National Oceanic and Atmospheric Administration
PROGRAM PLANNING AND INTEGRATION
Silver Spring, Maryland 20910

JUN 2 2010

To All Interested Government Agencies and Public Groups:

Under the National Environmental Policy Act, an environmental review has been performed on the following action.

TITLE: Framework Adjustment 21 to the Atlantic Sea Scallop Fishery Management Plan (FMP),
and RIN 0648-AY43

LOCATION: East Coast Exclusive Economic Zone (North Carolina – Maine)

SUMMARY: Framework 21 was developed by the Council to meet the FMP's requirement to biennially adjust the management measures for the scallop fishery to ensure that the measures meet the fishing mortality and other goals of the FMP and achieve optimum yield from the scallop resource on a continuing basis. Framework 21 was developed to achieve the following management measures for the 2010 scallop fishery: Total allowable catch (TAC); open area days-at-sea (DAS) and Sea Scallop Access Area (access area) trip allocations; DAS adjustments if an access area yellowtail flounder TAC is caught; limited access general category (LAGC) access area trip allocations; management measures to minimize impacts of incidental take of sea turtles as required by the March 14, 2008, Atlantic Sea Scallop Biological Opinion; minor adjustments to the LAGC individual fishing quota program; and minor adjustments to the industry-funded observer program.

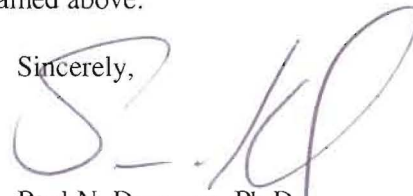

RESPONSIBLE
OFFICIAL:

The environmental review process led us to conclude that this action will not have a significant impact on the environment. Therefore, an environmental impact statement was not prepared. A copy of the finding of no significant impact (FONSI), including the environmental assessment, is enclosed for your information.

Although NOAA is not soliciting comments on this completed EA/FONSI, we will consider any comments submitted that would assist us in preparing future NEPA documents. Please submit any written comments to the Responsible Official named above.

Sincerely,

for Paul N. Doremus, Ph.D.
NOAA NEPA Coordinator

Framework 21 to the Atlantic Sea Scallop FMP

Including an Environmental Assessment, an Initial Regulatory Flexibility Analysis and Stock Assessment and Fishery Evaluation (SAFE) Report

Prepared by the New England Fishery Management Council, in consultation with the National Marine Fisheries Service and the Mid-Atlantic Fishery Management Council

Initial Council Meeting: April 7-9, 2009

Final Council Meeting: January 26-28, 20--2010

Submission to NMFS: December 18, 2009

Re-submission to NMFS: February 26, 2010/March 19,2010

Intentionally Blank

EXECUTIVE SUMMARY

This framework and Environmental Assessment (EA) presents and evaluates management measures and alternatives to achieve specific goals and objectives for the Atlantic sea scallop fishery. This document was prepared by the New England Fishery Management Council and its Scallop Plan Development Team (PDT) in consultation with the National Marine Fisheries Service (NMFS, NOAA Fisheries) and the Mid-Atlantic Fishery Management Council (MAFMC). This framework was developed in accordance with the Magnuson-Stevens Fishery Conservation and Management Act (MSFCMA, M-S Act) and the National Environmental Policy Act (NEPA), the former being the primary domestic legislation governing fisheries management in the U.S. Exclusive Economic Zone (EEZ). This document also addresses the requirements of other applicable laws (See Section 6.0).

In addition to the No Action alternative, the Council considered various other alternatives to address the purpose and need of this action. The purpose of this action is to achieve the objectives of the Atlantic Sea Scallop Fishery Management Plan (FMP), which is to prevent overfishing and improve yield-per-recruit from the fishery. The primary need for this action is to set specifications to adjust the day-at-sea (DAS) allocations and an area rotation schedule for the 2010 fishing year. This framework adjustment also addresses other issues such as minimizing impacts of incidental take of sea turtles as per the March 14, 2008 Atlantic Sea Scallop FMP Biological Opinion and minor adjustments to the observer set aside program.

The Council selected management alternatives as a final action in November 2009, but concerns about the target fishing mortality rate and corresponding DAS allocations caused the Council to reconsider the alternatives at its January 2010 meeting. After listening to additional testimony from the industry and other interested parties, and a discussion among Council members, the Council voted at the later meeting to change the November decision to select the No Closure, $F = 0.20$ option to the No Closure, $F = 0.24$ option. All other measures selected in November remained unchanged and are part of the final action for this framework.

The proposed action includes:

- An acceptable biological catch (ABC) as required by the reauthorized Magnuson Act (2007),
- Total allowable catch (TAC) specifications for the 2010 fishing year, DAS allocations, and access area schedule based on a target fishing mortality of $F = 0.24$ with no new closure in the Great South Channel on Georges Bank,
- A provision to allow limited access general category (LAGC) vessels with individual fishing quota (IFQ) permits to lease a portion of their IFQ to other IFQ-permitted vessels,
- Provisions to minimize impacts of incidental take of sea turtles as per the March 14, 2008 Atlantic Sea Scallop FMP Biological Opinion, and
- A measure to improve the observer set-aside program.

For 2010 the acceptable biological catch (ABC) will be set at 29,578 mt (65.2 million pounds), including an estimated 3363 mt – 7.4 million pounds - for non-yield fishing mortality (discards and incidental mortality). Therefore, the overall ABC for the fishery, excluding discards and incidental mortality is 26,219 mt (57.8 million pounds).

Fishery specifications for 2010 are included in this action for both limited access and limited access general category vessels. Fishery allocations are based on an overall fishing mortality target of $F = 0.24$ (Scenario ‘NCLF24’ – no new closure in the Channel and overall F of 0.24). Access areas available to the fishery this year include: Elephant Trunk, Delmarva, and Nantucket Lightship. The Council also considered closing a new access area in part of the Great South Channel, but did not select this alternative as part of the final action. After mortality from access areas is accounted for, the open area DAS allocations are set so that the overall fishing mortality equals 0.24 for the proposed action. Under this target the open area DAS allocations will be approximately 12,920 DAS for the fleet overall, equivalent to 38 DAS for full-time vessels, 15 DAS for part-time vessels and three DAS for occasional vessels.

The LACG IFQ program is expected to be fully implemented before March 1, 2010. Although, the proposed action also includes measures for the LAGC fishery that would extend the “transition period” to IFQs through the 2010 fishing year, allocating 10% of the TAC to IFQ vessels, the Council’s final decision assumes that the IFQ program will be in effect before March 1. Therefore, all qualifying IFQ LAGC vessels will be allocated a specific amount of the total general category allocation based on their qualifying contribution factor. The total general category allocation for IFQ-permitted vessels will be equivalent to 5% of the projected landings for 2010, after accounting for incidental catch and applicable set-asides, which is 2.3 million pounds. In addition, limited access vessels with both limited access and general category IFQ permits will be allocated 0.5% (233,000 pounds) of the projected 2010 landings, to be applied to their IFQ permits. Individual vessels will be allocated a set poundage they can fish from open areas or access areas if available. The general category IFQ fishery has been allocated 5% of projected catch from each access area as a total number of fleet-wide trips. Once the fishery uses all trips in an access area the area is closed to general category fishing for the remainder of the year. These fleet-wide trips are allocated to both general category vessels with IFQ permits and limited access vessels fishing under the provisions of their general category IFQ permits. All these measures were adopted under Amendment 11; this action only specifies the overall TAC for the 2010 fishing year and the number of access area trips available in 2010. The hard-TAC for vessels that qualify for a limited access Northern Gulf of Maine general category permit will remain at 70,000 pounds for 2010. Similarly, the target TAC for limited access incidental catch permits will remain at 50,000 pounds for 2010.

The new provision for limited access general category vessels would allow general category vessels with an IFQ permit to lease portions of their annual allocation during the fishing year. Amendment 11 prohibited leasing portions of allocations, leasing was restricted to full allocation amounts.

To minimize impacts of incidental take of sea turtles as per the March 14, 2008 Atlantic Sea Scallop FMP Biological Opinion, the proposed action includes a combination of measures considered including a two-month seasonal closure of the Delmarva (Delmarva) access area from September 1-October 31 and a limit on the number of access area trips that can be taken in access areas within the Mid-Atlantic from June 15 through October 31. During this period, each vessel is restricted to taking two of the three allocated Mid-Atlantic access area trips in the Mid-Atlantic. Since both Mid-Atlantic access areas would now be closed from September 1-October

31 to reduce impacts on sea turtles (if approved), the trip limit is applicable from June 15 through August 31.

Lastly, this action includes a measure to improve the observer set-aside program by limiting the amount of compensation a general category vessel can receive on observed access area trips. The limit would be equivalent to the value of one day of compensation, regardless of trip length. So if a general category vessel fishes for more than one day in an access area, even a portion of an additional day, it would not be eligible for more than one day of compensation from the observer set-aside program. The compensation rate is set by NMFS in the final regulations for each framework.

Summary of alternatives considered and the Council's rationale for the proposed action

Acceptable Biological Catch (2.3)

Acceptable biological catch (ABC) for this fishery in 2010 will be set at 29,578 mt (65.2 million pounds), including an estimated 3363 mt – 7.4 million pounds - for non-yield fishing mortality (discards and incidental mortality). Therefore, the overall ABC for the fishery, excluding discards and incidental mortality is 26,219 mt (57.8 million pounds). ABC is the maximum catch that the Council may allow; however, the Council must also consider management uncertainty, ecological, economic and social factors in setting catch levels for a fishery.

This level came directly from PDT analysis and was approved by the Science and Statistical Committee (SSC). Various sources of scientific uncertainty were considered when setting this value. The SSC presented their report to the Council regarding ABC for 2010 at the September 2009 Council meeting and the Council agreed with their recommendation. ABC calculations were based on the assumption of uniform fishing, and in particular, that there were no EFH or rotational closures. This is consistent with the current FMP overfishing definition, which defines overfishing relative to a "whole stock" fishing mortality. Therefore, the ABC calculation gives what would be an appropriate catch if all areas were open. That is not the case in the plan since there are groundfish mortality closed areas and EFH closed areas that are not accessible to the fishery, as well as scallop rotational areas that are only available to the fishery at certain times and effort is limited in these areas. A lower fishing mortality target would help to prevent overfishing in areas that are available, since all exploitable scallop biomass is not accessible to the fishery.

Allocation Scenarios (Section 2.4)

The Council considered four specific allocation scenarios for this action in addition to the No Action alternative. Two scenarios included closing a new access area in part of the Great South Channel and two did not include the closure. Various levels of overall fishing mortality were considered as well ranging from an overall $F = 0.18$ to $F = 0.24$. All four scenarios, as well as the No Action alternative include a total of four access area trips. All four scenarios included two trips in Elephant Trunk, one in Delmarva and one in Nantucket Lightship. The scenarios vary based on whether or not the new area is closed and how many open area DAS equate to the various fishing mortality targets.

Ultimately the Council selected a scenario that did *not* include a new closure in the Channel with an overall fishing mortality target of 0.24, referred to as the "NCLF24" scenario in this

document. This scenario includes four access area trips and 38 open area DAS for full-time limited access vessels. The Council ultimately selected this scenario for several primary reasons. First, the proposed action has an overall fishing mortality rate expected to prevent overfishing and minimize economic impacts. Second, while other alternatives under consideration were expected to have higher longer term benefits, these benefits were considered marginal compared to the short term (2010) economic impacts on communities and fishing ports along the east coast. Lastly, the proposed action is expected to reduce bycatch since area swept projections are lower than the No Action alternative and overall effort levels under the proposed action are less than recent years. Below is a summary of the Council discussion and rationale related to this decision.

The overall fishing mortality rate for the proposed action is expected to prevent overfishing and minimize economic impacts.

All four scenarios were developed by the PDT to meet the goals of the FMP to prevent overfishing. The FMP suggests that the stock-wide fishery mortality target be set at 80% of the overfishing threshold ($F = 0.29$). However, the PDT may recommend a different target fishing level to prevent overfishing and ensure that optimum yield is achieved on a continuing basis. For example, in Framework 19 (specifications for 2008 and 2009) the PDT and Council recommended a fishing mortality target of 0.20 to prevent localized overfishing in open areas and to account for other constraining issues on the fishery that lower optimum yield such as concerns about finfish bycatch. Setting the target fishing mortality rate at 0.20 also recognized that fishing mortality is not uniformly distributed in the scallop fishery (i.e. not all exploitable scallop biomass is accessible to the fishery) and, as such, is prone to localized overfishing.

As part of the framework analysis, the PDT prepared a Stock Assessment and Fishery Evaluation (SAFE) Report to informally assess the current condition of the scallop resource. This evaluation included updated estimates of biomass, landings per unit effort (LPUE), and fishing mortality for 2008 and 2009. The results indicate that these actual fishing mortality rates may have reached or exceeded the current overfishing threshold of $F = 0.29$, despite the fact F_{target} was set at 0.20 for those years. The Council weighed this information with new work done by the PDT related to setting fishing mortality targets and catch limits. A higher F_{max} value was calculated during this analysis, but it is not considered formally accepted until completion of the stock assessment in 2010. However, preliminary results were made available to the Council and the potential for a higher F_{max} made it more confident in choosing the higher F_{target} .

Since FW19 the PDT has improved the assumptions and models used to set F_{target} primarily based on adjustments made to how fishing mortality is estimated from open area DAS. Specifically, the PDT's most recent analyses has been adjusted for an increase in both LPUE and the number of active vessels assumed to fish in the fishery, which will reduce management uncertainty and increase the probability of achieving catch targets. Modifications have been made based on work the PDT did for developing alternatives in Amendment 15 to comply with new annual catch limit (ACL) requirements. To take this into account, the FW21 analysis included an adjustment to the model for calculating DAS to more accurately reflect the landings per-unit-effort (LPUE) value. Since vessel productivity can only increase so much, and is confined by a crew limit, the Council and PDT are confident that the current estimate of catch per DAS is reaching the actual value based on the fact that the fishery cannot keep increasing LPUE indefinitely. Therefore, it is likely that projected targets used in FW21 will be closer to

realized landings and fishing mortality compared to projections used in previous frameworks. Thus, the Council selected an overall target of 0.24 because it is below the current threshold of 0.29, and the Council has more confidence in the methods used to set this target than previous actions. This target is expected to prevent overfishing.

In all, the main rationale behind a higher fishing mortality rate was that all the scenarios presented were precautionary and would not jeopardize the resource, so choosing the one that had the least negative economic impact in 2010 and that would adequately address management uncertainty to prevent overfishing and exceeding the ABC. Also, the selection of $F = 0.24$ is a reduction from the preliminary estimate of F_{2008} at 0.30. Despite overshooting targets in recent years, the proposed action is still a comfortable level below both ABC and the overfishing threshold, and the Council is more confident in the updated projections in relation to these limits.

The longer term benefits from other options do not outweigh the expected short-term economic impacts.

Compared to the $F = 0.20$ alternative the higher F_{target} alternative ($F = 0.24$) had less negative short-term economic and social impacts. Much concern was voiced over the impacts of the cut in DAS from the lower F scenario (No Closure, $F = 0.20$ scenario equates to 29 open area DAS for fulltime vessels). Industry testimony cited direct, immediate reductions in employment and or hours employed based on losses in revenue from $F = 0.20$, in what are already considered difficult economic times nationwide. There was also fear of ripple effects throughout the major ports that could potentially affect business and fisheries outside of those directly tied to scallops, and that businesses hit in this hard time would have an extremely difficult time bouncing back in the future if allocations increase.

The proposed action yields 5.8 million pounds more in 2010 than the $F = 0.20$ (NCLF20) alternative, which equates to \$41 million in ex-vessel revenues. When compared to these numbers, the future return in landings and revenue (10.3 million pounds and \$58 million in 2011-2016) does not outweigh the high risk of lost market share. Expected returns would have to be higher to justify the likely loss of market share resulting from higher prices in 2010 and lower prices when the supply increases in 2011 and beyond. Therefore the impacts of lower landings in 2010 would be felt for possibly several years afterward because it could take a long time for market share and prices to recover.

The Council discussed that it would be desirable for the industry to maintain consistent landings from year to year, but this is difficult due to the high variability in scallop recruitment. Specifically, in 2000-2004 there was very high recruitment observed during 1998-2001 on Georges Bank and during 1998-2004 in the Mid-Atlantic, and that has provided increased catch and revenue for the fishery in recent years. However, in the middle of this decade recruitment has been average in the Mid-Atlantic and low on Georges Bank. There is currently no evidence that recruitment could be stabilized if biomass is kept large, which means there is less justification for a very large biomass. The proposed action minimizes impacts on the fishery by helping to stabilize landings from year to year compared to other alternatives considered. A higher catch level in 2010 will reduce the difference between catch in 2009 and 2011 that would exist at the lower F scenario.

In regards to the general category fishery, impacts will be minimized with the higher *F* scenario because the fishery is already facing a large reduction from 2009 catch levels since their allocation has changed from 10% of the overall TAC to 5% in one year. A larger overall allocation will minimize impacts in the first year of the IFQ program.

The proposed action is expected to reduce bycatch and impacts on essential fish habitat.

When compared to No Action, options that proposed closing the channel, and recent years, the proposed action has lower area swept projections, which has implications for expected impacts on bycatch, sea turtles and EFH. The two specific measures adopted to address the RPM are sufficient when combined with any of the scenarios under consideration. Under the proposed action the RPM alternatives limit scallop fishing in the Mid-Atlantic during the turtle season and are expected to reduce effort in that area and time by roughly 20% compared to 0% if no specific RPM were adopted.

Yellowtail flounder are managed within the Multispecies FMP, and the scallop fishery is a major source of bycatch for this rebuilding species. For this reason, yellowtail flounder are allocated to the scallop fishery so they may incidentally harvest yellowtail flounder during fishing operations. It was noted at the January council meeting that reduced yellowtail allocations for the groundfish fishery as a result of higher allocations to the scallop fishery in 2010 should not present a major issue for the directed yellowtail fishery. This is due to cooperation from major groundfish sector leaders and willingness of the two fisheries to cooperate in pursuing a trade/exchange agreement. It was noted that the directed yellowtail fishery has already been largely reduced by rebuilding requirements and associated low catch limits, and that both fisheries could benefit from working together. Lastly, the groundfish fleet stands in solidarity with the scallop fleet in terms of supporting infrastructure needed by both fleets within the major ports.

In summary, the Council selected the NCLF24 scenario because it adequately addresses management uncertainty to prevent overfishing and exceeding the ABC while having the least negative economic impacts in 2010 of the two options that did not include the new closure in the South Channel. The effort level under NCLF24 in 2010 gives better short-term landings that will support fishing communities from Maine to North Carolina, and maintains relatively low levels of bycatch of yellowtail flounder, potential interactions with sea turtles, and habitat impacts. Therefore, the Council's rationale for selecting this allocation scenario for 2010 is expected to optimize yield and reduce the risk of overfishing on a continuing basis, as required by MSA.

Measures for General Category vessels (Section 2.6)

This action includes specific allocations for the general category fishery in terms of number of fleet-wide access area trips. The hard-TAC for the NGOM management unit is 70,000 pounds for 2010, and the target TAC for incidental permits is 50,000 pounds. This action also considered an alternative to allow partial leasing of general category IFQ allocations during the fishing year. The Council adopted this alternative to increase flexibility for general category qualifiers and to improve overall economic profits of the IFQ program.

Consideration of a new rotational area in the Great South Channel (Section 2.7)

This action considered a new rotational area closure in part of the Great South Channel to protect strong recruitment in that area. After several years, when scallops have grown and increased yield potential, the area would reopen as a rotational access area with controlled access. The Council decided not to close this area at this time. At first the Council was cautious not to close a portion of the Channel because area rotation is the cornerstone of this FMP and has been a very successful strategy. During the final Council meeting it was noted that one consequence of area rotation is short term impacts from closing an area and shifting effort, but the long term gains from optimizing yield per recruit is what has allowed this program to be so successful. Ultimately, the Council decided not to close the area because the timing is not right for a new closure in this area and there are too many concerns and uncertainties about what impacts would be from expected shifts of effort from the Channel to other areas.

In terms of effort shifts, 2010 is the first year the scallop fishery will be allocated a fixed amount of yellowtail flounder as bycatch, and the new closure would have been expected to shift effort to the Mid-Atlantic with greater impacts on SNE/MA yellowtail flounder. In addition, this action is the first time the Council has been requested to adopt measures to comply with a reasonable and prudent measure related to sea turtles which requires NMFS to limit scallop effort in the Mid-Atlantic when turtles are likely to be present. Because the closure in the Channel may have shifted effort to the Mid-Atlantic, this alternative would have run counter to what the action is supposed to do in limiting scallop effort in the Mid-Atlantic. Lastly, closing the channel area could have beneficial impacts on the EFH in that area for several years when scallop fishing would be prohibited. But the analyses suggest that increases in area swept in other areas would likely offset any beneficial impacts on EFH from the closure. It was also noted that part of this access area is within the boundaries of the proposed cod HAPC area under consideration in Phase II of the EFH Omnibus Amendment. Identifying part of the area as a scallop access area now could constrain future decisions of the Council related to fishing effort in that area in the future.

Overall the Council argued this is not the right time to close the channel because there are several actions in development and soon to be initiated that may address some of the present constraints. Specifically, Amendment 15 may address EFH boundary issues within closed areas on Georges Bank that would provide additional access into areas with higher catch rates, Phase II of the EFH Omnibus Amendment may revise EFH management all together, and the Council voted to initiate an action in 2010 that would consider measures to address yellowtail bycatch by scallop vessels. Until these matters are considered in other actions, it seemed premature to adopt something that could exacerbate these issues further.

In summary, the biological projections show that the closure has two immediate effects: it reduces F and forces fishing effort elsewhere. The first effect causes there to be more open area days at a given fishing mortality with a closure than without, and vessels are concentrated in a smaller area. That is why catch rates are lower and area swept projections are higher at first for the two options that close the channel. After the channel rotational area opens in 2013 catch rates are higher and area swept is lower for the two scenarios that close the channel area. However, the differences are marginal and the Council felt that the cumulative increases

(benefits) in yield as a result of the closure were small compared to the immediate increases in area swept (costs) in the Mid-Atlantic that could have impacts on finfish bycatch and sea turtles.

Alternatives to comply with the reasonable and prudent measure (RPM) in biological opinion relating to turtles (Section 2.8)

This action includes alternatives to comply with the reasonable and prudent measure included in the recent biological opinion for the scallop fishery related to impacts on sea turtles. In summary, NMFS must limit the amount of allocated limited access scallop fishing effort that can be used in the Mid-Atlantic during the periods in which turtle takes have occurred, but the restrictions shall be limited to a level that will not result in more than a minor impact on the fishery. The Council considered a handful of measures to limit effort in this area from mid-June through the end of October. The measures ranged from limits on DAS or access area trips that could be used in that area and time period, seasonal closures of access areas in the Mid-Atlantic, and reduced possession limits in Mid-Atlantic access areas. After the Scallop Committee reviewed the preliminary analyses of the alternatives, some were considered more than minor due to high distributional impacts on vessels from the south compared to vessels from the north. One measure that was considered not more than minor was the seasonal closure in the Delmarva access area. Because this measure alone seemed to have neutral impacts on the fishery and possibly positive impacts on fishing mortality by shifting effort from time periods with lower meat weights to potentially higher meat weights, the Council was not confident this measure alone would be sufficient to meet the requirement of the RPM.

Therefore, at the November Council meeting the Council considered several “combined measures” of the alternatives already under consideration to ensure this action is compliant with the requirement to limit effort up to the point where impacts are more than minor. All three combined measures considered included the seasonal closure in Delmarva and some combination of limited effort within access areas in the Mid-Atlantic and during the turtle season. Ultimately the proposed action includes a combination of measures considered including a two-month seasonal closure of the Delmarva access area from September 1-October 31 and a limit on the number of access area trips that can be taken in access areas within the Mid-Atlantic from June 15 through October 31. Each vessel is restricted to taking 2 of the 3 allocated access area trips in the Mid-Atlantic. Since both Mid-Atlantic access areas are now closed from September 1-October 31 to reduce impacts on sea turtles, the limit is applicable for June 15 through August 31.

Limiting the maximum number of trips to two per vessel will move 358 DAS from the turtle window to the rest of the year, which constitutes about a 3.5% effort shift. There would be no loss in scallop revenue because the vessels will be allowed to land the same amount of pounds. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore fleet fishing costs will increase by \$15,577. In addition, this measure will involve closure of Delmarva (Alternative 3) from September 1 through October 31. It is estimated that 64 Delmarva trips (6.7%) would normally take place during the months of September to October. The DAS used for these trips is estimated to be 563, and this effort will be removed from turtle window. This constitutes a 5.4% effort shift and an increase in F of 0.002 for the entire turtle window from June 15 to August 31. Because more trips will take place in the window when meat weights are lower compared to the

status quo, it will take more DAS to land the same pounds. Therefore the fleet fishing costs will increase by \$24,518 because of the Delmarva closure.

The net change in F of closing Delmarva (increase in F of 0.002) and limiting the number of trips to two trips per vessel during the June 15 – August 31 window (increase in F of 0.001) will be a net increase in F of 0.003. The combined measure will also result in a 8.9% shift of effort from the turtle window (June 15 – October 31) into the rest of the year, which is slightly below the recommended threshold level (10%) for a minor change based on the analyses prepared by the PDT for the original RPMs in FW21. Adding the increase in fishing costs due to the Delmarva closure to the increase in costs due to effort shifts from ETA during the turtle window, the total trip costs with this combined measure will increase by \$40,095 for the scallop fleet. In summary, this final combined measure would limit scallop effort up to a point that is not expected to have more than a minor impact on the fishery. The Council also selected this measure because it does not have some of the timing and implementation issues identified for other combined measures.

Improvements to the observer set-aside program (Section 2.9)

This action considered two measures to improve specific aspects of the observer set-aside program. The proposed action only includes one of these measures - to limit the amount of compensation a general category vessel can receive on observed access area trips. In recent years there has been an increase in the amount of pounds general category vessels are compensated for observed trips in access areas. The Council was informed that a growing number of vessels seem to be taking advantage of a “loophole” for how compensation is granted. Some vessels leave right before midnight on day 1 and return at sometime during day 2 with 400 pounds for the trip plus 400 pounds for each calendar day carrying an observer (total of 1200 pounds).

The Council heard testimony that 400 pounds is presently more than enough to compensate for the costs of an observer on a general category access area trip. Vessels therefore have an incentive to stay out additional days to earn additional profits when carrying an observer. Therefore, the proposed action will limit the compensation to the equivalent of one day of compensation, regardless of the length of the trip. The Regional Office will still set the compensation rate, and that amount could be more or less than 400 pounds based on the most up to date information. Limiting the compensation per trip will help the total observer set-aside compensation pool last longer, reducing the chance of the pool running out before the end of the year. If the observer set-aside runs out before the end of the year vessels are required to pay for observers with no compensation awarded. Thus the Council supported inclusion of this alternative to eliminate potential abuse of the current program, limit compensation used per trip to help the set-aside last longer during the fishing year, and to be more consistent with how compensation is presently used for limited access vessels.

Table 1 - Summary of all the alternatives in Framework 21; the proposed action is in bold face.

| SECTION | ALTERNATIVES | DESCRIPTION |
|----------------|--|--|
| 2.2 | NO ACTION (page 17) | |
| 2.2.1 | No action | Trip allocations for access area would roll over from FY 2009. TACs would remain as estimated in A11 and FW19. |
| 2.2.2 | No action if IFQ program is not fully implemented by March 1, 2010 | Allocation to the LAGC fishery is set at 10% instead of 5% under IFQs. |
| 2.2.3 | Measures in effect March 1, 2010 until FW21 | ETA trips will be managed under the same regulations as 2009, OA days carry over until FW21 implemented. |
| 2.3 | Acceptable Biological Catch | SSC recommends ABC = 29,578 mt (65.2 million lbs) in 2010. |
| 2.4 | FW21 ALLOCATION SCENARIOS (page 21) | |
| | NCLF20 | Status Quo - No closure in Channel, overall $F = 0.20$ DAS=29; 1 trip in NL, 1 trip in Delmarva, 2 trips in ETA |
| | NCLF24 | No closure in Channel, overall $F=0.24$ DAS=38; 1 trip in NL, 1 trip in Delmarva, 2 trips in ETA |
| | CLF20 | New closure in Channel, overall $F = 0.20$ DAS= 42; 1 trip in NL, 1 trip in Delmarva, 2 trips in ETA |
| | CLF18 | New closure in Channel, overall $F = 0.18$ DAS=51; 1 trip in NL, 1 trip in Delmarva, 2 trips in ETA |
| 2.5 | MEASURES FOR LIMITED ACCESS VESSELS (page 25) | |
| 2.5.1.1 | Adjustments when YTF catch reaches 10% TAC Limit | The proposed action includes an allocation of a certain # of open area DAS for a full-time vessel if the Nantucket Lightship Area closes in 2010 due to the YT TAC being reached. |
| 2.5.1.2 | TAC set-asides for observers (1%) and research (2%) | The percent of TAC and total DAS set aside for observers (1%) and research (2%) would be removed before allocations are set for limited access and general category fisheries. |
| 2.5.1.4 | DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010 | If the LAGC IFQ program is not fully implemented before March 1, 2010 the LAGC fishery is allocated 10% of the total projected scallop catch during the transition period to ITQs, compared to 5% so LA DAS have to be reduced - See Table 9 page 27. |
| 2.6 | MEASURES FOR GENERAL CATEGORY VESSELS (page 28) | |
| 2.6.1 | Measures if IFQ program is delayed | |
| 2.6.1.1 | Quarterly hard-TAC for transition period to limited entry | |
| 2.6.2 | Georges Bank access area management | All four scenarios include access into Nantucket Lightship for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for that area in the form of fleet-wide trips. |
| 2.6.2.1 | Yellowtail flounder bycatch TAC | Yellowtail flounder bycatch TAC is shared between the two fisheries; therefore, once the TAC is reached the area closes for both fleets. |

| | | |
|---------|---|--|
| 2.6.3 | Mid-Atlantic access area management | All four scenarios include access into both Elephant Trunk and Delmarva for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for both areas in the form of fleet-wide trips. |
| 2.6.4 | NGOM Hard-TAC | The PDT reviewed landings data from the VTR database and recommends that the hard-TAC for this area be 70,000 pounds for FY2010. |
| 2.6.5 | Estimate of catch from LA incidental permits | The PDT recommends this target TAC remain at 50,000 pounds. This catch is removed before allocations to LA and LAGC fisheries. |
| 2.6.6 | Allow leasing of partial general category IFQ allocations during the fishing year | IFQ would be lease-able in partial allocations (amounts greater than or equal to 100 lbs) during the fishing year. |
| 2.7 | CONSIDERATION OF NEW ROTATIONAL AREA IN THE GREAT SOUTH CHANNEL (page 30) | |
| 2.7.1.1 | No action | No new rotational area would close in this action in the Great South Channel vicinity. |
| 2.7.1.2 | New rotational area in the Channel north of Nantucket Lightship and west of CAI | An area to the north of the Nantucket Lightship closed area and west of Closed Area I would close to scallop fishing for at least FY2008 and 2009 to protect seed scallops. |
| 2.8 | ALTERNATIVES TO MINIMIZE IMPACTS OF INCIDENTAL TAKE OF SEA TURTLES (page 34) | |
| 2.8.1.1 | Restrict number of OA DAS an individual can use in the Mid-Atlantic during a certain window of time | The restriction on DAS a vessel can use in the Mid-Atlantic |
| | Option A for Area | Would apply to all statistical areas south of the northern boundaries of statistical areas 612, 613, 533, 534, 541, 542, and 543 (see Figure 4). |
| | Option B for Area | Would apply to all statistical areas south of the northern boundaries of statistical areas 612, 613, 533, 534, 541, 542, and 543 July-October, and a subset of those areas for the month of June only. |
| | Option A for time window | June 16-October 14 - the full range of observed takes of turtles in scallop fishery. |
| | Option B for time window | June 15 - October 31 - slightly longer to recognize that turtle migration patterns change over time and one turtle was observed on a research trip near ETA in late October. |
| 2.8.1.2 | Restrict number of AA trips in the Mid-Atlantic that can be used during a certain window of time | The number of allocated access area trips that can be taken in the Mid-Atlantic during the two time periods under consideration would be restricted. |
| | Option A for time window | June 16-October 14 - full range of observed takes of turtles in scallop fishery. |
| | Option B for time window | June 15 - October 31 - slightly longer to recognize that turtle migration patterns change over time and one turtle was observed on a research trip near ETA in late October. |
| 2.8.1.3 | Consider a seasonal closure for Delmarva | The entire access area would close to both general category and limited access scallop vessels. |
| | Option A | September and October |
| | Option B | October only |
| 2.8.1.4 | Reduce possession limits in ETA and/or Delmarva | Possession limits would be reduced to cut back on effort, perhaps in the range of 10%. |

| | | | |
|------------------|--|--|--|
| 2.8.1.5.1 | Combined RPM 1: Reduced possession limit on any access area trip in ETA and/or Delmarva and seasonal closure of Delmarva | | |
| 2.8.1.5.2 | Combined RPM 2: Limit number of ETA trips with a reduced possession limit and seasonal closure in Delmarva | | |
| 2.8.1.5.3 | Combined RPM 3: Limit the number of MA access area trips that can be taken during turtle window and seasonal closure in Delmarva. | Vessels would be limited to take either 1 of 3 (Option A) or 2 of 3 (Option B) allocated access area trips allocated in Mid-Atlantic access areas. The Delmarva access area would also be closed from September 1 through October 31. | |
| 2.9 | IMPROVEMENTS TO THE OBSERVER SET-ASIDE PROGRAM (page 37) | | |
| 2.9.1.1 | No action | No changes would be made to the observer set-aside program. | |
| 2.9.1.2 | Provisions to discourage vessels owners from not paying deployed observers | This alternative would prohibit a vessel from fishing until all outstanding bills were paid by not issuing a permit to fish in a fishing year after an outstanding bill is due. | |
| 2.9.2 | Limit the amount of observer compensation general category vessels can get per observed trip in access areas | This alternative would limit the amount of observer set-aside compensation for IFQ vessels fishing in an access area to the equivalent of one day of compensation, regardless of the length of the trip. | |

LIST OF ACRONYMS

A10 – Amendment 10 to the Atlantic Sea Scallop Fishery Management Plan
A13 – Amendment 13 to the Northeast Multispecies Fishery Management Plan
BMSY – Biomass Maximum Sustainable Yield
BO – Biological opinion
CEQ – Council on Environmental Quality
CAI – Closed Area I
CAII – Closed Area II
CV – Coefficient of variation, a standard statistical measure of variation, expressed as a percentage of the mean. Lower CVs indicate more accuracy in the estimates and less variation in data.
CWA – Cape Wind Associates
DAS – Day-at-sea
DMV – Delmarva
DSEIS – Draft Supplemental Environmental Impact Statement
EA – Environmental Assessment
ESA – Endangered Species Act
EFH – Essential Fish Habitat
EFH designation life stages
A – Adult life stage
J – Juvenile life stage
E – Egg life stage
ETA – Elephant Trunk Area
FMP – Fishery Management Plan
FR – Federal Register
FSEIS – Final supplemental environmental impact statement
FW18 – Framework Adjustment 18 to the Atlantic Sea Scallop Fishery Management Plan
GB – Georges Bank
GC – General Category
GOM – Gulf of Maine
HAPC – Habitat Area of Particular Concern
HC(L)(S) – Hudson Canyon (Large) (Small)
LPUE – Landings per unit effort, usually a DAS in this document
IRFA – Initial Regulatory Flexibility Analysis
IVR – Interactive Voice Reporting
LA – Limited access
LIPA – Long Island Power Authority
LNG = Liquefied Natural Gas
MA – Mid-Atlantic
MAFMC – Mid-Atlantic Fishery Management Council
M-S Act – Magnuson Stevens Act
NEFMC – New England Fishery Management Council
NEFSC – Northeast Fisheries Science Center
NEPA – National Environmental Policy Act
NLSA/NL/NLA – Nantucket Lightship Area

NMFS – National Marine Fisheries Service
NOAA – National Oceanographic Atmospheric Administration
RIR – Regulatory Impact Review
SAP – Special access program
SARC – Stock Assessment Review Committee
SAW – Stock assessment workshop
SBNMS – Stellwagen Bank Marine Sanctuary
SBRM – Standardized bycatch reporting methodology
SCH – Great South Channel
SEIS – Supplemental Environmental Impact Statement
SMAST – School of Marine Science and Technology, University of Massachusetts
Dartmouth
SNE – Southern New England
TAC – Total Allowable Catch. This includes discards for finfish species, but not for scallops which have a much lower discard mortality rate.
PDT – Scallop Plan Development Team
U10 – A classification for large scallops, less than 10 meats per pound.
USGS – United States Geological Survey
VEC – Valued Ecosystem Component
VIMS – Virginia Institute of Marine Science
VMS – Vessel Monitoring System
VTR – Vessel Trip Reports
YTF/YT – Yellowtail flounder

1.0 BACKGROUND AND PURPOSE

1.1 BACKGROUND

In 2004, Amendment 10 introduced rotational area management and changed the way that the Scallop FMP allocates fishing effort for limited access scallop vessels. Instead of allocating an annual pool of DAS for limited access vessels to fish in any area, vessels now have to use a portion of their total DAS allocation in controlled access areas defined by the plan or exchange them with another vessel to fish in a different controlled access area. Vessels can fish their open area DAS in any area that is not designated a controlled access area. Amendment 10 set up this program with a biennial framework process, which means an action is required every two years to allocate fishing effort in both open and access areas. This framework action will only set specifications for a single fishing year, 2010. This framework is for a single year because the Council is working on Amendment 15 which will establish a process for implementing annual catch limits (ACLs) that are required to be in place in 2011 for the scallop fishery. Rather than have a framework with one year pre-ACLs and one year post-ACLs, the Council decided to develop this action for 2010 only and a subsequent framework will set measures for 2011 and 2012.

In 2008, the Council approved Amendment 11 to the Scallop FMP, which recommended a limited entry program for the general category fishery as well as other measures. Most of that action has been implemented, but the IFQ program for limited access general category vessels is not fully implemented yet, so this action considered measures in case the IFQ program is not implemented in 2010 (See Section 2.2.2), though implementation is expected by March 1st. A separate hard-TAC and limited entry program for the Northern Gulf of Maine was also adopted in Amendment 11 and the hard-TAC for 2010 will be specified in this action as well.

There are also several other issues that have been included for consideration in this framework that are not directly related to fishery specifications for FY2010. For example, NMFS recently published a biological opinion, pursuant to section 7 of the Endangered Species Act (ESA) that considered the effects of the continued authorization of the Atlantic sea scallop fishery on ESA-listed species. That biological opinion included a specific Reasonable and Prudent Measure (RPM) and accompanying Term and Condition (T/C) to limit the amount of allocated scallop fishing effort by limited access scallop vessels that can be used in the area and during the time of year when sea turtle distribution overlaps with scallop fishing activity. The biological opinion required NMFS to comply with this measure no later than the 2010 fishing year, so this action will consider measures that will comply with the RPM and T/C (See Section 2.8).

In addition this framework is considering minor adjustments to the industry-funded observer set-aside program including an alternative to prohibit vessels from not paying for observers and addressing a loophole for observed general category access area trips in terms of the amount of compensation a general category vessel can get per observed trip.

In summary, this framework adjustment will address several primary management issues:

- Fishery specifications for FY2010 including setting of acceptable biological catch as required by the reauthorized MSA and compliance with the first RPM and T/C required in the recent biological opinion
- Area rotation adjustments (if necessary) including consideration of a new scallop access area on Georges Bank
- Other measures including minor adjustments to the observer set-aside program

1.2 PURPOSE AND NEED

The purpose of this action is to achieve the objectives of the Atlantic Sea Scallop Fishery Management Plan (FMP) to prevent overfishing and improve yield-per-recruit from the fishery. The primary need for this action is to set specifications to adjust the day-at-sea (DAS) allocations and area rotation schedule for the 2010 fishing year and to minimize impacts of incidental take of sea turtles as per the March 14, 2008 Atlantic Sea Scallop FMP Biological Opinion.

1.3 SCALLOP MANAGEMENT BACKGROUND

The Atlantic Sea Scallop FMP management unit consists of the sea scallop *Placopecten magellanicus* (Gmelin) resource throughout its range in waters under the jurisdiction of the United States. This includes all populations of sea scallops from the shoreline to the outer boundary of the Exclusive Economic Zone (EEZ). While fishing for sea scallops within state waters is not subject to regulation under the FMP except for vessels that hold a federal permit when fishing in state waters, the scallops in state waters are included in the overall management unit. The principal resource areas are the Northeast Peak of Georges Bank, westward to the Great South Channel, and southward along the continental shelf of the Mid-Atlantic.

The Council established the Scallop FMP in 1982. A number of Amendments and Framework Adjustments have been implemented since that time to adjust the original plan. Amendment 4 was implemented in 1994 and introduced major changes in scallop management, including a limited access program to stop the influx of new vessels, a day-at-sea (DAS) reduction plan to reduce mortality and prevent recruitment overfishing, new gear regulations to improve size selection and reduce bycatch, a vessel monitoring system to track a vessel's fishing effort, and an annual framework adjustment process to allow certain measures to be modified in response to changes in the fishery including scallop abundance. Limited access vessels were assigned different DAS limits according to which permit category they qualified for: full-time, part-time or occasional. Amendment 4 established a planned reduction in the annual day-at-sea allocations for vessels with limited access scallop permits. Amendment 4 also created the general category scallop permit for vessels that did not qualify for a limited access permit. Although originally created for an incidental catch of scallops in other fisheries, and for small-scale directed fisheries, the general category fishery and fleet has evolved since its creation in 1994. The changes in the general category fishery are demonstrated in Section 4.4.

Also in 1994, Amendment 5 to the Northeast Multispecies FMP closed Closed Area I, Closed Area II, and the Nantucket Lightship Area to scallop fishing, because of concerns over finfish bycatch and disruption of spawning aggregations (See Figure 1).

In 1998, the Council developed Amendment 7 to the Scallop FMP, which was needed to change the overfishing definition, the day-at-sea schedule, and measures to meet new lower mortality targets to comply with new requirement under the Magnuson-Stevens Act. In addition, Amendment 7 established two new scallop closed areas (Hudson Canyon and VA/NC Areas) in the Mid-Atlantic to protect concentrations of small scallops until they reached a larger size. Amendment 7 further reduced the DAS allocations under a 10-year 'rebuilding' period. Framework Adjustments 12, 14 and 15 to the Scallop FMP later adjusted the DAS allocations upward to meet the Amendment 7 fishing mortality targets.

In 1999, Framework Adjustment 11 to the Scallop FMP allowed the first scallop fishing within portions of the Georges Bank groundfish closed areas since 1994. Scallop resource surveys and experimental fishing activities had identified areas where scallop biomass was very high due to no fishing in the intervening years. These surveys and experimental fisheries provided more precise estimates of total biomass as well as the distribution and amount of finfish bycatch and allowed the Council to open the southern part of Closed Area II.

In 2000, Framework Adjustment 13 to the Scallop FMP authorized full-time and part-time limited access vessels to take three trips in the southern part of Closed Area II during June 15 to August 14, 2000; one trip in the northeast corner of the Nantucket Lightship Area during August 15 to September 30, 2000; and two trips in the central part of Closed Area I from October 1, 2000 to January 31, 2001.

In 2001, Framework Adjustment 14 to the Scallop FMP implemented a new area access program to the Hudson Canyon and VA/NC Areas since scallop biomass had rapidly increased due to the enhanced survival of the strong 1997 and 1998 year classes, especially in the Hudson Canyon Area. Following the structure of the highly successful area access program for the Georges Bank closed areas in 2000; the framework adjustment allocated trips to limited access vessels and applied a scallop possession limit and a day-at-sea tradeoff. Unlike the Georges Bank closed area access program, however, Framework Adjustment 14 allowed vessels with general category scallop permits to land 100 pounds of scallop meats from the Hudson Canyon and VA/NC Areas.

Framework Adjustment 15 (2003) to the Scallop FMP continued the measures implemented in Framework Adjustment 14, but increased the Hudson Canyon and VA/NC Area scallop possession limit from 18,000 to 21,000 pounds per trip. This action was needed to achieve the objectives and fishing mortality target specified in Amendment 7, while the Council developed Amendment 10.

In 2004, Amendment 10 to the Scallop FMP introduced rotation area management and changed the way that the FMP allocates fishing effort for limited access scallop vessels. Instead of allocating an annual pool of DAS for limited vessels to fish in any area, vessels had to use a portion of their total DAS allocation in the controlled access areas defined by the plan, or exchange them with another vessel to fish in a different controlled access area. Vessels could fish their open area DAS in any area that was not designated a controlled access area. The amendment also adopted several alternatives to minimize impacts on EFH, including designating EFH closed areas, which included portions of the groundfish mortality closed areas. See Section

1.4 for a more detailed description of the rotational area management program implemented by Amendment 10.

Framework 16 to the Scallop FMP, implemented in November 2004, adjusted DAS allocations and defined the area rotation schedule for part of the 2004 fishing year and the 2005 fishing year. It also included: a) an access program for vessels with general category scallop permits with enhanced reporting requirements and a 2% TAC set-aside; b) yellowtail flounder TACs and provisions to minimize bycatch; c) changes in finfish possession limits to minimize bycatch and bycatch mortality; d) seasons when scallop fishing would be allowed to minimize bycatch and bycatch mortality; e) enhanced sea sampling to improve precision of bycatch estimates; f) provisions to enhance enforcement monitoring and compliance; and g) a dredge-only restriction for fishing in the access areas to minimize bycatch and bycatch mortality.

Framework 16 also attempted to make the habitat closed area boundaries implemented under Amendment 10 consistent with the areas later implemented under Amendment 13 to the Northeast Multispecies FMP. However, in August 2005, the Court, in *Oceana v. Evans*, ruled that any revisions to the boundaries under the Scallop FMP must be implemented under a full rule making process via an FMP amendment rather than through the abbreviated rule-making process used in a framework adjustment, and reinstated the EFH closed areas implemented under Amendment 10 to the Scallop FMP. Thus, the habitat closed area boundaries implemented under Amendment 10 are currently in effect. As a result, the remaining areas accessible to scallop vessels under the rotational area management program are substantially smaller in Closed Area I and the Nantucket Lightship Closed Area than anticipated until the court ruling.

Framework 17 to the Scallop FMP was implemented in the fall of 2005. The purpose of the action was to provide more complete monitoring of the general category scallop fleet by requiring that vessels landing more than 40 pounds of scallop meats use monitoring systems (VMS). It revised the broken trip adjustment provision for limited access scallop vessels fishing in the Sea Scallop Area Access Program, by eliminating the broken trip “penalty,” which may have had a negative influence on vessel operator decisions and safety at sea.

Framework 18 was implemented on June 15, 2006, which set management measures for fishing years 2006 and 2007. Limited access vessels were allocated a specific number of open area DAS for each fishing year, as well as a maximum number of trips for different access areas depending on their permit category. Specifically, Closed Area II and Nantucket Lightship were open in 2006 under restricted access, and Nantucket Lightship and Closed Area I are open in 2007. General category vessels are also permitted to fish in these access areas with a 400 pound possession limit up to a total number of trips for that component of the fleet. Both areas are subject to a bycatch TAC of yellowtail flounder; when that bycatch TAC is projected to be caught, the area closes to all scallop fishing. The Elephant Trunk area also opens as a result of this action with specific allocation of trips, opening dates, and seasonal closures to reduce potential interactions with sea turtles. An area called Delmarva was closed under this action to protect small scallops found in that area; the area is projected to open in 2010. Other measures were included in the action such as measures related to unused 2005 Hudson Canyon trips, transfer of access area trips to open areas if access areas close early if the YT bycatch TAC is attained, elimination of crew size restrictions in access areas, access area trips exchange program

changes, broken trip program changes, and allocations for set-aside programs (1% for observer program and 2% for research).

In June 2007 the Council approved Amendment 11 to the Scallop FMP and it was effective on June 1, 2008. The main objective of the action was to control capacity and mortality in the general category scallop fishery. Since 1999, there has been considerable growth in fishing effort and landings by vessels with general category permits, primarily as a result of resource recovery and higher scallop prices. This additional effort is likely a contributing factor to why the FMP has been exceeding the fishing mortality targets. Without additional controls on the general category fishery, there is a great deal of uncertainty with respect to potential fishing mortality from this component of the scallop fishery; thus, the potential for overfishing is increased.

Amendment 11 implemented a limited entry program for the general category fishery. Each qualifying vessel will receive an individual allocation in pounds of scallop meat with a possession limit of 400 pounds. Qualifying vessels will receive a total allocation of 5% of the total projected scallop catch. There is also a separate limited entry program for general category fishing in the Northern Gulf of Maine. In addition, Amendment 11 includes adjustments to the limited access scallop fleet fishing under general category rules. Another separate limited entry program for that fleet was adopted with the same qualification criteria as the limited entry general category permit. Qualifying vessels will also receive an individual allocation in pounds, and the entire category will receive 0.5% of the total projected scallop catch. In addition, a separate limited entry incidental catch permit was adopted that will permit vessels to land and sell up to 40 pounds of scallop meat per trip while fishing for other species. Other measures were included under Amendment 11 as well.

The Council approved Amendment 12 to the Scallop FMP in June 2007. This action is an omnibus amendment to all FMPs in the region and focuses on defining a standardized bycatch reporting methodology (SBRM). Section 303(a) (11) of the Magnuson-Stevens Fishery Conservation and Management Act requires that all FMPs include “a standardized reporting methodology to assess the amount and type of bycatch occurring in the fishery.” The SBRM Omnibus Amendment will ensure that all FMPs fully comply with the act. Amendment 10 and Framework 16 to the Scallop FMP were submitted to NMFS several years ago, and in 2004 Oceana, an environmental organization, filed suit in the U.S. District Court challenging the SBRM elements of the FMP. The Court found the actions did not fully evaluate reporting methodologies, did not sufficiently address potentially important scientific evidence, and did not mandate a methodology for bycatch monitoring. Therefore, the Court remanded that the Secretary of Commerce take further action on the SBRM aspects of the Scallop FMP. SBRM is the combination of sampling design, data collection procedures, and analyses used to estimate bycatch and to determine the most appropriate allocation of observers across the relevant fishery modes. The Council worked with NMFS in development of the SBRM Omnibus Amendment since 2005 and final measures were selected in June 2007. Amendment 12 was implemented on February 27, 2008.

Scallop Amendment 13 was also approved by both the Council and NMFS in 2007, which re-activated the industry-funded observer program. Since 1999, vessels required to carry an

observer are authorized to land more than the possession limit from trips in access areas, and in open areas, vessels are charged a reduced amount to help compensate for the cost of an observer. Observers were deployed through a contractual arrangement between National Marine Fisheries Service (NMFS) and an observer provider until June 2004. This arrangement was not renewed because of unresolved legal issues concerning the use of a contract to administer the industry-funded observer program. For some time, NMFS funded observers while a solution to this issue was investigated. As funding became insufficient, an interim rule went into effect that approved a new mechanism to use the observer set-aside funds through a non-contracted vendor. Amendment 13 was necessary to make this temporary mechanism part of the regulations. The Council selected final measures for that action at the February 2007 Council meeting and it was implemented on June 12, 2007. Amendment 13 also includes a provision to make changes to the observer set-aside program by framework action and the Council decided to address some issues raised with the current program in this framework action.

The Council initiated Phase 1 of the Essential Fish Habitat Omnibus Amendment in 2004. The primary purpose of Phase 1 is to review EFH designations, consider HAPC alternatives, describe prey species, and evaluate non-fishing impacts. This action is an amendment to all FMPs in this region, and is Amendment 14 to the Scallop FMP. The Council approved the DSEIS for Phase 1 at the February 2007 Council meeting, which then was submitted to NMFS in March 2007. The Council made final decisions on Phase 1 topics at their June 2007 meeting. Phase 2 of the EFH Amendment will begin in September 2007 and will consider the effects of fishing gear on EFH and move to minimize, mitigate or avoid those impacts that are more than minimal and temporary in nature. Phase 2 will also reconsider measures in place to protect EFH in the Northeast region. The entire Amendment (Phase 1 and Phase 2) is expected to be completed and implemented in 2010.

The Council also approved Framework 20 to the Scallop FMP at the June 2007 Council meeting and NMFS implemented that action in December 2007. Framework 20 considered measures to reduce overfishing for FY2007 through measures that were implemented by interim action earlier that year. At the November 2006 Council meeting, the Scallop PDT informed the Council that overfishing was likely to occur in 2007 under status quo measures implemented under Framework 18. The PDT presented several alternatives to reduce fishing mortality. The Council ultimately recommended that NMFS reduce the allocated number of trips for all scallop permit categories in the Elephant Trunk Access Area (ETA), delay the opening of the ETA, and prohibit vessels from possessing more than 50 bushels of in-shell scallops when leaving any controlled access area. NMFS agreed with the Council that the ETA has an unprecedented high abundance of scallops, which needs to be husbanded with precaution to effectively preserve the long term health of the scallop resource and fishery, and so implemented these measures by interim action.¹ This interim action became effective on December 22, 2006, and remained in effect until June 20, 2007 (180 days). This interim action was extended for an additional 180 days, but expired on December 26, 2007. Therefore, for the last two months of the 2007 fishing year (January-February 2008), management would revert back to status quo measures under FW18. Specifically, higher trip allocations would be granted in the Elephant Trunk Area for

¹ The interim rule published by NMFS on December 22, 2006 (**71 FR 76945**), included all measures recommended by the Council, except the prohibition on a vessel leaving an access area with more than 50 bu. of in-shell scallop was limited to the ETA only and not all access areas as recommended by the Council.

both limited access and general category fisheries. Therefore, the Council approved Framework 20 to extend the reduced fishing effort measures implemented by interim action through the end of the 2007 fishing year.

Measures for fishing year 2008 and 2009 were approved in Framework 19. Framework 19 included the fishery specifications for these two fishing years including the access area schedule, DAS allocations and general category measures. The general category fishery is still under transition to an IFQ program, so is allocated 10% of the total projected catch, until the IFQ program is fully implemented. Until that time the fishery is managed under quarterly hard TACs. The limited access fishery was allocated a series of access area trips and DAS allocations to achieve an overall F of 0.20. A new rotational area was closed to all scallop fishing (Hudson Canyon area) to protect small scallops. Other measures related to access area fishing were adopted including the continuation of eliminating the crew size restriction on access area trips and prohibiting all scallop vessels from “deckloading”, and prohibition from leaving an access area with more than 50 bushels of in-shell scallop onboard.

The Council is currently working on Amendment 15. There are three goals of A15: 1) bring the Scallop FMP in compliance with new requirements of the re-authorized MSA; 2) address excess capacity in the limited access (LA) scallop fishery through potential permit stacking and leasing alternatives; and 3) consider measures to adjust several aspects of the overall program to make the scallop management plan more effective. The Council approved the range of alternatives and analyses in the DEIS at the September 2009 Council meeting. Public hearings are expected in the Spring on 2010, final action in June 2010, and implementation around March 1, 2011.

1.4 DETAILED BACKGROUND ON ROTATIONAL AREA MANAGEMENT

Amendment 10 introduced area rotation: areas that contain beds of small scallops are closed before the scallops experience fishing mortality, then the areas re-open when scallops are larger, producing more yield-per-recruit. The details of which areas should close, for how long and at what level they should be fished were described and analyzed in Amendment 10. Except for the access areas within the groundfish closed areas on Georges Bank, all other scallop rotational areas should have flexible boundaries. Amendment 10 included a detailed set of criteria or guidelines that would be applied for closing and re-opening areas. Framework adjustments would then be used to actually implement the closures and allocate access in re-opened areas. The general management structure for area rotation management is described in 1.4. An area would close when the expected increase in exploitable biomass in the absence of fishing mortality exceeds 30% per year, and re-open to fishing when the annual increase in the absence of fishing mortality is less than 15% per year. Area rotation allows for differences in fishing mortality targets to catch scallops at higher than normal rates by using a time averaged fishing mortality so the average for an area since the beginning of the last closure is equal to the resource-wide fishing mortality target (80% of F_{max} , estimated to be $F = 0.23$).

Table 2- General management structure for area rotation management as implemented by Amendment 10

| Area type | Criteria for rotation area management consideration | General management rules | Who may fish |
|-----------------------------|---|--|--|
| Closed rotation | Rate of biomass growth exceeds 30% per year if closed. | No scallop fishing allowed Scallop limited access and general category vessels may transit closed rotation areas provided fishing gear is properly stowed. Scallop bycatch must be returned intact to the water in the general location of capture. | Any vessel may fish with gear other than a scallop dredge or scallop trawl Zero scallop possession limit |
| Re-opened controlled access | A previously closed rotation area where the rate of biomass growth is less than 15% per year if closure continues. Status expires when time averaged mortality increases to average the resource-wide target, i.e. as defined by the Council by setting the annual mortality targets for a re-opened area. | Fishing mortality target set by framework adjustment subject to guidelines determined by time averaging since the beginning of the most recent closure. Maximum number of limited access trips will be determined from permit activity, scallop possession limits, and TACs associated with the time-average annual fishing mortality target. Transfers of scallops at sea would be prohibited | Limited access vessels may fish for scallops only on authorized trips. Vessels with general category permits will be allowed to target scallops or retain scallop incidental catch, with a 400 pounds scallop possession limit in accordance with general category rules. |
| Open | Scallop resource does not meet criteria to be classified as a closed rotation or re-opened controlled access area | Limited access vessels may target scallops on an open area day-at-sea General category vessels may target sea scallops with dredges or trawls under existing rules. Transfers of scallops at sea would be prohibited | All vessels may fish for scallops and other species under applicable rules. |

2.0 MANAGEMENT ALTERNATIVES UNDER CONSIDERATION

2.1 SUMMARY OF THE PROPOSED ACTION

The Council recommends the measures described in this section for Framework 21; these measures were approved at the November 2009 Council meeting. This action includes measures that set specifications for FY2010 as well as setting of acceptable biological catch as required by the reauthorized MSA, compliance with the first reasonable and prudent measure and term and condition required in the recent biological opinion regarding turtles, area rotation adjustments, and other measures including allowance of partial leasing of general category IFQ and limiting observer compensation amounts for general category vessels in access areas. Table 7 describes the final measures included in the proposed action.

This action considered a potential new access area closure in the Great South Channel, but it was not selected as part of the proposed action. The overall allocation scenario selected by the Council to prevent overfishing in this action is “NCLF24”, or the scenario without the new closed area in the Channel and overall F set at 0.24. This scenario includes allocating one trip in Nantucket Lightship (NL), 2 trips in Elephant Trunk (ET), and one trip in Delmarva in 2010 (Table 3). The Hudson Canyon access area would remain closed (closed in 2008), and access would not be granted into either Closed Area I or II in 2010. The possession limits for each of the access area trips would be similar to the values presented in Table 4. Full-time vessels are only permitted to take the maximum number of allocated trips per area. However, for part-time

permits, a vessel can decide if it wants to take both allocated trips in ET, one trip in ET and one in NL, or 1 in ETA and one in Delmarva. An occasional vessel can decide if it wants to take its one access area trip in ET, NL or Delmarva.

The proposed action would allocate 38 open area DAS in 2010 for full-time vessels, 15 for part-time and 3 for occasional vessels (Table 5) (Section 2.4). When all of these allocations are combined, as well as expected mortality from the general category fishery and other sources, the overall fishing mortality rate is expected to average $F = 0.24$ for the entire resource (in closed, open and access areas).

Table 3 – Summary of 2010 rotational access schedule for the proposed action in Framework 21

| | | CL1 | CL2 | NLS | ET | Dmv | HC | Open Area DAS* |
|---------------|-------------|--------|--------|--------|---------|--------|--------|----------------|
| NCLF20 | 2010 | Closed | Closed | 1 trip | 2 trips | 1 trip | Closed | 38 |

* For full-time vessels

Table 4 –Access area allocations and possession limits for proposed action

| | 2010 | | |
|-------------------|-------------|------------------|---|
| | # of trips | Possession limit | Overall allocation in access areas for 2010 |
| Full-time | 4 | 18,000 | 72,000 (100%) |
| Part-time | 2 | 14,400 | 28,800 (40%) |
| Occasional | 1 | 6,000 | 6,000 (8.33%) |

Note: Possession limits are based on a previous policy decision that a part-time permit receive an allocation equal to 40% of a full-time permit, and an occasional permit receive an allocation equal to 8.33% of a full-time permit.

Table 5 – Summary of open area DAS allocations under the proposed action

| | Full-time | Part-time | Occasional |
|-------------|-----------|-----------|------------|
| 2010 | 38 | 15 | 3 |

Note: Open area allocations by permit type are based on a previous policy decision that a part-time permit receive an allocation equal to 40% of a full-time permit, and an occasional permit receive an allocation equal to 8.33% of a full-time permit. DAS allocations are rounded up to the nearest DAS.

The Council may adjust the values of the biomass and fishing mortality targets and thresholds by framework or amendment, based on updated analysis or upon recommendation of the Stock Assessment Workshop. A fishing mortality target is not a scientifically driven estimate, it is a policy decision. The current overfishing definition recommends setting F_{target} at a level of 80% of $F_{threshold}$ (0.29).

The current overfishing threshold of 0.29 is based on an assumption that fishing mortality is spatially uniform. In the scallop fishery, this assumption is not even close to being met due to unfished biomass in closed areas and variable fishing mortality rates in scallop access areas. In the case of highly non-uniform fishing effort, the fishing mortality that maximizes yield per recruit will be less than the spatially uniform target (0.29). For this reason, the PDT recommended that FW21 consider a scenario with a lower F , below the guidelines in Amendment 10 that say the fishing target should be set at 80% of the fishing threshold (80% of 0.29 is equivalent to $F = 0.23$). The proposed action has a target at 0.24, recognizing that fishing mortality is not uniformly distributed in the scallop fishery, but is prone to localized overfishing. This target was selected because the higher F option gives better short-term landings and

revenues with acceptable return in the longer term. The risk of overfishing is still within acceptable levels at $F = 0.24$, and setting F_{target} at 80 percent of $F_{threshold}$ is not a requirement of the overfishing definition. Maintaining the F_{target} at $F = 0.24$ will remain within appropriate management measures to achieve optimum yield on a continuing basis without causing negative economic impacts for the industry.

Limited access vessels would still be allocated an open area DAS compensation for Georges Bank access area trips that were not taken due to the YT bycatch TAC being reached (2.5.1.1). Also, observer and research set-asides would still be removed from access areas and open area DAS as they currently are in the regulations. For access areas, the set-aside percentages are removed before allocations are made to the fisheries, and in open areas, the set-asides are in the form of open area DAS, thus only apply to the limited access portion of open area DAS.

In terms of the Elephant Trunk Access area program the area would still open on March 1 and the seasonal closure to reduce potential interactions with sea turtles from September 1-October 31 would remain in effect. The Delmarva area will also open on March 1 and will also have the same seasonal closure to reduce potential impacts on sea turtles.

In terms of the general category IFQ fishery, several alternatives that are part of the proposed action are related to recommendations related to Amendment 11. These measures apply to both general category IFQ qualifiers as well as limited access vessels that qualify for a general category IFQ permit under Amendment 11. The total projected catch for the general category fishery is about 2.3 million pounds, 5% of the projected annual catch (Table 6). The total projected catch for limited access vessels fishing under the provisions of their general category IFQ permits is about 233,000 pounds, 0.5% of the projected annual catch. Total fleet-wide access area allocations for the IFQ-permitted vessels 2010 are 1,377 trips in ETA and 714 trips in NL, and 713 trips in Delmarva. The document also includes specific measure if the IFQ program is not implemented before March 1 (Section 2.5.1.4).

In addition, Amendment 11 approved a hard-TAC for a Northern Gulf of Maine (NGOM) limited entry program. This action includes a NGOM hard-TAC for 2010 equal to 70,000 pounds (Section 2.6.4). This action also specifies the target TAC for incidental permits equal to 50,000 pounds (Section 2.6.5). This action also allows partial leasing of IFQ (Section 2.6.6) and limits the amount of compensation a general category vessel can receive on observed access area trips (Section 2.9.2).

Table 6 – General category allocations under the proposed action

| | 2010 |
|-----------------------------|---------------|
| Total TAC (5%) | 2,326,707 lbs |
| LA with LAGC IFQ TAC (0.5%) | 232,671 lbs |
| ETA - # trips | 1,377 |
| Delmarva - # trips | 714 |
| NL - # trips | 713 |
| NGOM hard TAC | 70,000 lbs |
| Incidental target TAC | 50,000 lbs |

This action also includes specific measures to minimize impacts of incidental take of sea turtles as per the March 14, 2008 Atlantic Sea Scallop FMP Biological Opinion (Section 2.8). The

Council considered a range of alternatives that would limit the amount of allocated limited access scallop effort in the Mid-Atlantic during the summer and fall when turtles are more likely to interact with scallop fishing gear. The proposed action includes a combination of measures considered including a two-month seasonal closure of the Delmarva access area from September 1-October 31 and a limit on the number of access area trips that can be taken in access areas within the Mid-Atlantic from June 15 through October 31. Each vessel is restricted to taking 2 of the 3 allocated access area trips in the Mid-Atlantic. Since both Mid-Atlantic access areas are now closed from September 1-October 31 to reduce impacts on sea turtles, the limit is applicable for June 15 through August 31. It was also noted during the Council deliberations that the overall allocation decision of $F=0.24$ will also limit open area effort in the Mid-Atlantic compared to recent years and other allocation scenarios considered in this action that have higher open area DAS amounts (CL18 and CL20).

Fishery allocations will be made directly: poundage will be removed for incidental catch and general category fishing as well as observer and research set-aside programs. Figure 1 summarizes how catch will be allocated in 2010 under the proposed action. For example, in 2010, the total projected catch is estimated at 47.35 million pounds. Fifty-thousand pounds will be removed from the top for incidental catch. Based on the projection model the TACs for access areas are: NL = 5.9 million pounds, ETA = 11.4 million pounds, and Delmarva = 5.9 million pounds.

The actual catch may vary from this TAC because vessels are allocated a specific number of trips (in round integers for the limited access fishery). Therefore, the projected TAC may be over or under harvested since trips are rounded up or down depending on projection results. In addition, some limited access vessels for example have the ability to take their allocated trips in any area that is open (part-time and occasional), so total catch per area will vary. Additionally, some vessels will not land their full allocation on every trip, and some set-aside for research and observers may not be used. Likewise all general category access area trips may not harvest 400 pounds per trip, and all trips may not be taken. Since the general category fishery is going to be allocated 10% of the total catch under the transition period, and 5% will be allocated from access areas, the remaining amount for the general category fishery will come from open areas. Again, these numbers are just estimates because the actual LPUE per open area DAS is uncertain and varies between vessels and areas; thus the open area catch may also be over or under compared to the projected TAC of 22 million pounds for LA open area catch in 2010.

Figure 1 is illustrative in terms of how catch is expected to be allocated between the two fleets. This figure includes the TACs and trip allocations that are included in this proposed action. While these figures have been generated using total TACs estimated by area, they are not completely reflective of what the fishery will harvest because all access areas trips may not be taken and some may not reach the possession limit. In addition, the catch estimated from open area DAS is based on average catch per unit of effort data and may not be reflective of future fishing effort. As this document explains due to the way the scallop fishery is allocated access to the resource, a TAC for an area may be under or over harvested. For example, the model projects a 5.9 million pound TAC in 2010 in NL, but if all limited access vessels landed their full possession limit, all general category trips are taken and all observer and research set-aside is used the potential removal from that area will be closer to 6.6 million pounds. For allocation and

implementation purposes, the TACs and allocations in these figures reflect the proposed action even if they are slightly different in some subsequent tables in this document.

Figure 1 – Summary of allocations for the scallop fishery under Framework 21 (2010)

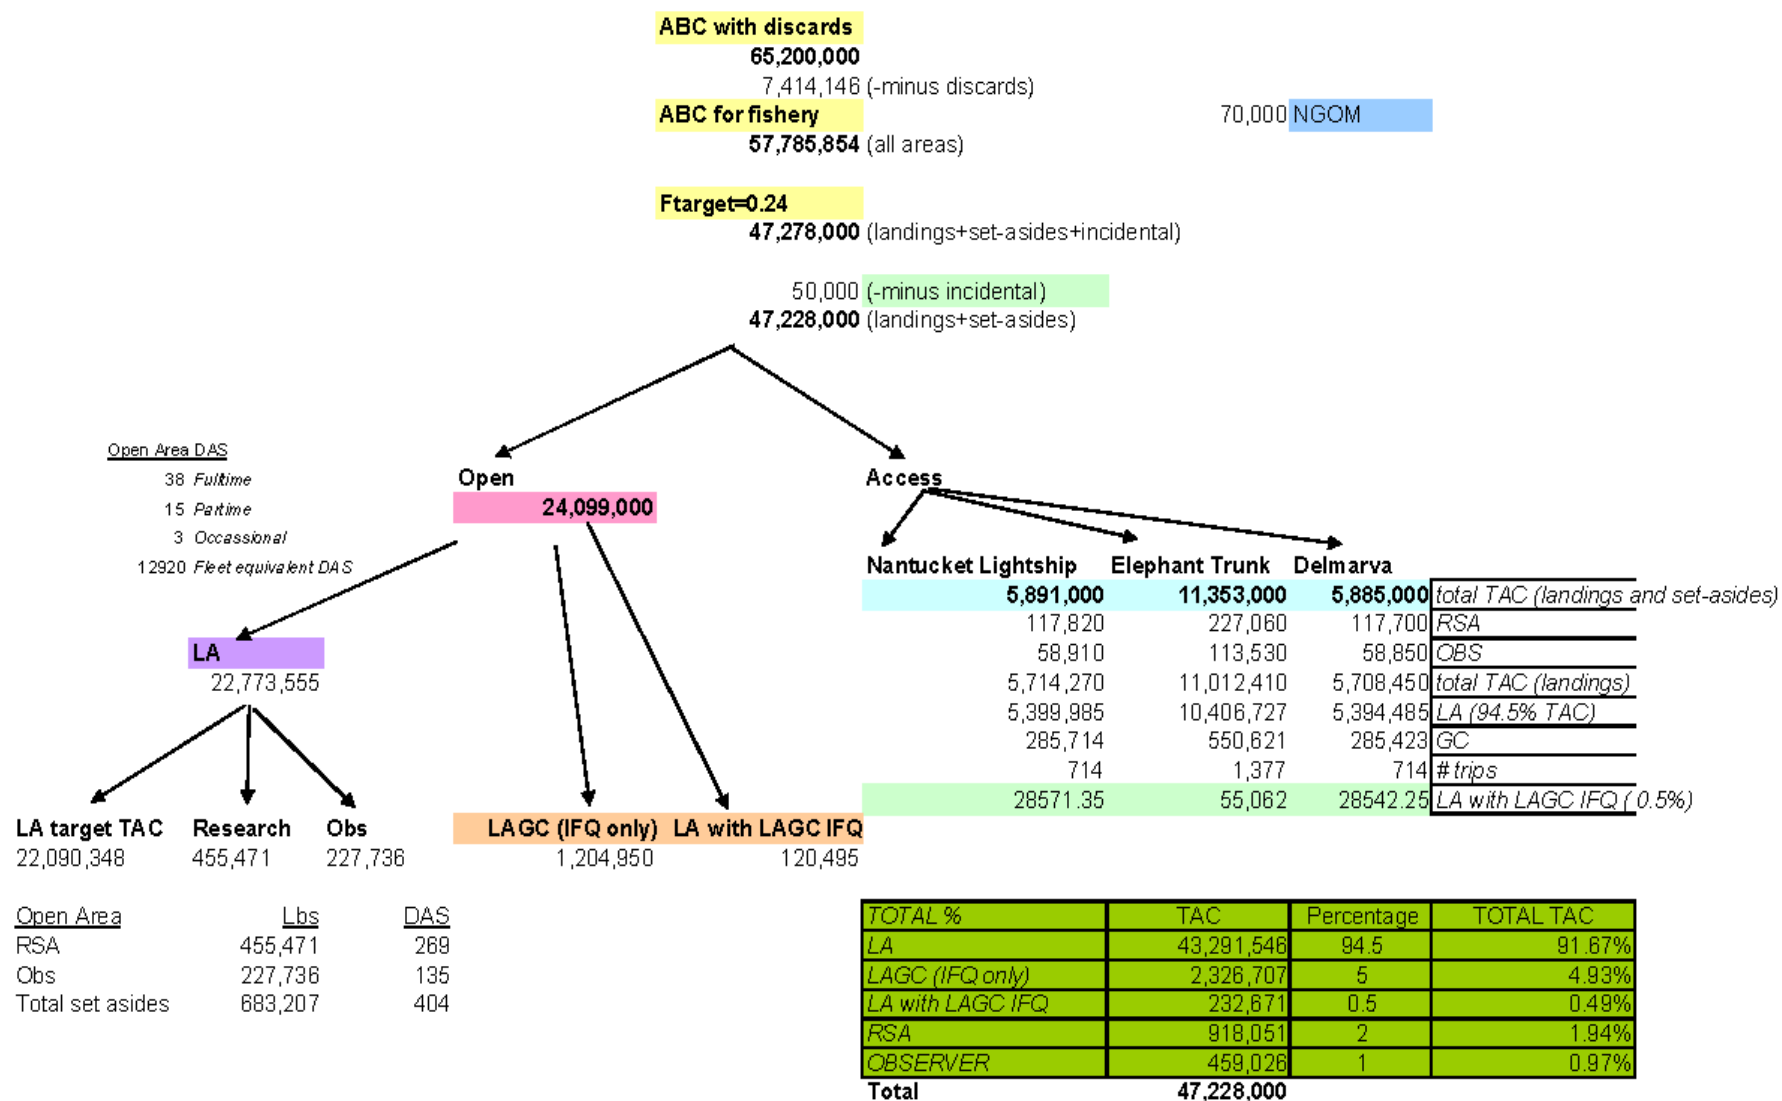

Table 7 – Summary of the Proposed Action

| SECTION | ALTERNATIVES | DESCRIPTION |
|----------------|---|---|
| 2.3 | Acceptable Biological Catch | SSC recommends ABC = 29,578 mt (65.2 million lbs) in 2010. |
| 2.4 | FW21 ALLOCATION SCENARIOS (page 21) | |
| | NCLF24 | Status Quo fishing mortality target - No closure in Channel, overall $F = 0.24$, DAS = 38; 1 trip in NL, 1 trip in Delmarva, 2 trips in ETA |
| 2.5 | MEASURES FOR LIMITED ACCESS VESSELS (page 25) | |
| 2.5.1.1 | Adjustments when YTF catch reaches 10% TAC Limit | The proposed action includes an allocation of a certain number of open area DAS for a full-time vessel if the Nantucket Lightship Area closes in 2010 due to the YT TAC being reached. For NCLF24 the DAS adjustment is 5.77 DAS. |
| 2.5.1.2 | TAC set-asides for observers (1%) and research (2%) | The percent of TAC and total DAS set aside for observers (1%) and research (2%) would be removed before allocations are set for limited access and general category fisheries. For NCLF24 the set asides are just over 900,000 pounds for research and about 450,000 pounds for observer set-aside. |
| 2.5.1.4 | DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010 | If the LAGC IFQ program is not fully implemented before March 1, 2010 the LAGC fishery is allocated 10% of the total projected scallop catch during the transition period to ITQs, compared to 5% so LA DAS have to be reduced. |
| 2.6 | MEASURES FOR GENERAL CATEGORY VESSELS (page 28) | |
| 2.6.1 | Measures if IFQ program is delayed | |
| 2.6.1.1 | Quarterly hard-TAC for transition period to limited entry | See Table 16 for specific allocations by quarter. |
| 2.6.2 | Georges Bank access area management | All four scenarios include access into Nantucket Lightship for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for that area in the form of fleet-wide trips. Total trip allocation for NL = 714. |
| 2.6.2.1 | Yellowtail flounder bycatch TAC | Yellowtail flounder bycatch TAC is shared between the two fisheries; therefore, once the TAC is reached the area closes for both fleets. |

| | | |
|----------------|---|--|
| 2.6.3 | Mid-Atlantic access area management | All four scenarios include access into both Elephant Trunk and Delmarva for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for both areas in the form of fleet-wide trips. Total allocations equal 1,377 trips for ETA and 713 trips for Delmarva. |
| 2.6.4 | NGOM Hard-TAC | The PDT reviewed landings data from the VTR database and recommends that the hard-TAC for this area be 70,000 pounds for FY2010. |
| 2.6.5 | Estimate of catch from LA incidental permits | The PDT recommends this target TAC remain at 50,000 pounds. This catch is removed before allocations to LA and LAGC fisheries. |
| 2.6.6 | Allow leasing of partial general category IFQ allocations during the fishing year | IFQ would be lease-able in partial amounts greater than or equal to 100 lbs during the fishing year. |
| 2.7 | CONSIDERATION OF NEW ROTATIONAL AREA IN THE GREAT SOUTH CHANNEL (page 30) | |
| 2.7.1.1 | No action | No new rotational area would close in this action in the Great South Channel vicinity. |
| 2.8 | ALTERNATIVES TO MINIMIZE IMPACTS OF INCIDENTAL TAKE OF SEA TURTLES (page 34) | |
| | Combined Alternative that would limit the number of MA access area trips that can be taken during turtle window and seasonal closure in Delmarva. | Vessels would be limited to take 2 of 3 allocated access area trips allocated in Mid-Atlantic access areas. The Delmarva access area would also be closed from September 1 through October 31. |
| 2.9 | IMPROVEMENTS TO THE OBSERVER SET-ASIDE PROGRAM (page 37) | |
| 2.9.2 | Limit the amount of observer compensation general category vessels can get per observed trip in access areas | This alternative would limit the amount of observer set-aside compensation for IFQ vessels fishing in an access area to the equivalent of one day of compensation, regardless of the length of the trip. |

2.2 NO ACTION

This section describes the No Action alternative as well as several other alternatives that are dependent on full implementation of the IFQ program for limited access general category qualifies approved under Amendment 11 and measures that would be in place if this action (Framework 21) were delayed.

2.2.1 No Action

In the alternatives for area rotation management and for open area DAS allocations, “No Action” is exactly what it implies: no additional action will be taken and so the measures and allocations that are specified in the present regulations (CFR §648, Sub-part D) are maintained. The scallop regulations state (paragraph 648.55(b)): “If the biennial framework action is not undertaken by the Council, or if a final rule resulting from a biennial framework is not published...with an effective date on or before March 1...the measures from the most recent fishing year shall continue, beginning March 1 of each year.”

Under “No Action,” the trip allocations for access areas would roll over from FY 2009. In terms of Mid-Atlantic access areas, full-time vessels would receive 3 Elephant Trunk Access Area (ETA) trip and one trip in Delmarva, part-time vessels would receive 2 access area trips in the Mid-Atlantic (1 trip in DMV, 1 trip in ETA; or 2 trips in ETA), and occasional vessels would receive one access area trip that could be taken in either area. As for Georges Bank access areas, Closed Area I is scheduled to open in 2010, but no trips would be allocated because none were allocated in 2009; Closed Area II is scheduled to be closed, and NL is scheduled to be open, but again since no trips were allocated in 2009, no trips would be allocated in 2010.

When Georges Bank access areas close due to yellowtail flounder catches, vessels would receive compensation for each access area trip not taken due to the closure. In addition, under “No Action,” the Hudson Canyon Access Area would remain closed.

In terms of open areas, under “No Action”, limited access scallop vessels would receive the same allocation designated for FY2009 had the IFQ program been fully implemented, resulting in the DAS fleet receiving 94.5 % of the allocated total target TAC rather than the 90% allocated to this fleet during the “transition period” to IFQs. This allocation would result in 42 DAS for full-time limited access scallop vessels. Part-time and occasional vessels would receive a pro-rata share of 40% and 1/12th, respectively, which is equivalent to 17 and 3 open area DAS, respectively.

Table 8 – Open area DAS allocations under No Action

| Full-Time | | Part-Time | | Occasional | |
|-------------|-------------|-------------|-------------|-------------|-------------|
| <u>2009</u> | <u>2010</u> | <u>2009</u> | <u>2010</u> | <u>2009</u> | <u>2010</u> |
| 37 | 42 | 15 | 17 | 3 | 3 |

Table 9 - Sea scallop access area allocation schedule under No Action

| | 2009 | 2010 |
|----------|-------------|--------------------------|
| CAII | Open | Closed |
| NLCA | Closed | Open – but no allocation |
| CAI | Closed | Open – but no allocation |
| ETAA | Open | Open |
| HCAA | Closed | Closed |
| Delmarva | Open | Open |

Table 10 – Access area trip allocations under No Action

| Area | <u>NLCA</u> | | <u>CAI</u> | | <u>CAII</u> | | <u>ETAA</u> | | <u>Delmarva</u> | |
|-------------------------|--------------------|----------------------|--------------------|----------------------|--------------------|--------------------|--------------------|--------------------|------------------------|--------------------|
| Fishing Year | <u>2009</u> | <u>2010**</u> | <u>2009</u> | <u>2010**</u> | <u>2009</u> | <u>2010</u> | <u>2009</u> | <u>2010</u> | <u>2009</u> | <u>2010</u> |
| Full-time | 0 | 0 | 0 | 0 | 1 | 0 | 3 | 3 | 1 | 1 |
| Part-time* | 0 | 0 | 0 | 0 | Up to 1 | 0 | Up to 2 | Up to 2 | Up to 1 | Up to 1 |
| Occasional* | 0 | 0 | 0 | 0 | Up to 1 | 0 | Up to 1 | Up to 1 | Up to 1 | Up to 1 |
| General Category | 0 | 0 | 0 | 0 | 0 | 0 | 1,964 | 1,964 | 728 | 728 |

* Part-time and occasional scallop vessel owners could determine which areas to take their trips, up to the maximum number of trips specified in the table above

** Scheduled to be open in 2010, but no trips allocated until FW21 is implemented

2.2.2 No Action if IFQ program is not fully implemented before March 1, 2010

If the limited access general category IFQ program is not fully implemented before March 1, 2010 then the fishery reverts to management under the “transition period” to IFQs. This “transition period” would continue through the entire 2010 fishing year and the IFQ program would not be implemented until March 1, 2011. The major difference between the transition period and post IFQs is the total allocation for the general category sector is set at 10% of the target scallop catch compared to 5% under IFQs. The Council selected 10% for the transition period to recognize that more vessels will be fishing under appeals so 10% would help reduce

impacts on general category qualifiers. In addition, 10% was still lower than recent years before development of Amendment 11, so was not viewed as very restrictive on the limited access fishery.

The 10% allocation for IFQ scallop vessels will be divided into quarterly hard TACs similar to how the fishery was managed in 2008 and 2009. The DAS allocation to the limited access scallop fishery would be the same as the “transition period” allocation in FY2009: Full-time limited access scallop vessels would receive 37 DAS, while part-time and occasional vessels would receive 15 and 3 open area DAS, respectively.

2.2.3 Measures that will be in effect March 1, 2010 until Framework 21 is implemented

Council final action on Framework 21 was moved back to the November Council meeting, and was revisited at the January meeting. Therefore, the action will not be implemented before the start of FY2010 on March 1, 2010. This action assesses impacts of the potential delay and considers measures to compensate. Several measures implemented by Amendment 11 and Framework 19 will carry over in the interim. For example, the Elephant Trunk Area will be managed under the same regulations in place in 2009 (three trips for full-time vessels and a total of 1,964 general category trips). In addition, under No Action the Mid-Atlantic access area allocations will rollover. Hudson Canyon will remain closed and vessels would get one trip in the Delmarva area.

The open area DAS allocations for limited access vessels will also carry over from Framework 19 into FY2010 until Framework 21 is implemented. As previously mentioned, the exact values of the DAS allocations will depend on whether or not the IFQ program has been fully implemented prior to March 1, 2010, as expected.

The specific measures that are included in this alternative if this action is not implemented by March 1, 2010, are:

- Any limited access open area DAS used in 2010 above the ultimate value allocated for 2010 will be reduced the following fishing year (2011).
- Any limited access or general category Elephant Trunk area trips taken in 2010 above the ultimate allocation for 2010 will be deducted from the following fishing year.
- If the IFQ program is not in place prior to March 1, the LAGC TAC will remain at 10% for the entirety 2010 fishing year. The TAC will remain at 2,082 mt, 10% of 2009 projected catch value of 20,820 mt, until FW 21 implements the 2010 specifications. If the general category quarterly hard TAC for Quarter 1 (March 1-May 31) is exceeded, then those pounds will be removed from Quarter 3 and/or 4. Catch cannot be removed from Quarter 2 because any overage would not be known until the Quarter 2 TAC was allocated. If the 2010 projected catch value differs from 2009, the LAGC TAC will be adjusted and permit holders will be notified.
- If the IFQ program is in place before March 1, IFQ vessels without a limited access DAS scallop permit will receive an IFQ based on a TAC of 1041 mt, which is 5% of 2009 projected catch value of 20,820 mt. IFQ vessels that have also been issued a limited access DAS scallop permit will receive an IFQ based on a TAC of 104.1 mt, which is 0.5% of the 2009 projected catch value of 20,820 mt. If that differs from 2010 final projected catch values, 2010 IFQs will be adjusted either up or down, depending on the

difference in the projected catch. Vessels will receive notice during the fishing year with different IFQs for 2010. If the 2010 projected catch value is less than the 2009 projected catch value, and if a vessel exceeds their ultimate 2010 IFQ before the 2010 IFQs are adjusted, the vessel's 2011 IFQ will be deducted by the same amount. A vessel that increases its IFQ through a lease will use leased IFQ before using its own IFQ, and multiple leases of IFQ will be used in the order that it was leased by the vessel. IFQ for the 2011 fishing year will be deducted from either the leased or the vessel's own IFQ that resulted in the excess catch. Any IFQ overage resulting from the IFQ revisions would come off the harvesting vessel.

- Any landings from within the Northern Gulf of Maine (NGOM) area caught in fishing year 2010 above the ultimate TAC for 2010 will be reduced the following year.

2.3 ACCEPTABLE BIOLOGICAL CATCH

The MSA was reauthorized in 2007. Section 104(a) (10) of the Act established new requirements to end and prevent overfishing, including annual catch limits (ACLs) and accountability measures (AMs). Section 303(a)(15) was added to the MSA to read as follows: “establish a mechanism for specifying annual catch limits in the plan (including a multiyear plan), implementing regulations, or annual specifications, at a level such that overfishing does not occur in the fishery, including measures to ensure accountability.” ACLs and AMs are required by fishing year 2010 if overfishing is occurring in a fishery, and they are required for all other fisheries by fishing year 2011. The Council initiated Scallop Amendment 15 to comply with these new ACL requirements, and that action is expected to be implemented before the start of the 2011 fishing year as required. However, the Act also requires that an acceptable biological catch be set in each fishery, and that provision is required in actions that set specifications after the Act was implemented (January 2007).

Acceptable Biological Catch (ABC) is defined as the maximum catch that is recommended for harvest, consistent with meeting the biological objectives of the management plan. The determination of ABC will consider scientific uncertainty and the Council may not exceed the fishing level recommendations of its Science and Statistical Committee (SSC) in setting ACLs (Section 302(h)(6)). The MSA enhanced the role of the SSCs, mandating that they shall provide ongoing scientific advice for fishery management decisions, including recommendations for acceptable biological catch (MSA 302(g)(1)(B)). This requirement for an SSC recommendation for ABC was effective in January 2007.

Therefore, while the full ACL program will not be implemented in the Scallop FMP until 2011 under Amendment 15 (if approved), this action is still required to include an ABC recommendation by the SSC, and the Council may not set management measures so that catch exceeds that amount. The SSC identified an ABC for the scallop fishery for 2010 at their September 2009 meeting and the results were presented to the Council on September 23, 2009. **The SSC recommends that Acceptable Biological Catch of scallops in 2010 should be 29,578 mt (65.2 million pounds) for the overall fishery, including an estimated 3363 mt – 7.4 million pounds - for non-yield fishing mortality (discards and incidental mortality). Therefore, the overall ABC for the fishery, excluding discards and incidental mortality is 26,219 mt (57.8 million pounds).**

This level came directly from PDT analysis and was approved by the Science and Statistical Committee (SSC). Various sources of scientific uncertainty were considered when setting this value. The SSC presented their report to the Council regarding ABC for 2010 at the September 2009 Council meeting and the Council agreed with their recommendation. ABC calculations were based on the assumption of uniform fishing, and in particular, that there were no EFH or rotational closures. This is consistent with the current FMP overfishing definition, which defines overfishing relative to a "whole stock" fishing mortality. Therefore, the ABC calculation gives what would be an appropriate catch if all areas were open. That is not the case in the plan since there are groundfish mortality closed areas and EFH closed areas that are not accessible to the fishery, as well as scallop rotational areas that are only available to the fishery at certain times and effort is limited in these areas. A lower fishing mortality target would help to prevent overfishing in areas that are available, since all exploitable scallop biomass is not accessible to the fishery.

This recommendation is based on analyses prepared by the Scallop PDT that would set ABC at the fishing mortality rate estimated to have 25% chance of exceeding OFL. In summary, Monte-Carlo simulations were used to determine the distribution around the model parameters such as growth, natural mortality, discard mortality etc. The probability of overfishing was plotted alongside the fraction loss of YPR to search for a best risk scenario. The details of these analyses and the SSC final recommendations are included in Amendment 15.

Some confusion came about during the process concerning what F_{max} is for this fishery because the SSC recommendation for ABC is based on a revised estimate of F_{max} that is greater than the currently accepted estimate of F_{max} . Based on the most recent peer-reviewed stock assessment (SAW 45, 2007), F_{max} is set at 0.29. However, the analyses used to identify what ABC should be for 2010 used a different estimate of $F_{max} = 0.37$. This calculation was based on new work the PDT is doing for Amendment 15 and in preparation for the upcoming assessment in Spring 2010 (SAW 50). It was clarified during the FW21 process that this estimate of F_{max} is still a work in progress and is not considered the most available science even though the SSC reviewed it because it has not been fully vetted through the SAW/SARC process. It was determined that as a stand alone value, without the full context of a benchmark assessment, the new estimate was not properly vetted as the best available science. Therefore it is considered supplementary information but not the accepted, fully vetted reference point until it has undergone a thorough peer review via the upcoming SARC.

While the higher F_{max} value is not fully vetted yet, knowing that the reference point for this fishery is likely to be higher than 0.29 in the very near future gave the Council additional confidence that setting a target at 0.24 for 2010 will have a very low risk of exceeding the ABC, the current estimate of F_{max} (0.29) and the potentially new estimate of F_{max} that will come out of the new assessment this spring/summer. Therefore, it is unlikely that overfishing will occur in 2010 with an F_{target} of 0.24.

2.4 SUMMARY OF FW21 ALLOCATION SCENARIOS

The alternatives described in this section are separated out by area (i.e. Georges Bank access areas, Elephant Trunk, Delmarva etc.), but due to the interrelated nature of area rotation and how the model projects impacts for the entire resource overall, it is difficult to pull out specific impacts by area. Therefore, the various alternatives under consideration were combined into a number of scenarios. The access area boundaries for all scenarios on Georges Bank and in the

Mid-Atlantic are depicted in Figure 2 and Figure 3. The proposed South Channel closure boundaries can be seen in Figure 4 (Section 2.7).

Overall four main scenarios were under consideration:

- No closure in Channel, Overall $F = 0.20$ (status quo F_{target})
- No closure in Channel, Overall $F = 0.24$
- S. Channel closure, Overall $F = 0.20$
- S. Channel closure, Overall $F = 0.18$

Overall F was reduced to 0.18 for last alternative because the new closure had unpredictable model effects on the overall F , so a lower value (0.18) was made an alternative instead of a higher F strategy ($F = 0.24$).

This action also includes a status quo F_{target} option, which for practical purposes is No Action in terms of how the Council would set specifications. Specifically, status quo would maintain the same approach the Council has used in recent years by setting specifications (access area trips and DAS allocations) equal to an overall $F = 0.20$ to prevent overfishing and account for uncertainty in projections and management measures in the fishery. Status quo for this action is considered to be the scenario that has an overall fishing mortality of 0.20 and does not include a new closure in the Channel (NCLF20). Therefore, this scenario is the baseline condition, which provides the standard against which all other alternative actions are compared. This scenario (NCLF20) is consistent with how the Council has been setting specifications for this fishery in the last few years (a handful of access area trips and DAS set to meet an overall F and no new closed areas under the area rotation program).

The following table gives the four alternatives and the resulting landings and DAS associated with each. The chosen alternative is shaded gray.

| Option | 2010 Landings (mt) | 2010 DAS |
|--------|-----------------------|----------|
| NCLF20 | 18,829 | 29 |
| NCLF24 | 21,445 | 38 |
| CL18 | 22,299 | 42 |
| CL20 | 24,269 | 51 |

Access area allocations are the same for all four scenarios: one trip in Nantucket Lightship, one trip in Delmarva and two trips into Elephant Trunk. The opening dates for all access areas are the same as in the past: June 15 for Nantucket Lightship and March 1 for both Elephant Trunk and Delmarva.

The Elephant Trunk area will continue to be closed in the months of September and October. Both LA and LAGC vessels are prohibited from fishing in Elephant Trunk in September and October to minimize interactions with sea turtles. In addition, FW19 included two measures for

access area trips that would remain in effect for this framework as well: elimination of crew restrictions, and prohibition on leaving any access area with more than 50 bushels of in-shell scallops to eliminate deckloading.

Overall allocation alternatives (combination of DAS and AA trips) under consideration for 2010 are lower than recent years for two primary reasons: there are only four access area trips available in 2010 compared to five that have been allocated in recent years, and overall effort should be cut back based on results in this SAFE Report that fishing mortality for 2009 is estimated to be 0.30, which is above the current overfishing threshold of 0.29. For example, the proposed action includes 38 DAS and 4 AA trips. This is a reduction from 2009 of one AA trip and 4 DAS (42 DAS compared to 38 DAS). The LA fleet was not actually allocated 42 DAS in 2009 because that was based on the GC fleet receiving a total allocation of 5% of projected catch, but because the IFQ program was not fully implemented in 2009 the GC fishery received a 10% allocation. To compensate, LA vessels received 37 DAS instead of 42 DAS.

Figure 2 - Boundaries of scallop access areas within Multispecies closed areas on Georges Bank

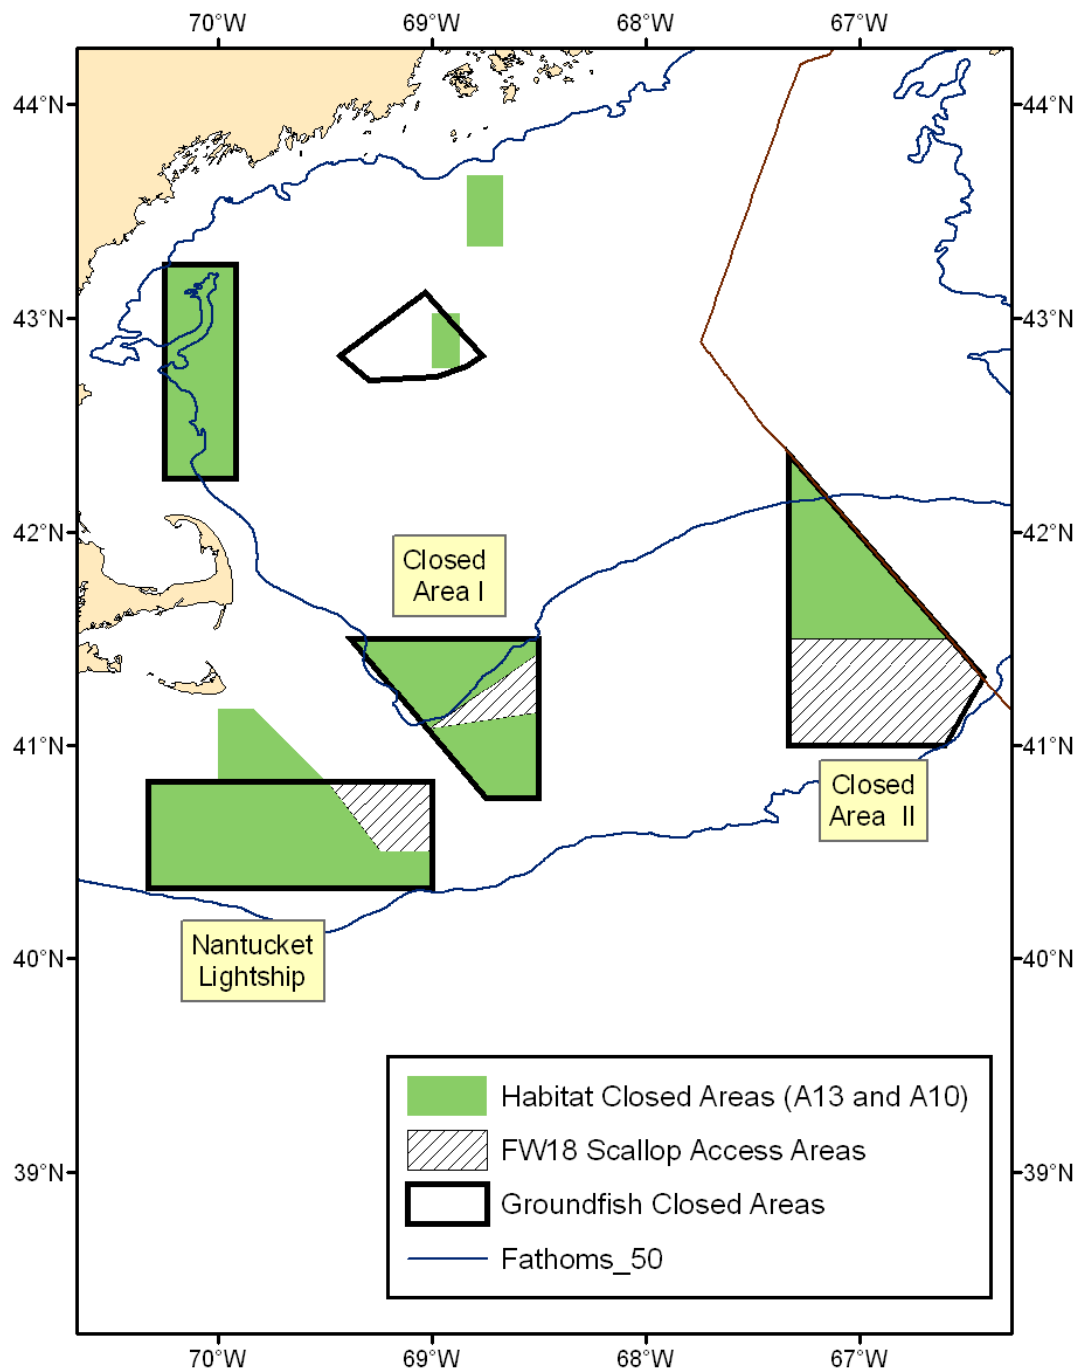

Figure 3 – Boundaries of scallop access areas in the Mid-Atlantic

2.5 MEASURES FOR LIMITED ACCESS VESSELS

Under current regulations (CFR §648.60), limited access vessels are authorized to take a certain amount of trips to each controlled access area during a fishing year. Each full-time vessel has been authorized to land 18,000 pounds of scallop meat per trip (40% of that for part-time vessels and 8.33% for occasional vessels). Fishing in controlled access areas may be subject to other limits such as seasons or potential closures due to TACs for yellowtail flounder. The maximum number of trips per area will be considered in this action for FY2010 to prevent overfishing and optimize yield. Access areas include areas within the Multispecies closed areas (Closed Area I, Closed Area II, and Nantucket Lightship), as well as areas specifically closed as scallop rotational closed areas (Hudson Canyon, Elephant Trunk, and Delmarva) (See Figure 2 and Figure 3).

Limited access vessels are also allocated a specific number of open area DAS in biennial frameworks to achieve optimum yield at the current target fishing mortality of $F = 0.20$ for the total scallop resource. The open area DAS allocations depend on what controlled access areas are available and the number of trips the Council recommends to allocate per area, as well as allocations made to the general category fishery. The open area allocations are also based on the assumption that a part-time vessel receives 40% of a full-time allocation, and an occasional vessel receives 8.33% of a full-time vessel.

Measures in the rest of Section 2 without a ‘No Action’ alternative didn't require Council action; they were specifications for allocations and measures pertaining to area rotation as previously established. The alternatives listed indicate what will be in place as a result of the Council's adopted allocation alternative; the Council did not take action on them because they were ‘automatic’ in a sense. The only specific alternatives that are new are in Sections 2.6.6, 2.7, and 2.8, and all of these have clear presentations of what No Action would entail.

2.5.1.1 Adjustments when yellowtail flounder catches reach 10% TAC limit

If the 10% yellowtail flounder (YT) bycatch TAC is reached and the Georges Bank access areas close, additional open area DAS are allocated for each trip not taken before the area closes, but at a prorated value of DAS. The prorated amount is calculated to achieve an equal amount of scallop mortality per DAS. This calculation takes into account the expected average landings per DAS based on relative biomass and scallop size in the open areas, compared to the GB access areas.

In 2006, the YT TAC for the scallop fishery in access areas was 14.3 mt (31,544 lbs) for Nantucket Lightship, in 2007 it was 21.3 mt (46,958 lbs), and in 2008 it was 31.2 mt (68,784 lbs). In 2010 the total YT ABC for SNE/MA YT flounder is 493 mt. Framework 44 to the Multispecies FMP considered a range of YT allocations for the scallop fishery for 2010 – 2012. At the November 2009 Council meeting, the Council recommended to allocate 100% of the projected GB and SNE/MA YT ACL needed for the scallop fishery for FY2010 and 90% for 2011 and 2012. Based on the fishing mortality level chosen, the YT “needed” for the scallop fishery (and thus the allocated other subcomponent) in the Southern New England/Mid-Atlantic stock area for 2010 is 135 mt, and in the Georges Bank stock it is 146 mt.

Currently there is a YT TAC cap of 10% that can be used in access areas. In addition, Amendment 16 to the Multispecies FMP and Amendment 15 to the Scallop FMP imply that this

10% cap will come from the allocated SNE YT ACL (310 mt). As a result, the limit of YT bycatch that can be used in the access area program in NL for FY2010 is 10% of 310 mt, or 31 mt. No buffer for management uncertainty is applied to the scallop allocation of YT flounder in 2010, because it is not an ACL yet and no AMs are in place for 2010. In 2011 and beyond the Council decided to apply a buffer for management uncertainty to the sub-ACL allocated to the scallop fishery, so the sub-ACL will be reduced by 7%, the final allocation will be equivalent to 93%. Because there are no access area trips in the GB stock area in 2010, it is not necessary to allocate YTF for the access program there.

It should be noted that this allocation of yellowtail is not the full SNE YT allocation for 2010. The total SNE YT allocation proposed in FW44 for the scallop fishery in 2010 is 135 mt of YT or 27.4% of the SNE YT ABC or 43.5% of the SNE YT ACL. Ten percent of the total YT ABC remains available to the scallop fleet in access area fishing, and the remainder is intended to cover YT bycatch from open area fishing within the SNE YT stock area from DAS and general category fishing. In addition, Framework 44 includes a buffer for management uncertainty, so it is likely that the scallop fishery will ultimately receive closer to 95% of 135 mt in 2010 if that is approved in FW44.

Table 11 –SNE YT TAC available for scallop access area program

| | 2010 |
|--------------------------------|-------------------------|
| SNE/MA YT ACL | 310 mt |
| 10% for scallop access program | 31.0 mt (68,342 pounds) |

In order to calculate the compensation that will be used for limited access trips that have not been taken if the YT bycatch TAC is reached, an estimate is made about the number of days in the open areas required to remove the same number of scallops that would have been taken in the closed areas. For example, in Nantucket Lightship, a full trip is 18,000 lbs, and according to the projections for the NCLF24 scenario, the average meat count will be 11.5, implying that $18,000 \times 11.5 = 207,000$ scallops will be removed per trip. In the open areas, the average meat count will be 21.2 so that 207,000 scallops correspond to $207,000 / 21.2 = 9,764$ pounds. The estimate of open area LPUE generated from the model for this scenario is 1693, so it will take $9,764 / 1693 = 5.77$ DAS to land the same number of scallops, resulting in compensation of 5.77 DAS. The proposed action includes an allocation of 5.77 open area DAS for a full-time vessel if the Nantucket Lightship Area closes in 2010 due to the YT TAC being reached.

Table 12 – Open area DAS Compensations for unused GB access area trips

| GB Access Area | Open Area Compensation |
|----------------------------|------------------------|
| Nantucket Lightship (2010) | 5.77 DAS (for NCLF20) |

2.5.1.2 TAC set-asides for observers (1%) and research (2%)

One-percent of the TAC for each access area and open area DAS will be set-aside to help fund observers. In addition, 2% of the TAC for each access area and open area DAS will be set-aside to fund scallop-related research. The percent of the TAC and total DAS set aside for observers and research will be removed before allocations are set for limited access and general category fisheries.

In terms of the access areas, see Table 13 for a breakdown of the TAC that will be assigned for observers and research in access areas in the proposed action.

Table 13 – Summary of research and observer set-asides in access areas for the proposed action (in million pounds)

| | 2010 | | |
|------------------|-------------|------------|-----------------|
| | NL | ETA | Delmarva |
| Total TAC | 5,891,000 | 11,353,000 | 5,885,000 |
| 2% for research | 117,820 | 227,060 | 117,700 |
| 1% for observers | 58,910 | 113,530 | 58,850 |

This action also continues the set-aside program that deducts one-percent of the allocated DAS to help fund observers on limited access scallop vessels in open areas and two-percent to fund scallop-related research with compensation trips taken in open scallop fishing areas. This allocation would be removed after the general category allocation is removed from open areas.

The total open area DAS allocated to the limited access fishery in 2010 is approximately 12,920 DAS (38 DAS for each of the 340 full-time equivalent vessels). That value is equal to approximately 97% of the “total” TAC available in open areas (after catch has been removed for the general category fishery). The remaining 3% is for observer and research set asides. When those amounts are added in, the total open area DAS is equal to 13,324 DAS for 2010. Table 14 illustrates the open area DAS that should be removed for the observer and research set-aside programs based on the proposed action.

It should be noted that the average LPUE in open areas for 2010 is estimated to be about 1,693 pounds per day from the biological model. If instead the total estimated catch by limited access vessels in open areas (22.8 million pounds) was divided by the total number of DAS allocated (12,920 DAS), the estimate of catch per DAS is just over 1,700.

Table 14 – Summary of open area DAS set-asides for research and observers for the proposed action

| | 2010 |
|---|-------------|
| “Total” DAS for open areas | 13,324 |
| Allocated DAS to the limited access fishery | 12,920 |
| DAS set-aside for research (2%) | 269 |
| DAS set-aside for observers (1%) | 135 |

2.5.1.3 Research priorities for 2010 and recent RSA announcement

The RSA announcement for federal funding came out earlier than in previous years in an attempt to expedite the process. In the past the announcement came out after final decision on the Framework when final allocations were known. This resulted in delayed responses and made it very difficult for researchers to complete all compensation for research before the end of the fishing year. This year the announcement did not include the precise amounts of RSA available and did not require applicants to apply for a certain amount of RSA compensation in DAS and/or access area pounds. Instead, applicants included an estimate of what their research and compensation needs were in dollar values.

Applicants for 2010 RSA funds were due on August 31, 2009. The final selections have not been made yet but are expected before the start of the fishing year. The Council approved a list of priorities to be included in the federal funding notice for 2010 RSA proposals. This time the Council included several issues with higher priority. Proposals that focus on either assessing scallop abundance in access areas and methods to reduce bycatch were identified with highest priority. Proposals that focus on sea turtles and their interaction with the scallop fishery have been given medium priority, and all other items are listed as other with equal priority. The priorities are listed below.

HIGHEST PRIORITIES (not listed in order of importance):

- An intensive industry-based survey of each of the access areas (access areas in Georges Bank including Closed Area I, Closed Area II, and Nantucket Lightship, as well as Elephant Trunk, Delmarva, and Hudson Canyon). These surveys can then be used to estimate total allowable catches (TACs) under the rotational area management program if the data from these surveys are available by August 2010.
- Identification and evaluation of methods to reduce bycatch of all managed species (i.e., gear research).

MEDIUM PRIORITY:

- Identification of sources of sea turtle interactions and/or identification of ways to minimize interactions with sea turtles. Two priority topics identified include evaluation and analysis of factors affecting bycatch rates of sea turtles and development of scallop dredge and trawl operations that would reduce or eliminate the threat or harm of sea turtle interactions. Other issues related to sea turtle research include, but are not limited to: gear modifications or fishing techniques that may be used to reduce or eliminate the threat of sea turtle interactions without unacceptable reduction in scallop retention, using available and appropriate technology to quantify the extent that chain mats reduce turtle mortalities, comparison and analysis of turtle capture rates of similar gear in other fisheries, and turtle behavior.

OTHER PRIORITIES (not listed in order of importance):

- Other surveys, including areas not surveyed by the annual NMFS survey (i.e., federal waters in the Northern Gulf of Maine management area and Southern New England).
- Scallop biology, including studies aimed at understanding recruitment processes (reproduction, larval and early post-settlement stages), growth, natural mortality (including predation and disease), incidental gear mortality, and discard mortality.
- Identification and evaluation of methods to reduce habitat impacts, including, but not limited to: broader investigation of variability in dredging efficiency across habitats, times, areas, and gear designs; and research on habitat effects from scallop fishing and development of practicable methods to minimize or mitigate those impacts.
- Habitat characterization research including, but not limited to: video and/or photo transects of the bottom within scallop access areas and within closed scallop areas and in comparable fished areas that are both subject and not subject to scallop fishing before and after scallop fishing commences; development of high resolution sediment mapping of scallop fishing areas using Canadian sea scallop industry mapping efforts as an example process; identification of nursery and over-wintering habitats of species that are vulnerable to habitat alteration by scallop fishing; and other research that relates to

habitats affected by scallop fishing, including, but not limited to, long-term or chronic effects of scallop fishing on marine resource productivity, other ecosystem effects, habitat recovery potential, and fine scale fishing effort in relation to fine scale habitat distribution. In particular, projects that directly support evaluation of present and candidate EFH closures and HAPCs to assess whether these areas are accomplishing their stated purposes and to assist better definition of the complex ecosystem processes that occur in these areas.

- Improved information concerning scallop abundance and evaluation of the distribution, size composition, and density of scallops, including but not limited to: efforts to develop a cooperative industry-based resource survey, high resolution surveys that include distribution, biomass of exploitable size scallops, recruitment, mortality, and growth rate information, research that provides more detailed scallop life history information (especially on age and area specific natural mortality and growth) and to identify stock-recruitment relationships, intensive sampling on both sides of access boundaries for fishing year 2007 and in subsequent years to gauge the short-and long-terms effects of fishing on the resource.
- Scallop and area management research, including but not limited to: evaluation of ways to control predation on scallops; research to actively manage spat collection and seeding of sea scallops; social and economic impacts and consequences of closing areas to enhance productivity and improve yield of sea scallops and other species; and estimation of factors affecting fishing power for each limited access vessel.
- Research projects that would help calibrate the transition of the federal dredge survey, or projects that compare various survey techniques and methods that would assist with the current transition period of the federal scallop dredge survey.

2.5.1.4 DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010

If the LAGC IFQ program is not fully implemented before March 1, 2010, the LAGC fishery is allocated 10% of the total projected scallop catch during the transition period to ITQs compared to 5%. The FW21 management scenarios include a specific DAS allocation to the LA fishery based on that sector of the fleet being allocated 95% of the projected catch. Regulations require that if the transition period is extended for another year LA DAS must be reduced by an equivalent amount to prevent overfishing. The needed DAS reductions per scenario are described in Table 15.

Table 15 – Summary of DAS reductions if the LAGC IFQ program is delayed and the LAGC fishery is allocated 10% of total projected catch compared to 5%

| Alternative | Landings | LPUE | 5% converted to Total DAS | DAS Reduction |
|--------------------|-----------------|-------------|----------------------------------|----------------------|
| CLF18 | 22298 | 1620 | 1517 | 4.5 |
| CLF20 | 24269 | 1542 | 1735 | 5.1 |
| NCLF20 | 18829 | 1722 | 1205 | 3.5 |
| NCLF24 | 21445 | 1696 | 1394 | 4.1 |

2.6 MEASURES FOR GENERAL CATEGORY VESSELS

Measures in this section without a 'No Action' alternative didn't require Council action. The alternatives listed indicate what will be in place as a result of the Council's adopted allocation alternative.

2.6.1 Measures if IFQ program is delayed

2.6.1.1 Quarterly hard-TAC for transition period to limited entry

The table below describes the quarterly hard TAC for the proposed action if the IFQ program is not in place before March 1, 2010. Note that Quarter 1 will likely close early before all access area trips are taken because the sum of all catch from access area trips is more than 35% of the annual catch.

Table 16 – Summary of general category catch and access area trips by quarter under the transition period to the IFQ program recommended under Amendment 11*

| | Quarter 1 | Quarter 2 | Quarter 3 | Quarter 4 | Total |
|-----------------------------------|------------|------------|------------|------------|-------------|
| Option A* | 35% | 40% | 15% | 10% | 100% |
| Estimated landings by area | | | | | |
| All areas (pounds) | 733,752 | 838,574 | 314,465 | 209,643 | 2,096,434 |
| Access area trips | | | | | |
| DMV | 713 | | | | |
| ETA | 1377 | | | | |
| NLS | | 714 | | | |

Note: Access area allocations are not made by quarter. All trips for that area are allocated at the start of the quarter. If all trips in an area are not caught in one quarter, those trips will be available in following quarters.

** Final implementation of IFQ Program was announced prior to resubmission of FW21 and as a result, no numbers related to sections about "If the IFQ program is not fully implemented prior to March 1, 2010" were updated.*

2.6.2 Georges Bank access area management

All four scenarios include access into Nantucket Lightship for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for that area in the form of fleet-wide trips.

2.6.2.1 Yellowtail flounder bycatch TAC

Under current regulations, if the 10% yellowtail flounder bycatch TAC for SNE is reached and the Nantucket Lightship access areas closes, general category vessels are not permitted to fish in the area. Furthermore, since it is a fleet-wide allocation, there is no compensation for vessels on an individual basis if the area closes before all the general category trips have been taken. The yellowtail flounder bycatch TAC is shared between the two fisheries; therefore, once the TAC is reached the area closes for both fleets. This is currently in the regulations and will not change as a result of this action.

2.6.3 Mid-Atlantic access area management

All four scenarios include access into both Elephant Trunk and Delmarva for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for both areas in the form of fleet-wide trips.

2.6.4 Northern Gulf of Maine (NGOM) Hard-TAC

The Council approved a separate limited entry program for the NGOM with a hard-TAC. Framework 21 will need to consider a separate hard TAC for this area for 2010. Individuals qualified for a permit if their vessel had a general category permit when the control date was implemented (November 1, 2004). There is no landings qualification for this permit. Vessels would be restricted to fish in this area under a 200 pound possession limit until the overall hard-TAC was reached. Currently there are approximately over 100 vessels that qualified for this permit.

Amendment 11 specifies that the Scallop PDT will recommend a hard-TAC for the federal portion of the scallop resource in the NGOM. The amendment recommends that the hard-TAC be determined using historical landings until funding is secured to undertake a NGOM stock assessment. The PDT reviewed landings data from the VTR database and recommends that the **hard-TAC for this area be 70,000 pounds for FY2010.**

While the fishery only landed less than 15% of the NGOM TAC in 2008 and 2009, the PDT still feels this TAC is appropriate until a formal assessment of the area can be completed. A survey of the scallop resource in the NGOM is currently being conducted by RSA funds under the Scallop FMP. That survey was conducted in summer 2009, but results are not available yet. The survey results may be reviewed at the next scallop assessment, and then can be used for management purposes.

2.6.5 Estimate of catch from LA incidental catch permits

Amendment 11 includes a provision that the Scallop FMP should consider the level of mortality from incidental catch and remove that from the projected total catch before allocations are made. The amendment requires the PDT to develop an estimate of mortality from incidental catch and remove that from the total. This section includes a summary of the PDT estimate and the value that was removed from the total projected catch before allocations to the limited access and general category fisheries were made.

In Framework 19 the PDT reviewed incidental landings from previous years (<40 pounds per trip) to estimate what level of projected catch should be removed in future years. According to the dealer database, approximately 10,000 to 27,000 pounds of scallops have been landed on trips with less than 40 pounds. According to the VTR database, closer to 30,000 pounds have been caught in previous years in increments less than 40 pounds. The PDT discussed that it is more appropriate to use the VTR data as a starting point for this estimate since incidental catch is not always sold to a dealer (i.e., it is consumed for personal use). The PDT also recommended that the average landings from the VTR database should be increased to some degree to account for an expected increase in scallop landings by incidental catch permits. Since some vessels are not going to qualify for a limited entry general category IFQ permit under Amendment 11,

landing scallops under incidental catch may be the only other alternative for some vessels (assuming the vessels had a general category permit before the control date). **Therefore, the PDT recommends taking VTR landings analyzed in FW19 as a starting point for an estimate of mortality from incidental catch and increasing that to 50,000 pounds to account for an expected increase due to measures implemented by Amendment 11. This amount will be removed from the total projected catch before allocations to the LA and LAGC fisheries.**

Just under 300 vessels are expected to qualify for incidental permits in 2010.

2.6.6 Allow leasing of partial general category IFQ allocations during the fishing year

2.6.6.1 No Action

Amendment 11 allowed for temporary and permanent IFQ transfers between permitted vessels but required that vessels transferring IFQ must transfer that allocation **in full prior to any fishing activity** (50 CFR 648.53(h)(5)) by the vessel transferring IFQ to another vessel. Under No Action, IFQ permitted vessels that do not have a limited access days-at-sea (DAS) permit will still be allowed to transfer only entire IFQ allocations.

2.6.6.2 Allowing for Partial IFQ Allocation Temporary Transfers

This alternative would allow for partial allocation transfers that would be leased from one vessel to another during a single fishing year and would not be carried over into a subsequent fishing year. A vessel could complete multiple leases of portions of its IFQ. This alternative would only apply to temporary transfers (leases) and not permanent transfers, which would still require the entire IFQ allocation to be transferred to a vessel permanently.

The Council clarified that the minimum for leasing should be the equivalent of 100 pounds. However, individuals that qualify for less than 100 pounds would still be permitted to lease that in full. Leasing does not have to be in increments of 100 pound blocks, that is only the minimum. For example, if a vessel qualifies for 1,250 pounds, it can lease 100 pounds or any amount greater than that up to 1,250 pounds. The current allowance of full transfers would still be allowed. Current IFQ allocations issued to vessels will be rounded up to 10 pounds.

The following provisions would not be changed by this alternative:

- The lessor must not fish any of its IFQ allocation prior to transfer to another vessel. With the absence of true real-time monitoring of IFQ allocations, NMFS wants to take precaution with allowing for vessels to fish prior to leasing out IFQ allocation. In addition, this first year of IFQ implementation will be complicated by the delay in Framework 21 and will require NMFS to apply new IFQ allocations after the start of the fishing year. A vessel that has leased IFQ to another vessel may fish its remaining IFQ after the lease, but may not lease the remainder of its IFQ once it has begun fishing under its IFQ.
- This alternative will not change the end-of-year deadlines for when applications must be received. Completed transfer applications must be submitted to NERO at least 30 days before the date on which the applicants desire to have the IFQ effective on the receiving vessel. Applications for temporary transfers should be submitted at least 45 days prior to

the end of the fishing year (i.e., mid-January) so that they will be processed in time for a vessel to use the transferred IFQ before the end of the fishing year in which the IFQ transfer was approved.

- Partial IFQ leasing will still be subject to the 2 percent and 5 percent caps for total allowable catch and ownership, respectively.
- Limited access days-at-sea vessels that also possess IFQ permits may not participate in temporary or permanent transfers.
- Cost recovery for the transferred IFQ will be applied to the vessel that lands the transferred IFQ allocation.

If a vessel (lessor) leases its entire IFQ allocation to one or more vessels, any overages over the amount of the individual IFQ transfers would be the responsibility of the appropriate lessee. If a lessor transfers part of its IFQ allocation to either one or more vessels but retains some of its allocation, any overages of that vessel's remaining IFQ allocation would be the responsibility of the lessor.

Rationale: This alternative would allow for more flexibility to the IFQ program while also meeting the needs of the current monitoring system that will be used for the first time in the 2010 fishing year.

2.7 CONSIDERATION OF NEW ROTATIONAL AREA IN THE GREAT SOUTH CHANNEL

Amendment 10 defines the criteria for closing an area to protect young scallops. Under adaptive area rotation, an area would close when the expected increase in exploitable biomass in the absence of fishing mortality exceeds 30% per year and re-open to fishing when the annual increase in the absence of fishing mortality is less than 15% per year. Identification of areas would be based on a combination of the NEFSC dredge survey and available industry-based surveys. The boundaries are to be based on the distribution and abundance of scallops at size; ten-minute squares are the basis for evaluating continuous blocks that may be closed. The guidelines are intended to keep the size of the areas large enough and regular in shape to be effective, while allow a degree of flexibility. The Council and NMFS are not bound to closing an area that meets the criteria and the Council and NMFS may deviate from the guidelines to achieve optimum yield.

If any areas qualify, the area would close to all scallop vessels and vessels would not be permitted in that area until a later date when biomass estimates project higher yields. The Council is not required to implement these rotational closed areas just because they meet the criteria recommended in Amendment 10 for new closures, but they should be considered.

Preliminary results from the 2009 survey suggest that small scallops have settled in parts of the Great South Channel. The PDT recommended consideration of an area to the north of the Nantucket Lightship closed area and west of Closed Area I; the top left coordinate of the polygon is 41 20' N and 69 30' W and the bottom left coordinate is 40 50' N and 68 50' W (Figure 4). Recruitment on GB has been below average since 2001 and has only improved in the last few years. High numbers of small scallops (<70 mm) were caught on 2007, 2008 and 2009 survey tows in this area.

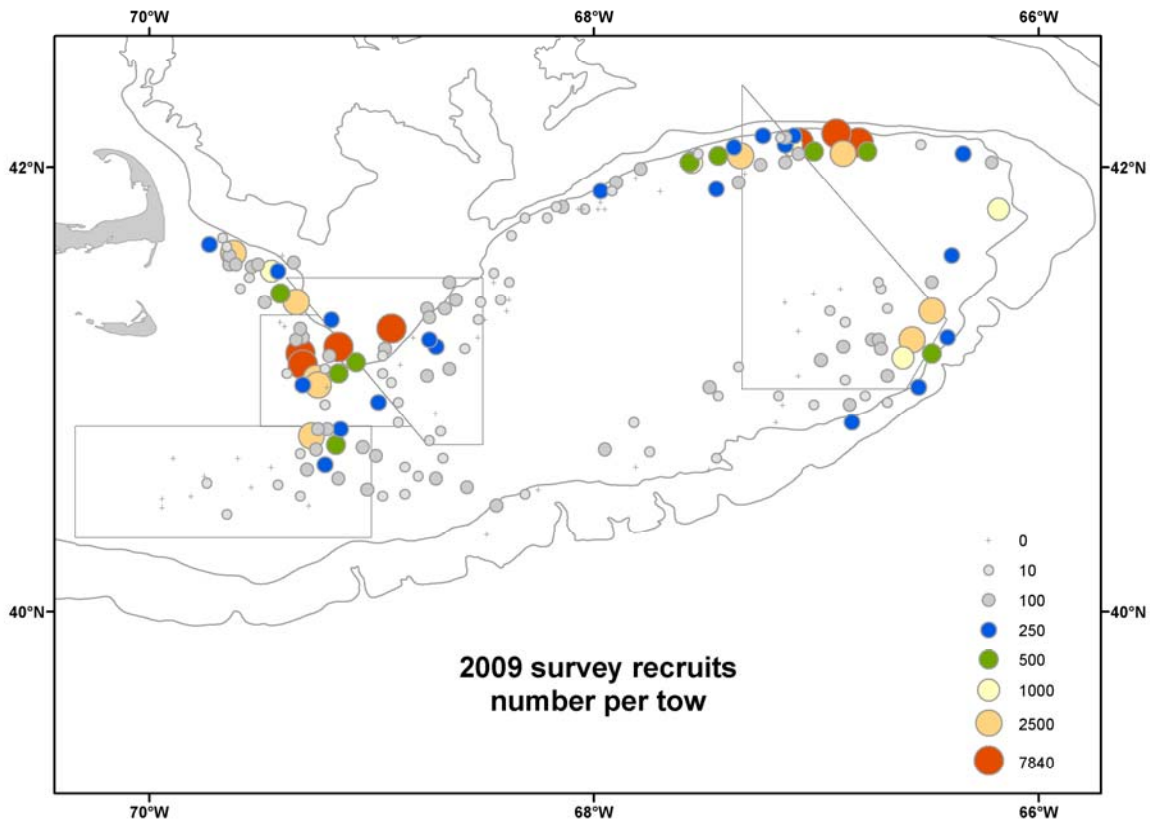

2.7.1.1 No Action

No new rotational area would close in this action in the Great South Channel vicinity.

2.7.1.2 New rotational area in the Channel north of Nantucket Lightship and west of Closed Area I

An area to the north of the Nantucket Lightship closed area and west of Closed Area I would close to scallop fishing for at least the 2010 and 2011 fishing years. The top left coordinate of the polygon proposed for closure is 41 20' N and 69 30' W and the bottom left coordinate is 40 50' N and 68 50' W. This area was chosen based on large amounts of small scallops in recent surveys, as illustrated in the recruitment plot (Figure 4). Effort levels are currently high in this area, which causes concerns about where that effort would shift to if the area were closed.

Figure 4 – Scallop recruitment on Georges Bank from the 2009 federal survey (scallops less than 70mm) with potential boundaries for a scallop rotational area within the Great South Channel

2.8 EFFORTS TO MINIMIZE INCIDENTAL TAKE OF SEA TURTLES AS PER THE MARCH 14, 2008 SCALLOP BIOLOGICAL OPINION

On March 14, 2008, NMFS completed an ESA Section 7 Consultation on the Atlantic Sea Scallop Fishery Management Plan.² Under the ESA, each Federal agency is required to ensure its actions are not likely to jeopardize the continued existence of any listed species or critical habitat. If a Federal action is likely to adversely affect a listed species, formal consultation is necessary. Five formal Section 7 consultations, with resulting biological opinions, have been completed on the Atlantic sea scallop fishery to date. All five have had the same conclusion: the continued authorization of the scallop fishery may adversely affect, but is not likely to jeopardize the continued existence of four sea turtles (loggerheads, green, Kemp's ridley, and leatherback). In the accompanying Incidental Take Statement, NMFS is required to identify and implement non-discretionary reasonable and prudent measures (RPMs) necessary or appropriate to minimize the impacts of any incidental take, as well as Terms and Conditions (T/C) for implementing each RPM. RPMs and T/C cannot alter the basic design, location, scope, duration, or timing of the action and may involve only minor changes. Five RPMs and T/Cs were identified in the March 2008 biological opinion. One RPM requires a limit of effort in the Mid-Atlantic during times when sea turtle distribution is expected to overlap with fishing activity; the other four are related to ongoing research needs and identification of measures to reduce interactions and/or the severity of such interactions.

NMFS Northeast Regional Administrator sent the Council a letter on April 9, 2008 requesting that the Council take the opportunity to develop the measures to meet RPM#1 through FW21 taking into consideration the impacts of possible effort shifts of the fishery and other potential impacts. The Council reviewed the biological opinion and RPM and found some issues with how the agency developed the first RPM and T/C, namely the reasonableness of the measures and the justification for selecting certain percentages in the T/C. On August 1, 2008, the agency submitted a second letter to the Council to clarify these issues and in that letter requested that the "Council should conduct an analysis to: (a) Determine whether the RPM and Term and Condition provided in the March 14, 2008, Opinion is reasonable and prudent in light of the regulatory and statutory guidance provided, and if not, then (b) identify what revisions are necessary to make it reasonable and prudent or identify why there is no acceptable revision that would make it meet the standard." On November 26, 2008, the Council developed a response to the agency with such analyses and found that the first RPM and T/C were not reasonable and prudent as they would cause more than a minor change to the scallop fishery. As such, the Council recommended revisions to the first RPM and T/C.

Based on the Council's response, the agency did revise the language of the first RPM and term and condition and replaced them with the text below:

Reasonable and Prudent Measures

NMFS has determined that the following reasonable and prudent measures are necessary or appropriate to minimize impacts of incidental take of sea turtles:

NMFS must limit the amount of allocated scallop fishing effort by "Limited access scallop vessels" as such vessels are defined in the regulations (50 CFR 648.2), that can be used in the

² The full biological opinion can be found at http://www.nero.noaa.gov/prot_res/section7/.

2.8.1 Alternatives to minimize impacts of incidental take of sea turtles

‘No Action’ would be that no restrictions would be in place during FY2010 in the Mid-Atlantic during the period of time when turtles interact with scallop fishing effort. No Action for this alternative was not analyzed because action was required.

2.8.1.1 Restrict the number of open area DAS an individual vessel can use in the Mid-Atlantic during a certain window of time

This alternative would set a maximum on the number of allocated open area DAS each limited access vessel can use in the area defined as the Mid-Atlantic during the time periods under consideration (June 16-October 14 or June 15-October 31). The maximum number of DAS that can be used will be identified as the maximum number of DAS before any less DAS would have “more than a minor impact” on the fishery as defined by the PDT analyses in Section 2.8.2. Measures to comply with a reasonable and prudent measure cannot have more than a minor impact on the fishery.

Option A for Area: in the entire area defined by the RPM

The restriction on DAS used would apply to all statistical areas south of the northern boundaries of statistical areas 612, 613, 533, 534, 541, 542, and 543 (Figure 5).

Option B for Area: in a subset of the area where turtle interactions are more likely to occur based on sea surface temperature data

The PDT analyzed sea surface temperature data to determine if the area defined by the RPM could be refined at all to maximize benefits for turtles and minimize impacts on the fishery. The PDT considered an option that would refine the line for the month of June by two criteria: 1) waters where mean sea surface temperature is greater than 17.9°C, the minimum temperature loggerhead turtles have been observed, and 2) waters that do not overlap any observed takes in the fishery. The approach could allow fishing in the statistical areas that are just south of the boundary for the month of June, but would revert back to the original RPM line in July-October.

Option A for time window: June 16 - October 14

This time period is consistent with the full range of dates for all observed turtle takes in the scallop fishery. From 2003-2008 a total of 59 turtles have been observed between these dates for both gear types on both on and off watches.

Option B for time window: June 15 – October 31

This time period is slightly longer than Option A to recognize that turtle migration patterns change over time and space and turtles may be in this area earlier and later than have been observed to date. It has also been noted that one turtle was observed on a research trip in late October 2002 in waters west of the Elephant Trunk Area.

2.8.1.2 Restrict the number of access area trips in the Mid-Atlantic that can be used during a certain window of time

This alternative would restrict the number of allocated access area trips that can be taken in the Mid-Atlantic during the two time periods under consideration. In 2010, each limited access scallop vessel is expected to be allocated three trips in access areas within the Mid-Atlantic. This alternative would restrict when those trips can be taken in terms of placing a maximum on

the number that can be taken during either June 16-October 14, or June 15 – October 31. The maximum number of trips that can be taken in this window of time will be identified as the maximum number of trips before any fewer trips would have “more than a minor impact” on the fishery as defined by the PDT analyses in Section 2.8.2. Measures to comply with a reasonable and prudent measure cannot have more than a minor impact on the fishery. This restriction would not change any seasonal closures already in place for Elephant Trunk, or under consideration for Delmarva.

Option A for time window: June 16 - October 14

This time period is consistent with the full range of dates for all observed turtle takes in the scallop fishery. From 2003-2008 a total of 59 turtles have been observed between these dates for both gear types on both on and off watches.

Option B for time window: June 15 – October 31

This time period is slightly longer than Option A to recognize that turtle migration patterns change over time and space and turtles may be in this area earlier and later than have been observed to date. It has also been noted that one turtle was observed on a research trip in late October 2002 in waters west of the Elephant Trunk Area.

2.8.1.3 Consider a seasonal closure for Delmarva

This alternative would consider a seasonal closure of the entire access area to both general category and limited access scallop vessels. While the RPM only specifies that these measures need to limit effort for the limited access fishery, the PDT recommends this restriction for both fleets to be consistent with the seasonal closure in Elephant Trunk and to further minimize impacts on turtles. Measures to comply with a reasonable and prudent measure cannot have more than a minor impact on the fishery.

Option A: September 1 – October 31

Option B: October 1 – October 31

2.8.1.4 Reduce possession limits in ETA and/or Delmarva to reduce fishing time per trip

In most cases a fulltime limited access vessel is allocated a maximum of 18,000 pounds per access area trip. The length of time it takes a vessel to catch that allowance varies, but in high density areas gear is fishing on the bottom a fraction of the time compared to open areas. If the possession limit is reduced, gear will be on the bottom that much less. For example, a 16,000 pound trip is 11% less than an 18,000 pound trip, so it is conceivable that gear will be fishing 11% less on that trip. That is a form of limiting the amount of effort that can be used in access areas in the Mid-Atlantic. Measures to comply with a reasonable and prudent measure cannot have more than a minor impact on the fishery.

2.8.1.5 Combined measures to further minimize impacts of incidental take of sea turtles

The Council considered the handful of measures listed above to limit effort in this area from mid-June through the end of October. After the Scallop Committee reviewed the preliminary analyses of the alternatives (Section 5.3), some were considered more than minor due to high distributional impacts on vessels from the south compared to vessels from the north. One measure that was considered not more than minor was the seasonal closure in the Delmarva access area. Because this measure alone seemed to have neutral impacts on the fishery and

possibly positive impacts on fishing mortality by shifting effort from time periods with lower meat weights to potentially higher meat weights, the Council was not confident this measure alone would be sufficient to meet the requirement of the RPM.

Therefore, at the November Council meeting the Council considered several “combined measures” of the alternatives already under consideration to ensure this action is compliant with the requirement to limit effort up to the point where impacts are more than minor. All three combined measures considered included the seasonal closure in Delmarva and some combination of limited effort within access areas in the Mid-Atlantic and during the turtle season. Ultimately the proposed action includes a combination of measures considered including a two-month seasonal closure of the Delmarva access area from September 1-October 31 and a limit on the number of access area trips that can be taken in access areas within the Mid-Atlantic from June 15 through October 31. Each vessel is restricted to taking 2 of the 3 allocated access area trips in the Mid-Atlantic. Since both Mid-Atlantic access areas are now closed from September 1-October 31 to reduce impacts on sea turtles, the limit is applicable for June 15 through August 31.

2.8.1.5.1 Combination of Delmarva seasonal closure in September and October as well as reduced possession limit on any access area trip in Elephant Trunk and/or Delmarva from June 15 through August 31

This alternative is a combination of RPM Alternative #3 Option B and RPM Alternative #4 in the current FW21 Draft EA. As Alternative #3 explains no vessels (LA or LAGC) would be permitted to fish in Delmarva from September 1 through October 31. In addition, limited access vessels that decide to use either of their two ETA access area trips (Option A) or their Delmarva trip (Option B) from June 15-August 31 would be permitted to do so, but the possession limit would be reduced. This alternative is different than Alternative #4 in that vessels would be permitted to take a subsequent trip outside the turtle season to recoup the difference on reduced possession limit during the turtle season. One or more subsequent trips could be taken between November 1, 2010 and February 29, 2011. Under Option A Delmarva trips could be taken anytime outside of Sept-Oct closure, and possession limit would remain the same. Under Option B both ETA and Delmarva trips taken during June 15-Aug 31 would be subject to reduced possession limit.

For full-time vessels, they would be permitted to take one or both ETA access area trips with a 12,000 pound possession limit. If they decide to take one, they would be permitted to take two additional trips in ETA outside the turtle season. Those two additional trips would have a possession limit of 12,000 pounds each. Current broken trip provisions would still apply, so vessels could return to ETA outside the turtle season on more than two occasions if necessary. If that vessel decided to take two ETA trips from June 15-August 31 at 12,000 pounds each, they would only be permitted to take one additional trip with a 12,000 pound possession limit. Again, current broken trip provisions would still apply, so vessels could return to ETA outside the turtle season on more than one occasion if necessary.

As for the Delmarva area, vessels would be permitted to take one Delmarva trip at a reduced possession limit of 9,000 pounds for full-time permits during the turtle season. If a vessel decided to take a reduced trip in Delmarva from June 15-August 31 at 9,000 pounds each, they would only be permitted to take one additional trip with a 9,000 pound possession limit outside

the turtle season. Again, current broken trip provisions would still apply, so vessels could return to Delmarva outside the turtle season on more than one occasion if necessary.

Rationale: This alternative is intended to limit scallop fishing in the Mid-Atlantic during the turtle season two ways: 1) prohibit vessels from taking trips in Delmarva in September and October completely, and 2) limiting effort in Elephant Trunk and or Delmarva between June 15 and August 31 by reducing the possession limit of those trips, which is likely to reduce the number of total access area trips taken during that season as well as reduce length of trips that do occur in that area by reducing the possession limit to 12,000 pounds and 9,000 pounds respectively.

2.8.1.5.2 Combination of Delmarva seasonal closure in September and October as well as a limiting the number of access area trips that can be taken in Elephant Trunk with a reduced possession limit if trip taken between June 15 through August 31

This alternative is a combination of RPM Alternative #3 Option B and RPM Alternative #4 in the current FW21 Draft EA. As Alternative #3 explains, no vessels (LA and LAGC) would be permitted to fish in Delmarva from September 1 through October 31. In addition, limited access vessels that decide to use either of their two ETA access area trips from June 15-August 31 would be permitted to do so, but the possession limit would be reduced to 14,000 pounds for full-time vessels, and by a similar amount for other permit categories. This alternative is different from Alternative #4 in that vessels would be permitted to harvest the difference in possession limit on their other ETA trip outside of the turtle season (from March 1-June 14 or November 1 – February 29).

Specifically, a vessel that decides to take their one trip permitted during the turtle season can do so at a reduced possession limit of 14,000 pounds. Then on a subsequent trip they can fish up to the possession limit for the second trip (18,000 pounds for full-time vessel) plus the difference from their trip during the turtle season of 4,000 pounds, for a total possession limit of 22,000 pounds on their trip outside the turtle window. Vessels do not have to fish during the turtle season, and if they decide not to would be limited to current possession limits of 18,000 pounds for each ETA trip.

Rationale: This alternative is intended to limit scallop fishing in the Mid-Atlantic during the turtle season two ways: 1) prohibit vessels from taking trips in Delmarva in September and October completely, and 2) limit effort in Elephant Trunk from June 15-August 31 by implementing a one trip maximum per vessel with a reduced possession limit to further reduce incentive to fish during the turtle season. These measures are likely to reduce the total number of access area trips taken during that season as well as reduce length of trips that do fish in that area by reducing the possession limit to 14,000 pounds.

2.8.1.5.3 Combination of Delmarva seasonal closure in September and October as well as a restriction on the number of access area trips in the Mid-Atlantic that can be used during June 15 through August 31 (Option B – Proposed Alternative)

This alternative is a combination of RPM Alternative #3 Option B and RPM Alternative #2 in the current FW21 Draft EA. As Alternative #3 explains, no vessels (LA and LAGC) would be permitted to fish in Delmarva from September 1 to October 31. In addition, limited access

vessels would be limited to either one (Option A) or two (Option B) total Mid-Atlantic access area trips from June 15-August 31, assuming both Delmarva and Elephant Trunk are closed for the months of September and October already. Vessels are allocated a total of three Mid-Atlantic access area trips in 2010: 2 in Elephant Trunk and 1 in Delmarva. This combined measure would limit vessels to using either one or two of their three allocated trips from June 15-August 31. No trips would be permitted in either area from September 1 – October 31. There would be no change in the possession limit for trips taken during the turtle season and current broken trip provisions would apply to all trips taken during and outside of the turtle season.

Rationale: This alternative is intended to limit scallop fishing in the Mid-Atlantic during the turtle season two ways: prohibit vessels from taking trips in Delmarva in September and October completely, and limiting effort in both Elephant Trunk and Delmarva from June 15-August 31 by implementing a maximum number of trips individual vessels can take during that time period (either one or two trips of the total three allocated). The second part of this alternative will limit the total number of trips that can be taken during the time of year when turtles are present. In the past there have been some vessels that use two or more of their total allocated Mid-Atlantic AA trips from June-October, so limiting the total amount of trips to two will reduce the number of trips that can take place in those areas during the turtle season. An equivalent of 1020 full-time Mid-Atlantic AA trips will be allocated in 2010. This alternative would limit the number of possible access area trips that could be taken during the turtle season to 340 or 680 depending on the option selected.

2.8.2 More than minor impact on the fishery

In the Council response to the biological opinion last year, the PDT decided to base “more than minor” change on the percent change in effort shift caused by a specific limitation on effort, and the resulting impact that shift would have on overall fishing mortality imposed by the RPM and Term and Condition. A model was developed last year that estimated changes in F , effort shifts and impacts on revenue when limitations are placed on the scallop fishery by season and/or area. The PDT used this same approach for Framework 21 in terms of assessing which measures meet the requirements of an RPM in terms of whether they have more than a minor impact on the fishery. Using final projections for 2010 the PDT estimated effort shifts from the alternatives and identified which ones qualify under RPM and what the expected impacts are from each. These analyses are described in Section 5.3.2.

2.9 IMPROVEMENTS TO THE OBSERVER SET-ASIDE PROGRAM

Over the last few years several concerns have been raised about the industry funded observer program. Primarily due to timing the Council has not been able to address most of these issues. The PDT identified a few adjustments that could be considered with limited work and analyses.

2.9.1 Provisions to discourage vessel owners from not paying deployed observers

2.9.1.1 No Action

There are currently two regulatory provisions to address the issue of observer non-payment. First, there is a provision that allows the observer service provider to refuse to deploy an observer due to non-payment (50 CFR 648.11(h)(4)(vii)(C)). The provider must notify NMFS of

the issue and receive written confirmation authorizing such refusal. Written notification via email is provided to all providers, including those to whom the debt is not owed. If such a vessel calls into the Observer Program and is required to carry an observer in a future trip, providers may refuse to cover the trip. As a result, without a waiver or an observer, that vessel would be unable to fish until providers stop refusing observer deployment. The language of this provision also supports refusing observer coverage for any vessel owned by a corporation owning multiple vessels that owes a debt for one of its vessels.

In addition, there is also a prohibition against failure to comply with observer services payment requirements ((§ 648.14(i)(1)(ix)(C))). This prohibition supports the MSA permit sanction provision which states that permits may be sanctioned through an enforcement action due to outstanding observer fees. The Northeast Region's enforcement attorneys are currently discussing the protocol for how to handle delinquent observer payments and will work out the details with the enforcement agents and with the Observer Program.

2.9.1.2 Include observer payment provision as part of annual permit renewal process

Although there is a permit sanction process for observer non-payment that can be utilized by providers, this process would not allow for quick resolution of outstanding fees and permit sanctions are not automatic. In addition to the current policies for observer non-payment, this alternative would add observer payment to the list of annual requirements that must be met before a scallop permit can be renewed, similar to submitting vessel trip reports before permit issuance. Prior to the start of the permit year, providers would notify NMFS regarding delinquent bills and NMFS would not reissue a scallop permit until the debt dispute had been resolved.

2.9.2 Limit the amount of observer compensation general category vessels can get per observed trip in access areas

In recent years there has been an increase in the amount of pounds general category vessels are compensated for observed trips in access areas. The Council was informed that a growing number of vessels seem to be taking advantage of a "loophole" for how compensation is granted. Some vessels seem to leave right before midnight on day 1 and return at some point on day 2 with 400 pounds for the trip plus 400 pounds for each calendar day carrying an observer (total of 1200 pounds). This alternative could create a ceiling to discourage overages in one of two ways: Set the observer compensation for general category vessels at 400 pounds per trip, regardless of the compensation rate for access area trips allocated to the DAS scallop fleet. This would allow for a general category vessel on an observed access area trip to land up to 800 pounds per trip (400 pounds of which would be taken off the observer set-aside TAC for that area), regardless of the length of the trip.

Set the observer compensation rate annually, as with the DAS scallop fleet, and allow general category vessels observer compensation equivalent to one day, regardless of trip length. For example, the rate is set at 350 pounds per day for DAS scallop vessels and for general category vessels, observed trips will result in 350 pounds per trip.

3.0 CONSIDERED AND REJECTED ALTERNATIVES

During development of this action there were no measures considered by the Council that did not remain as alternatives considered within this document. The following alternatives were raised at PDT meetings but they were never formally presented to the Committee or Council for further consideration.

- Additional RPM alternative: Allocate more effort on GB to shift effort that would have been used in MA (open area DAS that have to be used on GB or more access area effort on GB to shift effort away from MA access areas).
- Allocation of a half trip to one of the GB closed areas.

4.0 DESCRIPTION OF AFFECTED ENVIRONMENT – SAFE REPORT

The environment affected by the sea scallop fishery as a whole is described in Section 4 of Amendment 11 to the Sea Scallop FMP (NEFMC, 2007). That description is incorporated herein by reference. This section serves as the 2009 SAFE Report, which updates the data and analysis of the fishery through the 2009 fishing year, including an updated assessment of the scallop resource and new analyses of limited access and general category scallop effort distribution.

4.1 THE ATLANTIC SEA SCALLOP RESOURCE

The Atlantic sea scallop, *Placopecten magellanicus* (Gmelin), is a bivalve mollusk ranging from North Carolina to the Gulf of St. Lawrence (Hart and Chute, 2004). Although all sea scallops in the US EEZ are managed as a single stock per Amendment 10, four regional components and six resource areas are recognized. Major aggregations occur in the Mid-Atlantic from Virginia to Long Island (Mid-Atlantic component), Georges Bank, the Great South Channel (South Channel component), and the Gulf of Maine (Hart and Rago, 2006; NEFSC, 2007). These four regional components are further divided into six resource areas: Delmarva (Mid-Atlantic), New York Bight (Mid-Atlantic), South Channel, southeast part of Georges Bank, northeast peak and northern part of Georges Bank, and the Gulf of Maine (NEFMC, 2007). Assessments focus on two main parts of the stock and fishery that contain the largest concentrations of sea scallops: Georges Bank and the Mid-Atlantic, which are combined to evaluate the status of the whole stock (NEFMC, 2007).

Sea scallops are generally found in waters less than 20° C and depths that range from 30-110 m on Georges Bank, 20-80 m in the Mid-Atlantic, and less than 40 m in the near-shore waters of the Gulf of Maine. They feed by filtering zoo- and phytoplankton and detritus particles. Sea scallops have separate sexes, reach sexual maturity at age two, and use external fertilization. Scallops greater than 40 mm are considered mature individuals. Spawning generally occurs in late summer and early autumn, although there is evidence of spring spawning as well in the Mid-Atlantic Bight (DuPaul et al., 1989) and limited winter-early spring spawning on Georges Bank (Almeida et al., 1994; Dibacco et al., 1995). Annual fecundity increases rapidly with shell height; individuals younger than four years may contribute little to total egg production (MacDonald and Thompson, 1985; NEFMC, 1993; NEFSC, 2007). The pelagic larval stage lasts 4-7 weeks with settlement usually on firm sand, gravel, shells, etc. (Hart and Chute, 2004; NEFMC, 2007; NEFSC, 2007). Recruitment to the NEFSC survey occurs at 40 mm shell height (SH) and to the commercial fishery at 90-105mm SH, which corresponds to an age of 4-5 years old (NEFSC, 2007; NEFMC, 2007).

Meat weight can quadruple between the ages of three to five (NEFSC, 2004; NEFMC, 2007). Meat weight is dependent on shell size, which increases with age, and depth. Meat weight decreases with depth, possibly due to a reduced food supply (NEFSC, 2007). Both the Mid-Atlantic and Georges Bank showed a drop in meat weights between August and October, coinciding with the September-October spawning period (Haynes, 1966; Serchuk and Smolowitz, 1989; NEFSC, 2007). Meat weight of landed scallops may differ from those predicted based on research survey data because: 1) the shell height/meat weight relationship varies seasonally in part because of the reproductive cycle, causing meats collected during the NEFSC survey to differ from the rest of the year; 2) commercial fishers concentrate on speed

while shucking, leaving some meat on the shell (Naidu, 1987; Kirkley and DuPaul, 1989); and 3) fishers may target areas with relatively large meat weight at shell height, thus increasing commercial weights compared to those seen on the research survey vessel (NEFSC, 2007).

4.1.1 Assessment

The primary source of data used in the biological component of the scallop assessment currently comes from the federal scallop survey. The scallop dredge survey has been conducted in a consistent manner since 1979. An 8-foot modified scallop dredge is used with 2" rings and a 1.5" liner. Tows are 15 minutes in length at a speed of 3.8 knots, and stations are identified using a random-stratified design. About 500 stations are completed each year on Georges Bank and the Mid-Atlantic. The vessel platform used in the past (R/V Albatross IV) went out of service in 2008. The 2008 and 2009 resource surveys were conducted on the R/V Hugh Sharp owned by the University of Delaware. The 2009 surveys were conducted six weeks earlier than previous surveys in hopes that the data would be available in time for 2010 management actions. Calibration tows have been conducted with the WHOI HabCam in order to use this video survey in future projections. A Scallop Survey Advisory Panel (SSAP) is reviewing the scallop survey and making recommendations about how future surveys should be conducted.

Other primary components of the assessment include defining parameters for scallop growth, maturity and fecundity, shell height/meat weight relationships, recruitment, and estimates of natural mortality, which are all combined with fishery data (landing and discards) to estimate fishing mortality rates and biological reference points. The per-recruit reference points F_{max} and B_{max} are used by managers as proxies for F_{msy} and B_{msy} because the stock-recruitment relationship is not well defined. The Catch-At-Size-Analysis (CASA) model utilizes additional information including commercial catch, LPUE, commercial shell height compositions, data from the NMFS sea scallop and winter trawl surveys, data from the University of Massachusetts Dartmouth School of Marine Science and Technology (SMAST) small camera video surveys, data from dredge surveys conducted by VIMS, growth increment data from scallop shells, and shell height/meat weight data adjusted to take commercial practices and seasonality into account (NEFSC, 2007).

Based on the results of the last stock assessment workshop, biological reference points have been set for the entire US sea scallop stock. The threshold fishing mortality rate for fully-recruited scallops that generates the maximum yield-per-recruit, F_{max} , was estimated at 0.29 with the CASA model. The biomass target is 108.6 thousand metric tons meats and the recommended biomass threshold is half the biomass target, or 54.3 thousand metric tons meats.

During analyses for this framework, a new overfishing threshold (F_{max}) of 0.37 was computed based on updated data since the last stock assessment (SAW 45). However, this value is not considered formally peer-reviewed and is subject to change during the stock assessment planned for completion in spring 2010. The overfishing threshold remains at $F_{max} = 0.29$ until completion of SAW 50.

In general, scallop biomass has increased dramatically in recent years. Figure 6 shows this increase in terms of estimated Mid-Atlantic, Georges Bank and total scallop biomass based on the scallop survey through 2007. These values are unadjusted; therefore cannot be directly

compared to biomass thresholds, but the general increasing trend in biomass in both areas is evident.

Figure 6 - Trend in R/V Albatross stratified mean weight per tow from mid 1980s through 2006 by region.

4.1.2 Stock Status

Stock status has been fluctuating in recent years. Overall biomass increased almost without interruption since 1997, peaking at 8.2 kg/tow in 2004. Fishing mortality was above the threshold of 0.24 and target of 0.20 for both 2003 and 2004 with both years at or above 0.30. For 2005, 2006, and 2007, fishing mortality was reduced to 0.22, 0.20, and 0.20 respectively, staying below the threshold value. Preliminary results suggest that F has increased again in both 2008 and 2009.

The preliminary estimate of F in 2008 for the MA is estimated to be 0.38 and for GB it is 0.18, with an overall F of 0.28. The 2009 F in the MA is projected to be 0.42 and on GB 0.18, with an overall F of 0.30. The estimate for 2009 is preliminary because that fishing year is not over yet so assumptions were made about catch for the remainder of the year, and both years are preliminary until the assessment is completed next year. Both of these estimates for 2008 and 2009 are substantially higher than the F_{target} of 0.20 from FW19. Therefore, it is likely that fishing mortality will need to be reduced in 2010 to prevent overfishing.

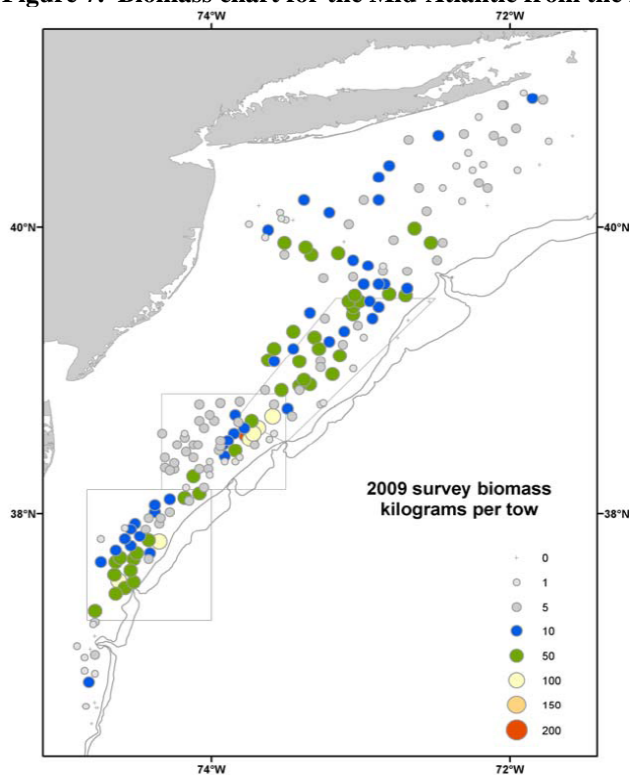

4.1.2.1 Biomass

Despite a decline in biomass in the past few years, the overall trend shows a considerable increase since 1994, especially in the Georges Bank closed areas (NEFSC, 2007). Scallop

biomass on Georges Bank has increased by a factor of 18 and in the Mid-Atlantic Bight by a factor of 8 (Hart and Rago, 2006), which is likely due to very strong recruitment in the Mid-Atlantic and improved management in both the Mid-Atlantic and Georges Bank (NEFMC, 2007). The resource remains in relatively good condition even though mortality was above target for 2003-2004 and 2008-2009 with a greater share of the landings coming from older and larger scallops. Whole-stock estimates indicate that annual abundance, annual egg production, and biomass were relatively high during 2009, with recruitment relatively low.

Biomass increased rapidly in the Mid-Atlantic Bight from 1998-2003 due to area closures, reduced fishing mortality, changes in fishery selectivity, and strong recruitment. Biomass in the Hudson Canyon area increased while it was closed from 1998-2001; likewise, biomass increased steadily in the ETA after its closure in 2004. Two very strong year classes were protected by the ETA closure, which contained over one-quarter of the total scallop biomass in 2007. Heavy fishing effort in the area since has decreased biomass. Figure 2 shows the biomass in the Mid Atlantic based on the 2009 NMFS scallop survey. Biomass is distributed fairly evenly throughout the three area closures (Hudson Canyon, Elephant Trunk, Delmarva), with the largest tows confined to ETA and Delmarva.

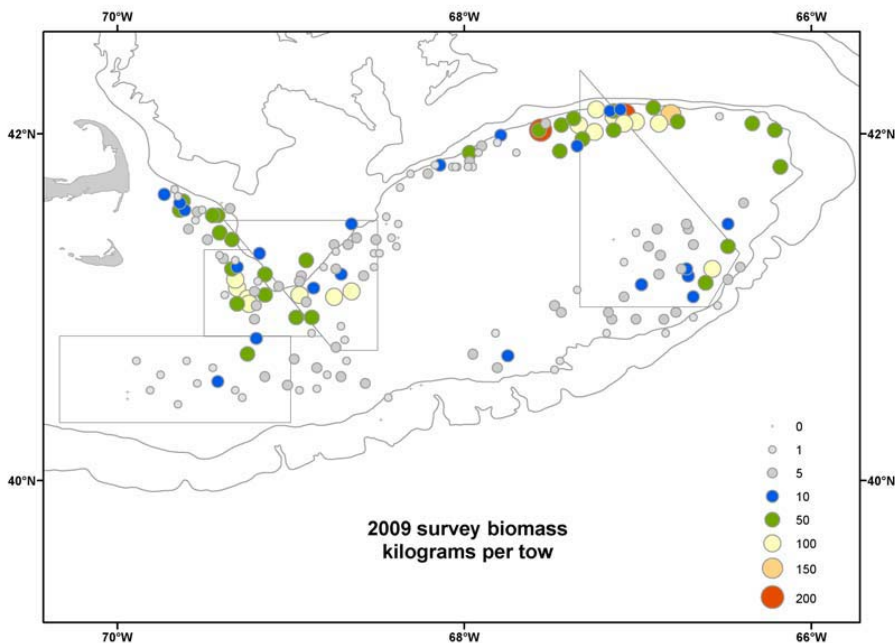

Figure 7. Biomass chart for the Mid-Atlantic from the 2009 NMFS sea scallop survey

The scallop abundance and biomass on Georges Bank increased from 1995-2000 after implementation of closures and effort reduction measures. Biomass and abundance then declined from 2006-2008 because of poor recruitment and the reopening of portions of groundfish closed areas. The 2009 survey estimates an increase in biomass on Georges Bank. The highest concentrations of biomass on Georges Bank are currently on the Northern Edge,

within Closed Area I, and within the Nantucket Lightship closed area (Figure 8). A large portion of the biomass is in the South Channel area proposed for closure in this framework.

Figure 8. Biomass chart for Georges Bank from the 2009 NMFS sea scallop survey

The sea scallop resource has experienced a change in distribution in recent years. Figure 9 displays scallop biomass in a pie chart by area based on 2007 (left) and 2009 (right) survey data. The ETA (shown in royal blue) contained 32% of the overall biomass in 2007, and now contains 15%. Overall biomass is less concentrated than in past years, with increases elsewhere in the Mid Atlantic and in open areas in both regions. Figure 10 illustrates the reduction in ET biomass from 2006-2009. The largest tows of scallops all but disappeared in 2009, and there has been a reduction in the medium-sized tows as well. This is not surprising since effort levels have been high in this area for several years. However, biomass is lower in ET than previous projections estimated, even with high fishing pressure.

Table 17 gives the estimated total and exploitable biomass by area for 2010 based on projections. ABC is calculated based on the assumption that F is spatially uniform, but this is not the case in the scallop fishery. About 40% of the exploitable biomass is currently in rotational closed areas that will not be open in 2010, and therefore the F in areas remaining open will be higher than the spatial average over all areas. Amendment 15 will adjust the overfishing definition to be more compatible with area rotation, essentially averaging F over time and not space and setting area-specific thresholds based on past F and area rotation policies.

Table 17 - Estimate of total and exploitable scallop biomass by area for 2010

| | | | | | | | | | | | |
|--------------------------|-----------|--|---------------------------------------|---|---------------------------------------|--|---|---------------------------------------|-------------------------------------|---------------------------|---------------------------|
| Total Biomass (mt) | MA | Hudson Canyon | Virginia Beach | Elephant Trunk | Delmarva | New York Bight | Long Island | | | | |
| | | 18572 | 558 | 19325 | 20042 | 6792 | 11955 | | | | |
| | GB | Closed Area I - No Access | Closed Area I - Access | Closed Area II - No Access | Closed Area 2 - Access | Nantucket Lightship - No Access | Nantucket Lightship - Access | South Channel - Closed | South Channel - Open | Northeast Peak | Southeast Peak |
| | | 13580 | 2782 | 12969 | 12729 | 457 | 8118 | 10308 | 8938 | 2089 | 4173 |

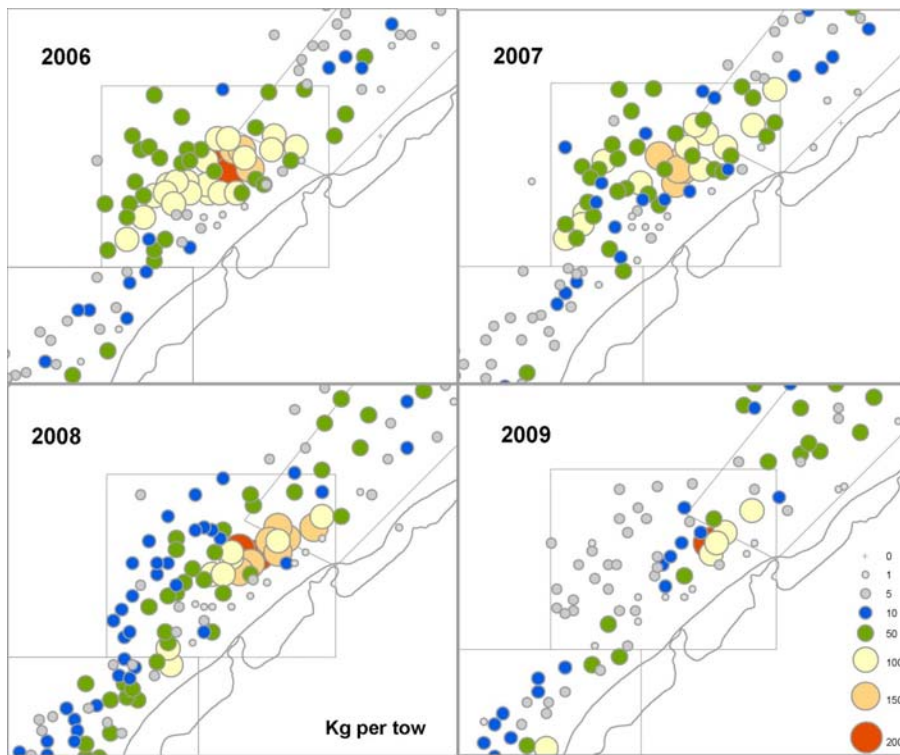

Figure 10 - Reduction of ET biomass from 2006-2009 surveys

4.1.2.2 Recruitment

Strong recruitment was observed on Georges Bank in 2009, especially in the South Channel, on the Northern Edge, and in the Southeast part of CA II (Figure 11). Several very large tows of recruits were observed in the South Channel area proposed for closure in Framework 21.

Poor recruitment was observed in the Mid-Atlantic, except for some promising tows in the southern portion of the Delmarva area (Figure 12). Looking at trends for both portions of the scallop stock (Figure 13), there is a strong recruitment pattern in place currently for Georges Bank, with three high years in a row. The drop-off in the Mid-Atlantic is somewhat drastic, but not inconsistent with the variable pattern shown by the stock of several strong years followed by a drop-off and recovery.

Figure 11 - Recruitment on Georges Bank from 2009 NMFS scallop survey

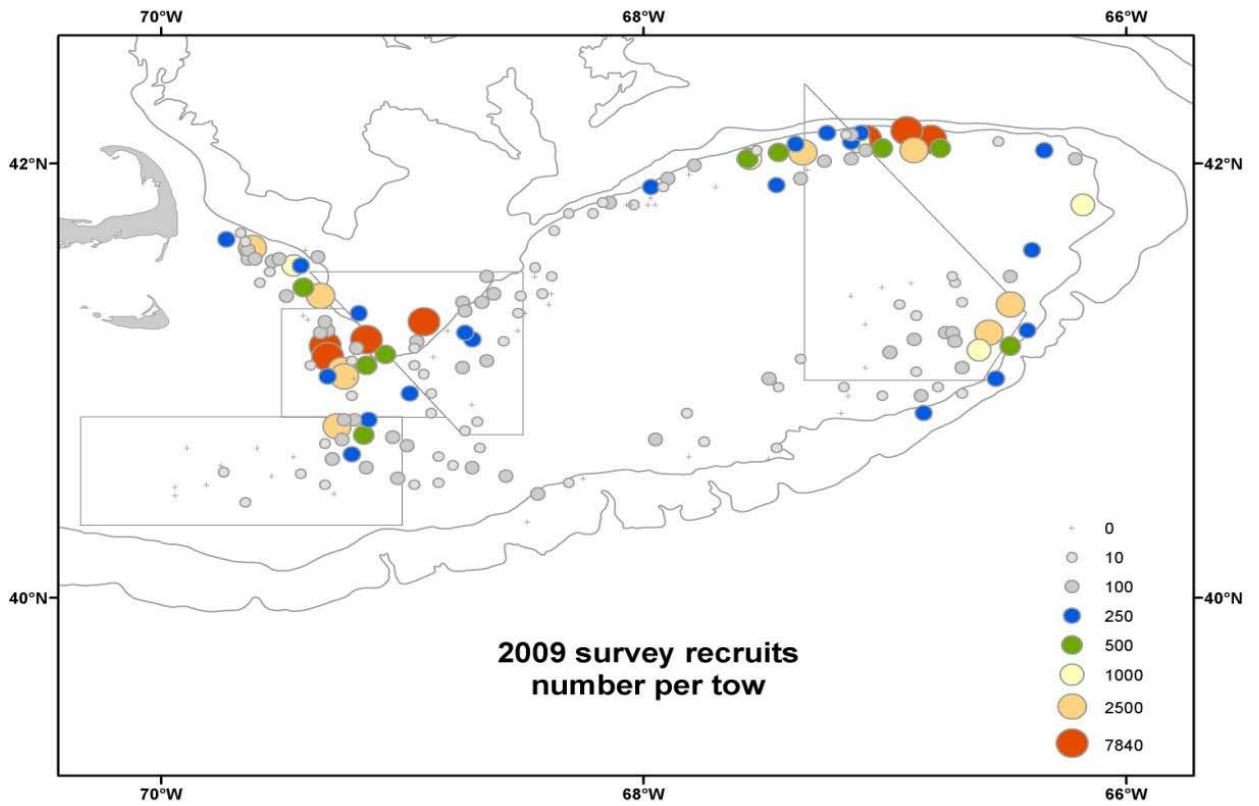

Figure 12 - Recruitment in the Mid-Atlantic from the 2009 NMFS scallop survey

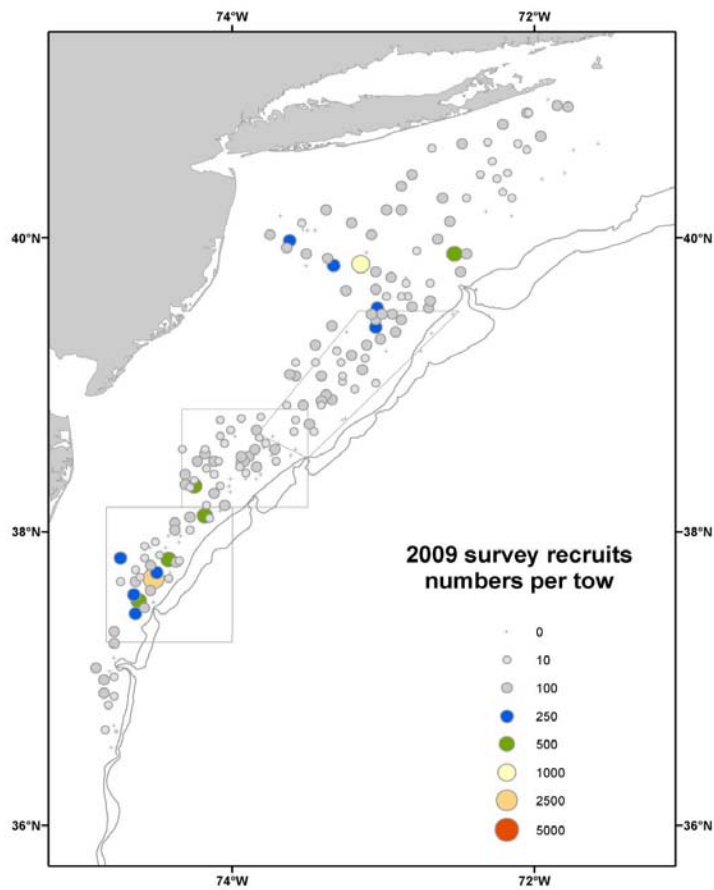

Figure 13 - Recruitment patterns on Georges Bank (left) and in the Mid-Atlantic (right)

4.1.2.3 Fishing mortality

Four types of mortality are accounted for in the assessment: natural, discard, incidental, and fishing mortality. The natural mortality rate was assumed to be $M = 0.1y^{-1}$ for scallops with shell heights greater than 40 mm based on estimates of M based on ratios of clappers (still-intact shells from dead scallops) versus live scallops (Merrill and Posgay, 1964). Natural mortality may increase at larger shell heights (MacDonald and Thompson, 1986; NEFSC, 2007).

Discard mortality occurs when scallops are discarded on directed scallop trips because they are too small to be economically profitable to shuck or due to high-grading during access area trips to previously-closed areas. Discard ratios were low during the 2005-2006 season, probably because of new gear regulations (4" rings). Scallops can also be caught as bycatch and either landed or discarded in other fisheries. Trawl fisheries with the largest scallop bycatch for 1994-2006 were longfin squid, summer flounder, yellowtail, haddock, cod, and monkfish. From 1994-2006, an estimated mean of 94 mt meats of scallops were landed and 68 mt meats were discarded per year as bycatch in other fisheries. Total discard mortality is estimated at 20% (NEFSC, 2007).

Incidental mortality is non-landed mortality associated with scallop dredges that likely kill and injure some scallops that are contacted but not caught by crushing their shells. Caddy (1973) estimated 15-20% of the scallops remaining in the dredge track were killed, while Murawski and Serchuk (1989) estimated that <5% were killed. The difference is possibly due to differences in substrate; the first study was done in a hard bottom area, while the subsequent study was in an area with a sandy bottom. Incidental mortality for this assessment was assumed to be $0.15 F_L$ in Georges Bank and $0.04 F_L$ in the Mid-Atlantic (NEFSC, 2007).

Fishing mortality, the mortality associated with scallop landings on directed scallop trips, was calculated separately for Georges Bank and the Mid-Atlantic because of differences in growth rates. For comparison to biological reference points used to identify overfishing and overfished stock conditions, a whole-stock estimate of fishing mortality is also necessary. Fishing mortality peaked for both stocks in the early 1990s, but has decreased substantially since then, as tighter regulations were put into place including area closures and biomass levels recovered. In general, F has remained stable on Georges Bank since 1995, and the Mid-Atlantic has shown larger fluctuations and an overall higher F (Figure 14).

Combined fishing mortality has steadily declined since the early 1990s (Figure 15). The most recent stock status update was prepared through FY2006 as part of SARC 45 (NEFSC, 2007). SARC 45 estimated that overall fishing mortality in 2006 was 0.23, the lowest overall F in the 1982-2006 time series. That estimate for fishing mortality still applies for the fishery until the next assessment, scheduled for June 2010. However, the current CASA F estimate for 2008 is 0.28 and 0.30 for 2009. An overall fishing mortality of 0.30 is above the current threshold for overfishing (0.29), which was approved in the last stock assessment. These values are preliminary and will be reviewed and finalized in the stock assessment scheduled for June 2010.

Figure 14 - Fishing mortality (red line) and biomass estimates (y^{-1} , gray bars) from the CASA model for scallops on Georges Bank (right) and in the Mid-Atlantic (left)

Figure 15 - Fishing mortality (red line) and biomass estimates (y^{-1} , gray bars) from the CASA model for sea scallop resource overall (Georges Bank and Mid-Atlantic combined)

4.2 PHYSICAL ENVIRONMENT AND EFH

The Northeast U.S. Shelf Ecosystem includes the area from the Gulf of Maine south to Cape Hatteras, extending from the coast seaward to the edge of the continental shelf, including the slope sea offshore to the Gulf Stream to a depth of 2,000 m (Figure 16, Sherman et al. 1996). Four distinct sub-regions are identified: the Gulf of Maine, Georges Bank, the Mid-Atlantic Bight, and the continental slope. The physical oceanography and biota of these regions were described in the Scallop Amendment 11. Much of this information was extracted from Stevenson et al. (2004), and the reader is referred to this document and sources referenced therein for additional information. These sources included, among others: Abernathy 1989; Backus 1987; Beardsley et al. 1996; Brooks 1996; Cook 1988; Mountain 1994; Reid and Steimle 1988; Schmitz et al. 1987; Sherman et al. 1996; Stumpf and Biggs 1988; Townsend 1992; and Wiebe et al. 1987. Primarily relevant to the scallop fishery are Georges Bank and the Mid-Atlantic Bight, although some fishing also occurs in the Gulf of Maine. Although part of the Northeast Shelf Ecosystem, the continental slope is not affected by the Atlantic sea scallop fishery and is therefore not discussed.

Figure 16 – Northeast U.S Shelf Ecosystem.

The Atlantic sea scallop fishery is prosecuted in concentrated areas in and around Georges Bank and off the Mid-Atlantic coast, in waters extending from the near-coast out to the continental shelf (Figure 17). This area, which could potentially be affected by the proposed action, has been identified as EFH for various species (Table 18). Most of the current EFH designations

were developed in NEFMC Essential Fish Habitat Omnibus Amendment 1 (1998). For additional information, the reader is referred to the Omnibus Amendment and the other FMP documents listed in Table 19. In addition, summaries of EFH descriptions and maps for Northeast region species can be accessed at <http://www.nero.noaa.gov/hcd/webintro.html>.

Two FMP amendments in development will update current EFH designations in the near term. Amendment 16 to the Northeast Multispecies FMP will add Atlantic wolffish to the management unit and includes an EFH designation for the species. Designations for all other species are being reviewed and updated in NEFMC Essential Fish Habitat Omnibus Amendment 2. The sea scallop fishery overlaps spatially with designated EFH for both NEFMC and MAFMC-managed species.

Figure 17 – Geographic extent of the Atlantic sea scallop fishery

Table 18 –Designated EFH that overlaps with the Atlantic sea scallop fishery, listed by managed species and lifestage.

| <i>Species</i> | <i>Life stage</i> | <i>Geographic area</i> | <i>Depth (m)</i> | <i>EFH Description</i> |
|----------------------|-------------------|---|------------------|---|
| American plaice | juvenile | GOM and estuaries from Passamaquoddy Bay to Saco Bay, ME and from Mass. Bay to Cape Cod Bay, MA | 45-150 | Bottom habitats with fine grained sediments or a substrate of sand or gravel |
| American plaice | adult | GOM and estuaries from Passamaquoddy Bay to Saco Bay, ME and from Mass. Bay to Cape Cod Bay, MA | 45-175 | Bottom habitats with fine grained sediments or a substrate of sand or gravel |
| Atlantic cod | juvenile | GOM, GB, eastern portion of continental shelf off southern NE and following estuaries: Passamaquoddy Bay to Saco Bay; Mass. Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay | 25-75 | Bottom habitats with a substrate of cobble or gravel |
| Atlantic cod | adult | GOM, GB, eastern portion of continental shelf off southern NE and following estuaries: Passamaquoddy Bay to Saco Bay; Mass. Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay | 10-150 | Bottom habitats with a substrate of rocks, pebbles, or gravel |
| Atlantic halibut | juvenile | GOM, GB | 20-60 | Bottom habitats with a substrate of sand, gravel, or clay |
| Atlantic halibut | adult | GOM, Georges Bank | 100-700 | Bottom habitats with a substrate of sand, gravel, or clay |
| Atlantic herring | eggs | GOM, GB and following estuaries: Englishman/Machias Bay, Casco Bay, and Cape Cod Bay | 20-80 | Bottom habitats attached to gravel, sand, cobble or shell fragments, also on macrophytes |
| Atlantic herring | juvenile | GOM, GB and following estuaries: Englishman/Machias Bay, Casco Bay, and Cape Cod Bay | 15-135 | Pelagic waters and bottom habitats |
| Atlantic herring | adult | Pelagic waters and bottom habitats | 20-130 | Pelagic waters and bottom habitats |
| Atlantic sea scallop | eggs | GOM, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Great Bay, Mass Bay, and Cape Cod Bay | n/a | Bottom habitats |
| Atlantic sea scallop | larvae | GOM, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Great Bay, Mass Bay, and Cape Cod Bay | n/a | Pelagic waters and bottom habitats with a substrate of gravelly sand, shell fragments, pebbles, or on various red algae, hydroids, amphipod tubes, and bryozoans. |
| Atlantic sea scallop | juvenile | GOM, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Great Bay, Mass Bay, and Cape Cod Bay | 18-110 | Bottom habitats with a substrate of cobble, shells, and silt |

| <i>Species</i> | <i>Life stage</i> | <i>Geographic area</i> | <i>Depth (m)</i> | <i>EFH Description</i> |
|----------------------|-------------------|---|-----------------------------|--|
| Atlantic sea scallop | adult | GOM, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Great Bay, Mass Bay, and Cape Cod Bay | 18-110 | Bottom habitats with a substrate of cobble, shells, coarse/gravelly sand, and sand |
| Atlantic surfclam | juvenile | Eastern edge of GB and the GOM throughout Atlantic EEZ | 0-60, low density beyond 38 | Throughout substrate to a depth of 3 ft within federal waters, burrow in medium to coarse sand and gravel substrates, also found in silty to fine sand, but not in mud |
| Atlantic surfclam | adult | Eastern edge of GB and the GOM throughout Atlantic EEZ | 0-60, low density beyond 38 | Throughout substrate to a depth of 3 ft within federal waters |
| Barndoor skate | juvenile | Eastern GOM, GB, Southern NE, Mid-Atlantic Bight to Hudson Canyon | 10-750, mostly <150 | Bottom habitats with mud, gravel, and sand substrates |
| Barndoor skate | adult | Eastern GOM, GB, Southern NE, Mid-Atlantic Bight to Hudson Canyon | 10-750, mostly <150 | Bottom habitats with mud, gravel, and sand substrates |
| Black sea bass | juvenile | Demersal waters over continental shelf from GOM to Cape Hatteras, NC, also includes estuaries from Buzzards Bay to Long Island Sound; Gardiners Bay, Barnegat Bay to Chesapeake Bay; Tangier/ Pocomoke Sound, and James River | 1-38 | Rough bottom, shellfish and eelgrass beds, manmade structures in sand-shell areas, offshore clam beds, and shell patches may be used during wintering |
| Black sea bass | adult | Demersal waters over continental shelf from GOM to Cape Hatteras, NC, also includes estuaries: Buzzards Bay, Narragansett Bay, Gardiners Bay, Great South Bay, Barnegat Bay to Chesapeake Bay; Tangier/ Pocomoke Sound, and James River | 20-50 | Structured habitats (natural and manmade), sand and shell substrates preferred |
| Clearnose skate | juvenile | GOM, along shelf to Cape Hatteras, NC; includes the estuaries from Hudson River/Raritan Bay south to the Chesapeake Bay mainstem | 0-500, mostly <111 | Bottom habitats with substrate of soft bottom along continental shelf and rocky or gravelly bottom |
| Clearnose skate | adult | GOM, along shelf to Cape Hatteras, NC; includes the estuaries from Hudson River/Raritan Bay south to the Chesapeake Bay mainstem | 0-500, mostly <111 | Bottom habitats with substrate of soft bottom along continental shelf and rocky or gravelly bottom |
| Haddock | juvenile | GB, GOM, middle Atlantic south to Delaware Bay | 35-100 | Bottom habitats with a substrate of pebble and gravel |
| Haddock | adult | GB and eastern side of Nantucket Shoals, throughout GOM, *additional area of Nantucket Shoals, and Great South Channel | 40-150 | Bottom habitats with a substrate of broken ground, pebbles, smooth hard sand, and smooth areas between rocky patches |
| Little skate | juvenile | GB through Mid-Atlantic Bight to Cape Hatteras, NC; includes the estuaries from Buzzards Bay south to the Chesapeake Bay mainstem | 0-137, mostly 73-91 | Bottom habitats with sandy or gravelly substrate or mud |

| <i>Species</i> | <i>Life stage</i> | <i>Geographic area</i> | <i>Depth (m)</i> | <i>EFH Description</i> |
|----------------|-------------------|--|---------------------|---|
| Little skate | adult | GB through Mid-Atlantic Bight to Cape Hatteras, NC; includes the estuaries from Buzzards Bay south to the Chesapeake Bay mainstem | 0-137, mostly 73-91 | Bottom habitats with sandy or gravelly substrate or mud |
| Longfin squid | eggs | GB, southern NE and middle Atlantic to mouth of Chesapeake Bay | <50 | Egg masses attached to rocks, boulders and vegetation on sand or mud bottom |
| Monkfish | juvenile | Outer continental shelf in the middle Atlantic, mid-shelf off southern NE, all areas of GOM | 25-200 | Bottom habitats with substrates of a sandshell mix, algae covered rocks, hard sand, pebbly gravel, or mud |
| Monkfish | adult | Outer continental shelf in the middle Atlantic, mid-shelf off southern NE, outer perimeter of GB, all areas of Gulf of Maine | 25-200 | Bottom habitats with substrates of a sandshell mix, algae covered rocks, hard sand, pebbly gravel, or mud |
| Ocean pout | eggs | GOM, GB, southern NE, and middle Atlantic south to Delaware Bay, and the following estuaries: Passamaquoddy Bay to Saco Bay, Massachusetts and Cape Cod Bay | <50 | Bottom habitats, generally in hard bottom sheltered nests, holes, or crevices |
| Ocean pout | larvae | GOM, GB, southern NE, and middle Atlantic south to Delaware Bay, and the following estuaries: Passamaquoddy Bay to Saco Bay, Massachusetts and Cape Cod Bay | <50 | Bottom habitats in close proximity to hard bottom nesting areas |
| Ocean pout | juvenile | GOM, GB, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Mass. Bay, and Cape Cod Bay | <80 | Bottom habitats in close proximity to hard bottom nesting areas |
| Ocean pout | adult | GOM, GB, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Mass. Bay, Boston Harbor, and Cape Cod Bay | <110 | Bottom habitats, often smooth bottom near rocks or algae |
| Ocean quahog | juvenile | Eastern edge of GB and GOM throughout the Atlantic EEZ | 8-245 | Throughout substrate to a depth of 3 ft within federal waters, occurs progressively further offshore between Cape Cod and Cape Hatteras |
| Ocean quahog | adult | Eastern edge of GB and GOM throughout the Atlantic EEZ | 8-245 | Throughout substrate to a depth of 3 ft within federal waters, occurs progressively further offshore between Cape Cod and Cape Hatteras |
| Pollock | juvenile | GOM, GB, and the following estuaries: Passamaquoddy Bay to Saco Bay; Great Bay to Waquoit Bay; Long Island Sound, Great South Bay | 0 – 250 | Bottom habitats with aquatic vegetation or a substrate of sand, mud, or rocks |
| Pollock | adult | GOM, GB, southern NE, and middle Atlantic south to New Jersey and the following estuaries: Passamaquoddy Bay, Damariscotta R., Mass Bay, Cape Cod Bay, Long Island Sound | 15 – 365 | Hard bottom habitats including artificial reefs |

| <i>Species</i> | <i>Life stage</i> | <i>Geographic area</i> | <i>Depth (m)</i> | <i>EFH Description</i> |
|----------------|-------------------|---|------------------------|---|
| Red hake | juvenile | GOM, GB, continental shelf off southern NE, and middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Saco Bay; Great Bay, Mass. Bay to Cape Cod Bay; Buzzards Bay to Conn. R.; Hudson R./ Raritan Bay, and Chesapeake Bay | <100 | Bottom habitats with substrate of shell fragments, including areas with an abundance of live scallops |
| Red hake | adult | GOM, GB, continental shelf off southern NE, and middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Saco Bay; Great Bay, Mass. Bay to Cape Cod Bay; Buzzards Bay to Conn. R.; Hudson R./ Raritan Bay, Delaware Bay, and Chesapeake Bay | 10-130 | Bottom habitats in depressions with a substrate of sand and mud |
| Redfish | juvenile | GOM, southern edge of GB | 25-400 | Bottom habitats with a substrate of silt, mud, or hard bottom |
| Redfish | adult | GOM, southern edge of GB | 50-350 | Bottom habitats with a substrate of silt, mud, or hard bottom |
| Rosette skate | juvenile | Nantucket shoals and southern edge of GB to Cape Hatteras, NC | 33-530, mostly 74-274 | Bottom habitats with soft substrate, including sand/mud bottoms, mud with echinoid and ophiuroid fragments, and shell and pteropod ooze |
| Rosette skate | adult | Nantucket shoals and southern edge of GB to Cape Hatteras, NC | 33-530, mostly 74-274 | Bottom habitats with soft substrate, including sand/mud bottoms, mud with echinoid and ophiuroid fragments, and shell and pteropod ooze |
| Scup | juvenile | Continental shelf from GOM to Cape Hatteras, NC includes the following estuaries: Mass. Bay, Cape Cod Bay to Long Island Sound; Gardiners Bay to Delaware Inland Bays; and Chesapeake Bay | 0-38 | Demersal waters north of Cape Hatteras and inshore on various sands, mud, mussel, and eelgrass bed type substrates |
| Scup | adult | Continental shelf from GOM to Cape Hatteras, NC includes the following estuaries: Cape Cod Bay to Long Island Sound; Gardiners Bay to Hudson R./ Raritan Bay; Delaware Bay and Inland Bays; and Chesapeake Bay | 2-185 | Demersal waters north of Cape Hatteras and inshore estuaries (various substrate types) |
| Silver hake | juvenile | GOM, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Casco Bay, Mass. Bay to Cape Cod Bay | 20-270 | Bottom habitats of all substrate types |
| Silver hake | adult | GOM, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Casco Bay, Mass. Bay to Cape Cod Bay | 30-325 | Bottom habitats of all substrate types |
| Smooth skate | juvenile | Offshore banks of GOM | 31-874, mostly 110-457 | Bottom habitats with a substrate of soft mud (silt and clay), sand, broken shells, gravel and pebbles |

| <i>Species</i> | <i>Life stage</i> | <i>Geographic area</i> | <i>Depth (m)</i> | <i>EFH Description</i> |
|---------------------|-------------------|--|---------------------------|---|
| Smooth skate | adult | Offshore banks of GOM | 31–874, mostly 110–457 | Bottom habitats with a substrate of soft mud (silt and clay), sand, broken shells, gravel and pebbles |
| Summer flounder | juvenile | Over continental shelf from GOM to Cape Hatteras, NC; south of Cape Hatteras to Florida; also includes estuaries from Waquoit Bay to James R.; Albemarle Sound to Indian R. | 0.5–5 in estuary | Demersal waters, on muddy substrate but prefer mostly sand; found in the lower estuaries in flats, channels, salt marsh creeks, and eelgrass beds |
| Summer flounder | adult | Over continental shelf from GOM to Cape Hatteras, NC; south of Cape Hatteras to Florida; also includes estuaries from Buzzards Bay, Narragansett Bay, Conn. R. to James R.; Albemarle Sound to Broad R.; St. Johns R., and Indian R. | 0–25 | Demersal waters and estuaries |
| Thorny skate | juvenile | GOM and Georges Bank | 18–2000, mostly 111 - 366 | Bottom habitats with a substrate of sand, gravel, broken shell, pebbles, and soft mud |
| Thorny skate | adult | GOM and GB | 18–2000, mostly 111 - 366 | Bottom habitats with a substrate of sand, gravel, broken shell, pebbles, and soft mud |
| Tilefish | juvenile | US/Canadian boundary to VA/NC boundary (shelf break, submarine canyon walls, and flanks: GB to Cape Hatteras) | 76–365 | Rough bottom, small burrows, and sheltered areas; substrate rocky, stiff clay, human debris |
| Tilefish | adult | US/Canadian boundary to VA/NC boundary (shelf break, submarine canyon walls, and flanks: GB to Cape Hatteras) | 76–365 | Rough bottom, small burrows, and sheltered areas; substrate rocky, stiff clay, human debris |
| White hake | juvenile | GOM, southern edge of GB, southern NE to middle Atlantic and the following estuaries: Passamaquoddy Bay to Great Bay; Mass. Bay to Cape Cod Bay | 5–225 | Pelagic stage - pelagic waters; demersal stage - bottom habitat with seagrass beds or substrate of mud or fine grained sand |
| White hake | adult | GOM, southern edge of GB, southern NE to middle Atlantic and the following estuaries: Passamaquoddy Bay to Great Bay; Mass. Bay to Cape Cod Bay | 5–325 | Bottom habitats with substrate of mud or fine grained sand |
| Windowpane flounder | juvenile | GOM, GB, southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Great Bay; Mass. Bay to Chesapeake Bay | 1–100 | Bottom habitats with substrate of mud or fine grained sand |
| Windowpane flounder | adult | GOM, GB, southern NE, middle Atlantic south to Virginia - NC border and the following estuaries: Passamaquoddy Bay to Great Bay; Mass. Bay to Chesapeake Bay | 1–75 | Bottom habitats with substrate of mud or fine grained sand |
| Winter flounder | eggs | GB, inshore areas of GOM, southern NE, and middle Atlantic south to Delaware Bay | <5 | Bottom habitats with a substrate of sand, muddy sand, mud, and gravel |

| <i>Species</i> | <i>Life stage</i> | <i>Geographic area</i> | <i>Depth (m)</i> | <i>EFH Description</i> |
|---------------------|-------------------|---|-------------------------|---|
| Winter flounder | juvenile | GB, inshore areas of GOM, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Chincoteague Bay | 0.1–10 (1 - 50, age 1+) | Bottom habitats with a substrate of mud or fine grained sand |
| Winter flounder | adult | GB, inshore areas of GOM, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Chincoteague Bay | 1-100 | Bottom habitats including estuaries with substrates of mud, sand, grave |
| Winter skate | juvenile | Cape Cod Bay, GB, southern NE shelf through Mid-Atlantic Bight to North Carolina; includes the estuaries from Buzzards Bay south to the Chesapeake Bay mainstem | 0-371, mostly < 111 | Bottom habitats with substrate of sand and gravel or mud |
| Winter skate | adult | Cape Cod Bay, GB southern NE shelf through Mid-Atlantic Bight to North Carolina; includes the estuaries from Buzzards Bay south to the Chesapeake Bay mainstem | 0-371, mostly < 111 | Bottom habitats with substrate of sand and gravel or mud |
| Witch flounder | juvenile | GOM, outer continental shelf from GB south to Cape Hatteras | 50-450 to 1500 | Bottom habitats with fine grained substrate |
| Witch flounder | adult | GOM, outer continental shelf from GB south to Chesapeake Bay | 25-300 | Bottom habitats with fine grained substrate |
| Yellowtail flounder | juvenile | GB, GOM, southern NE continental shelf south to Delaware Bay and the following estuaries: Sheepscot R., Casco Bay, Mass. Bay to Cape Cod Bay | 20-50 | Bottom habitats with substrate of sand or sand and mud |
| Yellowtail flounder | adult | GB, GOM, southern NE continental shelf south to Delaware Bay and the following estuaries: Sheepscot R., Casco Bay, Mass. Bay to Cape Cod Bay | 20-50 | Bottom habitats with substrate of sand or sand and mud |

4.3 PROTECTED RESOURCES

The following protected species are found in the environment in which the sea scallop fishery is prosecuted. A number of them are listed under the Endangered Species Act of 1973 (ESA) as endangered or threatened, while others are identified as protected under the Marine Mammal Protection Act of 1972 (MMPA). Two right whale critical habitat designations also are located within the action area. An update and summary is provided here to facilitate consideration of the species most likely to interact with the scallop fishery relative to the proposed action.

A more complete description of protected resources inhabiting the action area is provided in Amendment 10 to the Sea Scallop FMP (See Amendment 10 to the Atlantic Sea Scallop Fishery Management Plan, Section 7.2.7, Protected Species, for a complete list. An electronic version of the document is available at <http://www.nefmc.org/scallops/index.html>).

Cetaceans

Status

| | |
|--|------------|
| Northern right whale (<i>Eubalaena glacialis</i>) | Endangered |
| Humpback whale (<i>Megaptera novaeangliae</i>) | Endangered |
| Fin whale (<i>Balaenoptera physalus</i>) | Endangered |
| Blue whale (<i>Balaenoptera musculus</i>) | Endangered |
| Sei whale (<i>Balaenoptera borealis</i>) | Endangered |
| Sperm whale (<i>Physeter macrocephalus</i>) | Endangered |
| Minke whale (<i>Balaenoptera acutorostrata</i>) | Protected |
| Beaked whale (<i>Ziphius</i> and <i>Mesoplodon spp.</i>) | Protected |
| Pilot whale (<i>Globicephala spp.</i>) | Protected |
| Spotted and striped dolphin (<i>Stenella spp.</i>) | Protected |
| Risso's dolphin (<i>Grampus griseus</i>) | Protected |
| White-sided dolphin (<i>Lagenorhynchus acutus</i>) | Protected |
| Common dolphin (<i>Delphinus delphis</i>) | Protected |
| Bottlenose dolphin: coastal stocks (<i>Tursiops truncatus</i>) | Protected |
| Harbor porpoise (<i>Phocoena phocoena</i>) | Protected |

Pinnipeds

| | |
|---|-----------|
| Harbor seal (<i>Phoca vitulina</i>) | Protected |
| Gray seal (<i>Halichoerus grypus</i>) | Protected |
| Harp seal (<i>Phoca groenlandica</i>) | Protected |
| Hooded seal (<i>Crystophora cristata</i>) | Protected |

Sea Turtles

| | |
|---|-------------|
| Leatherback sea turtle (<i>Dermochelys coriacea</i>) | Endangered |
| Kemp's ridley sea turtle (<i>Lepidochelys kempii</i>) | Endangered |
| Green sea turtle (<i>Chelonia mydas</i>) | Endangered* |
| Loggerhead sea turtle (<i>Caretta caretta</i>) | Threatened |

* Green turtles in U.S. waters are listed as threatened except for the Florida breeding population which is listed as endangered. Due to the inability to distinguish between these populations away from the nesting beach, green turtles are considered endangered wherever they occur in U.S. waters.

Fish

| | |
|--|------------|
| Shortnose sturgeon (<i>Acipenser brevirostrum</i>) | Endangered |
| Atlantic salmon (<i>Salmo salar</i>) | Endangered |

4.3.1 Threatened and Endangered Species Not Likely to be Affected by the Alternatives Under Consideration

According to the most recent Biological Opinion (Opinion) provided by NMFS dated 3/14/08 (and amended February 5, 2009), the agency has previously determined that species not likely to be affected by the Scallop Fishery Management Plan or by the operation of the fishery include the shortnose sturgeon, the Gulf of Maine distinct population segment of Atlantic salmon, hawksbill sea turtles, and the following whales: North Atlantic right, humpback, fin, sei, blue, and sperm whales, all of which are listed as endangered species under the ESA. NMFS also concluded that the continued authorization of the sea scallop fishery would not have any adverse impacts on cetacean prey, and that it would not affect the oceanographic conditions that are conducive for calving and nursing of large cetaceans.

Large Cetaceans (Baleen Whales and Sperm Whale)

The western North Atlantic baleen whale species (North Atlantic right, humpback, fin, sei, and minke) follow a general annual pattern of migration from high latitude summer foraging grounds, including the Gulf and Maine and Georges Bank, and low latitude winter calving grounds (Perry et al. 1999; Kenney 2002). However, this is an oversimplification of species movements, and the complete winter distribution of most species is unclear (Perry et al. 1999; Waring et al. 2006). Studies of some of the large baleen whales (right, humpback, and fin) have demonstrated the presence of each species in higher latitude waters even in the winter (Swingle et al. 1993; Wiley et al. 1995; Perry et al. 1999; Brown et al. 2002).

In comparison to the baleen whales, sperm whale distribution occurs more on the continental shelf edge, over the continental slope, and into mid-ocean regions (Waring et al. 2006). However, sperm whale distribution in U.S. EEZ waters also occurs in a distinct seasonal cycle (Waring et al. 2006). Typically, sperm whale distribution is concentrated east-northeast of Cape Hatteras in winter and shifts northward in spring when whales are found throughout the Mid-Atlantic Bight (Waring et al. 2006). Distribution extends further northward to areas north of Georges Bank and the Northeast Channel region in summer and then south of New England in fall, back to the Mid-Atlantic Bight (Waring et al. 1999).

The most recent Marine Mammal Stock Assessment (SAR) (Waring et al. 2009) reviewed the current population trend for each of these cetacean species within U.S. Exclusive Economic Zone (EEZ) waters, as well as providing information on the estimated annual human-caused mortality and serious injury, and a description of the commercial fisheries that interact with each stock in the U.S. Atlantic. Information from the SAR is summarized below.

For North Atlantic right whales, the available information from the most recent stock assessment suggests that the population increased at a rate of 1.8 percent per year from 1990-2003, and the total number of North Atlantic right whales is estimated to be at least 323 animals in 2003 (Waring et al. 2009). The minimum rate of annual human-caused mortality and serious injury to

right whales averaged 3.8 per year during 2002 to 2006 (Waring et al. 2009), with 1.4 of these resulting from fishery interactions. Recent mortalities included six female right whales, including three that were pregnant at the time of death (Waring et al. 2009).

Based on the stock assessment data available, the minimum population estimates for other western north Atlantic whale stocks are 2,269 fin whales, 207 sei whales, 4,804 sperm whales, and 3,312 minke whales (Waring et al. 2009). No recent estimates are available for blue whale abundance. Insufficient data exist to determine trends for any other large whale species.

For the North Atlantic population of humpback whales, the most recent stock assessment resulted in a population estimate of 11,570, although this number is considered to be negatively biased (Waring, et. al, 2009). Information from the stock assessment indicates an upward trend in abundance for the Gulf of Maine population, but is inconclusive about the North Atlantic population as a whole. Based on data available for selected areas and time periods, the minimum population estimates for other western north Atlantic whale stocks are 2,269 fin whales, 207 sei whales, 4,804 sperm whales, and 3,312 minke whales (Waring et al. 2009). No recent estimates are available for blue whale abundance. Insufficient data exist to determine trends for any other large whale species.

The Atlantic Large Whale Take Reduction Plan (ALWTRP) was recently revised with publication of a new final rule (72 FR 57104, October 5, 2007) that is intended to continue to address entanglement of large whales (right, humpback, fin, and minke) in commercial fishing gear and to reduce the risk of death and serious injury from entanglements that do occur.

Small Cetaceans (Dolphins, Harbor Porpoise and Pilot Whale)

Numerous small cetacean species (dolphins, pilot whales, harbor porpoise) occur within the area from Cape Hatteras through the Gulf of Maine. Seasonal abundance and distribution of each species in Mid-Atlantic, Georges Bank, and/or Gulf of Maine waters varies with respect to life history characteristics. Some species primarily occupy continental shelf waters (e.g., white sided dolphins, harbor porpoise), while others are found primarily in continental shelf edge and slope waters (e.g., Risso's dolphin), and still others occupy all three habitats (e.g., common dolphin, spotted dolphins, striped dolphins). Information on the western North Atlantic stocks of each species is summarized in Waring *et al.* (2008).

Pinnipeds

Of the four species of seals expected to occur in the area, harbor seals have the most extensive distribution with sightings occurring as far south as 30° N (Katona *et al.* 1993). Grey seals are the second most common seal species in U.S. EEZ waters, occurring primarily in New England (Katona *et al.* 1993; Waring *et al.* 2006). Pupping colonies for both species are also present in New England, although the majority of pupping occurs in Canada. Harp and hooded seals are less commonly observed in U.S. EEZ waters. Both species form aggregations for pupping and breeding off of eastern Canada in the late winter/early spring, and then travel to more northern latitudes for molting and summer feeding (Waring *et al.* 2006). However, individuals of both species are also known to travel south into U.S. EEZ waters and sightings as well as strandings of each species have been recorded for both New England and Mid-Atlantic waters (Waring *et al.* 2006).

4.3.2 Threatened and Endangered Species Potentially Affected Adversely by the Alternatives Under Consideration

In the 2008 BiOp, NMFS determined that the action being considered in the Opinion may adversely affect the following ESA-listed sea turtle species: loggerhead, leatherback, Kemp's ridley, and green sea turtles.

4.3.2.1 Sea Turtle Ecology Background

Loggerhead, leatherback, Kemp's ridley, and green sea turtles occur seasonally in southern New England and Mid-Atlantic continental shelf waters north of Cape Hatteras. In general, turtles move up the coast from southern wintering areas as water temperatures warm in the spring (James *et al.* 2005; Morreale and Standora 2005; Braun-McNeill and Epperly 2004; Morreale and Standora 1998; Musick and Limpus 1997; Shoop and Kenney 1992; Keinath *et al.* 1987). The trend is reversed in the fall as water temperatures cool. By December, turtles have passed Cape Hatteras, returning to more southern waters for the winter (James *et al.* 2005; Morreale and Standora 2005; Braun-McNeill and Epperly 2004; Morreale and Standora 1998; Musick and Limpus 1997; Shoop and Kenney 1992; Keinath *et al.* 1987). Hard-shelled species are typically observed as far north as Cape Cod whereas the more cold-tolerant leatherbacks are observed in more northern Gulf of Maine waters in the summer and fall (Shoop and Kenney 1992; STSSN database <http://www.sefsc.noaa.gov/seaturtleSTSSN.jsp>).

In general, sea turtles are long-lived species and reach sexual maturity relatively late (NMFS SEFSC 2001; NMFS and USFWS 2007a; 2007b; 2007c; 2007d, 2008). Sea turtles are injured and killed by numerous human activities (NRC 1990; NMFS and USFWS 2007a; 2007b; 2007c; 2007d; NMFS and USFWS 2008, NMFS NERO 2008). Nest count data are a valuable source of information for each turtle species since the number of nests laid reflects the reproductive output of the nesting group each year. Based on the most recent information, a decline in the annual nest counts has been measured or suggested for four of five western Atlantic loggerhead recovery units (NMFS and USFWS 2008). Nest counts for Kemp's ridley sea turtles as well as leatherback and green sea turtles in the Atlantic demonstrate increased nesting by these species (NMFS and USFWS 2007b; 2007c; 2007d).

Loggerheads are found in temperate and subtropical waters and are the most common species of sea turtles in U.S. waters. The majority of nesting in US waters occurs on beaches of the southeastern U.S. (especially Florida). Waters as far north as 41-42° N (Figure 1) are used for foraging, with common occurrences of the species from Florida through Cape Cod, MA. While some long term in-water population studies have shown an increase in loggerhead abundance (Pamlico Sound, NC; St. Lucie Nuclear Power Plant, FL), other areas have shown no trend (Indian River Lagoon, FL; Florida Bay, FL) or declining abundance (New York inshore waters; Virginia Chesapeake Bay) (NMFS and USFWS 2008).

Leatherback sea turtles have a high tolerance to relatively low water temperatures, which allows them to be widely distributed throughout the world's oceans. Leatherbacks seem to be most vulnerable to entanglement in fishing gear, including bottom otter trawls.

Kemp's ridley sea turtles are one of the least abundant sea turtles. However, they are the second most abundant sea turtle in Virginia and Maryland state waters, farther inshore than the scallop

fishery takes place. They typically occur in the Gulf of Mexico and northern half of the Atlantic Ocean. Foraging areas along the Atlantic Coast include Pamlico Sound, Chesapeake Bay, Long Island Sound, Charleston Harbor, and Delaware Bay. The adults are found primarily in near-shore waters of 37m or less with sandy or muddy bottom.

Green sea turtles have a circumglobal distribution, ranging from the mid-Atlantic to Argentina and occurring seasonally in mid-Atlantic and New England waters. Of the 23 nesting groups assessed in the NMFS and USFWS (2007) report, 10 were considered increasing, 9 were considered stable, and 4 were considered decreasing. Fishery mortality accounts for a large proportion of annual anthropogenic mortality outside of the nesting beaches.

4.3.2.2 Impacts on Sea Turtles – 2008 Biological Opinion

On February 23, 2007, the NEFSC released NEFSC Reference Document 07-04 (Murray 2007). Based on observer data for the scallop trawl fishery for 2004 and 2005, Murray (2007) provided the first estimates of the average annual bycatch of loggerhead sea turtles in scallop trawl gear. NMFS NERO determined that the reference document presented new information regarding the capture of sea turtles in scallop trawl gear that reveals effects of the action that may affect listed sea turtles in a manner or to an extent not previously considered. Therefore, in accordance with the regulations at 50 CFR 402.16, formal consultation was reinitiated on April 3, 2007, to reconsider the effects of the Atlantic sea scallop fishery on ESA-listed sea turtles. Consultation was completed on March 14, 2008.

The 2008 Biological Opinion identified four endangered or threatened sea turtle species that may be adversely affected by the Scallop FMP and the fishery: loggerhead, leatherback, Kemp's ridley and green sea turtles, but concluded that the fishery was not likely to jeopardize their continued existence. Summary information is provided here that broadly describes the general distribution of sea turtles within the scallop action area, as well as the known interactions with sea scallop gear. Loggerheads are the most commonly observed taken species of sea turtle in the scallop fishery, thus most information herein pertains to loggerheads.

Additional background information on the relevant sea turtle species can be found in a number of published documents. These include sea turtle status reviews and biological reports (NMFS and USFWS 1995; Hirth 1997; USFWS 1997; Marine Turtle Expert Working Group (TEWG) 1998, 2000, & 2009; NMFS and USFWS 2007a, b, c, d; Murray 2007; Leatherback TEWG 2007; Haas et al. 2008; Murray 2008; Merrick and Haas 2008), and recovery plans for Endangered Species Act-listed sea turtles (NMFS 1991; NMFS and USFWS 1991a; NMFS and USFWS 1991b; NMFS and USFWS 1992; NMFS and USFWS 1998; USFWS and NMFS 1992; NMFS and NMFS 2005; NMFS and USFWS 2008).

The recently published Atlantic Loggerhead Sea Turtle Recovery Plan (NMFS and USFWS 2008) noted that out of five recovery units, one showed no trend in nesting numbers, while the other four showed declines. The highest priority threats to the species include bottom trawl, pelagic and demersal longline, and demersal large mesh gillnet fisheries; legal and illegal harvest; vessel strikes; beach armoring and erosion; marine debris ingestion; oil and light pollution; and predation by native and exotic species. The Atlantic sea scallop dredge fishery was not pinpointed, as a main source of mortality of loggerheads, but recovery actions are specified for the commercial scallop dredge fishery.

Results from a study done by Merrick and Haas (2008) suggest that mortalities of loggerhead sea turtles in the Atlantic sea scallop dredge and trawl fisheries are detectable, but have a relatively small effect on the trajectory of the adult female components of the western North Atlantic loggerhead sea turtle population over the next 100 years. The 1989-2005 population trends, with and without mortalities, were not significantly different and the probability of reaching the quasi-extinction threshold (250 adult females) under both scenarios was 0.01. Median times to extinction for both were greater than 200 years. This lack of impact occurred regardless of the use of values that generated the greatest consequence of the sea scallop fisheries takes of loggerheads. Comparing the effect of different background mortalities on population trajectories suggests that the relatively steep declining trend in population from 1996-2005 is being driven by some other larger source of mortality (Merrick and Haas 2008).

Estimated Sea Turtle Takes

The 2008 BiOp anticipated that up to 929 loggerheads will be captured biennially in the scallop dredge fishery, of which 595 are anticipated to be lethal. The 2008 BiOp also estimated that annually in the scallop dredge fishery there will be takes of 1 leatherback, 1 Kemp's ridley, and 1 green sea turtle (all of which may be lethal or non-lethal). The 2008 BiOp estimate of annual takes for the scallop trawl fishery is 154 loggerheads (20 lethal), 1 leatherback, 1 Kemp's ridley, and 1 green sea turtle (all of which may be lethal or non-lethal).

Sea turtles are known to be captured in scallop dredge and trawl gear, gear types that are used in the fisheries affected by this action. As the Loggerhead Recovery Plan (NMFS and USFWS 2008) discussed, loggerheads can be struck and injured or killed by scallop dredge frames or captured in the bag where they may drown or be further injured or killed when catch and heavy gear are dumped on deck. The most commonly described interaction is that of an injured juvenile loggerhead turtle caught in a dredge and brought aboard a vessel (Haas et al. 2008). The total estimated bycatch of loggerhead turtles in the scallop dredge fishery in the mid-Atlantic for 2003 was 749 turtles (Murray 2004), in 2004 was 180 turtles (Murray 2005), and 2005 was 0 turtles (Murray 2007). (It should be noted that three off-watch takes were reported in 2005, and the actual number of takes in the fishery for that year is assumed to be greater than zero.) Changes over the 3 years include implementation of rotational closed areas, and voluntary use of chain mats that prevent turtles (live and/or killed or injured by the dredge) from entering the bag and being observed (also referred to as "turtle chains"). The majority of loggerheads captured in the scallop dredge and trawl fisheries were likely derived from the south Florida nesting populations with relatively small representation from each of the other potential source populations (Haas et al. 2008).

Factors affecting estimated bycatch rates of loggerhead turtles, the species with the greatest number of interactions in scallop trawl and dredge gear in the Mid-Atlantic, vary from year to year (Murray 2004, 2005, 2007). All of the bycatch has occurred between June and October in the Mid-Atlantic. Bycatch analyses to date have not identified a shorter, more specific window of time and area where the greatest probability of turtle bycatch occurs in any given year. There were 91 observed sea turtle takes in scallop dredge gear from 1996 to 2008. Of these, 9 were decomposed so could have died prior to capture. Of the remaining 82, 57 were identified as loggerheads, 1 as green, 2 as Kemp's ridley, and 22 were unidentified.

The 2008 BiOp summarizes most of the information available to date concerning sea turtle interactions with scallop gear, including research on factors affecting estimated bycatch rates in the dredge fishery. The BiOp states that there were 91 observed sea turtle takes in scallop dredge gear from 1996 to 2008. Of these, 9 were decomposed so could have died prior to capture. Of the remaining 82, 57 were identified as loggerheads, one as green, two as Kemp's ridley, and 22 were unidentified. Six were fresh dead, 34 were injured, 22 were uninjured, and 18 were alive but their condition was unknown. One primary issue is that being caught in the gear likely results in a higher level of mortality than evidenced due to submergence and contact injuries.

Submergence injuries are classified as an absence or reduction in breathing and consciousness with no other apparent injuries; mortality is strongly dependent on tow time. Tows of less than 10 minutes likely achieve <1% mortality rate, which is considered negligible, and a rapid escalation in mortality rate does not occur until after 50 minutes of tow time (Sasso and Epperly 2006). This data is for trawl gear, but NMFS assumes the same is true for dredge gear. Because scallop dredge tows are generally less than or equal to 1 hour, this should help reduce the risk of death from forced submergence. Contact injuries are classified as including scrapes or cuts to soft tissues, cracks to the carapace and/or plastron, missing or damaged scutes, and/or bleeding from one or more orifice.

Chain mats do not decrease the number of turtles that come in contact with the gear; rather they decrease the likelihood that turtles will suffer serious injuries from being caught in the dredge bag. However, since NMFS cannot quantify the decrease in the mortality rate, they adhered to the 64% mortality rate that was in effect prior to chain mat implementation. This mortality rate was based on NMFS working guidance for serious injury determinations for sea turtles caught in scallop dredge gear and the analysis of observed scallop dredge takes in 2003. A 64% mortality rate assigned to the estimated 929 biennial loggerhead takes estimates that 595 of those takes will be lethal. The BiOp further stated that any Kemp's ridley and green sea turtle will be killed by the dredge fishery; however, leatherback turtle takes are unlikely to be lethal because they are more likely to happen in the water column, and because they are not likely to get caught in a dredge with a chain mat due to their size (both of which are not true for Kemp's and greens)

From 2004-2007, there were 16 observed takes in scallop trawl gear reported in the 2008 BiOp. All were captured in the net. One was dead before the tow and was decomposing. Of the non-decomposed turtles, 14 were loggerheads and one was unidentified. Twelve of the 14 turtles examined on board were alive with no apparent injuries. These takes were observed from June through September. An estimated 154 loggerheads were captured in trawl gear from 2004-2005, which is the best available information about the annual takes of loggerheads from the scallop trawl fishery. There were no observed leatherback, Kemp's ridley, or green sea turtle takes in scallop trawl gear. NMFS has not yet developed any serious injury criteria for turtles caught in scallop trawl gear.

According to the 2008 BiOp, the level of bycatch mortality removed from the turtle population would need to be much greater than the bycatch observed in the scallop fishery in order to have major effects on the population trajectory.

Action Required by 2008 Biological Opinion

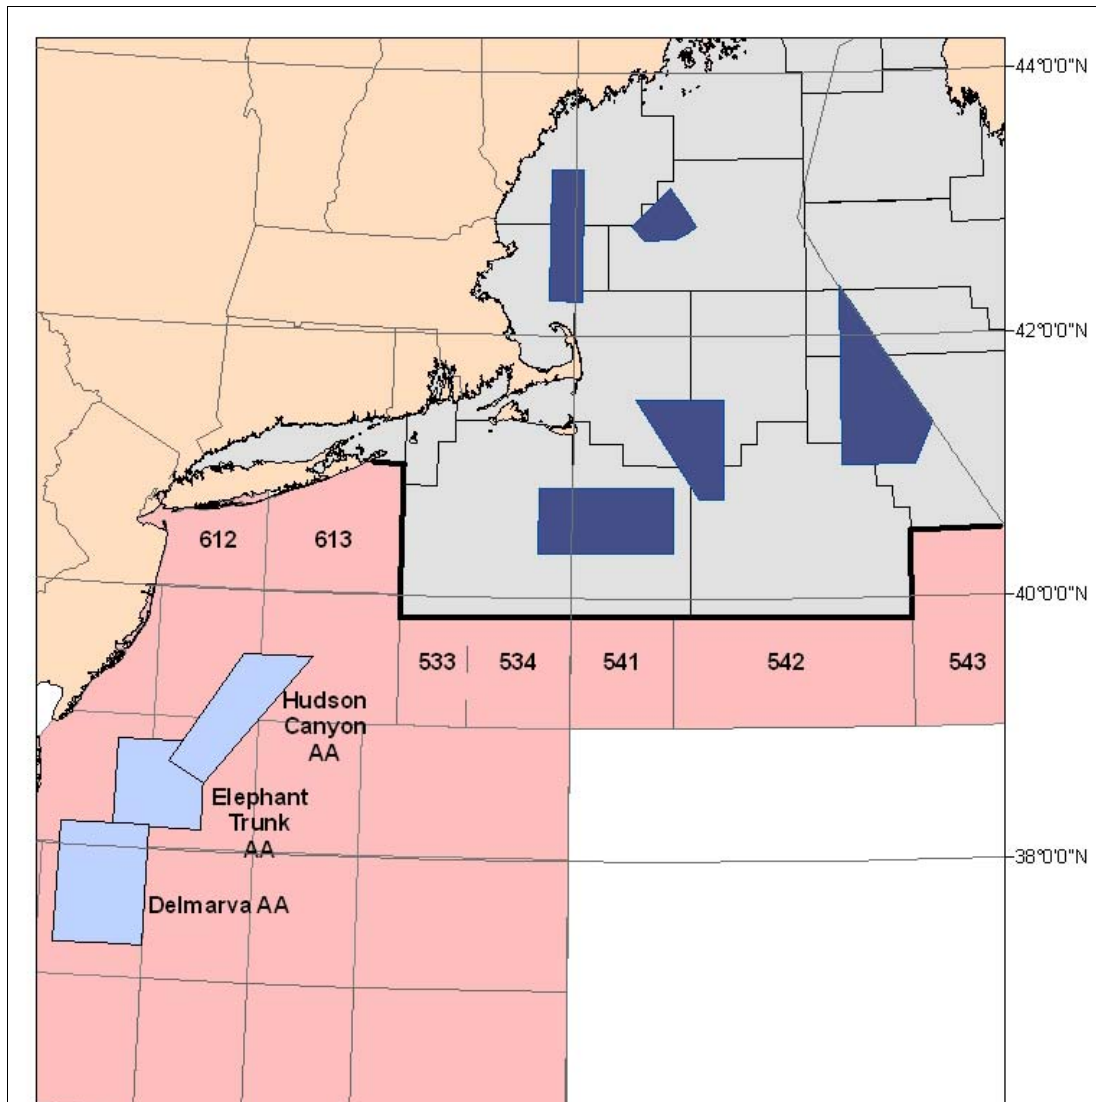

The overall conclusion of the 2008 BiOp for the sea scallop fishery is: *"After reviewing the current status of loggerhead, leatherback, Kemp's ridley, and green sea turtles, the environmental baseline and cumulative effects in the action area, the effects of the continued*

authorization of the Scallop FMP (including the seasonal use of chain mat modified scallop dredge gear in Mid-Atlantic waters), it is NMFS' biological opinion that the proposed activity may adversely affect but is not likely to jeopardize the continued existence of loggerhead, leatherback, Kemp's ridley and green sea turtles."

Specifically, the 2008 BiOp concluded that the four ESA-listed turtles will continue to be affected by the continued authorization of the scallop fishery as a result of: (a) capture in scallop dredge and trawl gear, and (b) physical contact with chain-mat equipped scallop dredge gear that may or may not result in subsequent capture of the sea turtle in the dredge bag or retention of the turtle against the outside of the dredge bag that is visible upon hauling of the gear. However, one major impact on turtles generally is ship strikes, which the BiOp found the scallop fishing vessels unlikely to do based on (a) scallop fishing vessels operate at a relatively low speed, (b) a portion of the fishing occurs in areas in which sea turtles are less or not likely (Georges Bank and Gulf of Maine), (c) a portion of the fishing occurs at times when sea turtles are not likely to be present (winter in the Mid-Atlantic and late fall thru mid spring in New England), (d) sea turtles spend part of their time at depths out of range of a vessel collision, (e) the proposed action is not expected to increase the amount of vessel traffic in areas where sea turtles occur, and (f) the fishery will continue as a limited access fishery such that the number of participants are expected to be further constrained. Lastly, continued authorization of the scallop fishery will not likely reduce the availability of prey for the four species of sea turtles.

The 2008 BiOp had five non-discretionary reasonable and prudent measures (RPMs) with an associated five terms and conditions (T&C) that implement the RPMs. The first RPM is the only one that directly affects the allocated effort in the fishery. The other RPMs (2-5) are more related to research needs and investigation of turtle interactions with the scallop fishery. RPM #1 states that *NMFS must limit the amount of allocated scallop fishing effort by "Limited access scallop vessels" as such vessels are defined in the regulations (50 CFR 648.2), that can be used in the area and during the time of year when sea turtle distribution overlaps with scallop fishing activity (as amended 2/5/09).* Its associated T&C is: *to comply with (RPM 1), no later than the 2010 scallop fishing year, NMFS must limit the amount of allocated limited access scallop fishing effort that can be used in waters south of the northern boundaries of statistical areas 612, 613, 533, 534, 541-543 (Figure 1) during the periods in which turtle takes have occurred. Restrictions on fishing effort described above shall be limited to a level that will not result in more than a minor impact on the fishery (as amended 2/5/09).*

Figure 18 – Area defined in the biological opinion relating to sea turtles. Includes waters south of the northern boundaries of statistical areas 612, 613, 533, 534, 541, 542, and 543. In this document this area is sometimes described as the “Mid-Atlantic.”

The following are RPMs 2-5:

2. *NMFS must continue to investigate and implement, as appropriate, gear modifications for scallop dredge and trawl gear to reduce the capture of sea turtles and/or the severity of the interactions that occur.*
3. *NMFS must review available data to determine whether there are areas (i.e., “hot spots”) within the action area where sea turtle interactions with scallop dredge and/or trawl gear are more likely to occur.*
4. *NMFS must quantify the extent to which chain mats reduce the number of serious injuries/deaths of sea turtles that interact with scallop dredge gear.*
5. *NMFS must determine (a) the extent to which sea turtle interactions with scallop dredge gear occur on the bottom vs. within the water column and (b) the effect on sea turtles of being struck by the scallop dredge.*

The T&C 2-5 are as follows:

2. *To comply with 2 above, NMFS must continue to investigate modifications of scallop trawl and dredge gear. Within a reasonable amount of time following completion of an experimental gear trial from or by any source, NMFS must review all data collected from the experimental gear trials, determine the next appropriate course of action (e.g., expanded gear testing, further gear modification, rulemaking to require the gear modification), and initiate action based on the determination. The goal of this RPM is ultimately to require modification of fishing gear used in the scallop fishery operating under the Atlantic Sea Scallop FMP within a reasonable timeframe following sound research that demonstrates that the gear modification is reasonable and feasible and will help to minimize the number and/or severity of sea turtle interactions with scallop fishing gear.*
3. *To comply with 3 above, NMFS must review all data available on the observed take of sea turtles in the scallop fishery and other suitable information (i.e., data on observed turtle interactions for other fisheries or fishery surveys in the area where the scallop fishery operates) to assess whether there is sufficient information to identify “hot spots” within the action area. Within a reasonable amount of time after completing the review, if NMFS determines that “hot spots” do exist, NMFS must take appropriate action to reduce sea turtle interactions and/or impacts within any identified hot spot.*
4. *To comply with 4 above, NMFS must use available and appropriate technologies (e.g., underwater video as part of an experiment using scallop dredge gear in either the natural or controlled environment, computer modeling, etc.) to quantify the extent to which chain mats reduce the number of serious injuries/deaths of sea turtles that interact with scallop dredge gear. This information is necessary to better determine the extent to which chain mats do reduce injuries leading to death for sea turtles and may result in further modifications of the fishery to ensure sea turtle interactions and/or interactions causing death are minimized. Initiate study no later than fiscal year 2009.*
5. *To comply with 5 above, NMFS must use available and appropriate technologies to better determine where (on bottom or in the water column) and how sea turtle interactions with scallop dredge gear are occurring. Such information is necessary to assess whether further gear modifications in the scallop dredge fishery will actually provide a benefit to sea turtles by either reducing the number of interactions or the number of interactions causing mortal injuries. Initiate study no later than fiscal year 2009.*

The 2008 BiOp also includes other requirements for monitoring, as well as several conservation recommendations. Conservation recommendations are discretionary activities designed to minimize or avoid adverse effects of an action, to help implement recovery plans, or to develop information. They are recommendations, not requirements like RPMs.

4.3.2.3 Overall Sea Turtle Conservation

Below is a summary of some of the measures in place for turtle conservation under the Scallop FMP and outside of the Scallop FMP. In addition, this section summarizes the recent and current research being conducted on sea turtles and the scallop fishery that address many of the research objectives of the Reasonable and Prudent Measures identified in Biological Opinions for the scallop fishery.

Measures in place outside the Scallop FMP that still affect the scallop fishery

On February 15, 2007, NMFS issued an advance notice of proposed rulemaking to announce it is considering amendments to the regulatory requirements for turtle excluder devices (TEDs). Among other issues, NMFS is considering requiring the use of TEDs in the Mid-Atlantic sea scallop trawl fishery, and moving the current northern boundary of the summer flounder fishery sea turtle protection area off of Cape Charles, VA to a point farther north. The objective of the proposed measures is to effectively protect all life stages and species of sea turtles where they are vulnerable to incidental capture and mortality in Atlantic trawl fisheries.

Among the many recovery objectives identified in the Loggerhead Recovery Plan (NMFS and USFWS 2008), one is to minimize bycatch in domestic and international commercial and artisanal fisheries. The plan includes 34 Priority 1 Actions needed that include promulgating regulations to require TEDs in trawl fisheries where they are currently not required, implementing seasonal TED regulations for domestic commercial non-shrimp trawl fisheries operating from Cape Charles, VA, north to Long Island Sound, and enforcement of fishery regulations to minimize loggerhead bycatch in commercial trawl fisheries.

Measures in place under the Scallop FMP

There are a number of measures currently in place in the Scallop FMP that help minimize interactions with turtles and the effect of those interactions on turtles now and in the future. These measures include a seasonal closure in the ETA, the mandated use of a chain mat from May 1 through November 30 in all areas south of 41° 9.0' N, and the research set-aside program that has funded a number of turtle-related projects. In addition, rotational area management has increased catch per unit effort thus the time that gear is in the water and could impact turtles has been reduced dramatically. See Section 5.3.2.5 for more detailed analyses of how effort levels have changed in the scallop fishery, particularly in the Mid-Atlantic during the time of year when turtles are more likely to be present.

The seasonal closure in ETA was implemented in 2007 when the area reopened. For two months (September 1-October 31) each year, the entire access area is closed. So far, analyses support that this seasonal closure may be having beneficial impacts on turtles by shifting effort to other times of the year with lower bycatch rates, compared to shifting effort to open areas during the same season. In 2007 and 2008, effort in the ETA increased in March, April, August, November and December compared to overall fishing time in years before that when fishing was permitted in the ETA during September and October (Figure 37). Excluding August, all of these months have less likelihood of catching turtles given the lower probability of turtles being present in the ETA during these months (March, April, November, and December).

NMFS finalized a rule (71 FR 50361, August 23, 2006) that requires modification of Atlantic sea scallop dredge gear, regardless of dredge size, by a chain mat when the gear is fished in waters south of 41° 9.0' N from the shoreline to the outer boundary of the EEZ during the period May 1 through November 30 each year. These regulations were modified through subsequent rulemakings (71 FR 66466, November 15, 2006; 73 FR 18984, April 8, 2008; 74 FR 46930, September 14, 2009). However, these modifications did not change the temporal or spatial extent of the chain mat requirements. The intent of the dredge gear modification is to reduce the severity of some turtle interactions that might occur by preventing turtles from entering the dredge bag.

While turtle observations have been reduced since the chain mat regulations went into place, there have still been several takes in the sea scallop dredge fishery in recent years. In 2007, there were 5 takes in scallop dredge gear. Four of the takes, all loggerhead sea turtles, occurred south of the northern boundary of the chain mat regulation, while one take, a Kemp's ridley sea turtle, was documented north of this line. Of the four takes south of the line, one of the turtles was observed on top of the dredge frame, swimming away before the dredge came on deck; two were observed in the dredge bag; and one turtle was reported between the chain mat and the dredge. There were two takes in scallop dredge gear in 2008 in the dredge frame. There were two takes in scallop dredge gear in 2009 (data available through Aug 09).

The research set-aside program, with additional NMFS financial support through contracts, has and continues to address many of the research objectives of the Reasonable and Prudent Measures (RPMs) identified in a series of Biological Opinions (BiOps) issued by NMFS for the sea scallop fishery. The sea scallop industry and its research partners have been working with NMFS to address specific RPMs since 2003. A summary of RPMs and how research has and continues to address sea turtle bycatch is below. Two outputs from some of this research that are currently being used by a growing number of scallop industry participants, but are not required, are a "turtle excluder dredge" and a "placard" that describes how to handle turtles safely and how to reduce the potential for interactions by rigging chain mats on the dredge.

Specific research that has been conducted related to RPMs in 2008 biological opinion

Research has been grouped by topic based on the RPMs in the 2008 biological opinion. The first RPM, related to limiting effort, is addressed in Section 2.8.1.1; RPMs #2 - #5, and the term and conditions (T&Cs) used to implement the RPMs, are all related to research and are summarized below. There is no time limit for when the agency must comply with these RPMs, and it is likely that future research funded through the RSA program will continue to support these projects since turtle related research is listed as a research priority for RSA funds. This is not a complete list of the work that has been or is being conducted to help comply with these RPM, this is only a list of the projects the PDT is aware of, many of which were fully funded by, partially funded by the Scallop RSA program, or through contracts with NMFS.

RPM #2 – Term and Condition #2

RPM #2: NMFS must continue to investigate and implement, as appropriate, gear modifications for scallop dredge and trawl gear to reduce the capture of sea turtles and/or the severity of the interactions that occur.

T&C#2: To comply with 2 above, NMFS must continue to investigate modifications of scallop trawl and dredge gear. Within a reasonable amount of time following completion of an experimental gear trial from or by any source, NMFS must review all data collected from the experimental gear trials, determine the next appropriate course of action (e.g., expanded gear testing, further gear modification, rulemaking to require the gear modification), and initiate action based on the determination. The goal of this RPM is ultimately to require modification of fishing gear used in the scallop fishery operating under the Atlantic Sea Scallop FMP within a reasonable timeframe following sound research that demonstrates that the gear modification is reasonable and feasible and will help to minimize the number and/or severity of sea turtle interactions with scallop fishing gear.

Turtle Excluder Devices (TEDs) have been proven to be an effective method to minimize adverse effects related to sea turtle bycatch in the shrimp trawl fishery, summer flounder trawl fishery, several state trawl fisheries, and certain other trawl fisheries around the world. TEDs have an escape opening, usually covered by a webbing flap that allows sea turtles to escape from trawl nets. On-going research is being conducted on catch retention of Atlantic sea scallops in trawl nets equipped with a TED.

As described above, the chain mat is designed to prevent sea turtles from being captured in the dredge bag. Another modification being tested is a modified dredge frame designed to guide sea turtles over the dredge. (See DuPaul et al, 2004 for more information). The chains were found to be 100% effective in keeping turtles out of the dredge bag during the research trials, but it should be noted that the potential exists for the smallest turtles to pass through the spacing in the chain and result in a take (NMFS 2008).

The two components of the design work independently; the chains prevent sea turtles from entering the dredge bag and the frame modifications prevent entrapment on top or underneath the dredge. While research continues to determine the magnitude of turtle encounters that take place while the dredge is on the sea floor or up in the water column, the new dredge design is proving to be successful in retaining scallop catch and has been shown to guide experimental sea turtle carcasses up and over the frame. This research is documented in the following reports: Smolowitz and Weeks, 2008; Smolowitz and Weeks, 2008b, Milliken et al., 2007, and Smolowitz et al., 2005.

RPM #3 – Term and Condition #3

***RPM#3:** NMFS must review available data to determine whether there are areas (i.e., “hot spots”) within the action area where sea turtle interactions with scallop dredge and/or trawl gear are more likely to occur.*

***T&C #3:** To comply with 3 above, NMFS must review all data available on the observed take of sea turtles in the scallop fishery and other suitable information (i.e., data on observed turtle interactions for other fisheries or fishery surveys in the area where the scallop fishery operates) to assess whether there is sufficient information to identify “hot spots” within the action area. Within a reasonable amount of time after completing the review, if NMFS determines that “hot spots” do exist, NMFS must take appropriate action to reduce sea turtle interactions and/or impacts within any identified hot spot.*

Ongoing and proposed research using an ROV and oceanographic sampling in conjunction with sea turtle tracking is shedding light on the location of the turtles geographically and on the amount of time they spend at the surface and on the sea floor. These projects have advanced the ability to locate, track and observe loggerhead sea turtles through innovative use of dredge- and ROV-mounted video cameras and side-scan sonar. Recent field work carried out in July 2009 tracked and observed sea turtles throughout the water column with an ROV.

During the same time period, oceanographic data was collected at a series of stations and during aerial over-flights in order to establish the localized oceanographic features associated with turtle distributions. Proposed work will continue to build this unique set of observational records and use them to assess ideas regarding the factors that govern sea turtle distributions and behavior in the Mid-Atlantic Bight (MAB) shelf region. While past studies have focused mainly on sea surface temperature and bathymetry as controlling and/or predictive factors (e.g. Hawkes et al.,

2007; Murray, 2007), ongoing research postulates that on time scales of days to weeks, sea turtle “hot spots” are more closely tied to the geography of oceanographic fronts associated with water mass and chlorophyll gradients driven by wind stress and buoyancy (density) contrasts. These linkages will be investigated by conducting regional hydrographic surveys with shipboard CTD (conductivity/ temperature/ depth), fluorometer and ADCP (Acoustic Doppler Current Profiler) measurements in conjunction with aerial sea turtle sighting and ROV video tracking surveys.

In addition, the NEFSC is currently analyzing observed turtle interactions in scallop dredge and trawl gear using a longer time series of data (2001 to 2008) to assess factors correlated with high and low bycatch rates in the scallop fishery.

RPM #4 – Term and Condition #4

RPM#4: NMFS must quantify the extent to which chain mats reduce the number of serious injuries/deaths of sea turtles that interact with scallop dredge gear.

T&C #4: To comply with 4 above, NMFS must use available and appropriate technologies (e.g., underwater video as part of an experiment using scallop dredge gear in either the natural or controlled environment, computer modeling, etc.) to quantify the extent to which chain mats reduce the number of serious injuries/deaths of sea turtles that interact with scallop dredge gear. This information is necessary to better determine the extent to which chain mats do reduce injuries leading to death for sea turtles and may result in further modifications of the fishery to ensure sea turtle interactions and/or interactions causing death are minimized. Initiate study no later than fiscal year 2009.

It is important to be able to quantify the effectiveness of chain mats in reducing potential injury to turtles during towing of the standard New Bedford dredge. The key cause of this potential injury is the possibility of a standard dredge running over a turtle on the seafloor. If one assumes that the turtle excluder dredge is highly effective in preventing turtles from getting under the cutting bar, a comparison of the two dredge types, without chain mats, would shed light on this issue. If both dredges have an equal probability of catching turtles in the water column, then a comparison should show no difference in takes between dredge types if there are no bottom interactions. This might indicate turtles are not suffering significant serious injury/deaths in interactions with conventional scallop gear as a result of interactions on the bottom. If the standard dredge catches significantly more turtles, then there is a high probability that it is catching those turtles on the sea floor and the potential for injury exists. Another issue regarding the modified frame is whether the initial encounter with the dredge causes injury, the severity of that injury, and the effectiveness of the modified dredge at reducing those injuries.

Proposed dredge comparison work will be a continuation of a study started by the NEFSC's Protected Species Branch and all protocols set forth by the NEFSC during previous contract work with Coonamessett Farm. To date, a total of more than 1500 paired tows have been observed following these protocols. In order to obtain statistically significant results, an additional 600 to 3000 paired tows may have to be observed due to the rarity of observed turtle-dredge interactions. This portion of the proposed study will take place on commercial fishing vessels working under normal fishing operations, but without the required turtle chain mats, during the months and areas in which loggerhead turtle interactions are known to occur. A total of at least 600 paired tows will be observed on vessels fishing a standard New Bedford scallop dredge and a Coonamessett Farm turtle excluder dredge simultaneously during 2010. A NMFS-

certified scallop fisheries observer will be onboard to record all catch and tow data while also observing sea turtle interactions.

RPM #5 – Term and Condition #5

RPM#5: NMFS must determine (a) the extent to which sea turtle interactions with scallop dredge gear occur on the bottom vs. within the water column and (b) the effect on sea turtles of being struck by the scallop dredge.

T&C #5: To comply with 5 above, NMFS must use available and appropriate technologies to better determine where (on bottom or in the water column) and how sea turtle interactions with scallop dredge gear are occurring. Such information is necessary to assess whether further gear modifications in the scallop dredge fishery will actually provide a benefit to sea turtles by either reducing the number of interactions or the number of interactions causing mortal injuries. Initiate study no later than fiscal year 2009.

As mentioned above, ongoing and proposed use of ROVs and oceanographic sampling along with tracking of tagged sea turtles will likely provide more information on seasonal locations and behavior of these animals which will aid in bycatch avoidance and scallop management. Knowledge of where turtles spend their time in the water column is one of the major outcomes of this research, which will help to assess current gear regulations and proposed modifications.

On August 24, 2009, Coonamessett Farm and NMFS staff successfully attached Fastloc Argos satellite tags to two juvenile loggerhead turtles in the HCAA. The tags are transmitting turtle location, time at depth, and water temperature data. This data will be incorporated with all the other data collection efforts to evaluate juvenile loggerhead behaviors on the scallop grounds. The tagging and ROV work will provide information toward addressing RPM 5a.

RPMs from previous biological opinions that have been addressed through projects at least partially funded by the scallop RSA program

NOAA Fisheries must ensure that guidance is provided to fishers in fishery to make them aware of sea turtle presence in fishing areas, advise them to not conduct tows where turtles are observed present at the surface, maintain <60 minute tow times, avoid damage to turtles possibly caught in dredge by lowering bag closer to deck before emptying and not dropping the dredge cutting bar on top of the catch; NOAA Fisheries must provide adequate guidance to all fishers participating in fishery prior to start of each FY so any incidental sea turtle take is handled w/due care, observed for activity, and returned to water; (BiOps 2/24/2003, 2/23/2004)

This was addressed by the production of a wheelhouse card that was distributed to each vessel in the limited access scallop fleet. The card was designed and produced as a joint effort of the FSF, Coonamessett Farm, VIMS and NMFS. In addition, a flyer addressing sea turtle conservation in the fishery was distributed to permit holders.

Handling the turtle to avoid injury can be achieved to a limited extent on a scallop vessel. During the season and area of turtles, after the dredge gets to the block and in the air, the crewmen can be instructed to observe if there is a turtle before dumping the dredge on deck. If there is a turtle, the captain and crew can use the other side's tackle to bring the bale over to the other side of the boat and use that side's tackle on the club stick to gently dump the contents of the bag without ever dropping the dredge or bag on deck. This protocol (or similar protocol) would reduce the

likelihood of injury to the turtle when the bag is emptied on deck. The wheelhouse card identified measures the crew could take to reduce injury and mortality to sea turtles on deck.

NOAA Fisheries must conduct video work to investigate how sea turtles interact with scallop fishery gear; (BiOp 12/15/2004)

Dredge-mounted cameras have been and will continue to be used in an attempt to capture underwater interactions between scallop dredges and sea turtles. The first two projects described below were not successful in observing any turtle interactions with dredge gear. This led to a change in strategy identified in the third project; instead of cameras mounted on the dredge turtles were observed and followed a Remotely Operated Vehicle (ROV): (Smolowitz et al., 2005, Smolowitz et al., 2005b, Smolowitz and Weeks, 2009).

4.3.2.4 Loggerhead 2009 Status Review - Summary

In 2007, a loggerhead 5-year review was conducted that acknowledged a possible separation by ocean basins and the need for a more in-depth analysis of the population structure. Also in 2007, NMFS and FWS received two separate petitions to reclassify loggerheads in the North Pacific and in the Northwest Atlantic Ocean as Distinct Population Segments (DPS) with endangered status. These actions prompted the most recent status review by the Biological Review Team (BRT) (Conant et al. 2009).

The BRT evaluated genetic data, tagging and telemetry data, demographics information, oceanographic features, and geographic barriers to determine whether population segments exist. Nine DPSs were identified as being discrete from other conspecific population segments and significant to the species. The 9 DPS are:

- North Pacific Ocean DPS
- South Pacific Ocean DPS
- North Indian Ocean DPS
- Southeast Indo-Pacific Ocean DPS
- Southwest Indian Ocean DPS
- Northwest Atlantic Ocean DPS
- Northeast Atlantic Ocean DPS
- Mediterranean DPS
- South Atlantic Ocean DPS

Note that the Northwest Atlantic Ocean DPS is the relevant DPS for the Atlantic sea scallop fishery, with the DPS delineated by 60 N latitude and the equator as the north-south boundaries and 40 W longitude as the east boundary.

Two analyses were completed to assess extinction risks of the DPSs. The first used a diffusion approximation approach based on counts of nesting females to calculate a metric (susceptibility to quasi-extinction (SQE)). SQE is an increasing function of the quasi-extinction threshold. As this analysis involved counts of nesting females, only beaches with >12-15 years of data were evaluated (North Pacific, South Pacific, Southwest Indian, Northwest Atlantic (besides Dry Tortugas Recovery Unit), South Atlantic). Of those five, the Northwest Atlantic, South Pacific, and North Pacific DPSs indicated a high likelihood of quasi-extinction over a wide range of QET values.

The second analysis used a deterministic stage-based population model focused on known anthropogenic mortalities on each DPS. This approach involved an estimation of how additional mortalities may affect the future growth and recovery of each DPS. According to the analysis, all DPS have the potential to decline in the future, but the threat is greatest for the North Indian, Northwest Atlantic, Northeast Atlantic, Mediterranean, and South Atlantic DPSs.

Overall, the BRT concluded that the Northeast Atlantic and Mediterranean DPSs are at immediate risk of extinction; the North Pacific, South Pacific, North Indian, Southeast Indo-Pacific, Northwest Atlantic DPSs are currently at risk of extinction; and the Southwest Indian and South Atlantic DPSs are likely not currently at immediate risk of extinction.

Note that the status review document is not a listing decision. The BRT submitted their independent report to NMFS and FWS on August 11, 2009, and the next steps are for the agencies to evaluate the report and determine what, if any, action is appropriate under the ESA. Possible decisions by the agencies include no change in listing status; a change in listing status for the species as currently defined (single species range wide); identification of distinct population segments (DPS) and proposing to list some or all of them as either threatened or endangered. The agencies will prepare proposed determinations and publish those in the Federal Register and solicit comments. The agencies will then review the comments and prepare a final determination which, again, could be any of the above options. Typically a listing action becomes effective 30 days after publication of the final rule in the Federal Register. Only after that final listing decision is announced in the Federal Register would DPSs be applied if deemed necessary and warranted, and a new listing be in effect.

A new listing decision for loggerhead sea turtles would warrant reinitiation of section 7 consultation on the Atlantic sea scallop fishery, but that would not happen until after a proposed and final determination was issued. The new status review does not impact anything the Council and NMFS need to do for FW21.

4.4 ECONOMIC TRENDS IN THE SEA SCALLOP FISHERY

4.4.1 Introduction

This document describes the trends in landings, revenues, prices, producer surplus and profits for the sea scallop fishery since 1994, and as such, it provides a background for the economic analyses that are conducted for Framework 21 alternatives.

4.4.2 Trends in Landings, prices and revenues

In the fishing years 2002-2008, the landings from the northeast sea scallop fishery stayed above 50 million pounds, surpassing the levels observed historically (Figure 19). The recovery of the scallop resource and consequent increase in landings and revenues was striking given that average scallop landings per year were below 16 million pounds during the 1994-1998 fishing years, less than one-third of the present level of landings. The increase in the abundance of scallops coupled with higher scallop prices increased the profitability of fishing for scallops by the general category vessels. As a result, general category landings increased from less than 0.4 million pounds during the 1994-1998 fishing years to more than 4 million pounds during the last four fishing years (2005-2008), peaking at 7 million pounds in 2005 or 13.5% of the total scallop landings.

Figure 19. Scallop landings by permit category and fishing year (dealer data)

Figure 20 shows that total fleet revenues tripled from about \$100 million in 1994 to over \$350 million in 2008 (in inflation-adjusted 2008 dollars). Scallop ex-vessel prices increased after 2001 as the composition of landings changed to larger scallops that in general command a higher price than smaller scallops. However, the rise in prices was not the main factor that led to the increase in revenue in the recent years compared to 1994-1998 and in fact, the inflation adjusted ex-vessel price of scallops in 2008 was lower than the price in 1994 (Figure 20). The increase in total fleet revenue was mainly due to the increase in scallop landings and the increase in the number of active limited access vessels during the same period. Figure 21 shows that average landings and revenue per limited access vessel more than doubled in recent years compared to the period 1994 -1998. The number of active limited access vessels increased by 50% (from about 220 in 1994 to 345 in fishing year 2008) resulting in tripling of total fleet scallop landings and revenue in 2008 compared to 1994 (Figure 21).

Figure 20. Trends in total scallop landings, revenue and ex-vessel price by fishing year (including limited access and general category fisheries)

Figure 21. Trends in average scallop landings and revenue per full time vessel and number of active vessels (including full-time, part-time and occasional vessels)

The trends in revenue per full-time vessel were similar to the trends for the fleet as a whole. Figure 21 shows that average scallop revenue per limited access vessel more than doubled from about \$400,000 in 1994 to about \$950,000 despite the fact that inflation adjusted ex-vessel price per pound of scallops was slightly higher in 1994 (\$7.15 per pound) compared to the ex-vessel price in 2008 (\$6.92 per pound). In other words, the doubling of revenue was the result of the doubling of the average scallop landings per vessel in 2008 (over 136,000 pounds) from its level in 1994 (over 57,000 pounds). The total fleet revenue for all the limited access vessels more than tripled during the same years as new vessels became active. Average scallop revenue per full-time vessel peaked in the 2005 fishing year to over \$1.1 million as a result of higher landings combined with an increase in ex-vessel price to about \$8.50 per pound of scallops (in terms inflation adjusted 2008 prices).

Table 20 describes the fraction of total landings by area for all limited access vessels from 2004-2008. In general, more and more of the total catch for the fishery is coming from access areas, open area catch has declined from 55-60% of total catch in 2004-2006 to just under 40% in 2007 and 2008.

Table 20 – Percent of total limited access scallop catch by area and calendar year (Dealer and DAS data)

| | 2004 | 2005 | 2006 | 2007 | 2008 |
|-------------|--------|--------|--------|--------|--------|
| CA1 | 0.0% | 12.3% | 0.0% | 9.8% | 0.0% |
| CA2 | 7.1% | 11.8% | 26.6% | 0.0% | 0.0% |
| ET | 0.0% | 0.0% | 0.0% | 31.1% | 48.9% |
| HC | 29.3% | 14.4% | 0.7% | 10.0% | 0.3% |
| NL | 3.7% | 0.0% | 16.2% | 10.3% | 9.7% |
| OPEN | 59.9% | 60.9% | 55.3% | 38.6% | 39.5% |
| Grand Total | 100.0% | 100.0% | 100.0% | 100.0% | 100.0% |

4.4.3 Trends in effort and LPUE

There has been a steady decline in the total DAS used by the limited access scallop vessels from 1994 to 2000 fishing years as a result of the effort-reduction measures of Amendment 4 (1994). DAS allocations during this period were reduced almost by half from 204 DAS in 1994 to 120 DAS for the full-time vessels and in the same proportions for the part-time and occasional vessels from their base levels in 1994 (Table 21). As a result, DAS used reached the lowest levels of about 23,000 days in the 1999 and 2000 fishing years from about 35,000 days in 1994 (Figure 22).

Table 21. DAS and trip allocations per full-time vessel

| Year | Allocations based on the Management Action | Total DAS Allocation (1) | Estimated Open area DAS allocations (2) | Access area trip allocations (3) | DAS charge or equivalent per access area trip (4) | Equivalent (estimated) DAS allocation for access areas (5) |
|------|--|--------------------------|---|----------------------------------|---|--|
| 1994 | Amendment 4 | 204 | None | None | | None |
| 1995 | Amendment 4 | 182 | None | None | | None |
| 1996 | Amendment 4 | 182 | None | None | | None |
| 1997 | Amendment 4 | 164 | None | None | | None |
| 1998 | Amendment 4 | 142 | None | None | | None |
| 1999 | Amendment 7, Framework 11 | 120 | 90 to 120 | 3 | 10 | 0 to 30 |
| 2000 | Framework 13 | 120 | 60 to 120 | 6 | 10 | 0 to 60 |
| 2001 | Framework 14 | 120 | 90 to 120 | 3 | 10 | 0 to 30 |
| 2002 | Framework 14 | 120 | 90 to 120 | 3 | 10 | 0 to 30 |
| 2003 | Framework 15 | 120 | 90 to 120 | 3 | 10 | 0 to 30 |
| 2004 | Framework 16 | 126 | 42 (MAX.62) | 7 | 12 | 84 |
| 2005 | Framework 16 | 100 | 40 (MAX.117) | 5 | 12 | 60 |
| 2006 | Framework 18 | 112 | 52 | 5 | 12 | 60 |
| 2007 | Framework 18 | 111 | 51 | 5 | 12 | 60 |
| 2008 | Framework 19 | 95 | 35 | 5 | 12 | 60 |
| 2009 | Framework 19 | 97 | 37 | 5 | 12 | 60 |

Total DAS allocation per full-time vessel represents a rough estimate for years 2004-08 since DAS is allocated for open areas only. DAS allocation for access areas is estimated by assuming an equivalent 12 days-at-sea allocation for each access area trip with a possession limit of 18,000 pounds.

After fishing year 2000, fishing effort started to increase as more limited access vessels participated in the sea scallop fishery. The increase in total effort was mostly due to the increase in the number of vessels because total DAS allocations (mostly less than 120 days) were lower than the DAS allocations in the mid-1990s (over 142 days, Figure 22). The recovery of the scallop resource and the dramatic increase in fishable abundance after 1999 increased the profits

in the scallop fishery, thus leading to an increase in participation by limited access vessels that had been inactive during the previous years. Georges Bank closed areas were opened to scallop fishing starting in 1999 by Framework 11 (CAII) and later by Framework 13 (CAII, CAI, NLS), encouraging many vessel owners to take the opportunity to fish in those lucrative areas. Frameworks 14 and 15 provided controlled access to Hudson Canyon and VA/NC areas. As a result, 45 new limited access vessels became active in the sea scallop fishery after 2000 during the next four fishing years. The total number of full-time equivalent vessels reached 310 in 2003 and total fishing effort by the fleet increased to 31,864 days in 2003 from about 22,627 in 2000 (Figure 22).

Figure 22. Total DAS-used and the number of active limited access vessels (including full-time, part-time and occasional vessels) in the sea scallop fishery

Total fishing effort (DAS used) declined after 2003 even though the number of active vessels increased to 343 vessels in 2006 from 310 vessels in 2003. With the implementation of Amendment 10 (2004) the limited access vessels were allocated DAS for open areas and a number of trips for the specific access areas with no open area trade-offs. The open area allocations were reduced to 42 DAS in 2004 whereas full-time vessels were allocated 7 access area trips in the same year (NEFSC, Framework 16). Even though total DAS equivalent allocations remained around the same levels during 2005-2007 (at about 110 equivalent days, Table 21), the fishing effort, i.e., fleet DAS used increased in the 2007 fishing year as many vessels took their unused 2005 HCA trips in that year. If not for those HCA trips, the total effort in the scallop fishery would probably have stayed constant during 2005-2007 with almost all

qualified limited access vessels participating in the fishery. Total DAS-used declined further in 2008 to 24,121 days as the open area DAS allocations are reduced by 30% from 51 days to 35 days per full-time vessel. The impact of this decline on scallop revenue per vessel was small (about 4%), however, due to the increase in LPUE from about 1600 pounds per day-at-sea in 2007 to about 1950 pounds per day-at-sea in 2008 (Figure 23). As a result of the constant increase in LPUE after 1998 from about 450 pounds per DAS in 1994 to over 1500 pounds per DAS after 2003, scallop revenue per vessel more than doubled in recent years compared to the levels in mid 1990's.

Figure 23. LPUE and average scallop revenue per limited access vessel

4.4.4 Trends in the meat count and size composition of scallops

Average scallop meat count has declined continuously since 1999 as a result of effort-reduction measures, area closures, and an increase in ring sizes implemented by the Sea Scallop FMP. The share of larger scallops increased with the share of U10 scallops rising to over 20% since 2006. The share of 11-20 count scallops increased from 12% in 1999 to 53% in 2008. On the other hand, the share of 30 or more count scallops declined from 30% in 1999 to 1% in 2008 (Table 22). Larger scallops priced higher than the smaller scallops contributed to the increase in average scallop prices in recent years despite larger landings (Table 23 and Figure 19).

Table 22. Size composition of scallops

| YEAR | Under 10 count | 11-20 count | 21-30 count | 30 count and over | Unclassified |
|------|----------------|-------------|-------------|-------------------|--------------|
| 1999 | 17% | 12% | 25% | 35% | 12% |
| 2000 | 7% | 18% | 44% | 20% | 11% |
| 2001 | 3% | 24% | 49% | 11% | 13% |
| 2002 | 5% | 15% | 65% | 5% | 11% |
| 2003 | 6% | 21% | 56% | 3% | 13% |
| 2004 | 7% | 41% | 42% | 2% | 8% |
| 2005 | 13% | 57% | 21% | 2% | 7% |
| 2006 | 23% | 52% | 18% | 1% | 6% |
| 2007 | 24% | 52% | 13% | 4% | 8% |
| 2008 | 23% | 53% | 18% | 1% | 4% |

Table 23. Price of scallop by market category (in 2008 inflation adjusted prices)

| YEAR | <=10 count | 11-20 count | 21-30 count | >30 count |
|------|------------|-------------|-------------|-----------|
| 1999 | 7.8 | 7.9 | 7.3 | 6.4 |
| 2000 | 8.7 | 6.8 | 5.9 | 6.1 |
| 2001 | 7.2 | 4.7 | 4.4 | 4.7 |
| 2002 | 6.7 | 4.8 | 4.5 | 5.1 |
| 2003 | 5.7 | 4.8 | 4.8 | 5.3 |
| 2004 | 6.8 | 5.8 | 5.5 | 5.7 |
| 2005 | 8.8 | 8.6 | 8.5 | 8.3 |
| 2006 | 6.6 | 7.3 | 7.6 | 7.6 |
| 2007 | 7.2 | 6.9 | 6.8 | 6.2 |
| 2008 | 7.2 | 6.9 | 6.8 | 6.4 |

4.4.5 Trends in Foreign Trade

One of most significant change in the trend for foreign trade for scallops after 1999 was the striking increase in scallop exports. The increase in landings especially of larger scallops led to a tripling of U.S. exports of scallops from about 5 million pounds in 1999 to over 20 million pounds per year since 2005 (Figure 24). Figure 24 shows exports from New England and Mid-Atlantic ports combined including fresh, frozen and processed scallops. Although exports include exports of bay, calico or weatherwane scallops, it mainly consists of sea scallops. France and other European countries were the main importers of US scallops. The exports from all other states and areas totaled only about \$1 million in 2006 and 2007, and thus were not considered significant. Imports of scallops fluctuated between 45 million pounds and 60 million pounds during the period 1999 and 2008.

Because of the increase in the value of scallop exports to over \$100 million after 2004, the difference in the value of exported and imported scallops, that is scallop trade deficit, declined considerably (Figure 25). Therefore, rebuilding of scallops as a result of the management of the scallop fishery benefited the nation by reducing the scallop trade deficit from over \$250 million in 1999-2000 to less than \$100 million in 2008.

Figure 24. Scallop imports and exports (by calendar year)

Figure 25. Value of Scallop imports and exports (by calendar year)

4.4.6 The trends in participation by permit, vessel characteristics and gear type

Table 24 shows the number of limited access vessels by permit category from 1994 to 2007. The fishery is primarily full-time, with a small number of part-time and few occasional permits. The number of full-time vessels has been on the rise since 1997 but seems to have leveled off around 340 to 345 beginning in 2007. Of these permits, the majority are dredge vessels, with a small amount of full-time small dredge and full-time trawl vessels

Table 24 through Table 29 describe scallop landings by limited access vessels by gear type and permit category. These tables are obtained from the dealer and permit data. Most limited access category effort is from vessels using scallop dredge including the small dredge (Table 27). The number of vessels using scallop trawl gear decreased continuously and consist of 11 full-time trawl vessels since 2006. In comparison, there has been an increase in the numbers of full-time and part-time small dredge vessels after 2002. In terms of landings, most scallop landings by the limited access vessels are with dredge gear including the small dredges (Table 25), with significant amounts also landed by full-time and part-time trawls. Table 26 shows the percent of limited access landings by primary gear and year. About 80% of the scallop pounds are landed by full-time dredge and about 13% landed by full-time small dredge vessels since 2007 fishing year.

Table 24. Number of limited access vessels by permit category and gear

| FISHYEAR | FT Dredge | PT Dredge | OC Dredge | FT SMD | PT SMD | FT TRW | PT TRW | OC TRW | Grand Total |
|----------|--------------|--------------|--------------|-----------|-----------|-----------|-----------|-----------|-------------|
| 1994 | 186 | 9 | 1 | 3 | 4 | 20 | 18 | 10 | 251 |

NA: Landings are not shown if the number of vessels in a cell is less than 3 to protect confidentiality

Horsepower of permitted vessels in the limited access fleet ranges from <500 hp to greater than 1000 hp. The majority of the small dredges had a horsepower of less than 500. Majority of the limited access vessels had a horse power of 700 to 999 HP. The number of vessels that had a horsepower of 1000 or more increased, especially since 2005. The overall fleet horsepower average has been on the rise but, like fleet size, shows signs of leveling off in the most recent years of data (Figure 26).

Figure 26. Number of limited access vessels by horsepower (including full-time, part-time and occasional vessels)

In contrast, most of the general category scallop vessels are small boats with less than 500 horsepower (Figure 27). The number of active general category vessels increased sharply after 2000 fishing year, but has been falling down as a result of the qualification measures included in Amendment 11 to the sea scallop FMP.

Figure 27. Number of general category vessels by horsepower (including full-time, part-time and occasional vessels)

Table 27 through Table 29 describe general category landings by gear type. These tables are generated by VTR data and since all VTR records do not include gear information, the number of vessels in these tables will differ from other tables that summarize general category vessels and landings from dealer data. Primary gear is defined as the gear used to land more than 50% of scallop pounds. Most general category effort is and has been from vessels using scallop dredge and other trawl gear (Table 27). The number of vessels using scallop trawl gear increased through 2006 but has declined in recent years. In terms of landings, most scallop landings under general category are with dredge gear (Table 28), with significant amounts also landed by scallop trawls and other trawls. Table 29 shows the percent of general category landings by primary gear and year. The percentages of scallop landings with other trawl gear in 2008 and 2009 were the highest they have been since 2001, but still significantly less than dredge.

4.4.7 Trends in scallop landings by port

The landed value of scallops by port landing fluctuated from 1994 through 1998 for many ports. During the past five years, six ports brought in the most landed value: New Bedford, MA; Cape May, NJ; Newport News, VA; Barnegat Light/Long Beach, NJ, Seaford, VA, and Hampton, VA (Table 30). In addition to bringing in the most landed value, in 1994 scallop landings represented more than 30% of the total landed value for New Bedford, MA and Cape May, NJ, and more than 65% of the total landed value for Newport News and Hampton, VA (Table 31). This increased in 2008 to 74% and 84% for New Bedford, MA and Cape May, NJ, respectively, and 93% and 84% for Newport News and Hampton, VA, respectively.

Landed value has increased steadily from 1999-2008; but, some leveling off is apparent in recent years (Table 30). In the most recent two years of data (2007-2008), 43% of ports saw a decrease in the percentage of landed scallop value to total landed value (Table 31). However, many of these decreases are very small, on the order of 1-3%. Between 2003 and 2005, 10 ports increased their landed value for scallops, potentially from an increase in general category landings. The average landed value has increased from \$2 million in 1994 to a peak of \$12 million in 2005. In 2006-2008, the average landed value has hovered between \$9 and \$10 million.

Table 30. Landed value of scallops (in thousands of dollars) by port of landing, FY 1994-2008.

* Includes only ports of landings with landed value of scallops in excess of \$100,000 during FY2008. X = confidential data, with landings that are greater than 100,000 but less than 1.25 million, X* = less than 70,000. Data run August 7, 2009, based on dealer weighout data YTD.

Table 32. Landed Value of scallops, linked to Vessel Homeport, ranked by fishing year 2008.

Table only includes ports with either more than \$1M in 2008 landed value, or more than \$250K in landed value with at least 10% port total scallops. X = confidential, less than 1M; XX = confidential, more than 1M. Data run, August 9, 2009.

The largest numbers of permitted limited access scallop vessels currently are in the ports of New Bedford, MA and Cape May, NJ, which represent 37% and 19% of the total, respectively (Table 33). Of the 348 permitted limited access vessels in 2009, 203 originate from New Bedford, MA and Cape May, NJ. Although the number of permitted limited access vessels has only increased from 308 in 1994 to a peak of 380 in 2005 and New Bedford has always had the largest number of permitted limited access vessels, the port with the next greatest number of contributors shifted from Norfolk, VA (18% in 1994 to 3% in 2009) to Cape May, NJ (9% in 1994 to 19% in 2009).

In addition to having the greatest number of permitted limited access scallop vessels, New Bedford, MA also has the greatest number of general category scallop vessels. Cape May, NJ, Barnegat Light, NJ, and Gloucester, MA also have high numbers of general category scallop vessels. Generally, ports that had a higher number of general category scallop vessels from 1994-2004, such as New Bedford, Gloucester, and Chatham, have seen a significant decrease in these vessels in recent years (Table 34).

Although the largest increases in general category vessels have been from ports in NC, they have increased from 1 or no permitted general category scallop vessels to only about 6 or 7, which results in a 600-700% increase. Regardless of this increase, these ports only had a landed value for scallops of \$311,000 or less (Table 30). Other ports that saw an increase of 300% in general category vessels, such as Chincoteague, VA and Barnegat Light, NJ (Table 34), had a landed value of \$7.3 million and \$16.9 million, respectively (Table 30). Although some ports such as New Bedford and Gloucester have experienced a decline in the number of general category scallop vessels, the simultaneous increase in permitted limited access boats has aided to increase the landed value of scallops in those ports to \$202.5 million and \$812,000 respectively. As Table 34 shows, the general category fleet is not homogeneous, but varies over space and time, with some ports showing a general category fleet that mirrors limited access vessels in size (for example Atlantic City NJ), and others showing a fleet of smaller-scale vessels (such as Fairhaven, MA). Thus impacts to the general category fishery as a whole can be experienced differently in different ports.

4.5 NON-TARGET SPECIES

Non-target species (or ‘bycatch’) include species caught by scallop gear that are not landed, including small scallops. The impacts of the scallop fishery on bycatch have been minimized to the extent practicable. Amendment 10 analyzed the impacts of new management measures (ring size, larger twine top, open area DAS, etc.) on bycatch, relying mainly on recent gear surveys and the general relationship between total area swept and bycatch. In general, the larger twine top mesh allowed greater escapement of many but not all finfish species with minor losses of sea scallop catch (particularly in areas having larger scallops). The effects of the increase to a 4” minimum ring size were assessed for various species observed in field trials, but the major effect came from a greater efficiency in catching scallops over 110-120 mm. Efficiency was forecast to increase by about 10-15%, reducing area swept by the same amount. Since most species were caught incidentally less frequently in dredges with larger rings and efficiency improved in most areas, Amendment 10 estimated that bycatch would decline, particularly in areas having most scallops larger than 110-120 mm. The increase to a minimum 4” ring in all areas occurred in December 2004. Amendment 10 also estimated that the reductions in open area DAS would reduce total area swept and increase scallop LPUE, particularly for larger scallops in the long-term. Appendix IX of Amendment 10 details scallop and finfish bycatch estimates in the scallop fishery (<http://www.nefmc.org/scallops/index.html>).

Framework 16/39 estimated the total bycatch of many finfish species from observed trips taken in controlled access areas. It also estimated the amount of sampling needed in each area to estimate the total bycatch of a given species with various levels of precision. In general, rotational area management is designed to improve and maintain high scallop yield, while minimizing impacts on groundfish mortality and other finfish catches. Access programs may even reduce fishing mortality for some finfish species, because the total amount of fishing time in access areas is very low compared with fishing time in open areas due to differences in LPUE. See Sections 6.1.1.2 and 6.1.1.3 of Framework 16/39 for more information about the expected impacts on bycatch from that action. Catches of regulated species in the access areas were expected to be less than 10% of the overall TAC in the Multispecies FMP. This amount is less than the level that the Groundfish PDT identified as having possible repercussions for meeting the groundfish mortality targets and affecting the rebuilding of overfished groundfish stocks. Many of the impacts are expected to be similar for Framework 21 since this action proposes to implement similar alternatives to both FW16/39 and FW19. Impacts on non-target species may even be reduced compared to recent years because this action proposes fewer open area DAS and less effort on Georges Bank.

4.5.1 Species caught incidentally in the scallop fishery

To identify potential non-target species caught incidentally in the scallop fishery, the Scallop PDT considered discard info from the 2008 SBRM report, Wigley et al. 2008, and various assessments such as GARM III and the Skates Data-poor Workshop (Table 36). A note of caution in using the 2008 SBRM data was that it was not extrapolated out to the entire fishery. Therefore, fisheries with higher observer coverage, such as the scallop fishery, appeared to have more bycatch than other fisheries.

Based on the 2008 SBRM report in which 2007-2008 data was compiled, the species with more than 5% of total estimated catch from discards in the scallop fishery are: fluke, winter flounder, monkfish, barndoor skate, little skate, unidentified skate, surfclams, and ocean quahog. These species were narrowed down by looking at the report presented by Wigley et al. (2008). While it is based on 2005 data, it is extrapolated out across fisheries such that a consistent conclusion can be made. Based on this report, the PDT identified the following species as having more than 5% of total estimated catch from discards in the scallop fishery: monkfish, skate (overall), and windowpane flounder (Table 36).

In addition to the snapshot of information available from the 2008 SBRM process and Wigley et al. (2008), the PDT also reviewed discard info for the scallop fishery in recent assessments for the species listed above. GARM III for multispecies identified that the scallop fishery caught more than 5% of the bycatch (compared to overall catch) for some species by region (Table 37). Georges Bank (GB) and Southern New England (SNE) yellowtail flounder were caught in amounts greater than 5%, but the Cape Cod yellowtail only has occasional spikes over 5%. GB winter flounder has catch over 5%, but neither SNE nor Gulf of Maine (GOM) winter flounder is caught appreciably. Although there is greater than 5% caught in both the GB/GOM and SNE regions for windowpane flounder, the catch is generally higher in SNE. The Skate Data-poor Working Group identified the greatest bycatch for the scallop fishery as little and winter skates. Lastly, when extrapolated out across the entire fishery, the ocean quahog and surfclam assessments show close to zero bycatch of these species by the scallop fishery.

Table 36 – Summary of discards by species in scallop gear types (Based on 2005 observer data presented in Wigley et al. 2008). All values in live mt.

4.5.2 Groundfish Mortality Closed Areas and Yellowtail Flounder

The groundfish closed areas were originally established to reduce the effects of fishing on spawning cod and haddock, in particular within Closed Areas I and II. Peak spawning activity occurs from February to April, coinciding with the original seasonal closures. After spawning, these fish often disperse to other areas during their annual migration. Yellowtail flounder is another species that was intended to be protected by the groundfish closed areas. The Georges Bank stock is predominately found on the southeastern and northwestern portions of Georges Bank, overlapping the scallop access areas in Closed Areas I and II. Unlike spawning cod and haddock, however, yellowtail flounder tend to be present in these locations year around. The Southern New England stock of yellowtail flounder was one of the primary intended beneficiaries of the Nantucket Lightship Area. Most of this stock occurs in the portions of the Nantucket Lightship Area that will remain closed to scallop fishing, or in other areas of Southern New England and the Mid-Atlantic region where scallop fishing occurs in open areas. More details about the biological characteristics of groundfish species in the closed areas is provided in the FSEIS for Amendment 13 to the Multispecies FMP.

Amendment 16 to the Multispecies FMP was recently approved by the Council and is currently under review by NMFS; it is expected to be implemented before May 1, 2010. This action identified a process for setting annual catch limits (ACLs) for all Groundfish species. A major sub-component of yellowtail flounder catch is incidental catch in the scallop fishery, most of

which is discarded. Amendment 16 calls for this catch to be estimated and identified as an “other sub-component” in 2010 until accountability measures (AMs) can be adopted through the scallop FMP under Amendment 15 in 2011, at which point the sub-component will be considered a sub-ACL. This ACL will apply to all scallop fishery catches of yellowtail flounder.

Framework 44 to the GF plan considered this allocation and the proposed action is to allocate 100% of the projected GB and SNE/MA YT flounder ACL needed for the scallop fishery for FY2010 and 90% of what is needed for 2011 and 2012. These values recognize the importance of yellowtail flounder to the scallop fishery and provide an incentive for scallop fishermen to reduce their YT bycatch in order to maximize scallop yield. The values for 2011 and 2012 can be adjusted if there is new information regarding scallop and yellowtail stocks, or based on access area measures in the scallop fishery for those years. The Council decided not to have a separate allocation for the CC/GOM YT stock for the scallop fishery because estimated levels of catch from that stock are relatively low. This may be changed in the future if it is deemed necessary to include CC/GOM YT as part of the sub-ACL.

With 100% of expected YT catch allocated to the scallop fishery, less will be available to harvest for Groundfish vessels. This allocation is intended to control overall mortality on SNE YT. So even under FW21 scenarios that project more scallop effort in SNE, more SNE YT may be allocated to the scallop fishery to compensate for this shift of scallop effort and limit total mortality on SNE YT.

The Council approved FW44 at the November 2009 Council meeting, and it will be effective in 2010. The decision to allocate these amounts was based on an analysis of estimated incidental catch of YT in the scallop fishery and the associated impacts of various allocation alternatives on revenue in both the scallop and groundfish fisheries. Multispecies Framework 44 includes all the analyses related to this decision. Framework 44 also proposes that all limited access vessels be required to land all legal-sized yellowtail flounder.

The Scallop and GF PDTs estimated the incidental catch of yellowtail flounder in the scallop fishery in 2010-2012 for Council action on MS Framework 44. At the September 2009 Council meeting staff presented the amount of YT needed to harvest scallop yield based on the ratio of yellowtail discards to scallop kept catches for the four scallop rotational management scenarios in this action, which will set measures for FY2010 only.

For CC/GOM yellowtail flounder the estimate of required yellowtail flounder allocation is always less than five percent. For GB yellowtail flounder the estimate of required allocation ranges from 11 to 29 percent, while for SNE/MA yellowtail flounder it ranges from 14 to 41 percent (Table 38). There are differences between the scallop scenarios with the ‘no new closure’ scenarios requiring the least yellowtail flounder for GB and SNE/MA yellowtail stocks. The range is relatively large due to the variety of scallop allocation scenarios under consideration (Table 38). In terms of YT catch in the scallop fishery in the past, the expected values for 2010 are within the range of catches for each stock area in recent years.

Table 38 – Range of percent YT catch needed for the 4 scallop allocation scenarios under consideration

| | 2010 | 2011 | 2012 |
|---------------|--------------|--------------|--------------|
| CC/GOM | 2.0 - 4.5% | 1.3 - 2.5% | 0.8 - 2.8% |
| GB | 11.4 - 22.4% | 20.9 - 24.3% | 25.9 - 28.8% |
| SNE/MA | 22.5 - 40.9% | 14.0 - 19.5% | 15.0 - 15.3% |

Table 39 – Summary of expected scallop catch and DAS allocations for 2010

| | 2010 Scallop Landings (mt) | 2010 Estimate of DAS per FT vessel |
|------------------------------|----------------------------|------------------------------------|
| No Closure F = 0.20 | 18829 | 29 |
| No Closure - F = 0.24 | 21445 | 38 |
| Closure F = 0.18 | 22299 | 42 |
| Closure F = 0.20 | 24269 | 51 |

Proposed action shaded

Table 40 summarizes the annual YT catch by scallop dredge gear (landings and discards) for 2004-2008. Annual changes in catch are largely due to varying scallop management tactics that allocated access areas and DAS differently each year.

Table 40 – Summary of YT TACs and YT catch on scallop dredge vessels for 2004-2008 compared to estimates for 2010 (in mt).

| Fishing Year | | 2004 | 2005 | 2006 | 2007 | 2008 | 2010 Estimates |
|---------------|--|------------|------------|------------|------------|------------|----------------|
| CC/GOM | Total TAC | 881 | 1233 | 650 | 1078 | 1406 | 863 |
| | Total TAC for scallop fishery* | 86.3 | 120.8 | 63.7 | 105.6 | 137.8 | N/A** |
| | Scallop AA open or closed | N/A | N/A | N/A | N/A | N/A | N/A |
| | Total YT catch by dredge gear (landings and discards) | 18 | 6 | 12 | 35 | 5 | 17-30 |
| SNE | Total TAC | 707 | 1982 | 146 | 213 | 312 | 493 |
| | Total TAC for scallop fishery* | 69 | 194 | 14 | 21 | 31 | 111 |
| | Scallop AA open or closed | open | closed | open | open | open | open |
| | Total YT catch by dredge gear (landings and discards) | 125 | 130 | 168 | 188 | 151 | 111-202 |
| GB | Total TAC | 6000 | 4260 | 2070 | 900 | 1869 | 960 |
| | Total TAC for scallop fishery* | 588 | 417 | 203 | 88 | 183 | 110 |
| | Scallop AA open or closed | open | open | open | open | closed | open |
| | Total YT catch by dredge gear (landings and discards) | 84 | 194 | 254 | 122 | 134 | 110-215 |

*Scallop TAC has been calculated from total TAC = 9.8% of total TAC. These values have not been confirmed with regulations.

** Council decided in Framework 44 that scallop fishery should not receive an allocation of CC/GOM YT since catch relatively minor

The Scallop PDT completed a relatively simple estimate of overall revenue loss if less YT were allocated to the scallop fishery than “needed.” For each FW21 scenario an estimate of YT needed by stock area (in both amount and percentage of total) was identified. The PDT then evaluated the overall impact on scallop revenue if some amount less was allocated to the scallop fishery. All the analyses are summarized in FW44, and since the Council selected to allocate 100% of the projected need of YT catch, impacts are expected to be minimal. The Council may consider other ways to address incidental catch of YT in the scallop fishery in the near future.

The final allocations of GB and SNEMA YT for the scallop fishery in 2010 through 2012 as specified in Multispecies Framework 44 are given in Table 41.

Table 41 - YT sub-components (2010) and ACLs (2011 and 2012) allocated to the scallop fishery 2010-2012 (in mt)

| | 2010 | 2011 | 2012 |
|--------------|-------------|-------------|-------------|
| GB | 146 | 201 | 307 |
| SNEMA | 135 | 82 | 127 |

Finally, this action continues to reduce impacts on finfish bycatch with a hard TAC of YT flounder in the NL access area. When that TAC is reached the area is closed to all scallop fishing. Limited access vessels are permitted to fish 5.77 DAS of compensation in open areas if they did not complete their NL access area trip before the closure. It is uncertain if vessels will have similar YT discard rates in NL compared to open areas since some vessels will fish those open area DAS in areas with higher, lower, or similar YT discard rates. In 2010 there is an overall allocation of SNE YT to the scallop fishery (included in Groundfish Framework 44), and if at the end of the year that is also exceeded, the Council intends to address any overages under Amendment 11 in the 2011 or 2012 fishing years. Therefore, this action is expected to minimize impacts on YT bycatch by maintaining the hard TAC in access area fishing as well as being held to an overall YT TAC in each stock area, as proposed in Framework 44.

4.5.3 Observer set-aside program

The scallop fishery is the only fishery in the Northeast that already has an industry-funded observer program in place. Since 1999, the majority of observer coverage in the scallop fishery has been funded through the scallop observer set-aside program. A percentage of the total allowable catch (TAC) in access areas has been deducted before allocations are made to generate funding for vessels required to carry an observer. Amendment 10 extended that requirement to open areas as well, so a percent of potential allocated effort in DAS from open areas is set-aside to help fund the program. Observer coverage is necessary in the scallop fishery to monitor bycatch of finfish and to monitor interactions with endangered and threatened species. Vessels required to carry an observer are authorized to land more than the possession limit from trips in access areas, and in open areas vessels are charged a reduced amount to help compensate for the cost of an observer.

In 2008 and 2009, a total of 629 trips and 404 trips, respectively, were observed on both limited access and general category vessels from the observer set-aside program (Table 42, 2009

numbers are through 11/30/09). This is equivalent to roughly 3600 sea days in 2008 and 2700 sea days in 2009 observed through this program. An additional 96 (in 2008) and 58 (in 2009) sea days were observed and paid for fully with federal funds.

Table 42 – Summary of observed trips in the scallop fishery from observer set-aside program

| | 2008 | | 2009 (as of 11/30/09) | |
|---|-------------------------------------|--------------------|-------------------------------------|--------------------|
| | Trips | DAS | Trips | DAS |
| <i>Elephant Trunk</i> | <i>4 trips allocated</i> | | <i>3 trips allocated</i> | |
| Limited Access | 213 | 1752 | 90 | 799 |
| General Category | 150 | 246 | 116 | 213 |
| <i>Delmarva</i> | <i>Closed</i> | | <i>1 trip allocated</i> | |
| Limited Access | Closed | | 21 | 247 |
| General Category | Closed | | 35 | 68 |
| <i>Closed Area II</i> | <i>Closed</i> | | <i>1 trip</i> | |
| Limited Access | Closed | | 23 | 191 |
| General Category | Closed | | N/A – no trips allocated | |
| <i>Nantucket Lightship</i> | <i>1 trip allocated</i> | | <i>Closed</i> | |
| Limited Access | 34 | 244 | Closed | |
| General Category | 106 | 193 | Closed | |
| <i>Open Areas</i> | <i>35 DAS allocated</i> | | <i>37 DAS allocated</i> | |
| Limited Access | 126 | 1195 | 119 | 1200 |
| General Category | N/A – not part of set-aside program | | N/A – not part of set-aside program | |
| <i>TOTAL</i> | <i>675</i> | <i>3726</i> | <i>404</i> | <i>2718</i> |
| Limited Access | 373 | 3191 | 253 | 2437 |
| General Category | 256 | 436 | 151 | 281 |
| Additional non-RSA federally funded days (GC Open Area) | 46 | 96 | 38 | 58 |

This framework includes the 1% set-aside for observer coverage from access area TACs as well as 1% of DAS in open areas. Estimated set-aside available for 2010 is 398,756 pounds (Table 13). Based on an estimated value of \$7.31 a pound (the updated estimate of average price for 2010 under proposed action scenario), this set-aside is expected to generate approximately \$2.9 million dollars. Based on that estimate, approximately 3,737 sea-days could be covered under the current set-aside program, assuming a \$780 per day cost to carry an observer. This value far exceeds the number of sea days needed to achieve the SBRM mandate of a 30% CV. The estimated sea days needed in the scallop fishery for 2009 were calculated using the same methods as the SBRM Amendment (NMFS, 2007).

For 2009 (April 2009-March 2010), 1354 sea days would achieve a 30% CV for all fishing modes in the scallop fishery (not counting federally funded general category open area days, 1564 with these days). Therefore, if the needed observer coverage levels for 2010 are similar to the values generated for 2009 with the 2007-2008 data, the 1% set-aside is expected to provide adequate funding to attain a 30% CV for each fishing mode. If additional days are needed to adequately observe the fishery beyond the 1% set-aside, they would be funded either directly by

the industry from vessels that are required to carry an observer after the set-aside has been exhausted or funded by the federal government under the regular observer program budget. The SBRM prioritization information for 2010 is expected to be available early in the 2010 calendar year, before April 2010 when the next year begins.

5.0 ENVIRONMENTAL CONSEQUENCES OF ALTERNATIVES

5.1 SCALLOP RESOURCE

5.1.1 No Action

In the alternatives for area rotation management and for open area DAS allocations, “No Action” is exactly what it implies: no additional action will be taken and so the measures and allocations that are specified in the present regulations (CFR §648, Sub-part D) are maintained.

Under “No Action,” the trip allocations for access areas would roll over from FY 2009. In terms of Mid-Atlantic access areas, full-time vessels would receive 3 Elephant Trunk Access Area (ETA) trip and one trip in Delmarva. As for Georges Bank access areas, Closed Area I is scheduled to open in 2010, but no trips would be allocated because none were allocated in 2009; Closed Area II is scheduled to be closed, and NL is scheduled to be open, but again since no trips were allocated in 2009, no trips would be allocated in 2010. In addition, under “No Action,” the Hudson Canyon Access Area would remain closed.

In terms of open areas, under “No Action”, limited access scallop vessels would receive the same allocation designated for FY2009 had the IFQ program been fully implemented, resulting in the DAS fleet receiving 94.5 % of the allocated total target TAC rather than the 90% allocated to this fleet during the “transition period” to IFQs. This allocation would result in 42 DAS for full-time limited access scallop vessels.

5.1.1.1 Summary of biological projections for the No Action alternative

Under the no action alternative overall fishing mortality is about $F = 0.25$. DAS are 42 for full-time vessels under this scenario, 3 trips in ETA and one trip in Delmarva. The total biomass from 2010 through 2016 is about 1.27 million mt (Table 43), about 4000 mt more than the proposed action (Table 45). Total landings for 2010 under this alternative are 22,510 mt or 49.6 million pounds. While landings are higher for 2010 under no action than the proposed action, it should be noted that there are very low U10 landings under No Action, due to no fishing in GB closed areas. The cumulative landings for 2010-2016 for the No Action alternative are 427.5 million pounds, just higher than the proposed action. Finally, total bottom area swept in 2010 is higher than the proposed action, since DAS allocations are higher (Table 51).

Table 43 – Summary of biological projections for No Action alternative

| Year | Total Biomass (mt) | Landings (lbs) | Bottom Area |
|---------------|--------------------|----------------|-------------|
| 2010 | 154,012 | 49,626,064 | 4,390 |
| 2011 | 171,583 | 59,317,586 | 3,349 |
| 2012 | 181,958 | 66,652,367 | 4,547 |
| 2013 | 185,518 | 62,622,316 | 4,429 |
| 2014 | 190,050 | 65,909,409 | 4,572 |
| 2015 | 191,604 | 64,729,936 | 4,864 |
| 2016 | 192,603 | 58,631,949 | 5,625 |
| Cum 2010-2016 | 1,267,328 | 427,489,627 | 31,776 |

Overall, impacts of No Action on the scallop resource would be higher than other scenarios since the overall estimate of F is higher (0.25). DAS are higher than most scenarios and no additional area is closed, thus overall F is higher. Fishing effort in ETA would definitely be higher than all scenarios since this alternative allows for three trips in ETA, same as 2009. Three trips would likely lead to high fishing mortality in that area. On the other hand, No Action includes no access into areas on GB, so F would be lower in that area than the biomass can support so optimizing potential yield in that area would not result. Not closing the Channel under No Action would reduce the potential yield from that area in the near and long term.

There are several measures included in this action that will be in effect if FW21 is delayed. Since these measures are designed to prevent excessive fishing before FW21 is implemented they are expected to have positive impacts on the resource. Any effort used prior to implementation that ends up being more than what is ultimately allocated will be reduced on an individual basis in 2011. For example, if a vessel uses more than 38 DAS in FY2010, any additional DAS will be reduced from their 2011 allocation.

Status quo for this action is considered to be the scenario that has an overall fishing mortality of 0.20 and does not include a new closure in the Channel (NCLF20). This scenario is considered the status quo because if the Council set F_{target} for 2010 based on how it has been set in recent years, the F_{target} would be $F = 0.20$. This target is lower than the guidance recommended in the Scallop FMP to set the target at 80% of the $F_{threshold}$, or at 0.23 in order to prevent overfishing, account for non-uniform fishing, and account for uncertainty in projections and management measures in the fishery. Therefore, this scenario would be consistent with how the Council has been setting specifications for this fishery in the last few years with a handful of access area trips and then DAS set to meet an overall F . No new closed area would be implemented under status quo. Status quo in this case does not mean current measures rollover, it is in reference to how F_{target} is set.

5.1.2 Summary of biological projections for management scenarios considered in this action

The biological impacts for this action are based on results from an updated version of the SAMS (Scallop Area Management Simulator) model. This model has been used to project abundances and landings to aid management decisions since 1999. SAMS is a size-structured model that forecasts scallop populations in a number of areas. In this version of the model, Georges Bank was divided into the three access portions of the groundfish closures, the three no access portions of these areas, a proposed closure area in the South Channel, the remainder of the South Channel, the Northern Edge and Peak, and the Southeast Part of Georges Bank (Figure 28). The Mid-Atlantic was subdivided into six areas: Virginia Beach, Delmarva, the Elephant Trunk Access Area, the proposed new version of the Hudson Canyon South Access Area, New York Bight South, and Long Island. For this framework these areas were then merged into the three YT stock boundaries because the Council needs to know the projected scallop catch by YT stock area for allocation decision related to YT bycatch TACs in Framework 22.

It is important to note that this model is based on fishing mortality by area and the inputs are not fishery-based in terms of DAS, etc. The simulation does not model individual vessels or trips; it

models the fleet as a whole. The output of the model is then used to eventually compute individual DAS allocations after set-asides are removed, general category landings, etc.

Overall four main scenarios are under consideration:

- No closure in Channel, Overall $F = 0.20$ (status quo F_{target})
- No, closure in Channel, Overall $F = 0.24$
- S. Channel closure, Overall $F = 0.20$
- S. Channel closure, Overall $F = 0.18$

Overall F was reduced to 0.18 for last alternative because the new closure had unpredictable model effects on the overall F , so a lower value (0.18) was made an alternative instead of higher F strategies ($F = 0.20$ or $F = 0.24$).

The following table gives the four alternatives and the resulting landings and DAS associated with each.

Table 44 – Summary of scenarios considered in the biological projections for Framework 21

| 2010 | | CL1 | CL2 | NLS | ET | Dmv | HC | Sch | IndvDAS* |
|-------|--|--------|--------|-----|----|-----|--------|--------|----------|
| NCF20 | | closed | closed | 1 | 2 | 1 | closed | open | 29 |
| NCF24 | | closed | closed | 1 | 2 | 1 | closed | open | 38 |
| CF18 | | closed | closed | 1 | 2 | 1 | closed | closed | 42 |
| CF20 | | closed | closed | 1 | 2 | 1 | closed | closed | 51 |

* The full-time individual DAS value is based on an estimate of 340 active full-time equivalent limited access vessels. These values have removed TAC for general category allocations and set-asides. Shaded alternative is proposed action.

Overall, allocations in 2010 are comparable but slightly less than the last few years because there are only four access area trips, and reduced DAS to accommodate a F_{target} of 0.24. Access area trip allocations are expected to return to five per year after 2010. Another reason DAS allocations are lower in 2010 is that the LPUE function has been changed (higher) so the chance of exceeding F_{target} is lower. The PDT discussed that it will not be popular to close a new area and allocate fewer access area trips in the same year. However, it was also discussed that the growth rate in the Channel is ~80%, and not closing it will prevent the fishery from gaining that high growth potential. It was also discussed that closing this area will make managing YT bycatch and minimizing impacts on EFH on GB easier because when the area reopens scallop catch rates will be higher, so time gear is fishing will be less in the Channel compared to that area being fished as an open area. Figure 29 is a chart of the cod HAPC under consideration in the Habitat Omnibus Amendment.

The SAMS model provides projected exploitable biomass estimates, scallop landings, average LPUE, DAS used and bottom area swept by area. All of these projections are described in the following tables and figures. The analyses focus on projections from 2010-2016 because those are the years that the impacts of a new closure would be apparent, and in which the model results are most accurate. If the Channel is closed in 2010, it will likely remain closed until 2013, and would be a controlled access area for about three years (until 2016). Therefore, both the short and long term impacts of this closure and various levels of overall F can be compared. After year one, the model uses the same assumptions for allocations in 2011-2016. Therefore, the only

difference between the overall performance of the scenarios is the year one allocations (closing the Channel area compared to not closing it and setting F_{target} at various levels). For this analysis F_{target} has been set at $F = 0.24$ in 2011 through 2016 assuming the same area rotation and DAS schedule except for the closure in the channel.

Figure 28- SAMS model areas, with statistical areas and stratum boundaries on Georges Bank and the Mid-Atlantic

5.1.2.1 Projected exploitable biomass by area

Exploitable biomass is similar for all 4 scenarios in 2010 when the fishery begins (assumed to be on March 1, 2010) (Table 45). In the short term (2010-2012) NCLF20 scenario has slightly higher biomass, but in the long-term CLF18 has the highest biomass compared to all the other scenarios (Table 46). From 2013 and the next several years the Channel area reopens as an access area CLF18 has biomass values close to 200,000 mt (440 million pounds) (Figure 30).

Table 45 – Total projected 2010 scallop exploitable biomass by scenario and SAMS area (million pounds)

Figure 30 - Comparison of projected total scallop biomass for the scenarios under consideration (2010-2016)

Exploitable biomass projections for the channel area alone are much higher from 2010-2016 if the area is closed compared to if it is left open. Exploitable biomass is projected to peak around 25,000 mt in 2013 if the area is closed compared to a peak of 14,000 mt if the area is left open (Figure 31).

Figure 31 - Comparison of projected scallop exploitable biomass for the channel closed area if closed (BLUE) compared to if it is left open (RED) for 2010-2016

5.1.2.2 Projected scallop landings by area

Projected landings are highest for CLF20, and lowest for NCLF20 in 2010 (Table 47). Projected landings are higher for the two options that do not close the channel for the short term, 2011-2012. But by 2013, when the Channel area is proposed to reopen catch levels are higher for the two alternatives that propose closing that area in this action. The CLF18 option has higher landings once the area reopens compared to all the other scenarios. From about 2013-2016, CLF18 has 2-4 million higher landings each year compared to the alternatives that do not close

the area. For the entire seven year period CLF18 has 5-10 million more pounds of landings. NCLF24 and CLF20 have about the same total landings for the same time period, about 426 million pounds, and NCLF20 projects 5 million more landings than those two scenarios and 5 million pounds less than CLF18 (Table 48).

Table 47 – Total projected 2010 scallop landings by scenario and SAMS area (million pounds)

| | SAMS Area | CLF18 | CLF20 | NCLF20 | NCLF24 |

Figure 32 - Comparison of projected scallop landings for the scenarios under consideration (2010-2016) in mt

Figure 33 compares the projected catch from the Channel area if it is closed in this action, compared to if it is left open. Again, for 2010-2012 catch is higher from that area if left open, and declines quickly after 2012. If closed, catch will be higher in 2013 (over 5000 MT or 12 million pounds). Table 46 shows that for the entire seven year period CLF18 and CLF20 have highest catch for this area, just over 43 million pounds, four to five million pounds more than the scenarios that do not close the channel.

Table 49 – Projected landings from the channel closure area for 2010-2016 (pounds)

| Scenario | CLF18 | CLF20 | NCLF20 | NCLF24 |

| Grand Total | 43,153,224 | 43,186,835 | 39,508,078 | 38,612,444 |

Figure 33 - Comparison of projected scallop landings for the channel closure area if closed (BLUE) compared to if left open (RED) for 2010-2016 (mt)

5.1.2.3 Projected LPUE

In 2010 overall LPUE is estimated to be between 1,671 and 1,885 depending on the scenario. It is much higher in access areas compared to open areas. LPUE values are similar for the scenarios in access areas, so LPUE are compared in this section for open areas only. In FY2010-2012 LPUE is higher for the two options that do not close the channel; this is primarily because those scenarios allocated fewer open area DAS, so F in open areas is lower providing more catch per DAS.

The closure has two immediate effects: it reduces F and forces fishing effort elsewhere. The first effect causes there to be more open area days at a given fishing mortality with a closure than without. Even when F is reduced down to $F = 0.18$, there are still more open area days than at $F = 0.24$ without a closure, and they are concentrated in a smaller area.

In years one through three average LPUE is higher for the scenarios that do not close the area in the Channel, because DAS allocations are lower. In 2013 and beyond, when the Channel area reopens, LPUE is lower for the two scenarios that close the area in the Channel. LPUE peaks in 2012 for these scenarios and then declines for the remainder of the time series. On the other hand, LPUE estimated in open areas are lower for the two scenarios that close the channel, again since these options allocate more DAS to make up for the closed area. When more DAS are allocated fishing mortality is higher in open areas and LPUE values decline. CLF20 allocated the more DAS (51 per vessel) and that alternative performs the worst in terms of LPUE.

After 2013 when the channel reopens F in open areas is reduced again since more F is coming from channel access area. So LPUE will increase for the two scenarios that close the channel after 2013. Average LPUE for open areas remain higher for the next few years while the Channel is an access area for the two scenarios that close the channel in FW21.

Figure 34 – Comparison of projected LPUE in open areas for the scenarios under consideration (2010-2016)

5.1.2.4 Projected DAS used by area

Projected DAS used in 2010 vary depending on the scenario. CLF20 has the highest projection of overall DAS used of over 32,000. This is due to the fact that this scenario allocates the most DAS of any other scenario (54 per FT vessel). NCLF20 has the lowest, and it also has the lowest DAS allocation of 29 DAS. By 2011, DAS used amounts are similar, and in the longer term NCLF20 has slightly higher DAS used projections, followed by CLF18.

Table 50. Projected DAS used by area for 2010

| Reg | Sreg | CLF18 | CLF20 | NCLF20 | NCLF24 |
|-----------|---------|--------|--------|--------|--------|
| GB | SEP | 1,953 | 2,502 | 737 | 1,032 |
| | CL1-Acc | 674 | 674 | 673 | 675 |
| | CL1-NA | 0 | 0 | 0 | 0 |

| | VB | 207 | 380 | 79 | 111 |
| | | | | | |
| All Total | | 28,189 | 32,020 | 22,053 | 25,740 |

** Note that all DAS associated with CAI access area has been converted to catch from NL access area. Original projection included partial access in both areas – but ultimate allocation scenarios have full access from NL only. Total DAS used in NL will be sum of CL1-Acc and NLS-Acc.*

5.1.2.5 Projected bottom area swept by area

Evaluating projected area swept is useful for comparing potential impacts on non-target species and EFH because it relates to the estimated area swept by scallop gear under each alternative. The two options that do not close the channel have lower area swept, and DAS allocated for Year 1 (2010) (Table 51). If the Channel is closed, area swept is expected to increase for MA open areas (LI, NYB, and VB). Bottom area for the open portion of the Channel will also be higher in the short term for the two options that close the channel. Once the Channel opens in 2013, the

two options that close the Channel now have lower total bottom area swept compared to the two scenarios that leave it open in this action.

From 2010-2016, the amount of time the Channel would be closed and re-opened as an access area total bottom area swept is lowest for the two scenarios that leave the channel open (Table 52). Area swept does decline for the two options that close the channel after 2013 when the channel reopens, but the reduction is not that dramatic because those scenarios also allocate higher DAS. The closure has two immediate effects: it reduces F and forces fishing effort elsewhere. The first effect causes there to be more open area days at a given fishing mortality with a closure than without. Even when F is reduced down to $F = 0.18$, there are still more open area days than at $F = 0.24$ without a closure, and they are concentrated in a smaller area. This is what causes the additional area swept. To eliminate an increase in area swept from the closure an even lower overall F would need to be applied (i.e. $F = 0.16$).

Table 51. 2010 Projected bottom area swept (sq. nautical miles)

| Reg | Sreg | CLF18 | CLF20 | NCLF20 | NCLF24 |

Figure 35 – Comparison of projected area swept for the scenarios under consideration (2010-2016)

5.1.2.6 Overall comparison of the scenarios

In the short term (2010-2012) NCLF20 scenario has slightly higher exploitable biomass, but in the long-term CLF18 has the highest exploitable biomass compared to all the other scenarios (Table 46). Not surprisingly, exploitable biomass projections for the channel area alone are much higher from 2010-2016 if the area is closed compared to if it is left open (Figure 31). For the entire seven year period (2010-2016) CLF18 has 5-10 million more pounds of landings compared to the other scenarios. NCLF24 and CLF20 have about the same total landings for the same time period (426 million pounds) and NCLF20 projects 5 million more landings than those two scenarios and 5 million pounds less than CLF18 (Figure 33). Therefore, CLF18 has the highest cumulative exploitable biomass and projected landings for 2010-2016 compared to the other alternatives.

Overall the closure has two immediate effects: it reduces F and forces fishing effort elsewhere. The first effect causes there to be more open area days at a given fishing mortality with a closure than without. Even when F is reduced down to $F = 0.18$, there are still more open area days than at $F = 0.24$ without a closure, and they are concentrated in a smaller area. That is why LPUE is lower and area swept is higher for the two options that close the channel at first. After the Channel opens in 2013 LPUE is higher and area swept is lower for the two scenarios that close the Channel. The differences are not that large since the only difference in the figure is for the channel area alone, all other aspects of the scenarios are identical in those years ($F_{target} = 0.24$). **In summary, over the seven years LPUE is slightly higher and area swept is slightly lower for the two options that do not close the channel, particularly in 2010-2012 while the channel is closed because DAS allocations are substantially higher to compensate for the closure.** This is an artifact of a system where the target fishing mortality is set for all areas combined (open, closed, and access areas). Having a fixed overall fishing mortality target under area rotation is very problematic and causes issues like this. Amendment 15 is considering an alternative to change the overfishing definition to address this problem.

5.1.3 Measures for limited access vessels

This framework includes the specific access area schedule and DAS allocations for all limited access scallop vessels. Four different scenarios were under consideration: two that propose closing a new area in the South Channel for area rotation and two that do not. Two options are considered for each at different overall F values.

In general, alternatives with higher open area DAS have higher estimates for DAS used and bottom contact time. In addition, LPUE in open areas is lower for these alternatives compared to the scenarios that allocate fewer DAS. Overall F is estimated to be the same for all scenarios over time, but since there is currently not much biomass in open areas, higher F rates in these areas are not beneficial for the scallop resource in open areas.

One-percent of the estimated TAC for each access area and open area DAS will be set-aside to help fund observers. In addition, 2% of the estimated TAC for each access area and open area DAS would be set-aside to fund scallop-related research. The percent of TAC and total DAS set aside for observers and research will be removed before allocations are set for limited access and

general category fisheries. Overall, setting aside TAC to help defray the cost of observers and collect scallop resulted research improves overall management of the Scallop FMP which ultimately has beneficial impacts on the scallop resource.

Georges Bank Access Areas

If the YT flounder bycatch TAC is reached in Nantucket Lightship, limited access vessels are permitted to use access area trips at a compensation rate in open areas. Analyses suggest that the compensation for Nantucket Lightship in 2010 would be 5.77 DAS under the proposed action. Since the compensation rates are determined by estimating an equivalent level of mortality, the overall impacts of this alternative on the scallop resource are expected to be neutral. For example, the number of scallops harvested in 5.77 DAS in open areas in 2010 is expected to be equal to the number of scallops harvested on one 18,000 pound access area trip in Nantucket Lightship.

Mid-Atlantic Access Areas

The seasonal closure in ETA that will roll over under this framework (September 1-October 31) is expected to have positive impacts on the scallop resource by reducing effort in that area when scallop shell height-to-meat weight ratios are lower. In the Mid-Atlantic - the southern range of the scallop resource - there is a seasonal cycle in meat yield that increases from March to July and then declines until October-November (Schmitzer, 1988). Therefore, reducing effort in that area during September and October will reduce mortality. Framework 18 assessed the seasonal differences in meat count for this time period in the Mid-Atlantic (See Section 5.1.1.2.7 of Framework 18; NEFMC, 2005).

The seasonal closure alternatives that were considered for Delmarva under the RPM alternatives (September 1-October 31 or October 1- October 31) are expected to have positive impacts on the scallop resource for the same reasons described above for ETA.

Other Measures

If the LAGC IFQ program is not fully implemented before March 1, 2010 the LAGC fishery would be allocated 10% of the total projected scallop catch during the transition period to ITQs, compared to 5% if it is in place. The FW21 management scenarios include a specific DAS allocation to the LA fishery based on that sector of the fleet being allocated 95% of the projected catch. Regulations require that if the transition period is extended for another year LA DAS must be reduced by an equivalent amount to prevent overfishing. The needed DAS reductions per scenario are described in Table 15. Overall, there are no expected differences of impacts on the scallop resource if the limited access fishery lands these scallops or the general category fishery. These vessels do tend to fish in different areas and sometimes seasons, but overall impacts on the scallop resource should be neutral.

5.1.4 Measures for General category vessels

5.1.4.1 Measures if IFQ program is delayed

5.1.4.1.1 Quarterly hard-TAC for transition period to limited entry (FY2008)

If the IFQ program is delayed and is not implemented before March 1, 2010 the general category fishery will continue to be managed under a quarterly hard TAC for 2010. All LAGC IFQ permits and permits under appeal will be permitted to fish under general category rules and would be allocated 10% of projected scallop catch. The total general category allocation (open and access areas combined) will be divided into four quarters. Since there is an overall TAC, this alternative is not expected to have impacts on the scallop resource. The proposed allocations are higher during the spring and summer (Quarters 1 and 2) when meat weights are larger.

If the LAGC IFQ program is fully implemented before March 1, 2010 then general category qualifiers will receive an individual fishing quota based on their contribution to historical landings. IFQs will not be area-specific; a vessel can choose to participate in an access area program and landings will be removed from their individual allocation. Vessels will be permitted to catch that quota in any area available (open areas or access areas) until the fleet-wide allocation is harvested. In general, this alternative is not expected to have impacts on the scallop resource. The impacts of the overall IFQ program were assessed in Amendment 11, and in general this alternative is expected to have positive impacts on the scallop resource compared to the No Action alternative for Amendment 11 (no limited entry program).

This action includes a 70,000 pounds hard-TAC for the NGOM. Vessels that qualify for a LAGC NGOM permit can fish up to 200 pounds a day in this area. Once the TAC is reached, no scallop vessels are permitted to fish in the NGOM area. Because all scallop fishing is prohibited once the TAC is reached, this alternative is expected to have beneficial impacts on the scallop resource, provided the TAC is set at the appropriate level and is effectively monitored. In the long run, when an assessment of this area is available, the hard TAC should help prevent overfishing of the scallop resource in this area.

This action includes a 50,000 pound target TAC for vessels with an incidental LAGC permit. Vessels that qualify for a LAGC incidental permit are permitted to land up to 50 pounds of scallop meats per fishing trip. Considering mortality from incidental catch in a more direct way could have indirect benefits on the scallop resource by taking this source of mortality into account before allocations are made to the fishery. The PDT will review this estimate and revise it if expected mortality from incidental catch changes in the future.

5.1.5 Consideration of new rotational area in the great south channel

Amendment 10 defines the criteria for closing an area to protect young scallops. Under adaptive area rotation, an area could close when the expected increase in exploitable biomass in the absence of fishing mortality exceeds 30% per year and re-open to fishing when the annual increase in the absence of fishing mortality is less than 15% per year. Identification of areas would be based on a combination of the NEFSC dredge survey and available industry-based surveys. The boundaries are to be based on the distribution and abundance of scallops at size;

ten-minute squares are the basis for evaluating continuous blocks that may be closed. The guidelines are intended to keep the size of the areas large enough and regular in shape to be effective, while allow a degree of flexibility. The Council and NMFS are not bound to closing an area that meets the criteria and the Council and NMFS may deviate from the guidelines to achieve optimum yield.

If any areas qualify, the area would close to all scallop vessels and vessels would not be permitted in that area until a later date when biomass estimates project higher yields. The Council is not required to implement these rotational closed areas just because they meet the criteria recommended in Amendment 10 for new closures, but they should be considered.

Results from the 2009 survey suggest that small scallops have settled in parts of the Great South Channel. The PDT recommended consideration of an area to the north of the Nantucket Lightship closed area and west of Closed Area I; the top left coordinate of the polygon is 41 20' N and 69 30' W and the bottom left coordinate is 40 50'N and 68 50'W (Figure 4). Recruitment on GB has been below average since 2001 and has only improved in the last few years. High numbers of small scallops (<70 mm) were caught on 2007, 2008 and 2009 survey tows in this area. The SMAST video survey of this area also found high scallop recruitment in this area.

Physical area of proposed closure

Approximately 18% of the total "South Channel" region (from A10 boundaries) would be included in the proposed GSC closure, which meets the rotational closure criteria from A10. In comparison to open areas on Georges Bank the closure is 11% of the total Georges Bank open area.

Table 53 – Physical area comparison of open versus closed with proposed GSC area

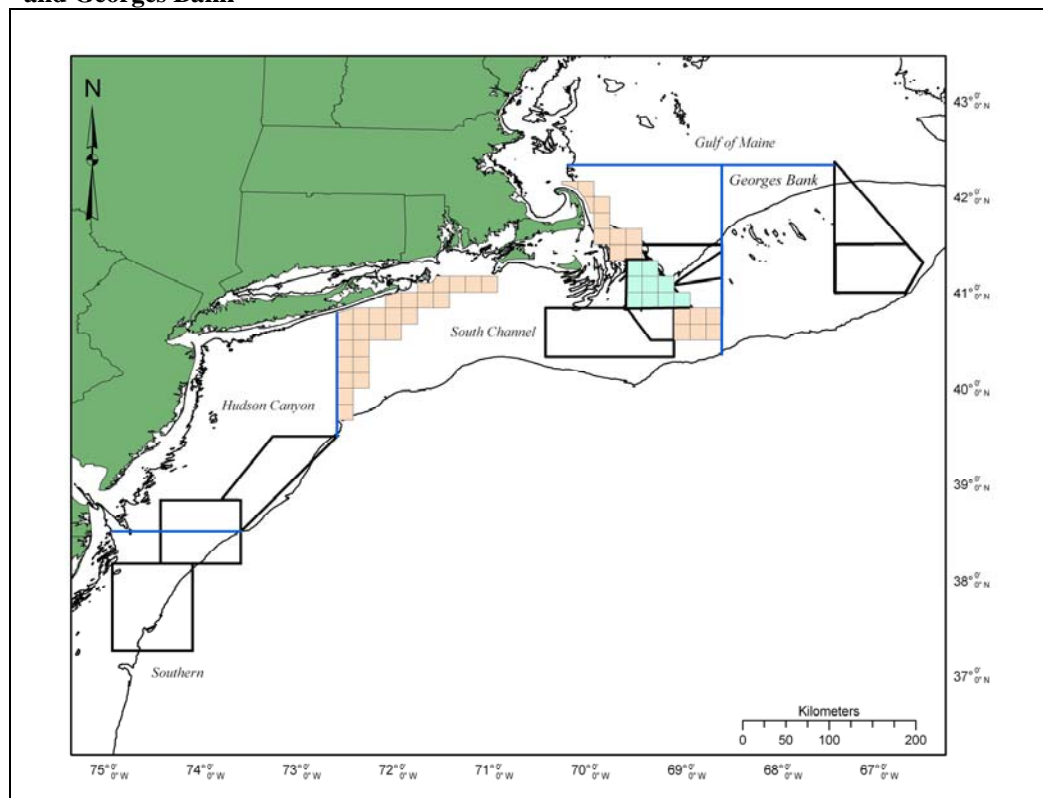

| Region | Area km² | % of Area Contained in Proposed GSC Closure |
|---|----------------------------|--|
| Proposed GSC Closure | 2332 | |
| A10 South Channel Region | 13129 | 18 |
| A10 South Channel Region - excluding Proposed GSC Closure | 10797 | 22 |
| Georges Bank Open Area | 20310 | 11 |
| Georges Bank Open Area - Excluding Proposed GSC Closure | 17978 | 13 |

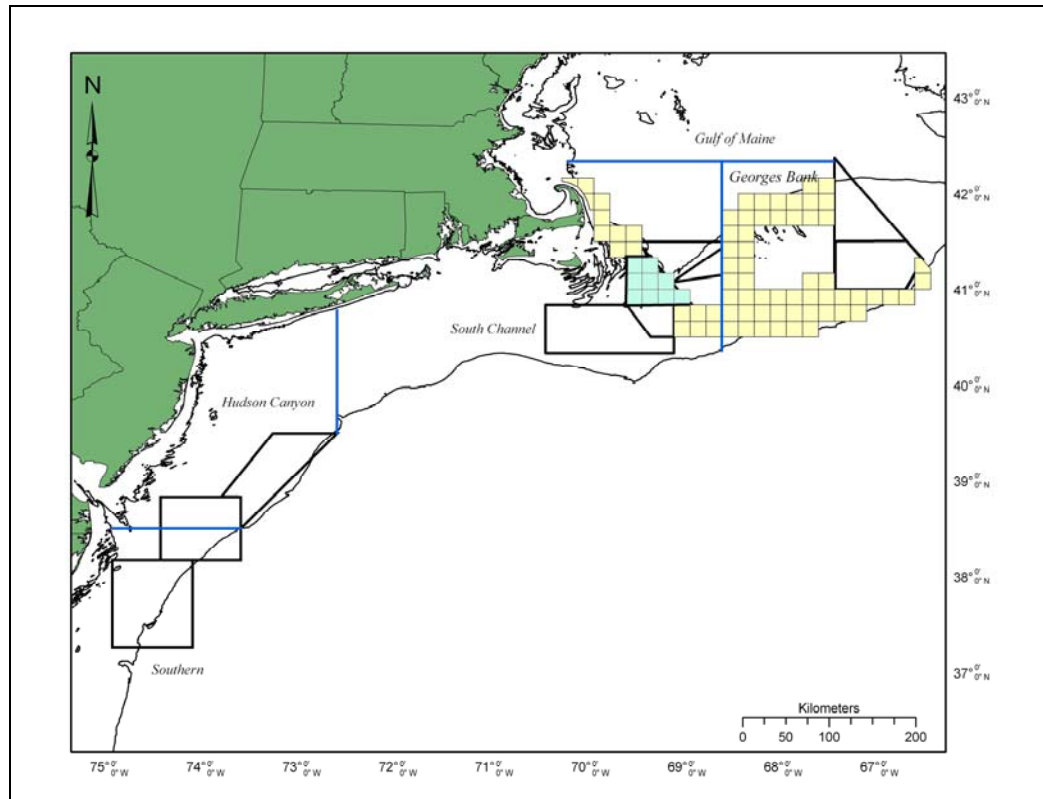

Biomass: Based on data provided by SMAST, approximately 8% of the exploitable biomass on all of Georges Bank and 35% of the exploitable biomass in open areas of Georges Bank is within the area proposed for closure.

Overall: In order to get a sense of expected impacts from this closure, it is useful to compare the projected exploitable biomass and LPUE estimates for the alternatives that close the area and the alternatives that do not. In the short term NCLF20 scenario has slightly higher exploitable biomass, but in the long-term CLF18 has the highest exploitable biomass compared to all the other scenarios. Exploitable biomass in open areas in the Channel is hit relatively hard for the two scenarios that close the Channel for the next few years. On the other hand, by 2013 exploitable biomass in the closure in the Channel is about 4 times greater compared to if the area was left open (6,000 MT if open compared to 24,000 MT if closed). In the long-term, CLF18 is expected to have higher exploitable biomass than the other scenarios, but closing the proposed area in the GSC would increase overall bottom area swept since that area includes some of the higher LPUE areas left in open areas. In addition, this closure is expected to have some displacement effects since there are limited areas left that the fishery can use open area DAS.

As with any rotational closure, it is more beneficial to harvest scallops after they have reached their growth potential to maximize yield. Therefore, since there are small scallops in that area, if they are given several years to grow, then fewer scallops will be harvested in the future, thus reducing mortality with positive benefits on the resource. In addition, this area includes a concentration of small scallops that have not shown up on Georges Bank in recent years and could produce an access area akin to the NL in the near future if managed like an access area.

Figure 36 – Area of proposed closure compared to A10 boundaries for area rotation for the South Channel and Georges Bank

5.1.6 Minimizing Impacts of Incidental Take of Sea Turtles

5.1.6.1 Alternatives to minimize impacts of incidental take of sea turtles

5.1.6.1.1 Restrict the number of open area DAS an individual vessel can use in the Mid-Atlantic during a certain window of time

This alternative would set a maximum on the number of allocated open area DAS each limited access vessel can use in the area defined as the Mid-Atlantic during the time periods under consideration (June 16 - October 14 or June 15 - October 31). There are also two options for what area would be closed (the entire area defined by the term and condition, or a smaller area for the month of June and the entire area for the remainder of the turtle season selected).

It is difficult to predict the impacts of this measure on the scallop resource because impacts are based on how vessels react to this restriction. If vessels respond by fishing in similar areas but shift effort to times of the year with greater meat weight yields (spring and summer) then impacts on the resource will be minimal, even positive. But if vessels fish these open area DAS in times of the year that have lower meat weight yields impacts on the resource will be negative. In addition, if vessels fish on GB during this season instead, impacts on F in that area may be higher than expected in the biomass projections.

In terms of the season alternatives, if the restriction is extended into late October that is actually good for the scallop resource, provided effort from those two weeks are used during more

productive months. In terms of the area alternatives, fewer restrictions in the month of June are good for the scallop resource because that is a time of year with very high meat weight yields, so fishing that time of year helps optimize yield.

This alternative will have more impacts the more DAS it impacts. Overall, the lower the percent of effort shift from the turtle season to the rest of the year the more impacts will be minimized on the resource because effort shifts are expected to have impacts on F that are difficult to predict.

5.1.6.1.2 Restrict the number of access area trips in the Mid-Atlantic that can be used during a certain window of time

This alternative would restrict the number of allocated access area trips that can be taken in the Mid-Atlantic during the two time periods under consideration.

It is difficult to predict the impacts of this measure on the scallop resource because impacts are based on how vessels react to this restriction. If vessels respond by fishing in similar areas but shift effort to times of the year with greater meat weight yields (spring and summer) then impacts on the resource will be minimal, even positive. But if vessels fish AA trips in times of the year that have lower meat weight yields impacts on the resource will be negative. The Council could consider reducing the possession limit on access area trips to taken during the turtle season minimize impacts on fishing mortality. Because vessels get a possession limit with compensation trips, if it takes more scallops to harvest 18,000 pounds there is nothing in the regulations to reduce that additional potential impact of this RPM.

In terms of the season alternatives, if the restriction is extended into late October that is actually good for the scallop resource, provided effort from those two weeks are used during more productive months. This alternative will have more impacts the more trips that are impacted by the RPM. Overall, the lower the percent of effort shift from the turtle season to the rest of the year the more impacts will be minimized on the resource because effort shifts are expected to have impacts on F that are difficult to predict.

5.1.6.1.3 Consider a seasonal closure for Delmarva

This alternative would consider a seasonal closure of the entire access area to both general category and limited access scallop vessels for either the months of September and October or October only.

Both seasons under consideration are expected to have beneficial impacts on the scallop resource if effort is shifted into other times of the year similar to recent behavior changes from the two-month seasonal closure of ETA. In the Mid-Atlantic, the southern range of the scallop resource, there is a seasonal cycle in meat yield that increases from March to July and then declines until October-November (Schmitzer, 1988). Therefore, reducing effort in that area during months of lower meat weight yields will reduce mortality. In 2007 and 2008, effort in the Mid-Atlantic increased in March, April, August, November and December compared to overall fishing time in years before that (Figure 37). Meat weights are lower in November and December compared to the annual average, but higher in March, April and August. So if effort from Sept and/or Oct is

primarily shifted into months with higher meat weight yields, impacts on *F* may be reduced, having beneficial impacts on the scallop resource.

Figure 37 – Percent change in Mid-Atlantic area fishing time by month in recent years compared to 2003-2005

5.1.6.1.4 Reduce possession limits in ETA and/or Delmarva to reduce fishing time per trip

This alternative would reduce the possession limit for any MA trip taken during the turtle season (June 16 - Oct 14 or June 15 - Oct 31). As currently written this alternative would not permit a vessel to harvest that remaining catch outside the turtle window.

This alternative would have beneficial impacts on the scallop resource since effort levels would be lower. The FMP would potentially not achieve optimum yield because catch that should have been harvested based on biological projections would not be, but that would increase scallop stock biomass. It is not clear how much the possession limit would change yet from this alternative, so if it is a small amount vessels may still fish, but if it is onerous enough vessels may decide not to fish at all during this season. If this measure causes vessels to change their seasonal fishing patterns considerably so that they do not take AA trips during this time period that could have negative consequences on the scallop resource if all the trips that normally occur in June – August occur in times of the year with lower meat weights.

5.1.7 Improvements to the observer set-aside program

5.1.7.1 Prohibit vessels from not paying for observers

This alternative would prohibit a vessel from fishing until all outstanding bills were paid by not issuing a permit to fish in a fishing year after an outstanding bill is due. This alternative would not have direct impacts on the scallop resource. If this ultimately improves the overall coverage of the scallop fishery there may be indirect benefits on the resource from improved information and monitoring of the fishery and resource.

5.1.7.2 Limit the amount of observer compensation general category vessels can get per observed trip in access areas

This alternative would create a ceiling to discourage overages by limiting the amount of compensation to two fishing days, whatever the daily compensation rate is for an access area. This alternative would not have direct impacts on the scallop resource. If this ultimately improves the overall coverage of the scallop fishery there may be indirect benefits on the resource from improved information and monitoring of the fishery and resource.

5.2 ESSENTIAL FISH HABITAT

5.2.1 Consistency with Omnibus EFH Amendment 2

Beginning in early 2008, NEFMC habitat staff, committee members, and plan development team members commenced work on Phase 2 of the Essential Fish Habitat Omnibus Amendment 2. The purpose of this phase is to identify fishing impacts to EFH across all NEFMC plans, and develop management alternatives to minimize those impacts. The analytical tool being developed for this purpose is called the Swept Area Seabed Impact, or SASI, model. **The primary assumption of the SASI model is that area of seabed swept by a particular fishery or subcomponent of a fishery is a proxy for seabed impact, and that seabed impact is a proxy for impacts to EFH.** Another assumption of SASI is that habitat impacts may vary by habitat type and gear type. Habitat types are defined based on seabed substrate (mud, sand, granule-pebble, cobble, or boulder dominated) and environmental energy (high or low natural seabed disturbance).

The following EFH impacts analysis references area swept estimates generated by the scallop PDT. While EFH Omnibus Amendment efforts are ongoing such that the SASI model cannot yet be used to analyze the alternatives proposed in Framework 21, the following assessment assumes, consistent with the SASI approach, that area swept can be used as a proxy for EFH impacts. Thus, the following assessment of EFH impacts compares area swept estimates between the various fishing effort/area rotation scenarios, with less area swept serving as one indication that a scenario would result in fewer impacts to EFH. Other alternatives are discussed qualitatively.

It should be noted that the area swept estimates discussed below are broadly consistent with preliminary SASI model results, with the primary difference being that SASI model estimates would also be conditioned by the contact of scallop dredges with the seabed and the vulnerability of various habitat types, as defined by their substrate, energy, and constituent features. Vulnerability incorporates both the susceptibility of seabed habitat components to fishing gears, and the ability of those habitat components to recover from impact. In order to estimate habitat component susceptibility and recovery parameters, the habitat PDT has reviewed the scientific literature on the effects of scallop dredges and other fishing gear types on seabed features. This review will be presented as an appendix to the Omnibus EFH Amendment. However, much of this research was considered previously by the Council as part of the EFH impacts analysis conducted for Amendment 10 to the Atlantic Sea Scallop FMP, and the reader is referred to the Amendment 10 EIS document for a summary of the fishing impacts literature relevant to the scallop fishery.

5.2.2 Impacts of proposed alternatives on physical environment and Essential Fish Habitat

The alternatives proposed in this framework are divided into two categories below: (1) those that affect the amount and/or location of fishing effort, and therefore may increase or decrease impacts to EFH as compared to the status quo, and (2) those which are primarily administrative in nature and therefore are unlikely to result in impacts to EFH.

5.2.2.1 Alternatives that affect the amount or location of fishing

Four allocation scenarios were considered in this framework: (1) No closure in Channel, Overall $F = 0.20$ (status quo F); (2) No closure in Channel, Overall $F = 0.24$; (3) S. Channel closure, Overall $F = 0.20$; (4) S. Channel closure, Overall $F = 0.18$. Access area allocations are the same for all four scenarios: one trip in Nantucket Lightship, 1 trip in Delmarva and 2 trips into Elephant Trunk. The choice of alternative would influence the magnitude, timing, and location of effort in the scallop fishery. Amongst the four alternatives, the proposed action (No GSC closure, $F=0.24$) has a moderate amount of area swept in both 2010, and over the following six year period, as shown in the table below.

Table 54 – Total bottom area swept (nm²) by year and scenario (2010-2016)

| Fishing year | GSC closure F=0.18 | GSC closure F=0.20 | No GSC closure F=0.20 | No GSC closure F=0.24 |
|-----------------------|-------------------------------|-------------------------------|----------------------------------|----------------------------------|
| 2010 | 5,515 | 6,864 | 2,916 | 3,663 |
| 2011 | 4,263 | 4,401 | 3,301 | 3,351 |
| 2012 | 5,068 | 5,211 | 4,375 | 4,400 |
| 2013 | 4,116 | 4,059 | 4,446 | 4,386 |
| 2014 | 4,152 | 4,114 | 4,597 | 4,536 |
| 2015 | 4,551 | 4,458 | 4,797 | 4,746 |
| 2016 | 5,590 | 5,484 | 5,665 | 5,662 |
| Cum. 2010-2016 | 33,255 | 34,591 | 30,097 | 30,744 |

Preliminary results from the 2009 survey suggest that small scallops have settled in parts of the Great South Channel. A rotational management area is being proposed north of the Nantucket Lightship closed area and west of Closed Area I; the top left coordinate of the polygon is 41 20' N and 69 30' W and the bottom left coordinate is 40 50' N and 68 50' W. This area meets the general guidelines specified in Amendment 10 for the creation of new rotational management areas. If this area is closed, it would likely reopen for access trips during fishing years 2013-2015. Exploitable biomass, landings, and area swept under the two closure scenarios ($F=0.18$, $F=0.20$) vs. the scenarios without the closure ($F=0.20$, $F=0.24$) are compared in the scallop resource impacts section. The two options that do not close the channel have both lower area swept and lower number of DAS allocated during 2010. If the Channel is closed, area swept in open areas of both Georges Bank and the Mid-Atlantic is assumed to increase. However, once the Channel opens in 2013, the two options that close the Channel result in reduced area swept. Comparing area swept estimates for two F levels with GSC closure and without, the GSC closure scenarios have increased area swept in the short-term (i.e. FY2010) and increased cumulative area swept in the long term (from 2010-2016). Thus, using increased area swept as a proxy for increased impacts to EFH, the allocation alternatives that include a closure in the GSC would be expected to have greater impacts on EFH in 2010 as compared to the two alternatives that do not close the GSC.

Overall, all four allocation alternatives under consideration for 2010 are lower than recent years for two primary reasons: (1) there are only four access area trips in 2010 compared to five in recent years, and (2) overall effort has to be cut back by about 20% because preliminary estimates of F for 2009 are close to $F=0.30$, which is above the overfishing threshold of 0.29, and

well above the target F of 0.20. Therefore, broadly speaking, any of the four allocation alternatives are expected to reduce impacts to EFH in comparison with the no action alternative.

Adjustments when yellowtail flounder catches reach 10% TAC limit

If the NL access area closes due to yellowtail bycatch, this alternative specifies the number of open area days at sea allocated for each trip not taken before the closure. The allocation rate of open DAS per access trip is intended to have neutral impacts in terms of sea scallop mortality, and accounts for the size of scallops in each of the areas (open vs. NL access). NL landings are restricted based on trip limits, but open area landings are not. On one hand, it is possible that vessels could sweep more of the seabed fishing under 5.4 open area DAS (under NCLF24) as compared to catching their trip limit in the NL. However, impacts to EFH resulting from the same amount of area swept may vary depending on where those areas are and what types of seabed habitats are present. Recently, catch rates in open areas have been higher than during past NL openings, such that fishing might be limited by shucking capacity rather than by DAS constraints. Given these factors, it is difficult to predict whether impacts to EFH would be negative, positive, or neutral if the NL closes and open area fishing occurs.

Minimization of impacts of incidental take of sea turtles

The following four alternatives were proposed in order to comply with a recent biological opinion on sea turtle takes in the scallop fishery. In all cases, whether or not the change constitutes a more than minor impact is assessed based on the percent change in effort shift caused by a specific limitation on effort, and the resulting impact that shift would have on overall fishing mortality.

- Restrict the number of open area DAS an individual vessel can use in the Mid-Atlantic during a certain window of time
- Restrict the number of access area trips in the Mid-Atlantic that can be used during a certain window of time
- Consider a seasonal closure for Delmarva
- Reduce possession limits in ETA and/or Delmarva to reduce fishing time per trip

As described in the impacts to the scallop resource section of the document, the effects of these types of restrictions are difficult to evaluate because they rely on assumptions about changes to fleet behavior. Ignoring possible shifts in effort to Georges Bank, if effort is reduced in the Mid-Atlantic Bight during times of year when meat yields are lower, benefits to EFH might result because the same weight of scallops can be caught more efficiently (i.e. with less area swept). However, if substantial effort shifts to open areas on Georges Bank, or if only access area fishing is modified and effort shifts into open areas in the Mid-Atlantic, localized overfishing could result, with inefficient harvest and greater area swept for a given weight of scallops landed.

5.2.2.2 Alternatives that are administrative in nature, or that relate to small amounts of scallop catch

The following measures either relate to very low amounts of scallop catch relative to the resource as a whole, or are primarily administrative in nature. In either case, any impacts to EFH are expected to be minimal.

NGOM TAC

This action considers a separate hard TAC of 70,000 pounds for LAGC vessels fishing in the NGOM area for 2010. Vessels qualifying for a permit to fish in this area are subject to a 200 lb trip limit. When the TAC is reached, the area is closed. In 2008 and 2009, less than 15% of the NGOM TAC was landed.

Incidental catch estimation

Amendment 11 included a provision that the Scallop FMP should consider the level of mortality from incidental catch and remove that from the projected total catch before allocations are made. For the proposed action, the PDT recommends taking VTR landings analyzed in FW19 as a starting point for an estimate of mortality from incidental catch and increasing that to 50,000 pounds to account for an expected increase due to measures implemented by Amendment 11.

TAC set-asides for observers (1%) and research (2%)

This alternative specifies the set-asides for observers and research in each of the three access areas that would be open in FY 2010.

Research priorities for 2010 and recent RSA announcement

This alternative is administrative in nature and would not have impacts on EFH, except to the extent that any research conducted benefits future EFH-related analysis.

Improvements to the observer set-aside program

Two alternatives propose changes to the observer set-aside program. One would prohibit vessels from not paying for observers, while the second would limit the amount of observer compensation general category vessels can get per observed trip in access areas.

5.2.2.3 Summary of impacts of the proposed action on EFH

As compared to the no action alternative, the proposed action is not expected to result in increased impacts of the scallop fishery on EFH. The primary reason for this is that all fishing effort allocation alternatives, including the proposed action, are expected to have reduced area swept in comparison with no action. Other proposed measures are administrative in nature, or affect only a small portion of fishing activity, and thus their implementation is not expected to alter the EFH impacts of the scallop fishery. The potential effects on area swept and thus on EFH due to time/area closures for turtles, or due to shifting NLCA access fishing to open area DAS due to yellowtail bycatch, are very difficult to predict.

Given that increased impacts on EFH are not expected to result from the proposed action, and that there have been no major changes to the fishery that would substantively alter the conclusions about adverse effects reached during the baseline evaluation of scallop fishery effects on EFH prepared for Amendment 10, no EFH consultation is required for this action. As EFH consultation is not required, an EFH Assessment is not included in the Framework 21 submission. Furthermore, adverse impacts of the scallop fishery on EFH were minimized to the extent practicable via measures implemented in Amendment 10, will continue to be minimized to the extent practicable once the proposed measures are implemented. Thus, no additional measures to minimize the impacts of the fishery on EFH are required by, or proposed by, this action.

5.3 PROTECTED RESOURCES

5.3.1 Background

The Framework Adjustment 21 alternatives are evaluated below for their impacts on protected resources with a focus on threatened and endangered sea turtles, as noted in the Affected Environment Section. As with the analyses provided in the last scallop management action, the species considered here are loggerhead, leatherback, Kemp's ridley and green sea turtles.

Both scallop dredge and scallop trawl gear will be addressed in this section, generally collectively, given they are the most commonly used gears by general category and limited access vessels in this fishery. To evaluate impacts it may be helpful to note that the majority of fishing effort is attributed to the dredge fishery. Most of the approximately 340 active limited access vessels use dredge gear. There are about 400 general category vessels that are expected to be allowed to land 10 percent of the total projected scallop landings during the transition period to IFQs and 5 percent of the total once the transition measures are phased out, likely before March 1, 2010.

To briefly summarize the sea scallop fishery management program, it employs a limited access permit system and controls DAS use in scallop open areas. Limited numbers of trips with trip limits also are allowed in designated rotational access areas. Major harvest areas include Georges Bank with less activity in the Gulf of Maine. Both are regions in which turtles are far less likely to be found relative to Mid-Atlantic waters, where effort and scallop catch levels have increased in recent years. In addition, directed general category scallop fishing effort has increased overall since 1994, including new effort in the Mid-Atlantic, but this trend is being addressed by measures implemented in Amendment 11 to the Atlantic Sea Scallop Fishery Management Plan.

Although scallop fishing is a year-round activity, takes of sea turtles potentially may occur from May through November given the overlap of the sea turtle distribution (Shoop and Kenney 1992; Braun-McNeill and Epperly 2002) and fishery effort (NEFMC 2003, 2005).

With respect to sea turtle interactions with the fishery overall, it is noteworthy that there were very low levels of observer coverage throughout the fishery up to 2001 (though observer coverage during 2001 and 2002 was concentrated mainly in the Hudson Canyon Access Area). Since that time, bycatch rates, with a focus on the Mid-Atlantic, have been analyzed in a number of publications that are discussed in the Affected Environment section.

Beginning in September 2006, federally permitted scallop dredge gear must be modified by adding an arrangement of horizontal and vertical chains, referred to as "chain mats", between the sweep and the cutting bar when fishing in an area that extends south of 41° 9.0 N from the shoreline to the outer boundary of the EEZ during the period May 1 through November 30 each year (71 FR 50361). The requirement is expected to reduce the severity of some turtle interactions with scallop dredge gear. There has also been a seasonal closure in ETA from September 1-October 31 since the area re-opened as an access area.

With respect to Framework Adjustment 21, several rotational fishing areas are considered: Nantucket Lightship Closed Area (NLCA), the Elephant Trunk Area (ETA), the Delmarva Area (DMV), and a potentially new access area in the Great South Channel off Cape Cod. Measures primarily serve to set 2010 access levels to these areas and change levels of fishing effort in the areas outside of these rotational areas. Additional measures address adjustments to the observer program and specific measures to comply with the recent biological opinion of this fishery related to impacts on sea turtles.

Discussions regarding sea turtle interactions with the fishery are largely qualitative and based on factors such as projected DAS use-by-area and projected bottom area swept (Section 5.3.3). It is important to recognize that neither factor directly relates to the frequency of turtle bycatch in the fishery, but provide some measure of how much effort is projected to occur and which areas might be subject to more or less activity based on catch rates. Although it is not repeated in each alternative, the general assumption is made that turtles interactions occur when and where scallop fishing effort overlaps with the presence of sea turtles. Risks may be greater during turtle high use periods, but interactions could still occur in the margins of that period given that both turtle distribution and fishing activities are highly variable.

The analyses for the alternatives to comply with the RPM are also largely qualitatively in terms of direct impacts on sea turtles. However, the approaches used to determine if impacts of the measures are expected to have more than a minor impact on the fishery are quantitative. The Scallop PDT used a similar approach for assessing what constitutes a more than minor impact on the fishery as it did last year when the Council was asked to evaluate original RPM measures in a previous biological opinion. The methods and results of the more than minor impact analyses are presented first below in Section 5.3.2, and are followed by an evaluation of the impacts of all FW21 alternatives on protected resources, namely sea turtles (Section 5.3.3).

5.3.2 Analysis of more than minor impact

There is no official guidance on how to define more than a minor change. We know that based on ESA regulations, a reasonable and prudent measure, along with the term and condition that implement it, cannot alter the basic design, location, scope, duration, or timing of the action and may involve only minor changes. But, how to define a minor change is not specified. After the biological opinion of the scallop fishery came out in 2008 the Scallop Committee requested that the PDT provide an analysis that would help identify what is more than a minor change in the scallop fishery.

The scallop fishery is managed under an adaptive rotational management plan. A substantial portion of total fishing effort is allocated into specific areas to maximize yield. Outside constraints on how effort is allocated and used over time or space can have impacts on the overall effectiveness of the program and fishing mortality. **Therefore, the PDT recommends that the threshold for more than a minor change should be based on an amount of “effort shift” imposed by the RPM and Term and Condition.** Spatial and/or temporal shifts in effort can increase overall fishing mortality, and depending on the nature and extent of the effort shift imposed by the RPM, more than minor changes can result if fishing mortality increases causing noticeable changes in yield, landings and revenue.

In terms of this biological opinion, the premise is to limit scallop fishing effort during the time of year and area where the overlap of turtles and scallop fishing activity is most likely to occur. Under area rotation, fishing effort is allocated in certain areas when yield is expected to be higher, and shifting that effort to other times and areas can reduce landings per unit of effort, and thus can have impacts on EFH, bycatch, revenue loss etc, and most importantly for this purpose, will increase fishing mortality. In both the short and long term, increases in fishing mortality that are more than a small amount will cause more than a minor change in the fishery.

Based on scallop meat weight analysis by month, it is shown that there are seasonal effects on relative fishing mortality (See Appendix I for more information). In general, the highest meat weights in the Mid-Atlantic are from April through August. About 40% of all fishing in Mid-Atlantic access areas and open areas has occurred between the months of June-October. If effort is limited during that period to reduce impacts on turtles, then that effort will be displaced to the other months of the year when meat weights are lower. Depending on the season and amount of effort that is displaced, the change in yield is expected to vary by 5-10% based on changes in average meat weights by month.

The PDT developed a model that estimates changes in fishing mortality, effort shift and impacts on revenue when limitations are placed on the scallop fishery by season and/or area. This model was first developed to assess whether the original term and condition was reasonable and prudent (more than a minor change), but it has also been used more recently to assess whether the alternatives to comply with the revised RPM developed in Framework 21 are expected to have more than a minor change on the scallop fishery. The differences in fishing mortality, yield, and revenue impacts can be compared.

In addition to the primary threshold for more than minor (percent change in effort shift), the PDT included a description of other factors that should also be considered when identifying a more than minor change that would also be affected by a shift of effort including: concern about safety at sea (shift to winter months), changes in bycatch (i.e. fluke bycatch increases in winter months because it overlaps with the scallop fishery offshore), revenue impacts because of reduced catch and changes in price, costs, markets, supply, etc., impacts on ability of observer program to maintain coverage from surges and shifts in effort, and general impacts of altering rotational area management and compromising the ability to achieve optimum yield.

5.3.2.1 Description of model used to assess more than minor change

A model was developed to estimate changes in fishing mortality, effort shift and impacts on revenue when limitations are placed on the scallop fishery by season and/or area. It includes several important assumptions that are described below.

5.3.2.1.1 Model Assumptions

The seasonal composition of open area effort

Updated analyses have been completed for the two season alternatives in FW21 based on dealer data from 2004-2008 fishing years. The first time period alternative in FW21 is June 16-October 14 and the estimate of landings from that shorter time period is 28.6%. Available catch data is

summarized by month only, so an assumption was made that total catch in June and October was evenly distributed by week, and half of June and October landings were included in this estimate only. For the second time period alternative (June 15 – October 31), an estimate of two additional weeks of catch from October was included for a total of 31.9% (See Table 55). The model assumes that effort will be distributed by these percentages in 2010 as well.

Effort displacement for open areas and access areas: 100%

It is assumed that if open area DAS in the Mid-Atlantic are limited by some amount, all vessels will use their remaining DAS at other times or in the GB open areas. The current estimate of open area DAS vary by management scenario in FW21 from 30-51 DAS.

In 2010 it is estimated that full-time vessels will be allocated 3 access area trips in the Mid-Atlantic (1 in Delmarva and 2 in ETA). Since these pounds cannot be landed from other areas, it is highly likely that the vessels will attempt to take their access area trips during months when the areas are open to fishing, outside the turtle season. So this model assumes that 100% of AA trips will be taken outside of the turtle season. It is noted that assuming 100% displacement is high, and it reflects the best case scenario in terms of potential impacts. The PDT discussed that it may not be realistic that all vessels will take multiple trips in the months outside the proposed turtle windows.

Open area effort distribution between Georges Bank and Mid-Atlantic

Updated analyses suggest that 44% of total open area effort was used on Georges Bank and 56% in Mid-Atlantic open areas. These percentages are based on the mean of landings from 2005-2008. Landings from 2004 were not included in the estimate because that year is an anomaly and does not reflect expected catch distribution for 2010. Specifically, recruitment has improved on GB in recent years, so catch in that area is expected to increase compared to the Mid-Atlantic, which is experiencing lower recruitment. Catch in Mid-Atlantic open areas was higher in 2004 than any year and many vessels opted to take open area DAS instead of access area trips in Hudson Canyon that year, so the PDT decided not to use 2004 in the range of data to determine an expected trend in open area catch (Table 56).

The seasonal composition of access area effort

In order to assess the potential impacts of the RPM alternatives the PDT evaluated the amount of effort that has taken place in access areas during the turtle seasons under consideration in FW21. Catch in Hudson Canyon and ETA were analyzed from 2004-2008 since these are the two access areas that were open in recent years. Delmarva has been closed to the scallop fishery since 2008, and was an open area before that, so fishing behavior in that area cannot be used directly to analyze trends in the fishery in MA access areas by month.

Hudson Canyon was open in 2004, 2005, 2006 and 2007. However, catch was very low in both 2005 and 2006 so these years were not included to get a trend of catch by month. Elephant Trunk was open in 2007 and 2008. The catch by month for these two areas was combined and the updated estimate of catch in MA access areas for both time periods: **for June16 - Oct14 approximately 27.4% of MA AA effort is expected to occur and for June 15 - October 31 it is 28.3% (Table 57).**

It should be noted that monthly effort patterns from HC in 2004 are very different than what is expected in 2010. In 2004 there were three access areas open on GB and they all opened on June 15 – so effort is lower in these months in the MA when vessels likely fished in AA on GB. In 2010 there is only one AA trip on GB so some effort will move from the MA in June and July after the opening in NL, but general trends of effort in the MA will likely be higher in June and July in 2010 than in 2004 when there were three trips allocated on GB starting on June 15. Similarly, in 2007 and 2008 there was only one GB AA trip (same as in 2010) so less effort shift from MA to GB during June and July in these years because there was only one GB AA trip.

Monthly fishing effort for Delmarva AA

For RPM Alternative #3 we need to make an assumption about how much effort would take place in Delmarva during September and October if no RPMs are implemented. The PDT first evaluated fishing effort by month in HC and assumed the fishing behavior would be similar in Delmarva. Effort in ETA cannot be used because that area already has a two month closure imposed for turtles, so no effort takes place in ETA in Sept and Oct. Based on fishing effort in HC in 2004 and 2007 10.9% of all HC effort occurred in Sept and Oct, and 4.9% in just October – the two time period alternatives under consideration (See Table 58).

However the PDT discussed that fishing patterns in HC from 2004 and 2007 are not expected to be reflective of monthly fishing effort trends in Delmarva. So instead the PDT evaluated monthly catch from VTR data from the Delmarva area in 2004-2006 before the area was closed. Catch from all limited access trips (dredge and trawl) were summarized by month and 19% of all catch was landed during Sept and Oct, and 11% for just October (Table 59). The PDT decided that these values would be the best estimate of fishing behavior by month for the Delmarva access area if no RPMs were imposed in the fishery. It was noted that these may even be low because ETA trips are prohibited in Sept and Oct already, so it is likely that vessels would take their AA trips in Delmarva during those months when ETA is closed.

Delmarva has only been open as an access area in FY2009. Catch data by month are not available yet for the Delmarva area, especially in September and October 2009. However, the PDT expected effort levels to be higher especially in October when weather is cooler (lower incidental catch mortality), vessels have already taken AA trips on GB, and open area catch rates are declining so vessels would be expected to take trips in AA that have a possession limit rather than fish open areas. **The model used the assumption that 19% of all Delmarva trips would be taken in Sept and Oct if no RPM imposed, and 11% in October based on the distribution of fishing effort in the Delmarva region in 2004-2006 before it was an access area.** Actual catch in Delmarva by month was not available for all of 2009 at the time that the PDT first considered what percent of effort is likely to occur in September and October.

Table 58 – Percent of catch from Hudson Canyon AA in 2004 and 2007

| | 2004 | 2007 | Mean |
|-----------------|-------------|-------------|-------------|
| Sept+Oct | 10.1% | 11.7% | 10.9% |
| Oct | 3.8% | 5.9% | 4.9% |

Changes in meat weight by season

Shifting effort from one season to another will affect catch and fishing mortality due to changes in seasonal meat weights (See Section 5.3.2.1.2 for more information). Some months will have higher losses and some lower depending on the length of the closure and when effort is displaced. The impacts of this loss on landings, fishing mortality and revenues would depend on which of the four FW21 management scenarios are selected and which RPM season is adopted.

The estimated change in meat weight from one season to another has been calculated for the various time periods under consideration in FW21 RPM alternatives using new projections of LPUE. The model used the assumption that if effort shifted from June16-Oct14 to the remainder of the year, average meat weight would decline by 4.4%. And for the other time period, average meat weight would decline by 2.7% if effort moved from June 15-Oct 31 to remainder of the year. This factor is then combined with the amount of effort expected in each turtle season used to estimate the projected LPUE for each season and FW21 scenario alternative. For example, FW21 projections estimate that average LPUE for the year will be 1,883 pounds per DAS in the open areas in the Mid-Atlantic. LPUE during June16-Oct14 would be 1,800 and 1,832 for the other season (Oct 15-June 15); a difference of 4.4% and 2.7%. So shifting effort from the first season to the second will reduce landing for the shifted DAS by 4.4% and 2.7% respectively. The two other time periods considered are specific to the Delmarva area (Alternative 3). If a seasonal closure is implemented for September-October the meat weight assumption is 5% greater in other months of the year. Lastly, if the area is closed for the month of October only, meat weights will be 1% higher in the other months of the year on average compared to October alone.

Table 60 – Scallop meat weight conversions for shifting effort from one season to another

| Meat Wt Change | |
|--------------------------------|---------|
| Jun 15-Oct 15 to Oct 16-Jun 15 | -0.0440 |
| Jun 15-Oct 31 to Nov 1- Jun 15 | -0.0270 |
| Sept 1-Oct 31 to Nov 1-Aug 31 | +0.050 |
| Oct 1-Oct 31 to Nov 1-Sept 30 | +0.0110 |

5.3.2.1.2 Effects of sea scallop management on meat-weight yields in the Mid-Atlantic

The PDT analyzed seasonal changes in scallop meat-weight yields to assess the potential impacts of restricting effort in the Mid-Atlantic during the time windows identified in the biological opinion relating to turtles (June-October and May-November). Meat weights in the Mid-Atlantic are highest in July and decrease rapidly after the animals have spawned in September. Meat weights remain lower through the winter and grow again in the spring. From April through August, meat weights are highest. Scallop landings also vary by season to take advantage of this pattern as well as other factors such as weather and price.

Seasonal meat weight variations can be quantified by comparing shell height/meat weight (volume) data collected by observers on commercial vessels to that collected on the annual research vessel survey conducted in the Mid-Atlantic in July, when meat weights are the highest. The seasonal meat weight anomaly is defined as $(MW_{\text{observed}} - MW_{\text{rv}}) / MW_{\text{rv}}$. The smaller the anomaly, the closer the yield is to maximum yield from July when the survey collects meat weights.

Figure 38 depicts the fraction of landings by month from 2001-2006 and the monthly meat weight anomaly. For some months like November – February, scallop yields are over 20% less than if they were harvested in July. Yields from March and September are over 10% less; the other months are less than 5% less. Not surprisingly, catch in the Mid-Atlantic is highest in March-July.

An analysis of the effects of seasonal effort displacements require an assumption as to when the displaced effort will be used. The PDT assumed that displaced effort will redistribute itself proportionally to the mean fraction of landings that have occurred historically (2001-2007) in each month. The seasonal closure in the Elephant Trunk Area from September 1 through October 31 actually has a positive impact on yield because the area is closed when meat weights are lower after spawning. This two month seasonal closure is expected to have a meat weight gain of about 7% because the Sept-Oct anomaly is 16% and the anomaly for the other months is 9%, a difference of 7%. If that closure remains in place and an additional restriction is placed on the fishery for June-August, a loss of yield over 10% would occur. For example, if one trip (6.0 million pounds) was shifted from June-August to Nov-May, the loss would be 600,000 pounds because the Jun-Aug anomaly is 3.8% and Nov-May is 14%, a difference of about 10%. The PDT considered this approach for both seasonal windows in the biological opinion and concluded that any version of seasonal effort shift is expected to result in losses in meat weights of between 5-10%, likely reducing long-term yields and economic gains. Thus, neither option provided by the RPM is economically beneficial for the industry nor are they biologically beneficial to the scallop resource.

If area rotation intends to increase yield per scallop, displacing effort from the spring and summer is not beneficial and likely hampers the FMPs effectiveness in achieving OY. Restricting access in September and October when meat weights are lower is beneficial for both scallops and turtles, and perhaps that season could be expanded to provide more benefit for turtles. But, limiting access in months when meat weights are highest (i.e. spring and summer) is not ideal when one goal of area rotation is to promote fishing when yield per unit of effort is

highest. Fishing during May should be encouraged, given its combination of good weather, good meat yields, and no or low probability of turtle takes.

Figure 38 – Fraction of scallop landings in the Mid-Atlantic by month (2001-2006) and monthly meat weight anomaly

5.3.2.2 Threshold for more than minor

After the original RPM was drafted and the Council was requested to evaluate and consider the RPM the Scallop Committee requested that the PDT identify a method for assessing whether the RPM would impose more than a minor impact on the scallop fishery. The model described above is what was used, but a value still needs to be identified in terms of how much effort shift, or change in fishing mortality is reasonable.

Last year staff presented a threshold of effort shift and change in fishing mortality (F) of 0.01 as a possible threshold for more than a minor change. An increase in fishing mortality of 0.01 is equivalent to a 12% effort shift multiplied by the assumed 8% loss of yield when effort is shifted from June-Oct to Nov-May ($0.12 \times 0.08 = 0.0096$). A threshold could be set anywhere, but the PDT identified 0.01 because it is 5% of the current fishing mortality target. This threshold is what was recommended for the specific time period and associated meat weight changes from the biological opinion last year (June 1-Oct 31 and an estimated loss of 8% yield shifting effort from that period to the remaining months of the year).

It is important to note that in this Framework there are four different seasons under consideration and each have a different meat weight change – so the same 0.01 change in F threshold cannot apply to all seasons. For example, the time period of June 15-Oct 31 has a meat weight change of -4.4 when effort is shifted to the remainder of the year. A similar 12% effort shift multiplied by that meat weight conversion comes out to 0.005 (about half of 0.01 because -4.4 is about half of -8.0). On the other hand, the shortest time period under consideration in the one month closure of Delmarva (Oct 1-Oct 31). The meat weight change for that month compared to the rest of the year is actually positive because meat weights are poor that time of year, so shifting effort from October to the rest of the year would increase meat weight by 11%. Multiplying an 11% increase in meat weight with the same 12% shift of effort would cause a change of F equal to 0.013, but this time in the positive direction, overall F would decline by that amount.

Therefore, for this framework having the same overall value of change in F is not useful since the time periods and measures under consideration are very different. Instead it may be more useful to consider the amount of effort shifting from the Mid-Atlantic during the turtle season to the remainder of the year and what that expected impacts on catch and revenue are. Percent effort shift is actually the original factor the PDT identified originally as what should be the threshold for more than a minor change. Ultimately, identifying what is more than minor is a policy decision, but ESA stipulates that, “a reasonable and prudent measure, along with the term and condition that implement it, cannot alter the basic design, location, scope, duration, or timing of the action and may involve only minor changes.

Ultimately, when the Scallop Oversight Committee considered all this related to the original biological opinion in 2008 the Committee decided that identifying a precise threshold for more than minor is not preferred; instead, during development of FW21, the PDT should evaluate what limit on effort will not result in more than a minor impact on fishing mortality or the fishery using updated information and considering all the issues described above such as concern about safety at sea, changes in bycatch, revenue impacts because of reduced catch and changes in price, costs, markets, supply, etc., impacts on ability of observer program to maintain coverage from

surges and shifts in effort, and general impacts of altering rotational area management and compromising the ability to achieve optimum yield.

The next section assesses the RPM alternatives currently in FW21 compared to status quo – what is currently expected for 2010. A summary of potential impacts of each RPM is assessed separately. **Again, there is no threshold set in stone, but the PDT presented and the Committee agreed that a measure that causes more than 10% of effort to shift from the Mid-Atlantic during the various turtle seasons under consideration would be a reasonable threshold for more than a minor change.**

The Committee supported 10% to be used in this action because these analyses are based on assumed fishing behavior responses and historical fishing patterns, so impacts could be very different if the fishery responds differently than assumed. Specifically, if effort shifts mostly to November and December, then impacts on F will actually be higher than the results suggest. If effort shifts only to the summer when meat weights are higher impacts on F will be reduced, thus overall impacts from the measure may be lower or even positive in some cases. Ultimately, the Committee voiced that 10% seems to be a reasonable level of effort shift to use as a standard since actual impacts could be higher or lower. For the alternatives under consideration that limit DAS or number of access area trips, a 10% effort shift is equivalent to an estimated loss in landings of about 50-100,000 pounds and \$400-700,000 dollars. Overall, the Committee seemed comfortable that this level of impact was reasonable and would not have more than minor impacts on the fishery overall.

However, when the Committee reviewed impacts of measures with higher amounts of effort shift (18%-23% from some of the RPM alternatives) the associated impacts on landings and revenue were higher, 100,000 pounds to over 200,000 pounds and \$1-2 million dollars of lost revenue. Additional issues were identified with these measures making them unreasonable or having more than minor impacts because they are expected to have high distributional impacts on the fleet; some will be impacted greatly and others not at all. Ultimately, since these impacts are difficult to predict because they are based on changes in fishing behavior and issues not in the model such as changes in price, and other unknowns, implementing something that could have the potential to have much higher impacts on F due to effort shifting into seasons with lower meat weight yields is risky and could have more than minor impacts on F and the fishery. In addition, the Committee voiced that shifting 10% of effort from that area and season is a considerable amount of total effort and should have beneficial impacts on turtles and that is an important element of this process.

Therefore, the tables below provide the results for shifting 10% of effort in the MA during the turtle season under consideration to the remainder of the year. The tables also provide the results if all effort expected to happen in the MA in the turtle season for that RPM is shifted (100%) to provide a sense of the maximum value of potential impacts on effort, F , landings and revenues.

5.3.2.3 Assessment of original RPM alternatives in FW21

The PDT met in the summer and fall of 2009 to begin developing possible RPM alternatives and to evaluate whether the alternatives are expected to have more than a minor impact on the scallop

fishery. The PDT reviewed the preliminary analyses of the model developed last year on October 15, 2009.

In summary, the model allows the PDT to estimate changes in fishing mortality, effort shift and impacts on revenue when limitations are placed on the scallop fishery by season and/or area. The assumptions above are included and the DAS and access area allocations are inputs into the model. The model estimates the expected effort by season based on historical trends, and evaluates what the impacts are from various constraints put on the fishery from the different RPM alternatives. Figure 39 is an example of the model used for Scenario 1 (No closure in the channel and overall $F = 0.20$) and RPM Alternative 1 (limit on DAS) for the turtle season June 15-October 31. The example is showing the results on effort, F , landings and revenue if 10% of the effort expected to occur in the MA during the turtle season is shifted to the remainder of the year. Very briefly, the assumptions about the fishery and meat weight changes by season are on the top of the first page of the model. The DAS allocation for this scenario is 30 DAS, circled in red. The expected DAS used and needed reductions during this season are also circled in red. The impacts of this RPM are on the second page of the model: the % shift of effort, change in fishing mortality, and impacts on landings and revenue are all circled in red. The model was run for all 4 FW21 scenarios, two time periods, and 4 RPM alternatives. The specific results are described below for each RPM alternative.

Before the results for each RPM alternative are evaluated, the differences in DAS, landings and other factors by area and season are described for the four FW21 scenarios *without* RPM measures. Therefore, the specific impacts of each RPM can also be compared to each FW21 scenario separately.

Figure 39 – Example of model used to evaluate RPM alternatives (Example is for NCLF20 scenario for the time period of June 15-Oct 31)

Summary of results for all 4 FW21 scenarios without RPM alternatives

This section summarizes the projected landings, revenue, DAS, and effort used in specific areas before RPM measures are adopted. The results of each RPM measure can be compared to these results and that is how the overall threshold of more than minor is determined. Specifically, the change in F and % effort shift from the turtle season to the other months of the year are assessed by comparing the results in this section with the specific impacts of the RPM measures that limit DAS, access area effort, or a seasonal closure of Delmarva.

Table 61 – Summary of results for each FW21 scenario without RPMs

Results of RPM Alternative 1 – Restrict the # of open area DAS an individual vessel can use in the Mid-Atlantic during a certain window of time

The first RPM alternative (limit DAS in open areas) does not seem to qualify as an RPM if considered for the fleet overall. When the impacts are assessed for the fleet overall, limiting effort by even a small amount during either season (June16 - Oct14 or June 15 - Oct 31) would result in available DAS much lower than a normal trip length. This is driven by the fact that the historical average of open area effort in the Mid-Atlantic is less than one average length trip. From June 16 - Oct 14, 29% of mid-Atlantic open area effort is expected to occur. For the FW21 scenario with the lowest open area DAS allocation (no closure and $F = 0.20$) the model estimated that 5 of the total 30 allocated open area DAS would be used per vessel on average in the Mid-Atlantic during that season if no RPMs were implemented (5 DAS equals 29% of 30 DAS) (See Figure 39). The PDT discussed that limiting vessels to any amount equal to or below the

average projected effort for the fleet would essentially be equivalent to a 100% reduction because vessels would not make a trip in open areas if the maximum is less than 5 DAS for this example.

The summary of impacts on DAS, *F*, effort shift, and reduction in landings and revenue are described in Table 62. Each FW21 scenario has been set so that 10% of projected effort in the MA during the turtle season is shifted to the remainder of the year. The table also provides the same information if all effort (100%) expected to happen in the MA in the turtle season for that RPM is shifted to provide a sense of the maximum value of potential impacts on effort, *F*, landings and revenues. For an effort shift of 10% the # of DAS reduced in the MA during the turtle window is a range of 866-1235 depending on the scenario and season. This is equivalent to about a 40-55% reduction of total DAS used in that area and season. When that amount of DAS is shifted to the other seasons of the year there are impacts on landings and revenue based on reduced average meat weight yields from one season to the other. It is also important to note that the model assumes 0% change in price from this effort shift. It is possible that there would be higher prices during the restricted season since supply will be less, but there will be more supply in the other season so prices will likely decline.

Table 62 – Summary of results for RPM Alternative 1 for each FW21 management scenario

| Scenario | NCF20 | | CF20 | | NCF24 | | CF18 | |

Some PDT members felt that these results suggested that the first alternative is not reasonable and prudent. Others suggested that the PDT could explore other ways to approach this alternative on a more individual basis that would reduce effort overall in open areas in the Mid-Atlantic for some vessels that historically fish in that area and season. Evaluating averages across the fleet in this manner is very misleading in terms of estimating fishing effort in specific areas and seasons, because these averages reflect higher effort levels from some vessels and no effort from other vessels. Specifically, the five DAS average is misleading because it is an average for the fleet and some vessels from southern ports likely take more than one trip during this time period, while most vessels from the north probably take no trips in the Mid-Atlantic during this time period or the entire year.

Therefore, the PDT decided to evaluate the distribution of DAS used in the Mid-Atlantic during the summer and fall to evaluate if there was a maximum DAS value that could be identified that would limit DAS in that area and time, but was based on more individual effort patterns compared to average for the fleet which includes many vessels that do not fish in that time and area at all. The alternative would still limit DAS based on a comparable reduction produced by the model results for the fishery overall. From the example above, a 40-55% reduction in DAS used or a total of 866-1235 DAS for that time and area would be equivalent to an effort shift of 10% from MA during turtle season to the remainder of the year. Since all vessels do not fish in that area and time the limit would effectively only impact vessels that tend to fish in that area and time period, so the maximum would be higher than the fleet average of DAS used in that area and time of 5-10 DAS for the four FW21 scenarios.

Out of about 340 limited access vessels, 143 used DAS in the Mid-Atlantic from during the months of June – October based on 2008 VTR data. Therefore, approximately 200 vessels did not use any DAS in the Mid-Atlantic during that window of time, explaining why the fleet-wide average is so low (5-10 DAS). Of the 143 vessels that did use DAS in the Mid-Atlantic during the turtle season the DAS used ranged from 2-47. The maximum DAS used in this analysis is 47 DAS (maximum allocation of 37 DAS plus 10 DAS carryover).

If the Council still wants to limit DAS as an RPM alternative, it is possible to identify a DAS maximum for a season that would be higher than the fleet average (5-10 DAS) but still be expected to reduce DAS in that area by a similar amount because some vessels that typically use more than the maximum would be restricted to a lower amount. For example, for the FW21 scenario that allocated 30 DAS (NCLF20) the fleet-wide DAS reduction that would comply with the PDT threshold for more than minor equates to 866 DAS used in the Mid-Atlantic. Based on the historical usage of DAS in 2008, if vessels were limited to 17 DAS during June-October, a total of 870 DAS would be reduced. This restriction is not expected to impact the 200 vessels that did not fish in the Mid-Atlantic during this time period, and should not impact the 82 vessels that used 17 or less DAS in the Mid-Atlantic from June-Oct. That leaves approximately 61 vessels that took more than 17 DAS that would be limited to 17 under this alternative and would have to use those DAS in other areas or seasons. Overall, these data show that a reduction well above the fleet-wide average of DAS used will still reduce DAS used in the Mid-Atlantic during the turtle season. For example, a restriction of no more than 20 DAS would reduce days fished by about 25%, and a restriction of 11 DAS would reduce days fished by about 50% compared to 2008 levels (See Table 63).

The PDT recognized that this RPM will have very different distributional impacts on the fleet; high for vessels that historically fish in that area and season and zero impacts on vessels from the north that never use DAS in that area and season. The number of DAS absent per LA vessel were evaluated using 2008 VTR data. Of the 143 vessels that used some DAS in this area and season, the majority of vessels were from Virginia and New Jersey, about 50 from each state. About 30 vessels were from either Massachusetts or Rhode Island. The majority of these vessels used 10-20 DAS in the Mid-Atlantic during this time period and the only states with vessels that used more than 20 DAS in this area and season are Virginia, New Jersey, Connecticut, and Massachusetts (Figure 41).

Table 64 – Number of vessels that fished in Mid-Atlantic by homeport state during turtle season of June-October (based on DAS absent from 2008 VTR data)

Results of RPM Alternative 2 – Restrict the # of access area trips an individual vessel can use in the Mid-Atlantic during a certain window of time

The PDT also discussed the results for Alternative 2 (limit number of access area trips that can be taken in the Mid-Atlantic during various seasons). This alternative does not seem to qualify as an RPM if considered for the fleet overall. When the impacts are assessed for the fleet overall, limiting effort on MA AA trips by even a small amount during either season (June 16-Oct 14 or June 15-Oct 31) would result reducing MA AA trips to less than half a trip in most cases. This is driven by the fact that the historical average of MA AA trips taken in the Mid-Atlantic is less than one trip per vessel.

The summary of impacts on DAS, F, effort shift, and reduction in landings and revenue are described in Table 65. Each FW21 scenario has been set so that 10% of projected effort in the MA during the turtle season is shifted to the remainder of the year. The table also provides the same information if all effort (100%) expected to happen in the MA in the turtle season for that RPM is shifted to provide a sense of the maximum value of potential impacts on effort, F, landings and revenues. For an effort shift of 10% the # of MA AA trips are expected to decline from 279-289 to 154-188 depending on the scenario and time period. Estimated DAS used on those shifted trips is in the order of 849-1151 DAS, the equivalent of 35-45% of all effort in the MA during the turtle season. When that amount of DAS is shifted to the other seasons of the year there are impacts on landings and revenue based on reduced average meat weight yields from one season to the other. It is also important to note that the model assumes 0% change in

price from this effort shift. It is possible that there would be higher prices during the restricted season since supply will be less, but there will be more supply in the other season so prices will likely decline.

The impacts on catch and revenue for this alternative are driven by the fact that possession limits are reduced in the time period outside the turtle season because meat weights decline. So in order to prevent fishing mortality from increasing in those areas possession limits are reduced in the model to account for changes in average meat weight differences. The differences are not very large, 500 pounds per trip, but that is what is driving the impacts. Since F can be controlled in this approach (possession limit can be reduced) actual F may not increase from this approach if the RPM is accompanied with a reduction in possession limit. Therefore, the change in F in these results is a relative change in F if the possession limit were not reduced. If the possession limit is not reduced in the other season then F will increase overall and economic impacts would be lower than these results because vessels would still be allowed to land up to their possession limit.

Similar to the alternative above, it could also be possible that limiting the number of trips vessels can take during the turtle season will still reduce effort during that time despite the fact that the average number of trips taken is lower than one per vessel. If the restriction is based on historical effort patterns of vessels *individually* compared to *on average* a more accurate picture of the actual number of trips taken during the turtle season can be considered. For example, for the Elephant Trunk area (since data for ETA and Delmarva opening in 2009 are not available yet) about 14% of all vessels took at least one trip in ETA during the turtle season in 2007 and about 75% in 2008 (Table 66). The two years are quite different: in 2007, most vessels took no trips during that time, probably both because of the rush in the beginning of the year since the area had been closed for 3 years, and the fact that there were 2 AA trips on GB that year (opening date June 15). In 2008, there were quite a few more vessels that took 1-3 trips into the Elephant Trunk during that time. This year is also different because there was only one GB AA trip and vessels got 4 trips allocated in ETA compared to 3 in 2007.

When the mean of these two years are combined, about 45% of all vessels took at least one trip in ETA during the turtle season. If a limit of one ETA trip is imposed for 2010, an average of 165 trips would be shifted from the turtle season according to these data. A limit of 2 ETA trips during the turtle season would shift about 76 trips from the turtle season to the remainder of the year. It is difficult to say if the same fishing patterns will exist in 2010 with 2 ETA trips and one Delmarva trip but the analyses suggest that some amount of effort will shift with a limit of 1 or 2 trips since many vessels did not take any ETA trips during the turtle season for both years.

Table 66 – Summary of vessels that took trips in ETA in 2007 and 2008 during turtle season

| #trips | 2007 | 2008 | MEAN |
|--|-------|-------|--------|
| 0 | 285 | 87 | 186 |
| 1 | 25 | 99 | 62 |
| 2 | 13 | 62 | 37.5 |

| 4 | 2 | 19 | 10.5 |
| 5+ | 0 | 14 | 7 |
| Total # vessels | 331 | 343 | 337 |
| Total # of trips ET allocated | 993 | 1372 | 1182.5 |
| % of vessels that took at least 1 trip in window | 13.9% | 74.6% | 44.8% |
| Total # of trips taken in window | 77 | 555 | 316 |
| % of total trips taken in window | 7.8% | 40.5% | 26.7% |
| shift of trips from max of 1 trip | 31 | 299 | 165 |
| shift of trips from max of 2 trips | 10 | 142 | 76 |

The PDT discussed that Alternative 2 could be modified another way as well; vessels could decide to use only a portion of an access area trip during the turtle season and the rest outside of the turtle season, then impacts could be reduced as compared to Alternative 4 that just removes those pounds from the fishery. A combination of Alternative 2 and 4 may be more workable if some effort is allowed during the turtle season to limit total effort, but allow the rest of that trip to be harvested in combination with other access area trips. The analyses suggest that a possession limit of 8,000 or 9,000 pounds during the turtle window would limit effort to a level

that would not have more than a minor impact on the fishery if the other pounds for that trip could be harvested outside the turtle window.

These analyses do not include information about changes in costs associated with shorter and longer trips as a result of this restriction. Another issue is that in 2010 the fishery is going to be allocated 2 ETA trips and one in Delmarva. It seems that it would not be economically viable for most vessels to go to Delmarva twice for 9,000 pounds each. However, if a vessel wanted to harvest 9,000 pounds during this time period from ETA and harvest the additional 9,000 pounds on their next trip to ETA that may be more viable. However, some vessels may not be able to hold that many scallops or may not want to extend trips that long to harvest 27,000 pounds on one trip. It is not clear to the PDT what amount of poundage would be viable for vessels to want to take advantage of this alternative. If the wrong amount is selected then the alternative would essentially cause no vessels to take any trips during the window and that is expected to have more than minor impacts on the fishery. When 100% of AA trips are restricted from the turtle season, the impact on F ranges from 0.006 to 0.13 depending on the scenario and about 20-28% of effort is expected to be shifted, well above the 10% threshold presented in the previous tables (Table 65).

Results of RPM Alternative 3 – Consider a seasonal closure for Delmarva access area

This alternative is impacted by the fact that ETA is already closed in September and October to reduce impacts on turtles, and it has been since it opened in 2007. Therefore, the historical average of MA effort in AA during these time periods is very low. Of all total 1020 trips allocated in 2010 to MA access areas, 680 of them are for ETA thus could not be fished during either of these months to start with. Therefore, only the 340 trips allocated for Delmarva could be used during these months. That is why the projected amount of trips used in the MA during these two months is either 64/1020 trips in Sept and Oct or 37 tips in October. This is based on an assumption that at least 19% of all Delmarva trips will take place in Sept-Oct and 11% in October only based on historical catch levels by month in the Delmarva region before it was an access area. This RPM proposes that Delmarva also be closed for this time period, essentially a 100% reduction from the projected MA AA effort for those time periods. The results for completely closing Delmarva for these two time periods are summarized in Table 67.

These results are different than the previous two alternatives because these changes in landings and revenues are actually positive for the fishery compared to reductions because the meat yield differences between Sept/October are lower than the average of the rest of the year. Therefore, if effort is shifted from these two periods to the remainder of the year overall yield is expected to increase if effort patterns by season are similar to the recent past. In addition, the overall change in F is positive due to this meat weight gain.

| Change in F if 100% DAS reduction | -0.005 | -0.007 | -0.003 | -0.005 | -0.004 | -0.006 | -0.004 | -0.006 |
| <u>GAIN</u> in landings if 100% DAS reduction | 55,256 | 66,247 | 55,256 | 66,247 | 55,256 | 66,247 | 55,256 | 66,247 |
| <u>GAIN</u> in revenue if 100% DAS reduction | \$403,921 | \$484,266 | \$400,606 | \$480,291 | \$401,711 | \$481,616 | \$402,264 | \$482,278 |

The assumptions used for changes in meat weight from trips shifted from either September-October or October only are a gain of 5% for the longer time period and 11% for the one month period. These values are weighted with historical catch in each period compared to the remainder of the year. The reason there is an increase in meat weight by shifting these trips is that meat weights in September and October are lower than some months like July and August, and if that effort is distributed evenly throughout the year meat weights will on average be higher compared to these two months alone (See Appendix I for more info on monthly meat weights).

However, based on effort shift patterns from the ETA seasonal closure of Sept-Oct we know that almost all the effort from Sept and Oct shifted to adjacent months (August, November and December) (Figure 37). There was also more effort in March and April, mostly from the pulse of effort that went into this area in 2007 since vessels were anxious to get in that area. If that same pattern is assumed to happen from a seasonal closure of Delmarva the change in meat weights would be 0.1% (compared to 5%) for Sept-Oct and 2% gain for October only, as compared to 11% if effort is distributed throughout the year (Table 68). The PDT used the annual assumptions because that is how the model is set up. The model is designed to estimate effort shifts from the closure period to the entire time period outside the closure and is weighted for historical catch for the entire period. The model is not capable of only assuming that effort will shift into a handful of months. Therefore, it should be noted that lower meat weight gains may be realized than the results presented for this alternative because effort is more likely to shift to adjacent months compared to the entire time period outside the window if trends are like the ETA closure in 2007 and 2008. Thus, economic gains that are described in the results for these two seasonal closure time periods from the increased meat weight values could be less than what is presented.

Table 68 – Expected change in meat weight if Delmarva trips are shifted from a seasonal closure

| Closure Period | Change in MW if effort redistributed to all other months | Change in MW if effort redistributed to adjacent months only |
|----------------|--|--|
| Sept-Oct | 5.0% | 0.1% |
| Oct | 11.0% | 2.0% |

Results of RPM Alternative 4 – Reduce possession limits in ETA and/or Delmarva to reduce fishing time per trip

Overall this alternative as written causes large economic impacts because this is the only option that does not allow vessels to recapture landings from the RPM restriction outside the turtle window. Specifically, because this alternative only reduces the possession of a MA AA trip if a vessel decides to fish during the turtle season and does not allow the vessel to catch those pounds on an additional trip, that catch is lost from the fishery completely. The estimated DAS reduction from this alternative is from shorter trips in AA because possession limits are reduced.

The two examples in the table below are setting effort shift to 10% and the other example is reducing the possession limit by 10% (i.e. an 18,000 pound trip would only be worth 16,200 pounds). This alternative is not really an effort shift since those pounds are never recaptured; it is

actually the equivalent of a 10% loss of all catch from the MA during the turtle season. The change in F for this alternative is positive because effort is reduced and not fished outside the turtle window. Even the example below that shows the impacts of reducing the possession limit by only 10% still has high economic costs because 279-289 of the total 1020 MA AA trips are expected to be taken during the window, and if the possession limit for all those trips was reduced to 16,200 pounds total catch from those trips would be reduced by 1.8 million pounds and over \$12 million dollars impact on revenue. The PDT identified that this alternative as written would cause more than a minor impact and reducing the possession limit would only be more workable as an RPM if those pounds could be harvested outside the window on a separate trip. That concept has been incorporated into Alternative 2 above.

Table 69 - Summary of results for RPM Alternative 4 for each FW21 management scenario

5.3.2.4 Analyses of combined RPM measures

Following the Scallop Committee meeting where the above analyses were reviewed, staff prepared similar analyses for “combined RPM measures” based on the Committee discussion. The Committee originally identified the two-month seasonal closure in Delmarva as a preferred alternative. However, general concern was raised at that meeting that the Delmarva seasonal closure would provide some benefit for sea turtles, but the RPM requires that the action minimize takes (in this case by limiting effort) up to point that would not have more than minor impact on the fishery. From the analyses to date some felt it was unclear how the Delmarva seasonal closure would minimize takes up to a more than minor impact threshold. As the impact on the fishery would be neutral (or positive if possession limits were adjusted to maintain fishing mortality rates), it would seem that the action could do more to minimize takes before approaching the more than minor threshold.

Therefore, staff developed several combination options and the expected impacts on effort shifts, fishing mortality, revenues and costs were completed and presented to the Council in November. This section summarizes the results of those combined options for the proposed action (NCLF24) scenario.

5.3.2.4.1 Status Quo Assumptions

Reducing possession limits or limiting the number of trips during the period from June 15 through August 31 will reduce effort in this time window from the Mid-Atlantic access areas while the Delmarva closure will reduce effort in September and October. The following analyses estimate the impacts of the combined alternatives on effort shift, fishing mortality, revenues, and fishing costs for the ‘turtle window’ from June 15 to October 31.

Moving effort out of the period from June 15 to October 31 is estimated to reduce meat weight by 2.7%. We calculated that 28.3% of the Mid-Atlantic access area effort took place during this time period and the rest (71.7%) took place outside of the turtle window. Applying the same percent distribution of effort to 1020 trips (3 access area trips for each of 340 FT equivalent vessels) that will be allocated for the 2010 fishing year, we estimated that about 289 trips will take place during this window, totaling 5.19 million pounds of scallop landings. It is estimated that 64 of these trips would take place in the Delmarva access area during September and October, totaling 1.15 million pounds of scallop landings. Thus, the rest of the 225 trips would take place during the window from June 15 to August 31, totaling 4.04 million pounds of scallop landings. Furthermore, we assumed that 22.03% of the Delmarva trips take place during this time period, totaling 75 trips and 1.35 million pounds landed at a possession limit of 18,000 pounds. There will be about 150 trips to ETA totaling 2.69 million pounds.

Table 72 through Table 74 estimate the number of trips, DAS used, and landings for each measure in the absence of the RPM measures (status quo), and the impacts on the number of trips, effort, fishing mortality, landings, fishing costs and revenues as a result of the RPM measures. Table 72 shows the results of the effort shifts for the turtle window from June 15 to October 31 without any closure of Delmarva in September and October, but without any effort shift from June 15 to August 31 window moving into the months of September and October.

Table 73 assesses the impacts on effort and landings of a closure of Delmarva in September to October with no change in effort during the June 15 to August 31 window. In other words, it is assumed that the Delmarva trips removed from the months of September and October will not shift into June 15 to August 31, but will take place outside of the longer window of November 1 to June 14. Finally, Table 74 shows the combined impacts of these measures on the number of trips, effort, fishing mortality, landings, fishing costs and revenues.

5.3.2.4.2 Combination of Delmarva closure in Sept. and Oct. and reduced possession limit in ETA (Option A) and/or Delmarva (Option B) from June 15 through August 31

5.3.2.4.2.1 Option A (ETA reduced possession limit only)

There will be no reduction in possession limit for Delmarva trips, therefore the projections expect there will still be 75 trips to this area during the window June 15 to August 31. The possession limit for ETA trips will be reduced however, so assuming that the same number of ETA trips (150) will be taken at 12,000 pounds each, total landings from this area will decline to 1.8 million pounds and total landings from Mid-Atlantic access areas including Delmarva will decline from 4.04 million to 3.15 million pounds during this window. Adding the estimated landings in Delmarva in September and October, total landings for the entire turtle window from June 15 to October 31 will go from about 5.19 million pounds to 4.30 million pounds (Table 72). This is equivalent to a 17% reduction in landings and effort as measured by DAS used during the turtle window. Total DAS used is estimated by dividing total landings by LPUE. Status quo DAS used is estimated to be 2539 DAS, which is expected to decline by 437 to 2102 DAS during the window.

Moving this effort and landings from the turtle window (from June 15 to October 31) to the rest of the year is about a 4.2% effort shift. If the possession limit stays at 12,000 pounds and there is no reduction in total landings from the Delmarva and ETA areas for the year, the fishing mortality is estimated to increase by 0.001. There would be no loss in scallop revenue because the vessels will be allowed to land the same amount of pounds. Because the number of trips would increase for people that take their trips in the summer period, however, there will be an increase in fishing costs. As indicated above, 150 trips are expected to be taken in ETA during the turtle window. The possession limit for these vessels will decline to 12,000 pounds, but they will be allowed to take three trips instead of two. If the steam time for each trip is one day both ways, this will increase total fleet trip costs by \$480,000 assuming that trip costs average \$1600 per DAS. This is in addition to the increase in fleet trip costs of \$19,030 due to fishing more in the less productive season, totaling an increase in fishing costs of \$499,030 (Table 72).

The results are based on the assumption that the reduction in the possession limit will have no affect on the number of trips taken to ETA during the turtle season. If the lower possession limit provides an incentive for some vessels to avoid taking any trips to ETA during this season, the increase in costs will be less, impacts on *F* will be higher, and there will potentially be beneficial impacts on turtles if more effort shifted out of this season than predicted.

In addition, this measure will involve closure of Delmarva (Alternative 3) from September 1 through October 31. If this effort could be shifted to the rest of the year from November 1 through August 31, the impacts of this closure would be positive because meat weight is

expected to be 5% higher in the November 1 to August 31 window compared to the September 1 to October 31 window. But the combined measure will restrict the number of trips from June 15 to August 31, therefore Delmarva trips removed from the September to October window are estimated to move to the window from November 1 to June 14. During this period (November 1-June 14) meat weight is expected to be 2.7% lower than the turtle window of June 15-October 31.

It is estimated that 64 Delmarva trips (6.7%) would normally take place during the months of September and October. The DAS used for these trips is estimated to be 563, and this effort will be removed from turtle window. This constitutes a 5.4% effort shift and an increase in F by 0.001 for the entire turtle window from June 15 to August 31. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same amount of pounds. Therefore the fleet fishing costs will increase by \$24,518 because of the Delmarva closure.

Therefore, the net change in F of closing Delmarva (increase of about 0.002) and reducing the possession limit on ETA trips during the turtle window (increase of about 0.001) will be 0.003. The combined measure will also result in a 9.7% shift of effort from the turtle window to the rest of the year. Adding the increase in fishing costs due to the Delmarva closure to the increase in costs due to the ETA measure discussed above during the turtle window, the total trip costs with the combined measure will increase by \$523,548 for the scallop fleet. The increase in costs will be less if the number of ETA trips declines during the turtle season.

The results discussed above assume that there will be no adjustment to the possession limits to keep fishing mortality constant when effort is moved to a less productive season. Likewise, the proposed measure does not include an adjustment to the possession limit given that changes in F are relatively small. The following analysis shows the theoretical results with an adjustment in possession limit to keep F constant. If the possession limit was adjusted to 11,999 pounds for ETA (from 12,000 pounds) for those taking two trips outside of the turtle window, then shifting effort from June 15 to August 31 will have no impact on F . But this reduction will lower landings by 42,246 pounds and revenues by \$307,131. For the Delmarva closure, keeping effort (DAS used) and fishing mortality at the same level would mean a reduction in possession limit of 17,962 pounds. As a result landings would decline by 31,104 pounds and revenues for the fleet would decline by \$226,126. The net result of adjusting possession limits for both ETA and Delmarva would be a decrease in fleet revenue by \$533,257.

Without a reduction in the possession limit there would be no change in revenues if the average prices stayed constant as a result of the RPM measures. These measures will change the composition of landings by shifting a part of the effort outside the turtle season, and as a result could have some impacts on the average annual price as discussed in Section 5.3.2.4.5 below.

5.3.2.4.2.2 Option B (ETA and Delmarva reduced possession limit)

Assuming a reduced possession limit of 9,000 pounds and reduced effort level of 75 trips in Delmarva taken during the window June 15 to August 31st, landings from Delmarva will decline to 0.675 million pounds. Assuming that the same number of ETA trips (150) will be taken at 12,000 pounds each, total landings from this area will decline to 1.80 million pounds and total

landings from Mid-Atlantic access areas including Delmarva will decline to 2.46 million pounds during this window. Adding the estimated landings in Delmarva (about 1.15 million pounds) in September and October, total landings for the entire turtle window from June 15 to October 31 will go down from about 5.19 million pounds to 3.62 million pounds (Table 72). This is equivalent to a 21% reduction in landings and effort as measured by DAS used during the turtle window. DAS used is estimated by dividing total landings by LPUE. Status quo DAS used is estimated to be 2539 DAS, which is expected to decline by 767 DAS to 1773 during the window. This assumes that Delmarva area is not closed in September and October.

Moving this effort and landings from the turtle window to the rest of the year corresponds to a 7.4% effort shift. If the possession limits are not adjusted down for the lower meat-weight outside the window and there is no reduction in total landings from the Delmarva and ETA areas for the year, fishing mortality is estimated to increase by 0.002. There would be no loss in scallop revenue because the vessels will be allowed to land the same amount of pounds.

Because the number of trips would increase for people that take their trips in the summer period there will be an increase in fishing costs. As indicated above, 150 trips are expected to be taken in ETA with 75 of those during the turtle window. The possession limit for these vessels will decline to 12,000 pounds for ETA, but they will be allowed to take three trips instead of two. The possession limit for Delmarva will decline to 9,000 pounds, but they will be allowed to take two trips instead of one. In other words, in total an extra 225 (150 + 75) trips would have to be taken at the reduced possession limit in both areas. If the steam time for each trip is one day each way, this will increase total fleet trip costs by \$720,000 assuming that trip costs average \$1600 per DAS. In addition, the fleet trip costs will increase by \$33,391 because effort is shifted to the less productive season. Thus, total trip costs for the fleet will go up by \$753,391. This is assuming that the reduction in the possession limit will have no effect on the number of trips taken to ETA and Delmarva during the turtle season. If the lower possession limit provides an incentive for some vessels to avoid taking any trips to ETA during this season, the increase in costs will be less.

In addition, this measure will involve closure of Delmarva (Alternative 3) from September 1 through October 31. If this effort could be shifted to the rest of the year from November 1 through August 31, the impacts of this closure would be positive because meat weight is expected to be 5% higher in the November 1 to August 31 window compared to the September 1 to October 31 window. But the combined measure will restrict the number of trips from June 15 to August 31, therefore Delmarva trips removed from the September to October window are estimated to move to the November 1 to June 14 window. During this period (November 1-June 14) meat weight is expected to be 2.7% lower than the turtle window of June 15-October 31.

It is estimated that 64 trips (6.7%) in Delmarva would normally take place during the months of September and October. The DAS used for these trips is estimated to be 563 DAS, and this effort will be removed from turtle window. This constitutes a 5.4% effort shift and an increase in *F* by 0.002 for the entire turtle window from June 15 to August 31. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore the fleet fishing costs will increase by \$24,518 because of the Delmarva closure.

Therefore, the change in F of closing Delmarva (increase by about 0.002) and moving effort from the June 15 to August 31 window to the rest of the year (increase by about 0.002) adds up to a net increase in F of 0.004 for the entire turtle window from June 15 to October 31. The combined measure will also result in a 12.9% shift of effort from the turtle window (June 15 – October 31) to the rest of the year. Adding the increase in fishing costs due to the Delmarva closure to the increase in costs due to the ETA measure discussed above during the turtle window gives a total trip cost increase of \$777,909 for the scallop fleet. The increase in costs will be less if the number of ETA trips declines during the turtle season.

The results discussed above assume that there will be no adjustment to the possession limits to keep fishing mortality constant when effort is moved to a less productive season. Likewise, the proposed measure does not include an adjustment to the possession limit given that changes in F are relatively small. The following analysis is conducted to show the theoretical results with an adjustment in possession limit to keep F constant. If the possession limit was decreased to 11,630 pounds (from 12,000 pounds for those taking 2 trips) and the Delmarva possession limit to 8,723 pounds outside of the turtle window, then shifting effort from June 15 to August 31st will have no impact on fishing mortality. However this reduction will lower landings by 60,092 pounds and revenues by \$436,871. For the Delmarva closure, keeping effort (DAS used) and fishing mortality at the same level would mean reducing the possession limit to 17,962 pounds. As a result landings would decline by 31,104 pounds and revenues for the fleet would decline by \$226,126. The net result of adjusting possession limits for both ETA and Delmarva would be a decrease in fleet revenue by \$662,997.

Without a reduction in the possession limit there would be no change in revenues if the average prices stayed constant as a result of the RPM measures. These measures will change the composition of landings by shifting a part of the effort outside the turtle season, and as a result could have some impacts on the average annual price as discussed in Section 5.3.2.4.5 below.

5.3.2.4.3 Combination of Delmarva seasonal closure in September and October as well as a limiting the number of trips that can be taken in ETA with a reduced possession limit between June 15 through August 31

For this alternative there will be no reduction in possession limit for Delmarva trips, but the possession limit for ETA trips will be reduced to 14,000 pounds and vessels will be allowed to take only one ETA trip during this period. There are several ways the results of this scenario could be analyzed. One way is to assume that the number of Delmarva trips will stay constant at 75 and the number of ETA trips will decline because the number of trips to this area will be limited to one and also because of the reduction in the possession limit to 14,000 pounds. This may not be a realistic assumption, however, because the vessels could increase the number of their Delmarva trips during this period instead to take their ETA trips outside the window. According to the analysis of the effort distribution during these months, it was estimated that 225 trips would be taken during this window if there were no limits on the number of trips per vessel. If this happened, there would be no change in effort, F or landings during this period.

The above assumption could be unrealistic since it assumes that the restriction on the number of trips and reduction in the possession limit will have no impact on total effort during this period.

The analysis provided in Section 5.3.2.4.4.2, below shows that when the number of trips was restricted to two per vessel during the June 15 to August 31 window, the total number of trips taken to the MA access areas would decline by 18% from 225 trips to 184 trips. Since this measure effectively limits the number of trips to two per vessel, one for Delmarva and one for ETA, it could be assumed that this measure will reduce the effort during this window to 184 trips.

The second assumption is about the composition of these trips between DMV and ETA areas. If the reduction in the possession limit for ETA discourages vessels from taking their ETA trips during this period, then more vessels could instead take their DMV trips between June 15 and August 31. Again, how many vessels would choose to do so is unknown, but the analysis provided in Section 5.3.2.4.4.1 below and in Table 70 shows that if the number of trips were limited to one per vessel, total number of trips would go down by 48%. If we apply this same reduction to the number of ETA trips (150) expected to be taken during this period under status quo conditions, the total number ETA trips would decline to 78 trips ($150 \times (1 - 0.48)$). This would increase the number of trips to the DMV area from 75 to 106 trips assuming that vessels will still take 184 trips to the Mid-Atlantic areas between June 15 and August 31. If instead it was assumed that the number of trips to DMV area would stay the same at 75 trips, the total number of trips would decline to 153 trips, which could be an extreme assumption. Therefore, for the purposes of this analysis, it is assumed that the total number of trips would decline from 225 trips to 184 trips as a result of this measure, with a decline in ETA trips to 78 and an increase in DMV trips to 106 between June 15 and August 31. Obviously, the assumption of constant effort in DMV (75 trips) and a decline in total number of trips to 153 in Mid-Atlantic access areas would magnify the negative impacts on effort, landings and fishing mortality compared to the scenario where trips are reduced from 225 to 184 in the window between June 15 through August 31.

We assumed that 22.03% of Delmarva trips take place during this time period, totaling 75 (340×0.2203) which equals 1.35 million pounds landed at a possession limit of 18,000. There will be about 150 trips to ETA totaling 2.69 million pounds.

Assuming 106 trips will be taken to the DMV at 18,000 pounds each, the landings from this area would increase to 1.9 million pounds from 1.35 million pounds. Assuming 78 trips will be taken at 14,000 pounds each to the ETA, total landings from this area will decline to 1.09 million pounds from 2.69 million pounds. Adding the estimated landings in DMV in September and October, total landings for the entire turtle window from June 15 to October 31 will decline from about 5.19 million pounds to 4.15 million pounds (Table 72). This is equivalent to a 20% reduction in landings and effort as measured by DAS used during the turtle window. Total DAS used is estimated by dividing landings by LPUE. Status quo DAS used is estimated to be 2539 DAS, which is expected to decline by 510 to 2029 DAS during the window for this measure alone.

Moving this effort and landings from the turtle window to the rest of the year is about a 4.9% effort shift and would increase the fishing mortality by 0.001. There would be no loss in scallop revenue because the vessels will be allowed to land the same amount of pounds. Because there will be more fishing during the less productive season, fleet trip costs would increase by \$22,217 due to needing to fish more to catch the same amount in the less productive season.

In addition, this measure will involve closure of DMV (Alternative 3) from September 1 through October 31. If this effort could be shifted to the rest of the year from November 1 through August 31, the impacts of this closure would be positive because meat weight is expected to be 5% higher in the window November 1 to August 31 compared to the September 1 to October 31 window. But the combined measure will restrict the number of trips from June 15th to August 31, so DMV trips removed from September and October are expected to move to November 1 to June 14. During this period (November 1-June 14) meat weight is expected to be 2.7% lower than the turtle window of June 15-October 31.

It is estimated that 64 DMV trips (6.7%) would normally take place during the months of September and October. The DAS used for these trips is estimated to be 563 DAS, and this effort will be removed from the turtle window. This constitutes a 5.4% effort shift and an increase in F of 0.002 for the entire turtle window. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same poundage. Therefore the fleet fishing costs will increase by \$24,518 because of the DMV closure.

Therefore, the net effect on F of closing DMV (increase by 0.002) and moving effort from between June 15 and August 31 to the rest of the year (increase by 0.001) will be net increase in F by 0.003 for the entire Turtle window from June 15 to October 31. The combined measure will also result in a 10.4% shift of effort from the turtle window to the rest of the year. Adding the increase in fishing costs due to the DMV closure to the increase in costs due to the ETA measure discussed above during the turtle window, trip costs for the combined measure will increase by \$46,735 for the fleet. The increase in costs will be less if the number of ETA trips declines during the turtle season.

The results discussed above assume that there will be no adjustment to the possession limits to keep fishing mortality constant when effort is moved to a less productive season. Likewise, the proposed measure does not include an adjustment to the possession limit given that changes in F are relatively small. The following analysis is conducted, however, to show the theoretical results with an adjustment in possession limit to keep F constant. If the possession limit was adjusted down, however, to 21,900 pounds (instead of 22,000 pounds for the trips taken to ETA during June 15 and August 31) outside of the turtle window, then shifting effort from June 15 to August 31 will have no impact on F . But this reduction will lower landings by 20,784 pounds and revenues by \$151,096. For the Delmarva closure, keeping effort (DAS used) and fishing mortality at the same level would mean a reduction in possession limit to 17,962 pounds. As a result landings would decline by 31,104 pounds and revenues for the fleet would decline by \$226,126. The net result of adjusting possession limits for both ETA and DMV would be a decrease in fleet revenue by \$377,222.

Without a reduction in the possession limit there would be no change in revenues if the average prices stayed constant as a result of the RPM measures. This alternative will change the composition of landings by shifting 10.4% effort to outside the turtle season, and as a result could have some impacts on the average annual price as discussed in Section 5.3.2.4.5 below.

5.3.2.4.4 Combination of Delmarva seasonal closure in September and October as well as a restriction on the number of access area trips in the Mid-Atlantic that can be used between June 15 and August 31

5.3.2.4.4.1 Option A (one trip maximum)

Status quo is same as described in Section 5.3.2.4.1 above. This alternative will not impact the possession limit for access areas but will limit the maximum number of trips that can be taken from June 15 to August 31. Table 70 provides a method of estimating the total number of trips when number of trips per vessel is restricted to one.

The landings data from Mid-Atlantic from past years indicated that 22% of trips took place during the window from June 15 to August 31, which amounts to 225 trips from both areas assuming an allocation of three trips per vessel. Including the 64 trips estimated in the Delmarva access area for September and October, the total number of trips for the turtle window is 289. However, this data does not provide information about the number of trips taken by each vessel. The DAS data for the access area trips in ETA in 2007 and 2008 shows that the average number of trips taking place there during the turtle window is 292 (Table 70). This number is greater than 289 because the vessels were allocated four trips in the Mid-Atlantic those years, but the projected number of trips corresponds to allocation of three trips to ETA and DMV combined. In order to estimate number of trips consistent with 2010 access area trip allocations (three per vessel), the total number of trips is derived in Table 70 by setting the maximum trips per vessel to three in 2007-2008.

These adjusted results indicate that as an average of these two years, there were about 292 trips during the turtle window. The projected 289 trips in the window are three trips less than the 292 trips shown in Table 70, because the former is based on the landings data estimates while the latter is based on the DAS data shown in (Table 71). This small difference does not have a significant impact on the results. Out of the 292 trips, 151 trips correspond to single trips taken by 151 vessels during this period. The rest of the 141 trips were taken as a second or a third trip by a subset of vessels that took at least one trip during the same window. Therefore, if the maximum number of trips per vessel was limited to one during this window, the total number of trips would decline by 141 trips, or by 48% as an average of 2007-2008. When the projected 225 trips for the June 15 to August 31 window are lowered by 48%, the total number of trips is estimated to decline to 117 trips. When the entire window and the 64 trips that are estimated to be taken from the DMV area is added to this number, total number of trips without a closure in DMV would add up to 181 trips as shown in (Table 72).

Table 70- Estimation of number of trips with constraints on maximum trip per vessel during the turtle window (June 15 to October 31st) and assuming 3 access area trip allocations per vessel (Based on info in Table 66, DAS data)

| Data | Number of trips per vessel | 2007 | | 2008 | | 2007-2008 average |
|--|----------------------------|-------------------|-----------------|-------------------|-----------------|-------------------|
| | | Number of vessels | Number of trips | Number of vessels | Number of trips | |
| | 0 | 285 | 0 | 87 | 0 | |
| | 1 | 25 | 25 | 99 | 99 | |
| | 2 | 13 | 26 | 62 | 124 | |
| | 3 | 8 | 24 | 95 | 285 | |
| Total number of vessels | | 331 | 75 | 343 | 508 | 337 |
| Total number of trips | | | 75 | | 508 | 292 |
| Number of trips if maximum trip=1 | | | 46 | | 256 | 151 |
| Decline in trips if maximum trip=1 | | | 29 | | 252 | 141 |
| Decline in trips if maximum trip =1 | | | 39% | | 50% | 48% |

Limiting the maximum number of trips to one per vessel will move 947 DAS from the turtle window to the rest of the year, which constitutes about 9.2% effort shift. If the possession limit is not adjusted down outside of the window for the decline in meat-weight there is no reduction in total landings from the DMV and ETA areas for the year, and the fishing mortality is estimated to increase by 0.002 for the entire turtle window from June 15 to October 31. There would be no loss in scallop revenue because the vessels will be allowed to land the same amount of pounds. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore the fleet fishing costs will increase by \$41,244.

In addition, this measure will involve closure of DMV (Alternative 3) from September 1 through October 31. If this effort shifted to the rest of the year from November 1 through August 31, the impacts of this closure would be positive because meat weight is expected to be 5% higher in the window of November 1 to August 31 compared to the September 1 to October 31 window. However the combined measure will restrict the number of trips from June 15 to August 31, therefore DMV trips removed from September and October are estimated to move to the window from November 1 to June 14. During this period (November 1 - June 14) meat weight is expected to be 2.7% lower than the turtle window of June 15-October 31.

It is estimated that 6.7% of DMV trips (64 total) would normally take place during the months of September and October. The DAS used for these trips is estimated to be 563, and this effort will be removed from the turtle window. This constitutes a 5.4% effort shift and an increase in F of 0.002 for the entire turtle window from June 15 to August 31. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore the fleet fishing costs will increase by \$24,518 because of the DMV closure.

The net change in F of closing DMV (increase F by 0.002) and limiting the number of trips to one per vessel during the June 15 – August 31 window (increase F by 0.002) will be a net increase in F of 0.004. This combined measure will also result in a 14.6% shift of effort from the

turtle window (June 15 – October 31) to the rest of the year. Adding the increase in fishing costs due to the DMV closure to the increase in costs due to effort shifts from ETA during the turtle window, the total increase in trip costs for the combined measure would be \$65,762 for the scallop fleet.

The results discussed above assume that there will be no adjustment to the possession limits to keep fishing mortality constant when effort is moved to a less productive season. Likewise, the proposed measure does not include an adjustment to the possession limit given that changes in F are quite small. The following analysis is conducted to show the theoretical results with an adjustment in possession limit to keep F constant. If the possession limit was adjusted down to 17,935 pounds (from 18,000 pounds) for those taking trips outside of the turtle window, then shifting effort from June 15 to August 31 will have no impact on F . But this reduction will lower landings by 52,323 lb and revenues by \$380,386. For the Delmarva closure, keeping effort (DAS used) and fishing mortality at the same level would mean reducing the possession limit to 17,962 pounds. As a result landings would decline by 31,104 pounds and revenues for the fleet would decline by \$226,126. The net result of adjusting possession limits for both ETA and DMV would be a decrease in fleet revenue by \$606,513.

Without a reduction in the possession limit there would be no change in revenues if the average prices stayed constant as a result of the RPM measures. This alternative will change the composition of landings by shifting 14.6% effort outside the turtle season, and as a result could have some impacts on the average annual price as discussed in Section 5.3.2.4.5 below.

5.3.2.4.4.2 Option B (two trip maximum) – Proposed Alternative

Status quo is same as described above in Section 5.3.2.4.1 above. This alternative will not impact the possession limit for access areas but will limit the maximum number of trips that can be taken from June 15 to August 31. Table 71 provides a method of estimating the total number of trips when number of trips per vessel is restricted to two.

The landings data from Mid-Atlantic access areas for the earlier years indicated that 22% trip took place during the window from June 15 to Aug. 31st, which amounts to 225 trips from both areas assuming an allocation of 3 trips per vessel. Including the 64 trips estimated for the Delmarva access area for September and October, total number of trips for the Turtle window amounts to 289 trips. However, this data does not provide information about the number of trips taken by each vessel. The DAS data for the access area trips in ETA showed that as an average of the years 2007 and 2008, about 316 trips took place during the turtle season from June 15 to October 31st (Table 66). This number is greater than 289 because the vessels were allocated 4 trips in ETA, while the projected number of trips, that is 289, corresponds to allocation of 3 trips to ETA and DMV combined. In order to estimate number of trips consistent with 2010 access area trip allocations (3 per vessel), total number of trips are derived in Table 71 by setting the maximum trip per vessel to 3 in 2007-2008. These adjusted results indicate that as an average of these two years, there were about 292 trips during the turtle window from June 15 to October 31st.

The projected trips, 289 trips, for the window are 3 trips less than the 292 trips shown in Table 71, because the former is based on the landings data estimates while the later is based on the

DAS data. This difference is very small and do not have any significant impact on the results because of the number of trips for vessels taking one trip only was calculated as a percentage of the total number estimated, i.e., 289 trips as follows: Using the same method as in Table 70 above, it is estimated that 240 out of 292 trips during the turtle window from June 15 to October 31st and 151 included trips by vessels that took one or two trips. The rest of the 52 trips were taken as a third trip by a subset of vessels that took at least one trip during the same window. Therefore, if the maximum trip per vessel was limited to two trips during this window, the total number of trips would decline by 52 trips, or by 18% as an average of 2007-2008 (Table 71). When the projected 225 trips for the June 15 to Aug.31st window are lowered by 18%, the total number of trips is estimated to decline by 41 trips to 184 trips. When the 64 trips that are estimated to be taken from the DMV area for the entire window from June 15th to October 31st are added to this number, total number of trips without a closure in DMV would add up to 248 trips as shown in last column of Table 72.

Table 71 - Estimation of number of trips when maximum trip per vessel are set to two trips per vessel during the turtle window (June 15 to October 31st) and assuming 3 access area trip allocations per vessel (Table 66, DAS data)

| Data | 2007 Number of vessels | Number of trips | 2008 Number of vessels | Number of trips | 2007- 2008 average |
|-------------------------------------|---|----------------------------|---|----------------------------|-----------------------------------|
| Number of trips per vessel | | | | | |
| 0 | 285 | 0 | 87 | 0 | |
| 1 | 25 | 25 | 99 | 99 | |
| 2 | 13 | 26 | 62 | 124 | |
| 3 | 8 | 24 | 95 | 285 | |
| Total number of vessels | 331 | 75 | 343 | 508 | 337 |
| Total number of trips | | 75 | | 508 | 292 |
| Number of trips if maximum trip=2 | | 67 | | 413 | 240 |
| Decline in trips if maximum trip=2 | | 8 | | 95 | 52 |
| Decline in trips if maximum trip =2 | | 12% | | 23% | 18% |

Limiting maximum number of trips to two per vessel will move 358 DAS from the turtle window to the rest of the year, which constitutes about a 3.5% effort shift. If the possession limit is not adjusted down outside of the window for the decline in meat weight, there is no reduction in total landings from the DMV and ETA areas for the year, and the fishing mortality is estimated to increase by 0.001 for the entire turtle window from June 15 to October 31. There would be no loss in scallop revenue because the vessels will be allowed to land the same amount of pounds. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore fleet fishing costs will increase by \$15,577.

In addition, this measure will involve closure of DMV (Alternative 3) from September 1 through October 31. If this effort could be shifted to the rest of the year from November 1 through August 31, the impacts of this closure would be positive because meat weight is expected to be 5% higher in the window of November 1 to August 31 compared to September 1 to October 31. The combined measure will restrict the number of trips from June 15 to August 31, therefore

DMV trips removed from September and October are expected to move into the window from November 1 to June 14. During this period (November 1-June 14) meat weight is expected to be 2.7% lower than the turtle window of June 15-October 31.

It is estimated that 64 DMV trips (6.7%) would normally take place during the months of September to October. The DAS used for these trips is estimated to be 563, and this effort will be removed from turtle window. This constitutes a 5.4% effort shift and an increase in F of 0.002 for the entire turtle window from June 15 to August 31. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore the fleet fishing costs will increase by \$24,518 because of the DMV closure.

The net change in F of closing DMV (increase in F of 0.002) and limiting the number of trips to two trips per vessel during the June 15 – August 31 window (increase in F of 0.001) will be a net increase in F of 0.003. The combined measure will also result in a 8.9% shift of effort from the turtle window (June 15 – October 31) into the rest of the year, which is slightly below the recommended threshold level for a minor change based on the analyses prepared by the PDT for the original RPMs in FW21. Adding the increase in fishing costs due to the DMV closure to the increase in costs due to effort shifts from ETA during the turtle window, the total trip costs with this combined measure will increase by \$40,095 for the scallop fleet.

The results discussed above assume that there will be no adjustment to the possession limits to keep fishing mortality constant when effort is moved to a less productive season. Likewise, the proposed measure does not include an adjustment to the possession limit given that the changes in F are quite small. If the possession limit was reduced to 17,975 pounds (from 18,000 pounds) for those taking trips outside of the turtle window, then shifting effort from June 15 to August 31 will have no impact on F , but this reduction will lower landings by 19,761 pounds and revenues by \$143,661. For the Delmarva closure, keeping effort (DAS used) and fishing mortality at the same level would mean a reduction of the possession limit to 17,962 pounds. As a result landings would decline by 31,104 pounds and revenues for the fleet would decline by \$226,126. The net result of adjusting possession limits for both ETA and DMV would be a decrease in fleet revenue of \$369,787.

Without a reduction in the possession limit there would be no change in revenues if the average prices stayed constant as a result of the RPM measures. These measures will change the composition of landings by shifting a part of the effort outside the turtle season, and as a result could have impacts on the average annual price as discussed in Section 5.3.2.4.5 below and compared with the impacts of other alternatives.

5.3.2.4.5 Discussion of impacts of effort shifts on prices

Without a reduction in the possession limit there would be no change in revenues if the average prices stayed constant as a result of the proposed RPM measures or the alternatives. The proposed measures will lead to a change in the seasonal composition of landings and therefore could lead to a change in prices. In general, the reduction in landings during the turtle window is expected to increase prices during the period from July 15 to October 31, but expected to reduce prices for months outside of the turtle window. Whether the increase in scallop prices in the first

period will offset the decrease in prices in the second period will depend on the magnitude of the shift, the timing of the displaced effort, and the change in meat weight of scallops outside of the turtle window. If the shift in effort and landings comprises a small proportion of total effort and landings in the turtle window the impacts on prices will be low. Similarly if the displaced effort is distributed more or less evenly throughout the window it is shifted to, the impacts on prices will be small.

The proposed action is expected to minimize the effort shift from the turtle window compared to the other alternatives considered by the Council (Table 74) Proposed measures would shift 8.9% of effort outside the turtle season, while the other alternatives would shift 9.7% (combined measure 1.1, Option A) to 14.6% (combined measure 1.3, Option A) and as a result the proposed action will have the least impacts on prices. However, this impact cannot be quantified with 100% accuracy due to the factors explained below.

With the proposed measure, the landings in the Mid-Atlantic access areas will decline by 1.8 million pounds during the turtle window, which amounts to about 9% of the total landings from all areas (20.7 million) during the same window. Therefore, it is unlikely for this shift to have a significant impact on the scallop prices for this period. It is also not possible to quantify with certainty the extent of the increase in prices at this time since many factors that impact prices such as the quantity of exports, import prices, size composition of scallops during and outside of the turtle window, and seasonal distribution of future landings are unknown at this time.

Since there will be no change in the possession limit, the access area effort shifted from the turtle window will take place between November 1 and June 14. Therefore 1.8 million more pounds will be landed in this window. Since total landings from all areas without the RPM measures are expected to be about 26.3 million pounds during this period, shifting 1.8 million pounds would increase landings by 7% outside the turtle window and would probably lower the price of scallops. Again, it is unlikely that this shift will reduce prices significantly during this period, especially if the displaced effort is distributed more or less evenly and if some vessels try to maximize their revenue by taking their trips during months when prices are relatively higher because of lower landings.

Since the reduction in landings during the turtle window (9%) is greater than the increase in landings (7%) outside of the turtle window, the percentage increase in prices could exceed the percentage decline in prices outside the turtle window, outweighing the decline in the later period. On the other hand, the meat weights will be slightly lower (by 2.7%) for the landings that are shifted out of the turtle window and this could have a negative impact on prices. If the effort during the turtle window is directed more to the areas with higher scallop abundance, the meat-weight composition of the landings could increase during this window, resulting in even higher prices.

Table 72 – Summary of potential impacts on fishing mortality, effort shifts, yield, revenue, and fishing costs associated with combined RPM alternatives based on effort shifts for the turtle window from June 15 to October 31 without any closure of Delmarva in September and October, and without any effort shift from June 15 to August 31 window moving in to the months of September and October. All analyses are based on the proposed action (NCLF24) scenario.

NET of combined alternatives

5.3.2.5 Additional analyses of scallop fishery trends related to RPM

The sea scallop fishery is managed under an adaptive rotational management plan, where the fishing levels and the number of access trips vary widely from year to year. Under area rotation, allocations may vary by year and area, but the overall fishing mortality rate is designed to be more constant. The current overfishing threshold is $F = 0.29$, and allocations are given so that level of F is not exceeded. In recent years, the target has been $F = 0.20$. In a given year the limited access fishery is allocated open area DAS and access area trips. The number of open area DAS vary depending on how many access area trips are allocated because, to prevent overfishing, the overall fishing mortality cannot exceed a certain level. So in a year where several access area trips are allocated, open area DAS will be lower. Furthermore, in some years, many areas may be completely closed to fishing because those areas have high levels of small scallops. Thus, those areas are closed for several years and when they reopen, fishing mortality will be higher in that area.

With respect to the total allocated DAS, the allocations fluctuate yearly. These allocations are based on available biomass and mortality estimates, which vary depending on the expected biomass and how much fishing mortality is being allocated in access areas. In some years, open area effort may be lower because more effort is being allocated in access areas. When more effort is allocated in access areas, open area effort must be reduced to keep overall effort levels below overfishing thresholds. Comparing 2004 to 2009, the number of total DAS allocated has declined by 39%. The average DAS allocated from 2004-2007 was 19,182, which is about 29% more than the estimate of allocated DAS for 2009. However, this does not take into account the fact the FMP does not dictate where open area effort can be used. Most years, open area effort is split evenly between the Mid-Atlantic and Georges Bank, but that fluctuates depending on where catch rates are higher in the open areas.

Table 75 – Scallop DAS allocated and used in recent years

| Year | Total DAS allocated | FT | PT | Occ | Total DAS used |
|------|---------------------|----|----|-----|----------------|
| 2004 | 22462 | 42 | 17 | 4 | 15987 |
| 2005 | 15344 | 40 | 16 | 3 | 14436 |
| 2006 | 20343 | 52 | 21 | 4 | 17344 |
| 2007 | 18577 | 51 | 20 | 4 | 15192 |
| 2008 | 11410 | 35 | 14 | 3 | |
| 2009 | 13692 | 42 | 17 | 3 | |

Based on which access areas are open during which years, the number of trips varies greatly. Allocated numbers of trips are based on biomass estimates and the basic principles of area rotation. From 2004-2007 roughly 50% of access area trips were allocated to the Mid-Atlantic, except in 2006, when no trips (other than Hudson Canyon carry-over trips) were allocated (

Table 76). Subsequently, for 2008-2009, 80% of the trips have been allocated to the Mid-Atlantic. In 2010 3 out of the 4 access area trips will be in the Mid-Atlantic.

Table 76 – Access area allocations from 2004-2009

| Access Areas | | GB | | | Mid-Atlantic | | |
|--------------|--------------------|-----|-----|----|--------------|----|-----|
| | Total trips for FT | CA1 | CA2 | NL | HC | ET | Del |
| 2004 | 7 | | 2 | 1 | 4 | | |
| 2005 | 5 | 1 | 1 | | 3 | | |
| 2006 | 5 | | 3 | 2 | carry-over | | |
| 2007 | 5 | 1 | | 1 | carry-over | 3 | |
| 2008 | 5 | | | 1 | | 4 | |
| 2009 | 5 | | 1 | | | 3 | 1 |

5.3.2.5.1 Scallop effort in the Mid-Atlantic

Fishing effort in the Mid-Atlantic has changed over time. In general, total catch from the MA was very low from 1994 until more recently (Figure 42). From 2004-2007 about 60% of total catch came from MA access areas and open areas. There is typically a peak in the spring until more recent years (2007 and 2008). The peak used to be May/June, and more recently it has shifted to April or even March. When the Elephant Trunk area was open in 2007 and 2008 more catch occurred during the early spring and later in the year compared to spring and summer in earlier years. This shift of effort, likely caused by the high amount of effort allocated to ETA and the two month turtle closure from Sept 1-Oct 31) seems to have reduced scallop fishing during most of the year when turtles are expected to be in the Mid-Atlantic. Figure 43 shows that overall catch in the Mid-Atlantic has steadily reduced during both turtle seasons under consideration in FW21 from 50-60% to closer to 30% for both time periods. Figure 44 shows catch by area during the turtle season compared to other times of the year for 2004-2008 combined, and for all areas in the Mid-Atlantic (Elephant Trunk, Hudson Canyon, and open areas) more catch is during the months of November–May compared to June–October.

Figure 42 – Scallop landings in the Mid-Atlantic by month and year

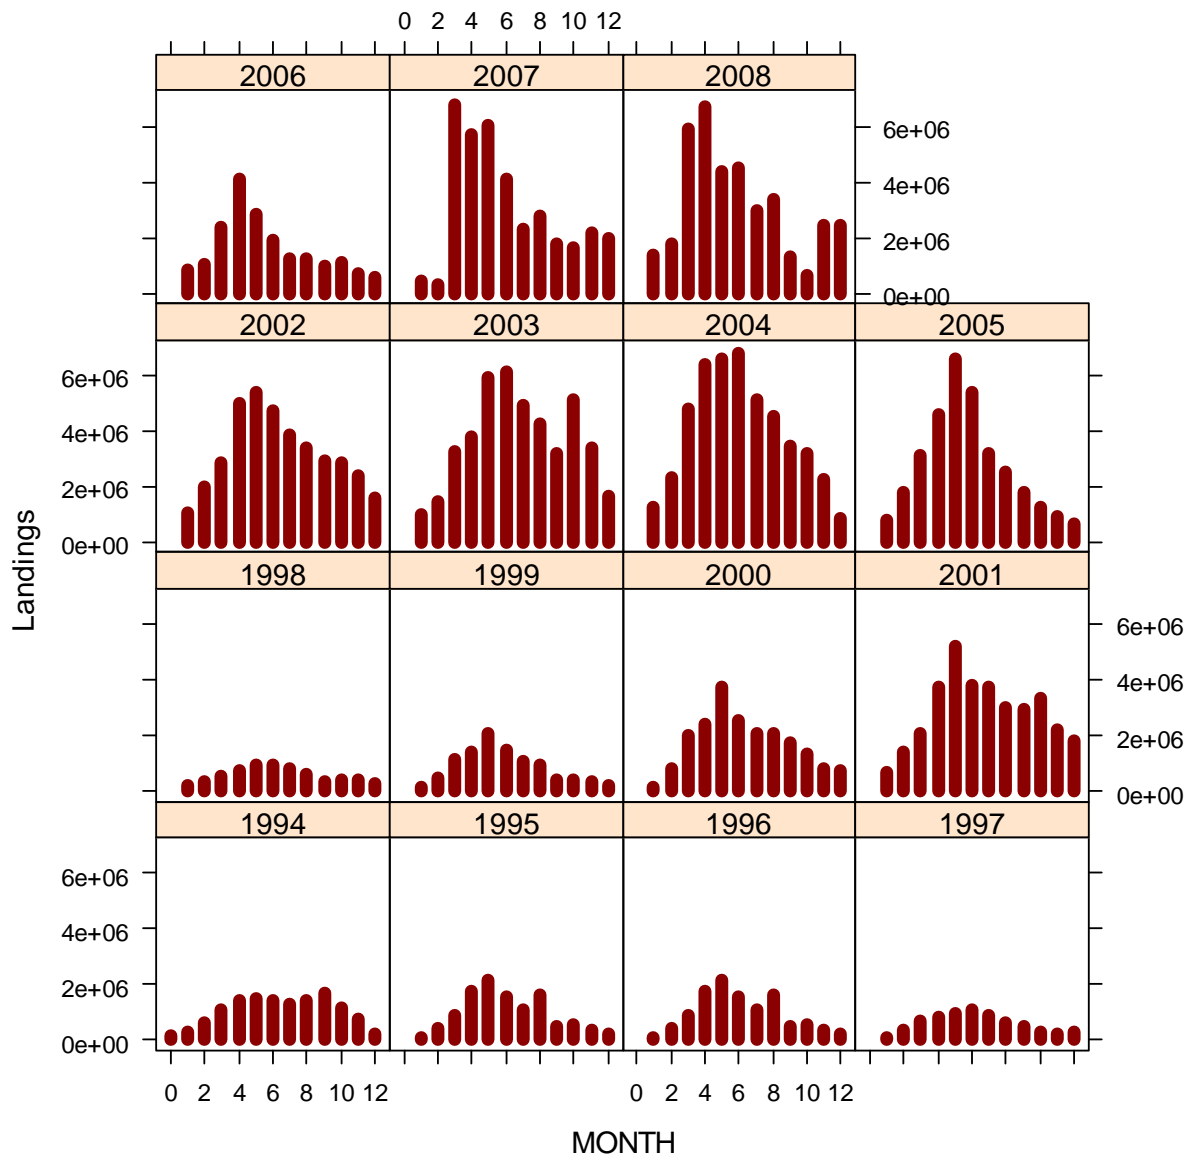

Figure 43 – Percent of Mid-Atlantic landings (open and access areas combined) for the two turtle seasons under consideration – June 16-Oct14 (dashed) and June 15-Oct 31 (solid)

Figure 44 – Scallop landings during turtle season of June-October compared to the rest of the year

Fishing mortality peaked in the early 1990s, but has decreased substantially since then and, in general, has remained stable since 1999 (Figure 45). In recent years, fishing mortality has been higher for the Mid-Atlantic than for Georges Bank. Georges Bank saw a significant decrease in fishing mortality from 1993-1995 and has remained very stable since 1995. However, the Mid-Atlantic fishing mortality, although in decline, is not as stable as Georges Bank. The threshold for overfishing is $F = 0.29$. The estimate of turtle takes was based on fishing effort levels in 2003 and 2004. Since 2004, F has been reduced by about 50% overall, as well as during the months of June-October, when turtles are more likely present in the Mid-Atlantic (Figure 46).

Figure 45 – Fishing mortality in the scallop fishery overall (and in Georges Bank and Mid-Atlantic) from 1983 -2006

Figure 46 – Estimate of fishing mortality in the Mid-Atlantic (blue) and during the months of June-October (red). Fractions in projections assume June-October fishing mortality is 42% of annual F.

F estimates for 2003-2006 from SAW Report and projections for 2007-2011 from FW19 projections

5.3.2.6 Additional issues to consider

There are several other factors that would affect the change in prices for scallops, such as a change in import or export prices in response to changes in the seasonal composition of landings, the change in numbers of U10 or U12 scallops as a proportion of monthly landings, fluctuations in monthly disposable income, and changes in seasonal demand. Many of these factors are unknowns at this point, making it difficult to accurately estimate the impact of effort shifts on prices. For example, if more scallops are imported in response to lower domestic landings during the turtle window, the price of scallops may not increase during these months, or may increase by a negligible amount. In addition, the estimates of average annual price used in these analyses are based on 1999-2006 data and these are currently being updated. Preliminary results including 2007 and 2008 as well, suggest that differences in total landings projected in these scenarios are not expected to have a large impact. Therefore, price estimates may be more similar than presented (\$6.87 compared to \$7.81). While prices may be different this should not impact the overall results in terms of change or percent change in revenue impacts. There is no question that the uncertainties created by these shifts in the seasonal composition of effort and landings will make it difficult for vessel-owners to make their plans about where and when to fish and could possibly lead to reduced economic efficiency and to higher costs, reducing vessel profits further.

The analyses provided above do not take into account the distributional impacts of turtle measures and effort shifts for various ports, states, and vessels of different size categories. Because turtle measures will require a reduction in effort in the Mid-Atlantic areas, they are expected to have greater negative impacts on vessels homeported in the Mid-Atlantic areas, particularly those that are smaller vessels that have less mobility to travel to other fishing grounds and are more vulnerable to the weather conditions.

Overall, it needs to be said that there are many unknowns about these types of measures in terms of what the outcomes will actually be. Impacts may be very different from these measures if assumptions made in these analyses are not realized. For example, if a seasonal closure in Delmarva shifts effort differently than it did in 2007 and 2008 from the ETA closure impacts on scallop fishing mortality, revenue, and turtles could be very different. If more effort is shifted into July and August that will reduce fishing mortality but could increase potential interactions with sea turtles. On the other hand if effort shifts primarily to months like November, December, March and April fishing mortality will be higher than projected and impacts on turtles will likely be more beneficial than projected because all these months are outside the turtle season. Vessels tend to fish to maximize potential revenues when yields are generally highest, but the market is unpredictable and behavior constantly adjusts. Therefore, it is very difficult to know in advance if measures such as these will ultimately have more than a minor impact on the fishery or not.

In addition to the primary measure of “more than minor” (percent change in effort shift) the PDT included a description of other factors that could influence impacts on the fishery that were not directly considered in this analysis. A shift in effort could also affect the following:

- concern about safety at sea (shift to winter months),

- changes in bycatch (i.e. fluke bycatch increases in winter months when overlap with scallop fishery offshore),
- revenue impacts because of reduced catch and changes in price, costs, markets, supply, etc.,
- impacts on the ability of the observer program to maintain coverage from surges and shifts in effort, and
- general impacts of altering rotational area management and compromising the ability to achieve optimum yield.

5.3.2.7 Overall PDT input

The PDT did not identify any of these measures as preferred recommendations. Some felt the measures that focus on access area management may have lower distributional impacts. Some felt that more impacts could result from these measures than the analyses show due to all the unknown factors such as change in price and markets. Some raised concern about how these will ultimately impact turtles, positive or negative. Overall, how these measures fit in with the other issues in FW21 such as the potential new closed area in the Channel and YT allocation decisions in Framework 22 is very complex. Several outside factors such as these are likely to have combined impacts on area rotation that will be very difficult to predict.

5.3.3 Analysis of measures in FW21

5.3.3.1 No Action

Impacts of No Action on protected resources could be higher than scenarios under consideration because fishing levels would be higher in ETA, 3 trips compared to 2 trips. If these additional trips occur in the season that turtles are present there is a higher chance of interaction with scallop gear compared to all 4 scenarios under consideration. All four scenarios include only two trips in ETA. However, No Action does not include a trip into Delmarva, so the cumulative impacts may not be that different. Open area DAS allocations under No Action are within the range being considered for this action, higher than some scenarios and lower than others.

Status quo for this action is considered to be the scenario that has an overall fishing mortality of 0.20 and does not include a new closure in the Channel (NCLF20). This scenario is considered the status quo because in recent actions the Council has set F at 0.20 to prevent overfishing and account for uncertainty in projections and management measures in the fishery. Therefore, this scenario would be consistent with how the Council has been setting specifications for this fishery in the last few years with a handful of access area trips and then DAS set to meet an overall F. No new closed area would be implemented under status quo. Because NCLF20 does not close the channel it has potentially greater impacts on protected resources if some of the additional open area effort moves from the Channel area to the Mid-Atlantic during the time of year turtles are present. Overall DAS allocations are similar to recent years so the potential increase is limited. In addition, this scenario has the lowest projected DAS used than all other FW21 scenarios (about 22,000 compared to 25-32,000 for the other scenarios) (Table 40 in FW21).

5.3.3.2 Overall comparison of the scenarios

Four different scenarios for open area and DAS allocations are under consideration: 2 that propose closing a new area in the South Channel for area rotation and 2 without. Two options are considered for each at different overall F values. Overall the closure has two immediate effects: it reduces F and forces fishing effort elsewhere. The first effect causes there to be more open area days at a given fishing mortality with a closure than without. Even when F is reduced down to $F = 0.18$, there are still more open area days than at $F = 0.24$ without a closure, and they are concentrated in a smaller area. That is why LPUE is lower and area swept is higher for the two options that close the channel at first. For these few years, (2010-2012) fishing effort could be higher in open areas in the Mid-Atlantic if effort from the channel shifts to that area. And if the effort is higher in June-October when turtles are present, impacts on protected resources may be greater compared to alternatives with lower open area DAS allocations. The two options that propose closing the Channel have higher DAS used values for open areas in the Mid-Atlantic including waters around Long Island, the New York bight and off Virginia Beach (Table 50).

However, after the Channel opens in 2013 LPUE is higher and area swept is lower for the two scenarios that close the Channel, so impacts on protected resources would be reduced during the years the Channel area reopens (Figure 34).

5.3.3.3 Measures for Limited access vessels

This framework includes the specific access area schedule and DAS allocations for all limited access scallop vessels. The expected impacts on protected resources from the various scenarios are described above. In terms of the set-asides for observers and research there are indirect beneficial impacts on protected resources if that set-aside is used to learn more about the interactions of the scallop fishery and protected resources. Numerous turtle related research projects have been funded through the Scallop RSA program to date, and that topic is a high priority for future research proposals. In addition, much of the information known about when and where interactions have happened are from data collected through the observer set-aside program. So both these programs are expected to have continued indirect benefits on protected resources.

Georges Bank Access Areas

If the YT flounder bycatch TAC is reached in Nantucket Lightship, limited access vessels are permitted to use access area trips at a compensation rate in open areas. Analyses suggest that the compensation for Nantucket Lightship in 2010 would be 5.77 DAS. If the area closes early those DAS could be used in open areas in the Mid-Atlantic, especially if southern vessels do not get a chance to use their trip in NL. Those additional DAS could have impacts on protected resources if fished during the time of year when turtles are present, but the amount of additional effort is limited.

Mid-Atlantic Access Areas

The seasonal closure in ETA that will roll over under this framework (September 1-October 31) is expected to have positive impacts on the protected resources. Preliminary analyses suggest that effort in ETA from the September and October closure has shifted into adjacent months.

Specifically, access area trips not taken in September and October were taken mostly in August, November and December. Vessels have not increased open area effort during Sept and Oct as a result of the seasonal closure. It is difficult to say whether increased fishing in August has different impacts on turtles compared to Sept and Oct since turtles can be present during all three months. But any effort shifted after October is expected to have beneficial impacts because turtle bycatch has not been observed in that area after October.

Other Measures

If the LAGC IFQ program is not fully implemented before March 1, 2010 the LAGC fishery is allocated 10% of the total projected scallop catch during the transition period to ITQs, compared to 5%. Overall, there are no expected differences of impacts on the protected resources if the limited access fishery lands these scallops or the general category fishery. General category vessels are found in the north and the south, and some vessels move depending on resource availability.

5.3.3.4 Measures for General category vessels

5.3.3.4.1 Measures if IFQ program is delayed

5.3.3.4.1.1 Quarterly hard-TAC for transition period to limited entry (FY2008)

If the IFQ program is delayed and is not implemented before March 1, 2010 the general category fishery will continue to be managed under a quarterly hard TAC for 2010. Similar to 2008 and 2009, it is expected that most general category fishing would take place several weeks after each opening. The quarterly TACs are not equally divided across the fishing year but represent percentages that generally reflect seasonal effort as it has historically been fished by the general category fleet: 35 percent during the March –May period, 40 percent from June-August, 15 percent from September-November and 10 percent for December-February. Because this alternative does not represent a redirection of effort during the four periods, the quarterly hard-TAC is not likely to have measurable impacts on protected resources except that it could potentially mitigate the possibility of concentrated effort over protracted periods of time.

If the LAGC IFQ program is fully implemented before March 1, 2010 then general category qualifiers will receive an individual fishing quota based on their contribution to historical landings. IFQs will not be area-specific; a vessel can choose to participate in an access area program and landings will be removed from their individual allocation. Vessels will be permitted to catch that quota in any area available (open areas or access areas) until the fleet-wide allocation is harvested. These measures are not expected to change overall fishing effort, nor are they likely to influence the distribution of that fishing effort. As such, they are expected to have a neutral impact on sea turtles inhabiting the sea scallop management unit.

The measures for NGOM and incidental catch TACs are not expected to have impacts on protected resources.

5.3.3.5 Consideration of new rotational area in the great south channel

Additional rotational areas could reduce the potential negative impacts of scallop gear interactions with threatened and endangered sea turtles if they allow for decreased effort and bottom contact time relative to No Action in areas and at times when fishery encounters are most likely to occur. In this case, however, DAS used and bottom area swept is greater under both closure options compared to non-closure options (Table 50 and Table 52). Because of these increases, correspondingly greater risks to turtles may result if effort overlaps with the presence of sea turtles. Further, closing the Great South Channel area is not likely to confer benefits to turtles because of their general scarcity in the area and because effort could potentially shift to the Mid-Atlantic where sea turtles have a higher risk of entanglement. Leaving the Channel area open under any of the scenarios is less risky relative to sea turtles.

It should be noted that this action is also considering specific measures to limit effort in the Mid-Atlantic to comply with a recent biological opinion of this fishery and its impacts on sea turtles. Therefore, if certain measures are selected under that section the combined potential impact on turtles of closing the Channel may be reduced if other actions are taken to limit scallop effort in the Mid-Atlantic during the time of year turtles are present.

5.3.3.6 Minimization of impacts of incidental take of sea turtles

5.3.3.6.1 Alternatives to minimize impacts of incidental take of sea turtles

Sea turtles are present seasonally in the Mid-Atlantic, moving up the coast from southern wintering areas as water temperatures warm in the spring and returning in the fall (NMFS 2008). Fisheries observers have recorded sea turtle interactions with scallop gear during June – October (Figure 1). While turtle interactions could occur in any month throughout the Mid-Atlantic during this time period, higher probabilities have generally been associated with warm sea water temperatures (>19C) and depths between 50 and 70m (see Murray 2004a, 2004b, 2005, 2007 for more information on estimated bycatch rates and observer coverage levels).

In mid-2006, NMFS finalized a rule (71 FR 50361, August 23, 2006) that required scallop fishermen operating south of 41° 9.0' N from May 1 through November 30 each year to equip dredges with chain mats. The intent of the dredge gear modification is to reduce the severity of some turtle interactions that might occur by preventing turtles from entering the dredge bag. Chain mats do not decrease the number of turtles in contact with the gear; rather they decrease the likelihood that turtles will suffer serious injuries. Because chain mats are designed to keep turtles out of the dredge bag, enumerating observed interactions in and around scallop dredge gear became difficult after 2006.

The impacts on sea turtles of FW21 alternatives designed to meet the requirements of the Biological Opinion can be assessed qualitatively, by comparing shifts in fishing effort to historic patterns in sea turtle bycatch rates, particularly those before 2006 when chain mats were not required. (Note that if sea turtle abundance in the Mid-Atlantic increases in 2010 and beyond, the effect of effort shifts become less predictable).

RPM Alternatives #1 and #2 will likely result in a reduction in turtle bycatch in the Mid-Atlantic, because effort will either be reduced in the region, or move into other seasons and areas where there have been very few turtle interactions. (Only one turtle interaction was observed north of the RPM line between 2001 and 2008, and none were observed during Nov-May, Figure 47). FW21 has analyzed the potential impacts of shifting 10% of expected catch in the Mid-Atlantic during the turtle season to other areas or seasons. If 10% of total effort in that area and time are shifted to other seasons or areas as a result of either RPM Alternative #1 or #2, overall impacts on turtles are expected to be positive since less effort will be permitted in the area and time of year turtle interactions are most likely.

In terms of the season options for these alternatives, if the restriction is extended into late October that may be more beneficial for turtles since turtles may still be in the general area. Limiting effort during the last two weeks of October may provide a buffer of protection around the time that turtles have been observed in case their migration pattern happens to be later in 2010. In terms of the area alternatives, there is sea surface temperature data that supports that limiting effort in the areas south of Long Island and east of New Jersey (statistical areas 612 – 616, and 533, 534, and 541-543) may not be necessary during the month of June because the mean sea surface temperature in that area is below the minimum temperature at which loggerhead sea turtle interactions have been observed in scallop gear (Figure 48 and Figure 49). However, limiting effort in this area in June as well is more precautionary in case temperature trends change or turtle migration patterns are different than data suggest.

Figure 47 - Observed turtle bycatch in scallop dredge and trawl gear 2001-2008 shown in relation to RPM line

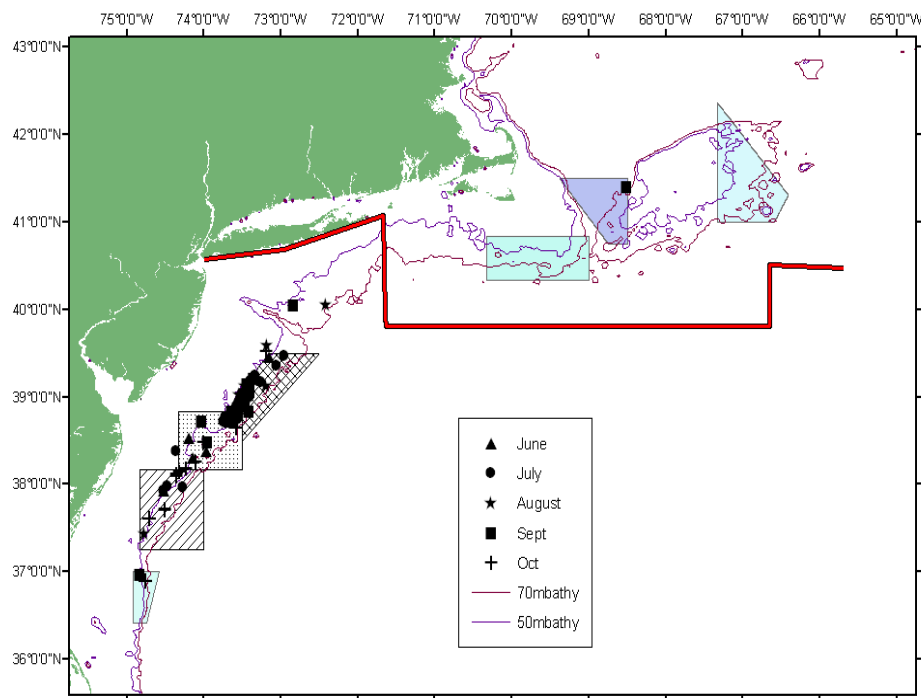

Figure 48 – Alternative RPM boundary for the month of June for RPM alternatives 1 and 2 based on sea surface temperature data

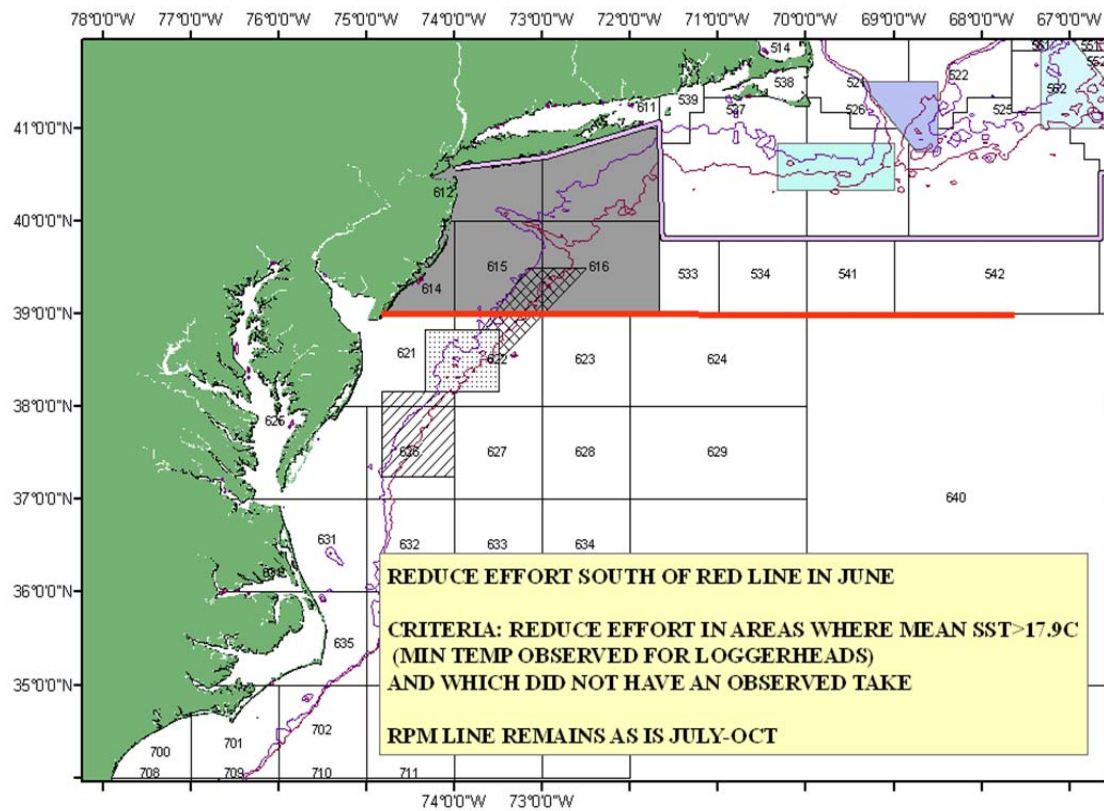

Figure 49 – Sea surface temperature from on-watch hauls from observed scallop trawl and dredge trips from 2001-2008

The affect of RPM Alternative #3, to close the Delmarva area during September and October, will depend on where and when fishing effort is displaced. If effort redistributes to November or December, as it did when the Elephant Trunk area was closed to fishing in 2007 and 2008 during September and October to minimize impacts on sea turtles, then the number of turtle interactions would likely decrease because effort is shifting into cooler-water months when sea turtles are not likely to be in the area (Figure 37). The increase in effort in ETA in March and April seen in 2007 and 2008 compared to 2003-2005 is not due to the seasonal closure. That increase in effort during those two months is likely from high levels of general category effort, increased interest to get in that area at the start of the fishing year after it was closed for several years, and more trips were allocated in 2007 and 2008 so vessels had to spread effort out more than they will in 2010 with only two allocated trips.

The affect of RPM Alternative #4 is likely to be positive because this alternative does not allow effort to be shifted to other seasons or areas; it simply reduces it for the entire area and year. Specifically, it reduces the possession limit if a vessel takes an access area trip in the Mid-Atlantic during the turtle season, and those pounds cannot be recaptured on a future trip outside the turtle season. For example, under NCLF20 for the June 15-Oct 31 alternative, 289 of the total 1020 MA AA trips are expected to be taken during that time period (Table 57). Those trips are expected to fish 2,541 DAS with an 18,000 pounds possession limit. This measure would restrict the possession limit to something lower so that 1,652 DAS would be used instead to equate to a 10% shift of total effort from that area and time. That restriction would have the equivalent reduction of 890 DAS (35% reduction), therefore, beneficial impacts on protected resources are expected.

The expected impacts of the Combined RPM measures are described in detail in Section 5.3.2.4. Overall, the first combined measure would have higher impacts on costs because it includes an additional trip that would need to be taken (3 ETA trips compared to 2). The major issue with this alternative and the second combined alternative is timing. Because FW21 will be implemented late vessels would not be able to take advantage of higher possession limits until the FW was implemented, likely not until June. Since that is very close to the beginning of the restricted window of June 15-Oct 31, vessels would be limited to taking larger trips, or additional trips after the seasonal restriction later in the year when weather is worse and meat weights are less. The combined measure that preformed the best in the analyses and seems to strike a balance in terms of limiting effort to benefit turtles but not beyond more than a minor impact on the fishery or the resource is the measure that combines the 2-month seasonal closure in Delmarva and restricting each vessel to only 2 of the three allocated MA access area trips from June 15-October 31.

Limiting the maximum number of trips to two per vessel will move 358 DAS from the turtle window to the rest of the year, which constitutes about a 4.0% effort shift. There would be no loss in scallop revenue because the vessels will be allowed to land the same amount of pounds. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore fleet fishing costs will increase by \$15,584. In addition, this measure will involve closure of DMV (Alternative 3) from September 1 through October 31. It is estimated that 64 DMV trips (6.7%) would normally take place during the months of September to October. The DAS used for these trips is estimated to be 563, and this effort will be removed from turtle window. This constitutes a 6.3% effort shift and an increase in F of 0.002 for the entire turtle window from June 15 to August 31. Because more trips will take place in the window when meat weights are lower compared to the status quo, it will take more DAS to land the same pounds. Therefore the fleet fishing costs will increase by \$24,530 because of the DMV closure.

The net change in F of closing DMV (increase in F of 0.002) and limiting the number of trips to two trips per vessel during the June 15 – August 31 window (increase in F of 0.001) will be a net increase in F of 0.003. The combined measure will also result in a 10.3% shift of effort from the turtle window (June 15 – October 31) into the rest of the year, which is just above the recommended threshold level for a minor change based on the analyses prepared by the PDT for

the original RPMs in FW21. Adding the increase in fishing costs due to the DMV closure to the increase in costs due to effort shifts from ETA during the turtle window, the total trip costs with this combined measure will increase by \$40,115 for the scallop fleet. In summary, this final combined measure would limit scallop effort and not have more than a minor impact on the fishery.

5.3.3.7 Improvements to the observer set-aside program

5.3.3.7.1 Prohibit vessels from not paying for observers

This alternative would prohibit a vessel from fishing until all outstanding bills were paid by not issuing a permit to fish in a fishing year after an outstanding bill is due. This alternative would not have direct impacts on protected resources. If this ultimately improves the overall coverage of the scallop fishery there may be indirect benefits on protected resources from improved information about how the fishery interacts with turtles.

5.3.3.7.2 Limit the amount of observer compensation general category vessels can get per observed trip in access areas

This alternative would create a ceiling to discourage overages by limiting the amount of compensation to two fishing days, whatever the daily compensation rate is for an access area. This alternative would not have direct impacts on protected resources. If this ultimately improves the overall coverage of the scallop fishery there may be indirect benefits on protected resources from improved information about how the fishery interacts with turtles.

5.4 ECONOMIC AND SOCIAL IMPACTS

5.4.1 No Action and Status Quo

The objective of the cost-benefit analysis is to evaluate the net economic benefits arising from changes in consumer and producer benefits that are expected to occur with implementation of a regulatory action. As the Guidelines for the Economic Analysis of the Fishery Management Action (NMFS, 2007) ³ state “the proper comparison is '*with the action*' to '*without the action*' rather than to '*before and after the action*,' since certain changes may occur even without action and should not be attributed to the regulation.” Even without action, the scallop stock abundance in open and access areas will be different, requiring changes in open area DAS and trip allocations in order to maximize yield from the fishery over the long-term. As a result, landings, scallop prices, fishing costs, revenues and benefits from the fishery would change. For these reasons and in accordance with the NMFS Guidelines (NMFS, 2007), the cost-benefit analyses presented in Section 5.4.2 compare the economic benefits of the proposed measures with the “No Action” scenario rather than with previous benefits or with economic impacts compared to 2009 fishing year. However, the data for landings, revenues and prices for the previous years were provided in Section 4.4 (Economic trends in the sea scallop fishery) as well as in Table 84.

As the Guidelines for Economic Analysis of Fishery Management Actions specify, “benefits and costs are measured from the perspective of the Nation, rather than from that of private firms or individuals. Benefits enjoyed by other nations are not included, although tax payments by foreign owners, and export revenues, are benefits to the Nation.”

No action for the cost-benefit analysis of the Framework 21 alternatives could be defined as “the continuation of all the measures including the open area DAS and access area trip allocations as specified in the present regulations, i.e., in Framework 19.” Thus, under no action the measures from the most recent year would continue. The full-time limited access vessels would get 42 DAS and 4 access area trips assuming that the general category IFQ program is implemented. Access area allocations drop to four trips because of the way the regulations are written; an access area scheduled to open cannot under No Action unless it was open the previous year. In 2010 both NL and CA1 are scheduled to open, but since neither was open in 2009, neither would be open in 2010. A full description of the no action alternative is provided in Section 2.2.1. The following section (Section 5.4.2) discusses the impacts of no action on economic benefits compared with the proposed action (NCLF24) and with other alternatives considered by this framework.

This action also includes a status quo option F_{target} (NCLF20) in terms of how the Council would set F_{target} and associated specifications. Specifically, NCLF20 would maintain the same approach the Council has used in recent years by setting specifications (access area trips and DAS allocations) equal to an overall $F = 0.20$ to prevent overfishing and account for uncertainty in projections and management measures in the fishery. Specifically, under NCLF20 alternative

³ Guidelines for Economic Reviews of National Marine Fisheries Service Regulatory Actions, March 2007, http://www.nmfs.noaa.gov/sfa/domes_fish/EconomicGuidelines.pdf

in open areas, full-time limited access scallop vessels would receive an allocation of 29 days-at-sea. There will be four access area trips allocated including one trip in Nantucket Lightship, one trip in Delmarva, and two trips in the Elephant Trunk Area.

The overall benefit and costs of the fishery management actions generally vary over time depending on the rate of growth of the stock and according to the nature of management measures implemented to maximize the yield from fishery. Although a general guideline for the period of analysis cannot be established for all fishery management actions due to the diversity of possible situations and measures to be dealt with, the Guidelines state that “the period of analysis could reflect the time it takes for the fishery to move from its initial equilibrium along the expansion path to the final equilibrium point (including the time needed for the present value of costs and benefits to approximate zero) due to the adoption of the proposed regulation, holding all other influence constant.” In addition, the Guidelines indicate that “a reasonable attempt should be made to conduct the analysis over a sufficient period of time to allow a consideration of all expected effects.”

Because fishery management actions in general result in short-term costs for the industry in terms of foregone revenue, “choosing a period of analysis that is too short may bias the analysis toward costs, where costs are incurred in the short-term and benefits are realized later.” Similarly, the Office of Management and Budget (OMB, 2003) indicated that the analyses should “present the annual time stream of benefits and costs expected to result from the rule,” and state that “the beginning point for your stream of estimates should be the year in which the final rule will begin to have effects” and “the ending point should be far enough in the future to encompass all the significant benefits and costs likely to result from the rule.”⁴

Furthermore, the economic impacts of the proposed regulations over the long-term should be evaluated by the discounted cumulative present value of the stream of benefits since benefits or costs that occur sooner are generally more valuable (or have a positive time preference). OMB Circular points out that the analytically preferred method of handling temporal differences between benefits and costs is to adjust all the benefits and costs to reflect their value in equivalent units of consumption and to discount them at the rate consumers and savers would normally use in discounting future consumption benefits (OMB, 2003). Discount rate is the interest rate used in calculating the present value of expected yearly benefits and costs. This Circular suggests that for regulatory analysis, the cost-benefit analyses should provide estimates of net benefits using both three percent and seven percent.

Since the benefits from the Framework 21 management action are expected to be realized over the long-term but will have some negative impacts during the first year, Section 5.4.2 examines both the short-term (fishing year 2010 only) and the long-term (2010-2023) economic impacts of the proposed regulations over the next 14 years. The long-term is divided into two sub-periods: near-term from 2010 to 2016 and longer-term from 2017 to 2023. The first period is considered to have less uncertainty in terms of biological and economic factors that impact landings and economic benefits compared with the last seven years from 2017 to 2023 and equals the amount of time the closure alternatives would impact the results. Specifically, if CLF18 or CLF20 were

⁴ OMB Circular A-4 (September 17, 2003), http://www.whitehouse.gov/omb/circulars_a004_a-4/

selected the closure would likely be in place 2010-2012 and reopen as an access area in 2013-2016. The present value of long-term benefit and costs are estimated using both a 3% and a 7% discount rate. The higher discount rate provides a more conservative estimate and a lower bound for the economic benefits of the proposed action compared with the No Action scenario and compared with the benefits predicted using a lower discount rate.

Results

The biological estimates for the “No Action” alternative show that this scenario will result in less than optimal long-term landings and economic benefits compared to the proposed action and other alternatives. Table 78 indicates that over the long-term (2010-2023) the cumulative landings with No Action will be 17 million pounds less than the landings expected with the proposed action. Similarly, the present value of the cumulative scallop revenues will be about \$53 million (at a 7% discount rate) to \$81 million (at a 3% discount rate) lower (Table 79), and the present value of the cumulative total economic benefits will be about \$54 million (at 7% discount rate) to \$81 million (at 3% discount rate) lower (Table 82) compared to the levels with the proposed action.

- The reasons for lower long-term benefits for the “No Action” compared to the proposed action and other alternatives could be summarized as follows:
- “No Action” alternative would allocate 3 trips to ETA, which is higher than the projected biomass in that area can support.
- Under “No Action”, there is no access into areas on Georges Bank while the biomass in those areas can support one trip.
- Under “No Action,” open area DAS allocations would also be higher than sustainable levels because the present conditions of biomass in those areas were not taken into account.
- For these reasons, the levels of exploitable biomass for the no action alternative will be less than the levels for the proposed action and all the other alternatives (Section 5.1.2.1). The proposed action (NCLF24) will result in higher exploitable biomass for each year from 2017 to 2023 compared to “No Action” alternative (Table 77).
- Because of higher DAS allocations, however, short-term (FY 2010) landings, revenues and economic benefits under “No Action” would exceed the landings and economic benefits for the status quo F_{target} (NCLF20) and no-closure high F (NCLF24) and closure low F (CLF18) alternatives.” On the other hand, more open area DAS are allocated with the new closure high- F option (CLF20), thus “No Action” landings, revenues and economic benefits will be less compared to this alternative.
- Over the long-term landings, revenues, producer and consumer surpluses and total economic benefits under “No Action” would fall short of the levels corresponding to all of the other alternatives considered in this Framework because of the suboptimal allocation of open area DAS and access area trips that result in lower exploitable biomass (Table 77 to Table 83).

Table 77. Percentage change in exploitable biomass (in metric tons) compared to Status Quo F_{target} Levels

| Fishing Year | No Action | No Closure $F = 0.24$ | Closure $F = 0.20$ | Closure $F = 0.18$ |
|--------------|-----------|--------------------------|-----------------------|-----------------------|
| 2010 | 0% | 0% | 0% | 0% |
| 2011 | -3% | -2% | -5% | -3% |
| 2012 | -2% | -3% | -4% | -1% |
| 2013 | -1% | -2% | 0% | 4% |
| 2014 | -1% | -2% | 0% | 4% |
| 2015 | -1% | -1% | 0% | 4% |
| 2016 | -1% | -1% | 0% | 3% |
| 2017 | -2% | -1% | -2% | 0% |
| 2018 | -2% | -1% | -2% | 0% |
| 2019 | -3% | 0% | -2% | 0% |
| 2020 | -3% | 0% | -1% | 0% |
| 2021 | -3% | -1% | -1% | 0% |
| 2022 | -3% | -1% | 0% | 0% |
| 2023 | -3% | -1% | 0% | 0% |

The economic impacts of the status quo F_{target} scenario were analyzed in Section 5.4.2 relative to the impacts of the alternatives described in Section 2.0.

5.4.1.1 Measures that will be in effect March 1, 2010 until Framework 21 is implemented (Section 2.2.3)

The specific measures that are included if this action is not implemented by March 1, 2010 will help to reduce the adverse impacts of exceeding the proposed allocations in Framework 21 in 2010 on the scallop resource. These measures are described in Section 2.2.3 of the Framework 21 document. Any excesses over the open area DAS-used or trip allocations for the access areas above the ultimate value allocated for 2010 will be reduced the following fishing year (2011). Any landings from within the Northern Gulf of Maine (NGOM) area caught in fishing year 2010 above the ultimate TAC for 2010 will be reduced the following year. The short-term impact of exceeding proposed allocations in 2010 will be positive in 2010, but negative in 2011 since vessels fished above the ultimate value allocated for 2010 will get smaller allocations in 2011. This will help reduce the negative impacts of overfishing in 2010 on the scallop resource over the long-term. Therefore, these measures will have positive long-term impacts on landings, revenues, producer and consumer benefit and net national economic benefits.

5.4.1.2 No Action if IFQ program not fully implemented before March 1, 2010

The economic impacts of No Action if the IFQ program is not in place prior to March 1 on the limited access and general category vessels are discussed in Section 5.4.3.5, 5.4.4.1, and 5.4.4.2 below.

5.4.2 Aggregate economic impacts of the Framework 21 alternatives

This section provides a cost/benefit analysis of the allocation alternatives proposed by the Council through Framework Action 21 to the Sea Scallop FMP including the status quo option as defined in Section 2.4 of the Framework document and summarized above in Section 5.4.1. The economic impacts of the proposed action and alternatives are compared with the impacts of “No Action” for the reasons explained above in Section 5.4.1. In addition to the proposed action, three other scenarios were considered, 2 that propose closing a new area in the South Channel for area rotation (CLF18 and CLF20) and another without (NCLF20) at different overall F values. The following notation is used interchangeably to identify the proposed action and the alternatives in the Tables and the text:

- Proposed action: No closure $F = 0.24 = \text{NCLF24}$
- Status quo F_{target} : No closure $F = 0.20 = \text{NCLF20}$
- Closure $F = 0.20 = \text{CLF20}$
- Closure $F = 0.18 = \text{CLF18}$

The following sections analyze the aggregate impacts of these options on landings, effort, revenues, fishing costs, consumer and producer surpluses and net economic benefits. These analyses include the economic impacts both on the limited access and general category fisheries given that respectively 95% and 5% of the TAC is allocated to these fisheries. The impacts of the proposed action and alternatives on individual vessels are expected to be proportional to the aggregate impacts on revenues, fishing costs and net revenues (producer surplus).

5.4.2.1 Acceptable Biological Catch

Reauthorization of the MSA requires the SSC to set an acceptable biological catch (ABC), or maximum catch level that can be removed from the resource taking into account all sources of biological uncertainty. The Council is prohibited from setting catch limits above that level. This new requirement is expected to have long-term economic benefits on the fishery by helping to ensure that catch limits and fishing mortality targets are set at or below ABC. This should help prevent overfishing and optimize yield on a continuous basis. Therefore, this measure is expected to have positive impacts on the landings and revenues, producer and consumer surpluses and net economic benefits to the nation.

5.4.2.2 Summary of overall economic impacts of the allocation alternatives

The short-term and long-term economic impacts of the alternatives considered in this Framework could be summarized as follows:

Economic benefits include the benefits both to the consumers and to the fishing industry and equal the sum of benefits to the consumers and producers. There are trade-offs between the short-term and long-term benefits, and alternatives with higher benefits in the short-term will, in general, result in lower benefits over the long-term.

In the short-term (i.e. fishing year 2010), landings, revenues and economic benefits for the status quo- F (NCLF20), for proposed action (NCLF24) and closure low F (CLF18) will fall short of landings and economic benefits for the ‘No Action’ alternative. Under the proposed alternative

(NCLF24), the landings (47 million pounds) will be about 3 million pounds less than the no action level in 2010 but will be about 6 million pounds more than the NCLF20 alternative (Table 78). This is because open area DAS allocations will be smaller under the proposed action (38 days) compared to the no action (42 days) but more than the open area DAS allocations for NCLF20 (29 days) alternative (Table 92). On the other hand, open area DAS allocations (42 days) with the new closure option (CLF18) would be equivalent to the No Action scenario. Because this option results in higher overall LPUE compared to No Action, the revenues and economic benefits for CLF18 would be higher than the No Action levels in 2010. The Council did not select this alternative because new rotational area closure alternatives resulted in a higher area swept estimates in Mid-Atlantic which could have impacts on non-target species in those areas.

Except for the new closure alternatives, the proposed action will minimize short-term loss in revenues and benefits compared to no action in 2010. The scallop revenues are expected to be \$7 million lower (Table 79), the producer surplus \$2 million lower (Table 80), consumer benefits \$3 million lower (Table 81), and total economic benefits \$5 million lower (Table 82) with the proposed action (NCLF24) compared with No Action in 2010. Table 83 shows percentage change from the No Action levels in 2010 and indicates that scallop revenues will decline by 2%, producer surplus by 1%, consumer surplus by 18% and total economic benefits (i.e., the sum of producer and consumer benefits) by 1%. The status quo-*F* (NCLF20) alternatives will result in largest loss in revenues (by \$47 million) and total economic benefits (\$41 million) in 2010 compared to no action and all the other alternatives.

Over the medium-term from 2010 to 2016, however, the landings, revenues, producer and consumer surpluses and total economic benefits for the status quo F_{target} (NCLF20) and other alternatives, except for the proposed action, are expected to exceed the “No Action” levels. In 2011 and 2012, the landings for the NCLF20 alternative are expected to increase to 62 million pounds and 69 million pounds, respectively, exceeding the levels for all the other alternatives. As a result, over the period 2010-2016, the sum of landings (431 million lbs) for this alternative (NCLF20) are estimated to be higher than landings compared to the other alternatives with the exception of CLF18. Consequently, the present value of the revenues for this alternative will be \$8 million more and the present value of the total benefits will be \$15 million more than the levels for no action during the same period when a 7% discount rate is applied.

The landings for the proposed action will slightly exceed the landings for no action in 2011, but will fall short of no action levels from 2012 to 2015. Consequently, the sum of landings for the proposed action for the period 2010-2016 (426 million lbs) will be lower than the level of landings for all the other alternatives including the no action. As a result, the revenues for the proposed action will be about \$9 million and the present value of the total benefits will be \$5 million less than the levels than the no action levels in the period 2010-2016. The Council revised its decision on January 27, 2010 and selected this alternative as the proposed action because the short-term decline in revenues and total economic benefits was significantly lower than the loss and declined in total economic benefits in 2010 with the NCLF20 alternative.

Table 78. Estimated Landings (million lbs)

| Fishing Year | No Action | No Closure $F = 0.20$ | No Closure $F = 0.24$ | Closure $F = 0.20$ | Closure $F = 0.18$ |
|---|-----------|--------------------------|--------------------------|-----------------------|-----------------------|
| 2010 | 50 | 42 | 47 | 54 | 49 |
| 2011 | 59 | 62 | 60 | 57 | 59 |
| 2012 | 67 | 69 | 66 | 58 | 61 |
| 2013 | 63 | 65 | 63 | 64 | 66 |
| 2014 | 66 | 67 | 65 | 66 | 69 |
| 2015 | 65 | 65 | 64 | 66 | 68 |
| 2016 | 59 | 61 | 61 | 62 | 63 |
| 2010-2016 Subtotal for the period | 427 | 431 | 426 | 427 | 436 |
| 2017 | 64 | 66 | 65 | 64 | 65 |
| 2018 | 62 | 65 | 65 | 62 | 65 |
| 2019 | 54 | 58 | 58 | 55 | 57 |
| 2020 | 61 | 65 | 64 | 63 | 64 |
| 2021 | 61 | 65 | 64 | 65 | 65 |
| 2022 | 53 | 57 | 56 | 57 | 57 |
| 2023 | 63 | 64 | 64 | 64 | 64 |
| 2017-2023 Subtotal for the period | 418 | 439 | 436 | 430 | 437 |
| 2010-2023 Grand Total | 846 | 870 | 863 | 857 | 873 |

Over the longer-term from 2010 to 2023, however, the proposed action landings are expected to exceed the levels for no action and CLF20, but will be less than the level of landings for the NCLF20 and CLF18. During the same period, the proposed action and all the other alternatives will result in higher revenues than the No Action scenario. The scallop revenues for the proposed action (NCLF24) will exceed the no action revenues by \$53 million (at 7% discount rate) to 81 million (at 3% discount rate). The status quo F_{target} (NCLF20) alternative will generate \$80 million (at 7% discount rate) to \$118 million (at 3% discount rate) more revenues than the no action alternative.

The economic benefits for the proposed action (NFL24) will exceed no action benefits by \$54 million to \$81 million. The NCLF20 alternative is estimated to have larger positive long-term impacts and will increase the present value of total economic benefits to the nation by \$86 million (at 7% discount rate) to \$125 million (at 3% discount rate).

Table 83 shows the changes as a percent of the no action levels at 7% and 3% discount rates. No discounting was applied to the first year benefits. It should be reminded that although percentage increase in benefits with the proposed action and alternatives compared with the no action benefits for the long-term are small (about 1% to 3% for 2010-2023) compared to decline in benefits in 2010 alone (about 13%), this is because the long-term includes 14 years including the first year (2010) and changes are calculated from the discounted cumulative benefits for these 14 years net of no action benefits.

The proportional impacts of the proposed action and the alternatives on the individual vessels in the limited access and general category fisheries compared to the “No Action” alternative will be similar to the impacts provided in Table 83. The revenues, costs and the net revenues of the individual vessels (producer surplus) will change proportionally according to the open area days and access area trips allocated per limited access vessels. Since the total TAC for the general category fishery will be 5% (10%) of the total TAC if IFQ program is (not) implemented in 2010, the impacts on the individual vessels will be proportional to the aggregate impacts of proposed action and alternatives on revenues, costs and net revenues. The IRFA Section (6.12) provides more analyses on the individual vessels of the proposed action and alternatives.

A detailed analysis of the short-term and long-term economic impacts is provided in Section 5.4.2.3 to Section 5.4.2.7 below.

5.4.2.3 Impacts of Framework 21 alternatives on prices, revenues

Prices are estimated using an updated version of the ex-vessel price model described in Amendment 11 and shown in Appendix I of this document. This model takes into account the impacts of changes in meat count, domestic landings, exports, import prices, income of consumers, and composition of landings by market category (i.e., size of scallops) including a price premium on under count 10 scallops. The price estimates shown in Table 85 correspond to the price model outputs assuming that the import prices will be constant at their 2008 levels (given that 2009 trade data is not complete yet), scallop exports will constitute 45% of the domestic landings, and the disposable income in 2010 will be slightly higher (about 1.19% according to the latest statistics) than the levels in 2008. These estimates (for no action) closely trace the average price of scallops in 2008 (about \$6.93 per pound) as well as the inflation-adjusted real price of scallops in 2006 and 2007 (in 2008 prices, Table 84).

The price estimate for the proposed action in 2010, \$7.27 per pound of scallops, is somewhat higher than its level in 2008 and 2009, because the scallop landings are projected to be lower (47 million lbs) compared to the levels in 2008 (53 million lbs) and 2009 (57 million lbs). It must be

cautioned, however, that actual prices could be higher (lower) than these price estimates depending on the future values of the exogenous factors that determine domestic ex-vessel prices. An increase (or decrease) in future disposable income, inflation rate, in the premium for large scallops, in exports or in import prices could result in higher (or lower) prices estimated in Table 85. In addition, the updated model is based on the years 1999 to 2008 and may not capture the increase in the price premium for U-10s and U12s during the recent year. Although the absolute values for revenues, producer and consumer surpluses, and total economic benefits would change with the value of estimated prices, and the percentage differences of these values for the proposed action and other alternatives relative to the no action alternative would not change in any significant way. Higher prices than estimated in Table 85 will increase the short-term impact of the proposed action on revenues compared to no action, while lower prices reduce this impact. The long-term benefits will be greater with higher prices and smaller with lower prices, however. Section 5.4.8 provides a discussion of uncertainties and a sensitivity analysis using lower import and domestic ex-vessel prices and shows that the ranking of alternatives in terms of revenues, benefits to the consumers and producer and to the nation will not change if the actual ex-vessel prices in 2010 turn out to be lower than the predicted prices.

Table 84. Estimated Prices (in inflation adjusted 2008 prices)

| Fishing year | Scallop Landings (million pounds) | Scallop Revenue (million \$.) | Ex-vessel Price |

| 2018 | 7.24 | 7.22 | 7.22 | 7.24 | 7.23 |
| 2019 | 7.28 | 7.25 | 7.25 | 7.26 | 7.26 |
| 2020 | 7.29 | 7.26 | 7.27 | 7.26 | 7.28 |
| 2021 | 7.31 | 7.28 | 7.30 | 7.27 | 7.30 |
| 2022 | 7.30 | 7.27 | 7.28 | 7.27 | 7.27 |
| 2023 | 7.31 | 7.31 | 7.29 | 7.29 | 7.30 |

Note: Projections assume that import prices will stay constant at their average value for 2005-2008 at about \$4.50 per pound of scallops and that scallop exports constitute 45% of the domestic landings.

The results of the economic analyses indicate that there will be trade-offs in the short-term versus long-term revenues. The revenues are estimated to be \$7 million lower in 2010 with the proposed action, but will be \$53 million (at a 7% discount rate) to \$81 million (at a 3% discount rate) higher in the long-term (2010-2023) compared to no action revenues. Although guidelines for the economic analysis indicate that changes in net benefits are measured by the difference in the present value of the discounted stream of net benefits of regulatory action as compared to the status quo or no action, OMB also suggests showing them in undiscounted constant dollars. If no discount was applied to the future benefits, the scallop revenues would be \$113 million higher than the no action revenues (Table 88, Table 89 and Table 90).

In the short-term (i.e. fishing year 2010), revenues for the status quo F_{target} (\$303 million, NCLF20) and for proposed action (\$344 million, NCLF24) will fall short of revenues (\$351 million) for the “No Action” alternative. The new closure options will result in higher revenues in the short-term because those options will result in higher landings in 2010 compared with no Action.

During the fishing years 2011 and 2012 the NCLF20 alternative will result in the highest revenues compared with all other alternatives including the revenues for no action. The undiscounted values of the scallop revenues are shown in Table 86 and present value of the discounted revenues at a 7% discount rate are shown in Table 87 below. Estimated scallop fleet revenue for the NCLF20 would increase from \$303 million in 2010 to \$434 million in 2011 and to \$473 million in 2012 without applying any discount rate. Proposed action undiscounted revenues will increase to \$422 million pounds in 2011 and to \$454 million in 2012 (Table 87). These would be the levels of the actual revenues earned if the actual landings and prices are equal to the predicted landings.

Discounting lowers the future level of revenues and benefits and as result, the sum of present value of revenues over the long-term periods is lower than the sum of undiscounted yearly revenues. For example, Table 87 shows that the present value of fleet revenue for the proposed action would be \$395 million in 2011 and \$397 million as a result of converting future revenues to present values by applying a discount rate of 7%. The present value of the revenues would be higher than these values (but lower than the undiscounted values) if a lower rate of discount (3%) was applied as Table 89 and Table 90 show.

Over the period from 2010 to 2016, total scallop revenue for the proposed action (NCLF24) is expected to be \$9 million lower than the “No Action” level. The cumulative discounted value of the revenues with the NCLF20 will be \$8 million more compared to no action if a 7% discount rate was applied (Table 90) and \$15 million more if a 3% discount rate was applied (Table 89). Over the longer-term 2010 to 2023, however, the scallop revenues with the proposed action (NCLF24) are expected to be \$53 to \$81 million higher than the revenues compared to the no action alternative. Again, NCLF20 alternative will result in higher revenues in the long-term compared to the proposed action (NCLF24), but Council did not select this alternative because of its large negative impact on revenues in 2010 fishing year (Table 89 and Table 90).

5.4.2.4 Impacts of Framework 21 alternatives on DAS, fishing costs, open area and crew days

Total effort measured in terms of DAS used as a sum total of all areas is expected to be smaller in 2010 for the proposed action (25,740 DAS) compared to no action (28,715 DAS) and NCLF20 (22,053) but lower than the DAS for new closure (CLF18, CLF20) alternatives (Table 91). Table 92 shows open area DAS, Table 93 shows the DAS used for all areas for each scenario and fishing year and Table 94 shows the percentage difference in total fleet DAS used compared to no action. The difference from the no action DAS used amounts to a 10% reduction for the proposed action and 23% reduction for the NCLF20 option (Table 94). Only the new closure high-*F* option (CLF24) would increase DAS used by 12% in 2010, while the new closure low-*F* (CLF18) option would reduce DAS used by 2% in 2010. As a result, crew-days will change in the same percentage change to the DAS used, declining for all options except for CLF20. Although it is uncertain to what extent the reduction in crew-days will result in a reduction in the number of crew, thus employment in the fishery, given that this reduction is mostly limited to 2010 and that DAS-used are expected to increase considerably in the following years, the vessel owners may prefer to employ same crew for less fishing days. (For additional discussion of potential impacts on employment please see Social Impacts, Section 5.4.9.

Table 91 shows that one-year negative short-term impacts on DAS-used (thus on crew-days) will be reversed in the future years. Starting in 2011, the DAS used will be slightly higher for the proposed action compared to no action. Total DAS used are expected to increase by 19% in 2011 for the proposed action from 25,740 days to 30,676 days, exceeding the no action levels by 2%. For the overall period from 2010-2016, however, total DAS-used for the proposed action (thus crew-days) will be about 1% lower than the no action levels. The DAS-used for NCLF20 will be slightly lower than the no action but higher than the proposed action levels. DAS-used for the new closure alternatives (CLF20 and CLF18) will exceed the “No Action” levels by 2% to 3%.

Over the long-term DAS used and crew days will be 1% higher for the proposed action and 2% higher for the status quo F_{target} (NCLF20) option compared to the no action levels. The new closure options will increase DAS used slightly more over the long-term.

Because of lower DAS used, trip costs for the proposed action (\$41.18 million) will be lower compared to the costs with no action (45.95 million) and new closure options in but will be higher compared to costs with the NCLF20 alternative (\$35.28 million) in 2010 (Table 95). For the near-term period from 2010 to 2016, present value of the trip costs for the proposed action (NCLF24) and NCLF20 are lower compared to No Action, but slightly higher than No action trip costs over the long-term from 2010 to 2023. Total DAS used and trip costs with the closure alternatives are expected to be higher than the no closure options both in 2010 and over the long-term (Table 96 and Table 97).

Table 91. Estimated DAS used (all areas)

| Fishing Year | No Action | No Closure $F = 0.20$ (Status Quo F_{target}) | No Closure $F = 0.24$ | Closure $F = 0.20$ | Closure $F = 0.18$ |

5.4.2.5 Impacts of Framework 21 alternatives on producer benefits

Producer surplus for a particular fishery shows the net benefits to harvesters, including vessel owners and crew, and is measured by the difference between total revenue and operating costs (Appendix I). The results of the cost-benefit analyses indicate that there will be trade-offs in the short-term versus long-term benefits. Producer benefits are estimated to be slightly less for the proposed action (NCLF24) from the no action levels (by \$2 million) in 2010. Over the period 2010-2016, producer surplus for the proposed action is estimated to be \$6 million lower than the no action levels using a 7% discount rate (Table 102). For the long-term from 2010 to 2023, however, producer benefits for the proposed action are estimated to exceed no action levels by \$49 million (at a 7% discount rate) and by \$75 million (at a 3% discount rate).

Producer benefits would be larger with the status quo F_{target} (NCLF20) option compared to the levels for no action both for the medium term (2010-2016) and for the long-term (2016-2023). The producer benefits for this options would exceed no action levels by \$76 million (at a 7% discount rate) to \$111 million (at a 3% discount rate) for the period 2010 to 2023 (Table 102, Table 103). This option would result in the largest reduction in producer benefits in 2010, by \$37 million, however, compared to the no action benefits. The new closure low- F (CLF18) producer surplus will exceed the benefits for the NCLF20 over the same period (Table 101, Table 102 and Table 103). The long-term producer benefits for new closure high- F (CLF20) is estimated to result in smallest producer benefits both for the 2010-2016 period and for the long-term from 2010 to 2023.

5.4.2.6 Impacts of Framework 21 alternatives on consumer benefits

Consumer surplus for a particular fishery is the net benefit that consumers gain from consuming fish based on the price they would be willing to pay for them. Consumer surplus will increase when fish prices decline and/or the amount of fish harvested goes up. In the short-term (2010), the consumer benefits for the proposed action (NCLF24) for (NCLF20) and (CLF18) will be lower than the benefits for the no action alternative while the CLF24 option will have the same level of benefits (Table 104). Both over the near-term from 2010 to 2016 and over long-term from 2010 to 2023, however, the proposed action and the alternative options will have higher consumer surplus compared to the no action levels. The proposed action will increase consumer benefits by about \$1 million in the near-term (2010-2016) and by about \$4 million to \$6 million in the long-term (2010-2023) compared to no action depending on the discount rate used (Table 105 and Table 106). The status quo F_{target} option will result in the largest consumer benefits in the long-run. With this option the present value of the consumer benefits is estimated to increase by \$10 million (at 7% discount rate) to \$14 million (3% discount rate) from 2010 to 2023, compared to no action levels measured in constant 2008 prices.

5.4.2.7 Impacts of Framework 21 alternatives on total economic benefits

Economic benefits include the benefits both to the consumers and to the fishing industry and equal the sum of benefits to the consumers and producers. There will be trade-offs between the short-term and long-term benefits and alternatives that result in highest landings and benefits in the short-term will in general result in lower benefits over the long-term.

- The total economic benefits for the proposed action (NCLF24) will be higher than the levels for other alternatives in the short-term (in 2010), but will be lower than the levels for other alternatives in the long-term with the exception of the new Closure alternative with high- F (CLF120). The CLF20 alternative results in higher short-term (2010) and lower overall long-term (2010 to 2023) benefits compared to the proposed action.
- The total economic benefits for the proposed action will be 5 million lower and for status quo F_{target} (NCLF20) benefits will be \$41 million lower than no action benefits in 2010, while the total benefits of the new closure alternatives will exceed the no action benefits in the same year (Table 108).
- The proposed action benefits will also be \$5 million lower than the no action benefits over the period from 2010 to 2016. Total economic benefits for the NCLF20 option will exceed the no action benefits by \$15 million (at 7% discount rate) to \$22 million (3% discount rate) in the near-term from 2010-2016. The new closure high- F option is expected to reduce economic benefits by \$12 to \$13 million during the same period while the new closure low- F option would increase the benefits by \$30 million to \$40 million depending on the discount rate applied (Table 108 and Table 109). The Council did not select new closure alternatives because these alternatives resulted in a higher area swept estimates in Mid-Atlantic which could have impacts on non-target species in those areas.
- Table 110 shows the present value of total benefits and its components when a 3% discount rate is used to convert future values to the present values. Table 111 shows the present values by applying a more conservative 7% discount rate. The economic benefits for proposed action (NCLF24) will exceed no action benefits by \$54 million (at 7% discount rate, Table 111) to \$81 million (at 3% discount rate, Table 110) over the long-term (2010-2023). The NCLF20 alternative will have larger economic benefits and will increase the present value of total economic benefits to the nation by 86 million (at 7% discount rate, Table 111) to \$125 million (at 3% discount rate, Table 110). Council selected NCLF24 alternative because it minimized short-term negative impacts and resulted in positive the long-term economic benefits from 2010 to 2023.

5.4.3 Measures for limited access vessels (Section 2.5)

This framework includes the specific access area schedule and DAS allocations for all limited access scallop vessels. The impacts of these measures are analyzed as part of the allocation alternatives analyzed, in Section 5.4.2 (Aggregate Economic Impacts) above. This section provides an analysis of the individual measures on limited access vessels other than these aggregate measures related to DAS and access area allocations.

5.4.3.1 Georges Bank Access Area Measures (Adjustments when YTF catch reaches 10% overfishing definition TAC limit, Section 2.5.5.1)

The proposed action and the alternatives include access into Nantucket Lightship (NLS) for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for that area in the form of fleet-wide trips. The economic impacts of trip allocations for NLS are analyzed in Section 5.4.2 in combination with other open and access area measures. By itself, allocating a trip (per full-time) vessel to NLS in 2010 will have positive economic impacts on both limited access vessels

If the YT flounder bycatch TAC is reached, limited access vessels with unused Georges Bank access area trips would have their open area DAS allocations increased by a prorated amount calculated to achieve an equal amount of scallop mortality per DAS. The proposed action includes an allocation of open area DAS for a full-time vessel if the Nantucket Lightship Area closes in 2010 due to the YT TAC being reached. Analyses suggest that the compensation rate for Nantucket Lightship trips would be 5.77 DAS in 2010. Since the compensation rates are determined by estimating an equivalent level of mortality, the overall impacts of this alternative on the scallop resource are expected to be neutral. In order to calculate the compensation that will be used for limited access trips that have not been taken if the YT bycatch TAC is reached,

an estimate is made about the number of days in the open areas required to remove the same number of scallops that would have been taken in the closed areas. For example, in Nantucket Lightship, a full trip is 18,000 lbs, and according to the projections for the proposed action (NCLF24), the average meat count will be 11.47, implying that $18,000 \times 11.47 = 206,460$ scallops will be removed per trip. In the open areas, the average meat count will be about 21.18 so that 206,460 scallops correspond to $206,460 / 21.18 = 9,748$ pounds. The LPUE in the open areas in 2010 will be about 1693, so it will take $9,748 / 1693 = 5.76$ DAS to land the same number of scallops, resulting in compensation of 5.76 DAS. The proposed action includes an allocation of 5.76 open area DAS for a full-time vessel if the Nantucket Lightship Area closes in 2010 due to the YT TAC being reached.

There will be no change in the economic impacts as a result of this alternative since this measure is also the no action alternative. Although compensation for the lost pounds due to closure of the NLS will have a positive impact on vessels, the scallop pounds per trip could be lower than the allocated pounds for the Georges Bank access area trips due to the proration. In other words, this alternative will help to minimize loss in pounds and revenue due to the closure of access areas before a vessel takes its trip, without entirely compensating for the loss. Although the loss in landings and revenue due to the closure and proration of the open area trips cannot be predicted accurately at this time, in some cases the loss could be significant depending on the open area meat counts.

Using the same method above, catches from the additional 5.76 open area trips could be 9,748 pounds for 2010 compared to the 18,000 lbs. from the NLS for each trip. Evaluated at a scallop price of \$7.27 per pound for the estimated price under the proposed action, for example, the reduction in revenue compared to the access area revenue could be about \$59,993 ($(18,000 - 9,748) \times 7.27$). The catch rates in the open areas vary, however, from one area to another and also according to the vessel size. Therefore, the revenue loss due to a yellowtail TAC closure will vary from one vessel to another depending on the open area fished. In general, the higher the meat count in the open areas, the higher the catches from these trips, and the smaller the loss.

5.4.3.2 Mid-Atlantic access area management (Section 2.4)

The proposed action and the alternatives include access into both Elephant Trunk and Delmarva for both the LA and LAGC fleets. The economic impacts of trip allocations for the Elephant Trunk and Delmarva areas are analyzed in Section 5.4.2 in combination with other open and access area measures. By itself, allocations for the highly productive areas of the Mid-Atlantic in 2010 will have positive economic impacts on both limited access and general category vessels. The LPUE in these areas are estimated to be higher compared to the open areas. As a result, trip costs will lower since the same amount of scallops could be landed in a shorter time frame compared to areas with lower scallop abundance.

5.4.3.3 TAC set-asides for observers (1%) and research (2%) (Section 2.5.1.2)

This action (Section 2.5.1.2) maintains the current policy of setting aside 2% of available TAC in access areas and 2% of the open area DAS for research and 1% of the estimated TAC for each access area and open area DAS to help fund observers. The percent of TAC and total DAS set-

aside for observers and research would be removed before allocations are set for limited access and general category fisheries. This alternative is expected to have indirect economic benefits on the sea scallop fishery by improving scallop management through better data and information made possible by research into current issues in the fishery such as bycatch and from the collection of data by observers.

5.4.3.4 Research priorities for 2010 and recent RSA announcement (Section 2.5.1.3)

Changing the RSA process and the announcement for federal funding earlier than in previous years will expedite the process and will help the researchers to complete all compensation for research before the end of the fishing year. This process is expected to have indirect economic benefits on the sea scallop fishery by improving scallop management through better data and information made possible by timely research into current issues in the fishery.

5.4.3.5 DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010 (Section 2.5.1.4)

If the LAGC IFQ program is not fully implemented before March 1, 2010 the LAGC fishery is allocated 10% of the total projected scallop catch during the transition period to ITQs, compared to 5% if it is in place. The economic impacts of a 10% TAC for the transition period on the limited access vessels were analyzed in Amendment 11 and Framework 19 documents. The FW21 management scenarios include a specific DAS allocation to the LA fishery based on that sector of the fleet being allocated 95% of the projected catch. Regulations require that if the transition period is extended for another year LA DAS must be reduced by an equivalent amount to prevent overfishing. This measure is not expected to impact the results of the cost-benefit analyses presented in Section 5.4.2 above since there will be no change in the overall landings, revenues, and producer and consumer benefits if the general category fishery scallop landings equal their total allocation.

The impacts on the revenues and profits of the limited access vessels will be negative, however, due to reduced DAS allocations (Table 15). Table 112 shows these impacts for each of the four options considered in this framework. The revenues are estimated by removing the set-asides for observers and research. Specifically, 1% of the estimated TAC for each access area and open area DAS would be set aside to help fund observers and 2% of the estimated TAC for each access area and open area DAS would be set aside to fund scallop-related research. The results show that the net revenue per full-time limited access vessel would decline by \$43,461 for the proposed action (NCLF24) or by 5% if there is a delay in general category IFQ implementation and the general category fishery is allocated 10% of the scallop TAC.

Table 112. The economic impacts of a delay in IFQ measures on limited access and general category vessels

5.4.4 Measures for general category vessels (section 2.6)

The economic impacts of the allocation alternatives on the sea scallop fishery are analyzed in Section 5.4.2 (Aggregate Economic Impacts) above. These analyses include the economic impacts both on the limited access and general category fisheries given that respectively 95% and 5% of the TAC is allocated to these fisheries. The impacts of the proposed action and alternatives on individual vessels are expected to be proportional to the aggregate impacts on revenues, fishing costs and net revenues (producer surplus). This section provides an analysis of the individual measures on general category vessels other than these aggregate measures.

5.4.4.1 Quarterly hard-TAC for transition period to IFQ (No Action if IFQ program is not implemented, Section 2.6.1.1)

This measure (2.6.1.1) will have positive impacts on the general category vessels by doubling their net revenues in 2010 compared to revenues with IFQ implementation (Table 112).

The economic impacts of a 10% TAC for the transition period were analyzed in Amendment 11 and Framework 19. The economic impacts of the level of general category TAC as determined in this action are within the range of impacts analyzed in Amendment 11 (Sections 5.4.8.5, 5.4.8.6 and 5.4.13 of Amendment 11) and Framework 19 (Section 5.4.10, 5.4.10.1.2). Under the proposed alternative, the total TAC for the general category fishery would be about 4.6 million pounds in 2010 and will vary between 4.0 million pounds (NCLF24) and 4.9 million pounds (CLF18) under the other alternatives (Table 112) very similar to the amounts estimated for Framework 19. These are double the amount general category vessels will receive if the IFQ program is implemented. Although management of the general category fishery by a hard TAC would create some derby-style fishing, the division of the total TAC into quarterly TACs will reduce the race to fish to some extent and lessen the negative economic impacts associated with derby fishing as analyzed in Section 5.4.10.1.1 of Framework 19 and discussed in Sections 5.4.8.5, 5.4.8.6 and 5.4.13 of Amendment 11.

Consistent with Amendment 11 and Framework 19 measures, Framework 21 would divide general category allocation (10% of total scallop TAC) into four quarters with higher proposed allocations during the spring and summer (Quarters 1 and 2) when meat weights are larger. Given that general category landings are expected to be 10% of the total scallop landings in 2008, the difference in the quarterly distribution of landings is not expected to have a significant impact on the scallop ex-vessel prices and the distribution of revenues. Table 16 describes the quarterly hard TAC for the proposed action if the IFQ program is not in place before March 1, 2010. Quarter 1 will likely close early before all access area trips are taken because the sum of all catch from access area trips is more than 35% of the annual catch.

5.4.4.2 Economic impacts of the IFQ program on the limited access and general category vessels

If the LAGC IFQ program is fully implemented before March 1, 2010 then general category qualifiers will receive an individual fishing quota based on their contribution to historical landings. IFQs will not be area-specific; a vessel can choose to participate in an access area program and landings will be removed from their individual allocation. Vessels will be permitted to catch that quota in any area available (open areas or access areas) until the fleet-wide allocation is harvested. This will provide flexibility of the general category vessels and have positive impacts on their economic profits. The impacts of the overall IFQ program were assessed in the FSEIS to Amendment 11 and the economic impacts of the present options on the general category fishery combined with the IFQ management will be within the range of impacts discussed in the FSEIS to Amendment 11.

5.4.4.3 Georges Bank Access Area management (Section 2.6.2)

The proposed action and the alternatives include access into Nantucket Lightship (NLS) for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for that area in the form of fleet-wide trips. The economic impacts of trip allocations for NLS are analyzed in Section 5.4.2 in combination with other open and access area measures. By itself, allocating access area trips to NLS in 2010 will have positive economic impacts on both limited access and general category vessels. The high biomass and LPUE in this area is estimated to be

quite high and taking a trip to this area will lower fishing costs since the same amount of scallops could be landed in a shorter time frame compared to the open areas.

Under current regulations, if the 10% yellowtail flounder bycatch TAC for SNE is reached and the Nantucket Lightship access area closes, general category vessels are not permitted to fish in the area. The yellowtail flounder bycatch TAC is shared between the two fisheries; therefore, once the TAC is reached the area closes for both fleets. This is currently in the regulations and will not change as a result of this action. For the general category fishery, since it is a fleet-wide allocation, there is no compensation for vessels on an individual basis if the area closes before the total number of general category trips has been taken. Limited access general category vessels could land scallops from other areas, however, as long as their landings do not exceed their IFQ allocations. Because they may have to land the pounds from less productive areas, closure could increase their fishing costs and lower their economic benefits from the scallop fishery. This discussion is only relevant for comparing the impacts on economic benefits under a closure scenario with the economic benefits if there was no yellowtail TAC and no closure requirement when that TAC is reached. The economic analysis guidelines require, however, that the impacts are compared with the impacts of the no action alternative. Since this measure is no action, there will be no change in economic impacts under the present regulations.

5.4.4.4 Mid-Atlantic access area management (Section 2.6.3)

The proposed action and the alternatives include access into both Elephant Trunk and Delmarva for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for both areas in the form of fleet-wide trips. The economic impacts of trip allocations for the Elephant Trunk and Delmarva areas are analyzed in Section 5.4.2 in combination with other open and access area measures. By itself, allocations for the highly productive areas of the Mid-Atlantic in 2010 will have positive economic impacts on both limited access and general category vessels. The LPUE in these areas are estimated to be higher compared to the open areas. As a result, trip costs will lower since the same amount of scallops could be landed in a shorter time frame compared to areas with lower scallop abundance.

5.4.4.5 Northern Gulf of Maine (NGOM) Hard-TAC

Proposed action includes a 70,000-pound hard-TAC for the NGOM, which is equivalent to the “No Action” scenario as specified in Framework 21. Vessels that qualify for a LAGC NGOM permit can fish up to 200 pounds a day in this area. Once the TAC is reached, no scallop vessels are permitted to fish in the NGOM area. The allocation of 70,000 pounds is more than what the fishery landed in 2008 and 2009, thus this TAC is not expected to reduce the landings and revenues for the LAGC NGOM fishery. As analyzed in Amendment 11 and Framework 19, this measure is, in fact, expected to have positive economic impacts on a larger number of vessels that are not qualified for limited access but qualifies for an NGOM permit since these vessels will have an opportunity to land scallops in this area when the resource conditions are favorable. At 70,000 pounds, and at an estimated price of about \$7.27 in 2010 under the proposed option, this allocation could generate about half a million dollars in scallop revenue for the vessels that qualify for NGOM area access if the resource conditions make it possible to land the full TAC.

5.4.4.6 Incidental catch

The proposed action is equivalent to “No Action” and includes a 50,000 pound target TAC for vessels with an incidental LAGC permit. Vessels that qualify for a LAGC incidental permit are permitted to land up to 50 pounds of scallop meats per fishing trip. As analyzed in Amendment 11 and Framework 19, removal of incidental catch from total landings before the trip and open area DAS allocations are determined will ensure that the fishing mortality targets are not exceeded. This measure will also have positive economic impacts on vessels that do not qualify for a LAGC permit because it will allow them to earn some income from the scallop fishery using their incidental permits. It may also provide more flexibility for vessels that do qualify for the LAGC permit but opt for this permit instead. As a result, this measure will have positive impacts on the resource, scallop yield, revenues and total economic benefits.

5.4.4.7 Allow leasing of partial general category IFQ allocations during the fishing year

This measure will provide flexibility for the general category vessels to lease to other vessels and earn income on their unused quota during the fishing year. As a result, the proposed action would allow fishermen to combine their allocations and to benefit from an economically viable operation when the allocations of individual vessels are too small to make scallop fishing profitable. Under these conditions, general category scallop TAC is likely to be fully utilized by qualifiers with positive impacts on vessel revenues and profits as well as on overall economic benefits for the sea scallop fishery.

5.4.5 Consideration of New rotational area in the Channel north of Nantucket Lightship and west of Closed Area I (Section 2.7)

The proposed action does not include any new area closures. However Framework 21 alternatives included a new rotational area in the Great South Channel with large amounts of small scallops to be closed in fishing year 2010. The economic impacts of this alternative are analyzed in Section 5.4.2 in combination with other open and access area measures and with low- F (CLF18) and high- F (CLF20) options. The alternative with new closure and low F (CLF18) is estimated to increase scallop revenues by \$14 million and total economic benefits by \$15 million in the long-term for the period from 2010-2016 compared to no action (Table 79 and Table 82). The high F option will reduce the total economic benefits by \$28 million (CLF20) during the same period compared to no action. Although CLF18 option estimated to result in higher benefits compared to the proposed action (NCLF24), the Council did not select this alternative because new rotational area closure alternatives resulted in a higher area swept estimates in Mid-Atlantic which could have impacts on non-target species in those areas.

5.4.6 Minimization of impacts of incidental take of sea turtles (section 2.8)

The economic impacts of the alternatives to minimize impacts of incidental take of sea turtles on landings and revenues are provided in Section 5.3.2.4 of this document. The same section fully describes the model and the assumptions used in these analyses, and provides a discussion of the potential economic impacts. The economic impacts of these alternatives will vary with the Framework 21 alternatives and the window of time in which the measures are applied. The

proposed action is a combination of the Delmarva closure in September and October with a limit on the maximum number of trips (at two per vessel) that can be taken in the Mid-Atlantic areas from June 15 to August 31. Because the effort is shifted to a relatively less productive season, total fleet trip costs are expected to increase slightly by \$40,095, or by less than 0.2%. Since there is no change in the possession limit, the trips that are shifted from this season are expected to be taken outside of the turtle window, without a loss in total revenue as long as these measures do not have a significant impact on prices.

The proposed measures will lead to a change in the seasonal composition of landings and therefore could lead to a change in prices. In general, the reduction in landings during the turtle window is expected to increase prices during the period from July 15 to October 31, but expected to reduce prices for months outside of the turtle window. Whether the increase in scallop prices in the first period will offset the decrease in prices in the second period will depend on the magnitude of the shift, on the timing of the displaced effort and on the change in meat weight of scallops outside of the turtle window. If the shift in effort and landings comprise a small proportion of total effort and landings in the turtle window the impacts on prices will be low. Similarly if the displaced effort is distributed more or less evenly throughout the window it is shifted to, the impacts on prices will be small.

The proposed action is expected to minimize the effort shift from the turtle window compared to the other alternatives considered by the Council (Table 72 through Table 74 in Section 5.3.2.4). Proposed measures would shift 8.9% of effort outside the turtle season, while the other alternatives would shift between 9.7% (Combined measure 1.1, Option A) and 14.6% (Combined measure 1.3, Option A) and as a result the proposed action will have the least impacts on prices. This impact cannot be quantified accurately, however, due to the factors explained below:

- With the proposed measure, the landings in the Mid-Atlantic access areas will decline slightly by 1.8 million pounds during the turtle window, which amounts to about 9% of the total landings from all areas (20.7 million) during the same window. Therefore, it is unlikely for this shift to have a significant impact on the scallop prices for this period. It is also not possible to quantify with certainty the extent of the increase in prices at this time since many factors that could impact prices, such as the quantity of exports, import prices, and size composition of scallops during and outside of the turtle window, and seasonal distribution of future landings are unknown at this time.
- Since there will be no change in the possession limit, the access area effort shifted from the turtle window will take place in the window November 1 to June 14, therefore 1.8 million more pounds will be landed in this window. Since total landings from all areas without the RPM measures are expected to be about 26.3 million pounds during this period, shifting 1.8 million pounds would increase landings by 7% during the window November 1 to June 14 and would probably lower the price of scallops. Again, it is unlikely for this shift to reduce prices significantly during this period especially if the displaced effort is distributed more or less evenly and if some vessels try to maximize their revenue by taking their trips during months when prices are relatively higher because of lower landings especially during the winter months.
- Since the reduction in landings during the turtle window (9%) is greater than the increase in landings (7%) outside of the turtle window, the percentage increase in prices could

exceed the percentage decline in prices outside the turtle window, outweighing the decline in the later period. On the other hand, the meat-weights will be slightly lower (by 2.7%) for the landings that are shifted out of the turtle window and this could have a negative impact on prices. If the effort during the turtle window directed more on the areas with higher scallop abundance, however, the meat-weight composition of the landings could increase during this window, resulting in even higher prices.

The proposed action related to compliance with the biological opinion also applies to the general category fishery to some degree. Part of the combined option selected in this action includes a seasonal closure in the Delmarva access area from September 1 – October 31 to all scallop vessels, including general category vessels. While the RPM only specifies that these measures need to limit effort for the limited access fishery, the Council decided to restrict both fleets to be consistent with the seasonal closure in ETA and to further minimize impacts on turtles. In terms of the impacts, there are no positive or negative impacts expected from this measure on the general category fleet specifically. The access area trips for this fleet are allocated as a fleet-wide number of trips, and tend to be used in the weeks following an opening. In the past few years all general category access area trips have been used in several weeks following an opening date for all areas, including Delmarva. Delmarva will open on March 1, 2010 and it is expected that all 713 trips will be used before September 1, so the seasonal closure should not have any impacts on fishing behavior or economic impacts.

5.4.7 Improvements to the observer set-aside program

5.4.7.1 Prohibit vessels from not paying for observers

If it was selected, this alternative would prohibit a vessel from fishing until all outstanding bills were paid by not issuing a permit to fish in a fishing year after an outstanding bill is due. This measure could improve the overall coverage of the scallop fishery and have indirect economic benefits from improved information and monitoring of the fishery and resource. The Council did not select this alternative, however, since there are currently two regulatory provisions in place that could be used to address this issue.

5.4.7.2 Limit the amount of observer compensation general category vessels can get per observed trip in access areas

The proposed action includes a provision to limit the amount of observer compensation general category vessels can receive on observed trips in access areas to the equivalent of one day compensation regardless of trip length. Therefore, this alternative would eliminate a “loophole” for how compensation is granted and create a ceiling to discourage overages. If this ultimately improves the overall coverage of the scallop fishery there may be indirect economic benefits from improved information and monitoring of the fishery and resource.

5.4.8 Uncertainties and risks

The economic impacts presented in the following sections are analyzed using an updated estimate of prices, revenues and total net benefits using the economic model provided in

Appendix I. The cost benefit analysis also included updated cost estimates fishing years obtained from the observer database and fixed cost surveys (Appendix I). These costs are used in calculating producer surplus for the proposed alternatives, which shows total revenue net of variable costs. These analyses are also based on the biological model simulations for landings, DAS and LPUE.

The numerical results (absolute values) of the economic cost/benefit analysis should be interpreted with caution and should be used in comparing proposed action with the other alternatives. The landings, DAS and LPUE were obtained from the biological model, which is based on fishing mortality by area and the inputs are not fishery-based in terms of DAS, etc. The simulation does not model individual vessels or trips; it models the fleet as a whole. The output of the model is then used to eventually compute individual DAS allocations after set-asides are removed, general category landings. The results for economic impacts would change if the actual landings, size composition of landings and LPUE are different than the forecasted values from the biological model. For example, the projected price in the last Framework 19 for 2008 fishing year was \$7.66 per pound corresponding to a projected landings of about 44.4 million pounds, and for 2009 fishing year it was \$7.55 assuming that the scallop landings will be around 45.9 million pounds. The actual landings in 2008 were over 53 million pounds, exceeding the projected levels in Framework 19 by 16%. In the same way, the actual landings for 2009 fishing year are expected to exceed the projected levels from the biological models which resulting in lower prices than estimated in the Framework 19 document.

The prices are estimated using the updated ex-vessel price model described in Appendix I. This model takes into account the impacts of changes in meat count, domestic landings, exports, price of imports, income of consumers, and composition of landings by market category (i.e., size of scallops) including a price premium on under count 10 scallops. The important changes in external factors, i.e., in exports, imports, value of dollar, export and import prices had some unpredictable impacts on scallop prices in recent years, first resulting an increase to over \$8 per pound (in terms of 2008 prices) in 2005, then a consequent decline to about \$7 per pound (in terms of 2008 prices) in 2006 even though there was not a significant increase in scallop landings in 2006 (about 56 million lbs) compared to 2005 (about 54 million lbs).

The estimated prices for the proposed action and the alternatives shown in Table 85 correspond to the price model output assuming that the import prices will equal to their average values in the recent years from 2005 to 2008, or about \$4.5 per pound of scallops and assuming that exports will equal to 45% of the domestic landings. The actual price could be lower (higher) if exports decline (increase); import prices decline (increase) or disposable income of consumers decline (increase) in 2010 and the future years. The uncertainty regarding a possible economic recovery starting in 2010 also makes it almost impossible to accurately estimate the prices and costs for the future years for the scallop fishery.

Given that the future values of these external variables are uncertain, various sensitivity analyses can be conducted using a range of estimates for the exogenous variable. The following estimates for prices are generated by assuming that the import prices will decline by 10% to about \$4 per pound in the future years. In fact, preliminary data for 2009 from January to September indicate

import prices declined by 7% in this year compared to 2008. Given that 2009 corresponded to a global recession, this decline may be expected but may not continue in the future years. The price estimates shown in Table 113 provide a lower value for ex-vessel prices if import prices could in fact decline by 10% in 2010 from their previous levels. The results also show these price estimates are sensitive to the changes in import prices and about 10% lower than the prices estimated in Table 85. The revenue estimates for each option shown in Table 114 are about 10% lower than the estimates provided in Table 86. The difference in revenues of the proposed action and the alternatives from the no action levels change only slightly, however. Lower prices reduce the negative impact of the proposed action on revenues from \$7 million to \$6 million in 2010 compared to no action (Table 115). The proposed action is still estimated to slightly reduce scallop fleet revenue in the medium term from 2010-2016 and increase the long-term revenue from 2010 to 2023 (Table 116).

Similarly, the ranking of the alternatives in terms of the cumulative present value of the revenues, producer surplus, consumer surplus and total economic benefits compared to no action does not change when lower prices are used to estimate the impacts (Table 116). Proposed action benefits would still be lower than the no action benefits in the medium-term (by \$3.8 million, 2010-2016), but exceed the no action benefits in the long-term (by \$71.9 million, 2010-2023). The percentage difference of the revenues, producer surplus, consumer surplus and total economic benefits compared to no action stay almost exactly the same whether lower or higher price estimates are used in the analysis (Table 117). Therefore, the results of the cost-benefit analyses of the proposed action and the alternatives do not change when the economic benefits are compared to the no action levels and in terms of ranking of the alternatives, the results are not sensitive to the values of price estimates obtained from the same price model, but using a different value for the import prices.

Sensitivity analyses can be conducted by changing the values of the other exogenous variables, such as disposable income or exports, or the composition of scallop landings in the terms of market size. Sensitivity analyses could also be conducted by using the confidence interval estimates of the coefficients of the price model. For example, a lower bound using 95% confidence interval estimate for the coefficient of the domestic consumption variable resulted in prices within a range of \$6 or lower, while the upper bound resulted in prices within a range of \$7.30 to \$7.50. As the sensitivity analysis with lower import prices indicated, however, the change in the values of prices impacted only the absolute values of the economic benefits, but not the ranking of the alternatives compared to no action.

The change in the fishing costs would also impact the absolute values of economic benefits compared to no action values. For example, higher fuel prices would increase the trip costs per day-at-sea and increase the cost savings from the proposed action and other alternatives that have lower DAS and trip allocations compared to the no action. As a result, the net economic benefits of the proposed action relative to no action and other alternatives would increase especially in the short-term. A decline in fishing cost will result in opposite effect because it would reduce the impacts of fishing costs in overall benefits. More discussion about the sensitivity analyses are provided in Appendix I.

Table 113. Estimated Prices (estimate in inflation adjusted 2008 prices)

| Fishing Year | No Action | No Closure $F = 0.20$ | No Closure $F = 0.24$ | Closure $F = 0.20$ | Closure $F = 0.18$ |

5.4.9 Impacts on social environment

5.4.9.1 Summary of FW21 allocation scenarios and consideration of new rotational area in the great south channel compared to status quo

The short-term social impacts from area closures include less flexibility for businesses stemming from possible short-term decreases in revenue, which would affect more those businesses with smaller cash flows, or less access to economic and social resources. Closing the Great South Channel would in particular negatively impact those fishermen who fish predominantly on Georges Bank, since there are already a variety of restrictions on fishing in the area, and it would more negatively impact fishermen from surrounding areas, such as Cape Cod and the Islands. This would be offset by slighter higher revenues in the long-term, since rotational area closures are designed to increase resource biomass and sustainability.

The economic section of the document describes the expected losses and gains in revenue and profit by year. In year one (2010) revenues and profits are expected to decline for the proposed action (NCLF24) compared to no action but the negative impacts will be significantly lower than the alternative status quo F_{target} option (NCLF20). This will have associated impacts on the fishery, especially after such a robust 2009 fishing year. Revenues are expected to be about \$931,799 dollars a year per full-time vessel, about \$18,661 less than the No Action alternative. Profits will also be lower compared to the No action alternative. Again, such short-term decreases in revenue tend to affect more those businesses with smaller cash flows than they affect larger enterprises with better access to credit. And such decreases in revenue have repercussions for crew income and potentially employment levels, as well as to boat owner income.

One way to consider potential impacts on crew from the various scenarios is to evaluate the projected DAS used for each allocation scenario; DAS used is a measure of days crew are working on fishing trips. Total effort measured in terms of DAS used as a sum total of all areas is

expected to be smaller in 2010 for the proposed action (25,740 DAS) compared to no action (28,715 DAS) and new closure options (CLF18 and CLF20). Compared to status quo F_{target} alternative (NCLF20, 22,053 DAS), however, the proposed action will minimize the negative impacts on employment (Table 91). The difference from the no action DAS used amounts to a 10% reduction for the proposed action and 23% reduction for the status quo F_{target} alternative (Table 94).

As a result, crew-days will change in the same percentage change to the DAS used, declining for all options except for CLF20. Although it is uncertain to what extent the reduction in crew-days will result in a reduction in the number of crew, thus employment in the fishery, given that this reduction is mostly limited to 2010 and that DAS-used are expected to increase in the following years, vessel owners may prefer to employ the same crew even though vessels will be fishing less. Table 91 shows that one-year negative short-term impacts on DAS-used (thus on crew-days) will be reversed in the future years. Starting in 2011, the DAS used will likely be higher for the proposed action compared to no action. Total DAS used are expected to increase by 19% in 2011 for the proposed action from 25,740 days to 30,676 days, exceeding the no action levels by 2%. For the overall period from 2010-2016, however, total DAS-used for the proposed action (thus crew-days) will be about 1% lower than the no action levels. The DAS-used for NCLF20 will be slightly lower than the no action but higher than the proposed action levels. DAS-used for the new closure alternatives (CLF20 and CLF18) will exceed the “No Action” levels by 2% to 3%. Over the long-term DAS used and crew days will be 1% higher for the proposed action and 2% higher for the status quo F_{target} (NCLF20) option compared to the no action levels.

When catch levels are stable from year to year that helps stabilize employment, spending, and market share. However, in the few years after 2010, revenues are expected to increase and the cumulative impacts of the proposed action are more favorable for the industry and society overall than the no action alternative.

The expected future increases in biomass from rotating closed areas would have more positive impacts on those more mobile fishermen who can switch areas more easily, and who have access to economic and social resources that enable them to more easily withstand fishing ups and downs. However, as discussed in Amendment 10, the general impacts from area management are likely to be more negative on fishermen on smaller vessels or on fishermen who have particular knowledge of particular locales, both of whom are less likely to practice mobile fishing strategies. Closing areas, if they are traditional fishing grounds, would create fewer options and less flexible fishing conditions for those fishermen.

5.4.9.2 TAC set-asides for observers (1%) and research (2%) and 2.4.1.3 Research priorities for 2010 and recent RSA announcement

Measures to allow for research and observers have, to the extent that they enhance understanding of the resource status and how it is used, can be expected to have positive social impacts in the long-term.

5.4.9.3 DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010

The continued allocation of 10% of projected scallop catch to the LAGC fishery instead of 5%, though obviously of positive benefit for the LAGC fishery, may have some geographic redistributions of the landings stream of scallops from ports that are predominantly limited access based to those that are predominantly LAGC, in the short-term.

5.4.9.4 Measures if IFQ program is delayed (Quarterly hard-TAC)

This measure continues the status quo of using a quarterly hard-TAC if implementation of Amendment 11 is delayed. In general, though a hard TAC can bring about derby fishing with its attendant negative impacts, the use of a quarterly hard TAC is designed to lessen that tendency and as such may lessen the negative impacts in the interim.

5.4.9.5 Northern Gulf of Maine (NGOM) Hard-TAC

This measure was previously analyzed in Amendment 11. In 2009, a total of 117 “LAGC-NGOM” permits were issued. A 70,000 lb TAC would provide a marginal source of revenue for these vessels until the resource status can be better determined.

5.4.9.6 Estimate of catch from LA incidental catch permits:

This measure was previously analyzed in Amendment 11. In general, given that only low mortality from incidental catch is expected, the impacts to the scallop fleet should be low. The impacts of the incidental catch permit alternative will have positive impacts on vessels that do not qualify for a limited access general category permit because it will allow them to still earn some income from scallops under the incidental catch permit. Furthermore, this alternative may provide more flexibility for vessels that do qualify for the limited access general category permit but opt for this permit instead, if fishing for more trips under 40 pounds is more advantageous than fishing for scallops under the 400 pound permit.

5.4.9.7 Measure to comply with biological opinion as it relates to turtles

5.4.9.7.1 Restrict the number of open area DAS an individual vessel can use in the Mid-Atlantic during a certain window of time

In general, the types of social impacts from this measure are similar to the impacts that can be expected from closing areas in general: those negatively impacted are fishermen who have traditionally fished in a given area, who have smaller vessels or who are homeported nearby and are less mobile. Given analyses elsewhere in the document (see Section 5.3.2.3), these impacts may be said to fall primarily on such smaller or less mobile vessels found in New Jersey and Virginia. Additionally, shifting effort out of summer months could have safety-at-sea implications.

5.4.9.7.2 Restrict the number of access area trips in the Mid-Atlantic that can be used during a certain window of time

This alternative would have reduced the number of access trips and not allowed them to be moved to outside the turtle window. Given the potential in loss of access trips to the Mid-Atlantic under this alternative, the social impacts from loss of revenue could be substantial and would impact the Mid-Atlantic and Southern fleet disproportionately. Loss of revenue can not only impact fishermen and fishing households, but communities and the infrastructures that landing activity helps to sustain. Additionally, shifting effort out of summer months could have safety-at-sea implications.

5.4.9.7.3 Consider a seasonal closure for Delmarva

Given the economic assessments that a shift to seasons in which meat yields are higher would increase economic revenue to fishermen, this measure could have indirectly positive impacts. However, fishermen who combine scallop fishing with other fisheries could be negatively impacted to the extent that such seasonal shifts affect participation in other fisheries. Additionally, shifting effort out of fall months when weather is relatively calm compared to other times of the year could have safety-at-sea implications.

5.4.9.7.4 Reduce possession limits in ETA and/or Delmarva to reduce fishing time per trip

As described elsewhere in this document (see Section 5.3.2.3), this measure could have a significantly negative impact on the scallop fleet if the loss of possession limit was not compensated elsewhere. Loss of revenue of a large scale can not only impact fishermen and fishing households, but communities and the infrastructures that landing activity helps to sustain.

5.4.9.8 Prohibit vessels from not paying for observers

If this measure helps by making the observer program run more effectively it should have indirect benefits on the scallop fishery in general, and the observer service companies that provide this service. If a vessel fails to pay for an observer, that observer service provider can refuse future service, but that vessel can then go to a different vendor and potentially cause the same problem. And if a vessel is refused an observer because of non-payment it may put the agency (NMFS) in the position of assigning a waiver when that vessel should have otherwise been assigned an observer. This measure was designed to help ensure that the observer set-aside, which belongs to the public, is used fairly and vessels are not taking advantage of this system by not paying for observers and being granted waivers.

5.4.9.9 Limit the amount of observer compensation general category vessels can get per observed trip in access areas

This measure, by closing a loophole in LAGC observer compensation, would have positive impacts in that it would ensure a perception of fairer use of compensation funds overall, and would help better meet the objectives of Amendment 11 that the LAGC fishery was intended to preserve the traditional day-boat character of the fishery.

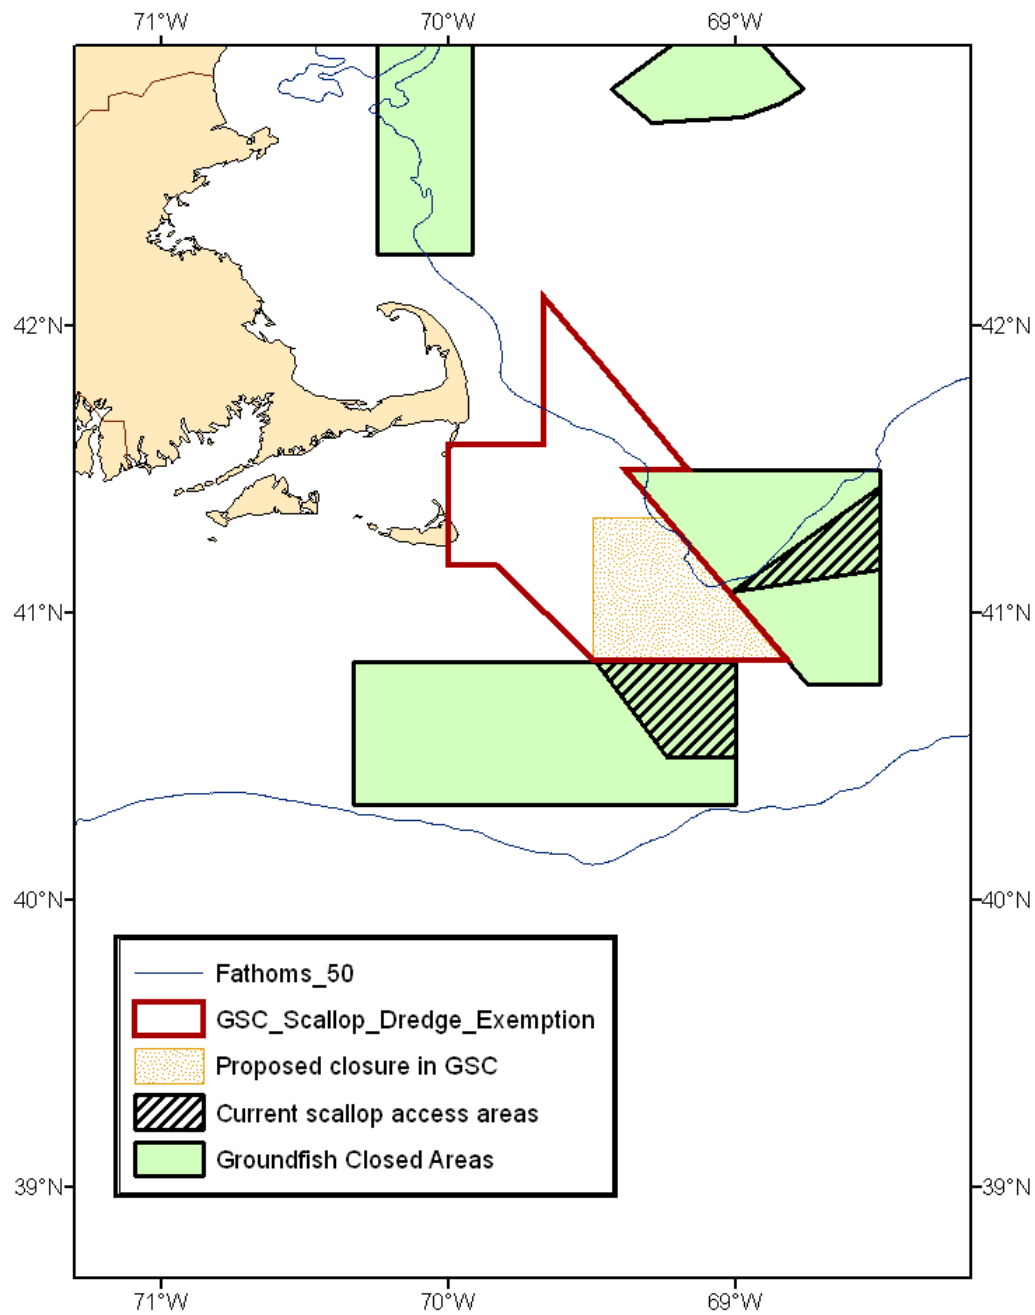

5.5 IMPACTS ON NON-TARGET SPECIES

The scallop fishery operates throughout the range of the scallop resource from Maine to North Carolina and results in the incidental catch of several other species. While some species are retained, other species are discarded due to restrictions in other fisheries or if the catch is not of value. Measures to minimize bycatch to the extent practicable in the scallop fishery pertain to all scallop vessels. The primary measures are the 10-inch minimum twine top restriction, and the bycatch TAC for yellowtail flounder in access areas. The 4-inch minimum ring size may also reduce finfish bycatch and reduces the bycatch of small scallops. The Northeast (NE) Multispecies and Monkfish FMPs also include measures to limit bycatch of species under the management of the specific FMP. The following measures in the FMPs apply:

The Northeast Multispecies FMP prohibits fishing in the Gulf of Maine/Georges Bank (GOM/GB) and Southern New England Exemption Areas unless a vessel is using exempted gear, is fishing under NE multispecies or scallop DAS, or is fishing under an exempted fishery. The prohibition prevents fisheries from occurring that might result in bycatch that could jeopardize the goals of the NE Multispecies FMP. Exempted fishery procedures in the NE Multispecies FMP allow a proven “clean” fishery to be implemented and allowed under the NE Multispecies FMP. Currently, the general category fishery can operate in two areas of the GOM/GB Exemption Area and in a portion of the SNE Exemption Area. In all three areas, vessels are restricted to 10 ½ ft dredges and may not possess any species other than scallops.

In addition, in the Great South Channel Sea Scallop Exemption Area within the GOM/GB Exemption Area, general category scallop vessels may not fish for scallops from April through June for one sub-area (the month of June for the other sub-area) (Figure 50). This period has been identified as the peak spawning for yellowtail flounder and protects high concentrations of yellowtail flounder from a portion of the scallop fleet. Note this area fully encompasses the new rotational area closure under consideration in this action.

Figure 50 – Great South Channel Sea scallop exemption area (outlined in red)

The Monkfish FMP allows vessels fishing for other species to harvest monkfish depending on the monkfish permit category, the declared fishing activity (i.e., multispecies DAS, scallop DAS, and/or monkfish DAS), the area fished, and the gear used. Unless otherwise restricted under another FMP, a vessel fishing outside of monkfish DAS, and while fishing for scallops under general category rules, is permitted to catch and retain up to 50 lb of monkfish tails per day, up to 150 lb total for the trip. This limitation prevents a scallop vessel using dredge gear from targeting monkfish and limits bycatch during scallop trips.

Other FMPs include overall quotas, state-by-state quotas, possession limits, and gear restrictions that may also reduce bycatch. The Skate and Summer Flounder/Scup/Black Sea Bass FMPs offer examples. The Skate FMP restricts possession of some species of skates and requires a permit to catch and land skate. Vessels fishing for scallops under general category rules would be restricted to the Skate FMP possession limits, limiting the impacts on skates as bycatch. Management measures for the summer flounder fishery include a state-by-state quota. When the quota is closed in a particular state, vessels can no longer land summer flounder in that state. When the quota is closed, scallop vessels from that state, fishing under general category rules, may have less incentive to fish in areas where summer flounder catch might be high since it could not be landed in the closed state.

These measures under other FMPs would continue to limit the impacts on bycatch species that are caught in the general category scallop fishery under all of the alternatives considered in Framework 21.

This action is not considering any measures that would trigger a skate baseline review based on the process approved in the Skate FMP. For more information see Section 6.1.3.

5.5.1 Summary of Framework 21 impacts on non-target species

None of the measures included in the proposed action are expected to have significant impacts on non-target species. This action has considered the potential impacts of the proposed action on non-target species (small scallops as well as finfish and other bycatch species) and in general, all the measures under consideration have positive or neutral impacts on non-target species. Many of the measures considered in this action concentrate fishing effort in areas with high scallop catch per-unit-of-effort, which reduces fishing time having positive impacts on bycatch rates.

Revising the area rotation schedule on Georges Bank is expected to keep high scallop biomass levels in the access areas in the foreseeable future, thus the areas will continue as a source to achieve optimum yield while minimizing effects on bycatch. This action maintains the YT bycatch TAC in access areas in GB and SNE. Overall, this action provides more flexibility to the fleet allowing the industry to better adapt to changing resource conditions. When the fleet is able to fish more efficiently, there may be a reduction in the amount of fishing time, with the potential to reduce bycatch. Limiting open area DAS keeps scallop biomass at target levels and maintains relatively high scallop LPUE. This keeps vessels from fishing long durations in marginal areas, where bycatch can be higher than normal.

See Section 5.1.2.5 for a description of the projected bottom contact time for the various scenarios considered. The two options that do not close the channel have lower area swept and open area DAS allocated for Year 1 (2010) (Table 41). If the Channel is closed, area swept is expected to increase for MA open areas (LI, NYB, and VB). This could have increased impacts on non-target species in these regions, but many if not all of the non-target species in these areas have possession limits or fishery wide quotas, so total impacts will be limited.

Information specific to interactions with yellowtail flounder can be found in Section 4.5.2. Bottom area for the open portion of the Channel will also be higher in the short term for the two options that close the channel. Once the Channel opens in 2013, the two options that close the Channel now have lower total bottom area swept compared to the two scenarios that leave it open in this action. In summary, over the next seven years LPUE is projected to be slightly higher and area swept is slightly lower for the two options that close the channel, but that is not the case at all in 2010-2012 while the channel is closed because DAS allocations are substantially higher for these scenarios to compensate for the closure.

The only other measures under consideration in FW21 that may have direct impacts on non-target species are the measures related to compliance with the biological opinion as it relates to turtles. RPM Alternatives #1 and #2 will likely result in a reduction in scallop effort in the Mid-Atlantic during the summer and fall. This could have positive or negative impacts on non-target species depending on whether bycatch rates are substantially different in the Mid-Atlantic by season. Observer data for the scallop fishery is not available in the form necessary to evaluate seasonal differences in bycatch rates for the specific seasons and areas under consideration. For example, it would be difficult to conclude that a two-month closure of Delmarva in September and October would have an overall affect on bycatch rates of non-target species in that area if effort was fished different months of the year. Furthermore, it is not clear when effort will shift (what months of the year) so even if monthly bycatch rates were known, actual impacts on bycatch are uncertain because fishing behavior responses from these RPMs are uncertain. However, because there are possession limits and fishery quotas for most if not all of the non-target species in this region, total impacts on non-target species are expected to be limited as a result of any of the RPM measures.

5.6 CUMULATIVE EFFECTS

5.6.1 Introduction

The term “cumulative effects” is defined in the Council of Environmental Quality’s (CEQ) regulations in 40 CFR Part 1508.7 as:

“The impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions.”

In 1997, the CEQ published a handbook titled, *Considering Cumulative Effects Under the National Environmental Policy Act*. The CEQ identified the following eight principles of cumulative effects analysis, which should be considered in the discussion of the cumulative effects of the proposed action:

1. Cumulative effects are caused by the aggregate of past, present, and reasonably foreseeable future actions.
2. Cumulative effects are the total effect, including both direct and indirect effects, on a given resource, ecosystem, and human community of all actions taken, no matter who (federal, non-federal, or private) has taken the actions.
3. Cumulative effects need to be analyzed in terms of the specific resource, ecosystem, and human community being affected.
4. It is not practical to analyze the cumulative effects of an action on the universe; the list of environmental effects must focus on those that are truly meaningful.
5. Cumulative effects on a given resource, ecosystem, and human community are rarely aligned with political or administrative boundaries.
6. Cumulative effects may result from the accumulation of similar effects or the synergistic interaction of different effects.
7. Cumulative effects may last for many years beyond the life of the action that caused the effects.
8. Each affected resource, ecosystem, and human community must be analyzed in terms of its capacity to accumulate additional effects, based on its own time and space parameters.

The following analysis will identify and characterize the impact on the environment by the Proposed Action and alternatives considered in Framework 21 when analyzed in the context of other past, present, and reasonably foreseeable future actions. Summary tables can be found following each of the text sections describing impacts. These tables contain brief summaries intended to distill the more detailed descriptions found in this section, and in Section 4.0 (Affected Environment), and Section 5.0 (Environmental Impacts). To enhance clarity and maintain consistency, the following terms are used to summarize impacts:

Table 118 - Terms used in cumulative effects tables to summarize cumulative impacts

| Impacts Are Known | Impacts Are Somewhat Uncertain |
|--------------------------|---------------------------------------|
| High Negative/Positive | Potentially High Negative/Positive |
| Negative/Positive | Potentially Negative/Positive |
| Low Negative/Positive | Potentially Low Negative/Positive |
| Neutral | Potentially Neutral |
| No Impact | |

**In some cases, terms like “more” and “most” are used for the purposes of comparing management alternatives to each other.*

5.6.2 Valued Ecosystem Components

This document was structured such that the cumulative effects can be readily identified by analyzing the impacts on valued ecosystem components (VECs). The affected environment is described in this document based on VECs that were identified specifically for Framework 21. The VECs identified for consideration in Framework 21 include: **Atlantic sea scallop resource; physical environment and essential fish habitat (EFH); protected resources; non-target species, and fishery-related businesses and communities**. While these components of the environment have been identified as the main VECs for this action, there are other objectives required under the Magnuson Act such as net national benefits that are met under this action as well. For example, non-target species are described in Section 4.5 and impacts on this action are summarized in Section 5.6, but this topic is not included as a primary VEC for this particular action because this action does not propose any modifications to the current area rotation program that will have different impacts on non-target species that have not already been assessed in previous actions. The action does assess the potential impacts on yellowtail flounder in more detail since there is now a specific allocation of YT to the scallop fishery under the Multispecies FMP (See Section 5.4).

VECs represent the resources, areas, and human communities that may be affected by a proposed action or alternatives and by other actions that have occurred or will occur outside the proposed action. VECs are the focus of an EIS since they are the “place” where the impacts of management actions are exhibited. An analysis of impacts is performed on each VEC to assess whether the direct/indirect effects of an alternative adds to or subtracts from the effects that are already affecting the VEC from past, present and future actions outside the proposed action (i.e., cumulative effects). While the document includes a description of other potentially affected parts of the ecosystem such as bycatch and enforcement of scallop measures, these components are not included as a specific VEC for the cumulative effects. They have been described and discussed in terms of impacts, but they were not identified as primary valued ecosystem components.

Changes to the Scallop FMP have the potential to directly affect the sea scallop resource. Similarly, management actions that would alter the distribution and magnitude of fishing effort for scallops could directly or indirectly affect other species and their corresponding fisheries. The physical environment and EFH VEC focuses on habitat types vulnerable to activities related to general category scallop fishing. The protected resources VEC focuses on those protected

species with a history of encounters with the scallop fishery. The fishery-related businesses and communities VEC could be affected directly or indirectly through a variety of complex economic and social relationships associated with either the scallop fishery or any of the other VECs.

The descriptive and analytic components of this document are constructed in a consistent manner. The Affected Environment (Section 4.0) traces the history of each VEC and consequently addresses the impacts of past actions. The Affected Environment section is designed to enhance the reader's understanding of the historical, current, and near-future conditions (baselines and trends) to fully understand the anticipated environmental impacts of the management action proposed in this amendment. The direct/indirect and cumulative impacts of the Proposed Action and other alternatives are then assessed in Section 5.6.6 of this document using a very similar structure to that found in the Affected Environment section. This EIS, therefore, is intended to follow each VEC through each management alternative.

5.6.3 Spatial and temporal boundaries

The geographic area that encompasses the biological, physical, and human community impacts to be considered in the following cumulative effects analysis is described in detail in Section 4.0 of this document. The physical range of the Atlantic sea scallop resource in the northeast region of the US is from Maine to North Carolina. The physical environment, including habitat and EFH, is bounded by the range of the Atlantic sea scallop fishery in the northeast region from Maine to North Carolina and includes adjacent upland areas (from which non-fishing impacts may originate). For Protected Species, the geographic range is the total range of the Atlantic sea scallop fishery. The geographic range for human communities is defined to be those fishing communities bordering the range of the scallop fishery.

Overall, the temporal scope of past and present actions for scallops, the physical environment and EFH, protected species, fishery-related businesses and communities, and other fisheries is focused principally on actions that have occurred since 1996, when the Magnuson-Stevens Fishery Conservation and Management Act was enacted and implemented new fisheries management and EFH requirements. In 1996, the Magnuson-Stevens Act identified sustained participation of fishing communities as a new National Standard (#8), so consideration of fishery-related businesses and communities is consistent within this temporal scope. The temporal scope for marine mammals begins in the mid-1990s, when NMFS was required to generate stock assessments for marine mammals that inhabit waters of the U.S. EEZ creating the baseline against which current stock assessments are evaluated. For turtle species, the temporal scope begins in the 1970s, when populations were noticed to be in decline.

The temporal scope for scallops is focused more on the time since the Council first submitted the Scallop FMP in 1982, and particularly since 1994 when Amendment 4 to the FMP implemented the general category scallop permit. The Scallop FMP was developed with comprehensive analysis as part of a complete EIS, which this document serves to supplement and update. The FMP has been adjusted a number of times since 1982, and many elements of the management plan that are not specifically addressed in this amendment will continue to influence the status of the sea scallop resource.

The Atlantic sea scallop fishery has a long history dating back to the late 1800s. Section 1.3 summarizes the major changes in the scallop fishery and management program since the FMP was approved in 1982. Landings information for the scallop fishery date back to the early 1900s (Serchuck et al, 1979), but the temporal scope for fishery-related businesses and communities extends back to 1994 to consider impacts from the date the general category permit was first issued.

The temporal scope of future actions for all four VECs extends several years into the future. This period was chosen because of the dynamic nature of resource management and lack of specific information on projects that may occur in the future, which make it difficult to predict impacts beyond this time frame with any certainty. In addition, most measures proposed in this action are only in place for one year only.

5.6.4 Past, present and reasonably foreseeable future actions

Section 4.0 of this document summarizes the current state of the scallop resource and the limited access and general category scallop fisheries, and it provides additional information about habitat and protected resources that may be affected by the Proposed Action.

5.6.4.1 Past and Present actions

The impacts of past and present actions have been considered relative to the VECs in this amendment and are described below and presented in Table 119.

Scallop Resource

The Council established the Scallop FMP in 1982 and later implemented several Amendments and Framework Adjustments to modify the original plan. See Section 1.3 for a detailed description of past and present actions. One major action in the past (1994) includes Amendment 4, which implemented limited access for the directed scallop fishery that is primarily managed by DAS and other controls such as crew limits and gear restrictions. During that same year, large areas on Georges Bank were closed to scallop fishing because of concerns over finfish bycatch and disruption of spawning aggregations.

In 1999 Framework Adjustment 11 to the Scallop FMP allowed the first scallop fishing within portions of the Georges Bank groundfish closed areas since 1994. Since then, several other framework actions have provided controlled access in these areas. In 2004 Amendment 10 to the Scallop FMP introduced rotation area management and changed the way that the FMP allocates fishing effort for limited access scallop vessels. Instead of allocating an annual pool of DAS for limited access vessels to fish in any area, vessels had to use a portion of their total DAS allocation in the controlled access areas defined by the plan, or exchange them with another vessel to fish in a different controlled access area. Vessels could fish their open area DAS in any area that was not designated a controlled access area. The amendment also adopted several alternatives to minimize impacts on EFH, including designating EFH closed areas, which included portions of the groundfish mortality closed areas. The most recent action that provided controlled access in the access areas was Framework 18 for FY2006 and FY2007.

Several other actions have recently been implemented: Amendment 13, Framework 20 and the SBRM Amendment (Amendment 12 to the Scallop FMP). The Council approved Amendment 12 to the Scallop FMP in June 2007. This action is an omnibus amendment to all FMPs in the region and focuses on defining a standardized bycatch reporting methodology (SBRM). Section 303(a) (11) of the Magnuson-Stevens Fishery Conservation and Management Act requires that all FMPs include “a standardized reporting methodology to assess the amount and type of bycatch occurring in the fishery.” The SBRM Omnibus Amendment will ensure that all FMPs fully comply with the Act. SBRM is the combination of sampling design, data collection procedures, and analyses used to estimate bycatch and to determine the most appropriate allocation of observers across the relevant fishery modes.

Scallop Amendment 13 was also approved by both the Council and NMFS in 2007, which re-activated the industry-funded observer program. Since 1999, vessels required to carry an observer are authorized to land more than the possession limit from trips in access areas, and in open areas, vessels are charged a reduced amount to help compensate for the cost of an observer. Observers were deployed through a contractual arrangement between National Marine Fisheries Service (NMFS) and an observer provider until June 2004. This arrangement was not renewed because of unresolved legal issues concerning the use of a contract to administer the industry-funded observer program. For some time, NMFS funded observers while a solution to this issue was investigated. As funding became insufficient, an interim rule went into effect that approved a new mechanism to use the observer set-aside funds through a non-contracted vendor. Amendment 13 was necessary to make this temporary mechanism part of the regulations. The Council selected final measures for that action at the February 2007 Council meeting and it was implemented on June 12, 2007. Amendment 13 also includes a provision to make changes to the observer set-aside program by framework action and the Council decided to address some issues raised with the current program in Framework 19.

The Council approved Framework 20 to the Scallop FMP at the June 2007 Council meeting and NMFS is expected to implement that action in the near term. Framework 20 considered measures to reduce overfishing for FY2007 through measures that were implemented by interim action earlier this year. At the November 2006 Council meeting, the Scallop PDT informed the Council that overfishing was likely to occur in 2007 under status quo measures implemented under Framework 18. The PDT presented several alternatives to reduce fishing mortality. The Council ultimately recommended that NMFS reduce the allocated number of trips for all scallop permit categories in the Elephant Trunk Access Area (ETA), delay the opening of the ETA, and prohibit vessels from possessing more than 50 bushels of in-shell scallops when leaving any controlled access area. NMFS agreed with the Council that the ETA has an unprecedented high abundance of scallops, which needs to be husbanded with precaution to effectively preserve the long term health of the scallop resource and fishery, and so implemented these measures by interim action.⁵ This interim action became effective on December 22, 2006, and remained effective until June 20, 2007 (180 days). This interim action was then extended for an additional

⁵ The interim rule published by NMFS on December 22, 2006 (**71 FR 76945**), included all measures recommended by the Council, except the prohibition on a vessel leaving an access area with more than 50 bu. of in-shell scallop was limited to the ETA only and not all access areas as recommended by the Council.

180 days, and expired on December 26, 2007. Therefore, for the last two months of the 2007 fishing year (January-February 2008), management would have reverted back to status quo measures under FW18. Specifically, higher trip allocations would have been granted in the Elephant Trunk Area for both limited access and general category fisheries. Therefore, the Council approved Framework 20 to extend the reduced fishing effort measures implemented by interim action through the end of the 2007 fishing year. This action expired on March 1, 2008, when Framework 19 was scheduled to be in place.

Framework 19 set specifications to adjust DAS allocations and set the area rotation schedule for 2008 and 2009. Maintaining the fishing mortality target of $F = 0.20$ is expected to have positive impacts on the scallop resource by reducing the risk of overfishing and establishing measures to achieve optimum yield on a continuing basis. In addition, the Hudson Canyon area was closed in this action which will help the FMP achieve optimum yield by reducing mortality on small scallops. Framework 19 also revised the overfishing definition, which was expected to have positive impacts on the scallop resource. The updated model is less biased, uses more sources of data, and is an improvement on the previous model.

It also addressed new requirements for the general category fishery including quarterly hard-TAC allocations for the transition period to an IFQ program. This action also included the details of a cost recovery program that was approved in Amendment 11 for general category IFQ permit owners. In addition, Amendment 11 approved a hard-TAC for a Northern Gulf of Maine (NGOM) limited entry program. FW19 included the specific hard-TAC for that program for the next two fishing years. General category vessels were allocated 5% of the total catch in access areas in both FY2008 and 2009 under this framework. The last alternative related to Amendment 11 was an estimate of incidental catch mortality that will be removed from the total projected catch before allocations are made.

Other measures in Framework 19 included alternatives to address specific issues with the observer set-aside program. In addition, the action included a provision for a vessel to power down their VMS unit for a minimum of 30 days. This action also included a clarification about when a vessel can leave for an access area trip. Lastly, this action approved research priorities to be incorporated in the RSA program for FY2008 and FY2009. The Council selected final measures for that action at the October 2007 Council meeting and it was implemented on June 1, 2008. The final rule for Framework 19 to the FMP was published on May 29, 2008 (73 FR 30790).

Lastly, the Council approved Amendment 11 to the Scallop FMP (June 2007) and most of it was implemented in 2008. The full IFQ program is expected to be implemented before March 1, 2010. The main objective of the action was to control capacity and mortality in the general category scallop fishery. Since 1999, there has been considerable growth in fishing effort and landings by vessels with general category permits, primarily as a result of resource recovery and higher scallop prices. This additional effort is likely a contributing factor to why the FMP has been exceeding the fishing mortality targets. Without additional controls on the general category fishery, there is a great deal of uncertainty with respect to potential fishing mortality from this component of the scallop fishery; thus, the potential for overfishing is increased.

The action includes a limited entry program for the general category fishery. Each qualifying vessel would receive an individual allocation in pounds of scallop meat with a possession limit of 400 pounds. Qualifying vessels would receive a total allocation of 5% of the total projected scallop catch. The proposed action also includes a separate limited entry program for general category fishing in the Northern Gulf of Maine. In addition, Amendment 11 includes adjustments to limited access scallop fishing under general category rules. Another separate limited entry program for that activity is proposed with the same qualification criteria as the limited entry general category permit. Qualifying vessels will also receive an individual allocation in pounds, and the entire category will receive 5% of the total projected scallop catch. In addition, a separate limited entry incidental catch permit is proposed that will permit vessels to land and sell up to 40 pounds of scallop meat per trip while fishing for other species. Other measures are recommended as well.

The cumulative impacts of past and present management actions have resulted in substantial effort reductions in the scallop fishery. Sea scallop biomass has mostly increased since 1999. It is estimated that area rotation management will end overfishing and provide a healthy resource for scallop fishermen to harvest for the long-term. Overall, the realized reductions in effort have been positive for the scallop resource.

Physical Environment and EFH

The effects of mobile bottom-tending gear (trawls and dredges) on fish habitat have been recently reviewed by the National Research Council (NRC 2002). This study determined that repeated use of trawls/dredges reduce the bottom habitat complexity by the loss of erect and sessile epifauna and smoothing sedimentary bedforms and bottom roughness. This activity, when repeated over the long term also results in discernable changes in benthic communities, which involve a shift from larger bodied long-lived benthic organisms for smaller shorter-lived ones. This shift also can result in loss of benthic productivity and thus biomass available for fish. Therefore, such changes in bottom structure and loss of productivity can reduce the value of the bottom habitat for demersal fish, such as haddock and cod. These effects varied with sediment type, with lower level of impact to sandy communities, where there is higher natural disturbance to a high degree of impact to hard-bottom areas such as bedrock, cobble and coarse gravel, where the substrate and attached epifauna are more stable. Use of trawls and dredges are common in inshore and offshore areas. The primary gear used in the scallop fishery is dredge gear; however, there is some otter trawl gear used in the scallop fishery. It is assumed for this analysis that the effects of bottom tending mobile gear, particularly dredge gear, are generally moderate to high, depending upon the type of bottom and the frequency of fishing activities to demersal species affected by this action. These activities, which cause impacts to essential fish habitat for a number of federally managed species in a manner that is more than minimal and less than temporary in nature, have been mitigated by the measures in Amendment 10 and by other actions described in Table 119.

Amendment 10 implemented a series of year-round closed areas to scallop gear to protect EFH in those areas. Furthermore, a gear modification (4-inch ring size) was implemented to reduce mortality on small scallops and reduce contact with the bottom. Total DAS allocated under

Amendment 10 were reduced, which had indirect benefits to EFH by reducing overall scallop fishing effort and thus reducing area swept by dredge gear. It should be noted that sea scallop EFH is not considered adversely affected by dredge or otter trawl fishing effort.

Table 119 includes a description of measures implemented by the Council in last major FMP amendments to minimize, mitigate or avoid adverse impacts on EFH.

In Amendment 13 to the Multispecies FMP the New England Council implemented a range of measures to minimize the impacts of bottom trawling in the Gulf of Maine, Georges Bank and Southern New England. In addition to the significant reductions in days-at-sea and some gear modifications (implemented through Scallop Amendment 10), the Council closed 2,811 square nautical miles (Habitat Closed Areas) to all bottom-tending mobile fishing gear, including scallop dredges. Framework 16 to the Scallop FMP/Framework 39 to the Multispecies FMP updated the Habitat Closed Area boundaries established by Amendment 10 to be consistent with those established by Amendment 13. On August 2, 2005, the portions of Framework 16/39 that modified the habitat closures to be consistent with A13 habitat closed areas were vacated by a court order. As a result, both the Amendment 10 and the Amendment 13 closures remain in effect. Table 119 includes a description of measures implemented by the Council in last major FMP amendments to minimize, mitigate or avoid adverse impacts on EFH, including measures established under other FMPs.

Framework 21 does not propose any changes to the current measures to minimize the adverse impacts of scallop fishing on EFH. No additional measures are needed at this time because most measures proposed in this action are expected to have neutral to positive impacts on EFH.

Table 119. Description of measures implemented by Council in last major FMP amendments to minimize, mitigate or avoid adverse impacts on EFH.

| Measure | Source FMP (implemented by) | Description | Description of Habitat Impacts | Overall Habitat Impact |
|---|-----------------------------|--|---|------------------------|
| CLOSED AREA MEASURES | | | | |
| Mortality Closure | Multispecies | Retention of existing groundfish closed areas in the Gulf of Maine, George's Bank and Southern New England. Addition of Cashes as a year round closure | Year-round closures provide habitat benefits to the areas within the closures. The addition of Cashes Ledge as a year-round closure will benefit EFH. Rare kelp beds are found in that area. | + |
| Habitat Closed Areas (MPAs) | Multispecies and Scallop | 2811 square nautical miles closed to bottom-tending mobile gear indefinitely in five separate closed areas in GOM, GB and SNE. | Significant benefits to EFH by minimizing adverse effects of bottom trawling, scallop dredging and hydraulic clam dredging by prohibiting use. | + |
| Rotational Area Management (RAM) | Scallop | Amendment 10 implemented a rotational area management strategy which introduced a systematic structure that determines where vessels can fish and for how long. Framework adjustments will consider closure and re-opening criteria. | Expected to have positive effects on habitat because effort on gravelly sand sediment types is expected to decline. In general, swept area is expected to decline in most of the projected scenarios (especially in the Mid-Atlantic region), which could have positive impacts on EFH. | + |
| Habitat Closed Areas (MPAs) | Monkfish | Amendment 2 closed Oceanographer and Lydonia Canyons to trawls and gillnets on a monkfish DAS. | Precautionary action taken to ensure that any expansion of the monkfish fishery as a result of the other measures in Amendment 2 will not affect sensitive deep-sea canyon habitats for which EFH is designated. | + |
| EFFORT REDUCTION MEASURES | | | | |
| Monkfish DAS usage by limited access permit holders in scallops and multispecies fisheries | Monkfish | Retain current requirement for vessels to use both monkfish DAS and scallop or multispecies DAS simultaneously | This alternative relies on the scallop and multispecies management plans to set DAS levels (with the exception of when DAS fall below 40 DAS). As DAS have been reduced by management actions over the past two years, consequent impacts on habitat by the directed monkfish fishery have been reduced proportionally. Further reductions are possible depending on management actions in these two plans. | + |
| Capacity Control | Multispecies | DAS can be transferred with restrictions and new measures for "reserve days" | Any measure that is intended to reduce the amount of time fishing by mobile gear will likely have benefits to EFH. These measures reduce amount of latent effort as well. | + |
| DAS Reductions | Multispecies | Mix of adaptive and phased effort reduction strategies. A days (60% of effective effort) B days (40% of effective effort) C days (FY01 allocation). | Reducing DAS will likely benefit EFH by reducing the amount of time vessels can fish. | + |

| Measure | Source FMP (implemented by) | Description | Description of Habitat Impacts | Overall Habitat Impact |
|---|--------------------------------|--|--|------------------------------|
| | | Provides opportunity to fish on stocks that do not need rebuilding. | | |
| DAS Limits | Scallops | Amendment 10 implemented a new program that allocates specific number of DAS for open areas and controlled access areas. | The total DAS allocation in open areas is significantly less than the Status quo DAS allocation. Less DAS translates into less fishing effort, so positive for EFH. Furthermore, CPUE in controlled access areas is expected to be greater, thus the gear is expected to spend less time on the bottom. | + |
| Possession Limits | Scallops | Reduced possession limit for limited access vessels fishing outside of scallop DAS | Vessels with limited access permits are currently allowed to possess and land up to 400 lbs per trip of shucked scallop meats when not required to use allocated DAS; this measure will reduce possession limit to 40 lbs/trip) and reduce fishing effort by vessels that have been targeting scallops under the higher general category possession limit. Scallops harvested under this provision cannot be sold. | + |
| GEAR MODIFICATION MEASURES | | | | |
| Minimum mesh size on directed MF DAS | Monkfish | Mobile gear vessels are required to use either 10-inch square or 12-inch diamond mesh in the codend. Gillnets must be at least 10 inches | The mesh size regulations do not have a direct effect on habitat, but may indirectly minimize adverse effects of the fishery on complex bottom types by reducing the ability to catch groundfish, and therefore the incentive to target those fish in hard bottom areas. | + |
| Roller gear restriction | Monkfish | Establishes maximum roller gear diameter size for vessels fishing on a monkfish DAS. | Positive but not significant – sets maximum roller gear diameter equivalent to size currently in use in the area; prevents expansion of trawl effort into complex bottom areas and canyons. | + |
| Four inch rings | Scallop | Increase ring size on scallop dredge rig to 4" everywhere. | Four inch rings will slightly increase dredge efficiency for larger scallops, thus reducing bottom contact time in recently-opened areas where large scallops are abundant, but will reduce catch rates and increase bottom time in areas where medium-small sized scallops are prevalent. | -/+ |
| OTHER MEASURES | | | | |
| Observer Coverage | Multispecies | 10% requested by 2006 for each gear type | If observers are able to collect data of interest to EFH management, increased coverage could indirectly benefit habitat. | + |
| TAC Set-Aside for research | Scallop | 2% set-aside from TAC and/or DAS allocations to fund scallop and habitat research and surveys | Could indirectly benefit habitat when habitat research is funded and provides better information for future management decisions. | + |

Protected Species

Before 2001, there were only three known interactions between sea turtles and scallop dredge gear (NMFS, 2007). By 2001, scallop fishing intensity in the Mid-Atlantic region increased following a general decline of scallop biomass in the Georges Bank region and closure of the groundfish Closed Areas in December 1994. Since turtle interactions in the high use areas and seasons are in part related to fishing effort, sea turtles may have benefited from reductions of fishing effort allocations in Amendments 4 and 7 to the Scallop FMP. During this time, DAS use declined from more than 40,000 DAS in 1993 to about 23,000 DAS in 1999, before increasing to about 31,000 DAS, in 2003 (NEFMC, 2005). The amendments and intervening framework adjustments also made other management changes, including new gear restrictions, although the effect of these changes on sea turtle interactions is unknown.

The extent of interactions between fishing with scallop dredges and sea turtles is still under investigation. Following the opening of the Hudson Canyon Access Area and increased observer coverage in the area, additional interactions between sea turtles and scallop dredge gear became known. New research is continuing to identify additional gear modifications and changes in fishing that could reduce interactions in the fishery.

The main goal of Amendment 10 to the Scallop FMP was to focus scallop fishing effort in areas where biomass is greatest with the rationale that actual fishing time is likely to be reduced as the overall catch per tow increases. Scallop management areas have been monitored through annual scallop surveys for scallop biomass and growth rates. When biomass in a closed area is high and the growth rates decline (i.e. the scallop resources are at maximum levels in the area) areas open to fishing at a controlled level. Conversely, closings occur when the reverse situation occurs (low biomass and high growth rate indicating a depleted scallop resource in the area). While Scallop Amendment 11 continued this management program, its purpose was to control capacity and mortality in the general category scallop fishery.

Certain general statements can be made regarding areas in the scallop management unit. Shifts in scallop effort from the Mid-Atlantic region to areas of Georges Bank may have had the effect of reducing potential risks to sea turtles. As the Georges Bank scallop resource is reduced and the Mid-Atlantic areas rebound a reverse shift in effort from an area of low use for turtles to high use areas in the Mid-Atlantic may potentially increase the risk of interactions from current levels. Accordingly, impacts to protected species could shift back and forth over the years under the management scheme implemented under Amendment 10. Since modifications to NEFMC management actions will occur through framework adjustments and plan amendments, they will undergo additional review to assess impacts to protected species.

The sea scallop FMP has several measures in place specifically to protect sea turtles. These include time area closures such as the seasonal Elephant Trunk closure in September and October in effect since that area opened in 2007 which will roll over in the current action. Also included are gear modifications and requirements designed to minimize impact of takes. In general, scallop effort has declined over the years and catch per-unit-of-effort has increased dramatically under area rotation. Comparing 2004 to 2009, the number of total DAS allocated has declined by 39%. The average DAS allocated from 2004-2007 was 19,182, which is about

29% more than the estimate of allocated DAS for 2009. More and more effort is concentrated in access areas with higher catch rates, so gear is in the water much less than in the past.

Fishing effort in the Mid-Atlantic has changed over time. In general, total catch from the MA was very low from 1994 until more recently (Figure 43). From 2004-2007, about 60% of total catch from MA access areas and open areas. There is typically a peak in the spring until more recent years (2007 and 2008). The peak used to be May/June, and more recently it has shifted to April or even March. When the Elephant Trunk area was open in 2007 and 2008 more catch occurred during the early spring and later in the year compared to spring and summer in earlier years. This shift of effort, likely caused by the high amount of effort allocated to ETA and the two month turtle closure from Sept1-Oct 31) seems to have reduced scallop fishing during most of the year when turtles are expected to be in the Mid-Atlantic. Figure 44 shows that overall catch in the Mid-Atlantic has steadily reduced during both turtle seasons under consideration in FW21 from 50-60% to closer to 30% for both time periods.

Five Biological Opinions for the sea scallop fishery have been issued since 2003. The latest BiOp was completed by NMFS on March 14, 2008 which summarized the overall impacts to threatened and endangered species. It concluded that the fishing operations being carried out under the Scallop FMP and as modified by Framework 19 were likely to adversely affect, but not jeopardize the continued existence of loggerhead, leatherback, Kemp's ridley and green sea turtles. ESA requires incidental take statement (ITS) and any reasonable and prudent measures (RPMs) necessary to minimize impacts along with implementing terms and conditions. One specific RPM in the most recent biological opinion included a requirement to limit scallop fishing. NMFS requested the Council develop measures to comply with that RPM in this action. See Section 2.8 for details. These measures will be implemented through the current action, and are expected to have beneficial impacts on turtles by reducing effort in the Mid-Atlantic during times of the year when turtles are most likely to be present.

The alternatives under consideration in this action do not appear to have any adverse cumulative effects on protected species that would alter the prognosis for impacts of fishing under Amendment 10 and Framework Adjustment 19, although there are other sources of human-induced mortality and/or harassment of turtles in the action area. These include incidental takes in state-regulated fishing activities, vessel collisions, ingestion of plastic debris, and pollution. While the combination of these activities may affect populations of endangered and threatened sea turtles, preventing or slowing a species' recovery, the magnitude of these effects is currently unknown.

State Water Fisheries - Fishing activities are considered one of the most significant causes of death and serious injury for sea turtles. A 1990 National Research Council report estimated that 550 to 5,500 sea turtles (juvenile and adult loggerheads and Kemp's ridleys) die each year from all other fishing activities besides shrimp fishing. Fishing gear in state waters, including bottom trawls, gillnets, trap/pot gear, and pound nets, take sea turtles each year. However, information on the takes is limited. Given that state managed commercial and recreational fisheries along the Atlantic coast are expected to continue within the action area in the foreseeable future, additional takes of sea turtles in these fisheries is anticipated.

Vessel Interactions – NOAA Fisheries STSSN data indicate that interactions with small recreational vessels are responsible for a large number of sea turtles stranded each year within the action area. Collision with boats can stun or easily kill sea turtles, and many stranded turtles have obvious propeller or collision marks.

Pollution and Contaminants - Marine debris (*e.g.*, discarded fishing line or lines from boats) can entangle turtles in the water and drown them. Turtles commonly ingest plastic or mistake debris for food. Chemical contaminants may also have an effect on sea turtle reproduction and survival. While the effects of contaminants on turtles are relatively unclear, pollution may be linked to the fibropapilloma virus that kills many turtles each year (NOAA Fisheries 1997). If pollution is not the causal agent, it may make sea turtles more susceptible to disease by weakening their immune systems. Excessive turbidity due to coastal development and/or construction sites could influence sea turtle foraging ability. As mentioned previously, turtles are not very easily affected by changes in water quality or increased suspended sediments, but if these alterations make habitat less suitable for turtles and hinder their capability to forage, eventually they would tend to leave or avoid these less desirable areas (Ruben and Morreale 1999).

Low and Mid-frequency Sonar – See Section 5.6.5.

The factors discussed above, and other factors, potentially have had cumulative adverse effects on most protected species to varying degrees. Because of a lack of cause-effect data, little is known about the magnitude and scope of these factors and how they have contributed to the species' listing.

A number of activities are in progress that may ameliorate some of the negative impacts on marine resources, sea turtles in particular, posed by the activities summarized above. Education and outreach are considered one of the primary tools to reduce the risk of collision represented by the operation of federal, private, and commercial vessels.

NMFS' regulations require fishermen to handle sea turtles in such a manner as to prevent injury. Any sea turtle taken incidentally during fishing or scientific research activities must be handled with due care to prevent injury to live specimens, observed for activity, and returned to the water according to a series of procedures (50 CFR 223.206(d)(1)). NMFS has been active in public outreach efforts to educate fishermen regarding sea turtle handling and resuscitation techniques. NMFS has also developed a recreational fishing brochure that outlines what to do should a sea turtle be hooked and includes recommended sea turtle conservation measures. These outreach efforts will continue in an attempt to increase the survival of protected species through education on proper release guidelines.

There is an extensive network of STSSN participants along the Atlantic and Gulf of Mexico coasts. This network not only collects data on dead sea turtles but also rescues and rehabilitates live stranded turtles. Data collected are used to monitor stranding levels and identify areas where unusual or elevated mortality is occurring. The data are also used to monitor incidence of disease, study toxicology and contaminants, and conduct genetic studies to determine population structure. All states that participate in the STSSN are collecting tissue for genetic studies to better understand the population dynamics of the northern subpopulation of nesting loggerheads.

These states also tag live turtles when encountered through the stranding network or in-water studies. Tagging studies help provide an understanding of sea turtle movements, longevity, and reproductive patterns, all of which contribute to our ability to reach recovery goals for the species.

There is no organized formal program for at-sea disentanglement of sea turtles. However, recommendations for such programs are being considered by NMFS pursuant to conservation recommendations issued with several recent Section 7 consultations. Entangled sea turtles found at sea in recent years have been disentangled by STSSN members, the whale disentanglement team, the USCG, and fishermen. NMFS has developed a wheelhouse card to educate fishermen and recreational boaters on the sea turtle disentanglement network and disentanglement guidelines.

Actions taken to protect sea turtles include a Strategy for Sea Turtle Conservation and Recovery in Relation to Atlantic Ocean and Gulf of Mexico Fisheries (Sea Turtle Strategy), released by NMFS in June 2001, to address the incidental capture of sea turtle species in state and federal fisheries in the Atlantic and Gulf of Mexico. The major elements to the strategic plan include: continuing and improving stock assessments; improving and refining estimation techniques for the takes of sea turtles to ensure that ESA criteria for recovery are being met; continuing and improving the estimation or categorization of sea turtle bycatch by gear type and fishery; evaluating the significance of incidental takes by gear type; convening specialist groups to prepare take reduction plans for gear types with significant takes; and promulgating ESA and MSFCMA regulations implementing plans developed for take reduction by gear type. Actions taken under the Sea Turtle Strategy are expected to provide a net benefit to sea turtles.

In February 2003, NMFS issued a final rule to amend regulations protecting sea turtles to enhance their effectiveness in reducing sea turtle mortality resulting from shrimp trawling in the Atlantic and Gulf areas of the southeastern U.S. Turtle Excluder Devices (TEDs) have proven to be effective at excluding sea turtles from shrimp trawls; however, NMFS has determined that modifications to the design of TEDs needed to be made to exclude leatherbacks and large and mature loggerhead and green sea turtles. In addition, several approved TED designs did not function properly under normal fishing conditions. NMFS disallowed these TEDs. Finally, the rule requires modification to the trawl net and bait shrimp exemptions to the TED requirements to decrease mortality of sea turtles (68 FR 8456, 21 Feb 2003).

Significant measures have been taken to reduce sea turtle takes in summer flounder trawls and trawls that meet the definition of summer flounder trawls, which would include fisheries for species like scup and black sea bass, by requiring TEDs in trawl nets fished in the area of greatest turtle bycatch off the North Carolina and part of the Virginia coast from the North Carolina/South Carolina border to Cape Charles, VA. These measures are attributed to significantly reducing turtle deaths in the area (NMFS, 2007). In addition, NMFS issued a final rule (67 FR 56931), effective September 3, 2002, that closes the waters of Pamlico Sound, NC to fishing with gillnets with a mesh size larger than 4 1/4 inch (10.8 cm) stretched mesh ("large-mesh gillnet"), on a seasonal basis from September 1 through December 15 each year, to protect migrating sea turtles. The closed area includes all inshore waters of Pamlico Sound south of 35° 46.3' N. lat., north of 35° 00' N. lat., and east of 76° 30' W. long.

In December 2003, NMFS issued new regulations for the use of gillnets with larger than 8 inch stretched mesh in federal waters off of North Carolina and Virginia (67 FR 71895, 3 Dec. 2002). Gillnets with larger than 8 inch stretched mesh are not allowed in federal waters (3-200 nautical miles) north of the North Carolina/South Carolina border at the coast to Oregon Inlet at all times; north of Oregon Inlet to Currituck Beach Light, NC from March 16 through January 14; north of Currituck Beach Light, NC to Wachapreague Inlet, VA from April 1 through January 14; and, north of Wachapreague Inlet, VA to Chincoteague, VA from April 16 through January 14. Federal waters north of Chincoteague, VA are not affected by these new restrictions although NMFS is looking at additional information to determine whether expansion of the restrictions are necessary to protect sea turtles as they move into northern mid-Atlantic and New England waters. These measures are in addition to Harbor Porpoise Take Reduction Plan measures that prohibit the use of large-mesh gillnets in southern mid-Atlantic waters (territorial and federal waters from Delaware through North Carolina out to 72° 30'W longitude) from February 15-March 15, annually.

In May 2004, the agency issued regulations prohibiting the use of all pound net leaders, set with the inland end of the leader greater than 10 horizontal ft (3 m) from the mean low water line, from May 6 to July 15 each year in the Virginia waters of the mainstem Chesapeake Bay, south of 37° 19.0' N. lat. and west of 76° 13.0' W. long., and all waters south of 37° 13.0' N. lat. to the Chesapeake Bay Bridge Tunnel at the mouth of the Chesapeake Bay, and the James and York Rivers downstream of the first bridge in each tributary. Outside this area, the prohibition of leaders with greater than or equal to 12 inches (30.5 cm) stretched mesh and leaders with stringers, as established by the June 17, 2002 interim final rule, will apply from May 6 to July 15 each year. The action, taken under the ESA, is necessary to conserve sea turtles listed as threatened or endangered. NMFS also provides an exception to the prohibition on incidental take of threatened sea turtles for those who comply with the rule (69 FR 24997, 5 May 2004).

In July 2004, NMFS issued sea turtle bycatch and bycatch mortality mitigation measures for all Atlantic vessels that have pelagic longline gear onboard and that have been issued, or are required to have, Federal HMS limited access permits, consistent with the requirements of the ESA, the MSFCMA, and other domestic laws. These measures include mandatory circle hook and bait requirements, and mandatory possession and use of sea turtle release equipment to reduce bycatch mortality. This final rule also allows vessels with pelagic longline gear onboard that have been issued or are required to have Federal HMS limited access permits to fish in the Northeast Distant Closed Area if they possess and/or use certain circle hooks and baits, sea turtle release equipment, and comply with specified sea turtle handling and release protocols (69 FR 40733, 6 Jul 2004).

More recently, NMFS has published a final rule (70 FR 42508, July 25, 2005) that allows any agent or employee of NMFS, the FWS, the U.S. Coast Guard, or any other Federal land or water management agency, or any agent or employee of a state agency responsible for fish and wildlife, when acting in the course of his or her official duties, to take endangered sea turtles encountered in the marine environment if such taking is necessary to aid a sick, injured, or entangled endangered sea turtle, or dispose of a dead endangered sea turtle, or salvage a dead

endangered sea turtle that may be useful for scientific or educational purposes. NMFS already affords the same protection to sea turtles listed as threatened under the ESA (50 CFR 223.206(b)).

In 2006, NMFS finalized a rule (71 FR 50361, August 23, 2006) that requires modification of scallop dredge gear by use of a chain mat when the gear is fished in Mid-Atlantic waters south of 49° 09' N from the shoreline to the outer boundary of the EEZ during the period May 1 through November 30 each year. The intent of the dredge gear modification is to reduce the severity of some turtle interactions that might occur by preventing turtles from entering the dredge bag.

On February 15, 2007 the agency also issued an advance notice of proposed rulemaking to announce it is considering amendments to the regulatory requirements for turtle excluder devices (TEDs). Among other issues, specific changes include increasing the size of the TED escape opening currently required for sea scallop trawl gear and moving the current northern boundary of the Summer Flounder Fishery-Sea Turtle Protection Area off Cape Charles, Virginia to a point farther north. The objective of the proposed measures is to effectively protect all life stages and species of sea turtle in Atlantic trawl fisheries where they are vulnerable to incidental capture and mortality.

In 2008 a Loggerhead Sea Turtle Recovery Plan was published (NMFS and USFWS 2008) which did not include the Atlantic sea scallop fishery as a main source of mortality of the species. This document estimated loggerhead bycatch in the scallop fishery and the impact of takes on the population.

Non-target Species

Actions taken by the Council in the Scallop FMP in past, present, and reasonably foreseeable timeframe are mostly positive. Effort controls to maintain sustainability in the scallop fishery have reduced effort and increased efficiency of the fleet, which reduces impact on non-target species.

Fishery-related Businesses and Communities

All actions taken under the Scallop FMP have had effects on fishery-related businesses and communities. None have specifically been developed to primarily address elements of fishing related businesses and communities. In general, actions that prevent overfishing have long-term benefits on businesses and communities that depend on those resources. Some actions that limit participation, such as the limited entry program that was adopted under Amendment 4 had distributional impacts on individuals and ports that participated in the scallop fishery at that time. While short-term negative impacts may follow an action that reduces effort, past and present actions had positive cumulative impacts on vessels owners, crew and their families in the scallop fishery by increasing their fishing revenues, incomes and standard of living. These impacts of these past and present actions were also positive for the related sectors including dealers, processors, primary suppliers to the vessels that sell them gear, engines, boats, etc. The increases in gross profits for scallop vessels and in crew incomes have had positive economic benefits on these sectors indirectly through the multiplier impacts. Total landings have increased, catch per unit of effort has increased, and price has steadily increased as well.

The Passamaquoddy Native American Tribe has been awarded licenses in the State of Maine to harvest scallops in state waters since 1998. Since this is a state fishery, the state of Maine monitors these landings. However, the impact of this fishery on the overall scallop resource is minimal because the size of the fleet is small relative to the scallop fleet managed under this FMP.

Table 120 – Summary of effects from past and present actions

| Action | Description | Impacts on Scallops | Impacts on Physical Env. and EFH | Impacts on Protected Species | Impacts on Fishery and Communities | |
|---|--|----------------------|----------------------------------|------------------------------|---|--|
| SCALLOP ACTIONS | | | | | | |
| Scallop FMP | Restore adult scallop stock and reduce fluctuation in stock abundance | Positive | Positive | Positive | Positive | |
| Amendment 4 | Changed the primary management mechanism from the meat-count standard to an effort control program for all resource areas | Positive | Positive | Positive | Positive | |
| Amendment 10 | Implement area rotation program and other measures to prevent overfishing and minimize impacts on EFH | Positive | Positive | Positive | Positive | |
| Framework 18 | Set management measures for FY2006 and FY2007 | Positive | Neutral | Neutral | Positive | |
| Amendment 13 | Implement the industry funded observer program | Positive | Neutral | Positive | Neutral | |
| Framework 20 | Implement measure to reduce effort in January and February of 2007 | Positive | Neutral | Neutral | Positive | |
| SBRM Amendment | Implement a bycatch reporting methodology | Potentially Neutral | No Impact | Potentially Positive | Potentially Neutral | |
| Framework 19 | Set management measures for FY2008 and 2009, eliminated crew size restriction, LAGC IFQ program, obs and RSA program improvements, and VMS 30-day power down | Positive | Neutral | Neutral | Positive | |
| Amendment 11 | Limited entry program for the general category fishery | Potentially Positive | Potentially positive | Neutral | Potentially positive for some and potentially negative for others | |
| SUMMARY OF IMPACTS FROM SCALLOP ACTIONS- | | Positive | Positive | Positive | Positive | |
| PHYSICAL ENVIRONMENT AND EFH ACTIONS | | | | | | |
| EFH Omnibus Amendment (1998) | Comply with 1996 SFA to describe and identify EFH and minimize impacts of fishing on EFH | Positive | Positive | Neutral | Neutral | |
| A13/A10 | Gear effects evaluation, minimize adverse impacts | Positive | Positive | Neutral | Negative | |
| SUMMARY OF IMPACTS FROM PHYSICAL ENV/EFH ACTIONS – | | Positive | Positive | Neutral | Neutral/Negative | |
| PROTECTED RESOURCES ACTIONS | | | | | | |
| Chain mat rule | Gear modification to address turtle bycatch in the Mid-Atlantic | Neutral | Neutral | Positive | Low Negative | |
| FISHERY AND COMMUNITY ACTIONS | | | | | | |
| None Specific | N/A | N/A | N/A | N/A | N/A | |
| SUMMARY OF IMPACTS OF ALL PAST AND PRESENT ACTIONS ON EACH VEC | | Positive | Positive | Positive/Neutral | Positive/Neutral | |

P = Past action/impact Pr = Presently occurring action/impact

5.6.4.2 Reasonably Foreseeable Future Actions

The impacts of reasonably foreseeable future actions have been considered relative to the VECs in this amendment and are described below and presented in Table 121. Overall, the impacts associated with reasonably foreseeable future actions to the VECs considered in this assessment are neutral and/or considered to be insignificant, as most impacts cannot be predicted at this time.

Scallop Resource

Several reasonably foreseeable future federal fishery management actions may affect the scallop resource. In general, the actions in the foreseeable future are expected to have positive impacts on the scallop resource overall.

- **Amendment 15 to the Scallop FMP**

The Council is considering Amendment 15 to the Scallop FMP and is expected to vote and approve it in June 2010. The primary need for this action is to bring the Scallop FMP in compliance with the re-authorized Magnuson-Stevens Conservation and Management Act (MSA). The Act was reauthorized in 2007 and included several new legal requirements. Foremost, the Act requires that each fishery use annual catch limits (ACLs) to prevent overfishing, including measures to ensure accountability. The Scallop FMP is required to be compliant with these new regulations by 2011 since the stock is not subject to overfishing. Therefore, the primary purpose of this A15 is to consider measures that will implement annual catch limits and accountability measures (AMs) to prevent overfishing, which will have a positive effect on the resource.

A15 is also considering measures that will adjust the current overfishing definition (OFD) to be more compatible with area rotation. Specifically, the new overfishing definition would average fishing mortality over time and not space; area-specific thresholds would be set based on past fishing mortality rates and area rotation policies. This more accurate model should increase the likelihood of successful management and be positive for the scallop resource.

Minor adjustments to the recently-implemented limited access general category management program that would affect the scallop resource are also being considered including an allowance of IFQ rollover; allocation of area-specific IFQ; modifications to the general category possession limit; and adjusting the restriction on maximum quota per fishing platform from 2% to 2.5% of the total general category allocation. These adjustments should increase the efficiency of the fleet and have a positive effect on the resource.

A range of options are being considered to address timing concerns and efficient use of resource for the RSA program which would be indirectly beneficial to the resource. This action will also consider measures to change the scallop fishing year because it is currently out of sync with the framework adjustment process and the timing of when scallop survey data are available for management decisions. Amendment 15 is considering changing the start of the fishing year from March 1 to May 1. It is too early to say what the overall impacts of Amendment 15 will be on each VEC until proposed measures are identified in June 2010, but most under consideration have neutral to positive impacts on the scallop resource.

- Multispecies Framework 44

Framework 44 to the Multispecies FMP will have an impact on the scallop resource because the fishery is dependent on the allocation of yellowtail flounder needed to harvest a certain amount of scallops. According to Amendment 16 to the Multispecies FMP a specific portion of the total ABC for YT will be allocated to the scallop fishery as bycatch. If approved, Framework 44 will allocate 100% of the yellowtail that is needed to harvest the projected scallop catch for 2010. Final action on this framework was made in November 2009 and it is expected to be implemented before May 1, 2010. This action is expected to have neutral impacts on the scallop resource for 2010 since 100% of the YT projected to be needed by the scallop fishery will be allocated. However, in the future (2011 and 2012), FW44 will only allocate 90%, so less effort may be allocated to the scallop fishery in those years; unless other modifications can be made to catch the same amount of scallops and less YT. If overall scallop effort has to be reduced in future actions to prevent exceeding YT allocations, there may be indirect beneficial impacts on the scallop resource as a result of less effort overall.

Physical Environment and EFH

In the spring of 2003, the New England Council initiated a Habitat Omnibus Amendment that will be considered Amendment 14 to the Atlantic Scallop FMP. It will also amend the Northeast Multispecies (Amendment 14), Monkfish (Amendment 4), Herring (Amendment 3) Skate (Amendment 2), Red Crab (Amendment 3) and Atlantic Salmon (Amendment 3) FMPs. This omnibus amendment will fulfill the five year EFH review and revision requirement specified in 50 CFR Section 600.815(a)(10). Although it is not known at this time how the recommendations might change fisheries or fisheries management, the intention is to provide additional habitat and species protection where it is needed.

Phase 1 of the EFH Omnibus has been substantially completed by the Council and includes new EFH designations for all species and life stages under management by the NEFMC, designation (but no management restrictions) of several habitat areas of particular concern (HAPC), an evaluation of the major prey species for species in the NEFMC fishery management units (FMU) and an evaluation of the potential impacts of non-fishing activities on EFH. Although the Council has completed Phase 1, the document and corresponding actions will not be submitted for implementation (and, therefore, no Record of Decision will be filed) until the completion of Phase 2 sometime in 2011. The potential exists for changes to the current suite of management measures to minimize adverse impacts on EFH (see Table 119) and/or additional measures to be implemented. The public will have the opportunity to comment on a combined Phase 1/Phase 2 document before final decisions are made by the Council.

- Amendment 15

Amendment 15 is considering measures to address the essential fish habitat (EFH) closed areas under the Scallop FMP if Phase II of the EFH Amendment is delayed. Specifically, this action would consider making the EFH closed areas consistent under both the Scallop and Groundfish FMP for scallop vessels if Phase II of the EFH Omnibus Amendment is delayed. If this measure is approved, there could be cumulative benefits for the scallop resource if more effort can be used in areas with higher catch per unit of effort.

Protected Species

NMFS recognizes that the specific nature of the interaction between sea turtles and scallop dredge gear remains unknown. The scallop dredge may strike sea turtles as it is fished, and this interaction would remain undocumented. Sea turtles could be taken when the dredge is being fished on the bottom or during haulback. NMFS does not know how the modified gear interacts with sea turtles on the bottom and in the water column. In order to understand the interaction, research is currently being conducted and is expected to continue. This work may provide more information on the interaction between sea turtles and scallop dredge gear in the water.

Currently there is an EIS in development for an Atlantic Trawl Rule to require the use of TEDs in trawl fisheries off the Northeast coast including the scallop trawl fishery. This rule consists of a series of temporal and spatial requirements for TED use. The scoping period has ended for this EIS and it is not clear when decision on this action will be made at this time. It is difficult to determine if there will be cumulative impacts on each VEC because this action is still early in development.

Fishery-related Businesses and Communities

Amendment 15 is considering measures that address capacity in the limited access scallop fishery and improve overall economic performance while considering impacts on various fisheries and fishing communities. Measures to improve the economic efficiency of the limited access fishery, an objective of National Standard 5, will also take into account the importance of fishery resources to fishing communities to (A) provide for the sustained participation of such communities, and (B) to the extent practicable, minimize adverse economic impacts on such communities (National Standard 8). This action will also include measures to minimize costs and unnecessary duplication (National Standard 7). There is some trepidation that stacking and leasing will lead to consolidation and loss of jobs, which would be a negative impact on businesses and communities.

Amendment 15 is considering implementation of Community Fishing Associations in the LAGC fishery. The establishment of CFAs could have positive impacts on the participants by allowing fishermen to combine their allocations and to fish using fewer vessels in order to reduce fishing costs. This will provide an opportunity for fishermen to establish and benefit from an economically viable operation when the allocations of individual vessels are too small to make scallop fishing profitable. Under these conditions, general category scallop TAC is likely to be fully utilized by qualifiers with positive impacts on revenues and producer and consumer benefits.

Table 121 – Summary of effects from reasonably foreseeable future actions

| Action | Description | Impacts on Scallops | Impacts on Physical Env. and EFH | Impacts on Protected Species | Impacts on Fishery and Communities | |
|---|--|-----------------------------|-------------------------------------|--|--|--|
| Scallop Actions | | | | | | |
| Amendment 15 | Implement ACLs, adjust OFD, address overcapacity in the LA fishery | Neutral to positive | Neutral to positive | Neutral | Potentially negative to potentially positive | |
| SUMMARY OF IMPACTS FROM SCALLOP ACTIONS- | | Neutral to Positive | Neutral to positive | Neutral to potentially positive | Neutral/potentially positive | |
| Physical Environment and EFH Actions | | | | | | |
| Phase I EFH Omnibus | Review EFH designations, consider HAPC alternatives, describe prey species, evaluate non-fishing impacts | Positive | Positive | Neutral | Neutral | |
| Phase II EFH Omnibus | Review gear effects and minimize adverse impacts | Potentially neutral | Positive | Potentially Neutral | Potentially positive or negative | |
| A15 –Measure to address inconsistent EFH boundaries | Make EFH closed areas consistent under both Scallop and Groundfish FMP for scallop vessels if Phase II of the EFH Omnibus Amendment is delayed | Potentially positive | Potentially positive | Potentially positive | Positive | |
| SUMMARY OF IMPACTS FROM PHYSICAL ENV/EFH ACTIONS – | | Positive | Positive | Neutral | Neutral | |
| Protected Resources Actions | | | | | | |
| Sea turtle strategy | NMFS program to address incidental capture of turtles in state and federal fisheries | No Impact | No Impact | Positive | Low Negative | |
| Atlantic take reduction team | Requirements to reduce interaction with marine mammals | No Impact | No Impact | Positive | Low Negative | |
| Use of TEDS in trawl gear | Action under consideration that could require the use of TEDs in trawl fisheries off the Northeast coast including the scallop trawl fishery | No Impact | No Impact | Positive | Potentially negative to potentially positive | |
| SUMMARY OF IMPACTS FROM PROTECTED RESOURCES ACTIONS | | No Impact | No Impact | Positive | Low Negative | |
| Fishery Community Actions | | | | | | |
| A15 - Stacking and Leasing of LA Permits | Reduce excess capacity in the LA fleet by allowing vessels to stack and lease permits. | Neutral to positive | Neutral to positive | Neutral to Positive | Potentially positive or negative | |
| A15 - Implementation of Community Fishing Associations (CFAs) | Allow non-profit organizations to hold quota on behalf of represented communities and allow fishermen to lease and fish the quota. | No Impact | No Impact | No Impact | Positive for vessels in CFAs | |
| SUMMARY OF IMPACTS OF ALL FUTURE ACTIONS ON EACH VEC | | Potentially Positive | Neutral/Potentially Positive | Neutral/Potentially Positive | Neutral | |

5.6.5 Non-fishing impacts

The impacts of the following non-fishing activities are discussed in relation to scallop EFH in Section 4.2 of this document. Although they are presented in relation to the physical environment and EFH, the non-fishing impacts relate to all VECs identified in this amendment and are considered in this analysis (Table 122). Other non-fishing impacts that are important for consideration are also discussed below. The non-fishing impacts discussed in this section include:

- Vessel operations and marine transportation;
- Dredge and fill activities;
- Pollution/water quality;
- Agricultural and silvicultural/timber harvest runoff;
- Pesticide application;
- Water intake structures/discharge plumes;
- Loss of coastal wetland;
- Road building and maintenance;
- Flood control/shoreline stabilization;
- Utility lines/cables/pipeline installation;
- Oil and gas exploration/development/production;
- Introduction of exotic species;
- Aquaculture operations;
- Marine mining; and
- Other potential sources.

Low and mid-frequency sonar may pose an additional threat to protected species. According to the June 2006 National Marine Fisheries Service's Biological Opinion (BO), issued under Section 7(a)(2) of the Endangered Species Act, regarding the effects of the U.S. Navy's proposed 2006 Rim of the Pacific Naval Exercise and the Permits, Education and Conservation Division's proposal to issue an incidental harassment authorization (IHA) for exercises associated with endangered and threatened species, acoustic systems are becoming increasingly implicated in marine mammal strandings. Citing the Joint Interim Report on the Bahamas Marine Mammal Stranding Event of 15–16 March 2000, DOC and the Department of the Navy (DON), 2001, the document discusses that mass strandings in particular have been linked to mid-frequency sonar.

Summarizing various theories associated with the impacts of low and mid-frequency sonar, the BO states that marine mammals become disoriented or that the sound forces them to surface too quickly, which may cause symptoms similar to decompression sickness, or that they are physically injured by the sound pressure. The biological mechanisms for effects that lead to strandings must be determined through scientific research, according to the NMFS document, which also provides an extensive overview of the issue. The Biological Opinion, the IHA permit issued on July 2006 and other related documents are available through NMFS at <http://www.nmfs.noaa.gov/pr/permits/incidental.htm#applications>.

More recent information on the impacts of low and mid-frequency sonar is provided in a request from the U.S. Navy for an authorization under the Marine Mammal Protection Act (MMPA) to take marine mammals by harassment, incidental to conducting operations of Surveillance Towed Array Sensor System (SURTASS) Low Frequency Active (LFA) sonar over a five-year period (72 FR 37404, July 9, 2007).

Federal legislation being debated in Congress could override a lawsuit settlement agreement and exempt the military from the “harassment” provisions of the MMPA, easing the restrictions that now limit the deployment of low frequency sonar by the U.S. Navy.

The **National Offshore Aquaculture Act** is proposed to provide the necessary authority to the Secretary of Commerce to establish and implement a regulatory system for aquaculture in Federal waters. The bill would: authorize the Secretary to issue offshore aquaculture permits and establish environmental requirements where existing requirements under current law are inadequate; exempt permitted offshore aquaculture from legal definitions of fishing that restrict size, season, and harvest methods; authorize the establishment of a research and development program in support of offshore aquaculture; require the Secretary to work with other Federal agencies to develop and implement a streamlined and coordinated permitting process for aquaculture in the EEZ; authorize to be appropriated “such sums as may be necessary” to carry out this Act; and provide enforcement for the Act.

In addition, one way the United States plans to meet its present and future energy demands is through the importation of **Liquefied Natural Gas (LNG)**. Currently, the United States has four onshore LNG import terminals in coastal port areas: Everett, Massachusetts, Cove Point, Maryland, Elba Island, Georgia, and Lake Charles, Louisiana. These four existing import terminals have been around since the 1970s. There is an additional onshore import facility located in Penuelas, Puerto Rico. This facility began importing liquefied natural gas in August 2000.

Due to potential hazards associated with onshore LNG terminals, many state and local governments have opposed the construction of any new onshore LNG terminals. For example, there have been numerous proposals for onshore LNG terminals along the coast of Maine. Most of these proposals (Harpwell, Hope Island, Cousins Island, Sears Island, and Pleasant Point) have either been rejected by local voters or withdrawn. Most opponents to onshore LNG terminals maintain that LNG is unsafe, harms the environment, and disrupts commercial fishing. Companies, like ChevronTexaco and Shell, are now moving towards developing LNG terminals offshore on the outer continental shelf.

In April 2005, Gulf Gateway Energy Bridge (formerly known as El Paso Energy Bridge) became the world’s first offshore LNG terminal to begin operation. Gulf Gateway is located 116 miles offshore of the Louisiana coastline. To date, including Gulf Gateway, there are three offshore LNG projects that have been approved. These three LNG terminals are all located in the Gulf of Mexico. Port Pelican’s (ChevronTexaco) proposed site is located thirty-six miles off the Louisiana coastline, while Gulf Landing’s (Shell) is located thirty-eight miles offshore of Louisiana.

Nationally, seven proposed offshore LNG terminals are currently under review, including a potential terminal to be built offshore of Gloucester, Massachusetts. The other projects under review include: Cabrillo Port (fourteen miles offshore of Ventura County, California), Clearwater Port (fourteen miles offshore of southern California), Main Pass Energy Hub (offshore of Alabama, Louisiana, and Mississippi), Compass Port (offshore of Alabama and Mississippi), Pearl Crossing (forty-one miles offshore of Louisiana), and Beacon Port (offshore of Louisiana). The application for the proposed offshore LNG terminal off the coast of Gloucester (Gateway and Neptune projects) have been approved.

The two primary effects on the commercial and recreational fishing industries from offshore LNG terminals are the indirect impacts of displaced fishing effort and the potential for adverse impacts on fish stocks resulting from adverse impacts on EFH due to the vaporization process, where LNG is converted from a liquid to gaseous state. The degree to which the scallop fishery in particular may be impacted can not be fully understood until an LNG terminal has completed the sitting process. However, a recent EIS filed by the U.S. Coast Guard and the Maritime Administration on the Main Pass Energy Hub plan indicates that the “open-loop” vaporization process, which pushes seawater through a radiator-type structure that warms and vaporizes the super-cooled LNG and discharges that water back into the sea, would affect fish eggs and larvae as well as other zooplankton and phytoplankton. The resulting impacts are limited to the water discharge plumes, and while no firm data on the size of such plumes have been provided, the report states that the effects will not be serious or long lasting. The report concludes that none of the potential impacts on EFH would be expected to result in population-level impacts or a reduction in biomass for any stocks.

According to preliminary documents filed with the U.S. Coast Guard and the Federal Energy Regulatory Commission, displacement of fishing effort would be limited to a less than one nautical mile radius circle that would be closed to all fishing and recreational activities during the offloading of LNG. Additionally, a security zone of less than one quarter of a nautical mile would be maintained around the LNG tankers as they transit to and from the offload facility. While these closures may displace a limited amount of fishing effort, the total amount of fishable bottom impacted is expected to be minimal, and the effort displaced would not likely have an adverse impact on neighboring, or any other, fishing areas.

Onshore LNG facilities are currently being proposed or planned for construction in Pleasant Point, ME; Somerset, MA; Providence, RI; Long Island Sound, NY; Logan Township, NJ; Philadelphia, PA; and an expansion of an existing facility in Cove Point, MD.

Depending on the specific location and type of LNG facility, a range of impacts to fisheries and/or fisheries habitat may result from both construction and operation of terminals. Due to the large size of LNG tankers, dredging may need to occur to access onshore terminals. Dredging can result in direct loss of fish and/or shellfish habitat and can elevate levels of suspended sediment within the water column. As with other dredging, suspended sediments can impact various life stages of fish and shellfish. Further, the construction of pipelines and fill associated with site construction can have adverse impacts on inter-tidal habitats and salt marshes in the area.

Although only two offshore wind energy projects have formally been proposed in the northeast region, at least 20 other separate projects may be proposed in the near future. Cape Wind Associates (CWA) proposes to construct a wind farm on Horseshoe Shoal, located between Cape Cod and Nantucket in Nantucket Sound, Massachusetts. A second project is proposed by the Long Island Power Authority (LIPA) off of Long Island, New York. The CWA project would have 130 wind turbines located as close as 4.1 miles offshore of Cape Cod in an area of approximately 24 square miles, with the turbines being placed at a minimum of 1/3 mile apart. The turbines will be interconnected by cables, which will relay the energy to shore to the power grid. If approved, vessels from southern New England may experience an increase in costs associated with having to steam around the wind farms on their way to and from fishing grounds on Georges Bank.

The Army Corps of Engineers has developed a DEIS and has completed a scoping process for the proposed Cape Wind Associates (CWA) project on Horseshoe Shoal. If constructed, the turbines would preempt other bottom uses in an area similar to oil and natural gas leases. The potential impacts associated with the CWA offshore wind energy project include the construction, operation and removal of turbine platforms and transmission cables; thermal and vibration impacts; and changes to species assemblages within the area from the introduction of vertical structures. A thorough analysis of the effects of these impacts on fishing has not yet been conducted, but data indicate that there would not be a substantial impact on the scallop fishery as there is little scallop fishing activity in this area. While EFH may be adversely impacted in the vicinity of the wind turbines, the extent of this proposal is not sufficient to have any population-level impacts on resource biomass or health.

Non-fishing activities pose a risk to EFH for all species as well as to each scallop life stage's EFH. Many of the non-fishing impacts are unquantifiable, but are likely negative. In general, the greatest potential for adverse impacts to scallops and scallop EFH occurs in close proximity to the coast where human-induced disturbances, like pollution and dredging activities, are occurring. Because inshore and coastal areas support essential egg, larval and juvenile scallop habitats, it is likely that the potential threats to inshore and coastal habitats are of greater importance to the species than threats to offshore habitats. It is also likely that these inshore activities will continue to grow in importance in the future. Activities of concern include: chemical threats; sewage; changes in water temperature, salinity and dissolved oxygen; suspended sediment and activities that involve dredging and the disposal of dredged material.

Impacts of non-fishing activities on all the VECs that were considered in this EIS were evaluated to be low to moderately negative.

Table 122 – Summary of effects from non-fishing activities

| Action | Description | Impacts on Scallops | Impacts on Physical Env and EFH | Impacts on Protected Species | Impacts on Fishery and Communities |
|---|--|--|--|--|--|
| P, Pr, RFFA Vessel operations, marine transportation | Expansion of port facilities, vessel operations and recreational marinas | No Impact at Site | Potentially Negative Inshore – may lead to destruction of habitat | Negative at Site – inshore species impacted by reduced water quality and haul out activity | Potentially Negative if loss of fishing opportunities occur |
| P, Pr, RFFA Beach nourishment, dredge and fill activities | Offshore mining of sand for beaches Placement of sand to nourish beach shorelines | Negative at Site – entrainment, sedimentation and turbidity impacts to fish in area in and around borrow site Negative at Site – may displace fish, remove benthic prey and increase mortality of early life stages | Negative at Site – may lead to destruction of habitat in and around borrow site Negative at Site – may result in burial of structures that serve as foraging or shelter sites | Negative at Site – mining activity increases noise and reduces water quality Negative at Site – turtles susceptible to impacts from beach nourishment | Negative at Site – potential loss of fishing opportunities Positive at Site – restoration of an eroding shore may protect or restore recreational beaches |
| P, Pr, RFFA Pollution/water quality | Land runoff, precipitation, atmospheric deposition, seepage, or hydrologic modification Point-source discharges | Negative at Site – impacts primarily inshore | Negative at Site – impacts primarily inshore, leads to destruction of habitat and EFH | Negative at Site – inshore species impacted by impaired biological food chain and poor water quality due to nutrient loading | Negative at Site – potential loss of fishing opportunities, human health issues |
| P, Pr, RFFA Agriculture and timber harvest runoff | Nutrients applied to agriculture land are introduced into aquatic systems | Negative at Site – impacts primarily inshore | Negative at Site – impacts primarily inshore, leads to destruction of habitat | Negative at Site – inshore species impacted by impaired biological food chain and poor water quality due to nutrient loading | Negative at Site – potential loss of fishing opportunities |
| P, Pr, RFFA Pesticide application | Substances that are designed to repel, kill, or regulate the growth of undesirable biological organisms | Negative at Site – impacts primarily inshore | Negative at Site – impacts primarily inshore, leads to destruction of habitat and EFH | Negative at Site – inshore species impacted by impaired biological food chain and poor water quality due to nutrient loading | Negative at Site – potential loss of fishing opportunities, human health issues |

| | | | | | |
|--|--|------------------|---|---|------------------|
| P, Pr, RFFA Water intake structures/discharge plumes | Withdrawal of estuarine and marine waters by water intake structures | No Impact | Potentially Low Negative at Site - discharge plumes may affect local oceanographic conditions | Negative at Site – intake structures can entrap protected species | No Impact |
|--|--|------------------|---|---|------------------|

| Action | Description | Impacts on Scallops | Impacts on Physical Env and EFH | Impacts on Protected Species | Impacts on Fishery and Communities |
|--|---|---|--|--|---|
| P, Pr, RFFA Loss of coastal wetland | Urban growth and development Development activities within watersheds and in coastal marine areas | Potentially Low Negative at Site – may result in habitat degradation | Potentially Low Negative at Site – may result in habitat degradation | Negative at Site – results in habitat loss for fish species that represent prey items and may result on habitat degradation potentially affecting nesting sites | Potentially Low Negative at Site – may result in biomass declines if spawning, health, or mortality are affected |
| P, Pr, RFFA Road building and maintenance | Paved and dirt roads Poorly surfaced roads can substantially increase surface erosion | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data |
| P, Pr, RFFA Flood control/shoreline stabilization | Protection of riverine and estuarine communities from flooding events Dikes, levees, ditches, or other water controls | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data |
| P, Pr, RFFA Utility lines/cables/pipeline installation | Dredging of wetlands, coastal, port and harbor areas for port maintenance | Negative at Site – impacts primarily inshore | Negative at Site – impacts primarily inshore, leads to destruction of habitat | Negative at Site – dredging activity increases noise and may lead to mortality or injury of protected species | Negative – potential loss of fishing opportunities |
| P, Pr, RFFA Oil and gas exploration/development | General exploration and development, as well as hydrocarbon spills associated with the transportation, loading and offloading of oil and gas products | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data |
| P, Pr, RFFA Exotic Species | Introduction of non-indigenous and reared species | Potentially Negative - while no direct evidence exists, it is likely that invasive species may affect overall ecosystem health and the biomass of marketable species | Potentially Negative - exotic species (ex., tunicates) found to adversely impact EFH and displace marketable and forage species | Potentially Negative – ecosystem effects of non-native species | Potentially Negative - while no direct evidence exists, it is likely that invasive species may affect overall ecosystem health and the biomass of marketable species |

| | | | | | |
|---|---|--|--|--|--|
| P, Pr, RFFA Marine Mining | Offshore mining as well the mining of gravel from beaches | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data | Potentially negative – no data |
| P, Pr, RFFA Low and mid-Frequency Sonar | Used in military exercises; considered a potential source of serious injury and mortality | Potentially negative – may negatively impact species in immediate vicinity of exercises using sonar | No impact | Potentially Negative - literature documents cetacean mortalities in vicinity of exercises using sonar | Potentially negative – potential loss of fishing opportunities, but exercises related to national security |
| RFFA National Offshore Aquaculture Act of 2005 (currently proposed) | Legislation would grant DOC authority to issue permits for offshore aquaculture in federal waters | Potentially negative - may negatively impact species by reducing water quality near aquaculture sites | Potentially negative - may negatively impact habitat by reducing water quality near aquaculture sites | Potentially negative - may be negative if activities result in interactions with protected species | Potentially neutral -may be positive for communities near sites; negative if prices of commercially harvested fish are impacted |
| RFFA Liquefied Natural Gas (LNG) terminals - several LNG terminals are proposed, including RI, NY, NJ and DE (w/in 5 years) | Transportation of natural gas via tanker to terminals located offshore and onshore | Potentially Negative – short-term disruption of habitat during construction could negatively impact organisms | Negative - habitat negatively impacted during construction phase and when vessels anchor to offload gas | Negative – may disrupt protected species during construction through increased noise and poor water quality | Negative - security zones around LNG facilities restrict access to fishing areas Positive – location of LNG facilities offshore may protect or improve communities |
| RFFA Offshore Wind Energy Facilities - several facilities proposed from ME through NC, including off the coast of NY/NJ and VA (w/in 5 years) | Construction of wind turbines to harness electrical power | Potentially Negative – short-term disruption of habitat during construction could negatively impact organisms | Negative – habitat negatively impacted during construction phase | Potentially Negative – may disrupt protected species during construction through increased noise and poor water quality | Negative – if fishing activity is precluded in area where turbines are located Negative – aesthetic impacts Positive – renewable clean energy resource |
| SUMMARY OF IMPACTS OF NON-FISHING ACTIVITIES – Overall, impacts are variable but greatest on the physical environment and EFH, but found to be low to moderately adverse; lack of data precludes more in-depth analysis of impacts on other VECs | | Potentially Negative | Potentially Negative | Potentially negative | Potentially Negative |

5.6.6 Cumulative Effects Analysis

Below is a description of the expected cumulative effects of the measures under consideration for Framework 21. First is a summary paragraph related to the direct and indirect impacts on each VEC. This description is based on the information provided in Table 123, a summary of the direct and indirect impacts of the measures under consideration on each VEC (scallop resource, EFH, protected resource, fishery related businesses and communities and other fisheries). The proposed action is highlighted in that table in grey.

For each VEC, there is also a summary paragraph describing the cumulative effects of the measures under consideration in terms of how the past, present and reasonably foreseeable future actions impact each VEC, as well as non-fishing activities and direct/indirect impacts of Framework 21. This discussion for each VEC is based on information summarized in previous sections and tables on the past, present, and reasonably foreseeable future actions, non-fishing impacts, and direct and indirect impacts of Framework 21. Lastly, Section 5.6.6.1 is a summary of the cumulative effects of the proposed action only, in terms of the magnitude and extent of cumulative impacts on a VEC-by-VEC basis in combination with other actions (past, present, and reasonably foreseeable future actions) as well as the effects from non-fishing actions.

Scallop Resource

Summary of direct and indirect impacts on the scallop resource

In general, most alternatives under consideration have neutral to positive indirect/direct impacts on the scallop resource when compared to the No Action. Overall allocation alternatives under consideration for 2010 are lower than recent years because of a reduction in access area trips (from five to four) and overall fishing mortality needs to be reduced since preliminary results suggest it has been higher than projected in recent year. The two scenarios that do not close the Channel have higher LPUE and lower area swept in the near-term, which would positively affect the resource. Projected exploitable biomass is similar overall when comparing the various scenarios, but does vary by area. Biomass in open areas is lowest under alternatives that close the Channel and the No Action alternative. Compared to the No Action alternative, the proposed action (NCLF20) has higher LPUE averages for both open and access areas; thus, lower impacts for the higher yield. The No Action alternative could have a negative effect on the resource because F would be higher in the Elephant Trunk area than the biomass there can support, it also has the highest overall F rate projection. Establishing a new rotational area in the Channel would be beneficial to the resource there, but could have negative impacts on the resource outside of the closure as effort is shifted and increased elsewhere. In general the measures for general category vessels related to Framework 21 are expected to have positive to neutral impacts on the scallop resource.

The alternatives to minimize impacts of incidental take of sea turtles for turtles could have a wide range of impacts on the resource depending on how fishing behavior changes in accordance with the measures. The alternatives with seasonal closures in Delmarva for September - October are potentially beneficial for the resource if effort shifts to months in which meat weights are higher, because reducing effort in the area during months of lower meat yields will reduce mortality. A reduction in possession limits in either Elephant Trunk or Delmarva would also be a

positive impact on the resource because lower effort levels would presumably cause an increase in stock biomass.

The alternatives to improve the observer set-aside program would not have direct impacts on the scallop resource, but could potentially have indirect positive impacts from better monitoring coverage leading to better management.

Summary of cumulative effects on the scallop resource

Overall, the cumulative effects on the scallop resource are neutral to positive. In terms of past and present actions such as the Scallop FMP, Amendment 4, and Amendments 10 and 11, there have been positive effects on the scallop resource. Other past EFH actions and actions in other FMPs have had neutral or positive effects as well (Table 120). In terms of reasonably foreseeable future actions, Amendment 15 is expected to have positive impacts on the scallop resource. There are also several EFH, protected resources and other fishery-related actions that are expected to have either no impact or potentially positive impacts. Therefore, the overall effects of reasonably foreseeable future actions on the scallop resource are potentially positive (Table 121). In addition, the effects of non-fishing activities on the scallop resource are mostly potentially negative (Table 122). Lastly, the direct and indirect effects of the measures under consideration in Framework 21 are expected to have positive to neutral impacts on the scallop resource (Table 123). Thus, when the direct and indirect effects of the alternatives are considered in combination with all other actions (*i.e.*, past, present, and reasonably foreseeable future actions), the cumulative effects on the scallop resource are likely to be neutral to positive.

Physical Environment / EFH

Summary of direct and indirect impacts on EFH

The potential impacts on EFH from each of the proposed measures are described within Section 5.2. Although scallop dredges have been shown to be associated with adverse impacts to some types of bottom habitat (NEFMC 2003), no measure contained in this Framework is likely to increase adverse impacts to areas designated EFH relative to the No Action alternative, and the net impact is likely to be neutral to marginally positive. Therefore, measures to further mitigate or minimize adverse effects on EFH, beyond those protections established under Amendment 10 to the Atlantic Sea Scallop FMP, are not necessary.

Summary of cumulative effects on EFH

Overall, the cumulative effects on the physical environment/EFH are neutral to positive. In terms of past and present actions such as the Scallop FMP, Amendment 4, and Amendments 10 and 11, there have been positive effects on EFH. Other past EFH actions and actions in other FMPs have had mostly positive effects as well (Table 120). In terms of reasonably foreseeable future actions, there are several EFH actions that may have potentially positive effects on EFH. In addition, there are several reasonably foreseeable future scallop and other fishery-related actions that are expected to have no impact on EFH. Therefore, the overall effects of reasonably foreseeable future actions on EFH are neutral to potentially positive (Table 121). In addition, the effects of non-fishing activities on EFH are negative (Table 122). Lastly, the direct and indirect effects of the measures under consideration in Framework 21 are expected to have mostly neutral impacts on EFH. Thus, when the direct and indirect effects of the alternatives are

considered in combination with all other actions (*i.e.*, past, present, and reasonably foreseeable future actions), the cumulative effects on the physical environment/EFH are likely to be neutral to positive.

Protected Resources

Summary of direct and indirect impacts on protected resources

Most alternatives under consideration in Framework 21 have neutral or potentially positive direct impacts on threatened and endangered sea turtles when compared to No Action. The specifications for 2010 include considerably less DAS than what was allocated in Framework 19 for 2008 and 2009, so cumulative impacts for allocation scenarios are expected to be positive relative to recent years. Access trips generally result in overall effort reductions and at best could be positive relative to turtle interactions because of reduced area swept. Alternatives involving closure of an area in the Great South Channel could result in effort shifts to the Mid-Atlantic and greater area swept scenarios, which could impact turtles negatively. However after the Channel reopens in 2013 LPUE is higher and area swept is lower, so impacts on protected resources would be reduced then.

In terms of the set-asides for observers and research there are indirect beneficial impacts on protected resources if that set-aside is used to learn more about the interactions of the scallop fishery and protected resources. Numerous turtle-related research projects have been funded through the Scallop RSA program to date, and that topic is a high priority for future research proposals. In addition, much of the information known about when and where interactions have occurred are from data collected through the observer set-aside program. So both these programs are expected to have continued indirect benefits on protected resources.

If the yellowtail flounder bycatch TAC is reached in Nantucket Lightship, limited access vessels are permitted to use access area trips at a compensation rate in open areas. Analyses suggest that the compensation for Nantucket Lightship in 2010 would be 5.77 DAS. If the area closes early those DAS could be used in open areas in the Mid-Atlantic, especially if southern vessels do not get a chance to use their trip in the NLCA. Those additional DAS could have negative impacts on protected resources if fished during the time of year when turtles are present, but the amount of additional effort is limited.

The seasonal closure in ETA that will rollover under this framework (September 1-October 31) is expected to have positive impacts on protected resources. Preliminary analyses suggest that effort in ETA from the September and October closure has shifted into adjacent months. Specifically, access area trips not taken in September and October were taken mostly in August, November and December. Vessels have not increased open area effort during Sept and Oct as a result of the seasonal closure. It is difficult to say whether increased fishing in August has different impacts on turtles compared to Sept and Oct since turtles can be present during all three months. But any effort shifted after October is expected to have beneficial impacts because turtle takes have not occurred in that area after October.

The specific impacts on protected resources from each of the proposed measures are described within Section 5.3.

Summary of cumulative effects on protected resources

Sea turtles, have been, are, and will continue to be, negatively impacted by a variety of past, present, and reasonably foreseeable future activities which may be affecting the recovery of the species. The extent to which this may be happening cannot be quantified at this time but is potentially negative. As noted above, however, the measures presented in this action are unlikely to alter the impacts that occur as a result of both fishing and non-fishing activities but may positively impact some currently negative effects by instituting a limited access management program. **Overall, the cumulative effects on protected resources are neutral to potentially positive.**

In terms of past and present actions, there have been positive to neutral effects on protected resources (Table 120). In terms of reasonably foreseeable future actions, there are several protected resource related actions that may have positive effects on protected resources. In addition, there are several reasonably foreseeable future scallop and other fishery-related actions that are expected to have potentially positive impacts on protected resources. The activities that are negatively impacting sea turtles will continue to be addressed through fishery management plans as well as by the agency to ensure sea turtles are protected. One of the goals of NMFS's Sea Turtle Strategy is to develop and implement plans to reduce takes of sea turtles in Atlantic Ocean and Gulf of Mexico fisheries. Implementation of these plans will have a net beneficial impact on sea turtle species. NMFS also intends to continue outreach efforts to educate fishermen regarding sea turtles. Future anticipated research will likely enhance knowledge concerning the nature of the interactions between sea turtles and sea scallop dredge gear, potentially leading to the implementation of alternative management measures that may confer benefits to animals in areas where overlap with the fishery occurs. Therefore, the overall effects of reasonably foreseeable future actions on protected resources are neutral to potentially positive (Table 121). In addition, the effects of non-fishing activities on protected resources are potentially negative (Table 122).

Lastly, the direct and indirect effects of the measures under consideration in Framework 21 are expected to have mostly potentially positive impacts on protected resources (Table 123). Thus, when the direct and indirect effects of the alternatives are considered in combination with other actions (*i.e.*, past, present, and reasonably foreseeable future actions), the cumulative effects on protected resource are likely to be neutral to potentially positive.

Non-Target Species

None of the measures included in the proposed action are expected to have significant impacts on non-target species. This action has considered the potential impacts of the proposed action on non-target species (small scallops as well as finfish and other bycatch species) and in general, all the measures under consideration have positive or neutral impacts on non-target species. Many of the measures considered in this action concentrate fishing effort in areas with high scallop catch per-unit-of-effort, which reduces fishing time having positive impacts on bycatch rates.

The combined effects of past actions in the scallop FMP have decreased effort and improved habitat protection, which benefits non-target species. In addition, current regulations continue to manage for sustainable stocks, thus controlling effort on direct and discard/bycatch species.

Finally, future actions are anticipated to continue rebuilding and thus limit the take of discards/bycatch in the scallop fishery. Overall, continued management of directed stocks will also control catch of non-target species.

Fishery-Related Businesses and Communities

Most alternatives under consideration in Framework 21 have neutral or potentially positive impacts on fishery-related businesses and communities compared to No Action. The aggregate economic impacts of the proposed measures and other alternatives including access area allocations, proposed Great South Channel area closure, open area DAS allocations, general category measures, and RPM alternatives are analyzed in Section 5.4 relative to No Action. The combined impacts of the proposed area rotation and DAS measures are expected to be negative in the short term compared to 2009 and positive in the long-term on fishery related businesses and communities.

In the short-term (i.e. fishing year 2010), landings, revenues and economic benefits for the proposed action (NCLF24) could fall short of landings and economic benefits for the ‘No Action’ alternative. The total economic benefits for the proposed action will be \$5 million lower than no action benefits in 2010 (Table 108). The proposed action benefits will be lower than the no action benefits by \$5 in the near-term from 2010-2016 as well (Table 108 and Table 109).

Table 78 indicates that over the long-term (2010-2023) the cumulative landings with No Action will be 17 million pounds less than the landings expected with the proposed action, resulting in lower economic benefits over the long-term compared to the proposed measures. Over the long-term from 2010 to 2023, the proposed action will generate \$53 million (at 7% discount rate) to \$81 million (at 3% discount rate) more revenues than the no action alternative. The proposed action will increase consumer benefits in the long-term (2010-2023) compared to no action (Table 105 and Table 106). The producer benefits (surplus) will increase by \$49 million to \$75 million with the proposed measures compared to no action. The proposed action will have positive long-term economic impacts and will increase the present value of total economic benefits to the nation by \$54 million (at 7% discount rate) to \$81 million (at 3% discount rate) compared to no action benefits (Table 79).

The economic impacts of the DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010 would be positive for the general category limited access fishery since it could result in short-term geographic redistribution of landings to ports that are predominantly LAGC. The economic impacts on the limited access vessels will be negative, however, since the revenues of these vessels would be reduced by 5% due to the reductions in open area DAS if general category was allocated 10% of the scallop TAC. However a quarterly hard-TAC for the transition period to limited entry could bring about derby fishing and its attendant negative impacts, but the quarterly nature is intended to lessen those impacts. The NGOM hard-TAC would provide a marginal source of revenue for permitted vessels until the resource status can be determined, which would be positive for fishing communities in that area. The estimate of catch from LA incidental permits would have positive impacts on vessels that do not qualify for a LAGC permit because it would allow them to earn some income from scallops under the incidental permit and provide increased flexibility. Finally the alternative to allow leasing of

partial general category IFQ allocations would increase flexibility and efficiency in the LAGC fleet and have positive impacts on related businesses and communities. Therefore, direct and indirect impacts of the proposed measures and alternatives are expected to be positive on fishery related businesses and their communities compared to No Action.

The economic impacts of the alternatives to minimize impacts of incidental take of sea turtles on landings and revenues are provided in Section 5.3.1 of this document. The proposed action is a combination of the Delmarva closure in September and October with a limit on the maximum number of trips (at two per vessel) that can be taken in the Mid-Atlantic areas from June 15 to August 31. Because the effort is shifted to a relatively less productive season, total fleet trip costs are expected to increase slightly by \$40,095, or by less than 0.2%. Since there is no change in the possession limit, the trips that are shifted from this season are expected to be taken outside of the turtle window, without a loss in total revenue as long as these measures do not have a significant impact on prices. The proposed measures will lead to a change in the seasonal composition of landings and therefore could lead to a change in prices. In general, the reduction in landings during the turtle window is expected to increase prices during the period from July 15 to October 31, but expected to reduce prices for months outside of the turtle window. The proposed action is expected to minimize the effort shift from the turtle window compared to the other alternatives considered by the Council, thus is not expected to have a significant impact on prices, revenues and total economic benefits.

Most of the other measures in this action will not change economic impacts for the scallop fishery, or are expected to have indirect economic benefits.

Summary of cumulative effects on fishery-related businesses and communities

Overall, the cumulative effects on the fishery-related businesses and communities are neutral to potentially positive. In terms of past and present actions such as the Scallop FMP, Amendment 4, and Amendment 10, there have been positive effects on the scallop fishing community. Other past EFH actions and actions in other FMPs have had neutral or low negative effects (Table 120). In terms of reasonably foreseeable future actions, there are several scallop related actions that are expected to have positive impacts overall. There are also several EFH, protected resources and other fishery-related actions that are expected to have potentially positive or low negative impacts on fishery-related businesses and communities. Therefore, the overall effects of reasonably foreseeable future actions on the fishery-related businesses and communities are neutral (Table 121). In addition, the effects of non-fishing activities on the fishery-related businesses and communities are mostly potentially negative (Table 122). Lastly, the direct and indirect effects of the measures under consideration in Framework 21 are expected to have neutral to potentially positive impacts on the fishery-related businesses and communities overall (Table 123). Thus, when the direct and indirect effects of the alternatives are considered in combination with other actions (*i.e.*, past, present, and reasonably foreseeable future actions), the cumulative effects on fishery-related businesses and communities are likely to be neutral to potentially positive.

Table 123 – Cumulative effects of alternatives under consideration on the four Framework 21 VECs (proposed action is in bold)

| Section | Alternative Name | Scallop Resource | Phys. Env / EFH | Protected Resources | Fishery-related businesses and communities |
|---------|---|-----------------------------------|-----------------------------------|-------------------------------------|---|
| 2.2.1 | No Action | Low negative | Neutral | Neutral to potentially low negative | Low negative |
| 2.2.2 | No Action if IFQ program is not fully implemented by March 1, 2010 | No impact | No impact | Neutral | Low positive for LAGC fleet, low negative for LA fleet |
| 2.2.3 | Measures in effect March 1, 2010 until FW21 | No impact | No impact | No impact | No impact |
| 2.4 | Framework allocation Scenarios | | | | |
| 2.4 | NCLF20 | Low positive in short-term | Low positive in short-term | Low positive | Negative in short-term (2010), positive in long-term |
| 2.4 | NCLF24 – Proposed Action | Low positive in short-term | Low positive in short-term | Low positive | Low negative in short-term (2010), low positive in long-term |
| 2.4 | CLF20 | High negative | High negative | Low negative | Low positive in short-term, low positive in long-term |
| 2.4 | CLF18 | Low negative in short-term | Low negative in short-term | Low negative | Low positive in short-term, positive in long-term |
| 2.5.1.1 | Adjustments when YTF catch reaches 10% TAC limit | Potentially negative | Potentially negative | Potentially negative | No impact |
| 2.5.1.4 | DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010 | No impact | No impact | No impact | Positive for LAGC fleet, negative for the limited access fleet |
| 2.6 | Measures for General Category Vessels | | | | |
| 2.6.1 | Measures if IFQ program is delayed | No impact | No impact | Neutral | Positive for LAGC fleet in short-term |
| 2.6.1.1 | Quarterly hard-TAC for transition period to limited entry | No impact | No impact | Potentially low positive | Potentially low positive compared to annual TAC |
| 2.6.2.1 | Yellowtail flounder bycatch TAC | Low positive | Low positive | Potentially negative | Positive |
| 2.6.4 | NGOM hard-TAC | Neutral | Neutral | No Impact | Low positive |
| 2.6.5 | Estimate of catch from LA incidental permits | No impact | No impact | No impact | Low positive |

| | | | | | |
|-----------|---|--|--|----------------------|--|
| 2.6.6 | Allow leasing of partial general category IFQ allocations during the fishing year | No impact | No impact | No impact | Low positive |
| 2.7 | Consideration of new rotational area in the Great South Channel | | | | |
| 2.7.1.1 | No Action | Potentially positive | Potentially positive | Neutral | Potentially positive |
| 2.7.1.2 | Close new rotational area in the Channel north of NLS and west of CAI | Potentially negative | Potentially negative | Potentially negative | Positive |
| 2.8 | Alternatives to minimize impacts of incidental take of sea turtles | | | | |
| 2.8.1.1 | Restrict number of OA DAS an individual can use in the Mid-Atlantic during a certain window of time | Potentially negative to potentially positive | Potentially negative to potentially positive | Positive | Low negative, especially to small vessels homeported in the Mid-Atlantic |
| 2.8.1.2 | Restrict number of AA trips in the Mid-Atlantic that can be used during a certain window of time | Potentially negative to potentially positive | Potentially negative to potentially positive | Positive | Low negative |
| 2.8.1.3 | Consider a seasonal closure for Delmarva | Potentially positive | Potentially low positive | Positive | Neutral to low positive if possession limit increased |
| 2.8.1.4 | Reduce possession limits in ETA and/or Delmarva to reduce fishing time | Positive | Positive | Positive | Negative |
| 2.8.1.5.1 | Combined RPM 1: Reduced possession limit on any access area trip in ETA and/or Delmarva and seasonal closure of Delmarva | Potentially positive to potentially negative | Potentially low positive | Positive | Neutral to Low Negative |
| 2.8.1.5.2 | Combined RPM 2: Limit number of ETA trips with a reduced possession limit and seasonal closure in Delmarva | Potentially positive to potentially negative | Potentially low positive | Positive | Neutral to Low Negative |
| 2.8.1.5.3 | Combined RPM 3: Limit the number of MA access area trips that can be taken during turtle window and seasonal closure in Delmarva. | Potentially positive to potentially negative | Potentially low positive | Positive | Neutral to Low Negative |

| | | | | | |
|--------------|---|---------------------------------|---------------------------------|---------------------------------|---------------------------------|
| 2.9 | Improvements to the observer set-aside program | | | | |
| 2.9.1.1 | No action | No impact | No impact | No impact | No impact |
| 2.9.1.2 | Provisions to discourage vessel owners from not paying for deployed observers | Potentially low positive | Potentially low positive | Potentially low positive | Potentially low positive |
| 2.9.2 | Limit the amount of observer compensation general category vessels can get per observed trip in access areas | Potentially low positive | Potentially low positive | Potentially low positive | Potentially low positive |

5.6.6.1 Summary of Cumulative Effects of the proposed action

To determine the magnitude and extent of cumulative impacts of the proposed action, the incremental impacts of the direct and indirect impacts should be considered, on a VEC-by-VEC basis, in addition to the effects of all actions (those effects identified and discussed relative to the past, present, and reasonably foreseeable future actions of both fishing and non-fishing actions). In general, while the management measures proposed result in cumulative impacts in some cases, none of the impacts discussed indicate a potentially significant impact. Section 5.6.6 above summarizes the expected cumulative effects of the measures that were considered in this amendment; this section focuses on the proposed action.

Overall, the cumulative effects of the proposed action are neutral to low positive. Table 124 summarizes the cumulative effects of the proposed action relative to the past, present, and reasonably foreseeable future fishing and non-fishing actions for each of the VECs considered. In general, the impacts of the past, present, and reasonably foreseeable future actions on all of the VECs identified in this action are positive to neutral. There are several future actions that may have potential low negative or positive impacts, but overall the expected impacts are neutral. Furthermore, there are potentially negative impacts of non-fishing activities in this region on the various VECs identified. As for the direct and indirect impacts of the proposed action on each VEC, the overall impacts are expected to be positive to neutral.

Table 124 – Summary of cumulative effects of the proposed action

| | Scallop Resource | Physical Habitat/EFH | Protected Resources | Fishery-Related Businesses and Communities | Summary of all VECs |
|--|---------------------------------|---------------------------------|---------------------------------|---|--------------------------------------|
| Direct/Indirect Impacts of Proposed Action | Neutral to positive | Neutral | Neutral or potentially positive | Neutral or Positive | Neutral to positive |
| Past and Present Fishing Actions Impacts | Neutral to positive | Positive | Neutral to positive | Low negative to positive | Neutral to positive |
| Reasonably Foreseeable Future Fishing Actions Impacts | Neutral to potentially positive | Neutral to potentially positive | Neutral to potentially positive | Low negative to positive | Low negative to potentially positive |
| Non-Fishing Actions Impacts | Potentially negative | Potentially negative | Potentially negative | Potentially negative | Potentially negative |
| Cumulative Effects | Neutral to positive | Neutral to positive | Neutral to potentially positive | Neutral to potentially positive | Neutral to low positive |

6.0 COMPLIANCE WITH APPLICABLE LAW

6.1 MAGNUSON-STEVENSON FISHERY CONSERVATION AND MANAGEMENT ACT

6.1.1 National standards

Section 301 of the Magnuson-Stevens Fishery Conservation and Management Act requires that fishery management plans (FMPs) contain conservation and management measures that are consistent with the ten National Standards:

(1) Conservation and management measures shall prevent overfishing while achieving, on a continuing basis, the optimum yield from each fishery for the United States fishing industry.

All four FW21 scenarios were developed by the PDT to meet the goals of the FMP to prevent overfishing. Amendment 10 recommends that fishery specifications be set at 80% ($F = 0.24$) of overfishing threshold ($F = 0.29$). However, the PDT is authorized to recommend a different level for justified reasons to prevent overfishing and ensure that optimum yield is achieved on a continuing basis. For example, in Framework 19 (specifications for 2008 and 2009) the PDT and Council recommended a lower fishing mortality target of 0.20 to prevent localized overfishing in open areas and to account for other constraining issues on the fishery that lower optimum yield such as concerns about finfish bycatch.

In this action the Council learned that preliminary results for updated estimates of fishing mortality for 2008 and 2009 are at or just above the overfishing threshold of $F = 0.29$, despite the fact F_{target} was set at 0.20 for those years. While these results are preliminary until the assessment is conducted this summer, the Council was initially concerned that even with a target of 0.20 it appears overall fishing mortality was closer to 0.28 for 2008 and 0.30 for 2009. The Council weighed this information with new work done by the PDT related to setting fishing mortality targets and catch limits. Since FW19 the PDT has improved the assumptions and models used to set F_{target} primarily based on adjustments made to how fishing mortality is estimated from open area DAS.

Specifically, the PDT's most recent analyses has been adjusted for an increase in both LPUE and the number of active vessels assumed to fish in the fishery, which will reduce management uncertainty and increase the probability of achieving catch targets. Modifications have been made based on work the PDT did for developing alternatives in Amendment 15 to comply with new annual catch limit (ACL) requirements. To take this into account, the FW21 analysis included an adjustment to the model for calculating DAS to more accurately reflect the landings per-unit-effort (LPUE) value. Since vessel productivity can only increase so much, and is confined by a crew limit, the Council and PDT are confident that the current estimate of catch per DAS is reaching the actual value based on the fact that the fishery cannot keep increasing LPUE indefinitely. Therefore, it is likely that projected targets used in FW21 will be closer to realized landings and fishing mortality compared to projections used in previous frameworks. Thus, the Council selected an overall target of 0.24 because it is below the current threshold of 0.29, and the Council has more confidence in the methods used to set this target than previous actions. This target is expected to prevent overfishing.

(2) Conservation and management measures shall be based upon the best scientific information available.

This document uses information of known quality from sources acceptable to the relevant scientific and technical communities. Several sources of data were used in the development of this document. These data sources include, but are not limited to: permit data, landings data from vessel trip reports, data from the dealer weighout purchase reports, scallop survey data, and data from at-sea observers. Although there are some limitations to the data used in the analysis, these data are considered to be the best available.

In addition, the biological projections are based on the CASA model that is expected to generate more accurate results using a wide variety of data sources. The CASA model was reviewed and approved for management use in the 2007 scallop assessment. The PDT, Council, and SSC used the data available (including updated survey information from 2009 surveys) to establish a preliminary updated assessment of the resource. Lastly, the Council's SSC reviewed and approved the Acceptable Biological Catch (ABC) for this fishery for 2010 based on updated analyses of biological uncertainty in the parameters used to assess the scallop resource. This is considered the best available science to set MSY in order to prevent overfishing.

(3) To the extent practicable, an individual stock of fish shall be managed as a unit throughout its range, and interrelated stocks of fish shall be managed as a unit or in close coordination.

Under the Atlantic Sea Scallop FMP, the target fishing mortality rate and stock biomass are applied to the scallop resource from NC to the US/Canada boundary. This encompasses the entire range of scallop stocks under Federal jurisdiction. See Section 4.1 for a description of the scallop resource.

(4) Conservation and management measures shall not discriminate between residents of different States. If it becomes necessary to allocate or assign fishing privileges among various United States fishermen, such allocation shall be (A) fair and equitable to all such fishermen; (B) reasonably calculated to promote conservation; and (C) carried out in such manner that no particular individual, corporation, or other entity acquires an excessive share of such privileges.

The management measures proposed in this action do not discriminate between residents of different states. This action includes allocation measures, but they do not discriminate between vessels from various states. Limited access vessels are relatively mobile and are expected to fish in various access areas. Limited access vessels are permitted to trade access area trips with other vessels; therefore, if an area is far from their homeport and they do not want to fish in that area, they can trade for a trip closer to their homeport. In 2010 there are access areas in the Mid-Atlantic and Georges Bank. General category vessels are not allocated individual access into access areas; it is a fleet-wide allocation of trips for that fishery. Thus, general category vessels can decide to participate in an access area program or not. Therefore, if a vessel is relatively small and cannot fish far offshore or travel great distances to fish in an access area, that vessel can fish in open areas.

Some of the RPM alternatives had the potential to have higher distributional impacts on some vessels homeported from southern states and that is one of the primary reasons the Council did not select those measures as part of the proposed action. Instead the RPM measures were modified so that distributional impacts would be minimized.

(5) Conservation and management measures shall, where practicable, consider efficiency in the utilization of fishery resources; except that no such measure shall have economic allocation as its sole purpose.

The Proposed Action should promote efficiency in the utilization of fishery resources by allocating effort in areas with higher catch rates. For example, catch per unit of effort is expected to be higher in access areas; therefore, since more effort is allocated in these areas than open areas under the proposed action, vessels will spend less time, money and fuel on access area trips. In general, area rotation intends to maximize yield and reduce fishing impacts by allocating effort in areas with higher concentrations of scallops.

(6) Conservation and management measures shall take into account and allow for variations among, and contingencies in, fisheries, fishery resources, and catches.

The Proposed Action takes into account variations among and contingencies in fisheries, fishery resources, and catches. This action enhances the ability of the FMP to adapt to changing resource conditions. The access program is expected to allow the FMP to reduce fishing effort in open areas, increasing the scallop biomass in open areas, and potentially allowing the FMP greater flexibility to achieve optimum yield through rotational area management in the future. It was noted that it is desirable for the industry to maintain consistent landings from year to year, and the fishing level chosen will allow for that. Variations in annual catch and allocations are still to be expected under area rotation, a system that is designed to optimize yield from variable recruitment patterns by area and year.

(7) Conservation and management measures shall, where practicable, minimize costs and avoid unnecessary duplication.

The Council considered the costs and benefits associated with the Proposed Action when developing this action. The proposed action does not introduce any new measures that duplicate measures already in place. Area rotation and DAS controls were implemented in 1994; the full area rotation program was implemented in June 2004. Both these types of measures are necessary components of the FMP to achieve the annual mortality targets and prevent the stock from becoming overfished. The increase in the average size of scallops landed, a primary objective of both the FMP and the proposed action, continues to be a major factor that minimizes harvesting costs. The management measures proposed in this amendment are not duplicative and were developed in close coordination with NMFS and the Mid-Atlantic Fishery Management Council.

(8) Conservation and management measures shall, consistent with the conservation requirements of this Act (including the prevention of overfishing and rebuilding of overfished stocks), take into account the importance of fishery resources to fishing communities by utilizing

economic and social data that meet the requirements of paragraph (2), in order to (A) provide for the sustained participation of such communities, and (B) to the extent practicable, minimize adverse economic impacts on such communities.

In the Amendment 10 FSEIS, the characteristics and participation of fishing communities involved in the scallop fishery were discussed in Section 7.1.1.3, and the impacts of rotation area management were discussed in Section 8.8. This document includes an update of fishery and community information in Section 4.4. The economic and social impacts, which affect fishing communities, are analyzed and discussed in Sections 5.4 and 5.5. The proposed action will not change these impacts anticipated under Amendment 10, except that fishing communities near the proposed access areas will benefit from higher landings and economic activity, while fishing communities distant from these areas are likely to experience some adverse social impacts.

The proposed action, however, is not expected to jeopardize the sustained participation of fishing communities that have depended on the scallop resource. The area rotation and DAS adjustments are expected to continue to ensure a healthy resource that will be able to support historical levels of participation by fishing communities.

In the short-term (i.e. fishing year 2010), landings, revenues and economic benefits for the proposed action are somewhat similar to landings and economic benefits for the ‘No Action’ alternative. As a result, revenues, producer and consumer surpluses, and total economic benefits for the proposed action will be higher than the levels for other alternatives in the short-term (2010)(Table 79 to Table 83), but will fall short of the levels for other alternatives in the long-term with the exception of the new closure alternative with low *F* (CLF18). In many respects, the impacts of the proposed action are better than ‘No Action’ and recent years. One major reason the Council selected the option they did for 2010 allocations was to reduce short-term economic impacts, especially in these difficult economic times. The proposed action has fewer impacts in 2010 compared to some of the other options considered. There was also fear of ripple effects throughout the major ports that could potentially affect business and fisheries outside of those directly tied to scallops, and that businesses hit in this hard time would have an extremely difficult time bouncing back in the future if allocations increase, thus the Council selected an option with higher DAS allocations in 2010, compared to some of the measures considered.

(9) Conservation and management measures shall, to the extent practicable, (A) minimize bycatch and (B) to the extent bycatch cannot be avoided, minimize the mortality of such bycatch.

Bycatch in the scallop fishery has been greatly reduced and minimized by the success of the FMP to increase scallop biomass and reduce the amount of time fished on a DAS. The FMP has also implemented several gear restrictions that have successfully reduced bycatch. These effects are discussed in detail in Section 6.1.9 of the Amendment 10 FSEIS, and in related sections of that document.

Because the proposed action includes access to areas that are otherwise closed to achieve groundfish conservation, the proposed action in this framework adjustment includes several measures to minimize bycatch and to ensure that groundfish mortality does not increase to a

point that it would threaten the rebuilding prognosis for overfished groundfish. These measures include a precautionary TAC for yellowtail flounder (a species vulnerable to capture by scallop dredges), seasons for access (to avoid peak groundfish spawning months), and enhanced sea sampling made possible from the industry-funded observer program (to monitor and assess bycatch). In addition, the proposed action will continue the regulations to use a minimum 4-inch ring in scallop dredges and a 10-inch minimum twine top. The Amendment 10 analysis showed that both these measures would reduce finfish bycatch by reducing fishing time and allowing greater escapement of small finfish.

A summary of the impacts of these measures are analyzed and described in Section 5.6. Skate bycatch is also analyzed and discussed in the skate baseline review (Section 6.1.3). Bycatch of protected species is analyzed in Section 5.3.

(10) Conservation and management measures shall, to the extent practicable, promote the safety of human life at sea.

Section 6.1.10 in the Amendment 10 FSEIS discusses the effect of current scallop management and of rotation area management on safety. This action does not propose any new measures that would change the findings in Amendment 10. Some of the measures related to reasonable and prudent measures (Section 2.8) are expected to potentially shift effort from the Mid-Atlantic and from the summer and fall to the spring and winter. Fishing is dangerous all times of the year, but some of the more restrictions alternatives would limit when vessels could fish in warmer months. The proposed action restricts the limited access fishery to 2 of the 3 access area trips between June 15-October 31, so only one trip would need to be taken in the winter and spring. It should be noted that many vessels fish Mid-Atlantic access areas during the winter and spring as it is, so the proposed action is not expected to have large impacts on fishing behavior, and thus safety at sea.

6.1.2 Other Required Provisions of the M-S Act

Section 303 of the Magnuson-Stevens Fishery Conservation and Management Act contains 14 additional required provisions for FMPs, which are discussed below. Any FMP prepared by any Council, or by the Secretary, with respect to any fishery, shall:

(1) contain the conservation and management measures, applicable to foreign fishing and fishing by vessels of the United States, which are-- (A) necessary and appropriate for the conservation and management of the fishery to prevent overfishing and rebuild overfished stocks, and to protect, restore, and promote the long-term health and stability of the fishery; (B) described in this subsection or subsection (b), or both; and (C) consistent with the National Standards, the other provisions of this Act, regulations implementing recommendations by international organizations in which the United States participates (including but not limited to closed areas, quotas, and size limits), and any other applicable law;

Since the domestic scallop fishery is capable of catching and processing the allowable biological catch (ABC), there is no total allowable level of foreign fishing (TALFF) and foreign fishing on sea scallops is not permissible at this time.

(2) contain a description of the fishery, including, but not limited to, the number of vessels involved, the type and quantity of fishing gear used, the species of fish involved and their location, the cost likely to be incurred in management, actual and potential revenues from the fishery, any recreational interest in the fishery, and the nature and extent of foreign fishing and Indian treaty fishing rights, if any;

The fishery and fishery participants are described in detail in Section 4.4 of Amendment 11 to the Scallop FMP. Section 4.4 in this document describes the scallop permits by category as well as the active scallop vessels by permit type that could be affected by this action. The number of trips and average scallops landed per category are also included in that section as well.

(3) assess and specify the present and probable future condition of, and the maximum sustainable yield and optimum yield from, the fishery, and include a summary of the information utilized in making such specification;

The present and probable future condition of the resource and estimates of MSY and OY are given in Section 8.2.2.2 of Amendment 10 to the Scallop FMP. The SSC reviewed the most recent work on assessing this resource and determined that acceptable biological catch be set at 29,578 mt (65.2 million pounds), including an estimated 3363 mt – 7.4 million pounds - for non-yield fishing mortality (discards and incidental mortality). Therefore, the overall ABC for the fishery, excluding discards and incidental mortality is 26,211 mt (57.8 million pounds). Acceptable Biological Catch (ABC) is defined as the maximum catch that is recommended for harvest, consistent with meeting the biological objectives of the management plan (Section 2.3).

This level was recommended by the Science and Statistical Committee (SSC) and various sources of scientific uncertainty were considered when setting this value. ABC calculations were based on the assumption of uniform fishing, and in particular, that there were no EFH or rotational closures. This is consistent with the current FMP overfishing definition, which defines overfishing relative to a "whole stock" fishing mortality. Therefore, the ABC calculation gives what would be an appropriate catch if all areas were open. That is not the case in the plan since there are Groundfish mortality closed areas and EFH closed areas that are not accessible to the fishery, as well as scallop rotational areas that are only available to the fishery at certain times and effort is limited.

Current domestic landings and processing capabilities are around 50 million lbs. Total landings have been above that level in some years since 2004, and are expected to be closer to 56 million pounds for 2009. Landings under this action are expected to be less than 50 million pounds, (about 47 million pounds under the proposed action).

(4) assess and specify-- (A) the capacity and the extent to which fishing vessels of the United States, on an annual basis, will harvest the optimum yield specified under paragraph (3); (B) the portion of such optimum yield which, on an annual basis, will not be harvested by fishing vessels of the United States and can be made available for foreign fishing; and (C) the capacity and extent to which United States fish processors, on an annual basis, will process that portion of such optimum yield that will be harvested by fishing vessels of the United States;

The US fishery is expected to harvest 100% of OY and domestic processors are expected to be able to process 100% of OY.

(5) specify the pertinent data which shall be submitted to the Secretary with respect to commercial, recreational, charter fishing, and fish processing in the fishery, including, but not limited to, information regarding the type and quantity of fishing gear used, catch by species in numbers of fish or weight thereof, areas in which fishing was engaged in, time of fishing, number of hauls, economic information necessary to meet the requirement and the estimated processing capacity of, and the actual processing capacity utilized by, United States fish processors;

The FMP and existing regulations specify the type of reports and information that scallop vessel owners and scallop dealers must submit to NMFS. These data include, but are not limited to, the weight of target species and incidental catch which is landed, characteristics about the vessel and gear in use, the number of crew aboard the vessel, when and where the vessel fished, and other pertinent information about a scallop fishing trip. Dealers must report the weight of species landed by the vessel, the date of landing, and the ex-vessel price for each species and/or size grade. Important information about vessel characteristics, ownership, and location of operation is also required on scallop permit applications. Dealers are also surveyed for information about their processing capabilities.

All limited access scallop vessels and general category vessels are required to operate vessel monitoring system (VMS) equipment to record the location of the vessel for monitoring compliance with DAS regulations. An at-sea observer is also placed on scallop vessels at random to record more detailed information about the catch, including size frequency data, the quantity of discards by species, detailed gear data, and interactions with protected species.

(6) consider and provide for temporary adjustments, after consultation with the Coast Guard and persons utilizing the fishery, regarding access to the fishery for vessels otherwise prevented from harvesting because of weather or other ocean conditions affecting the safe conduct of the fishery; except that the adjustment shall not adversely affect conservation efforts in other fisheries or discriminate among participants in the affected fishery;

The action proposed in this amendment does not alter any adjustments made in the Scallop FMP that address opportunities for vessels that would otherwise be prevented from harvesting because of weather or other ocean conditions affecting the safe conduct of the fisheries. No consultation with the Coast Guard is required relative to this issue.

(7) describe and identify essential fish habitat for the fishery based on the guidelines established by the Secretary under section 305(b)(1)(A), minimize to the extent practicable adverse effects on such habitat caused by fishing, and identify other actions to encourage the conservation and enhancement of such habitat;

Essential fish habitat was defined in earlier scallop actions. This amendment does not further address or modify those EFH definitions. There are no additional impacts to the physical environment or EFH expected from the action proposed in this amendment.

(8) in the case of a fishery management plan that, after January 1, 1991, is submitted to the Secretary for review under section 304(a) (including any plan for which an amendment is submitted to the Secretary for such review) or is prepared by the Secretary, assess and specify the nature and extent of scientific data which is needed for effective implementation of the plan;

Data and research needs relative to the Atlantic sea scallop and its associated fisheries are described in Section 5.1.8 of Amendment 10. Other data, already collected include fishery dependent data described in Section 6.2.4 of Amendment 10 and fishery-independent resource surveys that provide an index of scallop abundance and biomass.

(9) include a fishery impact statement for the plan or amendment (in the case of a plan or amendment thereto submitted to or prepared by the Secretary after October 1, 1990) which shall assess, specify, and describe the likely effects, if any, of the conservation and management measures on-- (A) participants in the fisheries and fishing communities affected by the plan or amendment; (B) participants in the fisheries conducted in adjacent areas under the authority of another Council, after consultation with such Council and representatives of those participants; and (C) the safety of human life at sea, including weather and to what extent such measures may affect the safety of participants in the fishery;

The impacts of the scallop management program in general have been analyzed in previous scallop actions (Amendment 10, Amendment 11, Framework 16, Framework 18 and Framework 19). Any additional impacts from measures proposed in this action on fishery participants are summarized in Section 5.4. Safety in the scallop fishery was described in Section 8.1.5.6 of Amendment 10 and nothing proposed in this action will affect safety of human life at sea.

(10) specify objective and measurable criteria for identifying when the fishery to which the plan applies is overfished (with an analysis of how the criteria were determined and the relationship of the criteria to the reproductive potential of stocks of fish in that fishery) and, in the case of a fishery which the Council or the Secretary has determined is approaching an overfished condition or is overfished, contain conservation and management measures to prevent overfishing or end overfishing and rebuild the fishery;

Overfishing reference points describing targets and thresholds for biomass and fishing mortality are presented and explained in Section 5.1.1 of Amendment 10. These reference points were slightly modified by Framework 19 (See Section 2.6 of FW19 for details). This action is designed to meet the fishing mortality target of 0.29, which is expected to prevent overfishing.

(11) establish a standardized reporting methodology to assess the amount and type of bycatch occurring in the fishery, and include conservation and management measures that, to the extent practicable and in the following priority-- (A) minimize bycatch; and (B) minimize the mortality of bycatch which cannot be avoided;

This action does not include changes to the current SBRM. This methodology is expected to assess the amount and type of bycatch in the scallop fishery and help identify ways the fishery can minimize bycatch and mortality of bycatch which cannot be avoided. The scallop fishery

also has an industry funded observer set-aside program that provides additional funding (portion of total scallop catch set-aside) to put observers on scallop vessels. A summary of the extent of observer coverage in this fishery can be found in Section 4.5.3.

(12) assess the type and amount of fish caught and released alive during recreational fishing under catch and release fishery management programs and the mortality of such fish, and include conservation and management measures that, to the extent practicable, minimize mortality and ensure the extended survival of such fish;

This Proposed Action does not address recreational fishing regulations.

(13) include a description of the commercial, recreational, and charter fishing sectors which participate in the fishery, including its economic impact, and, to the extent practicable, quantify trends in landings of the managed fishery resource by the commercial, recreational, and charter fishing sectors;

A detailed description of the scallop fishery is included in Section 7.1 of Amendment 10, Section 4.4 in Amendment 11, and Section 4.4 of this action. These sections provide information relative to scallop vessels, processors, and dealers.

(14) to the extent that rebuilding plans or other conservation and management measures which reduce the overall harvest in a fishery are necessary, allocate, taking into consideration the economic impact of the harvest restrictions or recovery benefits on the fishery participants in each sector, any harvest restrictions or recovery benefits fairly and equitably among the commercial, recreational, and charter fishing sectors in the fishery; and

This action does propose a reduction in total catch in the scallop fishery compared to recent years. However, over the long term the projected catch is above the average. The measures included in this action are expected to have long-term benefits for participating vessels, and the economic impacts on various sectors of the fishery have been considered. Section 5.4 is a detailed examination of the expected economic impacts of this action. Harvest from the Atlantic sea scallop fishery will continue to be reviewed, established, and analyzed through the biennial framework process. Recreational fishing for sea scallops is rare and does not affect the success of the FMP.

(15) establish a mechanism for specifying annual catch limits in the plan (including a multiyear plan), implementing regulations, or annual specifications, at a level such that overfishing does not occur in the fishery, including measures to ensure accountability.

The proposed action includes catch limits for certain sectors of the scallop fishery, as well as effort controls for the rest of the fishery that is not under a direct TAC or quota. This action covers 2010 only and will be followed by another action that will set specifications for the next two fishing years. Measures have been set at the fishing mortality target of $F = 0.29$, so overfishing is not expected to occur.

The Council is currently developing an amendment to bring the Scallop FMP in compliance with new annual catch limits required under the reauthorized Magnuson-Stevens Act of 2007 (Amendment 15). The Scallop FMP is required to implement ACLs and accountability measures by 2011, and the Council is scheduled to make final decisions on that action in June 2010. In the meantime, this FMP is still required to have an ABC set by the SSC, and management measures are not allowed to exceed that ABC. The ABC for 2010 is 29,578 mt (65.2 million pounds), including an estimated 3363 mt – 7.4 million pounds - for non-yield fishing mortality (discards and incidental mortality). Therefore, the overall ABC for the fishery, excluding discards and incidental mortality is 26,211 mt (57.8 million pounds). Fishery allocations under the proposed action are set at $F = 0.24$ and the annual catch associated with that fishing mortality level is projected to be 47 million pounds. One reason for a lower target is to recognize that the fishery is not uniform, and not all exploitable scallops that are part of the ABC estimate are accessible to the fishery; many are in closed areas.

6.1.3 Skate Baseline Review

The Skate FMP identified and characterized a baseline of management measures in other fisheries that provide additional conservation benefits to skate species. The FMP requires that if the Council initiates an action in another FMP that changes one or more of the baseline measures such that the change is likely to have an effect on the overall mortality for a species of skate in a formal rebuilding program, then a baseline review is required. It is important to point out that the skate baseline review is only required for skate species that are currently in a formal rebuilding program. Of the seven skate species managed under the Northeast Skate Complex FMP, only two species are in a formal rebuilding program: thorny and barndoor. Therefore, this baseline review will only evaluate the impacts of this framework action on the mortality rates of these two species.

A baseline review must be initiated if one of seven categories of management measures are changed which have been identified as beneficial for skates. The seven categories of management measures identified in the Skate FMP are: (i) NE Multispecies year-round closed areas; (ii) NE Multispecies DAS restrictions; (iii) Gillnet gear restrictions; (iv) Lobster restricted gear areas; (v) Gear restrictions for small mesh fisheries; (vi) Monkfish DAS restrictions for monkfish-only permit holders; and (vii) Scallop DAS restrictions (See Section 4.1.6 of the Skate FMP for more details).

The purpose of Framework Adjustment 21 is to set specifications and allocations for the 2010 fishing year, while making other management adjustments as necessary to achieve optimum yield. Framework 21 considered a host of measures, but only two technically trigger a skate baseline review. One measure includes the rotational access program on Georges Bank for 2010 fishing year. Since this program would allow limited access into portions of NE multispecies closed areas, a skate baseline review would normally be required. However, since this access program has already been approved under a previous scallop action (Framework 16/39 and Framework 18), the skate baseline review has already been conducted; therefore, no review is necessary based on this trigger. This action includes fewer trips on Georges Bank and does not include any modifications that would require further consideration for the skate baseline review.

This framework is considering a range of DAS allocation alternatives. Open area DAS allocations are estimated after the access area TACs are established in order to achieve the annual target mortality rate for the entire resource. If access area DAS increase, then open area DAS decrease, and vice versa. This framework considered a range of open area DAS from 29 to 52 pre full-time vessel in 2010. The proposed alternative projects that about 26,000 DAS will be used in all areas (open areas and access areas). DAS used in open areas will be much lower, fewer than 13,000 DAS expected (38 DAS multiplied by 340 full-time equivalent vessels).

The total estimate of 26,000 DAS under the proposed action is less than the baseline amount assessed in the Skate FMP of 34,000 DAS; therefore, the Skate PDT is not required to assess the potential impacts of Framework 21 in terms of the skate baseline review. There are other measures being implemented in this framework and none fall within the list of seven categories of management measures that trigger a skate baseline review.

Table 125 – Summary of allocated open area DAS and DAS equivalent for access areas for Framework 19 scenarios

| 2010 | # of access area trips | Individual open area DAS | Total Allocated Open Area DAS* | Projection of Total DAS used |
|-----------------|-------------------------------|---------------------------------|---------------------------------------|-------------------------------------|
| No Action | 4 | 42 | 14,280 | 28,715 |
| Proposed | 4 | 38 | 12,920 | 25,740 |

** Estimated by DAS allocation per full-time equivalent vessel (340 vessels)*

6.2 NEPA

NEPA provides a mechanism for identifying and evaluating the full spectrum of environmental issues associated with federal actions, and for considering a reasonable range of alternatives to avoid or minimize adverse environmental impacts. This document is designed to meet the requirements of both the M-S Act and NEPA. The Council on Environmental Quality (CEQ) has issued regulations specifying the requirements for NEPA documents (40 CFR 1500 – 1508). All of those requirements are addressed in this document, as referenced below.

6.2.1 Environmental Assessment

The required elements of an Environmental Assessment (EA) are specified in 40 CFR 1508.9(b). They are included in this document as follows:

- The need for this action is described in Section 1.2;
- The alternatives that were considered are described in Section 3.0 (alternatives including the proposed action);
- The environmental impacts of the proposed action are described in section 5.0; and,
- The agencies and persons consulted on this action are listed in Section 6.2.3.

While not required for the preparation of an EA, this document includes the following additional sections that are based on requirements for an Environmental Impact Statement (EIS).

- An Executive Summary can be found on page iii;
- A table of contents can be found on page xv;

- Background and purpose are described in Section 1.0;
- A summary of the document can be found in the Executive Summary;
- A brief description of the affected environment is in Section 4.0;
- Cumulative impacts of the proposed action are described in Section 5.6;
- A determination of significance is in Section 6.2; and,
- A list of preparers is in Section 6.2.3.

6.2.2 Finding of No Significant Impact

National Oceanic and Atmospheric Administration (NOAA) Administrative Order 216-6 (NAO 216-6) (May 20, 1999) contains criteria for determining the significance of the impacts of a proposed action. On July 22, 2005, NOAA published a Policy Directive with guidelines for the preparation of a Finding of No Significant Impact (FONSI). In addition, the Council on Environmental Quality (CEQ) regulations at 40 CFR 1508.27 state that the significance of an action should be analyzed both in terms of “context” and “intensity.” Each criterion listed below is relevant in making a finding of significant impact and has been considered individually, as well as in combination with the others. The significance of this action is analyzed based on the NAO 216-6 criteria, the recent Policy Directive from NOAA, and CEQ’s context and intensity criteria. These include:

(1) Can the proposed action reasonably be expected to jeopardize the sustainability of any target species that may be affected by the action?

Response: No, the proposed action is not reasonably expected to jeopardize the sustainability of the sea scallop resource. This action sets specifications for fishing year 2010 by modifying the rotational area management program implemented by Amendment 10. None of the modifications are expected to cause increases in fishing mortality that would jeopardize the sustainability of the scallop resource. The action is designed to be consistent with the mortality targets adopted in Amendment 10 and the overall target has been set at a level less than ABC taking into account sources of biological and management uncertainty.

(2) Can the proposed action reasonably be expected to jeopardize the sustainability of any non-target species?

Response: No, the proposed action is not reasonably expected to jeopardize the sustainability of any non-target species. A general description of the non-target species is summarized in Section 4.5, and a complete bycatch analysis of the scallop fishery was completed in Amendment 10. Section 5.5 summarizes the overall impacts of this action on non-target species. In general, this action does not increase overall fishing effort above levels assessed in Amendment 10, thus there is no indication that impacts on non-target species will be different.

Due to the distribution and behavior of yellowtail flounder, bycatch in the scallop fishery has been documented and is expected to continue under this action. Therefore, specific measures are in place to close access areas on Georges Bank when 10% of the yellowtail flounder TAC is reached on trips in the Nantucket Lightship area. In addition, since closed areas are considered beneficial to the recovery of thorny and barndoor skate, this document analyzes the impacts of controlled access into portions of the mortality closed areas on skate rebuilding (Section 6.1.3). No additional impacts are expected.

(3) Can the proposed action reasonably be expected to cause substantial damage to the ocean and coastal habitats and/or essential fish habitat (EFH) as defined under the Magnuson-Stevens Act and identified in FMPs?

Response: No, the proposed action is not reasonably expected to cause substantial damage to the ocean and coastal habitats and/or EFH. Relative to the baseline habitat protections established under Amendment 10 to the Atlantic Sea Scallop FMP, those impacts are negligible, and relative to the No Action alternative, those impacts are marginally positive. Specifically, this action does not allow access into the Habitat Closed Areas, and it maintains the requirement for scallop vessels to use 4-inch rings, which are believed to reduce impacts on benthic environments. Therefore, measures to further mitigate or minimize adverse effects on EFH are not necessary. An EFH Assessment was not included for this action.

(4) Can the proposed action be reasonably expected to have a substantial adverse impact on public health or safety?

Response: No, the proposed action is not reasonably expected to have substantial adverse impacts on public health or safety. This action does not modify the primary measures used to manage the fishery and is not expected to change fishing behavior in any substantial way to adversely impact safety. Some of the measures related to reasonable and prudent measures (Section 2.8) are expected to potentially shift effort from the Mid-Atlantic and from the summer and fall to the spring and winter. Fishing is dangerous all times of the year, but some of the more restrictions alternatives would limit when vessels could fish in warmer months. The proposed action restricts the limited access fishery to 2 of the 3 access area trips between June 15-October 31, so only one trip would need to be taken in the winter and spring. It should be noted that many vessels fish Mid-Atlantic access areas during the winter and spring as it is, so the proposed action is not expected to have large impacts on fishing behavior, and thus safety at sea.

(5) Can the proposed action reasonably be expected to adversely affect endangered or threatened species, marine mammals, or critical habitat of these species?

Response: No, the proposed action is not reasonably expected to adversely affect endangered or threatened species, marine mammals, or critical habitat of these species. Section 4.3 describes the endangered or threatened species that are found in the affected area. Section 5.3 summarizes the impacts of the proposed action on endangered and threatened species; overall, none of the proposed measures are expected to have a significant impact on these species. In fact, this action includes specific measures designed to minimize impacts on sea turtles by limiting effort in the Mid-Atlantic during the time of year when turtles are more likely to interact with scallop gear (Sections 2.8.12.8 and 5.3).

(6) Can the proposed action be expected to have a substantial impact on biodiversity and/or ecosystem function within the affected area (e.g., benthic productivity, predator-prey relationships, etc.)?

Response: The proposed action is not expected to have a substantial impact on biodiversity and/or ecosystem function within the affected area. Section 4.2 describes the physical environment of the affected area including the benthic environment and biological parameters of the scallop resource. In general, this action proposes to maintain fishing mortality at levels similar to what was established under Framework 19 (2008 and 2009 fishing years); therefore,

no additional impacts on biodiversity and ecosystem function are expected as a result of this action.

(7) Are significant social or economic impacts interrelated with natural or physical environmental effects?

Response: No, this action does not propose any significant social or economic impacts interrelated with significant natural or physical environmental effects. Because the proposed action improves flexibility and performance of the rotational area management program, which has not had significant social or economic impacts interrelated with significant natural or physical environmental effects in the past, none are expected to result from the proposed action.

(8) Are the effects on the quality of the human environment likely to be highly controversial?

Response: No, the effects on the quality of the human environment are not likely to be highly controversial. The proposed action will modify the rotational area management program and reduce short term landings, but positive impacts in the long-term are expected from this program; thus positive impacts on the human environment. Sections 5.1 through 5.5 assess the expected impacts of the proposed action on the human environment, and Section 5.6 describes the potential cumulative effects of this action on the human environment. Overall, the proposed action is expected to have negative short-term impacts compared to No Action due to reduced landings and revenues, but long term beneficial impacts. Furthermore, landings are expected to increase quickly after 2010, thus any impacts will be temporary. Therefore, this action is not likely to be highly controversial since long term impacts are favorable for the proposed action compared to No Action.

(9) Can the proposed action reasonably be expected to result in substantial impacts to unique areas, such as historic or cultural resources, park land, prime farmlands, wetlands, wild and scenic rivers or ecologically critical areas?

Response: No, unique areas, park land, prime farmlands, wetlands, wild and scenic rivers or ecologically critical areas are not located within the affected area; therefore, there are no impacts on these components of the environment from the proposed action.

(10) Are the effects on the human environment likely to be highly uncertain or involve unique or unknown risks?

Response: No, the effects on the human environment are not likely to be highly uncertain or involve unique or unknown risks. This action primarily proposes modifications to the existing rotational area management program. The risks and impacts of area rotation on the human environment have been discussed and analyzed in previous actions. Scallop vessels have been awarded access into portions of the Georges Bank closed areas since 1999; therefore, the likely effects on the human environment are well understood.

(11) Is the proposed action related to other actions with individually insignificant, but cumulatively significant impacts?

Response: No, the proposed action is not related to other actions with individually insignificant but cumulatively significant impacts. Section 5.6 describes fishing and non-fishing past, present and reasonably foreseeable future actions that occurred or are expected to occur in the affected area. Some measures within the proposed action do result in cumulative impacts in some cases,

but none of the impacts discussed exceed the threshold that would indicate a significant impact. In summary, the sea scallop resource, EFH, protected species, and the human environment have been impacted by past and present actions in the area and are likely to continue to be impacted by these actions in the future. In general, the proposed action will modify the rotational area management program, which will have positive impacts on the long-term success of the program at preventing overfishing and achieving optimum yield on a continuing basis.

(12) Is the proposed action likely to adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural or historical resources?

Response: No districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places are located in the affected area; therefore, there are no impacts on these resources from the proposed action.

(13) Can the proposed action reasonably be expected to result in the introduction or spread of a nonindigenous species?

Response: No, the proposed action is not reasonably expected to result in the introduction or spread of a nonindigenous species. The only nonindigenous species known to occur in any significant amount within the fishery areas is the colonial sea squirt (*Didemnum sp.*). The tunicate occurs on pebble gravel habitat, and does not occur on moving sand. NMFS and the WHOI HabCam have surveyed the area and studies are underway to monitor its growth and effect on scallops and their habitat. At this time, there is no evidence that fishing spreads this species more than it would spread naturally. Furthermore, the proposed action is not expected to spread the species more than regular fishing activity would; however, the spread of invasive tunicates and fishing gear needs to be monitored closely.

(14) Is the proposed action likely to establish a precedent for future actions with significant effects or represents a decision in principle about future consideration?

Response: No, the proposed action is not likely to establish a precedent for future action with significant effects, and it does not represent a decision in principle about future consideration. This action modifies an existing rotational area management program that is designed to be reviewed and adjusted every two years. Area rotation was established under Amendment 10, which was an EIS that assessed the long-term impacts of area rotation. The area rotation program and associated specifications will be updated by future frameworks, and each of these will include a new NEPA analysis.

(15) Can the proposed action reasonably be expected to threaten a violation of Federal, State or local law or requirements imposed for the protection of the environment?

Response: No, the proposed action is not reasonably expected to threaten a violation of Federal, State or local law or requirements imposed for the protection of the environment. This action does not propose any changes that would provide incentive for environmental laws to be broken.

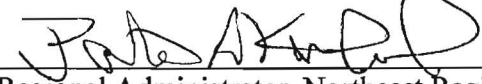

(16) Can the proposed action reasonably be expected to result in cumulative adverse effects that could have a substantial effect on the target species or non-target species?

Response: No, the proposed action is not reasonably expected to result in cumulative adverse effects that could have a substantial effect on the target species or non-target species. Both target

and non-target species have been identified and assessed in this document (Section 5.1, 5.5, and 5.6). In general, this action will modify the rotational area management program, which will have positive impacts on both target and non-target species.

FONSI DETERMINATION:

In view of the information presented in this document and the analysis contained in the supporting Environmental Assessment prepared for Framework 21, and in the SEIS for Amendment 10 to the Sea Scallop Fishery Management Plan, it is hereby determined that Framework 21 will not significantly impact the quality of the human environment as described above and in the supporting Environmental Assessment. In addition, all beneficial and adverse impacts of the proposed action have been addressed to reach the conclusion of no significant impacts. Accordingly, preparation of an EIS for this action is not necessary.

Regional Administrator, Northeast Region, NMFS

MAY 28, 2010
Date

6.2.3 List of Preparers; Point of Contact

Questions concerning this document may be addressed to:

Mr. Paul Howard, Executive Director
New England Fishery Management Council
50 Water Street, Mill 2
Newburyport, MA 10950
(978) 465-0492

Framework Adjustment 21 was prepared and evaluated in consultation with the National Marine Fisheries Service and the Mid-Atlantic Fishery Management Council. Members of the Scallop PDT prepared and reviewed portions of analyses and provided technical advice during the development of the Environmental Assessment. The list of Scallop PDT members includes:

Table 126 – List of Scallop PDT members

| Scallop Plan Development Team |
|--------------------------------------|
| Deirdre Boelke, PDT Chair, NEFMC |
| Emily Bryant, NMFS SF |
| Peter Christopher, NMFS SF |
| Rula Deisher, USCG |
| William DuPaul, VIMS |
| Demet Haksever, NEFMC |
| Dvora Hart, NEFSC |
| Kevin Kelly, ME DMR |
| Erin Kupcha, NMFS Observer Program |
| Jessica Melgey, NEFMC |
| Kimberly Murray, NEFSC |
| Cate O'Keefe, SMAST |
| Julia Olsen, NEFSC |
| Jim St. Cyr, NMFS FSO |
| Sarah Thompson, NMFS NEPA |
| Carrie Upite, NMFS PR |

In addition, other individuals contributed data and technical analyses for the document, Amy Van-Atten (NMFS Northeast Observer Program); Michelle Bachman (NEFMC staff – impacts on essential fish habitat); and Woneta Cloutier (NEFMC staff – administrative assistant for Scallop FMP).

6.2.4 Agencies Consulted

The following agencies were consulted in the preparation of this document:

New England Fishery Management Council
 Mid-Atlantic Fishery Management Council
 National Marine Fisheries Service, NOAA, Department of Commerce
 United States Coast Guard, Department of Homeland Security

6.2.5 Opportunity for Public Comment

The proposed action was developed during the period March 2009 through November 2009 and was discussed at the following meetings. Opportunities for public comment were provided at each of these meetings. The public is also permitted to attend Scallop PDT meetings, and about half a dozen PDT meetings were held during this time period as well.

Table 127 – Summary of meetings with opportunity for public comment for Framework 21

| | | |

6.3 MARINE MAMMAL PROTECTION ACT (MMPA)

Section 4.2 of this action contains a description of marine mammals potentially affected by the Scallop Fishery and Section 5.3 provides a summary of the impacts of the proposed action as analyzed in Framework 21. A final determination of consistency with the MMPA will be made by the agency when Framework 21 is implemented.

6.4 ENDANGERED SPECIES ACT (ESA)

Section 4.2 of this action contains a description of marine mammals potentially affected by the Scallop Fishery and Section 5.3 provides a summary of the impacts of the proposed action as analyzed in Framework 21. A final determination of consistency with the ESA will be made by the agency when Framework 21 is implemented.

6.5 ADMINISTRATIVE PROCEDURE ACT (APA)

Sections 551-553 of the Administrative Procedure Act established procedural requirements applicable to informal rulemaking by federal agencies. The purpose is to ensure public access to the federal rulemaking process, and to give public notice and opportunity for comment. The Council did not request relief from notice and comment rule making for this action, and the Council expects that NOAA Fisheries will publish proposed and final rule making for this action.

The Council has held fifteen meetings open to the public on Framework 21 (Table 127). The Council initiated this action at the April 2009 Council meeting and approved final measures at the November 2009 meeting. After submission to NMFS, a proposed rule and notice of availability for Framework 21 under the M-S Act will be published to provide opportunity for public comment.

6.6 PAPERWORK REDUCTION ACT (PRA)

The purpose of the Paperwork Reduction Act is to minimize paperwork burden for individuals, small businesses, nonprofit institutions, and other persons resulting from the collection of information by or for the Federal Government. It also ensures that the Government is not overly burdening the public with requests for information. Framework 21 does not have any new collection of information requirements subject to the PRA.

6.7 COASTAL ZONE MANAGEMENT ACT (CZMA)

Section 307 of the Coastal Zone Management Act (CZMA) is known as the federal consistency provision. Federal Consistency review requires that “federal actions, occurring inside or outside of a state's coastal zone, that have a reasonable potential to affect the coastal resources or uses of that state's coastal zone, to be consistent with that state's enforceable coastal policies, to the maximum extent practicable.” The Council previously made determinations that the FMP was consistent with each states coastal zone management plan and policies, and each coastal state concurred in these consistency determinations (in Scallop FMP). Since the proposed action does not propose any substantive changes from the FMP, the Council has determined that this action is consistent with the coastal zone management plan and policies of the coastal states in this region. Once the Council has adopted final measures and submitted Framework 21 to NMFS, NMFS will request consistency reviews by CZM state agencies directly.

6.8 DATA QUALITY ACT

Utility of Information Product

The proposed document includes: A description of the management issues, a description of the alternatives considered, and the reasons for selecting the preferred management measures, to the extent that this has been done. These actions propose modifications to the existing FMP. These proposed modifications implement the FMP's conservation and management goals consistent

with the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) as well as all other existing applicable laws.

This proposed framework is being developed as part of a multi-stage process that involves review of the document by affected members of the public. The public has had the opportunity to review and comment on management measures during several meetings.

The Federal Register notice that announces the proposed rule and the implementing regulations will be made available in printed publication and on the website for the Northeast Regional Office. The notice provides metric conversions for all measurements.

Integrity of Information Product

The information product meets the standards for integrity under the following types of documents:

Other/Discussion (e.g., Confidentiality of Statistics of the Magnuson-Stevens Fishery Conservation and Management Act; NOAA Administrative Order 216-100, Protection of Confidential Fisheries Statistics; 50 CFR 229.11, Confidentiality of information collected under the Marine Mammal Protection Act.)

Objectivity of Information Product

The category of information product that applies for this product is “Natural Resource Plans.”

In preparing specifications documents, the Council must comply with the requirements of the Magnuson-Stevens Act, the National Environmental Policy Act, the Regulatory Flexibility Act, the Administrative Procedure Act, the Paperwork Reduction Act, the Coastal Zone Management Act, the Endangered Species Act, the Marine Mammal Protection Act, the Data Quality Act, and Executive Orders 12630 (Property Rights), 12866 (Regulatory Planning), 13132 (Federalism), and 13158 (Marine Protected Areas).

This framework is being developed to comply with all applicable National Standards, including National Standard 2. National Standard 2 states that the FMP's conservation and management measures shall be based upon the best scientific information available. Despite current data limitations, the conservation and management measures proposed to be implemented under this framework are based upon the best scientific information available. This information includes complete NMFS dealer weighout data through 2008, and includes incomplete dealer weighout data for 2009. Dealer data is used to characterize the economic impacts of the management proposals. The specialists who worked with these data are familiar with the most recent analytical techniques and with the available data and information relevant to the scallop fishery.

The policy choices (i.e., management measures) proposed to be implemented by this document are supported by the available information. The management measures contained in the framework document are designed to meet the conservation goals and objectives of the FMP.

The supporting materials and analyses used to develop the measures in the framework are contained in the document and to some degree in previous amendments and/or FMPs as specified in this document.

The review process for this framework involves the New England Fishery Management Council, the Northeast Fisheries Science Center, the Northeast Regional Office, and NOAA Fisheries headquarters. The document was prepared by staff of the Council and Center with expertise in scallop resource issues, habitat issues, economics, and social sciences. The Council review process involves public meetings at which affected stakeholders have opportunity to provide comments on the specifications document. Review by staff at the Regional Office is conducted by those with expertise in fisheries management and policy, habitat conservation, protected species, and compliance with the applicable law. Final approval of the specifications document and clearance of the rule is conducted by staff at NOAA Fisheries Headquarters, the Department of Commerce, and the U.S. Office of Management and Budget.

6.9 E.O. 13132 (FEDERALISM)

The E.O. on federalism establishes nine fundamental federalism principles for Federal agencies to follow when developing and implementing actions with federalism implications. Previous scallop actions have already described how the management plan is in compliance with this order. Furthermore, this action does not contain policies with Federalism implications, thus preparation of an assessment under E.O. 13132 is not warranted.

6.10 E.O. 12898 (ENVIRONMENTAL JUSTICE)

The alternatives in this framework are not expected to cause disproportionately high and adverse human health, environmental or economic effects on minority populations, low-income populations, or Native American peoples.

6.11 EXECUTIVE ORDER 12866 (REGULATORY IMPACT REVIEW)

6.11.1 Introduction

The Regulatory Impact Review (RIR) provides an assessment of the costs and benefits of proposed actions and other alternatives in accordance with the guidelines established by Executive Order 12866. The regulatory philosophy of Executive Order 12866 stresses that in deciding whether and how to regulate, agencies should assess all costs and benefits of all regulatory alternatives and choose those approaches that maximize the net benefits to the society.

The RIR also serves as a basis for determining whether any proposed regulations are a “significant regulatory action” under the criteria provided in Executive Order 12866 and whether the proposed regulations will have a significant economic impact on a substantial number of small entities in compliance with the Regulatory Flexibility Act of 2180 (RFA).

This RIR summarizes the effects of the proposed observer program and other alternatives considered in this Framework 21. The Framework 21 document contains all the elements of the RIR/RFA, and the relevant sections are identified by reference to the document.

The purpose of and the need for action are described in Section 1.2. The description of the each selected alternative including the no action alternative is provided in Section 2.0.

6.11.2 Economic Impacts

Section 5.4 evaluated economic impacts of Framework 21 proposed measures and alternatives considered by the Council. The aggregate economic impacts of the proposed allocation alternatives are analyzed in Section 5.4.2. The numerical results are presented in the tables included in those sections. The individual measures considered by Framework 21 are discussed in Sections 5.4.3 through 5.4.7 and the relevant subsections shown below:

- Economic impacts of no action: Section 5.4.1
- Measures that will be in effect March 1, 2010 until Framework 21 is implemented: Section 5.4.1.1
- Aggregate Economic Impacts: Section 5.4.2
- Measures for limited access vessels in Section 5.4.3 including
 - Georges Bank access area management and adjustments when yellowtail flounder catches reach 10% TAC limit: Section 5.4.3.1
 - Mid-Atlantic access area management: Section 5.4.3.2
 - TAC set-asides for observers and research: Section 5.4.3.3
 - Research priorities and recent RSA announcement: Section 5.4.3.4
 - DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010: Section 5.4.3.5
- Measures for general category vessels in Section 5.4.4 including
 - Quarterly Hard TAC for General Category Vessels: Section 5.4.4.1
 - Economic Impacts of the IFQ program: Section 5.4.4.2
 - Georges Bank access area management: Section 5.4.4.3
 - Mid-Atlantic access area management: Section 5.4.4.4
 - Northern Gulf of Maine Hard TAC: Section 5.4.4.5
 - Incidental Catch: Section 5.4.4.6
 - Leasing of partial general category IFQ allocations during the fishing year: Section 5.4.4.7
- Consideration of a new rotational area: Section 5.4.5
- Minimization of impacts of incidental take of sea turtles: Section 5.4.6
- Uncertainties and risks: Section 5.4.8

6.11.2.1 Summary of Regulatory Impacts

The combined impacts of the proposed regulations on scallop fishery, on consumers and total economic benefits to the nation are analyzed in Section 5.4.2 and the economic impacts of the individual measures are discussed in subsections of 5.4.3 as indicated above. All the values for economic impacts are presented in terms of 2008 dollars except for the determination of the significant impacts, cumulative present value of the net economic benefits to the nation are also shown in terms of the 1996 dollars. No action here refers to continuation of all the measures and allocations that are specified in the present regulations, including trip allocations for access areas and open area allocation of 42 days per limited access vessel.

Summary of the aggregate impacts of the proposed measures

- The aggregate economic impacts of the proposed measures and other alternatives including the open area DAS and access allocations and TAC for the general category fishery are expected to be negative in 2010 compared to the no action alternative. In the short-term (i.e. fishing year 2010), landings, revenues and economic benefits for the proposed action (NCLF24), for status target-F (NCLF20) will be lower than the landings and economic benefits for the ‘No Action’ alternative. For the proposed action, the scallop revenues are expected to be \$7 million lower (Table 79), the producer surplus \$2 million lower (Table 80), consumer benefits \$3 million lower (Table 81) than no action levels. Total economic benefits for the proposed action (NCLF24) will be \$5 million (\$3.9 million) lower than No Action levels in terms of 2008 (1996) prices (Table 82). The estimated fleet revenues for no action in 2010 were \$351 million (Table 79). This amount is about \$15 million lower than the average annual scallop fleet revenue (\$366 million) for the 2008-2009 fishing years (Table 84). Therefore, the proposed action revenues (\$344 million) will be about \$22 million (\$17 million) lower in 2010 compared to the levels in 2008-2009 expressed in 2008 (1996) prices. Thus the proposed action will not have a short-term negative impact on the economy by \$100 million or more in 2010 either compared to the no action alternative or compared to the 2008-2009 levels for the scallop fleet revenue.
- The NCLF20 alternative would have the largest negative impacts on revenues (loss of \$47 million) and total economic benefits (reduction of \$41 million) in 2010. The new closure options (CLF18 and CLF20) will result in higher revenues and benefits compared to no action. Table 83 shows percentage change from the No Action levels in 2010 and indicates that scallop revenues will decline by 2%, producer surplus by 1%, consumer surplus by 18% and total economic benefits (i.e., the sum of producer and consumer benefits) by 1%.
- No Action open area DAS allocations would be higher than the allocations proposed for NCLF20 and NCLF24 and CLF20 alternatives, resulting in higher landings from open areas in 2010. On the other hand, open area DAS allocations (42 days) with the new closure option (CLF18) would be equivalent to the No Action scenario. Because this option results in higher overall LPUE compared to No Action, the revenues and economic benefits for CLF18 would be higher than the No Action levels in 2010. The Council did not select this alternative because new rotational area closure alternatives resulted in a higher area swept estimates in Mid-Atlantic which could have impacts on non-target species in those areas.
- The biological estimates for the ‘No Action’ alternative show that this scenario will result in less than optimal long-term landings, and thus will lower economic benefits compared to the proposed action and other alternatives. ‘No Action’ alternative would allocate 3 trips to ETA, which is higher than the projected biomass in that area can support. Under ‘No Action’, there is no access into areas on Georges Bank while the

biomass in those areas can support one trip. Under “No Action,” open area DAS allocations would also be higher than sustainable levels because the present conditions of biomass in those areas were not taken into account. For these reasons, the levels of exploitable biomass for the no action alternative will be less than the levels for the proposed action and all the other alternatives (Table 77).

- Over the medium-term from 2010 to 2016, landings, revenues, producer and consumer surpluses and total economic benefits for the proposed action (NCLF24) and CLF20 option are expected to be lower than “No Action” levels. The cumulative present value of the revenues for the proposed action will be lower than the no action revenues by \$9 million for the period 2010-2016 (Table 79 in Section 5.4.2). The revenues for the NCLF20 alternative will be \$8 million higher, CLF18 revenues will be \$31 million higher and CLF24 revenues will be \$10 million lower than the no action levels (at 7% discount rate).
- Because increase in revenues over the long-term outweighs the decline in revenues in 2010, the proposed action and all the other alternatives will result in higher revenues than the No Action scenario. Over the long-term from 2010 to 2023, cumulative present value of the scallop revenues for the proposed action (NCLF24) will exceed the no action revenues by \$53 million (at 7% discount rate) to \$81 million (at 3% discount rate). The status quo F_{target} (NCLF20) alternative will generate \$80 million (at 7% discount rate) to \$118 million (at 3% discount rate) more revenues than the no action alternative. The Council did not select NCLF20 alternative because of its severe negative impacts on revenues and economic benefits in 2010 fishing year. Cumulative present value of the revenues for the new closure option CLF20 will be lower and for the CLF18 option will be higher than the proposed action levels. Council did not select this alternative because new rotational area closure alternatives resulted in a higher area swept estimates in Mid-Atlantic which could have impacts on non-target species in those areas.
- The proposed action will have positive long-term economic impacts and will increase the present value of total economic benefits to the nation by \$54 million (at 7% discount rate) to \$81 million (at 3% discount rate) from 2010 to 2023. The economic benefits for the NCLF20 alternative exceed no action benefits by \$86 million to \$125 million.
- The impacts of the proposed action and alternatives the general category fishery will be similar to the aggregate impacts summarized above and will negative in 2010 but positive over the long-term from 2010 to 2023.
- The impacts on employment measured by total crew-days (Crew*DAS) would be negative in 2010 but positive starting with 2011 fishing year since the proposed action would allocate less DAS in 2010 but more after 2010 fishing year compared to no action. The difference from the no action DAS-used amounts to a 10% reduction for the proposed action and 23% reduction for the NCLF20 option (Table 94). Only the new closure high- F option (CLF24) would increase DAS used and crew-days by 12% in 2010, while the new closure low- F (CLF18) option would reduce DAS used and crew-days by 2% in 2010. As a result, crew-days will change in the same percentage change to the

DAS used, declining for all options except for CLF20 in 2010. Although it is uncertain to what extent the reduction in crew-days will result in a reduction in the number of crew, thus employment in the fishery measured by number of people employed, given that this reduction is mostly limited to 2010 and that DAS-used will increase in the following years, the vessel owners may prefer to employ same crew for less fishing days in 2010 knowing that DAS-used will increase considerably in the following years. Starting in 2011, the DAS used will be higher for the proposed action compared to no action. Total DAS used and crew-days will increase by 19% in 2011 for the proposed action exceeding the no action levels by 4%. For the long-term period from 2010 to 2023, total DAS-used (thus crew-days) for the proposed action will be 1% higher than the no action levels. The DAS-used and crew-days for high-*F* alternatives (NCLF20 and CLF20) and for CLF18 will exceed the “No Action” levels by 2% to 3%.

- The cumulative impacts of the measures from Framework 21 proposed measures, and the past actions including Amendment 10, Frameworks 18 and Amendment 11 to the scallop FMP, are estimated to be positive over the long-term. Adjustment of the open area DAS allocations, implementation of trip limits and allocations for the access areas and rotation area management had positive impacts on the scallop industry by increasing the revenues, producer and consumer surpluses and net benefits in the past. The Framework 19 measures were estimated to have positive impacts on consumer, producer and total economic benefits during 2008-2009 and total benefits were expected to increase by \$42 million during 2008-2009 under the action implemented in Framework 19 in 2006 prices. The realized benefits were higher, about \$50.6 million because actual landings were higher and prices were lower than projected in Framework 19 document. Because the proposed action for Framework 21 will reduce the total benefits by \$5 million in 2010 relative to no action, and by about \$23 million relative to the levels in 2008-2009, the cumulative impacts of the proposed measures and the past actions would be positive in the 2010. The actions proposed by Framework 21 are expected to increase fleet revenues, profits and total economic benefits compared to no action over the long-term, however. As a result, cumulative economic benefits, which measure the sum of benefits from previous and proposed actions, are expected to be positive.

Summary of the impacts the individual measures

- Reauthorization of the MSA requires the SSC to set an acceptable biological catch (ABC), or maximum catch level that can be removed from the resource taking into account all sources of biological uncertainty. The Council is prohibited from setting catch limits above that level. This new requirement is expected to have long-term economic benefits on the fishery by helping to ensure that catch limits and fishing mortality targets are set at or below ABC. This should help prevent overfishing and optimize yield on a continuous basis.
- Providing access to the Nantucket Shoals Nantucket Lightship (NLS) for both the LA and LAGC fleets in 2010 will have positive economic impacts on both limited access and general category vessels
- Adjustments when yellowtail flounder catches reach 10% TAC limit will help to minimize loss in pounds and revenue due to the closure of access areas due to yellowtail quota before a vessel takes its trip.

- Providing access to Delmarva and Elephant Trunk areas will have positive economic impacts on both limited access and general category vessels because these areas have more biomass compared to open areas or other access areas.
- Open area DAS allocations are expected to prevent overfishing in the open areas and to have positive economic impacts over the long-term on scallop vessels when combined with controlled access area.
- TAC set asides for research and observer coverage and speeding up the RSA process are expected to have indirect economic benefits on the sea scallop fishery by improving scallop management through better data and information made possible by timely research into current issues in the fishery.
- Proposed action measure will provide flexibility for the general category vessels to lease and earn income their unused quotas to other vessels during the fishing year. As a result, this measure will have positive impacts on vessel revenues and profits.
- DAS adjustment for the limited access vessels if the LAGC IFQ program is not implemented by March 1, 2010 will have negative impacts on the revenues and profits of the limited access vessels due to reduced DAS allocations. This measure is not expected to impact the results of the cost-benefit analyses presented in Section 5.4.2 since there will be no change in the overall landings, revenues, and producer and consumer benefits.
- Management of general category fishery by a quarterly hard TAC during the transition period will reduce race to fish and lessen the negative economic impacts associated with derby fishing. This action is a continuation
- The proposed action does not include any new area closures. However Framework 21 alternatives included a new rotational area in the Great South Channel with large amounts of small scallops to be closed in fishing year 2010. The impacts of this alternative were analyzed as a part of the aggregate economic impacts (Section 5.4.2). This alternative was not selected because new rotational area closure alternatives resulted in a higher area swept estimates in Mid-Atlantic which could have impacts on non-target species in those areas.
- The economic impacts of the RPM measures will vary with the Framework 21 allocation alternatives and the window of time in which the measures are applied. The proposed action is a combination of the Delmarva closure in September and October with a limit on the maximum number of trips (at two per vessel) that can be taken in the Mid-Atlantic areas from June 15 to August 31. Because the effort is shifted to a relatively less productive season, total fleet trip costs are expected to increase slightly by \$40,095, or by less than 0.2%. Since there is no change in the possession limit, the trips that are shifted from this season are expected to be taken outside of the turtle window, without a loss in total revenue. The proposed action is expected to minimize the effort shift from the turtle window compared to the other alternatives considered by the Council, thus is not expected to have a significant impact on prices, revenues and total economic benefits.
- Many measures that are discussed in Framework 21 are measures that were implemented with earlier actions, such as Framework 19 and Amendment 11. In other words, for Framework 21 these actions constitute no action, and their impacts were analyzed in previous documents. The following provides a summary of the impacts of these actions:
 - The specific measures that are included if this action is not implemented by March 1, 2010 will help to reduce the adverse impacts of exceeding the proposed allocations in Framework 21 in 2010 on the scallop resource over the long-term.

Any excesses over the open area DAS-used or trip allocations for the access areas above the ultimate value allocated for 2010 will be reduced the following fishing year (2011). Therefore, these measures will have positive long-term impacts on landings, revenues, producer and consumer benefit and net national economic benefits.

- The proposed action (no action) would continue to allow a vessel to carry any number of crew it wishes on an access area trip. No crew limit would give vessels the most flexibility, potentially reducing total fishing costs, thus would have positive economic impacts on scallop vessels.
- As analyzed in Amendment 11, IFQ's will have positive economic impacts on general category vessels that qualify for limited access. Framework 19 includes a program, however, that could collect up to 3% of ex-vessel value of scallop product landed to recover the costs directly related to management, data collection and analysis, and enforcement of the general category IFQ program as mandated by the Magnuson Stevens Fishery Management Act (MSA). The positive economic impacts of IFQs for the general category limited access qualifiers are expected to exceed the costs of this cost recovery program.
- 70,000 pounds of hard TAC for the Northern Gulf of Maine (NGOM) general category fishery is expected to have positive economic impacts on vessels that do not qualify for limited access but do for an NGOM permit because it allows them to land scallops in this area during favorable resource conditions.
- Removal of incidental catch (50,000 lbs) before making allocations will ensure fishing mortality targets are not exceeded, thus, will have positive impacts on the resource, scallop yield, on the revenues and profits of the scallop vessels.

6.11.2.2 Enforcement Costs

The enforcement costs and benefits of the proposed options for Framework 21 are within the range of impacts addressed in Section 8.9 of Amendment 10 FSEIS and Section 5.4.22 and Section 5.6.3 of Amendment 11. The qualitative analysis included a discussion of the pros and cons of the proposed alternatives from an enforcement perspective. The proposed measures by Framework 21 are very similar to the existing measures in terms of the enforcement requirements, since they include the continuation of the area specific trip allocations, area closures, open area DAS allocations, measures for reducing bycatch, and the continuation of observer coverage program. The enforcement costs and benefits of the quarterly hard TAC and IFQ management of the general category fishery were discussed in Section 5.4.22 of Amendment 11. The costs of implementing and enforcing the proposed action are not expected to compromise the effectiveness of implementation and enforcement of this action. Furthermore, there are several mechanisms and systems, such as VMS monitoring and data processing, already in place that will aid in monitoring and enforcement of this action. Therefore, the overall enforcement costs are not expected to change significantly from the levels necessary to enforce measures under the no action regulations.

6.11.2.3 Determination of Significant Regulatory Action

Executive order 12866 defines a "significant regulatory action" as one that is likely to result in:
a) an annual effect on the economy of \$100 million or more, or one which adversely affects in a

material way the economy, a sector of the economy, productivity, jobs, the environment, public health or safety, or state, local, or tribal governments or communities; b) a serious inconsistency or interference with an action taken or planned by another agency; c) a budgetary impact on entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients thereof; d) novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in this executive order.

The preceding analysis shows that Framework 21 would not constitute a "significant regulatory action" since it will not raise novel legal and policy issues, other than those that were already addressed and analyzed in Amendment 10 and Amendment 11. Overall impacts on net benefits are expected to be positive, an increase of \$54 (at 7% discount rate) million to \$81 million (at 3% discount rate) in terms 2008 prices for the long-term period 2010-2023 compared to no action. In terms of 1996 prices, the net benefits will increase by \$42 (at 7% discount rate) million to \$63 million (at 3% discount rate) for the long-term period 2010-2023. Therefore, the proposed regulations may not have an annual impact on the economy of \$100 million or more. The proposed alternatives will not adversely affect in a material way the economy, productivity, competition, public health or safety, jobs or state, local, or tribal governments or communities in the long run. The proposed action also does not interfere with an action planned by another agency, since no other agency regulates the level of scallop harvest. It does not materially alter the budgetary impact of entitlements, grants, user fees, or loan programs, or the rights and obligations of recipients.

6.12 INITIAL REGULATORY FLEXIBILITY ANALYSIS

The purpose of the Regulatory Flexibility Analysis (RFA) is to reduce the impacts of burdensome regulations and record-keeping requirements on small businesses. To achieve this goal, the RFA requires government agencies to describe and analyze the effects of regulations and possible alternatives on small business entities. Based on this information, the Regulatory Flexibility Analysis determines whether the proposed action would have a "significant economic impact on a substantial number of small entities."

6.12.1 Problem Statement and Objectives

The purpose of the action and need for management is described in Section 1.2 and goal and objectives in Section 2.0 of the Framework 21 document.

6.12.2 Management Alternatives and Rationale

The proposed action is described in Sections 2.1 and No Action alternative is described in Section 2.2 of the framework document.

6.12.3 Determination of Significant Economic Impact on a Substantial Number of Small Entities

6.12.3.1 Description of the small business entities

The RFA recognizes three kinds of small entities: small businesses, small organizations, and small governmental jurisdictions. It defines a small business in any fish-harvesting or hatchery business as a firm that is independently owned and operated and not dominant in its field of operation, with receipts of up to \$4 million annually. The vessels in the Atlantic sea scallop fishery could be considered small business entities because all of them grossed less than \$3 million according to the dealer's data for 1994 to 2008 fishing years (Table 130). According to this information, annual total revenue averaged over a million per limited access full-time vessel since 2004. According to the 2008 Dealer data total revenues per vessel, including revenues from species other than scallops, was equivalent to 1,079,722 per full-time vessel. Average scallop revenue per general category vessel was \$88,702 in 2005 and \$77,077, in 2008 fishing years. Average total revenue per general category vessel was higher, exceeding \$250,000 in 2005 and 2006 fishing years, but lower than \$135,000 in 2008 (Table 129).

The proposed regulations of Framework 21 would affect vessels with limited access scallop and general category permits. Section 4.4 (Fishery-related businesses and communities) of Amendment 11 document and Section 4.4 of Framework 21 provide extensive information on the number, the port, the state, and the size of vessels and small businesses that will be affected by the proposed regulations. The current information on the number of scallop permits for the years 1997 to 2008 are provided in Table 128. According to the recent permit data, there were 321 vessels that obtained full-time limited access permits in 2006, including 56 small-dredge and 11 scallop trawl permits. In the same year, there were also 34 part-time and 1 occasional limited access permit in the sea scallop fishery (Table 128). The number of active general category vessels has fluctuated in recent years and is described in Table 129. Therefore, the proposed alternatives of Framework 21 are expected to have impacts on a substantial number of small entities.

Table 128. Scallop Permits by category by application year

| Permit category | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2007 | 2008 |
|-----------------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Full-time | 204 | 203 | 213 | 220 | 224 | 234 | 238 | 242 | 248 | 255 | 256 | 254 |

| 2007 | 157,191 | 1,064,050 | 6.77 | 315 |
| 2008 | 145,191 | 1,007,801 | 6.94 | 316 |

6.12.3.2 Determination of significant effects

The Office of Advocacy at the SBA suggests two criteria to consider in determining the significance of regulatory impacts, namely, disproportional and profitability.

The disproportionality criterion compares the effects of the regulatory action on small versus large entities (using the SBA-approved size definition of "small entity"), not the difference between segments of small entities. Framework 21 is not expected to have significant regulatory impacts on the basis of the disproportionality criterion for the following reasons:

1. The majority of the permit holders in the sea scallop fishery are considered small business entities.
2. The proposed measures will affect all the vessels participating in the sea scallop fishery. Although these measures could affect some vessels within the scallop fleet differently than others as discussed below, these differential impacts are not relevant for the disproportionality criterion. The changes in profits, costs, and net revenues due to Framework 21 are not expected to be disproportional for small versus large entities since all entities, that is, all vessels participating in the scallop fishery are considered small.
3. The proposed action is not expected to place a substantial number of small entities at a significant competitive disadvantage relative to large entities.

The profitability criterion will apply if the regulation significantly reduces profit for a substantial number of small entities from the current levels. The revenues per limited access vessel will decline by about 2.3% in 2010 but increase in the following years compared to the levels for 2008-2009. The rate of profits as a percentage of gross scallop revenue is estimated to be about 25% in 2010 for the proposed action, which is slightly smaller than the average rate in 2008-

2009 (26%, Table 133). In the following years starting with 2011, the rate of profits will increase and range from 26% to 29%. As a result, the proposed action will not have significant impacts on profits in 2010 and will have positive impacts on the revenues and profits of the majority of small business entities in scallop fishing industry over the medium-term from 2010 to 2016 both compared to the no action alternative and relative to the average levels in 2008-2009. The *No Action* alternative, strictly defined, would roll over current specifications with open area allocation of 42 days and access area allocation of 4 trips per limited access vessel, 3 to ETA and 1 to DMV. The scallop revenues and net revenues will decline with the proposed alternative in the short-term, but increase in the long-term compared to no action as summarized in Section 6.12.3.3.3. The following section provides a summary of the economic impacts from the proposed action and discusses the mitigating factors. The relevant section of Framework 21, which discusses the rationale and impacts of these measures are also identified.

6.12.3.3 Economic impacts of proposed measures and alternatives

6.12.3.3.1 DAS and access area allocation alternatives

Rationale for the proposed allocation measures is provided in Executive Summary for Framework 21. Aggregate Economic impacts of these measures are analyzed in Section 5.4.2. The following sections provide an analysis of the impacts on the individual vessel and small business entities based on the fleet-wide impacts analyzed in Section 5.4.2.

Summary of the aggregate impacts in the short- and medium term

The economic impacts under E.O. 12866 need not be identified at the vessel or firm level in the RIR, whereas, these levels remain the focus of the RFAA. The aggregate economic impacts of the proposed measures and other alternatives including Georges Bank, Elephant Trunk and Delmarva access area allocations, open area DAS allocations and TAC for the general category fishery are analyzed in Section 5.4.2 relative to no action from a net national benefit perspective and using a cost-benefit framework. The primary goal of RFAA analysis is to consider, however, the effect of regulations on small businesses and other small entities, recognizing that regulations frequently do not provide for short-term cash reserves to finance operations through several months or years until the positive effects of the regulation start paying off.

The potential economic impacts of the proposed action on the small business entities and on an average scallop vessel are expected to be proportional to the aggregate economic impacts. The proposed regulations will change the allocations of the scallop vessels in the same proportions. In 2010 fishing year, each limited access vessel's open area DAS allocations will decline in exactly the same percentage compared to the no action levels, and each general category vessel will be affected proportionally from the decline in overall TAC with the proposed action compared to the no action and the average levels in 2008-2009. Because the thrust of the RFA analysis is short- and medium-term in nature, the RFA analyses provided below are focused on the medium-term (near-term) impacts from 2010 to 2106 fishing years whereas cost-benefit analyses considered impacts also for the long-term from 2010 to 2023 fishing years.

The analysis of the fleet-wide aggregate economic impacts indicated that the proposed action will have negative economic impacts in the first year, in 2010 fishing year, both relative to the no action and relative to the levels for 2008-2009 fishing years. As a result, the proposed action will

have negative impacts on the revenues and profits of the scallop vessels and the small business entities in 2010. These negative impacts will be small, however, with a 2% reduction in scallop revenues compared to no action and a 2.3% reduction compared to the levels in 2008-2009 fishing years. In the medium term from 2011 to 2016, the proposed action will increase revenues and profits for the scallop vessels compared to the average levels in 2008-2009 (Table 131 to Table 133).

The following sections provide an analysis of impacts on an average vessel in the scallop fishery based on the economic analyses provided in Section 5.4, by converting annual fleet revenues, costs and net revenues to a per full-time vessel equivalent level after removing the 3% set-asides and 5% for the share of the general category fishery. The economic impacts of the proposed action and the alternatives are compared both to the no action and the average levels in the last two recent years from 2008 to 2009 fishing years.

Impacts of the proposed action on the revenues and net revenues of the scallop vessels and mitigating factors

- Each full-time limited access vessel will receive the same number of access area trips under both no action and under the proposed action, although the later alternative would allocate those trips to more productive areas compared with no action. Because the proposed action will reduce the open area DAS allocations from 42 days to about 38 days for each full-time limited access vessel (and proportionally for the PT and OC vessels). As a result, the total landings are estimated to be 50 million pounds with no action to 47 million pounds for the proposed action. Compared to the average level of about 55 million pounds in 2008-2009, the proposed action will reduce the landings by 14%. As a result scallop revenues for an average limited access vessel will decline by about 2.3% (Table 131) in 2010 from the 2008-2009 levels and in similar proportion compared to no action levels. The percentage decline in revenues is less than the percentage decline in landings because the price per pound of scallops is estimated to be higher for the proposed action (\$7.27 per pound) than no action (\$7.07) and than 2008 (\$6.92) and 2009 (\$6.45) levels.
- The impacts of the proposed action relative to no action levels (in 2010) are estimated to be similar relative to the average levels in 2008 and 2009 fishing years. The no action revenue for 2010 was estimated to be \$950,460 per average full-time vessel after 3% for TAC set-asides and 5% for the general category fishery are deducted from the total scallop landings and revenues. This amount is less than the average gross revenues for 2008 (\$1,007,801) shown in Table 130 above because the numbers in the later table include TAC set-asides for some vessels and also the records for some vessels may not be included in the dealer data. But if the average revenue per full-time vessel for 2008 and 2009 were estimated using the same method, that is after deducting 3% TAC set-aside and 5% for general category from estimated landings and dividing this amount by 340 full-time equivalent vessels, the no action revenue would turn out to be similar to estimated revenues for 2008 (\$947,867) and for 2009 (\$959,954), or an average of \$953,910 (Table 131). This is partly because the general category landings were over 8% of the landings in 2008-2009, but is estimated to be 5% of the total TAC in 2010 and

beyond. Another reason is that the estimated prices are higher in 2010 than in 2008-2009 because scallop landings for no action is lower (50 million pounds) than the average levels in 2008-2009 (55 million pounds).

- The revenues for an average full-time limited access vessel is estimated to be \$931,799 for the proposed action, about \$22,111 (2.3%) lower than the average revenues in 2008-2009. The revenues for the NCLF20 alternative are expected to be 13.8% lower than the 2008-2009 levels (by \$131,674). Average revenue per vessel is expected to be higher for the new closure alternatives, however.
- During the medium-term from 2011-2016, the proposed action and other alternatives will result in higher revenues per limited access vessel compared to the average scallop revenue per vessel for 2008-2009 fishing years (Table 131).
- The proposed action scallop revenue per vessel will be slightly higher than the no action levels in 2011 and in 2016, but slightly lower than no action revenues from 2012 to 2015. With the NCLF20 alternative, the scallop revenues for an average vessel are expected to exceed the no action levels. The new closure alternatives will result in lower revenues compared to no action in 2011 and 2012 but higher revenues starting with 2013 as the closed areas open for fishing.
- The percentage change in scallop revenues compared to no action and the average levels for 2008-2009 will vary from vessel to vessel depending on their relative LPUE's. Because larger vessels with higher fishing power can land more pounds of scallops per day-at-sea (have higher LPUE) than smaller vessels, with less open area days compared to no action and recent levels, the revenues they earn from these areas could decline by a larger amount than the revenues of the smaller vessels. This would reduce the proportion of the revenues they obtain from the open areas and thus could lead to decline in their overall revenues somewhat larger than 2.3% in the first year (2010). On the other hand, the larger boats could be able to access productive areas farther from the port and fish in weather conditions that smaller vessels may not be able to. In the following year (2011) as the allocations increase, however, the revenues of the larger vessels could increase relatively more than the average vessel.
- General category vessels will receive 5% of the total scallop TAC and their revenues will be 2% less for the proposed action compared to no action in 2010. Compared to the levels in the 2008-2009, however, the revenues of the general category vessels will decline by a larger percentage as Amendment 11 regulations become effective. The total scallop revenue for the general category fishery was estimated to be about \$30.8 million for 2008 and about \$29.6 million for 2009 fishing years averaging about \$30.2 million. With the proposed action, the revenues for the limited access general category fishery will decline to about \$17 million, or by 43% (Table 112?, Table 129). The major portion of this decline is not due, however, to the proposed action in this Framework, but due to the implementation of Amendment 11 which restricts general category TAC to 5% of the total. During the last two fishing years, the implementation of Amendment 11 was delayed and the general category fishery was allocated 10% of the TAC. The impacts of

the Framework 21 action could be separated from the impacts of Amendment 11 if it was assumed that they continue to land about the same proportion of total landings in 2010 (about 4.5 million pounds or 8.3%) as they did in 2008-2009. Under this scenario, the general category fishery revenues would be about \$28.5 million for the proposed action and the decline from the 2008-2009 levels would be about 5.3%. Therefore, the rest of the reduction in general category fishery revenues (37.7%) will be due the impacts of the Amendment 11 regulations. Amendment 11 analyses were conducted by assuming a general category TAC of about 2.5 million pounds corresponding to a 50 million pounds total scallop TAC, which is very close to the general category TAC for 2010 (2.3 million pounds). The economic impacts were compared to the general category revenues in 2005 (Amendment 11) and 2006 (Framework 19) fishing years during which the total general category scallop revenue were over \$30 million and higher than the level for 2008-2009 general category revenues (Table 129). In short, the short- and the long-term economic impacts of allocating 5% of the total TAC to general category fishery were already analyzed in Amendment 11 and Framework 19 documents, and the economic impacts of the general category TAC in this action are within the range of impacts analyzed in Amendment 11 (Sections 5.4, 5.4.8.5, 5.4.8.6 and 5.4.13 of Amendment 11) and Framework 19 (Section 5.4.10, 5.4.10.1.2).

- The proposed action will have positive economic impacts for the general category fishery as well starting with 2011 (as apart from the impacts of the Amendment 11 regulations). The total scallop landings are estimated to increase to 60 million pounds and over for the proposed action and the revenues are estimated to increase over \$400 million per year for all the alternatives including the proposed action. Therefore, general category TAC is expected to increase compared to the 2010 levels and to have positive impacts on the revenues and profits of these vessels.

Table 131. Average annual scallop revenue per average full-time (FT) vessel (in 2008 inflation adjusted prices and undiscounted values and after TAC set-asides)

| Fishing year | Scenario | Fleet scallop revenue (\$ million) | Revenue per FT vessel | Change from No Action | Change from average of 2008-09 | % Ch. from avg. of 2008-09 |

Alternatives:

NCLF20: Status quo target-F with no closure

NCLF24: Proposed action

CLHighF and CLLowF; New closure alternatives with F=0.20 and F=0.18 respectively.

- The net revenues per limited access vessel are estimated in Table 132 and crew incomes and profits in Table 133. The trip costs per full-time limited access vessel for the proposed action and other alternatives (except for CLHighF) will be lower in 2010 than the values estimated for 2008-2009 because there will be one less access area trip in 2010 and also because fuel prices than what they were in 2008. As a result, net revenues (gross minus the trip costs) for the proposed action (NCLF24) will be slightly higher than the average net revenue per vessel in 2008-2009 fishing years. The NCLF20 alternative would reduce the net revenues by 11% from the 2008-2009 levels in 2010 and the new closure alternatives would result in an increase in the net revenues in the same year (Table 132).
- Proposed action (NCLF24) is expected to reduce net revenues of the vessels by only about 1% while NLCF20 alternative will reduce net revenues by 12% compared to the no action in 2010. These changes are proportional and same as the changes in the fleet-wide producer surplus estimates provided in Section 5.4.2.5.
- Table 132 shows that estimated net revenues for the proposed action and alternatives will increase after 2010 and will exceed the levels for 2008-2009 significantly (by 9% to 29%) especially during 2011-2015 (Table 132).
- In summary, both in the short- and the medium-term (2010-2016), the proposed action will not have a considerable adverse impact on the net revenues of the scallop vessels. Therefore, the proposed action is not expected to have significant impacts on the viability of the vessels especially in a highly profitable industry like the scallop fishery.

Table 132. Average annual scallop net revenue (gross stock minus trip costs) per average full-time (FT) vessel (in 2008 inflation adjusted prices and undiscounted values and after TAC set-asides)

| Fishing year | Scenario | Estimated trip costs per vessel | Estimated net revenue per vessel | Change from No Action | Change in net revenue from 2008-09 | % Ch. from 2008-09 |

Alternatives:

NCLF20: Status quo target-F with no closure

NCLF24: Proposed action

CLHighF and CLLowF; New closure alternatives with F=0.20 and F=0.18 respectively.

Impacts of the proposed action on the profits of the scallop vessels and mitigating factors

- For the RFA analyses, it is important to determine if the proposed action will wipe out the profits entirely in the short-term and if that could result in vessels not meeting their short-term and long-term costs and obligations, resulting in insolvency. The NMFS guidelines (NMFS, 2007) state that “Ultimately, the question the RFA analysis needs to answer is whether in the short and medium-term, the costs (or reduction in revenues) imposed by the regulation can be absorbed by the firm (due to higher than average profitability) or passed on to its customers”.
- Table 133 estimates profits for full-time limited access vessels for the proposed action and the alternatives and provides a comparison with the average levels in 2008-2009. As discussed in Appendix I, boat share is assumed to be 48% and the crew share is assumed to be 52% of the net stocks after paying 5% for the captain and for annual communication and association costs. Profits are estimated by deducting fixed costs from the boat share. Net crew income is estimated by deducting the trip costs from the crew shares. The crew incomes shown in Table 133 do not include the captain’s bonus, which is taken out of the gross stock before the boat and crew shares are determined. Captain’s bonuses will decline in the same proportion as the revenue decline, i.e., by 2% in 2010.
- According to the observer data on fixed costs for the period 2001 to 2007, the fixed costs including maintenance, repairs, engine and gear replacement and hull and liability insurance averaged \$162,000 per full-time vessel (Appendix I). The 2006 and 2007 fixed cost survey data included other cost items such as office, accounting, taxes and interest payments in addition to the repairs, maintenance and insurance. Using the survey cost data, total fixed costs are estimated to be \$176,616 per full-time vessel in 2006 constant dollars and \$188,343 in 2008 dollars (Appendix I). These estimates exclude vessel improvement costs (other than repairs and maintenance) which could be considered as discretionary investment and could be postponed when there is a temporary shortfall in cash earnings. Profits are estimated by removing fixed costs from the net boat shares (Table 133).
- The proposed action will have negative impacts on the profits of the scallop vessels in 2010, but is expected to have positive impacts on profits in the following years starting with 2011. The impacts of the proposed action on profits will be negative in the first year compared to the average levels in 2008-2009 fishing years as well as compared to the no action levels. In 2010, profits will decline by 4% for the proposed action (NCLF24) and by 25% for NCLF20 compared to the average levels in 2008-2009. The profits per average vessel are still estimated to be positive, however, about \$234,253 for the proposed action and about \$184,292 for NCLF20. Profits are estimated to increase for the new closure alternatives in 2010 compared to average values for 2008-2009.
- The percentage decline in profits and crew income in 2010 for the proposed action and for NCLF20 will vary from vessel to vessel and from the average levels depending on the vessel size and LPUE’s. Because larger vessels with higher fishing power can land more

pounds of scallops per day-at-sea (have higher LPUE) than smaller vessels, with less open area days compared to no action, the revenues they earn from these areas could decline by a larger amount than the revenues of the smaller vessels from the no action levels. This could lower the profits of the larger vessels relatively more given that fixed costs are larger for the bigger boats as well. Total revenues of the larger vessels are still expected to be higher than the smaller vessels, however, because they land more scallops from their open area days. The larger boats could be able to access productive areas farther from the port and fish in weather conditions that smaller vessels may not be able to. Since the trips costs per day-at-sea are larger for the bigger boats, their cost savings due to the reduction in open area effort will be larger than the average vessels. For these reasons, the impacts of the proposed action on the profits of the larger boats relative to the no action levels are not expected to be significantly different from the impacts on an average boat in the scallop fishery. In the following year as the allocations increase, the revenues of the larger vessels could increase relatively more than the average vessel, thus the increase in profits could be higher than relative to an average vessel.

- Although smaller scallop vessels in the fishery have lower revenues from the open areas, thus, have lower total revenues than an average vessel, their fixed costs and trip costs are substantially lower as well. For example, total fixed costs of the small boats with a 51 gross tons to 100 gross tons were about 60% of the fixed costs for an average vessel (Appendix I, Estimation of fixed costs). Therefore, the impacts of the proposed action on the profits of the small boats are not expected to be significantly different from the impacts on an average boat in the scallop fishery. That is, the decline in allocations with the proposed action will lower their net revenues and profits in 2010, but is expected to increase their revenues and profits in 2011. Due to the decline in net revenues in 2010, the profits for the general category vessels are estimated to decline as well.
- The existence of relatively high profits in the scallop fishery is expected to mitigate the decline in net revenues in the fishery in 2010. Table 133 shows that the profit rates for the full-time limited access vessels were about 26% of the gross scallop revenue during 2008-2009 fishing years. The surplus over the costs could be applied in years when the fishery is not doing so well. The profits for an average full-time vessel would still be around 25% of the gross scallop revenue for the proposed action and 22% of the gross scallop revenue for the NCLF20 alternative and higher for the new closure alternatives.
- The allowance for carry-over days is another factor could also mitigate some of the negative impacts of the proposed action on net revenues and profits of the vessels, negative impacts on crew incomes and employment (in terms of crew-days =Crew*DAS-used) in 2010. The vessels that choose to save some of the open area days allocated in the past or in 2009 could use up to 10 days in 2010 to mitigate the decline in DAS allocations in 2010.
- The proposed action is estimated to increase profits by 29% in 2011 compared to the levels in 2008-2009. In fact, profits will increase for all alternatives relative to the levels in 2008-2009. Profit rates will vary between 26% to 29% during 2011-2016 for the proposed action and the alternatives (Table 133).

Table 133. Average boat shares, crew income and profits per average full-time (FT) vessel (in 2008 inflation adjusted prices and undiscounted values and after TAC set-asides)

| Fishing year | Scenario | Net boat share | Net crew income | Profits | Change from 2008-2009 | % Change from 2008-09 | Profit rate (% of gross revenue) |

Alternatives:

NCLF20: Status quo target-F with no closure

NCLF24: Proposed action

CLHighF and CLLowF; New closure alternatives with F=0.20 and F=0.18 respectively.

In summary, both in the short- and the medium-term (2010-2016), the proposed action will not have a considerable adverse impact on the profits of the scallop vessels. Therefore, the proposed

action is not expected to have significant impacts on the viability of the vessels especially in a highly profitable industry like the scallop fishery.

Comparison of the impacts with the alternative options:

The analyses provided above and in Section 5.4 of the document compared the impacts of the alternative options. No action alternative is expected to minimize negative economic impacts on the small business entities and scallop vessels in 2010, but will result in smaller revenues over the medium to long-term compared to some alternatives. No action alternative does not prevent overfishing and would result in suboptimal allocation of open area DAS and access area trips as discussed in Section 5.4.1. Consequently, no action would have negative impacts on scallop stock biomass, on landings, revenues and economic benefits from the scallop fishery. In addition, since fishing mortality would be higher in the open areas, no action would have higher impacts on area swept projections in SNE which has impacts on YT bycatch and turtles. This in turn, would have required more stringent measures to comply with RPM with negative short-term impacts on the scallop vessels.

The status-quo target-F (NCLF20) alternative would have larger positive impacts on the vessel revenues and profits for the medium-term (2011-2016) compared to the proposed action. This alternative (NCLF20) would have considerable negative impacts on vessel revenues and profits in 2010, however. The profits is estimated to decline by 25% in 2010 with this alternative, whereas the proposed action will minimize the short-term negative impacts on revenues and profits (4% estimated loss for 2010) compared to the average levels for 2008-2009.

The new closure (CLF20) would have positive economic impacts on the profits scallop vessels in 2010, but the profits for the proposed action will be larger in 2011-2012. The comparative impacts of these alternatives on the net revenues of individual vessels will be proportional on their fleet-wide impacts as estimated by the producer surplus in Section 5.4.2.5 and reproduced in Table 134 below. The present cumulative value for the producer surplus (total revenues minus fishing costs) for the new closure high F option \$14 million less than the no action and lower than the proposed action cumulative producer surplus for 2010-2016. Therefore, this alternative is not expected to generate higher benefits for the scallop vessels in the medium-term (2010-2016) compared to the proposed action.

The new closure low-F option (CLF18) would result in higher benefits for the scallop vessels both in the short - (2010) and the medium-term (2010-2016) compared to the proposed action. This alternative would have undesirable biological impacts, however, because new rotational area closure alternatives resulted in a higher area swept estimates in Mid-Atlantic which could have impacts on non-target species in those areas. If the scallop fishery caused negative impacts on the non-target species, then more stringent measures would have to be taken to reduce effort with potentially negative economic impacts on the scallop vessels.

Table 134. Short and long-term cumulative present value of the producer surplus (million \$, in 2008 inflation-adjusted prices, discount rate of 7% (except otherwise noted as 3%))

| Period | Data | No action | No Closure <i>F</i> = 0.20 | No Closure <i>F</i> = 0.24 | Closure <i>F</i> = 0.20 | Closure <i>F</i> = 0.18 |
|--------------------------|--------------------------------|-----------|-------------------------------|-------------------------------|----------------------------|----------------------------|
| 2010 (not discounted) | PV of producer surplus | 305 | 268 | 303 | 333 | 309 |
| | Difference from No Action | | -37 | -2 | 28 | 4 |
| 2011-2016 | PV of producer surplus | 1,864 | 1,913 | 1,860 | 1,822 | 1,886 |
| | Difference from No Action | | 49 | -3 | -42 | 22 |
| | Difference from No Action (3%) | | 55 | -3 | -41 | 31 |
| 2010-2016 | PV of producer surplus | 2,169 | 2,181 | 2,163 | 2,155 | 2,194 |
| | Difference from No Action | | 12 | -6 | -14 | 26 |
| | Difference from No Action (3%) | | 18 | -5 | -13 | 35 |
| 2017-2023 | PV of producer surplus | 1,363 | 1,427 | 1,418 | 1,398 | 1,424 |
| | Difference from No Action | | 64 | 55 | 35 | 61 |
| | Difference from No Action (3%) | | 93 | 80 | 53 | 88 |
| 2010-2023 | PV of producer surplus | 3,532 | 3,608 | 3,581 | 3,553 | 3,618 |
| | Difference from No Action | | 76 | 49 | 21 | 86 |
| | Difference from No Action (3%) | | 111 | 75 | 39 | 123 |

The aggregate impacts of the proposed measures could differ from the economic impacts of the individual measures as discussed in the relevant subsections of Section 5.4 and summarized in the following section.

6.12.3.3.2 Economic impacts of the individual measures

Acceptable Biological Catch

- Economic impacts are analyzed in Section 5.4.2.1
- Rationale is provided in Section 2.3 and in Executive Summary.
- **Summary of the impacts of the proposed option and mitigating factors:**

This new requirement is expected to have long-term economic benefits on the fishery by helping to ensure that catch limits and fishing mortality targets are set at or below ABC. This should help prevent overfishing and optimize yield on a continuous basis. Therefore, this measure is expected to have positive impacts on the landings and revenues, producer and consumer surpluses and net economic benefits to the nation.

- **Comparison of the impacts with the alternative options:** There are no alternatives that would generate higher economic benefits for the participants of the scallop fishery.

Adjustments when yellowtail flounder catches reach 10% TAC limit

- Rationale is provided in Executive Summary and in Section 2.5.1.1
- Economic impacts are analyzed in Section 5.4.3.1
- **Summary of the impacts of the proposed option and mitigating factors:** This alternative will continue the measures under no action and the allocation of prorated open area DAS will have the same impacts. It will help to minimize loss in pounds and revenue due to the closure of access areas due to yellowtail quota before a vessel takes its trip. As a result, this measure will have positive economic impacts on scallop vessels although the scallop pounds per trip could be lower than the allocated pounds for the Georges Bank access area trips due to the proration.

- **Comparison of the impacts with the alternative options:** There are no alternatives that would generate higher economic benefits for the participants of the scallop fishery.

TAC set-asides for observers and research

- Rationale is provided in Section 2.5.1.2
- Economic impacts are analyzed in Section 5.4.3.3
- **Summary of the impacts of the proposed option and mitigating factors:** Setting aside 2% of available TAC in access areas for research, and 1% to provide funding for observers is expected to have indirect economic benefits on the sea scallop fishery by improving scallop management through better data and information made possible by research and the observer program.
- **Comparison of the impacts with the alternative options:** There are no alternatives that would generate higher benefits for the scallop vessels.

DAS adjustments if the LAGC IFQ program is not implemented by March 1, 2010

- Rationale is provided in Section 2.5.1.4.
- Economic impacts are analyzed in Section 5.4.3.5
- **Summary of the impacts of the proposed option and mitigating factors:** If the LAGC IFQ program is not fully implemented before March 1, 2010 the LAGC fishery is allocated 10% of the total projected scallop catch compared to 5% for status quo. As a result, open area DAS allocations for limited access vessels will be reduced resulting with negative impacts of revenues and profits of the limited access vessels in 2010.
- **Comparison of the impacts with the alternative options:** There are no alternatives to reducing open area DAS if LAGC IFQ program is not implemented by March 1, 2010.

Quarterly Hard TAC for General Category Vessels

- Rationale is provided in Executive Summary.
- Economic impacts are analyzed in Sections 5.4.4.1
- **Summary of the impacts of the proposed option and mitigating factors:** This constitutes no action if the LAGC IFQ program is not implemented by March 1, 2010. General category TAC (% 10 of total scallop TAC) will be allocated on a quarterly basis to the general category fishery during the interim period to prevent overfishing of the scallop resource due to the expansion of the general category effort. As a result, this measure will have positive economic impacts over the long-term on the vessels that qualify for general category limited access fishery. The division of the total TAC into quarterly TACs will reduce race to fish to some extent and lessen the negative economic impacts associated with derby fishing.
- **Comparison of the impacts with the alternative options:** There is no other alternative to the no action alternative of 10% hard quarterly TAC for the general category fishery if LAGC IFQ program is not implemented by March 1, 2010.

Georges Bank Access Area management

- Rationale is provided in Section 2.6.2 and 2.6.2.1 and in Executive Summary.
- Economic impacts are analyzed in Section 5.4.3.1 and 5.4.4.3

- **Summary of the impacts of the proposed option and mitigating factors:** Allocation of one access area trip to the Nantucket Lightship area (NLS) is expected to have positive economic impacts. The biomass and LPUE in this area is estimated to be quite high and trip costs will lower since the same amount of scallops could be landed in a shorter time frame compared to areas with lower scallop abundance. Providing allocations to high abundance areas will help increase yield, landings and revenues from the fishery both in the short- and the long-term, benefiting both limited access and general category vessels that participate in the scallop fishery. The proposed action (no action) also includes closure of the NLS area if the 10% yellowtail flounder bycatch TAC for SNE is reached (section 2.6.2.1). The yellowtail flounder bycatch TAC is shared between the limited access and general category fisheries; therefore, once the TAC is reached the area closes for both fleets. Since this measure is no action, there will be no change in economic impacts under the present regulations.
- **Comparison of the impacts with the alternative options:** There are no alternatives that would generate higher benefits for the scallop vessels. The only alternative is the no action. Because there is no trip allocation to the NLS area under no action, economic benefits would be lower both in the short and long-term compared to the proposed alternative.

Mid-Atlantic access area management

- Description is provided in Section 2.6.3 and rationale is provided in Executive Summary
- Economic impacts are analyzed in Section 5.4.3.2 and 5.4.4.4
- **Summary of the impacts of the proposed option and mitigating factors:**

The proposed action and the alternatives include access into both Elephant Trunk and Delmarva for both the LA and LAGC fleets. The LAGC fleet would be allocated 5% of the total projected catch for both areas in the form of fleet-wide trips. The economic impacts of trip allocations for the Elephant Trunk and Delmarva are analyzed in Section 5.4.2 in combination with other open and access area measures. By itself, allocations for the highly productive areas of Mid-Atlantic in 2010 will have positive economic impacts on both limited access and general category vessels.

- **Comparison of the impacts with the alternative options:** There are no alternatives that would generate higher benefits for the scallop vessels. The only alternative is the “No Action” which would allocate would allocate 3 trips to ETA, which is higher than the projected biomass in that area can support. As a result, “No Action” would have negative impacts on the biomass and yield from the ETA.

Northern Gulf of Maine (NGOM) Hard-TAC

- Rationale is provided in Section 2.6.4 and in executive Summary
- Economic impacts are analyzed in Section 5.4.4.5
- **Summary of the impacts of the proposed option and mitigating factors:**

Proposed action includes a 70,000 pounds hard-TAC for the NGOM, which is equivalent to the “No Action” scenario as specified in the previous Framework action 19. This measure is expected to have positive economic impacts on a larger number of vessels that are not qualified for limited access but qualifies for an NGOM permit since these vessels will have an opportunity to earn some income from scallops in this area until the resource status can be better determined and becomes more favorable.

- There are no other alternative options.

Allow leasing of partial general category IFQ allocations during the fishing year

- Rationale is provided in Executive Summary and in Section 2.6.6
- Economic impacts are analyzed in Section 5.4.4.7
- **Summary of the impacts of the proposed option and mitigating factors:** Proposed action measure will provide flexibility for the general category vessels to lease and earn income their unused quotas to other vessels during the fishing year. This will allow fishermen to combine their allocations and to benefit from an economically viable operation when the allocations of individual vessels are too small to make scallop fishing profitable. As a result, this measure will have positive impacts on vessel revenues and profits.
- **Comparison of the impacts with the alternative options:** There are no other alternatives that would generate higher benefits for the scallop vessels. The only alternative is the “No Action” and it does not allow vessel to lease their unused quotas to other vessels during the fishing year.

Minimization of impacts of incidental take of sea turtles

- Rationale is provided in Section 2.8 and in the Executive Summary of the Framework 21 document.
- Economic impacts are analyzed in Section 5.3 and in Section 5.4.6.
- **Summary of the impacts of the proposed option and mitigating factors:**

The proposed action is a combination of the Delmarva closure in September and October with a limit on the maximum number of trips (at two per vessel) that can be taken in the Mid-Atlantic areas from June 15 to August 31. Because the effort is shifted to a relatively less productive season, total fleet trip costs are expected to increase slightly. Since there is no change in the possession limit, the trips that are shifted from this season are expected to be taken outside of the turtle window, without a loss in total revenue if as expected, this measure does not have a negative impact on prices. The proposed action includes a seasonal closure in the Delmarva access area from September 1 – October 31 to all scallop vessels, including general category vessel. This measure is not expected to affect general category fleet specifically since the access area trips for this fleet are allocated as a fleet-wide number of trips, and tend to be used in the weeks following an opening and before September 1st.

Comparison of the impacts with the alternative options: There are no other alternatives that would generate higher benefits for the scallop vessels. The only alternative is the “No Action,” but no action would not comply with the reasonable and prudent measures to minimize the impacts of any incidental take. The economic impacts of the RPM measures will vary with the Framework 21 allocation alternatives and the window of time in which the measures are applied. The proposed action is expected to minimize the effort shift from the turtle window compared to the other alternatives considered by the Council, thus, there are no other alternatives that would generate higher benefits for the scallop vessels.

Limit the amount of observer compensation general category vessels can get per observed trip in access areas

- Description is provided in Section 2.9.2 and Rationale is provided in the Executive Summary.
- Economic impacts are analyzed in Section 5.4.7.2.

- **Summary of the impacts of the proposed option and mitigating factors:** Proposed action includes a provision to limit the amount of observer compensation general category vessels can receive on observed trips in access areas to the equivalent of one day compensation regardless of trip length. Therefore, this action would eliminate a “loophole” for how compensation is granted and create a ceiling to discourage overages. If this ultimately improves the overall coverage of the scallop fishery there may be indirect economic benefits from improved information and monitoring of the fishery and resource.
- **Comparison of the impacts with the alternative options:** There are no other alternatives that would generate higher benefits for the scallop vessels.

6.12.3.3 Indirectly affected industries

Indirect impacts include the impacts on the sales, income, employment and value-added of industries that supply commercial harvesters, such as the impacts on marine service stations that sell gasoline and oil to scallop vessels. The induced impacts represent the sales, income and employment resulting from expenditures by crew and employees of the indirect sectors. Proposed action is expected to have negative indirect impacts in 2010 and negligibly small negative indirect impacts over the medium-term from 2010-2016 compared to no action. But given that overall impacts of the proposed measures on the fleet revenues and profits will be small during 2010-2016, their indirect and induced impacts are not expected to be significant in the medium term. Over the long-term from 2010 to 2023, however, the proposed action will generate \$53 million (at 7% discount rate) to \$81 million (at 3% discount rate) more revenues than the no action alternative and will have positive indirect impacts on the indirectly affected industries.

6.12.3.3.4 Identification on Overlapping Regulations

The proposed regulations do not create overlapping regulations with any state regulations or other federal laws.

7.0 GLOSSARY

Annual fishing mortality target – a rate of removals that when applied over a fishing year is consistent with the objectives of the FMP.

Annual potential increase – the percent increase in total or relative biomass that would occur during a one-year interval if no fishing occurs (i.e. zero fishing mortality). Projection models take into account the size frequency distribution of the population, the expected growth of individuals at each size class, and natural mortality.

Area based management – in contrast to resource wide allocations of TAC or days, vessels would receive authorization to fish in specific areas, consistent with that area's status, productivity, and environmental characteristics. Area based management does not have to rotate closures to be effective.

Area rotation – a management system that selectively closes areas to fishing for short to medium durations to protect small scallops from capture by commercial fishing until the scallops reach a more optimum size. Closed areas would later re-open under special management rules until the resource in that area is similar to other open fishing areas. Area rotation is a special subset of area based management that relies on an area closure strategy to achieve the desired results when there are sufficient differences in the status of the management areas.

B_{max} – a theoretical value when the scallop stock with median recruitment is fished at F_{max}. For a stock without a stock-recruitment relationship, like sea scallops, this stock biomass produces MSY when fished at F_{max}.

Biological Opinion – an ESA document prepared by either the NMFS or USFWS describing the impacts of a specific Federal action, including an FMP, on endangered or threatened species. The Biological Opinion concludes whether or not the NMFS/USFWS believe that the actions are likely to jeopardize the continued existence of any of the protected species, and provides recommendations for avoiding those adverse impacts.

Closed rotation area – an area that is temporarily closed to postpone mortality on abundant, small scallops.

Consumer surplus - The net benefit consumers gain from consuming fish based on the price they would be willing to pay for them. Consumer surplus will increase when fish prices decline and/or landings go up.

Contagious recruitment – similar amounts of scallop settlement in related areas. When scallop settlement is above average in one area, it tends to be above average in neighboring areas.

Controlled access – a program that allows fishing in a specified area under rules that differ from the normal fishery management rules that apply to normal, open fishing areas. Often controlled

access areas have a scallop TAC, a scallop possession limit, and area-specific trip and DAS allocations. Other regulations may apply to achieve certain conservation objectives.

Critical habitat – an area that has been specifically designated under the ESA as an area within the overall geographical region occupied by an endangered or threatened species on which are found the physical or biological features essential to conservation of the species.

Day-at-sea (DAS) – is each 24-hour period that a vessel is on a scallop trip (i.e. not declared out of the day-at-sea program) while seaward of the Colregs line.

Day-at-sea tradeoff – the number of days automatically charged for fishing for scallops in designated areas, regardless of the time actually fished.

Day-at-sea use – the amount of time that a vessel spends seaward of the Colregs line on a scallop trip.

Days-at-sea accumulated – days charged against a vessel's annual day-at-sea allocations, including day-at-sea tradeoffs. Trips in controlled access areas are often charged a pre-established amount of DAS, regardless of the actual duration of the trip.

Endangered species – a species that is in danger of extinction throughout all or a significant portion of its range.

ESA - Endangered Species Act of 1973 as amended.

Exploitable biomass - the total meat weight of scallops that are selected by fishing, accounting for gear and cull size, at the beginning of the fishing year⁶.

F_{max} – a fishing mortality rate that under equilibrium conditions produces maximum yield-per-recruit. This parameter serves as a proxy for F_{msy} for stocks that do not exhibit a stock-recruitment relationship, i.e. recruitment levels are driven mostly by environmental conditions.

Fixed costs - These costs include expenses that are generally independent of the level of fishing activity, i.e., DAS-used, such as insurance, license, half of repairs, office expenses, professional fees, dues, utility, interest, dock expenses, bank, rent, store, auto, travel, and employee benefits.

Fixed duration closure – a rotational closure that would be closed for a pre-determined length of time.

Fixed rotational management area boundaries – pre-defined specifications of areas to be used to manage area rotation.

⁶ The **average exploitable biomass** is different and is defined as the total meat weight of scallops that are selected by fishing averaged over the fishing year, accounting growth, natural mortality, fishing mortality, and gear and cull size.

FMP – Fishery Management Plan.

Heterogeneity – spatial differences in the scallop resource, life history, or the marine environment.

Incidental Take Statement – a section of a Biological Opinion that allows the take of a specific number of endangered species without threat of prosecution under the ESA. For the Scallop FMP, an incidental take statement has been issued for a limited number of sea turtles to be taken by permitted scallop vessels.

IWC – International Whaling Commission; an international group that sets international quotas and/or establishes moratoria on harvesting of whales.

Localized overfishing – a pattern of fishing that locally exceeds the optimum rate, considering the age structure of the population, recruitment, growth, and natural mortality. This effect may cause mortality that is higher than appropriate on small scallops while under-fishing other areas with large scallops (assuming that the overall amount of effort achieves the mortality target for the entire stock). The combined effect is to reduce the yield from the fishery through the loss of fast-growing small scallops and the loss of biomass from natural mortality on very large scallops.

Long-term closure area – an area closed to scallop fishing for reasons other than achieving area rotation objectives. These areas may be closed to minimize habitat impacts, avoid bycatch, or for other reasons.

LPUE – Similar to catch per unit effort (CPUE), commonly used terminology in fisheries, LPUE in the Scallop FMP refers to the amount of landings per DAS a vessel achieves. This value is dependent on the scallop abundance and catch rate, but also depends on the shucking capacity of the crew and vessel, since most of the scallop catch must be shucked at sea. Since discard mortality for sea scallops is low, discards are not included as a measure of catch in the calculation of LPUE.

Magnuson Act – Magnuson Stevens Act of 1976 as amended.

Meat yield – the weight of a scallop meat in proportion to the total weight or size of a scallop. Scallops of similar size often have different meat yields due to energy going into spawning activity or due to the availability of food.

MMPA - Marine Mammal Protection Act of 1972 as amended.

NAAA - The Northwest Atlantic Analysis Area was a geographic area used in the habitat metric analysis. Its boundary to the North is the Hague line, the NC/SC border to the South, the coastline to the West, and the 500 fathom depth contour to the East.

NEPA – National Environmental Policy Act of 1972 as amended.

Net economic benefits - Total economic benefits measure the benefits both to the consumers and producers and are estimated by summing consumer and producer surpluses. Net economic benefits show, however, the change in total economic benefits net of no action.

NMFS – National Marine Fisheries Service.

Nominal versus real economic values - The nominal value of fishing revenues, prices, costs and economic benefits are simply their current monetary values unadjusted for inflation. Real values are obtained, however, by correcting the current values for the inflation.

Open area – a scallop fishing area that is open to regular scallop fishing rules. The target fishing mortality rate is the resource-wide target.

Operating expenses or variable costs - The operating costs measures the expenses that vary with the level of the fishing activity including food, ice, water, fuel, gear, supplies and half of the annual repairs.

Opportunity cost - The cost of forgoing the next best opportunity. For example, if a fisher's next best income alternative is to work in construction, the wage he would receive from construction work is his opportunity cost.

PDT – Scallop plan Development Team; a committee of experts that contributed to and developed the technical analysis and evaluation of alternatives.

Potential biomass increase - the annual change in the total biomass of scallop meats if no fishing occurs.

Producer surplus -Producer surplus for a particular fishery shows the net benefits to harvesters, including vessel owners and the crew, and is measured by the difference between total revenue and operating costs.

Recently re-opened area – an area that has recently re-opened to scallop fishing following a period of closure that postponed mortality on small scallops. The annual TAC and target fishing mortality rate is defined by time-averaged fishing mortality that allows the area-specific target to deviate from the norm. Special rules (i.e. day-at-sea allocations or trips with possession limits and day-at-sea tradeoffs may apply).

Recruitment – a new year class of scallops measured by the resource survey. Scallop larvae are pelagic and settle to the bottom after 30-45 days after spawning. The resource survey, using a lined dredge, is able to capture scallops between 20 – 40 mm, but more reliably at between 40 and 60 mm. Recruitment in this document refers to a new year class that is observable in the survey, at around two years after the eggs had been fertilized and spawned.

Recruitment overfishing – a high level of fishing mortality that causes spawning stock biomass to decline to levels that significantly depresses recruitment. Because sea scallops are very

productive, this mortality rate is substantially higher than F_{\max} and the biomass where recruitment is threatened is much lower than the present biomass target.

SAFE Report – A Stock Assessment and Fishery Evaluation Report, required by the Sustainable Fisheries Act. This report describes the present condition of the resource and managed fisheries, and in New England it is prepared by the Council through its Plan Development Teams (PDT) or Monitoring Committees (MC). The Scallop PDT is the MC for the Atlantic Sea Scallop FMP and prepares this report.

SMAST – School for Marine Science and Technology, University of Massachusetts Dartmouth

Scallop productivity – the maximum average amount of biomass that can be taken from a defined area.

Shucking – a manual process of cutting scallop meats from the shell and viscera.

Size selection – in the scallop fishery, size selection occurs at two points: when the fishing gear captures the scallop and when the crew culls the catch before shucking. At the first point, size selection depends on escapement through the dredge rings, twine top, or trawl meshes. At the second point, size selection depends on the size of the catch and marketability. Small scallops are less valuable and more time consuming to shuck a pound of meats. These factors influence whether the crew retains scallops at a smaller or larger size. Size selection by the fishery is the combined effect of mortality from landed scallops, from discard mortality, and from non-catch mortality from the fishing gear. Except under certain rare conditions, most of the mortality has been associated with the landed portion of the catch.

TAC – Total allowable catch is an estimate of the weight of scallops that may be captured by fishing at a target fishing mortality rate. The TAC could apply to specific areas under area based management rules.

Take – a term under the MMPA and ESA that means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct with respect to either a marine mammal or endangered species.

Ten-minute square – an approximate rectangle with the dimensions of 10-minutes of longitude and 10-minutes of latitude.

Threatened species – any species that is likely to become endangered within the foreseeable future throughout all or a significant portion of its range.
