Date: 2007

Resource Survey Report

Bottom Trawl Survey

Cape Hatteras – Gulf of Maine

March 7 – April 28 2007

NOAA Ship Albatross IV

NOAA Fisheries Service
Northeast Fisheries Science Center
Woods Hole, MA 02543

Scientists stand in awe of the largest number of barndoor skates (*Raja laevis*) ever caught in the forty-four year history of the survey. Caught on Southern Georges Bank, 277 individuals weighed in at 3,224 lbs.

A large catch of Atlantic cod (*Gadus morhua*), caught inshore in the Gulf of Maine, lined up and ready for sampling.

RESOURCE SURVEY REPORT

Catch Summary

NOAA Fisheries Service
Northeast Fisheries Science Center

Spring Bottom Trawl Survey
Cape Hatteras - Gulf of Maine
March 7 - April 28, 2007

Attached are field notes, station and catch summaries and a series of geographical plots of commercially and recreationally important species caught during the Northeast Fisheries Science Center's 2007 spring bottom trawl survey aboard the NOAA Ship *ALBATROSS IV*. Tows were made with a #36 Yankee otter trawl rigged with rollers, 5 fathom legs and 1000 pound polyvalent doors. The cod end and upper belly were lined with 1/2-inch mesh to retain young-of-the-year fish.

Because of the 30-minute tow duration, and random selection of station locations, catches can be light compared with commercial tows. Also, vessel operations are on a 24-hour basis and catches have not been adjusted for day/night differences. Nevertheless, these data can provide fishermen with useful information about the distribution and relative abundance of species inhabiting the survey area (Cape Hatteras to the Gulf of Maine).

The data are now summarized from audited catch files generated from the Fisheries Scientific Computer System (FSCS).

Field Notes

In an effort to share some of the natural history observations made during the bottom trawl survey, we have requested that the Chief Scientists on each part of the cruise comment on some of the more interesting catches that were brought aboard the NOAA Ship *ALBATROSS IV*.

Rare Species

The first leg of the spring survey was very cold, and subzero temperatures were consistent for the first week. We noticed that striped bass appeared to be confined to the mouths of the major spawning sites (Chesapeake Bay, Delaware Bay and New York City) rather than scattered up the coast beaches as in past years. Of note was the capture of a sharpnose sevengill shark, *Heptranchias perlo*. This species is small, with a maximum size listed at just over three feet. They are known to feed on squid and shortfin squid were captured with this specimen. This species is considered fairly rare, and I suspect that it is more of a midwater rather than benthic species. An interesting fact about this species is that the flesh is reported to be mildly poisonous.

Memorable Catches

History was made at Oceanographer Canyon, station 204, when over 3200 pounds of barndoor skates and 1500 pounds of winter skates came over the stern and ended up sliding all over the back deck. This is the first time in survey history that so many barndoor skates were landed. These skates ranged in size from 8-52 inches (from the nose tip to tail end); 137 of them were longer than 39 inches! It was amazing to see so many of them concentrated in one area (depth was 182 fm) and to see such a wide size range! This tow eclipses the previous all time record which occurred last spring when 147 barndoors weighing 1500 pounds were brought aboard. The catch of barndoor skates in this one tow exceed the total catch in all spring tows conducted from 1968 – 2005. Both winter and barndoor skates at this station were in a spawning aggregation.

On station 213, 1650 pounds of haddock (1198 individuals) ranging in size from 11-20 inches with a mode at 16 inches were sampled. Fish as small as 12 inches were in spawning condition. This tow was larger than any single haddock tow we had last spring and was likely dominated by fish from the 2003 year class. Haddock from this year class are growing “stubbornly” slow, frustrating both industry members and fishery managers.

The largest catch of fourspot flounder that I have ever seen came aboard on station 217 when 734 pounds of these flounders (1529 individuals) were landed. Fourspots do not support either a directed commercial or recreational fishery and are often combined with other miscellaneous unclassified flatfish when landed.

High Seas Adventure

Leg III of the survey started off uneventful but ended with a blow. Three days into the cruise we encountered gale force winds which forced us to stop operations for about ten hours. Little did we know this was just the beginning. For the next three days the winds continued to blow 20 to 30 knots hampering our progress. We were able to

complete a portion of the cruise track along the coast of Nova Scotia up to the Bay of Fundy when the fun really began. The forecast called for a nor'easter with winds of 40 to 50 knots and gusts up to 60 knots. The commanding officer of the *ALBATROSS IV* prudently decided to seek shelter and late Sunday afternoon we anchored in Machias Bay, Maine. At first the forecast was for the storm to pass through in 24 hours and we assumed that we would start operations again early Tuesday morning. The storm then stalled, continuing to slam the coastline with near hurricane force winds. Unofficially the wind sensors on the bridge recorded a gust of 97 knots. Even though we were in Machias Bay the force and duration of the winds whipped the bay waters into rolling 4 to 6 foot swells. Finally, on Wednesday, morning we ventured out into open waters again where the wind continued to blow 30 to 40 knots and the swells from the storm were periodically hitting 16 to 18 feet. Ironically the trip home was beautiful with cloudless skies and gently rolling seas.

Impressive Cod Tows

I was impressed with two decent sized Atlantic cod tows during the fourth leg of the survey. The first tow (station 327) consisted of 800 individuals ranging in size from 10-29 inches with an overall catch weight of 1835 pounds. The second catch (station 330) resulted in 101 individuals ranging in size from 7-37 inches with a total catch weight of 319 pounds. The presence of juvenile cod in the Gulf of Maine is encouraging.
