Abstract

In support of marine monitoring measurement programs, NIST, in cooperation with the NOAA National Status and Trends Program (NS&T), conducts yearly interlaboratory comparison exercises to provide one mechanism for participating laboratories/monitoring programs to evaluate the quality and comparability of their performance in measuring selected organic contaminants in environmental samples. In this report, results of the 1998 exercises of the NIST/NOAA NS&T Intercomparison Exercise Program for Organic Contaminants in the Marine Environment are described in which selected polychlorinated biphenyl (PCB) congeners, chlorinated pesticides, and polycyclic aromatic hydrocarbons (PAHs) were determined in Mussel Tissue Homogenate IX and Marine Sediment VIII exercise materials. The analytical methods used by each participating laboratory in this performance-based program are summarized.

Introduction

The preparation and distribution of two materials, Mussel Tissue IX (QA98TIS9) and Marine Sediment VIII (QA98SED8), used in interlaboratory comparison exercises of 1998 for the NIST/NOAA NS&T Organics Quality Assurance Program and the NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment and the results of these exercises are described in this report. The analytical methods used by each participating laboratory are summarized.

Tools and mechanisms for the assessment of data produced by laboratories providing environmental analyses are critical because decision-making based on inaccurate results or data of unknown quality can have significant economic and health consequences. NIST provides a variety of activities in support of environmental monitoring programs for organic contaminants. The largest of these programs was initiated and funded in part for the past twelve years by the NOAA National Status and Trends (NS&T) Marine Monitoring Program [1,2,3]. The EPA Environmental Monitoring and Assessment Program (EMAP) participated in the existing NIST/NOAA NS&T effort for a number of years. For this program, NIST efforts focus on providing mechanisms for assessing the interlaboratory and temporal comparability of data, and on improving measurements for the monitoring of organic contaminants such as polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyl (PCB) congeners, and chlorinated pesticides in bivalve, sediment, and fish samples. This program includes the development of improved analytical methods, production of needed NIST Standard Reference Materials (SRMs) and other control materials, conduct of annual interlaboratory comparison exercises, and the coordination of workshops to discuss the results of these exercises and to provide a forum for cooperative problem-solving efforts by participants. Since 1993, private sector and other laboratories that cannot be accommodated under the NOAA, EPA, and NIST funding have reimbursed NIST for participation costs and have participated in these exercises and workshops as part of the NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment. Current participants represent multi-laboratory monitoring programs as well as a number of individual programs, and include federal, state/municipal, university/college, private sector, and international laboratories. In this performance-based program, each participating laboratory uses the methods currently being used by that laboratory for analysis of similar materials for its program customers. The target analytes are listed in Table 1.

For the annual intercomparison exercises, samples of two natural-matrix-based homogeneous materials derived from the marine environment that have not been fortified with any of the target analytes are analyzed by the participating laboratories. Typical materials, such as mussel or fish tissue homogenates or wetted marine sediment, have target contaminant levels in the 1ng/g to 15000 ng/g range.

Numerical indices (z- and p-scores) are used to assess and track laboratory performance (for accuracy and precision, respectively) and to provide a mechanism for assessing the comparability of data being produced by the participating laboratories for over 60 target analytes and percent moisture.

Sources and Preparation of Materials used in 1998 Intercomparison Exercises

Marine Sediment VIII. Marine Sediment VIII was prepared from Certified Reference Material (CRM) PACS-2 (Marine Sediment Reference Material for Trace Elements and Other Constituents, National Research Council of Canada), a marine sediment that was collected from Esquimalt harbor in British Columbia and has been freeze-dried, passed through a No. 120 (125 μm) screen, blended, bottled, and radiation sterilized (2.5 Mrad). The sediment material was issued as a wet sediment to more closely match the matrix of wet sediments routinely analyzed by the laboratories.

Clear, 2-oz, wide-mouth, glass bottles were rinsed with deionized water, thermally cleaned at 500 °C for 18 h in a ventilated oven, cooled, capped, and labeled. Each label contained the material's name and code (Marine Sediment VIII, QA98SED8) as well as an individual bottle number. The Teflon liners of the phenolic screw caps had been removed from the caps, cleaned with hexane, dried, and reinserted in the caps. A calibrated toploader balance (resolution of 0.01 g) was used for weighing the PACS-2 sediment and water. For each sample, 11.00 g of PACS-2 sediment (as received) was weighed into a tared bottle. The bottle was then capped and stored in the dark at room temperature. Approximately four days before samples were to be shipped to laboratories participating in the intercomparison exercise, 9.0 g of HPLC-grade water were added by pipet to each tared bottle of sediment. (Preliminary trials had shown that a minimum of 9 g of water would moisten 11 g of this sediment.) The mass of sediment and water in each bottle were recorded. Each sample was "tilted" by hand until no "dry" sediment was visible. Only a very small amount of water was observed on the top of the wet sediment. After 24 h at room temperature (in the dark), followed by approximately 4 h at -20 °C, each bottle of material was stored at -80 °C until shipped. The bottles were never inverted until the wet samples had been frozen in the bottom of the bottles. The material was not enriched or spiked with any of the analytes of interest in this intercomparison exercise.

Summary statistics of preparation of Marine Sediment VIII:

	<u>PACS-2</u>	<u>HPLC water</u>
mean, g	11.00	9.04
median, g	11.00	9.03
number	168	168
standard deviation, g	0.00	0.06
relative standard deviation (as %)	0.00	0.66
95% confidence level, g	0.00	0.01
minimum, g	11.00	9.00
maximum, g	11.00	9.32

Mussel Tissue IX. Mussel Tissue IX was the same material as Mussel Tissue IV (QA92TIS4) used as the 1992 exercise material [3]. The bottles of Mussel Tissue IV were emptied into new precleaned (same procedure as for the sediment), prelabeled (Mussel Tissue IX, QA98TIS9 with individual bottle numbers), precooled (-80 °C) bottles. This sample is a cryogenically homogenized “fresh” material prepared from mussels collected in Boston Harbor in February 1992.

Each of the three bottles sent to each participant contained approximately 17 g (wet basis) of Mussel Tissue IX. This frozen mussel tissue homogenate material had not been enriched or spiked. Each 2-oz glass bottle had a Teflon-lined screw cap and was labeled with an individual bottle number as well as the material’s name and code (Mussel Tissue IX, QA98TIS9).

Percent Moisture Determinations

Marine Sediment VIII. Each bottle of Marine Sediment VIII, as prepared, contained 11.00 g of PACS-2 sediment plus 9.04 g (see preparation statistics above) of HPLC water. For the purposes of this exercise, the calculated value for the percent water in the Marine Sediment VIII samples is based on the mean of 9.04 g of water added to each bottle because the variability of the water mass added (0.66%) is much smaller than the expected analytical variability. For evaluation of exercise results, the NIST assigned value for moisture content in Marine Sediment VIII (with the uncertainty expressed as the 95% confidence interval) is:

$$\text{NIST}_{\text{assigned value}} = 45.08\% \pm 0.02\% \text{ moisture.}$$

Mussel Tissue IX. The assigned value for the moisture content of Mussel Tissue IX based on the results received from the 31 laboratories that participated is (no outliers):

$$\text{Exercise}_{\text{assigned value}} = 91.4\% \pm 0.5\% \text{ moisture.}$$

This compared favorably to the exercise assigned value of $91.8 \pm 0.3\%$ moisture for Mussel Tissue IV reported at the 1993 QA meeting.

Storage and Distribution of Materials

Each bottle of Marine Sediment VIII and Mussel Tissue IX material was stored at -80 °C until shipped via overnight delivery to participating laboratories. Instructions for the storage and use of the exercise material and a diskette with files for electronic submission of data were included with each set of material shipped. These instructions are shown in Appendices A and B. Samples of each of these materials have been archived in the National Biomonitoring Specimen Bank at NIST.

Each laboratory participating in these intercomparison exercises was sent the following by overnight delivery:

Exercise 1: Mussel Tissue IX (QA98TIS9)

Three bottles of Mussel Tissue IX material (shipped on dry ice)
Description of the materials and storage/use/reporting instructions for the exercise (See Appendix A.)
Data diskette with files for the reporting of results

Exercise 2: Marine Sediment VIII (QA98SED8)

Three bottles of Marine Sediment VIII material (shipped on dry ice)
Description of the materials and storage/use/reporting instructions for the exercise (See Appendix B.)
Data diskette with files for the reporting of results

In the letter accompanying each shipment each participant was asked to analyze each of three replicate samples in a separate batch/set/string/catalog in order to provide a more realistic assessment of laboratory precision and, if possible, to concurrently analyze NIST SRM 1974a, Organics in Mussel Tissue, [4] with Mussel Tissue IX and NIST SRM 1941a, Organics in Marine Sediment, [5] with Marine Sediment VIII. Laboratories were requested to submit results for these exercises by November 1, 1998.

Evaluation of Exercise Results

Establishment of the Assigned Values

The following guidelines were used by the NIST exercise coordinators for the establishment of the exercise "Assigned Values" for these two exercises. In essence, the laboratory's performance on concurrent reference material analyses was used to determine if that laboratory's results would be included in the calculation of the exercise assigned value for the unknown material for a particular analyte. The results reported for the unknown materials from laboratories that did not report results for the reference materials were not used in these calculations. After the exercise assigned values, standard deviations, and 95% confidence limits had been calculated, **all** reported results for the Mussel IX and Sediment VIII materials were evaluated relative to these exercise "assigned values."

Laboratory data submission: Each participating laboratory was to submit data from three replicate determinations of the "unknown" materials (Mussel IX and Sediment VIII) and were requested to report results of concurrent analyses of SRM 1974a, a mussel tissue homogenate reference material, and SRM 1941a, a marine sediment reference material. Laboratories were requested to report these results to three significant figures, and brief descriptions of their extraction, cleanup, and analytical procedures.

Determination of laboratory analyte means: For each laboratory, the laboratory analyte mean of

the three sample results (S1, S2, and S3) was calculated for each analyte. Non-numerical data were treated as follows: A mean "<value" was used when three "<values" were reported; NA (not analyzed/determined) was used for three reported NA's, etc.; and, if the reported results were of mixed type, e.g., S1 and S2 were numerical values and S3 was reported as "<value", the two similar "types" were used to either determine the mean or to set a non-numerical descriptor.

Determination of assigned values: For a particular analyte, the performance on the reference material was deemed acceptable for the purpose of this exercise if the laboratory result was within 30% of the confidence interval for analytes listed in the Certificates of Analysis for SRM 1941a and SRM 1974a. For each analyte of interest not certified in these materials, a "target" concentration and the associated uncertainty were calculated. The targets for SRM 1941a were based on noncertified concentrations in SRM 1941a, results of the 1992 Sediment III exercise in which SRM 1941a was used as the "unknown material," and exercise results when SRM 1941a was used as a control. Similarly, the targets for SRM 1974a were based on noncertified concentrations in SRM 1974a, results of the 1993 Tissue V exercise in which SRM 1974a was used as the "unknown material," and exercise results when SRM 1974a was used as a control. Laboratory results within target upper and lower limits, typically 30% to 40%, of these concentrations were deemed acceptable for this exercise. If a laboratory demonstrated acceptable performance on a particular analyte in the reference material, that laboratory's results for that analyte in the corresponding "unknown" exercise material was then used in the calculation of the analyte's exercise assigned value unless it was deemed an "outlier." For evaluation of potential outliers, statistical tests and expert analyst judgement were used after viewing both normal and log plots of the data. This judgement utilized knowledge of potential coeluters based on the laboratory's reported methods. In instances in which the analyte concentration was below the detection limit of most participating laboratories, no exercise assigned value was calculated. In data sets such as this with a number of laboratories reporting results as "not detected" at various detection limits, there is no consensus as to what "numerical" value should be assigned to these results in the computation of grand means, etc., e.g., "0," ½ Detection Limit (DL), and the DL value itself have all been used and the choice is influenced by the use of the particular data set. (Note: Because Lab 32 reported results after the meeting, their results were not included in the calculation of the exercise assigned values.)

For the 1998 exercises, NIST-Gaithersburg (Lab 1) used pressurized fluid extraction. (See Appendices G and H for summaries of methods used.) NIST- Gaithersburg used two different columns of different selectivity for the analysis of the PAHs using gas chromatography with mass spectrometric detection for both exercise materials and HPLC with fluorescence detection for the determination of the PAHs in Sediment VIII. NIST-Gaithersburg utilized gas chromatography with electron capture detection and gas chromatography with mass spectrographic detection to determine the PCB congeners and chlorinated pesticides in both exercise materials. Schantz et al. have reported results of the validation of these methods with NIST and European Bureau of Community Reference (BCR) reference materials [6] and a comparison of Soxhlet extraction and pressurized fluid extraction for a number of sediment, tissue, dust, and particulate matter certified reference materials [7].

Reported Results

Laboratories were assigned numerical identification codes in order of receipt of data with the exception of NIST-Gaithersburg, which is Laboratory 1 in these exercises. A laboratory was assigned the same code for each material. In this report, the triplicate results as reported by the laboratories for both the exercise materials and the two SRMs are shown in Appendix C (Mussel Tissue IX) and Appendix D (Sediment VIII) along with reference values for each of the materials and performance scores [numerical indicators of accuracy (bias) and precision (reproducibility)]. The laboratory mean replicate data are shown in Tables 2 to 4 and Tables 5 to 7 for the Mussel Tissue IX and Sediment VIII materials, respectively. Included in the means tables are the exercise assigned values, the standard deviation of the assigned value, the percent relative standard deviation (%RSD), and the calculated 95% confidence limit of the assigned value for the percent water, PAHs, chlorinated pesticides, and PCB congeners as applicable. Figures 1 to 6 show charts of the mean concentrations of reported numerical results by laboratory for the PAHs, pesticides, and PCB congeners, respectively, in Tissue IX and Sediment VIII. Notes included by a laboratory with its data are listed in Appendices E (Mussel Tissue IX) and F (Sediment VIII). Summaries of the methods used by each laboratory are in Appendices G (Mussel Tissue IX) and H (Sediment VIII).

In Appendices I (Mussel Tissue IX) and J (Sediment VIII), charts of the mean reported numerical results by laboratory for **each analyte** are shown for the exercise material and the corresponding reference material except in those instances in which the majority of laboratories reported non-quantitative results.

Performance Scores

The exercise coordinators recognize that different programs have different data quality needs. The acceptability of the results submitted by a particular laboratory will be decided by the individual program(s) for which the particular laboratory provides data. Typically, the program will use these exercise results in conjunction with the laboratory's performance in the analysis of certified reference materials and/or control materials, and of other quality assurance samples. These exercise results are shown in a number of ways in this report to facilitate their use by these programs in their acceptability assessments.

IUPAC guidelines [8] describe the use of z-scores and p-scores for assessment of accuracy and precision in intercomparison exercises such as those described in this report. These indices assess the difference between the result of the laboratory and the exercise assigned value and can be used, with caution, to compare performance on different analytes and on different materials.

Accuracy Assessment (z-score)

$$\text{z-score} = \frac{\text{bias estimate}}{\text{performance criterion}}$$

$$z = \frac{(x - \bar{X})}{\sigma}$$

where x is the individual laboratory result, \bar{X} is the "Exercise Assigned Value," and σ is the target value for standard deviation.

As described in the IUPAC guidelines, the choice of σ is dependent upon data quality objectives of a particular program. It can be "fixed" and arrived at by perception, prescription, or reference to validated methodology (e.g., $\sigma = 0.125 X$, X is the analyte concentration), or it can be an estimate of the actual variation (e.g., the calculated s from the exercise data). The "fixed" performance criterion is more useful in the comparison of a laboratory's performance on different materials while the use of the actual variation may be more useful within a given exercise, for example, if the determination of a particular analyte is more problematic than usual.

We have calculated and reported z-scores using both approaches for each analyte for each laboratory. At a previous workshop, it was decided to use "25% of the exercise assigned value" as the fixed target value for standard deviation for this program, at least for a few years. We also calculated z-scores based on "one assigned-value standard deviation." The z-scores calculated for these exercises can thus be interpreted as shown in the following examples:

z-score (25% X):

- +1 \Rightarrow laboratory result is 25% higher than the assigned value
- 2 \Rightarrow laboratory result is 50% lower than the assigned value

z-score (s):

- +1 \Rightarrow laboratory result is one "exercise standard deviation" higher than the assigned value
- 2 \Rightarrow laboratory result is "two exercise standard deviations" lower than the assigned value

From a scientific point of view, IUPAC does not recommend the classification of z-scores but allows that it is possible to classify scores, e.g.:

$ z \leq 2$	Satisfactory
$2 < z < 3$	Questionable
$ z \geq 3$	Unsatisfactory

The Tables in Appendices C (Tissue IX) and D (Sediment VIII) show the calculated z-scores for

each laboratory for each reported analyte. These tables of the results and performance include a summary of the number of reported analytes that fall within each category for each laboratory. Figures 7 to 9 (Tissue IX) and 10 to 12 (Sediment VIII) show the distribution of z-scores (25%) by analyte. Figures 13 to 15 (Tissue IX) and 16 to 18 (Sediment VIII) show the z-scores (25%) by laboratory that are useful for assessing intra- and interlaboratory bias trends and relative performance for the three chemical classes.

Precision Assessment (p-score)

$$p = \frac{\sigma_{lab}}{\sigma_{target}} = \frac{CV_{lab}}{CV_{target}}$$

Prior to the 1994 exercises, participating laboratories typically analyzed the three replicate samples for an exercise with the same sample set, i.e., within one set of samples with the same blank, calibration curve, etc. being applicable for each. Since the repeatability for replicates within a set is generally better than for replicates in different sets, this does not result in data that is very useful for precision (repeatability) assessment. Since 1994, laboratories have been requested to process each replicate in a different sample set for precision assessment. For the calculation of p-scores for this program, the current target CV for the three replicates is 15%.

The Tables in Appendices C (Tissue IX) and D (Sediment VIII) show the calculated p-scores for each laboratory for each reported analyte.

Discussion

These results were discussed at the QA workshop that was held February 2, 1999 in Richmond, CA.

The PAH, chlorinated pesticide, and PCB congener concentrations in the 1998 Tissue IX are compared to the exercise assigned concentrations for Mussel Tissue IV (QA92TIS4) since they are the same material just relabeled.

Comparison of Consensus Means and Standard Deviations (ng/g dry basis) for Mussel Tissue Analyzed as QA92TIS4 and QA98TISIX

Compound	QA92TIS4	QA98TISIX
<i>PAHs</i>	<i>14 labs</i>	<i>20 labs</i>
Naphthalene	25.1 (5.7)	25.7 (6.2)

% Water	91.8 (0.3)	91.4 (1.04)

The agreement between the consensus means determined in 1992 and this year is good with an overlap of the ranges defined by the mean and one standard deviation for all of the compounds. For the PAHs, the largest differences between the two consensus means are for biphenyl and 2,6-dimethylnaphthalene. For both of these compounds, there were laboratories in the 1992 exercise that reported data close to the means that are being reported in the 1998 exercise. The same is true for 2,4'-DDE, dieldrin, and PCB 206, the two pesticides and one of the PCBs with the largest differences. For the other PCB with a large difference, PCB 180, there is a group of 12 results in the 1998 exercise that centers around the consensus mean determined in 1992 giving a mean of 9.75 ng/g dry basis with a standard deviation of 2.31 ng/g dry basis. Since there are four additional laboratories, however, that are in close agreement with each other and that had results for SRM 1974a that were within the 30% criterion, the 16 results were used for the consensus mean and standard deviation, 15.5 ng/g (11.0 ng/g) dry basis, shown above.

For the analytes of interest, the PAH concentrations in Marine Sediment VIII range from 27 ng/g dry basis to 2100 ng/g dry basis. The pesticide concentrations range from below the detection limits of the methods used to 20 ng/g dry basis while the PCB concentrations range from 2 ng/g dry basis to 50 ng/g dry basis. The concentration range for the PAHs is similar to that found in SRM 1941a, also a harbor sediment; however, the concentrations for the individual PAHs vary between the two sediments with SRM 1941a having higher concentrations for the naphthalenes and Marine Sediment VIII having higher concentrations for phenanthrene, fluoranthene, pyrene, and some of the other higher molecular weight PAHs. The pesticide concentrations in Marine Sediment VIII are generally higher than SRM 1941a except for the hexachlorobenzene concentration, which is 70 ng/g dry basis in SRM 1941a and <3 ng/g dry basis in Marine Sediment VIII. The 4,4'-DDT and 4,4'-DDD concentrations are higher in Marine Sediment VIII, while the 4,4'-DDE concentration is comparable in the two sediments. The PCB concentrations are generally higher in Marine Sediment VIII than in SRM 1941a.

For the 1998 exercises, the data provided in the various figures and tables of this report can be used for assessing the comparability of results of over 60 analytes of interest in this program and the performance of an individual laboratory. Summaries of the numbers of z-scores and p-scores by category for each laboratory are shown in Tables 8 and 9 (Tissue VIII z-scores), 10 and 11 (Sediment VII z-scores), 12 (Tissue VIII p-scores), and 13 (Sediment VII p-scores). Summaries of the median of the absolute z- and p-scores by laboratory are shown in Tables 14 and 15. For both the sediment and mussel tissue 1998 exercises, the highest percentage of z-scores and p-scores that were in the unsatisfactory category were for the chlorinated pesticides. The chlorinated pesticides were typically present at lower concentrations in both of these materials than the concentrations of the PAHs and PCB congeners. In these exercises, interlaboratory variability is a greater contributor to measurement incomparability than is the intralaboratory variability. Laboratories reporting results of concurrent reference material analyses typically showed better performance than those laboratories who did not analyze the reference materials.

Subgroups of the exercise participants have demonstrated comparability of results for many

analytes within the 0 to 2 z-range based on use of “25% of the analyte concentration” as the performance criterion. This implies that this subgroup can distinguish between two samples that have an analyte concentration difference of 100%. The reported accuracy and reproducibility indices (z- and p-scores, respectively) can be easily converted to conform to the acceptability requirements of a particular program. For example, a z-score based on 25% can be multiplied by two to convert to a z-score based on 12.5% of the analyte concentration.

It is important to evaluate the non-quantitative results reported by each laboratory as well. Although these results are not easily presented or numerically evaluated, they are provided in the various tables of this report that list the mean and individual results of the laboratories. The laboratory and its data users should look closely at these non-quantitative results. For example, one laboratory reported a mean concentration of 16 ng/g of aldrin that has an exercise assigned value of <2 ng/g. Decisions based on false negative or false positive results from a laboratory can lead to significant environmental and/or economic consequences. Some laboratories reported detection limits in these “real” matrix materials that may be too high for the data quality needs of their program(s) and these should be assessed as well.

Intercomparison exercises provide an important mechanism for assessing the comparability, accuracy, and reproducibility of data being produced by the participating laboratories. Exercise materials similar in matrix, form, and analyte concentration to typical samples routinely analyzed by the laboratories are most useful for demonstrating the level of comparability and for revealing potential problem areas.

For the determination of the target compounds in these complex marine matrices with relatively low levels of these analytes, the levels of bias and reproducibility of many of the participating laboratories meet their current acceptability requirements; however, there is certainly room for improvement. Minimizing the between-laboratory bias such that the analytical variability is significantly less than the sampling variability should be an achievable goal.

Acknowledgments

The time and efforts of the analysts and management of the participating laboratories, the partial support of the NOAA National Status and Trends Program (NS&T), and the assistance of the NIST Standard Reference Materials Program and National Research Council of Canada with the procurement and preparation of the exercise materials is very gratefully acknowledged.

Disclaimer

Certain commercial equipment, instruments, or materials are identified in this report to specify adequately the experimental procedure. Such identification does not imply recommendation or endorsement by the National Institute of Standards and Technology, nor does it imply that the materials or equipment identified are the best available for the purpose.

Table 1. (continued)

Polycyclic Aromatic Hydrocarbons (PAHs)

naphthalene	fluoranthene
2-methylnaphthalene	pyrene
1-methylnaphthalene	benz[<i>a</i>]anthracene
biphenyl	chrysene
2,6-dimethylnaphthalene	benzofluoranthenes [<i>b+j+k</i>]
acenaphthylene	benzo[<i>e</i>]pyrene
acenaphthene	benzo[<i>a</i>]pyrene
1,6,7-trimethylnaphthalene	perylene
fluorene	indeno[1,2,3- <i>cd</i>]pyrene
phenanthrene	dibenz[<i>a,h</i>]anthracene
anthracene	benzo[<i>ghi</i>]perylene
1-methylphenanthrene	

^a Please note that the following are typically reported by participants as the sums of the indicated components:

PAH

chrysene + triphenylene
benzo[*b*]- + benzo[*j*]- + benzo[*k*]fluoranthene
dibenz[*a,h*]anthracene + dibenz[*a,c*]anthracene

PCB congeners

PCB 66 + PCB 95^b
PCB 101 + PCB 90
PCB 138 + PCB 163 + PCB 164
PCB 187 + PCB 182 + PCB 159
PCB 170 + PCB 190

^b Because PCB 66 and PCB 95 can now be separated by a significant number of participants, we have changed the table for reporting results so that participants may report these as two separate concentrations or as the sum of PCB 66 and PCB 95.

**Appendix A: Description, Storage, Use, and Reporting Instructions
for Mussel Tissue IX**

**NIST Intercomparison Exercise Program for
Organic Contaminants in the Marine Environment**

NIST/NOAA-NS&T/EPA-EMAP QA Program

**Intercomparison Exercise: Mussel Tissue IX
Description of Materials and Instructions**

Intercomparison Exercise Materials:

QA98TIS9 (Mussel Tissue IX)

Each of the three bottles contains approximately 17 g (wet basis) of Mussel Tissue IX, a frozen mussel tissue homogenate material. The tissue is a cryogenically homogenized "fresh" material still containing its endogenous water. (It has not been freeze-dried.) The material has not been enriched or spiked. Each 2-oz clear glass jar has a Teflon-lined screw cap and is labeled with an individual bottle number as well as the above name.

In addition, three concurrent analyses of SRM 1974a, Organics in Mussel Tissue, are recommended. This frozen mussel tissue is also a cryogenically homogenized "fresh" material still containing its endogenous water. This material can be obtained from the NIST Standard Reference Materials Program (\$417 for 3 bottles each containing approximately 15 g to 20 g [wet basis] of frozen tissue homogenate plus shipping) (phone: 301/975-6776; fax: 301-975-948-3730).

Storage of Materials:

Mussel Tissue IX and SRM 1974a. The tissue material should be stored in the dark at temperatures of -20 °C or lower. If allowed to thaw or if stored for extended periods at temperatures higher than -40°C, it will lose its powder-like form. This material has been stored at NIST at -80 °C and was shipped to you on dry ice. If only a portion of the contents of a jar is used, the jar should be tightly closed immediately after removal of a subsample to preserve the integrity of the remaining material for later analysis.

Instructions for Use:

You are to analyze Mussel Tissue IX and SRM 1974a, using **your** laboratory's and/or program's analytical protocols, for the concentrations (wt/dry wt) of the 22 chlorinated pesticides, 18 polychlorinated biphenyl (PCB) congeners, and 23 polycyclic aromatic hydrocarbon (PAH)

compounds¹ of interest in the current NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment. These compounds are listed in Table 1. Concentrations of these analytes in samples collected near the site of this collection were in the 1 to 500 ng/g dry weight range.

It is best if the Mussel Tissue IX samples and the SRM 1974a material are not allowed to thaw prior to the taking of samples for analysis; however, if the material has been even partially thawed, you should use the contents of the entire jar as a single sample as it is difficult to take representative samples from a jar once the material has thawed. After removing the material for analysis from the jars, the samples should be used without delay.

The percentage of water in the mussel materials should be determined so the results can be reported on a dry basis. You should have received enough material so that you can perform separate determinations for the water content if you typically do not dry your tissue samples prior to analysis.

The amount of material used for each analysis should correspond to the amount of marine bivalve tissue (wet basis) you would typically analyze as prescribed in your protocols. You should analyze three replicate samples of Mussel Tissue IX and at least one, and more if possible, of SRM 1974a in three different batches/sets/strings/catalogs using your protocol for marine bivalve tissue samples. Specifically, we are asking that you analyze one sample of Tissue IX and one sample of SRM 1974a with one batch of laboratory samples; analyze a second sample of each material with another batch; and the third sample with yet another batch. This will allow a more realistic assessment of laboratory precision over a longer term than the assessment obtained when a laboratory places all three samples in the same extraction and cleanup batch and the resulting extracts are analyzed using the same calibration curve, etc.

Reporting of Results:

Please report one result, as if three figures were significant, for each of the requested analytes in each of the three replicates of the Mussel Tissue IX and of the SRM 1974a. Report results in units of ng/g **dry** basis. Report the date of measurement of each sample in the requested m/d/y format. Also, report the results of your percentage water determinations of Mussel Tissue IX and SRM 1974a.

We recognize that the reported concentrations for some of the requested determinands will probably include concentrations of compounds reported to coelute with the determinand of interest with methods commonly in use in environmental laboratories. The more common of these coelutions have been listed in Table 1 and in the data table format shown in Table 2. Please note at the bottom of your table of reported results if any of these listed coelutions are not applicable

¹If your laboratory is not analyzing samples for all three chemical classes, you are expected to submit results only for those compounds in classes currently being determined in your laboratory.

to the data being reported by your laboratory and/or if other coelution qualifiers not listed are applicable to your data. Please note that any changes you make to the column or row headings **within** the tables will **not** be seen by the coordinators because only the table entries and comments at the bottom of the tables are automatically transferred to the exercise database.

We prefer that concentrations be reported for each analyte determined. If the measured concentration is below your typical reporting concentration for an analyte in a particular matrix, you can report the number and list the appropriate detection limit, quantification limit, etc. at the bottom of the data table. However, if you need to report non-numerical data please use the following conventions:

NA	"Not analyzed", "not determined"
<"value"	"Less than specified concentration", e.g., <8 ng/g
Other	"Other"; add note of explanation at end of data table, e.g., interference
DL	"Below detection limit" may be used, however, <"value" is preferable

Do not use negative numbers or parentheses to indicate "less than detection limits".

Since a number of participants expressed an interest in "total extractable organics" (TEO), this has been added to the reporting sheet for the tissues. The organizers realize that the method used to determine TEO will effect the value; therefore, please be specific in describing the method used.

The enclosed floppy diskette (DOS format) contains files, any of which you may utilize to report your data. The files TIS9.WK3 is in a LOTUS format, TIS9.XLS is in an EXCEL format, and TIS9.WQ1 is in a QuatroPro format. A text file TIS9.TXT is also provided. If you have any software/hardware conversion problems, please contact Michele Schantz. The data file templates also include places for you to list the surrogate/internal standards and type of calibration curve used, and to provide a brief description of the analyses. Please **do not** add "spaces" before entering numbers in the table cells. Please **do not** insert any columns or rows **within** the table in the data file. If you wish to include additional data and/or other information or comments, you may add it to the bottom of the data table in the diskette file or send it in hard copy. A printout of the data file format is shown in Table 2.

Submit your results either via diskette file or as an attached file via e-mail to Michele M. Schantz.

heptachlor	4,4'-DDD
heptachlor epoxide	2,4'-DDT
cis-chlordane (alpha-chlordane)	4,4'-DDT
trans-chlordane (gamma-chlordane)	aldrin
oxychlordane	dieldrin
cis-nonachlor	endrin
trans-nonachlor	endosulfan I
mirex	endosulfan II

Polychlorinated Biphenyl Congeners

<i>PCB No.</i>	<i>Compound Name</i>
8	2,4'-dichlorobiphenyl
18	2,2',5-trichlorobiphenyl
28	2,4,4'-trichlorobiphenyl
44	2,2',3,5'-tetrachlorobiphenyl
52	2,2',5,5'-tetrachlorobiphenyl
66	2,3',4,4'-tetrachlorobiphenyl
101	2,2',4,5,5'-pentachlorobiphenyl
105	2,3,3',4,4'-pentachlorobiphenyl
118	2,3',4,4',5-pentachlorobiphenyl
128	2,2',3,3',4,4'-hexachlorobiphenyl
138	2,2',3,4,4',5'-hexachlorobiphenyl
153	2,2',4,4',5,5'-hexachlorobiphenyl
170	2,2',3,3',4,4',5-heptachlorobiphenyl
180	2,2',3,4,4',5,5'-heptachlorobiphenyl
187	2,2',3,4',5,5',6-heptachlorobiphenyl
195	2,2',3,3',4,4',5,6-octachlorobiphenyl
206	2,2',3,3',4,4',5,5',6-nonachlorobiphenyl
209	decachlorobiphenyl

Table 1. (continued)

Polycyclic aromatic hydrocarbons (PAH)

naphthalene	fluoranthene
2-methylnaphthalene	pyrene
1-methylnaphthalene	benz[<i>a</i>]anthracene
biphenyl	chrysene
2,6-dimethylnaphthalene	benzofluoranthenes [<i>b+j+k</i>]
acenaphthylene	benzo[<i>e</i>]pyrene
acenaphthene	benzo[<i>a</i>]pyrene
1,6,7-trimethylnaphthalene	perylene
fluorene	indeno[1,2,3- <i>cd</i>]pyrene
phenanthrene	dibenz[<i>a,h</i>]anthracene
anthracene	benzo[<i>ghi</i>]perylene
1-methylphenanthrene	

^a Please note that the following are typically reported by exercise participants as the sums of the indicated components:

PAH

chrysene + triphenylene
benzo[*b*]- + benzo[*j*]- + benzo[*k*]fluoranthene
dibenz[*a,h*]anthracene + dibenz[*a,c*]anthracene

PCB congeners

PCB 66 + PCB 95^b
PCB 101 + PCB 90
PCB 138 + PCB 163 + PCB 164
PCB 187 + PCB 182 + PCB 159
PCB 170 + PCB 190

^b Because PCB 66 and PCB 95 can now be separated by a significant number of participants, participants may report these as two separate concentrations or as the sum of PCBs 66 and 95.

NIST Intercomparison Exercise Program for Organics in the Marine Environment
NIST/NOAA-NS&T/EPA-EMAP QA Program
Sample: QA98TIS9 - Mussel Tissue IX

Please fill in all blanks; Use requested units of concentration; Report results as if 3 figures were significant

DO NOT INSERT ROWS OR COLUMNS WITHIN THIS TABLE. DO NOT MOVE CELLS.

- If necessary, add additional data/information at the end of the table.

- Use one of the following if no concentration is reported for an analyte:

NA = Not analyzed/determined; <"conc" = <detection limit conc.; Other = other, explain in a note at end of table

(DL = "below detection limit" may be used, but <"conc", e.g., <8, is preferable.)

Do not use parentheses or negative numbers to indicate "less than detection limit".

**Appendix B: Description, Storage, Use, and Reporting Instructions
for Marine Sediment VIII**

**NIST Intercomparison Exercise Program for
Organic Contaminants in the Marine Environment**

NIST/NOAA-NS&T/EPA-EMAP QA Program

**Intercomparison Exercise: Marine Sediment VIII
Description of Materials and Instructions**

Intercomparison Exercise Materials:

QA98SED8 (Marine Sediment VIII)

Each of the three jars contains 21 g (wet basis) of Marine Sediment VIII. This wetted sediment was prepared from material that was collected from a site on Vancouver Island and then freeze-dried, ground sieved, and radiation-sterilized. This material has not been enriched or spiked. Each 2-oz clear glass jar has a Teflon-lined screw cap and is labeled with an individual jar number as well as the above name.

In addition, three concurrent analyses of SRM 1941a, Organics in Marine Sediment, are recommended. This material can be obtained from the NIST Standard Reference Materials Program (\$402/50 g (dry basis) (phone: 301/975-6776; fax: 301-975-948-3730).

Storage of Materials:

Marine Sediment Material. This Marine Sediment VIII material should be stored in the dark at temperatures of -15 °C or lower. If only a portion of the contents of a jar is used, that jar should be tightly closed immediately after removal of a subsample to preserve the integrity of the remaining material for later analysis.

Instructions for Use:

You are to analyze Marine Sediment VIII and SRM 1941a, using **your** laboratory's and/or program's analytical protocols, for the concentrations (mass/mass [dry basis]) of the 23 polycyclic aromatic hydrocarbon (PAH) compounds, 22 chlorinated pesticides, and 18 polychlorinated biphenyl (PCB) congeners¹ of interest in the current NIST Intercomparison Exercise Program for Organic Contaminants in the Marine Environment. These compounds are listed in Table 1.

The percentage of water in the Sediment VIII material should be determined so that the results can be reported on a dry basis. You should have received sufficient material so that you can perform separate determinations for the water content if you do not dry your sediment samples prior to analysis.

¹If your laboratory is not analyzing samples for all three chemical classes, you are expected to submit results only for those compounds currently being determined in your laboratory.

The amount of material used for each analysis should correspond to the amount (wet basis) of marine sediment that you would typically analyze as prescribed in your protocols. Prior to removing an aliquot of Sediment VIII, you should thaw the sample in the jar and then **stir or otherwise mix it thoroughly**.

You should analyze three samples of Marine Sediment VIII and at least one, and more if possible, of SRM 1941a in three different batches/sets/strings/catalogs using your protocol for marine sediment samples. Specifically, we are asking that you analyze one sample of Sediment VIII and one sample of SRM 1941a with one batch of laboratory samples; analyze a second sample of each material with another batch; and the third sample with yet another batch. This will allow a more realistic assessment of laboratory precision over a longer term than the assessment obtained when a laboratory places all three samples in the same extraction and cleanup batch and the resulting extracts are analyzed using the same calibration curve, etc.

Reporting of Results:

Please report one result, as if three figures were significant, for each of the requested analytes in each of the three replicates of the Marine Sediment VIII and of SRM 1941a. Report results in units of ng/g **dry** basis. Report the date of measurement of each sample in the requested m/d/y format. Also, report the results of your percentage water determinations of Marine Sediment VIII.

We recognize that the reported concentrations for some of the requested determinands will probably include concentrations of compounds reported to coelute with the determinand of interest with methods commonly in use in environmental laboratories. The more common of these coelutions have been listed in Table 1 and in the data table format as shown in Table 2. Please note at the bottom of your table of reported results if any of these listed coelutions are not applicable to the data being reported by your laboratory and/or if other coelution qualifiers not listed are applicable to your data. Please note that any changes you make to the column or row headings **within** the tables will **not** be seen by the coordinators because only the table entries and comments at the bottom of the tables are automatically transferred to the exercise database.

We prefer that concentration values be reported for each analyte determined. If the measured concentration is below your typical reporting concentration for an analyte in a particular matrix, you can report the number and list the appropriate detection limit, quantification limit, etc. at the bottom of the data table. However, if you need to report non-numerical data please use the following conventions:

NA	"Not analyzed", "not determined"
<"value"	"Less than specified concentration", e.g., <8 ng/g
Other	"Other"; add note of explanation at end of data table, e.g., interference
DL	"Below detection limit" may be used, however, <"value" is preferable

Do not use negative numbers or parentheses to indicate "less than detection limits".

The enclosed floppy diskette (DOS format) contains files, any of which you may utilize to report your data. The file SED8.WK3 is in a LOTUS format, SED8.XLS is in an EXCEL format, and SED8.WQ1 is in a QuatroPro format. A text file SED8.TXT is also provided. If you have any software/hardware conversion problems, please contact Michele Schantz. The data file templates also include places for

you to list the surrogate/internal standards and type of calibration curve used, and to provide a brief description of the analyses. Please **do not** add "spaces" before entering numbers in the table cells and enter them as "numbers" not as "labels". Please **do not** insert any columns or rows **within** the table in the data file. If you wish to include additional data and/or other information or comments, you may add it to the bottom of the data table in the diskette file or send it in hard copy. A printout of the data file format is shown in Table 2.

Submit your results either via diskette file or as an attached file via e-mail to Michele M. Schantz.

Endosulfan-I (ES-I)	118
---------------------	-----

Endosulfan-II (ES-II)	64
-----------------------	----

PCB GC-MS analyses were performed on different days than pesticide GC-MS analyses

8 Only two SRM1941a were prepared and analyzed.

Lab Notes

9 Blank cells indicate that the samples were not analyzed for those analytes.
 All target analytes that were included in the analyses but not detected have the detection limit reported.
 SRMs were not analyzed for non-certified analytes

10 Sample # 1 suffered an extraction casualty
 More sample for next year would be appreciated.

11 None

12 None

14 Samples were analyzed in a single sample batch.

15 * : Instead of SRM 1941A we have used a remaining portion of CRM IAEA 357
 Other: Means confirmed as HCB but not quantified.
 **: Means lost extract of sample.

16 Endosulfan I co-elutes with 2,4'-DDE.
 PCB170/190 has interference in GC analysis.

17	PCB 99	1.88	2.1	2.08	2.82	2.82	2.11
	PCB 183	1.85	1.85	1.49	2.11	1.41	2.1

NOTE: The fraction containing the light Pah's was accidentally subjected to conditions which affected thier recovery, so we did not analyze for these compounds.

19 none

Appendix G: Laboratory Methods Used, Mussel Tissue IX

Summary of Methods Used

Mussel Tissue IX QA98TIS9

Lab No./

Reporting

Date	Approximate amount of sample extracted:	Procedures used to determine percentage water	
1a	Mussel IX, g (wet basis)	10	freeze-drying
10/30/98	SRM 1974a, g (wet basis)	10	
1b	Mussel IX, g (wet basis)	10	freeze-drying
10/30/98	SRM 1974a, g (wet basis)	10	
2	Mussel IX, g (wet basis)	5	Dried at 103 C, Gravimetric
10/15/98	SRM 1974a, g (wet basis)	6(PAH)	
4	Mussel IX, g (wet basis)	10	Did not correct for moisture.
10/22/98	SRM 1974a, g (wet basis)	10	
5	Mussel IX, g (wet basis)	10.4	Freeze drying was used to determine the moisture content of the mussel tissue. The procedure was repeated until a constant mass was obtained.
10/29/98	SRM 1974a, g (wet basis)	8	
6	Mussel IX, g (wet basis)	7.8	Weighed 1g of the sample with an analytical balance with an accuracy of 0.2mg. Dry it in oven at 104 C for 1hour , Weighed it again to get dry weight
10/21/98	SRM 1974a, g (wet basis)	7.6	
7	Mussel IX, g (wet basis)	10.0	Freeze drying for both Tissue IX and SRM 1974a
october 30,19	SRM 1974a, g (wet basis)	8.0	
8	Mussel IX, g (wet basis)	5.84	Weighed approximately 2 g of sample into a preweighed aluminum pan and dried for 24 hours in an oven set at 105 degree centigrade. To calculate percent water, the dry weight was divided by the wet weight, subtracted from 1, and multiplied by 100.
10/26/98	SRM 1974a, g (wet basis)	5	
9	Mussel IX, g (wet basis)	11	Homogenized aliquot weighed into a pre-weighed aluminum weighing pan. Weight recorded to nearest 0.01g. Sample covered and placed in drying oven at ~105 C. After ~24 hr, sample removed and cooled at room temperature for at least 30 min. Sample weighed; weight recorded to nearest 0.01 g.
10/29/98	SRM 1974a, g (wet basis)	7	
11	Mussel IX, g (wet basis)	14	Entire sample was freeze dried and percent moisture was calculated.
11/1/98	SRM 1974a, g (wet basis)	16.8	
12	Mussel IX, g (wet basis)	7.3	Total solids at 105 degrees C by gravimetric
10/29/98	SRM 1974a, g (wet basis)	15.2	
13	Mussel IX, g (wet basis)	10	Portion of wet sample weighed onto tared pan, allowed to dry in dessicator at room temperature until constant weight.
10/29/1998	SRM 1974a, g (wet basis)	10	
14	Mussel IX, g (wet basis)	5	Gravimetric with oven drying
10/29/98	SRM 1974a, g (wet basis)	3

11/20/98	SRM 1974a, g (wet basis) 8	
29	Mussel IX, g (wet basis) 14	vacuum freeze dried ~15g wet tissue for 24h determine % water gravimetrically = ((wet - dry tissue)/wet tissue)*100
12/4/98	SRM 1974a, g (wet basis) 16	
30	Mussel IX, g (wet basis) 10	Dry at 105 degrees C, for 24 hours
1/7/99	SRM 1974a, g (wet basis) 10	
31	Mussel IX, g (wet basis) 2	gravimetric after drying
12/22/98	SRM 1974a, g (wet basis) 2	

Summary of Methods Used

Mussel Tissue IX QA98TIS9

Lab No.	Extraction method	Extraction solvent	Extraction time	Extraction - other
1a	PFE	dichloromethane	5 min equilibrium time, 5 min static	100 C, 2000 psi
1b	PFE	dichloromethane	5 min equilibrium time, 5 min static	100 C, 2000 psi
2	Soxhlet	Methylene chloride/Acetone 2/1	18 - 20 hrs.	Acetonitrile (Pesticides)
4	Soxhlet	Methylene Chloride	overnight (min. of 12 hours)	
5	Soxhlet	Dichloromethane	24 hours	
6	3550 Sonication	75mL of Methylene Chloride:Acetone (1:1)	3 x 2 minute pulse sonication	
7	Freidrich Soxhlet	1:1 hexane/acetone	8 Hour	
8	Microwave Solvent Extraction	30 ml 4:1 acetone:hexane	15 minutes in the microwave	
9	Tissumizer technique; tissue homogenate spiked w/ surrogates, mixed w/ Na2SO4 and solvent	methylene chloride	2 min + 2 min + 2 min	
11	Soxhlet extraction	3:1 mixture of methylene chloride and acetone.	16 hrs	
12	Sample mixed with anhydrous sodium sulfate and activated copper: extracted 3 times using rotary tumbler.	Methylene Chloride	Three times for a total of 38 hr.: first 16 hrs., second 6hrs., and last 16 hr.	Rotated at 40 RPM in 500 ml Teflon Bottle
13	Soxhlet	Petroleum Ether	__18 hours	
14	NOAA Technical Memorandum NOS ORCA 71 Volume IV, Chapter 2	methylene chloride		sodium sulfate added to samples and solvent prior to extraction
15	Soxhlet extraction, by 16 hours.	Methylene Chloride-Hexane (50:50)	16 hours	
16	Extracted with DCM and 40 grams NaSO4. Tissumized 3 times.	Dichloromethane	Tissuemized 3 times for 3 minute duration	Samples were dried by the addition of NaSO4 prior to extraction.
17	Soxhlet	Dichlormethane	18 hours	
18				
19	Tissuemiser	Methylene chloride	3 minutes	

Summary of Methods Used

Mussel Tissue IX QA98TIS9

Lab No.	Extraction method	Extraction solvent	Extraction time	Extraction - other
22	PFE 5 min heat, 5 min static, 300 sec purge, 85 % flush, 2000 psi, 100 degrees C	PAH- 10% Acetone/ 90% methylene chloride PEST/PCB- 10% Acetone/ 90% Hexane	Approx 15 min	The 33 ml cells were extracted twice for each sample. The extracts were combined into a 250 ml KD, concentrated to approx 5 mls, then concentrated by nitrogen blowdown to 0.5 mls for pah and 1.0 mls for Pest/PCB
24	ACCELERATED SOLVENT EXTRACTION WITH DCM	DCM	CA 20 MINUTES	
25	EPA Method 3550 - sonication	Methylene chloride/acetone (50:50)	3 x 5 min	0.45 um filtration sodium sulfate drying column
26	Metabolic shaker of sample and solvents at 50 degrees C.	Acetonitrile : hexane. (3:2)	One (1) hour.	Cool, add water, centrifuge and draw off hexane layer; repeat with hexane twice more.
27	soxhlet	50% methylene chloride/ 50% acetone	24 hrs.	
28	Accelerated Solvent Extractor (ASE)	Methylene chloride/acetone	40 minutes	
29	Soxhlet	CH ₂ Cl ₂ (400ml)	16h	
30	Tissumizer w/ sodium sulfate	Methylene chloride	3 times, 2 min. each	
31	Accelerated Solvent Extraction (Dionex ASE 200)	100% dichloromethane	11 min per sample	2000 psi, 100 oC, 2 static extraction cycles/sample, 100% solvent flush TurboVapII and/or water bath at 60oC, solvent reduction to 1.0 mL

Summary of Methods Used

Mussel Tissue IX QA98TIS9

Lab No.	Wet or dry samples extracted? Tissue IX SRM 1974a		Sample extract cleanup method
1a	wet	wet	size exclusion chromatography to remove lipid and biogenic material LC-aminopropylsilane column for separation of PCB and lower polarity pesticides from more polar pesticides
1b	wet	wet	size exclusion chromatography to remove lipid and biogenic material LC-aminopropylsilane column for separation of PCB and lower polarity pesticides from more polar pesticides
2	Wet	Wet	Florisil and copper clean up
4			GPC Sodium Sulfate filtration column alumina-silica clean-up column
5	wet	wet	The steps involved were: [1] Sulfuric acid wash [2] Clean with activated copper [3] Silica column [4] Sephadex LH-20 column
6	wet	wet	No cleanup performed for PAH Solvent exchange to hexane with turbvap for pesticide/PCB Acid clean and copper clean were performed for pesticide/PCB
7	wet	wet	Multi-column (1) 20g 2% deactivated Florisil, eluted 300 mL hexane, rotovap to 1 mL (2) 3.7 g Alumina column, eluted 50 mL 15%ethyl ether in hexane, rotovap to 2 mL
8	WET	WET	Silica Gel Column Chromatography to separate PCBs from chlorinated pesticides and PAHs
9	wet	wet	2% deactivated alumina column (20 g) followed by HPLC
11	Dry	Dry	Lipid was removed using Florisil dry column method. Silica gel column chromatography and sulfuric acid cleanup method was used for PCB fraction. Silica gel column chromatographic method for pesticides.
12	wet	wet	Alumina-Silica Gel and GPC
13	__wet sample	__wet sample	Acetonitrile / Petroleum ether liquid-liquid partition followed by florisil column chromatography
14	wet	wet	See reference above.
15	Dry (Na2SO4)	*	Solid-liquid chromatography, using alumina and silica gel %5 percent deactivated with water.
16	Dry	Dry	1. Silica/Alumina column cleanup: 10g Alumina and 20g silica gel. Elute with 200 mL pentane/DCM(50:50 v/v). 2. HPLC gel permeation chromatography.
17	wet	wet	Extracts were cleaned up using high performance GPC on porous divinylbenzene copolymer gel to remove the majority of the lipids. The extracts were then fractionated using a semipreparative aminosilane column.
18	wet	wet	
19	wet		Extract run through silica gel/alumina column with pentane and methylene chloride.
22	wet	wet	The Pest/PCB cells were packed with 6 grams of alumina (7% water activated) followed by the samples. The sample were sulfuric acid cleaned prior to injection.
24	WET	WET	GPC FOLLOWED BY HPLC (AMINOPROPYL) USED TO SEPARATED PCBs FROM PESTICIDES.

Summary of Methods Used

Summary of Methods Used

Mussel Tissue IX QA98TIS9

Lab No.	Were PCBs separated from pesticides prior to GC?	Does PCB 132 coelute with PCB 153, PCB 105 or both?	Differences in procedures used for SRM 1974a from those for described Mussel Tissue IX
1a	yes	separated from both	
1b	yes	separated from both	
2	No	On DB-XLB 168/153 coelute	
4	DDE, HCB, Mirex, Aldrin, and Heptachlor		
5			
6	yes	PCB 153 and 132 was separated on one column	No None
7	LY THE MORE POLAR O	132 COELUTES ON LEADING EDGE OF 105	None
8	YES	PCB 132 co-elutes with PCB153 and	Moisture was standardized in SRM1974a prior to microwave extraction.
9	no	separated	none
11		PCB-132 coelutes with PCB-105	No
12	no		
13			
14	No	Coelutes with PCB 153	3g of SRM 1974a extracted, vs. 5g of Tissue IX.
15	No	Coelute with PCB 153	** Instead of use SRM 1974 we used IAEA CRM-IAEA 351
16	No	PCB-132 Coelutes with PCB-153	None
17	YES	APPEARS TO COELUTE WITH 153	
18	yes		PCB 28, 44, 66, 101, 138, 153, 118 and pp'-DDE are outside of the calibration curve range for the SRM.
19			We were unable to obtain any SRM 1974a because shipper could not find courier to take dry ice.
22	NO	separate	NONE
24	YES	SEPARATES	NONE
25	No		
26	NO	We don't measure BZ132.	NONE
27	no	Coelution (PCB 132 is not in the method)	
28	NO		

Summary of Methods Used**Mussel Tissue IX QA98TIS9**

Lab No.	Were PCBs separated from pesticides prior to GC?	Does PCB 132 coelute with PCB 153, PCB 105 or both?	Differences in procedures used for SRM 1974a from those for described Mussel Tissue IX
29	partially	PCB-132 appears to co-elute with -153	
30	No		
31	NO	coelutes with PCB 153 only	

Appendix H: Laboratory Methods Used, Sediment VIII

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No./ Reporting Date	Approximate amount of sample extracted:	Procedures used to determine percentage water
1a 9/11/98	Sediment VIII, g (wet bas) SRM 1941a, g (dry basis)	19 5 freeze-drying
1b 10/30/98	Sediment VIII, g (wet bas) SRM 1941a, g (dry basis)	19 5 freeze-drying
1c 11/16/98	Sediment VIII, g (wet bas) SRM 1941a, g (dry basis)	5 10 Not determined - dry samples analyzed
2 10/15/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	8g 10g Dried at 103 C, Gravimetric
3 10/23/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	10 1g for PAHs and 10g for Pest./Cong. EPA 160.3
4 10/15/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	15-19 15-22 Drying balance
5 10/27/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	16.1 10 The percent water in the sediments was determined by drying the wet sediment in an oven at 90oC. The sediment was dried for 18 hours and then allowed to cool in a dessicator. Once cooled to room temperature, the sediment was reweighed and the % moisture was
6 10/21/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	9.4 6.4 Weighed 1g of the sample with an analytical balance with an accuracy of 0.2mg. Dry it in oven at 104 C for 1hour , Weighed it again to get dry weight
7 10/30/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	5 5 oven drying
8 10/25/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	5 2.5 Weighed approximately 2 grams of sample into a preweighed aluminum pan and dried for 24
9 10/30/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	6.8 5 Homogenized aliquot weighed into a pre-weighed aluminum weighing pan. Weight recorded to nearest 0.01g. Sample covered and placed in drying oven at ~105 C. After ~24 hr, sample removed and cooled at room temperature for at least 30 min. Sample weighed; weight recorded to nearest 0.01 g.
10 10/30/98	Sediment VIII, g (wet basis) SRM 1941a, g (dry basis)	16 10 104 degree C oven. EPA SW-846 method for determining % solids

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No./ Reporting Date	Approximate amount of sample extracted:	Procedures used to determine percentage water
11	Sediment VIII, g (wet basis) 20g	Entire sample was freeze dried and percent moisture was calculated.
11/1/98	SRM 1941a, g (dry basis) 5g	
12	Sediment VIII, g (wet basis) 3.2	Total solids at 105C by gravimetric
10/29/98	SRM 1941a, g (dry basis) 2.5	
14	Sediment VIII, g (wet basis) 10	Gravimetric with oven drying
10/27/98	SRM 1941a, g (dry basis) 2	
15	Sediment VIII, g (wet basis) 11.5	Weight difference between wet and dried sample. Sample was dried by heating overnight
10/30/98	SRM 1941a, g (dry basis) *	
16	Sediment VIII, g (wet basis) 15	An aliquot of the tissue sample is placed in a beaker and weighed. The sample in the beaker is dried in an oven at 50 degrees celsius to a constant weight. The percentage of water is calculated based on the weight loss.
10/29/98	SRM 1941a, g (dry basis) 1	
17	Sediment VIII, g (wet basis) 15	Weighed approximately 2 grams of sample into a preweighed aluminum pan. Samples were dried overnight at 120 degree C. Samples were transferred to a desiccator and allowed to cool before reweighing.
10/30/98	SRM 1941a, g (dry basis)	
19	Sediment VIII, g (wet basis) 20	Gravimetric. Dried an aliquot in drying oven for 24 hrs.
11/3/98	SRM 1941a, g (dry basis) 1	
20	Sediment VIII, g (wet basis) 5 -- 7	by weighting
11/4/98	SRM 1941a, g (dry basis) 5	
21	Sediment VIII, g (wet basis) 12	Sample was completely mix. A portion of the sample is placed in a pre-weighed tin, weighed, and dried in a 105c oven overnight. The sample is cooled and reweighed and the percent water determined. water
10/28/98	SRM 1941a, g (dry basis) 6	
22	Sediment VIII, g (wet basis) 3	approx. 2.5 grams weighed into aluminum pan and dried overnight at 120 degrees C. Samples reweighed and percent moisture was determined by difference
11/7/98	SRM 1941a, g (dry basis) 2	
23	Sediment VIII, g (wet basis) 9.4	Standard Methods 2540b
11/10/98	SRM 1941a, g (dry basis) 8.1	
24	Sediment VIII, g (wet basis) 10	SAMPLE WEIGHED THEN DRIED AT 120 DEG C FOR 24 H THEN REWEIGHED

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No.	Extraction method	Extraction solvent	Extraction time	Extraction - other
1a	PFE	dichloromethane	5 min equilibrium time, 5 min static	100 C, 2000 psi
1b	PFE	dichloromethane	5 min equilibrium time, 5 min static	100 C, 2000 psi
1c	Soxhlet	dichloromethane	20 h	
2	Soxhlet	Methylene chloride:Acetone 2:1	18 - 20 hours	Acetonitrile
3	Dionex ASE	Methylene Chloride	5MIN	100DEG C, 5 MIN EQUILIBRATION TIME, 1500->2000PSI 0.6 TIMES TUBE VOLUME FOR FLUSH, PURGE 45 SEC NITROGEN @ 150 PSI
4	soxhlet	methylene chloride	overnight	
5	Soxhlet	Dichloromethane	24 hours	
6	3550 Sonication	75mL of Methylene Chloride:Acetone (1:1)	3 x 2 minute pulse sonication	
7	Freidrichs Soxhlet	1:1 acetone/hexane	24 hours	
8	Microwave Solvent Extraction	30 ml of a 1:1 acetone:hexane	15 minutes in the microwave	
9	NOAA (1993). Three DCM extractions using shaker table techniques. Sample spiked with surrogates, Na2SO4 added, followed by solvent	methylene chloride (DCM)	12 hr + 4 hr + 1 hr	
10	EPA SW3540A	Acetone	16 hr	
11	Soxhlet extraction	3:1 mixture of methylene chloride and acetone	16 hrs	
12	sample mixed with anhydrous sodium sulfate and activated copper: extracted 3 times using rotary tumbler.	Methylene Chloride	Three times for a total of 38 hr.: first 16 hrs, second 6 hrs, and last 16 hrs.	Rotated at 40 rpm in 500 ml Teflon bottle
14	NOAA Technical Memorandum NOS ORCA 71 Volume IV, Chapter 2	methylene chloride		sodium sulfate and copper added to samples and solvent prior to extraction
15	Soxhlet extraction	Methylene Chloride-Hexane (50:50)	16 hours.	
16	Soxhlet extraction	Dichloromethane	8 hours	Samples were "dried" prior to extraction by addition of sodium sulfate

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No.	Extraction method	Extraction solvent	Extraction time	Extraction - other
17	Soxhlet Extraction	Dichloromethane	18 hours	
19	Agitator/tumbler	Methylene Chloride	36 hrs.	
20	Soxhlet	Hexane/Acetone (50/50)	24 hours	
21	Doinex automated soxhlet extractor	Methylene chloride	15 minutes	
22	PFE- 5 min heat, 5 min static, 85% flush, 300 second purge, 2000 psi, 100 degrees C	10% acetone/ 90% methylene chloride	approx 15 min	each 33 ml cell was extracted twice. The two extracts were combined in a 250 ml KD and concentrated to approx 5 ml on steam bath. The extracts were further concentrated by nitrogen blowdown to 1.0 ml final volume.
23	USEPA 3550a	methylene chloride:acetone	20 minutes	solvent evaporation to final volume using autoevaporation= 1 hour
24	ACCELERATED SOLVENT EXTRACTION WITH DCM	DCM	CA 20 MINUTES	
25	EPA Method 3550	Methylene chloride/acetone (50:50)	3 x 5 min	0.45 um filtration Sodium sulfate drying column
26	Metabolic shaker of sample and solvents at 50 degrees C.	Acetonitrile : hexane. (3:2)	One (1) hour.	Cool, add water, centrifuge and draw off hexane layer; repeat with hexane twice more.
27	wet	50% methylene chloride/ 50% acetone	24 hours	
28	Accelerated Solvent Extractor (ASE)	Methylene chloride/acetone	40 minutes	
29	Soxhlet	CH ₂ Cl ₂	16 h	
30	Ultrasonication; Ambient Temperature shaking	1:1 Methylene chloride:Acetone	Three cycles of 3 minute sonication, 4 hours Shaker Table	
31	Accelerated Solvent Extraction (Dionex ASE 200)	50:50 v/v Dichloromethane : Hexane and 100% Dichloromethane	13 min per sample	200 psi, 100 o C, 2 static extraction cycles/sample TurboVapII reduction to 1.0 mL

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No.	Wet or dry samples extracted?		Sample extract cleanup method
	Sediment VIII	SRM 1941a	
1a	wet	dry	silica Sep Pak, copper powder to remove sulfur, LC-aminopropylsilane column for separation of PCB and lower polarity pesticides from more polar pesticides
1b	wet	dry	silica Sep Pak, copper powder to remove sulfur, LC-aminopropylsilane column for separation of PCB and lower polarity pesticides from more polar pesticides
1c	dry	dry	two precleaned aminopropylsilane solid phase extraction columns LC
2	wet	dry	Florisil and copper clean up
3	Wet	Wet	PAH: Alumina/activated copper _____ PCB/PESTICIDES: Alumina/activated copper; exchange to hexane
4	wet	dry	1. Gel Permeation chromatography clean-up 2. Alumina-Silica clean-up column
5	wet	wet	The steps involved were: [1] Sulfuric acid wash [2] Clean with activated copper [3] Silica column [4] Sephadex LH-20 column
6	wet	wet	No cleanup method performed for PAH Solvent exchange to hexane with turbvap for pesticide/PCB Acid clean and copper clean were performed for pesticide/PCB
7	wet	wet	20 g 2% deactivated Florisil, elute 200 mL hexane for PCB fraction, then elute 200 mL 30% methylene chloride/hexane for pesticide fraction or SPE using a 1.0g/6.0mL Florisil SPE tube, elute 10 mL 2% ethyl ether /hexane for PCB fraction, then elute 10 mL 6% ethyl ether/hexane for pesticides
8	WET	DRY	Silica Gel Chromatography to separate PCBs from chlorinated pesticides and PAHs
9	wet	dry	2% deactivated alumina column followed by HPLC (modified Krahn method); activated Cu on extract
10	wet	dry	Silica gel
11	Dry	Dry	Silica gel column chromatography. For PCB fraction, in addition to silica gel column chromatographic cleanup activated copper treatment was performed to remove sulfur.
12	wet	dry	Alumina-Silica Gel and GPC
14	wet	wet	see reference above
15	dry (Na ₂ SO ₄)	NA	Solid-Liquid chromatography wit alumina and silica gel both 5% water deactivated.
16	Dry	Dry	Silica/alumina column cleanup: 10 g of alumina and 20 g of silica gel. Samples were placed on the column and eluted with 200 ml of pentane/DCM (1:1, v/v).

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No.	Wet or dry samples extracted?		Sample extract cleanup method
	Sediment VIII	SRM 1941a	
17	wet	dry	Extracts were cleaned up using high performance GPC on porous divinylbenzene copolymer gel to remove the majority of the lipids. The extracts were then fractionated using a semipreparative aminosilane
19	wet	dry	Extract run through silica gel/alumina column with pentane and methylene chloride
20	dry	dry	By using a column of 6 % (w/w) deactivated Florisil (100-200 mesh). The column was 20 cm long by 1 cm diameter. Florisil was previously Soxhlet extracted with dichloromethane (16 h) for cleaning. Samples were eluted with 25 ml of hexane and 10 ml of dichloromethane in hexane (10 %) in only one fraction A treatment with Hg was necessary to remove the S present in the sample.
21	wet	wet	Sediment samples were cleaned up through GPC for PAHs, and the congeners were cleaned with alumina.
22	wet	dry	none
23	wet	wet	copper for sulfur GPC for samples undergoing ECD analysis
24			GPC FOLLOWED BY HPLC (AMINOPROPYL) USED TO SEPARATED PCBS FROM PESTICIDES. ACTIVATED COPPER USED TO REMOVE SULFUR
25	Wet		EPA Method 3620 - Florisil Hexane elute Hexane/15% ether elute 100% Ether elute
26	wet samples	wet samples (2.2%)	Removal of elemental sulfur via copper powder. Cleanup using silica gel column chromatography to give one fraction, using 70% hexane/30% dichloromethane. Split fraction and treat PCB/OCP portion with concentrated sulfuric acid before GC analysis. No treatment for PAH portion.
27	wet	wet	Gel Permeation Chromatography and Florisil Column
28	wet	dry	Florisil columns
29	dry	dry	silica gel packed column chromatography, 2.0g activated @ 130oC overnight and slurry packed in hexane F1 -- 75ml hexane F2 -- 150ml CH2Cl2 in hexane (1:1 v/v)
30	Wet	Dry	Alumina/Silica gel column, granulated copper
31	3 g dry	2 g dry	addition of copper granules to extracts for sulfur removal

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No.	Were PCBs separated from pesticides prior to GC?	Does PCB 132 coelute with PCB 153, PCB 105 or both?	Differences in procedures used for SRM 1941a from those for described Marine Sediment VIII
1a	yes	separated from both	
1b	yes	separated from both	
1c	0	0	
2	No	On DB-XLB-168/153 coelute,	
3	No	Coelutes with 105 on DB17.	
4	yes	not determined	none
5			
6	yes	PCB 153 and 132 was separated on one column	PAH Analysis: SRM 1941A required two separate filterations using Whatman #41 filter paper in order to reduce the amount of fine particulates in the extract.
7	e long florisil column;	coelutes leading edge 105	NONE
8	YES	PCB 132 co-elutes with PCB153 and is separated	Moisture was standardized in SRM1941a prior to microwave extraction.
9	no	separated	raw extract centrifuged prior to pour-off from extraction container.
10			
11	Yes	PCB-132 coelutes with PCB-105	No
12	no		
14	No	Coelutes with PCB 153	
15	Not	Coelute	* We used the same procedure with our own CRM(IAEA 357) and with blind samples.
16	0		0
17	yes		Dry sample was weighed, and then wet with a small quantity of DI water, then dried with sodium sulfate.
19			
20		We did not analyze PCB 132. PCB 153 and 105 did not coelute.	PCB 204 was used as internal standard for SRM 1941a analysis and PCB 30 was used as internal standard to quantify Sediment VIII.
21	no	Separate	NONE
22	NO	separate from both	
23	NA	NA	none

Summary of Methods Used

Marine Sediment VIII QA98SED8

Lab No.	Were PCBs separated from pesticides prior to GC?	Does PCB 132 coelute with PCB 153, PCB 105 or both?	Differences in procedures used for SRM 1941a from those for described Marine Sediment VIII
24	YES	SEPARATES	
25	No		
26	NO	We don't measure BZ132.	NONE
27	no	coelution (PCB 132 is not in the method)	none
28	NO		
29	partially	PCB-132 appears to co-elute with -153	SRM1941a was not oven dried prior to extraction/analysis (SRM1941a is received in dried powder form)
30	NO		
31	NO	coelutes with PCB153 only	

Appendix I: Charts of Mussel Tissue IX and SRM 1974a Results by Analyte

See Tables 2, 3, and 4 and Appendix C for results reported as *<number, DL, etc.*
Charts for analytes with few reported numerical results are not included in this appendix.

For Mussel Tissue IX plots:

Solid line:

exercise assigned value

Dotted line:

$z = \pm 1$, i. e., 25% from assigned value

Dotted/dashed line:

$z = \pm 2$, i. e., 50% from assigned value

Dashed line:

$z = \pm 3$, i. e., 75% from assigned value

For SRM 1974a plots:

Solid line:

material certified concentration, certificate information concentration or target value (see caption of each plot)

Dotted line:

95% confidence limits

Dashed line:

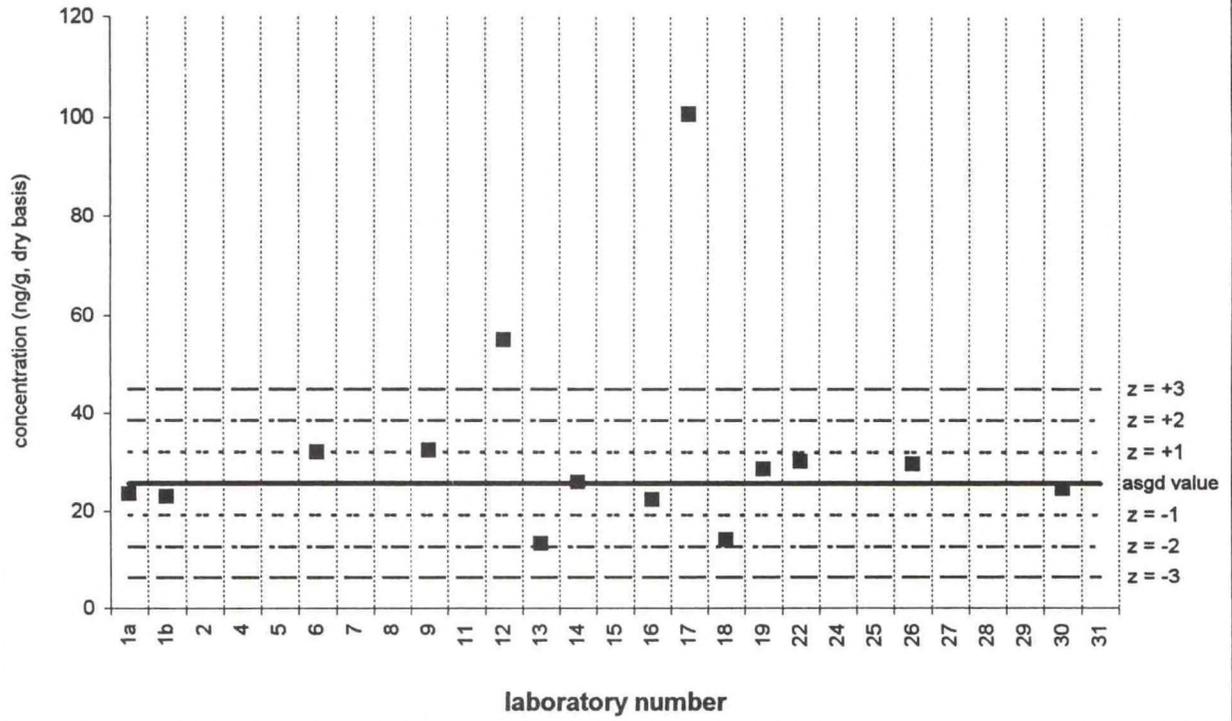

30% from 95% confidence limits

Appendix J: Charts of Sediment VIII and SRM 1941a Results by Analyte

See Tables 5, 6, and 7 and Appendix D for results reported as *<number, DL, etc.*
Charts for analytes with few reported numerical results are not included in this appendix.

For Sediment VIII plots:

Solid line:

exercise assigned value

Dotted line:

$z = \pm 1$, i. e., 25% from assigned value

Dotted/dashed line:

$z = \pm 2$, i. e., 50% from assigned value

Dashed line:

$z = \pm 3$, i. e., 75% from assigned value

For SRM 1941a plots:

Solid line:

material certified concentration, certificate information concentration or target value (see caption of each plot)

Dotted line:

95% confidence limits

Dashed line:

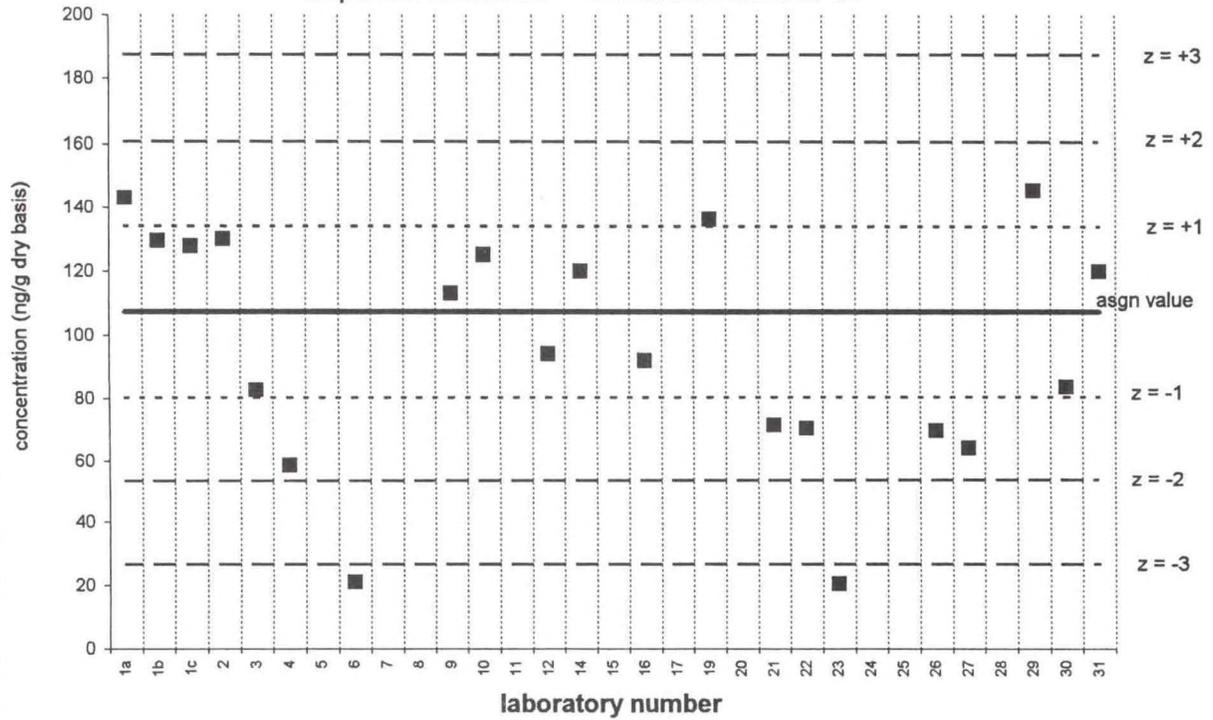

30% from 95% confidence limits

benzo[a]pyrene

SRM 1941a

Certified Value = 628 ± 52 ng/g (dry basis)

Reported Results: 24 Quantitative Results: 23

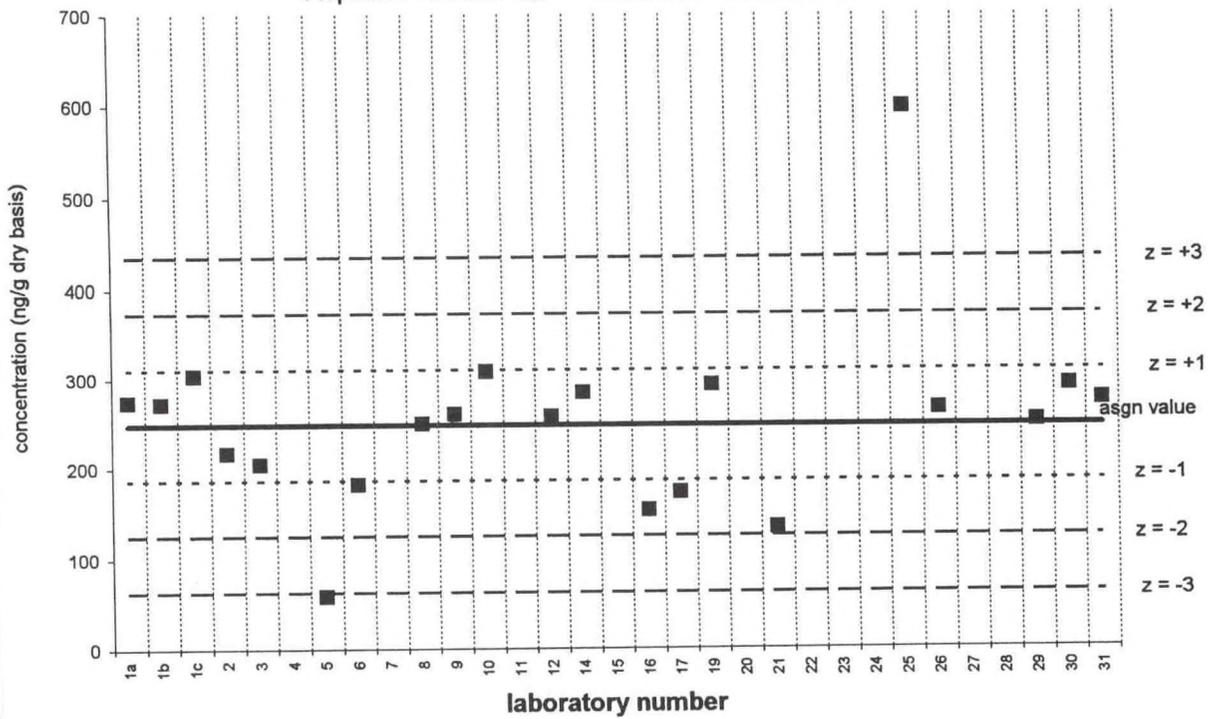

perylene

Sediment VIII (QA98SED8)

Assigned value = 248 ng/g $s = 52$ ng/g 95% CL = 26 ng/g (dry basis)

Reported Results: 22 Quantitative Results: 21

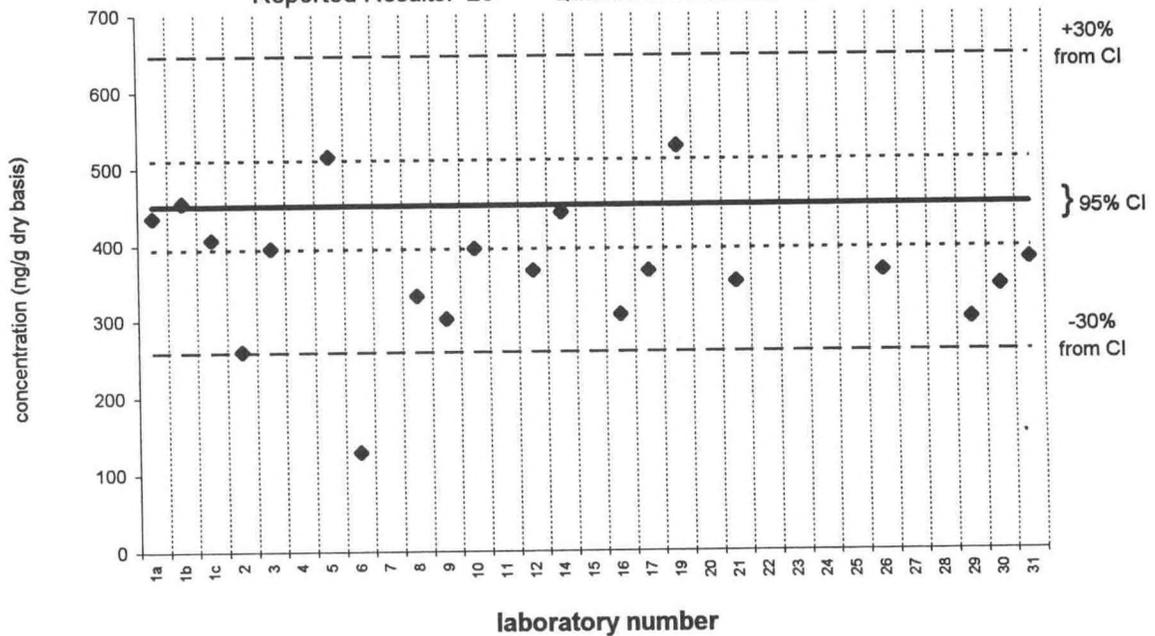

perylene

SRM 1941a

Certified Value = 452 ± 58 ng/g (dry basis)

Reported Results: 20 Quantitative Results: 19

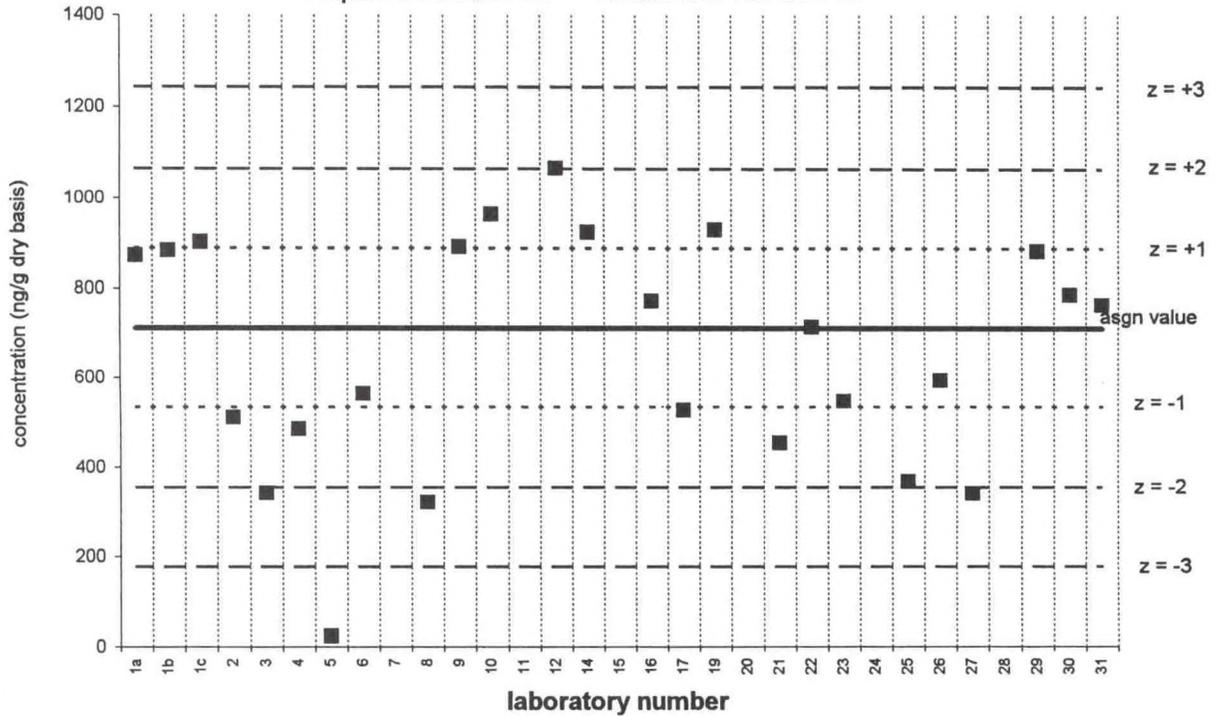

indeno[1,2,3-cd]pyrene

Sediment VIII (QA98SED8)

Assigned value = 710 ng/g s = 219 ng/g 95% CL = 102 ng/g (dry basis)

Reported Results: 25 Quantitative Results: 25

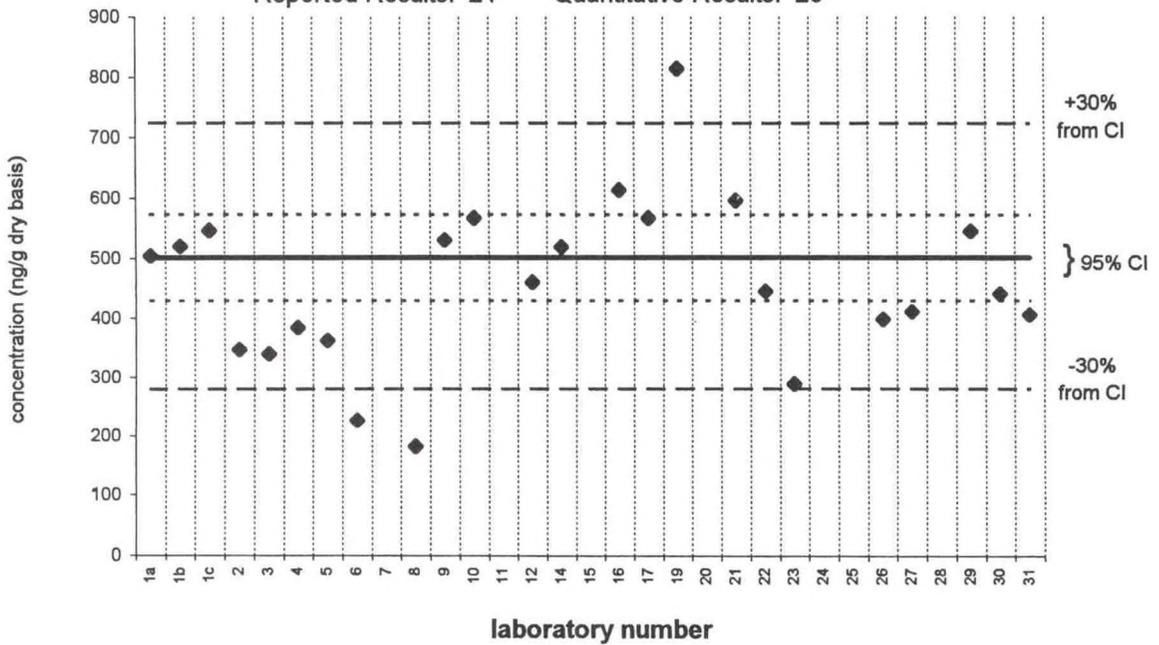

indeno[1,2,3-cd]pyrene

SRM 1941a

Certified Value = 501 ± 72 ng/g (dry basis)

Reported Results: 24 Quantitative Results: 23

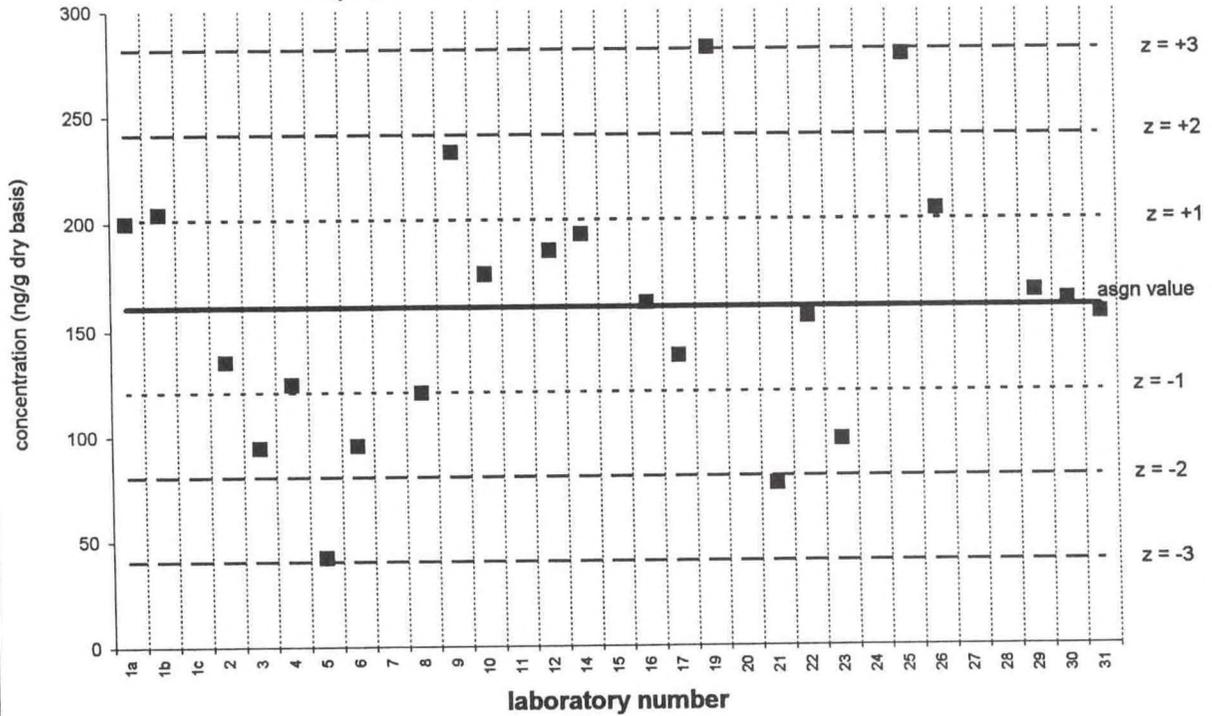

dibenz[a,h]anthracene + [a,c]

Sediment VIII (QA98SED8)

Assigned value = 161 ng/g s = 43 ng/g 95% CL = 23 ng/g (dry basis)

Reported Results: 24 Quantitative Results: 17

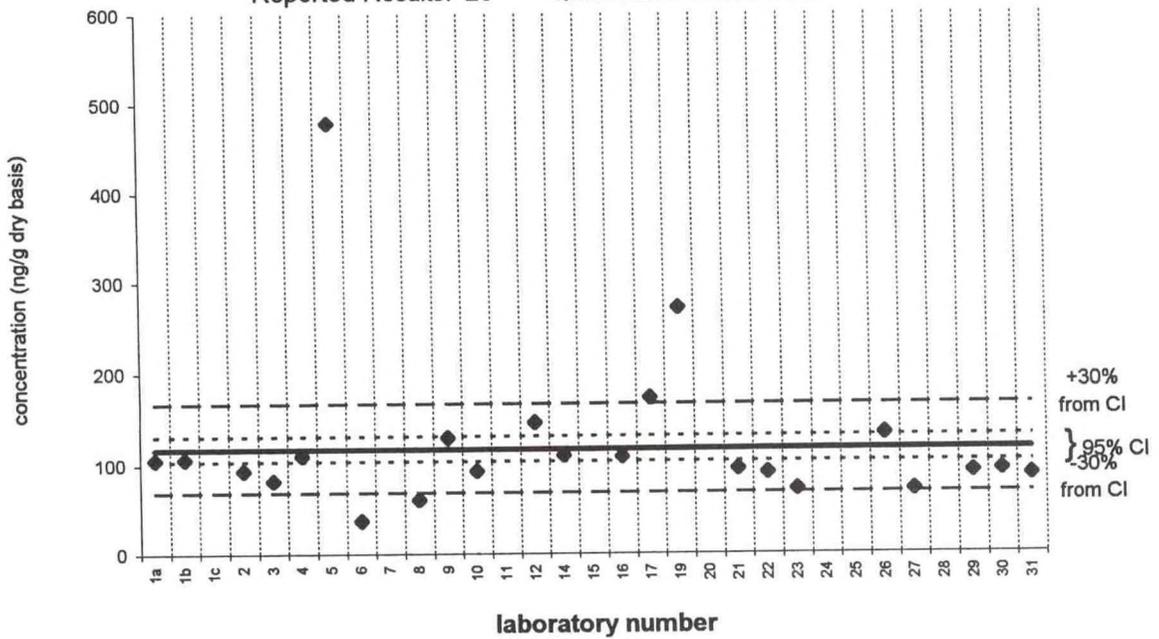

dibenz[a,h]anthracene + [a,c]

SRM 1941a

Certified Value = 117 ± 14 ng/g (dry basis)

Reported Results: 23 Quantitative Results: 22

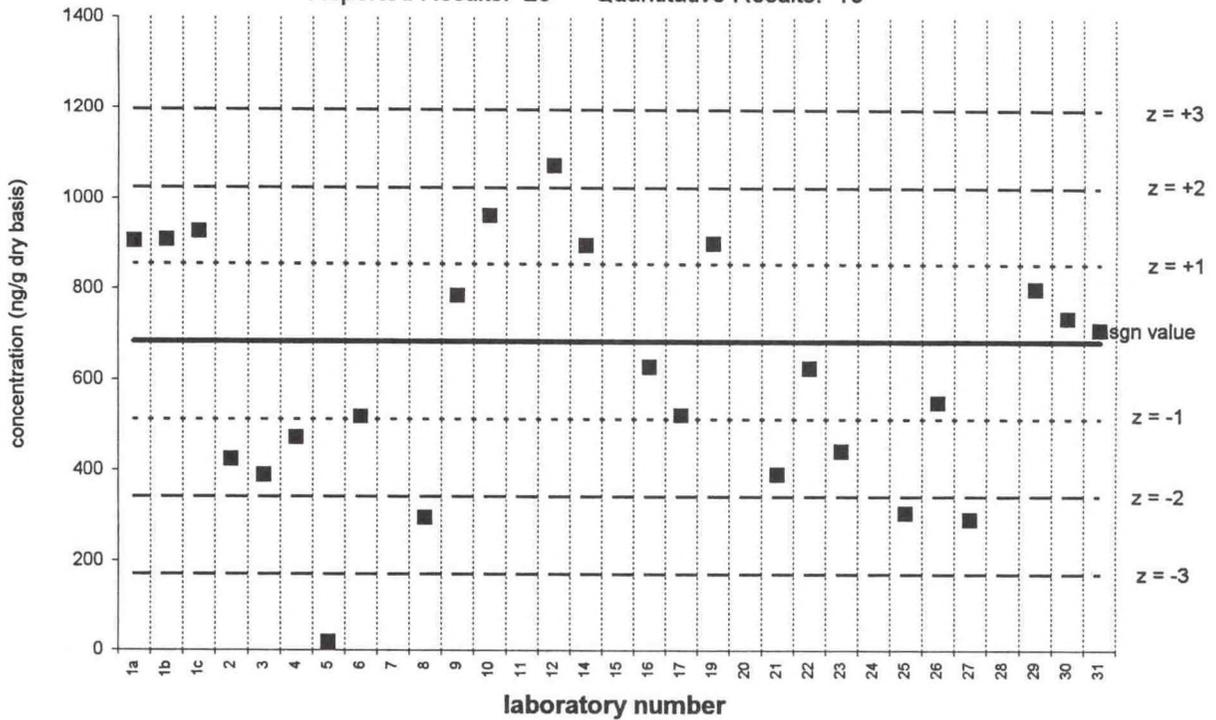

benzo[ghi]perylene

Sediment VIII (QA98SED8)

Assigned value = 683 ng/g s = 229 ng/g 95% CL = 104 ng/g (dry basis)

Reported Results: 25 Quantitative Results: 19

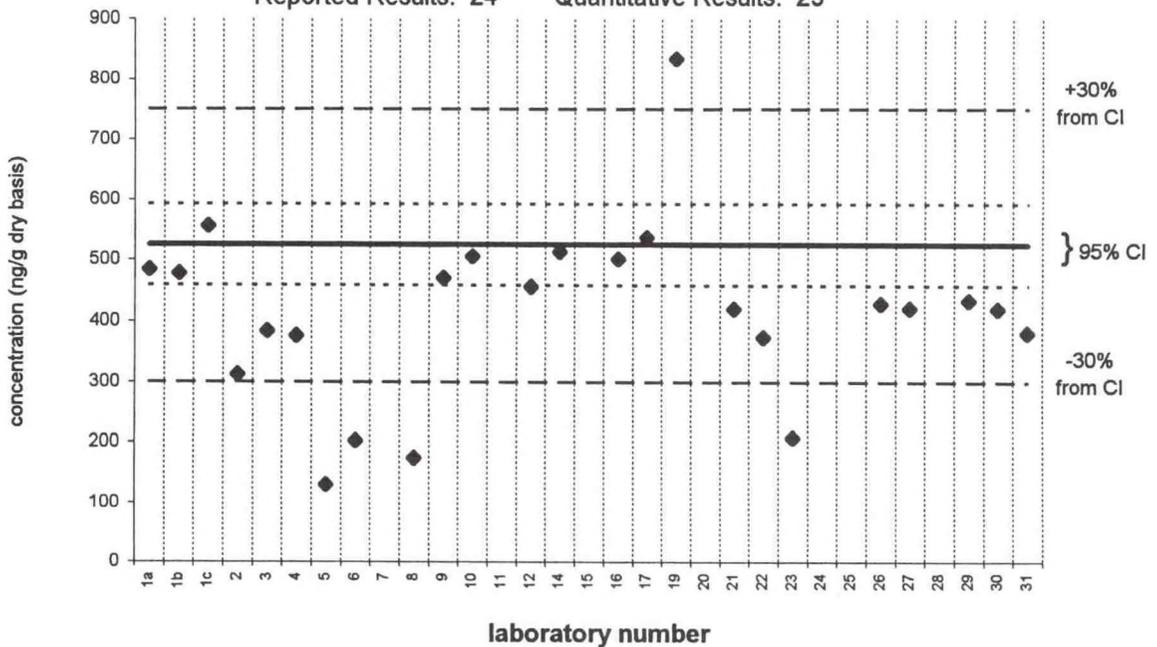

benzo[ghi]perylene

SRM 1941a

Certified Value = 525 ± 67 ng/g (dry basis)

Reported Results: 24 Quantitative Results: 23

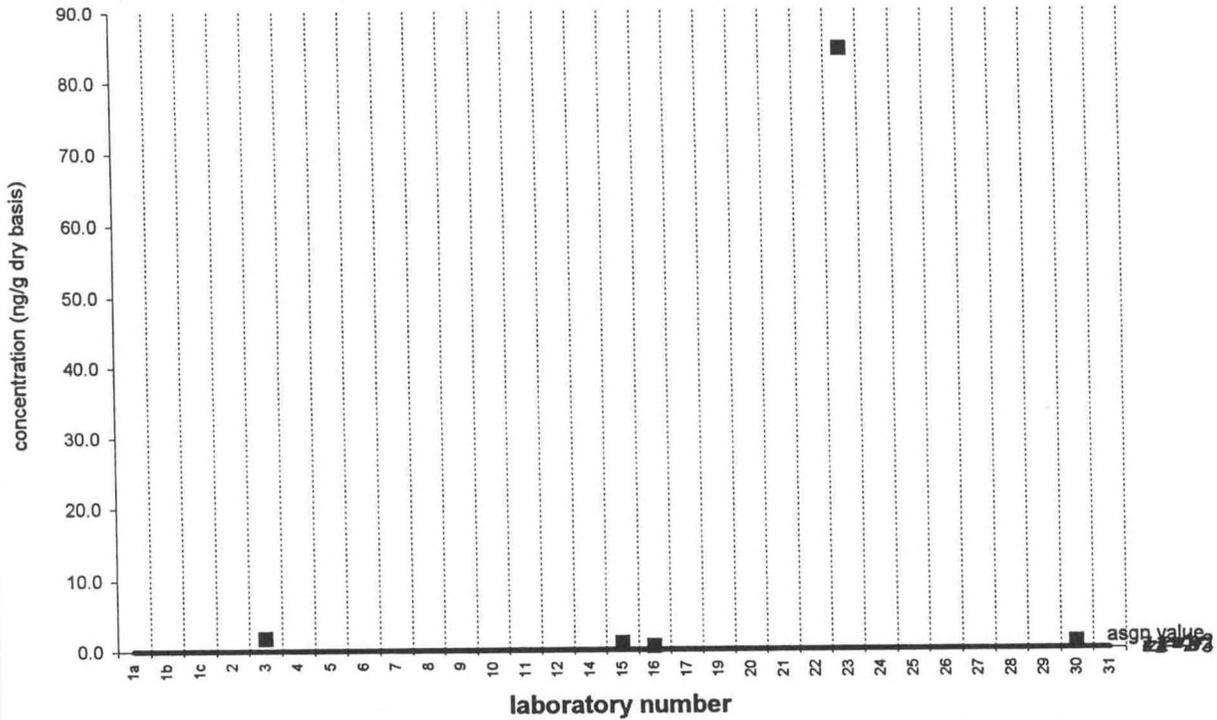

alpha-HCH

Sediment VIII (QA98SED8)

Assigned value = <2 ng/g (dry basis)

Reported Results: 17 Quantitative Results: 5

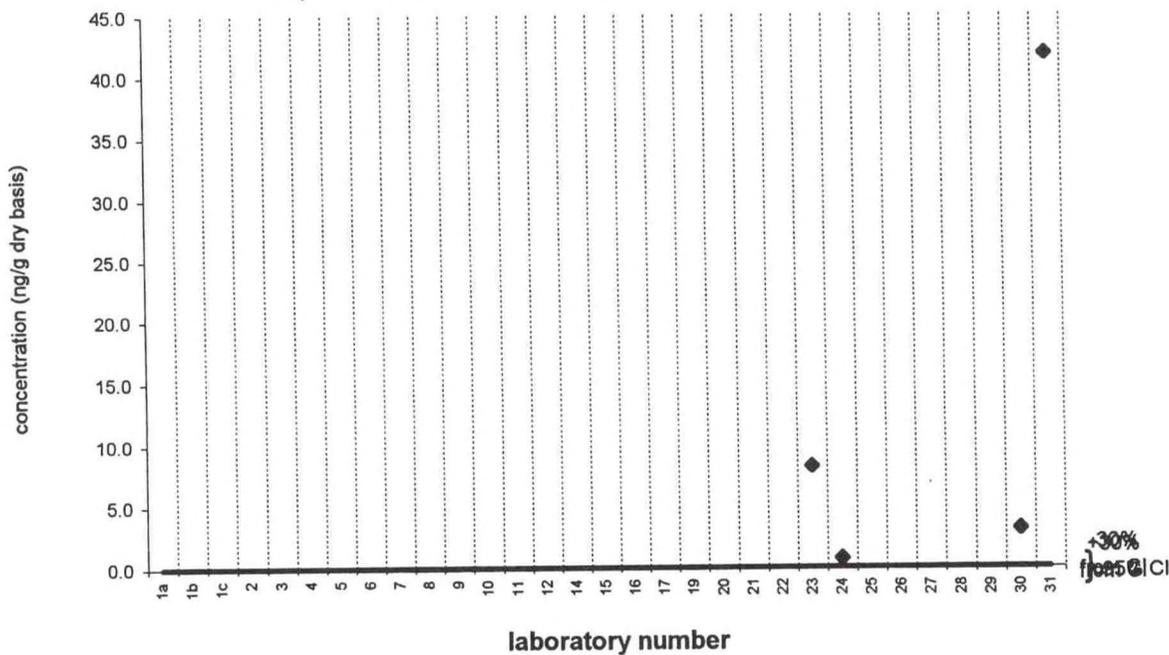

alpha-HCH

SRM 1941a

Target Value = <2 ng/g (dry basis)

Reported Results: 16 Quantitative Results: 3

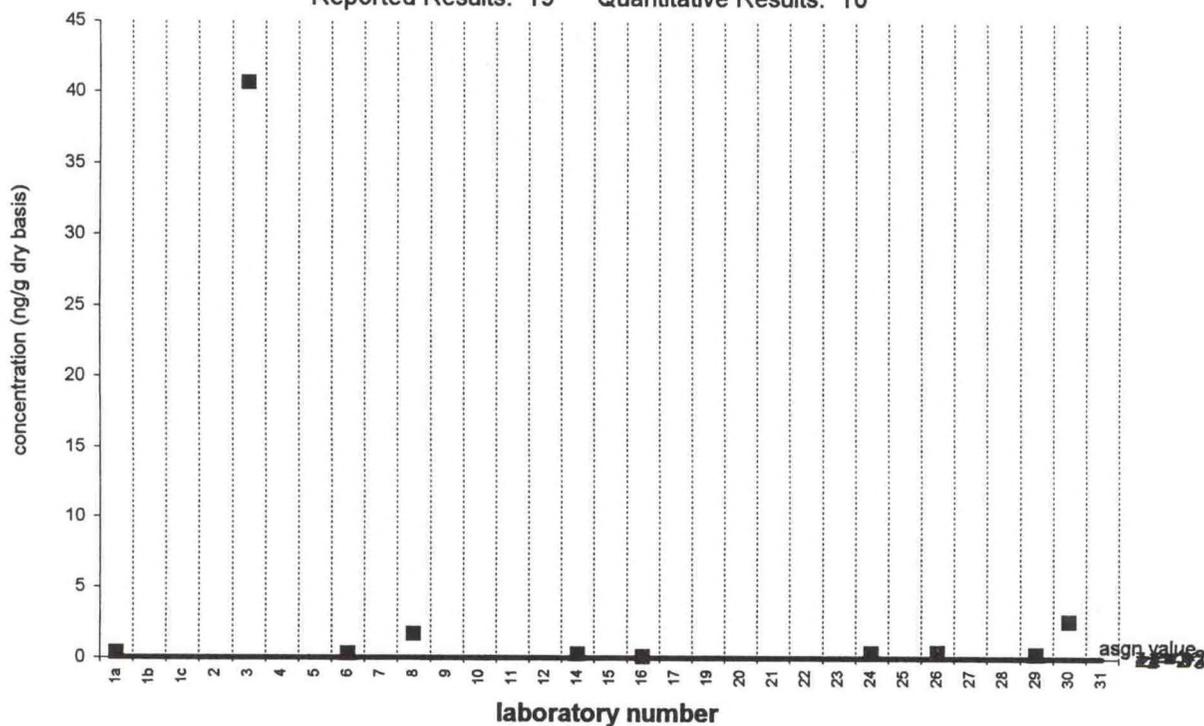

hexachlorobenzene

Sediment VIII (QA98SED8)

Assigned value = <3 ng/g (dry basis)

Reported Results: 19 Quantitative Results: 10

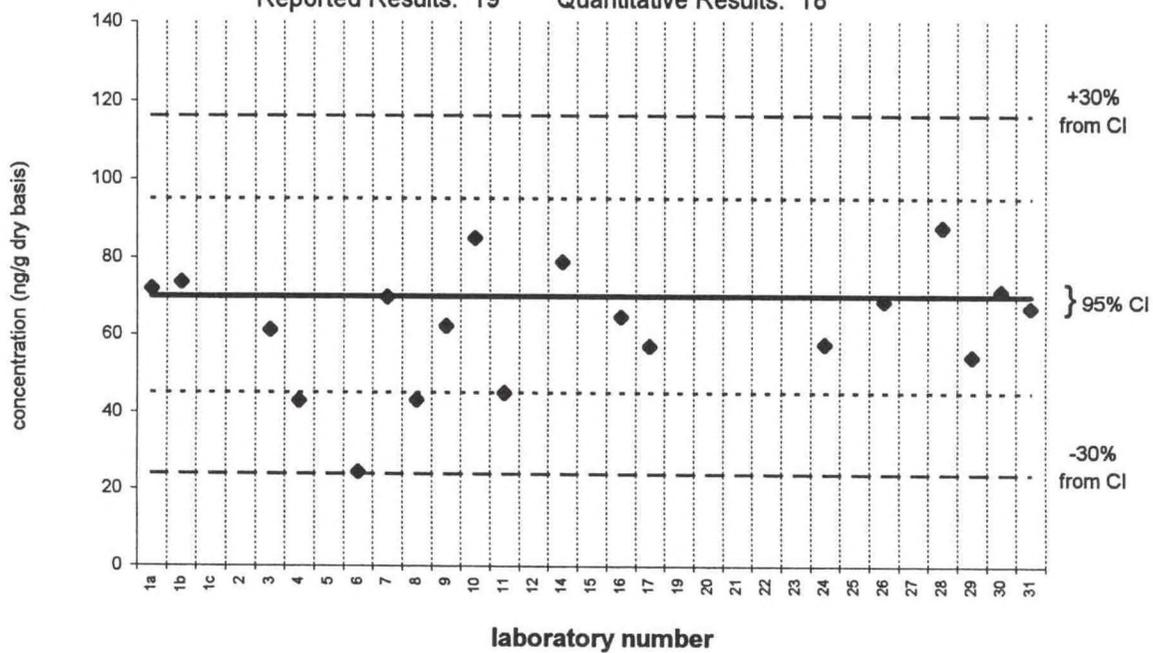

hexachlorobenzene

SRM 1941a

Certified Value = 70 ± 25 ng/g (dry basis)

Reported Results: 19 Quantitative Results: 18

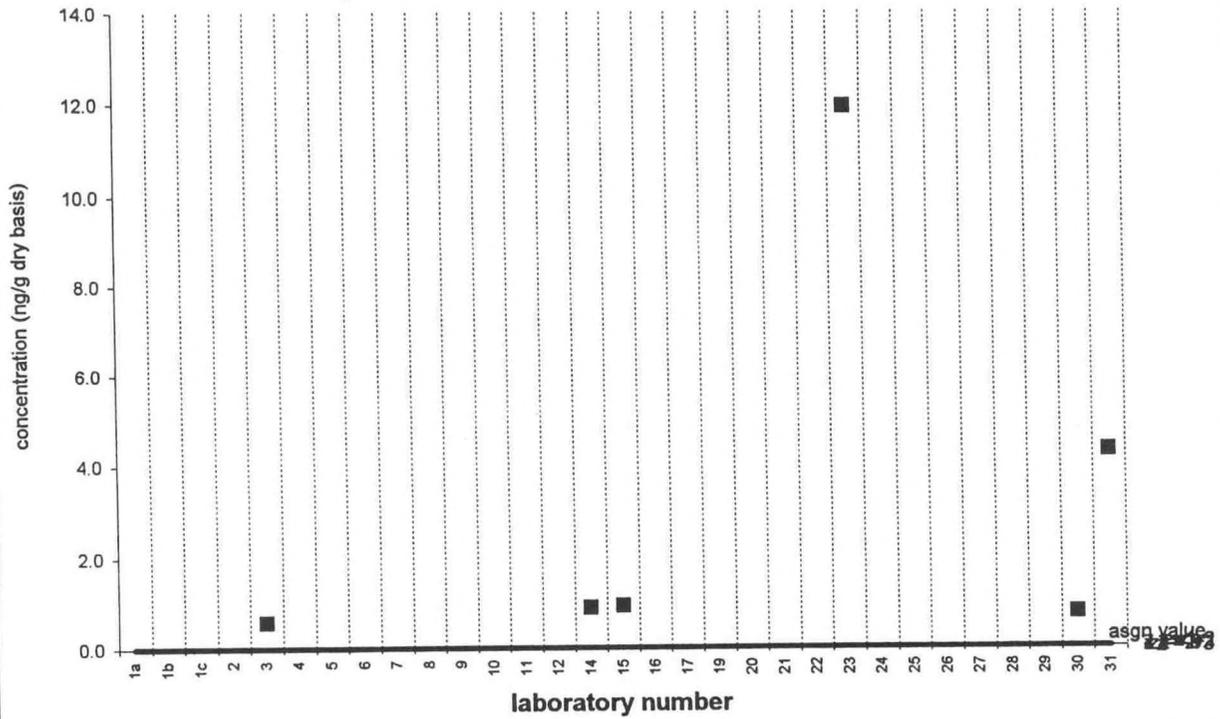

gamma-HCH

Sediment VIII (QA98SED8)

Assigned value = <2 ng/g (dry basis)

Reported Results: 23 Quantitative Results: 6

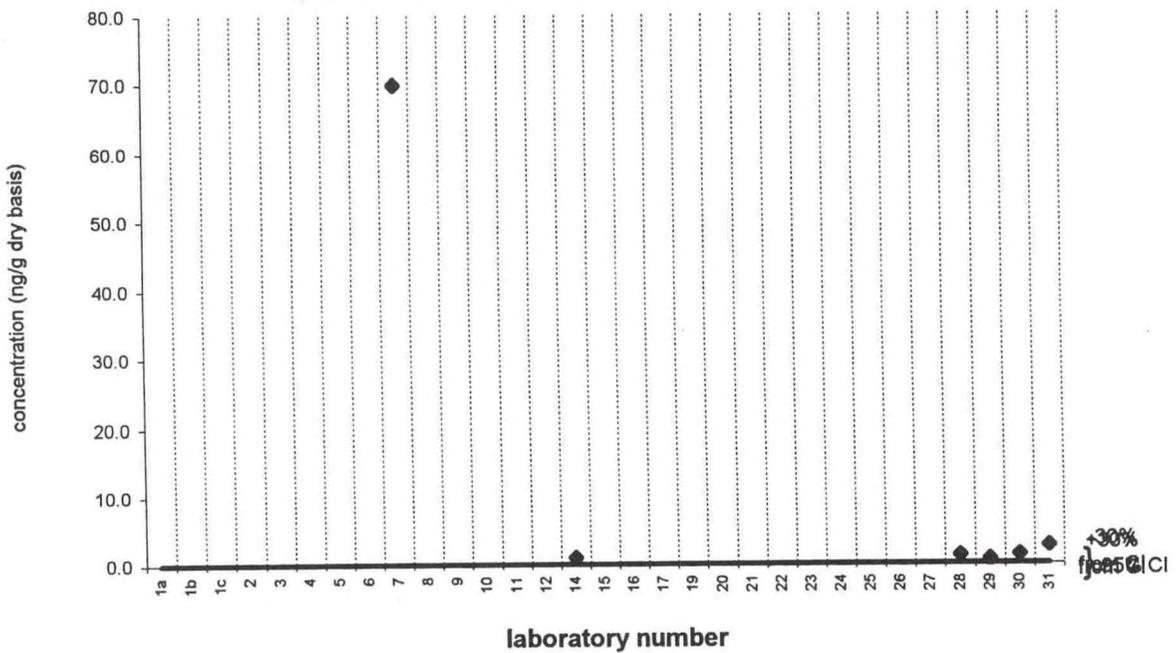

gamma-HCH

SRM 1941a

Target Value = <2 ng/g (dry basis)

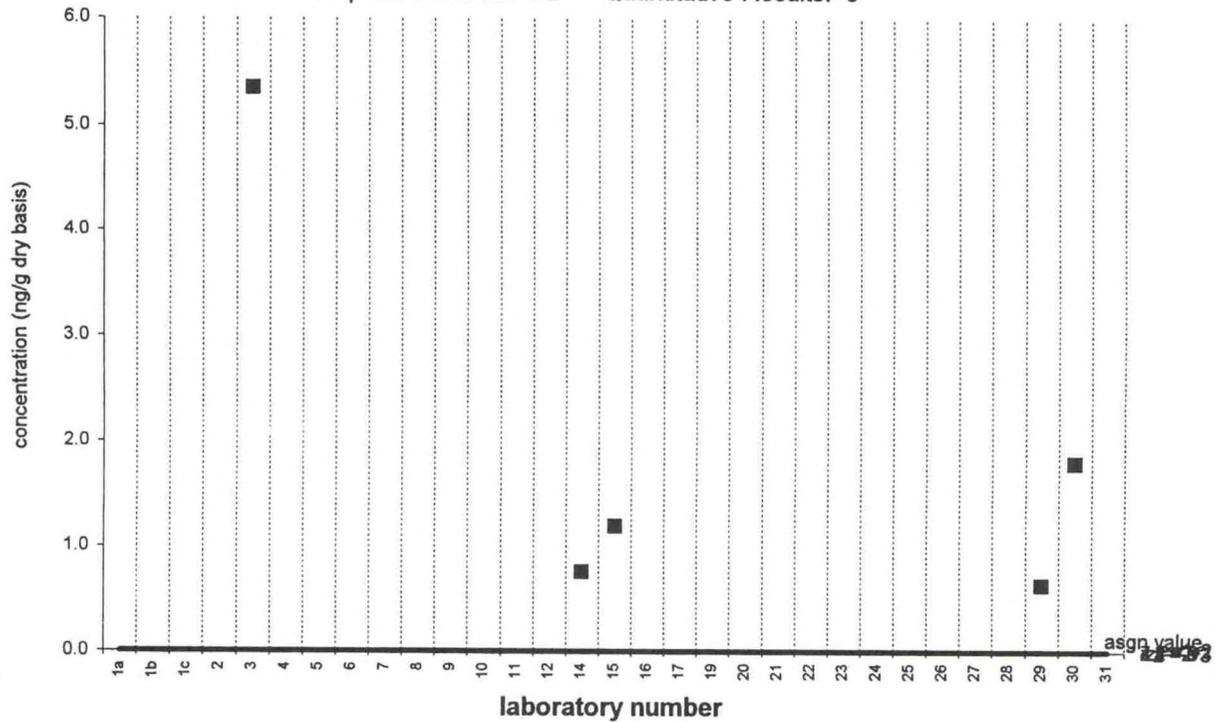

Reported Results: 21 Quantitative Results: 5

heptachlor

Sediment VIII (QA98SED8)

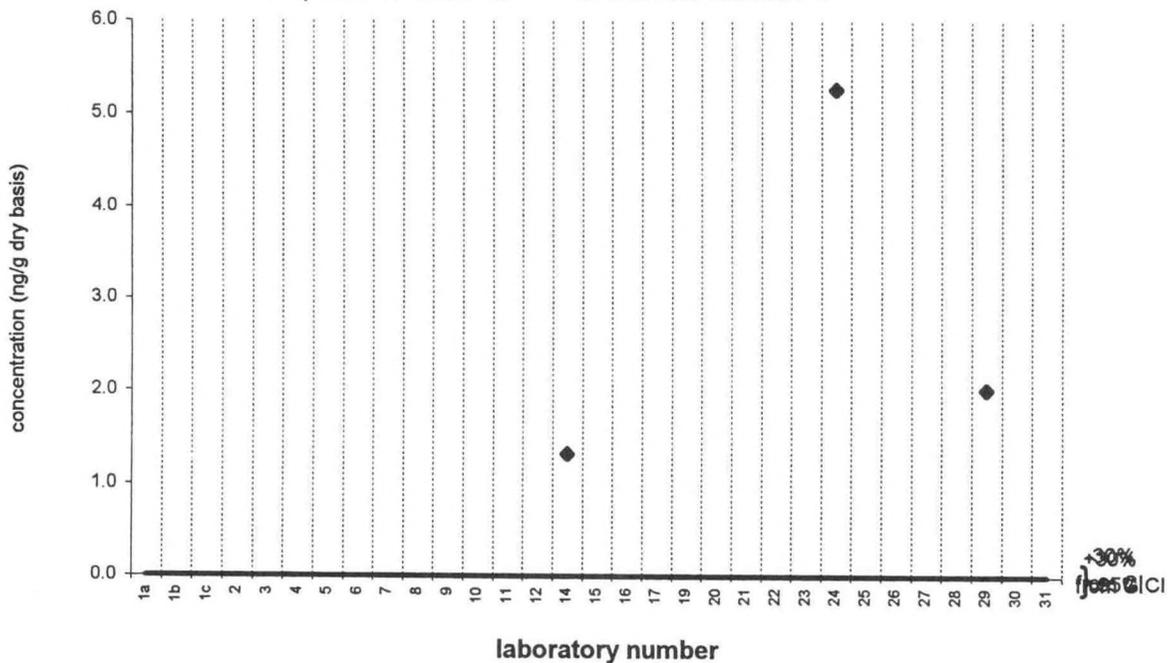

Assigned value = <2 ng/g (dry basis)
Reported Results: 22 Quantitative Results: 5

heptachlor

SRM 1941a

Target Value = <2 ng/g (dry basis)
Reported Results: 20 Quantitative Results: 3

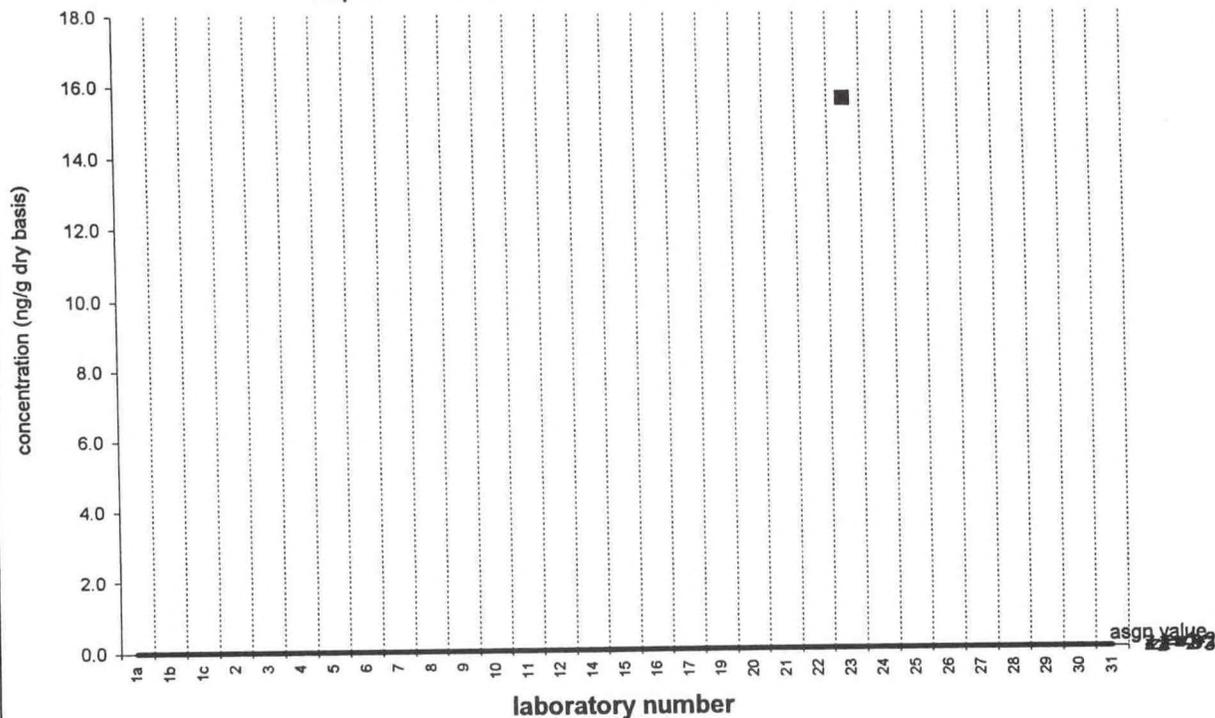

aldrin

Sediment VIII (QA98SED8)

Assigned value = <2 ng/g (dry basis)

Reported Results: 22 Quantitative Results: 1

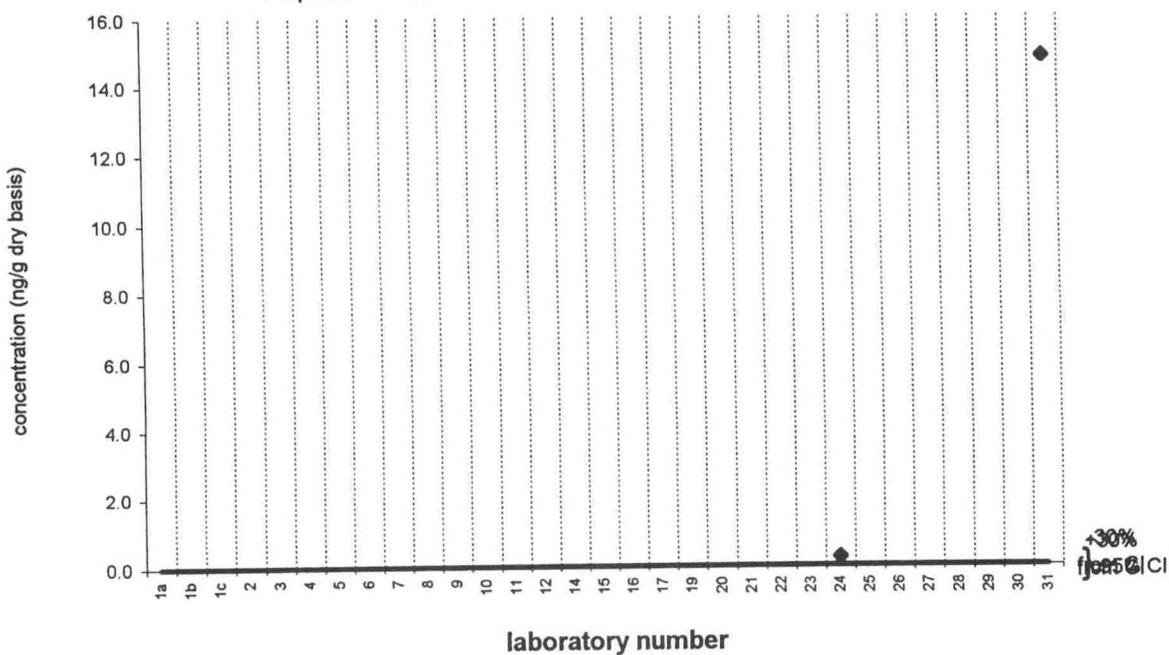

aldrin

SRM 1941a

Target Value = <2 ng/g (dry basis)

Reported Results: 20 Quantitative Results: 1

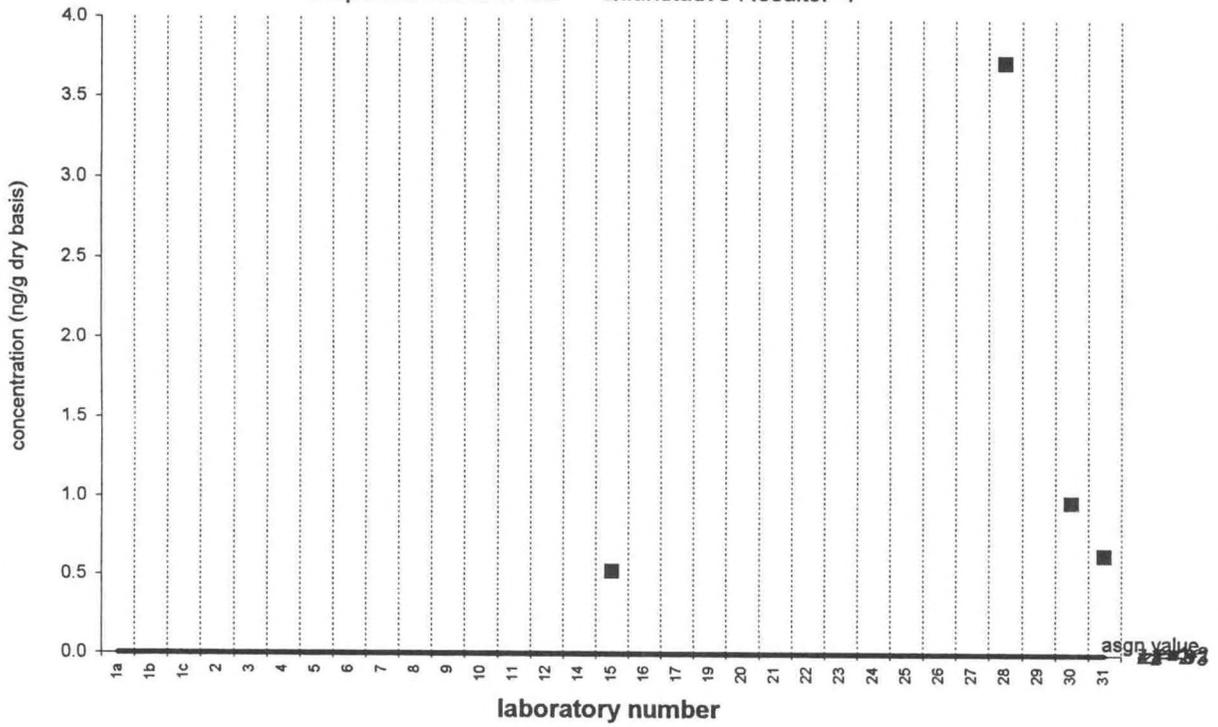

heptachlor epoxide

Sediment VIII (QA98SED8)

Assigned value = <2 ng/g (dry basis)

Reported Results: 22 Quantitative Results: 4

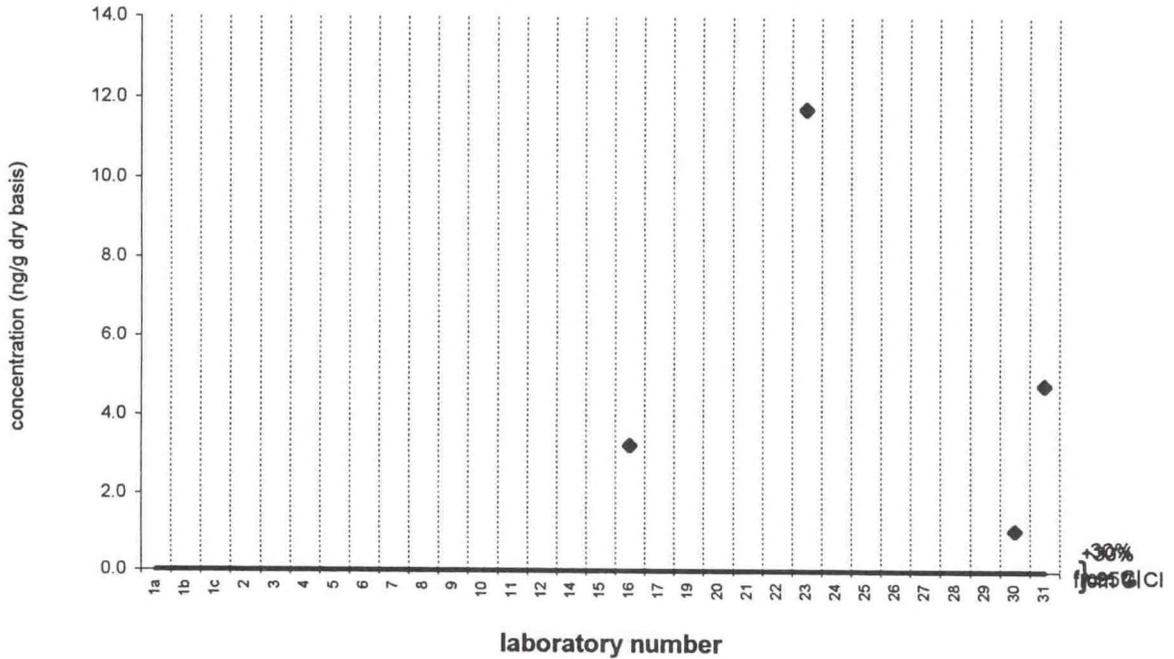

heptachlor epoxide

SRM 1941a

Target Value = <2 ng/g (dry basis)

Reported Results: 20 Quantitative Results: 3

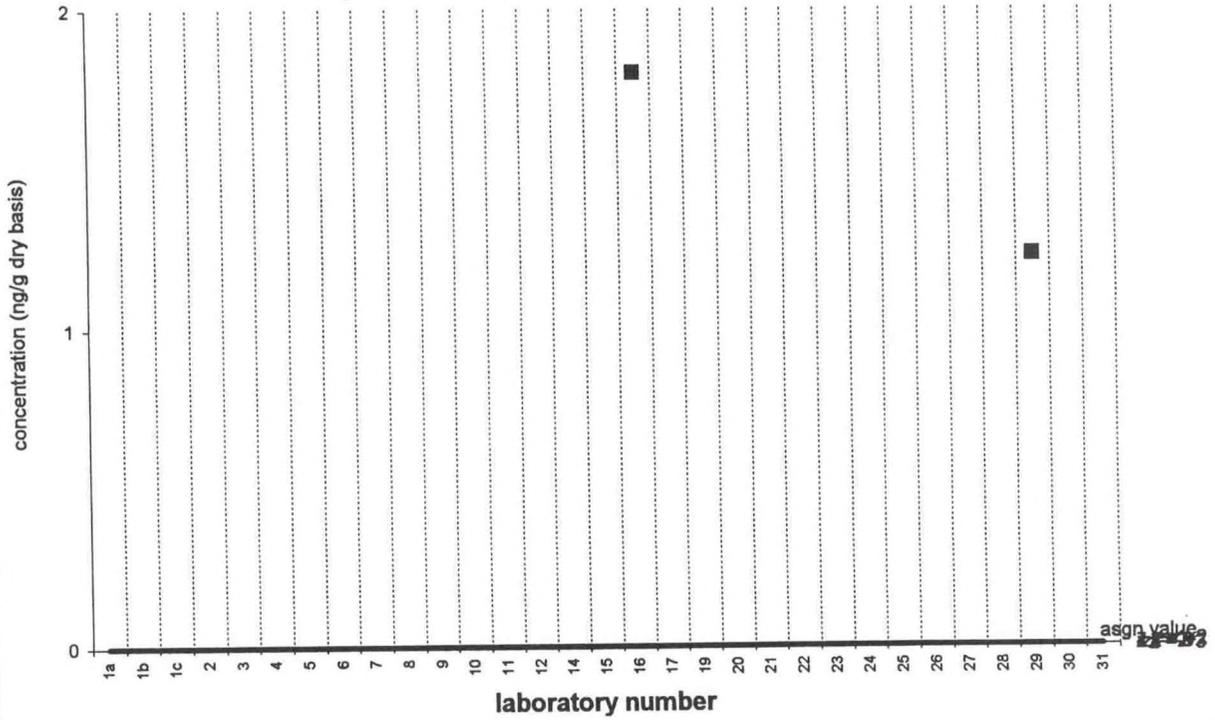

oxychlordanes

Sediment VIII (QA98SED8)

Assigned value = <2 ng/g (dry basis)

Reported Results: 17 Quantitative Results: 2

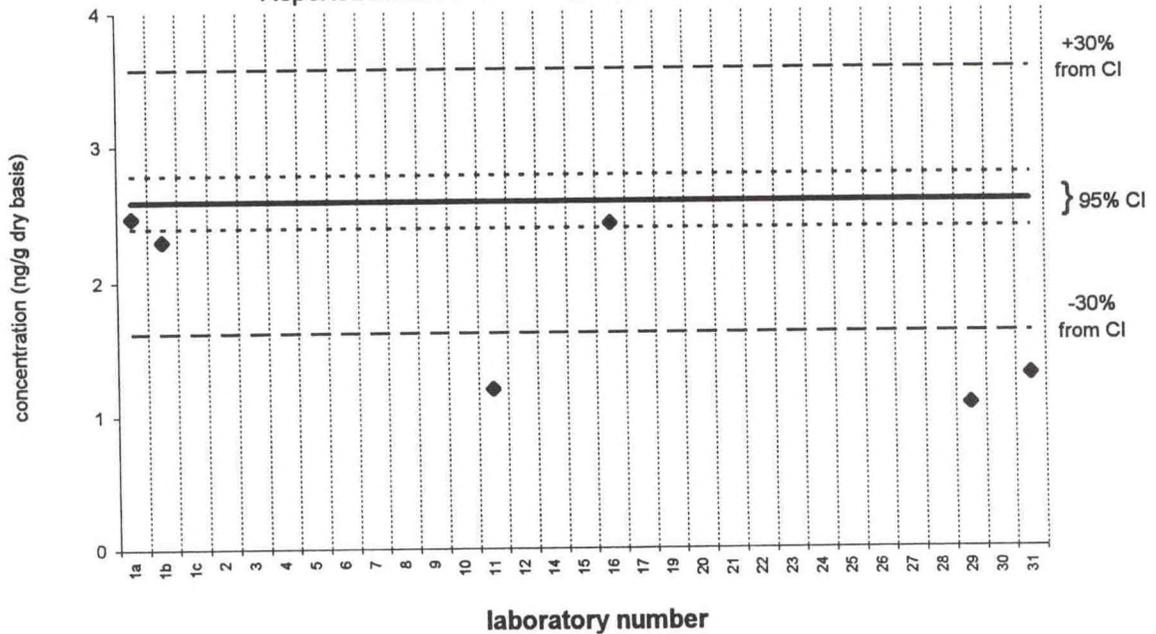

oxychlordanes

SRM 1941a

Information Value = 2.59 ± 0.20 ng/g (dry basis)

Reported Results: 16 Quantitative Results: 5

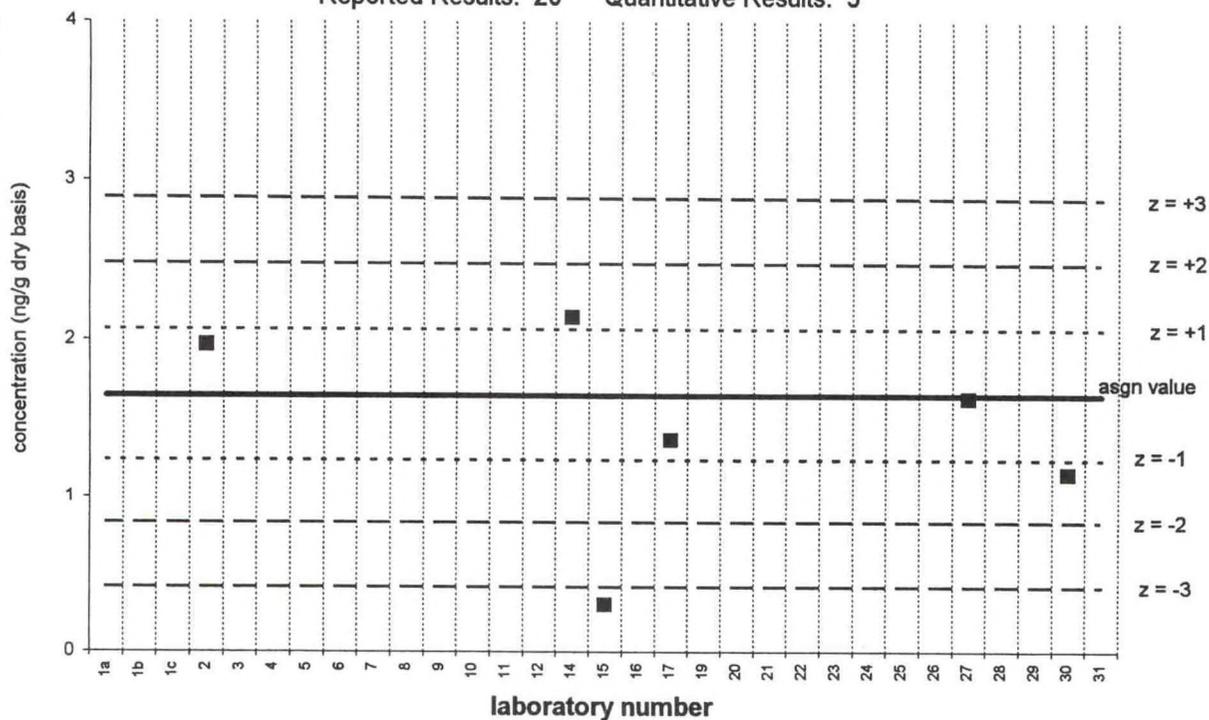

trans-chlordane

Sediment VIII (QA98SED8)

Assigned value = 1.65 ng/g $s = 0.41$ ng/g 95% CL = 0.51 ng/g (dry basis)

Reported Results: 20 Quantitative Results: 5

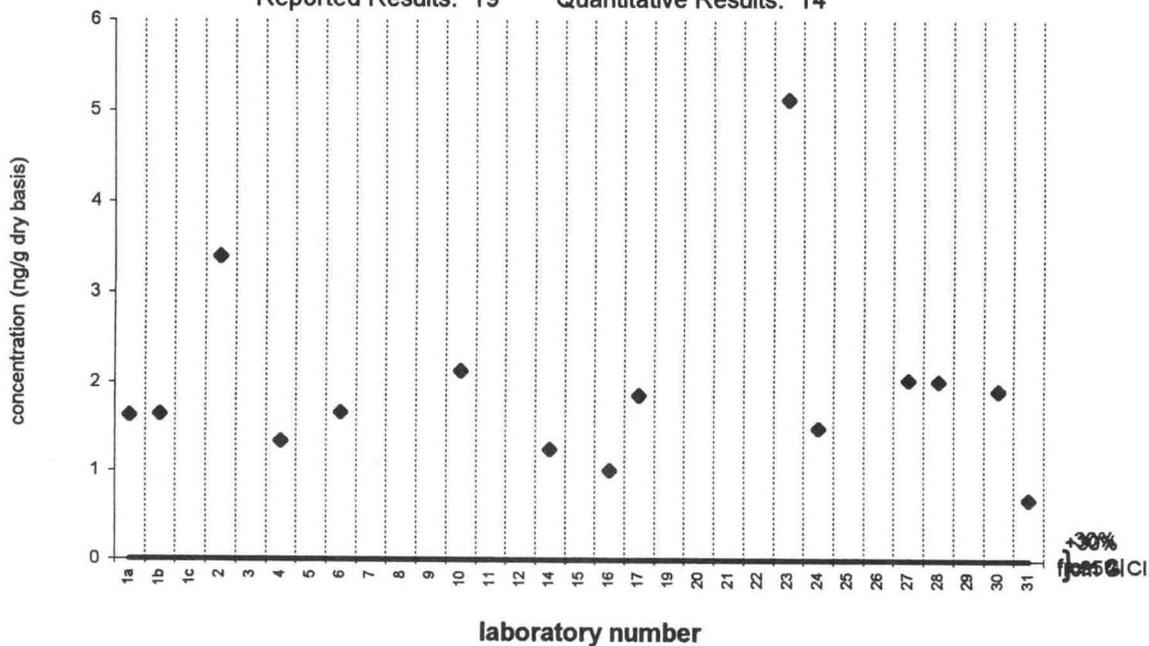

trans-chlordane

SRM 1941a

Target Value = <2 ng/g (dry basis)

Reported Results: 19 Quantitative Results: 14

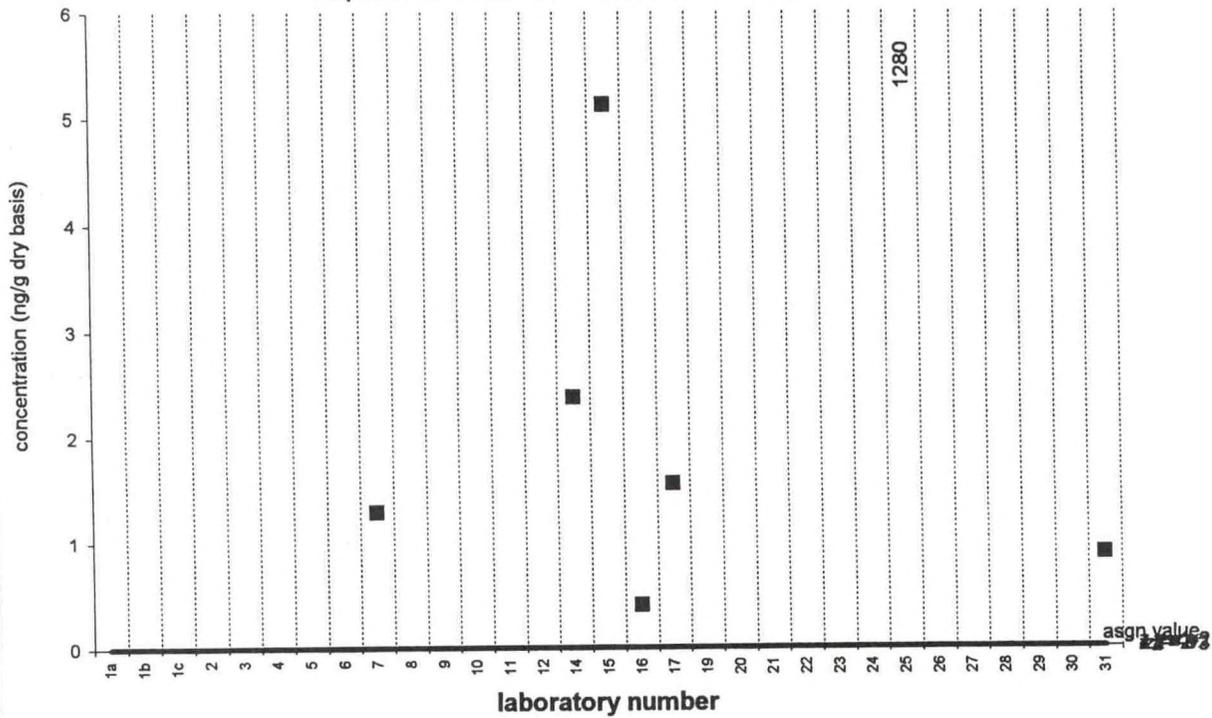

2,4'-DDE

Sediment VIII (QA98SED8)

Assigned value = <2 ng/g (dry basis)

Reported Results: 21 Quantitative Results: 7

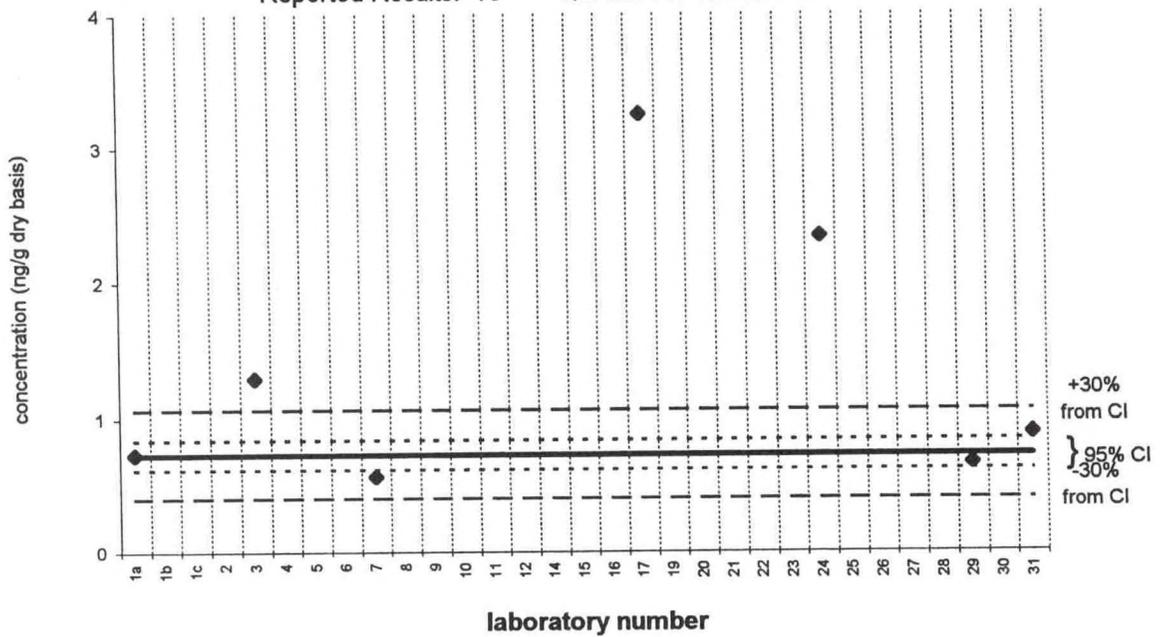

2,4'-DDE

SRM 1941a

Certified Value = 0.73 ± 0.11 ng/g (dry basis)

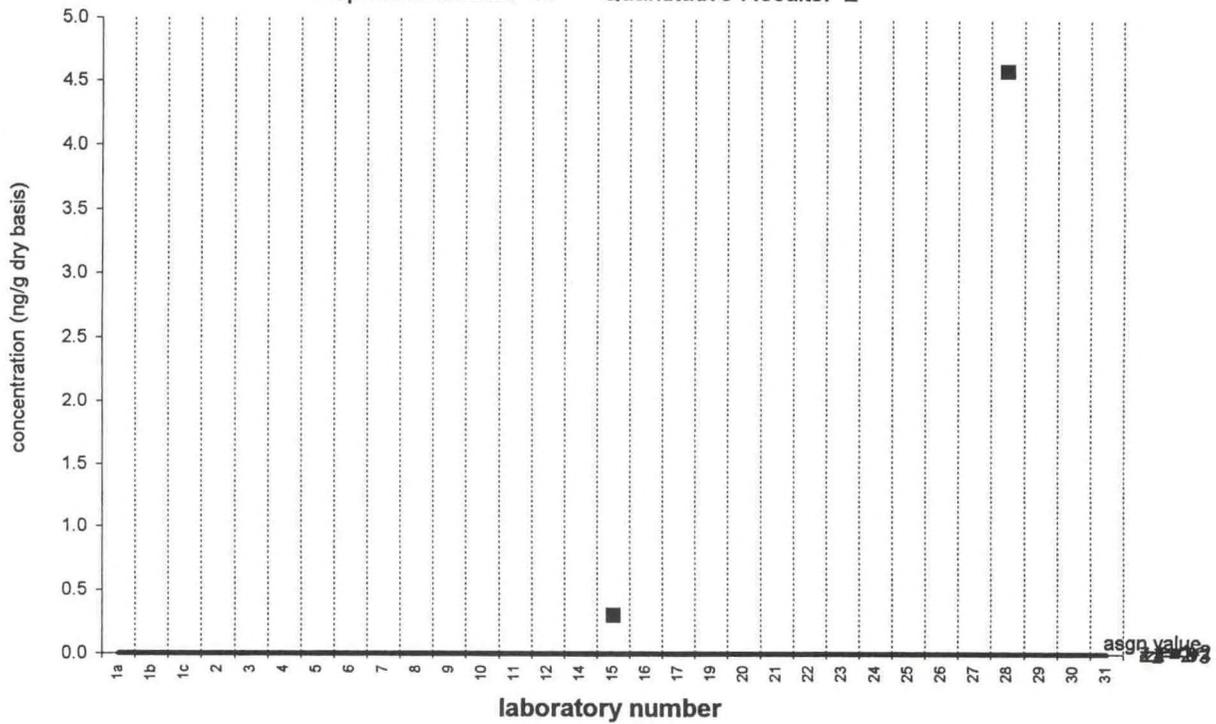

Reported Results: 18 Quantitative Results: 6

endosulfan I

Sediment VIII (QA98SED8)

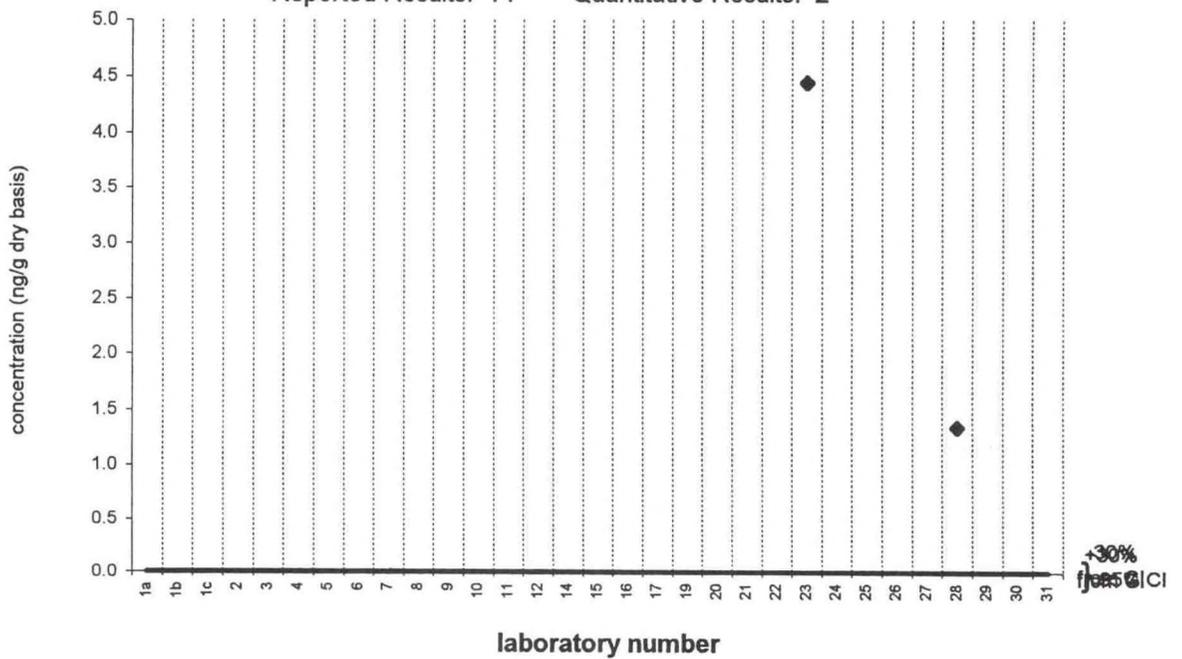

Assigned value = <2 ng/g (dry basis)
Reported Results: 15 Quantitative Results: 2

endosulfan I

SRM 1941a

Target Value = <2 ng/g (dry basis)
Reported Results: 14 Quantitative Results: 2

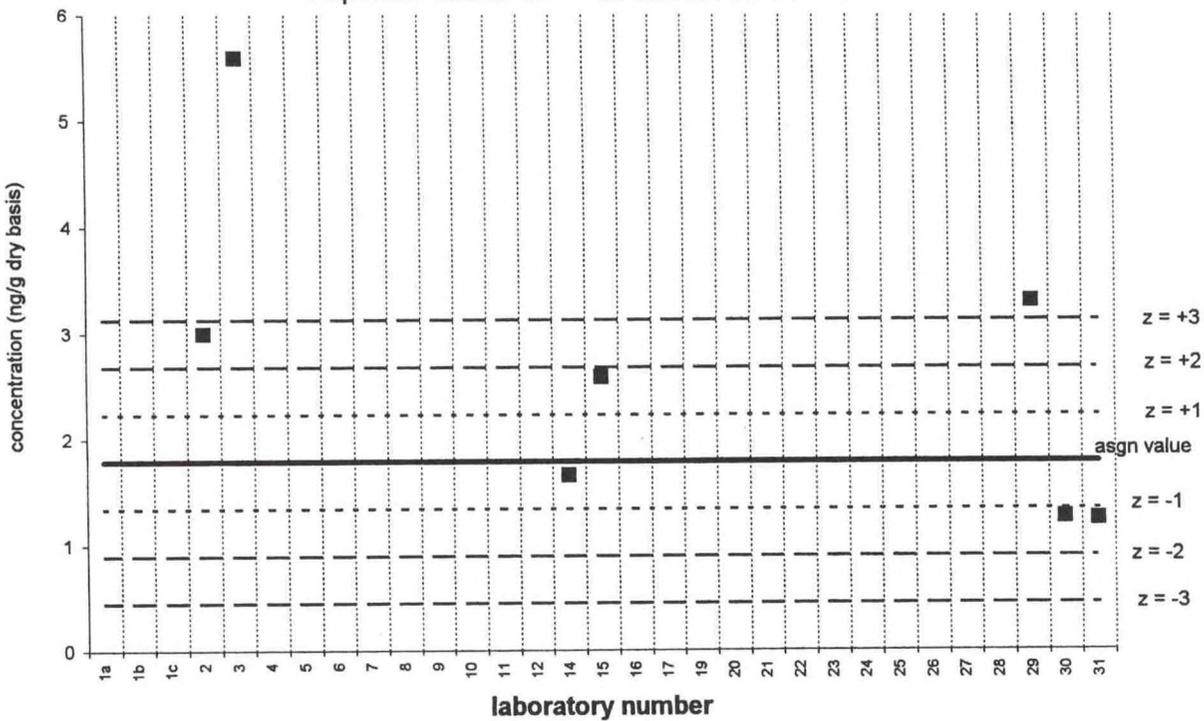

cis-chlordane

Sediment VIII (QA98SED8)

Assigned value = 1.78 ng/g s = 0.83 ng/g 95% CL = 1.32 ng/g (dry basis)

Reported Results: 23 Quantitative Results: 7

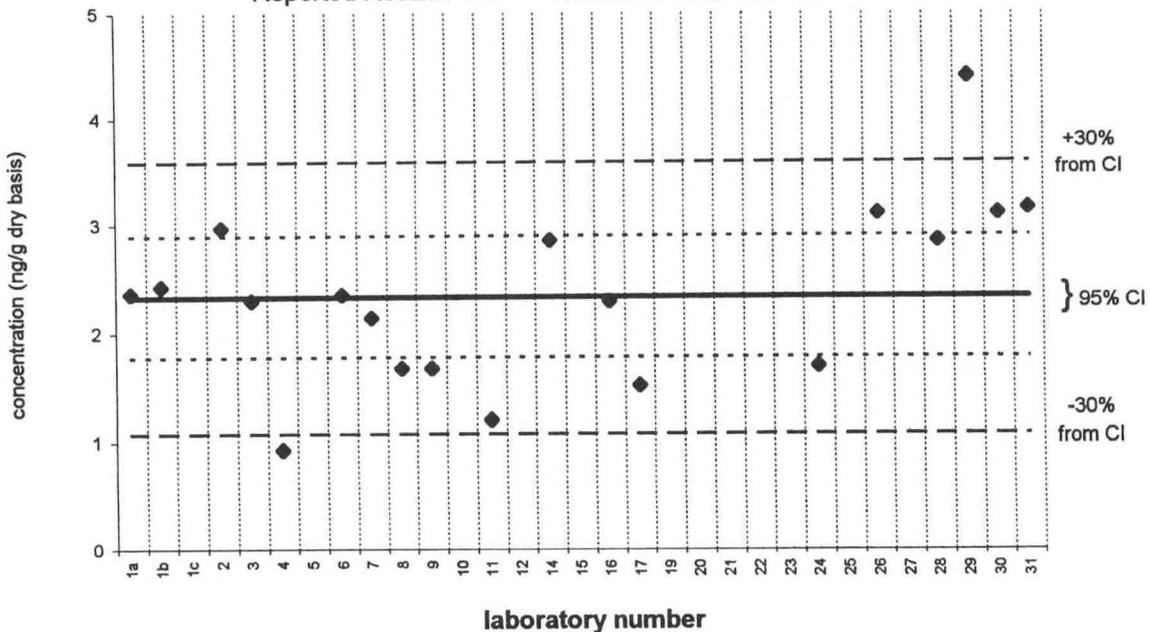

cis-chlordane

SRM 1941a

Certified Value = 2.33 ± 0.56 ng/g (dry basis)

Reported Results: 22 Quantitative Results: 18

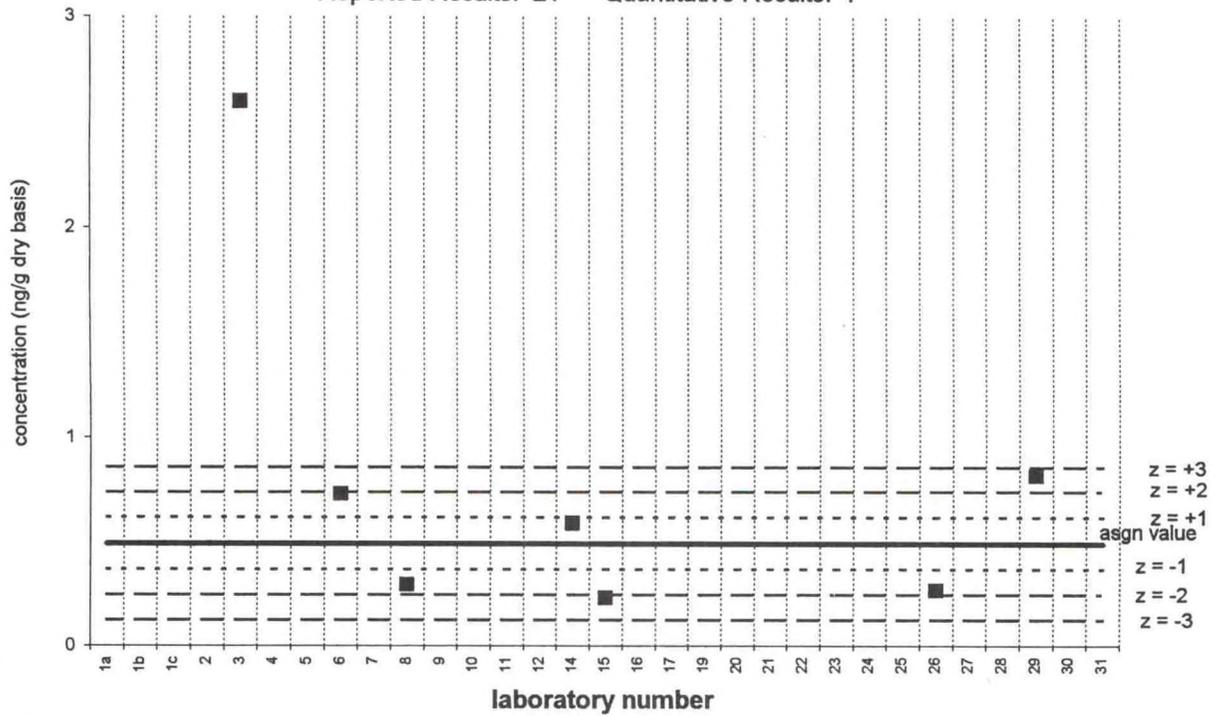

trans-nonachlor

Sediment VIII (QA98SED8)

Assigned value = 0.489 ng/g s = 0.259 ng/g 95% CL = 0.412 ng/g (dry basis)

Reported Results: 21 Quantitative Results: 7

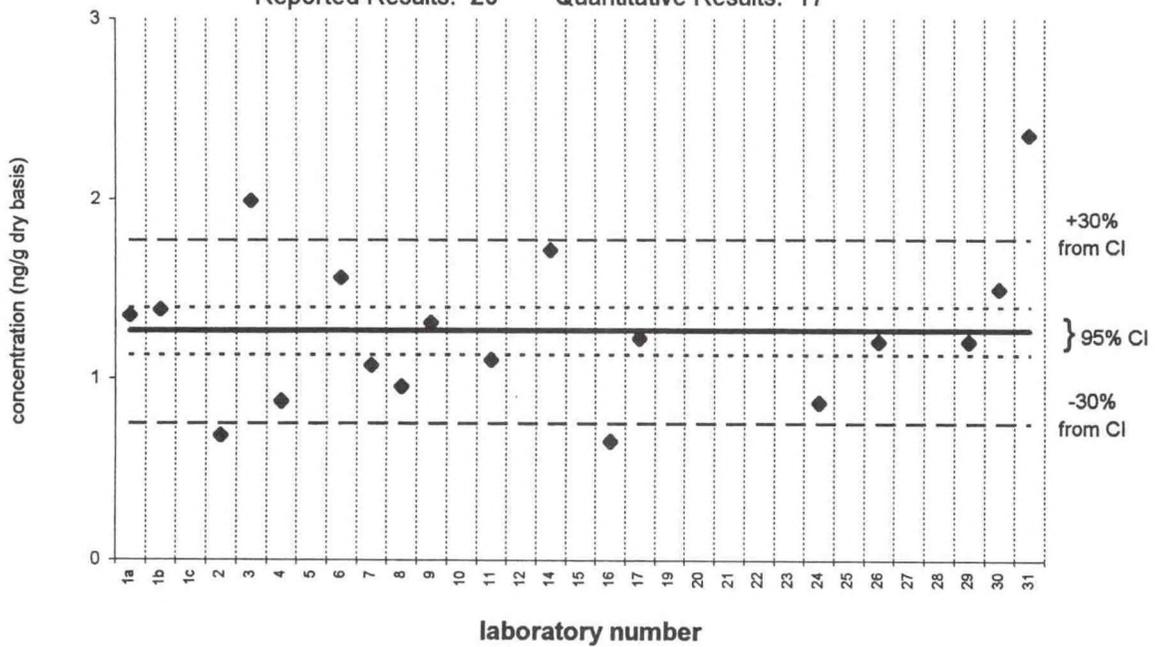

trans-nonachlor

SRM 1941a

Certified Value = 1.26 ± 0.13 ng/g (dry basis)

Appendix K: List of Laboratories Participating in 1998 Intercomparison Exercises

For this exercise, data was received from the following laboratories within the required timeframe. (This listing does NOT correspond to the laboratory number identification codes used in this report which were assigned in order of receipt of data with the exception of NIST-Gaithersburg which is Laboratory #1 in this exercise. The same code was used with both exercises.)

Armed Forces Institute of Pathology
Dept. of Environ. Toxicol. Path.
Bldg. 54, 6825 16th Street, NW
Washington, DC 20306-6000
Victor Kalasinsky

Arthur D. Little, Inc.
Acorn Park
Cambridge, MA 02140-2390
John Brown

B& B Laboratories
1902A Pinon C
College Station, TX 77845
Bernie B. Bernard

Battelle Ocean Sciences
397 Washington Street
Duxbury, MA 02332
Carole Peven

California Dept. of Fish and Game
Water Pollution Control Laboratory
2005 Nimbus Road
Rancho Cordova, CA 95670
David Crane / Kathleen Regalado

Central Contra Costa Sanitary District
5019 Imhoff Pl
Martinez, CA 94553
Bhupinder Dhaliwal

CIEMAT
Chemistry Program
Avda. Complutense, 22
28040-Madrid
Spain
R. Perez-Pastor

City of Los Angeles
Dept. of Public Works
Environmental Monitoring Division
222 North Sepulveda, Suite 1600
El Segundo, CA 90245
Zbyslaw J. Petryka

City of San Jose
Environmental Services Department
700 Los Esteros Road
San Jose, CA 95134
Eric Papp

East Bay Municipal Utility District
EBMUD Laboratory
2020 Wake Avenue
Oakland, CA 94607
Francois Rodigari

Environmental Protection Agency (EPA)
Office of Research and Development
Environmental Research Laboratory
27 Tarzwell Drive
Narragansett, RI 02882
Joseph LiVolsi

Environment Canada
Environmental Science Center
P. O. Box 23005
Corner of Morton & Archibald Streets
Moncton, New Brunswick E1A6S8
Canada
James Doull / Mireille Abi-Khattar

Institute for Marine Bioscience
National Research Council
1411 Oxford St.
Halifax, Nova Scotia B3H 321
Canada
Jonathan Curtis / Denise Le Blanc

Institute for National Measurement Standards
M-12, National Research Council of Canada
Montreal Road
Ottawa, Ontario K1A 0R6
Canada
Cathie Fraser / Graeme Gardner

King County Environmental Laboratory
322 W. Ewing St.
Seattle, WA 98119
Michael Doubrava

MD Department of Health and Mental Hygiene
Room 6B 13
201 West Preston St.
Baltimore, MD 21201
Jonathan R. Johnston

Murray State University
Chemical Services Laboratory
Rm 439 Blackburn Science Bldg.
Murray KY 42071-3306
Bomanna G. Loganathan

MWRA Central Lab, DITP
100 Taft Ave.
Winthrop, MA 02152
Tim Beaulieu / Steve Rhode

NIST
B208, Bldg. 222
Gaithersburg, MD 20899
Michele M. Schantz

NIST
Charleston Lab
219 Fort Johnson Road
Charleston, SC 29412
John Kucklick

NOAA NMFS
Auke Bay Laboratory
P. O. Box 210155
11305 Glacier Highway
Juneau, AK 99821
Marie Larsen

NOAA NMFS
Charleston Laboratory
217 Fort Johnson Road
Charleston, SC 29412
Dan Bearden

NOAA NMFS, F/NWC6
Environmental Conservation Division
2725 Montlake Boulevard, East
Seattle, WA 98112
Donald Brown

Old Dominion University
Applied Marine Research Laboratory
1034 West 45th Street
Norfolk, VA 23529
Rob McDaniel II

SIHN Depto. Oceanografia
Av. Montes de Oca 2124 (1271)
Buenos Aires - Argentina
Lucio Jose Janiot

Skidaway Institute of Technology
10 Ocean Science Circle
Savannah , GA 31411
Keith Maruya

State of Washington
Department of Ecology
Manchester Environmental Laboratory
7411 Beach Drive East
Port Orchard, WA 98366-8204
Stuart Magoon

Texas A & M University
GERG
833 Graham Road
College Station, TX 77845
Terry Wade

University of Rhode Island
Organic Geochemistry Laboratory
Graduate School of Oceanography
Horn Bldg., South Ferry Road
Narragansett, RI 02882
James G. Quinn

U. S. Geological Survey
National Water Quality Laboratory
5293-B Ward Road
Arvada, CO 80002
Ann Watterson

Virginia Bureau of Chemistry
Div. of Consolidated Laboratories
1 North 14th Street
Div of Water Quality
Richmond, VA 23219
Gail Johnson

Woods Hole Group
375 Paramount Dr, Suite B
Raynham, MA 02767
Peter J. Kane
