ADMINISTRATIVE REPORT SWR-88-3

OCTOBER 1988

## U.S. TUNA TRADE SUMMARY, 1986

### EXECUTIVE SUMMARY

This report is the fourth annual review of the United States tuna industry prepared jointly by the Southwest Fisheries Center and the Southwest Region.

Tuna fleet activity and performance, canned tuna processing, exvessel, wholesale and retail prices, fresh tuna markets and imports are examined and compared to previous years. Nine tables and two figures present tuna industry statistics gathered from government agencies and industry contacts.

In 1986, both U.S. production capability and fleet size were at their lowest levels in a number of years. Despite this reduced capacity, U.S. catch and canned tuna production rose 6 percent and 17 percent, respectively, from 1985 and matched or in some cases surpassed the previous five-year average.

Imports of canned tuna reached a record of 12.1 million standard cases in 1986, which, when combined with U.S. production of 32.7 million cases, provided a total supply of 44.8 million cases worth \$1.1 billion to the U.S. economy.

Abundant supplies of raw tuna helped to keep exvessel prices depressed throughout the year. Lower production costs coupled with the competition from low priced canned imports kept wholesale canned tuna prices down. As a result, the retail composite canned tuna price, which decreased 2 percent in 1985, fell an additional 2 percent in 1986. This downward price trend contributed to corresponding growth in consumption of canned tuna which was a record 3.6 pounds per capita in 1986.

## INTRODUCTION AND HIGHLIGHTS

In 1986, eight major U. S. tuna canneries were in operation at three locations: California, (1); American Samoa, (2); and Puerto Rico, (5). The total imported and domestically caught raw tuna delivered to these eight U.S. canneries for processing rose sharply in 1986, increasing 12 percent from 1985, and matching the 1981-85 average volume of annual cannery receipts (Table 1, Figure 1). Cannery deliveries by domestic vessels increased 6 percent from 1985, while imports of raw tuna rose by 16 percent (Table 1).

Direct exports of domestically caught tuna were down 3 percent from 1985 but were 129 percent ahead of the five-year average. When direct exports are combined with domestic deliveries to U.S. canneries, total U.S. fleet deliveries were 5 percent greater than the corresponding amount for 1985, and 1 percent above the five-year average.

The Western Pacific Ocean<sup>1</sup> was the predominant production area for the U.S. fleet in 1986, providing 55 percent of the domestically caught cannery receipts and direct exports for the year (Table 2). Total domestically caught deliveries from this area increased 11 percent from 1985. The Western Pacific was also the area from which most of the raw tuna imports originated in 1986, 23 percent of total imports by oceanic area (Table 3).

The U.S. pack of canned tuna during 1986 rose 17 percent from 1985 (Table 4). When canned imports were combined with U.S. production, the total U.S. canned supply in 1986 was up 15 percent from 1985 (Table 4). Canned imports set a new record in

---

<sup>1</sup>The Eastern and Western Pacific for this report are distinguished at 150 degrees West longitude.

1986, reaching 12.1 million standard cases<sup>2</sup>. This represents an 11 percent increase from 1985 and an increase of 234 percent since 1981. Imports were dominated by tuna packed in water which is subject to a much lower import duty than tuna packed in oil.

No action was taken on legislation introduced into the U.S. House of Representatives (H.R. 3610) during 1985 which was aimed at eliminating the tariff difference between imports of canned tuna in water and canned tuna in oil. However, as requested by the U.S. Trade Representative, the International Trade Commission conducted a "332 investigation" during 1986 for the purpose of gathering, presenting, and analyzing information on the competitive and economic factors affecting the performance of the U.S. tuna industry (U.S. International Trade Commission, 1986). Unlike the Commission's 1984 "201 investigation" (U.S. International Trade Commission, 1984), the 332 study was not conducted in response to a petition for import relief, but rather, to update the information collected for the previous investigation. Therefore, it did not require a determination on the Commission's part as to whether such relief was warranted.

The retail composite canned tuna price, which decreased 2 percent in 1985, fell an additional 2 percent during 1986. The downward price trend contributed to corresponding growth in overall apparent consumption. On the fresh fish front, landings and sales of U.S. fresh and fresh-frozen tuna products continued to improve during 1986.

The following sections review the 1986 production of white and light meat tuna by the U.S. tuna industry and consumption of tuna products by U.S. consumers. In the final section the economic performance of the U.S. tuna purse seine fleet is analyzed and updated for the period 1979-85.

---

<sup>2</sup>A standard case consists of 48 6.5-ounce cans or 19.5 pounds.

## PRODUCTION AND PROCESSING OF ALBACORE (WHITE MEAT) TUNA

Albacore, which is the only species that may be canned as white meat tuna in the United States (21 CFR 161.190 (a)(4)(i)) accounted for approximately 25 percent of the total U.S. tuna pack in 1986 (Table 4). Total cannery receipts -- domestically caught albacore plus imports -- reached 115,819 tons in 1986, 14 percent above receipts for 1985 and 17 percent above the 1981-1985 average (Table 1). Domestic white meat production for 1986 amounted to 8.1 million standard cases (Table 4), 19 percent above the pack in 1985.

### U.S. Albacore Production and Fleet Activity

Historically, the U.S. albacore fishery has occurred almost entirely in the Pacific Ocean north of 25° N latitude and offshore from the U.S. west coast to approximately 180° W longitude. This area is divided at 140° W longitude into offshore (mid-Pacific) and inshore fishing areas. Troll (jig) gear is the dominant gear used by U.S. fishermen.

The volume of domestically caught North Pacific albacore delivered to U.S. canneries in 1986 totaled 3,527 tons, 49 percent less than the amount in 1985 (Table 1). This represents a 76 percent decrease in the average volume over the last five years. In addition 1,157 tons of domestically caught albacore were exported during 1986 to France, Japan, Spain and Thailand (G.K. Alameda, Premium Tuna, personal communication)<sup>3</sup>.

Although U.S. fishermen have traditionally harvested considerable amounts of albacore from the North Pacific, the

---

<sup>3</sup>U.S. albacore exports do not appear under direct exports in Table 1 because albacore exported in 1986 was initially landed in the United States and then exported through brokers.

South Pacific is currently developing into what could be a major alternative albacore fishing area: some large U.S. trollers are alternating between the North and South Pacific, fishing in each during their respective summers. The number of U.S. albacore trollers operating in the South Pacific is expected to increase substantially in 1987, amidst reports of favorable catch rates and ready markets.

A generally abundant supply of albacore being offered through the international market during 1986 kept contract prices for domestically caught albacore delivered to U.S. canneries at relatively low levels throughout the year: \$1,100 per ton for fish 9 pounds or greater and \$750 per ton for fish under 9 pounds (Table 5). This represents a 10 percent increase and a 6 percent decrease in respective prices at the end of 1985. Prices at year-end 1985 and 1986 were the lowest they have been in the past 6 years.

With the decline in domestically caught receipts and exvessel prices, aggregate exvessel revenue from the 1986 albacore fishery fell 48 percent from that of 1985. However, dividing exvessel albacore revenue by total cannery deliveries yields a weighted exvessel price of \$1,108 per ton for 1986, a 2 percent gain from 1985 (Table 6).

#### Processing of Canned White Meat Tuna

The primary U.S. tuna receiving and processing sites during 1986 were Mayaguez and Ponce, Puerto Rico; San Pedro, California; and Pago Pago, American Samoa. For reporting purposes, tuna receipts and processing data are combined for American Samoa and California. Data for Puerto Rico are reported separately.

Seventy-five percent of the raw albacore supplied to U.S. canneries in 1986 was delivered to canneries in Puerto Rico and

the balance to canneries in American Samoa and California. There was a 14 percent increase from 1985 in the amount of albacore delivered to Puerto Rico and a 13 percent gain in the amount delivered to American Samoa and California. Of the total 1986 domestically caught albacore receipts, 92 percent was received in American Samoa and California and the remainder was transshipped from west coast ports to canneries in Puerto Rico (Table 1). This was a 42 percent reduction from 1985 in domestically caught albacore deliveries to American Samoa and California and a 76 percent decrease in domestically caught albacore transshipments to Puerto Rico.

U.S. cannery receipts of imported raw albacore totaled 112,292 tons in 1986, an 18 percent increase from 1985 (Table 1). Imports accounted for 97 percent of the 1986 total cannery supply of albacore compared with 93 percent in 1985. Puerto Rico was the major receiving site for imports with 77 percent of the total albacore imports; American Samoa and California received the remainder.

Albacore imports received in Puerto Rico during 1986 increased 15 percent from 1985, and imports received in American Samoa and California increased 29 percent. The leading point of origin of raw albacore shipments to U.S. canneries was South Africa, a major transshipping base for Japanese and Taiwanese vessels, which accounted for 24 percent of the total imports (Table 7).

Imports of raw albacore received at U.S. canneries in 1986 were valued at approximately \$163 million,<sup>4</sup> up 6 percent from 1985. Dividing this value by the corresponding volume yields a

---

<sup>4</sup>The values of raw imported tuna (white and light meat) are computed using the declared value reported by importers to the U.S. Customs Service, and volumes of imports compiled by the Statistics and Market News Service, NMFS, Southwest Region.

weighted average import price of \$1,450 per ton for raw albacore in 1986, nearly 10 percent below that for 1985.

In 1986, 62 percent of the total U.S. cannery supply of raw albacore came from the Atlantic Ocean followed by the Pacific and Indian Oceans which contributed 28 percent and 10 percent, respectively, to the total supply. All of the albacore received from the Atlantic and Indian Oceans consisted of imports. Receipts of albacore from the Atlantic Ocean increased 28 percent from 1985, those from the Pacific decreased 9 percent, and those from the Indian Ocean increased 4 percent (Tables 2 and 3).

During 1986, wholesale list prices for U.S.-produced, nationally advertised brands of white meat tuna ranged between \$57 and \$59 per standard case. With discounts, the actual selling price at wholesale was as low as \$42 for a standard case which represented a decrease of 7 percent from 1985. Production of both advertised and private brands of white meat tuna was valued at approximately \$321 million (free-on-board (FOB) plant value) in 1986, up 16 percent from 1985. Based on total white meat volume, the weighted average value in 1986 was \$39.75 per standard case which was a slight drop from \$39.89 for the equivalent size case in 1985.

#### PRODUCTION AND PROCESSING OF LIGHT MEAT TUNA

In the United States, skipjack, yellowfin, bigeye, blackfin, and bluefin tuna are collectively canned as light meat tuna. The 6.5-ounce can of chunk style, light meat tuna in water has been the most popular tuna product consumed in the United States in recent years.

Processing of canned light meat tuna by U.S. canners during 1986 increased considerably from 1985. The domestic pack of all light meat products totaled 24.6 million standard cases in 1986,

16 percent above the pack for 1985 (Table 4). The total cannery supply of raw light meat tuna for 1986 was 407,832 tons, up 11 percent from 1985 (Table 1). Prices of light meat tuna at the exvessel and wholesale levels continued to decline during 1986.

#### U.S. Light Meat Production and Fleet Activity

Receipts of domestically caught, light meat tuna at U.S. canneries totaled 223,666 short tons in 1986, 8 percent above receipts for 1985. This total comprised 90,605 tons of skipjack tuna and 133,061 tons of yellowfin tuna (includes small quantities of bigeye, bluefin and blackfin tuna), an 8 percent increase in both skipjack and yellowfin deliveries from 1985. In addition to deliveries at U.S. canneries, U.S. flag vessels exported 22,207 tons of skipjack tuna and 11,539 tons of yellowfin tuna to foreign canneries in 1986, up 13 percent and down 24 percent respectively from 1985 (Table 1).

The U.S.-flag tuna fleet consisted of 110 vessels with an overall carrying capacity of 99,594 tons at the outset of 1986: 92 purse seiners and 18 baitboats (pole-and-line gear). By the end of 1986, the fleet had declined to 88 vessels, 84 purse seiners and four baitboats with a total carrying capacity of 92,732 tons, a 20 percent loss in number and a 7 percent decrease in total capacity from the beginning of the year. In addition, 17 of these 88 vessels were listed as inactive, and all of the inactive vessels were seiners having individual carrying capacities of 400 tons or more.

During 1986, the fleet operated almost exclusively in the Pacific Ocean. There were 33 vessels active in the Western Pacific during the first quarter of 1986 with a combined carrying capacity of 40,675 tons. The number operating in the Western Pacific rose to 35 by the end of 1986 with a capacity of 42,455

tons. Thirty-five purse seiners with a total carrying capacity of 34,095 tons operated in the Eastern Pacific during the first quarter of 1986, increasing to 36 vessels with a capacity of 33,667 tons by the end of the year. Only three U.S.-flag vessels, having a combined capacity of 3,180 tons, fished in the Caribbean area of the Atlantic Ocean during 1986.

In the early 1980's, the U.S. tuna fleet increased its operations in the Western Pacific. The United States does not recognize national jurisdiction over tunas (highly migratory species) beyond 12 nautical miles from coastlines. However, all Pacific Island states claim jurisdiction over tuna to 200 miles from their coasts.

To resolve this problem, the United States opened negotiations for a South Pacific regional licensing arrangement with 16 Pacific island states in 1986, with formalization of the arrangement scheduled for 1987. Terms of the regional licensing pact include provisions for vessel licensing, economic assistance and technical assistance to be provided by the federal government and by the U.S. tuna industry.

A second problem arose on October 21, 1986 when National Oceanic and Atmospheric Administration issued a rule prohibiting U.S. flag tuna purse seiners in excess of 400 short tons capacity from catching, possessing or landing yellowfin or bigeye tuna from the Eastern Tropical Pacific Ocean (ETP). The rule was implemented after National Marine Fisheries Service calculations indicated that the annual allowable incidental quota for porpoise taken in association with tuna purse seine fishing, 20,500 animals, had been reached. The prohibition was in effect from the date of closure until December 31, 1986. During the closure period, only vessels that voluntarily carried a NMFS observer to verify that porpoise were not set upon were allowed to fish in the ETP.

Along with the prohibition on U.S. purse seiners, imports of yellowfin and bigeye tuna from nations fishing in the ETP were also prohibited. The import prohibition was to be active from the purse seine closure date to July 31, 1987, in order to prevent stockpiling of fish caught during the closure and subsequently imported after January 1, 1987. Imports were allowed from harvesting nations certifying that the yellowfin and bigeye tuna were taken by fishing operations conforming to U.S. standards or that the fish were taken outside the ETP or not during the closure period.

In the face of potentially poor trips, several U.S. vessels declined to leave port during the closure (American Tunaboat Association, Living Marine Resources, Inc., personal communications). This may have had an influence on the 15 percent decline in U.S. purse seine effort in the ETP in the fourth quarter of 1986 compared to effort in the same period in 1985.

Potential losses to U.S. fishermen were offset somewhat by successful fishing on non-porpoise related schools and by increases in price paid for skipjack toward the end of the year. Statistics indicate a 36 percent decline in ETP yellowfin deliveries by the U.S. purse seine fleet in the fourth quarter of 1986 compared to the fourth quarter 1985. On the other hand, fourth quarter 1986 deliveries of ETP skipjack increased substantially from the fourth quarter 1985. Therefore, total fourth quarter 1986 deliveries of light meat tuna from the ETP declined only 11 percent compared to 1985.

At the beginning of 1986, contract exvessel prices, without quality adjustments<sup>5</sup>, for most size classes of skipjack and

---

<sup>5</sup>Contract prices may be adjusted for salt content, temperature of the fish, physical condition of the fish at unloading, and other quality criteria.

yellowfin were comparable to 1985 contract prices. Exvessel prices declined slightly in March but began to recover in November (Table 5).

Receipts of domestically caught skipjack tuna were valued at \$56 million in 1986, up 7 percent from 1985. This yields a weighted average exvessel price of \$616 per ton, a 1 percent decrease from 1985. Domestic deliveries of yellowfin tuna generated approximately \$99 million in exvessel revenue for 1986, 2 percent below 1985. The weighted average exvessel price for yellowfin tuna in 1986 was \$743 per ton, a decrease of 9 percent from 1985 (Table 6). Total exvessel revenue was approximately \$155 million in 1986, 1 percent greater than that for 1985.

#### Processing of Canned, Light Meat Tuna

During 1986, 407,832 tons of raw, light meat tuna were delivered to U.S. canneries in Puerto Rico, American Samoa, and California (Table 1). Puerto Rico received 248,444 tons in 1986, 61 percent of the total; the balance, 159,388 tons, was received at canneries in American Samoa and California. Total receipts for Puerto Rico increased 5 percent from 1985 and rose 22 percent for American Samoa and California (Table 1).

Domestically caught, light meat tuna deliveries to canneries in Puerto Rico during 1986 reached 94,743 tons, 42 percent of the total domestically caught, light meat deliveries for 1986. The remainder, 128,923 tons, went to canneries in American Samoa and California. Compared with 1985, domestically caught, light meat tuna deliveries to Puerto Rico fell 10 percent, while deliveries to American Samoa and California rose 26 percent (Table 1). Imports of light meat tuna totaled 184,166 tons in 1986, 15 percent above the level of imports for 1985. Imports made up 45 percent of the total cannery supply in 1986 versus 44 percent in

1985. Puerto Rico was the major receiving site for imports during 1986 accounting for 153,701 tons (83 percent of the total), a 17 percent increase from 1985 (Table 1). Skipjack made up 56 percent of the 1986 light meat imports, yellowfin the balance. Overall, skipjack tuna imports were up 16 percent from 1985, while yellowfin imports increased 18 percent.

The Seychelles was the top exporter of raw light meat tuna to the United States in 1986 with 30,866 tons, 17 percent of the 1986 total. Venezuela followed with 27,450 tons, 15 percent of the total. Also in 1986, Mexico resumed exports of frozen light meat tuna to the United States, 3,331 tons through December 31 (Table 7).

The embargo on U.S. imports of Mexican-caught tuna and Mexican tuna products, which was instituted in July, 1980, after the seizure of U.S. tuna vessels within Mexico's 200-mile Exclusive Economic Zone, was lifted in August 1986. Recognizing the potential economic stress that an inundation of exports could impose on the U.S. tuna industry, Mexico agreed to voluntarily limit its exports of tuna products to the United States, which would presumably consist mainly of frozen light meat tuna, to the following maximum levels beginning September 1, 1986:

12-month period ending --	Volume	
	Short tons	Metric tons
August 31, 1987	19,290	17,500
August 31, 1988	24,802	22,500
August 31, 1989	30,314	27,500

Source: Office of Fisheries Affairs, U.S. Department of State.

After August 31, 1989, there will be no voluntary restraint on exports to the United States.

Light meat imports in 1986 were valued at \$151 million, up 16 percent from 1985. The value of skipjack tuna imports was approximately \$80 million and the value of yellowfin tuna imports was approximately \$71 million, increases from 1985 of 18 percent for skipjack and 14 percent for yellowfin. These values convert to weighted average prices of \$763 per ton for imported skipjack tuna and \$899 per ton for imported yellowfin tuna, an increase of about 7 percent and a decrease of less than 1 percent, respectively, from 1985.

Light meat cannery receipts and U.S. exports of light meat tuna totalled 441,578 tons in 1986. The Pacific Ocean provided 356,410 tons or 81 percent of this total, the Atlantic Ocean 11 percent, and the Indian Ocean 8 percent. On a regional basis, the Western Pacific was the leading production area with 179,309 tons, 42 percent of total U.S. receipts and exports. Of the total receipts originating in the Western Pacific during 1986, 33 percent (143,408 tons, which includes U.S. exports) was domestically caught and the remainder (38,984 tons) consisted of imports. Skipjack tuna was the predominant species in the receipts from the Western Pacific. Other oceanic regions contributing to the 1986 U.S. cannery supply and U.S. raw exports were in order of importance, the Eastern Pacific -- primarily domestically caught yellowfin tuna; the Indian Ocean -- primarily skipjack imports; the Eastern Atlantic, and the Western Atlantic. A breakdown of the 1985 cannery supply and U.S. exports by ocean of origin is given in Tables 2 and 3.

The wholesale list price of U.S. produced, advertised, light meat tuna ranged between \$34.20 and \$43.45 a standard case, but with discounts the price fell as low as \$26 a case during the year. Total production of canned light meat tuna, both advertised and private label brands, was valued at \$561 million (FOB plant value) in 1986, up 2 percent from 1985. This results

in a weighted average value of \$22.80 for a standard case of light meat tuna in 1986, a decrease of 12 percent from 1985.

#### CANNED IMPORTS

Foreign processed canned tuna packed in oil is subject to a 35 percent tariff and therefore imports are negligible. Foreign processed canned tuna not in oil is under a tariff rate quota which allows imports of up to 20 percent of the previous year's domestic production, excluding American Samoa, to enter at 6 percent ad valorem; imports above the quota level enter at 12.5 percent ad valorem. Canned tuna not in oil entering the continental United States from American Samoa is not counted against the quota. Before the quota on canned imports not in oil is reached, the Bureau of the Census categorizes white meat and light meat imports separately. However, once the quota is reached, there is no longer a distinction between white and light meat imports. Thus, year-end figures comprise imports of both canned light and white meat not in oil.

In 1986, the quota on canned imports not in oil was 81.1 million pounds or 4.2 million standard cases. Total imports reached a record 236.6 million pounds or approximately 12.1 million standard cases, an increase of 11 percent from 1985 (Table 4). When the 1986 quota was reached in late March, white meat made up 17 percent of the imports of canned tuna not in oil. Imports of canned tuna in oil, practically all light meat tuna, totaled 301,000 pounds or about 15,000 standard cases, virtually the same as in 1985.

The leading exporter of canned tuna to the United States in 1986 was Thailand with 152.3 million pounds or 7.8 million standard cases (Table 8). This was 64 percent of total imports and represents a 24 percent increase from 1985 in imports from

Thailand. The Philippines was a distant second with 28.6 million pounds or 1.4 million standard cases, 12 percent of the 1986 total.

Imports in 1986 were valued at approximately \$229 million FOB, an increase of 9 percent from 1985. This converts to a weighted average price of \$0.97 per pound or \$18.87 per standard case, which is 1 percent below that for 1985 (Table 8).

## CONSUMPTION

### Canned Tuna

Consumption of canned tuna products in the United States for 1986 (excluding non-civilian consumption) was calculated to be 3.6 pounds per capita, 9 percent greater than 1985. An informal survey of industry members indicates that tuna was consumed at a ratio of approximately 21 percent white meat to 79 percent light meat. Based on these figures, per capita consumption was approximately 0.76 pounds of white meat tuna and 2.84 pounds of light meat tuna. This converts to 1.9 standard cans of white meat tuna and 6.9 standard cans of light meat tuna per capita. When compared with consumption in 1985, based on the same consumption pattern, there was a 15 percent increase in white meat consumption and a 7.5 percent increase in light meat consumption.

### Fresh Tuna

U.S. production and consumption of fresh albacore, bluefin, bigeye, and yellowfin tuna continued to grow in 1986. Off the U.S. east coast, from Maine to Virginia, Atlantic bluefin tuna are harvested primarily for export to Japan. The Atlantic

bluefin tuna fishery is highly regulated and catch quotas (by fish size and harvesting gear) are imposed through the International Commission for the Conservation of Atlantic Tunas. In 1986, U.S. fishermen, using a variety of gears including purse seine, longline, rod and reel, and handlines, landed 1,050 short tons of Atlantic bluefin. Approximately 80 percent of the 1986 landings of sashimi-quality giant bluefin was exported to Japan with the remainder going to U.S. fresh fish markets (Northeast Regional Office, NMFS, personal communication).

In an attempt to satisfy a strong export market to Japan and an increasing domestic demand, east and gulf coast fishermen are expanding fishing effort on bigeye and yellowfin tuna. In 1986, domestic bigeye tuna landings destined for fresh consumption were approximately 660 short tons, which exceeded 1985 landings by 77 percent. The average exvessel price for large, high-quality bigeye tuna exported to Japan in 1986 was \$7,900 per short ton (Southeast Fisheries Center, NMFS, personal communication). Landings of yellowfin tuna from both the southeast Atlantic coast and Gulf of Mexico fisheries were also on the rise during 1986. Preliminary reports placed landings at 3,530 short tons, an increase of 90 percent over 1985 landings (Southeast Fisheries Center, NMFS, personal communication). Data on exvessel prices is limited. However, reports indicate prices, which are strongly related to grade, reached \$5 per pound in 1986 (Florida Sea Grant, personal communication).

Bluefin tuna continues to be a target species for fishermen from southern California, particularly fishermen of the San Pedro wetfish fleet. In recent years, exvessel prices have been rising, not only because of the continued desirability of bluefin in the Japanese market but also due to the increasing domestic demand for bluefin by the sushi restaurant trade nationwide. In 1986, 5,206 short tons of bluefin were landed on the west coast, largely for the fresh fish market.

West coast landings of albacore destined for fresh consumption during 1986 totaled 1,200 tons valued at \$1.3 million. Fresh-caught albacore from the west coast has been the subject of a large-scale promotional campaign over the last few years, aimed at increasing interest in quality albacore among restaurateurs and fresh fish retailers. According to industry sources, approximately 200 tons of the total domestically caught fresh albacore were channeled through the albacore alternative marketing program during 1986 (Tennyson and Associates, personal communication). Exvessel prices for this high-quality albacore reportedly ranged from under \$1,100 per ton to \$1,500 per ton with an average of \$1,250 per ton, which was 14 percent higher than the average cannery price.

Landings of fresh tuna in Hawaii totaled 3,400 tons worth \$9.6 million in 1986. In 1986, U.S. imports of fresh tuna, primarily yellowfin, received in California amounted to 1,500 tons with a value of \$5 million. This compares to imports of 1,109 tons having a value of \$2.9 million in 1985.

#### PERFORMANCE OF THE U.S. PURSE SEINE FLEET

To provide a more current evaluation of the economic performance of the U.S. tropical tuna purse seine fleet, the purse seine "fleet performance index" developed by Herrick and Koplín in 1986,<sup>6</sup> has been updated through 1985. The fleet performance index (FPI) is a composite index, constructed from an aggregate output price index (OPI), an aggregate input price index (IPI), and a total factor productivity index (TFPI) which

---

<sup>6</sup>See Herrick, Jr., S. F. and S. J. Koplín. 1986. U.S. tuna trade summary, 1985. Admin. Report SWR-86-10. Southwest Region, National Marine Fisheries Service, NOAA.

respectively account for changes in exvessel prices, input prices, and changes in cannery deliveries relative to corresponding changes in the quantity of inputs used.

The aggregate output price index is a weighted average of exvessel price indexes for skipjack and yellowfin tuna over the 1979-85 time period (1979 serves as the base year,  $t=0$ , in the construction of all indexes). Exvessel prices for skipjack and yellowfin tuna were obtained by dividing the total dollar value of cannery receipts for each species by total cannery receipts. Nominal output prices were then converted to 1972 constant dollars using the U.S. Gross National Product (GNP) implicit price index. The weights used in calculating the aggregate output price index are the relative contributions of skipjack and yellowfin revenues to total exvessel revenue. Table 9 presents the price and revenue share data used in calculating the aggregate output price index; the aggregate output price index is shown in Figure 2.

The aggregate input price index is a weighted average of price indices for major categories of factors used in owning and operating a purse seine vessel in the U.S. tropical tuna fishery. The inputs considered are labor, capital, fuel, and other intermediate inputs. Constant dollar, unit prices for these inputs, over the 1979-85 period, were estimated based on purse seine expenditure data reported by the U.S. International Trade Commission (ITC, 1986), data from the Inter-American Tropical Tuna Commission on days absent from port for the U.S. purse seine fleet, and annual average fuel prices from the American Tunaboat Association (V. Bernadino, ATA, personal communication).

The unit price of labor, cost per crew day absent, was estimated by dividing the sum of the ITC's reported annual per vessel expenditures on crew and galley by a measure of annual crew days absent per vessel. Annual crew days absent for U.S.

purse seiners were derived by multiplying estimated total days absent per vessel by 19 crew members, which is the assumed average crew complement in each year of the period.

The sum of the annual interest expense and reported depreciation per vessel from the ITC sample was used as the unit price of capital services in constructing the aggregate input price index.

Other intermediate inputs consist of transshipment services, repairs, gear, insurance, helicopter services, travel, and other. The sum of the nominal expenditures on these inputs per vessel was deflated by the producer price index for industrial commodities to represent the collective use of these inputs in real terms. The nominal expenditure for this category of inputs divided by the corresponding deflated expenditure is used as a proxy for the unit price for other intermediate inputs.

The weights used in calculating the aggregate input price index are the expenditures on each input category relative to the total expenditures on inputs. These weights are computed from the ITC expenditure data and are presented in Table 9 along with the price data used in constructing the aggregate input price index. The aggregate input price index is shown in Figure 2.

Changes in factor productivity, output per unit input, are accounted for through the total factor productivity index which is simply the ratio of a aggregate output index to an aggregate input index. The aggregate indices of outputs and inputs are formed from Tornqvist-Theil (T-T) quantity indexes for each output produced and input used.<sup>7</sup>

---

<sup>7</sup>For a discussion of the properties of such a TFP index see Christensen (1975), and Squires (in press). For an application of this type of TFP to the Pacific coast groundfish fishery, see: Squires, D. 1987. Productivity measurement in the Pacific trawl fleet. Admin. Report LJ-86-24. Southwest Fisheries Center, National Marine Fisheries Service, NOAA.

Annual output consists of the volume of domestically caught skipjack and yellowfin tuna delivered to U.S. canneries over the 1979-85 period. The number of active purse seine vessels comprising the U.S. fleet in each of the years 1979-85 is used as a measure of capital stock. Aggregate labor usage is measured in crew days absent as described above. An estimate of annual fleet fuel consumption is obtained by dividing annual fuel expenditure per vessel from the ITC sample by average fuel prices provided by the ATA. Fuel consumption per vessel is then multiplied by the number of vessels in the fleet to get total fuel consumption. The quantity of other intermediate inputs used annually is approximated by deflating the nominal expenditure on this category of inputs by the producer price index for industrial commodities to obtain relative use in constant dollars. The quantity data used to construct the total factor productivity index is shown in Table 9 together with the T-T indexes and the aggregate output and input indexes. The total factor productivity index is displayed in Figure 2.

By combining the aggregate output price index, the aggregate input price index, and the total factor productivity index, the composite fleet performance index can be written as:

$$FPI_t = OPI_t * TFPI_t / IPI_t$$

where the terms to the right of the equals sign are those indices described above. The FPI is an expression of the economic performance of the fleet in the year "t" relative to the base year 1979. The FPI (Figure 2) denotes the collective effect of changes in revenues, costs, and fleet productivity on fleet performance over the 1979-85 period.

Based on projections using the purse seine cost-earnings data from the 1986 ITC investigation, it was found that the U.S. fleet experienced a net accounting loss in the base year, 1979. When interpreting subsequent values of the FPI, a value greater

than one in year "t" does not necessarily mean that the fleet realized a profit in that year. It means that the fleet improved economic performance relative to the base year -- that is, the fleet could be earning a profit in "t"; it could be just breaking even in year "t"; or it is continuing to operate at a loss in year "t," although the loss will not be as great as in the base year. Conversely, if the index in "t" is less than one, the fleet is performing worse than it did in the base year. Also, the indices are calculated for the fleet and therefore will not necessarily be indicative of the performance of an individual vessel. When a marginally performing vessel exits the fishery, fleet performance may improve due to an increase in overall productivity.

The slight improvement in the FPI through 1980 can be attributed to an increase in output prices which more than offset the increase in input prices and the decrease in total factor productivity. During 1981, the FPI fell as output prices declined more sharply than input prices, and total factor productivity continued to drop. This trend continued through 1982, but in 1983 there was a major reduction in the size of the fleet accompanied by a significant increase in tropical tuna cannery deliveries producing a sharp increase in the total productivity index. Because this was accompanied by another decrease in input prices, the FPI improved despite a further decline in output prices. The total productivity index continued to climb through 1984 as the fleet contracted further while aggregate output remained relatively unchanged. Nonetheless, the FPI dropped as output prices fell and input prices remained about the same. Another significant reduction in the size of the fleet during 1985, with little change in cannery deliveries, led to an increase in total factor productivity. However, this occurrence together with a drop in input prices did not offset the decrease in output prices; hence the decline in the FPI.

The changes in the indexes over the 1979-85 period are not unexpected given the developments in international supply and expansion of the fishery into more productive grounds. Exvessel prices have been depressed as the supply of raw tuna has increased, and at the same time input prices have remained relatively steady. This compels individual vessels to improve productivity to maintain overall performance, or leave the fishery. On a fleetwide basis, this is probably reflected by the total factor productivity index for 1983, the year in which there was a major push by the U.S. fleet into the Western Pacific, a significant increase in cannery deliveries, and a substantial decrease in the number of active vessels.

## ACKNOWLEDGEMENTS

The authors wish to express their appreciation to the U.S. tuna industry for its continuing support. Their assistance through voluntary reporting of data made this report possible.

Sincere appreciation is also extended to Earl C. Weber, Southwest Fisheries Center, and to Steven T. Brown and Richard A. Deering, Southwest Regional Office, for their assistance in the preparation of this report.
