INTRODUCTION

Interest in Maine's coastal waters grows as does the pressure placed upon them by what we are pleased to call civilization. This interest dictates that information on those waters be easily available to all their users. This report presents most of the hydrographic and nutrient data for the Damariscotta River estuary collected from October 1967 through December 1977. McAlice's (1977) discussion of the hydrography of the estuary was based on intensive sampling during the summers of 1968 and 1969, and seasonal cruises in 1970 and 1971. Petrie (1975) collected hydrographic and nutrient data at several stations from June 1969 to May 1970. Sampling has been carried out routinely at station D7 (Fig. 1) since June 1969. All these data are given here. Lee (1974) measured temperature, salinity, and turbidity at three stations from November 1971 to December 1972. His data are not included, nor are those from a few occasional or incidental studies.

METHODS

Temperature and salinity were measured with a Beckman RS5-3 field salinometer, except where noted. This instrument was periodically checked against a laboratory thermometer and a Beckman RS7-B laboratory salinometer calibrated with Copenhagen standard seawater. The field salinometer did not read below 0°C; any zero readings in the data should be interpreted as $\leq 0^{\circ}\text{C}$. Extinction coefficients were calculated from Secchi disc measurements, using the relation $k = 1.44/D$ recommended by Holmes (1970) for coastal waters; D is the depth at which the Secchi disc disappears.

Dissolved oxygen was determined by a modification of the standard Winkler method, using phenylarsine oxide as titrant instead of the less stable sodium thiosulfate.

Through January 1974 nitrate was determined by the method of Mullin and Riley (1955). Beginning in February 1975 the procedure of Wood, Armstrong, and Richards (1967) was used. Determinations of phosphate, silicate, and nitrite followed the procedures given by Strickland and Parsons (1968). The method of Solorzano (1969) was used for ammonia analyses, and that of McCarthy (1970) for urea.

PRESENTATION OF THE DATA

Table 1 summarizes the periods for which the several kinds of data are available at the stations shown in Figure 1. Mid-channel isopleths of temperature (Fig. 2) and salinity (Fig. 3) between stations D1 and D8 are given for selected dates. Isopleths of temperature (Fig. 4) and salinity (Fig. 5) in

the top 10 m at station D7 cover the period January 1970 through December 1976. Changes in the 0.5 m and 9 m values of temperature, salinity, nitrate, phosphate, silicate, and dissolved oxygen from January 1970 through December 1977 are shown in Figures 6-11. Monthly summaries of measurements of temperature, salinity, and nitrate (Fig. 12) and of phosphate, silicate, and dissolved oxygen (Fig. 13) made at station D7 from January 1970 through December 1976 complete the graphic presentation. The bulk of the report then consists of a tabulation of the data.

ACKNOWLEDGMENTS

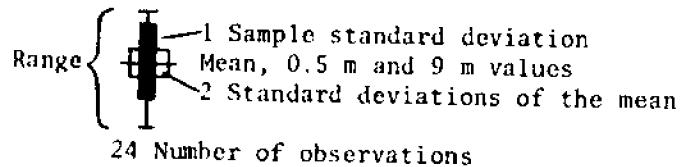

Many people assisted in the collection of these data. Particular thanks are due Wayne Petrie, who gathered much of the summer hydrographic information in 1968 and 1969, and also allowed me to include his own unpublished data. Robert Packie established the analytical procedures for nutrients, and Stephen Macko extensively refined them. Field or laboratory assistance was also given by David Carlson, Jerome Cura, Harold Elliot, Byron Hollet, Gretchen Hull, Nancy Leavitt, Wen-Yuh Lee, Carol Manen, Arthur Mayers, Daniel Plassé, and Lanny Whitten. Principal financial support was provided by the Maine Geological Survey and Maine Yankee Atomic Power Company

HYDROGRAPHIC AND NUTRIENT DATA

All times are Eastern Standard Time

H.W. and L.W. are the times of high and low waters at Portland, Maine, from the U.S. Department of Commerce Tide Tables.

T: temperature, °C

S: salinity, ‰

O₂: dissolved oxygen, ml/l

Po₄: phosphorus present as reactive phosphate, µg at P/l

NO₃: nitrogen present as reactive nitrate, µg at N/l

NO₂: nitrogen present as reactive nitrite, µg at N/l

NH₃: nitrogen present as ammonia, µg at N/l

Urea: nitrogen present as urea, µg at N/l

SiO₂: silicon present as reactive silicate, µg at Si/l

k: extinction coefficient, per meter

*: temperature by hand-held thermometer, salinity by hydrometer

†: salinity calculated from temperature and conductivity data

#: salinity measured on laboratory salinometer

Station suffixes E and W indicate that observations were made near the east and west shores of the estuary.

Table I. Summary of data included in this report. T, temperature and salinity; O, dissolved oxygen; P, phosphate; N₃, nitrate; N₂, nitrite; A, ammonia; U, urea; Si, silicate; k, extinction coefficient.
