HARBOR SEAL, PHOCA VITULINA RICHARDSI, CENSUS
IN CALIFORNIA, MAY-JUNE 1988

by

Doyle Hanan, John Scholl, and Sandra Diamond

INTRODUCTION AND METHODS

California Department of Fish and Game (CDFG) initiated a harbor seal, Phoca vitulina richardsi, census along the mainland California coast in 1981 as part of a cooperative marine mammal assessment program with the National Marine Fisheries Service/NOAA Fisheries (NMFS). The data gathered from the censuses are to be used for development of an annual index of abundance, which is used for detecting trends in population abundance and distribution. The first census was incomplete, but allowed refinement of techniques, which have been employed in the subsequent censuses. Those techniques and the results of the 1982 to 1987 censuses are reported in Miller et al. (1983) and Hanan et al. (1985, 1986a, 1986b, 1987, and 1988). This report presents results of the 1988 census, which employed previous survey techniques as closely as field conditions permitted.

The survey was flown at a 600-foot altitude in a Cessna 185¹. The airplane was equipped with an optical glass photography port

1. Use of brand names does not imply endorsement by CDFG or NOAA Fisheries

in the airplane floor, which enabled us to take nearly vertical pictures (less counting bias than oblique pictures) of the seals. The sites were photographed sequentially from south to north, taking advantage of the northward progression by time and location of the low tide. Since the tides progress northward faster than the survey plane, a section of the coast was surveyed each day by starting at the southern-most hauling site one hour before local low tide and surveying northward until an hour and a half after local low tide. Some sites were surveyed on consecutive days to assure adequate photographic coverage. The major bays and estuaries were surveyed during the high tide window of one hour before to an hour and a half after local low tide.

The survey team consisted of a pilot, data recorder, and photographer using a Hasselblad model 500-ELM camera with a 80-mm f2.8 lens and motordrive. Kodak 64 or 200 ASA Ektachrome film was used depending on lighting conditions determined by a Soligor II spotmeter. A Nikon 35-mm camera with motordrive and a 100-mm lens were taken as a backup camera system in case of Hasselblad malfunctions.

Counts of harbor seals were made by viewing rolls of developed film through dissecting microscopes. Each seal was counted by marking a thin plastic sheet laid over the photograph. Seals not easily identified as pups were counted as adults. Counts were recorded by hauling-site number and transferred later to a computer database.

Besides the aerial surveys, 39 hauling sites were surveyed by observers from the shore (ground counts). These observers counted seals each half hour or, if numbers were large, as frequently as conditions permitted. They counted, using binoculars or spotting scopes, from one hour before low tide to one hour and one half after low tide. For each day censused, the maximum count at each site was entered into the database. If the ground count exceeded the aerial count for a site, the ground count was used in the estimated mainland total (Appendix I).

The harbor seal census database includes both aerial and ground count information stored in a separate file for each year (Appendix II). The files were created using the database management program dBASE III Plus². The files are maintained as individual records for each hauling site along the California coast. The records contain descriptive information about each site as well as the seal counts (Appendix III).

RESULTS and DISCUSSION

The mainland coast of California was surveyed on June 6-9, 1988. The total count was 14,355 seals, occupying 278 of 695 hauling sites, including 17 new sites (not previously identified or occupied, Table 1). Although there were more seals per occupied site in 1988 than in 1987, fewer sites were occupied in 1988 and this was the first year since 1983 that the mainland count was lower than the previous year (Table 2). Counties north of San Francisco Bay had a larger portion of the mainland count than did the counties south of the bay; although, the percentage north of the bay is the lowest since CDFG started the survey in 1981 (Table 2).

The southern California islands were surveyed on May 25-27, using the same techniques as for the mainland. The total count for all eight islands was 3,947 seals (Table 3), which is lower than the previous year (4,322 seals).

Combining the mainland and island counts (assuming little movement between counting areas during the census) yields a 1988 count of 18,302 harbor seals in California (Table 2).

ACKNOWLEDGMENTS

We thank the pilots Richard Anthes of CDFG and Roy Everingham of EBCO Industries, who flew this survey for us. We also thank the people who donated their time to do the ground counts: M. Klope, C. Kuizenga, P. Howorth, C. Woodhouse, D. Seagars, K. Bray, M. Torok, C. Stiles, M. Workman, R. Rehder, S. Fox, M. White, M. McElligott, C. Pergler, R. Hardy, L. Laurent, S. Owen, F. Wendell, B. Hatfield, J. Hardwick, J. Ames, D. Miller, N. Black, S. Allen, T. Penniman, J. Penniman, J. Mello, C. Gutierrez, P. Collier, and B. Sydeman.
