FOREWORD

This publication is a supplement to the NODC publication M-2, Processing Physical and Chemical Data from Oceanographic Stations, Part I, Coding and Keypunching, and describes the provisional procedures developed by the National Oceanographic Data Center (NODC) for coding and cardpunching station data obtained with continuous measuring devices. It is hoped that originators of electronically obtained serial data will be encouraged to submit their data to the NODC on the interim coding form devised for this purpose.

INTRODUCTION

Over the past several years, a significant number of institutions have begun sampling oceanic areas by using continuous measuring devices which yield values of depth, temperature, salinity, and sound velocity. In addition, a program is now being developed by the U. S. Naval Oceanographic Office (NAVOCEANO) to measure ambient light on a continuous basis. The devices used in taking these types of measurements are generally referred to as STD (salinity, temperature, depth) systems. The letters <u>STD</u>, however, already are used in the NODC station data system to identify values at standard depths. In order to avoid confusion, the letters <u>DTS</u> will be used in this publication when referring to the continuous measuring instrumentation.

Although the use of DTS systems is at this time still in an experimental stage, the oceanographic community has already compiled several hundred stations by this means. Indications are that during the next year, several thousand such stations will be taken by both foreign and domestic institutions; within the next several years, the volume of observations made with DTS systems may reach tens of thousands.

The National Oceanographic Data Center (NODC) feels that for future output from these systems, considerable thought must be given to the possible implementation of computer techniques for data selection, processing, storage and retrieval, and data analysis. To meet the present and near future needs, the NODC has designed a form for reporting DTS data. It should be emphasized, however, that the form developed thus far is considered provisional and meets only the immediate needs of the oceanographic community.

This publication presents the form used for reporting DTS data to the NODC and outlines the coding and cardpunching instructions associated with the form. As can be seen from Appendix I, the form is very similar to the standard "Physical and Chemical Data Form for Oceanographic Stations" associated with the NODC station data processing system. This similarity is intentional for the purpose of merging DTS data with the results of standard Nansen bottle casts when desired.

Appendix II is an example of a publication listing of DTS data. For expediency, the listing scheme currently used to list Nansen bottle data is used to list DTS data. As a result, the letters <u>DTS</u> and the values for ambient light and measured sound velocity do not appear as discrete blocks of type on the listing. Spaces originally intended to separate fields when listing Nansen bottle data occur between the <u>T</u> and <u>S</u> in DTS, between the unit and tenths position in ambient light, and between the hundred and tens position in measured sound velocity.

I

In answer to the question as to how much data from each station should be recorded, the NODC recommends that all standard depth values and significant flexure point values be reported (see page 3). In the event that data are not recorded for any of the standard depths listed in Table 1, these values will be interpolated using the same formulas currently used for Nansen cast data and will be based on the observed points immediately above and below the standard depth for which a value is required.

The NODC welcomes suggestions and comments concerning material in this publication as well as desired features of a DTS data storage and retrieval system.

GENERAL INFORMATION

This interim publication is issued as a supplement to the NODC publication M-2, <u>Processing Physical and Chemical Data from Oceano-</u> <u>graphic Stations, Part I, Coding and Keypunching</u>. The instructions pertain only to those data fields appearing in Appendix I, "Form for Reporting Electronically Obtained Serial Data," which <u>do not</u> appear on the "Physical and Chemical Form for Oceanographic Stations," NODC-EXP-3167/25(3-64). Publication M-2 should be referred to for coding and cardpunching data fields common to both formats.

When being lowered or raised, all DTS sensors of which the NODC has knowledge provide completely separate records. A comparison of these records normally reveals significant changes in the structure of the water column, even when the time interval between lowering and raising the sensor is small. For this reason, the NODC will process data from the down and up casts as separate stations, even though the position remains relatively unchanged. The meteorological data observed at the station need to be recorded only once, preferably with the data obtained when the sensor is lowered. Sufficient identification entries, such as location, date, time, station number, and cast, must be made on the form for reporting the data obtained when the sensor is raised.

For reporting the observed data from DTS systems on Appendix I, the NODC recommends that all values be reported for the standard depths given in Table 1. In addition, sufficient flexure point values should be included to adequately describe the vertical structure of the water column.

INSTRUCTIONS FOR CODING THE MASTER CARD INFORMATION (See Appendix I)

Columns 1-41

Code according to instructions in NODC publication M-2, part I.

 Columns 42-44
 DTS INDICATOR

No entry is required on the coding form.

Column 45

CAST

The entry in this field indicates whether the data were taken while lowering (D) or raising (U) the DTS sensor. Cross out the letter that <u>does not</u> apply.

Columns 46-64

Code according to instructions in NODC publication M-2, Part I. <u>Columns 65-66</u> INSTRUMENT

Enter the identifying code of the instrument package or device used according to Table 2. If Table 2 does not include this information, record the complete name of the instrument in the Remarks space of the coding form.

Columns 67-80

Code according to instructions in NODC publication M-2, part I.

INSTRUCTIONS FOR CODING THE DETAIL CARD INFORMATION

Columns 1-24 are omitted from the coding form. The entries for these columns on the Detail Card are identical in those of the Master Card.

<u>Columns 25-27</u> Data collected when lowering and raising the sensor are processed at the NODC as separate stations. See General Information, page 3.

CAST TIME

Enter hours and tenths of hours in GMT to show the beginning time of lowering or raising the sensor.

DURATION OF CAST

Enter in hours and tenths of hours the time interval required to lower or raise the sensor.

Columns 28-32

DEPTH OF SAMPLE

Enter depth of sample in meters in Columns 28-31. (When sample depths are greater than 9999 meters, enter the extra digit in Column 28.) Column 32 may be used to enter tenths of a meter or to enter a question mark for doubtful depths.

Columns 33-42

Code according to instructions in NODC publication M-2, part I.

Columns 43-49 do not appear on the coding form. On the punch card, these columns are reserved for computed sigma-t (ot) and computed sound velocity $(V_{\rm f})$.

Columns 51-53

Code according to instructions in NODC publication M-2, part I.

Columns 54-58

AMBIENT LIGHT

Enter ambient light in lumens and tenths of lumens. If measured in whole lumens, leave Column 58 blank.

Columns 59-66

No entries required.

Columns 67-71

SOUND VELOCITY

Enter measured sound velocity in meters and tenths of meters per second. Enter thousands, hundreds, tens, units, and tenths digits.

Columns 72-79 are omitted from the data form. The entries in these columns of the Detail Card are identical to the entries in the Master Card; the information must be reproduced in each Detail Card from the Master Card.

Column 80

CARD TYPE

No entry is required on the coding form.

INSTRUCTIONS FOR CARDPUNCHING DTS DATA

The form for reporting electronically obtained serial data is arranged in such a manner that most entries can be punched directly into the corresponding columns of the punch card.

The following card punching instructions are only for those fields of the "Form for Reporting Electronically Obtained Serial Data" which are not covered in the NODC publication M-2, part I; for further instructions, refer to that publication.

MASTER CARD

Entry on Data Form

- Letters DTS in Columns 42, 43, and 44.
- Letter U crossed out in Column 45.

Letter D crossed out in Column 45.

Entry on Punch Card

- Letters DTS punched in Columns 42, 43, and 44.
- Letter <u>D</u> punched in Column 45.
- Letter U punched in Column 45.

DETAIL CARD

Entry on Data Form

"Cast Time" in Columns 25-27 at first (zero meter) depth level.

"Duration of Cast" in Columns 25-27 at third depth level.

Digits entered under "Ambient Light," Columns 54-58.

Digits entered under "Sound Velocity," Columns 67-71.

Numeral 3 entered in Column 80.

Entry on Punch Card

Punch digits as entered in first Detail Card in Columns 25-27.

Punch digits as entered in third Detail Card in Columns 25-27.

- Punch digits as entered in Columns 54-58.
- Punch digits as entered in Columns 67-71.

Punch as entered in Column 80.
