NOT FOR PUBLICATION

PREFACE

In recent years, the demand for data and information concerning marine fisheries has greatly increased. To help meet these increased needs in the central and western Pacific areas, the National Marine Fisheries Service's (NMFS) Southwest Fisheries Science Center (SWFSC) initiated the Western Pacific Fishery Information Network (WPacFIN) to assist Pacific island fisheries agencies in upgrading their data collecting, processing, and reporting capabilities. Several agencies participate in this program:

American Samoa	Department of Marine and Wildlife Resources (DMWR)
Commonwealth of the Northern Mariana Islands (CNMI)	Division of Fish and Wildlife (DFW)
Guam	 Division of Aquatic and Wildlife Resources (DAWR) Department of Commerce (DOC)
Hawaii	 Hawaii Division of Aquatic Resources (HDAR) NMFS Southwest Fisheries Science Center (SWFSC), Honolulu Laboratory NMFS Southwest Region (SWR), Pacific Island Area Office (PIAO)

In 1982, these agencies formed a Fisheries Data Coordinating Committee (FDCC) and a FDCC Technical Subcommittee to help guide, coordinate, and monitor all of their activities. Significant progress has been made by all participating agencies, particularly in the areas of upgrading data collecting and processing systems.

As a major step in improving and coordinating the data reporting and distributing systems of the agencies, in May 1985 the FDCC agreed to produce a combined document reporting each island's major fisheries statistics. Production of the document would be the responsibility of the FDCC Technical Subcommittee and would be coordinated by the WPacFIN program manager. Each agency would supply the data required to produce the tables and graphs for its respective chapter of the report, and central WPacFIN staff would produce and distribute the document as part of the Administrative Report Series of the Southwest Fisheries Science Center.

This document is the fifteenth volume in the series "Fishery Statistics of the Western Pacific" and contains 1998 summaries of commercial landings for American Samoa, the Commonwealth of the Northern Mariana Islands, Guam, and Hawaii. As with previous volumes, this volume is divided into sections, one each for the major island areas.

BACKGROUND

This report is compiled by fisheries agencies participating in the Western Pacific Fishery Information Network (WPacFIN, formerly referenced as WPACFIN). A collaborative effort between agencies in Hawaii, Guam, the Commonwealth of the Mariana Islands (CNMI), and American Samoa, WPacFIN's goal is to improve the availability and dissemination of fisheries information. Participating groups include:

American Samoa	Department of Marine and Wildlife Resources (DMWR)
Commonwealth of the Northern Mariana Islands (CNMI)	Division of Fish and Wildlife (DFW)
Guam	 Division of Aquatic and Wildlife Resources (DAWR) Department of Commerce (DOC)
Hawaii	 Hawaii Division of Aquatic Resources (HDAR) NMFS Southwest Fisheries Science Center (SWFSC), Honolulu Laboratory NMFS Southwest Region (SWR), Pacific Island Area Office (PIAO)

WPacFIN and these groups collect, computerize, edit, and process data from these agencies. Ultimately WPacFIN staff at the Honolulu Laboratory create the summaries and graphs found in this document.

Data from DMWR, DAWR, and DFW are supplied on portable computer media in established WPacFIN database formats, whereas data for Hawaii were provided by HDAR via a dial-in telecommunications link. Once data from all agencies are put into the proper format on the central WPacFIN computer and appropriate edit and verification procedures completed, summary reports and files are produced using software developed by WPacFIN staff specifically for this purpose. Graphs are produced using commercially available software.

PROGRESS

In 1981 when WPacFIN began assisting agencies improve their data collecting and

processing systems, only the State of Hawaii had computerized processing. By mid-1982, fisheries offices in American Samoa, Guam, and the CNMI were using WPacFIN supplied computers to process data. Since that time, these agencies have made many significant improvements to their data collecting systems and have established sound, automated data processing systems. Most agencies can now provide fishery statistics to WPacFIN within 45 days of the date of collection.

In particular, the HDAR has significantly improved its procedures for editing, updating, and processing Hawaii's data; it has reduced the lag time in data processing from about 2 ½ years to less than 3 months for most data. The biggest problems still facing HDAR in improving their data systems are reducing delinquency of fishermen reporting and implementing a validation system to ensure that what gets reported by fishermen is accurate. Efforts are currently underway to develop and implement such a system.

PRECAUTIONS

Data collecting and processing systems vary greatly among Pacific island fisheries agencies. Although much standardization has taken place and is continuing, there remain many unique aspects of each island's systems based on local needs and capabilities.

When using summaries contained in this report, especially if making comparisons, one should keep in mind the nature of the systems used to produce the data. For instance, Hawaii's commercial landings data are based on mandatory monthly reporting by licensed commercial fishermen; CNMI's and Guam's data are based on voluntary reporting of major fish buyers using government-provided "trip-ticket" invoices; American Samoa's data are based on creel survey sampling of participation, interviews of fishermen, and a data expansion program. Each system has advantages and disadvantages, and the user should be aware of them when comparing or interpreting data. Additionally, WPacFIN staff and the island agencies are continually making improvements to the data collecting and processing systems in each area. Because the improvements usually result in updates to the estimates of total and commercial landings, the data in this volume may not match exactly with data in previous volumes of this report series.

The user should also be aware that species assemblages vary among island groups, as do cultural preferences and principal fishing techniques and gear. Population size is of particular importance when making interpretations of the relative value and importance of the fisheries. To help the user make these value judgments, explanations of the data collecting and processing systems are provided in each island's section of this report.

CONTENTS

This document is divided into sections by island group. Each section contains reports on the monthly and annual landings by species or species groups for the commercial fleet. Two sets of annual summaries are included for Hawaii, one each for commercial landings that were sold and not sold.

Definitions

In addition to the description of the systems and the monthly and annual reports, each section contains graphs of some of the summary fishery statistics of particular interest or importance to participating WPacFIN agencies. For purposes of graphical presentation of the data, several categories have been defined for each island's fisheries. Because of differences in reporting systems and capabilities among the islands, species contained within each category may vary, but all categories are documented in each island's section. Overlap exists among some of the categories used for different graphs. Categories used in the graphs include the following:

- 1. Fisheries Categories These are combinations of species of similar ecological types, specifically, pelagic, bottom fish, reef fish, and "other." "Other" includes groups that generally traverse these categories, such as certain sharks and jacks, or are not typically included in these groups, such as mullet and milkfish.
- 2. Pelagic Management Unit Species (PMUS) The Magnuson Fishery Conservation and Management Act of 1976 was amended in 1992 to place tunas under U.S. jurisdiction for management. The Fishery Management Plan for Pacific Pelagic Species was amended to reflect this change and the acronym PPMUS was created to refer to a new group which includes the tunas. However, this report series will continue to treat the tunas as a separate category for graphical purposes and use the PMUS acronym. Therefore, the PMUS category in this document includes only the billfishes, wahoo, mahimahi, and oceanic sharks.
- 3. Bottom Fish Management Unit Species (BMUS) Defined as the species of initial importance in the Fishery Management Plan for bottom fish and seamount fisheries, including the major deepwater snapper, grouper, emperor, and certain jacks.
- 4. Tunas Predominantly skipjack and yellowfin tunas in all areas, but also including most other tuna species and excluding wahoo. With the recent growth of longline fisheries in Hawaii and American Samoa, bigeye and albacore tuna have also become more important.
- 5. Other Tunas All tunas as defined above, but excluding skipjack and yellowfin tunas.
- 6. Billfish Combination of all marlin, sailfish, spearfish, and swordfish species.

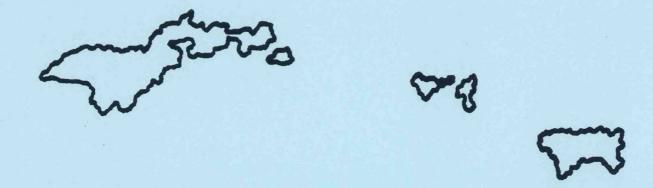

Graphics

A minimum of four types of graphs are provided with each island's data. Type I graphs present summary charts of the major species and species groups for 1998. Type II graphs are seasonality plots for the major species or species groups, showing the average weight landed during each month for all years combined. Type III graphs are based on annual summary

statistics and help visualize the variability among years. Type IV graphs are plots of monthly landings of some of the major commercially important species and document fluctuations in landings of these species over the entire time series. Type V graphs are based on creel survey data and include plots of catch and effort by fishing method plus a combination of several of the types I-IV graphs.

- I. Monthly graphs for each year's data including:
 - A. Major fisheries categories
 - B. Tunas, PMUS, and BMUS
 - C. Wahoo, mahimahi, and billfish
 - D. Skipjack, yellowfin, and other tunas
- II. Plots of average monthly landings for:
 - A. Tunas, PMUS, and BMUS

AMERICAN SAMOA 1998 FISHERY STATISTICS

INTRODUCTION

American Samoa, located at lat. 14° S and long. 170° W, is made up of several islands — Tutuila, Aunu`u, the Manu`a Islands of Ofu, Olesaga and Ta`u, the uninhabited Rose Atoll, and the sparsely populated Swain's Island (see map). Its population is approximately 64,000, over 80% of which reside on the main island of Tutuila, and its economy is based primarily on its tuna industry.

The American Samoa Department of Marine and Wildlife Resources (DMWR), formerly known as the Office of Marine Resources, is located near Pago Pago on Tutuila. It has been collecting commercial fisheries data from the Tutuila fleet since the early 1970s and from the Manu'a Islands since 1983. In 1985, DMWR's data collection programs were modified to include recreational and subsistence fisheries data as well

American Samoa source: http://www.cia.gov/cia/publications/factbook/aq.html;

The World Factbook 1999

American Samoa's domestic fisheries are typically small-boat, one-day fisheries. *Alias* (pronounced *ah-lee-ahs*), or manta cats, make up the majority of the fleet. Measuring 28 to 32 feet in length, these outboard-engine-powered catamarans traditionally did trolling and bottomfishing until mid-1995 when their conversion for longlining began.

The domestic longlining fishery became the dominant fishery by 1996 and has continued to be very successful. By 1998 26 longlining vessels were active, resulting in significantly increased catches of albacore tuna (the primary target species), blue marlin, yellowfin tuna, wahoo, and mahimahi.

During 1998, 49 different boats were sampled during the weekly creel survey, 43 from Tutuila and 8 from the Manu'a Islands, with 2 boats being sampled in both areas. The majority of the catch was sold locally, and most of the longline albacore went to the two canneries on Tutuila. On average, Tutuila boat trips consisted of 3-man crews, fished 8 hours, and caught 360 pounds of fish. Manu'a boat trips also consisted of 3-man crews, but only fished for 5 hours and caught less than 80 pounds of fish. Over 99% of the longline fishing was based on Tutuila.

SPECIAL NOTE ON DATA REVISIONS

Significant changes in the fisheries of American Samoa began taking place in the mid 1990's with the development of the longline fishery and a nighttime, boat-based SCUBA spearfishing fishery. Because of the nature of these fisheries, biases began creeping into the effort-counting and interviewing processes of the DMWR surveys. By 1997 WPacFIN staff discovered the problems, and modifications to survey techniques were implemented by DMWR staff. It became clear by early 1998 that the algorithms used to expand the survey data and estimate for the total fishery also needed to be changed. Much progress has been made in the past year to develop a new data processing system that will better handle the more complex nature of today's fisheries in American Samoa and reprocess the historical time series. This volume includes improved, "best available" data for most years, but these are not considered "final" at this time as additional data quality control procedures and algorithm enhancements are still being made.

DATA COLLECTING SYSTEM

Before 1985, DMWR obtained catch statistics by interviewing fishermen at the end of their trips and kept records of as much commercial fishing activity as possible. This data collection method was accurate for trips where interviews were conducted. Yet it was very labor intensive, did not cover all trips, and intentionally excluded recreational and subsistence fisheries.

Therefore in October 1985 a new sampling system was implemented on Tutuila to provide better coverage and statistics on all boat-based fisheries (the new sampling methods were not implemented in the Manu'a Islands because the fishing fleet is centrally located and is small enough that statistics are being collected for nearly every trip).

The details of this boat-based fishery sampling program have changed over the years to accommodate changes in the fisheries; but it is still a systematic, random sampling program that stratifies sampling by type of day, either weekday or weekend/holiday. Because of logistical and cultural reasons, Sundays are no longer sampled as effort is extremely low and not similar to other weekend/holiday-type days. DMWR staff normally sample 2 weekdays and 1 weekend/holiday per week. During survey days, counts of total participation are collected. Tutuila is divided into six areas, five of which are sampled. It is assumed that the non-sampled area is similar to the sampled areas in fishing activity and success rate. Furthermore, it is assumed that the fisherman interviewed are representative of the entire fishing population and that they give accurate information. Unless contrary information is available, a boat is assumed to be "out fishing" if its trailer is at a boat ramp or the boat is missing from its normal berthing area. The survey data is later expanded to estimate the total catch and effort in Tutuila.

Survey data are collected in the field on log sheets and returned to the DMWR office for editing. The following information is collected for each interview:

- Date *
- Type of day *
- Time *
- Boat name *
- Captain or boat owner's name
- Method of fishing *
- Disposition of catch *
- Species caught *
- Number of pieces for each species
- Weight in pounds for each species *
- Price per pound for each species
- Area fished

- Home island
- Total trip weight in pounds *
- Total hours fished (trip length) *
- Number of fishermen
- Number of gear used

It is not always possible to obtain information on all the items listed. However, the ones marked with an asterisk (*) are considered essential for data expansion purposes. Also, identification and weight of each species are often not obtainable; in this case a code for species groupings (e.g., miscellaneous bottom fish) is used.

In addition to the extensive creel survey and monitoring programs in Tutuila and the Manu'a Islands, DMWR staff also obtain data from the two canneries, from the federal logbooks used by the longline fleet, and from purchase receipts from most fish dealers, hotels, stores, and restaurants. All sources of data are used to create the best available information for American Samoa.

DATA PROCESSING SYSTEM

Interview forms are returned to the office, edited, coded, and entered into databases — the pre-October 1985 commercial landings database and the offshore creel survey data collected since then. DMWR produces edit and summary reports to help verify that the data is entered correctly.

Next, the creel survey data are processed using WPacFIN's offshore data expansion system. This menu-driven system has undergone several major revisions over the years and the current version is the most robust of all. It summarizes the creel survey, participation count, and interview data and produces total catch-and-effort-expansion and species-composition reports. Based on the "disposition of catch" it also produces estimates of the commercial landings of the monitored fleet.

During 1998, a large longline vessel offloaded its catch directly at the cannery and was not monitored in the standard creel survey. However, the new data processing system adjusts for this by integrating the catch data, provided by the vessel via the federal logbook program, with the creel fish size data and cannery price data. Additionally, the data from the Manu'a Islands is

added. This fairly complex integration of data from four data systems provides the best estimates of total commercial landings for American Samoa.

DATA REPORTING SYSTEM

After all editing, quality control, and data interpretation activities are completed monthly and annual commercial landings reports by species are generated. Each of the commercial landings reports contains the common name, weight in pounds, value in dollars, and the average price per pound of each species or species group. Each monthly report contains a subtotal for the sum of all species for that month, and the December report contains the December subtotal and the annual total. Annual reports contain the total estimated commercial landings for each species and for all species combined for the calendar year.

The following species, species groups, and abbreviations are used in the tables and graphs of American Samoa's data:

I. Pelagic Management Unit Species (PMUS)

Although the Magnuson Fishery Conservation and Management of 1976 was amended in 1992 to include tunas in the PMUS (PPMUS), this report series will continue to tunas as a separate category from the PPMUS. The PMUS category includes:

Mahimahi (dolphin) Blue marlin Black marlin Sailfish Shortbill spearfish Wahoo Sharks

II. Bottomfish Management Unit Species (BMUS)

Jacks (unclassified)

Black jack Amberjack Giant trevally

Bottom fish (unclassified)
Groupers (unclassified)

Blacktip grouper Lunartail grouper Snappers (unclassified) Bluelined snapper

Gray jobfish (uku)

Deepwater bottom fish (unclassified)

Yellow opakapaka

Hawaiian opakapaka

Opakapaka

Gindai (flower snapper) Yellowtail snapper Lehi (silverjaw snapper) Onaga (red or longtail snapper)

Ehu (red snapper)

Emperorfish (unclassified)

Ambon emperor Redgill emperor

III. Billfish

Blue marlin Black marlin Sailfish Shortbill spearfish

IV. Tunas

Tunas (unclassified) Skipjack tuna Yellowfin tuna Dogtooth tuna Albacore Bigeye tuna Kawakawa

V. Other Tuna

The above tuna species excluding skipjack and yellowfin tuna

VI. Fisheries Categories

A. Pelagics

All PMUS and tuna species plus the following:

Troll fish (unclassified) Barracuda Rainbow runner

B. Bottom Fish

All BMUS plus the following:

Bigeye trevally
Bluefin trevally
Goldspot trevally
Trevally
Whitemouth trevally
Peacock grouper
Flagtail grouper
Tomato grouper

Twinspot/red snapper
Humpback snapper
Blood snapper
Brown snapper
Bluelined gindai
Black snapper
Stone's snapper
Kusakar's snapper

Yellowspot grouper Striped grouper Spotted grouper Small mouth grouper Giant grouper Rufous snapper Bigeye emperor Goldenline bream Longnose emperor Bluelined bream Orangespot emperor Snake mackerel Oilfish

Blacktail snapper Onespot snapper

C. Reef Fish

Reef fish (unclassified)

Mullet Rabbitfish

Surgeonfish and tangs (unclassified)

Lined surgeon

Yelloweyed surgeon

Convict tang

Dussumier's surgeon Spotted surgeon Unicornfish

Squirrelfish (unclassified)

Berndt's soldierfish

Bigeye squirrelfish

Parrotfish Terapon perch

Wrasse

Goatfish (unclassified)

Pink goatfish

Inshore groupers (unclassified)

Triggerfish Butterflyfish Porcupinefish

Inshore snappers (unclassified)

D. Other

Miscellaneous Bigeye scad

Rays
Eels
Invertebrates (unclassified)
Crabs (unclassified)
Kona crab

Mangrove crab

Spiny lobster Slipper lobster

Shrimp Octopus Squid Clams Turtle

INTERPRETATION OF STATISTICS

The user is reminded to pay heed to the precautions and assumptions identified earlier in this document, when making interpretations of or inferences from data reported in the tables and graphs. Remember also that the commercial landings summaries are not based on a census of all the fishing activities, but on samples of those activities and on integration of data from four separate data systems. One of the major factors in expanding the creel survey data into monthly and annual estimates is the use of proportionality constants to adjust for percent coverage of the surveys. The flexibility of the survey design allows for refinement of these constants as additional information is gained on the fishing activities. If the constants are improved upon, the

basic survey data can be re-expanded to create better overall estimates. However, the variability and species composition would not be expected to change since these statistics are based on the actual survey information collected from the fishermen. The estimates of total landings are considered to be conservative because the catch from the subsistence inshore fisheries are currently not included in this document.

COMMONWEALTH OF THE NORTHERN MARIANA ISLANDS 1998 FISHERY STATISTICS

INTRODUCTION

The Commonwealth of the Northern Mariana Islands (CNMI) comprises a string of islands located at about long. 145° E and extends northward from about lat. 14 to 21° N. Virtually all of the 68,000+ inhabitants of the CNMI live on the three main islands of Saipan, Rota, and Tinian, with the vast majority living on Saipan. CNMI's biggest industry is tourism.

The Division of Fish and Wildlife (DFW) has been collecting fishery statistics on the commercial fishing fleet of Saipan since the mid-1970's. In 1983, DFW also began collecting information on vessels transshipping tuna out of Tinian.

source: http://www.cia.gov/cia/publications/factbook/cq.html;
The World Factbook 1999

The chief domestic commercial fishery of the CNMI is a small boat, one-day troll fishery. Most of the boats are 12 to 24-foot outboard-powered, runabout-type vessels. However, a few larger boats are also used, and a small charter fleet is also developing. During 1998, 24 vessels were registered as "charter" for their primary use. In recent years, there has been a fairly rapid increase in the number of boats in the CNMI, and in 1998 131 boats were registered to participate in the commercial fisheries. Another 143 boats were registered as either part-time or full-time.

Trolling is by far the most common fishing method, but bottomfishing and reef fishing are also popular. Reef fish make up a significant portion of the total commercial catch and are an important component of the local diet. In recent years several larger boats started fishing more intensively for bottomfish around the islands north of Saipan. While the vast majority of the domestic catch is consumed locally, there have been some exports of fish to Guam, Hawaii, and most recently Japan. The one exception would be reef fish; an increasing amount is imported from other Pacific islands as local demand exceeds local supply.

In 1982 WPacFIN significantly improved data collecting and processing systems by providing computer hardware, software, and training. Since then numerous system upgrades and replacements have been implemented to keep up with changing technologies and the increasing demands for improved fisheries statistics.

DATA COLLECTING SYSTEM

DFW's principal method of collecting domestic commercial fisheries data is a dealer invoicing system, sometimes referred to as a "trip ticket" system. The DFW provides numbered two-part invoices to all purchasers of fresh fishery products (including hotels, restaurants, stores, fish markets, and roadside vendors). Dealers complete an invoice each time they purchase fish directly from fishermen, one copy going to their records and one copy to DFW.

Some advantages of this data collection method are that it is relatively inexpensive to implement and maintain, it is fairly easy to get complete coverage of the commercial fisheries, and DFW can provide feedback to dealers and fishermen to ensure data accuracy and continued cooperation.

Disadvantages include: dependency on non-DFW personnel to identify the catch and record the data, restrictions on the types of data that can be collected, education and cooperation of all fish purchasers are required, and recordings of fish actually sold to dealers are limited. Therefore, a potentially important portion of the total landings is unrecorded.

Since 1982 DFW has tried to minimize these disadvantages in several ways: 1) maintain a close working relationship with dealers; 2) add new dealers to their list and educate them; and 3) implement a creel survey to help estimate total catch, including recreational and subsistence catch.

The current system collects data from dealers in Saipan, where DFW estimates over 90% of all CNMI commercial landings are made. The DFW also estimates that the proportion of total commercial landings that have been recorded in the Saipan database since 1983 is about 90%. Therefore, the reported data summarized herein represents an estimated 80+% of the total commercial landings for CNMI. In mid-1999 this trip ticket invoice data collection program was expanded to Tinian and Rota as well, so data directly from those islands will be available in future volumes of this series.

Information collected from the fishermen includes the following:

- Date
- Buyer's name (dealer)
- Seller's name (fisherman)
- Species

- Weight (pounds)
- Price per pound
- Value
- Invoice number

These data elements are collected for all purchases of fishery products; however, species identification is frequently made only to a group level, especially for reef fish.

DATA PROCESSING SYSTEM

At the beginning of each month, a DFW employee visits each of the dealers on Saipan to collect the previous month's invoices, to resolve problems, and to answer any questions the dealers may have. The invoices are then returned to the office for an initial visual edit during the coding process and entered into the "Purchase" database. After the records are entered, reports are generated to help verify that all data were entered correctly. On a quarterly basis, copies of the database are sent to the Honolulu Laboratory, where the data are transferred to the central computer for additional verification before generating summary reports. These reports and databases are then ready for use by qualified WPacFIN participants.

DATA REPORTING SYSTEM

After all editing and quality control activities have been completed, monthly and annual summary reports by species are generated. Each monthly report contains a subtotal for the sum of all species for that month, and the December report also includes the annual total. Annual reports contain the total landings for each species and the total recorded landings for all species for the calendar year.

The following species, species groups, and abbreviations are used in the tables and graphs of CNMI's data:

I. Pelagic Management Unit Species (PMUS)

Although the Magnuson Fishery Conservation and Management Act of 1976 was amended in 1992 to include tunas in the Pacific PMUS (PPMUS), this report series will continue to specify tunas as a separate category from the PPMUS. The PMUS category in this report includes:

Mahimahi (dolphin) Marlin Shortbill spearfish Sailfish Wahoo Sharks

II. Bottomfish Management Unit Species (BMUS)

Jacks (unclassified, but excluding bigeye scad)
Bottom fish (unclassified)
Ehu (red snapper)
Gindai (flower snapper)
Grouper (unclassified)

Kalekale (pink snapper)
Lehi (silverjaw snapper)
Onaga (red or longtail snapper)
Opakapaka (pink snapper)
Uku (gray snapper)
Emperorfish

III. Billfish

Marlin (probably all blue marlin but could also include the rarely landed striped and black marlin)

Shortbill spearfish

Sailfish

IV. Tunas

Tunas (unclassified) Skipjack tuna Yellowfin tuna Dogtooth tuna

V. Other Tuna

The above tunas excluding skipjack and yellowfin tuna

VI. Fisheries Categories

A. Pelagics

All PMUS and tuna species plus the following:

Troll fish (unclassified)

Barracuda

Rainbow runner

B. Bottom Fish

Same as BMUS

C. Reef Fish

Reef fish (unclassified)

Giant wrasse

Rabbitfish (hitting, hitting feda, menahac, and sesjun)

Rudderfish

Squirrelfish

Parrotfish

Snapper

Surgeonfish

Unicornfish

Goatfish

D. Other

Miscellaneous

Eels

Mullet

Invertebrates (unclassified)

Milkfish

Coconut crab

Crabs (unclassified)

Shrimp

Lobster

Squid

Octopus

Seaweeds

Turtle

Imported

Bigeye scad

GUAM 1998 FISHERY STATISTICS

INTRODUCTION

The Territory of Guam (lat. 13.4° N and long. 144.4° E) is the southernmost, largest, and most populous island (about 151,716) in the Mariana Archipelago. Guam is located about 6,000 km (3,700 mi.) west-southwest of Honolulu, 2,500 km (1,550 mi.) south-southeast of Tokyo, and 2,600 km (1,600 mi.) east of Manila. The islands in the chain north of Guam belong to the Commonwealth of the Northern Mariana Islands.

Guam's economy relies heavily on tourism and military spending by the United States.

source: http://www.cia.gov/cia/publications/factbook/gq.html;
The World Factbook 1999

Fishing activities on Guam are divided into two basic categories: offshore and inshore fishing. Offshore fishing typically involves small boats (12 to 48 feet) going on 1 to 2-day trolling and bottomfishing trips. They usually originate from one of the three principal harbors located on the west coast and southern tip of the island. Inshore fishing is typically conducted without the use of a boat and consists mostly of nearshore casting, netting, and spearfishing. In recent years, the sportfishing charter boat industry has increased significantly and contributes considerably to the commercial landings on Guam since much of the charter-caught catch is sold.

In 1982, WPacFIN began working with staff of the Division of Aquatic and Wildlife Resources (DAWR) and with local fish wholesalers to obtain information on the commercial landings of Guam through volunteer use of "trip ticket" invoices provided by WPacFIN. The tables and graphs in this section are summarized from receipts submitted by all the participating wholesalers on Guam and are estimated to include 80% of the total commercial landings.

COMMERCIAL LANDINGS DATA COLLECTION SYSTEM

Fish enter the commercial market in Guam from three sources: 1) full-time commercial fishermen; 2) part-time commercial fishermen; and 3) subsistence or recreational fishermen who frequently sell portions of their catch to help defray costs. Licenses are not required to sell fish in Guam, nor are there any reporting requirements for those selling fish.

Before 1979 there was no central place to sell fish; fishermen had to develop their own markets and peddle their own fish after each trip. In July 1979 the Guam Fishermen's Coop was established in Agana via government funding. The Coop subsequently became the central distribution center for fresh local fish.

In 1982, WPacFIN began working with the Coop to improve their invoicing system and obtain data on all fish purchases. A cooperative system was established whereby the Coop would use the forms and coding schemes designed by WPacFIN and would supply copies of all invoices to WPacFIN for computer data entry. In return, WPacFIN would provide the Coop with document quality control and computer generated summary statistics. All purchase-data back to July 1979 were also coded and computerized. As time progressed other fish markets began to operate, and DAWR and WPacFIN staff worked with them to obtain their data via the voluntary receipt book program as well.

Although a proposed law has been introduced several times that would require reporting by dealers and possibly commercial fishermen, it has never made it very far through the legislative process. Therefore, the commercial landings data collection system still remains a voluntary system and does not reflect the true total commercial landings. The receipt book program in 1998 is estimated to have covered 80% of the total commercial landings on Guam.

Data collected on commercial receipts forms include:

- Date
- Number of fishermen
- Area fished
- Number of pieces caught
- Price per pound

- Fisherman code
- Hours fished
- Species caught
- Pounds caught

COMMERCIAL LANDINGS DATA PROCESSING SYSTEM

The processing system for the commercial landings data collected from the fish dealers is fairly straightforward. Dealers complete a purchase form every time they purchase fish from a fisherman. On this form, catches are divided into categories for weighing by species or species group (where practicable, number of pieces is also recorded). In the early years data processing was done at the central WPacFIN office in Honolulu, but beginning in 1994 DAWR staff took over this task using a computer and software provided by WPacFIN. Once all the edits, verifications, and corrections are made, summary reports are generated. Numerous standard reports are available, but only the monthly and annual landings by species are provided in this document.

COMMERCIAL LANDINGS DATA REPORTING SYSTEM

After completing all editing and quality control activities for the commercial landings

data, monthly and annual summary reports by species are generated. Each table contains information on the pounds, value and the average price per pound for each species or species group. Each monthly report contains a subtotal for the sum of all species combined for that month, and the December report also includes the annual total. Annual reports contain the total landings for each species and the total recorded landings for all species for the calendar year.

Included with the commercial landings summary reports are graphs of some of the important statistics. The following groupings of species, species categories, and abbreviations are used in the tables and graphs for Guam's commercial landings:

I. Pelagic Management Unit Species (PMUS)

Although the Magnuson Fishery Conservation and Management Act of 1976 was amended in 1992 to include tunas in the Pacific PMUS (PPMUS), this report series will continue to specify tunas as a separate category from the PPMUS. The PMUS category in this report includes:

Mahimahi (dolphin) Marlin (probably all blue but possibly striped or black) Spearfish Sailfish Wahoo Sharks

II. Bottomfish Management Unit Species (BMUS)

Jacks (unclassified but excluding bigeye scad)
Bottom fish (unclassified)
Ehu (red snapper)
Gindai (flower snapper)
Grouper
Kalekale (pink snapper)
Lehi (silverjaw snapper)
Onaga (red or longtail snapper)
Opakapaka (pink snapper)
Uku (gray snapper)
Emperor (mafute)

III. Billfish

Marlin (probably all blue but possibly striped or black) Spearfish Sailfish

IV. Tunas

Tunas (unclassified)
Skipjack tuna
Yellowfin tuna
Dogtooth or white tuna
Kawakawa

V. Other Tuna

All the above tunas excluding skipjack and yellowfin tunas.

VI. Fisheries Categories

A. Pelagic Species

All PMUS and tuna species plus the following:

Troll fish (unclassified) Barracuda Rainbow runner

B. Bottom Fish

Same as the BMUS

C. Reef Fish

Reef fish (unclassified)ParrotfishGiant wrasseSnapperRabbitfishSurgeonfishRudderfishUnicornfishSquirrelfishGoatfish

D. Other

Miscellaneous (unclassified)

Bigeye scad

Mullet

Eels

Milkfish

Invertebrates (unclassified)

Crabs (unclassified)

INTERPRETATION OF STATISTICS

The user is reminded again to pay heed to the precautions and assumptions identified earlier in this document when making interpretations of or inferences from data reported in the tables and graphs. Remember also that the commercial landings summaries are not based on a census of all the fishing activities, but on samples of those activities. Guam's commercial landings reported in this volume for 1998 are believed to include approximately 80% of the actual commercial landings made on Guam during that year.

STATE OF HAWAII 1998 FISHERY STATISTICS

INTRODUCTION

The Hawaiian Archipelago stretches northwestward over 1,500 miles, from about lat. 19° N and long. 155° W to about lat. 28° N and long. 178° W. The seven main Hawaiian Islands — Hawai'i, Mau'i, Lana'i, Moloka'i, O'ahu, Kaua'i, and Ni'ihau — comprise over 99% of the total land area and have virtually all of the State's population of over 1.3 million residents. In 1998, over 80% of the State's recorded commercial catch was landed on Oahu, about 13% on Hawaii, 4% on Kauai, 2% on Maui, and less than 1% on other islands.

The Department of Land and Natural Resources' Division of Aquatic Resources (DAR) has been collecting statistics on the commercial fisheries of Hawaii for over 50 years.

Hawaiian Islands; copied and modified from:

http://satftp.soest.hawaii.edu/space/hawaii/maps/All_Islands_map.710x509.gif;

SOEST Satlab Server

The fisheries of the State of Hawaii are quite diverse; they vary from shore-based algae harvesting by hand to large-vessel fisheries such as longlining and lobster fishing. The major fisheries include tuna fishing through various methods, longlining for broadbill swordfish, lobster trapping, hook-and-line bottom fishing for the grouper-snapper-jack complex, net fishing for such species as the bigeye scad, and trolling for such pelagic species as marlin, wahoo, and mahimahi.

Commercial fishing (i.e., selling catches or providing charter fishing services) in Hawaii requires purchasing a commercial marine fishing license. In 1998, there were over 4,000 licensed commercial fishermen required to submit monthly reports to DAR, and of these approximately 2,700 vessels were used in their activities. The summary 1998 data provided in this document were created from licensed commercial fishermen reports processed by DAR as of April 2000; it is believed to represent about 99% of what may eventually be submitted and processed.

DATA COLLECTING SYSTEM

DAR's primary data collecting system is based on a State law that requires commercial fishermen to report their catches on a monthly basis. Several different data collection forms are used because of the diversity of fishing methods and a desire to obtain specific information on

some of these methods. The vast majority of commercial fishermen use the standard C-3 Fish Catch Report, which is submitted each month and requires the following information for each trip taken:

- Fisherman's name and commercial license number
- Boat's name and its registration number
- Date
- Area or buoy fished
- Type of gear used
- Species caught

- Number caught
- Pounds caught
- Pounds sold
- Value of sales
- Port of landing

The other forms used to report commercial catches are for specific fisheries. These include the C-4 Aku Catch Report for the pole-and-line or bait-boat fishery for skipjack tuna, the C-5 Flagline Catch Report for the longline fishery for tunas and other pelagic species, the Albacore Trolling Trip Report, and the Pond Operator's Monthly Fish Report for operators of saltwater fish ponds. All of the forms request basic catch and revenue information by species, plus additional fishery-specific information such as effort and bait. Commercial collectors of tropical marine fish are required to have an aquarium permit in addition to their commercial marine license and are required to report monthly on the C-6 Aquarium Fish Catch Report. The aquarium fish catch, however, is not included in the statistics provided in this document.

Some of the advantages of a mandatory fisherman-reporting system are its relative efficiency, low cost, the potential for excellent percent coverage, and the amount of information that can be collected directly from the fishermen. The major disadvantage is that it places the responsibility for data recording and timely data submission on the fishermen.

The assumption is made, therefore, that the data submitted by the fishermen are complete and accurate. The DAR is continuing its efforts to improve the quality of data and decrease the time delays in receiving and processing the data. No real measurement is available for what percent of the total commercial catch is actually reported to DAR, but estimates have ranged from about 10% to over 99%, depending on the species and fishery. The overall percent coverage was probably over 80% in 1998.

DATA PROCESSING SYSTEM

When DAR receives various data reporting forms, it codes and edits the data before sending it out for keypunching. Forms that fail the initial DAR staff editing are returned to the fishermen for correction and resubmission, or the fisherman may be contacted by telephone to resolve minor problems. Notices are sent to fishermen who fall more than a few months behind in the submission of their reports. Once the data are keypunched, DAR staff use computergenerated reports to verify and correct errors in the database. When the database is considered to be reasonably complete and error free, it is ready for use in production of various summary catch reports.

DATA REPORTING SYSTEM

More than 150 marine species and species groups are recorded in DAR's monthly landings reports, many of which are insignificant in the total catch. To help reduce this document's size and improve the usability of the tables, WPacFIN staff combined some of the less important species, reorganized the order of presentation, created a new species coding system, and translated all records in the database. The new coding system has 100 species and species groups based on flexible ecological and phylogenetic criteria. All of the commercially important pelagic and bottom fish species or unique species groups have individual codes and are reported separately. Marine pond catches are included in the species totals, but make up less than 0.4% of the total landings for each year.

The monthly and annual reports included in this document contain the common name, weight in pounds, value rounded to the nearest dollar, and the average price per pound for each species. Also included is a separate annual report for commercial fishermen's landings that were not sold. Each monthly report contains a subtotal for the sum of all species for that month, and the December report contains the December subtotal and the annual total. Annual reports contain the total landings for each species and the total recorded landings for all species combined for the calendar year.

Four graphs of monthly landings are presented for 1998, and 26 trend and seasonality graphs, based on 1979-97 data, are also provided. The following species, species groups, and abbreviations are used in the tables and graphs of Hawaii's fishery statistics:

I. Pelagic Management Unit Species (PMUS)

Although the Magnuson Fishery Conservation and Management Act of 1976 was amended in 1992 to include tunas in the Pacific PMUS (PPMUS), this report series will continue to specify tunas as a separate category from the PPMUS. The PMUS category in this report includes:

Mahimahi (dolphin)

Wahoo

Blue marlin

Black marlin

Striped marlin

Shortnose spearfish

Sailfish

Broadbill swordfish

Sharks

Billfish (misc.)

II. Bottomfish Management Unit Species (BMUS)

Deep water jacks (misc.)

Amberjack

Pig-lipped ulua (jack)

White Ulua

Giant sea bass

Blue lined snapper

Ehu (red snapper)

Kalekale (pink snapper)

Onaga (long tailed snapper) Uku (gray snapper) Gindai (flower snapper) Lehi (silverjaw snapper) Opakapaka (pink snapper)

III. Billfish

Billfish

Black Marlin

Classic Marini

Shortnose spearfish Broadbill swordfish Blue Marlin Striped Marlin

Sailfish

IV. Tunas

Tunas (misc.)

Yellowfin tuna Bigeye tuna

Dogtooth tuna

Skipjack tuna

Albacore

Kawakawa

V. Other Tunas

All of the previous tunas excluding skipjack and yellowfin tuna

VI. Fisheries Categories

A. Pelagic Species

All PMUS and tuna species including the following:

Rainbow runner

Japanese mackerel

Ocean sunfish

Barracuda

Frigate tuna

Ocean moonfish

B. Bottom Fish

All BMUS plus the following:

Blue crevally

Paapaa ulua

Dobe ulua

Blue spot grouper

Porgy

C. Reef Fish

Reef jacks (misc.)
Trumpetfish
Mountain bass
Cardinalfish
Rudderfish
Damselfish
Tipapia
Parrotfish
Surgeonfish-tangs
Triggerfish
Pufferfish

Squirrelfish Scorpionfish Bigeyes Goatfish Butterflyfish Hawkfish Wrasse Gobies Flounders Filefish

D. Other

Miscellaneous

Eels

Mackerel scad (opelu)

Anchovy Bonefish Milkfish Needlefish Threadfin

Pomfret

Freshwater fish

Slipper lobster

Shrimp (freshwater)

Octopus

Limpets (saltwater)

Clams

Precious Corals Sea cucumbers

Algae

Rays

Bigeye scad (akule)

Leatherback
Ten pounder
Herring-sardine
Flyingfish
Halfbeaks
Mullet

Snake mackerel Spiny lobster

Crabs

Shrimp (saltwater)

Squid

Limpets (freshwater)

Stoney corals Sea urchins Sea turtles
