Resource Survey Report

Bottom Trawl Survey

Cape Hatteras – Gulf of Maine

28 February – 4 May 2012

NOAA FSV *Henry B Bigelow*

NOAA Fisheries Service
Northeast Fisheries Science Center
Woods Hole, MA 02543

Scientist removing the otoliths from a six foot three inch, 212 pound Atlantic halibut (*Hippoglossus hippoglossus*)

A catch of juvenile haddock (*Melanogrammus aeglefinus*)

Scientists sorting a catch of Acadian redfish (*Sebastes fasciatus*)

Significant Changes to the NEFSC Bottom Trawl Survey

Many significant changes in survey methodology were implemented, beginning with the 2009 Spring Multispecies Bottom Trawl Survey, that have significant implications for the use of these data. Prior to 2009, multispecies bottom trawl surveys were conducted primarily on the NOAA FSV *Albatross IV* and occasionally on the NOAA FSV *Delaware II*. The 2009 survey was conducted using the NOAA FSV *Henry B. Bigelow*, which is equipped with an autotrawl system that balances warp tensions throughout the duration of survey tows.

The bottom trawl system used for sampling has also been changed. Prior to 2009, the survey was conducted with a Yankee 36 bottom trawl and 450-kg euronet polyvalent trawl doors. Beginning in 2009, the survey is being conducted using a 400 x 12, 4-seam bottom trawl designed and extensively tested with the fishing industry, fishery management, and academic stakeholders in conjunction with the Northeast Fisheries Science Center scientists through the mid-Atlantic and New England Trawl Survey Advisory Panel. The net was extensively tested on the FSV *Delaware II* and the FSV *Henry B. Bigelow* prior to being adopted as the standard survey gear. The bottom trawl is fished with 550-kg, 2.2-m Polyice oval trawl doors.

The survey towing speed was decreased from 3.8 knots prior to 2009 to 3.0 knots beginning in 2009. The new towing speed was selected after extensive scope and tow speed trials conducted on both the FSV *Delaware II* and the FSV *Henry B. Bigelow* and consideration of the range of species to be sampled. The tow duration was also changed from 30 minutes (timed from when the winches were locked until they were reengaged) to 20 minutes of actual bottom time (as determined by net monitoring systems). The adjustments to both tow speed and tow duration have resulted in a decrease of average tow distance from 1.9 nautical miles prior to 2009 to an average tow distance of 1.0 nautical miles beginning in 2009. The shorter tow distance allows us to conduct additional tows in areas that are constrained by fixed fishing gear, untrawlable bottom and steep contours along the edge of the continental shelf. While some commercial fishery stakeholders are likely to express concern about the reduction in tow duration, a preliminary analysis of the length frequency data from paired FSV *Albatross IV* and the FSV *Henry B. Bigelow* tows shows few differences in the largest sized fish of each species caught by the vessels.

Station allocation also changed significantly due to an increase in total available vessel time from 48 to 60 sea days and a reduction in inshore sampling by the FSV *Henry B. Bigelow*. At the time that inshore strata in the mid-Atlantic were historically sampled (September to early October), survey results indicate low densities of commercially and recreational species. These areas will continue to be sampled by the Northeast Area Monitoring and Assessment Program (NEAMAP) bottom trawl survey, although later in the year (late September through early October). As a result of station reallocation, station density was increased significantly in offshore strata that have historically

demonstrated higher densities of fish particularly in the mid-Atlantic and southern New England regions.

The Northeast Fisheries Science Center conducted an extensive comparison of the catchability of the FSV *Albatross IV* sampling with the Yankee 36 bottom trawl using historical protocols and the FSV *Henry B. Bigelow* sampling with the 400 x 12, 4-seam bottom trawl with revised protocols. The resulting dataset is one of the most comprehensive ever produced to study the catchability characteristics of a fisheries bottom trawl survey. A preliminary overall result is that the survey conducted by the FSV *Henry B. Bigelow* has significantly higher catch rates for nearly all species except those with very small total body size (e.g. anchovy species). The results of this study were peer reviewed in August 2009 and analytic approaches will be subsequently used to appropriately interpret pre-2009 survey results with 2009 and later results.

Given the changes in vessel, trawling gear, tow speed, tow duration, sample allocation and towing procedures, straight-forward comparisons of catches in this report with fall bottom trawl survey catches in previous Resource Survey Reports are not appropriate without employing statistical approaches that are reviewed and endorsed for stock assessment applications through peer review processes.

Ecosystems Survey Branch

RESOURCE SURVEY REPORT

Catch Summary

NOAA Fisheries Service
Northeast Fisheries Science Center

Spring Bottom Trawl Survey
Cape Hatteras - Gulf of Maine
28 February – 4 May 2012

This report consists of field notes, station and catch summaries, and a series of geographical plots of commercially and recreationally important species caught during the Northeast Fisheries Science Center's 2012 Spring Bottom Trawl Survey conducted by the NOAA FSV *Henry B Bigelow*. Tows were made with a NEFSC standardized 4 seam, 3 bridle otter trawl rigged with a rockhopper sweep, 550kg (1200lbs) Poly Ice Oval doors, and 36.6m (20 fathoms) bridles. The cod end and upper belly were lined with 1/2-inch mesh to retain young-of-the-year fish.

Because of the 20-minute tow duration, and random selection of station locations, catches can be light compared with commercial tows. Also, vessel operations are on a 24-hour basis and catches have not been adjusted for day/night differences. Nevertheless, these data can provide fishermen with useful information about the distribution and relative abundance of species inhabiting the survey area (Cape Hatteras to the Gulf of Maine).

The data are now summarized from audited catch files generated from the Fisheries Scientific Computer System (FSCS).

Field Notes

In an effort to share some of the natural history observations made during the bottom trawl survey, we have requested that the Chief Scientists on each part of the cruise comment on some of the more interesting catches that were brought aboard FSV *Henry B. Bigelow*.

Delayed, but Not Defeated

Despite mechanical issues, Leg I was able to complete the southern portion of the survey area, as well as capture, tag and release four Atlantic sturgeon.

New Experiences

On Leg II, we intercepted a huge volume of green mud just south of Martha's Vineyard and cleanly blew out the fourth belly, as well as the codend of the trawl; the mud was also very difficult to clean out of both the net and the vessel. This leg was my first experience with FSCS 2.0 (an automatic data entry system which has been recently enhanced), our new station location planning interface, as well as with the ME-70 bathymetric package which ultimately saves vessel time in terms of scouting for towable areas to set the trawl.

Biologically, this leg was not too diverse as we mostly encountered the cooler water Mid-Atlantic Bight species like spotted hake, skates, butterfish, and *Loligo* squid.

One Hefty Halibut

The highlight of Leg III was the capture of a 212 lb halibut (pictured below). The fish was captured in 33 fathoms of water off the Winter Fishing Ground on Georges Bank, and measured in at 6' 3 inches. Analysis of the gonads revealed this fish to be a female. Otoliths were taken and preliminary aging attempts put the fish at 18 years old. The skeleton of the fish (minus the otoliths and the slight degree of damage to the skull extracting them) were sent to Cornell's Shoals Marine Laboratory for academic use in their marine science programs centered around the Gulf of Maine.

The largest halibut caught during our 49 years of surveys occurred back in 1978. During the Autumn Bottom Trawl Survey, a female Atlantic halibut measuring 7'3 inches and weighing 310 lbs (pictured below) was caught at the northern end of the Great South Channel at a depth of 93 fathoms. This fish was 24 years old.

As one of the true vertebrate giants of the Gulf of Maine, the halibut is eclipsed in the bony fish world in this region only by the swordfish, bluefin tuna, and ocean sunfish. However, considering the halibut is essentially a gargantuan flounder, in some ways it is the most unusual and impressive of the giant bony fishes of the Gulf of Maine. As impressive as this fish was, the idea that this species can reach over three times the size of what we saw this spring is almost impossible to imagine. We hope to see more captures like this large halibut in the future, and a recovery of this species to former abundance levels.

Surrounded by Gear

Leg 4 went very well even with all the extra stations around Stellwagen Bank and the north shore. The first week of the trip put the scientists to the test with stations right on top of one another and an abundance of different specimens to be sampled. However, this early workload made the second week, with stations

more spread out, a welcomed and deserved reward for the scientists and crew.

Lobster gear continues to make sampling difficult in inshore waters from Mass Bay to downeast Maine but we were able to carefully work around some of these high density gear areas.

Species on this cruise were the usual suspects seen in the Gulf of Maine including nice redfish tows, more and more halibut, many juvenile lobsters off the coast of downeast ME, and some of the biggest mackerel I've ever seen at the entrance of the Bay of Fundy. One small Atlantic salmon was captured during just a 5 minute tow and was returned back to the sea promptly after identification and measurements.

Drifters

A memorable diversion towards the end of the cruise was the deployment of two unmanned salmon drifter boats that acoustically track salmon and other tagged species in the Gulf of Maine and beyond. The small boats were deployed (picture below) on May 2, at $43^{\circ}12.4'N$ and $068^{\circ}24.1'W$ and were on a course southeast to exit the Gulf. However, a few days later a southwesterly wind blew the vessels back into the GOM where one was recovered on Scrags Island (May 11) by the Swan's Island Harbormaster and the other recovered on the Isle au Haut (May 16) by a lobsterman. For more information about this project, go to:

<http://www.nefsc.noaa.gov/rcb/news/features/wf1219/>

The rest of the leg went off without a hitch and we completed the survey ahead of schedule.

* "Total others" in southern areas are comprised primarily of smooth dogfish and spotted hake

** Excluded from stock assessment due to unacceptable tow evaluation code.

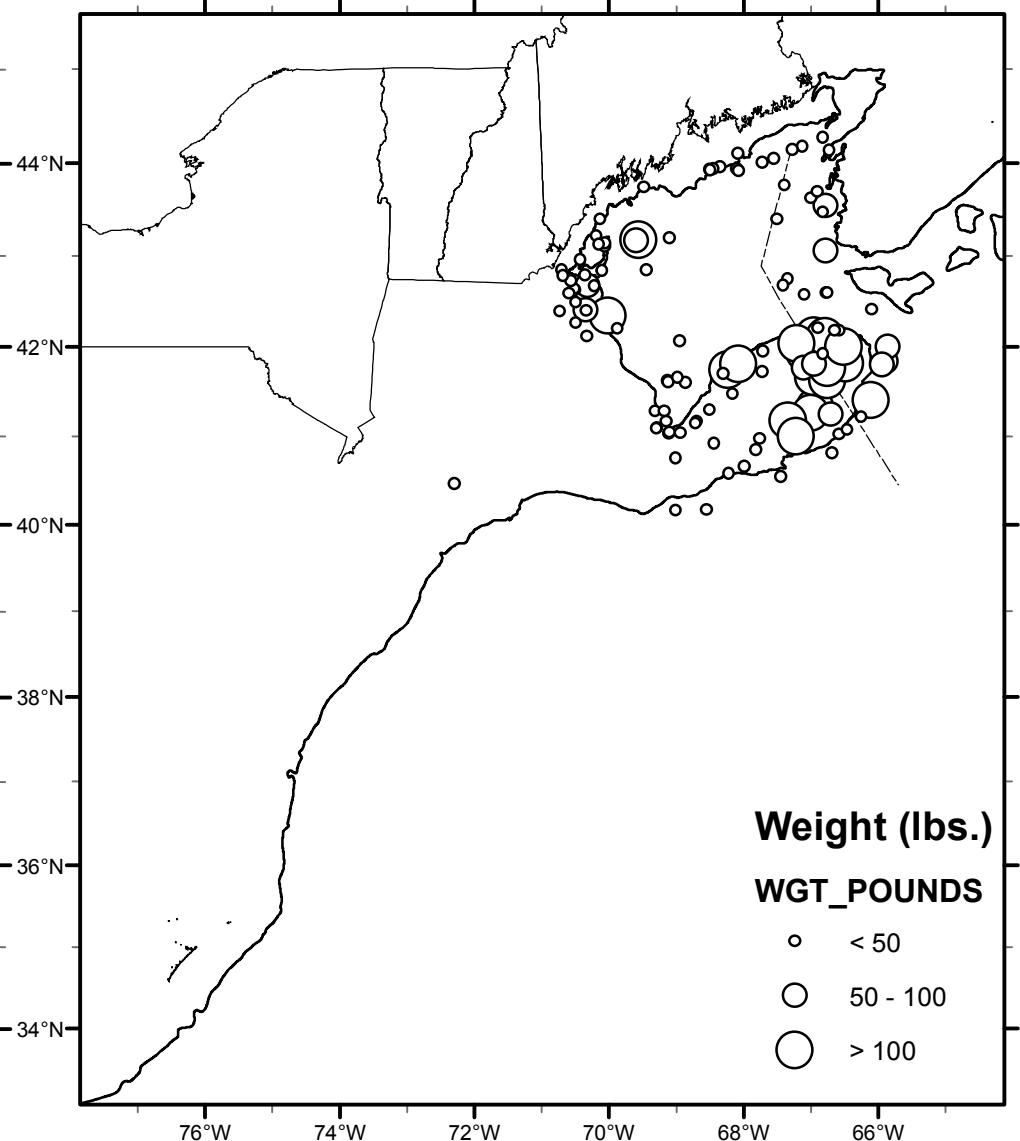

*** Missing sequential numbers indicate either a test-tow or no-trawl-was-attempted
