#### Sea Level Variations for the United States

#### 1855 - 1986

#### Stephen D. Lyles Leonard E. Hickman, Jr. Henry A. Debaugh, Jr.

#### ABSTRACT.

Relative apparent secular sea level trends, their standard errors, and annual variabilities are computed for 78 United States longterm control stations. The computations are for the entire length of series at each station and for the common series length, 1950 through 1986. Graphs of both monthly and yearly mean sea level are depicted for the individual stations. Monthly and yearly mean sea level data are tabulated for the entire length of series at the 78 stations.

#### 1. INTRODUCTION

This report constitutes a reintroduction of a former NOAA publication on sea level variations for the United States (Hicks, et al., 1983). Since 1983, the report has been expanded to include data gathered through 1986 and data gathered from 11 additional stations.

The purpose of this report is to provide a statistical, graphic, and numerical description of relative apparent secular sea level variations for the United States from 1855-1986. It is directed toward the fields of physical oceanography for tidal datum evaluations; geological oceanography and coastal engineering for coastal processes investigations; meteorology, climatology, and hydrology for climate monitoring; and geology, tectonophysics, and geophysics for vertical land movement studies.

The report includes: (1) computations of relative apparent secular trend and yearly variability at each station; (2) graphs of monthly mean sea level for each station averaged for the present National Tidal Datum Epoch, 1960 to 1978; (3) superimposed graphs for the most recent year of monthly mean sea level; (4) graphs of yearly mean sea level for each station; (5) graphs of monthly mean sea level for 1982 and 1983 to show the effects of the El Nino on the West Coast, Alaska, and Pacific Islands; and (6) the tabulation of all monthly and yearly mean sea level values used in the study. The scope of the presentation is limited to: (1) the marine coasts of the United States, Puerto Rico, U.S. trust territories in the Pacific, and Bermuda; (2) observations from National Ocean Service tide stations; (3) observational series that began prior to 1960 and that have relatively few and short breaks; and (4) computed monthly and yearly mean sea level.

Sea level variations over geological time spans leading up to the present measurement series are given by Fairbridge (1962) and by Milliam and Emery (1968). Lucid summaries are in Fairbridge (1960) and Emery (1969).

An analysis of recent global sea level trends can be found in Emery (1980); Etkins and Epstein (1982); Gornitz, et al. (1982); and Barnett (1984). A study on predicted future sea level trends can be found in Hoffman, et al. (1983).

2. DATA AND SERIES

Yearly mean sea level is the arithmetic mean of a calendar year of hourly heights. The hourly heights were either scaled directly from a marigram or obtained from the digital output of an analog tide gage at each tide station. The tide gage, usually located on a pier, continuously measures sea level heights relative to the land adjacent to the station location. A tide staff at the gage site is connected to bench marks on the adjacent land by precise second-order Class I leveling. The bench marks are located in bedrock whenever possible.

Table 1 lists the long-term control tide stations used in this study by number, name, and location (latitude and longitude). They are all operated by the National Ocean Service. Of the 78 stations, 46 were in operation before 1940 and have had very few and short breaks in their measurement series. Table 2 lists the 78 station locations and the first complete year of each series. San Francisco dates from 1855 (Smith, 1980), and New York, Fernandina, and Seattle date from 1856, 1898, and 1899, respectively. Where the length of a break in a series is sufficient to invalidate a yearly mean, the missing year is also listed.

Periodic reviews are undertaken in an effort to provide users with the most accurate data sets possible. Since the last report, monthly means at three stations were adjusted to reflect changes due to undocumented datum shifts. The monthly mean values will differ from those listed in the 1983 edition of this report for the stations and time periods indicated below.

## Table 2. Trends and variability, station list (cont'd).

f Berth 60. g 1945-69, Avila Beach; 1970-86, Port San Luis, CA. h 1855-1877, Fort Point; 1877-1897, Sausalito (2 locations); 1897-1986, The Presidio (2 locations).

#### 3. TRENDS AND VARIABILITY

Table 3 gives the relative apparent secular trend, its standard error, and variability for the entire length of the series at each station. Relative apparent secular trend is represented by the slope of a leastsquares line of regression through the yearly means. About 95 percent of repeated calculations of apparent secular trend will differ by less than twice the standard error of trend, and practically all repeated calculations will differ by less than three times the standard error of trend.

Variability is represented by the standard error of estimate, which is the standard deviation from the line of regression. About two-thirds of yearly mean sea level values will differ from the straight line of regression by less than the variability (standard error of estimate). About 95 percent of the yearly mean sea level values will differ from the line by less than twice the variability, and practically all the values will differ by less than three times the variability.

Table 4 gives the same statistical values for the common series 1950 through 1986. The date 1950 was chosen in order to give as long a series as possible that would be common to most stations, and at the same time, include a sufficient number of stations for a representative coverage of the coast. The formulae used to compute the values in Tables 3 and 4 are given in Appendix D. Table 3 should be used for the best values at each station; Table 4, for comparing stations.

<sup>a</sup> Standard Error of Estimate.

### 4. STATION GRAPHS AND DATA VALUES

All sea level data for the 78 tide stations were obtained from historic summaries of each tide station. These data were entered into a Data Base Management System (DBMS), "System 2000" by SASS, resident on a Univac 1180 computer. All graphs and tables in Appendices A through C were generated from this data source. Data for the graphs were reformatted and the graphs themselves were produced using the "DISSPLA" graphics package by Computer Associates. All tables in Appendix C were produced using the report facility of the DBMS.

Two graphs for each of the 78 tide stations are given in Appendix A. Zero of the ordinate is the mean sea level of the station for the 1960 to 1978 tidal epoch. The first graph shows the series average of monthly mean sea level (dotted) for the 1960 to 1978 tidal epoch and a superimposed curve (solid) of the most recent year of monthly mean sea levels. The second graph is yearly mean sea level against time. The values are connected by straight lines.

Graphs of monthly mean sea level for the years 1982 and 1983 for the West Coast, Alaska, and the Pacific Island stations are in Appendix B. These additional years were plotted to show the effect of the 1982-83 El Nino on mean sea level.

All monthly and yearly mean sea level data from the 78 stations are listed in Appendix C. The numerical values are referenced to staff zero, the local datum at each station location.

#### 5. ACKNOWLEDGMENTS

The authors thank the following individuals for their contributions to the study and document: Raymond A. Smith for the computation of the tidal summaries and review of the leveling information for 1986, Douglas M. Martin for the verification of the tidal summaries, Kevin Mulheron for data entry, Stephen K. Gill and James R. Hubbard for their technical expertise and support, Wendy E. Hudson for editorial review, and Pauly Plunkett for typing the document. Appreciation is also expressed to the present and past members of the Sea and Lake Levels Branch for their care and competence in the measurement, processing, reduction, and summation of the sea level data.

## APPENDIX D

## Formulae for Calculating Trends and Variability

.

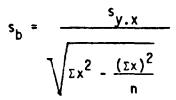

Slope of a least-squares line of regression:

$$b = \frac{\sum xy - \frac{(\sum x)(\sum y)}{n}}{\sum x^2 - \frac{(\sum x)^2}{n}}$$

Where x = date,

y = height of yearly mean sea level, and n = number of yearly mean sea-level values.

Standard Error of Slope:

Where  $s_{y,x}$  = Standard Error Estimate.

Standard Error of Estimate (standard deviation from line of regression):

$$s_{y.x} = \sqrt{\frac{\Sigma y^2 - \frac{(\Sigma y)^2}{n} - b\left(\Sigma xy - \frac{(\Sigma x)(\Sigma y)}{n}\right)}{n - 2}}$$
