NOAA TECHNICAL MEMORANDUMS

Environmental Data Service Series

service (EDS) is responsible for storing, retrieving, and publishing data developing systems to process and present NOAA data in the most useful histories. These data, which relate to the solid earth, ocean, atmosphere, and extra-basic input in scientific and engineering studies having broad application in science, and industry.

NOAA Technical Memoranda EDS series facilitate rapid dissemination of studies and reports which may be preliminary in nature and which may be published formally elsewhere at a later date. Publications 1 and 2 are in the former series, Weather Bureau Technical Notes (TN), publications 3 to 17 are in the former series, ESSA Technical Memoranda, Environmental Data Service Technical Memoranda (EDSTM). Beginning with 18, publications are now part of the series, NOAA Technical Memoranda EDS.

Publications listed below are available from the National Technical Information Service, U.S. Department of Commerce, Sills Bldg., 5285 Port Royal Road, Springfield, VA 22161. Price: Various for paper copy; \$3.00 microfiche. Order by accession number shown in parentheses at end of each entry.

Weather Bureau Technical Notes

- TN 33 Part 1: Weather and Disease. H. E. Landsberg. Part 2: Solar Radiation and Skin Cancer Deaths. G. D. Brinckerhoff. February 1966. (PB-169-813)
- TN 43 A Bibliography of Meso- and Micro-Environmental Instrumentation. John F. Griffiths and M. Joan Griffiths, July 1966. (PB-173-088)

ESSA Technical Memorandums

- EDSTM 3 Climatological Aspects of Air Pollution in West Virginia. Robert O. Weedfall, January 1967. (PB-176-905)
- EDSTM 4 Estimates of Winds at Constant Heights Generated From Winds Observed at Constant Pressure Surfaces. H. L. Crutcher, H. B. Harshbarger, R. L. Durham, F. T. Quinlan, J. D. Matthews, and W. B. Tschiffely, February 1967. (PB-174-499)
- EDSTM 5 Synoptic Aspects of Mortality: A Case Study. Dennis M. Driscoll, February 1967. (PB-174-500)
- EDSTM 6 A Technique for Determination of a Climatology of High Altitude Balloon Trajectories. Frank T. Quinlan and Lee R. Hoxit. October 1968. (PB-180-200)
- EDSTM 7 Minimum Temperature Patterns Over New York State on Two Winter Nights. A. Boyd Pack, February 1969. (PB-183-398)
- EDSTM 8 Coastal Weather and Marine Data Summary for Gulf of Alaska, Cape Spencer Westward to Kodiak Island. Harold W. Searby, May 1969. (PB-184-784)
- EDSTM 9 A Bibliography of Weather and Architecture. John F. Griffiths and M. Joan Griffiths, April 1969. (PB-184-969)
- EDSTM 10 A Note on Climatology of Thailand and Southeast Asia. H. L. Crutcher, S. Bintasant Nash, and D. K. Kropp, May 1969. (PB-187-569)
- EDSTM 11 Meteorological Drought in West Virginia. Robert O. Weedfall, September 1969. (PB-187-474)

HEATING AND COOLING DEGREE DAYS FOR TENNESSEE

Dewayne L. Ingram¹ and Henry A. Fribourg²

ABSTRACT. Warm and cold season monthly heating and cooling degree days for 40 Tennessee locations are tabulated for base temperatures 55°, 60°, 65°, and 70°F. Included also are a map and brief discussion of Tennessee temperature climate, and a table of mean monthly temperature at these locations. The length of record used is 30 yr (1941-70) for most stations.

INTRODUCTION

Heating and cooling degree days can be used to characterize the climate of Tennessee in general, and in particular can be used to estimate heating and cooling requirements in areas throughout the State. Because of the simplicity of the degree day method it has been widely used to guide agricultural operations, to plan land usage, and to maximize energy conservation efforts.

The realization in this country of the need for energy conservation has stimulated consideration of federal and State energy policies. Information concerning heating and cooling requirements at specific locations helps put reliable facts into study and action programs involving utilization and conservation of energy. Heating and cooling degree days are also a help in long-range planning by agriculturists, contractors, and persons in business and industry. This information can help engineers determine insulation requirements in a specific area, and help in greenhouse planning. Cooling degree days information can be used to estimate summer stress on humans and animals, and air conditioning needs.

The degree day method is very helpful in the prediction of planting and harvesting dates for many crops. The food processing industry needs to know when certain crops will be harvested, to plan for peak processing periods (Chang 1971; Shaw 1975). This is done by fitting growth patterns of crops to the accumulation of degree days through the several stages of plant growth. Heating and cooling degree days also can be used in universities and other agencies dealing with public services. Information concerning heating and/or cooling degree days during the time an experiment is in progress could help the investigator more accurately interpret the results.

¹Formerly Graduate Research Assistant in Ornamental Horticulture and Landscape Design, University of Tennessee, now Assistant Professor of Ornamental Horticulture, University of Florida, Gainesville.

²Professor of Plant & Soil Science, University of Tennessee, Knoxville.

This report presents heating and cooling degree days for 40 locations throughout Tennessee. The heating degree days were determined for four base temperatures (55° , 60° , 65° , and 70°F) and the cooling degree days for three (60° , 65° , and 70°F). The degree days obtained at the different base temperatures could help users evaluate differences in maintaining indoor temperatures economically at these various bases. A greenhouse producer might be considering producing a winter crop that requires a minimum temperature of 65°F , while another requires a minimum temperature of only 55°F . The heating degree days required to maintain these two temperatures could allow the producer to examine the costs and returns for the two crops in advance, and determine which crop would yield the best return on the investment.

GENERAL CLIMATE OF TENNESSEE

Tennessee falls within the "humid subtropical" subtype of "humid mesothermal" climates. In most years, there are four distinct seasons of about equal duration caused by easterly movement of migratory high and low pressure systems across the State. Weather systems which influence the State originate either in the interior portion of North America or over the Gulf of Mexico, which is the primary source of moist and warm air.

The terrain differs across Tennessee. The State extends from the rocky crest of the southern Appalachian Mountains in the east to the Mississippi River flood plain in the west (figure 1). Statewide average annual temperatures vary from 60°F in the southwest to near 45°F at the higher elevations in the mountains.

The mountains in the eastern end of the State range up to 6,000 ft above sea level. These mountains and the Cumberland Plateau play an important role in the temperature pattern in East Tennessee, since temperature is greatly affected by topography. Temperature generally decreases 3°F for each 1000-ft increase in elevation. This factor accounts for most of the real temperature variations in East Tennessee. Thus, the temperature is lower on the Cumberland Plateau and in the mountains than in the Great Valley which lies between these two regions. In the Great Valley temperatures increase from north to south and are comparable to those in Middle and West Tennessee in southern counties. The Plateau has cooler summers and colder winters than the Valley. Temperatures in East Tennessee generally remain somewhere between 10°F and 80°F throughout the year. Daily averages are normally near 35°F in January and 75° - 80°F in July.

West Tennessee is relatively flat to gently rolling. The elevation is about 300 ft above sea level in Memphis and increases slightly toward the east. The average annual temperature of 60° - 65°F in West Tennessee is the warmest in the State. Temperatures generally remain somewhere between 20°F and 90°F throughout the year. Daily average temperatures are normally near 45°F in January and 80°F in July. Mississippi River bottomland locales generally average 2° to 3°F warmer than locations farther east.

SOURCES OF DATA

The temperature data used for calculating the degree days were obtained from daily observations collected by National Weather Service Climatological Cooperative stations and first-order stations, and Tennessee Agricultural Experiment Station research stations.

An attempt was made to select as many stations as possible to better characterize all areas of the State. It should be recognized that the data obtained at an observation site are most representative of the immediately-surrounding area, and that the temperature in a specific area will be affected by the immediate topography within that area. The 40 sites reported in this publication are shown in figure 1.

The temperatures used in this study were observed in louvered ventilated wooden shelters following standards of the National Weather Service (U. S. Dept. of Commerce 1970). Daily minimum and maximum air temperatures were obtained with minimum and maximum thermometers. The standard height of observation is 5 ft above the ground.

It was intended that 30 yr of continuous records, ending in 1970, be used from each site. The entire 30-yr record was not available for a few stations, and the exact length of record used for each station is given in table 1. Stations with less than 30 yr of continuous records were included in the study, with proper reference to the length of record, to maintain a reasonably regular sampling density across the region.

For some stations, data values were missing for short periods. Although such situations occurred with varying frequency among sites and years, computations were done using all days for which both daily maximum and minimum temperatures were available.

PRESENTATION OF DATA AND METHODS OF COMPUTATION

Since the temperature data base was very large (over 400,000 days), digital computer programs were used for quality control procedures on the original entries, to calculate the appropriate statistics, and to summarize and tabulate the results.

The National Weather Service publishes normal and mean heating and cooling degree days at a base of 65°F, usually on monthly and annual bases (U. S. Dept. of Commerce 1973). Normal values are the arithmetic average of 30 yr of record, in accord with standards set by the World Meteorological Organization.

DEGREE DAYS

The heating degree day is a measurement of the departure of the mean daily temperature below a selected base temperature. Conversely, the cooling degree day is a measure of the departure of the mean daily temperature above a selected base temperature. For example, if the base temperature is 65°F and the mean daily temperature was 48°F, then there are 17 heating degree

days for that particular day. If the base temperature for cooling degree days is 70°F and the mean daily temperature was 80°F, then there are 10 cooling degree days for that day. If the same occurred for a 30-day month, there would be 300 degree days for that month. Annual degree days are the sum of the monthly degree days.

Monthly and annual heating degree days for the 40 locations at base temperatures of 55°, 60°, 65°, and 70°F are presented in tables 2, 3, 4, and 5, respectively. It can be noted that the number of heating degree days at the 65°F base, for example, is larger than the number of heating degree days at a lower base, such as 55°F. This would be expected, since it takes more heat input to maintain a 65°F temperature in a building during winter than it would take to maintain 55°F.

The monthly and annual cooling degree days are presented in tables 6, 7, and 8, for bases of 60°, 65°, and 70°F, respectively. As would be expected, the number of cooling degree days is larger at lower base temperatures, for example, 60°F than at higher bases. The extent of this difference depends upon the general temperature regime at each specific location.

In the tables, the average and maximum monthly degree days and the average annual degree days, calculated from the years of record, are presented for all locations. The maximum monthly degree days represent the maximum number of degree days observed in each particular month over the period of available data.

EDS 21 Bibliography of the Urban Modification of the Atmospheric and Hydrologic Environment. John F. Griffiths and M. Joan Griffiths, February 1974. (COM-74-10962/AS)

EDS 22 Probability of Sequences of Wet and Dry Days for Tennessee. John M. Safley, Jr., Henry A. Fribourg, John V. Vaiksnoras, and Rodney H. Strand, September 1974. (COM-75-10650)

EDS 23 Probability of Low and High Temperatures in Tennessee. Henry A. Fribourg and Dewayne L. Ingram, March 1978.

NOAA SCIENTIFIC AND TECHNICAL PUBLICATIONS

The National Oceanic and Atmospheric Administration was established as part of the Department of Commerce on October 3, 1970. This mission responsibilities of NOAA are to assess the socioeconomic impact of natural and technological changes in the environment and to monitor and predict the state of the solid Earth, the oceans and their living resources, the atmosphere, and the space environment of the Earth.

The six Major Line Components of NOAA regularly produce various types of scientific and technical information in the following kinds of publications:

PROFESSIONAL PAPERS — Important definitive research results, major techniques, and special investigations.

TECHNICAL REPORTS — Journal quality with extensive details, mathematical developments, or data listings.

TECHNICAL MEMORANDUMS — Reports of preliminary, partial, or negative research or technology results, interim instructions, and the like.

CONTRACT AND GRANT REPORTS — Reports prepared by contractors or grantees under NOAA sponsorship.

TECHNICAL SERVICE PUBLICATIONS — These are publications containing data, observations, instructions, etc. A partial listing: data serials; prediction and outlook periodicals; technical manuals, training papers, planning reports, and information serials; and miscellaneous technical publications.

ATLAS — Analyzed data generally presented in the form of maps showing distribution of rainfall, chemical and physical conditions of oceans and atmosphere, distribution of fishes and marine mammals, ionospheric conditions, etc.

Information on availability of NOAA publications can be obtained from:
