NOAA TECHNICAL MEMORANDA
National Weather Service, Pacific Region Subseries

The Technical Memoranda series provides an informal medium for the documentation and quick dissemination of results not appropriate, or not yet ready, for formal publication in the standard journals. The series is used to report on work in progress, to describe technical procedures and practices, or to report to a limited audience. These Technical Memoranda will report on investigations devoted primarily to regional and local problems of interest mainly to Pacific Region personnel and, hence, will not be widely distributed.

Papers 1 and 2 are in the former series, ESSA Technical Memoranda, Pacific Region Technical Memoranda (PRTM); papers 3-8 are in the former series, ESSA Technical Memoranda, Weather Bureau Technical Memoranda (WBTM); and papers 9-24 are part of the series, NOAA Technical Memoranda NWS.

Papers 1-3 are available from the Pacific Region Headquarters, Attention: OPS, P. O. Box 50027, Honolulu, HI 96850. Beginning with 4, the papers are available from the National Technical Information Service, U. S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22151. Prices vary for paper copy and microfiche. Order by accession number, when given, in parentheses at the end of each entry.

ESSA Technical Memoranda

No. 1 The Trade Wind Regime of Central and Western Maui. Carl M. Peterson. January 1966.

No. 2 A Meteorological Glossary of Terms Used by Forecasters in Hawaii (Revised). R. F. Shaw. November 1967.

No. 3 Utilization of Aircraft Meteorological Reports at WBFC Honolulu. E. M. Chadsey, P. R. Moore, R. E. Rush, J. E. Smith, J. Vederman. June 1967.

No. 4 Tropical Numerical Weather Prediction in Hawaii - A Status Report. E. M. Carlstead. November 1967. (PB-183-621)

No. 5 A Computer Method to Generate and Plot Streamlines. Roger A. Davis. February 1969. (PB-183-622)

No. 6 Verification of an Objective Method to Forecast Frontal Passages in the Hawaiian Islands. E. M. Carlstead. September 1969.

No. 7 Meteorological Characteristics of the Cold January 1969 in Hawaii. Richard I. Sasaki. November 1969. (PB-188-040)

No. 8 Giant Waves Hit Hawaii. Jack D. Bottoms. September 1970. (COM-71-00021)

TROPICAL STORM GREG - August 20-22, 1981

GREG was born T.D. 8E off the coast of Mexico near 16N 112W on August 13, 1981. The Eastern Pacific Hurricane Center (EPHC) issued its first bulletin on T.D. 8E at 130900 GMT. At that time, the depression had maximum sustained winds estimated at 30 knots. T.D. 8E was upgraded to a tropical storm and named GREG on the 14th at 1800 GMT with maximum sustained winds of 40 knots. GREG followed a westerly course for several days and maintained tropical storm intensity.

As he approached 140W, he intensified and became a hurricane at 200600 GMT. His life as a hurricane was short lived. He moved under strong upper level southwesterlies and the resulting shearing action caused him to weaken rapidly. GREG was downgraded to a tropical storm at 201800Z, just prior to crossing 140W. Responsibility for GREG was passed to the Central Pacific Hurricane Center (CPHC) at this time. The first bulletin by the CPHC was issued at 210300 GMT. GREG continued to weaken and was downgraded to a tropical depression at 211800 GMT (Fig. 1). T.D. GREG maintained a well defined circulation for another 24 hours.

The CPHC issued 8 advisories on the storm with the last bulletin issued at 222100 GMT. There were no reports of damages or casualties to ships.

Verification statistics (Fig. 2) verified the 24-hour CPHC forecast and forecasts from the EPHC77, EPANLG, and EPCLPR models. All computations were made using the best track positions.

Figure 2

TROPICAL STORM JOVA - September 18-20, 1981

JOVA began as T.D. 12E on September 14, 1981. The Eastern Pacific Hurricane Center (EPHC) issued its first bulletin at 141200 GMT. T.D. 12E intensified rapidly and was upgraded to a tropical storm and named JOVA at 141800 GMT. JOVA continued to strengthen and reached hurricane intensity 24 hours later at 151800 GMT. From her birth to the time she reached hurricane intensity, JOVA moved in a westerly direction. Between 151800 and 160000 GMT, the storm took a northerly track and moved toward the west northwest, reaching a maximum intensity of 75 knots.

As JOVA approached 140W, she began to weaken and turned toward the west again (Fig. 3). JOVA was downgraded to a tropical storm at 181200 GMT and passed to the Central Pacific Hurricane Center (CPHC). CPHC issued its first bulletin at 182100 GMT. JOVA continued to weaken over the next 48 hours while moving westward at 15 to 18 knots. As she approached 150W, an upper level trough and a rapidly moving mid latitude low north of the Hawaiian Islands began to lend their influence to the storm's movement and JOVA began to move toward the west northwest (Fig. 3). As a tropical storm, JOVA passed within 90 miles of the island of Hawaii at 201200 GMT. She was downgraded to a depression at 201800 GMT. The track of T.D. JOVA brought her within 60 miles of the eastern coasts of Maui, Molokai, and Oahu. During this period she deteriorated rapidly and the final bulletin by CPHC was issued at 210300 GMT.

JOVA's positions and intensities while in the CPHC's area were determined almost entirely by satellite fixes and estimations using DVORAK's techniques. However, as JOVA neared the Hawaiian Islands, ship KCKB at 200000 GMT reported winds of 090 degrees 35 knots 135 miles northwest of the storm's center. At 200600 GMT the same ship reported winds of 050 degrees 35 knots 125 miles north of the center.

The CPHC issued 10 advisories on the storm. There were no reports of damages or casualties to ships.

In view of the rapid speed of movement (about 50% higher than normal) that JOVA moved through the CPHC area, the CPHC 24-hour error of 81.1 miles was extremely gratifying. Climatologically, systems moving through the same area that JOVA did average 10 knots.

Verification statistics in Fig. 4 verified the 24-hour CPHC forecast and forecasts from the EPHC77, EPANLG and EPCLPR models. Statistical computations on the MFM and 48-hour forecasts were not made due to an insufficient number of cases. All computes were made from the best track positions.

NOAA SCIENTIFIC AND TECHNICAL PUBLICATIC

NOAA, the *National Oceanic and Atmospheric Administration,* was established as part of the Department of Commerce on October 3, 1970. The mission responsibilities of NOAA are to monitor and predict the state of the solid Earth, the oceans and their living resources, the atmosphere, and the space environment of the Earth, and to assess the socioeconomic impact of natural and technological changes in the environment.

The six Major Line Components of NOAA regularly produce various types of scientific and technical information in the following kinds of publications:

PROFESSIONAL PAPERS — Important definitive research results, major techniques, and special investigations.

TECHNICAL REPORTS—Journal quality with extensive details, mathematical developments, or data listings.

TECHNICAL MEMORANDUMS — Reports of preliminary, partial, or negative research or technology results, interim instructions, and the like.

CONTRACT AND GRANT REPORTS—Reports prepared by contractors or grantees under NOAA sponsorship.

TECHNICAL SERVICE PUBLICATIONS—These are publications containing data, observations, instructions, etc. A partial listing: Data serials; Prediction and outlook periodicals; Technical manuals, training papers, planning reports, and information serials; and Miscellaneous technical publications.

ATLAS—Analysed data generally presented in the form of maps showing distribution of rainfall, chemical and physical conditions of oceans and atmosphere, distribution of fishes and marine mammals, ionospheric conditions, etc.

Information on availability of NOAA publications can be obtained from:
