39. Bumpus, D. F. (1965) RESIDUAL DRIFT ALONG THE BOTTOM ON THE CONTINENTAL SHELF IN THE MIDDLE ATLANTIC BIGHT SEA

Plastic and brass sea-bed drifters have been used to investigate residual drift along the bottom on the continental shelf, between Nantucket Shoals and the offing of Delaware Bay. Some conclusions: the residual drift is variable; there is a definite residual drift toward the mouths of estuaries; the rate of residual flow varies from < 0.1 to 0.7 nautical miles per day, but more frequently 0.2 to 0.5 nautical miles per day; the recoveries are biased by the intensity of bottom trawling in certain areas.

REF: Limnology and Oceanography, Supplement to volume 10, pages R48 to R53, 1965. Lawrence, Kansas

40. Bumpus, D. F., and L. M. Lauzier (1965) SURFACE CIRCULATION ON THE CONTINENTAL SHELF OFF EASTERN NORTH AMERICA BETWEEN NEWFOUNDLAND AND FLORIDA

Drift bottles were released at various points along the Continental Shelf. Extensive data with maps are presented to show the number of bottles released, percent recovered, place and time of recovery, for each month of year, from which the circulation is plotted for nontidal drift for each (direction and speed).

REF: Serial atlas of the marine environment, American Geographical Society, New York, New York, 1965.

41. Burton, I., R. W. Kates, J. R. Mather, and R. E. Sneed (1965)
THE SHORES OF MEGALOPOLIS: COASTAL OCCUPANCE AND HUMAN
ADJUSTMENT TO FLOOD HAZARD

From Maine to Cape Hatteras 1302 miles of shore were studied with one sample area in Delaware covering 8% of the state shore (at Bethany Beach). The history of the Bethany area is described, as well as the physical features--sand dunes, mean low and high tide areas, zonal uses: industrial, commercial, public, residential, recreational, agricultural. The emphasis is on the adjustment to storm damage, and human use of the shore.

REF: Publications in Climatology, volume 18, number 3, pages 435-603, 1965.

42. Byron, G. (1969) DELAWARE'S WETLANDS

Wetlands comprise 1/8 of the state's area. Flora and fauna of wetlands and estuaries form interdependent patterns in which all elements contribute and share. In 1930's some marshes were ditched and drained to decrease number of mosquitoes, only to threaten survival of black ducks and muskrats that lived in these wetlands. Reviews history of muskrat trapping.

60. Cronin, L. E. (1964) THE ROLE OF MAN IN ESTUARINE PROCESSES

The effect of diversions of water from Delaware River to New York City is discussed. Predictions by Ketchum and biologists on effects of salinity change. Segerstraale (1951) reported that avg. changes of 0.5 - 75° /00 produced significant changes in the effective distribution of estuarine species. Discusses effects of additions of heat on a continuous basis. Also discusses changes in salinity, modifications of shape of estuaries, effect of biocides, addition of nutrient chemicals, radioactive waste, pulp waste, geological process, biological processes and activity in the ocean, operating control of modification of estuaries. Such control now dispersed among many states and federal legislative bodies, executive agencies, and public will. Example given: Massachusetts recently requires review and prior approval of all proposed modification of marshlands, shores and coastal lands. This law overrides the privilege of private ownership in recognition of the effects of such modification on public interest.

61. Cronin, L. E., F. C. Daiber, and E. M. Hurlburt (1962)
QUANTITATIVE SEASONAL ASPECTS OF ZOOPLANKTON IN THE DELAWARE RIVER ESTUARY

The Delaware estuary was sampled quantitatively for zooplankton over a 2-year period. The total standing crop of zooplankton was always greatest in the estuary with smaller catches in the river and in the ocean. The species were identified and their relative abundance described. Gives detailed description of the Delaware Estuary, drainage area, tidal influences, flow of river. Plankton collections made at quarterly intervals to embrace extremes of temperature and river-flow.

85. Delaware Bay Transportation Company Feasibility Study Group (1970) STATEMENT SUBMITTED TO THE GOVERNOR'S TASK FORCE ON MARINE AND COASTAL AFFAIRS, STATE OF DELAWARE

Delaware Bay Transportation Company is owned by four oil companies; has been joined by nine others to form and finance the feasibility study group. Their plan, presented December 1970 at Dover, consists of the following elements: Use of large supertankers; an offshore terminal located 6 1/2 miles off Big Stone Beach. Two submerged pipelines connecting this receiving terminal to the shore, offshore tank storage facilities on property owned by the above oil companies, an onshore pipeline from the storage facilities to the participating refineries. There is complete assurance that these plans are in line with concern for the preservation of the environment. The history and details of the project are discussed, map, graph, and 2 engineering drawings of proposed facility.

97. Fischer, A. G. (1961) STRATIGRAPHIC RECORD OF TRANSGRESSING SEAS IN LIGHT OF SEDIMENTATION ON THE ATLANTIC COAST OF NEW JERSEY

The presently transgressing sea has a marginal low and intermediate energy zone of tidal marshes and lagoons, protected from the wave energy of the open ocean by barrier beaches. Peats and muds are being deposited in the tidal marshes, sands and muds in the lagoons. The sands are largely derived from the ocean and deposited as tidal deltas, which start as gaps in the barrier beaches and grow across the lagoon toward the mainland. Implications for sedimentology and stratigraphy.

102. Goldfield, M. O., R. P. Kandle, and Sussman (1967) PROGRESS REPORT ON ARBOVIRUS STUDIES IN NEW JERSEY

In 1966 only one case of arbovirus encephalitis was recognized in a New Jersey hospital. This was a California virus. Most of the potential host isolations have been from mammals. A natural cycle of mammals--Aedes mosquitoes--has been suggested. This finding makes the continued surveillance of California virus activity imperative. This study has been greatly expanded in New Jersey.

106. Groot, J. J. (1966) SOME OBSERVATIONS ON POLLEN GRAINS IN SUSPENSION IN THE ESTUARY OF THE DELAWARE RIVER

Pollen spectra of samples of suspended and bottom sediments in the Delaware River estuary represent the regional vegetation of the basin as a whole rather than local plant communities. There appears to be a relationship between the number of pollen grains and the quality of mineral matter in suspension suggesting that the two types of particles are transported together and in similar fashion, that is, primarily by water currents.

138. Jordan, R. R. (1969) SUSPENDED AND BOTTOM SEDIMENTS IN THE DELAWARE ESTUARY

Abstracts of papers presented in meetings in 1968. Suspended and bottom sediments in the Delaware Estuary, major clay minerals. Sediment concentration, textural parameters, and mineralogy do not show clear correlation with location, current velocities or directions, salinity or other measured variables in the estuary. Preliminary conclusions are: (1) transportation through Delaware estuary appears to have little effect on textures or mineralogy of suspended sediment; (2) upper portion of estuary is filling with stream-derived sediment, and this deposition is selective only with regard to sand sizes; (3) lower bay is filling with coarse materials probably derived from the Continental Shelf and the Ocean Shores; (4) the estuary is so agitated, mostly by tidal

currents, that the transportation of suspended sediment is not a very selective process.

152. Kent, R. E. (1958) TURBULENT DIFFUSION IN A SECTIONALLY HOMOGENEOUS ESTUARY

The U. S. Army Corps of Engineers Delaware Estuary model at Vicksburg was used to verify a theoretical development. An equation is derived which involves a variable coefficient of eddy diffusion.

REF: Technical Report 16, reference 58-1, 1958. Chesapeake Bay Institute, The Johns Hopkins University, Baltimore, Maryland

153. Kent, R. E. (1960) DIFFUSION IN A SECTIONALLY HOMOGENEOUS ESTUARY

Turbulent diffusion in a well-mixed tidal estuary is considered. A theory is presented from which quantitative predictions of mean pollutant concentration distribution may be obtained for an estuary characterized by a steady-state salinity and velocity fields which are considered to vary only in the axial direction. Flushing investigations were conducted by the Army Corps of Engineers at the Waterways Experiment Station at Vicksburg, Mississippi, on the model of the Delaware River and Bay Estuary; these data were employed in the present study. Representative data demonstrating the agreement between the model and prototype salinities are given in figure 2. There are 14 figures and 17 references.

REF: American Society of Civil Engineers, Proceedings, Sanitary Engineering Division, volume 86, pages 15-47, 1960.

154. Ketchum, B. H. (1952) DISTRIBUTION OF SALINITY IN THE ESTUARY OF THE DELAWARE RIVER

To determine the relationship between river flow and the salinity in various parts of the estuary of the Delaware River, the study included a review of data on the distribution of fresh and salt water in the coastal water immediately outside the Delaware Capes. The salinity is inversely related to river flow; under present natural conditions the range of variation of salinity expected for the high and low river flows would be greatest near the head of the bay; the predicted changes are found farther downstream during high river flows and farther up-stream during low flows.

REF: Reference 52-103, pages 1-52, December 1952. Woods Hole Oceanographic Institute, Woods Hole, Massachusetts

155. Ketchum, B. H. (1953) PRELIMINARY EVALUATION OF THE COASTAL WATER OFF DELAWARE BAY FOR THE DISPOSAL OF INDUSTRIAL WASTES

Summary of data for 1951-1952; salinity and temperature of the waters and recent studies for the U. S. Navy Hydrographic Office. About 3000 drift bottles were released in the area immediately off Delaware Bay extending about 50 miles along the coast and 40 miles offshore. The local currents and rates of exchange have been evaluated. Enumerates general coastal conditions, conditions of circulation, distribution of salinity, and temperature off the bay, the rate of circulation, drift-bottle returns, flushing times and diluting volumes in the bay, and recommendations on waste disposal in the proposed disposal area.

REF: Reference 53-31, 1953. Woods Hole Oceanographic Institute, Woods Hole, Massachusetts

156. Ketchum, B. H., and D. J. Keen (1955) ACCUMULATION OF RIVER WATER OVER THE CONTINENTAL SHELF BETWEEN CAPE COD AND CHESAPEAKE BAY

The depth mean salinities for the waters of the Continental Shelf show a seasonal variation in the concentration of river water. The spring and the winter accumulations are about the same, but about 25% more river water is present in the summer. The total volume of fresh water in spring and winter is equivalent to that produced by the rivers in about one and a half years. The extra accumulation in summer is equal to

a half year's flow and reflects, in part, the fact that the high spring flows of two successive years are present on the shelf at this time. Drainage areas and flows from Delaware are presented, and the horizontal mixing coefficients normal to the coast have been computed.

159. Kraft, J. C. (1968) COASTAL SEDIMENTARY ENVIRONMENTS LEWES-REHOBOTH BEACH, DELAWARE

Many varied sedimentary environments are under study. Environments include bays, inlets from open marine and tidal deltas, baymouth bars and dunes, marshes and tidal creeks, transgressive beaches and marsh fringes of Delaware Bay. Preliminary results are summarized. Has 13 pages.

REF: Guidebook, Annual Fieldtrip of the Northeastern Section, Society of Economic Paleontologists and Mineralogists, Tulsa, Oklahoma, September 1968

160. Kraft, J. C. (1968) TRANSGRESSIVE FACIES PATTERNS IN DELAWARE COASTAL AREA

Studies of recent sediments in coastal Delaware show complex sediment-distribution patterns resulting from lateral and vertical movements of successive environments of deposition over a Pleistocene unconformity. Recent sediments are infilling a drowned topography with a local relief of 70 feet and possibly up to 125 feet eroded on highly variable Pleistocene sediments. Cores of sediments taken under shallow bays (Rehoboth, Indian River and Assawoman Bays) and in fringing marsh environments show that the depositional units are thin, highly irregular in areal extent, extremely variable in thickness, and difficult to project. Sedimentary processes active in the shallow bays include shoreline marsh erosion and formation of thin, possibly ephemeral beach-dune complexes of clean well-sorted sand.

162. Kraft, J. C. (1971) SEDIMENTARY FACIES PATTERNS AND GEOLOGIC HISTORY OF A HOLOCENE TRANSGRESSION

Holocene sediments in coastal Delaware show complex sediment distribution patterns resulting from lateral and vertical movement of successive environments of deposition over a Pleistocene unconformity. These sediments are infilling a drowned topography. Larger depositional features forming around eroding Pleistocene headlands and infilling the estuaries include characteristic shoreline environments, such as dunes, spits, and baymouth barriers, a network of intertidal deltas, nearshore marine erosional-depositional sands and gravel, and lagoons or estuaries, with adjoining marshes.

164. Kraft, J. C., and G. Margules (1969) CORRELATION OF FORAMINIFERA DISTRIBUTION WITH SEDIMENT FACIES PATTERNS AND PHYSICAL DATA IN INDIAN RIVER BAY, COASTAL DELAWARE

The physiographic setting, bottom-sediment facies patterns, and salinity, temperature, pH, Eh, and organic content of the water mass and bottom sediments of the Indian River Estuary compared with the distribution of living benthonic foraminifera. Twelve genera, 23 facies, of foraminifera identified and separated into 6 geographically distinctive facies groups. Bottom sediment types range from dark grey mud in center and west to a well-sorted clean sand in the tidal delta to the east. No significant correlation found between patterns of foraminifera abundance and the distribution of sediment types.

168. Lauff, G. H., ed. (1964) ESTUARIES

Papers presented at conference on estuaries held at Jekyll Island, Georgia, 31 March - 3 April 1964. Subjects: definitions, physical factors, geomorphology, sediments and sedimentations, microbiota nutrients and Biological production, ecology and population, physiology and evolution, fisheries, and human influences. Much of the discussion is general, but the Delaware Estuary is mentioned a few times.

Papers on "physical factors" concern circulation and diffusion, circulation in Coastal Plain estuaries, salt balance and circulation in partially mixed estuaries, salinity measurements, and methods and devices for measuring currents.

"Sediments and sedimentation" papers deal with origin of sediments, sediment transport, rates of sediment accumulation, littoral drift and tidal inlets, sediments of Chesapeake Bay, and the compactness variability of estuarine sediments.

181. Mather, J. R., N. Adams, III, and G. A. Yoshioka (1964) COASTAL STORMS OF THE EASTERN UNITED STATES

Storms resulting in damage to the East Coast over the past 42 years have been classified into: synoptic situations; hurricanes; wave developments in the vicinity of Cuba; wave developments in Florida or the nearby coastal water; wave developments in the Gulf of Mexico; inland depressions; secondary cyclonic disturbances in the Hatteras area, intense cyclones moving northeastward, west of the coast, and strong cold fronts with associated squall lines. The seasonal and geographical distributions of these storm types were investigated. Delaware had 20 storms during this period or about 1 every two years. Of these 8 were of the hurricane type,

etc. 1 storm was severe, 13 moderate, and 6 light. Damage from coastal storms will undoubtedly increase significantly in the years to come as development of the coastal area proceeds.

REF: Journal of Applied Meteorology, volume 3, number 6, pages 693-706, 1964. American Meteorological Society, Boston, Massachusetts

182. Mather, J. R., R. T. Field, and G. A. Yoshioka (1967) STORM DAMAGE HAZARD ALONG THE EAST COAST OF THE UNITED STATES

Study of damage during the past 40 years has revealed a significant increase in the past decade. Reasons for this increase are analyzed. Man's generally unrestricted development of the outer coastal margin, as well as a slight intensification of coastal cyclones, has contributed. A storm as damaging as the one in March 1962 would be expected once every 20 years. The New Jersey, Maryland, and Delaware coasts and that from South Carolina to Florida seem to have a relatively low storm damage potential.

194. Moody, D. W. (1964) COASTAL MORPHOLOGY AND PROCESSES IN RELATION TO THE DEVELOPMENT OF SUBMARINE SAND RIDGES OFF BETHANY BEACH, DELAWARE

"Offshore there are 14 sand ridges which develop contemporaneously with the westward migration of a barrier beach. These ridges are spaced 500-800 meters apart and meet the barrier beach at 5-6 meter depths below mean low water. Comparison of surveys made in the past 42 years (1919-1961) indicate the ridges have moved southeast a maximum distance of 250 meters while the shoreline has migrated 25-85 meters landward, etc.

"The distribution and stratigraphic relationships of Quaternary Sediments in eastern Sussex County, Delaware, indicate a complex history of erosion and deposition in fluvial, estuarine, and marine environments. As sea level fell during the late Wisconsin glaciation, the ancestral Delaware River probably transported sands and gravel across the coastal plain and continental shelf, etc."

201. O'Connor, D. J. (1960) OXYGEN BALANCE OF AN ESTUARY

The dissolved-oxygen profile depends on the concentration of the organic material, its rate of oxidation, and the resulting rate of aeration. These interrelationships are described by a differential equation under steady state conditions. The assumption of constant coefficients in

the equation is confirmed by field data from estuarine surveys of the Delaware and James Rivers. Chlorides, BOD, and dissolved oxygen values are given and the curves fitted.

205. Oostdam, B. L., and R. N. Swift (1970) VARIATIONS IN TIDAL CURRENTS, SALINITY AND TURBIDITY ACROSS THE DELAWARE BAY MOUTH

Current salinity and turbidity data were collected at five depths throughout complete cycles and used to calculate suspended-sediment transport rates. Suspended water appears to travel in "turbidity clouds". Turbidities increased from top to bottom with distinctly lower values during ebb for the upper 2/3 of the water column. Salinity increased from top to bottom with maximum difference of 2.1 percent just before a slack tide.

209. Paulson, R. W. (1969) LONGITUDINAL DIFFUSION COEFFICIENT IN THE DELAWARE RIVER ESTUARY AS DETERMINED FROM A STEADY-STATE MODEL

An analytic solution of the one-dimensional steady-state diffusion equation for a conservative substance in an estuary of constant depth in which the half-width is related to the

longitudinal distance and may be found if the turbulent diffusion coefficient is given a general form. Data from Torresdale, Pennsylvania, to Reedy Island, Delaware, where fresh-water inflow has been measured and the channel geometry satisfies the requirements. Salinity data to test the solution were also available for the mathematical modeling. Analysis of data indicates that for low fresh water inflow K_x is of the order of 100 m/sec and that for most operational purposes, K_x may be assumed to be a constant.

212. Paulson, R. W. (1970) VARIATION OF THE LONGITUDINAL DISPERSION COEFFICIENT IN THE DELAWARE RIVER ESTUARY AS A FUNCTION OF FRESHWATER INFLOW

Three solutions of the one-dimensional steady-state diffusion equation for a conservative substance (ocean salinity) were derived for an estuary whose cross-sectional area increases linearly in the seaward direction. The three solutions were tested with U. S. Geological Survey water-quality-monitor data for five stations between Torresdale, Pennsylvania, and Reedy Island. The longitudinal dispersion coefficient in the estuary increased with fresh water inflow to the estuary. This is in disagreement with Harleman (Proc. 2nd

Int'l Water Pollution Res. Conf., Tokyo, 1964. Pergamon Press, N. Y., pages 279-306, 1965.) Has five figures, three tables, and six references.

223. Price, K. S., Jr., and E. P. Creaser, Jr. (1967) FLUCTUATIONS IN TWO OSMOREGULATORY COMPONENTS, UREA AND SODIUM CHLORIDE, OF THE CLEARNOSE SKATE, *Raja eglanteria*: I, UPON LABORATORY MODIFICATION OF EXTERNAL SALINITIES: II, UPON NATURAL VARIATION OF THE SALINITY OF THE EXTERNAL MEDIUM

R. eglanteria from lower Delaware Bay were studied. When acclimated to high salinities, they experienced loss of serum chloride and urea after exposure to lower salinities. After exposure to higher salinities, they experienced increases in serum chloride and urea. These changes produce changes in serum osmotic pressure. No definite depression of chloride values was related to dilution of sea water. Urea values were depressed at lower salinities, although urea values and the resultant serum osmotic pressures were higher at low salinities than expected.

225. Pringle, B. H., et. al. (1968) TRACE METAL ACCUMULATION BY ESTUARINE MOLLUSCS

The selectivity for trace metals depends upon the metals available in the environment, their chemical and physical properties, the kind and number of ligands available for chelation, transport, and storage, and the stability of the complex formed. The relative toxicities of the various metals also play a prominent role. The rate of depletion of various metals are different for different species, such as the Eastern Oyster, Northern Quohaug, and soft shell crab.

The study was based on the known fact that molluscs are able to concentrate selectively chemical materials up to many times the level found in their environment.

247. Shepard, F. P., and G. V. Cohee (1926) CONTINENTAL SHELF SEDIMENTS OFF THE MID-ATLANTIC STATES

Mechanical analysis of the sediment divides the shelf off the Mid-Atlantic states into two zones: the southern zone from Delaware Bay to Block Island contains sediments composed almost entirely of sand with subordinate amounts of gravel, but with sediment almost as coarse at the seaward edge of the shelf. The Northern zone to Martha's Vineyard has decidedly finer sediment in the same patchy arrangement of coarse and fine material found further south. Most common mineral is quartz, with feldspar next; 2 dozen heavy minerals were found. Biotite occurred in samples near the shore south of Delaware Bay. Cretaceous formations were found in a belt 12-15 miles wide across New Jersey and along the lower Delaware River. Sediment for most part was quite out of harmony with present-day conditions and was evidently deposited during the Pleistocene stages of lowest sea level.

262. Smith, E. T., and E. Mehr (1968) COST ALLOCATION MODEL FOR ZONED OPTIMIZATION OF WASTE TREATMENT REQUIREMENTS

Three cost allocation models have been developed for achieving desired water quality: (1) a uniform-treatment model; each source must remove a uniform percentage of its raw waste load. (2) a cost-minimization model; it requires construction of a cost function relating dollars spent on waste-treatment facilities to amount of waste removed. This method will be difficult to implement. (3) Zoned-optimization model; it combines elements of (1) and (2) in that it seeks treatment levels which are uniform for various groups of sources, but not necessarily uniform for the whole estuary; it also seeks a combination of such zone removals which yields a minimum overall cost. This is the model selected by the DRBC for implementation on the estuary.

263. Smith, E. T., and A. R. Morris (1969) SYSTEMS ANALYSIS FOR OPTIMAL WATER QUALITY MANAGEMENT

Since 1961, the objectives of the Delaware Estuary Comprehensive Study have been to (1) develop methods of water-quality management (2) determine the relationships between pollution and the present deteriorated quality of water, and (3) prepare a program for improvement and maintenance of water quality. An objective set was selected and is now being carried out to 30 sections (geographical areas essentially homogeneous in water quality) between Trenton and location below Wilmington. This set has resulted in load allocations for individual firms and municipalities, so that water quality in the estuary will be maintained at an enhanced level. The set is based on the use of systems analysis methods. The mathematical model for pollution control is based on the relationship between BOD and DO (dissolved oxygen). The limitation and the mathematics are discussed.

296. Vasuki, N. C. (1970) WATER QUALITY LIMITATIONS IN DELAWARE ESTUARY

The seriousness of the situation and need for action. "Delaware is a dirty river." There are certain limitations to what can be done under present political and technological conditions: Delaware will remain a muddy estuary below Marcus Hook. The upper estuary will experience algal blooms. The appearance of color, addition of flotsam, and

sewage overflows will continue to pose problems. Continued discharge of heavy metals will adversely affect aquatic life. Continued dredging and filling will constantly upset benthic communities. Oil slicks, spills, increasing. Irreversible changes may have already reduced the capacity of the estuary to act as a nursery for many fish species. We must reverse the thinking of allowing land-use classification without regard to water quality or use. Out of the 133.4 miles of estuarine water, 38.4 miles are already lost for fish propagation. Between 1954 and 1964 more than 45,000 acres of marshland were destroyed between Maine and Delaware. Unless we drastically reduce the amount of heavy metals discharged, the remaining aquatic life will be harmed. Yet, statistics show that sport fishing is increasing. 60 million anglers harvest 1.5 billion pounds of fish per year. Of these, 843 million pounds were caught in salt water and about 630 million pounds of these were estuary dependent.

316. DRBC (1964) ANSWERS TO QUESTIONS

The nation's most heavily populated region, with more than 22,000,000, expects 30,000,000 by 1980 and 42,000,000 by 2010. The basin occupies 12,757 square miles (including the Bay). The compact with the federal government is similar to an international treaty. A commission is needed, among other reasons: (1) Water respects its own boundaries and not manmade. (2) Government in the basin is not organized to control and develop water resources. (3) Water can be used more economically and beneficially through unified planning. We are not running out of water, but are managing it poorly, such as the 50% unused flow into the ocean.

REF: Delaware River Basin Commission, Trenton, New Jersey

317. DRBC (1964) DELAWARE RIVER BASIN COMPACT

The legal compact entered into in 1961 between Delaware, New Jersey, New York, Pennsylvania, and the United States is presented in detail in 51 pages.

REF: Delaware River Basin Commission, Trenton, New Jersey

318. DRBC (1965) SECOND WATER RESOURCES PROGRAM, 1964-1969

Comprehensive report on the prospective supply of, and demand for water and related goods and services in the Delaware River basin during six calendar years (1964-1969). Has 26 tables on water quality; streams, runoff, flood, and storage volumes; water demands and withdrawals, export, etc. Has 16 figures on dissolved oxygen, chlorides, temperature, geohydrologic sections, maps, etc.

REF: Delaware River Basin Commission, Trenton, New Jersey

319. DRBC (1966) REVIEW OF ACTIVITIES IN 1965-1966

Considerable discussions of flood control and water diversion during the previous year's drought. Federal authorities bringing to a close a 5-year effort known as the Delaware Estuary Comprehensive Study, which used computerized techniques to determine cause and effect of pollution. The study offered 5 alternative proposals for clearing up pollution with different costs and different treatments. The total carbonaceous oxygen-demanding waste load produced daily in the basin was found to be 1.9 million pounds daily, nearly half (900,000 pounds) being removed by treatment, and 1 million pounds being discharged daily into the estuary.

REF: 4th Annual Report. Delaware River Basin Commission, Trenton, New Jersey

320. DRBC (1967) REVIEW OF ACTIVITIES IN 1966-1967

Adopted estuary and nontidal water standards keyed to water uses which are summarized. Standards vary within the basin, with higher oxygen requirements in certain parts of the

estuary. Other requirements for water temperature, alkalinity-acidity balance, phenols, odor, detergents, fluorides, radioactivity, and turbidity.

REF: 5th Annual Report. Delaware River Basin Commission, Trenton, New Jersey

321. DRBC (1968) REVIEW OF ACTIVITIES IN 1967-1968

Adopted comprehensive pollution control standards in 1967. These standards approved by Washington in 1968 for compliance with federal law. Delaware Estuary divided into 4 zones. All wastes must be treated to the same minimum degree of removal of pollutants, in order to reduce the oxygen consumption of pollutants. Federal scientists (department of government not specified) devised a mathematical formulation of the Delaware Estuary.

REF: 6th Annual Report. Delaware River Basin Commission, Trenton, New Jersey

322. DRBC (1969) REVIEW OF ACTIVITIES IN 1968-1969

Expanded efforts on assuring sound future surface and ground water supply management gave attention to protection of the rich estuarine qualities of lower Delaware Bay. Entered into regional efforts for disposal of wastes on both sides of the river. Organized a pollution surveillance program throughout the estuary. Began a 3-year study of Salem and Gloucester regional waste disposal. Began engineering study of regional facility for sewage disposal of wastes from part of Delaware County, Pennsylvania south of Philadelphia and from New Castle, Delaware and treating them near Marcus Hook, Pennsylvania below the Delaware-Pennsylvania boundary. The City of Wilmington waste discharge program (to be in full operation by 1973) has been approved. Several other sewerage schedules above Wilmington have also been approved. Development of a mathematical model of major Delaware River reservoirs planned. State of Delaware is collecting and analyzing water samples in the Delaware Estuary below Trenton for 32 pollution indicators, e.g., dissolved O_2 , acidity, bacteria, toxics, and radioactivity.

REF: 7th Annual Report. Delaware River Basin Commission, Trenton, New Jersey.

323. DRBC (1970) DEEPWATER REGIONAL SEWERAGE SYSTEM: PRELIMINARY ENGINEERING AND FEASIBILITY STUDY

The estuary is defined as the 86-mile portion of the river between Trenton, New Jersey, and Liston Point. The service area of the river comprises less than 1% of the area of the continental USA but has 13% of population, 16.6% of personal income. This study is concerned with Gloucester and Salem counties, New Jersey. Has 14 chapters.

Table of Contents: 1. Pollution of estuary. 2. The study area. 3. Projected population, land use, industry. 4. Sewerage. 5. Waste water. 6. Water quality. 7. Pretreatment requirements. 8. Alternative methods. 9. Design, cost. 10. Alternative waste water management. 11. Preliminary design and cost. 12. Financing. 13. Cost. 14. Summary, conclusions.

335. Water Resources Association of the Delaware River Basin (1966)
DELAWARE BASIN BULLETIN

Summarizes the Delaware Estuary Comprehensive Study (DECS); a preliminary report and findings of the 6-year study of pollution in the Delaware estuary. The organic waste load to the estuary found to be 1 million pounds of organic waste per day: municipalities 65%, industries 35%. Water quality evaluation made by mathematical modeling and use of new techniques of systems analysis, etc. Five objective sets of different water quality standards proposed with different achievements and costs.

REF: Volume 7, number 1. Water Resources Association of the Delaware River Basin, 21 South 12th Street, Philadelphia, Pennsylvania

336. Water Resources Association of the Delaware River Basin (1968)
DELAWARE BASIN BULLETIN

Water quality regulations adopted March 7, 1968 by the DRBC provides control of river with respect to: (1) Oxygen consumption by carbonaceous material (carb. O.D.) to be reduced from present daily waste load of 1 million pounds to 322,000 pounds through various waste treatment methods. 4 zones established--zone 5 (Pennsylvania-Delaware border to Liston Point, Delaware 30 miles-67,000 pounds per day carb. D.O. (2) Bacteria--human waste must be chlorinated (3) Thermal Pollution--in tidal waters, the induced temperature increase shall not exceed 5°F. above the average daily temperature gradient or a maximum of 86°F. whichever is less (4) Load allocations assimilative capacity of the streams to be apportioned equitably between dischargers. (Other details given for zones 2, 3, and 4 which are above the Pennsylvania-Delaware line.)

REF: Volume 9, number 1. Water Resources Association of the Delaware River Basin, 21 South 12th Street Philadelphia, Pennsylvania

337. Water Resources Association of the Delaware River Basin (1969)
TENTH ANNUAL REPORT

Summarizes accomplishments of the WRA/DRB for the period 1959-1969; includes information to basin residents; encouraged creation of the Delaware River Basin Commission; supports establishment of the Toock's Island National Recreation Area (now Delaware Water Gap National Recreation Area;

worked for adoption of adequate and equitable standards of water quality in Delaware River estuary; monitoring the Delaware River Basin Commission's activities; and presently urging preparation of a comprehensive plan for the development of the Delaware Bay area. The WRA/DRB is now setting water quality standards for Delaware Bay.

345. DBG&FC Lesser, C. A. (1966) AQUATIC VEGETATION SURVEY

Verifies changes in characteristics of vegetation growth which are potentially detrimental to desirable fish production and to fishing. Recommends remedial action before irreparable damage done to sport fishing.

REF: Federal Aid in Fish Restoration Project No. F-21-R, 1966. Division of Fish and Wildlife, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware

346. DBG&FC Lesser, C. A. (1968) MARINE FISHERIES SURVEY

Survey of the marine fisheries harvest; the effort in taking this harvest, and the utilization of public access areas and waters by other outdoor recreation seekers. The survey was conducted in five sectors: (1) Delaware River and its tributaries, (2) Delaware Bay, (3) Atlantic Ocean from Cape Henlopen to Fenwick Island, (4) Rehoboth Bay and Indian River and Bay, and (5) Nanticoke River. The results are presented in a series of tables.

352. DSBH Eastman, A. S., and R. C. Beckett (1931) PUBLIC WATER SUPPLIES OF DELAWARE 1931

Reports the chemical and bacteriological analyses of 30 cities and towns in Delaware. Short description of the geology of Delaware given at end of the report.

REF: Division of Physical Health, Department of Health and Social Services, State of Delaware, Dover, Delaware

353. DSHD (1945,... 1969) ANNUAL REPORTS OF THE MOSQUITO CONTROL DIVISION

A series covering description of mosquito control research and evaluation of the severity of the mosquito problem on an annual basis.

REF: Department of Highways and Transportation, State of Delaware, Dover, Delaware

354. DSPO (1966) EVALUATION OF THE WATER RESOURCES OF DELAWARE

At present, Delaware has an abundance of water for the foreseeable future, but is already faced with water problems in some municipalities. These problems can only be resolved by a complete evaluation of the state's water resources and by studies of broad answers to water management. A master plan for the development of Delaware's water resources is recommended.

REF: Prepared by the Delaware Geological Survey for Delaware State Planning Office, Dover, Delaware

355. DSPO (1966) SHORELINE PLAN

REF: Delaware State Planning Office, Dover, Delaware

356. DSPO (1967) PRELIMINARY COMPREHENSIVE DEVELOPMENT PLAN

Purpose: as guide for the growth of the state. Background: State has a viable economic base, has a very favorable location relative to N.E. U.S. metropolitan area; is well suited to agriculture; sizable wildlife areas of great value; the Atlantic Ocean beaches are a significant asset. Potential problems: water supply and sewage disposal; highway system inadequate for anticipated growth; rapid urbanization is encroaching on farm land; wildlife threatened by industrialization. Population is expected to increase by 389,000 over 1960 to 835,000 in 1980. The goals are: Concentrate urban development; preserve agricultural and open land; maximize utility of major highways; encourage mass transportation (RR); health, welfare, education; encourage industrial growth. Recommend: preserve all marsh areas south of C and D Canal. Several new highways are proposed. State facilities are proposed to implement the plan, also for legislation and administrative policy. Has 93 pages.

REF: Delaware State Planning Office, Dover, Delaware

357. DSPO (1968) BETHANY BEACH COMPREHENSIVE DEVELOPMENT PLAN

The plan is intended to serve as a policy-making guide for the future development. The program consisted of (1) background studies, (2) plan preparation and (3) effectuation of plan. Under (1): History, existing land use, population, community facilities, housing, resident survey, transportation, economic base, financial analysis. Under (2): Goals, land use, community facilities, transportation. Under (3): Zoning, subdivision regulations, capital improvement, administrative procedures. Has 64 pages.

REF: Delaware State Planning Office, Dover, Delaware

358. DSPO (1968) DELAWARE POPULATION AND ECONOMY: A SUMMARY REPORT

From a study of 41 tables of statistical data, the report concludes that the state is divided into an industrialized metropolitan region in the north and a rural-urban region in the south; the economy is heterogenous, but with a heavy concentration of chemical industry in New Castle County. Delaware is undergoing considerable structural change in its economy. The size of the manufacturing sector has remained relatively constant in employment, but has increased in output as shown by wage and salary income. There is evidence that the economy of the two lower counties will become more industrialized and urbanized. Has 47 pages.

REF: Delaware State Planning Office, Dover, Delaware, and the Division of Urban Affairs, University of Delaware, Newark, Delaware

359. DSPO (1968) OUTDOOR RECREATION FOR DELAWARE-INVENTORY

This report is designed to be an inventory of the areas and facilities, both public and private, presently available in the State of Delaware.

REF: Delaware State Planning Office, Dover, Delaware

360. DSPO (1968) REHOBOTH COMPREHENSIVE DEVELOPMENT PLAN

Has 42 pages.

REF: Delaware State Planning Office, Dover, Delaware

361. DSPO (1969) ENVIRONMENTAL STUDY OF REHOBOTH, INDIAN RIVER AND ASSAWOMAN BAYS

Report to Governor Peterson of the unified effort by Delaware's natural resources and planning agencies to document the need for preserving Delaware's inland bay areas, and to outline a specific program for achieving that goal.

Participating agencies: Delaware Geological Survey; University of Delaware Marine Laboratories; State Park Commission; State Game and Fish Commission, Water & Air Resources Commission; and State Planning Office. Conclusions: The inland bays of Sussex County, while still prime recreational areas, are in danger of being despoiled through increasing and uncontrolled development. Such further development would disrupt the bottom mud and sand, destroy the marshland and decrease fish populations, increase pollution, contaminate ground water, and destroy woodlands, to further intensify erosion. Has 35 pages.

REF: Delaware State Planning Office, Dover, Delaware

362. DSPO (1969) LAND USE IN SUSSEX COUNTY, DELAWARE: AN INVENTORY AND ANALYSIS

Factual and analytical basis for estimating land requirements for development. Environmental factors, including natural drainage systems, tidal and inland wetlands, and soil drainage characteristics. Has appendix, 5 tables, 3 maps; coded to punchcards in statewide data bank.

REF: Prepared for Sussex County Planning and Zoning Commission, Georgetown, by Delaware State Planning Office, Dover, Delaware

363. DSPO (1969) TRENDS IN HOUSING CONDITIONS AND CONSTRUCTION FOR SUSSEX COUNTY: 1960-1968

REF: Prepared for Sussex County Planning and Zoning Commission, Georgetown, by Delaware State Planning Office, Dover, Delaware

364. DSPO (1970) DELAWARE COMPREHENSIVE OUTDOOR RECREATION PLAN

An updated and expanded version of the 1966 report. It includes the findings of detailed studies on inventory, demand and needs, as well as details regarding the uses of existing property and potential acquisitions. The

Delaware Outdoor Recreation Plan is discussed in detail. Has 35 tables, 35 figures, 21 budget schedules, bibliography, 239 pages.

REF: Delaware State Planning Office, Dover, Delaware

365. DSPO (1970) LEWES COMPREHENSIVE DEVELOPMENT PLAN

Includes detailed plans for the region and the city. Sussex County population was 73,200 in 1960, 80,900 in 1970, and is projected to 91,780 in 1980 and 101,930 in 1990. The planning is geared to this population growth. Statistical tables, maps and photographs of the area are included in 28 pages.

REF: Delaware State Planning Office, Dover, Delaware

366. DSPO (1970) NATURAL RESOURCES INVENTORY

Climate. Weather Stations, data. Agricultural land. Changes in acreage of farms. Forests. Distribution, 1957. Forest types. Geology. Rock types. Mineral resources. Soils. Associations types. Soil map. Water resources. Streams, drainage, discharges. Ponds. Analysis of ground water. Wetlands. Types. Has 72 pages.

REF: Delaware State Planning Office, Dover, Delaware

367. DSPO (1970) SUSSEX COUNTY COMPREHENSIVE DEVELOPMENT PLAN

Intended to serve as guideline for the county's future growth to 1990. Proposes a feasible relationship between the needs of the people and the provision of essential public facilities. Has 47 pages.

REF: Delaware State Planning Office, Dover, Delaware

368. SCP&ZC (1969) ANALYSIS OF HOUSING PROBLEMS AND OBSTACLES TO PROBLEM SOLUTION, SUSSEX COUNTY

REF: *Prepared for Sussex County Planning and Zoning Commission, Georgetown, by Delaware State Planning Office, Dover, Delaware*

369. DW&ARC (1968) SECOND ANNUAL REPORT, 1967-1968

Water Resources and Subaqueous Lands Division spent the year primarily in collection of data and writing regulations; emphasized underground water supplies; regulations being drafted for well-drilling practices. Subaqueous Lands Division acted on 40 applications; guidelines adopted for procedures to be followed; commission policy relative to certain land reclamation projects. Water Pollution Control Division submitted water quality standards to Department of the Interior in June 1967 which were approved; the adopted standards are compatible with those of the Delaware River Basin Commission.

REF: Division of Environmental Control, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware

370. DWPC (1951) SURVEY OF POLLUTION AND ITS EFFECT UPON THE STREAMS WITHIN THE MISPELLION RIVER DRAINAGE BASIN

Detailed analyses as affected by the pollution were made and suggestions for improvement deducted.

REF: Report by the State Board of Health to the Water Pollution Commission. Division of Environmental Control, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware

371. DWPC Aulenbach, D. B., and A. J. Kaplovsky (1958) COMPREHENSIVE STUDY OF POLLUTION AND ITS EFFECT ON THE WATERS WITHIN THE NANTICOKE RIVER DRAINAGE BASIN

Detailed field and laboratory measurements were made of the existing water quality in both the Nanticoke River proper and the Broad Creek to determine the effects of polluttional material. The effluent at the nylon plant was studied.

REF: Report by the State Board of Health to the Water Pollution Commission. Division of Environmental Control, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware

372. DWPC Aulenbach, D. B., and A. J. Kaplovsky (1961) COMPREHENSIVE STUDY OF POLLUTION AND ITS EFFECTS ON THE WATERS WITHIN THE ST. JONES RIVER DRAINAGE BASIN

Detailed field and laboratory measurements of the existing water quality and the waste discharges at the Dover Sewage Treatment Plant and two International Latex Plants, as well as at Dover Air Force Base to determine effects of pollutional discharges.

REF: Report by the State Board of Health to the Water Pollution Commission. Division of Environmental Control, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware

373. DWPC Kaplovsky, A. J. (1952) COMPREHENSIVE STUDY OF POLLUTION AND ITS EFFECT UPON WATERS WITHIN THE RED CLAY CREEK DRAINAGE BASIN

Chemical, physical, bacteriological and biological determinations were made in a study of the pollution entering the Red Clay Creek and its effect upon the quality of the receiving waters. Recommendations are made for decreasing the existing pollution.

REF: Report by the State Board of Health to the Water Pollution Commission. Division of Environmental Control, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware

374. DWPC Kaplovsky, A. J. (1954) COMPREHENSIVE STUDY OF POLLUTION AND ITS EFFECT UPON THE WATERS WITHIN THE BRANDYWINE CREEK DRAINAGE BASIN

Its sources of pollution and their effect upon the water supply of the City of Wilmington was studied. Detailed conclusions are drawn and recommendations made.

REF: Report by the State Board of Health to the Water Pollution Commission. Division of Environmental Control, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware

375. DWPC Kaplovsky, A. J., and D. B. Aulenbach (1956) COMPREHENSIVE STUDY OF POLLUTION AND ITS EFFECT ON THE WATERS WITHIN THE INDIAN RIVER DRAINAGE BASIN

Chemical, physical, bacteriological and biological determinations were made in a study of the pollution entering the Indian River and its effect upon the quality of the receiving waters.

REF: *Report by the State Board of Health to the Water Pollution Commission, Division of Environmental Control, Department of Natural Resources and Environmental Control, State of Delaware, Dover, Delaware*

376. Graham, R. L. (1969) PLANNING-PROGRAMMING-BUDGETING REPORT 1967-1969

One of a series of reports under the same name compiled for the division.

379. Maits, B. (1966) THE NATURAL RESOURCES OF DELAWARE

Starting with the history of earth itself, this is the story of how Delaware and the eastern North American Continent evolved from the barren lifelessness of primordial time over the last two billion years to affect the climate and natural resources of the present. Has 39 pages.

REF: Soil and Water Conservation Commission, State of Delaware, Dover, Delaware

UNIVERSITY

380. Alls, R. T. (1969) KILLIFISH PREDATION OF MOSQUITOES IN LOW-LEVEL IMPOUNDED DELAWARE SALT-MARSHES

REF: Master's thesis in the Department of Entomology and Applied Ecology, Hugh M. Morris Library, University of Delaware, Newark, Delaware

381. Baker, W. W., R. D. Varrin, J. J. Groot, and R. R. Jordan (1966) EVALUATION OF THE WATER RESOURCES OF DELAWARE

At present, Delaware has an abundance of water for the foreseeable future. However, the studies of water use are far too narrow to provide the broad answers needed for water management. It is recommended that a master plan for the development of Delaware's water resources be prepared to assure an adequate supply of high-quality water as the state's economy continues to expand.

REF: Report of Investigation No. 8, March 1966. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

382. Brams, M. R., C. Chandler, and N. Wilson (1969) ECONOMIC AND ENGINEERING FEASIBILITY OF A UNIFIED WATER SYSTEM FOR NORTHERN NEW CASTLE COUNTY, DELAWARE

Discusses an area of 232 square miles, with a population of 355,447 and an average daily water use of 51 gallons. The sources of the water and their operating costs are described. Unification promises greater efficiency, wholly or partially, physically and administratively, under county ownership. The proposal for building White Clay Creek Dam is a first step in the direction of county involvement with the problem of water supply and distribution. Has 166 pages.

REF: Division of Urban Affairs, University of Delaware, Newark, Delaware

383. Coskery, O. J. (1956) WATER LEVELS AND ARTESIAN PRESSURES IN DELAWARE 1955

Recording gages were maintained in municipal well fields at New Castle, Newark, and Lewes, and at Governor Bacon Health Center. Water levels varied from 4.8 to 9.0 feet below land

surface datum for 1950 to 1955. Precipitation in 1955 was less than normal (40.04 inches).

REF: Water Level Report number 4, 1956. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

384. Coskery, O. J. (1961) WATER LEVELS IN DELAWARE 1957

Similar to previous reports. Precipitation in 1957 was less than normal. Withdrawal of water from aquifers in Delaware City area was 10 times that for 1953 because of industrial development. Decline in 1957 in the four wells surveyed ranged from 12 to 50 feet from levels in earliest records (1954 and 1955).

REF: Water Level Report number 6, 1961. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

385. Coskery, O. J. (1961) WATER LEVELS IN DELAWARE 1958

Similar to previous reports in this series. Precipitation in 1958 was greater than normal (54.5 inches). The data are brought up to date.

REF: Water Level Report number 7, 1961. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

386. Coskery, O. J., and W. C. Rasmussen (1958) WATER LEVELS IN DELAWARE 1956

Similar to previous reports. Precipitation in 1956 was greater than normal (47.35 inches). Results from 4 continuous water level records at New Castle, Newark, Lewes, and Governor Bacon Health Center from 1950 to 1956.

REF: Water Level Report number 5, 1958. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

387. Crosswhite, W. M. (1968) USE OF WATER FOR SUPPLEMENTAL IRRIGATION IN DELAWARE

Compared with the present use, Delaware has a large physical

supply of water. Undetermined amounts of water are held in 12 major ground reservoirs. In addition there is an average stream flow of 1.5 billion gallons per day. Short periods of drought are common. Irrigation through sprinkler systems is used to supplement rainfall and the amount used varies accordingly. The investment and costs of irrigation systems are discussed, as are the economic benefits derived. Has 24 pages.

REF: Bulletin number 375, Agricultural Experiment Station, University of Delaware, Newark, Delaware

388. Delaware Geological Survey (1961) THE STORY OF YOUR STATE GEOLOGICAL SURVEY'S SEARCH FOR WATER

A brief story about water and the ways in which the Delaware Geological Survey helps insure that you will always have a plentiful supply.

REF: Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

389. Gaither, W. S., ed. (1968) OCEAN ENGINEERING EDUCATION: PROCEEDINGS OF A WORKSHOP AT THE UNIVERSITY OF DELAWARE IN OCTOBER 1968

The workshop brought together individuals from industrial, government, and academic organizations to examine and discuss programs which are available now, or are being developed, to educate engineers and technicians for ocean-oriented careers.

REF: Department of Civil Engineering, College of Engineering, University of Delaware, Newark, Delaware

390. Governor's Task Force on Marine and Coastal Affairs (1971) COASTAL ZONE MANAGEMENT

A preliminary report of Governor Peterson's Task Force containing some recommendations toward the forming of policy guidelines and certain key recommendations for the management and conduct of marine and coastal affairs for the State of Delaware.

REF: College of Marine Studies, University of Delaware, Newark, Delaware

391. Groot, J. J. (1955) SEDIMENTARY PETROLOGY OF THE CRETACEOUS SEDIMENTS OF NORTHERN DELAWARE IN RELATION TO PALEOGRAPHIC PROBLEMS

Because of lack of identifiable fossils in nonmarine sediments in northern New Castle County and presence of only a few in the Pleistocene and Wenonah formations, study of sediments in coastal plains were made by modern methods of mechanical and heavy mineral analyses. Most samples were obtained from outcrops, which do not permit use of systematic grids to provide an even geographic distribution of sampling sites.

REF: Bulletin number 5, 1955. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

392. Groot, J. J., D. M. Organist, and H. G. Richards (1954) MARINE UPPER CRETACEOUS FORMATION OF THE CHESAPEAKE AND DELAWARE CANAL

The marine Upper Cretaceous formations were studied at 8 stations along the canal using fossils and sedimentary characteristics. Formations of the Matawan Group (Merchantville and Wenonah) [sic] and Monmouth Group (Mount Laurel Sand, Navesink, and Red Bank Sand) were identified. Has 37 references, 64 pages; historical record on pages 11-29; outcrop description on pages 31-38.

REF: Bulletin number 3, 1954. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

393. Harman, O. (1968) ENVIRONMENTAL CONTROL SYSTEM FOR OYSTER FARMING

Progress report on design, development and analysis of system for oyster culture. Defines approach, enumerates procedures and equipment used for work in progress at Lewes and Newark, describes diet.

REF: Department of Agricultural Engineering, College of Agricultural Sciences, University of Delaware, Newark, Delaware

394. Hoeh, R. S. (1966) WATER RESOURCES ADMINISTRATION IN DELAWARE

Discusses primarily the legal doctrines that were operating in Delaware in 1965-66 to determine the allocation and use of water and what governmental agencies influence, by statute

and administrative action, the use and development of water resources in the state. Chapters (1) The Legal Framework; (2) Administration Organization; (3) Intergovernmental Relations; (4) Conclusions and Recommendations, Figures A, B, & C summarize the organization of water-related agencies and recommended organization. Appendix (1968) discusses local agencies related to water resources. Has 43 references, 175 pages.

REF: Marine Laboratory, Department of Biological Science, University of Delaware, Newark, Delaware

396. Jordan, R. R. (1962) STRATIGRAPHY OF THE SEDIMENTARY ROCKS IN DELAWARE

The stratigraphy of the coastal plain of Delaware is described and a revised stratigraphic column for Delaware is proposed and compared with similar columns for New Jersey and Maryland. The rock units of the coastal plain of all three states are an interrelated mass; however, profound facies changes do occur, particularly in the dip direction. Has 4 plates, 3 figures, 101 references.

REF: Bulletin number 9, 1962. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

397. Jordan, R. R. (1964) COLUMBIA (PLEISTOCENE) SEDIMENTS OF DELAWARE

The Columbia deposits of Delaware form a sheet of sand with maximum thickness of 150 feet which covers most of the coastal-plain portion of the state. Columbia sediment is essentially medium sand, but coarser admixtures are typical in the north and finer admixtures, in the south. Geographical distribution used of a sampling grid based on meridians and parallels spaced 5 minutes apart; quadrangles measured 4.5 to 6.0 miles; 75 quadrangles were studied with 2 outcrops in each. Samples were tested for texture, mineralogy, lithology, and heavy mineral content. Has 9 plates, 17 figures, 3 tables, 79 references.

410. Rima, D. R., O. J. Coskery, and P. W. Anderson (1964) GROUND-WATER RESOURCES OF SOUTHERN NEW CASTLE COUNTY, DELAWARE

The geologic formations and water resources of the 190-square-mile area are described, and the chemical and physical properties of waters from representative wells are given. If large-scale pumping near the shoreline of bay is necessary, they suggest placing a line of "injection wells" between the shoreline and the area of withdrawal. Has 2 plates, 18 figures, 6 tables, 30 references.

411. Seidenstat, P. (1966) THE MARKET FOR WATER BASED OUTDOOR RECREATION SERVICES IN NEW CASTLE COUNTY, DELAWARE

An attempt to explore the demand for water-related recreation in an outdoor setting. The chapters cover: Recreation as a use for water; Present market for water-based recreation; Future market; Procedures used in estimating water-based recreation demand and capacity.

REF: Water Resources Center, University of Delaware, Newark, Delaware

412. Smith, R. C. (1970) DELAWARE'S FARM INCOME: CROP AND LIVESTOCK PRODUCTION IN 1969

Delaware agricultural statistics taken from publications of the U.S. Department of Agriculture are assembled and reproduced.

REF: Pamphlet No. 48, November 1970, Department of Agriculture and Food Economics. College of Agricultural Sciences, University of Delaware, Newark, Delaware

413. Smith, R. C., and D. R. Crossan (1969) ECONOMIC ANALYSIS OF THE MARKET STRUCTURE OF THE COMMERCIAL FISHING INDUSTRY IN THE NORTHEAST IN 1968

Analytical objectives enumerated; the approach used, especially in compiling information on menhaden for animal feeds. Detailed evaluation of value of fish meal in broiler production. Many statistical procedures employed, some less successfully than others.

REF: Department of Agriculture and Food Economics, College of Agricultural Sciences, University of Delaware, Newark, Delaware

414. Spoljaric, N. (1967) PLEISTOCENE CHANNELS OF NEW CASTLE COUNTY, DELAWARE

Two Pleistocene channel systems are recognized; a system of straight channels north of the Chesapeake and Delaware Canal, and a braided system south of the canal. During high stream flow, most of the area was submerged. Primary sources were melt-water streams originating from glaciers which at times advanced to within 100 miles north of the county. Thus, the age of the channels is thought to be glacial. Has 15 pages.

REF: Report Investigation number 10, 1967. Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

415. Spoljaric, N. and R. R. Jordan (1966) GENERALIZED GEOLOGIC MAP OF DELAWARE

A one-page spread giving the major types and location of rocks throughout the state.

REF: Office of the Delaware Geological Survey, University of Delaware, Newark, Delaware

416. Sundstrom, R. W. and T. E. Pickett (1968) THE AVAILABILITY OF GROUND WATER IN KENT COUNTY, DELAWARE, WITH SPECIAL REFERENCE TO THE DOVER AREA

Ground water is available from several sources or aquifers. The quantities have been determined by methods of applied hydrology described and illustrated in this report. The combined use of all of the aquifers in the county in 1966

amounted to an average of 17,856,000 gallons per day. Has 123 pages.

REF: Water Resources Center, University of Delaware, Newark, Delaware

417. Sundstrom, R. W. and T. E. Pickett (1969) THE AVAILABILITY OF GROUND WATER IN EASTERN SUSSEX COUNTY, DELAWARE

This report is concerned with the ground water in the 485 square miles of Eastern Sussex County that drains eastward toward the Delaware Bay and the Atlantic Ocean. The amount of water used in this area for all purposes in 1966 averaged about 18 million gallons per day. This was computed to be less than 13% of the available supply of the area of more than 140 million gallons per day. Salt-water problems occur in the coastal area where the altitude of the water table is less than 5 feet above sea level. Problems have occurred at Lewes, Rehoboth Beach and other areas. Has 136 pages.

REF: Water Resources Center, University of Delaware, Newark, Delaware

418. Sundstrom, R. W., and T. E. Pickett (1970) AVAILABILITY OF GROUND WATER IN WESTERN SUSSEX COUNTY, DELAWARE

The geology and ground-water hydrology of eight ground-water reservoirs were studied in detail. The ground-water drained by all streams in the area is estimated to average about 280 million gallons per day. The area receives an average of 46.75 inches of rainfall a year. Of this an estimated average of 460 million gallons per day is available for recharge to the water table aquifer and an estimated average of 70 million gallons per day is overland runoff. Has 118 pages.

REF: Water Resources Center, University of Delaware, Newark, Delaware

419. Sundstrom, R. W., and T. E. Pickett (1971) THE AVAILABILITY OF GROUND WATER IN NEW CASTLE COUNTY, DELAWARE

The county encompasses partitions of two geological provinces whose ground-water reservoirs vary widely in water yielding properties. The ground-water reservoirs in the northern Piedmont region are contained in very old rocks

in yields of small quantities in wells throughout the area, supplying 67% of the base flow of the Brandywine, Red Clay, and White Clay creeks. The ground-water reservoirs of the Coastal plain of much younger sedimentary rocks, are important for supplying up to large quantities of water. The important aquifers are described and their present and potential yields are detailed. Has 156 pages.

REF: Water Resources Center, University of Delaware, Newark, Delaware

420. Sundstrom, R. W., and R. D. Varrin (1971) WATER SUPPLY AND USE IN THE DRAINAGE BASINS OF THE DELAWARE RIVER SYSTEM AND ATLANTIC COASTAL DRAINAGE BASINS IN DELAWARE

The available waters of the area, the trends of development, the anticipated needs for water to the year 2000, and potential problems of keeping the area adequately supplied with water. South of the Chesapeake and Delaware Canal most areas either have adequate water or their problems are not grave. In the northern part of New Castle County there could be a potential deficiency of 28 million gallons per day in 1980 and 68 million gallons per day in 2000. Has 90 pages.

REF: Water Resources Center, University of Delaware, Newark, Delaware

421. Sundstrom, R. W., et al. (1967) THE AVAILABILITY OF GROUND WATER FROM THE POTOMAC FORMATION IN THE CHESAPEAKE AND DELAWARE CANAL AREA, DELAWARE

Drawdown quantitative curves for the two aquifers were constructed. Several hypothetical plans of pumping centers in the canal area are demonstrated. There appears to be no danger of salt water contamination in the foreseeable future. The Magothy Formation in the western section of the canal crops out in the canal and is protected by the hydraulic gradient toward the canal. Geology section prepared by J. J. Groot et al. of the Office of the Delaware Geological Survey. Has 95 pages.

WATER LEVELS AND ARTESIAN PRESSURES IN DELAWARE 1955

During 1955, 363 individual water level measurement made in 21 wells. Recording gages maintained on 3 wells in municipal well fields at New Castle, Newark, and Lewes. Recording gages also at Governor Bacon Health Center. Figure 2 shows average water level based on 13 wells, and average monthly statewide precipitation September 1950 to December 1955. Water level varied from 4.8 to 9.0 feet below land surface datum. Data given for each well approximately monthly. Precipitation for year below normal (40.04).

REF: Delaware Geological Survey, Water Level Report number 4, University of Delaware, Newark, Delaware

426. University of Delaware Geological Survey (1958) Coskery, O. J., and W. C. Rasmussen WATER LEVELS IN DELAWARE 1956

Similar to previous reports. Precipitation in 1956 was greater than normal (47.35"). Results from 4 continuous water level records at New Castle, Newark, Lewes, and Governor Bacon Health Center from 1950 to 1956.

 FURTHER STUDIES IN TIDAL MARSH ECOLOGY IN DELAWARE

A paper presented at American Fisheries Society meeting, February 1969. Evaluates the role of the salt marsh in estuarine productivity and the effects of man-made changes in the wetlands areas of Delaware.

REF: Marine Laboratories, Department of Biological Sciences, University of Delaware, Newark, Delaware

448. UDML Daiber, F. C., C. W. Beattie, and W. de Witt, III (1970)
FLUSHING PATTERN OF CERTAIN TIDAL STREAMS IN DELAWARE

The Murderkill River has a residence time of 140 hours during a high-runoff period. The discharge is not linear. It resembles the Broadkill in that salinity and temperature vary longitudinally and are influenced by tides and runoff. Zooplankton populations appear to be distributed on the basis of salinity in both rivers, with low oxygen and pH levels further influencing zooplankton distribution and relative abundance.

There are very great differences in concentrations of dissolved oxygen, soluble phosphorous, and nitrate. The Broadkill is overenriched with phosphorus and contains an oxygen-deficient water zone. The Murderkill is overenriched with nitrate.

467. UDML Shuster, C. N., Jr. (1963) OUR EVER-CHANGING COASTLINE

The average rate of shoreline erosion at Delaware Coast is about 1 yard per year. Carbon-14 analysis of wood stumps found 300 yards from the present shoreline gave a value of about 3,000 years. It is also quite possible that the coast of Delaware is gradually being flooded by a rising sea level; it is estimated to be as much as 1 foot per century. There is a large counterclockwise eddy off the mouth of Delaware Bay. A smaller whirl of water usually rotates just off Cape Henlopen and Rehoboth Beach. Small colored plastic pellets were released and simultaneous observations were made at three locations. The transport mechanism was revealed by the distribution of the pellets at different time intervals.

481. USDC Harrison, W., J. J. Norcross, and E. M. Stanley (1967) CIRCULATION OF SHELF WATERS OFF THE CHESAPEAKE BIGHT

Surface and bottom drift of continental shelf waters between Cape Henlopen and Cape Hatteras, N. C. Earlier research on the continental shelf waters is summarized. Beginning in June 1963, drift bottles and seabed drifters were released by aircraft and then drift and temperature and salinity variations were determined in 15 monthly shipboard surveys. The effects of winds, run-off, and characteristics of the thermal structure of the shelf waters are offered as explanations for variations in surface flow. Predictor equations are presented based on a computerized screening procedure.

U. S. Navy Hydrographic Office, Washington, D. C.

486. USACE (1940) MODEL STUDY OF PLANS FOR ELIMINATION OF SHOALING IN THE DELAWARE RIVER ENTRANCE TO THE CHESAPEAKE AND DELAWARE CANAL

REF: Technical Memorandum number 93-3, Department of the Army, Waterways Experiment Station, Corps of Engineers, Vicksburg, Mississippi

487. USACE (1952) DELAWARE RIVER MODEL STUDY: REPORT 3, EFFECTS OF PROPOSED CHANNEL ENLARGEMENT BETWEEN PHILADELPHIA AND TRENTON

Conclusions from all model tests are that the enlarged channel (from 25' deep and 300' wide to 40' deep and 400' wide) would not increase salinity concentrations in any portion of the estuary for either normal or very low fresh-water discharge. There are 35 plates which summarize data obtained in the tests.

REF: Technical Memorandum number 2-337, Department of the Army, Corps of Engineers, Waterways Experiment Station, Vicksburg, Mississippi

488. USACE (1954) DELAWARE RIVER MODEL STUDY: REPORT 2, SALINITY TESTS OF EXISTING CHANNEL

Studies on the model at Vicksburg concerning the salinity intrusion in the Delaware Estuary for the channel existing in 1942. Determined (a) relation between fresh-water discharge at Schuylkill River (6 values of fresh water discharge ranging from 5000 to 16,475 cfs) and salinity distribution throughout the estuary for mean tide conditions, (b) relation between tidal range and salinity distribution for conditions of mean fresh-water discharge (c) relation between sea level and salinity distribution for mean conditions

of tide and fresh-water discharge, and (d) effects of varying fresh-water discharges on salinity concentration at the Delaware-Pennsylvania state line. Has 2 tables and 16 plates summarizing test data.

REF: Technical Memorandum number 2-337, Department of the Army, Corps of Engineers, Waterways Experiment Station, Vicksburg, Mississippi

489. USACE (1955) WATER RESOURCES DEVELOPMENT IN DELAWARE

Lists projects compiled or underway in 1955 by the Corps of Engineers, most of which involve improvement of navigation. There are some projects on shore protection (Kitts Hummock to Fenwick Island) and on flood control. Tables give the tonnage carried each year in the C & D Canal from 1831 through 1953 and the tonnage of foreign and domestic commerce for each year in the Delaware River from 1925 through 1953.

REF: Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania

490. USACE (1956) BEACH EROSION CONTROL REPORT ON COOPERATIVE STUDY OF THE DELAWARE COAST FROM KITTS HUMMOCK TO FENWICK ISLAND

State comprises a frontage of 32 miles to Cape Henlopen--Contents: Description of study area. The problem factors pertinent to problem: (1) Geomorphology (2) Littoral material (3) Littoral forces (4) Shore history--plans of protection--Analysis of problem costs, etc.

Appendices: (A) Geomorphology of Delaware shoreline, (B) Littoral forces, etc.

Plates: Maps--comparative profiles, shoreline and offshore depth changes, storm, wind and wave data.

REF: Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania

491. USACE (1956) DELAWARE RIVER MODEL STUDY: REPORT 1, HYDRAULIC AND SALINITY VERIFICATION

The Delaware River model reproduces the entire estuarine portion of Delaware Bay and River from the Capes to Trenton, New Jersey. It is equipped to reproduce and measure tides, tidal

currents, salinity intrusion, channel shoaling and other significant phenomena of the prototype. The report presents complete data showing the degree of accuracy obtained in the hydraulic and salinity verification of the model, i.e., excellent agreement of the model with the prototype. Prototype parameters discussed are area, channel dimensions, tides, current velocities, salinity intrusion, etc. The model is described in detail, and maps show locations of channel stations. Plates 3 to 74 give data on tides, velocities at various stations along the entire model, and surface current directions.

REF: Technical Memorandum number 2-337, Department of the Army, Corps of Engineers, Waterways Experiment Station, Vicksburg, Mississippi

492. USACE (1959) WATER RESOURCES DEVELOPMENT IN DELAWARE

Discusses projects completely underway in Delaware by the Corps of Engineers. The projects primarily concern river and harbor improvements for benefit of commercial navigation, sea food production, and recreation. There are few projects on shore protection (Rehoboth Beach to Indian River Inlet). Tables give annual tonnage of foreign and domestic commerce in Delaware River from 1925 to 1957; tonnage in C & D Canal 1831 to 1957; tonnage of commerce in Wilmington Harbor 1930 to 1957. Flood control projects are under way in Delaware River near New Castle and Delaware City and in the Nanticoke River.

REF: Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania

493. USACE (1960) BEACH EROSION CONTROL REPORT ON SURVEY OF THE NEW JERSEY COAST ALONG DELAWARE BAY BETWEEN THE ENTRANCE TO CAPE MAY CANAL AND MAURICE RIVER

The report develops plans for restoration and protection of the problem areas.

REF: Information Bulletin, Delaware River Basin Study, Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania

495. USACE (1960) REPORT ON THE COMPREHENSIVE SURVEY OF THE WATER RESOURCES OF THE DELAWARE RIVER BASIN

Volume 1 Main Report (revised 1961)

Comprehensive study in response to several resolutions by Congress, carried out in cooperation with various U. S. Government agencies, states, and cities. Discussion and summaries of results are given in this volume. Details of studies are given in 24 appendices in volumes 2-11. A total of 193 major reservoir potentials in the basin were considered. A basic plan of 19 major control projects were recommended and a timetable for their completion by 2010. Estimated costs of such projects are also given. There are 45 tables and 32 plates.

Volume 2 Appendix A History of Investigation

Appendix B Economic base survey

Volume 3 Appendix C Municipal and industrial water use and stream quality

Many tables and figures give data on annual water use by industry and municipalities, stream quality, low-flow conditions, dissolved oxygen, effect of algae concentration on dissolved oxygen, turbidity, hardness and alkalinity.

Appendix D Flood damages

Appendix E Navigation

Appendix F Power market and evaluation of power

Volume 4 Appendix G Water for irrigation and rural use

Appendix H Fluvial sediment

Most of the sediment is transported as "suspended load". Only 10% of the total load is estimated to be moved as "bed load". During water-years 1950-1957 the average annual suspended load at Trenton was 148 tons per square mile (ranging from 59 tons per square mile in 1957 to 342 tons in 1955.) Table 1 includes data for the annual suspended sediment load in Brandywine Creek at Wilmington from 1948 to 1957. Table 3 gives the computed annual sediment load as 135 tons per square mile for Brandywine Creek.

Appendix I Recreation resources

Volume 5 Appendix J Fish and wildlife resources

Appendix K Use and management of land and cover resources

There are about 30,000 acres of tidal marshes in the coastal plains section of the Delaware River Basin (page 59).

Volume 6 Appendix L Insects of public health importance in the Delaware Basin

Appendix M Hydrology

There are many tables and figures showing various hydrological data: precipitation (seasonal, annual, and storm); runoff data (stream gaging at 108 stations, at Trenton since 1911, and at Brandywine Creek, Wilmington, since 1911, and major floods since 1839); evaporation and infiltration losses; basic hydrology studies involving mass curves, flow duration curves, frequency analyses of peak flows; generalized flood-frequency studies; unit hydrographs; surface-water-availability studies. There are sections on hypothetical floods and design capacities and sections on effects of the proposed water-control plan.

Volume 7 Appendix N General geology and ground water

The potential ground water supply in the coastal plain section of the basin is considered equal to the ground water discharge to streams, about 1,600 m.g.d. in an area of 2,750 square miles; it is estimated that 800 m.g.d. can be developed. Present use (1951-1956) average is 210 m.g.d. Ground water suitable for most uses may be developed, at least in small quantities, almost anywhere in the basin except near the ocean and the Delaware Bay. In the coastal plain area some wells have become salty; for the most part this represents encroachment from the sea. Encroachment is due in part to the slow world-wide rise in sea level (6 in. in this area since 1930), but mostly it is due to pumping too near a body of salt ground or surface water (pages 50-62). In some cases salt water has been introduced to a former fresh-water domain through dredging operations. Along bays and estuaries the marsh deposits may serve as portals for salt-water encroachment into underlying shallow aquifers. Table 5 consists of chemical analyses of ground water in the coastal plains at various locations at various times from 1931 to 1957. Aquifer management is discussed on pages 136-147. There is also a discussion of the geology and hydrology of other areas of the Basin.

Volume 8 Appendix O State of Delaware, intrastate water resources survey

See DELAWARE DOCUMENTS, State, DBSCC

Volume 9 Appendix P Gross and net water needs

Appendix Q Formation of the plan of development

Appendix R Water control at intermediate upstream levels

Appendix S Salt water barrier

Volume 10 Appendix T Hydroelectric power

Appendix U Project designs and cost estimates

There are projects for Newark and the Christiana River dams

on pages 81 and 101.

Volume 11 Appendix V Benefits and cost allocation
 Appendix W Recreation needs and appraisals
 Appendix X Operating organization

498. USACE (1966) THE PORT OF WILMINGTON, DELAWARE, AND PORTS ON DELAWARE RIVER BELOW AND ABOVE PHILADELPHIA, PENNSYLVANIA

Detailed reports on port and harbor conditions; port administration and federal services; port and terminal services and charges; facilities; and transportation services. Part 2 has 72 pages and detailed maps.

REF: Port Series, number 8, Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania

499. USACE (1968) DELAWARE COAST: BEACH EROSION CONTROL AND HURRICANE PROTECTION

The study area consists of the Delaware coast extending 34 miles from Pickering Beach to Cape Henlopen and 34 1/2 miles along the Atlantic Ocean to the state line at Fenwick Island. All public and private beaches have been damaged by erosion. Plans for improvement are presented for control, which consists of the placement of beach fill, periodic nourishment of beaches, etc. Sufficient justification exists to warrant federal participation at Broadkill Beach, South Bowers, and Lewes, only. Plans are also provided for the entire Atlantic coast of Delaware. Has 110 pages.

REF: Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania. Also published as Senate Document 90, 90th Congress, 2nd session, Library of Congress, Washington, D. C.

500. USACE (1968) REPORT ON THE DELAWARE COAST FROM CAPE HENLOPEN TO FENWICK ISLAND

Report on the Delaware Coast from Cape Henlopen to Fenwick Island.

REF: Senate Document 90, 90th Congress, Library of Congress, Washington, D. C.

501. USACE (1968) REPORT ON NAVIGATION STUDY: DELAWARE BAY-CHESAPEAKE BAY WATERWAY IN DELAWARE, MARYLAND, AND VIRGINIA

This is the report of a study to determine the feasibility, method, and cost of providing a navigable sheltered waterway from Roosevelt Inlet, Delaware, on the Delaware Bay, along the Atlantic Coast to the Chesapeake Bay near Cape Charles, Virginia. Also, the construction of a canal from the Chincoteague Bay, Maryland, to connect with the existing federal project on the Pocomoke River near Snow Hill, Maryland.

The continuous waterway is economically feasible. It would be known as the DelMarVa Intracoastal waterway, and have a channel generally 6 feet deep and 100 feet wide. The estimated cost would be \$10,203,000 of which 67.5% would be borne by the federal government.

REF: Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania

502. USACE (1968) WATERBORNE COMMERCE OF THE UNITED STATES: CALENDAR YEAR 1968: PART 1, WATERWAYS AND HARBORS, ATLANTIC COAST

Detailed tables of foreign and domestic commerce are given for the Delaware River from Trenton to the sea, for individual ports and harbors, and for the Chesapeake and Delaware Canal.

REF: Department of the Army, Corps of Engineers, Washington, D. C.

503. USACE (1969) FEASIBILITY REPORT: OFFSHORE TERMINAL

Local interests have requested information on the possibility that the Corps of Engineers will provide a channel 72 feet deep to a proposed deep water terminal to be located in Delaware Bay. This terminal would be used to offload super tankers up to 250,000 d.w.t. Preliminary investigations indicate that the terminal is a feasible alternative to further deepening of the Delaware River. The most desirable project would provide for the terminal an access channel 72 feet deep and 1000 feet wide and no further deepening of the Delaware River. The annual transportation benefits would be \$34,955,000. The annual cost would be \$13,010,000. The District Engineer intends to proceed with a detailed study of the terminal.

504. USACE (1969) WATER RESOURCES DEVELOPMENT IN DELAWARE

Summary of projects completed, underway, and authorized but not yet started by the Corps of Engineers in Delaware on 1 January 1969. Mentions work on navigation channels and harbors, beach erosion control, Delaware River Basin projects; no major projects are authorized in Delaware. North Atlantic Regional and Water Resources (NAR) study is one of 20 regional comprehensive water and related land resources studies being conducted throughout the nation.

Surveys underway are Delaware River & Bay navigation, including a study of measures necessary to provide relief from oil pollution in Philadelphia's port area; flood control in Little Mill Creek, New Castle County; and beach erosion

control along the Atlantic Ocean, Broadkill Beach, South Bowers Beach, and Lewes Beach. Some of these surveys are to be completed in 1969 and 1971.

A transcript of the meeting held 1 April 1970 in Philadelphia with 18 speakers and 81 exhibits. Has 293 pages.

REF: Channel Dimensions and Anchorages Study, Delaware River--Philadelphia to the Sea, Department of the Army, Philadelphia District, Corps of Engineers, Custom House, Philadelphia, Pennsylvania

507. USACE (1970) MINUTES OF THE 70TH MEETING

J. F. Phillips (Corps) gave a description of the present status of the C & D Canal with respect to dredging operations and possible damaging effects. At present, there is an average net transfer towards the Delaware end of 900-1,000 c.f.s. After completing the widening, the net transfer is expected to increase by three times the present. H. B. Simmons (Waterways Experiment Station) reported that the existing model of the Delaware Estuary has been modified to comply with the changes in the canal. D. W. Pritchard (Johns Hopkins) pointed out that in this case the cost of hydraulic modeling may be less than a mathematical model. J. Cosentino (Corps) said the amount of shoaling between May 1969 and May 1970 amounted to 600,000 cubic yards at

the Chesapeake approach to the C & D Canal. Dr. Pritchard described the work undertaken by parties other than the Corps at the Chesapeake Bay entrance to the C & D Canal. He compared the salinity distributions as a result of the old and new canal dimensions. The effects of these changes on biota are not fully known or understood. The diversion to the Delaware is a seasonable phenomenon. The ecological impact may not be severe, but it could be cumulative over a long period of time. T. S. Y. Koo (U. Maryland) discussed the biological significance of the upper Chesapeake Bay and the C & D Canal, the theoretical effects of flow and salinity on organisms, and the means of determining these effects. L. Coccese (Corps) summarized the completed studies of the spoil disposal problem along the Delaware Estuary. P. Hartzell (Corps) described the work to determine the nature and cause of shoaling in the Delaware Estuary. J. Neibeisel (Corps) spoke on the source of shoaling materials in the Delaware Estuary. R. B. Krone (U. California) reported on his studies of the flocculation phenomenon in the Savannah Estuary. These observations taken at 30-minute intervals measured current velocities, suspended solids and salinities. At 1 to 4 feet above the bottom, the density gradient stabilizes flows so that they are slow and uniform. Colligative flocs are due to thermal conditions, settling, and internal shear which tend to make the flocs denser. It was important to reduce the concentration of shoaling by minimizing the amount of suspended sediment and maintaining high shear stresses through avoidance of piles and other structures. Flocculation is an important factor in shoaling.

510. USACE Ippen, A. T., and D. R. F. Harleman (1961) ONE-DIMENSIONAL ANALYSIS OF SALINITY INTRUSION IN ESTUARIES

(1) Introduction and previous investigation and present program, (2) theoretical considerations, (3) analysis of experimental results, (4) correlation of diffusion parameters, (5) conclusion.

Prior to 1950, the analysis of longitudinal salinity distributions was based on the concept of the tidal prism. This method is only applicable to an estuary with a fully mixed condition. As an example, even though the Delaware Estuary has a tidal prism/fresh-water discharge ratio of the order of 100, it still exhibits characteristics of a partially mixed estuary in that the salinity transfer by gravitational convection current is quite strong. It is recommended that the one-dimensional approach of this study be broadened to include a study of the longitudinal distribution of salinity. Test data from the Delaware Estuary model could be utilized to advantage.

524. USDI (1970) SURFACE WATER SUPPLY OF THE UNITED STATES 1961-1965: PART I, NORTH ATLANTIC SLOPE BASINS: VOLUME 2, BASINS FROM NEW YORK TO DELAWARE

Data for Delaware River basins are given for Murderkill, St. Jones, Mispillion, Broadkill, and Indian River, including discharge of streams, daily, monthly, and annually for water years 1961-1965. Water years begin 1 October, end 30 September. Gives data on daily discharge of streams in cubic feet/second, average discharge for 7 years, maximum and minimum discharge for water years 1961-1965. Monthly totals and yearly summaries are included. At some gaging stations water-quality records are collected; chemical analysis, temperature of water, suspended sediment concen-

tration, and particule size distribution of suspended sediment and bed material.

The numbers of Water Supply Papers containing results of stream measurement in the North Atlantic Slope Basin for years 1899 to 1960 are listed on page 9. The last 5 years are: 1956--1432; 1957--1526; 1958--1552; 1959--1622; 1960--1702.

REF: Water Supply Paper 1902, Geological Survey

525. USDI Adams, J. K., and D. H. Boggess (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE WILMINGTON AREA, DELAWARE

The specific locations of 19 soil types are mapped.

REF: Hydrologic Investigations Atlas HA-79, Geological Survey

526. USDI Adams, J. K., and D. H. Boggess (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE ELLENDALE QUADRANGLE, DELAWARE

Specific locations of 16 soil types are mapped. There is a small amount of marine tidal-marsh deposits, but a considerable amount of swamp deposits which are underlain by various types of soil.

REF: Hydrologic Investigations Atlas HA-101, Geological Survey

527. USDI Adams, J. K., and D. H. Boggess (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE TAYLOR'S BRIDGE AREA, DELAWARE

The specific locations of 8 soil types are mapped. Figure 2 shows the water levels in 13 Delaware wells during 12 years. Tables 2, 3, and 4 give soil classifications, laboratory analyses, and characteristics of engineering soil types in the area. Water-table contours, wells, perennial streams, and intermittent streams are shown on the map.

REF: Hydrologic Investigations Atlas HA-80, Geological Survey

528. USDI Adams, J. K., D. H. Boggess, and O. J. Coskery (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE FRANKFORD AREA, DELAWARE

There are 13 soil types identified and located on the map, which shows only a small amount of tidal-marsh area.

REF: Hydrologic Investigations Atlas HA-119, Geological Survey

529. USDI Adams, J. K., D. H. Boggess, and C. F. Davis (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE LEWES AREA, DELAWARE

The 19 types of soil identified are located specifically on the map. Extensive marine tidal-marsh deposits are indicated.

REF: Hydrologic Investigations Atlas HA-103, Geological Survey

530. USDI Adams, J. K., D. H. Boggess, and C. F. Davis (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE DOVER QUADRANGLE, DELAWARE

There are 19 soil types identified and located on the map.

REF: Hydrologic Investigations Atlas HA-139, Geological Survey

531. USDI Anderson, P. W., and J. R. George (1963) WATER QUALITY CHARACTERISTICS OF NEW JERSEY STREAMS

Water discharge and dissolved solids are given in figure 1 for the Delaware River at Trenton and in figure 2 for 4 stations in the Delaware River in 1957-58 (Trenton, Easton, Port Jervis, and Barryville). Variations in dissolved solids with the tidal stage at Philadelphia, and at the Delaware Memorial Bridge for April 19-20, 1963. Figure 8 gives synthetic detergent concentration (AB5) in streams in New Jersey during low flow condition in 1962 at 50 gaging stations. Figure 12 shows the annual fluctuations in stream flow and dissolved solids concentration in the Delaware River at Trenton from 1946 to 1962 and shows the 15 year

average of these for comparison. Water temperatures at Trenton and at other rivers are given in Figure 14. Other comparisons are also made.

REF: Water-Supply Paper 1819-G, Geological Survey

532. USDI Barkdale, H. C., and J. B. Graham (1952) PROGRESS OF THE INVESTIGATION OF THE GROUND WATER RESOURCES OF THE LOWER DELAWARE RIVER BASIN

Study of ground water resources in Pennsylvania (5 counties), New Jersey (5 counties) and Delaware (New Castle County). Within the lower Delaware area, there are a dozen important water-bearing formations. Figure 1 shows water-yielding components of important aquifers. Figure 2 shows present use of ground water by industry, municipalities, and others. Table 1 gives estimated ground water use in each of the 11 counties. Problems of water quality, geology, and lowered water levels are discussed.

REF: Professional Paper 381, Geological Survey

533. USDI Bascom, F. (1904) WATER RESOURCES OF THE PHILADELPHIA DISTRICT, FLORENCE

A very small part of northeast New Castle County, Delaware, is included in this Philadelphia district. The report discusses physiography and stratigraphy of the district and also discusses rainfall, runoff, and river flow.

REF: Water-Supply Paper 106, Geological Survey

534. USDI Bock, William (1966) HYDROCHEMICAL FACIES AND GROUND WATER FLOW PATTERNS IN NORTHERN PART OF ATLANTIC COASTAL PLAIN HYDROLOGY OF AQUIFER SYSTEMS

Studies made principally in New Jersey, Maryland, and Virginia. One figure shows information for Delaware; that is the general pattern of ground-water flow in the Cretaceous sediments in New Castle County.

REF: Professional Paper 498-A, Geological Survey

535. USDI Boggess, D. H., and J. K. Adams (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE BETHANY BEACH AREA, DELAWARE

The 10 soil types are identified and located on the map, which shows a considerable amount of tidal-marsh area.

REF: Hydrologic Investigations Atlas HA-122, Geological Survey

536. USDI Boggess, D. H., and J. K. Adams (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE MIDDLETOWN AREA, DELAWARE

There is some marsh land on the eastern edge of the area.

REF: Hydrologic Investigations Atlas HA-82, Geological Survey

537. USDI Boggess, D. H., and J. K. Adams (1965) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE LITTLE CREEK QUADRANGLE, DELAWARE

The 10 soil types are identified and located, showing the very large extent of tidal-marsh areas.

REF: Hydrologic Investigations Atlas HA-134, Geological Survey

538. USDI Boggess, D. H., and J. K. Adams (1965) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE MILLSBORO AREA, DELAWARE

The map locates and identifies 15 soil types and shows considerable tidal-marsh and swamp area.

REF: Hydrological Investigations Atlas HA-121, Geological Survey

539. USDI Boggess, D. H., J. K. Adams, and O. J. Coskery (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE MILTON QUADRANGLE, DELAWARE

The map locates 18 soil types and extensive marine tidal-marsh deposits.

REF: Hydrologic Investigations Atlas HA-102, Geological Survey

540. USDI Boggess, D. H., J. K. Adams, and C. F. Davis (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE SMYRNA AREA, DELAWARE

There are maps locating the 24 soil samples tested.

REF: Hydrologic Investigations Atlas HA-81, Geological Survey

541. USDI Boggess, D. H., J. K. Adams, and C. F. Davis (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE REHOBOTH BEACH AREA, DELAWARE

The map identifies and locates 19 soil types. There are extensive marine tidal-marsh deposits.

REF: Hydrologic Investigations Atlas HA-109, Geological Survey

542. USDI Boggess, D. H., O. J. Coskery, and C. F. Davis (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE MILFORD QUADRANGLE, DELAWARE

The 19 soil types identified and located on the map show the considerable extent of the tidal-marsh areas.

REF: Hydrologic Investigations Atlas HA-133, Geological Survey

543. USDI Boggess, D. H., C. F. Davis, and O. J. Coskery (1965) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE WYOMING QUADRANGLE, DELAWARE

There are 15 soil types identified and located on the map.

There is a small amount of tidal marsh area in the northeast corner of the quadrangle.

REF: Hydrologic Investigations Atlas HA-141, Geological Survey

544. USDI Boggess, D. H., and D. R. Rima (1962) ARTIFICIAL RECHARGE OF GROUND WATERS

The prospect of using excess storm water runoff to recharge the shallow water table aquifer at Newark was evaluated. There was no indication that any appreciable water reached the producing aquifer, instead a zone of saturation was created by the presence of an impermeable bed above the water table. However, the unsaturated material at shallow depths of the ditch dug is sufficient to permit the disposal of large volumes of storm runoff.

REF: Water-Supply Paper 1594-B, Geological Survey

545. USDI Cohen, B., and L. T. McCarthy (1962) SALINITY OF THE DELAWARE ESTUARY

The survey covered on the Delaware River from Philadelphia to the Appoquinimink River, Delaware includes the effect of water inflow on distribution of salinity; the frequency of chloride concentration changes; the major effect on salinity of hurricanes, dissolved solids and chloride concentration as functions of specific conductance, chloride movement in the river. The salinity at any one time is the resultant of fresh-water flow and changes in sea level at the mouth of Delaware Bay. The sea level and therefore salinity is highest from August to October, least from December to May.

REF: Water-Supply Paper 1586-B, Geological Survey

546. USDI Coskery, O. J., and R. A. Garnder (1965) GROUND-WATER LEVELS IN THE U. S. 1958-1962, NORTHEASTERN STATES

About 47 wells were observed during 1958 through 1962. Well locations (by 5' quadrangles and 1' blocks) were tabulated and water-levels are reported in tabular form for about 6-8 months of each year. The highest and lowest water levels for period observed are given.

REF: Water-Supply Paper 1782, Geological Survey

547. USDI Davis, C. F., and Boggess, D. H. (1964) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE MISPELLION RIVER QUADRANGLE, DELAWARE

The map locates and identifies 16 soil types and indicates a large expanse of tidal-marsh area.

REF: Hydrologic Investigations Atlas HA-137, Geological Survey

548. USDI Davis, C. F., D. H. Boggess, and O. J. Coskery (1965) WATER-TABLE, SURFACE-DRAINAGE, AND ENGINEERING SOILS MAP OF THE FREDERICA AREA, DELAWARE

There are 14 soil types identified and located on the map. The tidal-marsh area is extensive.

REF: Hydrologic Investigations Atlas HA-140, Geological Survey

549. USDI Durfor, C. N., and W. B. Keighton (1954) CHEMICAL CHARACTERISTICS OF DELAWARE RIVER WATER, TRENTON TO MARCUS HOOK

Report on the quality of water from August, 1949 to December, 1952.

REF: Water-Supply Paper 1262, Geological Survey

550. USDI Geological Survey (1964) HYDROLOGIC INVESTIGATIONS ATLAS

Water-table, Surface-Drainage and Engineering soils map of various areas in Delaware. The maps are on a scale of 1: 24,000; they show specific locations of various types of soil in the particular areas. Samples of soil are taken from several pits at 2 to 4 depths. Samples are analyzed for mechanical properties and plasticity index and the results tabulated. Soils are classified by HRB (Highway Research Board) systems and by unified (unified soil classification) systems in Tables 2, 3, and 4. Maps show water-table contours at 10 foot intervals and engineering characteristics of soils, perennial and intermittent streams; they also show marine tidal-marsh deposits. Figure 2 shows ground water levels over a period of 12 years in 13 observation wells in entire state of Delaware (1951-1962). There are

separate abstracts for those areas showing tidal-marsh lands along Delaware Bay.

REF: Hydrologic Investigations Atlas HA-Series of Maps,
Geological Survey

551. USDI Hardison, C. H., and R. O. R. Martin (1963) WATER SUPPLY CHARACTERISTICS OF STREAMS IN THE DELAWARE RIVER BASIN AND IN SOUTHERN NEW JERSEY

Annual low flows at short-term stream gaging stations in the Delaware River Basin are compared with the annual low flows at long-term stations to determine the magnitude and frequency of annual low flows at 95 stations for the period 1913-1953.

REF: Water-Supply Paper 1669-N, Geological Survey

552. USDI Heck, L. W. et al. (1966) DELAWARE PLACE NAMES

Alphabetical list of known geographic names in Delaware. Gives graphic coordinate for most of the streams, bays, islands, lakes and populated places.

553. USDI Hely, A. G., and F. H. Olmsted (1963) SOME RELATIONS BETWEEN STREAM FLOW CHARACTERISTICS AND THE ENVIRONMENT IN THE DELAWARE RIVER REGION: CONTRIBUTIONS TO STREAM-BASIN HYDROLOGY

Summary of hydrologic parameters is given for 107 gaging stations: physiographic units, draining area, average precipitation runoff and discharge for 1921-1950. Conclusion: very large proportion of the area variations in low-flow characteristics of streams is associated with area variations in average precipitation and geology. Has 5 tables, 10 figures, and 13 references.

REF: Professional Paper 417-B, Geological Survey

554. USDI Henry, H. R. (1964) INTERFACES BETWEEN SALT WATER AND FRESH WATER IN COASTAL AQUIFERS

In a coastal aquifer a steady flow of fresh water toward the sea limits the encroachment of the sea water. Under the assumption that the salt water and the fresh water do not diffuse into one another so that a sharp interphase exists, this action is treated for steady two-dimensional flow. Exact solutions for the position of the interface and the boundary velocities are derived for several sets of boundary conditions.

REF: Water-Supply Paper 1613-C, Geological Survey

555. USDI Keighton, W. B. (1966) FRESH-WATER DISCHARGE--SALINITY RELATIONS IN THE TIDAL DELAWARE RIVER

The chemical quality of the Delaware River was measured at three locations in Pennsylvania over a 14 year period. Sustained flows of fresh water into the Delaware River Estuary at Trenton greater than 3,500, 4,400, and 5,300 cfs assure low salinity at Marcus Hook, etc. With a discharge of less than these critical values, salinity is very sensitive to change in discharge, so that a relatively small decrease in fresh water discharge results in a relatively great increase in salinity in the Delaware River estuary at Trenton, New Jersey. Comparison of the discharge-salinity relations observed from August 1949-December, 1963, with relations proposed by other workers but based on other time periods indicate that such relations change with time and that salinity is affected not only by discharge but also by dredging; construction of breakwater, dikes and tidal barriers; tidal elevation; changing sea level; tidal range; and wind intensity and direction. Has 16 pages.

556. USDI Keighton, W. B. (1969) WATER QUALITY IN THE DELAWARE ESTUARY FOR TWO YEARS OF DROUGHT--1965 and 1966--FROM TRENTON TO REEDY ISLAND

Salinity and dissolved oxygen for different months at the various locations are charted and described on 2 charts 34 x 43 inches.

REF: Hydrologic Investigations Atlas HA-335, Geological Survey

557. USDI Livingstone, D. A. (1963) CHEMICAL COMPOSITION OF RIVERS AND LAKES

A compilation of representative chemical data for the lakes and river of the world. The rate of chemical denudation ranges from 6 (for Australia) to 110 long tons per square mile (for Europe). The rivers of the world deliver 3.9 billion tons of dissolved material to the sea each year. Water analyses of the Delaware River at Trenton, N. J., and Belvedere, N. J., are included.

REF: Professional Paper 440-G, Geological Survey

558. USDI MacKichen, K. A., and J. C. Krammorer (1961) ESTIMATED USE OF WATER IN THE UNITED STATES

Estimates for 1960 are given for each state for irrigation, industrial use, public utility, air-conditioning, water power, and as public supplies for rural use.

REF: Circular 456, Geological Survey

559. USDI Miller, E. G. (1960) CHARACTERISTICS OF TIDE-AFFECTED FLOW OF THE LOWER DELAWARE RIVER

The depth and velocity of the tidal flow through one complete cycle was measured at the Burlington-Bristol Bridge.

REF: Water Resources Division, Geological Survey. Abstracted in Journal of Geophysical Research, volume 65, page 2511, 1960.

560. USDI Miller, E. G. (1962) OBSERVATIONS OF TIDAL FLOW IN THE DELAWARE RIVER: HYDROLOGY OF TIDAL STREAMS

Data was taken at the Burlington-Bristol Bridge and at the Delaware Memorial Bridge by crews working simultaneously on 5 days in August 1955-1957. On one day of measurement, the maximum downstream rate flow at Delaware Memorial Bridge was 400,000 cfs and the maximum upstream rate 600,000 cfs, as compared to a daily ocean discharge of 1,650 cfs at Trenton. Apparently reliable figures of net downstream flow cannot be obtained by subtracting the total upstream flow from total downstream flow and correcting for changes in storage.

Satisfactory correlation might be obtained between velocity at a fixed point in a cross section of the river and its mean velocity in that cross section.

Observation of specific conductance at the Burlington-Bristol Bridge showed no significant variation during the tidal cycles studied. At the Delaware Memorial Bridge the variation was pronounced: an increase on the incoming tide and a decrease on the outgoing tide.

561. USDI Minard, J. P., H. E. Gill, J. F. Mello, J. P. Owens, and N. F. Sohl (1969) CRETACEOUS-TERTIARY BOUNDARY IN NEW JERSEY, DELAWARE AND EASTERN MARYLAND

Discussions of stratigraphy of the Cretaceous-Tertiary Boundary in New Jersey, Delaware, and Eastern Maryland. Present geologic quadrangle mapping of more than 600 square miles in Coastal Plains of New Jersey and detailed reconnaissance in parts of Delaware and Maryland offer evidence of the unconformable nature of the contact for 120 miles along the strike. Figure 5 gives specific stratigraphic sections in area of Odessa, Delaware and Gregg Neck, Maryland. Figure 9 shows cross section (geologic) from Dover, Delaware to Laurelton, New Jersey, based on gamma ray logs. 33 references.

REF: Bulletin 1274-H, Geological Survey

562. USDI Moody, D. W., and E. D. Van Reenan (1967) HIGH RESOLUTION SUBBOTTOM SEISMIC PROFILES OF THE DELAWARE ESTUARY AND BAY MOUTH

Continuous longitudinal profiles were made along center of navigation channel and channel cross-sections at 1-kilometer intervals by means of a high-resolution boomer system. This was found to be an effective means of determining the thickness of sediments overlying bedrock. This might also be useful in locating areas where a wider and deeper channel might truncate shallow aquifers and possibly increase movement of salt water into local ground-water supplies. It was possible to penetrate as much as 42 meters of sediment by this method.

REF: Professional Paper 575-D, Geological Survey

563. USDI Parker, Gerald G., et al. (1964) WATER RESOURCES OF THE DELAWARE RIVER BASIN

The basin, including areas tributary to Delaware Bay, contains 12,756 square miles and occupies major parts of Delaware, New Jersey, Pennsylvania, and New York plus parts of Maryland. Unusually large and increasing demands are made of these water resources because of its proximity to great urban and industrial centers. Extensive detailed maps give the geology, annual and seasonal precipitation, water loss (difference between precipitation and runoff), average annual temperature, and chemical analyses.
