include, but are not limited to, designing construction projects around or over the resources, covering subterranean resources with fill, protecting resources through the use of fences, berms, shoreline armoring, and rerouting of construction activities. Developers may also establish protective covenants, native plant barriers, erect signs, increase surveillance, shift trails and other access routes away from the resources, or educate the public, using boardwalk access for an educational interpretation of the resources.

The preservation techniques listed below are presented in "Archaeological Site Preservation

Techniques: A Preliminary Review" which is available from the Department of the Army, Corps of Engineers, Vicksburg, Mississippi.

1. Earth burial retards erosion; is used for site reconstruction and concealment and permits revegetation.

2. Sand burial used as marker bed to contrast with artifact-bearing matrix; serves as a permeable filter layer; and makes the surface reusable.

3. Stone or gravel burial is very durable; resists erosion; impedes vandalism; can shift naturally; permits vegetation; and is used to retard streambank and lakeshore erosion.

4. Sodding is a form of site burial; it stabilizes the surface and prevents surface erosion; and has a natural appearance.

5. Channelization and placement of dredged materials along shorelines; covers sites and provides a pseudo-shore.

6. Backfilling will stabilize excavated areas; prevents vandalism and erosion.

7. Vegetation controls surface erosion; provides cover; and is environmentally compatible. However, unnecessary landscaping of sites should be prevented, e.g. digging holes to plant oleanders, etc.

8. Continuous concrete slabs will prevent vandalism and is difficult to break through.

9. Gunite (a mixture of sand, cement, and water) can be mixed in the field and pressure-sprayed on the ground surface; the thickness can be controlled; prevents erosion and vandalism; and permits access to underlying deposits.

10. Articulated concrete block mattresses consist of a series of concrete blocks that are closely fitted and then cabled together with wire rope; used for bank stabilization along shorelines and large rivers; precludes easy access by vandals.

11. Cellular blocks are patterned blocks that permit revegetation and control erosion, especially along streambank sites.

12. Interlocking blocks are lightweight and permit vegetative growth; can fit over curved surfaces; resist erosion; and are difficult to remove.

13. Asphalt mixes are used for site stabilization and erosion control; are difficult to break through; and could be used underwater.

14. Soil cement is generally used on upper banks and horizontal surfaces for streambank stabilization; and are relatively durable.

15. GEOWEB is the trade name for an expanding system of honeycomb cells; it traps silt and sand to cover unstable surfaces; may be used under water; and prevents erosion.

16. Rock berms are appropriate protective devices for archaeological properties that are exposed on lakeshores, along streambanks, or in the banks of man-made ditches; and are very durable.

17. Sandbags and filter cloth is good to use in bank control.

18. Dikes are used to deflect current; encourage sedimentation and bank stabilization; permit revegetation; divert streams away from site.

19. Fencing controls human or animal traffic to avoid impacts to specific areas. In Santa Rosa County, the county lay out heavy duty construction wire with fill dirt over that on top of a prehistoric cemetery. Although it will eventually rust away, this procedure makes "pot-hunting" much more difficult and the site is protected for the present.

20. Signs notify public that site is protected - a legal notice to limit access.

21. Deadfalls and driftwood facings are used to camouflage sites; restrict access; trap silt; retard erosion; reduce vandalism and permit revegetation.

These techniques are useful in preserving archaeological resources, however, some of them are very costly. Objective criteria must be used when deciding to preserve one site instead of other similar sites. Typically, those criteria which are used to judge a site's eligibility for the National Register are applied to the issue of site selection for preservation (Thorne, Fay, and Hester 1987:66).

Mitigation, especially at regionally significant sites, should occur only when impacts cannot be avoided. Mitigation activity frequently involves additional investigation through some level of archaeological excavation at sites where impacts are proposed. Additional mitigation activities might include the preparation of non-technical reports discussing the site, its interpretation, etc. and/or the construction of an interpretive exhibit where excavation has occurred, to increase the public's knowledge concerning archaeological and cultural resources.

SUMMARY

In summary, there are several measures that can be taken to help preserve and protect archaeological resources. Of primary importance is a more comprehensive public education program. People need to be made aware of the value of the remnants of our heritage. The task of conveying an appreciation of the value of our archaeological resources must be approached from several directions, particularly in regard to the protection and ultimate preservation of sites and the data they contain (Thorn, Fay, and Hester 1987:68). A few ways to communicate this to the public is through museum displays, traveling exhibits, films, television programs, lectures, etc.

From a more academic point of view, there is a need for (1) more experimental research into the nature of specific impacts on archaeological resources, both from natural or human causes, and (2) a greater appreciation of data from other scientific fields such as soils, hydrology, and geomorphology to building models of the impacts caused by natural processes (Wildesen 1982:82).

Third, planners need a way to predict, with reasonable accuracy, those areas of the region which should be surveyed by a professional archaeologist prior to development in order to avoid needless destruction of archaeological resources. Prediction models and information regarding their purpose is crucial to the protection of archaeological resources.

Finally, it should be recognized that both avoidance and mitigation strategies can benefit the public and the private sector if the importance of cultural resource preservation is recognized early in the development review process. By careful planning, it is possible to avoid unnecessary destruction of our cultural resources (Andrea LeVasseur 1981). In addition, there are many examples in the Tampa Bay Region where historical and archaeological resources have resulted in an economic advantage to the developer and where the public has benefited, not only from the preservation of the resource, but also from the public education contributions (museums, exhibits, etc.).

GLOSSARY

ANTHROPOLOGY: The study of humankind, extant and extinct, from an all-encompassing holistic approach.

ARCHAEOLOGY: The study of human past based on evidence contained in the ground. Archaeology's initial objective is the construction of cultural chronology.

CORE: A piece of stone from which other pieces of stone are flaked off to make artifacts.

COORDINATES: Refers to the Universal Transverse Mercator Coordinate Projection system, a universal mapping technique for establishing the precise location of any area on earth. It also refers to locations based on the township-range-section grid system found on the USGS quadrangle and other maps.

DATA: Relevant observations made on objects, serving as the basis for study and discussion.

EASTING: This field contains the easting coordinate assigned to a site. The easting coordinate is half of the information needed in the Universal Transverse Mercator Coordinate Projection System. The easting is always six digits long, and is accompanied by a northing coordinate. When the two coordinates are combined they will indicate the position of a site on a map.

IN SITU: A term referring to the position in which an artifact or ecofact was initially located.

LITHIC: Stone material.

MC: This field contains explanations for sites that were labeled Multiple Component in the PERIOD field. Sites with the MC designation have multiple culture periods represented. For example, Archaic period peoples and Transitional period peoples both could have existed at the same location during different time periods. This results in both cultures being represented in the archaeological record at a single location.

MAPNAME: This field contains the name of the USGS quadrangle map on which a site is located. A quadrangle is a unit of survey bounded by parallels of latitude and meridians of longitude. These maps show elevation, vegetation, waterways, roads, and buildings.

MIDDEN: Refuse deposits resulting from the activities of humans.

NORTHING: This field contains the northing coordinate assigned to a site. The northing coordinate is half of the information needed in the Universal Transverse Mercator Coordinate Projection System. The northing is always seven digits long, and is accompanied by an easting coordinate. When the two coordinates are combined they will indicate the position of a site on a map.

PERIOD: This field contains the numerical code for a particular cultural period. Culture and period do not mean the same thing. The former implies a way of living while the latter refers to a period of time. Archaeologists use "culture period" to refer to the temporal time span of an archaeological culture (Milanich and Fairbanks 1980:19). Cultural periods include Archaic, Weedon Island, Paleo-Indian etc., and are described in detail Chapter II.

PREHISTORIC: The time before written records.

SITEID: This field contains the identification numbers assigned to each site in the state of Florida. The number is read as follows:

(8) is the number assigned to the state of Florida
(MA) stands for Manatee County
(HI) stands for Hillsborough County
(PI) stands for Pinellas County
(PA) stands for Pasco County
(number) is assigned to each unique site

For example, 8MA23 is assigned to site number 23 in Manatee County, Florida.

SITENAME: This field contains the name of each site. Sites are named by the individual who is recording the site information. The majority of sites are given a name, although a few are only assigned site numbers for identification purposes.

STRATA: Layers in the soil (either geological or human in origin).

STATUS: This field contains information concerning current land use practices at individual sites.

STATUS: This field contains the current status of an archaeological site. Five categories were devised to describe site status. These are as follows:

Unknown: sites which could not be evaluated due to a lack of information.

Minor Disturbance: sites which had suffered little disturbance.

Moderate Disturbance: sites which had been obviously disturbed, but only slightly.

Major Disturbance: sites which had undergone serious disruption.

Destroyed: sites that have been completely destroyed.

TYPE: This field contains the numerical code for a particular site type. Site types include midden, mound, cemetery, etc., for a detailed description of site types see Chapter IV.

APPENDIX A

ARCHAEOLOGICAL SITE INVENTORY, HILLSBOROUGH COUNTY, 1989

APPENDIX A

AN INTRODUCTION TO HILLSBOROUGH COUNTY

Hillsborough County is located along the west coast of central Florida. The county is approximately 1,040 square miles in area. It is bordered to the north by Pasco County, to the east by Polk County, to the west by Pinellas County, and to the south by Manatee County. Hillsborough County was settled in 1820 and originally encompassed the area of Pasco, Polk, Manatee, Sarasota, DeSoto, Charlotte, Highland, and Hardee Counties combined. It has an average winter temperature of 81 F, and an average summer temperature of 61 F. The elevation ranges from sea level to 144 feet. Hillsborough County is located in the Atlantic Coastal Plain.

The county has large, nearly level plains called flatwoods. The county also has a cover of pine, saw-palmetto, huckleberry bushes, gallberry bushes, runner oak, and grasses. The water features includes ponds, swamps, marshes, lakes, and bays. The surface drainage goes towards old Tampa Bay. Principal streams are the Hillsborough River, the Alafia River, and the Little Manatee River. The soil is mainly well drained deep sand. Subtropical-winters are short and mild with moderately high winds and accompanying thunderstorms.

ARCHAEOLOGICAL SITES IN HILLSBOROUGH COUNTY

OCTOBER 1989

SUMMARY REPORT

Total Number of Sites: 490
Total Number of Sites/Locations Known: 460
Percentage of Sites Known: 94%
Total Number of Coastal Sites: 111
Percentage of Coastal Sites: 24%
Percentage of Known Sites Visited (1989): 46%
Total Number of Known Sites Destroyed: 98
Percentage of Known Sites Destroyed: 21%
Total Number of Coastal Sites Destroyed: 37
Percentage of Coastal Sites Destroyed: 33%

APPENDIX B

ARCHAEOLOGICAL SITE INVENTORY, MANATEE COUNTY, 1989

APPENDIX B

AN INTRODUCTION TO MANATEE COUNTY

Manatee County is located along the west coast of central Florida. The county is approximately 701 square miles in area. It is bordered to the north by Hillsborough County, to the east by Hardee and DeSoto Counties, to the West by the Gulf of Mexico, and to the south by Sarasota County. Although the population is rapidly growing throughout Florida, much of Manatee County remains agricultural. The climate is subtropical with average winter temperatures of 62 F and average summer temperatures of 80 F.

Manatee County lies within the Coastal Plain area. The county is almost totally coastal lowlands. Some of the major water bodies around and within Manatee County include the Manatee River, the Braden River, the Gulf of Mexico, Terra Ceia Bay, Lake Manatee, and Palma Sola Bay.

ARCHAEOLOGICAL SITES IN MANATEE COUNTY

OCTOBER 1989

SUMMARY REPORT

Total Number of Sites: 207
Total Number of Sites/Locations Known: 183
Percentage of Sites Known: 88%
Total Number of Coastal Sites: 116
Percentage of Coastal Sites: 63%
Percentage of Known Sites Visited (1989): 36%
Total Number of Known Sites Destroyed: 28
Percentage of Known Sites Destroyed: 15%
Total Number of Coastal Sites Destroyed: 25
Percentage of Coastal Sites Destroyed: 22%

APPENDIX C

ARCHAEOLOGICAL SITE INVENTORY, PASCO COUNTY, 1989

APPENDIX C

AN INTRODUCTION TO PASCO COUNTY

Pasco County is located along the coast of west-central Florida. The county is approximately 742 square miles in area. It is bordered to the north by Hernando County, to the east by Polk and Sumter Counties, to the west by the Gulf of Mexico, and to the south by Hillsborough and Pinellas Counties. Although much of the county is urban/suburban, there is also agriculture in the central and eastern section of the county. The average winter temperature is 61 F and the average summer temperature is 80 F. The county is characterized by discontinuous highlands in the form of ridges separated by broad valleys. Within Pasco County are swamps, lakes, and lowlands of pine flatwoods. Some of the major rivers include the Withlacoochee River, Hillsborough River, Pithlachascotee River, and the Anclote River.

The county was created in 1887, and was named after United States Senator Samuel Pasco. Archaeological evidence from the county suggests human occupation as early as 9000 B.C., reinforcing the urgent need for protection of the county's archaeological resources.

ARCHAEOLOGICAL SITES IN PASCO COUNTY

OCTOBER 1989

SUMMARY REPORT

Total Number of Sites: 318
Total Number of Sites/Locations Known: 298
Percentage of Sites Known: 94%
Total Number of Coastal Sites: 54
Percentage of Coastal Sites: 18%
Percentage of Known Sites Visited (1989): 22%*
Total Number of Known Sites Destroyed: 23
Percentage of Known Sites Destroyed: 8%
Total Number of Coastal Sites Destroyed: 18
Percentage of Coastal Sites Destroyed: 33%

*Does not include recent survey of archaeological sites on SWFWMD Properties.

APPENDIX D

ARCHAEOLOGICAL SITE INVENTORY, PINELLAS COUNTY, 1989

APPENDIX D

AN INTRODUCTION TO PINELLAS COUNTY

Pinellas County is located along the west coast of central Florida. The county is approximately 280 square miles in area. It is bordered to the north by Pasco County, to the east by Hillsborough County and Tampa Bay, and to the west and south by the Gulf of Mexico. The county was originally included as a part of the much larger Hillsborough County, but in 1911, it was declared a separate county. The peninsula ranges from between four and 15 miles in width and there are many islands and keys off the coast of Pinellas County. Elevation in Pinellas County ranges from sea level to 97 feet. The soil is poorly drained and the water table is extremely high resulting in many ponds. Pinellas County experiences humid summers and mild winters. The average temperature during the summer is 83 F and 63 F in the winter.

Although Pinellas County is the second smallest county in Florida, it is the most densely populated. Pinellas County has experienced intense development pressures since the 1950's which resulted in the loss of many irreplaceable archaeological sites. In response, many of the 24 local governments in Pinellas County have implemented historical and archaeological preservation ordinances in order to protect the remaining resources.

ARCHAEOLOGICAL SITES IN PINELLAS COUNTY

OCTOBER 1989

SUMMARY REPORT

Total Number of Sites: 260
Total Number of Sites/Locations Known: 219
Percentage of Sites Known: 84%
Total Number of Coastal Sites: 117
Percentage of Coastal Sites: 53%
Percentage of Known Sites Visited (1989): 95%
Total Number of Known Sites Destroyed: 157
Percentage of Known Sites Destroyed: 72%
Total Number of Coastal Sites Destroyed: 67
Percentage of Coastal Sites Destroyed: 57%

APPENDIX E

LEGISLATION RELATING TO ARCHAEOLOGICAL RESOURCE PROTECTION

APPENDIX E

REVIEW OF LEGISLATION

RELATING TO ARCHAEOLOGICAL RESOURCES

Over the years, there has been several pieces of significant legislation passed by the State of Florida and the Federal Government which provide protection for important prehistoric and historic resources. Listed below is a summary of this legislation, including laws, executive orders and regulations. The first section relates to Florida legislation. The second section describes federal legislation.

STATE LEGISLATION

Florida Historical Resources Act (Chapter 267 F.S. 1986) is Florida's primary historic preservation law. It establishes the Division of Historical Resources within the Department of State. Division responsibilities include:

a. to promote and administer state preservation programs to the public and private sectors;

b. offer funding incentives to encourage preservation activities; and

c. to assist in local government planning and expand their present preservation programs.

The Act also states that all abandoned archaeological and historic sites and their accompanying artifacts located on state-owned uplands and bottomlands belong to the state for administration and protection. Furthermore, the act requires state agencies of the executive branch to consider impacts to historic resources (both archaeological sites and structures) in all state and state-assisted actions. The Division of Historical Resources is charged with coordination and overseeing all of these activities. It also creates the positions of State Archaeologist and State Historic Preservation Officer within the Division.

Environmental Land and Water Management Act (Chapter 380, F.S. 1986) Of particular concern to archaeological and historic sites, this Act and its Rules address the effect of development in Areas of Critical State Concern (ACSC) and by Developments of Regional Impact (DRI) and Florida

Quality Developments (ss. 380.05, 380.06 and 380.061, F.S., respectively). ACSC may be named for an area containing, or having a significant impact upon, historical or archaeological resources, sites of districts, the development of which would cause substantial deterioration or complete loss of the resource, site or district. The DRI application requires that developers address the effect of their project on archaeological and historic sites and properties. The effect of ACSC and DRI processes is to allow the public and local government greater involvement and control over the types of development conducted in their area and the types of environments desired. Florida Quality Development Program (FQD) requires that significant archaeological sites, as well as their resources, be protected in perpetuity.

Conservation and Recreation Lands Trust Fund (Chapter 253) and Land Conservation Act (Chapter 259) provide a means for the State to purchase historic and archaeological properties in order to protect them. These statutes are supplemental to Chapter 267 and Chapter 380, respectively.

Offenses Concerning Dead Bodies and Graves (Chapter 872, F.S.) prohibits and establishes a penalty for any disturbance to a grave or memorial to the dead, regardless of the land's ownership.

Local Government Comprehensive Planning Act (Chapter 75-257, Laws of Florida, same as Chapter 163, F.S.) prohibits any public or private development except in conformity with comprehensive plans. Historic and scenic preservation programs are named as optional elements of comprehensive plans.

Environmental Control (Chapter 403, F.S., Part VIII, Permitting of Activities in Wetlands): Chapter 403.918 (2) (a) item 6 requires DER to determine whether a project will adversely effect or will enhance significant historical or archaeological resources under provisions of Chapter 267.061, F.S. (Florida Historical Resources Act).

Easements (Chapter 704.06, F.S.) and Assessments (Chapter 193.505, F.S.) provide economic incentives for the conservation of archaeological sites or historic buildings through a deferral of property tax or through charitable contributions on dedicated property.

FEDERAL LEGISLATION

Antiquities Act, 1906 (P.L. 59-209) Protects all historic and prehistoric sites on Federal Lands, and prohibits excavation or destruction of such antiquities without the permission (antiquities permit) of the Secretary of the Department having jurisdiction. It also authorizes the President to declare

areas of public lands as National Monuments and to reserve or accept private lands for that purpose.

The National Park Service Organic Act This Act establishes the National Park Service. It shall promote and regulate the use of the Federal areas known an national parks, monuments, and reservations, whose purpose is to conserve the scenery and the natural and historic objects and the wildlife.

The Historic Sites Act, 1935 (P.L. 74-292) Authorized the establishment of National Historic Sites and otherwise authorized the preservation of properties of national historic or archaeological significance and authorized the establishment of museums in connection therewith; authorized the designation of National Historic Landmarks; established criminal sanctions for violation of regulations pursuant to the act; authorized interagency, intergovernmental, and interdisciplinary efforts for the preservation of cultural resources; and other provisions.

Federal-Aid Highway Act, 1956 (P.L. 91-605) This statute protects archaeological resources from the impacts of Federal or Federally financed construction projects unless there is no feasible alternative.

Reservoir Salvage Act, 1960 (P.L. 86-523) Requires Federal agencies building, or permitting the building of reservoirs, to notify the Secretary of the Interior when such activities might destroy important archaeological, historic, or scientific data. The Secretary is authorized to conduct appropriate investigations

to protect those data. The Act also authorized agencies to spend up to 1% of their construction funds on the protection of historic and archaeological resources.

National Historic Preservation Act, 1966 (P.L.89-665)as amended This Act establishes as Federal policy the protection of historic sites and values in cooperation with other nations, States, and local governments. It establishes a program of grants-in-aid to States for historic preservation activities. Subsequent amendments designated the State Historic Preservation Officer as the individual responsible for administering programs in the States. The Act also creates the President's Advisory Council on Historic Preservation.

Department of Transportation Act, 1966 (P.L. 89-670) Directs the Secretary of Transportation not to approve any program or project that requires the use of land from a historic site of National, State or local significance unless there is no feasible and prudent alternative to use such lands and such program includes all possible planning to minimize harm to such historic properties.

National Environmental Policy Act, 1969 (P.L. 91-190) This Act requires Federal agencies to prepare an Environmental Impact Statement (EIS) for every major Federal action that affects the quality of the human environment, including both natural and cultural resources.

Archaeological and Historic Preservation Act, 1974 (P.L. 93-291)
Congress amended the Reservoir Salvage Act to extend the provisions of the Act to all Federal construction activities and all Federally licensed or assisted activities that will cause loss of scientific, prehistoric, or archaeological data. It requires the Secretary of the Interior to coordinate this effort, and to report annually to congress on the program. It permits agencies either to undertake necessary protection activities on their own or to transfer to the Secretary up to 1% of the total authorized for expenditure on a Federal or Federally assisted or licensed project to enable the Secretary to undertake the necessary protection activities.

American Indian Religious Freedom Act, 1978 (P.L. 95-341) This Act makes it a policy of the government to protect and preserve for American Indians, Eskimos, Aleuts, and Native Hawaiians their inherent right of freedom to believe, express, and exercise their traditional religions. It allows them access to sites, use and possession of sacred objects, and the freedom to worship through ceremonial and traditional rights. It further directs various Federal departments, agencies, and other instrumentalities responsible for administering relevant laws to evaluate their policies and procedures in consultation with Native traditional religious leaders to determine changes necessary to protect and preserve Native American cultural and religious practices. Applicable regulation is 43 CFR 7, ARPA Permitting.

Archaeological Resources Protection Act, 1979 (P.L.96-95) This Act supplements the provisions of the 1906 Antiquities Act. The law makes it illegal to excavate or remove from Federal or Indian lands any archaeological resources without a permit from the land manager. Permits may be issued only to educational or scientific institutions, and only if the resulting activities will increase knowledge about archaeological resources. Major penalties for violating the law are included. The Act authorizes the Secretary of the Interior to promulgate regulation for the ultimate disposition of materials recovered as a result of permitted activities. Permits for archaeological work on tribal lands cannot be issued without the consent of the Indian Tribe.

Regulations are promulgated, adopted, and then compiled in the Code of Federal Regulations (CFR), in order to implement provisions of general laws. The name of the act it implements follows each CFR citation below.

43 CRF 3 (Antiquities Act)
"Proposed Rule: Preservation of American Antiquities" defines "objects of antiquity" in relation to the Antiquities Act of 1906, in terms of objects of archaeological, anthropological, paleontological, or historical interest.

43 CFR 7 (Archaeological Resources Protection Act of 1979) "Final Rule: Protection of Archaeological Resources: Uniform Regulations," it establishes government-wide policy for additional regulations by which agencies protect federally owned archaeological resources through permits for authorized excavation and through civil penalties for unauthorized excavation, removal, or damage. It also allows information about the location of archaeological resources to be kept confidential where disclosure of such information may threaten the resource.

36 CFR 60 (NHPA and EO 11593) "Procedures for Approved State and Local Government Historic Preservation Program" establishes the standards for the Secretary's approval of State historic preservation programs, and requires State Historic Preservation Officers to conduct a statewide survey of cultural properties, to prepare and implement a State preservation plan, and to cooperate with Federal agencies in their compliance with the provisions of Section 106 of the National Historic Preservation Act. In addition, 36 CFR 61 provides for local government certification to participate in the Federal Preservation program, and establishes standards for the qualifications of professionals in the preservation field.

36 CFR 63 (NHPA and EO 11593) entitles "Determinations of Eligibility for inclusion in the National REgister of Historic Places," codified the process through which Federal agencies request and obtain a determination of properties' eligibility for inclusion in the National Register of Historic Places.

36 CFR 65 (Historic Sites Act of 1935) "National Historic Landmarks Program" establishes procedures to identify cultural resources of exceptional national significance, to designate them and to encourage their owners to preserve and protect them. It also provides for revising boundaries of National Historic Landmarks and removing a landmark designation.

36 CFR 66 (Archaeological and Historic Preservation Act of 1974) "Proposed Rule: Recovery of Scientific, Prehistoric, Historic, and Archaeological Data: Methods, Standards, and Reporting Requirements," it establishes guidelines and standards for data recovery from cultural resources important primarily for their research potential. It also covers qualification of professionals carrying out work, the content of the recovery program, the curation of data and materials retrieved, and directions for filing reports on data recovery with the Dept. of the Interior.
36 CFR 68 (NHPA) contains the

Secretary of the Interior's standards for historic preservation projects, including standards for acquisition, protection, stabilization, preservation, rehabilitation, restoration, and reconstruction.

36 CFR 800 (NHPA and EO 11593) "Protection of Historic and Cultural Properties," includes the regulations published by the Advisory Council on Historic Preservation to implement Section 106 of the National Historic Preservation Act.

40 CFR 1500 "Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act," was published by the Council on Environmental Quality as directed by Executive Order 11991 to "make the environmental statement more useful to decision makers and the public; and to reduce paper work and the accumulation of extraneous background data, in order to emphasize the need to focus on real environmental issues and alternatives."
