In 2010, 7 residents, or 9.9% of the population, held 8 permits issued by the Commercial Fishery Entry Commission (CFEC). In 2000, 10 residents held 8 CFEC permits. In both 2000 and 2010, salmon permits made up 88% of the CFEC permits issued. In addition, one Federal Fisheries Permit (FFP) and one License Limitation Program (LLP) permit for groundfish were held, although neither was actively fished. No residents held halibut, sablefish, or crab quota between 2010 and when the programs began.

Residents held 8 commercial crew licenses in 2010, compared to 12 in 2000. In addition, residents held majority ownership of four vessels that year, compared to two in 2000. Overall, every CFEC permit issued in 2010 was actively fished, compared to 88% in 2000. Fisheries prosecuted by residents of Akhiok that year included Kodiak gillnet and purse seine herring roe, and Kodiak purse seine and set gillnet salmon.⁹⁹

Akhiok (Alitak Bay) ranked 39th of 67 communities who reported landings in terms of total pounds landed that year and 33rd in terms of total ex-vessel value of landings. All information regarding total net poundage and total ex-vessel value of landings in Akhiok (Alitak Bay) between 2000 and 2010 are considered confidential. In addition, all information regarding total poundage and ex-vessel value of landings by residents of Akhiok between 2000 and 2010 are also considered confidential. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Sportfishing on Kodiak Island can be divided into private anglers who use boats and those who use the Island's road system to access sportfishing destinations. There are 75 mi of paved and hard-packed gravel roads that cross 10 significant streams and provide access to 18 stocked lakes. Road system anglers can find salmon, Dolly Varden, rainbow trout, and steelhead in freshwaters. Remote areas on Kodiak, categorized as any areas outside the road system, provide opportunities for salmon, Dolly Varden, and fall-run steelhead trout. Remote Area salmon being to return in early June, and fishing grounds are typically accessed by charter boat or seaplane.¹⁰⁰

Troll-fishing Kodiak's marine waters for Chinook and coho salmon is a popular activity on the island. Chiniak bay provides year-round habitat for Chinook. The Karluk River south of

¹⁰⁰ Alaska Dept. of Fish and Game. (2012). *Kodiak*. Division of Sport Fish. Retrieved August 14, 2012 from: <http://www.adfg.alaska.gov/static-sf/Region2/pdfpubs/kodiak.pdf>.

Larsen Bay provides one of Kodiak’s only native freshwater Chinook fisheries. Normally, the Karluk River annually averages an in-river run of 8,000 Chinook; however, recent runs have been in decline.

Sockeye salmon are plentiful in many drainages on Kodiak and tend to spawn along lakeshores and tributary systems. Generally, sockeye salmon arrive in early June and run through the end of July. The Kodiak road system provides access to sockeye salmon on the Buskin, Pasagshak, and Saltery rivers on eastern Kodiak Island. Pink salmon are found in abundance throughout the coastal and freshwater drainage systems around Kodiak Island. Pink salmon can be caught along ocean beaches and near stream mouths between middle to late July with runs peaking around mid-August. Coho salmon are typically targeted in offshore marine areas using charter or private vessels. The troll recreational fishery peaks the third week of August and is typically over by mid-September. Large runs of coho salmon occur late in the year in the Karluk River, with lagoon fishing starting in early September and peaking by the end of the month. The Karluk River also maintains the largest population of steelhead trout on the island, averaging 8,000 fish annually. Middle to late October is the best time to fish for steelhead, although mid-April and early May are also good times. Dolly Varden are found at lake outlets and near the mouths of freshwater systems feeding on out-migrating pink salmon fry. Then in mid-July through October, Dolly’s migrate back into freshwaters to spawn and winter. Halibut are abundant around Kodiak Island, and sportfishing is excellent from late April through early September. In a typical year, sport anglers catch over 25,000 halibut in Kodiak waters. More than 30 species of rockfish are found in Kodiak marine waters. Common species caught include dark, dusky, and yellow-eye rockfish. The estimated rockfish catch is around 25,000 fish annually. Lingcod are also found in the area, and the typical annual catch averages around 2,500 fish.¹⁰¹

Although sportfishing around Kodiak Island is immensely popular among both Alaska resident and non-Alaska resident private anglers, accessibility and infrastructure limit large-scale tourism-based sportfishing within Akhiok. In 2010, only one registered sport fish guide business was active in the community. South Kodiak Adventures provides lodging, fishing, hunting, and wildlife viewing services.¹⁰² In 2010, 14 sportfishing licenses were sold to residents, compared to 16 in 2000. No sportfishing licenses were sold within the community between 2000 and 2010.

Akhiok is located within the Kodiak Island ADF&G Harvest Survey Area, which includes all Alaskan waters and drainages of the Kodiak and Afognak Island groups. In 2010, angler days fished totaled 40,377 for saltwater and 41,082 for freshwater fisheries, compared to 55,576 and 65,831 in 2000, respectively. In that year non-Alaska residents accounted for 49.6% of saltwater angler days fished, compared to 30.2% in 2000; indicating a proportional decline in resident angler days fished. The same trend was seen in freshwater angler days fished with non-Alaska residents accounting for 45.9% in 2010, compared to 28.3% in 2000.

According to ADF&G Harvest Survey data, local anglers using private boats target Chinook, coho, sockeye, and pink salmon, Dolly Varden char, halibut, and Dungeness crab. Other species targeted include chum salmon, rainbow and steelhead trout, and Tanner crab.¹⁰³ There is no kept/released charter log data available for Akhiok.

Subsistence Fishing

Many residents of Akhiok supplement their income and diets with subsistence resources. According to a survey conducted by the AFSC in 2011, community leaders reported that halibut, salmon, and clams were the three most important subsistence resources to the community. In a 2003 ADF&G survey of subsistence participation by household, 88% were participating in salmon subsistence activities, 100% were participating in halibut subsistence activities, 21% were participating in marine mammals subsistence activities, 77% were participating in marine invertebrates subsistence activities, and 26% were participating in non-salmon fish subsistence activities. Estimated pounds per capita harvested that year for those species was 157.22. Another similar survey conducted by ADF&G in 2004 found 92% of households participating in salmon subsistence activities and 46% participating in non-salmon fish subsistence activities.

Of the species reported by ADF&G in Table 13, residents reported harvesting sockeye salmon the most often, followed by pink and coho. In 2008, residents reported harvesting 90 salmon on 3 permits, compared to 105 salmon on 2 permits in 2000. In 2010, 6 residents held 10 Subsistence Halibut Registration Certificates (SHARC), compared to 15 in 2003. In that year, an estimated 320 lbs of halibut was harvested using 8 SHARC, compared to an estimated 1,846 lbs harvested on 14 SHARC in 2003. Subsistence halibut harvests peaked in 2005 with an estimated 3,587 lbs harvested on 16 SHARC. Residents living in Akhiok have seen dramatic declines in subsistence halibut harvests. Between 2007 and 2012, the community reported significant declines in number of halibut over 20 lbs, compared to regular harvests of fish ranging from 80 to 100 lbs during the 1990s. There have also been observations in skin abnormalities (including the apparent “shearing” of skin from the underside of the fish) in halibut harvests. Overall there is concern within the community over implications of commercial trawl fisheries on subsistence resources.¹⁰⁴ In terms of marine mammal harvests, an ADF&G survey estimated that 15 sea lions and 78 harbor seals were harvested between 2000 and 2008 (Table 15). Further information regarding subsistence trends can be found in Tables 12 through 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders reported that commercial fishing has “dwindled down to almost non-existent” and that the community’s economy is currently not dependent on natural resources. Commercial vessel traffic to the community has remained unchanged over the last 5 years, although there has been an increase in recreational and pleasure vessels in the harbor.

Karluk (KAR-luck)

People and Place

*Location*¹⁰⁵

Karluk is located on the west coast of Kodiak Island, on the Karluk River, 88 air miles southwest of Kodiak and 301 miles southwest of Anchorage. The community occupies 55.4 sq mi of land and 2.4 sq mi of water. Karluk is unincorporated and under the jurisdiction of the Kodiak Island Borough.

*Demographic Profile*¹⁰⁶

In 2010, there were 37 residents in Karluk, making it the 309th largest of 352 communities in Alaska with recorded populations that year. Between 1990 and 2000, the population declined by 62%, followed by a rebound of 37% between 2000 and 2010. Overall, the Karluk's population in 2010 was 47.9% lower than in 1990. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 40.7%., with an average annual growth rate of 4.06%.

In 2010, a majority of Karluk residents identified themselves as American Indian and Alaska Native (35 individuals; 94.6% of the total population), while 2 individuals (5.4%) identified themselves as White. It is important to note that, although no Asian population appears to be represented in 2010, in 2000 one individual (3.7% of the population) identified as Asian, and no residents identified themselves as White that year. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Karluk was 3.08, a slight increase from 3.0 persons per household in 2000, but an overall decrease from 3.9 in 1990. In that year, there were a total of 21 housing units, compared to 27 in 1990 and 24 in 2000. Of the households surveyed in 2010, 43% were owner-occupied, compared to 25% in 2000; 14% were renter-occupied, compared to 13% in 2000; and 43% were vacant or occupied seasonally, compared to 63% in 2000.

The gender distribution in 2010 was skewed towards males at 56.8% male and 43.2% female. This was less even than the statewide distribution (52.0% male, 48.0% female), and similar to the distribution in 2000 (55.6% male, 44.4% female). The median age in 2010 was 18.8 years, which was significantly lower than both the statewide median of 33.8 years and 2000 median of 30.3 years.

Figure 1. Racial and Ethnic Composition, Karluk: 2000-2010 (U.S. Census).

The population structure was significantly irregular in both 2000 and 2010, likely due to the small population size. However, there was a strong shift to a younger demographic between those years. In 2010, 54.0% of residents were under the age of 20, compared to 37.0% in 2000; 5.4% were over the age of 59, compared to 7.4% in 2000; 35.1% were between the ages of 30 and 59, compared to 44.4% in 2000; and 5.4% were between the ages of 20 and 29, compared to 11.1% in 2000.

Gender distribution by age cohort was significantly less even in 2010 than in 2000. In 2010, the greatest absolute gender difference occurred in the 10 to 19 range (24.3% male, 8.1% female), followed by the 0 to 9 (16.2% male, 5.4% female) and 30 to 39 (10.8% female, 2.7% male) ranges.

Figure 2. Population Age Structure in Karluk Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)¹⁰⁷ estimated that 66.7% of residents aged 25 and over held a high school diploma or higher degree in 2010, significantly less than the estimated 90.7% of Alaska residents overall.

¹⁰⁷ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Also in that year, 16.7% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; 16.7% of resident had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; 10% of residents had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; no resident held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Kodiak Island is within the traditional territory of the Alutiiq peoples, and the area is estimated to have been inhabited for at least 7,500 years.^{108,109,110} Great numbers of salmon can be harvested at the mouth of the Karluk River. In part due to this abundant resource, the Karluk village site is thought to have been populated by indigenous people for more than 7,000 years. Thirty-six archaeological sites have been identified in the area.¹¹¹ At one of the more recent sites called 'Karluk 1' (1250 - 1750 A.D.), a large number of well preserved wooden artifacts have been excavated, including masks, tools, and boxes.¹¹²

Russian hunters established a trading post and salmon saltery at Karluk in 1786. The Russians often referred to Karluk village as 'Nunakakhvak'. During that period, the village was located on both sides of the Karluk River.¹¹³ Following the U.S. purchase of Alaska from Russia in 1867, commercial exploitation of the salmon resource intensified. The first cannery at Karluk – also the first on Kodiak Island – was built on Karluk Spit in 1882, and by 1884, five other canneries were also operating at Karluk.¹¹⁴ In the beginning of the industry, few Alaska Natives worked in the local canneries, and a majority of cannery employees were hired from outside the region, primarily from the U.S. and China. In 1890, only 10% of the people living at Karluk were Alaska Native. However, Native Alaskans became increasingly involved in commercial salmon fishing in the early 1900s, and coordinated their commercial fishing activity with subsistence hunting and fishing activities.^{115,116} In the early 1900s, Karluk was known for having the largest cannery and the greatest salmon stream in the world.¹¹⁷ However, overfishing forced all of the Karluk canneries to close by the late 1930s.¹¹⁸

In 1978, a severe storm with winds of 100 miles per hour from the northeast damaged personal property and caused severe coastal erosion, including breaching the spit that connected the two sides of the community of Karluk.^{119,120} Following the storm, the Karluk village council chose to relocate the community to its present site, upstream on the south side of the Karluk Lagoon. The U.S. Department of Housing and Urban Development constructed 23 houses at the new community location. Today, Karluk residents continue to engage in commercial fishing and subsistence hunting, fishing, and gathering.¹²¹

Natural Resources and Environment

The climate of the Kodiak Islands is dominated by a strong marine influence. There is moderate precipitation, frequent cloud cover and fog, and little to no freezing weather. Severe storms are common from December through February. Annual precipitation averages 60 inches with 87 inches of snowfall. Temperatures remain within a narrow range throughout the year, from 32 to 62 °F.¹²²

Karluk is located in close proximity to Kodiak National Wildlife Refuge (KNWR). The KNWR was established in 1941 with the purpose of wildlife conservation, in particular the Kodiak brown bear, unique to the island, as well as fulfillment of treaty obligations, providing for continued subsistence use, and to ensure water quality and quantity.¹²³ In 2002, the KNWR signed an agreement with Koniag, Inc. (the regional Native corporation for Kodiak Island) and the State of Alaska creating a conservation easement zone on Koniag land surrounding Karluk Lake and the portion of Karluk River within the boundaries of the KNWR. The 22-mile long Karluk River begins in the KNWR and passes through tribal land before emptying into the Gulf of Alaska at Karluk. Koniag, Inc. owns the majority of the land adjacent to the river and the northern portion of Karluk Lake while the Native Village of Karluk owns the land adjacent to the lower 3 miles of the Karluk River and the Karluk Lagoon. To facilitate public use of this zone, the KNWR implemented a cost-free permit system for unguided users of land within one-half mile of Karluk Lake and Karluk River.¹²⁴ In addition to the KNWR, protected areas near Karluk include a number of state parks, state historical parks, and state recreation sites located on the northeast corner of Kodiak Island.¹²⁵

Kodiak Island is located in a highly active volcanic and tectonic zone along the Pacific “Ring of Fire”. The earthquake belt along the Aleutian Islands, Alaska Peninsula, and Kenai Peninsula is known as the Alaska-Aleutian subduction zone, where strong earthquakes occur as a result of slipping along the contact zone between the Pacific and Alaska plates. Earthquakes can

cause tsunamis, landslides, snow avalanches, and submarine slumps. The risk posed to Karluk by any individual earthquake depends on the quake's severity and location. The 1964 Alaska Earthquake and ensuing tsunami, which destroyed the City of Old Harbor and caused significant damage in Kodiak, did not inflict any significant damage in Karluk. The earthquake did cause 1.5 feet of subsidence, causing tides to run slightly earlier into the area.¹²⁶ The 1912 eruption of the volcano Novarupta, located 100 miles northwest of Kodiak Island on the Alaska Peninsula, covered the island in ash and gasses and disrupted the local salmon fishery, especially between 1915 to 1919, when many adult fish starved and failed to spawn in ash-choked streams.¹²⁷

In addition to risk of earthquake and volcanic activity, natural hazards that pose a high risk in Karluk include coastal erosion and severe weather. The primary weather hazards in Karluk are freezing rain, heavy snowfall, and high winds. Winds can occasionally exceed 50 miles per hour, with gusts of up to 90 miles per hour. Extreme weather events can also exacerbate the hazard of coastal erosion, which is already a problem in the community. In 1978, extreme winter weather eroded the Karluk spit and forced a relocation of the entire village. Coastal erosion has also occurred in several other places in the village, and has the potential to impact current structures and future residential and commercial development. According to the Karluk Emergency Response Plan of 2000, a hillside road from the airstrip down to the lagoon was eroding away. The potential impact of natural hazards is increased by Karluk's relative isolation from emergency response services.¹²⁸

Kodiak Island was directly impacted by the *Exxon Valdez* Oil Spill in March of 1989, in which 11 million gallons of crude oil spilled into Prince William Sound and spread to surrounding areas.¹²⁹ Oil was carried by currents throughout the area of the Alutiiq people, and hit the beaches of Kodiak Island in mid-April.¹³⁰ The *Exxon Valdez* Oil Spill Trustee Council was formed following the spill, and has overseen large-scale habitat restoration, protection, and acquisition. On Kodiak Island, the Trustee Council has protected over 260,000 acres, much of it now included within the KNWR.¹³¹

According to the Alaska Department of Environmental Conservation, there were no notable active environmental cleanup sites located in Karluk as of August 2012.¹³²

Current Economy¹³³

From the late 1800s through the 1930s, fish processing was a primary source of livelihood in Karluk.^{134,135,136,137} Today, Karluk residents have minimal involvement in

¹³³ Unless otherwise noted, all monetary data are reported in nominal values.

commercial fishing activities, and the lack of marine facilities in Karluk provides a barrier to higher levels of local involvement. Construction of docking and moorage facilities would allow for expansion in fishing as well as tourism opportunities. Today, the primary economic activity in the community is sport hunting and fishing. As of 2011, there were six lodges in Karluk that provide a limited number of seasonal employment opportunities to local residents. Other top employers in the community are the Native Village of Karluk Traditional IRA Council and the Kodiak Island Borough School District. Local residents rely heavily on subsistence hunting and fishing to supplement their diets.¹³⁸ Salmon, trout, ducks, seals, and deer are some of the primary subsistence resources utilized by local residents.¹³⁹

Based on household surveys for the 2006-2010 ACS,¹⁴⁰ in 2010, the per capita income in Karluk was estimated to be \$7,540 and the median household income was estimated to be \$34,375. This represents a decrease from the per capita income reported in the year 2000 (\$13,736) and an increase from the median household income reported in 2000 (\$19,167). If inflation is taken into account by converting 2000 values to 2010 dollars,¹⁴¹ the drop in per capita income is revealed to be even greater; real per capita income in 2000 was \$18,063. In contrast, the real median household income in 2000 was \$25,204, and the 2010 estimate remains a substantial increase. In 2010, Karluk ranked 300th in per capita income out of 305 Alaskan communities with per capita income data, and 220th in median household income, out of 299 Alaskan communities with household income data that year.

Although Karluk's small population size may have prevented the ACS from accurately portraying economic conditions,¹⁴² the decline in per capita income suggested by the 2006-2010 ACS estimate is supported by data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Karluk in

¹⁴⁰ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹⁴¹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹⁴² While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

2010 is \$10,939.^{143,144} Although this is higher than the ACS estimate, it remains lower than the reported inflation-adjusted per capita income in 2000. Despite the apparent decline in per capita income in Karluk from 2000 to 2010, the community was not recognized as “distressed” by the Denali Commission in 2011.¹⁴⁵ It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, 48.6% of the population age 16 and older was estimated to be in the civilian labor force, a substantially lower percentage than was estimated to be in the civilian labor force statewide (68.8%). In the same year, 65.5% of local residents were estimated to be living below the poverty line, almost seven times the statewide rate of 9.5%, and the unemployment rate was estimated to be 11.4% compared to the statewide rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 9%, compared to a statewide unemployment rate estimate of 11.5%.¹⁴⁶

Also based on the 2006-2010 ACS, a majority of Karluk workers were estimated to be employed in the public sector (76.9%), along with 23.1% in the private sector. Of the 13 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest number was estimated to work in transportation, warehousing, and utilities (4 individuals; 30.8% of the civilian labor force), retail trade (3 individuals; 23.1%), educational services, health care, and social assistance (3 individuals; 23.1%), and public administration (3 individuals; 23.1%). In 2010, 0% of the employed civilian labor force was estimated to be working in agriculture, forestry, fishing and hunting, and mining. However, the number of individuals employed in the fishing industry is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3.

By occupation type, most (53.8%) residents were estimated to hold management or professional positions in 2010; followed by service (23.1%) and sales or office (23.1%) positions. Between 2000 and 2010, there was a significant proportional decline in the number of service positions occupied by residents. Conversely, there were significant proportional gains in the number of management and professional positions between those years (Figure 4).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 18 employed residents in Karluk in 2010, of which 12 (66.7%) were employed in local government, 3 (16.7%) were employed in financial activities, 2 (11.1%) in trade, transportation, and utilities, and 1 (5.6%) in educational and health services.¹⁴⁷ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Governance

Karluk is an unincorporated community under the jurisdiction of the Kodiak Island Borough. Because the community is not incorporated, no information is available regarding local revenue sources (Table 2). However, the Borough administers a 11.27 mills property tax in Karluk, along with a 5% Bed Tax and 1.05% severance tax. Karluk was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized Indian Reorganization Act Tribal Council, recognized by the Bureau of Indian Affairs, is the Native Village of Karluk.¹⁴⁸ The Tribal Council administers a variety of federal programs, including local health care, employment assistance, and other social services.¹⁴⁹

A village corporation, Karluk Native Corporation, was formed in 1971 pursuant to ANCSA. Karluk Native Corporation selected and received 83,787 acres of land conveyance, approximately 90% of the total acreage to which it was entitled. On December 6, 1980, Karluk Native Corporation merged with Koniag, Incorporated, the regional Native corporation for Kodiak Island. The merged corporation owns both surface and subsurface rights to lands

originally titled to Karluk Native Corporation.¹⁵⁰ Shareholders of the original village corporation received additional shares of Koniag stock, and the Native Village of Karluk received 1,860 acres of land near the village and \$35,340 to divide among its former shareholders.¹⁵¹

In early 2012, the Native Village of Karluk brought a lawsuit against Koniag, Incorporated in an effort to have former reservation lands put under the control of the IRA Council. In July 2012, a federal court blocked the lawsuit, saying that Karluk tribal court lacks jurisdiction over Kodiak Island's regional Native corporation.¹⁵²

Karluk is a member of the Kodiak Area Native Association (KANA), a tribal non-profit organization headquartered in Kodiak that serves communities in the Kodiak Archipelago.¹⁵³ KANA is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.¹⁵⁴ KANA provides health and development services, as well as career development and other community services, with the goal of promoting economic self sufficiency and promote healthy families.¹⁵⁵ KANA provides health services in Karluk under an agreement with the Native Village of Karluk.¹⁵⁶

The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish and Game (ADF&G), and U.S. Bureau of Citizenship and Immigration Services offices are all located within the City of Kodiak. The nearest Alaska Department of Natural Resources office is a Division of Parks and Outdoor Recreation office, also located in Kodiak, and the nearest office of the Alaska Department of Commerce, Community, and Economic Development is in Anchorage.

Infrastructure

Connectivity and Transportation

Karluk is accessible by air and water. Regular and charter flights depart from nearby Kodiak. There are both a state-owned 2,000 feet long by 60 feet wide gravel airstrip and a seaplane base at Karluk Lake.¹⁵⁷ As of early June 2012, a roundtrip ticket between Kodiak and Anchorage cost \$360.¹⁵⁸ Several companies offer service between Kodiak and Karluk if a minimum number of passengers charter a plane. As of summer 2012, a roundtrip ticket between

¹⁵⁸ This price was calculated on November 21, 2011 using kayak.com.

Kodiak and Karluk with Island Air Service cost \$300 roundtrip, and was available Monday, Wednesday, or Friday with a minimum of two passengers. Servant Air did not offer scheduled service to Karluk, but a stop could be added for three or more seat fares.¹⁵⁹ Barge service is available twice a month from Kodiak, and goods are lightered to shore by skiff.¹⁶⁰ Karluk does not have a harbor or docking facilities, so landing crafts are used to bring supplies ashore. Local residents who transport their own supplies will anchor off shore and haul their goods with smaller boats or skiffs. There is about one mile of gravel road in the community.¹⁶¹

Facilities

Water in Karluk is retrieved from a creek and is treated and stored in a 50,000-gallon tank. All occupied homes are fully plumbed. A community septic tank and sewage lagoon are used to manage waste. There is no organized refuse collection service, and individuals must haul their own garbage. The landfill is a temporary, unpermitted site, and is operated by the Village Council. The school organizes aluminum recycling. Power is provided by a diesel powerhouse operated by the Village Council.¹⁶² The Kodiak Island Borough is considering options for renewable energy sources. Some of the most promising opportunities include electrical interties between communities that are currently powered by hydroelectric and nearby communities still operating diesel plants, such as a possible intertie between Larsen Bay and Karluk. In addition, wind power generation is of interest. Karluk is one of several communities on Kodiak Island that may have potential for wind generation, although the proximity to the KNWR may present challenges to gaining approval of such a facility.¹⁶³

Police services in Karluk are provided by a Village Public Safety Officer stationed in Karluk. The nearest state trooper post is located in Kodiak. Fire and rescue services are provided by the Karluk Village Response Team.¹⁶⁴ Additional community facilities include a community hall and the school library, which is accessible to the public, and a small post office operated by the U.S. Postal Service. As of August 2012, a telephone system was in place in Karluk. Residents can access internet through purchase of individual satellite dishes. No cable service is available locally.¹⁶⁵¹⁶⁶

Medical Services

The Karluk Health Clinic provides residents with basic medical services. The Clinic is a Community Health Aid Program site. It is owned and operated by the Karluk Village Council.¹⁶⁷ KANA provides health services in Karluk under an agreement with the Native Village of

Karluk.¹⁶⁸ Emergency Services have coastal floatplane and air access.¹⁶⁹ The nearest hospital is located in the City of Kodiak.

Educational Opportunities

One school is present in Karluk. The school offers a Kindergarten through 12th grade education. However, due to the small student population residing in Karluk and the requirement that a rural school have a minimum of 10 students enrolled to retain funding, each year the Karluk school is at the risk of being closed for the year.¹⁷⁰ The school was closed due to low enrollment during the 1999-2000 and 2002-2003 school years.¹⁷¹ In 2010, Karluk School had 13 enrolled students and 2 teachers, in 2011 there were 15 students and 4 teachers, and in 2012 there were 16 students and 3 teachers.¹⁷² A few high school students attend Mount Edgecumbe High School in Sitka, Alaska.¹⁷³

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prior to the arrival of Europeans, subsistence hunting and fishing was the basis of the economy for people living on Kodiak Island and surrounding areas. The Koniags historically migrated between permanent winter villages and temporary summer fish camps. For up to 7,000 years, the mouth of the Karluk River has been utilized as a village site due to the great numbers of salmon can be harvested there. Like Alutiiq people today, the ancient residents of Karluk smoked and dried the river salmon they caught during the summer to provide food through the long winter.^{174,175} In addition to salmon, the Alutiiq people of Kodiak Island also harvested other fish, intertidal resources, and marine mammals, including whales, sea lions, seals, and sea otters.^{176,177}

With the arrival of Russian colonists to Kodiak Island in the late 1700s, the Alutiiq people were forced to hunt for sea otters to fuel the trade of their valuable pelts. The Russians also began commercial salmon exploitation in the early 1800s. They blocked salmon streams, such as the Karluk River on the west side of Kodiak Island, using fish weirs. Commercial processing involved salting. In addition, Alutiiq women dried the fish for the winter for use in the Russian colony.¹⁷⁸

After the U.S. purchase of Alaska, American entrepreneurs arrived to continue hunting sea otter and to develop other industries, including salmon fishing. The first cannery at Karluk – the first on Kodiak Island – was built on Karluk Spit by Smith & Hirsch in 1882, who had previously operated a salting operation there. In 1884, this cannery was organized under the title of Karluk Packing Company. By 1884, five other canneries were also operating at Karluk, including canneries operated by the Alaska Improvement Company and the Alaska Packers Association (APA). By 1897, the APA operated all of the local canneries.¹⁷⁹ Few Natives worked initially worked in the local canneries, and a majority of cannery employees were hired from outside the region, primarily from the United States and China. By 1890, only 10% of the people living at Karluk were Alaska Native. However, Native Alaskans became increasingly involved in commercial salmon fishing in the early 1900s, and coordinated their commercial fishing activity with subsistence hunting and fishing activities.^{180,181}

By 1901, the Karluk salmon fishery harvest reached about 4 million sockeye, but after that point began to decline.¹⁸² At that time, Karluk was known for having the largest cannery and the greatest salmon stream in the world.¹⁸³ In the early 1900s, additional canneries were constructed in the area by the APA.¹⁸⁴ The APA finally opened a hatchery in 1896 because officials believed that hatcheries would protect the dwindling salmon runs. But overfishing continued to reduce the number of salmon at the Karluk River. In 1911, the APA moved its prominent cannery operations from the village of Karluk to the sheltered inlet at Larsen Bay due to the lack of a harbor in Karluk and the frequent shipwrecks in the shallow and rocky waters. The hatchery was closed in 1917.^{185,186} Overfishing forced all of the Karluk canneries to close by the late 1930s.¹⁸⁷

Through the early decades of the 1900s, the salmon fishery remained the primary focus of local commercial fishing activity, and the most common fishing gear was the beach seine. With the rise of diesel engines in the 1920s, the range of fishing vessels expanded, and commercial exploitation of halibut and groundfish extended into the Gulf of Alaska. The rise of fuel-powered vessels also led to a shift toward use purse seines in the salmon fishery. Herring

fishermen also began stopping in Kodiak by the 1920s, and a herring reduction also operated in Kodiak until the early 1960s.^{188,189,190}

Since the closure of the Karluk canneries in the 1930s,¹⁹¹ no processing facilities have been operational locally, although it is important to note that Icicle Seafoods currently operates a cannery at nearby Larsen Bay.¹⁹² Today, the primary economic activity in Karluk is sport hunting and fishing. As of 2011, there were six lodges in Karluk that provide a limited number of seasonal employment opportunities to local residents. Local residents also rely heavily on subsistence hunting and fishing to supplement their diets.¹⁹³ Salmon, trout, ducks, seals, and deer are some of the primary subsistence resources utilized by local residents.¹⁹⁴

Karluk is located in Federal Statistical and Reporting Area 620, Pacific Halibut Fishery Regulatory Area 3A, and the Central Gulf of Alaska Sablefish Regulatory Area. Karluk is eligible to participate in the Community Quota Entity. The governing body that recommended Karluk was the Native Village of Karluk, but as of August 2012, the community had not formed a CQE.¹⁹⁵ The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there were no registered shore-side processing plants in Karluk. Karluk was a historical center of the Kodiak salmon fishery

beginning in the late 1800s, but the last canneries in the area were closed by the late 1930s.¹⁹⁶ It is important to note that one shore-side processing facility is located nearby in the community of Larsen Bay (see the community profile for Larsen Bay profile).

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue in Karluk (Table 3).

Commercial Fishing

Karluk residents are minimally involved in commercial fishing. Two Karluk residents held commercial crew license in 2010, representing a decline of crew licenses through the decade when compared to six crew license holders in 2000. In 2000, there were also two vessels homeported and two vessels primarily owned by Karluk residents, but none in other years during the decade. No fish buyers or shore-side processors were present in any year during the 2000-2010 period, and it follows that no landings or ex-vessel revenue were reported locally (Table 5).

The only state Commercial Fisheries Entry Commission (CFEC) permit held by a Karluk resident between 2000 and 2010 was a groundfish permit held by one permit holder in 2004. The permit was held in the statewide miscellaneous saltwater finfish fishery, and was associated with mechanical jig gear. The permit was actively fished that year. Between 2000 and 2010, no Karluk residents held other state CFEC permits, federal License Limitation Permits or Federal Fisheries Permits (Table 4). In addition, no Karluk residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab during the period (Tables 6 through 8). Given the lack of fish buyers and shore-side processors (Table 5), no landings or ex-vessel revenue were generated in the community during the 2000-2010 period (Table 9). Two vessels were owned by Karluk residents in 2000, but due to the small number of participants, landings and ex-vessel revenues generated by Karluk vessel owners are considered confidential that year. Given the lack of vessel owners in the remaining years of the period, no data are reported from 2001 to 2010 (Table 10).

Recreational Fishing

Today, the primary economic activity in Karluk is sport hunting and fishing. As of 2011, there were six lodges in Karluk that provide a limited number of seasonal employment opportunities to local residents.¹⁹⁷ However, according to data reported by ADF&G, sportfishing activity appears to have declined between 2000 and 2010. While there were sport fish guide businesses registered in Karluk between 2000 and 2010, none were active during those years. The number of sport fish guide licenses held in the community declined from 14 in 2000 to 1 in 2009. No residents held sport fish guide licenses in 2010 (Table 11). Eight residents purchased sportfishing licenses in 2000 (irrespective of point of sale), while only two purchased licenses in 2009. Similarly, the number of sportfishing licenses purchased in Karluk fell from 85 in 2000 to 4 in 2009, and 0 in 2010. Given that a greater number of licenses were purchased each year in Karluk than were purchased by local residents indicates that sportfishing activities brought visitors to Karluk during the 2000-2010 period.

Karluk is located within Alaska Sport Fishing Survey Area Q – Kodiak. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. On average, Alaska resident anglers fished more angler days per year than non-Alaska residents in both saltwater and freshwater sport fisheries, and more angler days were fished per year in freshwater than in saltwater in the Kodiak region between 2000 and 2010. However, sportfishing activity in by both Alaska resident and non-Alaska resident anglers, and in both saltwater and freshwater, was extremely high. Information about the sportfishing sector in and near Karluk is displayed in Table 11.

The Alaska Statewide Harvest Survey,¹⁹⁸ conducted by ADF&G between 2000 and 2010, noted the following species targeted in freshwater by private anglers in Karluk: Chinook, coho, and sockeye salmon. They also noted sport harvest of Pacific halibut in saltwater by private anglers in Karluk. No kept/release log book data were reported for sportfishing charters out of Karluk between 2000 and 2010.¹⁹⁹

Subsistence Fishing

Villages have existed through history at the mouth of the Karluk River, where great numbers of salmon can be harvested. Like Alutiiq people today, the ancient residents of Karluk smoked and dried the river salmon they caught during the summer to provide food through the winter.²⁰⁰ In addition to salmon, Alutiiq people living on Kodiak Island caught other fish and gathered intertidal resources on the shores. Hunting was done with harpoons and clubs, and fish were speared, gaffed, harpooned or hooked. Salmon were often caught in weirs built across rivers.²⁰¹ Today, local residents rely heavily on subsistence hunting and fishing to supplement their diets.²⁰² Salmon, trout, ducks, seals, and deer are some of the primary subsistence resources utilized by local residents.²⁰³

Between 2000 and 2010, ADF&G did not report any information about the percentage of Karluk households participating in marine resource subsistence or regarding per capita subsistence harvest (Table 12). An earlier ADF&G subsistence survey provides species-level household participation information regarding marine invertebrate, marine mammal, and non-salmon fish harvest in 1991. That year, 54% of Karluk households reported harvesting black chitons, 39% harvested mussels, 31% harvested butter clams, 23% harvested sea urchin, 15% harvested Pacific littleneck clams, 8% harvested geoducks, and 8% reported harvesting octopus. Although no households reported harvest of Dungeness crab, Tanner crab, or scallops, 8% of households reported using each of these subsistence resources in 1991. In the same year, 8% of Karluk households reported harvesting harbor seal, while 39% of households reported using harbor seal. Also in 1991, species of non-salmon fish harvested by the greatest percentage of Karluk households included Dolly Varden (69% of households reported involvement in harvesting), steelhead (46%), flounder (23%), rainbow trout (15%), and black rockfish (8%). Although no households reported harvest of Pacific cod or red rockfish in 1991, 23% of households reported using Pacific cod and 8% reported using red rockfish for subsistence. The fact that some households utilized resources not harvested in the community suggests sharing of resources between communities. It is also important to note that, in many cases, the percentage of households using subsistence resources was higher than the percentage involved in harvest, indicating the presence of sharing networks within Karluk as well.²⁰⁴

Some information was available regarding subsistence salmon, halibut, and marine mammal harvest between 2000 and 2010 in Karluk. For those years in which data were available between 2000 and 2010, the number of subsistence salmon permits issued to Karluk households varied between one and three. In addition, a number of permits were reported as returned in

2001, 2002, and 2003 although no data were available regarding the total number issued to households in those years. No information was reported regarding the species harvested using these permits. In addition, no data were reported regarding total harvest of marine invertebrates or non-salmon fish in Karluk between 2000 and 2010 (Table 13). Between 2003 and 2007, one Subsistence Halibut Fishing Certificate (SHARC) was issued per year to an individual in Karluk, and no information was reported regarding the number of permits returned or the total pounds harvested using these SHARC. In 2010, 9 SHARC were issued, and an estimated 595 lbs of halibut harvested (Table 14). Marine mammals were also harvested by Karluk residents between 2000 and 2010. According to data reported by ADF&G, between 2000 and 2008, Karluk residents harvested 11 to 63 harbor seals per year, and also harvested 2 to 3 Steller sea lions in some early years of the period (Table 15).

Kodiak (KOH-dee-ack)

People and Place

*Location*²⁰⁵

Kodiak is located near the northwestern tip of Kodiak Island in the Gulf of Alaska. Kodiak Island (aka: “the emerald isle”) is the largest island in Alaska and is the second largest island in the United States. Kodiak National Wildlife Refuge (KNWR) encompasses nearly 1.9 million acres on Kodiak and Afognak Islands. It is 252 mi south of Anchorage (a 45-minute flight) and is a 4-hour flight from Seattle. The area encompasses 3.5 sq mi of land and 1.4 sq mi of water. Kodiak was first incorporated in 1940 and is now a Home Rule City and the seat of the Kodiak Island Borough .

*Demographic Profile*²⁰⁶

In 2010, there were 6,130 residents in Kodiak, ranking it the 16th largest of 352 total Alaskan communities with recorded populations that year. Between 1990 and 2010, the population declined by 3.7%. Between 2000 and 2009, the population increased by 4.6% with an average annual growth rate of 0.51%, which was similar to statewide average of 0.75% and indicative of modest growth (Table 1). In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there were an estimated 6,000 permanent residents, and 600 transient residents living in Kodiak in 2010. According to community leaders, seasonal workers live in Kodiak from July through September, with annual population peaks typically occurring in July and August. Peaks in population are mostly driven by employment in fisheries sectors.

Kodiak has a racially and ethnically diverse community. The majority of the Alaska Native population is Alutiiq, and there is a large Filipino subculture residing in the city. The majority of the changes in racial distribution in the population occurred as proportional increases in the Asian population and decreases in the White population between 2000 and 2010. Further, in 2010, 40.3% of residents identified themselves as White, compared to 46.4% in 2000; 37.4% identified themselves as Asian, compared to 31.7% in 2000; 9.9% identified themselves as American Indian or Alaska Native, compared to 10.5% in 2000; 1.0% identified themselves as Native Hawaiian or Other Pacific Islander, compared to 0.9% in 2000; 0.5% identified themselves as Black or African American, compared to 0.7% in 2000; 6.3% identified themselves as two or more races, compared to 5.4% in 2000; and 4.6% identified themselves as some other race, compared to 4.4% in 2000. In addition, 9.4% of residents identified themselves as Hispanic or Latino, compared to 8.5% in 2000. Information regarding racial and ethnic trends can be found in Figure 1.

Figure 1. Racial and Ethnic Composition, Kodiak: 2000-2010 (U.S. Census).

In 2010, the average household size was 2.94, compared to 2.90 in 1990 and 3.10 in 2000. In that year, there were a total of 2,178 households, compared to 2,177 in 1990 and 2,255 in 2000. Of the households surveyed in 2010, 46% were owner-occupied, compared to 43% in 2000; 47% were renter-occupied, compared to 46% in 2000; 5% were vacant, compared to 10% in 2000; and 2% were occupied seasonally, compared to 1% in 2000. In addition, 144 residents were living in group quarters in 2010, compared to 146 in 2000.

In 2010, the gender distribution in Kodiak was 52.5% male and 47.4% female. This was similar to both the statewide gender distribution (52.0% male, 48.0% female), and 2000 distribution (53.3% male, 46.7% female). The median age that year was 35.1 years, which was higher than both the statewide median of 33.8 years and 2000 median of 33.5 years.

In general, population structure was stationary in both 2000 and 2010. However, cohorts displayed age transitions consistent with a stable population, meaning that they retained their overall structure as they aged. In 2010, 29.9% of residents were under the age of 20, compared to 31.8% in 2000; 14.3% were over the age of 59, compared to 9.7% in 2000; 41.9% were between the ages of 30 and 59, compared to 45.7% in 2000; and 13.8% were between the ages of 20 and 29, compared to 12.8% in 2000.

Figure 2. Population Age Structure in Kodiak Based on the 2000 and 2010 U.S. Decennial Census.

Gender distribution by age cohort was more even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within the 20 to 29 range (7.9% male, 5.9% female), followed by the 50 to 59 (8.2% male, 6.6% female) and 40 to 49 (7.9% male, 7.0% female) ranges. Of those three, the greatest relative difference occurred within the 20 to 29 range. Information regarding changes in Kodiak's population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)²⁰⁷ estimated that 88.2% of residents aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 7.8% had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; and estimated 4.0% had 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 30.4% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 8.5% held an Associate's degree, compared to an estimated 8.0% of Alaska residents overall; an estimated 17.8% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 5.8% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Kodiak Island is estimated to have been inhabited for at least 7,500 years.^{208,209,210} According to some archaeologists "the ancestors of the present-day Native Alaska residents of the Alutiiq culture area have continuously inhabited the area for at least 7,000 years."²¹¹ Alutiiq is the more recent term which is used for the culture and the language of the "group of Alaska Native people indigenous to the Kodiak Island Archipelago, the southern coast of the Alaska Peninsula, Prince William Sound, and the lower tip of the Kenai Peninsula."²¹² By about 1200 C.E., the Island may have had a population of about 14,000 Alutiiq inhabitants which is similar to the total number of inhabitants today on the island of Kodiak.²¹³

At the time of Russian contact the peoples living on Kodiak Island were the Koniags (the Alutiiq of Kodiak Island and the Alaska Peninsula) of which there were 10,000 or more.²¹⁴ The first European and specifically Russian contact was in 1763 by Stephen Glotov. A Russian settlement was established at Three Saints Bay by Gregorii Shelikof in 1784 where the native population was forced to work hunting sea otters. Prior to this hundreds of Alutiiq natives were killed attempting to hide from Shelikof's party and the Alutiiqs were dominated by the Russians

²⁰⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

using muskets and cannons. Shelikof was recalled back to Russia and in 1792 Alexander Baranov, a fur trapper established a trading post at St. Paul Harbor, which is the site of the City of Kodiak today. Kodiak became the capital of Russian America and at that time the island was called “Kikhtak” and later “Kadiak” which is the Inuit word for the island. Russian Orthodox clergymen arrived around 1794 to missionize the people of the region. There were more than 6,500 Koniags in the area at that time, but by the end of Russian control of the island in 1867 the population had decreased down to around 2,000 because of “hardship, accidents, and starvation, along with diseases introduced by the Russians.”²¹⁵

Alaska became a U.S. Territory in 1867 and the harvesting of the sea otters was still the major commercial enterprise of the area, although this quickly led to the near extinction of the animals. In 1882 a fish cannery opened at the Karluk spit which began the development of commercial fishing in the Kodiak area. Many canneries opened by the 1890’s with salmon being the main fish harvested at that time. Kodiak was incorporated in the year of 1940. During World War II, Kodiak was a key operations area throughout the Aleutian Campaign and both the Navy and Army built bases on the island. The population of the town rocketed up to more than 25,000 people during the World War II. After the war the Navy base was transferred into a Coast Guard base and now is the largest Coast Guard base in the world.

Natural Resources and Environment

The climate of the Kodiak Islands has a strong marine influence. There is little to no freezing weather, moderate precipitation, occasional high winds, and frequent cloud cover and fog. Severe storms are common from December through February. Annual rainfall averages 67 inches, and annual snowfall averages 78 inches. January temperatures range from 14 to 46 °F (-10 to 8 °C); July temperatures vary from 39 to 76 °F (4 to 24 °C).²¹⁶

Kodiak Island comprises of 3,588 sq mi of diverse landscapes, and is part of a larger archipelago encompassing roughly 5,000 sq mi. The Island consists primarily of mountainous terrain, with mountain ridges running northeast-southeast. Most peaks range between 3,000 and 4,000 ft, although several peaks are greater than 4,000 ft. Approximately 40 small cirque glaciers are located along the main divide of the glaciers; feeding into hanging valleys. Many swift-water streams drain upland areas. The Barren Islands to the north of Shuyak Island consist primarily of barren, rocky environments. Tugidak Island is relatively flat and supports expansive areas of moist and wet tundra. Sitka spruce stands dominate much of the landscape from the shore to the treeline on Shuyak Island to northeastern Kodiak Island. Stands extend south to a general northwest-southeast divider running from Kupreanof Peninsula to Cape Chiniak. Southeast Kodiak Island is relatively flat and covered by wet and moist tundra. Exposed bedrock and shallow soils cover the 2,500 mi coastline.²¹⁷

Subsurface geology is diverse, consisting of both marine sedimentary and meta-sedimentary rocks to intrusive igneous plutons that make up the ridge and peak formations that provide the interior drainage divide of Kodiak Island. The central part of the island is composed of weakly metamorphosed turbidites including shale, slate, and phyllite, with lesser amounts of

²¹⁵ See footnote 211.

²¹⁶ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

²¹⁷ Kodiak Chamber of Commerce. (2003). *Kodiak Region Comprehensive Economic Development Strategy*. Retrieved September 11, 2012 from: <http://www.commerce.state.ak.us/dca/plans/KodiakRegion-EDP-2003.pdf>.

siltstone and greywacke sandstone. The southeast portion of the island consists of clastic sedimentary marine deposits, including siltstone. Most of the Kodiak Island was extensively glaciated during the late Pleistocene. During glacial maximum, glaciers extended well offshore in the southern region of the Island. As they retreated they scoured bedrock and left a thin layer of moraine which is clay-rich and poorly drained. As glaciers retreated into valleys, cobble and boulder outwash was deposited at the lower reaches, leaving glacio-fluvial gravels more than 100 ft thick in some areas. Following deglaciation, the Island was repeatedly covered by layers of volcanic ash from Alaska Peninsula volcanoes, the thickest and most recent originating from the 1912 Mt. Katmai eruption. Ash rich soils are moderately permeable and can form perched aquifers when covering bedrock. Perched aquifers are generally very shallow and easily contaminated, possibly leading to a high incidence of septic system failure on the Island.²¹⁸

Primary habitat areas located within the Kodiak Island Borough include small portions of the Alaska Maritime National Wildlife Refuge and Alaska Peninsula National Wildlife Refuge, The KNWR, Shuyuk Island State Park, Afognak Island State Park, Tugidak Island Critical Habitat Area, Koniag Inc. trust lands, and other essential habitat areas throughout the Borough.²¹⁹ The KNWR encompasses 1.9 million acres of the southwestern two-thirds of Kodiak Island, Uganik Island, Ban Island, and the Red Peaks area on the northwest side of Afognak Island. In terms of local wildlife, six species of terrestrial mammals occur naturally within the KNWR. These include: Kodiak brown bear, red fox, river otter, ermine, tundra vole, and little brown bat. Introduced species include Sitka black tail deer, mountain goats, Roosevelt elk, reindeer, beaver, red squirrel, snowshoe hare, and pine marten. In addition, a total of 247 species of birds have been observed on the Kodiak archipelago.²²⁰ Freshwater and anadromous fish include all five species of Pacific salmon, Dolly Varden, and rainbow trout. Saltwater species include sablefish, Alaska pollock, Pacific cod, Pacific halibut, black rockfish, skate, lingcod, octopus, littleneck clams, shrimp, scarlet king crab, red sea cucumber, golden king crab, Tanner crab, Dungeness crab, razor clams, sea urchin, and Pacific herring. Marine mammals include sea otters; Dalls porpoise; white-sided porpoise; fin, minke, sei, humpback, and gray whales; Steller sea lion; and harbor seals.²²¹

Kodiak Island has an abundance of natural resources. The KNWR provides ecosystem services which support wildlife habitat and recreational opportunities. Wildlife viewing, hunting, hiking, fishing, and camping are accessible by boat, floatplane, or road system.²²² Mineral resources include lode deposits of gold, mainly in quartz veins, are found throughout the Kodiak Island Borough. Tungsten, chromite, pyrite, arsenopyrite, galena, bornite, chalcocopyrite, pyrrhotite, chlorite, sphalerite, and stibnite occurrences are also found within the Borough. Placer gold mining produced approximately \$150,000 from Borough beaches in the early 20th century. Lode mining of gold occurred prior to World War I, and a small amount of activity continued until 1935. However, gold mining has generally been unprofitable within the Borough, and there are no active commercial-scale mining operations within the vicinity of Kodiak. Coal Beds are found on the eastern portion of Kodiak Island and on Sitkinak Island. The coal that is exposed

²¹⁸ Kodiak Island Borough. (2008). *KIB Comprehensive Plan Update*. Retrieved September 11, 2012 from: <http://www.commerce.state.ak.us/dca/plans/KodiakIslandBorough-CP-2008.pdf>.

²²¹ Glen Gray and Associates. (2007). *KIB Coastal Management Plan – Final Plan Amendment*. Retrieved September 11, 2012 from: http://alaskacoast.state.ak.us/District/FinalFinalPlans/Kodiak/Kodiak_CMP.pdf.

²²² See footnote 218.

does not contain economically viable reserves. Abundant sand, gravel, and rock resources are available for local use. A large sand and gravel deposit is found on one of the Trinity Islands.²²³

Timber resources are abundant, and make up an important although declining segment of the Kodiak economy. Sitka spruce stands extend from the northern portion of Kodiak Island toward both the south and west. Most natural emerging stands contain many knots which decrease their value. Second growth stands that develop naturally following clear-cutting produce higher quality timber. In 2002, two forest products companies operated within the Kodiak Island Borough. Production has been in decline due to depressed Asian timber markets. The Kodiak Island Borough contains portions of petroleum reserves located within the Cook Inlet Planning Area for Oil and Gas Lease 149. Three exploration plays sourced are recognized in the sale area.²²⁴ Cultural and historic resources which are listed on the National Register of Historic Places and are located in Kodiak include the Agricultural Experiment Station Barn, American Cemetery, Erskine House, Fort Ambercrombie State Historic Site, Holy Resurrection Church, Kad'yak, and several archaeologically significant sites. Sites in the area are mostly related to Alutiiq cultural history, Russian Orthodox history, or World War II.²²⁵

Kodiak Island is located in a geologically active zone, and hazards posed by earthquakes and volcanism are prevalent. Many fault lines run along the length of Kodiak Island in a southwest-northeast direction, just south of the City of Kodiak. Kodiak Island lies directly above the eastern Aleutian subduction zone and the Aleutian megathrust, which lies under Kodiak, is the largest active fault in North America. The Kodiak Island Borough designates the entire coastal zone, excluding federal land, as an Earthquake Hazard Area. It generated the 1964 “Good Friday” earthquake which devastated many coastal areas around south-central Alaska. Much of downtown Kodiak was destroyed by the resulting tsunami. The City of Kodiak has experience at least 14 earthquake generated tsunamis since settlement by Russians in the late 18th century. The Alaska Volcano Observatory at the University of Alaska Fairbanks list 19 active or dormant volcanoes bordering the western edge of the Kodiak Island Borough, on the Alaska Peninsula. Several have generated major eruptions including the 1912 Mt. Katmai eruption. Pyroclastic flows, lahars, and slope failures have the potential to create tsunamis if they reach the Shelikof Straits. Steep slope relief within the Kodiak area poses a significant threat of slope failure and avalanche. Flood hazards are present in valley bottoms of larger rivers and along some coastlines. Bank erosion hazards are high among rivers and channels where there is a high content of glaciofluvial and alluvial deposition. The Kodiak Island Borough designates areas 20 ft on either side of rivers and streams and areas 50 ft from the mean high water mark of coastlines as erosion hazard areas.^{226,227}

There are a number of hazardous waste “Superfund” sites located within the Kodiak Island Borough; however, none of them are on the National Priorities List. Most contamination sites involve petroleum products, sourced from fuel farms and marine vessel spills. Portions of the Kodiak region were also impacted by the 1989 *Exxon Valdez* spill.²²⁸ According to the Alaska Department of Environmental Conservation, there is an ongoing cleanup effort being conducted within the vicinity of the U.S. Coast Guard Integrated Support Command facility.

²²³ See footnote 221.

²²⁶ Ibid.

²²⁷ See footnote 221.

²²⁸ See footnote 218.

Contaminates of concern include petroleum compounds, PCBs, paints, solvents, metals, herbicides, pesticides, and leachate from solid waste. Possible impacts to the Buskin River, which runs through the facility, are being monitored.²²⁹

Current Economy²³⁰

Commercial fishing, seafood processing, and commercial fishing support services are the major industries contributing to the local economy. The U.S. Coast Guard station is also a significant employer. Other industries include retail services and government. Tourism is growing, and recreational fishing, hiking, and kayaking are increasing in popularity. In 2002, the visitor industry generated estimated revenue of over \$19 million. The local hospital is another top employer. The Kodiak Launch Complex is a commercial orbital launch facility operated by the Alaska Aerospace Corporation, a public corporation of the State of Alaska. In 2001, the launch facility provided an equivalent of 85 jobs.²³¹ In a survey conducted by the AFSC in 2011, community leaders reported that Kodiak's economy is reliant on logging, fishing, ecotourism, and sport hunting and fishing.

In 2010,²³² the estimated per capita income was \$23,674 and the estimated median household income was \$56,731, compared to \$21,522 and \$55,142 in 2000. However, after adjusting for inflation by converting 2000 values to 2010 dollars,²³³ the real per capita income (\$28,301) and real median household income (\$72,511) indicate a decline in both individual and household earnings. In 2010, Kodiak ranked 121st of 305 communities from which per capita income was estimated, and 91st of 299 communities from which median household income was estimated.

However, Kodiak's small population size may have prevented the ACS from accurately portraying economic conditions.²³⁴ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$84.04 million in total wages in 2010.²³⁵ When matched with the 2000 Decennial Census population, the per capita income equaled \$13,710, which was significantly lower than the 2010 ACS estimate, and suggests that caution should be used when comparing 2010 ACS and 2000 Census figures.²³⁶

²²⁹ Alaska Dept. of Environmental Conservation (n.d.). *Contaminated Sites Program*. Retrieved September 12, 2012 from: <http://dec.alaska.gov/spar/csp/list.htm>.

²³⁰ Unless otherwise noted, all monetary data are reported in nominal values.

²³¹ See footnote 224.

²³² U.S. Census American Community Survey 2006-2010 estimates.

²³³ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²³⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²³⁵ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

²³⁶ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

According to 2006-2010 ACS estimates,²³⁷ 75.4% of residents over the age of 16 were in the civilian labor force and 2.5% were in the Armed Forces in 2010. Unemployment that year was estimated at 3.0%, compared to 5.9% statewide; and an estimated 12.8% of residents were living below the poverty level, compared to an estimated 9.5% of Alaska residents overall. According to 2010 ALARI estimates, the unemployment rate was 23.9% based on unemployment insurance claimants.²³⁸ Both the unemployment rate and per capita income estimated by DOLWD differed significantly from 2010 ACS estimates.

Of those employed in 2010 (according to ACS estimates), an estimated 82.5% worked in the private sector, an estimated 13.6% worked in the public sector, and an estimated 3.9% were self-employed. Kodiak's economy is diverse. By industry, most (22.7%) employed residents were estimated to work in manufacturing sectors; followed by retail trade (18.8%) and education services, health care, social assistance sectors (15.4%). Between 2000 and 2010, there were no extreme variations in employment by industry sector. The most significant proportional increase occurred in retail trade sectors, while the most significant proportional decline occurred in manufacturing sectors. Agriculture, forestry, fishing, hunting, and mining sectors accounted for 1.8% of industry sector employment in 2010, compared to 6.8% in 2000. According to 2010 ALARI estimates, most (37.2%) employed residents worked in manufacturing sectors; followed by trade transportation, and utilities (16.1%) and educational and health service (9.3%) sectors.²³⁹

According to 2006-2010 ACS estimates, by occupation, most (32.9%) employed residents were estimated to hold production, transportation, or material moving positions; followed by sales or office (28.9%); management or professional (17.9%); service (17.1%); and natural resource, construction, or maintenance (6.3%) positions. Again there were no extreme variations in employment by occupation type between 2000 and 2010. The most significant proportional gain occurred in residents holding sales or office positions. The most significant proportional decline occurred in residents holding natural resources, construction, or maintenance positions. According to 2010 ALARI estimates, most employed residents held occupations related to food processing; followed by cashiers, janitorial, and retail sales positions.²⁴⁰ There was a diverse range of occupations represented in Kodiak in 2010, and DOLWD listed over 100 distinct occupational categories. Information regarding employment trends can be found in Figures 3 and 4.

Governance

Kodiak is a Home Rule city and the seat of the Kodiak Island Borough. Incorporated in 1940, Kodiak has a Council-Manager form of government, which includes a mayor, a six-person city council, a five member school board, and six municipal employees. The City of Kodiak also has a seven-member advisory board.²⁴¹ In addition, there is a U.S. Bureau of Indian Affairs recognized tribal government located in Kodiak. The Shoonaq' Tribe of Kodiak was federally recognized in 2001. The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Kodiak is Koniag, Incorporated, and the local ANCSA chartered non-profit is the Kodiak Area Native Association. The ANCSA chartered village corporation is Native of Kodiak, Inc.

The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish & Game (ADF&G), and Bureau of Citizenship and Immigration Services offices are all located within the city of Kodiak. The new NOAA ship *Oscar Dyson* is homeported in Kodiak.

There is a 6% sales tax for a maximum of \$30 per transaction, a property tax of 2 mills (0.2%) by the City and 9.25 mills (0.93%) by the Borough, and a 5% accommodations tax imposed by the City and the Borough. Beyond the revenue sources that accrue to the municipality directly, residents of Kodiak (like the residents of other communities on the island) derive benefits from services provided by the Borough, which also funds its services in part through fishery derived revenues. The Borough has a resource-based severance tax that applies to extraction of natural resources including rock, sand, and gravel as well as timber and fish. This Borough tax is designed to mirror that state raw fish tax with the taxes being applied to the transactional value at the point of extraction, based on the value paid to commercial fishermen (as part of the transaction with the processors upon landing).

In 2010, Kodiak's municipal budget was \$30.48 million, compared to \$22.99 in 2000; a 2.5% increase after adjusting for inflation.²⁴² Municipal revenues estimated here include general fund revenues, special revenues, enterprise funds, and capital project funds. The annual municipal budget peaked in 2008 at \$60.76 million. In 2010, sales tax accounted for 30.5% of the total municipal budget that year, compared to 31.0% in 2000. In addition, state allocated Community Revenue Sharing accounted for 1.4% of the total municipal budget that year, compared to less than 1% in 2000. Fisheries related state and federal grants awarded to Kodiak between 2000 and 2010 included: \$2.0 million for a large vessel lift and boat yard, \$250,000 for a cruise ship pier master plan, \$710,000 for city harbor projects, \$2.3 million for Pier III repairs; \$2.3 million for a travel lift and tidal grid, \$78,367 for seafood marketing projects, \$15,000 for Half Moon Bay Fisheries: RSW and Skiff modifications, \$200,000 for St. Herman Harbor loading dock planning and design, \$200,000 for a fisheries research building feasibility study, and \$140,000 for St. Paul Harbor spit improvements. Information regarding municipal finances can be found in Table 2.

²⁴¹ City of Kodiak (2006). *City of Kodiak Annual Operating Budget: July 1, 2005 – June 30, 2006*. Prepared for Kodiak City Council. May 25, 2005. Retrieved July 27, 2012 from <http://www.commerce.state.ak.us/dcra/commfin/Kodiak/KodiakFY06Budget.pdf>.

²⁴² Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Kodiak from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$22,985,854	\$7,122,358	\$82,265	n/a
2001	\$25,204,376	\$7,139,290	\$70,535	\$140,000
2002	\$29,219,409	\$6,996,894	\$68,511	\$400,000
2003	\$33,409,555	\$7,003,452	\$63,501	\$150,000
2004	\$27,827,753	\$7,130,691	n/a	\$95,367
2005	\$34,780,344	\$7,328,281	n/a	\$2,300,000
2006	\$32,797,953	\$7,814,820	n/a	\$2,000,000
2007	\$48,467,736	\$8,136,785	n/a	\$600,000
2008	\$60,759,520	\$8,838,679	n/a	n/a
2009	\$55,024,164	\$8,878,804	\$400,759	\$2,960,000
2010	\$30,482,743	\$9,308,959	\$428,304	n/a

Infrastructure

*Connectivity and Transportation*²⁴³

Kodiak is accessible by air and sea. The state-owned Kodiak airport has three asphalt runways measuring 7,542-ft long by 150-ft wide, 5,399-ft long by 150-ft wide, and 5,013-ft long by 150-ft wide. Kodiak Municipal Airport also offers a 2,475-ft long by 40-ft wide paved runway. Three airlines serve Kodiak with several daily flights, and a number of air taxi services provide flights to other communities on the island. City-owned seaplane bases at Trident Basin and Lilly Lake accommodate floatplane traffic. Roundtrip airfare between Anchorage and Kodiak in June 2012 was \$360.²⁴⁴

Approximately 140 mi of state roads connect island communities on the east side of the island. Rental cars are available through Budget, Rent-a-Heap, and Avis. Numerous taxi services are available for transport on the island. Kodiak also has its own transit system with limited public service.

²⁴³ Alaska Dept. of Comm. and Rural Affairs. (n.d.). Community Database Online. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

²⁴⁴ Airfare calculated using lowest fare from www.travelocity.com (Retrieved November 22, 2011).

Facilities

Electricity in Kodiak is operated and purchased by Kodiak Electric Association Incorporated, a cooperative utility, from the Four Dam Pool-owned Terror Lake Hydroelectric Facility. Kodiak Electric Association also operates a Coast Guard-owned plant and owns three additional diesel-powered plants at Swampy Acres, Kodiak, and Port Lions. In a survey conducted by the AFSC in 2011, community leaders indicated that Kodiak plans to expand their alternative energy sources (e.g. hydro, wind, tidal) between 2012 and 2015. The City operates piped water and sewage systems. Water is supplied by the Pillar Creek and Monashka Creek reservoirs and chlorinated before distribution. Piped sewage is processed in a treatment plant. All homes are fully plumbed. A washeteria is privately operated within the community. Refuse collection services are provided by the Kodiak Borough through Waste Management Inc., and refuse is delivered to a permitted, Class 1 landfill located six mi north of the city at Monashka Bay.²⁴⁵

A public teen center, community gym and pool, public library, and food bank are also available in the community.²⁴⁶ Community leaders report that a community center will be completed between 2013 and 2015. Safety services are provided by the City police department and the state trooper post in Kodiak itself. The City also maintains its own fire department. Visitor accommodations are provided by Russian Heritage Inn, Comfort Inn, and 38 Bed and Breakfasts in the area.²⁴⁷ The community is also home to four museums including the Alutiiq Museum. Kodiak also has a post office, and telephone service and broadband internet access are in place.

With regard to fisheries-related infrastructure, the City provides several public dock facilities. Pier I is 204-ft by 28-ft and provides mooring, loading, and unloading capabilities. Services include water and bulk fuel. This dock also services Alaska Marine Highway ferries. Pier II (City Dock) is 804-ft by 64-ft and has a harbor depth that exceeds 30 ft depending on tides (which range approximately 10 ft). Uses include loading and unloading commercial freight, and services include bulk fuel, water, warehousing, and cargo cranes. Pier III (Container Terminal) is 490-ft by 64-ft. Uses include container services for general cargo, and services include water and a 30 ton Gantry crane. Small vessel moorage includes two small boat harbors with 600 stalls and mooring buoys in St. Paul and St. Herman Harbors. Ship and boat repair services are available through local boatyards, and can accommodate vessels up to 150 tons. Dry dock storage is also available.²⁴⁸

In the 2011 AFSC survey, community leaders reported that 35,000 linear ft of floating dock space and 3,000 linear ft of fixed dock space is available for permanent vessels to moor at. Transient vessels have access to 5% of dock space for mooring. The current dock infrastructure is serviced by electricity, water, and roads although no fuel tanks exist at the dock. Currently, community leaders report that vessels up to 710 ft long can use moorage in Kodiak, and the port of Kodiak is capable of handling rescue vessels (e.g., Coast Guard), cruise ships, ferries, fuel barges, and containers ships. Community leaders also report that Kodiak has a fish cleaning station and built dry dock space, haul out facilities, and an Environmental Protection Agency

certified boat cleaning station in 2009. Within the next 10 years, Kodiak hopes to make improvements to its existing dock structure and construct new dock spaces. Community leaders indicate that multiple fisheries-related businesses are available in Kodiak, including fish processing plants, fishing gear sales and repair, haul out facilities, and extensive boat repair services.

*Medical Services*²⁴⁹

The primary medical facilities in Kodiak are the Alutiiq Health Clinic, the Kodiak Community Health Center, the Providence Kodiak Island Medical Center, and the U.S. Coast Guard (USCG) Rockmore-King Medical Clinic. Both hospitals are qualified Acute Care Facilities, and long-term care is available at Providence Kodiak Island Medical Center. The USCG facility provides emergency support only. The City is part of the Southern Emergency Medical System (EMS) Region. Emergency Services have limited highway marine airport floatplane and helicopter access, and are provided by 911 Telephone Service and paid EMS Service.

Educational Opportunities

In 2012, there were 6 schools and a correspondence school. Combined, these schools employed 144 teachers, and enrolled 2,147 students.²⁵⁰ Kodiak is located in the Kodiak Island Borough School District. St. Herman Orthodox Seminary, located in Kodiak, is one of only two Russian Orthodox seminaries in the United States. Kodiak College, a branch of the University of Alaska system, offers a number of occupational certificates and undergraduate degrees. Bachelor's degrees are offered for early childhood education and elementary education.²⁵¹

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The Kodiak archipelago was likely populated approximately 7,500 years ago. The Alutiiq culture has been strongly dependent on harvesting fish, marine invertebrates, and marine mammals. Salmon, caught in both salt and fresh water, have been extremely important resources and Alutiiq peoples have traditionally hunted whales. Today, residents of Kodiak Island Borough continue to rely on subsistence resources as a lifestyle, and to supplement income and diet. Reliance on subsistence resources is higher within the six villages within the Borough with higher Alaska Native populations than in the City of Kodiak and other communities along the road system.²⁵²

Kodiak has participated in commercial fisheries since the early 1800s, when Russians in the area began salting and exporting salmon. The first salmon cannery was established on the Karluk spit in 1882 to take advantage of large sockeye runs. By 1889, five canneries were operating on the mouth of the Karluk River. Sockeye salmon harvests in the region ranged between 1.0 million (1887) and 4.83 million (1901) fish between 1887 and 1928. From 1984 to 1999, the average ex-vessel value of salmon landings was \$88.3 million. A record harvest of 39 million salmon occurred in 1993 within the Kodiak Management Area (KMA). Over 800 salmon producing streams are located in the KMA, contributing to the highly productive fishery.²⁵³

Before 1950, most seafood processing facilities in Kodiak were dedicated to salmon. However, in 1950, 60,000 pounds of king crab were landed and processing capacity was added by building new plants and expanding others. The king crab fishery became a major component in Kodiak's fisheries economy from 1950 to 1959 as catch increased from 60,000 to 21 million pounds. By 1968, the City of Kodiak was the largest fishing port in the United States in terms of ex-vessel value. However, by the late 1960s and early 1970s, harvest levels began to drop and several seafood processors relocated in Unalaska and Dutch Harbor to be closer to the crab supply. This diverted much of the Bering Sea and Aleutian Island harvests away from Kodiak. In 1982, king crab harvest was 8.7 million pounds, which was the lowest in 24 years. Soon after, the crab fishery was closed because of poor stock conditions.

The Kodiak shrimp fishery began in the 1950s with a harvest of 31,886 pounds in 1958. The fishery grew rapidly to an annual catch of 10 to 12 million pounds in the early 1960s. The 1964 "Good Friday" earthquake devastated seafood processing infrastructure, leading to the fishery's decline; however, harvests peaked in 1970s at 82.2 million pounds in 1971. Sharp declines in harvests followed this peak, and effort was shifted to the Chignik and South Peninsula areas until those areas experienced similar declines in the late 1970s. Since its decline, the Kodiak shrimp fishery has remained depressed.

As harvests and processing capacity declined through overharvesting and resource competition, an effort to develop groundfish fisheries began in the 1980s and continued through the 1990s. During those two decades, groundfish landings increased from \$528,000 to almost \$45 million ex-vessel, making groundfish one of Kodiak's most valuable fisheries.

Kodiak is located in Federal Statistical and Reporting Area 630, Pacific Halibut Fishery Regulatory Area 3A, and the Central Gulf of Alaska Sablefish Regulatory Area. The community is not eligible for the Community Quota Entity program or the Community Development Quota program.

Processing Plants

According to ADF&G's Intent to Operate list, there were 11 shoreside processing plants in Kodiak in 2010. Alaska Fresh Seafoods, Inc. operates a seafood processing facility in Kodiak. The plant began operations in 1978 and in 2010 employed a maximum of 60 workers.²⁵⁴ Alaska

²⁵⁴ This information is based on the results of a survey of processing plant managers conducted by the Alaska Fisheries Science Center in 2011.

Fresh Seafoods processes cod (black, Pacific), crab (king, snow), halibut, herring, lingcod, pollock, scallops, and all five species of Pacific salmon.²⁵⁵

Alaska Seafood Systems operates a seafood processing facility in Kodiak. Alaska Seafood Systems processes cod (black and Pacific), flounder, halibut, octopus, pollock, sea urchin, skate, and all five species of Pacific salmon.²⁵⁶ The plant began operations in 2007 and in 2010 employed a maximum of 20 workers.²⁵⁷

Global Seafoods North America owns several processing facilities though out the Pacific Rim, including a plant in Kodiak. The plant began operations in 2000 and was previously owned by Peter Pan Seafoods.²⁵⁸ The facility in Kodiak processes black and Pacific cod, pollock, sole, rockfish, halibut and several species of salmon.²⁵⁹ In 2010, the plant employed a maximum of 100 workers.²⁶⁰

International Seafoods of Alaska, Inc. was founded in Kodiak in 1978. Its shoreside processing facility takes deliveries from fishing vessels directly from its dock. Located near the Kodiak boat harbor, the plant operates year round. During the summer months the facility processes salmon, halibut and black cod. Throughout the rest of the year the plant processes Pacific cod, pollock, and various types of sole and rockfish. In addition to processing facilities International Seafoods of Alaska also owns the largest cold storage facility in Kodiak.²⁶¹ In 2010, the plant employed a maximum of 420 workers.²⁶²

Island Seafoods began in 1995 as a small custom processing facility for charter boat fishermen. After being acquired by Pacific Seafood Group in 2003, Island Seafoods has expanded dramatically. Their processing facility is located just outside the Kodiak boat harbor breakwater. Today, the Island Seafoods processing facility operates year round and processes millions of pounds of cod, halibut, rockfish and salmon from commercial fishing vessels. Staying true to its roots, Island Seafood continues to offer custom processing for sport fishermen.²⁶³ In 2010, the plant employed a maximum of 100 workers.²⁶⁴

Since 1984, Kodiak Island Smokehouse has been a small family owned and operated smokehouse that processes smoked salmon (Chinook, sockeye and coho) caught by sport fishermen and a few commercial salmon boats. The plant began operations in 2001 and its

primary customers are tourists and locals.²⁶⁵ Kodiak Island Smokehouse also processes and smokes black cod and halibut. It is located on Mill Bay road.²⁶⁶

North Pacific Seafoods Inc. facility is located in the City of Kodiak. The plant was originally built in the early 1950s as an ice and cold storage facility. When North Pacific Seafoods purchased the facility in 1975 they expanded it to include seafood processing. Today, the plant is open year-round and processes all major commercially harvested species from the Gulf of Alaska including salmon, pollock, Pacific cod, rockfish, black cod, halibut, crab, roe, octopus, herring, flatfish and sea cucumber. During the peak season from June until the end of September the facility employs a maximum of 280 workers.²⁶⁷ The Kodiak plant provides to its fish processors free room and board (including shower facilities), as well as free air transportation from and to Anchorage, provided the processors fulfill their contractual obligations.²⁶⁸

Ocean Beauty Seafoods LLC., founded in 1910, operates the largest and oldest seafood production facility in Kodiak (constructed in 1911). Located near the Kodiak boat harbor, Ocean Beauty - Kodiak is a major producer of fresh, frozen and canned salmon, as well as halibut, perch, cod, pollock, flatfish and herring. The facility processes seafood year round and employs a maximum of 375 workers during the peak season.²⁶⁹

Trident Seafoods Corporation, founded 1973, owns and operates two processing facilities in Kodiak. A portion of the processing activity takes place on the *Star of Kodiak*, a permanently moored World War II Liberty Ship that has been converted into a processing facility. The shipboard operation works in conjunction with another modern facility located next to the vessel. The facilities operate year-round, processing cod (black and Pacific), crab, pollock, halibut, flatfish, rockfish, and various species of Pacific salmon. The *Star of Kodiak* alone can process 1.1 million pounds of pollock and 400,000 pounds of cod per day. The very culturally diverse crew size varies from 100 to 300 employees depending on the season. The Kodiak facility provides room and board (including shower facilities) to its fish processing workforce at a nominal fee, as well as free air transportation from and to Seattle. Its on-site store sells personal care items to the workers, such as toothpaste and soap.²⁷⁰

Westward Seafoods was established in 1989 and started operations in 1991. In 2004, Western Alaska Fisheries merged with Westward Seafoods to form what is now known as Westward Seafoods Inc. One of Westward's seafood processing facilities is located in Kodiak. Westward also owns a facility in Dutch Harbor. The Kodiak plant processes cod, pollock, halibut

and salmon. The facility has an annual total production of 45,000,000 pounds²⁷¹ and employs a maximum of 300 workers each year.²⁷²

Wildsource Inc. processes black cod and salmon (Chinook, coho, pink and sockeye) in Kodiak²⁷³ and began operations in 2008.²⁷⁴ The Sun'aq tribe purchased the Wildsource facility in January 2010 with grant money from the Office of Indian Energy and Economic Development.²⁷⁵ The plant employs a maximum of six workers each year.²⁷⁶

Fisheries-Related Revenue

In 2010, Kodiak collected \$5.27 million in fisheries-related taxes, compared to \$3.63 million in 2000. However, it should be noted that data related to port/dock usage fees are not available for 2010. Since those fees accounted for a significant portion of fisheries-related revenue in previous years, it is likely that revenue figures are grossly underrepresented. The most accurately represented year was 2009, when fisheries-related revenue peaked at \$31.1 million. In that year, port/dock usage fees accounted for most revenues collected, followed by harbor usage fees and Shared Fisheries Business Tax revenues. Revenue collected for port/dock fees increased significantly between 2000 and 2009. Information regarding fisheries-related taxes and fees can be found in Table 3. In a survey conducted by the AFSC in 2011, community leaders reported that Kodiak received \$100,680 from harbor sales tax, \$1.05 million from raw fish tax sharing, and \$179,789 from Commercial Passenger Vessel Tax revenues in 2010. Revenues collected from fisheries-related taxes are put towards maintaining the harbor, roads, water and wastewater systems, and public safety services.

Commercial Fishing

Kodiak hosts Alaska's largest fishing port. The KMA has 7 districts and 52 sections. There are approximately 750 salmon producing streams within the KMA. Chinook salmon occur in 6 streams, and sockeye salmon are found in 49. Coho salmon are found in 204 streams, while 404 streams support pink salmon. Finally, chum salmon can be found in 174 streams. Two hatcheries are located within the KMA which supplement natural populations. One is located in Kitoi Bay on the southeast side of Afognak Island, while the other is located at Pillar Creek near the City of Kodiak. Commercial salmon in the KMA dates back to 1882. In 1974, a limited entry system was created by the state to restrict effort. The primary gear used in harvesting is either purse or beach seine, although gillnets are also used. In 2010, the projected KMA harvest was

²⁷⁶ This information is based on the results of a survey of processing plant managers conducted by the Alaska Fisheries Science Center in 2011.

20,000 Chinook, 2.49 million sockeye, 413,108 coho, 11.4 million pink, and 1.02 million chum salmon.²⁷⁷

Pacific herring have been harvested for food and bait in the KMA since 1912. Early harvests were primarily used for food or reduction products. During the 1980s and 1990s, harvests occurred mainly in the northeast portion of the Shelikof Strait, with effort targeting both the Kodiak and Kamishak Bay stocks. However, the Kamishak spawning biomass has been below acceptable levels since 1998, and the Kamishak Bay sac roe and Kodiak food/bait fisheries have remained closed since then. Fisheries remain open in the rest of the KMA where spawning stocks are strong. The Kodiak food/bait herring fishery has been utilized primarily as bait for crab and longline fisheries, while the sac roe fishery is typically exported to Asian markets.²⁷⁸

Halibut stocks in IPHC Area 3A were at average levels as of 2007; however, levels are believed to be declining due to low recruitment and decreasing size-at-age.²⁷⁹

Historically, Kodiak supported significant red king crab populations, and trawl shrimp fisheries. However, since the 1980s, red king crab populations have been depressed, and the commercial fishery remains closed. Shrimp stocks as of 2009 only support minor fisheries. Small green sea urchin, golden king crab, and grooved Tanner crab fisheries exist, and various clam species are commercial harvested for consumption or bait. The dominate species harvested from Kodiak waters in 2009 were Tanner crab, Dungeness crab, giant Pacific octopus, and red sea cucumber. Dungeness crab was the most valuable shellfish harvested in the Kodiak area in 2009.²⁸⁰

Commercially significant groundfish species harvested in the Kodiak area include Pacific cod, sablefish, lingcod, skates, black rockfish, and walleye pollock. In 2010, walleye pollock and Pacific cod comprised the largest volume of groundfish harvested from state waters around Kodiak. Pacific cod are managed primarily through NMFS, although ADF&G issues emergency orders for state-water or parallel fisheries. The largest harvest of cod in federal waters occurred in the early 1990s, but has recently been more closely regulated in order to mitigate impacts on Steller sea lion populations. Harvest of Pacific cod within the KMA during the 2010 parallel season reached 8.59 million pounds. The majority of cod was harvested using pot and longline gear. Total Pacific cod harvests from state-waters in 2010 was 13.56 million pounds. Walleye pollock are managed by NMFS as three separate stocks, with parallel fisheries occurring in state-waters. Harvests from state-waters within the KMA totaled 23.68 million pounds in 2010.²⁸¹ Black rockfish were not targeted commercially in the Kodiak area until 1990. Harvests declined shortly after they started due to low abundance and poor market conditions. Skate harvests grew

quickly starting in 2003 due an emerging Korean market for skate products. Fishermen targeting skates were also allowed to retain cod in some instances. Sablefish habitat in state waters is limited in the Kodiak area, and larger adult fish prefer deeper waters. Lingcod are not typically targeted in the western Gulf of Alaska (GOA), although they are harvested from bycatch. Harvests primarily occur in rocky reef areas, although large catches are sometimes taken in offshore trawl fisheries.²⁸²

In 2010, 587 residents, or 9.6% of the population, held 1,279 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 716 residents held 1,646 CFEC permits, indicating an 18% decrease in commercial fisheries participation by local residents over the decade. Of the permits held in 2010, 13% were for crab, compared to 8% in 2000; 6% were for “other” shellfish, compared to 4% in 2000; 16% were for halibut, compared to 18% in 2000; 11% were for herring, compared to 10% in 2000; 3% were for sablefish, compared to 4% in 2000; 23% were for groundfish, compared to 34% in 2000; and 31% were for salmon, compared to 23% in 2000. Also in that year, 187 residents held 216 License Limitation Program (LLP) groundfish permits, compared to 245 permits held by 200 residents in 2000; 42 residents held 47 LLP crab permits, compared to 67 permits held by 56 residents in 2000; and 137 residents held 143 Federal Fisheries Permits (FFP), compared to 188 FFP held by 168 residents in 2000.

In 2010, 224 account holders held 47.77 million shares of halibut quota, compared to 304 who held 57.08 million in 2000. The number of halibut quota shares held in Kodiak peaked in 2000. However, it should be noted that the amount of Individual Fish Quota (IFQ) in pounds decreased steadily between 2000 and 2010 from 9.26 million pounds, to 6.44 million. Also in 2010, 62 account holders held 19.09 million shares of sablefish quota, compared to 67 who held 17.99 million in 2000. The number of sablefish shares held in Kodiak peaked in 2010, and the IFQ allotment peaked in 2006 at 1.79 million pounds. Finally, 57 account holders held 174.24 million pounds of crab quota, compared to 46 who held 146.08 million in 2005. The number of crab quota shares held in Kodiak peaked in 2009 at 181.71 million, and the IFQ allotment peaked in 2008 at 6.75 million pounds. Overall, Kodiak residents held 23.3% of halibut, 14.4% of sablefish, and 32.5% of crab quota statewide in 2010.

Of the CFEC permits held in 2010, 59% were actively fished, compared to 60% in 2000. By fishery, 47% of crab permits were actively fished, compared to 69% in 2000; 35% of “other: shellfish permits, compared to 36% in 2000; 86% of halibut permits, compared to 81% in 2000; 26% of herring permits, compared to 23% in 2000; 89% of sablefish permits, compared to 69% in 2000; 63% of groundfish permits, compared to 52% in 2000; and 59% of salmon permits, compared to 73% in 2000.

Residents held 884 commercial crew licenses in 2010, compared to 1,263 in 2000; which was also the year in which the number of locally held crew licenses peaked. Also in that year, residents held majority ownership of 452 commercial fishing vessels, compared to 719 in 2000; which was again, the year in which local vessel ownership peaked. Both the number of crew licenses and the number of vessels owned by local residents declined at a steady rate between 2000 and 2010. Fisheries prosecuted by Kodiak residents in 2010 included: Westward pot Dungeness crab; Kodiak pot king and Tanner crab; Bering Sea pot king and Tanner crab; Bristol Bay pot king crab; Alaska Peninsula pot Tanner crab; statewide hand troll, mechanical jig, and longline halibut; southeast purse seine herring roe; Kodiak purse seine and gillnet herring roe; Alaska Peninsula purse seine herring roe; Bristol Bay purse seine herring roe; Kodiak purse seine

²⁸² See footnote 279.

herring food/bait; statewide longline, otter trawl, mechanical jig, and pot miscellaneous saltwater finfish; GOA longline, otter trawl, pot, and mechanical jig miscellaneous saltwater finfish; southeast longline demersal shelf rockfish; statewide pot octopi/squid; Prince William Sound pot shrimp; Westward pot shrimp; statewide dive sea cucumber; Kodiak dive sea cucumber; statewide dredge scallop; statewide longline sablefish; Prince William Sound purse seine and drift gillnet salmon; Kodiak set gillnet and purse and beach seine salmon; Chignik purse seine salmon; Cook Inlet drift gillnet salmon; Alaska Peninsula drift gillnet salmon; Bristol Bay drift and set gillnet salmon; and statewide power troll salmon.²⁸³

In 2010, a total of 316.50 million pounds of seafood was landed in Kodiak valued at \$121.70 million ex-vessel, compared to 285.43 million pounds valued at \$96.71 million in 2000. Pounds landed in Kodiak peaked in 2006 at 376.51 million. Total ex-vessel value of landings peaked in 2008 at \$145.33 million. Overall, 13.6% of total 2010 landings made in Alaska were made in Kodiak, compared to 13.0% in 2000. In addition, Kodiak received 9.9% of total ex-vessel revenue made statewide that year, compared to 13.2% in 2000. Kodiak ranked 2nd of 65 communities reporting landings for 2010 in both total pounds landed and total ex-vessel value of landings and pollock was ranked first in 2010 in terms of pounds landed, followed by Pacific cod, “other” groundfish, salmon, herring, halibut, sablefish, and “other” shellfish. In that year, 106.78 million pounds of pollock valued at \$17.43 million ex-vessel was landed, compared to 106.09 million pounds valued at \$12.17 million ex-vessel in 2000; an increase of \$0.00 per pound ex-vessel after adjusting for inflation.²⁸⁴ Also in that year, 75.38 million pounds of Pacific cod valued at \$19.43 million ex-vessel was landed, compared to 64.17 million pounds valued at \$22.90 ex-vessel in 2000; a decrease of \$0.23 per pound ex-vessel after adjusting for inflation.²⁸⁵ In terms of “other” groundfish, landings totaled 66.15 million pounds valued at \$7.41 million ex-vessel, compared to 47.02 million valued at \$4.54 million ex-vessel in 2000. In terms of salmon, 44.22 million pounds were landed valued at \$24.02 million ex-vessel, compared to 52.03 million pounds valued at \$18.59 million ex-vessel in 2000; an increase of \$0.05 per pound ex-vessel after adjusting for inflation,²⁸⁶ and without considering the species composition of landings. In terms of herring, landings totaled 11.63 million pounds valued at \$1.33 million in 2010, compared to 1.87 million pounds valued at \$635,596 in 2000; a decrease of \$0.11 per pound ex-vessel after adjusting for inflation.²⁸⁷ In terms of halibut, 6.45 million pounds valued at \$31.16 million were landed in 2010, approximately a third less than landed in 2000 (9.23 million pounds valued at \$23.02 million); however, also representing an increase of \$0.40 per pound ex-vessel after adjusting for inflation.²⁸⁸ In terms of sablefish, 2.76 million pounds were landed valued at \$21.02 million, compared to 2.07 million pounds valued at \$6.34 million in 2000; an increase of \$0.72 per pound ex-vessel after adjusting for inflation.²⁸⁹ Finally, 674,606 pounds of “other” shellfish were landed valued at \$452,263, significantly higher than the 141,935 pounds valued at \$49,545 landed in 2000.

For landings made by Kodiak residents in 2010, pollock ranked first in terms of pounds landed; followed by Pacific cod, salmon, “other” groundfish, herring, halibut, crab, sablefish, and “other” shellfish. In that year, residents landed 67.07 million pounds of pollock valued at \$10.40 million ex-vessel, compared to 75.44 million pounds valued at \$8.48 million ex-vessel; an increase of \$0.01 per pound ex-vessel after adjusting for inflation.²⁹⁰ Residents landed 54.20 million pounds of Pacific cod valued at \$14.65 million ex-vessel, compared to 52.90 million pounds valued at \$22.45 million ex-vessel in 2000; a decrease of \$0.31 per pound ex-vessel after adjusting for inflation.²⁹¹ Residents landed 31.97 million pounds of salmon valued at \$18.88 million ex-vessel, compared to 31.73 million pounds valued at \$11.66 million ex-vessel in 2000; an increase of \$0.08 per pound ex-vessel after adjusting for inflation,²⁹² and without considering the species composition of landings. Residents landed 27.82 million pounds of “other” groundfish valued at \$3.24 million ex-vessel, compared to 35.76 million pounds valued at \$4.55 million ex-vessel in 2000. Residents landed 22.36 million pounds of herring valued at \$3.60 million ex-vessel, compared to 8.0 million pounds valued at \$1.19 million in 2000; a decrease of \$0.04 per pound ex-vessel after adjusting for inflation.²⁹³ Residents landed 7.52 million pounds of halibut valued at \$35.64 million ex-vessel, compared to 10.85 million pounds valued at \$27.04 million ex-vessel in 2000; an increase of \$1.31 per pound ex-vessel after adjusting for inflation.²⁹⁴ Residents landed 7.30 million pounds of crab valued at \$17.29 million ex-vessel, compared to 7.41 million pounds valued at \$19.15 million ex-vessel in 2000; a decrease of \$1.18 per pound ex-vessel after adjusting for inflation,²⁹⁵ and without considering the species composition of landings. Residents landed 1.61 million pounds of sablefish valued at \$8.60 million ex-vessel, compared to 1.87 million pounds valued at \$6.62 million in 2000; an increase of \$0.47 per pound ex-vessel after adjusting for inflation.²⁹⁶ Finally, residents landed 453,391 pounds of “other” shellfish valued at \$446,032, compared to 224,160 pounds valued at \$311,114 in 2000. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

The KMA is a very popular recreational fishing area for both Alaska resident and non-resident anglers. The 70 mi of paved and hard-packed gravel roads provide access to 10 significant salmon streams and over 20 stocked lakes. Freshwater fishing opportunities available include Chinook, pink, sockeye, and coho salmon, Dolly Varden, rainbow trout, and steelhead. Fishing destinations not located adjacent to the road system can be accessed by boat or floatplane. Approximately 11,000 people live along the Kodiak road system, and around 14,000 visitors travel to the Kodiak area every year. Available services include 65 charter operators, 33 remote lodges, 6 air taxis, 12 state and federal public cabins, 10 private remote rental cabins, 5 hotels and motels, 30 bed and breakfasts, 4 sporting good stores, and a range of other services which support a robust visitor economy.²⁹⁷ According to ADF&G records, there were 46 sport fish guide businesses active in Kodiak in 2010, compared to 47 in 2000. According to records, active sport fish guide businesses peaked in 2008 at 58. In addition, 98 sport fish guide licenses were issued to residents in 2010, compared to 140 in 2000. The number of sport fish guide licenses held by residents declined at a steady rate between 2000 and 2010. Between 4,300 and 5,000 sportfishing licenses were sold to residents each year between 2000 and 2010; however, as many as 11,436 licenses were sold in the community (irrespective of residence) indicating that Kodiak is a popular sportfishing destination for non-residents (Table 11).

On the road system, Chinook salmon can be found offshore of Monashka Bay, Cape Chiniak, and the American and Olds rivers. Saltwater trolling is a popular activity in marine waters, and most trolling occurs in Chiniak Bay between April and October. The Karluk and Ayakulik rivers, located on the southwest end of Kodiak Island, are Kodiak's only native Chinook fisheries. There are three sockeye salmon producing streams on the Kodiak road system: the Buskin, Pasagshak, and Saltery rivers. The largest sockeye run occurs on the Saltery River, starting in early July, and peaking near the end of the month. Pink salmon are widely available throughout the Kodiak area. Pinks can be taken along beaches or at the mouth of most drainages, and are available by mid-July. Coho salmon are typically targeted in marine waters by troll vessel during the last week of July as they begin to move towards shore.

Popular areas include Cape Chiniak and Buoy 4. Steelhead trout are available in limited numbers within Buskin, Miam, and Saltery drainages adjacent to the road system. The Karluk River contains Kodiak Island's largest population of steelhead. The Dog Salmon and Litnik rivers also contain large concentrations. Halibut are found in abundance throughout marine waters around Kodiak Island, and are typically targeted from late April through early September. More than 30 species of rockfish are also available, with yellow-eye caught most often. Lingcod can be targeted beginning July 1, but are in relatively lower abundance. Dolly Varden are at their peak in late May, and again from mid-July through October. Fishing areas along the road system include Mission and Pillar creek beaches in the spring and most Kodiak drainages in the summer and fall.²⁹⁸

Kodiak is located in the Kodiak ADF&G Harvest Survey Area, which included all Alaskan waters, including drainages, of the Kodiak and Afognak Island groups. In 2010, there were a total of 40,377 saltwater and 41,082 freshwater angler days fished, compared to 55,576

²⁹⁷ Alaska Dept. of Fish and Game. (n.d.). *Kodiak Management Area*. Retrieved September 17, 2012 from: <http://www.adfg.alaska.gov/index.cfm?adfg=ByAreaSouthcentralKodiak.fishingInfo#/runtiming>

and 65,831 in 2000, respectively (Table 11). Both saltwater and freshwater angler days fished peaked in 2000. Between 2000 and 2010, the proportion of non-Alaska residents participating in freshwater and saltwater recreational fisheries grew relative to the total number of angler days fished. Overall, non-Alaska residents accounted for 49.6% of saltwater and 45.9% of freshwater angler days fished in 2010, compared to 30.2% and 28.1% in 2000, respectively.

In a survey conducted by the AFSC in 2011, community leaders reported that private anglers in Kodiak target Chinook salmon, coho salmon, sockeye salmon, halibut, and crab. Fishing is typically done by charter vessel, locally owned private vessel, or from shore (residents only). According to ADF&G Harvest Survey data, local private anglers target all five species of Pacific salmon, rainbow trout, Dolly Varden, Arctic grayling, northern pike, Pacific halibut, rockfish, lingcod, Pacific cod, sablefish, smelt, Dungeness crab, Tanner crab, razor clams, hardshell clams, and shrimp.²⁹⁹ According to 2010 catch/release data collected by ADF&G, charter vessels kept 1,017 Chinook salmon, 1,759 coho salmon, 83 sockeye salmon, 421 unspecified salmon, 7,133 halibut, 1,423 lingcod, and 11,388 rockfish. Overall, the number of salmon caught was lower in 2010 than in previous years since 2000. The number of Chinook and coho salmon caught was lower than any other year during that decade. Conversely, the number of rockfish caught was at its highest level in 10 years in 2010.

Subsistence Fishing

Subsistence resources have been relied on in Kodiak since human occupation began some 7,500 years ago. The Alutiiq culture relied strongly on subsistence use of marine fish, invertebrates, marine mammals, terrestrial mammals, and freshwater fish. While Kodiak's economy is not as dependent on subsistence resources as more remote locations on Kodiak Island, residents still practice subsistence to supplement diets and income. Participation in the KMA subsistence salmon fishery is open to any Alaska residents. However, subsistence activities on federal waters are limited only to qualified rural Alaska residents. All communities located within the KMA are considered rural by the Federal Subsistence Board and are eligible to participate in subsistence activities on federal lands and waters.³⁰⁰ In a survey conducted by the AFSC in 2011, community leaders reported that residents consider salmon, halibut, and crab as the three most important aquatic subsistence resources. Species which Kodiak Island Borough residents harvest for subsistence purposes include: all five species of Pacific salmon, halibut, sole, flounder, herring, capelin, cod, bass, snapper, herring, crab, mussels, razor clams, butter clams, softshell clams, cockles, emmas, bidarkis, king crabs, tanner crabs, Dungeness crabs, horse crabs, limpets, snails, octopus, sea urchins, shrimp, Dolly Varden, whitefish, lake trout, rainbow/steelhead trout, Arctic grayling, Northern pike, burbot, blackfish, longnose sucker, smelt, harbor seal, spotted seal, ringed seal, bearded seal, Steller sea lion, walrus, and beluga whale.³⁰¹

According to 2006 ADF&G estimates detailed in Kodiak Island Borough's *2007 Coastal Management Plan*, 93.3% of Kodiak residents use subsistence salmon, 1.9% use marine mammals, 79.0% use marine invertebrates, and 95.2% use non-salmon fish.³⁰² Of the species listed by ADF&G in Table 13, residents reported harvesting sockeye salmon the most, followed by coho, pink, Chinook, and chum salmon. In 2008, residents reported harvesting 19,996 salmon,

³⁰² Ibid.

compared to 23,619 in 2000. Reported salmon harvests peaked in 2004 at 29,399 fish. In 2010, residents were issued 1,720 Subsistence Halibut Registration Certificates (SHARC), compared to 1,345 in 2003. In that year, an estimated 130,384 pounds of halibut was harvested on 508 SHARC, compared to an estimated 157,746 pounds harvested on 667 SHARC in 2003. This represents a significant decline in both the number of SHARC fished and the estimated pounds harvested, as well as the lowest permit activity relative to the number of SHARC issued since the program began. Subsistence halibut harvests peaked in 2004 at an estimated 257,581 pounds harvested on 827 SHARC (Table 14). Between 2000 and 2010, an estimated 458 sea otters were harvested. Estimated sea otter harvests peaked in 2002 at 64 otters. Between 2000 and 2008 an estimated 222 harbor seals and 8 Steller sea lions were harvested (Table 15).

Additional Information

In a survey conducted by the AFSC in 2011, community leaders reported that high fuel prices, variable fish prices, and continuous changes in fishery regulations are current challenges for the portion of Kodiak’s economy that is based on fishing. They expressed that due to the diversity of Kodiak’s fleet and seafood processing sectors, most policy or management changes have an impact on some portion of the local population and fishing industry. In the past, regulations pertaining to rationalization and privatization have affected Kodiak the most.

Larsen Bay

People and Place

*Location*³⁰³

Larsen Bay is located on the northwest coast of Kodiak Island. It is 60 miles southwest of the City of Kodiak and 283 miles southwest of Anchorage. The area encompasses 5.4 square miles of land and 2.2 square miles of water. The City was incorporated in 1974 and is under the jurisdiction of the Kodiak Island Borough.

*Demographic Profile*³⁰⁴

In 2010, there were 87 residents in Larsen Bay, ranking it the 259th largest of 352 Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population decreased by 40.8%. Between 2000 and 2009, the population declined by 31.3% and there was an average annual growth rate of -1.37%, compared to the statewide average of 0.75%; indicative of a steep rate of decline. Information regarding population trends can be found in Table 1.

Larsen Bay is a predominately Alutiiq community. In 2010, 71.3% of residents identified themselves as American Indian or Alaska Native, compared to 78.3% in 2000; 24.1% identified themselves as White, compared to 20.9% in 2000; and 4.6% identified themselves as two or more races, compared to 0.9% in 2000. Information regarding racial and ethnic trends can be found in Figure 1.

In 2010, the average household size in Larsen Bay was 2.56, compared to 3.30 in 1990 and 2.88 in 2000. Also in 2010, there were a total of 70 housing units, compared to 74 in 1990 and 70 in 2000. Of the households surveyed in 2010, 29% were owner-occupied, compared to 46% in 2000; 20% were renter-occupied, compared to 11% in 2000; 11% were vacant, compared to 3% in 2000; and 40% were occupied seasonally, compared to 40% in 2000.

In 2010, the gender makeup of Larsen Bay was 55.2% male and 44.8% female. This was somewhat more skewed than both the distribution statewide (52.0% male, 48.0% female) and the distribution in 2000 (53.0% male, 47.0% female). The median age was estimated to be 43.5 years, higher than both the statewide median of 33.8 years, and 2000 median of 29.3 years.

Compared with 2000, the population structure in 2010 was more constricted in the younger age groups and expanded in the older age groups. In that year, 24.2% of residents were under the age of 20, compared to 39.1% in 2000 while 10.4% were between the ages of 20 and 29, compared to 12.2% in 2000. However, in 2010, 40.4% were between the ages of 30 and 59, compared to 37.5% in 2000 and 25.3% were over the age of 59, compared to 11.3% in 2000.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

This suggests that the population of Larsen Bay is continuing to age and no longer possesses a pyramid structure when the population is examined by age and gender.

Gender distribution by age cohort was slightly more even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within both the 60 to 69 age range (9.2% male, 5.7% female) and the 80 and over age range (0.0% male, 3.5% female) with a disparity of 3.5%, closely followed by the 10 to 19 (6.9% male, 3.5% female) age group. Further information regarding trends in Fairbanks’ population structure can be found in Figure 2.

Figure 1. Racial and Ethnic Composition, Larsen Bay: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Larsen Bay Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)³⁰⁵ estimated that 94.4% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 2.6% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 3.1% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 14.1% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; 28.2% of resident held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 17.9% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

³⁰⁵ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*³⁰⁶

Kodiak Island is within the traditional territory of the Alutiiq peoples, and the area is estimated to have been inhabited for at least 7,500 years.^{307,308,309} The area around Larsen Bay is believed to have been inhabited for at least 2,000 years. Hundreds of artifacts have been uncovered in the community, which attest to the fact that an Aleut or more recently termed Alutiiq community lived in the area for about 2,000 years prior to the first contact with the Russians in the mid-1700s when fur traders began to frequent the islands. A tannery was present at Uyak Bay during the early 1800s. Peter Larsen was an Unga Island furrier, hunter and guide during the late 1800s and at the time of the 1890 Census the native village which was situated on the west shore of the bay, Uyak was renamed Larsen Bay after him. A cannery was constructed by the Alaska Packers Association in 1911. Owned now by the Kodiak Salmon Packers, the facility is one of the largest in the State of Alaska.³¹⁰

Larsen Bay was incorporated in the year 1974. The City gained national attention in 1991 when the Smithsonian Institution repatriated the remains of 756 Alutiiq people which had been taken 50 years earlier in accordance with the Native American Graves Protection and Repatriation Act. The remains were given a Russian Orthodox reburial and interned in a mass grave. This was the largest repatriation of Native remains carried out by the Smithsonian.

Natural Resources and Environment³¹¹

The climate of the Kodiak Islands is dominated by a strong marine influence. There is moderate precipitation, frequent cloud cover and fog, and little or no freezing weather. Severe storms are common from December through February. Average annual precipitation is 23 inches. Temperatures remain within a narrow range, from 32 to 62 °F.³¹²

The Larsen Bay area was sculpted heavily by glacial activities dating back to the Miocene. The bay itself is a fjord, which was at one time filled with ice as part of an extensive ice mass occupying Uyak Bay. Larsen Bay's coastal regions are characterized by narrow rocky beaches, moist tundra lowlands, and steep relief uplands. The community itself is located along a beach with gradual incline. Surrounding mountains reach elevations of approximately 3,000 feet. Because of extensive glaciation, the hills are generally smooth and rounded.³¹³

Subsurface geology consists primarily of slate dating by to the Late Cretaceous Period. Bedrock is found and varying depths, with some areas exposed. The mantle of bedrock is

³¹² Ibid.

³¹³ See footnote 310.

covered in till with thicknesses up to 30 feet. Organic silt and volcanic ash overlay this till in depths of up to four feet. Soils are relatively shallow throughout Kodiak Island.³¹⁴

Vegetation in the area is dominated by scattered birch, cottonwood, and alders. In addition, high brush alder and willow is mixed with tree stands. There are no Sitka spruce or western hemlock in the area, as are found in eastern Kodiak Island. Bluejoint and fescue grasses abound in the open area, accompanied by other vegetation, such as lupine, Jacob's ladder, germs, sedges, and horsetail. Small areas of wetlands are found, especially near the head of the bay where soils are poorly drained.³¹⁵

The Kodiak archipelago and waters that surround it are home to many species of terrestrial and aquatic life. The Kodiak National Wildlife Refuge occupies two-thirds of Kodiak Island and is home to terrestrial species such as brown bears, bats, tundra vole, short-tailed weasel, red fox, river otter, Sitka black-tail deer, beavers, red squirrels, snowshoe hare, arctic ground squirrel, Roosevelt elk, muskrat, and mountain goat. Marine mammals documented in the area include whales, harbor seals, fur seals, sea otters, and Steller sea lions.³¹⁶ The adjacent waters provide some of the richest commercial fishing grounds in the world, home to stocks of Pacific salmon, halibut, flounder, cod, trout, grayling, crab, and shrimp.³¹⁷

There are several mineral projects in the area as of 2011 including a tin claim around Halibut Bay to the north and a gold/silver claim around the City of Kodiak.³¹⁸ In addition, there is a placer gold deposit located in the vicinity of Alitak and Tanner Head Island to the south.³¹⁹

Natural hazards in the area include coastal flooding, coastal erosion, earthquakes, tsunamis, volcanism, landslides, and sea-level rise. Coastal flooding and erosion is mainly attributed to storm surges. There are several faults that run through Kodiak Island, including one 3.5 km west of Larsen Bay, and earthquakes that are magnitude six or above are relatively frequent. Threats from Aleutian volcanoes include the possibility of acidic rain, ash clouds, landslides, tsunamis, and earthquakes. Residents in the area reported subsidence of around 2 to 20 ft as a result of the 1964 Good Friday earthquake. Coastal erosion is a significant threat to the coastline of Larsen Bay, particularly along the shore to the northeast of the mouth of Humpy Creek. East-facing shorelines are the most prone to such damage. Gulf of Alaska (GOA) storms exacerbate coastal erosion as well as cause wind-related damage to infrastructure and utilities. Cyclonic storms in the GOA can sustain speeds of between 50 and 75 knots. Tsunami risks are considered low because of Larson Bay's location on the west side of Kodiak Island. Ash is considered a secondary threat posed by volcanism in the area. In 1912, the eruption of Mt. Katmai blanketed Kodiak Island in several feet of ash. Corrosive rains cause ash clouds may also pose a threat.³²⁰

According to the Alaska Department of Environmental Conservation, there were no local significant environmental remediation projects active in 2010.³²¹

Current Economy³²²

Larsen Bay's economy is heavily dependent on commercial fishing. In the summer months, the population swells to over 300 with approximately 200 local cannery workers and transient lodge workers joining the community. The local commercial fishing industry has been in decline since its peak in the 1980s. The impact of limited entry consolidated local fishing efforts, and many residents emigrated to find other employment. Permanent wage employment was replaced with a more seasonal economy as the community shrank. Local demographics have also had an impact on the local economy. Between 2000 and 2010, Larsen Bay's population structure went from an expansive, younger demographic, to a more constrictive, older demographic. Youth retention is of particular concern to the community and its economy. In 2004, only 12 of the 222 positions available in Larsen Bay were full time. The local seafood processor and tourism lodges provide seasonal employment, but the positions are low paying and typically outsourced to non-residents. The area surrounding Larsen Bay provides an abundance of exploitable marine resources. In addition, the Karluk River and Kodiak National Wildlife Refuge provides ample wildlife habitat and recreational resources. However, many areas surrounding Larsen Bay are restricted to non-commercial uses. As of 2004, Larsen Bay supported six tourism sport fish lodges; two of which were open year round.³²³

In 2010,³²⁴ the estimated per capita income was \$15,350 and the estimated median household income was \$37,083, compared to \$16,227 and \$40,833 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,³²⁵ the real per capita income \$21,338 and real median household income \$53,695 indicate a decline in both individual and household earnings between 2000 and 2010. In 2010, Larsen Bay ranked 200th of 305 Alaskan communities from which per capita income was estimated, and 208th of 299 communities from which median household income was estimated.

However, Larsen Bay's small population size may have prevented the ACS from accurately portraying economic conditions.³²⁶ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$1.06 million in total wages in 2010.^{327,328} When matched with the 2010 Decennial Census population, the per capita income

³²² Unless otherwise noted, all monetary data are reported in nominal values.

³²³ Townsend-Vennel, R. J. (2004). *Community of Larsen Bay, Community Comprehensive Plan*. Retrieved August 13, 2012 from: <http://www.commerce.state.ak.us/dca/plans/LarsenBay-CP-2004.pdf>.

³²⁴ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

³²⁵ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

³²⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³²⁷ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

³²⁸ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

equals \$12,233, which is somewhat less than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Decennial Census figures.

According to 2006-2010 ACS estimates,³²⁹ 50% of residents over the age of 16 were part of the civilian labor force in 2010. In that year, unemployment was estimated at 0%, compared to an estimated 5.9% statewide; and an estimated 0% of residents were living below the poverty level, compared to an estimated 9.5% of Alaskan residents overall. However, it is likely that the ACS misrepresented employment conditions due to Larsen Bay's small population size. The ALARI database³³⁰ estimated that unemployment in 2010 was 27.4% according to unemployment insurance claimants. In addition, the 2006-2010 ACS estimated to 50% of those employed worked in the public sector, and 50% were self-employed. Again, the validity of this estimate is questionable considering the ACS sample size; however, if accurate, ALARI estimates may be misrepresentative as they do capture not self-employed residents.

By industry, half of those employed were estimated to work in public administration sectors; and half in agriculture, forestry, fishing, hunting, and mining sectors. Between 2000 and 2010, there was significant consolidating of Larsen Bay's economy. The proportion of residents working in agriculture, forestry, fishing, hunting, and mining sectors experienced the greatest gain in those years, while all other sectors—with the exception of public administration—experienced significant proportional declines. This reduction in diversity was also seen in employment by occupation type, with significant proportional increases in natural resources, construction, and maintenance positions. Again, it is likely that Larsen Bay's small population size impacted the ACS' ability to accurately portray economic conditions. According to 2010 ALARI estimates,³³¹ most (59.6%) employed residents worked in local government sectors; followed by financial service sectors (11.5%); leisure and hospitality sectors (5.8%); and education and health service sectors (5.8%). It was estimated that natural resources and mining sectors accounted for only 1.9% of sector employment that year. Further information regarding employment by industry sector can be found in Table 3.

By occupation, most (50.0%) employed residents were estimated to hold natural resources, construction, or maintenance positions; followed by service (25.0%) and sales or office positions (25.0%). With the exception of service positions, there was significant proportional variation in employment by occupation type between 2000 and 2010. Between those years, there were large representative gains in natural resources, construction, maintenance, sales, and office occupations; while there were large declines in production, transportation, material moving, management, and professional occupations. As with employment by industry sector, it is possible that the ACS was unable to accurately portray local employment by occupation type in 2010. Further information regarding employment by occupation type can be found in Table 4.

Figure 4. Local Employment by Occupation in 2000-2010, Larsen Bay (U.S. Census).

Governance

Larsen Bay is a Second-class city located within the Kodiak Island Borough. Incorporated in 1974, Larsen Bay has a manager or “Strong Mayor” form of government. In addition, there is a U.S. Bureau of Indian Affairs (BIA) recognized tribal government located in Larsen Bay. The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Larsen Bay is Koniag, Incorporated, and the local ANCSA chartered non-profit is the Kodiak Area Native Association. The ANCSA chartered village corporation is Anton Larsen, Inc. The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish and

Game (ADF&G), and Bureau of Citizenship and Immigration Services offices are all located within the City of Kodiak, 60 miles northeast.

The City collected a 3% sales tax and an accommodations tax in 2010. When adjusted for inflation,³³² total municipal revenues increased by 14.5% between 2000 and 2010 from \$627,854, to \$929,462. In 2010, most (91.1%) locally generated revenues came from utility rents; followed by local tax revenues (2.9%) and building and equipment rentals (2.5%). In terms of outside revenues, Outside revenues were almost entirely collected from state revenue sharing sources. Also in that year, sales taxes accounted for 1.3% of total municipal revenues, compared to 3.1% in 2000. Finally, state allocated Community Revenue Sharing accounted for 10.8% of total municipal revenues, compared to 3.4% from State Revenue Sharing in 2000. State and federal fisheries-related grants awarded to Larsen Bay between 2000 and 2010 included \$399,600 for a small boat harbor, \$67,624 for a disaster/boat harbor, and \$965,000 for freezer/storage/processing equipment.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Larsen Bay from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-related Grants (State and Federal) ⁵
2000	\$627,854	\$19,418	\$21,301	\$222,630

Infrastructure

Connectivity and Transportation

Larsen Bay is accessible by water or air only. No roads connect the community with any other on Kodiak Island. Docking facilities are available. In 2002, a small boat harbor was completed. A cargo barge arrives every 6 weeks from Seattle.

The State of Alaska operates a 2,690-foot gravel airstrip and a seaplane base. As of November 2011, the price for airfare in June 2012 was \$360 for roundtrip from Anchorage to the City of Kodiak.³³³ Regular and charter flights are available from Kodiak to Larsen Bay and serviced by Island Air Service and Servant Air. Uyak Air Service is based in Larsen Bay and provides air service to other Kodiak Island communities on a charter basis.

Facilities

Water is supplied by two groundwater sources – a gravity feed from the hydrological plant and a backup well – and stored in a 200,000-gallon steel tank. A water supply line is connected to the penstock of the hydroelectric plant and used a majority of the time to reduce utility expenses to both the service plant and the customers. All 40 homes are connected to the piped water system. A community septic tank with outfall line serves approximately half of these homes and the rest are on individual septic systems. Weekly refuse collection services are provided.

In the City's Comprehensive Development Plan, community members report that a post office is present in the community.³³⁴ The community also has telephone and internet access, but does not have a cable provider. A fire-hydrant system is attached to the City's water storage tank, and the community utilizes a local volunteer fire department for fire protection. The community is served by a Village Public Safety Officer. The nearest state troopers are located in Kodiak.

Medical Services

The Larsen Bay Health Clinic provides residents with basic medical services and contains an examination room as well as laboratory, waiting room, and office. Larsen Bay is part of the Southern Emergency Medical Services Region. Emergency Services have coastal and air access. Emergency service is provided by a health aide. The nearest hospital is located in Kodiak.

Educational Opportunities

The education system is operated by the Kodiak Island Borough School District. The school is housed in two buildings,³³⁵ the first being the older building which houses grades kindergarten through sixth grade. This building has two classrooms and a library. The second building was constructed in 1980 and houses grades seventh through twelfth. This building

contains two classrooms, a vocational education room, a gymnasium, a kitchen, and a storage area. The facility is utilized by the community during selected non-school hours for recreational use. In 2011, the school had 16 students in attendance and 5 teachers.³³⁶

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prior to the arrival of Europeans, subsistence hunting and fishing was the basis of the economy for people living on Kodiak Island and surrounding areas. The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources and marine mammals, including whales, sea lions, seals, and sea otters. With the arrival of Russian colonists to Kodiak Island in the late 1700s, the Alutiiq people were forced to hunt for sea otters to fuel the trade of their valuable pelts.³³⁷

After the U.S. purchase of Alaska, American entrepreneurs arrived to continue hunting sea otter and to develop other industries, including salmon fishing. In 1889, the Royal Packing Company constructed a cannery at Larsen Bay. Shortly afterward, the American Packing Company built another. A majority of cannery employees were hired from outside the region, primarily from the United States and China. Native Alaskans became increasingly involved in commercial salmon fishing in the early 1900s, and coordinated commercial fishing activity with subsistence hunting and fishing activities. The most common fishing gear was the beach seine until purse seining became popular in the 1920s with the rise of fuel-powered boats. The salmon fishery was the primary focus of local commercial fishing activity, although by the 1920s, halibut fisherman began stopping in Kodiak, and herring and cod fishermen also worked in the area.³³⁸

The ADF&G manages the Kodiak salmon and herring fisheries in waters surrounding the Kodiak archipelago.³³⁹ The salmon fishery is divided into seven fishing districts (Afognak District, Northeast Kodiak District, Eastside Kodiak District, Alitak Bay District, Southwest Kodiak District, Northwest Kodiak District, and Mainland Districts). Gear types in use currently include purse seine, set gillnets and beach seine.³⁴⁰ Kodiak herring fisheries include a roe fishery (using both purse seine and gillnet gear) and a food/bait fishery. Herring sac roe fisheries take place in the spring when individual spawning biomasses are aggregated. In contrast, food/bait fisheries take place in the summer, fall, and winter when herring from several stocks may be mixed together. A Kodiak food/bait herring fishery has historically taken place in Shelikof Strait, but has been closed in recent years because the Kamishak Bay spawning biomass (Cook Inlet)

has been below threshold since 1998. The Alaska Board of Fish (BOF) closes food/bait fisheries if any of the individual spawning populations is below threshold.³⁴¹

Groundfish and crab fisheries that occur within 3 nautical miles (nm) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nm in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction. In the Gulf of Alaska (GOA), federally-managed groundfish fisheries target Pacific cod, walleye pollock, pelagic shelf rockfish, sablefish, and flatfish. Parallel fisheries for Pacific cod and walleye pollock also take place in state waters surrounding Kodiak Island. Parallel fisheries occur at the same time as the federal fisheries. The Total Allowable Catch (TAC) set by NMFS in each fishery applies to both federal and parallel harvest. In addition to federally-managed groundfish fisheries, beginning in 1997, a ‘state-waters fishery’ for Pacific cod was initiated in the Kodiak area. Management plans for state-waters fisheries are approved by the BOF, and guideline harvest limits (GHL) are set by the ADF&G. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, the ADF&G manages lingcod fisheries in both state and EEZ waters off Alaska, and beginning in 1998, management of black rockfish and blue rockfish in the GOA was transferred from NMFS to ADF&G.³⁴²

Kodiak Island is one historical center of the red king crab fishery, and Tanner crabs are also distributed through the GOA. The ADF&G manages red king crab and Tanner crab stocks in the GOA. Ouzinkie residents primarily held permits in the snow crab fishery between 2000 and 2010. Snow crab are distributed throughout the eastern and northern Bering Sea, and are not found in the immediate Kodiak area.^{343,344} The Kodiak red king crab fishery has been closed in recent years due to low abundance. Parts of the Kodiak district have been open for Tanner crab harvest in recent years. Kodiak area Tanner crab harvest is managed using 8 separate management areas, each with its own GHL.³⁴⁵ Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

Larsen Bay has the longest history of a running cannery, Kodiak Salmon Packers, dating back to 1911. Since this time, Larsen Bay has been a focal point for the commercial and sports fishing industry. Before Russian fur traders arrived in the 18th century, Alutiiq villagers fished the waters around what is today Larsen Bay.

The City is located in Federal Statistical and Reporting Area 620, Pacific Halibut Fishery Regulatory Area 3A, and the Central Gulf of Alaska (GOA) Sablefish Regulatory Area. Larsen Bay is not eligible to participate in the Community Development Quota program. The community is, however, eligible to participate in the Community Quota Entity (CQE) program.

The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels.

³⁴⁵ See footnote 342.

Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf. As of 2013, 45 communities were considered eligible for the CQE program, and 2 CQE non-profits had purchased commercial halibut IFQ and were actively leasing it to eligible community residents. Both of these CQE non-profits were located in the Kodiak area: Cape Barnabas, Inc. in Old Harbor and the Ouzinkie Company Holding Corporation in Ouzinkie.³⁴⁶

The Larsen Bay Development Company is the CQE non-profit entity which represents Larsen Bay and according to a household survey conducted in 2006, the majority of residents (72%) expressed a desire to participate directly in the CQE program and 85% of residents expected the program to help the Larsen Bay community.³⁴⁷ As of October 2013, the Larsen Bay Development Company had not purchased any commercial IFQ. However, the non-profit did have seven halibut charter permits available for lease to community members.³⁴⁸

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there is one shoreside processing plant in Larsen Bay. In 2006, Icicle Seafoods Inc. purchased the Larsen Bay processing plant from Kodiak Salmon Packers. The plant, constructed in 1911, is located in a small glacial fjord off of the large Uyak Bay that bisects Kodiak Island and is one of the oldest canneries in Alaska. The plant exclusively processes and cans salmon and is only open during the summer and early fall. Over 200 employees work at the facility from June until late September. Free room, laundry service and board as well as air transportation between Anchorage and Larsen Bay are provided to fish processing workers, provided they fulfill their contractual obligations. Icicle offers a varied fare in its galley.³⁴⁹ In 2010, the plant employed a maximum of 246 workers.³⁵⁰

Fisheries-Related Revenue

The City began collecting harbor usage fees in 2004, but has collected revenue from the Shared Fisheries Business Tax and Fisheries Resource Landing Tax programs every year between 2000 and 2010. In 2010, known fisheries-related revenue totaled \$107,079, an increase

from 2000 when a total of \$81,489 was collected. However, there was significant inter-annual variation in the intervening years. In the second half of the decade, anywhere from 23% to 34% of the total fisheries-related revenues came from harbor usage fees. For more information on known fisheries-related revenues for Larsen Bay between 2000 and 2010, see Table 3.

Commercial Fishing

In 2000, 21 residents held 26 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2010, 14 residents, or 16% of the population, held 14 CFEC permits. Of the permits held in 2010, 86% were for salmon, compared to 73% in 2000; 7% were for groundfish, compared to 23% in 2000; and 7% were for crab, compared to 0% in 2000. In addition, one resident held a groundfish License Limitation Program (LLP) permit in 2010. No residents held halibut quota shares between 2008 and 2010. However, residents held 1,181 shares through 1 account in 2007, compared to 4,559 shares through 2 accounts in 2000. No residents held sablefish or crab quota shares between 2005 and 2010.

Residents held 8 commercial crew licenses in 2010, compared to 29 in 2000. Also in that year, residents held majority ownership of 8 vessels, compared to 20 in 2000. Both the number of crew licenses and vessels owned by residents declined between 2000 and 2010. Of the permits held in 2010, 64% were actively fished, compared to 77% in 2000. This varied by fishery from 100% of groundfish and crab permits, to 58% of salmon permits. Fisheries prosecuted in 2010 by Larsen Bay residents included: GOA mechanical jig saltwater finfish and Kodiak purse seine, beach seine, and set gillnet salmon.

Between 2000 and 2010, no landings were made in Larsen Bay, with the exception of 2010, when 40 vessels made landings. However, landings are considered confidential for that year. Landings reported by Larsen Bay residents are considered confidential, with the exception of 2004 when residents landed 166,330 pounds of Pacific cod valued at \$53,759. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Larsen Bay residents participate in recreational fishing. The number of active sport fish guide businesses remained relatively steady between 2000 and 2010 at either three or four in any given year. The only exception was 2004 when only two sport fish guide businesses were active. The number of sport fish guide licenses held also remained relatively steady, averaging about 12 licenses annually. Residents

Larsen Bay is located within Alaska Sport Fishing Survey Area Q – Kodiak. This area includes all Alaskan waters, including drainages, of the Kodiak and Afognak Island groups, including the Trinity Islands. Sportfishing on Kodiak Island can be divided into private anglers who use boats and those who use the Island’s road system to access sportfishing destinations. There are 75 miles of paved and hard-packed gravel roads that cross 10 significant streams and provide access to 18 stocked lakes. Road system anglers can find salmon, Dolly Varden, and rainbow and steelhead trout in fresh waters. Remote areas on Kodiak, categorized as any areas

outside the road system, provide opportunities for salmon, Dolly Varden, and fall-run steelhead trout. Remote Area salmon begin to return in early June, and fishing grounds are typically accessed by charter boat or seaplane.³⁵¹

Troll-fishing Kodiak's marine waters for Chinook and coho salmon is a popular activity on the island. Chiniak Bay provides year-round habitat for Chinook. The Karluk River south of Larsen Bay provides one of the only native freshwater Chinook. Normally, the Karluk River annually averages an in-river run of 8,000 Chinook; however, recent runs have been in decline. Sockeye salmon are plentiful in many drainages on Kodiak and tend to spawn along lakeshores and tributary systems. Generally, sockeye arrive in early June and run through the end of July. The Kodiak road system provides access to sockeye on the Buskin, Pasagshak, and Saltery rivers, in eastern Kodiak Island. Pink salmon are found in abundance throughout the coastal and freshwater drainage systems around Kodiak Island. Pinks can be taken along ocean beaches and near stream mouths between middle to late July with runs peaking around mid-August. Coho salmon are typically targeted in offshore marine areas using charter or private vessels. The troll recreational fishery peaks the third week of August, and is typically over by mid-September. Large runs of coho occur late in the year in the Karluk River, with lagoon fishing starting in early September and peaking by the end of the month. The Karluk River also maintains the largest population of steelhead trout on the island, averaging 8,000 fish annually. Middle to late October is the best time to fish for steelhead, although mid-April and early May are also good times. Dolly Varden are found at lake outlets and near the mouths of freshwater systems feeding on out-migrating pink salmon fry. Then in mid-July through October, Dolly Varden migrate back into freshwaters to spawn and winter. Halibut are abundant around Kodiak Island, and sportfishing is excellent from late April through early September. In a typical year, sport anglers catch over 25,000 halibut in Kodiak waters. More than 30 species of rockfish are found in Kodiak marine waters. Common species caught include dark, dusky, and yellow-eye rockfish. The estimated rockfish catch is around 25,000 fish annually. Lingcod are also found in the area, and the typical annual catch averages around 2,500 fish.³⁵²

In 2010, angler days fished totaled 40,377 for saltwater and 41,082 for freshwater fisheries, compared to 55,576 and 65,831 in 2000, respectively (Table 11). In that year non-Alaskan residents accounted for 49.6% of saltwater angler days fished, compared to 30.2% in 2000; indicating a proportional decline in resident angler days fished. The same trend was seen in freshwater angler days fished with non-Alaska residents accounting for 45.9% in 2010, compared to 28.3% in 2000.

According to ADF&G Harvest Survey Records, Larsen Bay private anglers target Chinook, coho, sockeye, and pink salmon, Pacific halibut, rockfish, Pacific cod, steelhead trout, and Tanner crab. According to 2010 kept/released charter logs, local charter fishing vessels reported keeping 232 Chinook salmon, 2,792 coho salmon, 2,487 halibut, 57 lingcod, 1,098 rockfish, and 6 sockeye salmon.³⁵³

Subsistence Fishing

Larsen Bay residents participate extensively in subsistence fishing. Community residents consider halibut, salmon, trout, grayling, flounder, and cod as primary fish subsistence resources. In addition, clams, crab, and shrimp are harvested. Subsistence marine mammals include seals and sea lions. Waterfowl and terrestrial mammal hunting also takes place. Uyak Bay is the principal area for subsistence activities, both upland and waterside. Zachar and Spiridon Bay are also important areas for subsistence harvest.³⁵⁴

According to the ADF&G Community Subsistence Information System (CSIS), an estimated 83% of households participated in salmon subsistence activities in 2005, and 25% of households participated in non-salmon fish subsistence activities. In 2003, an estimated 80% of households participated in salmon subsistence activities, an estimated 76% participated in halibut subsistence activities, an estimated 12% participated in marine mammal subsistence activities, an estimate 40% participated in marine invertebrate subsistence activities, and an estimated 11% participated in non-salmon fish subsistence activities.³⁵⁵

Data on subsistence harvest of salmon, marine invertebrates, and non-salmon fish are somewhat limited. In 2008, residents reported harvesting sockeye salmon most often, followed by coho, pink, Chinook, and chum salmon. In that year, residents reported harvesting 1,130 fish, compared to 439 in 2000. Reported salmon harvests peaked in 2005 at 1,470 fish. In addition, residents reported harvesting 3,199 lbs of marine invertebrates and 1,034 lbs of other fish species in 2003.

Halibut is a popular subsistence resource in Larsen Bay. In 2010, 33 residents held Subsistence Halibut Registration Certificates (SHARC), compared to 21 in 2003. In that year, an estimated 2,617 lbs of halibut was harvested on 13 SHARC, compared to an estimated 5,684 on 20 SHARC in 2003. Estimated halibut harvests peaked in 2004 at 12,327 lbs. In 2010, SHARC activity and estimated pounds harvested were both at their lowest since the program began. SHARC activity declined significantly after years of stable use.

Reported marine mammal harvests included sea otters and harbor seals. Between 2000 and 2010, a total of 46 sea otters were reported harvested; and 96 harbor seals were reported harvested between 2000 and 2008.

According to ADF&G's CSIS database, marine and freshwater species that residents of Larsen Bay have harvested or used include chitons, butter clams, king crab, octopus, razor clams, sea cucumber, sea urchin, Tanner crab, harbor seal, Steller sea lion, rockfish, Dolly Varden, herring, Pacific cod, and steelhead trout.³⁵⁶ Information regarding subsistence trends can be found in Tables 12 through 15.

Old Harbor

People and Place

Location

Old Harbor is situated on the southeast coast of Kodiak Island. The harbor is protected from the Gulf of Alaska by Sitkalidak Island to the southeast. A large salt lagoon is present at the center of the community.³⁵⁷ Old Harbor is located 70 miles southwest of the City of Kodiak and 322 miles southwest of Anchorage. The City encompasses 21.0 square miles of land and 6.2 square miles of water. Old Harbor is located in the Kodiak Island Borough Census Area and the Kodiak Recording District.³⁵⁸

*Demographic Profile*³⁵⁹

In 2010 there were 218 residents in Old Harbor, making it the 189th largest of 352 communities in Alaska with recorded populations that year. Overall between 1990 and 2010, the population of Old Harbor declined by 23%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents decreased by 18.6%, with an average annual growth rate of -0.71%. A majority of the population in Old Harbor identifies with the cultural group Alutiiq/Sugpiaq.³⁶⁰ This is reflected in U.S. Census statistics. In 2010, a majority of Old Harbor residents identified themselves as American Indian or Alaska Native (87.6%). In addition, 11% of the population identified as White in 2010, 1.4% identified with two or more races, and 1.4% of the population also identified themselves as Hispanic. Individuals identifying as American Indian or Alaska Natives made up 14.6% more of the population in 2010 than in 2000, while 2.1% less of the population identified as White and 12.5% less identified with two or more races. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

According to household surveys conducted for the U.S. Census, the average household size in Old Harbor in 2010 was 2.6, a substantial decrease from 3.60 persons per household in 2000 and 3.20 in 1990. Over the same period, the number of households stayed relatively stable, decreasing from 87 in 1990 to 79 in 2000, and then increasing again to 84 occupied housing units in 2010. Of the 105 housing units surveyed for the 2010 U.S. Decennial Census, 66.7% were owner-occupied, 13.3% were rented, and 20% were vacant or used only seasonally. From 1990 to 2010, no residents of Old Harbor lived in group quarters.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

³⁶⁰ Based on community feedback provided during review of the draft of this community profile in December, 2012.

The gender makeup in Old Harbor in 2010 was more skewed toward males (56.4% male and 43.6% female) than the gender makeup of the State as a whole, which was 52% male and 48% female. That year, the median age of Old Harbor residents was 34.3 years, slightly higher than the median age for Alaska of 33.8, and lower than the U.S. national average of 36.8 years. The overall population structure of Old Harbor in 2000 and 2010 is shown in Figure 2 below. In 2010, almost all age groups had more males than females, with the exception of more females in the 0-9 and 70-79 age categories, and an equal number of males and females between 30 and 39 years of age. Relatively few people were over the age of 70, and no one over the age of 80 lived in Old Harbor in 2010.

Figure 1. Racial and Ethnic Composition, Old Harbor: 2000-2010 (U.S. Census).

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),³⁶¹ 78.9% of Old Harbor residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 9.2% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 11.9% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 20.2% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 3.7% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 0% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 7.3% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

Figure 2. Population Age Structure in Old Harbor Based on the 2000 and 2010 U.S. Decennial Census.

³⁶¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Kodiak Island is within the traditional territory of the Alutiiq peoples, and the area is estimated to have been inhabited for at least 7,500 years.^{362,363,364} At the time Russian settlement, the Alutiiq peoples were referred to as ‘Aleuts’. The name ‘Alutiiq’ has been used since the 1980s to refer to the linguistic and cultural group of Alaska Natives from the southern coast of the Alaska Peninsula to Prince William Sound, as distinguished from the Aleuts living in the Aleutian Islands. Alutiiq people living on Kodiak Island and the south coast of the Alaska Peninsula are called Koniag (Koniagmiut), and those living on Kodiak Island specifically are called Qikertarmiut (people of Kodiak Island). The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources, and marine mammals, including whales, sea lions, seals, and sea otters. They were skilled mariners, using skin kayaks and larger wooden boats for both war raids and trade.^{365,366}

After the Russian fur trade caused sea otter populations to decline in the Aleutian Islands, fur traders entered the territory of the Koniags. The Russians were initially repelled by the Alutiiqs, but in 1784 Gregorii Shelikof approached Kodiak Island armed with muskets and cannons to take the area by force. Several thousand Natives retreated to Refuge Rock near Sitkalidak Island. The Russians discovered a hidden access to the rock, and hundreds of Natives were killed jumping off a cliff to escape from Shelikof’s party. That same year, Shelikof’s men founded a settlement near the present location of Old Harbor. It was named Three Saint’s Bay after Shelikof’s flagship, the “Three Saints”. Three Saint’s Bay was the first Russian colony in Alaska, but in 1788 the settlement was destroyed by a tsunami. The community experienced two more earthquakes and relocated to the northeast coast of the island in 1793, to “Saint Paul’s,” which today is the City of Kodiak.³⁶⁷

By the time of the sale of Alaska to the United States in 1867, hardship, starvation, and disease had reduced the Native population of Kodiak Island from 8,000 to 2,000. Salmon canneries were established around the region starting in the 1880s. Although some Natives worked in the canneries, the workforce was primarily hired from the U.S. and China. Starting in the late 1800s there was a wave of Scandinavian immigrants to the region.³⁶⁸ In 1884 the community of “Staruigayan”, which translates to “old harbor” from Russian, was established near the original site of Three Saint’s Bay. In 1932, the Old Harbor post office opened. The Good Friday earthquake in 1964 and accompanying tsunami destroyed the whole community of Old Harbor; only the church and two homes remained. The community was rebuilt, and in 1966 the City of Old Harbor was incorporated.^{369,370}

Natural Resources and Environment

The climate of Kodiak Island is dominated by a strong marine influence. There is little or no freezing weather, moderate precipitation, and frequent cloud cover and fog. Severe storms are common from December through February.³⁷¹ Annual precipitation averages 69 inches. Average temperatures vary between 23 to 62 °F.³⁷² Extreme low temperatures can be well below freezing and summer high temperatures can run as high as 80 or 90 °F.³⁷³ Kodiak Island is located in a highly active volcanic and tectonic zone along the Pacific “Ring of Fire”. The original settlement at the site of Old Harbor was destroyed by a tsunami in 1788, and Old Harbor was again destroyed by the tsunami resulting from the Good Friday earthquake of 1964.³⁷⁴ The 1912 eruption of the volcano Novarupta, located 100 miles northwest of Kodiak Island on the Alaska Peninsula, covered the island in ash and gasses and disrupted the local salmon fishery, especially between 1915 to 1919, when many adult fish starved and failed to spawn in ash-choked streams.³⁷⁵ For more information about earthquakes and volcanic activity near Old Harbor, see the *Additional Information* section of this profile.

Old Harbor is located in close proximity to Kodiak National Wildlife Refuge (NWR). The NWR was established in 1941 with the purpose of wildlife conservation, in particular the Kodiak brown bear, unique to the island, as well as fulfillment of treaty obligations, providing for continued subsistence use, and to ensure water quality and quantity.³⁷⁶ Two conservation easements were purchased in 1995 from the village Native corporation, Old Harbor Native Corporation. They are located in the Lagoon Creek and Mountain Creek Drainages, and became part of the NWR. In 2000, the local electrical utility, Alaska Village Electric Cooperative (AVEC) requested amendments to the conservation easements in order to divert water from Mountain Creek to a hydroelectric powerhouse discharging into Lagoon Creek. The amendments were granted, and the project was estimated to impact between 24 and 36 acres of the NWR.³⁷⁷ There are also a number of state parks, state historical parks, and state recreation sites located on the northeast corner of Kodiak Island.³⁷⁸

Kodiak Island was directly impacted by the *Exxon Valdez* Oil Spill in March of 1989, in which 11 million gallons of crude oil spilled into Prince William Sound and spread to surrounding areas.³⁷⁹ Oil was carried by currents throughout the area of the Alutiiq people, and

hit the beaches of Kodiak Island in mid-April.³⁸⁰ The *Exxon Valdez* Oil Spill Trustee Council was formed following the spill, and has overseen large-scale habitat restoration, protection, and acquisition. On Kodiak Island, the Trustee Council has protected over 260,000 acres, much of it now included within the NWR.³⁸¹

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Old Harbor as of May 2012.³⁸²

Current Economy³⁸³

Commercial and subsistence fishing, as well as subsistence hunting, are all very important to the community of Old Harbor. Many residents hold commercial fishing permits or work as crew members. In 2000, the number of state fishery permit holders in Old Harbor was equivalent to 14% of the total local population, and the number of crew license holders was equivalent to 26.5% of the population. By 2010, the number of permit holders had declined to 13% and the number of crew license holders declined to 16.5% of the population. The City also has a number of sportfishing guide businesses. Important subsistence food sources include salmon, halibut, crab, deer, seal, rabbit, and bear.³⁸⁴ In addition to commercial fisheries, top employers of Old Harbor residents in 2010 included local government offices, the Kodiak Island Borough School District, regional housing and other community service providers, Kodiak Sportsman Lodge, LLC, a construction company, a stevedoring company, and Servant Air, Inc.³⁸⁵

Based on household surveys for the 2006-2010 ACS,³⁸⁶ in 2010, the per capita income in Old Harbor was estimated to be \$10,992 and the median household income was estimated to be \$33,333, compared to \$14,265 and \$32,500 reported in 2000, respectively. This drop in per capita income between 2000 and 2010 is revealed to be even greater when accounting for inflation by converting the 2000 values to 2010 dollars,³⁸⁷ showing that the real per capita income in 2000 was \$18,758. Household income is also shown to have decreased over the period after accounting for inflation, from a real median household income in 2000 of \$42,737. In 2010, Old Harbor ranked 257th in per capita income out of 305 Alaskan communities with per capita income data, and 227th in median household income, out of 299 Alaskan communities with household income data that year.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

³⁸⁷ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Although Old Harbor's small population size may have prevented the ACS from accurately portraying economic conditions,³⁸⁸ the 2010 ACS per capita income estimate is supported by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Old Harbor in 2010 is \$7,050.³⁸⁹ This is slightly lower than the 2006-2010 ACS estimate, and provides additional evidence that per capita income declined in Old Harbor between 2000 and 2010. This decline is reflected in the fact that the community was recognized as "distressed" by the Denali Commission, indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.³⁹⁰ It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, 75.6% of the population age 16 and older was estimated to be in the civilian labor force, a higher percentage than was estimated to be in the civilian labor force statewide (68.8%). Also in 2010, 41.6% of local residents were estimated to be living below the poverty line, compared to 9.5% statewide, and the unemployment rate was estimated to be 25.2%, much higher than the state estimate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 9.9%, compared to a statewide unemployment rate estimate of 11.5%.³⁹¹

Also based on the 2006-2010 ACS, a majority of Old Harbor workers were estimated to be employed in the public sector (79.4%), along with 16.2% worked in the private sector, and 4.4% estimated to be self-employed. Of the 68 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest number of workers was estimated to be employed in educational services, health care, and social assistance (54.4%) and public administration (20.6%). No residents reported working in fishing or other natural resource industries. However, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 96 employed residents in Old Harbor in 2010, of which 52.1% were employed in local government, 10.4% in education and health services, 10.4% in financial activities, 7.3% in trade, transportation, and utilities, 6.3% in leisure and hospitality, 5.2% in construction, 1% in professional and business services, and 7.3% in other industries.³⁹² As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

³⁸⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Governance

Old Harbor is a 2nd Class City in the Kodiak Island Borough. The City was incorporated in 1966 and has a Strong Mayor form of government, including a mayor, a seven-person city council, a five-person advisory school board, and six municipal employees. The City administers a 3% sales tax, and the Borough administers a 10.5 mills (1.05%) property tax, excluding service area taxes.³⁹³ In addition to sales tax revenue, other locally-generated revenue sources in Old Harbor included building leases, state contracts for maintenance of facilities, building and equipment rentals, water and sewer service fees, and fuel sales. Outside revenue sources included shared revenue from various state programs as well as a number of capital and special project grants. Shared revenues came from the State Revenue Sharing program (contributions of just over \$20,000 per year from 2000 to 2003), the Community Revenue Sharing program (just over \$100,000 per year in 2009 and 2010), the Safe Communities program, telephone and electric co-op refunds, and fish tax refunds. (See the *Fisheries-Related Revenue* section for more information about fish tax revenues.) Total municipal revenue was substantially higher in 2004 and in the last two years of the 2000-2010 period. Grants were received in a number of years for special projects and capital improvements including equipment upgrades, erosion control, and road building. Particularly large grants were received in 2006, 2009, and 2010, accounting in large part for the substantial increase in total municipal revenues in these years. State and federal grants were received from the Alaska Division of Emergency Services, the Alaska Department of Commerce, Community, and Economic Development, the Bureau of Indian Affairs (BIA), the Denali Commission, and the Federal Emergency Management Agency, among others. In addition, Old Harbor received fisheries-related grants in some years for projects including city dock construction and replacement, small boat harbor renovations, and purchase of processing equipment.³⁹⁴ Information about selected revenue sources in Old Harbor are presented in Table 2.

Old Harbor was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the BIA, is the Village of Old Harbor. The Native village corporation is the Old Harbor Native Corporation, which manages 115,200 acres of land. The regional Native corporation to which Old Harbor belongs is Koniag, Incorporated.³⁹⁵

Old Harbor is also a member of the Kodiak Area Native Association (KANA), a tribal non-profit organization headquartered in Kodiak that serves communities in the Kodiak Archipelago.³⁹⁶ KANA is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.³⁹⁷ KANA provides health and

Infrastructure

Connectivity and Transportation

The community of Old Harbor is only reachable by air or water. A state-owned 2,750 foot by 60 foot gravel runway is present in Old Harbor, as well as a seaplane base. Both regularly scheduled and charter flights are available from Kodiak.³⁹⁹ As of June 2012, the approximate cost to fly roundtrip between Kodiak and Anchorage \$360,⁴⁰⁰ and an additional roundtrip flight between Kodiak and Old Harbor was approximately \$200 roundtrip.⁴⁰¹ A harbor is present in Old Harbor with docking facilities for 55 boats. Seattle-based and local barge services are available.⁴⁰²

Facilities

Water in Old Harbor is derived from a dammed creek and an infiltration gallery,⁴⁰³ then filtered, chlorinated, and stored in a tank. The City operates a piped water and sewer system. A diesel powerhouse provides electricity to the community, operated by the Alaska Village Electric Cooperative. The City operates a landfill but does not provide refuse collection.⁴⁰⁴ Police services are available from the State Village Public Safety Officer stationed in Old Harbor.⁴⁰⁵ The nearest state trooper post is located in the City of Kodiak.⁴⁰⁶ Accommodations are available at the Bay View Bed and Breakfast, the Ocean View Lodge and the Kodiak Sportsman Lodge.⁴⁰⁷

Medical Services

Health care is available at the Old Harbor Health Clinic and owned by the City and operated by KANA.⁴⁰⁸ The nearest hospital is located in the City of Kodiak.

Educational Opportunities

There is one school in the community which offers Kindergarten through 12th grade. As of 2011, the Old Harbor School had 43 students and 10 teachers.⁴⁰⁹

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prior to the arrival of Europeans, subsistence hunting and fishing was the basis of the economy for people living on Kodiak Island and surrounding areas. The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources, and marine mammals, including whales, sea lions, seals, and sea otters. With the arrival of Russian colonists to Kodiak Island in the late 1700s, the Alutiiq people were forced to hunt for sea otters to fuel the trade of their valuable pelts. The Russians also began commercial salmon exploitation in the early 1800s. They blocked salmon streams, such as the Karluk River on the west side of Kodiak Island, using fish weirs. Commercial processing involved salting. In addition, Alutiiq women dried the fish for the winter for use in the Russian colony.^{410,411}

After the U.S. purchase Alaska, American entrepreneurs arrived to continue hunting sea otter and to develop other industries, including salmon fishing. The first salmon cannery on the Karluk River was established in 1882, and two more followed. Few Natives worked initially in the local canneries; a majority of cannery employees were hired from outside the region, primarily from the lower U.S. states and China. However, Native Alaskans became increasingly involved in commercial salmon fishing in the early 1900s, and coordinated their commercial fishing activity with subsistence hunting and fishing activities.⁴¹²

Through the early decades of the 1900s, the salmon fishery remained the primary focus of local commercial fishing activity, and the most common fishing gear was the beach seine. With the rise of diesel engines in the 1920s, the range of fishing vessels expanded, and commercial exploitation of halibut and groundfish extended into the Gulf of Alaska (GOA). The rise of fuel-powered vessels also led to a shift toward use purse seines in the salmon fishery. Herring fishermen also began stopping in Kodiak by the 1920s, and a herring reduction also operated in Kodiak until the early 1960s.^{413,414,415}

All three salmon canneries on the Karluk River were destroyed by the Good Friday earthquake of 1964, along with the City of Old Harbor and nearby Native villages. Kodiak's fishing fleet was also destroyed. The canneries near Old Harbor were never rebuilt, and after the tsunami processing activity became increasingly concentrated in Kodiak. The king crab fishery emerged as a new focus for the Kodiak fishing fleet in the years following the tsunami. Most

Alutiiq fishermen continued to focus on salmon fishing into the late 1900s, but some also diversified into herring, cod, and crab fisheries. Today all of these commercial fisheries continue to be important to fishermen living in Old Harbor, as well as continued subsistence fishing and hunting.⁴¹⁶

Between 2000 and 2010, Old Harbor fishermen were most engaged in commercial fisheries for salmon and Pacific cod, as well as halibut, herring, crab, ‘other groundfish’ and ‘other shellfish’ fisheries (see the *Commercial Fishing* section for details). Fisheries that occur within 3 nautical miles (nmi) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nmi in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction.⁴¹⁷ Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

Old Harbor is located in Federal Statistical and Reporting Area 630, Pacific Halibut Fishery Regulatory Area 3A, and the Central GOA federal Sablefish Regulatory Area. ADF&G manages the Kodiak salmon and herring fisheries in waters surrounding the Kodiak archipelago.⁴¹⁸ The salmon fishery is divided into seven fishing districts (Afognak District, Northeast Kodiak District, Eastside Kodiak District, Alitak Bay District, Southwest Kodiak District, Northwest Kodiak District, and Mainland Districts). Gear types in use currently include purse seine, set gillnets and beach seine.⁴¹⁹ Kodiak herring fisheries include a roe fishery (using both purse seine and gillnet gear) and a food/bait fishery. Herring sac roe fisheries take place in the spring when individual spawning biomasses are aggregated. In contrast, food/bait fisheries take place in the summer, fall, and winter when herring from several stocks may be mixed together. A Kodiak food/bait herring fishery has historically taken place in Shelikof Strait, but has been closed in recent years because the Kamishak Bay spawning biomass (Cook Inlet) has been below threshold since 1998. The Alaska Board of Fish (BOF) closes food/bait fisheries if any of the individual spawning populations is below threshold.⁴²⁰

In the GOA, federally-managed groundfish fisheries target Pacific cod, walleye pollock, pelagic shelf rockfish, sablefish, and flatfish. Parallel fisheries for Pacific cod and walleye pollock also take place in state waters surrounding Kodiak Island. Parallel fisheries occur at the same time as the federal fisheries. The Total Allowable Catch (TAC) set by NMFS in each fishery applies to both federal and parallel harvest. In addition to federally-managed groundfish fisheries, beginning in 1997, a ‘state-waters fishery’ for Pacific cod was initiated in the Kodiak area. Management plans for state-waters fisheries are approved by the BOF, and guideline harvest limits (GHL) are set by the ADF&G. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, the ADF&G manages lingcod fisheries in both state and EEZ waters off Alaska, and beginning in 1998, management of black rockfish and blue rockfish in the GOA was transferred from NMFS to ADF&G.⁴²¹ Kodiak Island is one historical center of the red king crab fishery, and Tanner crabs are also distributed through the GOA. The

⁴²¹ Ibid.

ADF&G manages red king crab and Tanner crab stocks in the GOA.^{422,423} The Kodiak red king crab fishery has been closed in recent years due to low abundance. However, parts of the Kodiak district have been open for Tanner crab harvest in recent years. Kodiak area Tanner crab harvest is managed using eight separate management areas, each with its own GHL.⁴²⁴

In 1995, management of the Pacific halibut and sablefish fisheries shifted from limited entry to a catch share program. The program includes allocation of the annual Total Allowable Catch (TAC) of halibut and sablefish via Individual Fishing Quota (IFQ). The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual TAC to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries.⁴²⁵ These and other factors that may contribute to decreasing fisheries participation in villages of the Kodiak Island archipelago have been discussed in detail in a number of research papers. Please refer to the books and articles referenced here for a more nuanced discussion of the impact of catch share programs on Kodiak-area coastal communities.^{426,427}

The Community Quota Entity (CQE) program, implemented by the North Pacific Fishery Management Council in 2005, is one program intended to address the issue of fishing rights leaving rural communities. Under the program, eligible communities can form a non-profit corporation under state law to purchase and manage quota share on their behalf. After they purchase quota share, CQE non-profits can lease the IFQ to eligible community residents.⁴²⁸ Old Harbor participates in the program through Cape Barnabas, Incorporated, a non-profit entity created under the program through the recommendation of the City of Old Harbor. Cape Barnabas, Inc. is one of two CQE non-profits in Alaska that held commercial halibut IFQ and was actively leasing commercial halibut quota to residents in 2013. As of October that year, Cape Barnabas, Inc. held 151,234 halibut quota shares in Area 3B.⁴²⁹ It is important to note that, in addition to commercial halibut quota, CQE non-profits now have the ability to acquire and

lease charter halibut permits and non-trawl gear groundfish License Limitation Permits (LLP). In October 2013, Cape Barnabas, Inc. held seven halibut charter permits and five non-trawl groundfish LLPs.^{430,431} Old Harbor is not eligible to participate in the Community Development Quota (CDQ) program.

Processing Plants

A fish buyer operated in Old Harbor during one year of the 2000-2010 period (2003). That year, one vessel delivered fish in Old Harbor. Despite the lack of fish buyers in other years during the decade, ADF&G's 2010 Intent to Operate List listed one shore-side processing plant in Old Harbor from 2003 and 2010 (Table 5).

The seafood processing facility Old Harbor's Finest processes sablefish, Pacific cod, Pacific halibut, and all five species of salmon.⁴³² According to a survey of processing plant managers conducted by the Alaska Fisheries Science Center in 2012, the plant is a home-based business that began operations in 2006 and primarily smokes fish, freezes fresh fillets, and processes for sport fisherman and charter boats.

Fisheries-Related Revenue

Overall, in 2010, the City of Old Harbor received \$34,485 from fisheries-related taxes and fees. The most consistent fisheries-related revenue sources between 2000 and 2010 were a raw fish tax, the Shared Fisheries Business Tax, the Fisheries Resource Landing Tax, an Extraterritorial Fish Tax, and fees for harbor usage. In 2010, Old Harbor also received \$5,000,000 in state and federal fisheries-related grants, the most the community received in any year between 2000 and 2010. Refer to Tables 2 and 3 for details on selected aspects of community finances during this period.⁴³³

Commercial Fishing

Between 2000 and 2010, Old Harbor residents were engaged in commercial fishing activities as vessel owners, quota share account and permit holders, and crew license holders. There was one registered fish processor in town from 2003 to 2010. With the exception of 2003, there were no fish buyers in Old Harbor between 2000 and 2010. In 2010, there were no direct landings of fisheries resources and no ex-vessel revenue generated in Old Harbor, indicating that landings are made elsewhere and then shipped to the plant for processing. The fish buyer that operated briefly in 2003 received landings from one vessel, but information about the landings and ex-vessel revenue generated is considered confidential due to the small number of buyers. Table 9 presents information about landings and ex-vessel revenue generated in Old Harbor.

⁴³² Alaska Seafood Marketing Institute. 2005. *Supplier Information: Old Harbor's Finest*. Retrieved June 25, 2012 from <http://alaskaseafood.org/industry/suppliers/detail.cfm?Supplier=471>.

⁴³³ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

In 2010, 36 Old Harbor residents held state crew licenses (equivalent to 16.5% of the total local population) and 22 residents were the primary owner of a fishing vessel. Both of these numbers represent substantial declines since 2000, with a 42.9% decrease in crew licenses (down from 63 in 2000), and a 43.6% decrease in vessels owned by residents (down from 39 in 2000). In 2010, 27 vessels were homeported in Old Harbor, down from 41 homeported there in 2000 (a decline of 34.1%). These characteristics of the Old Harbor commercial fishing sector are available in Table 5.

As the data in Table 5 indicate, along with permit data presented in Table 4 and described in below, there have been dramatic changes in fisheries participation in the Kodiak Archipelago. This topic has been thoroughly studied by Courtney Carothers at the University of Alaska. Please refer to the books and articles referenced here a more detailed discussion of the impact of declining fishing participation on Kodiak-area villages.^{434,435}

In 2010, 57 state Commercial Fisheries Entry Commission (CFEC) permits were held by 29 Old Harbor residents (equivalent to 13.3% of the population). Of these, 24 were salmon permits (11 actively fished in 2010, including 7 Prince William Sound seine permits, 1 Bristol Bay drift gillnet, and 1 Kodiak set gillnet), 8 were halibut permits (6 actively fished in 2010, all longline permits for vessels under 60 feet), 7 were for groundfish (2 actively fished in 2010, both using pot gear), 7 were for crab (2 actively fished in 2010, Tanner crab, fished using pot gear on vessels under 60 feet) and 2 were for ‘other shellfish’ (0 active in 2010, octopi/squid fished using pot gear on vessels under 60 feet). These numbers represent a 19.7% decline in total permits held since the year 2000, but only a 12.1% decline in total permits actively fished. This information can be found in Table 4.

In addition to state fishery permits, 10 Old Harbor residents held a total of 11 License Limitation Permits (LLP) in federal groundfish fisheries and 4 residents held 5 Federal Fisheries Permits (FFP). That year, no LLPs were held in federal crab fisheries. This permit information is also presented in Table 4.

Also in 2010, eight Old Harbor residents held quota share accounts in the federal halibut catch share fishery, with a total of 313,812 quota shares held. The number of halibut quota shares held in the community increased between 2000 and 2010, and the annual halibut individual fishing quota (IFQ) allotment also increased slightly over the period. Information about federal halibut catch share participation is presented in Table 6. Between 2000 and 2010, no Old Harbor residents held quota share accounts or quota shares in federal catch share fisheries for sablefish or crab (Tables 7 and 8).

In 2010, Old Harbor vessel owners landed 1,571,308 net pounds of salmon and 49,085 pounds of halibut, earning \$929,828 and \$221,741 in ex-vessel revenue, respectively. Information about landings and earnings by Old Harbor vessel owners in other fisheries in 2010 is considered confidential due to the small number of participants. However, it should be noted that over time Pacific cod and herring fisheries have also made up a large portion of total harvest and value for local fisherman. Some local vessel owners have also participated in crab, ‘other groundfish’, and ‘other shellfish’ fisheries. Information about landings and ex-vessel revenue earned by vessels owners residing in Old Harbor is presented in Table 10.

Recreational Fishing

In 2010, there were three active sport fish guide businesses in Old Harbor, a decrease from six guide businesses in the year 2000. The number of licensed sport fish guides residing in Old Harbor also declined slightly from 11 in 2000 to 5 in 2005, and rebounded to 8 guides by 2010. The number of Old Harbor residents who purchased sportfishing licenses (irrespective of point of sale) varied between 43 and 69 per year between 2000 and 2010. Starting in 2004, sportfishing licenses were sold in the community. In 2004, 44 licenses were sold locally, and from 2005-2010 the number varied between 217 and 338 licenses sold per year. The greater number of sportfishing licenses purchased in Old Harbor than those purchased by residents of Old Harbor, along with the presence of several guides and guide businesses, suggests that visitors come to Old Harbor in order to engage in sportfishing activity (Table 11). It is also important to note that, as of 2013, Old Harbor's CQE non-profit, Cape Barnabas, Inc., held seven charter halibut permits that were available for lease to community residents.⁴³⁶

Old Harbor is located within Alaska Sport Fishing Survey Area Q – Kodiak. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. On average, Alaska resident anglers fished more angler days per year than non-Alaska residents in both saltwater and freshwater sport fisheries, and more angler days were fished per year in freshwater than in saltwater in the Kodiak region between 2000 and 2010. However, sportfishing activity in by both resident and non-Alaska resident anglers, and in both saltwater and freshwater, was extremely high. Information about the sportfishing sector in and near Old Harbor is displayed in Table 11.

The Alaska Statewide Harvest Survey,⁴³⁷ conducted by ADF&G between 2000 and 2010, noted the following species targeted by private anglers in Old Harbor: Chinook, coho, sockeye, and pink salmon, and Pacific halibut. The survey also noted harvest of Dungeness crab and razor and hardshell clams in Old Harbor. Kept/released statistics from charter logbook data reported by ADF&G⁴³⁸ show that Pacific halibut was by far the most important species targeted by fishing charters out of Old Harbor, with 1,067 halibut kept and 880 released in 2010. These numbers represent a decline from 1,501 halibut kept and 1,250 released in 2005. Chinook and coho salmon were important, with 234 large Chinook kept and 4 released, and 854 coho kept and 0 released in 2010. Pelagic rockfish were also important, with 739 kept and 240 released in 2010, down from 1,561 kept and 1,219 released in 2007. Other species that were also caught during charters out of Old Harbor between 2000 and 2010 include sockeye, chum, and pink salmon, lingcod, yelloweye rockfish, 'other rockfish', sablefish, and shark.

Subsistence Fishing

Subsistence harvest continues to play an important role in the traditional Alutiiq culture and lifestyle of Old Harbor.⁴³⁹ Between 2003 and 2005, the years for which subsistence surveys were conducted by ADF&G in the community, an average of 85.5% of households were reported to participate in salmon subsistence. In 2003, 92.3% of households participated in halibut subsistence and 35.6% of households participated in non-salmon fish subsistence (other than halibut). In the case of marine mammals and marine invertebrates, data were only available for 2003. In that year, 35.3% of households participated in marine mammal subsistence and 55.7% participated in marine invertebrate subsistence. In 2003, per capita subsistence harvest of land and sea-based resources in Old Harbor was 357 lbs. This information is presented in Table 12. In total that year, 4,752 lbs of marine invertebrates were harvested and 2,138 lbs of ‘non-salmon’ fish were harvested (not including halibut) (Table 13).⁴⁴⁰

At the species level, some Old Harbor households reported harvesting marine mammals in 2003, including harbor seal and Steller sea lion. The species of marine invertebrates harvested by the greatest number of Old Harbor households in 2003 included butter clams, black chitons, sea urchin, Pacific littleneck clams, Tanner crab, octopus, Dungeness crab, and king crab. The species of non-salmon fish harvested by the greatest number of households included Pacific cod, black rockfish, and lingcod. In addition, while only a small number of Old Harbor households reported subsistence harvest of herring and sablefish in 2003, a greater percentage of households reported using these species. Most species listed above were used by a greater percentage of household than were involved in harvest activities, indicating the presence of sharing networks in the community.⁴⁴¹

In 2008, the most recent year for which data are available from ADF&G about subsistence salmon harvest, 25 Old Harbor households were issued subsistence salmon permits. All 25 were returned that year, with a total of 1,445 salmon harvested. These numbers represent a decline from 38 to 39 permits issued in 2004 and 2005, and total salmon harvests of 2,000 – 3,000 in those years. Coho and sockeye salmon made up the greatest percentage of the subsistence salmon harvest in all years for which data were reported.

In 2010, 41 Subsistence Halibut Fishing Certificates (SHARC) were issued to residents of Old Harbor. Of these, 13 were fished that year, and the total reported subsistence halibut harvest was 3,583 pounds. These numbers represent a decline from earlier years in the decade. Of all years in which data were reported, the highest volume harvest was reported in 2004, when 13,150 pounds of halibut were reported harvested using 46 SHARC cards. Information about subsistence halibut harvest is presented in Table 14.

Old Harbor residents also participated in the subsistence harvest of marine mammals. According to data reported by the U.S. Fish and Wildlife Service, for years in which data were reported, the number of sea otters harvested varied between 2 and 21. According to data reported by ADF&G, the number of harbor seals harvested varied between 1 and 28 per year, and the number of Steller sea lions harvested varied between 20 and 71. No information was reported by

management agencies regarding harvest of beluga whale, walrus, or spotted seal between 2000 and 2010. Information about marine mammal subsistence is presented in Table 15.

Additional Information

The Alaska-Aleutian arc, also known as the “Pacific Ring of Fire” is one of the most active earthquake areas in the world.⁴⁴² Some of these earthquakes are associated with explosive volcanic eruptions.⁴⁴³ Since the arrival of Europeans to Kodiak Island, three major geologic events stand out in history, including two great earthquakes in 1788 and 1967, both followed by tsunamis, and the eruption of Novarupta Volcano on the Alaska Peninsula in 1912.

During the period of Russian settlement, the community of Three Saint’s Bay was destroyed by a tsunami. Based on the following evidence from written accounts, geologists have determined that this earthquake was large enough to have ruptured at least a 600-km portion of the Alaska-Aleutian arc:

*In a letter of 1789 to G.I. Shelikov, Merkul’ev described strong shaking on Kodiak Island, an intense flood (tsunami) consisting of a series of waves, aftershocks every day for a month or longer, and a permanent change in sea level. Davydov also mentioned landslides on Kodiak Island and observed that the sea first withdrew from shore, surged onshore, and carried a vessel onto the top of a cabin.*⁴⁴⁴

Ash clouds from the 3-day-long 1912 eruption of the volcano Novarupta traveled as far as Seattle, Washington, by the end of the eruption, and 10 days later reached Algeria in Africa. Kodiak Island was in the immediate path of the ash, located only 100 miles southeast of the volcano. Water became undrinkable on the island and people suffered from respiratory distressed and sore eyes. Radio communications were disrupted, and boats were unable to dock due to low visibility. Roofs in Kodiak collapsed under more than a foot of ash, and building were wrecked in ash avalanches. The Novarupta eruption also formed the famous Valley of 10,000 Smokes located in Katmai National Park on the Alaska Peninsula. In the years following the eruption local fish and wildlife populations suffered from lack of food and poor water quality. The salmon fishery faltered between 1915 to 1919 due to starvation and failure of many adult fish to spawn in ash-choked streams.⁴⁴⁵

The Good Friday earthquake of 1964 was the largest recorded earthquake in the United States, with a magnitude of 9.2 on the Richter scale. It struck Prince William Sound on Good Friday, March 28th, 1964. Kodiak Island was one of the areas affected by the ensuing tsunami. The extreme southeast coast of Kodiak Island, Sitkalidak Island and part or all of Sitkinak Island experienced extreme uplift of between 13 and 15 m. In Anchorage, the quake lasted for about 3 minutes, and although the City was 75 miles from the location of the quake’s epicenter, major damages resulted. Many buildings were damaged beyond repair, displacements broke the ground

Ouzinkie (ooh-ZINK-ee)

People and Place

*Location*⁴⁴⁷

Ouzinkie is located on the west coast of Spruce Island, adjacent to the northeast coast of Kodiak Island. It lies 10 miles north of the City of Kodiak and 247 air miles southwest of Anchorage. Ouzinkie is located in the Kodiak Recording District and the Kodiak Island Borough Census Area. The City encompasses 6.0 square miles of land and 1.7 square miles of water.

*Demographic Profile*⁴⁴⁸

In 2010 there were 161 residents in Ouzinkie, making it the 216th largest of 352 communities in Alaska with recorded populations that year. Since the community was first recorded in the 1880 U.S. Census, the population has fluctuated from no inhabitants at the lowest point (1900 and 1910) to 253 inhabitants at the highest point (in 1940). Since 1930 the population has remained relatively stable, remaining close to 200 inhabitants. Between 1990 and 2010, the population of Ouzinkie declined by 23%. After a period of growth between 1990 and 2000, Alaska Department of Labor estimates suggest that the population of permanent residents decreased by 24.4% between 2000 and 2009, with an average annual growth rate of -0.9%. According to a survey conducted by the NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders indicated that approximately 10 additional people are present in Ouzinkie each year as seasonal workers or transients. They also indicated that the population of Ouzinkie is stable year-round, and the seasonal fishing activities do not influence population fluctuations in the community.

In 2010, a majority of the population of Ouzinkie identified as American Indian and Alaska Native (79.5%), along with 10.6% who identified as White, 0.6% as Asian, and 9.3% who identified with two or more races. In addition, 1.9% of the population considered themselves to be Hispanic in 2010. Individuals identifying as American Indian and Alaska Natives made up 1.4% less of the population in 2010 than in 2000, while those identifying as White made up 0.5% less of the population, and 1.3% more of the population identified with two or more races. In addition, Asian residents appeared to be present in 2010 but not in 2000, and the percentage of residents identifying as Hispanic decreased by 2.5%. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

According to household surveys conducted for the U.S Census, the average household size in Ouzinkie in 2010 was 2.88, a slight decrease from 3.04 persons per household in 2000 and 3.0 in 1990. The total number of households increased slightly between 1990 and 2000, from 68 to 74 occupied housing units, and then decreased to 56 households in 2010. Of the 88 housing units surveyed for the 2010 U.S. Decennial Census, 45.5% were owner-occupied, 18.2% were rented, and 36.4% were vacant or used only seasonally. From 1990 to 2010, no residents of Ouzinkie lived in group quarters.

Figure 1. Racial and Ethnic Composition, Ouzinkie: 2000-2010 (U.S. Census).

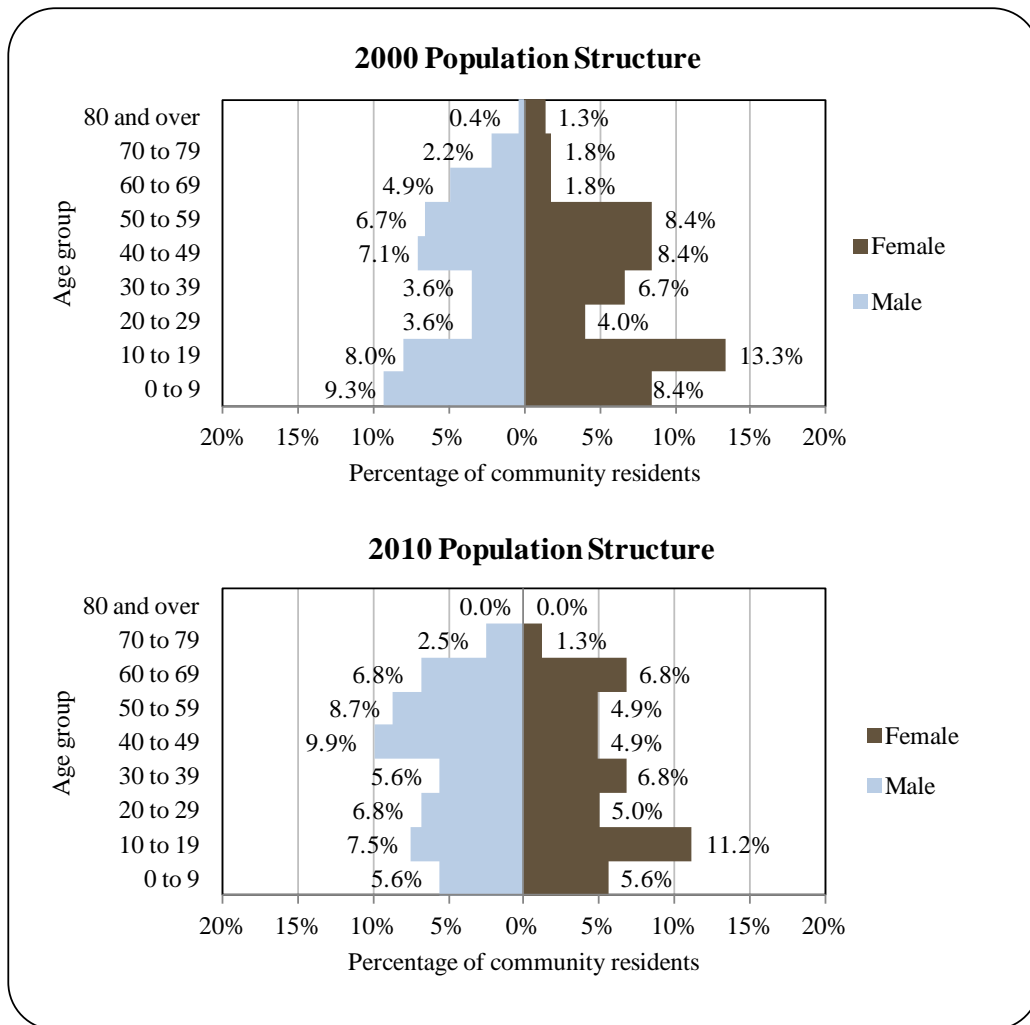

Figure 2. Population Age Structure in Ouzinkie Based on the 2000 and 2010 U.S. Decennial Census.

The gender makeup in Ouzinkie in 2010 was slightly more skewed toward males (53.4% male and 46.6% female) than the gender makeup of the State as a whole, which was 52% male and 48% female. That year, the median age was 40.7 years, higher than the median age for Alaska of 33.8 and the U.S. national average of 36.8 years. In 2010, almost all age groups had more males than females, with the exception of more females in the 10-19 and 30-39 age groups, and an equal number of males and females between 0 and 9 and between 60 and 69 years of age. Relatively few people were over the age of 70, and no one over the age of 80, lived in Ouzinkie in 2010. The overall population structure of Ouzinkie in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁴⁴⁹ 80% of Ouzinkie residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also

⁴⁴⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

in 2010, 3.9% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 16.1% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 16.1% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 0% were estimated to have an Associate's degree, compared to 8% of Alaskan residents overall; 17.4% were estimated to have a Bachelor's degree, the same as the percentage of Alaskan residents overall; and 11% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Kodiak Island is within the traditional territory of the Alutiiq peoples, and the area is estimated to have been inhabited for at least 7,500 years.^{450,451,452} At the time Russian settlement, the Alutiiq peoples were referred to as 'Aleuts'. The name 'Alutiiq' has been used since the 1980s to refer to the linguistic and cultural group of Alaska Natives from the southern coast of the Alaska Peninsula to Prince William Sound, as distinguished from the Aleuts living in the Aleutian Islands. Alutiiq people living on Kodiak Island and the south coast of the Alaska Peninsula are called Koniag (Koniagmiut), and those living on Kodiak Island specifically are called Qikertarmiut (people of Kodiak Island).

The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources and marine mammals, including whales, sea lions, seals and sea otters. They were skilled mariners, using skin kayaks and larger wooden boats for both war raids and trade. When sea otter populations began to decline in the Aleutian Islands, Russian fur traders entered the territory of the Koniags. They were initially repelled by the Alutiiqs, but in 1784 Gregorii Shelikof and his men took Kodiak Island by force using cannons and muskets.⁴⁵³

Following a smallpox epidemic that dramatically reduced the Native population of Kodiak Island, in the 1840s the Russian colonial administration consolidated the remaining population into seven villages. Two villages, including Ouzinkie, were intended to be creole⁴⁵⁴ settlements. The number of creoles increased during the period of the Russian colony. In addition, Ouzinkie was conceived as a retirement community for employees of the Russian American Company, many of whom had Native families and wanted to stay in Alaska.⁴⁵⁵ The Russians referred to the settlement in 1849 as "Uzenkiy," meaning "village of Russians and Creoles."⁴⁵⁶

In 1889, the Royal Packing Company constructed a cannery at Ouzinkie. Shortly afterward, the American Packing Company built another. In 1890, a Russian Orthodox church

was built, and in 1927 a post office was established. Cattle ranching was popular in the early 1900s. In 1964, the Good Friday Earthquake and resulting tsunami destroyed the Ouzinkie Packing Company cannery. Following the disaster, Columbia Ward bought the remains and rebuilt the store and dock but not the cannery. The City was incorporated in 1967. In the late 1960s, the Ouzinkie Seafoods cannery was constructed. The operation was sold to Glacier Bay and burned down in 1976 shortly after the sale. No canneries have operated since. Today, Ouzinkie remains an Alutiiq village.⁴⁵⁷

Natural Resources and Environment

The climate of the Kodiak Islands is dominated by a strong marine influence. There is moderate precipitation, frequent cloud cover and fog, and little to no freezing weather. Severe storms are common from December through February. Annual precipitation averages 60 inches, with 87 inches of snowfall. Temperatures remain within a narrow range throughout the year, from 32 to 62 °F.⁴⁵⁸

Ouzinkie is located just over 20 miles east of the border of the Kodiak National Wildlife Refuge (NWR). The NWR covers the southwestern two-thirds of Kodiak Island. It was established in 1941 with the purpose of wildlife conservation, in particular the Kodiak brown bear unique to the island, as well as fulfillment of treaty obligations, providing for continued subsistence use, and to ensure water quality and quantity.⁴⁵⁹ There are also a number of state parks, state historical parks, and state recreation sites located on the northeast corner of Kodiak Island.⁴⁶⁰

Kodiak Island is located in a highly active volcanic and tectonic zone along the Pacific “Ring of Fire”. The earthquake belt along the Aleutian Islands, Alaska Peninsula, and Kenai Peninsula is known as the Alaska-Aleutian subduction zone, where strong earthquakes occur as a result of slipping along the contact zone between the Pacific and Alaska plates. Earthquakes can cause tsunamis, landslides, snow avalanches, and submarine slumps.⁴⁶¹ The 1912 eruption of the volcano Novarupta, located 100 miles northwest of Kodiak Island on the Alaska Peninsula, covered the island in ash and gasses and disrupted the local salmon fishery, especially between 1915 to 1919, when many adult fish starved and failed to spawn in ash-choked streams.⁴⁶²

In addition to risk of earthquake and volcanic activity, natural hazards present in Ouzinkie include wildfire and severe weather. A drought scenario has the potential to exacerbate wildfire risk and disrupt hydroelectric power production. A backup diesel generator is present in the community in such an event. High winds are the greatest weather threat in Ouzinkie.⁴⁶³

⁴⁶³ See footnote 461.

Kodiak Island was directly impacted by the *Exxon Valdez* Oil Spill in March of 1989, in which 11 million gallons of crude oil spilled into Prince William Sound and spread to surrounding areas.⁴⁶⁴ Oil was carried by currents throughout the area of the Alutiiq people, and hit the beaches of Kodiak Island in mid-April.⁴⁶⁵ The *Exxon Valdez* Oil Spill Trustee Council was formed following the spill, and has overseen large-scale habitat restoration, protection, and acquisition. On Kodiak Island, the Trustee Council has protected over 260,000 acres, much of it now included with Kodiak NWR.⁴⁶⁶

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Ouzinkie as of May 2012.⁴⁶⁷

Current Economy⁴⁶⁸

According to a survey conducted by the AFSC in 2011, community leaders reported that Ouzinkie's economy relies upon commercial fishing and sport hunting and fishing. Other top local employers in 2010 included local government offices, regional health and social service organizations, the Kodiak Island Borough School District, the village Native corporation (Ouzinkie Native Corporation), a construction company, a stevedoring company, and Servant Air, Inc.⁴⁶⁹ In addition, almost the entire population depends to some extent on subsistence activities for various food sources. Salmon, crab, halibut, shrimp, clams, ducks, deer, and rabbit are utilized.⁴⁷⁰

Based on household surveys for the 2006-2010 ACS,⁴⁷¹ in 2010, the per capita income in Ouzinkie was estimated to be \$18,548 and the median household income was estimated to be \$48,824. This represents a decrease from the per capita and median household incomes reported in the year 2000 (\$19,324 and \$52,500, respectively). If inflation is taken into account by converting 2000 values to 2010 dollars,⁴⁷² this drop in income is revealed to be even greater. Real per capita income in 2000 was \$25,411 and real median household income was \$69,037. In 2010, Ouzinkie ranked 166th in per capita income out of 305 Alaskan communities with per capita income data, and 139th in median household income, out of 299 Alaskan communities with household income data that year.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁴⁷² Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Although Ouzinkie’s small population size may have prevented the ACS from accurately portraying economic conditions,⁴⁷³ the 2010 ACS per capita income estimate is supported by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Ouzinkie in 2010 is \$10,970.⁴⁷⁴ This is lower than the 2006-2010 ACS estimate, providing additional evidence that per capita income declined in Ouzinkie between 2000 and 2010. Despite this apparent decline in per capita income in Ouzinkie, the community was not recognized as “distressed” by the Denali Commission.⁴⁷⁵ It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, 54.3% of the population age 16 and older was estimated to be in the civilian labor force, a lower percentage than was estimated to be in the civilian labor force statewide (68.8%). In the same year, 26.5% of local residents were estimated to be living below the poverty line, compared to 9.5% statewide, and the unemployment rate was estimated to be 7.5%, compared to the state percentage of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 8.5%, compared to a statewide unemployment rate estimate of 11.5%.⁴⁷⁶

Also based on the 2006-2010 ACS, a majority of Ouzinkie workers were estimated to be employed in the public sector (64.2%), along with 34.6% worked in the private sector, and 1.2% estimated to be self-employed. Of the 81 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest number was estimated to work in educational services, health care, and social assistance (27.2%), public administration (27.2%), construction (17.3%), and transportation, warehousing, and utilities (13.6%). Also in 2010, 4.6% of the employed civilian labor force was estimated to be working in agriculture, forestry, fishing and hunting, and mining. However, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 97 employed residents in Ouzinkie in 2010, of which 53.6% were employed in local government, 10.3% in trade, transportation, and utilities, 10.4% in educational and health services, 9.3% in professional and business services, 5.2% in construction, 4.1% in natural resources and mining, 1% in leisure and hospitality, 1% in unknown industries, and 5.2% in other industries.⁴⁷⁷ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

⁴⁷³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Governance

Ouzinkie is a 2nd Class City in the Kodiak Island Borough. The City was incorporated in 1967 and has a Strong Mayor form of government, including a seven-person city council which includes the Mayor, a five-person advisory school board, and several municipal employees. The City administers a 3% sales tax, and the Borough administers a 11.27 mills (1.127%) property tax, excluding service area taxes.⁴⁷⁸ In addition to sales tax revenue, other locally-generated revenue sources included contracted maintenance services, land leasing, fees for water/sewer,

⁴⁷⁸ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

landfill, and electricity services, gravel sales, apartment rentals, and equipment rentals. Outside revenue sources included shared funds from various state revenue sharing programs, as well as grants and subsidies in some years. Revenue sharing contributions came from the State Revenue Sharing program (approximately \$21,000 per year from 2000 to 2003), the Community Revenue Sharing program (just over \$100,000 per year in 2009 and 2010), and state fish tax revenues (see the *Fisheries-Related Revenue* section of this profile). In addition, Ouzinkie received a variety of fisheries-related grants between 2000 and 2010, including a \$1,300,000 grant in 2002 for improvements to harbor facilities, a \$11,854 disaster aid grant in 2005 for construction of a Wave Wall, and a series of grants in 2008 and 2010 for dock replacement. Information about selected aspects of Ouzinkie municipal revenue is presented in Table 2.

Ouzinkie was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Native Village of Ouzinkie. The Native village corporation is the Ouzinkie Native Corporation, which manages 151,052 acres of land. The regional Native corporation to which Ouzinkie belongs is Koniag, Incorporated.⁴⁷⁹

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Ouzinkie from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$522,007	\$12,318	\$21,640	n/a
2001	\$627,637	\$6,276	\$20,824	\$1,300,000
2002	\$576,919	\$5,962	\$20,825	n/a
2003	\$490,483	\$8,134	\$20,970	n/a

Ouzinkie is also a member of the Kodiak Area Native Association (KANA), a tribal non-profit organization headquartered in Kodiak that serves communities in the Kodiak Archipelago.⁴⁸⁰ KANA is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.⁴⁸¹ KANA provides health and development services, as well as career development and other community services, with the goal of promoting economic self sufficiency and promote healthy families.⁴⁸²

The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish and Game (ADF&G), and U.S. Bureau of Citizenship and Immigration Services offices are all located within the City of Kodiak, 10 miles south of Ouzinkie. The nearest Alaska Department of Natural Resources office is a Division of Parks and Outdoor Recreation office, also located in Kodiak, and the nearest office of the Alaska Department of Commerce, Community, and Economic Development is in Anchorage.

Infrastructure

Connectivity and Transportation

The village is accessible by air and water. There is a state-owned 2,085 ft long by 80 ft wide gravel airstrip, although runway conditions are not monitored, so visual inspection is recommended prior to use.⁴⁸³ As of early June 2012, a roundtrip ticket between Kodiak and Anchorage cost \$360.⁴⁸⁴ Several companies offer service between Kodiak and Ouzinkie, including Servant Air, Inc. and Island Air Service. As of June 2012, a roundtrip ticket between Kodiak and Ouzinkie with these air services cost between \$110 and \$120.⁴⁸⁵ A floatplane landing area is also available at Ouzinkie Harbor.⁴⁸⁶ According to a survey conducted by the AFSC in 2011, water taxi service was also available to Ouzinkie. Barges provide cargo delivery from Seattle and Kodiak.⁴⁸⁷ The road system in Ouzinkie is limited, including only a few miles of gravel roads and paths. Less than 50 vehicles are present in town, along with approximately 40-60 ATVs.⁴⁸⁸

⁴⁸⁸ See footnote 483.

Facilities

The City operates a piped water system in Ouzinkie. Water is derived from a dam on Mahoona Lake, and also from Katmai Creek. The City also operates a piped sewage system. A central septic treatment system and a sludge disposal site are used for waste. Over 90% of all homes in Ouzinkie are fully plumbed. Electricity is provided in Ouzinkie from a hydroelectric facility operated by the City, with a diesel backup generator.⁴⁸⁹ Public safety services are provided by a Village Public Safety Officer (VPSO) stationed in Ouzinkie,⁴⁹⁰ as well as a state trooper post in Kodiak. Fire and rescue services are provided by the city volunteer fire department and the U.S. Coast Guard (USCG). Additional community facilities include a Community Center, school gymnasium, and public library. A meals program for senior citizens operates out of the Community Center.⁴⁹¹ According to a survey conducted by the AFSC in 2011, a post office and publicly subsidized housing are also present in Ouzinkie.

With regard to fisheries-related infrastructure, according to the 2011 AFSC survey, community leaders reported that Ouzinkie has a breakwater, small boat harbor, and dock with fuel tanks. They indicated that 800 feet of dock space is available for permanent vessel moorage along with 100 ft of space for transient vessel moorage. They said that vessels up to 80 ft in length can be accommodated in Ouzinkie. According to community leaders, several improvements are currently underway to these facilities, including construction of new dock space and pilings, improvements to the existing dock structure, and addition of roads and electricity serving the dock. The new dock will have the capacity to receive a ferry. They noted that plans are in place to add a fish cleaning station and barge landing area and to connect the water system to the dock within the next 10 years. Additionally, they reported that harbor dredging has recently been carried out. For fisheries-related businesses and services not available locally, community leaders indicated that Ouzinkie residents typically travel to Kodiak, Homer, or Anchorage.

Medical Services

Health care is available at the Ouzinkie Health Clinic which is owned by the Village Council and operated by KANA. The clinic is a Community Health Aide Program site. Emergency Services have coastal and air access. Emergency service is provided by volunteers and a health aide.⁴⁹² The nearest hospital is located in the City of Kodiak.

Educational Opportunities

There is one school in the community, which offers Kindergarten through 12th grade. As of 2011, the Ouzinkie School had a total of 28 students and 3 teachers.⁴⁹³

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prior to the arrival of Europeans, subsistence hunting and fishing was the basis of the economy for people living on Kodiak Island and surrounding areas. The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources and marine mammals, including whales, sea lions, seals, and sea otters. With the arrival of Russian colonists to Kodiak Island in the late 1700s, the Alutiiq people were forced to hunt for sea otters to fuel the trade of their valuable pelts.⁴⁹⁴

After the U.S. purchase of Alaska, American entrepreneurs arrived to continue hunting sea otter and to develop other industries, including salmon fishing. In 1889, the Royal Packing Company constructed a cannery at Ouzinkie. Shortly afterward, the American Packing Company built another. A majority of cannery employees were hired from outside the region, primarily from the lower U.S. states and China. Native Alaskans became increasingly involved in commercial salmon fishing in the early 1900s, and coordinated commercial fishing activity with subsistence hunting and fishing activities. The most common fishing gear was the beach seine until purse seining became popular in the 1920s with the rise of fuel-powered boats. The salmon fishery was the primary focus of local commercial fishing activity, although by the 1920s halibut fisherman began stopping in Kodiak, and herring and cod fishermen also worked in the area.⁴⁹⁵

The Ouzinkie cannery was destroyed by the Good Friday earthquake of 1964. Following the disaster, Columbia Ward bought the remains and rebuilt the store and dock but not the cannery. In the late 1960s, the Ouzinkie Seafoods cannery was constructed. The operation was sold to Glacier Bay and burned down in 1976 shortly after the sale. No canneries have operated since.⁴⁹⁶ After the 1964 earthquake, Kodiak became the focal point of seafood processing for the region. The king crab fishery emerged as a new focus for the Kodiak fishing fleet in the years following the tsunami. Most Alutiiq fishermen continued to focus on salmon fishing into the late 1900s, but some also diversified into herring, cod, and crab fisheries.⁴⁹⁷ Today all of these commercial fisheries continue to be important to fishermen living in Ouzinkie, as well as continued subsistence fishing and hunting.⁴⁹⁸

Between 2000 and 2010, Ouzinkie fishermen were most engaged in commercial fisheries for salmon, groundfish, and halibut, and were also involved to a lesser degree in fisheries for crab, sablefish, and ‘other shellfish’. According to a survey conducted by the AFSC in 2011, community leaders indicated that the Pacific cod jig fishery takes place during the first half of January each year, the snow crab fishery takes place in the second half of January, and the Pacific halibut longline fishery runs between mid-March and mid-November. Fisheries that occur within 3 nautical miles (nmi) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nmi in the U.S. Exclusive Economic

⁴⁹⁷ See footnote 494.

⁴⁹⁸ See footnote 496.

Zone (EEZ) are under federal jurisdiction.⁴⁹⁹ Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

Ouzinkie is located in Federal Statistical and Reporting Area 630, Pacific Halibut Fishery Regulatory Area 3A, and the Central GOA federal Sablefish Regulatory Area. ADF&G manages the Kodiak salmon and herring fisheries in waters surrounding the Kodiak archipelago.⁵⁰⁰ The salmon fishery is divided into seven fishing districts (Afognak District, Northeast Kodiak District, Eastside Kodiak District, Alitak Bay District, Southwest Kodiak District, Northwest Kodiak District, and Mainland Districts). Gear types in use currently include purse seine, set gillnets and beach seine.⁵⁰¹ Kodiak herring fisheries include a roe fishery (using both purse seine and gillnet gear) and a food/bait fishery. Herring sac roe fisheries take place in the spring when individual spawning biomasses are aggregated. In contrast, food/bait fisheries take place in the summer, fall, and winter when herring from several stocks may be mixed together. A Kodiak food/bait herring fishery has historically taken place in Shelikof Strait, but has been closed in recent years because the Kamishak Bay spawning biomass (Cook Inlet) has been below threshold since 1998. The Alaska Board of Fish (BOF) closes food/bait fisheries if any of the individual spawning populations is below threshold.⁵⁰²

In the GOA, federally-managed groundfish fisheries target Pacific cod, walleye pollock, pelagic shelf rockfish, sablefish, and flatfish. Parallel fisheries for Pacific cod and walleye pollock also take place in state waters surrounding Kodiak Island. Parallel fisheries occur at the same time as the federal fisheries. The Total Allowable Catch (TAC) set by NMFS in each fishery applies to both federal and parallel harvest. In addition to federally-managed groundfish fisheries, beginning in 1997, a ‘state-waters fishery’ for Pacific cod was initiated in the Kodiak area. Management plans for state-waters fisheries are approved by the BOF, and guideline harvest limits (GHL) are set by the ADF&G. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, the ADF&G manages lingcod fisheries in both state and EEZ waters off Alaska, and beginning in 1998, management of black rockfish and blue rockfish in the GOA was transferred from NMFS to ADF&G.⁵⁰³ Kodiak Island is one historical center of the red king crab fishery, and Tanner crabs are also distributed through the GOA. The ADF&G manages red king crab and Tanner crab stocks in the GOA.^{504,505} The Kodiak red king crab fishery has been closed in recent years due to low abundance. However, parts of the Kodiak district have been open for Tanner crab harvest in recent years. Kodiak area Tanner crab harvest is managed using eight separate management areas, each with its own GHL.⁵⁰⁶

⁵⁰⁶ See footnote 499.

In 1995, management of the Pacific halibut and sablefish fisheries shifted from limited entry to a catch share program. The program includes allocation of the annual Total Allowable Catch (TAC) of halibut and sablefish via Individual Fishing Quota (IFQ). The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual TAC to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries.⁵⁰⁷ These and other factors that may contribute to decreasing fisheries participation in villages of the Kodiak Island archipelago have been discussed in detail in a number of research papers. Please refer to the books and articles referenced here for a more nuanced discussion of this issue.^{508,509}

The Community Quota Entity (CQE) program, implemented by the North Pacific Fishery Management Council in 2005, is one program intended to address the issue of fishing rights leaving rural communities. Under the program, eligible communities can form a non-profit corporation under state law to purchase and manage quota share on their behalf. After they purchase quota share, CQE non-profits can lease the IFQ to eligible community residents.⁵¹⁰ Ouzinkie participates in the program through the Ouzinkie Community Holding Corporation, a non-profit entity created under the program through the recommendation of the City of Ouzinkie. The Ouzinkie Community Holding Corporation is one of two CQE non-profits in Alaska that held commercial halibut IFQ and was actively leasing commercial halibut quota to residents in 2013. As of October that year, the Ouzinkie Community Holding Corporation held 159,978 halibut quota shares in Area 3A.⁵¹¹ It is important to note that, in addition to commercial halibut quota, CQE non-profits now have the ability to acquire and lease charter halibut permits and non-trawl gear groundfish License Limitation Permits (LLP). In October 2013, the Ouzinkie Community Holding Corporation held seven halibut charter permits and nine non-trawl groundfish LLPs.^{512,513} Ouzinkie is not eligible to participate in the Community Development Quota (CDQ) program.

Community leaders also commented in the 2011 AFSC survey that Ouzinkie is not actively involved in the fisheries management process in Alaska. They also noted that lack of local infrastructure and high fuel costs are challenges for Ouzinkie's fishing sector, and expressed that the IFQ system has led to decreased recruitment of local residents into the fishing industry. They commented that most of the original local IFQ shareholders have sold their shares to individuals outside of the community, and noted that the community of Ouzinkie is actively looking for ways to buy into community quota to promote new entry into IFQ fisheries and invigorate future fishing opportunities locally. It is important to note that the declining fishery participation has a dramatic impact on coastal fishing communities. Several books and articles are referenced here that provide a more detailed discussion of the impact of declining fishing participation on Kodiak-area villages.^{514,515}

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Ouzinkie. However, 11 processing facilities were registered in nearby Kodiak in 2010.

Fisheries-Related Revenue

According to information provided in Ouzinkie's annual municipal budget between 2000 and 2010, local fisheries-related revenue sources included a raw fish tax, the Shared Fisheries Business Tax, the Fisheries Resource Landing Tax, a fuel transfer tax, and harbor usage fees. In 2010, Ouzinkie received \$17,250 in raw fish tax revenue, \$15,777 from the Shared Fisheries Business Tax, \$87 from the Fisheries Resource Landing Tax, \$10,000 in fuel transfer tax revenue, and \$10,000 from harbor usage fees. In addition, community leaders reported in a 2011 survey conducted by the AFSC that \$100 was generated from tax on marine fuel sales. They also noted that a portion of revenues from fisheries-related funding sources is used to fund harbor maintenance activities. Information about fisheries-related revenue is presented in Table 3.⁵¹⁶

Commercial Fishing

Between 2000 and 2010, Ouzinkie residents were engaged in commercial fishing activities as vessel owners, permit and quota share account holders, and crew license holders. In 2010, 23 Ouzinkie residents held state crew licenses and 20 residents were the primary owner of a fishing vessel. Both of these numbers represent decreases since 2000, with a 34.3% decrease in crew licenses, down from 35 in 2000, and a 28.6% decrease in vessels owned by residents, down from 23 in 2000. In addition, 16 vessels were homeported in Ouzinkie in 2010, down from 23 in 2000, a decline of 30.4%. Please refer to literature cited above, at the end of the *History and*

⁵¹⁴ Carothers, C. 2012. Enduring ties: salmon and the Sugpiat of the Kodiak Archipelago. Pages 133-160 in B.J. Colombi and J.F. Brooks, eds. *Keystone Nations: Indigenous Peoples and Salmon across the North Pacific*. School for Advanced Research Press, Santa Fe, NM.

⁵¹⁵ Carothers C. 2010. Tragedy of commodification: Transitions in Alutiiq fishing communities in the Gulf of Alaska. *MAST* 90:91-115.

⁵¹⁶ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Evolution of Fishing section, for a more detailed discussion of the impact of declining fishing participation on Kodiak-area coastal communities.

According to the 2011 AFSC survey, community leaders reported that fishing boats using the community as their base of fishing operations are typically under 35 feet or between 35 and 60 feet in length, and used pots, longline, gillnet, or seine gear. No fish buyers or shore-side processors were present in Ouzinkie between 2000 and 2010. These characteristics of the Ouzinkie commercial fishing sector are presented in Table 5.

In 2010, a total of 31 state Commercial Fisheries Entry Commission (CFEC) permits were held by 19 Ouzinkie residents in fisheries for salmon, groundfish, halibut, herring, crab, and ‘other shellfish’. Salmon permits were held in the Kodiak purse seine, beach seine, and set gillnet fisheries. Of 11 total salmon permits held in 2010, 5 were actively fished (45%). All eight permits in the statewide halibut fishery were actively fished in 2010. Also in 2010, groundfish permits were held in the statewide lingcod and miscellaneous saltwater finfish mechanical jig fisheries, and Gulf of Alaska (GOA) miscellaneous saltwater finfish troll and mechanical jig fisheries. Of the seven permits held, three were actively fished that year (43%). In addition, one crab permit was actively fished in 2010 in the Kodiak Tanner crab pot gear fishery, one sablefish permit was held but not actively fished in the statewide longline fishery (vessel under 60 ft), and one ‘other shellfish’ permit was held but not actively fished in the westward shrimp pot gear fishery (vessel under 60 ft). Overall between 2000 and 2010, the total number of CFEC permit holders declined by 32.1% and the number of permits held declined by 36.7%. The percentage of permits held that were actively fished remained relatively stable over the period. Information about CFEC permits held in Ouzinkie can be found in Table 4.

In addition, seven Ouzinkie residents held a total of nine License Limitation Program permits (LLP), all of which were held in federal groundfish fisheries. Four of these nine permits were actively fished in 2010 (44%). In 2001, one LLP was also held in a federal crab fishery, but was not actively fished that year. In 2010, five Ouzinkie residents also held a total of five Federal Fisheries Permits (FFP), of which three were actively fished that year (60%). This federal permit information is also presented in Table 4.

In 2010, Ouzinkie residents held 10 quota share accounts in the federal halibut catch share fishery, with a total of 550,333 halibut quota shares. The number of quota share accounts and the number of quotas held in Ouzinkie decreased between 2000 and 2010. The annual halibut individual fishing quota (IFQ) allotment increased to 17% higher than 2000 levels by 2004, and then declined again to 10% under the 2000 allotment level by 2010. Between 2000 and 2010, one sablefish quota share account was also held in Ouzinkie, and 91,457 sablefish quota shares were held each year. Sablefish IFQ allotment increased to 27% over the 2000 level by 2004, and then declined to almost 22% lower than the 2000 allotment by 2010. Between 2000 and 2010, no Ouzinkie residents held quota share accounts or quota shares in federal crab catch share fisheries. Federal catch share participation is presented in Tables 6 through 8.

Given the lack of fish buyers in Ouzinkie (Table 5), no landings or ex-vessel revenue were reported in the community between 2000 and 2010 (Table 9). However, information was reported regarding landings and ex-vessel revenue generated by Ouzinkie vessel owners, including all delivery locations. In 2010, Ouzinkie vessel owners landed 63,802 net pounds of Pacific halibut and 34,787 net pounds of Pacific cod. Other landings and ex-vessel revenue in 2010 are considered confidential due to the small number of participants. Salmon landings and revenue data were reported for 6 years during the 2000-2010 period. In 2007, Ouzinkie vessel owners landed 1,488,878 net pounds of salmon for an ex-vessel value of \$408,426. ‘Other

groundfish' landings and ex-vessel revenue were reported for only one year between 2000 and 2010 while information from other years is considered confidential due to the small number of participants. During the year in which 'other groundfish' data were reported (2002), Ouzinkie vessel owners landed 7,265 net pounds of groundfish, valued at \$2,775. For information about landings and ex-vessel revenue earned by vessels owners residing in Ouzinkie, see Table 10.

Recreational Fishing

Between 2000 and 2010, there was at least one active sport fish guide business in Ouzinkie in each year except 2002. The number of licensed sport fish guides residing in the community declined slightly over this period, falling from four in 2000 to one in 2010, after a brief increase to six guides present in 2003 and 2004. The number of Ouzinkie residents who purchased sportfishing licenses (irrespective of point of sale) varied between 46 and 75 per year between 2000 and 2010. This was higher than the number of licenses sold in Ouzinkie, which varied between 31 and 63 per year, suggesting that Ouzinkie residents may travel to Kodiak or other areas to prepare for or engage in sportfishing activity. According to a survey conducted by the AFSC in 2011, community leaders indicated that local sportfishing activity is largely made up of residents using private boats or fishing from docks or the shore, as well as charter fishing. They also noted that fishing lodges are present in Ouzinkie.

Ouzinkie is located within Alaska Sport Fishing Survey Area Q – Kodiak. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. On average, Alaska resident anglers fished more angler days per year than non-Alaska residents in both saltwater and freshwater sport fisheries, and more angler days were fished per year in freshwater than in saltwater in the Kodiak region between 2000 and 2010. However, sportfishing activity in by both Alaska resident and non-Alaska resident anglers, and in both saltwater and freshwater, was extremely high. Information about the sportfishing sector in and near Ouzinkie is displayed in Table 11.

The Alaska Statewide Harvest Survey,⁵¹⁷ conducted by ADF&G between 2000 and 2010, noted the following saltwater species targeted by private anglers in Ouzinkie: Chinook, coho, sockeye, and pink salmon, Dolly Varden, Pacific halibut, rockfish, lingcod, and Pacific cod, as well as Tanner crab and razor clams. In freshwater the survey noted sport harvest of Chinook, coho, and pink salmon. In the 2011 AFSC survey, community leaders reported a similar list of species targeted by recreational fishing, including all five species of Pacific salmon, Pacific halibut, rockfish, crab, and clams.

Kept/released statistics from charter logbook data reported by ADF&G⁵¹⁸ show that Pacific halibut, coho salmon, and pelagic rockfish were the most important species targeted by fishing charters out of Ouzinkie. In 2010, 112 halibut were kept and 21 released, 104 coho were kept, and 66 pelagic rockfish were kept and 43 released. These numbers represent a decline from higher charter harvest levels in 2005 and 2006. Other species that were also caught on charter fishing trips out of Ouzinkie between 2000 and 2010 include Chinook, chum, sockeye, and pink salmon, lingcod, yelloweye rockfish, ‘other rockfish’, and shark.

It is also important to note that, as of 2013, Ouzinkie’s CQE non-profit, the Ouzinkie Community Holding Corporation, held seven charter halibut permits that were available for lease to community residents.⁵¹⁹

Subsistence Fishing

Subsistence harvest continues to play an important role in the culture and economy of Ouzinkie.⁵²⁰ According to a survey conducted by the AFSC in 2011, salmon, Pacific halibut, and waterfowl were some of the most important subsistence resources for Ouzinkie residents. Crab, shrimp, clams, deer, and rabbit are also utilized.⁵²¹ Between 2003 and 2005, the years for which subsistence surveys were conducted in the community, an average of 85% of households were reported to participate in salmon subsistence, and an average of 29% participated in non-salmon fish subsistence (not including halibut). In 2003, 98% of households participated in halibut subsistence, 27% of households participated in marine mammal subsistence, and 65% participated in marine invertebrate subsistence. That year, the per capita subsistence of land and sea-based resources by residents of Ouzinkie was 316 lbs. This information is presented in Table 12.

Information was also available from ADF&G regarding the species of marine invertebrates, non-salmon fish, and marine mammals harvested by Ouzinkie households in 2003. The species of marine invertebrate harvested by the greatest number of Ouzinkie households that year included black chitons, octopus, Tanner crab, sea urchin, limpets, butter clams, Dungeness crab, razor clams, Pacific littleneck clams, red chitons, shrimp, and weathervane scallops. The species of non-salmon fish harvested by the greatest number of households included black rockfish, Pacific cod, Dolly Varden, lake trout, rainbow trout, steelhead, lingcod, red rockfish, herring, greenling, walleye pollock, starry flounder, Pacific tomcod, and Irish lord. In addition, although no households reported harvesting herring roe, a small number of households did report using it, indicating the presence of sharing networks between Ouzinkie and other communities. In addition, a number of Ouzinkie households reported involvement in the harvest of harbor seal. Most species listed above were used by a greater percentage of household than were involved in harvest activities, indicating the presence of sharing networks within the community.⁵²²

Information was also reported during the 2000-2010 period regarding total subsistence harvests of salmon and halibut. In 2008, the most recent year for which data are available about subsistence salmon harvest, 29 Ouzinkie households were issued subsistence salmon permits, and all 29 were returned, with a total harvest of 1,644 salmon. These numbers represent a decline from 43 permits issued in 2004 and 36 in 2005, and harvests of between 2,000 and 3,400 salmon in those years. Sockeye salmon made up the greatest percentage of the subsistence salmon harvest in all years for which data were reported. Additionally, in 2003, 2,966 pounds of marine invertebrates were harvested and 13,543 lbs of non-salmon fish (not including halibut) were harvested. This information is presented in Table 13.

In 2009, the most recent year for which data are available regarding subsistence halibut harvest, 59 Subsistence Halibut Fishing Certificates (SHARC) were issued to residents of Ouzinkie. Of these, 26 were fished that year, and a total of 3,433 lbs of halibut were harvested through the program. The number of SHARC cards issued varied considerably between 2003 and 2010, fluctuating between a low of 39 in 2003 and a high of 66 in 2007. The greatest volume of

⁵²⁰ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

halibut was harvested in 2006 through this program, with 8,718 lbs harvested on 39 active SHARC cards. This information about subsistence halibut harvest is presented in Table 14.

Ouzinkie residents also participated in the subsistence harvest of marine mammals. Data reported by the U.S. Fish and Wildlife Service (FWS) indicate that six sea otters were harvested for subsistence purposes in 2003, and data from a 2009 ADF&G report indicates that Steller sea lions were also harvested in several years between 2000 and 2010. No information was available from management agencies regarding subsistence harvest of beluga whale, walrus, harbor seal, or spotted seal during the 2000-2010 period. This information is presented in Table 15.

Port Lions

People and Place

*Location*⁵²³

Port Lions is located in Settler Cove, on the north coast of Kodiak Island, 247 air miles southwest of Anchorage. Port Lions is located in the Kodiak Island Census Area and is under the jurisdiction of the Kodiak Island Borough. The community encompasses 6.3 square miles of land and 3.7 square miles of water. Port Lions is a Second-class city and was incorporated in 1966.

*Demographic Profile*⁵²⁴

In 2010, there were 194 residents in Port Lions, making it the 196th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population decreased by 12.6%. According to Alaska Department of Labor population estimates, between 2000 and 2009, the population of permanent residents fell by 21.88%. The average annual growth during this period was -1.82%, indicating a slow, steady decline. The change in population from 1990 to 2010 is provided in Table 1.

The majority of the residents of Port Lions in 2010 identified themselves as American Indian or Alaska Native (58.8%), with the remaining racial composition as follows: White (36.1%), Asian (2.6%), two or more races (2.6%), and Hispanic or Latino (1.5%). The percentage of the population identifying themselves as American Indian or Alaska Native decreased by 8.8% from 2000 to 2010, with corresponding increases in the percentage of the population identifying themselves as White, Asian, and two or more races. The change in racial and ethnic composition from 2000 to 2010 is provided in Figure 1 below.

In 2010, the average household size was estimated at 2.52, a decrease from 2.88 in 2000 and 3.0 in 1990. There was a decrease in the number of households present in 2000 (89), though the 2010 estimate number of households (77) is still larger than the number of households in 1990 (73). Of the 113 total housing units surveyed for the 2010 Decennial Census, 62 were owner-occupied, 15 were renter-occupied, and 36 were vacant. In 2010, no residents of Port Lions were reported to be living in group quarters.

In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimate that approximately 50 people come to Port Lions as seasonal workers each year between May and August.

Figure 1. Racial and Ethnic Composition, Port Lions: 2000-2010 (U.S. Census).

In 2010, the gender makeup was fairly even, at 51% male and 49% female, similar to the state as a whole (52% male, 48% female). The median age in Port Lions was 44.3, higher than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. The greatest percentage of residents fell within the age category 40-59 years old, with the next largest percentage for the age category 0-29 years old. Relatively few people were 30-39 years old or 60 or older. The overall population structure of Port Lions in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁵²⁵ an estimated 86.6% of residents aged 25 and older had a high school diploma or higher degree, compared to 90.7% of Alaskans overall. Also in 2010, an estimated 3.2% of residents had less than a ninth grade education, compared to 3.5% of Alaskan residents overall; 10.2% had a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 32.5% had a high school diploma, compared with 27.4% of Alaskan residents overall; 29.9% had some college but no degree, compared to 28.3% of Alaskan residents overall; 7.6% had an Associate’s degree, compared with 8% of Alaskan residents overall; 2.5% had a Bachelor’s degree, compared with 17.4% of Alaskan residents overall; and 14% had a graduate or professional degree, compared with 9.6% of Alaskan residents overall.

Figure 2. Population Age Structure in Port Lions Based on the 2000 and 2010 U.S. Decennial Census.

⁵²⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*⁵²⁶

The majority of the population of Port Lions is Alutiiq, and the residents lead a fishing and subsistence lifestyle. The town was founded in 1964 by the displaced inhabitants of Afognak, which was destroyed by a tsunami after the Good Friday Earthquake. The community was named in honor of the Lions Club for their support in rebuilding and relocating the village. The city government was incorporated in 1966. For many years, Port Lions was the site of the large Wakefield Cannery on Peregrebni Point. The cannery burned down in March 1975. Soon thereafter, the village corporation purchased a 149-foot floating processor, the *Smokwa*. Although sold in 1978, the *Smokwa* processed crab in the area intermittently between 1975 and 1980. A small sawmill, located south of town, operated until 1976.

Natural Resources and Environment⁵²⁷

The climate of the Kodiak Islands is dominated by a strong marine influence. There is little or no freezing weather, moderate precipitation, and frequent cloud cover and fog. Severe storms are common from December through February. Annual precipitation averages 54 inches, with 75 inches of snowfall. Temperatures remain within a narrow range, from 20 to 60 °F (-6.7 to 15.6 °C).

The economy of Port Lions depends on the area's natural resources, especially fish. In a survey conducted by the AFSC in 2011, community leaders report local reliance on commercial fishing, recreational/sportfishing, and charter fishing.

Port Lions is located near the Kodiak National Wildlife Refuge (Refuge). The Refuge covers the southwestern two-thirds of Kodiak Island. It was established in 1941 with the purpose of wildlife conservation, in particular the Kodiak brown bear unique to the island, as well as fulfillment of treaty obligations, providing for continued subsistence use, and to ensure water quality and quantity.⁵²⁸ There are also a number of state parks, state historical parks and state recreation sites located on the northeast corner of Kodiak Island.⁵²⁹

Kodiak Island is located in a highly active volcanic and tectonic zone along the Pacific "Ring of Fire". The earthquake belt along the Aleutian Islands, Alaska Peninsula and Kenai Peninsula is known as the Alaska-Aleutian subduction zone, where strong earthquakes occur as a result of slipping along the contact zone between the Pacific and Alaska plates. Earthquakes can cause tsunamis, landslides, snow avalanches, and submarine slumps.⁵³⁰ The 1912 eruption of the volcano Novarupta, located 100 miles northwest of Kodiak Island on the Alaska Peninsula,

covered the island in ash and gasses and disrupted the local salmon fishery, especially between 1915 to 1919 due to starvation and failure of many adult fish to spawn in ash-choked streams.⁵³¹

Kodiak Island was directly impacted by the *Exxon Valdez* Oil Spill in March of 1989, in which 11 million gallons of crude oil spilled into Prince William Sound and spread to surrounding areas.⁵³² Oil was carried by currents throughout the area of the Alutiiq people, and hit the beaches of Kodiak Island in mid-April.⁵³³ The *Exxon Valdez* Oil Spill Trustee Council was formed following the spill, and has overseen large-scale habitat restoration, protection and acquisition. On Kodiak Island, the Trustee Council has protected over 260,000 acres, much of it now included with Kodiak National Wildlife Refuge.⁵³⁴

Current Economy⁵³⁵

The economy of Port Lions is based primarily on commercial fishing, fish processing, and tourism. In addition, the residents depend to some extent on subsistence food sources such as salmon, crab, halibut, shrimp, clams, duck, seal, deer, and rabbit.⁵³⁶

Based on the 2006-2010 ACS,⁵³⁷ the per capita income in Port Lions in 2010 was estimated to be \$24,555, and the median household income in 2010 was estimated to be \$64,167, compared to \$17,492 and \$39,107 in 2000, respectively. However, after accounting for inflation by converting the 2000 values to 2010 dollars,⁵³⁸ the real per capita income (\$23,002) and the real median household income (\$51,425) in 2000 indicate an increase in both per capita and household income between 2000 and 2010. However, the small population size of Port Lions may have prevented the ACS from accurately portraying economic conditions.⁵³⁹ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database, the per capita income in Port Lions in 2010 was \$9,243, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.⁵⁴⁰ In 2011, Port Lions was recognized as a distressed community (using a plus/minus 3% formula) by the Denali Commission, prioritizing it for economic assistance.⁵⁴¹ In 2010, Port Lions ranked 113th of 305

Alaskan communities with per capita income that year, and 65th out of 299 Alaskan communities with household income data.

Based on the 2006-2010 ACS, in 2010, 54.8% of the population age 16 and older was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 4.6%, compared to the statewide unemployment rate of 5.9%. Approximately 6% of residents were living below the poverty line, compared to 9.6% of Alaskan residents overall. It should be noted that income and poverty statistics are based on wage income and other money sources; figures reported for Port Lions are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Port Lions. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 15.2%.

Based on household surveys conducted for the 2006-2010 ACS, the greatest number of workers was employed in the public sector (47.1%), while 24% were employed in the public sector and 28.8% were self-employed. Out of 104 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest percentage worked in transportation, warehousing, and utilities (23.8%), arts, entertainment, recreation, accommodations, and food services (17.9%), retail trade (14.3%), public administration (13.1%), and wholesale trade (10.7%). Only 7.1% of the workforce was estimated to be employed in education services, health care, and social assistance, with 7.1% employed in agriculture, forestry, fishing, hunting, and mining, and 6% employed in construction. The number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Port Lions (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Port Lions (U.S. Census).

Governance

Port Lions is a Second-class City, governed by a mayor and city council. Port Lions is part of the Kodiak Island Borough, and is also a member of a regional Native corporation called Koniag, Incorporated. The Native village corporation is Afognak Native Corporation, which manages 98,208 acres of land granted under the Alaska Native Claims Settlement Act. The nearest Alaska Department of Fish and Game (ADF&G), National Marine Fisheries Service (NMFS), U.S. Bureau of Citizenship and Immigration Services, and Alaska Department of Natural Resources offices are located in Kodiak. The nearest office of the Alaska Department of Commerce, Community, and Economic Development is located in Anchorage.

As of 2010, neither the Kodiak Island Borough nor the City of Port Lions administered a sales tax. However, the Borough administered a 1.05% severance tax and the City administered a 10.5 mills property tax and a 5% bed tax.⁵⁴² Municipal revenues were taken from Certified Financial Statements. When adjusted for inflation,⁵⁴³ total revenues increased 26.1% between 2000 and 2010 from \$252,856, to \$412,368. Municipal revenues peaked in 2006 at \$470,565, and were at their lowest in 2007 at \$192,238. In 2010, most (25.6%) municipal revenues were collected from state allocated Community Revenue Sharing, followed by water and sewer charges (19.0%) and outside grants (13.0%).

Also in 2010, Port Lions received \$1,690,421 in fisheries-related grants, including a harbor feasibility grant, a grant for Port Lions city dock and ferry terminal repair, design, and construction, and a grant for harbor improvements. Refer to Table 2 for details on community finances from 2000 to 2010. While the amount received from fisheries-related grants varies from year to year, the total grants received in 2010 is the second-largest amount during the period.

The Native Village of Port Lions, a federally recognized Tribe, was established in August 1978 with a base roll of 225 members. Membership has grown steadily and is currently over 300. The Port Lions Traditional Tribal Council is the traditional governing body of the village.⁵⁴⁴

Infrastructure

Connectivity and Transportation

Port Lions is accessible by air and water, but not by road. There is a state-owned 2,200 ft long by 75 ft wide gravel airstrip, and the city dock may be used by seaplanes. Regular and charter flights are available from Kodiak. The boat harbor with breakwater and dock provide 82 boat slips. The state ferry operates bi-monthly from Kodiak between May and October. Barge service is available from Seattle.⁵⁴⁵ After a short flight to Kodiak (\$110⁵⁴⁶), round-trip airfare to Anchorage was \$360.⁵⁴⁷

⁵⁴⁵ See footnote 542.

⁵⁴⁶ Regular air service from Port Lions to Kodiak is provided by Island Air. One-way fares are \$55. Retrieved on December 1, 2011 from <http://www.kodiakislandair.com>.

⁵⁴⁷ Airfare was obtained from the travel website <http://www.travelocity.com> for a round-trip ticket for travel from June 1 to June 8, 2012. Retrieved on December 1, 2011.

*Facilities*⁵⁴⁸

The community system was built by the Bureau of Indian Affairs and Indian Health Service in 1965. Over 100 residences are connected to the City's piped water and sewer systems, and 95% of these have complete plumbing. The Branchwater Creek Reservoir provides water, which is treated and stored in a 125,000-gallon tank.

Local law enforcement is provided by a local Village Public Safety Officer and state troopers stationed in the City of Kodiak. Fire and rescue services provided by Port Lions Public Safety/Emergency Medical Services. The Village Council operates a youth center, senior services, and bingo. There are both public and school libraries. The city of Port Lions provides sewage collection through a piped sewer system and a community septic tank, and also operates a Class 3 landfill. Electricity is powered by diesel fuel and is provided by the Kodiak Electric Association.

In a survey conducted by the AFSC in 2011, community leaders report that a fish cleaning station and new dock space with electricity, water, and pilings are currently in progress. In the same survey, community leaders report that plans for additional new dock space and a breakwater will be completed in the future.

*Medical Services*⁵⁴⁹

Medical services are provided by the Port Lions Health Clinic, which is operated by the Kodiak Area Native Association. The clinic is a Community Health Aid Program site. Alternate health care is provided by the Port Lions Department of Public Safety. Emergency services have marine and air access and are provided by 911 telephone service volunteers and a health aide.

*Educational Opportunities*⁵⁵⁰

The Port Lions School provides instruction to students from kindergarten through 12th grade and, in 2011 had 36 students and 4 teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prior to the arrival of Europeans, subsistence hunting and fishing was the basis of the economy for people living on Kodiak Island and surrounding areas. The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources and marine mammals, including whales, sea lions, seals, and sea otters. With the arrival of Russian colonists to Kodiak Island in the late 1700s, the Alutiiq people were forced to hunt for sea otters to fuel the trade of their valuable pelts.⁵⁵¹

After the U.S. purchase of Alaska, American entrepreneurs arrived to continue hunting sea otter and to develop other industries. The salmon fishery was the primary focus of local commercial fishing activity, although by the 1920s halibut fisherman began stopping in Kodiak, and herring and cod fishermen also worked in the area. After the 1964 earthquake, the City of Kodiak became the focal point of seafood processing for the region. The king crab fishery emerged as a new focus for the Kodiak fishing fleet in the years following the tsunami. Most Alutiiq fishermen continued to focus on salmon fishing into the late 1900s, but some also diversified into herring, cod, and crab fisheries.⁵⁵² Today all of these commercial fisheries continue to be important to fishermen living in Port Lions, as well as continued subsistence fishing and hunting.⁵⁵³

Between 2000 and 2010, Port Lions fishermen were most engaged in commercial fisheries for salmon, groundfish, halibut, and herring, and were also involved to a lesser degree in fisheries for crab, sablefish, and ‘other shellfish’. According to a survey conducted by the AFSC in 2011, community leaders indicated that the Pacific cod jig fishery takes place during the first half of January each year, the snow crab fishery takes place in the second half of January, and the Pacific halibut longline fishery runs between mid-March and mid-November.

The ADF&G manages the Kodiak salmon and herring fisheries in waters surrounding the Kodiak archipelago.⁵⁵⁴ The salmon fishery is divided into seven fishing districts (Afognak District, Northeast Kodiak District, Eastside Kodiak District, Alitak Bay District, Southwest Kodiak District, Northwest Kodiak District, and Mainland Districts). Gear types in use currently include purse seine, set gillnets and beach seine.⁵⁵⁵ Kodiak herring fisheries include a roe fishery (using both purse seine and gillnet gear) and a food/bait fishery. Herring sac roe fisheries take place in the spring when individual spawning biomasses are aggregated. In contrast, food/bait fisheries take place in the summer, fall, and winter when herring from several stocks may be mixed together. A Kodiak food/bait herring fishery has historically taken place in Shelikof Strait, but has been closed in recent years because the Kamishak Bay spawning biomass (Cook Inlet)

⁵⁵⁴ Alaska Dept. of Fish and Game. 2012. *Kodiak Management Area*. Retrieved June 25, 2012 from <http://www.adfg.alaska.gov/index.cfm?adfg=commercialbyareakodiak.main>.

⁵⁵⁵ Clark, McGregor, Mecum, Krasnowski and Carroll. 2006. “The Commercial Salmon Fishery in Alaska.” *Alaska Fisheries Research Bulletin* 12(1):1-146. Alaska Dept. of Fish and Game. Retrieved January 4, 2012 from <http://www.adfg.alaska.gov/static/home/library/PDFs/afrb/clarv12n1.pdf>.

has been below threshold since 1998. The Alaska Board of Fish (BOF) closes food/bait fisheries if any of the individual spawning populations is below threshold.⁵⁵⁶

Groundfish and crab fisheries that occur within 3 nautical miles (nmi) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nmi in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction. In the Gulf of Alaska (GOA), federally-managed groundfish fisheries target Pacific cod, walleye pollock, pelagic shelf rockfish, sablefish, and flatfish. Parallel fisheries for Pacific cod and walleye pollock also take place in state waters surrounding Kodiak Island. Parallel fisheries occur at the same time as the federal fisheries. The Total Allowable Catch (TAC) set by NMFS in each fishery applies to both federal and parallel harvest. In addition to federally-managed groundfish fisheries, beginning in 1997, a ‘state-waters fishery’ for Pacific cod was initiated in the Kodiak area. Management plans for state-waters fisheries are approved by the BOF, and guideline harvest limits (GHL) are set by the ADF&G. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, the ADF&G manages lingcod fisheries in both state and EEZ waters off Alaska, and beginning in 1998, management of black rockfish and blue rockfish in the GOA was transferred from NMFS to ADF&G.⁵⁵⁷

Kodiak Island is one historical center of the red king crab fishery, and Tanner crabs are also distributed through the GOA. The ADF&G manages red king crab and Tanner crab stocks in the GOA. From 2000 to 2002, Port Lions residents held permits in the Kodiak king crab and Bristol Bay Dungeness crab fisheries. However, from 2003 to 2010, only Tanner crab permits were held.^{558,559} The Kodiak red king crab fishery has been closed in recent years due to low abundance. Parts of the Kodiak district have been open for Tanner crab harvest in recent years. Kodiak area Tanner crab harvest is managed using 8 separate management areas, each with its own GHL.⁵⁶⁰ Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

Port Lions is located in the Gulf of Alaska Federal Statistical and Reporting Area 630, the Pacific Halibut Fishery Regulatory area 3A, and the Central Gulf of Alaska Sablefish Regulatory Area. The community is not eligible to participate in the Community Development Quota (CDQ) program. However, Port Lions is eligible to participate in the Community Quota Entity (CQE) program.

The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In

⁵⁶⁰ See footnote 557.

addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf. As of 2013, 45 communities were considered eligible for the CQE program. Only two CQE non-profits had purchased commercial halibut IFQ and were actively leasing it to eligible community residents. Both of these CQE non-profits were located in the Kodiak area: Cape Barnabas, Inc. in Old Harbor and the Ouzinkie Company Holding Corporation in Ouzinkie.⁵⁶¹

Port Lions Fisheries, Inc. is the CQE non-profit entity which represents Port Lions. In a survey conducted by the AFSC in 2011, Port Lions community leaders reported that the CQE non-profit was developed with the intention of also purchasing and managing commercial quota shares in eligible fisheries as well as charter halibut permits for the community. As of October 2013, Port Lions Fisheries, Inc. had not purchased any commercial IFQ. However, the non-profit did have seven halibut charter permits available for lease to community members.⁵⁶²

In the 2011 AFSC survey, community leaders also said in the survey that the community's annual population peak is "entirely" driven by employment in the fishing sectors, particularly commercial fishing, recreational/sportfishing, and charter fishing. Community leaders also reported that Port Lions has seen an increase in charter/party boats and in commercial fishing boats over the past five years.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Port Lions does not have a registered processing plant. The nearest processing plant is located in Kodiak.

Fisheries-Related Revenue

Overall, in 2010, Port Lions received \$63,459 from fisheries-related taxes and fees (Table 3).⁵⁶³ These revenue sources include the Shared Fisheries Business Tax, the Fisheries Resource Landing Tax, and harbor usage fees. Table 3 shows the historical annual revenue for each of these categories.

In a survey conducted by the AFSC in 2011, community leaders reported that roads, social services, and water and wastewater systems are supported at least partially by funds obtained through fisheries-related revenue sources.

⁵⁶¹ NOAA Fisheries. (2013). *Community Quota and License Programs and Community Quota Entities*. Retrieved October 24, 2013 from <http://alaskafisheries.noaa.gov/ram/cqp.htm>.

⁵⁶² Ibid.

⁵⁶³ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In 2010, 16 residents of Port Lions held a total of 38 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). Salmon permits made up 37% of the CFEC permits issued in 2010, a percentage which remained generally the same between 2000 and 2010. The majority (10) of the salmon CFEC permits issued in 2010 were for the Kodiak purse seine fishery, with the remainder issued for the Kodiak beach seine fishery, the Peninsula-Aleutians drift gill net fishery, and the Kodiak set gill net fishery. Halibut CFEC permits were issued for the statewide longline fishery using vessels under 60 ft. Also in 2010, herring CFEC permits were issued for the Kodiak purse seine and gill net roe herring fisheries, the Cook Inlet purse seine fishery (roe and food/bait), and the Kodiak purse seine food/bait fishery using vessels under 60 ft. Permits were also issued in 2010 for the following “other shellfish” fisheries: statewide octopi/squid longline fishery using vessels under 60 ft and pot gear fishery using vessels under 60 ft, the Kodiak sea cucumber diving gear fishery, and the Kodiak Tanner bairdi crab pot fishery using vessels under 60 ft. There were also other finfish CFEC permits issued for the statewide and Gulf of Alaska miscellaneous saltwater finfish mechanical jig fisheries. In addition, one Federal Fisheries Permit (FFP) was issued to a Port Lions resident in 2010 (Table 4). Overall, just over half the permits issued to residents of Port Lions in 2010 were actually fished, although this varies by fishery, with 71% of salmon CFEC permits fished to 100% of halibut CFEC permits fished to 20% of crab CFEC permits fished. There was a large decline in the total quota shares held by residents of Port Lions for both halibut and sablefish between 2000 and 2010. Note that no residents of Port Lions held quota shares in any of the Alaskan crab fisheries regulated by catch share programs.

Between 2000 and 2010, there were an average of 25 crew license holders, 28 vessels owned primarily by Port Lions residents and 31 vessels homeported in Port Lions. There were no fish buyers, shore-side processing facilities, or vessels landing catch in Port Lions between 2000 and 2010 (Table 5). The number of halibut quota share account holders decreased between 2000 and 2010, as did the number of halibut quota shares held by Port Lions residents and the annual IFQ allotment (Table 6). There was one Port Lions resident holding sablefish quota shares between 2000 and 2009, though there were no Port Lions residents holding sablefish quota shares in 2010 (Table 7). There were no Port Lions residents holding crab quota shares between 2005 and 2010 (Table 8). Since there were no vessels landing catch in Port Lions between 2000 and 2010, there are no landings or ex-vessel revenue data to report during this period (Table 9). Landings by Port Lions residents were considered confidential due to a small number of participants for all species in all years with the exception of halibut (2000, 2002, 2006-2008, and 2010), Pacific cod (2004), and salmon (2000-2010). Landings and ex-vessel revenue reported by Port Lions residents for halibut decreased during the period for years in which data were available, while landings and ex-vessel revenue for salmon varied considerably during the period (Table 10).

In a survey conducted by the AFSC in 2011, community leaders reported that gear types used by commercial fishing vessels based in Port Lions include gill nets, pots, and purse seines. Community leaders also reported that Port Lions is home to more commercial fishing boats than there were five years ago. In addition, community leaders reported that, while not directly involved in the fisheries management process in Alaska, Port Lions relies on regional organizations, such as the Gulf of Alaska Regional Communities Coalition, to provide information on fisheries management issues to the community.

Recreational Fishing

According to the ADF&G Statewide Harvest Survey, Chinook salmon, coho salmon, pink salmon, sockeye salmon, Dolly Varden, Pacific halibut, rockfish, Pacific cod, razor clams, and hardshell clams are caught by private anglers in Port Lions. In addition, charter logbook data indicate that Chinook salmon, chum salmon, coho salmon, pink salmon, sockeye salmon, other salmon, halibut, lingcod, pelagic rockfish, yelloweye rockfish, other rockfish, and sharks have been targeted by the charter industry in Port Lions.⁵⁶⁴ According to the ADF&G Charter Logbook data, Chinook salmon, chum salmon, coho salmon, halibut, lingcod, other rockfish, other salmon, pink salmon, pelagic rockfish, sablefish, shark, sockeye, and yelloweye rockfish are caught by anglers aboard charter vessels operating out of Port Lions.⁵⁶⁵ According to a survey conducted by the AFSC in 2011, community leaders indicated that the following saltwater species are targeted by recreational fishermen that use boats based in Port Lions: pink salmon, chum salmon, Chinook/king salmon, sockeye/red salmon, halibut, rockfish, crab, and clams.

In 2010, there were nine registered sport fish businesses active and twelve registered sport fish guides. The number of active sport fish guide businesses fluctuated at any given year between 2000 and 2010, but ranged between 6 and 10. In addition, there was a yearly average of 12 registered sport fish guides located in the community during that time. A total of 77 sportfishing licenses were sold to residents of Port Lions in 2010 (irrespective of the location of the point of sale). In comparison, a total of 84 sportfishing licenses were sold in Port Lions, indicating the potential that visitors to Port Lions are participating in recreational fishing activities.

Port Lions is located within Alaska Sport Fishing Survey Area Q – Kodiak. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. On average, Alaska resident anglers fished more angler days per year than non-Alaska residents in both saltwater and freshwater sport fisheries, and more angler days were fished per year in freshwater than in saltwater in the Kodiak region between 2000 and 2010. However, sportfishing activity in by both Alaska resident and non-Alaska resident anglers, and in both saltwater and freshwater, was extremely high. Information about the sportfishing sector in and near Port Lions is displayed in Table 11.

Subsistence Fishing

Residents of Port Lions supplement their incomes and diet with subsistence resources such as salmon, crab, halibut, shrimp, clams, duck, seal, deer, and rabbit.⁵⁶⁶

According to a survey conducted by the AFSC in 2011, community leaders indicated that salmon, halibut, cod, clams, and sea ducks are the most important subsistence marine resources for the residents of Port Lions. There has been considerable harvest of halibut for subsistence by residents of Port Lions that hold a valid Subsistence Halibut Registration Certificate (SHARC) issued by NMFS (Table 14). The ADF&G Division of Subsistence estimated subsistence participation between 2003 and 2004 by household and species, showing a high percentage of households participating in salmon and halibut subsistence, as well as lower participation levels in marine mammal, marine invertebrate, and non-salmon fish subsistence (Table 12).

Between 2000 and 2010, for years in which data are available, the estimated total subsistence harvest of salmon appears to be somewhat variable from year to year (Table 13). From 2003 to 2010, while somewhat variable, the total subsistence harvest of halibut decreased overall by nearly half. During this same time period, the number of SHARC card holders and the number of SHARC cards fished has also decreased (Table 14). In 2004, there was a significant spike in subsistence halibut harvests. In that year, an estimated 18,914 pounds were harvested on 44 SHARC despite permit activity remaining relatively unchanged in the shouldering years. In years for which data were reported by ADF&G between 2000 and 2010, an estimated total of 97 sea otters, 16 Steller sea lions, and 301 harbor seals were harvested. Sea otter harvests peaked in 2010 at an estimated 32 otters, while harbor seal harvests peaked in 2005 through 2007 at an estimated 77 seal in each of those years. However, it should be noted that years which reflect consecutive estimates may represent estimates which were carried over from the original year. This was done in the event that there was a gap in the data. This should be considered when calculating total Steller sea lion and harbor seal harvests (Table 15).

The ADF&G Division of Subsistence reported that the following species of marine invertebrates were used for subsistence in Port Graham during this period: black (small) chitons, butter clams, Dungeness crab, king crab, limpets, octopus, Pacific littleneck clams (steamers), razor clams, sea urchin, snails, Tanner crab, unknown king crab, unknown mussels, and unknown Tanner crab. Marine mammals reported as harvested for subsistence use included harbor seal and Steller sea lion. Non-salmon fish reported as harvested for subsistence use included: black rockfish, Dolly Varden, herring, lake trout, lingcod, Pacific cod, rainbow trout, red rockfish, sablefish (black cod), starry flounder, steelhead, unknown rockfish, unknown shark, unknown sole, unknown trout, and walleye pollock.⁵⁶⁷

Regional Introduction: Aleutian and Pribilof Islands

Communities

Adak

Akutan

Atka

Cold Bay

False Pass

King Cove

Nelson Lagoon

Nikolski

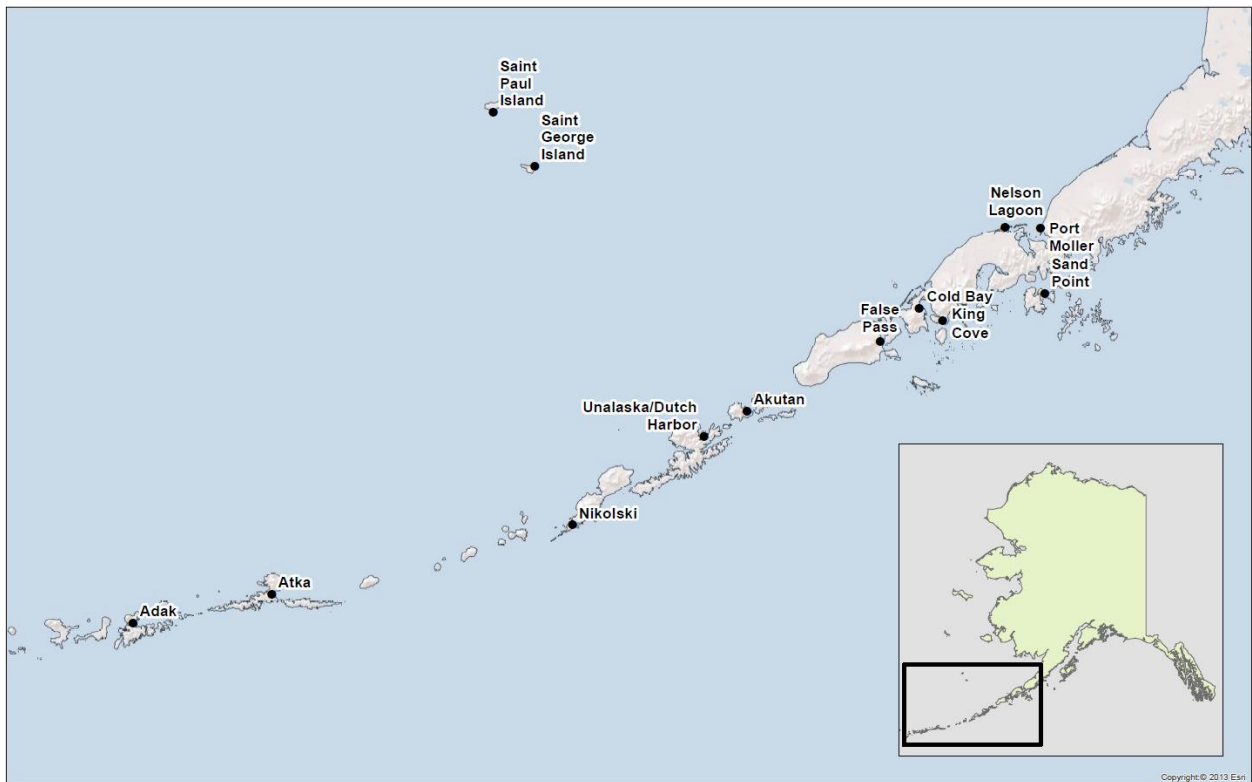

Port Moller

Saint George

Saint Paul

Sand Point

Unalaska/Dutch Harbor

People and Place

Location

The Aleutian Island chain stretches approximately 1,200 miles southwest from the end of the Alaska Peninsula at False Pass, toward the Kamchatka Peninsula in Russia. The chain itself consists of 14 large volcanic islands and 55 smaller ones located between 51° and 55° N latitude and 172° E and 163° W longitude. A total of 13 communities were selected to be profiled from this region, all of which are located within either the Aleutians East Borough or the Aleutians West Census Area. Saint George and Saint Paul are located within the Pribilof Island group, 200 miles north of Unalaska.

Demographic Profile

Of the 13 communities profiled, only 4 had populations exceeding 500 residents as of 2010. In that year, the total regional population was 8,498; 51.5% of which lived in Unalaska/Dutch Harbor. However, it should be noted that 2010 Census figures are misleading as seasonal seafood processor employees were tallied for the communities of Unalaska and Akutan. In the case of Akutan, the inflated population figure is extremely misrepresentative of the total number of permanent residents.¹

Because of its robust seafood processing sector, the region has a highly diversified population in terms of race or ethnicity. In 2010, 23.1% of residents identified themselves as at least part American Indian or Alaska Native, 34.4% as at least part Asian, 31.3% as White, and 7.0% as at least part Black or African American. In addition, 13.1% identified themselves as Hispanic or Latino.² Again, those demographics may not have been representative of residents living in the region permanently.

The Aleutian and Pribilof Islands area is highly dependent on commercial fishing and seafood processing. Most economic activity comes from communities where large seafood processors are operating and/or commercial fishing fleets are staged. In larger fishing ports, most jobs are seasonal and are related to commercial fishing, fish processing, or support services. The communities of Atka, Nelson Lagoon, Saint George, and Saint Paul are largely dependent on subsistence activities to supplement limited wage employment opportunities. The community of Adak is somewhat unique in that it is in the process of reinventing its economy from a military installation to a more diversified transportation service and commercial fishing hub. In 2010, the overall regional per capita income was estimated at \$26,100, while the estimated median household income was \$63,646.³

History

There is evidence of human occupation of the Aleutian Islands dating back at least 8,000 to 9,000 years; however, it is believed that humans were populating the Americas at least 13,000 years ago during the end of the last glacial maximum. Archaeological sites dating back over 11,000 years have been found on Prince of Wales Island, lending evidence to a possible coastal migration route.⁴ Archaeological sites on Anangula Island, near Nikolski, are thought to be around 8,000 years old and are some of the earliest evidence of human occupation of the area.⁵

Russian ships first reached the Aleutians in 1741, lured by the abundance of fur bearing animals. During the beginning of Russian occupation, many social and cultural upheavals took place in the Aleutians, often to the detriment of the indigenous population. Many local inhabitants were placed into slavery, while most others feel victim to diseases brought from Europe.⁶

By the late eighteenth century, the Aleutians had for the most part been abandoned by Russians in favor of eastern trapping grounds. American influence in Alaska increased as people migrated northward; drawn by furs, fishing, and whaling. Unalaska and Dutch Harbor flourished in the 1880s as a coaling station and commercial trade center. The Gold Rush of the 1890s brought many ships to Dutch Harbor, lured by its position as a gateway to the gold fields of northwest Alaska. Many prospectors traveled through Dutch Harbor on their way to goldfields in Nome. By the turn of the twentieth century, several seafood processors may have been in operation processing herring, salmon, and whale meat.⁷

Interest in fishery resources of the Aleutians began to increase around 1950 with the harvesting and processing of halibut, salmon, and king crab. The growth of the king crab fishery in the early 1960s greatly improved local economic conditions. Today, the region is dependent mainly on commercial and subsistence fisheries tied to the Bering Sea, which is home to productive cod and crab fisheries.⁸

Natural Resources and Environment

The Aleutian and Pribilof Islands are located in Alaska's maritime climate zone, with winter temperatures ranging from 10 to 35° F and cool summers with temperatures from 45 to 65° F. Precipitation averages 20 to 25 inches annually. Wind and fog are frequent, and communities which face the Bering Sea experience average winds of 15 knots year-round, with severe winter storms bringing winds in excess of 100 miles per hour. The warm Japanese Current keeps Bering Sea ports ice-free during all seasons and contributes to one of the richest marine ecosystems on earth.

The Aleutian Range was formed by volcanic outpourings which began around sixty million years ago, and which have continued to shape the region since. Much of the eastern region of the Aleutians was glaciated during the last ice age, covering portions of Unimak and

⁸ Ibid.

Unalaska islands and leaving behind a layer of gravel moraine and till in some areas. Overall, subsurface geology consists of volcanic basalts and lahar deposits. Soil is generally thin and unproductive. Topography is characterized by moderate relief alpine tundra and flat coastal meadows.⁹ Much of the region is covered by the Alaska Maritime National Wildlife Refuge (AMNWR), which covers approximately 3.4 million acres.¹⁰

There are no terrestrial mammals endemic to AMNWR, although foxes, rats, caribou, cattle, and ground squirrels have been introduced. Marine mammals include sea otter, Steller sea lion, northern fur seal, harbor seal, walrus, and beluga, blue, bowhead, gray, humpback, and killer whales. Marine fish include lampreys, mackerel sharks, skates, all five species of Pacific salmon, Dolly Varden, smelts, toothed cod, Pacific cod, walleye pollock, stickleback, rockfish, sablefish, greenling, mackerel, sculpin, Pacific halibut, sole, and flounder. Marine invertebrates include king, Tanner and Dungeness crab, shrimp, scallop, razor clam, and hardshell clam. Finally, AMNWR provides critical birding habitat for approximately 40 million seabirds.¹¹

Governance

The Aleutian and Pribilof Islands region is comprised of one borough and one census area. The Aleutians East Borough seat is located in Sandpoint, a city of 976 residents and the largest within the Borough. In 2010, the Aleutians East Borough administered at 2% raw fish tax, and took in \$6.4 million in total revenue.¹² The Aleut Corporation is the regional Alaska Native Claims Settlement Act (ANCSA) chartered for-profit corporation with 66,000 acres of surface and 1.57 million acres of subsurface land holdings. Unalaska is the largest city in the Aleutian and Pribilof Islands region as well as the economic center. The city is the western-most container terminal in the United States and a regional shipping hub.¹³

The Aleutian Pribilof Island Community Development Association is the regional Community Development Quota (CDQ) group that operates in the region. CDQ groups distribute a portion of commercial fishing proceeds to their various communities and sponsor economic and infrastructural development. Most communities in this region are not eligible to participate in the Community Quota Entity (CQE) program given their geographic location outside of the Gulf of Alaska. However, one entity has been formed. Aleutia Incorporated is the CQE representing Sand Point. CQE groups are eligible to purchase fishing quota share on behalf of residents of their respective communities.

In addition, there are a number of ANCSA chartered village corporations and Indian Reorganization Act recognized tribal governments.

Involvement in North Pacific Fisheries

Shoreside seafood processing plants are located in Adak, Akutan, Atka, False Pass, King Cove, Port Moller, Saint Paul, Sand Point, and Dutch Harbor (Unalaska).¹⁴ Dutch Harbor is a base of operation for approximately 300 licensed vessels that fish within the Bering Sea.¹⁵ Target species for the commercial fleet include pollock, Pacific cod, halibut, mackerel, sole, rockfish, herring Pacific salmon, and crab.^{16,17}

In 2010, over 1.1 billion pounds of seafood was landed at Aleutian/Pribilof communities, accounting for roughly a quarter of total landings made in Alaska that year. Pollock accounted for most landings in 2010, at 846.6 million pounds of total. Pacific cod accounted for 149.8 million pounds, and the two species combined made up approximately 91% of total landings in the region.¹⁸ Aleutian and Pribilof Islands residents held 7.9 million shares of halibut quota, 1.1 million shares of sablefish quota, and 46.4 million shares of crab quota in 2010.¹⁹

Sportfishing is limited compared to other parts of Alaska. Most recreational fishing takes place in marine waters or on various drainages found throughout the islands. Most sportfishing activity is based out of Unalaska where 1,163 of the region's 1,405 sportfishing licenses were sold in 2010. In that year, residents held 762 sportfishing licenses.²⁰ Popular species targeted by recreational anglers include greenling, black bass, halibut, Pacific cod, flounder, Dolly Varden, and all five species of Pacific salmon.^{21,22}

Subsistence fishing and hunting form a major part of residents' livelihoods, especially in communities that are dependent on subsistence resources to supplement their incomes and diet. Common subsistence species include halibut, Pacific cod, salmon, rockfish, sculpin, greenling, flatfish, king and Tanner crab, razor clams, butter clams, chitons, limpets, mussels, and

octopus.²³ In 2008, residents reported harvesting 133,671 lbs of salmon, of which approximately 76% were sockeye. Chinook salmon also made up a significant portion of salmon harvested at 11% of fish reported. Sockeye salmon were the most frequently harvested species of Pacific salmon, accounting for 8,285 of the reported 15,751 salmon harvested in 2008.²⁴ In 2008, an estimated 61,473 pounds of halibut was harvested by Aleutian and Pribilof Island residents. In that year, residents of Sand Point harvested more than any other community with an estimated 25,013 pounds.²⁵ Marine mammals harvested by residents include Steller sea lions, harbor seals, sea otters, and walrus.^{26,27}

Regional Challenges

The region's heavy dependence on commercial fishing often places communities at the whim of ever-changing market conditions and management regimes. According to community surveys administered by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, several communities throughout the region expressed frustration over Pacific cod and Atka mackerel closures in the Western Aleutians resulting from depressed Steller sea lion populations. Measures limiting bycatch are also seen as overly restrictive by several communities. As with many remote areas of Alaska, developing fishery-related infrastructure can be cost prohibitive in many situations, as is being experienced in Adak.

If current trends continue, the potential opening of a seasonal shipping route through the Arctic could create unique challenges as well as opportunities for communities in the Aleutian and Pribilof Islands. As Arctic sea ice retreats as a result of climate change, there is the potential for seasonal shipping routes to open, subsequently connecting the Aleutian Islands with ports in New York, Europe, and Russia. It is believed that these theoretical routes can reduce shipping times significantly, and could allow Aleutian ports to become major transportation hubs.^{28,29}

Adak (A-dack)

People and Place

*Location*³⁰

Adak is located on Kuluk Bay on Adak Island. It lies 1,300 mi southwest of Anchorage and 350 mi west of Unalaska in the Aleutian Island Chain. Flight time to Anchorage is 3 hours. Adak is the southern-most community in Alaska, on the latitude of Vancouver Island in Canada. The area encompasses 122.4 sq mi of land and 4.9 sq mi of water. Adak was incorporated as a city in 2001, is located in the Aleutians West Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*³¹

In 2010, there were 326 residents living in Adak, which ranked the community 156th of 352 Alaska communities in terms of population size. Between 1990 and 2010, the population declined by 93.0%. Between 2000 and 2009, the population declined by 47.8% with an average annual growth rate of 8.1% which was much higher than the statewide average of 0.75% and indicative of a significantly variable population. Information regarding population trends can be found in Table 1.

In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that the permanent population in Adak was estimated to be between 120 to 140 residents. Typically there are seasonal residents living in Adak from January through April as well as June through October. Peaks in population seen in July and January through April are entirely attributed to employment in fisheries sectors.

Adak's racial and ethnic composition was relatively mixed in 2010. In that year, 52.5% of residents identified themselves as Asian, compared to 9.8% in 2000; 19.6% identified themselves as White, compared to 49.7% in 2000; 10.7% identified themselves as two or more races, compared to 2.2% in 2000; 5.5% identified themselves as American Indian or Alaska Native, compared to 35.1% in 2000; 4.0% identified themselves as Black or African American, compared to 1.3% in 2000; 1.5% identified themselves as Native Hawaiian or Other Pacific Islander, compared to 1.9% in 2000; and 6.1% identified themselves as some other race, compared to 0% in 2000. In addition, 8.9% of residents identified themselves as Hispanic of Latino in 2010, compared to 5.1% in 2000. Information regarding racial and ethnic trends can be found in Figure 1.

Although unconfirmed, it is highly likely that the 2010 U.S. Census captured a large population of seasonal workers. This would explain the significant variation in racial

³⁰ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

composition between 2000 and 2010, and the discrepancy between 2010 Census population figures and local and state estimates. Locally, more of the population is identified as White, with American Indian or Alaska Native residents comprising the second largest racial or ethnic group.

The average household size in 2010 was 2.48, compared to 3.10 in 1990 and 1.99 in 2000. In that year there were a total of 500 housing units, compared to 1,051 in 1990 and 884 in 2000. Of the households surveyed in 2010, 6% were owner-occupied, compared to 0% in 2000; 3% were renter-occupied, compared to 18% in 2000; 85% were vacant, compared to 81% in 2000; and 7% were occupied seasonally, compared to 1% in 2000.

Table 1. Population in Adak from 1990 to 2010 By Source.

Figure 1. Racial And Ethnic Composition, Adak: 2000-2010 (U.S. Census).

The gender distribution in 2010 was moderately skewed at 61.0% male and 39.0% female. This was significantly more skewed than the distribution statewide (52.0% male, 48.0% female), and somewhat less skewed than the distribution in 2000 (64.9% male, 35.1% female). The median age in 2010 was 45.5 years, which was significantly older than the statewide median of 33.8 years and 2000 median of 35.2 years. Gender distribution by age cohort was more even in 2010 than in 2000, with male biases among most age ranges. In that year, the greatest absolute gender difference occurred within the 50 to 59 range (15.4% male, 6.7% female), followed by the 60 to 69 (10.7% male, 4.3% female) and 40 to 49 (12.6% male, 9.5% female) ranges. Of those three, the greatest relative gender difference occurred in the 60 to 69 range.

Compared with the year 2000, the population structure was less expansive in 2010, with older cohorts showing age transitions consistent with a stable population; meaning that overall, older cohorts appeared to age with little attrition compared with younger cohorts. In 2010, 11.0% of residents were under the age of 20, compared to 20.6% in 2000; 16.5% were over the age of 59, compared to 3.7% in 2000; 60.1% were between the ages of 30 and 59, compared to 58.9% in 2000; and 12.3% were between the ages of 20 and 29, compared to 16.8% in 2000. It should be noted that seasonal workers captured in the 2010 Census may have affected Adak’s population structure. Because of this, determining a trend may be difficult. Information regarding population structure can be found in Figure 2.

Figure 2. Population Age Structure in Adak Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)³² estimated that 97.6% of residents aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 2.4% had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; and estimated 46.3% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; an estimated 2.4% held an Associate's degree, compared to an estimated 8.0% of Alaskan residents overall; an estimated 7.3% held a Bachelor's degree, compared to an estimated 17.4% of Alaskan residents overall; and an estimated 12.2% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

*History, Traditional Knowledge, and Culture*³³

There is evidence of human occupation of the Aleutian Islands dating back at least 8,000 years; however, it is believed that humans were populating the Americas at least 13,000 years

³² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³³ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

ago during the end of the last glacial maximum. Archaeological sites dating back over 11,000 years have been found on Prince of Wales Island, lending evidence to a possible coastal migration route.³⁴ Archaeological evidence in the vicinity of Clam Lagoon shows that confirmed occupation of Adak Island dates back approximately 6,000 years.³⁵

The island was abandoned in the early 17th Century when Aleut hunters moved or were forced eastward because of the Russian fur trade. The Native people continued to use the island as a place to fish and hunt until the beginning of World War II. The island had been designated in 1913 as part of the Aleutian Island Reservation, but in the 1940's became "a key operations and supply location for United States military forces after the Japanese occupation of Kiska and Attu Islands during World War II". Adak's population in the spring of 1944 was made up of at least 32,000 military personnel, peaking at approximately 90,000 during the early staging periods of the war. After World War II, Adak was developed into a Naval Air Station and played an important role during the Cold War as a submarine surveillance center. The navy base housed 6,000 personnel and their families during its peak, but harsh cut-backs occurred in 1994 and navy family housing and schools were closed. Adak Naval Station officially closed on March 31, 1997. Aleut Corporation acquired the majority of Adak's facilities in 2004 in a land transfer agreement and in 1998 about 30 families with children (mostly Aleut Corp. shareholders) relocated to Adak.³⁶

Natural Resources and Environment³⁷

Located in Alaska's maritime climate zone, Adak's weather is characterized by frequent and intense storms in the winter and extensive fog in the summer. Temperatures average from 20 °F (-7 °C) to 60 °F (16 °C). Total precipitation is 64 inches annually, with an average accumulated snowfall of 100 inches, primarily in the mountains.

Adak Island is located in the Alaska Maritime National Wildlife Refuge (AMNWR), which includes over 3,000 islands, islets, rocks, pinnacles, and headlands covering 3.4 million acres. Subsurface geology on Adak Island consists primarily of volcanic basalts and lahar deposits. Soils are generally thin, and there is evidence of Holocene age moraine deposits.³⁸ Much of Adak's local topography is characterized by steep to moderate relief alpine tundra. Coastal regions consist of lowland tundra and meadows. Vegetation includes grasses, sedges, lichens, mosses, wildflowers, and heath plants.³⁹ Trees are few in number and limited to introduced spruce.

There are no terrestrial mammals endemic to AMNWR although foxes, rats, caribou, cattle, and ground squirrels have been introduced. Marine mammals include sea otter, Steller sea lion, northern fur seal, harbor seal, walrus, and beluga, blue, bowhead, gray, humpback, and orca whales. Marine fish include lampreys, mackerel sharks, skates, all five species of Pacific salmon, Dolly Varden, smelts, toothed cod, Pacific cod, walleye pollock, stickleback, rockfish, sablefish, greenling, mackerel, sculpin, Pacific halibut, sole, and flounder. Marine invertebrates include king, Tanner and Dungeness crab, shrimp, scallop, razor clam, and hardshell clam. Finally, AMNWR provides critical birding habitat for approximately 40 million seabirds.⁴⁰

Although Adak does not have a hazard mitigation plan, the Aleutians East Borough identified several natural hazards with the potential to impact Aleutian communities, including volcanic eruptions, earthquakes, coastal flooding and erosion, ground failure, tsunami, and extreme weather. All of these hazards have records of occurrence in the area and have a high potential for future occurrence.⁴¹

Since the closure of the Adak Naval Station in 1997, the U.S. Navy and U.S. Environmental Protection Agency has been performing Superfund clean-up and restoration of Adak. Contamination was the result of hazardous substances including PCBs (polychlorinated biphenyl), petroleum, chlorinated solvents, and contaminants sourced from discarded batteries that were released over a 40-year period during base operation.⁴² Site cleanup was still in progress as of 2010.⁴³

Current Economy⁴⁴

Adak provides a fueling port and crew transfer facility for foreign fishing fleets, and an airport, dock, housing facilities, restaurant, grocery store, and ship supply store are available. Adak has a shore-based processing plant capable of processing more than 500,000 lbs of fish per day.^{45,46} However, the plant closed in 2013 because of concerns over the viability of the Aleutian Pacific cod resource.⁴⁷ A land exchange between Aleut Corp., the U.S. Navy, and the Department of the Interior has transferred most of the naval facilities to the Aleut Corporation. A portion of the island remains within the AMNWR, managed by the U.S. Fish & Wildlife Service. A portion of northern Adak Island is still held by the U.S. Navy. In a survey conducted by the AFSC in 2011, community leaders reported that Adak's economy is reliant on fishing, fuel sales (predominately related to fishing), ecotourism, sportfishing and hunting, and historical tourism. Top employers⁴⁸ in 2010 included: Adak Seafoods LLC, City of Adak, Adak Petroleum LLC, Lakloey Inc., Eastern Aleutian Tribes Inc., State of Alaska, TDX Adak Generating LLC, Adak General Store LLC, the Aleutian Region School District, and Adak Eagle Enterprises.

According to the 2006-10 ACS,⁴⁹ the estimated per capita income was \$36,947 and the estimated median household income was \$75,417, compared to \$31,747 and \$52,727 in 2000, respectively. However, after adjusting for inflation by converting 2000 values into 2010 dollars,⁵⁰ the real per capita income (\$41,747) and real median household income (\$69,335) indicate that individual earnings declined while household earnings increased. In that year, Adak ranked 22nd of 305 communities from which per capita income was estimated, and 33rd of 299 communities from which median household income was estimated.

It should be noted that Adak's small population size may have prevented the ACS from accurately portraying economic conditions. Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database, total wages based on state and private employers in 2010 was \$1.60 million.⁵¹ When compared with the 2010 Census population, the per capita income equals \$4,921, indicating an extreme decrease compared to per capita income values reported by the U.S. Census in 2000.⁵²

⁴⁴ Unless otherwise noted, all monetary data are reported in nominal values.

⁴⁵ Personal correspondence.

⁴⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁵⁰ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁵¹ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

⁵² Alaska Department of Labor and Workforce Development (n.d.). Alaska Local and Regional Information Database. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

According to 2006-2010 ACS estimates, 90.9% of residents aged 16 and older were part of the civilian labor force. Between 2006 and 2010, unemployment was estimated at 2.3%, compared to an estimated 5.9% statewide. In addition, 1.7% of residents were estimated to be living below the poverty line, compared to an estimated 9.5% of Alaskan residents overall. However, ALARI estimates 22.6% unemployment.⁵³ Of those employed between 2006 and 2010, an estimated 74.4% worked in the private sector and 25.6% worked in the public sector.

By industry, Adak's economy was relatively diverse between in 2010. In that year, most (17.9%) employed residents were estimated to work in information sectors; followed by construction sectors (15.4%); education service, health care, and social assistance sectors (12.8%); and arts, entertainment, recreation, accommodations, and food service sectors (12.8%) (Figure 3). By occupation type, most (41.0%) employed residents were estimated to hold natural resources, construction, or maintenance positions; followed by management or professional positions (17.9%); production, transportation, or material moving positions (17.9%); sales or office positions (12.8%); and service positions (10.3%) (Figure 4). Overall, there was significant variation in industry sector representation between 2000 and 2010. There were notable declines in the proportion of residents employed in professional, scientific, management, administrative, waste management, and retail trade sectors. Conversely there were notable increases in construction, information, education services, health care, social assistance, arts, entertainment, recreation, accommodations, and food service sectors. While this may be attributed to shifts in economic regimes, ACS sampling methods may not have captured accurate conditions. According to 2010 ALARI estimates,⁵⁴ 15.0% if residents worked in construction sectors; 2.5% worked in manufacturing sectors; 25.0% worked in trade, transportation, and utilities sectors; 2.5% worked in information sectors; 2.5% worked in financial service sectors; 7.5% worked in education and health service sectors; 2.5% worked in leisure and hospitality sectors; 7.5% worked in state government; 20.0% worked in local government; and 15.0% worked in undetermined sectors.

Finally, it should be noted that no individuals characterized themselves as working in natural resource based industries, which includes fishing, in 2010. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

⁵³ See footnote 48.

⁵⁴ Ibid.

Figure 4. Local Employment by Occupation in 2000-2010, Adak (U.S. Census).

Governance

The City of Adak has a manager form of government which includes a mayor (elected from the council), a seven-member city council, and eight municipal employees, including a City Manager. The City is not part of an organized borough.

Adak was not included in Alaska Native Claims Settlement Act (ANCSA) and is not federally recognized as a Native village. However, the Aleut Corporation has taken a very active role in the development of the city in tandem with the City government, taking over

responsibilities of almost all services to the community, the ownership of a large amount of the land, and taking action to bring new businesses to the community.

The closest Bureau of Citizenship and Immigration Services office, National Marine Fisheries Service (NMFS) office, Office of Sustainable Fisheries, and Alaska Department of Fish and Game (ADF&G) office are all located in Dutch Harbor, 350 mi east.

Adak administers a 4% sales tax, and 5% transient lodging tax. The total municipal budget in 2010 was \$877,545, compared to \$594,420 in 2002. Total municipal revenues peaked in 2004 at \$1.63 million. Sales tax accounted for 25.1% of total municipal revenues in 2010, compared to 73.6% in 2002. In addition, State allocated Community Revenue Sharing accounted for 7.4% of total municipal revenues that year, compared to 2.0% in 2003 when the State Revenue Sharing program was still active. State and federal fisheries-related grants awarded to Adak between 2000 and 2010 include \$7.1 million in harbor projects, \$5.7 million in small vessel harbor projects, and \$300,000 for port improvement projects. Information regarding municipal finances can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Adak from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	n/a	n/a	n/a	n/a
2001	n/a	n/a	n/a	n/a
2002	\$594,420	\$571,978	n/a	\$300,000
2003	\$3,198,200	\$570,978	\$30,245	n/a
2004	\$2,511,256	\$660,000	n/a	\$2,428,530
2005	\$2,628,478	\$632,817	n/a	\$3,328,530
2006	\$2,857,315	\$660,000	n/a	\$2,000,000

Infrastructure

*Connectivity and Transportation*⁵⁵

Adak is only accessible by air or by sea. Alaska Airlines provides twice weekly non-stop service from Anchorage. The price of a roundtrip flight between Anchorage and Adak in June, 2012 was \$1,198.00.⁵⁶ Along with fishing and cargo vessels, Adak also provides services to various personal craft. Peak visits of these vessels typically coincide with the tourism season. Shortened periods of sea-ice cover in the Arctic associated with climate change have increased the possibility that a seasonal northern shipping route might open in the future. Adak hopes that if trends continue, the community can grow as an international shipping hub connecting Europe and the Eastern United States with Asian markets.⁵⁷

Facilities

The city operates water, sewer, and landfill services. Water is derived from Lake Bonnie Rose, Lake De Marie, and Nurses Creek, stored in any of the four water tanks throughout the community, and piped to facilities and housing units. The wastewater treatment system discharges through a marine outfall line to Kuluk Bay. Husky Road landfill is class III permitted. Aleut Corporation (Adak Petroleum) owns nine fuel storage tanks with the combined capacity of 22 million gallons. Accommodations include Aleut Real Estate (D/B/A Adak Island Inn) and Little Michaels Lodges. Public safety is provided by City Public Safety, and Alaska state troopers based in King Salmon. Fire and rescue services are provided by Adak Volunteer Fire Department and supported by the State of Alaska Airport. Additional public facilities include a City Hall with gymnasium, Olympic size swimming pool, community center, weight room, and racquetball court. Communication services include local and long distance telephone, internet, cellular services, and local and cable television.⁵⁸

In a survey conducted by the AFSC in 2011, community leaders reported on completed and in progress infrastructure projects. These projects included broadband internet access, warehouse facilities, cable television, and improvements to current water and sewer systems, water treatment, community center, public safety, emergency response systems, fire department, school, and telephone services. Projects planned for completion within 10 years included sewage treatment, new landfill, and airport updates (glideslope antennae). Port facilities completed or in progress included fish cleaning stations, dockside electricity and water, harbor dredging, dock structure improvements, pilings, and a barge landing area. Port facility projects planned for completion within 10 years included electrical system upgrades and replacement, hydroelectricity, new dock space, additional dock improvements, additional pilings, additional harbor dredging, dry dock space, haul-out facilities, completion of a small boat harbor, and an EPA-certified cleaning station.

Services supporting the fisheries sector include processing plants, boat welding services, small vessel haulout facilities, commercial and recreational vessel moorage, tackle and bait sales, commercial cold storage, drydock, fish lodges, fishing related bookkeeping, fishing gear storage, and ice sales. Fisheries related businesses and services include fish processing, vessel repair (welding), small vessel (<60 ft) haulout facilities, commercial fishing vessel moorage, recreation vessel moorage, tackle sales, bait sales, commercial cold storage, drydock storage, fish lodges, vessel fuel sales, fishing gear storage, and ice sales. Additional businesses include a United Parcel Service (UPS) station, post office, housing rentals, grocery store, liquor store, vehicle rentals, bar and grill, food bank, and marine logistics. Residents typically travel to Unalaska, King Cove, Sandpoint, Anchorage, or Seattle for services not available locally.

As of 2010, Adak was capable of handling vessels of all sizes, including rescue vessels, cruise ships, ferries, fuel barges, cargo vessels, barges, and vessels containing hazardous materials. Between 2005 and 2010, community leaders noticed that there were a significant reduction in the number of visits by charter boats, commercial fishing boats, vessels between 35 and 125 ft, and vessels over 125 ft. In addition, there was an increase in the number of visits by private pleasure boats, and no change in the number of visits by vessels under 35 ft.

*Medical Services*⁵⁹

Health care is provided by the Adak Community Health Center, operated by Eastern Aleutian Tribes. Adak Community Health Center is a qualified Emergency Care Center and Primary Health Care facility. The clinic is staffed by a physician's assistant and Community Health Aide/Practitioner(s) who provide emergency care family practice and referral services. Lab, pharmacy, behavioral health, and public health services are available. Adak is an isolated town/sub-regional center located in the Southern EMS (Emergency Medical Services) Region. Emergency Services have coastal and airport access to Adak. Alternate health care is provided through the City via the Adak Volunteer Fire Department.

*Educational Opportunities*⁶⁰

The Adak Public School offers preschool through 12th grade instruction. As of 2011, there were 20 students enrolled with 2 teachers and 3 teacher aides employed.

Involvement in North Pacific Fisheries

*History and Evolution of Fisheries*⁶¹

The Aleuts of the region were the first to be involved in North Pacific fisheries through their participation in subsistence activities. Historically, salmon, cod, herring, and other fish were targeted throughout the Aleutian chain. Subsistence fish stocks were more abundant in the

⁵⁹ Ibid.

⁶⁰ Alaska Department of Education and Early Development. (2012). *Statistics and Reports*. Retrieved April 24, 2012 from <http://eed.alaska.gov/stats/>.

⁶¹ Atkinson, C.E. (n.d.). A Brief Review of the Salmon Fishery in the Aleutian Islands Region. Retrieved May 20, 2012 from: [http://www.npafc.org/new/inpfc/INPFC%20Bulletin/Bull%20No.1/Bull1%20p93-104%20\(Atkinson\).pdf](http://www.npafc.org/new/inpfc/INPFC%20Bulletin/Bull%20No.1/Bull1%20p93-104%20(Atkinson).pdf).

eastern part of the Aleutians, and became less abundant further to the west. Subsistence fishing was typically done by beach seines and hooks.

Previous to Alaska's purchase in 1867, American schooners were fishing for cod in the Aleutian Islands and Okhotsk Sea regions. By the end of the nineteenth century, salmon canneries were being established in western Alaska and on the eastern portion of the Alaska Peninsula. No large-scale commercial seafood processing operation was undertaken in the Aleutian area during those years however. In 1916, Pacific American Fisheries, Inc. established a cannery at Makushin Bay, Unalaska. In those days, adverse weather conditions typically kept the small seine fleet close to Unalaska and Umnak islands.

Following the 1924 White Act, newly protected fisheries began to proliferate throughout the Aleutian region. The implementation of a 1928 Executive Order removed Akun, Akutan, Tigalda, Umnak, and Unalaska Islands from an earlier established wildlife reserve, opening up further opportunities.

The International Packing Company fished the Aleutian area between 1924 and 1942 and operated a floating processor in the region through 1941. Pink, sockeye, and chum salmon were popular species.

Although historically not a fishing community, the cessation of military operations in Adak led to economic diversification which included an increase in commercial, recreational, and subsistence fishing participation. As of 2010, several residents held commercial fishing permits, and Adak Seafood LLC operated a seafood processing plant (see *Commercial Fishing* section below).

In a survey conducted by the AFSC in 2011, community leaders reported that community representatives participate in North Pacific Fishery Management Council as well as Federal Subsistence Board/Federal Subsistence Regional Advisory Council processes. The community is located in Federal Reporting Area 541, International Pacific Halibut Commission (IPHC) Regulatory Area 4B, and the Aleutian Islands Sablefish Regulatory District. Adak is eligible for participation in the Community Quota Entity (CQE) program and is represented by the Adak Community Development Corporation. The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, an unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.⁶²

⁶² North Pacific Fishery Management Council (2010). *Review of the Community Quota Entity (CQE) Program under the Halibut/Sablefish IFQ Program*. Retrieved October 23, 2012 from: <http://www.fakr.noaa.gov/npfmc/PDFdocuments/halibut/CQEreport210.pdf>.

Processing Plants

After Adak Seafoods LLC closed in 2011, Icicle Seafoods took over on-shore seafood processing in Adak. Cod is the principal species purchased, and product is processed, frozen, and distributed globally.⁶³ In addition to cod, Icicle Seafoods processed halibut and crab during its cod season. In 2013, Icicle announced that it would cease operations in Adak due to economic uncertainty.

Fisheries-Related Revenue

In 2010, Adak received fisheries-related revenue from Shared Fisheries Business Taxes, Fisheries Resource Landing Taxes, fuel transfer taxes, bulk fuel transfer fees, and harbor usage fees. In that year, revenues totaled \$314,200, compared to \$56,600 in 2002. Fisheries-related revenue peaked in 2010 at \$749,058. It should be noted that based on figures given in Table 3, a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the reported municipal budget. Information regarding fisheries-related revenue trends can be found in Table 3.

In a survey conducted by the AFSC in 2011, community leaders reported fisheries-related taxes and fees are put towards harbor maintenance, emergency response services, water and wastewater systems, and public safety services.

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that commercial vessels ranging 35 to over 125 feet use Adak as a base of operation during fishing seasons (generally January through November depending on species). Gear types being used include trawl, pots, longlines, jigs, and circle hooks.

In 2010, three residents, or 1% of the population, held 10 permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, four residents held seven CFEC permits. Of the permits held in 2010, 10% were for salmon, compared to 0% in 2000; 40% were for groundfish, compared to 100% in 2000; 20% were for sablefish, compared to 0% in 2000; and 30% were for halibut, compared to 0% in 2000. In addition, two residents held Federal Fisheries Permits (FFP) and three residents held three License Limitation Program (LLP) groundfish permits. Residents held 288,494 shares of halibut quota on two accounts in 2010, compared to 0 in 2000; and 451,426 shares sablefish quota on one account, compared to 0 in 2000. No residents held crab quota between when the program began in 2005 and 2010.

Nine residents held commercial crew licenses in 2010, compared to two in 2000. In addition, residents held majority ownership of two vessels that year, compared to four in 2000. Of the CFEC permits held in 2010, 50% were actively fished, compared to 86% in 2000. This varied by fishery from 67% of halibut permits, to 50% of both sablefish and groundfish permits

⁶³ Icicle Seafoods, Inc. (n.d.). *Adak*. Retrieved November 13, 2012 from: <http://www.icicleseafoods.com/locations/adk/>.

and 0% of salmon permits. Fisheries prosecuted by Adak residents in 2010 included: statewide longline halibut and statewide longline miscellaneous saltwater finfish.⁶⁴

In 2010, 800,992 lbs of fish valued at \$583,005 ex-vessel were landed in Adak, compared to 11.16 million lbs valued at \$12.44 million landed in 2000. In that year, Adak ranked 40th of 67 communities in terms of total lbs landed and 42nd in terms of ex-vessel revenue from landings. By species type, 2010 landings are considered confidential with the exception of halibut, which totaled 100,103 lbs and was valued at \$399,256 ex-vessel. All landings reported by residents of Adak are considered confidential for 2010. Information regarding commercial fishing trends can be found in Table 4 through 10.

Recreational Fishing

Recreational fishing is limited in Adak due to its remote location. Several sport fish guide businesses operated locally between 2000 and 2008; however, as of 2010 there were none registered. Also in that year, residents were sold 27 sportfishing licenses, compared to 68 in 2000. No sportfishing licenses were sold in the community between 2000 and 2010.

Adak is located within the Alaska Peninsula and Aleutian Islands ADF&G Harvest Survey Area which includes all Alaskan waters, including drainages, between Cape Douglas and the community of Naknek. In 2010, angler days fished totaled 5,297 for saltwater fisheries and 33,635 for freshwater fisheries. In that year, non-Alaska resident anglers accounted for 38.4% of saltwater and 58.4% of freshwater angler days fished, compared to 15.8% and 39.5% in 2000, respectively. According to ADF&G Harvest Survey data,⁶⁵ local private anglers target coho salmon, Pacific halibut, and Pacific cod. In a survey conducted by the AFSC in 2011, community leaders reported that recreational fishers target pink, Chinook, coho, and sockeye salmon, halibut, crab, sablefish, clams, mussels, Dolly Varden, and flounder. No kept/released charter information is available for Adak. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Subsistence is an important part of Adak's economy. In 2007, Adak's status as a federally recognized rural place was revised, and the community became eligible to participate in the Federal Subsistence program on Federal public lands.⁶⁶ According to a survey conducted by the AFSC in 2011, community leaders reported salmon, halibut, crab, seal, sea lion, duck, and geese as important subsistence resources.

Information on subsistence participation is limited, and data on participation by household is unavailable. Of the species listed by ADF&G in Table 13, sockeye salmon were harvested the most often. In 2008, residents reported harvesting 369 salmon, compared to 346 in 2000. Reported salmon harvests peaked in 2001 at 479 fish. In 2009, 26 residents held Subsistence Halibut Registration Certificates, compared to six in 2003. In that year an estimated 377 lbs of halibut was harvested on four SHARC cards, compared to an estimated 687 harvested on six in 2003. Estimated halibut harvests peaked in 2008 at 3,058 lbs harvested on 12 SHARC cards. Between 2000 and 2008, an estimated seven sea otters were harvested. In addition, an estimated 11 sea lions and 22 harbor seals were harvested in those years. Information regarding subsistence trends can be found in Tables 12 through 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders reported that commercial fishing restrictions prompted by measures to protect western Steller sea lion populations, attempts to keep fisheries open, opening a new fish plant, a lack of essential services, and a lack of support businesses are challenges to Adak’s fisheries economy. Negative effects that fisheries management or policies have had on Adak include “Olympic-style” fishing, low processing capacity, a struggling business sector, declines in fish tax revenues, population declines, and unemployment. Positive effects that fisheries management or policies have had on Adak include Adak specific quota and small boat fisheries. Community leaders expressed that Steller sea lion restrictions deter potential growth and increase the cost of living and doing business in Adak.

In addition, Adak continues to face challenges regarding funding for fishery infrastructure and service projects. Community leaders noted a downward trend in vessel visitations and home-porting which has put strain on local revenues and the fishing industry.

Akutan (ACK-oo-tan)

People and Place

*Location*⁶⁷

Akutan is located on Akutan Island in the eastern Aleutians, one of the Krenitzin Islands of the Fox Island group. It is 35 mi east of Unalaska and 766 mi southwest of Anchorage. The area occupies 14.0 sq mi of land and 4.9 sq mi of water. The community was incorporated as a Second-class city in 1979 and is under the jurisdiction of the Aleutians East Borough.

*Demographic Profile*⁶⁸

As of 2010, there were 1,027 residents, ranking Akutan 64th of 355 Alaskan communities in terms of population size (this population count captured a large number of non-permanent residents). Between 1990 and 2010, the population grew by 74.4%. Between 2000 and 2009, the population grew by 18.7% with an average annual growth rate of 0.61%, which was similar to the statewide average of 0.75% and reflective of the small increases and declines in population over time. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there were an estimated 85 permanent and 900 seasonal residents living in Akutan in 2010. Seasonal workers typically live in Akutan from January through April with the population peaking in May. Peaks in Akutan's population are mostly driven by seasonal employment in fisheries sectors. Information regarding population trends can be found in Table 1.

Akutan was a racially and ethnically diverse community in 2010. In that year, 43.3% of residents identified themselves as Asian, compared to 38.6% in 2000; 23.3% identified themselves as White, compared to 23.6% in 2000; 17.9% identified themselves as Black or African American, compared to 2.1% in 2000; 5.5% identified themselves as American Indian or Alaska Native, compared to 15.7% in 2000; 1.5% identified themselves as Native Hawaiian or Other Pacific Islander, compared to 0.3% in 2000; 4.7% identified themselves as two or more races, compared to 1.5% in 2000; and 3.9% identified themselves as some other race, compared to 18.2% in 2000. In addition, 20.8% of residents identified themselves as Hispanic or Latino, compared to 20.8% in 2000. Information regarding racial and ethnic trends can be found in Figure 1.

In 2010, the average household size was 2.25, compared to 2.80 in 1990 and 3.0 in 2000. Total housing units that year was 44, compared to 34 in 1990 and 38 in 2000. Of the households surveyed between in 2010, 30% were owner-occupied, compared to 74% in 2000, 61% were renter occupied, compared to 16% in 2000, 9% were vacant, compared to 11% in 2000, and no

houses were occupied seasonally. A total of 937 residents were living in group quarters, compared to 638 in 2000.

In 2010 the gender distribution of Akutan was heavily skewed towards males at 76.9% male and 23.1% female. This was similar to the gender distribution in 2000 (77.0% male, 23.0% female) and markedly more skewed than the distribution statewide (52.0% male, 48.0% female). The median age in 2010 was 44.1 years, which was older than both the Alaska median of 33.8 years and 2000 median of 40.2 years.

Figure 1. Racial and Ethnic Composition, Akutan: 2000-2010 (U.S. Census).

The population structure for both 2000 and 2010 was highly constrictive due to the seasonally based population. In 2010, 2.9% of residents were under the age of 20, compared to 5.4% in 2000; 9.3% were over the age of 59, compared to 3.7% in 2000; 68.8% were between the ages of 30 and 59, compared to 75.4% in 2000; and 18.9% were between the ages of 20 and 29, compared to 15.3% in 2000.

Gender distribution by age cohort was similar in both 2000 and 2010 with heavy male biases among almost every age range. The greatest absolute gender difference in 2010 occurred within the 40 to 49 (22.9% male, 6.1% female) range, followed by the 20 to 29 (15.4% male, 3.5% female) and 50 to 59 (17.2% male, 6.0% female) ranges. Of those three, the greatest relative gender difference occurred within the 20 to 29 range. Information regarding Akutan’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Akutan Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)⁶⁹ estimated that 59.5% of residents aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 21.4% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 19.1% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 24% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 5.1% had an Associate's degree, compared to an estimated 8% of Alaska residents overall; and an estimated 9.2% had a Bachelor's degree compared to an estimated 17.4% of Alaska residents overall. No residents were estimated to have a graduate or professional degree.

History, Traditional Knowledge, and Culture^{70,71}

Occupation of the area dates back approximately 8,500 years to the early Anangula tradition, and evidence is represented by an archaeological site located on Anangula Island. However, that site was abandoned following a volcanic eruption which blanketed the area with a thick layer of ash. Evidence of an early Aleutian tradition was found on Umnak Island dating back approximately 5,400 years.

The Krenitzin Islands were first visited by Russian fur traders in 1766. The first camp was established on Akun Island, which had been occupied by Aleuts since around 780 CE. At the time of contact, every habitable region within the Unalaska District was occupied, and in 1792, five villages existed on Akutan Island. In 1806, a severe disease epidemic impacted a large portion of the Krenitzin Island group and by 1834, only one village remained on Akutan Island; two small dwellings occupied by 13 people. Following the small pox outbreak in 1838, the Unangan population of the area was all but decimated, and many survivors relocated. Between 1866 and 1879, people returned to Akutan and in 1878, the Western Fur and Trading Company established a sea otter trading post and a Russian Orthodox Church and school were built. Alexander Nevsky Chapel was built in 1918 to replace the original structure. The Pacific Whaling Company built a whale processing station across the bay from Akutan in 1912. It was the only whaling station in the Aleutians and operated until 1939.

After the Japanese attacked Unalaska in June 1942, the U.S. government evacuated Akutan residents to the Ketchikan area. The village was re-established in 1944, although many villagers chose not to return. This exposure to the outside world brought many changes to the traditional lifestyle and attitudes of the community. The Wakefield Seafood Processors began to process king crab in 1948. In 1979, Seawest, Inc. purchased Wakefield operations, which triggered rapid expansion of Akutan's shore-based facilities. Historic and cultural resources documented in the area include the Ugathigana archaeological site and St. Alexander Nevsky

⁶⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Chapel, both which have been recommended as eligible for listing in the National Register of Historic Places (NRHP).⁷²

Natural Resources and Environment

Akutan lies in a maritime climate zone, characterized by mild winters and cool summers. Mean temperatures range from 22 to 55 °F (-5 to 13 °C) and precipitation averages 28 inches per year. High winds and storms are frequent in the winter, and fog is common in the summer.

Akutan Island and neighboring Akun Island predominately consist of moist and alpine tundra and barren ground. There are meadows along the sand and gravel shorelines consisting of various grasses and forbs. Sedge marshes can be found around the head of Akutan Harbor. There are limited trees on the islands due to shallow and unproductive soils. There are several streams on Akutan Island that support anadromous fish.⁷³

Terrestrial wildlife documented in the area includes an abundance of bird species, red fox, tundra voles, domestic rabbits, arctic fox, ground squirrel, Norway rat, and Greenland collared lemming. In addition, the Aleut Corporation owns cattle, which they allow to graze on Akun Island.⁷⁴ Aquatic wildlife documented in the area includes harbor seals, Steller sea lion, northern sea otter, Pacific cod, walleye pollock, Atka mackerel, sole, sculpins, skates, red crab, king crab, Tanner crab, coho salmon, chum salmon, pink salmon, sockeye salmon, and orca and humpback whale.⁷⁵

Natural hazards which threaten the community include tsunamis, earthquakes, storm surges, coastal erosion, coastal flooding, riverine erosion and volcanoes.⁷⁶ According to the Aleutians East Borough Hazard Mitigation Plan,⁷⁷ there is a high probability of an earthquake or volcanic event affecting the community, while there are moderate chances of tsunami, severe weather, and erosion events occurring. As of 2010, erosion was threatening the impoundment pond carrying the community's water supply.⁷⁸

According to the Alaska Department of Environmental Conservation (DEC), there were no significant environmental remediation projects active in Akutan as of 2010.⁷⁹

Current Economy⁸⁰

Akutan's economy is largely based on the commercial fishing industry and subsistence. Trident Seafoods' Akutan plant is the largest facility in North America, processing over three million pounds of product per day and capable of housing up to 825 employees.⁸¹ Top employers in 2010⁸² included Trident Seafood Corp., the City of Akutan, Akutan Corp., Akutan Traditional Council, Aleutians East Borough School District, Akutan Roadhouse Inc., Akutan Rural Power System Upgrade Project, and Aleutian Housing Authority.

In 2010,⁸³ per capita income in Akutan was estimated at \$22,099 and the median household income was estimated at \$34,375, compared to \$12,258 and 33,750 in 2000, respectively. After accounting for inflation by converting the 2000 values to 2010 dollars,⁸⁴ the real per capita income (\$16,119) and real median household income (\$42,381) indicate a rise in individual earnings and drop in household earnings. In 2010, Akutan ranked 134th of 305 communities from which per capita income was estimated, and 217th of 299 communities from which median household earnings was estimated.

It should be noted that Akutan's small permanent population size may have prevented the ACS from accurately portraying economic conditions.⁸⁵ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database, residents earned \$3.47 million in total wages in 2010.⁸⁶ When matched with the estimated number of permanent residents reported by community leaders in the AFSC 2011 Community Survey, the per capita earnings equal \$40,824, which was significantly more than inflation adjusted per capita values reported in the 2000 Census.⁸⁷

According to the 2006-10 ACS,⁸⁸ an estimated 98.2% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 2.7%, compared to an estimated 5.9% statewide; and an estimated 11.4% of residents were estimated to be living below the poverty level, compared to an estimated 9.5% of Alaska residents overall. Of those employed in the civilian labor force, an estimated 97.8% worked in the private sector, an estimated 0.9% worked in the public sector, and an estimated 1.4% were self-employed.

By industry, most (96.6%) were estimated to be employed in manufacturing sectors, followed by wholesale trade (2.2%). By occupation type, most (80.0%) employed residents were estimated to hold production, transportation, or material moving positions; followed by sales or office positions (9.9%); natural resources, construction, or maintenance positions (4.0%); service positions (3.9%); and management or professional positions (2.2%). Between

⁸⁰ Unless otherwise noted, all monetary data are reported in nominal values.

⁸⁴ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012) from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>.

⁸⁵ See footnote 69.

⁸⁶ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

⁸⁷ See footnote 82.

⁸⁸ See footnote 69.

2000 and 2010, estimated employment in manufacturing sectors experienced substantial proportional growth while all other sectors declined. By occupation type, estimated production, transportation, and material moving positions experienced proportional growth between 2000 and 2010, while management, professional, and service positions declined. According to 2010 ALARI estimates, most (62.0%) of those employed worked in manufacturing sectors; followed by local government sectors (21.7%) and financial service sectors (9.3%). No individuals characterized themselves as working in natural resource based industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly. Information regarding employment trends can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Akutan (U.S. Census Bureau).

Figure 4. Local Employment by Occupation in 2000-2010, Akutan (U.S. Census Bureau).

Governance

Akutan is a Second-class city with a mayoral form of government. The Akutan Corporation is the local Alaska Native Claims Settle Act (ANCSA) chartered village corporation, and the Aleut Corporation is the regional ANCSA chartered corporation. The closest Alaska Department of Fish and Game (ADF&G), U.S. Bureau of Citizenship and Immigrant Services (BCIS), and National Marine Fisheries Service (NMFS) offices are located in Unalaska, 35 mi west.

In 2010, the city administered a 1% raw fish tax in addition to the borough administered 2% raw fish tax. Other community taxes include a 1% sales tax. The total municipal budget for 2010 was \$2.65 million, compared to \$1.02 million in 2000.⁸⁹ In that year, state allocated Community Revenue Sharing accounted for 5.2% of the total municipal budget, compared to 2.6% in 2000 from State Revenue Sharing. State and federal fisheries-related grants awarded between 2000 and 2010 included \$3.1 million for a harbor access road project, \$434,000 for port and ferry dock improvements, \$100,000 for a skiff moorage facility, and \$22.5 million for harbor construction. Information regarding municipal finances can be found in Table 2.

⁸⁹ Inflation calculated using Anchorage CPI for 2010 from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Akutan from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$1,016,600	n/a	\$25,969	n/a
2001	\$1,452,963	n/a	\$24,986	n/a

Infrastructure

Connectivity and Transportation

Boats and amphibious aircraft are the only means of transportation into Akutan. A 200-ft dock and a small boat mooring basin are available. The state ferry operates from Kodiak bi-monthly between May and October. Cargo is delivered weekly by freighter from Seattle and the city owns and operates a landing craft. A 10,000-ft by 1,000-ft seaplane base is available and open to the public, and as of 2011 there was an airstrip under construction on Akun Island.⁹⁰ In June 2012, roundtrip airfare between Anchorage and Unalaska was \$958.⁹¹ Seaplane charters are available by appointment.

Facilities

Water is supplied by a local stream and dam, originally constructed in 1927. Water is treated and piped into all homes and sewage is piped to a community septic tank, with effluent

⁹⁰ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

discharge through an ocean outfall. Refuse is collected three times a week and taken to the landfill. The city recycles aluminum. Trident Seafoods operates its own water, sewer, and electric facilities.⁹²

General infrastructure located in Akutan includes police and fire services, youth center, community center, city and school library, café, telephone services, post office, broadband internet services, and several hotels. In a survey conducted by the AFSC in 2011, community leaders indicated that a fish cleaning station, barge landing area, dockside utilities, pilings, breakwater, jetty, dry dock space, haul out facilities, and a U.S. Environmental Protection Agency (EPA) certified boat cleaning station exist within the community. In addition, there is 350 ft of public dock space for permanent and transient moorage and vessels up to 400 ft in length can use the community's mooring facilities. Regulated vessels which the port of Akutan is capable of handling include rescue vessels, cruise ships, ferries, and fuel barges. Local businesses and services supporting the local fishing industry include a processor, bait sales, and boat fuel sales. Residents typically go to Unalaska, King Cove, and Sand Point for services that are not available in Akutan.

*Medical Services*⁹³

Basic health care is provided by Anesia Kudrin Memorial Clinic. The clinic is a Primary Health Care facility, qualified Emergency Care Center, and Community Health Aid Program (CHAP) site. The closest hospital is located in Unalaska.

*Educational Opportunities*⁹⁴

There is one school in Akutan offering a preschool through 12th grade education. As of 2011, there were eight students enrolled and two teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Historically, Aleut fishermen would harvest salmon, cod, herring, and other abundant local species. The Russian American Company moved Aleutians by the early 1800s and by 1855, was awarded a contract to deliver ice, fish, coal, and timber to a company in San Francisco. However, the venture was a total failure. Prior to Alaska's purchase in 1867, American schooners were fishing for cod in Aleutians.⁹⁵ Today, cod are fished throughout the Bering Sea and Aleutian Islands regions using trawl, longline, pot, and jig gear types. Trawl catcher vessels range from 60 to 180 ft in length, while catcher processor vessels typically range

⁹² See footnote 90.

⁹⁵ Atkinson, C. E. (n.d.). *A Brief Review of the Salmon Fishery in the Aleutian Islands Area*. Retrieved July 13, 2012 from: [http://www.npafc.org/new/inpfc/INPFC%20Bulletin/Bull%20No.1/Bull1%20p93-104%20\(Atkinson\).pdf](http://www.npafc.org/new/inpfc/INPFC%20Bulletin/Bull%20No.1/Bull1%20p93-104%20(Atkinson).pdf)

from 107 to 295 ft. Smaller vessels typically fish longline, pot, or jig gear. Pollock are fished in nearshore waters as a mid-water trawl fishery.⁹⁶

Aleutian herring typically congregate within the vicinity of Unalaska Island, where the Togiak-spawning herring reside during the summer feeding period. An early food and reduction fishery was established in at Dutch Harbor between 1929 to 1939. The Dutch Harbor herring fishery resumed in 1982, primarily as a bait fishery. Other areas along the Alaska Peninsula host smaller and more sporadic harvests.

Crab fisheries began in 1930 and accelerated in size and scope in the 1950s, when king crab fisheries developed in the Bering Sea. Red king crab is found throughout the Bering Sea and Aleutian Islands (BSAI) area, while blue king crab is found in small populations around the Pribilof Islands. Golden king crab is found along the continental slopes. Hair crabs are mostly found near the Pribilof Islands. Tanner grab is distributed widely throughout the BSAI region. Snow crab is found throughout the Bering Sea along continental slopes, and Dungeness crab is found throughout estuaries and intertidal zones. King crab harvests peaked in the 1970s and early 1980s, but declined significantly along with biomass. Although management has tightened, many populations are still considered depressed. Snow crab replaced king crab in terms of harvest size, and several peaks were seen in the 1990s. Today, crab harvests remain at low levels compared to years past.

According to survey conducted by the AFSC in 2011, community leaders reported that the community's economy relies heavily on fisheries. The community is approximately 40 mi closer to fishing grounds than Unalaska and is one of the busiest fishing ports in the world.⁹⁷ Akutan's proximity to the Bering Sea brought the crab and fish processing industry in the late 1940s, at first through floating processors, followed by the construction of a shore-based processing plant in the 1980s by Trident Seafoods.⁹⁸ In addition, community leaders reported that commercial vessels up to 125 ft in length use Akutan as their base of operation during fishing seasons. In addition, there was an increase in the number of visits by commercial vessels under 125 ft in Akutan between 2005 and 2010. However, visits by vessels 125 ft and over became less frequent during those years.

Akutan is eligible to participate in the Community Development Quota (CDQ) program and is represented by the Aleutian Pribilof Islands Community Development Association. The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the Bering Strait and Aleutian Islands region.⁹⁹ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ. The community is located in Federal Reporting Area 519, International Pacific Halibut Commission (IPHC) Regulatory Area 4B, and the Aleutian Islands Sablefish Regulatory Area.

Processing Plants

Trident Seafoods Corporation was founded in 1973, and by the year 2000 was employing 4,000 people annually throughout Alaska and the Pacific Northwest. It is a remote and self-contained facility on the island of Akutan at the eastern end of the Aleutian Islands chain and is the largest seafood production facility in North America, processing pollock, cod, halibut and crab.¹⁰⁰ During its peak seasons in the winter and summer it can accommodate as many as 825 employees. Trident employees and stockholders funded the 1998 creation of the village of Akutan's 14,000 sq-ft Safe Harbor Church and Community Center. In addition Trident continues to fund non-profit community services, fishing vessel safety training, school activities, and scholarship programs in the Akutan community. The Akutan facility provides room and board at a nominal cost, as well as air transportation to Akutan from Seattle and back to its seafood processors.¹⁰¹ According to a survey conducted by the AFSC in 2011, the plant employs a maximum of 1000 workers and does not rely on public infrastructure or services, as it is located outside the city limits of Akutan. From Akutan, the plant can be reached by road or boat.

Fisheries-Related Revenue

The majority of fisheries-related revenue collected between 2000 and 2010 came from Shared Fisheries Businesses Taxes, although revenue also came from raw fish taxes, Fisheries Resource Landings Taxes, Extraterritorial Fish Taxes, boat haul fees, and harbor usage fees. In 2010, Akutan received \$1.40 million in fisheries-related revenue, compared to \$1.24 million in 2000; a 13% decrease after adjusting for inflation.¹⁰² However, it should be noted that data regarding revenue acquired from raw fish taxes was not available for 2010. Fisheries-related revenue peaked in 2006 at \$2.09 million. In a survey conducted by the AFSC in 2011, community leaders reported that Akutan received \$12,000 in funding and grants from APICDA (their CDQ entity) in 2010. Information regarding fisheries-related revenue can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that crab, pollock, cod, and halibut are the major commercial fisheries prosecuted by residents of Akutan. The crab fishery runs from October to December, pollock is fished from January to May, cod is fished from January to May, and halibut fishing runs from March to November. Gear types used by residents include trawl, pots, and longline.

¹⁰² Inflation calculated using Anchorage CPI for 2010 from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

In 2010, 11 residents, or 12.9% of the estimated permanent population, held 13 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 8 residents held 13 CFEC permits. Of the CFEC permits issued 2010, 54% were for halibut, compared to 31% in 2000; 38% were for groundfish, compared to 46% in 2000; and 8% were for salmon, compared to 8% in 2000. In addition, 4 residents held 4 Federal Fisheries Permits (FFP) and 6 residents held 6 License Limitation Program (LLP) groundfish permits. In 2010, residents held 288,622 shares of halibut quota on nine accounts, compared to 73,959 shares on six accounts in 2000. No residents held sablefish quota in 2010; however, 428,834 shares was held on one account between 2000 and 2003. No residents held crab quota between 2010 and when the program began.

Of the CFEC permits issued in 2010, 77% were actively fished, compared to 62% in 2000. This varied by fishery from 100% of halibut permits, to 60% of groundfish and 0% of salmon permits. In addition, 50% of FFP and 33% of LLP groundfish permits were actively fished in that year. Fisheries prosecuted by residents of Akutan in 2010 included statewide longline halibut and statewide mechanical jig miscellaneous saltwater finfish fisheries.¹⁰³

Residents held 19 commercial crew licenses in 2010, compared to 18 in 2000. In addition, residents held majority ownership of 6 vessels that year, compared to 7 in 2000. In 2010, Akutan ranked 3rd of 67 communities reporting landings in terms of total pounds landed and 4th of 67 communities in terms of ex-vessel revenue earned from landings in the community. In that year, 152 vessels landed 315.60 million lbs total, representing a 35% reduction in lbs landed compared to 2002. However, ex-vessel revenue increased during that time from \$66.32 million to \$82.66 million. Revenue from landings peaked in 2005 at \$84.19 million. By fishery, 48.66 million lbs of Pacific cod valued at \$11.34 million ex-vessel was landed in Akutan in 2010, compared to 32.82 million lbs valued at \$6.82 million in 2002; a decrease of \$0.07 per pound landed after adjusting for inflation.¹⁰⁴ Other landings made in Akutan for 2010 are considered confidential. Residents landed 51,119 lbs of halibut valued at \$230,393 ex-vessel in 2010 and 179,296 lbs of Pacific cod valued at \$105,535 ex-vessel in 2009. All other landings made by Akutan residents between 2000 and 2010 are considered confidential. Information regarding commercial fishing trends can be found in Table 4 through 10.

Recreational Fishing

Due to its remote location, non-Alaska resident sportfishing is limited in Akutan. In 2010, there were three sportfishing licenses sold to residents, none of which were sold in the community. The number of sportfishing licenses sold to residents of Akutan peaked at 13 in 2004, which was the same year the Alaska Peninsula-Aleutian Islands ADF&G Harvest Survey Area saw the greatest number of resident angler days fished. There were no sport fish or charter businesses operating in the community between 2000 and 2010. In 2010, angler days fished totaled 5,297 for saltwater fisheries, compared to 10,534 in 2000. In that year, non-Alaska resident anglers accounted for 38.4% of saltwater angler days fished, compared to 15.8% in 2000. In addition, there were 33,635 total freshwater angler days fished in 2010, compared to 44,976 in 2000. In that year, non-Alaska residents accounted for 58.4% of freshwater angler days fished, compared to 39.6% in 2000.

In a survey conducted by the AFSC in 2011, community leaders reported the presence of shore-based recreational fishing by residents and non-Alaska residents, as well as by private

boat. Local private anglers typically target pink, chum, coho, and sockeye salmon, halibut, and rockfish. Information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

Subsistence resources are used by residents of Akutan to supplement their incomes and diet. In a survey conducted by the AFSC in 2011, community leaders reported that the three most important subsistence resources to the community are seals, ducks, and salmon. There is also considerable amount of halibut harvested by residents.

According to a 2009 ADF&G survey, salmon, non-salmon fish, and marine invertebrates made up an estimated 80% of subsistence harvests in Akutan. Also in that year, marine mammals made up an estimated 8% of subsistence harvests, and terrestrial mammals, birds, eggs, and wild plants made up an estimated 12%.¹⁰⁵ Information on salmon subsistence somewhat limited, and residents reported harvesting only 30 fish between 2000 and 2009. In 2010, 16 residents held Subsistence Halibut Registration Certificates (SHARC). In that year, residents reported harvesting 790 lbs of halibut on nine SHARC, compared to 9,612 lbs on 39 SHARC in 2003. Reported subsistence halibut harvests declined sharply since they peaked in 2005 (15,011 lbs). Halibut harvesting peaked in 2005 when an estimated 15,011 lbs of halibut was harvested on 47 SHARC. Marine mammals are harvested extensively in Akutan. An estimated 52 Steller sea lions and 111 harbor seals were harvested between 2000 and 2008. In addition, one sea otter was reported harvested in 2004. According to ADF&G's *Community Subsistence Information System*,¹⁰⁶ species that have been harvested and/or used by residents of Akutan includes mussels, butter clams, cockles, Dungeness crab, hair crab, horse clams, king crab, limpets, octopus, Pacific littleneck clams, razor clams, chitons, scallops sea cucumber, sea urchin, shrimp, snails, Tanner crab, blue whale, fur seals, humpback whale, mink whale, sei whale, Steller sea lion, rockfish, sculpin, Dolly Varden, flounder, grayling, greenling, herring, mackerel, Pacific cod, rainbow trout, sablefish, smelt, sole, and pollock. Information regarding subsistence trends can be found in Tables 12 through 15.

Atka (AT-ka)

People and Place

*Location*¹⁰⁷

Atka is located on Atka Island, 1,200 mi southwest of Anchorage and 350 mi west of Unalaska. The area encompasses 8.7 square mi of land and 27.4 square mi of water. Atka was incorporated as a Second-class city in 1988, is located in the Aleutians West Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*¹⁰⁸

In 2010, there were 61 residents, ranking Atka 288th of 352 communities in Alaska in terms of population size. Between 1990 and 2010, the population declined by 16.4%. Between 2000 and 2009, the population fell by 22.8% with an average annual growth rate of -2.68%, which was well below the statewide average annual growth rate of 0.75% and indicative of a steadily declining population. In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that the estimated number of permanent residents was 72 in 2010, while the estimated number of seasonal or transient residents was 12. Atka typically has seasonal workers living in the community between March and August with the population peaking from April through July. This peak in population is thought to be entirely driven by employment in the fisheries sectors. Information regarding population trends can be found in Table 1.

Atka was predominately an Aleut (Unangas) community in 2010. In that year, 95.1% of the population reported themselves as American Indian or Alaska Native, compared to 80.4% in 2000; and 4.9% identified themselves as White, compared to 6.5% in 2000. Those identifying themselves as two or more races dropped from 10.9% in 2000 to 0% in 2010. No residents reported themselves as Hispanic or Latino in 2010. Information regarding racial and ethnic trends can be found in Figure 1.

The average household size in 2010 was 2.54, compared to 3.60 in 1990 and 2.69 in 2000. In that year there were 43 total housing units, compared to 26 in 1990 and 41 in 2000. Of the households surveyed in 2010, 23.3% were owner-occupied, compared to 63.4% in 2000; 32.6% were renter-occupied, compared to 14.6% in 2000; 37.2% were vacant, compared to 12.2% in 2000; and 7% were occupied seasonally, compared to 9.8% in 2000. There were no residents living in group quarters in 2010, compared to six in 2000.

The gender distribution of Atka residents was relatively skewed in 2010 at 59.0% male, and 41.0% female. This was less even than both the distribution statewide (52.0% male, 48.0%

¹⁰⁷ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

female), and in 2000 (50.0% male, 50.0% female). The median age that year was 35.5 years, which was somewhat higher than the statewide median of 33.8 years and identical to the median in 2000.

Compared to 2000, the population structure in 2010 was more irregular. In that year, 31.2% of residents were under the age of 20, compared to 31.4% in 2000; 16.4% were over the age of 59, compared to 13.0% in 2000; 39.6% were between the ages of 30 and 59, compared to 44.5% in 2000; and 13.2% were between the ages of 20 and 29, compared to 10.8% in 2000.

Figure 1. Racial and Ethnic Composition, Atka: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Atka Based on the 2000 and 2010 U.S. Decennial Census.

Gender distribution by age cohort was significantly less even in 2010 than in 2000, with notable male biases among many age ranges. In 2010, the greatest absolute gender difference occurred in the 10 to 19 range (16.4% male, 3.3% female), followed by the 60 to 69 (8.2% male, 1.6% female) and 70 to 79 (5.0% male, 0.0% female) ranges. Of those three, the greatest relative gender difference occurred in the 70 to 79 range. Information regarding Atka’s population structure can be found in Figure 2.

According to the U.S. Census’ 2006-2010 American Community Survey (ACS),¹⁰⁹ an estimated 71.4% of residents aged 25 years and older held a high school diploma or higher

¹⁰⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 14.3% had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 14.3% had a 9th to 12th grade education but no degree, compared to an estimated 5.8% of Alaska residents overall; and an estimated 14.3% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall. No residents were estimated to hold a post-secondary degree in 2010.

*History, Traditional Knowledge, and Culture*¹¹⁰

There is evidence of human occupation of the Aleutian Islands dating back at least 8,000 years; however, it is believed that humans were populating North America at least 13,000 years ago during the end of the last glacial maximum. Archaeological sites dating back over 11,000 years have been found on Prince of Wales Island, lending evidence to a possible coastal migration route.¹¹¹

The island has been occupied by Unangas for at least 2,000 years. Unangas speak the western dialect, known since the Russian era as "Aleut". Recent archaeological evidence indicates that the present village site may have had human use since prehistoric times. The first contact with Russians occurred in 1747, and Atka became an important trade site and safe harbor for Russians. In 1787, a number of hunters were enslaved and relocated to the Pribilofs to work in the fur seal harvest. The townsite was settled in the 1860s. After the end of the sea otter hunting era in the late 1800s, Atka had no viable cash economy. Reindeer were introduced to the island in 1914. During the 1920s, Atka became relatively affluent due to fox farming. After the Japanese attacked Unalaska and seized Attu and Kiska in June 1942, the U.S. Government evacuated Atka residents to the Ketchikan area and burned it to the ground to prevent Japanese forces from using it and advancing. The community was rebuilt by the U.S. Navy after the war, and residents were allowed to return. Many Attu villagers, released from imprisonment in Japan in 1945, relocated to Atka. This exposure to the outside world brought many changes in the traditional culture and attitudes in the community.

Natural Resources and Environment

Atka lies in a maritime climate zone and temperatures range from 20 to 60 °F (-7 to 16 °C). Precipitation averages 60 inches per year, and snowfall averages 61 inches per year. There are frequent winds and severe storms in the winter and calm, foggy weather in summer.¹¹²

Atka Island is part of the Aleutian Islands Unit of the Alaska Maritime National Wildlife Refuge (AMNWR), which covers 3.4 million acres of the Aleutian Islands, Pribilof Islands, and areas around the Chukchi Sea.¹¹³ The local environment is characterized by tundra which transitions to upland mountainous regions. Steep topographical relief and shallow soils prevent

many trees from growing in the Aleutians, and trees that are found often consist of introduced spruce. Local flora includes many grasses, sedges, lichens, mosses, wildflowers, and heath plants. Wild rye often grows near beaches. Marine fish are diverse and abundant, and include pollock, herring, skates, smelt, cod, rockfish, sablefish, greenling, sculpin, halibut, flounder, crab, shellfish, shrimp, and all five species of Pacific salmon. Freshwater species include whitefish, arctic lamprey, Dolly Varden and arctic char, sculpin, arctic grayling, northern pike, burbot, and sheefish. Marine mammals include 11 species of whale, dolphin, porpoise, sea otter, fur seal, Steller sea lion, walrus, harbor seal, and elephant seal. Over 250 species of birds migrate through the Aleutian Islands Unit of the AMNWR.¹¹⁴

Although Atka does not have a hazard mitigation plan, the Aleutians East Borough identified several natural hazards which potentially impact Aleutian communities, including volcanic eruptions, earthquakes, coastal flooding and erosion, ground failure, tsunami, and extreme weather. All of these hazards have records of occurrence in the area and have a high potential for future occurrence.¹¹⁵

According to the Alaska Department of Environmental Conservation (DEC),¹¹⁶ there were no significant environmental remediation projects active within Atka in 2010.

Current Economy¹¹⁷

Atka's economy is based on subsistence living and wages earned from the halibut fishery. A small local fish processing plant, Atka Pride Seafoods, operates seasonally to serve the local fleet. They currently process halibut and sablefish. A number of offshore fish processors carry out crew changes through Atka. Year-round income opportunities in the village are limited to education- and government-related work. A reindeer herd of over 2,500 head provides a source of food.¹¹⁸ Top employers in 2010¹¹⁹ included the City of Atka, Village Safe Water, Aleutian Pribilof Island Association, Atka Pride Seafoods Inc. Aleutian School District, Aleutian Pribilof Islands Community Development Association (APICDA), Atka Native Store, and Atxam Corporation. In a survey conducted by the AFSC in 2011, community leaders reported that the community's economy is reliant on commercial fishing and recreational hunting/fishing.

In 2010,¹²⁰ the estimated per capita income was \$27,542 and the estimated median household income was \$90,000, compared to \$17,980 and \$30,938 in 2000, respectively.¹²¹ After adjusting for inflation by converting 2000 values to 2010 dollars,¹²² the real per capita income

¹²¹ See footnote 109.

¹²² Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

(\$22,460) and real median household income (\$40,683) indicate significant increases in both individual and household earnings. In 2010, Atka ranked 83rd of 305 communities from which per capita income was estimated, and 14th of 299 communities from which median household income was estimated.

It should be noted that Atka's small population size may have prevented the ACS from accurately portraying economic conditions.¹²³ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, total wages earned by Atka residents in 2010 was \$1.03 million.¹²⁴ When compared with the 2010 population, per capita income equals \$16,834; suggesting that caution should be used when comparing 2010 ACS estimates with the 2000 Census.¹²⁵ The per capita income estimate based on ALARI data is likely more accurate than the 2010 ACS estimate, as \$90,000 was confirmed as unlikely based on estimates given by the community directly.

According to 2006-2010 ACS estimates,¹²⁶ 68.4% of residents aged 16 years and over were part of the civilian labor force in 2010. In that year, unemployment was estimated at 0.0%, compared to an estimated 5.9% statewide; and an estimated 4.2% of residents lived below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed, an estimated 76.9% worked in the private sector and an estimated 23.1% worked in the public sector. Again, it is likely that the 2010 ACS misrepresented economic conditions within Atka due to the community's small population size. According to 2010 ALARI employment data, the unemployment rate was 18.4% based on unemployment insurance claimants.

By industry, most (38.5%) employed residents were estimated to work in finance, real estate, or insurance sectors; followed by public administration sectors (23.1%) and non-public administration service sectors (15.4%). By occupation type, most (46.2%) employed residents were estimated to hold management or professional positions; followed by natural resource, construction, or maintenance positions (30.8%); sales or office positions (15.4%); and production, transportation, or material moving positions (7.7%). Information regarding employment trends can be found in Figures 3 and 4.

Overall there were strong variations among most industry sectors and occupation types between 2000 and 2010. There was a significant increase in the proportion of residents employed in finance, insurance, real estate, and non-public administration sectors; while there was a significant decrease in arts, entertainment, recreation, accommodations, food services, education services, health care, and social assistance sectors. By occupation type, there was a significant increase in the proportion of management, professional, natural resources, construction, and maintenance positions; while there was a significant decrease in the proportion of service, sales, and office positions. It should be noted that while it is possible that the significant shifts can be attributed to economic regime changes, it is also likely the ACS sampling methods were unable

¹²³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹²⁴ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

¹²⁵ Alaska Department of Labor and Workforce Development (n.d.). Alaska Local and Regional Information Database. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

¹²⁶ See footnote 123.

to capture economic conditions accurately. ALARI estimated that in 2010, most (58.5%) private or state employees worked in local government sectors; followed by education or health service sectors (14.6%); manufacturing sectors (12.2%); financial sectors (7.3%); and professional or business sectors (7.3%).

In 2010, no individuals characterized themselves as working in natural resource-based occupations or industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

Figure 3. Local Employment by Industry in 2000-2010, Atka (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Atka (U.S. Census).

Governance¹²⁷

Atka is a Second-class city with a mayoral form of government. The community has a seven member city council and 10 municipal employees which include a fire chief, Village Public Safety Officer (VPSO), and Anchorage-based City Administrator. In addition, there is a U.S. Bureau of Indian Affairs (BIA) recognized Tribal government, and an Alaska Native Claims Settlement Act (ANCSA) chartered Native village corporation (Atxam Corporation). The regional ANCSA chartered Native Corporation representing Atka is the Aleut Corporation. Total ANCSA land entitlement in the area is over 100,000 acres. The closest National Marine Fisheries Service (NMFS), U.S. Bureau of Citizenship and Immigration Services (BCIS), and Alaska Department of Fish and Game (ADF&G) offices are located in Unalaska, 350 mi east. As of 2010, the city administered a 10% bed tax and 2% raw fish tax.

In 2010, total municipal revenue was \$833,779, compared to \$243,643 in 2000; a 165% increase after adjusting for inflation.¹²⁸ In addition, the community was allocated \$99,561 from the state Community Revenue Sharing program, which accounted for approximately 12% of the municipal budget that year. In contrast, Atka received \$27,706 in State Revenue Sharing in 2000, which accounted for approximately 11% of the municipal budget that year. Municipal revenue estimates include only general fund revenues, and include capital project and business related funds. Information regarding municipal finances can be found in Table 2.

Infrastructure

Connectivity and Transportation

Atka has a state-owned, city-maintained 4,800-ft by 100-ft asphalt, lighted runway. Scheduled air services are available three times weekly from Unalaska. Planes can be chartered from Cold Bay or Unalaska. Freight service is provided from April to October. The city dock and port facility is located 5 mi from town in Nazan Bay.¹²⁹ Roundtrip airfare between Anchorage and Unalaska in June 2012 was \$958.¹³⁰

Facilities

The community system was constructed in 1978 and was expanded in 1982 to a new housing area. Water is supplied by a stream and wooden reservoir dam northwest of the city. Water is treated and stored in a 130,000-gal water tank before distribution. All homes are connected to the piped water and sewer system and are plumbed. Sewage is piped to a central septic system. Wastewater flows untreated through outfall lines into Nazan Bay. Garbage is collected twice a week.¹³¹

In a survey conducted by the AFSC in 2011, community leaders reported on general and fisheries-related infrastructure and services present or under development in the community. These include a fishing cleaning station, barge landing area, dock improvements, dock utilities, dock access, pilings, broadband internet access, road improvements, airport improvements, general utility improvements, alternative energy projects, emergency response systems, telephone service, fire department, post office, and fire department improvements. In addition, there are plans for dockside fuel tanks, a breakwater, harbor dredging, a jetty, dry dock space, haulout facilities, U.S. Environmental Protection Agency (EPA) certified cleaning station, sewage treatment station, and a new landfill. Fisheries-related businesses located in the community include fish processors, fishing gear sales, boat repair (machine shop, mechanical services, and hydraulics), small vessel haulout facilities (less than 60 tons), commercial fishing vessel moorage, tackle sales, bait sales, commercial cold storage facilities, marine refrigeration, boat fuel sales, fishing gear storage, ice sales, water taxi, and air taxi.

According to a Community Development Plan created by the City of Atka in 2006,¹³² development projects completed or marked as ongoing include housing improvements and

¹³² City of Atka. (2006). *Community Development Plan*. Retrieved December 28, 2011 from: <http://www.commerce.state.ak.us/dca/plans/Atka-GCP-2006.pdf>.

repair, a new clinic, ambulance services, road and bridge repair, community enrichment programs, fish marketing, processor improvements, a restaurant, and a new post office. Projects that the community would like to pursue include an airport terminal, additional rental housing, a recreation center, and a larger general store.

Medical Services

The Atka Village Clinic is a Primary Health Care Facility, regional Emergency Medical Service provider, and Community Health Aid Program (CHAP) site. Acute and long-term care is provided in Unalaska.

*Educational Opportunities*¹³³

Yakov E. Netsvetov School provides Kindergarten through 12th grade instruction. As of 2011, there were 10 students enrolled and one teacher employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Unangas have occupied Atka Island for at least 2,000 years and perhaps as long as 4,500 years.¹³⁴ During this time, the local inhabitants have relied extensively on a subsistence lifestyle. Today, residents of Atka participate heavily in commercial, recreational, and subsistence fisheries.

Previous to Alaska's purchase in 1867, American schooners were fishing for cod in the Aleutian Islands and Okhotsk Sea regions. By the end of the nineteenth century, salmon canneries were being established in western Alaska and on the eastern portion of the Alaska Peninsula. No large-scale commercial seafood processing operation was undertaken in the Aleutian area during those years however. In 1916, Pacific American Fisheries, Inc. established a cannery at Makushin Bay, Unalaska. In those days, adverse weather conditions typically kept the small seine fleet close to Unalaska and Umnak islands. Following the 1924 White Act, newly protected fisheries began to proliferate throughout the Aleutian region. The implementation of a 1928 Executive Order removed Akun, Akutan, Tigalda, Umnak, and Unalaska Islands from an earlier established wildlife reserve, opening up further opportunities. The International Packing Company fished the Aleutian area between 1924 and 1942 and operated a floating processor in the regional through 1941. Pink, sockeye, and chum salmon were popular species.¹³⁵ In 1982, local residents formed the Atka Fishermen's Association and began fishing commercially for halibut. The first seafood processing plant was built in 1987, and Atka Pride Seafoods was formed following Atka's entry into the Community Development Quota (CDQ) program. Dock

facilities were completed in 1997.¹³⁶ Popular commercial fisheries within the Bering Sea and Aleutian Islands Management Area include red king crab, snow crab, walleye pollock, golden king crab, Tanner crab, weathervane scallops, Dungeness crab, Pacific cod, flatfish, sablefish, Pacific salmon, Pacific herring, and halibut.

Aerial surveys of Pacific herring biomass began in the Alaska Peninsula and Aleutian Islands region in 1979, when large congregations of herring were documented in coastal waters between Adak and Port Heiden. No herring sac roe harvests have occurred within the Aleutian Islands region due to lack of interest. Herring food and bait fisheries began in the Eastern Aleutian Islands area in 1929, occurring intermittently until 1981, when a Dutch Harbor food and bait fishery began operating annually. In 2004, an exploratory herring fishery was established in the vicinity of Adak Island. This fishery has attracted very little interest, and no harvests have occurred since it was established.¹³⁷

Groundfish were first commercially harvested in the Bering Sea and Aleutian Islands (BSAI) region in 1864, when a single schooner fished for Pacific cod in the Bering Sea. Most fishing effort during the early cod fishery was concentrated north of Unimak Island and the Alaska Peninsula. Pacific halibut was commercially harvested within the region as early as the late 1800s as well; however, halibut did not reach North American markets until 1928. Foreign fleets had a large presence within the BSAI region throughout much of the 20th century, targeting pollock, sablefish, turbot, perch, and other groundfish. Foreign fleets were phased out during the 1980s as fishing fleets became increasingly “Americanized”. Today, walleye pollock is the largest groundfish fishery in the BSAI region in terms of lbs landed and ex-vessel value. Pacific cod is the second largest fishery, followed by various flatfish including arrowtooth flounder, rock sole, and yellowfin sole. Other important commercial species include sablefish, rockfish, and Atka mackerel.¹³⁸

According to a survey conducted by the AFSC in 2011, community leaders reported that Atka participates in the fisheries management process in Alaska through a paid staff member who attends North Pacific Fishery Management Council (NPFMC) meets and/or Board of Fisheries meetings. In addition, Atka relies on regional organizations to provide information on fisheries management issues.

Atka is located in Federal Reporting Area 541, International Pacific Halibut Commission (IPHC) Regulatory Area 4A, and the Aleutian Islands Sablefish Regulatory District. Atka is eligible for participation in the CDQ program and is represented by APICDA. The CDQ program was established in an effort to address social and economic hardships imposed on BSAI fishing communities from cost prohibitive entry requirements into groundfish, halibut, and crab fisheries. Non-profit corporations, created under CDQ program requirements, are provided with an apportionment of quota allowing for direct investments by CDQ entities into local infrastructure and services.¹³⁹

Processing Plants

Atka Pride Seafoods is a subsidiary of APICDA. Since 1994, Atka Pride has processed seafood on the island of Atka in the western region of the Aleutian Islands chain. From June through September Atka Pride processes halibut and sablefish. In regard to local infrastructure projects, APICDA has constructed a small dock (and attendant floating barges), a major dock facility, a water catchment system and pipeline to the city dock, and a hydro-electricity facility. Between 2006 and 2008, its infrastructure plans included construction of a boat harbor, widening of the face of the Atka City Dock, development of a fuel supply business, and extension of the local airport runway.¹⁴⁰ The plant relies on public docks, water services, and power/electricity (except in summer months), and in 2010 employed a maximum of seven workers.¹⁴¹

According to the 2010 Alaska Department of Fish and Game's Intent to Operate list, the Atxam Corporation, operates a fish processing plant in Atka and shares a mailing address with Atka Pride Seafoods, although its port location code is listed as Adak.

According to a survey conducted by the AFSC in 2011, community leaders reported that three residents are employed permanently in the seafood processing sector.

Fisheries-Related Revenue

Overall, Atka received \$449,358 in fisheries-related taxes and fees in 2010. This represented a 141% increase in fisheries-related revenue from 2000 after adjusting for inflation by converting 2000 values to 2010 dollars.¹⁴² During that time, Atka saw large increases in revenue received from Fisheries Resource Landing Taxes, and harbor fees. In 2010, Fisheries Resource Landing Taxes made up almost half of fisheries-related revenue that year.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

In a survey conducted by the AFSC in 2011, community leaders reported that services funded by fisheries-related revenue include harbor maintenance, road construction and maintenance, water and wastewater systems, law enforcement, and fire protection. In 2010, the community received \$100,000 from its CDQ entity (APICDA). Information regarding fisheries-related revenue trends can be found in Table 3.

Commercial Fishing

In 2010, four residents, or 6.6% of the population, held a total of four permits issued by the Commercial Fisheries Entry Commission (CFEC), all of which were for halibut. This represented a decline from 2000 when 9 residents held 17 CFEC issued permits. In that year, 53% were for halibut, 24% were for sablefish, 18% were for groundfish, and 6% were for salmon. In addition, residents held 228,323 shares of halibut quota on nine accounts in 2010, compared to 234,999 shares held in 2000. Residents held 257,848 shares of sablefish quota on one account in 2000. Between 2000 and 2010, no residents held Federal Fisheries Permits (FFP)

¹⁴⁰ Aleutian Pribilof Island Community Development Association. (n.d.) Retrieved from: <http://apicda.com/>.

¹⁴¹ This information is based on the results of a processing plant survey conducted by the Alaska Fisheries Science Center in 2011.

¹⁴² Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>

or License Limitation Program (LLP) permits for groundfish or crab. No residents held crab quota between 2010 and when the program began.

In 2010, residents held 7 commercial crew licenses, compared to 19 in 2000. In addition, residents held majority ownership of three vessels that year, compared to six in 2000. Of the CFEC permits held in 2010, 100% were actively fished, compared to 59% in 2000. The only fishery prosecuted by residents of Atka that year was for statewide longline halibut.

In 2010, Atka ranked 41st of 67 communities in terms of total lbs landed and 35th in terms of ex-vessel value of landings. Total lbs landed and ex-vessel value of landings in Atka between 2000 and 2010 are considered confidential, with the exception of 2009 when no landings were reported. Landings reported by Atka residents between 2000 and 2010 are also considered confidential. Information regarding commercial fishing trends can be found in Tables 4 through 10.

In a survey conducted by the AFSC in 2011, community leaders reported that between 2005 and 2010, the community did not see a change in the number of commercial vessels or vessels smaller than 60 ft visiting Atka. In addition, vessels larger than 60 ft, charter/party boats, and private vessels typically do not visit the community.

Recreational Fishing

Recreational fishing by non-Alaska resident anglers is limited in Atka due to its remote location. No sportfishing licenses were sold in the community between 2000 and 2010. In addition, no sport fish guide businesses were registered to be active in the community during that time. Only three Atka residents held sportfishing licenses in 2010.

Atka is located in the Aleutian Islands ADF&G Harvest Survey Area, which includes all Alaskan waters, including drainages, between Cape Douglas and the community of Naknek. In 2010, angler days fished totaled 5,297 for saltwater fisheries and 33,635 for freshwater fisheries. In that year, non-Alaska resident anglers accounted for 38.4% of saltwater and 58.4% of freshwater angler days fished, compared to 15.8% and 39.5% in 2000, respectively. Between 2000 and 2010, there were no reports of charter businesses operating within Atka.

According to a survey conducted by the AFSC in 2011, community leaders reported that species targeted by shore-based and private vessel based anglers include all five species of Pacific

salmon, halibut, rockfish, and clams. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Salmon, halibut, and cod have been important subsistence resources in the Aleutian Islands for thousands of years. On average, Aleutian Island households harvest 1,292 lbs of fish, game, wild plants, and marine mammals each year.¹⁴³

According to 2005 interviews conducted by the U.S. Fish and Wildlife Service (USFWS),¹⁴⁴ the community historically harvested sockeye salmon at Korovin Bay during the summer. In the past, community members would set up camps and traps on the shore until USFWS shut them down around 1949. Another fish trap was built in 1991 and used for several years but was abandoned when subsistence users switched to gill nets. Elders reported that sockeye salmon were abundant in Korovin Lake and that in some years the lake filled to capacity. Some people in Atka travel west to Adak in private vessels to troll for Chinook salmon. Nuclear tests on Amchitka Island are perceived by many subsistence users to have been seriously detrimental to the fish in the region.

In a survey conducted by the AFSC in 2011, community leaders reported that Atka residents harvest fish, hunt marine and terrestrial birds and mammals, and gather local vegetation for subsistence purposes. In addition, a reindeer herd is maintained on Atka Island as a local source of meat. Information provided by the ADF&G is limited and data on household subsistence participation and subsistence salmon harvests are not available.

According to the ADF&G *Community Subsistence Information System*,¹⁴⁵ species which residents of Atka have used and/or harvested include chitons, mussels, butter clams, cockles, Dungeness crab, hair crab, horse clams, limpets, octopus, Pacific littleneck clams, pinkneck clams, razor clams, rock jingles, scallops, sea anemone, sea cucumber, sea urchin, shrimp, snails, squid, Tanner crab, king crab, fur seal, harbor seal, ringed seal Steller sea lion, whale, arrowtooth flounder, Atka mackerel, black rockfish, brook trout, sculpin, Dolly Varden, Arctic grayling, greenling roe, herring (roe and food/bait), lingcod, mahi mahi, Pacific cod, rainbow trout, Irish lord, red rockfish, sablefish, steelhead, swordfish, sole, shark, tuna, and walleye pollock. In 2010, 1 resident held a Subsistence Halibut Registration Certificate (SHARC), although there were no reported harvests between 2006 and 2010. In 2008, an estimated 7,000 lbs of marine mammals were harvested, a significant increase from 2000 when an estimated 942 lbs were harvested. Marine mammal harvests peaked in 2003 at an estimated 16,986 lbs harvested. Between 2000 and 2008, an estimated 503 marine mammals were harvested. Data regarding sea lion and seal harvests are unavailable. Information regarding subsistence trends can be found in Tables 12 through 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders reported that expanding the community's seafood processor is one of the current challenges for the portion of Atka's

Cold Bay

People and Place

*Location*¹⁴⁶

Cold Bay is located in the Izembek National Wildlife Refuge (NWR) at the western end of the Alaska Peninsula. It lies 634 mi. southwest of Anchorage and 180 mi northeast of Unalaska. The area encompasses 54.4 sq mi of land and 16.6 sq mi of water. It was incorporated as a Second-class city in 1982 and is under the jurisdiction of the Aleutians East Borough.

*Demographic Profile*¹⁴⁷

In 2010, there were 108 residents, ranking Cold Bay 240th of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population declined by 27%. Between 2000 and 2009, the population declined by 4.55% with an average annual growth rate of -3.31%, which was much lower than the statewide average of 0.75% and reflective of the steep decline following a population spike in 2002. In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there were an estimated 60 permanent residents living in Cold Bay in 2010. The community's population reaches its annual peak in September and is somewhat driven by employment in fishing sectors. Information regarding population trends can be found in Table 1.

The racial and ethnic composition of Cold Bay is relatively mixed, with the majority of residents (74.1%) identifying themselves as White in 2010, compared to 71.6% in 2000. Also in that year, 12.0% of residents identified themselves as American Indian or Alaska Native, compared to 17.0% in 2000; 1.9% identified themselves as Black or African American, compared to 3.4% in 2000; 1.9% identified themselves as Asian, compared to 4.5% in 2000; 9.3% identified themselves as two or more races, compared to 1.1% in 2000; and 0.9% identified themselves as some other race, compared to 0.0% in 2000. In addition, 4.6% of residents identified themselves as Hispanic or Latino in 2010, compared to 2.4% in 2000. Racial and ethnic composition remained somewhat unchanged between 2000 and 2010. Information regarding trends in race and ethnicity in Cold Bay can be found in Figure 1.

In 2010, the average household size was 2.33, compared to 2.7 in 1990 and 2.28 in 2000. In that year, there were 82 total housing units, compared to 73 in 1990 and 98 in 2000. Of the households surveyed in 2010, 6% were owner-occupied, compared to 3% in 2000; 50% were renter-occupied, compared to 34% in 2000; 7% were vacant, compared to 46% in 2000; and 37% were occupied seasonally, compared to 17% in 2000. In 2010 there was one person living in group quarters, compared to six in 2000.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

Gender distribution in Cold Bay was skewed in 2010 at 61.2% male and 38.8% female. This was significantly less even than the statewide distribution (52% male, 48% female), and slightly more even than the 2000 distribution (64.7% male, 35.3% female). The median age that year was 44.8 years, which was significantly older than the statewide median of 33.8 years and 2000 median of 34 years.

Figure 1. Racial and Ethnic Composition, Cold Bay: 2000-2010 (U.S. Census).

The population structure in 2010 was slightly more constricted than it was in 2000 as the population aged. In that year, 20.4% of residents were under the age of 20, compared to 26.2% in 2000; 6.4% were over the age of 59, compared to 3.4% in 2000; 60.7% were between the ages of 30 and 59, compared to 57.9% in 2000; and 13.0% were between the ages of 20 and 29, compared to 12.5% in 2000.

Overall gender distribution by age cohort was about the same in both 2000 and 2010. In 2010, the greatest absolute gender difference occurred within the 10 to 19 range (7.4% male, 0.9% female), followed by the 50 to 59 (14.8% male, 9.3% female) and 0 to 9 (8.4% male, 3.7% female) ranges. Of those three, the greatest relative gender difference occurred within the 10 to 19 range. Information regarding trends in Cold Bay’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Cold Bay Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)¹⁴⁸ estimated that 100% of residents aged 25 years and higher held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. In this same time period, an estimated 25% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; and estimated 20% had an Associate's degree, compared to an estimated 8% of Alaska residents overall; and an estimated 35% of residents had a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall. No residents were estimated to hold a graduate or professional degree between 2000 and 2010.

History, Traditional Knowledge, and Culture

Archaeological sites dating to the last ice age indicate the area around Cold Bay was once inhabited by a large Eastern Aleut population.¹⁴⁹ Additional archaeological data indicates that the first inhabitants of the area may have arrived approximately 6,000 years ago. The first historic record of the area is from 1827, when the Russian captain Count Feodor Petrovich Lutke named the largest lagoon to the north of Cold Bay after his surgeon, Karl Izembek. Additional features in the area were also named after crew aboard the Russian sloop "Moller," including Moffet Lagoon and Cape Glazenap. During World War II, the U.S. military established a base at Cold Bay, staffing it with 40,000 soldiers during its lifetime. At its peak, Cold Bay was home to approximately 9,000 military personnel (although estimates have gone as high as 60,000). By 1942, the base supported military aircraft, communications equipment, and other facilities. The military facilities were abandoned in 1950; however, the U.S. Air Force did maintain a presence in support of a Distant Early Warning Station built at Grant Point in 1958. In that year, the Federal Aviation Administration (FAA) established facilities at Outer Marker Road, and the remainder of the military land was transferred to the FAA and Bureau of Land Management (BLM) in 1961. The Izembek NWR was established in 1960 and the Izembek State Game Refuge in 1971.¹⁵⁰

Natural Resources and Environment

The community has a maritime climate, with temperatures ranging from 25 to 60 °F (-4 to 16 °C). The average annual rainfall is 36 inches, and average annual snowfall is 55 inches. Wind speeds of 30 mph are common for Cold Bay.¹⁵¹

Cold Bay resides in the Izembek NWR, which was designated a Globally Important Bird Area in 2001.¹⁵² The local surface geology consists primarily of glacial outwash and alluvium

¹⁴⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

consistent with coastal plains in the region. The lagoons to the north of Cold Bay are thought to have formed by emerging coastlines formed from tectonic activity, wind, and offshore currents. Lowland areas are commonly made up of volcanic ash, unconsolidated sands, silts, and gravel. Upland soils mostly consist of volcanic ash. Organic soils consist of sedge peat and moss.¹⁵³ Vegetation is limited due to unproductive shallow or poorly drained soils. Vegetation types are consistent with low shrub tundra, wetlands, and moist herbaceous meadows. There are scattered alder stands in mid-slope areas east of Cold Bay.¹⁵⁴ Terrestrial wildlife present in the area include brown bears, caribou, moose, wolverine, red foxes, river otters, wolves, mink, porcupine, hares, shrews, voles, lemmings, mice, and ground squirrels. Local fish include all five species of Pacific salmon, Arctic char, Dolly Varden, stickleback, steelhead trout, Pacific sand lance, yellowfin sole, sculpin, turbot, smelt, greenling, cod, whitefish, and herring. Marine mammals present in the area include sea otters, northern fur seals, walrus, harbor seals, mink whales, killer whales, gray whales, and Steller sea lions. There are also approximately 80 species of birds that frequent the area as well.¹⁵⁵

Localized mineral resources include titanium sands, iron, and gold concentrations in the Moffet Lagoon and Moffet Point areas. However, mineral prospecting in the Izembek NWR is advised against. In addition, the 2005 Bristol Bay Area Plan designated tidelands adjacent to the Izembek NWR off-limits to new mineral prospects. Uplands are closed to mining or mineral entry under federal law and currently development can only be approved offshore. Cold Bay is located close to oil and gas exploration areas of interest, although of the 26 test wells drilled around the Alaska Peninsula between 1902 and 1985, none produced commercially viable quantities of either. However, there are several coal bed methane sites which could prove viable in the future.¹⁵⁶

Cold Bay is susceptible to natural hazards including earthquakes, volcanoes, tsunamis, and severe weather events. According to the *Aleutians East Multi-Jurisdictional, Multi-Hazards Mitigation Plan*, damage from an earthquake, volcanic eruption, or tsunami would be critical with a projected 25% of critical facilities damaged or destroyed. Severe weather events could result in limited damage, and would not likely result in severe casualties or extensive damage to infrastructure. There is a high probability of an earthquake or volcanic event occurring, while the probability of a tsunami or severe weather event is moderate.¹⁵⁷

The Alaska Department of Environmental Conservation is in the process of cleaning up contaminants left from the now defunct Fort Randall. During World War II, the military base was consistently supplied with 4,000 to 5,000 fifty-five gal drums containing heating oil, lubricants, solvents, pesticides, and volatile fuels. In 1998, 2,138 buried drums were removed from a disposal area, and in 2001 approximately 4,760 cubic yards of contaminated soil were

treated and backfilled. Other cleanup projects in the area include asphalt seeps and underground fuel tank leaks near the airport.¹⁵⁸

Current Economy¹⁵⁹

Cold Bay's local economy is complex and tied to the region as a whole. Although a federal presence has been reduced greatly following the closing of Fort Randall, the state owned airstrip remains an active resupply and emergency stop for air traffic crossing the Pacific Ocean. The deep water port has the potential to be developed into a regional center as well. The Izembek NWR provides recreational opportunities for bird and hunting enthusiasts, and tourism is a top development priority in Cold Bay. Finally, Cold Bay is part of a commercial fishing network connecting King Cove, Sand Point, and False Pass. However, in a survey conducted by the AFSC in 2011, community leaders reported that there is not a fishing industry in Cold Bay. There have been efforts towards economic diversification in the region following the Bristol Bay commercial salmon crash of the late 1990s, and because of the city's past reliance on federal employment.¹⁶⁰ Top employers in 2010¹⁶¹ included Peninsula Airways, State of Alaska, City of Cold Bay, Aleutians East Borough School District, G&K Inc., Eastern Aleutian Tribes Inc., Frosty Fuels LLC, CK Enterprises LLC, and Aleutians East Borough.

In 2010,¹⁶² the estimated per capita income was \$26,136 and the estimated median household income was \$44,167, compared to \$20,037 and \$55,750 in 2000, respectively. However, after accounting for inflation by converting the 2000 values to 2010 dollars,¹⁶³ the real per capita income (\$26,358) and real median household income (\$73,310) indicate that while individual earnings remained relatively unchanged, household earnings decreased significantly. In 2010, Cold Bay ranked 94th of 305 Alaskan communities from which per capita income was estimated, but only 166th of 299 Alaskan communities for from which median household income was estimated.

Cold Bay's small population size may have prevented the ACS from accurately portraying economic conditions.¹⁶⁴ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$1.48 million in total wages in 2010.¹⁶⁵ When matched with the population in 2010, the per capita income equals \$13,720, which is significantly less than the 2010 ACS estimate, suggesting that caution should be used when comparing 2010 ACS and 2000 Census figures.¹⁶⁶ It should be noted that ALARI and

¹⁶⁴ See footnote 148.

¹⁶⁵ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

¹⁶⁶ See footnote 161.

Census income figures are based on wage earnings and do not take into account the value of subsistence to the community.

According to 2006 to 2010 estimates,¹⁶⁷ 65% of residents aged 16 years or older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 0.0%, compared to 5.9% statewide; and an estimated 8.3% of residents were living below the poverty line, compared to 9.5% statewide. Because of Cold Bay's small population size, it is possible that the 2010 ACS misrepresented local unemployment. The 2010 ALARI database estimated that, based on unemployment insurance claimants, the unemployment rate was 8.3%.¹⁶⁸

Of those employed in 2010, an estimated 61.5% worked in the public sector, while an estimated 38.5% worked in the private sector. By industry, most (53.8%) were estimated to be working in public administration sectors in that year; followed by wholesale trade sectors (23.1%), transportation, warehousing, and utilities sectors (15.4%), and professional, scientific, management, administrative, and waste management sectors (7.7%). By occupation type, most (38.5%) were estimated hold sales or office positions, followed by management or professional positions (30.8%), natural resource, transportation, or material moving positions (15.4%), and service positions (15.4%). Overall, the 2006-10 ACS purported a strong shift towards public administration and wholesale trade sectors between 2000 and 2010. However, it should be noted that sampling techniques may not have captured the true scope of industry representation. This may account for the apparent reduction in economic diversity in those years. According to 2010 ALARI estimates, most (26.8%) employed residents worked in trade, transportation, and utilities sectors; followed by local government sectors (26.8%); and state government sectors (12.2%). Information regarding employment trends can be found in Figures 3 and 4.

No individuals characterized themselves as working in natural resource based industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

¹⁶⁷ See footnote 148.

Figure 4. Local employment by occupation in 2000-2010, Cold Bay (U.S. Census).

Governance

Cold Bay is a Second-class city with a mayoral form of government. The community was not included in the Alaskan Native Claims Settlement Act (ANCSA) and does not have a federally recognized Tribal government. The closest National Marine Fisheries Service (NMFS) and U.S. Bureau of Citizenship and Immigration Services (BCIS) offices are located in Unalaska, 179 mi southwest. There is a seasonally operated Alaska Department of Fish and Game (ADF&G) office located in the community, which is open during summer months. The closest permanent ADF&G office is located in Sand Point, 90 mi to the east.

Taxes administered by the city in 2010 included a 10% accommodations tax and \$0.04 per gallon fuel tax. The borough administers a 2% raw fish tax. When adjusted for inflation,¹⁶⁹ total municipal revenues increased 100.2% between 2000 and 2010 from \$248,547 to \$643,343. In 2010, most locally generated revenues were collected from utilities rents and local tax revenues. In addition, \$171,324 was collected that year from insurance reimbursements for dock repairs. Most outside revenues were generated from Community Revenue Sharing and raw fish tax refunds. In that year, Cold Bay received \$100,591 in state allocated Community Revenue Sharing, which accounted for 15.6% of the municipal budget. This was a proportional increase from 2000, when \$29,470 in State Revenue Sharing accounted for 11.9% of the municipal budget. Fisheries-related state and federal grants received by the City included a \$26,316 for a state matching grant for the city dock and \$25,000 for construction of dockside electrical utilities. Information regarding municipal finances can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Cold Bay from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$248,547	n/a	\$29,470	\$51,316
2001	\$259,540	n/a	n/a	n/a

¹⁶⁹ Inflation calculated using the 2010 Anchorage CPI from the Alaska Department of Labor: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Infrastructure

Connectivity and Transportation

A state-owned 10,415-ft long by 150-ft wide paved and lighted runway with a 6,235-ft long by 150-ft wide paved crosswind runway, an FAA flight service station, and a seaplane base are available. Cold Bay is a regional transportation center and provides scheduled flights to surrounding communities. The community has a dock but wants to develop a breakwater, boat harbor, and boat launch. Marine cargo services are available monthly from Seattle, but not from Anchorage. The state ferry operates bi-monthly from Kodiak to Cold Bay between May and October. There are approximately 40 mi. of local gravel roads.¹⁷⁰ In 2009, a new Public Lands Bill was signed into law that could allow for the construction of an access road connecting Cold Bay and King Cove in exchange for expansions of the Izembek NWR.¹⁷¹ The price for roundtrip airfare between Cold Bay and Anchorage in June 2012 was \$831.¹⁷²

Facilities

Water is supplied to the community by one well and stored in a 213,000-gal tank. Most residents are connected to a piped water and sewer system. A few homes have individual wells and septic systems. The sewage treatment plant can process up to 45,000 gal a day. Residents transport their own refuse to the landfill, located 1.5 mi north of the community.¹⁷³ In a survey conducted by the AFSC in 2011, community leaders reported that infrastructure projects completed since 2000 or under development include a fish cleaning station, dockside electrical and water utilities, dock improvements, broadband internet access, road improvements, water treatment facilities, landfill improvements, community center improvements, school improvements, telephone service, and post office improvements. There is 650 ft of dock space for transient moorage; however, there is no space available for permanent moorage. Vessels up to 320 ft long can use moorage in Cold Bay. Cold Bay facilities can accommodate the following Coast Guard regulated vessels, rescue vessels, cruise ships, ferries, and fuel barges. The community currently lacks a harbor or breakwater, although there are plans for future development. Fisheries-related businesses and services located in the community include fishing gear sales, small vessel (less than 60 tons) haulout facilities, tackle sales, recreational fishing vessel moorage, bait sales, fish lodges, and boat fuel sales. Residents of Cold Bay typically go to Unalaska, King Cove, and Sandpoint for fisheries-related services and businesses that are not available locally. Public services available in the community include medical services and a public library. Visitor accommodations include the Cold Bay Lodge, Bayview Bed and Breakfast, and the Bearfoot Inn. Public safety services are provided by local State Troopers. Fire and rescue services are provided by the Alaska Department of Transportation and Cold Bay Fire and Rescue.¹⁷⁴

*Medical Services*¹⁷⁵

Anna Livingston Memorial Clinic provides general healthcare and is a Community Health Aid Program site. Nearby King Cove Medical Clinic is a qualified Emergency Care Center.

*Educational Opportunities*¹⁷⁶

Cold Bay School offers preschool through twelfth grade instruction. As of 2011, there were 13 students enrolled and two teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Previous to Alaska's purchase in 1867, American schooners were fishing for cod in the Aleutian Islands and Okhotsk Sea regions. By the end of the nineteenth century, salmon canneries were being established in western Alaska and on the eastern portion of the Alaska Peninsula. No large-scale commercial seafood processing operation was undertaken in the Aleutian area during those years however. In 1916, Pacific American Fisheries, Inc. established a cannery at Makushin Bay, Unalaska. In those days, adverse weather conditions typically kept the small seine fleet close to Unalaska and Umnak islands. Following the 1924 White Act, newly protected fisheries began to proliferate throughout the Aleutian region. The implementation of a 1928 Executive Order removed Akun, Akutan, Tigalda, Umnak, and Unalaska Islands from an earlier established wildlife reserve, opening up further opportunities. The International Packing Company fished the Aleutian area between 1924 and 1942 and operated a floating processor in the regional through 1941. Pink, sockeye, and chum salmon were popular species.¹⁷⁷

Popular commercial fisheries within the Bering Sea and Aleutian Islands Management Area include red king crab, snow crab, walleye pollock, golden king crab, Tanner crab, weathervane scallops, Dungeness crab, Pacific cod, flatfish, sablefish, Pacific salmon, Pacific herring, and halibut. Aerial surveys of Pacific herring biomass began in the Alaska Peninsula and Aleutian Islands region in 1979, when large congregations of herring were documented in coastal waters between Adak and Port Heiden. No herring sac roe harvests have occurred within the Aleutian Islands region due to lack of interest. Herring food and bait fisheries began in the Eastern Aleutian Islands area in 1929, occurring intermittently until 1981, when a Dutch Harbor food and bait fishery began operating annually. In 2004, an exploratory herring fishery was established in the vicinity of Adak Island. This fishery has attracted very little interest, and no harvests have occurred since it was established.¹⁷⁸

Groundfish were first commercially harvested in the Bering Sea and Aleutian Islands (BSAI) region in 1864, when a single schooner fished for Pacific cod in the Bering Sea. Most fishing effort during the early cod fishery was concentrated north of Unimak Island and the Alaska Peninsula. Pacific halibut was commercially harvested within the region as early as the late 1800s as well; however, halibut did not reach North American markets until 1928. Foreign fleets had a large presence within the BSAI region throughout much of the twentieth century, targeting pollock, sablefish, turbot, perch, and other groundfish. Foreign fleets were phased out during the 1980s as fishing fleets became increasingly “Americanized.” Today, walleye pollock is the largest groundfish fishery in the BSAI region in terms of lbs landed and ex-vessel value. Pacific cod is the second largest fishery, followed by various flatfish including arrowtooth flounder, rock sole, and yellowfin sole. Other important commercial species include sablefish, rockfish, and Atka mackerel.¹⁷⁹

Cold Bay’s history is associated with its establishment as a military base; therefore, there was very little historical participation in North Pacific Fisheries. The community’s efforts to diversify its economy following the closure of the military base included commercial fishing as residents began participating in salmon, halibut, and groundfish fisheries. However, in a survey conducted by the AFSC in 2011, community leaders reported that no commercial fishing vessels use Cold Bay as a base of operations during fishing seasons and most residents likely fish out of King Cove. In addition, the community does not participate actively in the fisheries management process in Alaska. In 2010, Cold Bay became eligible for participation in the Community Quota Entity program. However, it has not yet formed a non-profit entity eligible to purchase quota shares. The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.

Cold Bay is located in Federal Reporting Area 610, International Pacific Halibut Commission (IPHC) Regulatory Area 3B, and the Western Gulf of Alaska (GOA) Sablefish Regulatory District.

Processing Plants

According to ADF&G’s 2010 Intent to Operate list, Cold Bay does not have a registered processing plant. The closest seafood processor is located in King Cove.

¹⁷⁹ North Pacific Fishery Management Council. (2012). *Fishery Management Plan for Groundfish of the Bering Sea and Aleutian Islands Management Area*. Retrieved February 4, 2013 from: <http://alaskafisheries.noaa.gov/npfmc/PDFdocuments/fmp/BSAI/BSAI.pdf>.

Fisheries-Related Revenue

The majority of Cold Bay's fisheries-related revenue comes from port and dock usage fees. Revenues from this source increased steadily from \$6,000 in 2000 to \$34,000 in 2010. Other sources of fisheries-related revenue come from a Shared Fisheries Business Tax and Fisheries Resource Landings Tax. In 2010, the community received \$56,153 in fisheries-related taxes and fees, compared to \$21,433 in 2000. In a survey conducted by the AFSC in 2011, community leaders reported that revenue raised by fisheries-related taxes and fees goes towards port infrastructure projects and maintenance. Information regarding fisheries-related revenue trends can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In 2010, 2 residents, or 1.9% of the population, held 4 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 3 residents held 3 CFEC permits. Of the CFEC permits held that year, 50% were for salmon, compared to 100% in 2000; 25% were for groundfish, compared to 0% in 2000; and 25% were for halibut, compared to 0% in 2000. Also in that year, 2 residents held 2 License Limitation Program (LLP) groundfish permits. No residents held Federal Fisheries Permits (FFP) between 2000 and 2010. Residents held 64,445 shares of halibut quota on 1 account between 2006 and 2010. No residents held sablefish or crab quota share between 2010 and when the programs began.

In 2010, 6 residents held commercial crew licenses, compared to 1 in 2000. In addition, residents held majority ownership of 3 vessels, compared 6 in 2000. Of the CFEC permits held that year, 75% were actively fished, compared to 100% in 2000. This varied by fishery from 100% of groundfish and halibut permits, to 50% of salmon permits. Fisheries prosecuted by residents in 2010 included Alaska Peninsula set gillnet salmon, Gulf of Alaska longline miscellaneous saltwater finfish and statewide longline halibut.¹⁸⁰

No landings were reported in the community between 2000 and 2010, although landings were reported by residents. Those landings are considered confidential with the exception of salmon landings in 2001. In that year, residents landed 161,948 lbs of salmon valued at \$79,835 ex-vessel, which amounts to approximately \$0.70 per pound ex-vessel after accounting for inflation¹⁸¹ and without taking species composition into consideration. In a survey conducted by the AFSC in 2011, community leaders reported that an average halibut season lasted July through November, an average coho or sockeye salmon season runs from August through September. Information regarding commercial fisheries trends can be found in Tables 4 through 10.

Recreational Fishing

Recreational fishing has been growing in popularity in Cold Bay as the Izembek NWR continues to draw a diverse range of visitors to the region. While the community's remote location makes travel to Cold Bay costly, the port is capable of handling cruise ships, which visit periodically. In 2010, ADF&G reported there were no active sport fish guide businesses registered within the community, although the Cold Bay Lodge does advertize sportfishing services.¹⁸² Between 2000 and 2010, between 2 and 3 sport fish guide licenses were held in Cold Bay, with the exception of 2008 when only 1 was held. In 2010, residents were sold 62 sportfishing licenses, compared to 57 in 2000; and 72 sportfishing licenses were sold in the community, compared to 82 in 2000. Sportfishing license sales within the community peaked in 2002 at 121.

¹⁸² Cold Bay Lodge. (n.d.). *Homepage*. Retrieved February 17, 2012 from: <http://coldbaylodge.com/default.aspx>.

Cold Bay is located within the Alaska Peninsula and Aleutian Islands ADF&G Harvest Survey Area which includes all Alaskan waters, including drainages, between Cape Douglas and the community of Naknek. In 2010, overall angler days fished totaled 5,297 for saltwater fisheries, compared to 10,534 in 2000; and 33,635 for freshwater fisheries, compared to 44,976 in 2000. In that year, non-Alaska residents accounted for 38.4% of saltwater and 58.4% of freshwater angler days fished, compared to 15.8% and 39.5% in 2000, respectively. According to ADF&G Harvest Survey data, private anglers in Cold Bay target coho, sockeye, pink, and chum salmon, Dolly Varden char, halibut, lingcod, and Pacific cod. There is no kept/released charter information available for Cold Bay. In a survey conducted by the AFSC in 2011, community leaders reported that local recreational anglers on private boats typically target coho and sockeye salmon, and halibut. Information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

Cold Bay is federally designated as rural, and therefore eligible for subsistence harvesting on federal lands. While there is a grocer available in town, subsistence resources are still relied upon as supplies are limited. In a survey conducted by the AFSC in 2011, community leaders reported that residents rely on halibut, salmon, and waterfowl mostly for subsistence. Subsistence participation data is limited, and information on household participation is unavailable. According to species documented by ADF&G, sockeye salmon are harvested the most by residents, followed by coho, chum, pink, and Chinook salmon (Table 13). In 2008, 489 total salmon were reported harvested, compared to 630 reported in 2000. In 2010, 35 residents were issued Subsistence Halibut Registration Certificates (SHARC), compared to 18 in 2003. In that year, 3,760 lbs of halibut were reported harvested, compared to 2,265 reported in 2003. Reported halibut harvests peaked in 2010. In terms of subsistence marine mammal harvest, sea otters were the only species reported in ADF&G records. In 2007, 5 sea otters were reported harvested, compared to 1 reported in 2000. A total of 9 sea otters have been reported harvested between 2000 and 2010. No data are available regarding Steller sea lion, harbor seal, and spotted seal harvests. Information regarding subsistence trends can be found in Tables 12 through 15.

False Pass

People and Place

*Location*¹⁸³

The community of False Pass is located on the eastern shore of the easternmost Aleutian Island, Unimak, on Isanotski Strait, midway between the Bering Sea and the Gulf of Alaska. Located 646 air mi southwest of Anchorage, False Pass encompasses 26.8 sq mi of land and 41.4 sq mi of water. False Pass was incorporated as a Second-class city in 1990, and is under the jurisdiction of the Aleutians East Borough. It is included in the Aleutian Islands Recording District.

*Demographic Profile*¹⁸⁴

In 2010, there were 35 residents, making False Pass the 311th largest community in Alaska out of 352 total communities. Between 1990 and 2010, the population declined by 48.5%. Between 2000 and 2009, the population fell by 35.9%, with an average annual growth rate of -4.2% indicating a steady rate of decline (Table 1).

False Pass is predominately Unangan. In 2010, 77.1% of residents identified themselves as American Indian or Alaska Native, compared to 62.5% in 2000; 20.0% identified themselves as White, compared to 26.6% in 2000; and 2.9% identified themselves as Asian, compared to 0.0% in 2000. Further information regarding racial and ethnic trends within False Pass can be found in Figure 1.

In 2010, the average household size in False Pass was 2.33, compared to 2.90 in 1990 and 2.91 in 2000. In that year, there were a total of 40 housing units, compared to 36 in 1990 and 40 in 2000. Of the households surveyed in 2010, 20% were owner-occupied, compared to 28% in 2000; 18% were renter-occupied, compared to 28% in 2000; 58% were vacant, compared to 40% in 2000; and 5% were occupied seasonally, compared to 5% in 2000. No residents lived in group quarters between 1990 and 2010.

In 2010, the gender makeup in False Pass was 54.3% male and 45.7% female, which was more uneven than both the statewide distribution (52.0% male, 48.0% female) and distribution in 2000 (50.0% male, 50.0% female). The median age that year was 32.8 years, which was lower than the statewide median of 33.8 years, but higher than the 2000 median of 31.5 years.

False Pass' population structure was irregular in both 2000 and 2010. While this may be attributed to a relatively small population size, it may also point towards a transient and variable population. This is supported by False Pass' role as an operating center for the Bristol Bay and Bering Sea fishing fleets.¹⁸⁵ Because of this, it is difficult to discern a trend in the community's

population structure. In 2010, 31.5% of residents were under the age of 20, compared to 37.5% in 2000; 20.2% were over the age of 59, compared to 6.3% in 2000; 40.3% were between the ages of 30 and 59, compared to 45.3% in 2000; and 8.7% were between the ages of 20 and 29, compared to 11.0% in 2000.

Figure 1. Racial and Ethnic Composition, False Pass: 2000-2010 (U.S. Census).

Gender distribution by age cohort was less even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within the 10 to 19 range (8.6% male, 0.0% female), followed by the 20 to 29 (5.8% female, 2.9% male) and 40 to 49 (2.9% male, 0.0% female) ranges. Of those three, the greatest relative gender difference occurred within the 10 to 19 range. Information regarding False Pass' population structure can be found in Figure 2.

In terms of educational attainment, an estimated 100% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall, according to the 2006-10 American Community Survey (ACS).¹⁸⁶ Also in that year, an estimated 60.0% of residents had some college but no degree, compared to an estimated 28.3% of Alaska residents overall. No residents were estimated to hold a post-secondary degree in 2010.

Figure 2. Population Age Structure in False Pass Based on the 2000 and 2010 U.S. Decennial Census.

¹⁸⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*¹⁸⁷

The False Pass area has been inhabited since prehistory by Aleuts or Unangan. At the time of Russian contact during the fur trade in the eighteenth Century, the area had the largest population of Aleuts anywhere in the Aleutian Islands, with twelve Aleut settlements on Unimak Island alone. Disease and war during the Russian fur trade destroyed most of the Aleut settlements in the area, and the Russians consolidated the remnants of the surviving villages into one newly created village on the tip of the Alaska Peninsula on Isanotski Strait, opposite the present community of False Pass. This village was called Morzhovoi.

The P.E. Harris Company from Seattle established a salmon cannery in False Pass in 1919, and the community grew with an increasingly large and diverse population. Alaska Natives immigrated from Akutan, Unalaska, Morzhovoi, Sanak Island, Ikatan and elsewhere, attracted to the opportunities provided by the cannery. A local post office was established at this time. After Alaska became a U.S. Territory, new immigrants, mostly of Scandinavian origin, began to settle in the area. They brought with them commercial fishing and fish preservation technologies, most importantly salting. The first commercial fisheries in the area were thus focused on salted cod and salmon. In addition, hunting and trapping has been an important means of subsistence for the people of False Pass. People from this area have often moved between nearby towns in the area in response to cannery and school closures. History, family ties and social networks continue to provide links between local Native communities in the area, and intra-community cohesion is strong.¹⁸⁸

Isanotski Strait, accessible by vessels up to 200 ft in length, is the major pass between the Gulf of Alaska and the Bering Sea. For this reason, both Isanotski Strait and the community of False Pass have long been called “the Pass” by fishermen from all over southwestern Alaska. Despite its name, there is nothing “false” about the pass; because the north entrance to Isanotski Strait is shallow, it was historically very difficult for non-motorized sailing vessels to navigate the channel, so the sailing ship captains gave it the name “False Pass” and the name stuck. False Pass is situated in a volcanic region, but this is not considered to pose an immediate threat.

Natural Resources and Environment

False Pass lies in the maritime climate zone. Temperatures range from 11 to 55 °F (-12 to 13 °C). Annual snowfall averages 56 inches, with total annual precipitation of 33 inches. Prevailing southeast winds are constant and often strong during winter. Fog is common during summer months.¹⁸⁹ Unimak Island’s maritime climate subjects it to frequent cyclonic storms

¹⁸⁹ See footnote 187.

which cross the Pacific Ocean into the Bering Sea. The warmer Japanese Current regulates what would otherwise be a more frigid climate.¹⁹⁰

False Pass rests on a base of volcanic material which has been subsequently eroded by ice and water over time, even though the eastern end of Unimak Island, where False Pass is located, is the area of lowest volcanic activity on the island. Round Top volcano lies just west of False Pass and dominates the head of the broad glacial valley on which the community was built. Other volcanoes on eastern Unimak Island include Isanotski and Shishaldin peaks. Today, Isanotski is highly eroded and now represents just the core of the older mountain and is locally known as Ragged Jack.¹⁹¹

False Pass is largely surrounded by the Unimak Wilderness Area (designated in 1980) of the Izembek National Wildlife Refuge, which was designated a Globally Important Bird Area in 2001.¹⁹² The landscape of False Pass and Unimak Island is rugged and marked by a young geomorphology that is prone to earthquakes. In fact, the U.S. Geological Survey's Earthquake Hazards Program that has installed a continuously operating drum recorder seismograph in False Pass to monitor earthquake activity in the area. This seismograph is part of a large network of sensors that now make it possible to notify the public very quickly of potential destructive earthquake hazards.¹⁹³

The Bering Sea lowland on the north side of the island consists of a gently sloping plain rising gradually from the sea. The hilly north side is characterized by a dense growth of vegetation and numerous lakes, streams, and marshes.¹⁹⁴ Lowland areas are commonly made up of volcanic ash, unconsolidated sands, silts, and gravel. Upland soils mostly consist of volcanic ash. Organic soils consist of sedge peat and moss.¹⁹⁵ Major vegetation community types found on Unimak Island are consistent with dry coastal and mesic meadows, alpine tundra, and bog environments. Plant species range from grasses and sedges, to herbaceous and deciduous shrub thickets. Willow and green alder populate shrub thickets.¹⁹⁶

Terrestrial mammals found on Unimak Island include caribou, brown bear, wolf wolverine, river otter, red fox, mink, weasels, Arctic ground squirrel, dusky shrew, collared lemming, and root vole. Unimak Island is the only island within the Aleutian chain that supports an indigenous caribou herd. There are many species of birds which nest on Unimak Island; however, two Species of Conservation Concern are present, including the Aleutian Tern and

¹⁹⁶ See footnote 190.

Short-eared Owl. In addition, there is an endemic population of Tundra Swans living on the Island.¹⁹⁷

Fisheries resources in the vicinity include all five species of Pacific salmon, Dolly Varden, steelhead trout, herring, halibut, cod, sablefish, yellowfin sole, walleye pollock, sandlance, and several rockfish species. Shellfish include crab, bidarkis (chitons), octopus, shrimp, razor clam, and sea urchins. Marine mammals include Steller sea lion, walrus, whales, porpoise, sea otter, and seals.¹⁹⁸

According to the Alaska Department of Environmental Conservation (DEC), there were no significant environmental remediation sites active within or around False Pass in 2010.¹⁹⁹

Current Economy²⁰⁰

False Pass' economy, like its neighbors, is reliant on salmon, herring, halibut, and crab fisheries. The local economy is mainly driven by commercial salmon fishing and fishing-related services, and is supplemented by subsistence practices and government. False Pass' central location at the end of the Alaskan Peninsula makes it an important refueling and supply stop for the Bristol Bay, Bering Sea and northern Gulf of Alaska fishing fleets. Top employers in 2010²⁰¹ included: the City of False Pass, Isanotski Corp., Bering Pacific Seafoods LLC, and Aleutians East Borough School District.

In 2010,²⁰² the estimated per capita income was \$25,147 and the estimated median household income was \$19,688, compared to \$21,465 and \$49,375 in 2000, respectively. However, after adjusting for inflation by converting 2000 values into 2010 dollars,²⁰³ the real per capita income (\$28,226) and real median household income (\$64,927), indicating a decline in both individual and household earnings. In 2010, False Pass ranked 106th of 305 communities from which per capita income was estimated, and 278th of 299 communities from which median household income was estimated.

False Pass' small population size may have prevented the American Community Survey from accurately portraying economic conditions.²⁰⁴ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents aged 18 and over earned \$301,674 in

²⁰³ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²⁰⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

total wages in 2010.²⁰⁵ When matched with the total Decennial Census population for 2010, the per capita income equals \$8,619, which is significantly less than the 2010 ACS estimate, suggesting that caution should be used when comparing 2010 ACS and 2000 Decennial Census figures.²⁰⁶ However, it should be noted that False Pass was not recognized as “distressed” by the Denali Commission, which estimated that greater than 30% of residents earned more than \$16,120 in 2010.

According to 2006-2010 ACS estimates, 90% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 20%, compared to an estimated 5.9% statewide, and no residents were estimated to live below the poverty level, compared to an estimated 9.5% of Alaska residents overall. Again, it should be noted that it is possible that the 2006-2010 ACS misrepresented employment figures. According to ALARI estimates, the unemployment in 2010 was 11.8% based on unemployment insurance claimants.²⁰⁷

By industry, most (28.6%) employed residents were estimated to work in professional, scientific, management, administrative, and waste management sectors; followed by retail trade sectors (28.6%); manufacturing sectors (28.6%); and agriculture, forestry, fishing, hunting, and mining sectors (14.3%) (Figure 3). By occupation type, most (28.6%) employed residents were estimated to hold production, transportation, or material moving positions; followed by sales or office positions (28.6%); service positions (28.6%); and natural resources, construction, or maintenance positions (14.4%) (Figure 4). Employment by industry sector varied significantly between 2000 and 2010 (Figure 3); displaying a homogenization of industry employment in 2010, compared to 2000. Again, this may likely be attributed to False Pass’ small population preventing the 2006-2010 ACS from accurately capturing economic conditions. Employment by occupation type may have been affected as well. There were significant proportional declines in the number of management, professional, natural resources, construction, and maintenance positions, while there were significant proportional increases in production, transportation, material moving, and service positions. According to 2010 ALARI estimates, most (41.2%) of those employed worked in local government sectors; followed by financial service sectors (17.6%); manufacturing sectors (11.8%); trade transportation, and utilities sectors (11.8%); and educational and health service sectors (11.8%).

²⁰⁵ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

²⁰⁶ See footnote 201.

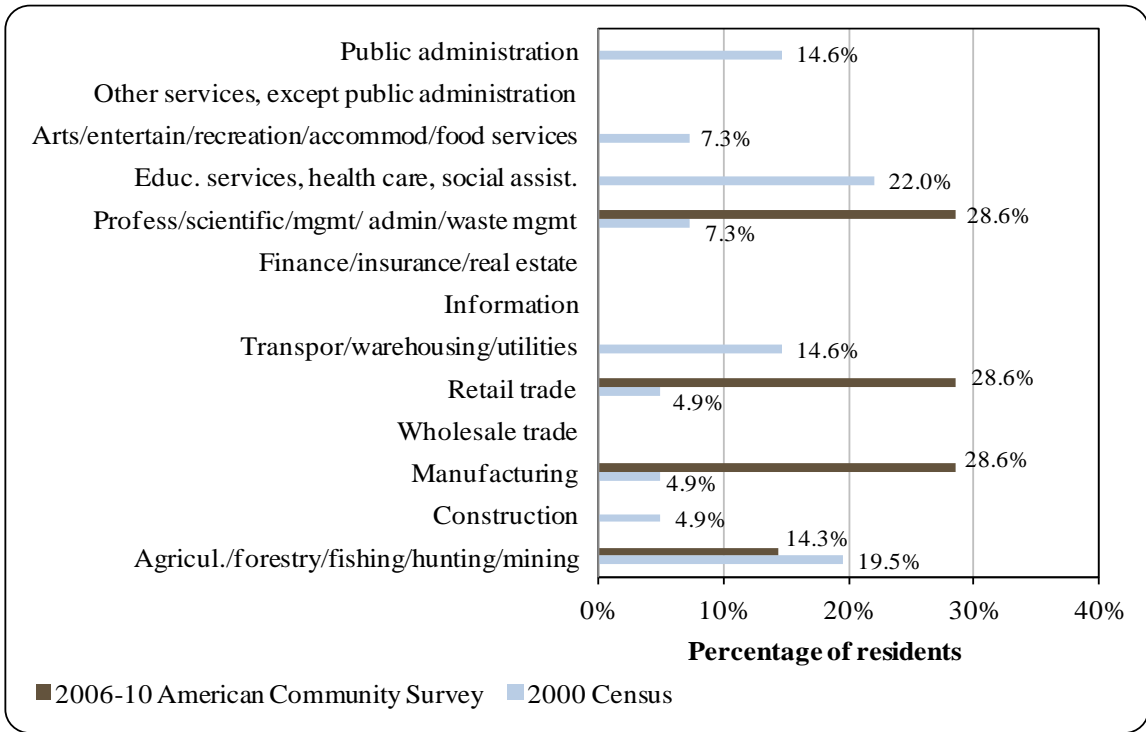

Figure 4. Local Employment by Occupation in 2005-2009, False Pass (U.S. Census).

Governance

False Pass is a Second-class city and was incorporated in 1990. It is governed locally by a mayor and seven-member city council that meets monthly. Taxes in False Pass include a 6% bed tax and a 2% fish tax implemented by the city on local commercial landings and a 3% Sales and Use Tax on goods and services. There is also a 2% raw fish tax from the borough based on all landings in the borough. The Aleutian Pribilof Islands Association, Inc., a federally recognized non-profit tribal organization of the Aleut people in Alaska which contracts with federal, state and local governments, also provides services in False Pass including public safety (Village

Public Safety Officers) and health programs (emergency, elders, behavioral, outreach and advocacy oriented programs).

False Pass is a member of the regional for-profit Aleut Corporation under the Alaska Natives Claims Settlement Act (ANCSA). Isanotski Corporation is the local Native village corporation. The total land entitlement under ANCSA is almost 80,000 acres. The False Pass Tribal Council is federally recognized and eligible for funding and services from the Bureau of Indian Affairs (BIA). False Pass belongs to the Aleutians East Borough, which is responsible for many services.

The nearest National Marine Fisheries Service Regional Office is in Unalaska, as is the nearest Bureau of Citizenship and Immigration Services. The nearest Alaska Department of Fish and Game (ADF&G) office is seasonally located in Cold Bay (between May and October), while the nearest permanent office is located in Unalaska.

Table 2. Selected Municipal, State, or Federal Revenue Streams for False Pass Municipal Government from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$572,853	\$20,299	\$25,946	n/a
2001	\$626,668	\$9,350	\$24,978	n/a
2002	\$579,441	\$6,485	\$24,979	\$2,500,000
2003	\$1,183,061	\$15,970	\$25,507	\$4,000,000
2004	\$1,165,020	\$20,280	n/a	\$10,000,000

⁵ Alaska Department of Community and Rural Affairs. (n.d.). *Community Funding Database*. Retrieved at http://www.commerce.state.ak.us/dca/commdb/CF_Grants.htm. Data retrieved April 15, 2011.

When adjusted for inflation,²⁰⁸ total municipal revenues declined by 37.4% between 2000 and 2010, from \$571,853 to \$464,111. Total revenues peaked in both 2003 (\$1.18 million) and 2004 (\$1.17 million) thanks to sizable capital grants and contributions. In 2010, most locally generated revenues was collected from utility rents, marine service fees, sales taxes, raw fish taxes, and clinic fees. Most outside revenues were generated from state revenue sharing and Aleutian Pribilof Island Community Development Association (APICDA) contributions.

In 2010, sales tax accounted for 6.6% of the total municipal budget, compared to 3.5% in 2000. Also in that year, state allocated Community Revenue Sharing accounted for 21.1% of total municipal revenues, compared to 4.5% from State Revenue Sharing in 2000. Sales tax revenue peaked in 2009 at \$54,797. Fisheries-related federal and state grants awarded between 2000 and 2010 included: \$1.02 million for boat harbor rehabilitation, \$10.5 million for harbor construction, and \$1.5 million for small boat harbor construction. Further information regarding municipal revenues can be found in Table 2.

Infrastructure

Connectivity and Transportation

False Pass is accessible only by air and sea. Its location offers protection from ocean swells, and coves within the pass itself provide safe anchorages during severe weather. The pass is almost always free of sea ice. Unimak Pass, at the western end of Unimak Island, is used only by the largest oceangoing ships; the north channel of Isanotski Strait into the Bering Sea has navigation buoys so that passage is routine and safe. The price for roundtrip airfare between Cold Bay (the closest large airport) and Anchorage in June 2012 was \$831.²⁰⁹ Peninsula Airways provides service to False Pass via Cold Bay. Reeve Aleutian Airways ceased scheduled service to False Pass in 2000.²¹⁰

Facilities

There are no hotels in False Pass, but short-term accommodations are available at the Isanotski Bed and Breakfast, which opened in 1974. Water is derived from a nearby spring and reservoir and is treated and stored in a 60,000-gal tank. Most homes are connected to the piped water system. Residents use individual septic tanks for sewage disposal; the city operates a septic sludge tanker and sludge disposal site. All homes are fully plumbed. Wastewater from seafood processing flows directly into an outfall line. The City collects refuse twice a week. There is a public library and a local post office was established around 1919.²¹¹

The City Dock accommodates the Alaska State Ferry and is also used for general cargo. At the base of the dock are the Isanotski Grocery Store and Tribal Warehouse. Farther north is a recently constructed small boat harbor. Next to the small boat harbor is the Bering Pacific

Seafoods plant (see *Processing Plants* section below). To the north of the processing plant is a gear (crab pot) storage area.²¹²

Medical Services

Local healthcare is provided by the King Cove Medical Clinic, which is operated by the Eastern Aleutian Tribes Inc. Public safety is provided by city police and Village Public Safety Officers associated with the Aleutian Pribilof Islands Association, Inc. Because of its isolated location, False Pass is part of the Southern Emergency Medical Services Region. Emergency Services have coastal and air access. Emergency service is provided by volunteers and health aides. The closest emergency care center is located in Unalaska. The closest major hospital is located in Anchorage.

*Educational Opportunities*²¹³

False Pass is within the Aleutians East School District and in 2011, two teachers instructed 12 students in levels kindergarten through 12th grade at the False Pass School.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries^{214,215}

The residents of False Pass have long been engaged in North Pacific fisheries, beginning with Aleuts or Unangan peoples who fished and continue to fish in the waters surrounding False Pass. Scandinavians, Scots, and other northern Europeans moved into the Eastern Aleutians around the late nineteenth century. Around that time, Sand Point, King Cove, False Pass, and Nelson Lagoon were established around newly formed commercial fisheries. As mentioned earlier, the P.E. Harris & Co. from Seattle established a salmon cannery in False Pass in 1919. That event invoked the growth and diversity of the community. Alaska Natives immigrated from Akutan, Unalaska, Morzhovoi, Sanak Island, Ikatán and elsewhere, attracted to the opportunities provided by the cannery. After Alaska became a U.S. Territory, new immigrants, mostly of Scandinavian origin, began to settle in the area. They brought with them commercial fishing and fish preservation technologies, most importantly salting. The first commercial fisheries in the area were thus focused on salted cod and salmon.

Sockeye salmon caught by fish trap was supplied to the P.E. Harris cannery for many years until traps were outlawed following statehood in 1959. Salmon was also purchased from independent seiners and gillnetters. In 1962, P.E. Harris & Co. changed its name to Peter Pan Seafoods, Inc. The company's regional influence grew in 1965 when it purchased the western operations of Pacific American Fisheries, which included canneries in King Cove and Port Moller.

²¹⁴ Martinson, C. (n.d.). Unimak Area Website. Retrieved July 25, 2012 from: <http://unimak.us/contact.shtml>.

²¹⁵ See footnote 212.

In 1981, the Peter Pan cannery burned, putting an end to salmon processing in False Pass. Following the fire, local salmon fishermen delivered catch to the processing plant in King Cove. Facilities that survived the fire provided support for the salmon fleet until Peter Pan Seafoods closed the property in 2004. In 2008, Bering Pacific Seafoods, LLC began processing salmon in a plant owned by its parent company, APICDA.

Commercial cod fishing began in the late nineteenth century and continued until the middle 1930s when declining cod stocks made it unprofitable to fish commercially. Cod stocks became so depressed that local fishermen could not even catch enough for subsistence purposes. By 1972, cod numbers began to increase, with the most abundant populations near Sanak Island, 15 mi from False Pass. The modern cod fishery developed in 1997, when the state took over cod management in Gulf of Alaska (GOA) waters. The state Board of Fisheries allocates a percentage of GOA cod to smaller pot or jig gear vessels, which along with reducing bycatch, allows smaller entrants more access to the fishery. Important cod fishing areas include the Ikatán-Sanak area outside of False Pass, and Shumagin Island area outside of Sandpoint.

Halibut has been an important subsistence fish in the Eastern Aleutians for thousands of years. However, a commercial halibut fishery did not develop in False Pass until after World War II, when a market for halibut finally developed. Commercial halibut fishing in the North Pacific began in 1888 off the coast of Washington state. Following its inception, the fishery expanded up the Pacific coast through British Columbia, Canada, and Southeast Alaska. Fishing effort was initially conducted by two-person dories that delivered catch to small sailing vessels, where the fish was processed and stored. During the 1920s, the commercial halibut fishery extended to Unimak Pass as schooners began to be outfitted with diesel engines and mechanical gear. The initial False Pass area halibut fishery was conducted by Washington based schooners that would transport their catch directly back to the Seattle area. Halibut stocks were becoming depressed as early as 1915 due to over-fishing. Negotiations by both the United States and Canada led to the signing of the *Halibut Convention of 1923*. However, halibut stocks remained low in years following its signing. The Magnuson-Stevens Fisheries Conservation and Management Act of 1976 helped to quasi-nationalize the fishery; however, derby-style fishing effort was still stressing halibut stocks. An effort to limit access to the fishery in 1982 was met with opposition until 1995 when a halibut quota share system was introduced.

Crab fisheries, like groundfish, are managed by the state within a 3 nautical mile (nmi) zone extending from the coast. Fisheries within the remainder of the 200 mi Exclusive Economic Zone (EEZ) are federally managed. Golden king crab populate areas of high relief along the continental shelf surrounding the Aleutian Islands and Bering Sea. Red king crab is found in abundance within Bristol Bay, as well as along the northern Aleutian Islands region.

ADF&G manages commercial salmon fisheries in the False Pass regions, and local fishermen typically conduct fishing effort within the Northwestern, Southwestern, and Unimak districts. The Limited Entry Salmon Fishing Permit designation for the area is “Area M”. False Pass is involved in the Community Development Quota (CDQ) program under APICDA, which provides mechanisms for the distribution of money from a fishing quota in the Bering Sea to community development initiatives. The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the

Bering Strait and Aleutian Islands region.²¹⁶ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ.

False Pass is located between Federal Reporting Area 610 and 518, and next to International Pacific Halibut Commission (IPHC) Regulatory Area 3B. In addition, it is located adjacent to Western Gulf of Alaska and Bering Sea Sablefish Regulatory Districts.

Processing Plants

Bering Pacific Seafoods is operated by APICDA in False Pass. APICDA's Bering Sea sablefish quota and its Bristol Bay Red King crab quota are processed at the facility, as are sockeye salmon and halibut. APICDA funded a project to extend power and water to the local dock due to the absence of a small boat harbor. It also secured money to construct a boat harbor in False Pass in 2006, which is the location of the present Bering Pacific Seafoods facility. APICDA's other infrastructure projects have included: a gear storage warehouse (owned by the False Pass Tribal Council); improvements to the airport and runway; and development of the False Pass Store, Fuel Farm, and Ship Supply.²¹⁷

Fisheries-Related Revenue

False Pass received fisheries-related revenue from several sources between 2000 and 2010 included raw fish taxes, Shared Fisheries Business Taxes, Fisheries Resource Landings Taxes, and port/dock usage fees. In 2010, the community received a total of \$75,777 in known fisheries-related revenue, mostly from raw fish taxes. This represented a decline in revenues from 2000, when \$277,609 was raised. Known fisheries-related revenue dropped to its lowest level in 2006 before recovering somewhat between 2007 and 2010. Information regarding fisheries-related revenue trends can be found in Table 3. It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget. However, municipal revenue is provided in Table 3 as a reference point.

Commercial Fishing

In 2010, 6 residents, or 17.1% of the total population, held 13 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 12 residents held 25 CFEC permits. Of the CFEC permits held in 2010, 54% were for salmon, compared to 40% in 2000; 15% were for groundfish, compared to 24% in 2000; 8% were for herring, compared to 29% in 2000; 15% were for halibut, compared to 12% in 2000; and 8% were for crab, compared to 0% in 2000. In addition, one resident held one License Limitation Program (LLP) groundfish permit, and two residents held two Federal Fisheries Permits (FFP). Residents held 246,444 shares of halibut quota on three accounts in 2010, compared to 309,631 shares held on three accounts in 2000. In addition, residents held 190,306 shares of sablefish quota in 2001 and

²¹⁶ Fina, M. (2011). Evolution of Catch Share Management: Lessons from Catch Share Management in the North Pacific. *Fisheries*, Vol. 36(4). Retrieved September 12, 2012 from http://www.fakr.noaa.gov/npfmc/PDFdocuments/catch_shares/Fina_CatchShare_411.pdf.

²¹⁷ Aleutian Pribilof Island Community Development Association. (n.d.). *Company Website*. Retrieved September 16, 2011 from: <http://www.apicda.com/>.

70,805 shares in 2000. No residents held crab quota between 2010 and when the program began in 2005.

Residents held 7 commercial crew licenses in 2010, compared to 13 in 2000. Also in that year, residents held majority ownership of 13 vessels, compared to 15 in 2000. Of the CFEC permits held in 2010, 77% were actively fished, compared to 76% in 2000. This varied by fishery from 100% of halibut and crab permits, to 86% of salmon permits, 50% of groundfish permits, and 0% of herring permits. Fisheries prosecuted by False Pass residents in 2010 included: Alaska Peninsula pot Tanner crab, statewide longline halibut, GOA miscellaneous saltwater finfish, and Alaska Peninsula purse seine, drift gillnet, and set gillnet salmon.²¹⁸ Landings made in False Pass between 2000 and 2010 are considered confidential; however, 31 vessels made landings in the community, compared to 8 in 2000. No landings were made in 2003, 2005, 2006, 2007, and 2008. In 2010, False Pass ranked 46th out of 67 communities that received landings that year and 45th overall in terms of total ex-vessel revenue earned.

Landings by False Pass residents in were considered confidential in 2010, with the exception of salmon landings. In that year, residents landed 992,925 lb of salmon valued at \$523,854 ex-vessel; compared to 1.11 million pounds valued at \$507,312 ex-vessel in 2000; a decline of \$0.10 per pound landed after adjusting for inflation²¹⁹ and without considering the species composition of landings. In addition, residents landed 986,694 lb of Pacific cod valued at \$234,049 in 2004. Further information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Early in the 2000-2010 period, one sport fish guide business was reported to be active in False Pass. However, beginning in 2002, no active sport fish guide businesses were registered in the community. No sportfishing licenses were sold locally between 2000 and 2010. The number of sportfishing licenses purchased by False Pass residents, irrespective of the location of the point of sale, declined from 13 in 2000 to 1 in 2010. The minimal recreational fishing activity reported in False Pass may be due in part to the remoteness of the community and the infrequency of transportation from larger population centers. Additionally, the community does not have the facilities to support a significant tourism industry.

False Pass is located within the Alaska Peninsula and Aleutian Islands Recreational Harvest Survey Area which includes all Alaskan waters, including drainages, between Cape Douglas and the community of Naknek. Although there is no sportfishing in False Pass itself, there is data showing the presence of sportfishing in this region. In 2010, there were a total of 5,297 saltwater and 33,635 freshwater angler days fished in the region, compared to 10,534 and 44,976 in 2000, respectively. In that year, non-Alaska residents accounted for 38.4% of saltwater and 58.4% of freshwater angler days fished in the region, compared to 15.8% and 39.5% in 2000, respectively. Further, information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

Many residents of False Pass supplement their incomes and diet with subsistence resources. Unimak Island host a diverse range of terrestrial and aquatic fauna (*see Natural Resources*) available for subsistence use. Local subsistence flora includes cow parsnip, purple orchid, wild rye grass, and monks hood.²²⁰ According to data reported by (ADF&G), there has been considerable subsistence harvest of chum, coho, sockeye, and pink salmon species. In 2008, residents reported harvesting 228 salmon, compared to 1,437 in 2000. Reported salmon harvests peaked in 2003 at 2,582 fish. Reported salmon harvests varied greatly between 2000 and 2008; however, 2007 and 2008 marked years of significant decline in harvests compared to previous years. Between 2003 and 2010, residents of False Pass also relied on Subsistence Halibut Registration Certificates (SHARC) issued by NMFS. In 2010, one SHARC was issued and fished, a decline compared to 13 issued and 9 fished in 2003. In that year, an estimated 200 lb of halibut were harvested, compared to 1,752 in 2003. Estimated halibut harvests peaked in 2004 at 2,337 lb harvested on 10 SHARC. In terms of subsistence marine mammal harvests, an estimate of 21 total harbor seals were harvested between 2000 and 2005, with an average of 3.5 harbor seals harvested each year.

According to ADF&G *Community Subsistence Information System* data,²²¹ residents of False Pass have historically harvested or used butter clams, chitons, cockles, Dungeness crab, hair crab, king crab, limpets, mussels, Pacific littleneck clams, razor clams, scallops, sea urchin, shrimp, snails, softshell clams, Tanner crab, fur seal, gray whale, Steller sea lion, burbot, capelin, Dolly Varden, flounder, greenling, herring, herring spawn on kelp, Pacific cod, Pacific tom cod,

King Cove

People and Place

*Location*²²²

King Cove is located on the south side of the Alaska Peninsula, on a sand spit fronting Deer Passage and Deer Island. It is 18 miles southeast of Cold Bay and 625 miles southwest of Anchorage. King Cove is in the Aleutians East Borough and the Aleutian Islands Recording District. The City's area encompasses 25.3 square miles of land and 4.5 square miles of water.

*Demographic Profile*²²³

In 2010, there were 938 residents in King Cove, making it the 70th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population increased by 108%. Between 2000 and 2010, there was an average annual growth rate of 18.4%, which was significantly above the statewide average of 0.75% (Table 1). It is important to note that, in a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that the 2010 Decennial Census population count may have been inflated, including approximately 400 individuals that do not reside in the community permanently. Community leaders estimated 450 permanent residents in 2010.

In 2010, the greatest number of King Cove residents identified themselves as American Indian and Alaska Native (38.4% of the total population), along with 36.5% that identified as Asian, 16.2% identifying as White, 4.6% identifying with two or more races, 3.2% as 'some other race', and 1% identifying themselves as Black or African American (Figure 1). In addition, 11.2% of residents identified as Hispanic or Latino in 2010. The percentage of the population identifying as Asian increased by 36.2% between 2000 and 2010 although the most significant increase was with the percent of the population identifying as Hispanic or Latino which increased by over 50%. During this same time period, the percentage of the population identified as American Indian and Alaska Native declined by nearly 18%.

In 2010, the average household size in King Cove was 2.76, a slight decline from 2.9 persons per household in 1990 and 2000. The decline in household size may be related to the growth in number of households in King Cove over this period, increasing from 144 occupied housing units in 1990 to 170 in 2000, and 181 occupied housing units in 2010. Of the 229 housing units surveyed for the 2010 Decennial Census, 41.9% were owner-occupied households, 37.1% were renter-occupied households. In that same year, 48 housing units were vacant, compared to 37 in 2000. The number of King Cove residents living in group quarters increased over this period, from 189 in 1990 to 299 in 2000, and 438 in 2010.

Figure 1. Racial and Ethnic Composition, King Cove: 2000-2010 (U.S. Census).

In the 2011 AFSC survey, community leaders reported that King Cove's population reaches a yearly peak between June and August and peaks again between February and March. They indicated that these population fluctuations are entirely driven by employment in fishing sectors. Community leaders indicated that the 2010 Decennial Census count of 938 included approximately 450 year-round residents, while a seasonal workforce and transient population made up the remainder. In 2010, the gender makeup of King Cove's population (based on the U.S. Census) was 61.5% male and 38.4% female – substantially more weighted towards males than the gender distribution statewide (52.0% male, 48.0% female). It is of note that the population was much more balanced between males and females in 2000 (51.3% male, 48.7% female). The median age was estimated to be 41.2 years, higher than both the U.S. national average of 36.8 years and the median age for Alaska of 33.8 years.

Compared with 2000, the population structure in 2010 was somewhat more constricted amongst the youngest and oldest age groups while becoming less constricted amongst the middle age group. In that year, 17.8% of residents were under the age of 20, compared to 24.5% in 2000; 11.0% were over the age of 59, compared to 7.2% in 2000; 53.6% were between the ages of 30 and 59, compared to 52.6% in 2000; and 17.3% were between the ages of 20 and 29, compared to 15.7% in 2000. Age distribution by gender cohort continued to be skewed towards males in 2010, as it was in 2000. In 2010, the greatest absolute gender difference occurred within the 20 to 29 age range (12.5% male, 4.8% female), followed by the 40 to 49 (14.6% male, 8.0% female) and 50 to 59 (11.4% male, 6.9% female) ranges. Two age groups – those 70 to 79 and 10 to 19 – had perfectly matched gender distributions in 2010. Further information regarding trends in King Cove's population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)²²⁴ estimated that 71.8% of residents aged 25 and over held a high school diploma or higher degree in 2010, significantly less than the estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 9.9% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 18.3% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 17.3% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; 12.1% of resident held a Bachelor's degree, compared to an estimated 17.4% of Alaskan residents overall; and 1.6% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

²²⁴ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Figure 2. Population Age Structure in King Cove Based on the 2000 and 2010 U.S. Decennial Census.

History, Traditional Knowledge, and Culture

Archaeological evidence suggests that Aleut (Unanga and Alutiiq) peoples have occupied the Alaska Peninsula for approximately 9,000 years.^{225,226} Excavation of a village site near the middle of King Cove suggests that Aleut people have been utilizing this site for at least 4,000 years.²²⁷ King Cove was named after the first recorded settler, a man named Robert King, who had settled there in the early 1800s. The site was originally called ‘King’s Cove’, and the name

was eventually shortened to ‘King Cove’.²²⁸ The modern community of King Cove grew starting in 1911, the year that Pacific American Fisheries (PAF) built a salmon cannery. Early settlers were Unangan, Scandinavian, and other European fishermen. Of the first 10 founding families, 5 had a European father and an Aleut mother.²²⁹ Many of these early settlers were employed at the King Cove cannery, and Aleut people came from neighboring villages of Belkofski, Sanak, and False Pass to work in the cannery and purchase supplies.²³⁰ A Chinese workforce was also brought to King Cove to work in the cannery. In 1965, the major portion of PAF’s assets was sold to a consolidated firm of Peter Pan Seafoods and Taiyp Gyogyo KK.²³¹ The cannery was partially destroyed by a fire in 1976.²³² Today, Peter Pan Seafoods continues to operate the King Cove facility, which currently has the largest salmon canning capacity of any plant in Alaska.²³³ King Cove remains economically tied to commercial fishing and fish processing, as well as traditional subsistence practices.²³⁴

The City of King Cove first incorporated as a 2nd Class City in 1947, and gained 1st Class City status in 1974. Development in King Cove was initially concentrated near the head of the cove, and in recent years it has expanded into a small valley southeast of the cove.²³⁵ Scandinavians have historically influenced the cultural, economic, and social structures in the community, and today King Cove is a mixed non-Native and Unangan Aleut community.²³⁶

Natural Resources and Environment

King Cove lies in the maritime climate zone. Temperatures average 25 to 55 °F, with extremes from -9 to 76 °F. Annual snowfall averages 52 inches, and total annual precipitation averages 33 inches. Fog during summer and high winds during winter can limit accessibility.²³⁷ The landscape surrounding King Cove is dominated by a series of mostly glaciated volcanoes, and the coastline is characterized by rocky headlands and sandy beaches.²³⁸

King Cove is located at the southern boundary of the Pavlof Unit of the Alaska Peninsula National Wildlife Refuge (NWR). Other protected areas in the vicinity of King Cove include the Alaska Maritime NWR, which includes islands off the southern coast of the Alaska Peninsula, and the Izembek National Wildlife Refuge (NWR) to the north and west of the community. The Alaska Peninsula NWR and Alaska Maritime NWR were both established under the Alaska National Interest Land Conservation Act (ANILCA) of 1980. With a total area of 3.7 million acres, the Alaska Peninsula NWR extends as far west as False Pass and east beyond Chignik

Bay, and includes a separate eastern unit south of Ugashik. It hosts a dramatic landscape of towering mountain peaks, including a number of active volcanoes, rolling tundra, and rugged coastlines. Salmon return to the rivers of the Alaska Peninsula NWR, supporting brown bear populations. Other land mammals include wolverine, the 7,000-animal Northern Alaska Peninsula caribou herd, wolves, and moose. It is of note that no black bears are found in the Alaska Peninsula NWR. Marine mammals living along the coastline include sea otters, harbor seals, sea lions, and migrating whales. The Alaska Peninsula NWR also provides important habitat for migrating birds.²³⁹

The Alaska Maritime NWR hosts a similar array of species in the Alaska Peninsula region. However, it contains a greater diversity overall, as it spans four time zones,²⁴⁰ stretching from the Aleutian Islands to the Southeast Alaska Panhandle. It was created in part to promote a program of scientific research on marine ecosystems. The Alaska Maritime NWR “protects breeding habitat for seabirds, marine mammals, and other wildlife on more than 2,500 islands, spires, rocks, and coastal headlands.”²⁴¹

The 417,533-acre Izembek NWR was established in 1960 as “a refuge, breeding ground, and management area for all forms of wildlife.” The Izembek NWR hosts the Pavlof and Shishaldin Volcanoes and Izembek Lagoon. The Lagoon provides habitat for an extraordinary abundance and diversity of waterfowl and shorebirds, and was the first site in the United States to be designated a Wetland of International Importance by the Ramsar Convention in 1986, and in 2001 was also designated a Globally Important Bird Area by the American Bird Conservancy. In addition to providing critical habitat for hundreds of thousands of migrating birds, the Izembek NWR supports a similar range of animal species as the Alaska Peninsula NWR.²⁴²

Deposits of gold and silver and copper are known to be present in the region between False Pass and Belkofski, but there are currently no active mining operations. There are no significant deposits of coal in the area, and land-based oil and gas potential is not well known.²⁴³ Reserves of oil and natural gas are thought to be present on the outer continental shelf in the Bristol Bay Basin along the northern edge of the Aleutian Islands and Alaska Peninsula. However, given the importance of Bristol Bay fisheries to the nation and the proximity of the Bristol Bay Basin to a number of protected areas, in March 2010, Secretary of the Interior Ken Salazar removed the area from oil and gas leasing for the 2007-2012 program.²⁴⁴ On March 31,

2010, President Obama withdrew the Bristol Bay area of the North Aleutian Basin from oil and gas leasing, whether for exploratory or production purposes, through 2017.²⁴⁵

Natural hazards with the potential to impact King Cove include earthquakes, volcanic activity, tsunami, severe weather, and erosion, with high probability of earthquake or volcanic eruption, moderate probability of tsunami or severe weather, and low probability of erosion. The possible damage from an earthquake, volcanic eruption, or tsunami is considered to be critical, with potential to result in complete shutdown of critical facilities for more than one week, or in which more than 10% of property would be severely damaged. Possible damage from severe weather or erosion is considered to be limited. Areas of King Cove that are most susceptible to erosion include one-half mile of road along Gould's Lagoon and the main road to the small boat harbor, which has been washed out by tidal activity in the past. The road along Gould's Lagoon is currently armored against coastal erosion.²⁴⁶

According to the Alaska Department of Environmental Conservation, no active environmental cleanup sites were located near King Cove as of August 2012.²⁴⁷

Current Economy²⁴⁸

In the 2011 AFSC survey, community leaders indicated that 75% of economic activity in King Cove is based on direct and indirect fishing activity. Between 2000 and 2010, the number of commercial fishery permit holders, crew license holders, and vessel owners residing in King Cove all declined, but all of these numbers represented a large percentage of the population. On average over the 2000-2010 period, the number of state permit holders was equivalent to 7.8% of the local population, the number of vessel owners was equivalent to 10.2%, and the number of crew license holders was equivalent to 19.2%. Subsistence activities supplement local incomes. Primary subsistence resources harvested include salmon, caribou, geese, and ptarmigan.²⁴⁹

Based on household surveys conducted for the 2006-2010 ACS,²⁵⁰ in 2010, the per capita income in King Cove was estimated to be \$22,038 and the median household income was estimated to be \$50,500. This represents a decrease from the per capita reported in 2000 (\$17,791) and a slight increase from the median household income reported in 2000 (\$45,893). However, if inflation is taken into account by converting the 2000 values to 2010 dollars,²⁵¹ both per capita and median household incomes appear to have decreased over the decade, from a real per capita income in 2000 of \$23,395 and a real median household income of \$60,349. In 2010,

²⁵⁰ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²⁵¹ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

King Cove ranked 135th of 305 Alaskan communities with per capita income data, and 130th in median household income, out of 299 Alaskan communities with household income data that year.

Although King Cove's small population size may have prevented the ACS from accurately portraying economic conditions,²⁵² additional evidence for a decrease in per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for King Cove in 2010 is \$5,900.^{253,254} However, despite this evidence for a decline in income between 2000 and 2010, King Cove did not meet the Denali Commission's criteria as a "distressed community" in 2010. It is important to note that community leaders indicated in the 2011 AFSC survey that the 2010 Decennial Census population count may have been inflated, including approximately 400 individuals that do not reside in the community permanently. If this is the case, this ALARI per capita income estimate may be low. However, if community leaders' estimate of 2010 population (450 permanent residents) is used instead to calculate per capita income, the figure still remains much lower than the ACS estimate for 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a greater percentage of King Cove residents were estimated to be in the civilian labor force (87%) than in the civilian labor force statewide (68.8%). In the same year, 10% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate was estimated to be 0.2%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment, based on the ALARI database, indicates that the unemployment rate in King Cove was much higher in 2010 (19.3%), almost twice the statewide unemployment rate estimate of 11.5%.²⁵⁵ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Also based on the 2006-2010 ACS, a majority of the King Cove workforce was estimated to be employed in the private sector (89.5%), along with 7.9% in the public sector, and 2.4% estimated to be self-employed. Of the 506 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number was estimated to be working in manufacturing (83%), and some were also estimated to be working in educational services, health care, and social assistance (5.7%), public administration (3.2%), retail trade (2.6%), and agriculture, forestry, fishing, hunting, and mining (2.4%), along with very small numbers in other industries (Figure 3). The number of individuals employed in fishing industry is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. Between 2000 and 2010, local employment by industry became more heavily concentrated, with 24.3% more of the employed workforce estimated to be employed in

²⁵² While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²⁵⁴ See footnote 250.

²⁵⁵ See footnote 253.

manufacturing in 2010. At the same time, the percentage of the local workforce estimated to be employed declined.

By occupation type, 2006-2010 ACS estimates indicate that a majority (73.3%) of employed residents hold production, transportation, or material moving positions, along with 9.9% holding service occupation positions, 6.5% with management or professional positions, 5.5% with sales and office positions, and 4.7% with natural resources, construction, or maintenance positions (Figure 4). As with employment by industry sector, employment by occupation type became more concentrated between 2000 and 2010, with 20% more of the labor force employed in production, transportation, and material moving occupations in 2010 compared to 2000, and a commensurate decrease in the percentage employed in all other occupation categories. Data reported in the ALARI database supports ACS estimates, suggesting that the most common occupations in King Cove were production, transportation, or material moving positions, meat processors, and fish workers. Other common occupations in King Cove in 2010 included educational, housekeeping, health, or administrative services, and mechanical and maintenance workers.²⁵⁶ It is important to note that ALARI statistics shows the highest percentage of the workforce involved in local government, while the ACS estimates that the vast majority of the workforce is employed in manufacturing. As noted earlier in this section, in the 2011 AFSC survey, community leaders reported that the 2010 Decennial Census population figure may have been overestimated by almost 400 individuals. This could account for conflicts in labor force and industry employment figures between the 2006-2010 ACS and the 2010 ALARI database.

Figure 4. Local Employment by Occupation in 2000-2010, King Cove (U.S. Census).

Governance

King Cove is a 1st Class City located in the Aleutians East Borough. Incorporated in 1947, King Cove has “Strong Mayor” form of government, which includes a mayor, a seven-person city council, seven-person school board, five-person planning commission, and a number of municipal employees. The City administers a 4% sales tax and a 2% fish tax, and the Borough also collects a 2% fish tax. In addition, the City collects a \$100,000 Fisheries Business Impact Tax.²⁵⁷ In the 2011 AFSC survey, community leaders reported that the Fisheries Business Impact Tax is collected from Peter Pan Seafoods, and is used to support the City’s General Fund, providing police, emergency response, and public works funding.

Annual municipal revenue appears to have stayed relatively stable from 2000 to 2005, averaging almost \$1.5 million per year, with an almost 50% increase from 2005 to 2006, followed by an average of almost \$2.5 million between 2006 and 2010. Total sales tax revenues varied between \$434,863 in 2004 and \$1,775,000 in 2009. King Cove also received approximately \$25,000 per year in State Revenue Sharing contributions from 2000 to 2003, and Community Revenue Sharing contributions of \$16,994 in 2008 and just over \$130,000 per year in 2009 and 2010.

In addition, King Cove received a variety of fisheries-related grants between 2000 and 2010. In 2000 and 2001, the Alaska Department of Commerce, Community, and Economic Development’s Division of Community and Regional Affairs (DCRA) granted the community \$25,000 per year for construction of a harbor house and warehouse. Funds were also received in 2000 and 2001 for development of an access road to Lenard Harbor; \$26,663 were supplied by the Denali Commission in 2001, and a private funding source granted \$34,500 in 2001. Funds for upgrades to the north boat harbor were received from various sources from 2007 to 2009, including \$440,000 in 2007 and \$400,000 in 2008 from the DCRA, \$93,500 in 2007 and \$59,000 in 2008 from the State of Alaska, \$1.5 million from the Denali Commission in 2009, and \$3 million from the Alaska Department of Transportation and Public Facilities (DOT&PF) in 2009.

²⁵⁷ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

For information on selected municipal, state, and federal revenue streams between 2000 and 2010, see Table 2.

King Cove was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity recognized by the Bureau of Indian Affairs (BIA) is the Agdaagux Tribe of King Cove. The Native village corporation is the King Cove Corporation, which manages 128,646 acres of land.²⁵⁸ King Cove belongs to the Aleut Corporation, the regional Native corporation of the eastern Alaska Peninsula and Aleutian Islands.²⁵⁹

King Cove is also a member of the Aleutian Pribilof Islands Association (APIAI), one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.²⁶⁰ APIAI provides services including cultural heritage, health, education, social, psychological, employment, vocational training, environment, natural resources, and public safety services.²⁶¹

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of King Cove from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$1,477,300	\$1,011,597	\$26,857	\$51,633
2001	\$1,539,000	\$1,165,613	\$25,885	\$59,500
2002	\$1,270,500	\$636,720	\$25,881	n/a
2003	\$1,055,000	\$926,188	\$26,020	n/a
2004	\$1,464,500	\$434,863	n/a	n/a
2005	\$1,760,616	\$1,370,134	n/a	n/a
2006	\$2,585,615	\$1,636,507	n/a	n/a
2007	\$2,163,000	\$1,506,588	n/a	n/a
2008	\$2,364,500	\$1,820,357	\$16,994	\$533,500
2009	\$2,565,500	\$1,775,000	\$134,260	\$459,000
2010	\$2,585,850	\$1,615,925	\$133,312	\$4,500,000

The closest regional office of the Alaska Department of Fish and Game (ADF&G) is located in Sand Point. Kodiak has the nearest National Marine Fisheries Service (NMFS) office, including a NOAA Fisheries Sustainable Fisheries Division and Enforcement Office, as well as the nearest office of the Alaska Department of Natural Resources. The nearest Alaska Department of Commerce, Community, and Economic Development office is in Dillingham, and the closest offices of the U.S. Bureau of Citizenship and Immigration Services are located in Unalaska and Kodiak. However, the Anchorage offices of these agencies may be more accessible to people from the Alaska Peninsula region.

Infrastructure

Connectivity and Transportation

King Cove is accessible by air and sea only. A state-owned 3,500 feet long by 100 feet wide gravel runway is available. Gale force crosswinds are common, as the airport lies in a valley between two volcanic peaks. Currently a hovercraft provides regular service to nearby Cold Bay, which enjoys more stable flying conditions. Cold Bay Airport also has a longer runway allowing the airport to handle larger planes.²⁶² Scheduled air service is available to King Cove with Peninsula Airways, connecting through Cold Bay. As of September, 2012, roundtrip airfare between King Cove and Anchorage was \$1,226.²⁶³ However, flights from King Cove to Cold Bay are canceled about 50% of the time due to thick fog or high winds.

A high priority for local transportation has long been construction of an access road between King Cove and Cold Bay to provide a more reliable link to the outside world during emergencies. In 2004, construction began on a combined road and hovercraft system to provide better access between King Cove and Cold Bay via a temporary hovercraft terminal north of King Cove at Lenard Harbor. Completion of this initial phase of the project was expected by September, 2012.^{264,265} As of the Fall of 2012, the City of King Cove awaited a final decision on a proposed land transfer that would allow the access road to be extended directly to Cold Bay. The land transfer would increase the size of the Izembek and Alaska Peninsula NWRs in exchange for the 206 acres needed to construct a single-lane road corridor.²⁶⁶ A final decision from the U.S. Secretary of the Interior was expected sometime between November 2012 and January 2013.²⁶⁷ The City of King Cove currently maintains approximately 5.65 miles of local

roads and 4.5 miles of state road between the City and the airport. The airport road was paved in 2004, and there are plans for primary local roads to be paved.²⁶⁸

In addition to air travel and limited road access, the state ferry provides bi-monthly service to King Cove between May and October. As of summer 2012, a roundtrip fare from Homer to King Cove on the Alaska state ferry was \$512, and roundtrip between King Cove and Dutch Harbor was \$214.²⁶⁹ Peter Pan Seafoods allows the ferry and marine cargo services to use one of its three docks for a fee. One of the other two docks owned by Peter Pan is used for off-loading fish and transferring supplies to tenders and the fishing fleet, and the final dock is used as a fuel dock. In addition, one public deep-water dock is available in King Cove. The dock can be used by fuel and cargo barges, the state ferry, and large fishing vessels. In addition, a new harbor south of the city dock was constructed in 2000.²⁷⁰ The new harbor is operated by the City and provides additional moorage for larger vessels ranging between 60 and 150 feet in length.²⁷¹

Facilities

Water in King Cove is derived from Ram Creek using a sheet pile dam that stores about 980,000 gallons of unfiltered water. The City of King Cove operates water and sewage systems. A piped sewage collection system connects all homes and facilities to central septic tanks. Two lift stations and tanks provide primary (20,000 gallons) and secondary treatment (84,000 gallons) of waste, with discharge through an outfall line. All residents are connected to the piped water system, and all homes are fully plumbed.²⁷² In the 2011 AFSC survey, community leaders reported that King Cove has made substantial investment in utilities in the last two to three decades, including water and sewer pipelines, water and sewage treatment, roads and airport infrastructure, police, fire and emergency response, landfill, the school, community center, telephone service, and alternative energy sources.

Since initial construction in 1995, a hydroelectric facility on Delta Creek has provided a majority of electricity to the community of King Cove, along with three backup diesel generators.²⁷³ Upgrades to the Delta Creek hydroelectric plant were completed in 2008,²⁷⁴ and as of August 2012, construction had begun on an additional hydroelectric facility at Waterfall Creek, with an expected completion date of late 2013.²⁷⁵ The Peter Pan Seafoods facility operates its own power source and is not connected to the city electrical grid. The City collects garbage twice a week before depositing it in an unpermitted, Class 3 landfill.²⁷⁶ The City of King Cove actively promotes waste reduction and recycling in the community to help alleviate

²⁷⁶ See footnote 270.

pressure on the landfill, which is nearing capacity.²⁷⁷ Recycling is currently provided for aluminum only, and expansion of the recycling program to include plastics, glass, paper, and cardboard is desired.²⁷⁸

Community facilities in King Cove include a community center, public library, recreation center, and a teen center. Safety services are provided by the city police department, a Village Public Safety Officer in King Cove and state troopers posted in Dillingham. The City also maintains its own volunteer fire and rescue squad. Visitor accommodations are provided by B-N-W Bed and Breakfast.²⁷⁹ In a survey conducted by the AFSC in 2011, community leaders reported that King Cove also has a post office and that telephone and broadband internet service are both in place. Cable service is also available locally.²⁸⁰

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that 3,700 feet of dock space is available for permanent vessels to moor at in King Cove. An additional 4,000 feet of dock space is available to transient vessels for mooring. Community leaders reported that vessels up to 150 feet long can use moorage, and that the community can handle rescue vessels (e.g., Coast Guard), cruise ships, ferries, and fuels barges. According to community leaders, new dock space has been constructed within the last 10 years, along with upgrades to existing dock structures, including addition of water and electricity serving the dock. Also within the last 10 years, a barge landing area and breakwater were completed, and fuel tanks were also made available at the dock. Community leaders also noted substantial investments in fisheries-related infrastructure prior to the last 10 years, including construction of a jetty, dry dock space, haul out facilities, and roads serving dock space. Today, community leaders also noted the presence of multiple fishing support businesses in King Cove, including fishing gear sales and repairs, tackle and bait sales, bookkeeping, boat fuel sales, dry dock storage, and boat repair services. The extent and availability of these services vary with the season. Community leaders indicate that residents typically travel to the cities of Homer, Kodiak, and Unalaska (Dutch Harbor) to access fisheries-related businesses and services not found in King Cove.

Medical Services

The King Cove Medical Clinic provides basic medical services in King Cove. The clinic is a qualified Emergency Care Center and a Community Health Aide Program site. Emergency Services have limited marine and air access. Emergency service is provided by 911 Telephone Service volunteers and the local health aide.²⁸¹ The nearest hospitals are located in Dillingham and Kodiak.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the King Cove area for thousands of years. Villages and fish camps were often located at mouths of streams for access to both fresh water and abundant salmon runs.²⁸³ During Alaska's Russian period, salmon remained a subsistence resource, but soon after the purchase of Alaska by the United States in 1867, commercial exploitation of salmon was initiated.²⁸⁴ Herring was one of the earliest commercial fisheries, along with salmon, during the period when the product was salted for storing and shipment to be used for human consumption. Commercial harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s.²⁸⁵ Halibut and groundfish fisheries began to develop in the Alaska Peninsula region by the 1920s with the development of diesel engines, which allowed fishing vessels to undertake longer trips.^{286,287}

The first salmon saltery was built in Alaska in 1868, and the first cannery was established in 1869.²⁸⁸ The modern community of King Cove grew around a PAF cannery that began operations there in 1911. Fishing and processing jobs attracted a mixed population of Unangan Aleut from the surrounding region, Scandinavians and other European fishermen. A Chinese workforce was also brought in to operate the cannery in its early years. In 1965, the major portion of PAF's assets was sold to a consolidated firm of Peter Pan Seafoods and Taiyp Gyogyo KK.²⁸⁹ The facility operated continuously until 1976, when it was partially destroyed by fire. Today, Peter Pan Seafoods continues to operate the King Cove facility, which is currently the largest salmon cannery in North America.^{290,291} Peter Pan Seafoods added crab processing as a strong secondary species at the King Cove facility, as well as halibut, cod, and pollock.²⁹² In addition to fisheries for these species, the King Cove fishing fleet has participated in fisheries for a variety of groundfish species, herring, octopi/squid, and sablefish in recent years.

Pacific halibut fisheries are managed under the International Pacific Halibut Commission. In 1995, management of Alaskan halibut and sablefish fisheries shifted from limited entry to a system of Individual Fishing Quotas (IFQ). Motivations for the shift included overcapitalization, short seasons, and the derby-style fishery that led to loss of product quality and safety concerns. As a result of program implementation, the number of shareholders and total vessels participating in the halibut and sablefish fisheries declined substantially, and product quality has improved. This shift to catch shares has been controversial, raising concerns about equity of catch share allocation, reduced crew employment needs, and loss of quota from coastal communities to outside investors.²⁹³

Groundfish and crab fisheries that occur within three nautical miles (nmi) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond three nm in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction.²⁹⁴ In the Gulf of Alaska (GOA), federally-managed groundfish fisheries target Pacific cod, walleye pollock, pelagic shelf rockfish, sablefish, and flatfish. Major state groundfish fisheries in the Alaska Peninsula region include a jig fishery for black rockfish out of Unalaska and a Pacific cod fishery, in addition to a statewide lingcod fishery, and a sablefish fishery in state waters for non-federal sablefish quota share holders. Management plans for state-waters fisheries are approved by the Alaska Board of Fisheries (BOF), and guideline harvest limits (GHL) are set by the ADF&G. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, the ADF&G manages lingcod fisheries in both state and EEZ waters off Alaska, and beginning in 1998, management of black rockfish and blue rockfish in the GOA was transferred from NMFS to ADF&G.²⁹⁵

Both Bristol Bay and the Kodiak area were historical centers of the red king crab fishery. Tanner crabs are also distributed through the GOA. The range of Dungeness crabs includes the Alaska Peninsula, eastern Aleutians, and Kodiak Island. Bering Sea and Aleutian Islands crab stocks are jointly managed by the North Pacific Fishery Management Council (NPFMC) and ADF&G, while GOA stocks are solely managed by the State of Alaska.^{296,297} The Kodiak red king crab fishery has been closed in recent years due to low abundance. However, parts of the Kodiak district have been open for Tanner crab harvest in recent years. The largest aggregation of herring in Alaska spawns along the northern shore of Bristol Bay, near the village of Togiak. Herring are harvested for bait in the vicinity of Unalaska when Togiak-spawning herring are in residence during the summer feeding period. On occasion, a herring sac roe fishery occurs near Port Moller when aerial surveys determine that a sufficient quantity of herring is present, and if processing capacity is available.²⁹⁸

King Cove is located in Pacific Halibut Fishery Regulatory Area 3B, Federal Statistical and Reporting Area 610, and the Western Gulf of Alaska Sablefish Regulatory Area. Because King Cove is not located on the Bristol Bay side of the Alaska Peninsula, the community is not

eligible for the Community Development Quota program. The community is eligible for the Community Quota Entity (CQE) program. Aleutia, Inc. is a CQE with headquarters in Sand Point that also serves King Cove. In 2008, Aleutia Inc. reached an agreement with Peter Pan Seafoods to purchase processor quota shares on behalf of King Cove, Sand Point, Nelson Lagoon, False Pass, Cold Bay, and Akutan. Peter Pan Seafood in King Cove will process the product and assist with marketing.^{299,300}

A local advisory committee for the BOF is located in King Cove. The activities of the advisory committee include developing regulatory proposals; evaluating regulatory proposals and making recommendations to the BOF; providing a local forum for fish and wildlife conservation and use, including matters relating to habitat; advising the appropriate regional council on resources; and consulting with individuals, organizations, and agencies.³⁰¹ In the 2011 AFSC survey, community leaders reported that King Cove actively participates in fisheries management processes in Alaska through a variety of other avenues, including sending a paid staff member to NPFMC meetings. They also indicated that King Cove has a representative that sits on NPFMC committees or advisory groups, a representative that sits on regional fisheries advisory and/or working groups run by ADF&G, and a representative that participates in the Federal Subsistence Board or Federal Subsistence Regional Advisory Council process.

When asked to comment about current challenges to King Cove's fishing economy, community leaders responded that approximately 75% of the local economy is based on direct and indirect fishing activities, and given this, changes in quota, regulations, processor ownership, fluctuations in processing capacity, and limitations in access to King Cove between fishing seasons are the community's primary challenges. When asked to describe effects of management actions or policies on King Cove, community leaders indicated that crab rationalization significantly reduced the fleet, thereby reducing demand for moorage and moorage revenue in King Cove. In addition, approximately 15-20 local crab crew jobs were eliminated. In addition, the CDQ program has been a controversial issue for King Cove fishermen.

Processing Plants

Peter Pan Seafood's King Cove facility primarily processes salmon, and has the largest salmon canning capacity of any Alaska's processing facilities. The cannery also processes king, Tanner and snow crab, pollock, cod, salmon, halibut, and sablefish. Although the plant operates year-round, its peak seasons are in the winter and summer, when it employs up to 500 people.³⁰² The King Cove cannery was originally built by Bellingham-based PAF in 1911, and was sold to Peter Pan Seafoods in 1965.³⁰³

Fisheries-Related Revenue

In 2010, King Cove received a total of \$2,585,850 in known fisheries-related revenue. A majority of this revenue was generated from harbor usage fees and the Shared Fisheries Business Tax. Overall, from 2000 to 2010, there was a 106.6% increase in known fisheries-related revenues. For more information on known fisheries-related revenues for King Cove between 2000 and 2010, see Table 3.³⁰⁴

It is important to note that, while no detailed information was reported regarding annual revenue from the raw fish tax between 2000 and 2010, community leaders indicated in the 2011 AFSC survey that, in 2010, combined revenues from local and state raw fish tax and the extraterritorial fish tax contributed \$2,000,000 to King Cove's Annual General Fund. Community leaders also reported that a variety of public services are at least partially funded by fisheries-related taxes and fees, including harbor maintenance, the health clinic, roads, the police force and fire protection, the recreation center, social services such as libraries, and general city administration. King Cove has local fishing-related fee programs that charge the fishing industry specifically to support public services and infrastructure.

Commercial Fishing

King Cove is one of the leading processing communities in Alaska, ranking 7th in landings and 11th in ex-vessel revenue out of 67 Alaskan ports that received landings in 2010. That year, seven fish buyers were present locally, and one shore-side processing facility was in operation. The total net poundage of landings in 2010 was 79,853,218, with total ex-vessel value of \$41,650,304 (Table 5). Between 2000 and 2010, King Cove residents were also highly engaged in commercial fisheries as state and federal permit holders, quota share account holders, crew members, and vessel owners.

Although the population of permanent residents increased in King Cove during the 2000-2010 period, the total number of King Cove residents engaged in commercial fishing declined. In 2000, there were 66 state permit holders and 201 crew license holders, and 94 fishing vessels were primarily owned by King Cove residents. By 2010, total state permits holders had fallen to 53, crew license holders to 132 and vessel owners to 70. There were also decreases in homeported vessels and total vessels landing catch in King Cove between 2000 and 2010. Information about the commercial fishing sector in King Cove is presented in Table 5.

In the 2011 AFSC survey, community leaders indicated that vessels homeporting in King Cove range in size from 35 feet to over 125 feet in length, and utilize gear types including trawl, pots, longline, gillnet, purse seine, and troll gear. They also indicated that most of the decline in fishing vessels in recent years has been a loss of the larger fleet – those vessels ranging from 60 to more than 125 feet in length. Specifically, they reported that one source of this decline is fewer Bering Sea crab boats coming to King Cove as a result of crab rationalization.

In 2010, the 53 King Cove state permit holders held a total of 116 Commercial Fisheries Entry Commission (CFEC) permits. Of these 116 CFEC permits, 51 (44%) were held in salmon fisheries, 35 (30.2%) were held in fisheries for groundfish, 17 (14.7%) were held in crab fisheries, 11 (9.5%) for halibut, and 2 (1.7%) in 'other shellfish' fisheries. CFEC permit statistics are presented in Table 4, and further details about permits are presented below.

³⁰⁴ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

A majority of the 51 salmon CFEC permits held by King Cove residents in 2010 were held in Peninsula-Aleutians area fisheries, including 20 in the Peninsula-Aleutians purse seine fishery, 15 in the drift gillnet fishery, and 13 in the set gillnet fishery. In addition, one permit was held in the Bristol Bay drift gillnet fishery that year, and two permits were held in the Bristol Bay set gillnet fishery. Overall, 78% of salmon permits held were actively fished in 2010. Both the total number of salmon CFEC permit holders and total permits held in King Cove declined slightly over the 2000-2010 period, while the percentage of permit actively fished remained relatively stable. It is important to note that, from 2000-2002, one King Cove resident also held a permit in the Kodiak purse seine fishery, but the permit was not actively fished in these three years.

Groundfish CFEC permits were held in 2010 in miscellaneous saltwater finfish fisheries using a variety of gear types, including longline, pot gear, mechanical jig, and otter trawl. The number of groundfish state permit holders decreased slightly from 2000 to 2010, as did the total number of groundfish CFEC permits held and the percentage of permits that were actively fished.

A majority of crab permits held in 2010 were for the Peninsula-Aleutians Tanner crab fishery. From 2000 to 2009, king crab CFEC permits were also held by King Cove residents in Bristol Bay and Dutch Harbor management areas. Prior to 2010, several Tanner crab permits were also held in the Bering Sea and Dutch Harbor management areas. In addition to king and Tanner crab, one Dungeness crab permit was held per year in 2001 and 2002, and again from 2005 to 2010. Until 2009, the permit was held in the Alaska Peninsula management area, while it was held for the Westward region in 2010. The total number of crab permits held in King Cove was variable from year-to-year, with spikes in permit ownership in 2001, 2005-2006, and 2010 reflecting increases in permit holders in the Peninsula-Aleutian Tanner crab pot gear fishery in those years.

The number of halibut CFEC permit holders and total halibut permits held in King Cove both decreased from 14 in 2000 to 11 in 2010. All halibut permits were associated with longline gear, and a majority of permits were for use on vessels under 60 feet in length. The number of herring CFEC permits held in King Cove declined from 12 in 2000 to 0 by 2010. Early in the 2000-2010 period, herring permits were held in the Bristol Bay and Peninsula-Aleutians roe herring fisheries, the Peninsula-Aleutians bait/food purse seine fishery, and the Alaska Peninsula food/bait gillnet fishery. From 2003 to 2009, the only remaining herring permits were held for the Bristol Bay roe herring purse seine fishery. Several sablefish and ‘other shellfish’ permits were held in some years during the 2000-2010 period. Sablefish permits were either held in the statewide mechanical jig fishery or the longline fishery excluding Southeast Alaska and Prince William Sound. All ‘other shellfish’ permits were held in the statewide octopi/squid pot gear fishery.

In addition to CFEC permits, King Cove residents held federal License Limitation Program (LLP) permits in groundfish and crab fisheries and also held a number of Federal Fisheries Permits (FFP) during the 2000-2010 period. Between 2000 and 2010, the number of King Cove residents holding LLPs stayed relatively stable, while the number of LLPs held declined slightly. From 2003 to 2010, the number of FFPs that were actively fished varied between 13 and 17, while 0 were actively fished from 2000 to 2002. Information about federal permits is presented in Table 4, along with CFEC permit statistics.

In addition to state and federal permits, between 2000 and 2010, King Cove residents held quota share accounts and quota shares in federal catch share fisheries for halibut, sablefish,

and crab. The number of halibut quota share account holders in King Cove ranged from 19 to 13 during the 2000-2010 period, with a generally decreasing trend over time. The total number of quota shares held varied between a high of 1,026,276 held in 2001 to a low of 849,123 held in 2004. The overall halibut IFQ allotment for account holders in King Cove initially increased to 14% higher than 2000 levels in 2002, before decreasing to 30-40% below 2000 levels during the 2006-2010 period. Information about federal halibut catch share participation is presented in Table 6. There were fewer sablefish quota share account holders in King Cove, with four in 2000 decreasing to one by 2010. The number of sablefish quota shares held also decreased, from 209,677 in 2000 to 456 in 2010. The overall sablefish IFQ allotment increased to almost 60% above 2000 levels in 2003 and 2004, before decreasing to just over 5% below 2000 levels in 2010. Information about federal sablefish catch share participation is presented in Table 7. The number of crab quota share account holders decreased from seven in 2005 (the first year quota share accounts were available) to four by 2010, with a similar decrease in quota shares held from 2,973,739 in 2005 to 1,216,882 in 2010. The overall crab IFQ allotment increased to almost 40% above 2005 levels in 2007, and then declined to over 15% below 2005 levels in 2009 and 2010. Information about federal crab catch share participation is presented in Table 8.

A majority of landings in King Cove were considered confidential between 2000 and 2010 due to the small number of fish buyers and/or participants in fisheries for each species. Salmon landings can be reported for four years during the period, averaging 18,765,378 net pounds valued at \$8,015,837 on average during these years. In addition, Pacific cod landings can be reported in 2001 only, when 19,092,707 net pounds were landed, valued at \$4,510,130 in ex-vessel revenue. Information about landings and ex-vessel revenue in King Cove is presented in Table 9.

More information can be reported regarding landings delivered by King Cove vessel owners in all locations. Salmon, Pacific cod, and halibut information can be reported for all years during the 2000-2010 period. On average, King Cove vessel owners landed 10,129,430 net pounds of salmon per year, valued at an average of \$2,761,334. Salmon landings and revenue generally increased over the 2000-2010 period, although they declined slightly in 2009 and 2010 following a 2008 peak. Pacific cod landings averaged 7,357,816 net pounds per year, valued at \$2,288,681 in ex-vessel revenue on average. Cod landings were relatively stable between 2000 and 2010. There appears to have been a peak in cod prices in 2007 and 2008, when ex-vessel revenue was higher than average relative to total landings. Halibut landings averaged 22,945 between 2000 and 2010, with an average of \$675,237 in ex-vessel revenues per year. Halibut landings appear to have been relatively stable from 2000 to 2005 before beginning to decline slightly, while the average price per pound appears to have increased over the decade. Landings and revenue for crab, herring, 'other groundfish', 'other shellfish', and pollock can be reported in some years during the 2000-2010, while sablefish details are considered confidential in all years due to the small number of participants. Information about landings made by King Cove vessel owners is presented in Table 10.

Recreational Fishing

In the 2011 AFSC survey, community leaders indicated that a majority of sportfishing activity in King Cove is local residents using private boats or fishing from shore. In addition, they noted that a significant number of non-residents fish from shore, made up mostly of transient workers who come to King Cove to work in the processing facility. This information is supported by the fact that few sport fish guides were present in King Cove between 2000-2010. Based on data reported by the ADF&G Division of Sport Fish, licensed sport fish guides were registered in King Cove in only a few years during the 2000-2010 period, and an active sport fish guide business was only present in one year. Sportfishing license statistics also support community leaders' description, showing that a similar number of licenses were sold to residents as the total number sold per year in King Cove. This indicates that only a small number of non-local anglers come to King Cove for sportfishing purposes. This information about the sportfishing sector in King Cove is presented in Table 11.

King Cove is located within Alaska Sport Fishing Survey Area R – Alaska Peninsula/Aleutian Islands. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, sportfishing activity varied considerably. For saltwater sportfishing, non-Alaska resident angler days fished varied between 1,603 and 4,126 during this period, while Alaska resident angler days fished varied between 3,261 and 12,721 days. Alaska resident anglers fished consistently more saltwater days than non-Alaska resident anglers during this period. In contrast, non-Alaska resident anglers fished more angler days in freshwater in the Alaska Peninsula/Aleutian Islands region on average (18,462 per year on average) than Alaska resident anglers (15,290 per year on average). This information about the sportfishing sector in and near King Cove is also displayed in Table 11.

³ Alaska Department of Fish and Game. 2011. Alaska Sport Fishing Survey results, 2000 – 2010. ADF&G Division of Sport Fish, Alaska Statewide Harvest Survey project. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sf/sportfishingsurvey/> (Accessed September 2011).

Community leaders also reported in the 2011 AFSC survey that the primary targets of local sportfishing activity are coho and sockeye salmon, halibut, and crab. The Alaska Statewide Harvest Survey,³⁰⁵ conducted by ADF&G between 2000 and 2010, indicates that freshwater sportfishing in the King Cove area targets coho, sockeye, pink, and chum salmon, as well as Dolly Varden char, and saltwater fishing targets Pacific halibut, Pacific cod, Dungeness and Tanner crab, and hardshell clams. No kept/release log book data were reported for sportfishing charters out of King Cove between 2000 and 2010.³⁰⁶

Subsistence Fishing

Subsistence harvest activities remain an important aspect of King Cove's economy, supplementing wage income.³⁰⁷ In the 2011 AFSC survey, community leaders indicated that the most important marine and aquatic resources utilized for subsistence purposes by King Cove residents include salmon, halibut, and crab.

No information is available from ADF&G regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010 (Table 12). However, a survey of 1992 subsistence activity conducted by ADF&G provides species-level information about harvest of marine invertebrates, non-salmon fish (not including halibut), and marine mammals at the household level. That year, the following species of marine invertebrates were harvested by the greatest number of King Cove households: black chitons (44% of households reported harvest), octopus (40% of households), sea urchin (23%), butter clams (21%), king crab (16%), Tanner crab (12%), Dungeness crab (11%), Pacific littleneck clams (5%), shrimp (3%), snails (3%), scallops (3%), hair crab (3%), cockles (1%), mussels (1%), pinkneck clams (1%), razor clams (1%), and sea cucumber (1%). Species of non-salmon fish reported as harvested by the greatest number of households included Dolly Varden (43% of households), Pacific cod (24%), red rockfish (12%), black rockfish (11%), herring (9%), greenling (5%), sculpin (5%), sablefish (4%), flounder (3%), pollock (3%), pike (1%), rainbow trout (1%), skates (1%), and steelhead (1%). In addition, 3% of households reported harvest of herring roe (spawn on kelp). The ADF&G survey also found that 11% of King Cove households participated in a harvest of harbor seal.³⁰⁸ In most cases, a greater number of households reported using these resources than the number involved in harvest, indicating the presence of sharing networks within the community, and possibly between communities.

For the 2000-2010 period, data are available from various management agencies regarding subsistence harvest of salmon, halibut, and marine mammals by King Cove residents. Between 2000 and 2008, the last year for which salmon data were available, the number of subsistence salmon permits issued to King Cove households varied from 52 to 69 per year. Sockeye and coho were the most targeted and harvested salmon species for subsistence in all years during this period (Table 13).

In 2010, a total of 87 Subsistence Halibut Registration Certificates (SHARC) were issued to King Cove residents, compared to 44 in 2003. In 2010, 27 SHARC cards were actively fished, and 6,004 pounds of halibut were harvested for subsistence purposes. This represents a decline in the average pounds harvested per active SHARC card. In 2004, when only 26 SHARC cards were actively fished, twice the volume was harvested compared to 2010 (Table 14).

Data were also available regarding harvest of some marine mammal species in King Cove. According to data reported by NMFS, subsistence harvest of sea otters ranged from 1 to 13 animals per year between 2000 and 2010. ADF&G reported that harbor seal subsistence harvest varied between 4 and 32 per year and Steller sea lion harvest varied between 1 and 12 per year, for those years in which data were reported. Information about subsistence harvest of marine mammals by King Cove residents is presented in Table 15.

Nelson Lagoon

People and Place

*Location*³⁰⁹

Nelson Lagoon is situated on the northern coast of the Alaska Peninsula, on a narrow sand spit that separates the lagoon from the Bering Sea. The town is located 580 miles southwest of Anchorage. The community encompasses 135.3 square miles of land and 61.4 square miles of water. Nelson Lagoon is located in the Aleutian Islands Recording District and the Aleutians East Borough Census Area.

*Demographic Profile*³¹⁰

In 2010, there were 52 inhabitants in Nelson Lagoon, making it the 293rd largest of 352 total Alaskan communities with recorded populations that year. Nelson Lagoon first appears in U.S. Decennial Census records in 1970. Overall between 1990 and 2010, the population of Nelson Lagoon decreased by 37.3%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents decreased by 24.1%, with an average annual growth rate of -0.63%. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that approximately 20 seasonal fishing crew are based out of Nelson Lagoon between June and September, with an annual population peak in July. They also indicated that population fluctuations are entirely driven by employment in fishing sectors.

In 2010, a majority of Nelson Lagoon residents identified themselves as American Indian and Alaska Native (75%), 21.2% identified themselves as White, 1.9% as Asian, and 1.9% identified with two or more races. That year, 1.9% of Nelson Lagoon residents also identified themselves as Hispanic. Compared to 2000, individuals identifying as American Indian and Alaska Native made up 3.3% less of the population in 2010, while those identifying as White made up 7.9% more of the population. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Nelson Lagoon was 2.36, a slight decrease from 2.6 persons per household in 1990 and 2.68 persons per household in 2000. The number of households in Nelson Lagoon has also decreased over time, with 31 occupied households in 1990 and 2000, and 22 occupied housing units in 2010. Of the 32 total housing units surveyed for the 2010 U.S. Census, 46.9% were owner-occupied, 21.9% were rented, and 31.3% were

vacant or used only seasonally. From 1990 to 2010, no residents of Nelson Lagoon lived in group quarters.

In 2010, the gender makeup of Nelson Lagoon’s population (51.9% male and 48.1% female) was similar to the state population as a whole, which was 52% male and 48% female. The median age of Nelson Lagoon residents was 29.5 years, younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 21.1% of Nelson Lagoon’s population was between 60 and 69 years of age, and no one was over 70. The overall population structure of Nelson Lagoon in 2000 and 2010 is shown in Figure 2.

Figure 1. Racial and Ethnic Composition, Nelson Lagoon: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Nelson Lagoon Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),³¹¹ 47.1% of Nelson Lagoon residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also in 2010, 47.1% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 5.9% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 11.8% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 5.9% were estimated to have an Associate's degree, compared to 8% of Alaskan residents overall; 0% were estimated to have a Bachelor's degree, compared to 17.4% of Alaskan residents overall; and 0% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Archaeological evidence suggests Unanga (Aleut) tribes have inhabited the Alaska Peninsula since the last ice age.³¹² Nelson Lagoon was historically used as a summer fish camp by the Aleut people. They were drawn to the site by the excellent resources of the lagoon and nearby Bear River.³¹³ Subsistence harvest of marine mammals and salmon has historically been of primary importance for the Aleut, and today salmon, Pacific halibut, octopus, shellfish, seal, and sea lion are an important part of the subsistence diet along with some harvest of land mammals.³¹⁴

The Lagoon was named in 1882 for Edward William Nelson of the U.S. Signal Corps, an explorer in the Yukon Delta region between 1877 and 1920. A salmon saltery operated from 1906 to 1917, which attracted Scandinavian fishermen, but there has been no cannery since. In 1965, a school was built, and the community began to be occupied year-round. The culture is focused on commercial fishing and subsistence activities. There is a strong community pride and loyalty among the residents, with a desire to maintain their lifestyle with slow, monitored growth and development that can be managed by the residents.³¹⁵

Natural Resources and Environment

Nelson Lagoon lies in the maritime climate zone. Frequent and dramatic weather changes occur, with a constant prevailing wind of 20 to 25 mph. Temperatures average 25 to 50 °F, with a range from -15 to 75 °F. Annual snowfall averages 56 inches, with a total precipitation of 33 inches.³¹⁶ Nelson Lagoon is located at the western tip of the Alaska Peninsula, on the northern

³¹¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³¹⁵ See footnote 313.

³¹⁶ Ibid.

coast bordering Bristol Bay. The northern and central portions of the Peninsula are generally flat and contain many lakes, while the southern portion is mountainous.³¹⁷

Protected Areas in the vicinity of Nelson Lagoon include the Izembek National Wildlife Refuge (NWR) to the west, the Alaska Peninsula NWR and Alaska Maritime NWR to the south. The 417,533 acre Izembek NWR was established in 1960 as “a refuge, breeding ground, and management area for all forms of wildlife.” The NWR hosts the Pavlof and Shishaldin volcanoes and Izembek Lagoon. The Lagoon provides habitat for an extraordinary abundance and diversity of waterfowl and shorebirds, and was the first site in the United States to be designated a Wetland of International Importance by the Ramsar Convention in 1986, and in 2001 it was also designated a Globally Important Bird Area by the American Bird Conservancy. In addition to providing critical habitat for hundreds of thousands of migrating birds, the Izembek NWR is also home to resident seabirds; marine mammals including harbor seals, sea otters, Steller sea lions, gray, orca, and minke whales; and land mammals, including brown bear, caribou, wolves, red fox, river otter, mink, wolverine, and many small mammals. Salmon spawn in NWR streams.³¹⁸

The Alaska Peninsula NWR and Alaska Maritime NWR were both established under the Alaska National Interest Land Conservation Act (ANILCA) of 1980. With a total area of 3.7 million acres, the Alaska Peninsula NWR extends as far west as False Pass and east beyond Chignik Bay, and includes a separate eastern unit south of Ugashik. It hosts a dramatic landscape of towering mountain peaks, including a number of active volcanoes, rolling tundra, and rugged coastlines. Salmon return to the rivers of the NWR, supporting brown bear populations. Other land mammals include wolverine, the 7,000-animal northern Alaska Peninsula caribou herd, wolves, and moose. It is of note that no black bears are found in the Alaska Peninsula NWR. Marine mammals along the coastline include sea otters, harbor seals, sea lions, and migrating whales. The Alaska Peninsula NWR also provides important habitat for migrating birds.³¹⁹

The Alaska Maritime NWR hosts a similar array of species in the Alaska Peninsula region. However, it contains a greater diversity overall, as it spans four time zones,³²⁰ stretching from the Aleutian Islands to the Southeast Alaska Panhandle. It was created in part to promote a program of scientific research on marine ecosystems. The Alaska Maritime NWR “protects breeding habitat for seabirds, marine mammals, and other wildlife on more than 2,500 islands, spires, rocks, and coastal headlands.”³²¹

At least eleven known minerals occur in the Nelson Lagoon area. Copper, gold, silver, lead, zinc, antimony, arsenic, and silver deposits have been identified. Ilmenite sands occur on the beaches near Nelson Lagoon. Reserves of oil and natural gas are also thought to be present on the outer continental shelf in the Bristol Bay Basin along the northern edge of the Aleutian Islands and Alaska Peninsula.³²² However, given the importance of Bristol Bay fisheries to the

³²² See footnote 317.

nation and the proximity of the Bristol Bay Basin to a number of protected areas, in March 2010, Secretary of the Interior Ken Salazar removed the area from oil and gas leasing for the 2007-2012 program.³²³ On March 31, 2010, President Obama withdrew the Bristol Bay area of the North Aleutian Basin from oil and gas leasing, whether for exploratory or production purposes, through 2017.³²⁴

Natural hazards with the potential to impact Nelson Lagoon include earthquakes, tsunamis, severe weather, erosion, and volcanoes. Erosion is of immediate concern in Nelson Lagoon. As a result of global climate change, winter pack ice has declined, leaving the community more vulnerable to the action of severe winter storms. The U.S. Army Corps of Engineers has estimated an annual average erosion rate of 5 feet per year in Nelson Lagoon as a result of wind and tidal surges. Impacts of erosion include exposure of the community's water transmission line, resulting either in breaking as a result of wave action or freezing due to winter temperatures.³²⁵

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Nelson Lagoon as of May 2012.³²⁶

Current Economy³²⁷

Nelson Lagoon is situated in the middle of a rich and productive salmon fishing area.³²⁸ In 2010, 23 residents held commercial fishing permits (Table 4), primarily for salmon set and drift gillnet fisheries in the Alaska Peninsula region. In 2000, the number of residents holding commercial fishing permits was equal to 32.5% of the total local population, and the number of commercial crew license holders was equal to 28%. These percentages increased by 2010, when the number of permit holders was equivalent to 44% of the population, and crew license holders were equal to 31%. Subsistence activities balance the seasonal nature of the commercial fishery. Some trapping occurs.³²⁹

Based on household surveys conducted for the 2006-2010 ACS,³³⁰ in 2010, the per capita income in Nelson Lagoon was estimated to be \$15,608 and the median household income was estimated to be \$32,500. This represents a substantial decrease from the per capita and median household incomes reported in the year 2000 (\$27,596 and \$43,750, respectively). The decrease

³²⁹ Ibid.

³³⁰ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

is even greater if inflation is taken into account by converting the 2000 values to 2010 dollars,³³¹ revealing a real per capita income in 2000 of \$36,288 and a real median household income of \$57,531. In 2010, Nelson Lagoon ranked 199th of 305 Alaskan communities with per capita income data, and 233rd in median household income, out of 299 Alaskan communities with household income data that year.

Although Nelson Lagoon's small population size may have prevented the ACS from accurately portraying economic conditions,³³² additional evidence for a decrease in per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Nelson Lagoon in 2010 is \$13,511.^{333,334} However, despite this evidence for a decline in income between 2000 and 2010, Nelson Lagoon did not meet the Denali Commission's criteria as a "distressed community" in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a similar percentage of Nelson Lagoon residents were estimated to be in the civilian labor force (70%) as in the civilian labor force statewide (68.8%). In the same year, 44% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate was estimated to be 0%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in Nelson Lagoon in 2010 was 3.9%, compared to a statewide unemployment rate estimate of 11.5%.³³⁵

Also based on the 2006-2010 ACS, 50% of the Nelson Lagoon workforce was estimated to be employed in the public sector, and 50% in the private sector. Of the 14 people aged 16 and over that were estimated to be employed in the civilian labor force, a majority were estimated to work in educational services, health care, and social assistance industries (64.3%) and in service occupations (64.3%). None of the civilian labor force was estimated to be working in fishing-related industries or occupations in 2010. However, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4. It is important to note that, compared to 2000, fewer industries and occupations appear to be represented in Nelson Lagoon in 2010. This could be due in part to a shift in methods employed by the U.S. Census Bureau to estimate employment statistics.³³⁶

³³¹ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

³³² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Figure 3. Local Employment by Industry in 2000-2010, Nelson Lagoon (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Nelson Lagoon (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 28 employed residents in Nelson Lagoon in 2010, of which 35.7% were employed in local government, 21.4 in education and health services, 14.3% in trade, transportation, and utilities, 14.3% in professional and business services, 7.1% in financial activities, 3.6% in information, and 3.6% in other industries.³³⁷ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

³³⁷ See footnote 334.

Governance

Nelson Lagoon is an unincorporated town in the Aleutians East Borough. No municipal revenue was reported and no taxes were administered by the community. The Borough administers a 2% raw fish tax, but does not levy a sales or property tax in Nelson Lagoon.³³⁸ In 2007 and 2008, Nelson Lagoon received Community Revenue Sharing contributions of \$40,000 and \$96,798, respectively. Also in 2007, Nelson Lagoon received a \$2,000,000 grant from the Economic Development Administration (EDA) for design and construction of a fish handling facility.^{339,340} For more information about the facility, see the *Processing Plants* and *Fisheries-Related Revenue* sections of this profile. Information about some of Nelson Lagoon’s revenue sources is presented in Table 2.

Nelson Lagoon was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Native Village of Nelson Lagoon. The Native village corporation is the Nelson Lagoon Corporation, which manages 77,188 acres of land.³⁴¹ Nelson Lagoon belongs to the Aleut Corporation, the regional Native corporation of the eastern Alaska Peninsula and Aleutian Islands.³⁴²

Nelson Lagoon is also a member of the Aleutian Pribilof Islands Association (APIAI), one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.³⁴³ APIAI provides services including cultural heritage, health, education, social, psychological, employment, vocational training, environment, natural resources, and public safety services.³⁴⁴

The closest regional offices of the Alaska Department of Fish and Game (ADF&G) are in Sand Point and Port Moller. The Port Moller office is seasonal, operating between May and September. The nearest offices of the National Marine Fisheries Service (NMFS) and Bureau of Citizenship and Immigration Services (BCIS) are located in Unalaska and Anchorage. The nearest office of the Alaska Department of Commerce, Community, and Economic Development (DCCED) is located in Dillingham, and Anchorage has the closest office of the Alaska Department of Natural Resources (DNR).

Infrastructure

Connectivity and Transportation

Nelson Lagoon is accessible only by air and sea. A state-owned 4,000 feet long by 75 feet wide gravel runway serves regularly-scheduled flights.³⁴⁵ The price of a roundtrip ticket by plane from Nelson Lagoon to Anchorage in early June of 2012 was \$691.³⁴⁶ Nelson Lagoon also has a dock. Some freight is landed at the Peter Pan Seafoods dock, 30 miles away at Port Moller.³⁴⁷

Facilities

Water is derived from a lake about 10 miles from Nelson Lagoon and is treated. Water storage capacity is 600,000 gallons. All homes are connected to a piped water system operated by the Village Council. Individual septic systems enable households to have complete plumbing. A sewage lagoon is used for sewage treatment. The Village Council also operates a landfill, but no organized refuse collection services are available. A diesel powerhouse, operated by the

Nelson Lagoon Electric Cooperative, provides power to the town.³⁴⁸ Public safety services are provided by a Village Public Safety Officer stationed in Nelson Lagoon.³⁴⁹ The nearest state trooper post is located in Cold Bay.³⁵⁰ Telephone and internet service is accessible in Nelson Lagoon, but no cable service provider is present. Community facilities include a washeteria operated by the Village Council, a community center and a school multipurpose room.³⁵¹

With regard to fishing-related infrastructure, Nelson Lagoon has a dock, harbormaster's office, and a warehouse.³⁵² In a survey conducted by the AFSC in 2011, community leaders reported that 150 feet of dock space is available for moorage of transient and public vessels up to 40 feet in length, but no space is available for permanent moorage. Additional infrastructure reported by community leaders includes a haulout facility for small boats (less than 60 tons) and a fish processing plant that is currently not operational (see the *Processing Plants* section of this profile). Community leaders also noted that residents travel to the communities of Port Moller, King Cove, and Sand Point to access fisheries-related businesses and services not available in Nelson Lagoon.

Medical Services

As of 2012, local health care is provided by the Nelson Lagoon Clinic, which is owned by the Village and operated by Eastern Aleut Tribes, Inc. The Nelson Lagoon Clinic is a Community Health Aide Program site. Emergency Services have coastal and air access. Emergency service is provided by volunteers and a health aide. Auxiliary health care is provided by Nelson Lagoon First Responders.³⁵³ However, as of June 2012, the status of clinic operations was in question. Closure of the Nelson Lagoon School means that the health aide will move somewhere else where her child can attend school.³⁵⁴ For more information, see the *Educational Opportunities* section. The nearest hospital to Nelson Lagoon is located in Dillingham.

Educational Opportunities

As of 2011, there was one school in the community, which offered preschool through 12th grade and had a total of seven students and one teacher. In 2012, the student body declined to six students. In late May 2012, a decision was made to close the school due to low enrollment.³⁵⁵

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Nelson Lagoon area for thousands of years. Villages and fish camps were often located at mouths of streams for access to both fresh water and abundant salmon runs.³⁵⁶ During Alaska's Russian period, salmon remained a subsistence resource, but soon after the purchase of Alaska by the United States. in 1867, commercial exploitation of salmon was initiated. The first salmon saltery was built in Alaska in 1868, and the first cannery was established in 1869.³⁵⁷ In Nelson Lagoon, a salmon saltery operated from 1906 to 1917, which attracted Scandinavian fishermen, but no cannery has operated in the community since.³⁵⁸

In addition to salmon, commercial fisheries that have played a role in Nelson Lagoon's history in recent years include groundfish, octopus, and herring fisheries. Major groundfish fisheries in the Alaska Peninsula region include a jig fishery for black rockfish out of Unalaska and a Pacific cod fishery in state waters (0-3 miles from the coast), in addition to a statewide lingcod fishery, and a sablefish fishery in state waters for non-federal sablefish quota share holders. Octopus is typically harvested only as bycatch in pot and trawl fisheries, but vessels working along the Alaska Peninsula can obtain a Commissioner's permit to specifically target octopus. Herring are harvested for bait in the vicinity of Unalaska when Togiak-spawning herring are in residence during the summer feeding period. On occasion, a herring sac roe fishery occurs near Port Moller when aerial surveys determine that a sufficient quantity of herring is present, and if processing capacity is available.³⁵⁹

Nelson Lagoon is located in Federal Statistical and Reporting Area 512 and the Bering Sea Sablefish Regulatory Area. The Village is located in a marine area closed to Pacific halibut harvest, but residents may be able to access nearby Pacific Halibut Fishery Regulatory Areas 4E to the north and east, 4A to the west, and 3B to the south. Nelson Lagoon is a member of the Aleutian Pribilof Island Community Development Association (APICDA), a Community Development Quota (CDQ) group that works to develop stable local economies in member communities through scholarships, vocational education activities, substance abuse programs, school grants, and infrastructure development, including matching funds for the construction of docks and harbors.³⁶⁰ Nelson Lagoon is not eligible to participate in the Community Quota Entity program. According to a survey conducted by the AFSC in 2011, community leaders reported that Nelson Lagoon is not directly involved in fisheries management processes in Alaska.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, no registered processing plants were located in Nelson Lagoon. In 2007, Nelson Lagoon received a \$2,000,000 grant from the Economic Development Administration (EDA) for design and construction of a fish handling facility.^{361,362} The regional CDQ entity, the APICDA, provided a matching grant for a total of \$4,000,000 toward the facility.³⁶³ According to the 2011 AFSC survey, community leaders reported that the fish processing plant was present in Nelson Lagoon, but was not yet operational.

Local drift and set gillnetters have access to a processing facility in Port Moller, 30 miles east of Nelson Lagoon. Peter Pan Seafoods operates this remote processing (freezing) plant, which primarily processes sockeye salmon, as well as small amounts of Chinook, coho, and chum salmon. During the season, which runs from May through September, the Port Moller facility "supports a fleet of 105 drift gill netters and 30 set netters, both resident and non-resident fishermen."³⁶⁴ There are no year-round residents in Port Moller, but according to an AFSC survey of plant managers in 2011, during peak production (from June through August) the crew is made-up of 165 people. The Port Moller facility is self-sufficient and provides all housing and food for its workforce as well as its own electricity, water, and other supplies.³⁶⁵

According to ADF&G's Intent to Operate List, processing facilities are also located in nearby communities of False Pass, King Cove, and Sand Point. More information about these processing facilities can be found in the profiles for each of these communities.

Fisheries-Related Revenue

The only information about fishing-related revenue received by Nelson Lagoon between 2000 and 2010 came from the 2011 AFSC survey. Community leaders reported that, in 2010, the town received \$1,000 in revenue from public dock use fees (Table 3). In addition, community leaders noted that \$100,000 in funding or grants were received from the regional CDQ entity, the APICDA. In 2007, the APICDA also provided a matching grant to supplement \$2,000,000 in funding from the EDA, for a total of \$4,000,000 toward design and construction of a fish handling facility in Nelson Lagoon (see *Processing Plants* section of this profile.)³⁶⁶ Information about selected sources of fisheries-related revenue received in Nelson Lagoon is presented in Table 3.

Commercial Fishing

Between 2000 and 2010, Nelson Lagoon residents participated in commercial fisheries as permit holders, crew members, and vessel owners. In 2010, there were 23 Nelson Lagoon

³⁶¹ Alaska Dept. of Comm. and Rural Affairs (n.d.). *Community Funding Database*. Retrieved at http://www.commerce.state.ak.us/dca/commdb/CF_Grants.htm. Data retrieved April 15, 2011.

residents (equivalent to 44% of the local population) holding a total of 27 Commercial Fisheries Entry Commission (CFEC) permits. These included 26 salmon permits in Alaska Peninsula salmon set and drift gillnet fisheries, of which 89% were actively fished that year. The number of salmon permits and the percentage of permits actively fished remained relatively stable between 2000 and 2010. In 2010, one statewide mechanical jig ‘other groundfish’ permit was also held in Nelson Lagoon, but was not actively fished. Groundfish permit holdings increased from zero in 2000-2001 to three by 2004-2005, which included one lingcod mechanical jig permit, one ‘other groundfish’ mechanical jig permit, and one statewide ‘other groundfish’ pot gear permit. From 2005 to 2010, 0% of groundfish permits held by Nelson Lagoon residents were actively fished.

In years prior to 2010, Nelson Lagoon residents were also involved in CFEC fisheries for crab, ‘other shellfish’, and herring. One crab permit was held but not actively fished in 2000 in the Bering Sea Hair Crab pot gear fishery, and one active permit was held in 2005 in the Chignik Tanner Crab pot gear fishery. One ‘other shellfish’ permit was held in 2004 and 2005 in the statewide octopi/squid pot gear fishery. The permit was actively fished in 2004 but not in 2005. Several herring permits were also held by Nelson Lagoon residents between 2000 and 2002, but were not actively fished in any of these years. The permits were for the Alaska Peninsula herring roe gillnet fishery. Information about CFEC permit holdings is presented in Table 4.

Between 2000 and 2010, no Nelson Lagoon residents held Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) (Table 4). Likewise, no Nelson Lagoon residents held quota share accounts in the federal halibut, sablefish, or crab catch share fisheries between 2000 and 2010. Information about federal catch share participation is presented in Tables 6 through 8.

In 2010, a total of 16 Nelson Lagoon residents (equivalent to 31% of all residents) held commercial crew licenses, and 28 fishing vessels were primarily owned by Nelson Lagoon residents. The number of crew license holders varied between 16 and 23 over the 2000-2010 period, while the number of vessels owned by Nelson Lagoon residents remained stable, varying between 28 and 30. The number of vessels homeported in Nelson Lagoon was also very stable, varying between 43 and 46 over the period. Information about the commercial fishing sector in Nelson Lagoon is presented in Table 5. According to the 2011 AFSC survey, community leaders indicated that the vessels using Nelson Lagoon as a base of operations during the fishing season were primarily gillnet boats between 35 and 60 feet in length. They also noted that, compared to 5 years ago, there are currently more boats 35 feet and under and boats between 35 and 60 feet mooring in Nelson Lagoon. They indicated that the boats come to Nelson Lagoon from Port Moller when there is downtime in the fishery.

No landings or ex-vessel revenue were recorded in Nelson Lagoon (Tables 5 and 9), given the lack of fish buyers and shore-side processors in the community (Table 5). Information about landings and ex-vessel revenue generated by vessels owned by Nelson Lagoon residents is largely considered confidential between 2000 and 2010 due to the small number of participants, with the exception of salmon harvest data (Table 10). On average between 2000 and 2010, Nelson Lagoon vessel owners harvested 1,355,672 net pounds of salmon, with a low of 833,813 pounds in 2001 and a high of 2,058,330 pounds in 2004. The average ex-vessel value of the catch was \$812,702 per year, with a low value of \$408,497 in 2001 and a high value of \$1,253,872 in 2007, when 1,933,072 net pounds were landed. Note that the high value did not occur in the same year as the highest total landings. This may reflect variations in species composition of the harvest, differences in price from year to year, and possible differences in the location where vessel owners delivered their catches.

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses were present in Nelson Lagoon, although one licensed sport fish guide was registered in the community in 2007, 2009, and 2010. The number of sportfishing licenses held by residents of Nelson Lagoon varied between 3 and 9 between 2000 and 2010, and the number of licenses sold in the town varied between 1 and 11. According to a survey conducted by the AFSC in 2011, community leaders indicated that Chinook, coho, and sockeye salmon are the primary targets of sportfishing activity in Nelson Lagoon, and that the local CDQ group, the APICDA, provides some funding to support sportfishing by local residents and clients.

Nelson Lagoon is located within Alaska Sport Fishing Survey Area R – Alaska Peninsula/Aleutian Islands. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, sportfishing activity varied considerably. For saltwater sportfishing, non-Alaska resident angler days fished varied between 1,603 and 4,126 during this period, while Alaska resident angler days fished varied between 3,261 and 12,721 days. Alaska resident anglers fished consistently more saltwater days than non-Alaska resident anglers during this period. In contrast, non-Alaska resident anglers fished more angler days in freshwater in the Alaska Peninsula/Aleutian Islands region on average (18,462 per year on average) than Alaska resident anglers (15,290 per year on average). This information about the sportfishing sector in and near Nelson Lagoon is also displayed in Table 11.

The Alaska Statewide Harvest Survey,³⁶⁷ conducted by ADF&G between 2000 and 2010, did not include information about species targeted by private anglers in Nelson Lagoon, and no kept/release log book data were reported for sportfishing charters out of Nelson Lagoon between 2000 and 2010.³⁶⁸

Subsistence Fishing

Nelson Lagoon residents combine subsistence harvest of a wide variety of marine resources with employment opportunities in commercial fishing.³⁶⁹ In a survey conducted by the AFSC in 2011, Nelson Lagoon community leaders said that salmon are the most important subsistence resources utilized by local residents.

No information is available from ADF&G regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010 (Table 12). However, a survey of 1987 subsistence activity conducted by ADF&G provides species-level information about harvest of marine invertebrates, non-salmon fish (not including halibut) and marine mammals at the household level. That year, the following species of marine invertebrates were harvested: cockles (69% of households), king crab (39%), softshell clams (15%), butter clams (8%), chitons (Bidarkis gumboots) (8%), Pacific littleneck clams (8%), and razor clams (8%). Tanner crab were also harvested by an unreported percentage of households. Three species of non-salmon fish were reported as harvested by Nelson Lagoon households in 1987: Dolly Varden (harvested by 46% of households), flounder (8%), and cod

³⁶⁹ Alaska Dept. of Comm. and Rural Affairs (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

(unreported percentage of households harvesting). In addition, 8% of households were reported to harvest harbor seal that year.³⁷⁰

Between 2000 and 2010, data are available regarding subsistence salmon permits. In 2000, nine Nelson Lagoon households were issued subsistence salmon permits, and the number declined to two permits issued in 2008. In almost all years, sockeye were the most heavily harvested of the salmon species, followed in number by coho. A small number of Chinook were also reported as harvested each year, as well as chum in the year 2001 only. No subsistence harvest of pink salmon was reported by Nelson Lagoon households between 2000 and 2008. ADF&G did not report information regarding subsistence harvest of marine invertebrates or non-salmon fish (not including halibut) between 2000 and 2010. Information about subsistence salmon permits and harvest of marine invertebrates and non-salmon fish is presented in Table 13.

Between 2005 and 2010, one Nelson Lagoon resident per year was issued a Subsistence Halibut Registration Certificates (SHARC). No information was reported about the number of SHARC cards returned or the total pounds of subsistence halibut harvested by Nelson Lagoon residents during these years. This information about the subsistence halibut fishery is presented in Table 14.

Between 2000 and 2010, limited information was reported about subsistence harvest of marine mammals by residents of Nelson Lagoon. According to data reported by the U.S. Fish and Wildlife Service, 1 walrus was harvested in 2001, 2 sea otters in 2003, and 13 sea otters in 2005. No information was available from management agencies regarding harvest of beluga whale, Steller sea lion, harbor seal, or spotted seal between 2000 and 2010. Information about subsistence harvest of marine mammals by Nelson Lagoon residents is presented in Table 15.

Nikolski (*nih-COAL-skee*)

People and Place

*Location*³⁷¹

Nikolski is located on Nikolski Bay, on the southwest end of Umnak Island, one of the Fox Islands group in the Aleutian Chain. Nikolski is located 300 air miles southwest of False Pass (the western tip of the Alaska Peninsula), 116 air miles west of Unalaska, and 900 air miles from Anchorage. Nikolski is located in the Aleutian Islands Recording District and Aleutians West Census Area.

*Demographic Profile*³⁷²

In 2010, there were 18 inhabitants in Nikolski, making it the 329th largest of 352 total Alaskan communities with recorded populations that year. Nikolski is considered by some to be the oldest continuously inhabited settlement in the world, with archaeological evidence within the Village of Nikolski dating to 4,000 years ago, and additional archaeological sites on Umnak Island dating back 8,500 years. Nikolski first appeared in the U.S. Census in 1880, with 127 individuals reported to be living in the community.³⁷³ There has been a downward population trend since that time. Between 1990 and 2010, the population declined by almost 50%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents decreased by 15.4%, with an average annual growth rate of -3.23%. These high percentages are in part reflective of the low population size in Nikolski; small variations in population number account for a larger percentage of the population than in larger communities.

In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that anywhere from 5 to 12 seasonal workers are present in Nikolski each year between July and November to work in seasonal hunting and fishing tourism positions. They also indicated that Nikolski's population is at its yearly peak during this period, which coincides with hunting season, and that local population fluctuations are only slightly driven by employment in fishing sectors.

In 2010, a majority of Nikolski residents identified themselves as American Indian and Alaska Native (94.4%) and the remaining 5.6% identified themselves as White. That year, no Nikolski residents identified themselves as Hispanic. Compared to 2000, individuals identifying as American Indian and Alaska Native made up 25.2% more of the population in 2010, while those identifying as White made up 25.2% less of the population. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Figure 1. Racial and Ethnic Composition, Nikolski: 2000-2010 (U.S. Census).

Household size in Nikolski increased between 1990 and 2000, from 1.8 to 2.6, and then decreased again to 1.38 persons per household in 2010. The number of households in Nikolski also decreased over time, with 19 occupied housing units in 1990, 15 in 2000, and 13 occupied housing units in 2010. Of the 23 total housing units surveyed for the 2010 U.S. Census, 47.8% were owner-occupied, 8.7% were rented, and 43.5% were vacant or used only seasonally. From 1990 to 2010, no residents of Nikolski lived in group quarters.

In 2010, there were an equal number of males and females living in Nikolski, compared to the state population as a whole, which had more males than females (52% male and 48% female). The median age of Nikolski residents was 63.5 years, significantly older than the

national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, half of Nikolski’s population was between 60 and 80 years of age, and there were no children between the ages of 0 and 9 residing in the community. There were also no females aged 10 to 29, and no males aged 30 to 39 or 50 to 59. The overall population structure of Nikolski in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),³⁷⁴ 100% of Nikolski residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Of these, 69.2% were estimated to have a high school diploma and no further education, compared to 27.4% of Alaskan residents overall; 30.8% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; and 0% were estimated to hold an Associate’s degree, Bachelor’s degree, or graduate or professional degree, compared to 8%, 17.4% and 9.6%, respectively, of Alaska residents overall.

Figure 2. Population Age Structure in Nikolski Based on the 2000 and 2010 U.S. Decennial Census.

³⁷⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Nikolski is thought by some to be the oldest continuously-occupied community in the world. The Chaluka archaeological site, in the village of Nikolski, shows evidence of 4,000 years of virtually continuous occupation. People were living in Nikolski before the pyramids were built, the Mayan calendar was invented, or the Chinese language was written.³⁷⁵ Archeological evidence found at the Anangula Blade site indicates that the region's earlier residents lived 9,000 years ago on Anangula Island. Anangula Island lies several miles offshore but probably was connected to Umnak Island in ancient times.³⁷⁶

Upon the arrival of the Russians in 1759, there were estimated to be approximately 2,000 – 2,500 Unangans living on Umnak Island in 20 villages. Interaction with the Russians greatly diminished the island's population, and by 1840 there were only two villages remaining. One of these was Nikolski (*Nikol'skoe*), which was used as a sea otter hunting site. Nikolski was formerly recorded by the Russians as "Recheshnoe," which means "river." In 1920, a boom in fox farming occurred on the island. The Unangan became affluent enough to purchase a relatively large boat, the "Umnak Native", which was wrecked in 1933. A sheep ranch was established in 1926 as part of the Aleutian Livestock Company. Today Nikolski is the only community on Umnak Island.^{377,378}

In June 1942, when the Japanese attacked Unalaska and seized Attu and Kiska, residents were evacuated to the Ketchikan area.³⁷⁹ The people of Nikolski were deposited at Ward Cove, a recreation facility near Ketchikan constructed by the Civilian Conservation Corps (CCC). The villagers quartered in the Ward Cove camp suffered the highest mortality rate of all the interned Unangans. Of the 72 Nikolski villagers who were evacuated in June of 1942, 19 perished due to inadequate housing, poor sanitation, and lack of medical care. Upon returning to their homes in 1945, villagers found that the U.S. military had continuously occupied their residences. There was extensive pilfering and looting of their property, and homes were destroyed or in need of massive repairs.³⁸⁰ The village was restored, but the traditional lifestyle and community attitudes were changed. Locals were allowed to return in 1944, but the exposure to the outside world brought about many changes in the traditional lifestyle and community attitudes. In the 1950s, the Air Force constructed a White Alice Communications System on the island, which provided some jobs. However, it was abandoned in late 1977.³⁸¹

Today, the residents that remain are largely of Unangan descent, and Aleut is spoken in three-quarters of all homes. Subsistence activities, sheep and raising cattle, and fishing-related employment sustain the community.³⁸²

Natural Resources and Environment

Nikolski lies in a maritime climate zone. Temperatures range from 11 to 65 °F. Annual snowfall averages 41 inches, and total precipitation averages 21 inches. Strong winds are frequent during the winter and fog occurs during the summer, which limits accessibility.³⁸³ The topography where the community is located is a gently rolling plain with elevations reaching 500 feet north of the village. Vegetation in the vicinity of the village is primarily Arctic/alpine tundra and grasses that are typical of the Aleutian Islands Chain.³⁸⁴

The Aleutian Islands provide habitat for marine mammals, including the Steller sea lion, northern sea otter, and harbor seal. Most of the land mammals, including foxes, reindeer, and caribou, have been introduced by humans.³⁸⁵ No native land mammals inhabit most of the Aleutian Islands. Some islands close to the mainland along the Alaska Peninsula can be reached occasionally by strong swimmers such as bears and river otters.³⁸⁶ The principal marine fish are Pacific halibut, Pacific cod, rockfish, sablefish, yellowfin sole, pollock, sand lance, herring, and salmon. The Aleutian Islands are best known for its birds. More than 10 million nest on the islands each summer. Puffins, auklets, gulls, storm petrels, cormorants, terns, kittiwakes, murrelets, and murrelets are among the most abundant species.³⁸⁷

Parts of Umnak Island are included in the 1,300,000-acre Aleutian Islands Wilderness, which was included as part of the Alaska Maritime National Wildlife Refuge (NWR).³⁸⁸ The 3.4-acre NWR was established in 1980 to conserve marine mammals, seabirds and other migratory birds, and the marine resources upon which they depend.³⁸⁹ The Alaska Maritime NWR covers a great diversity of ecosystems beyond the immediate area of Nikolski, as it spans four time zones,³⁹⁰ stretching from the Aleutian Islands to the Southeast Alaska Panhandle. The Alaska Maritime NWR was created in part to promote a program of scientific research on marine ecosystems. The Alaska Maritime NWR “protects breeding habitat for seabirds, marine mammals, and other wildlife on more than 2,500 islands, spires, rocks, and coastal headlands.”³⁹¹

The community of Nikolski is interested in emergency response training to be better prepared for natural disasters including earthquakes, flooding, and volcanic eruptions.³⁹² The Alaska-Aleutian arc, also known as the “Pacific Ring of Fire,” is one of the world’s most active

earthquake areas in the world.³⁹³ Some of these earthquakes are associated with explosive volcanic eruptions.³⁹⁴ Umnak Island consists of two volcanic peaks and old lava flows and ash falls. Because Nikolski is located along the west-to-east storm tracks of the North Pacific, the community is also vulnerable to strong storms and accompanying winds.³⁹⁵

According to the Alaska Department of Environmental Conservation (DEC), there are no notable active environmental cleanup sites located in Nikolski as of May 2012.³⁹⁶

Current Economy³⁹⁷

Nikolski has a mixed subsistence and cash economy, although few cash employment opportunities are available within the community. Most residents support themselves by working outside the village for some portion of the year at crab canneries and on processing ships. The lack of a harbor and dock in Nikolski limits fisheries-related activities. The village is interested in developing a small value-added fish processing plant and a sportfishing lodge to provide employment and attract former residents who left Nikolski for economic reasons.³⁹⁸

The top employers in Nikolski in 2010 were the local Village Council and a sportfishing lodge called Ugludax Lodge.³⁹⁹ The Lodge is operated by a partnership between the Native village corporation, Chaluka Corporation, and the regional Community Development Quota (CDQ) group, the Aleutian Pribilof Island Community Development Association (APICDA).⁴⁰⁰ In addition, the APICDA purchased a sportfishing charter boat for Nikolski. Sheep, cattle, and horses graze over much of the island, and wage income is supplemented by subsistence activities, which provide a substantial part of the villagers' diets. Salmon, halibut, seals, and ducks are of particular importance for subsistence purposes.⁴⁰¹

Based on household surveys conducted for the 2006-2010 ACS,⁴⁰² in 2010, the per capita income in Nikolski was estimated to be \$13,410 and the median household income was estimated to be \$16,500. This represents a decrease from the per capita and median household incomes reported in the year 2000 (\$14,083 and \$38,750, respectively). The decrease is even

⁴⁰² U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

greater if inflation is taken into account by converting the 2000 values to 2010 dollars,⁴⁰³ revealing a real per capita income in 2000 of \$18,519 and a real median household income of \$50,956. In 2010, Nikolski ranked 221st of 305 Alaskan communities with per capita income data, and 288th in median household income, out of 299 Alaskan communities with household income data that year.

Although Nikolski's small population size may have prevented the ACS from accurately portraying economic conditions,⁴⁰⁴ additional evidence for a decrease in per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Nikolski in 2010 is \$14,148.⁴⁰⁵ This decline is reflected in the fact that the community was recognized as "distressed" by the Denali Commission, indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁴⁰⁶ It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a significantly smaller percentage of Nikolski residents was estimated to be in the civilian labor force (31.3%) compared to the civilian labor force statewide (68.8%). In the same year, no residents were estimated to be living below the poverty line, compared to 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 12.5%, compared to a statewide unemployment rate of 5.9%. An alternative estimate of unemployment is based on the ALARI database, which indicates that the 2010 unemployment rate in Nikolski was 14.3%, compared to a statewide unemployment rate estimate of 11.5%.⁴⁰⁷

Also based on the 2006-2010 ACS, 100% of the Nikolski workforce was estimated to be employed in the public sector in 2010. The civilian labor force was estimated to consist of two individuals aged 16 and over. Compared to 2000, this represents a dramatic decline in the workforce, from 39 to 2. In addition, it is important to note that many fewer industries and occupations were represented in 2010 than in 2000. In 2010, both individuals in the civilian labor force were estimated to work in educational services, health care, and social assistance industries / service occupations. While the concentration of the workforce in fewer industries and occupations may be due to a real population decline in Nikolski, it is also important to note that the sampling methods utilized by the U.S. Census Bureau were altered between 2000 and 2010. The shift in sampling methods may also account for some of the differences observed in employment estimates.⁴⁰⁸ It is also important to note that, while none of the civilian labor force was estimated to be working in agriculture, forestry, fishing, hunting, and mining in 2010, the

⁴⁰³ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁴⁰⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁴⁰⁸ See footnote 404.

number of individuals employed by fishing may be underestimated in census statistics. Fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 14 employed residents in Nikolski in 2010, of which 50% were employed in local government, 14.3% in education and health services, 14.3% in leisure and hospitality, 7.1% in natural resources and mining, 7.1% in manufacturing, and 7.1% in information.⁴⁰⁹ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Community Profiles for North Pacific Fisheries – Alaska: Nikolski

Governance

Nikolski is an unincorporated community, and is not located in an organized borough. No municipal revenue was reported and no taxes were administered by the town between 2000 and 2010. In addition, no State or Community Revenue Sharing contributions or fisheries-related grants were reportedly received by Nikolski during this period (Table 2).

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Nikolski from 2000 to 2010.

Nikolski was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Native Village of Nikolski. The local village Native corporation is the Chaluka Corporation, which manages 77,188 acres of land.⁴¹⁰ Nikolski belongs to the Aleut Corporation, the regional Native corporation of the western Alaska Peninsula and Aleutian Islands.⁴¹¹

Nikolski is also a member of the Aleutian Pribilof Islands Association, Inc., (APIAI), one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of

services to villages in their regions.⁴¹² APIAI provides services including cultural heritage, health, education, social, psychological, employment, vocational training, environment, natural resources, and public safety services.⁴¹³

The closest regional offices of the Alaska Department of Fish and Game (ADF&G) are in Sand Point and Port Moller. The Port Moller office is seasonal, operating between May and September. The nearest National Marine Fisheries Service (NMFS) and Bureau of Citizenship and Immigration Services offices are located in Dutch Harbor, while Dillingham has the closest office of the Alaska Department of Commerce, Community, and Economic Development, and Kodiak has the nearest office of the Alaska Department of Natural Resources (DNR). However, the Anchorage offices of these agencies may be more accessible to Nikolski residents.

Infrastructure

Connectivity and Transportation

Nikolski is primarily accessible by air. A 3,512 feet long by 135 feet wide unlighted gravel runway is present in the village that provides passenger, mail, and cargo service. The airstrip used to be owned by the U.S. Air Force.⁴¹⁴ Peninsula Airways operates one roundtrip air taxi flight between Nikolski and Unalaska twice weekly, on Mondays and Thursdays.⁴¹⁵ The price of a roundtrip ticket between Nikolski and Unalaska in early June of 2012 was \$296, and a roundtrip ticket between Unalaska and Anchorage was \$964.⁴¹⁶ Nikolski currently has no landing or port facilities for ships. Barges deliver cargo once or twice a year. Goods and passengers are lightered 3 miles to the beach.⁴¹⁷

Facilities

Water in Nikolski is derived from a community well and surface water source and is chlorinated. The Nikolski Village Council operates a piped water system. All occupied homes are fully plumbed and connected to the pipe system. Homes have individual septic tanks, and the Village Council provides septic pumping services. There is no landfill or refuse collection service in Nikolski. Umnak Power Company's diesel generator is operated by the Village Council to provide electricity to the community. Police services are provided by state troopers stationed in Unalaska. Fire and rescue services are provided by the Nikolski Volunteer Fire Department. Visitor accommodations are available in town, including a trailer/hotel run by the Chaluka Corporation.⁴¹⁸ APICDA Joint Ventures also operates a hunting and fishing lodge just outside of Nikolski, in partnership with the Chaluka Corporation. The "Ugludax Lodge" is the westernmost fishing lodge in North America.⁴¹⁹

⁴¹⁹ Nikolski Adventures (n.d.). *Welcome to Nikolski Adventures at Ugludax Lodge*. Retrieved February 23, 2012 from <http://www.nikolskiadventures.com/about.html>.

According to a survey conducted by the AFSC in 2011, community leaders reported that Nikolski has a water storage tank and a community center. They also indicated that development of an alternative energy source has been completed, and improvements are in process. In July, 2007, a wind turbine was installed in Nikolski to be integrated with the existing diesel power plant.⁴²⁰ As of 2011, further funding was being sought to complete the final phase of the wind-diesel project.⁴²¹

Regarding fisheries-related infrastructure, no docking facilities are present in Nikolski. According to the 2011 AFSC survey, the only fisheries-related service reported by community leaders was a fishing lodge. Community leaders also noted that residents of Nikolski most frequently travel to Unalaska and Atka to access fisheries-related businesses and services not available locally.

Medical Services

Local health care is provided by the Nikolski Health Clinic, which is owned by the Village and operated by the APIAI. The Nikolski clinic is a Community Health Aide Program site. Emergency Services have coastal and helicopter access. Emergency service is provided by volunteers.⁴²² The nearest hospitals are located in Dillingham and on Kodiak Island.

Educational Opportunities

One school building is present in Nikolski. However, as of the year 2011 there was no current student enrollment, and no teachers were working at the school.⁴²³ The school was closed in the fall of 2009 after fewer than 10 students were present during the annual statewide student counting period.⁴²⁴

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to people living in the Nikolski area for thousands of years. The ancestors of the modern Unangan relied heavily on harvests of marine mammals, along with harvest of birds, waterfowl, fish, and other marine life living on the extensive reefs surrounding the Aleutian Islands.⁴²⁵ Today subsistence remains a fundamental

element of the Nikolski economy. Commercial and recreational fishing have both found an important place as well.⁴²⁶

Between 2006 and 2008, one Nikolski resident was involved in commercial fisheries for halibut and groundfish (Table 4). Commercial exploitation of halibut and groundfish first extended out along the Aleutian Islands chain in the 1920s after development of diesel engines, which allowed fishing vessels to undertake longer trips.⁴²⁷ Today, major groundfish fisheries in the region include a jig fishery for black rockfish out of Unalaska and a Pacific cod fishery in state waters, (0-3 nautical miles (nmi) from the coast), in addition to a statewide lingcod fishery, and a sablefish fishery in state waters for non-federal sablefish quota share holders. Groundfish fisheries in state waters are managed the ADF&G and groundfish fisheries beyond 3 nmi are managed by NMFS.⁴²⁸ The International Pacific Halibut Commission sets yearly harvest limits for the Pacific halibut fishery in Alaskan waters in areas 4A, 4B, and the combined Area 4CDE.⁴²⁹

Nikolski is located in Pacific Halibut Fishery Regulatory Area 4A, the Bering Sea and Aleutian Islands (BSAI) Federal Statistical and Reporting Area 518, and the Bering Sea Sablefish Regulatory Area. To the south of Umnak Island, the marine area is encompassed by Gulf of Alaska (GOA) Federal and Statistical Reporting Area 610 and the Western GOA Sablefish Regulatory Area. It is also important to note that the state coastal waters surrounding Umnak Island have been designated by the coastal district as a ‘subsistence use area’.^{430,431}

Nikolski is a member of the APICDA, a CDQ group that works to develop stable local economies in member communities through scholarships, vocational education activities, substance abuse programs, school grants, and infrastructure development, including matching funds for the construction of docks and harbors.⁴³² Nikolski is not eligible to participate in the Community Quota Entity (CQE) program.

According to a survey conducted by the AFSC in 2011, community leaders reported that Nikolski is not directly involved in fisheries management processes in Alaska.

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Nikolski, although the Village is interested in developing a small value-added fish processing plant.⁴³³ According to a survey of processing plants conducted by the AFSC in 2011, the closest and most diversified processing port is Dutch Harbor/Unalaska. Other Aleutian Islands ports offering processing facilities are Atka and Akutan. More information about these processing facilities can be found in the profiles for each of these communities.

Fisheries-Related Revenue

The only information about fishing-related revenue received by Nikolski came from community leaders in a survey conducted by the AFSC in 2011. Community leaders reported that, in 2010, \$62,000 in funding or grants were received from APICDA. No other data were reported about fisheries-related revenue received by Nikolski between 2000 and 2010 (Table 3).

Commercial Fishing

Between 2000 and 2010, several Nikolski residents participated in commercial fisheries as permit holders, crew members, and vessel owners. One Nikolski resident held Commercial Fisheries Entry Commission (CFEC) permits from 2006 to 2008. A halibut permit was held in all three of these years in the statewide longline fishery using vessels under 60 feet in length and was actively fished in all 3 years. In addition, a resident held a groundfish CFEC permit in 2007 and 2008. In 2007, the groundfish permit was held for the statewide mechanical jig fishery, while in 2008, the permit was held for the statewide longline fishery using vessels under 60 feet. These groundfish permits were not actively fished in either 2007 or 2008. Between 2000 and 2010, no Nikolski residents held either Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP). Likewise, no Nikolski residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab between 2000 and 2010. Information about CFEC, FFP, and LLP permits is presented in Table 4, and information about federal catch share participation is presented in Tables 6 through 8.

The number of crew license holders in Nikolski varied between zero and two during the 2000-2010 period. Between 2002 and 2004, one resident was the primary owner of a fishing vessel, and one fishing vessel was homeported in Nikolski. No fish buyers or shore-side processors were present in the community between 2000 and 2010. This information about the commercial fishing sector in Nikolski is presented in Table 5. According to a survey conducted by the AFSC in 2011, community leaders indicated that the number of fishing vessels coming to Nikolski has increased slightly over the past five years. They explained that fishing vessels have increasingly been used to bring cargo and fuel to the community, as air service has been reduced in recent years and fishing captains are more able to enter Nikolski Bay than fuel barges. No landings or ex-vessel revenue were recorded in Nikolski between 2000 and 2010 (Table 9), given the lack of fish buyers in the community (Table 5). Information about landings and ex-vessel revenue generated between 2002 and 2004 by the Nikolski-owned vessel is considered confidential (Table 10).

⁴³³ See footnote 426.

Recreational Fishing

The Village of Nikolski has been working to increase sportfishing infrastructure in the community. With the help of the APICDA a charter boat was purchased, and there is interest in developing a sportfishing lodge.⁴³⁴ Aleutian Adventures, based in Anchorage, currently runs a fishing lodge located just outside the Village.⁴³⁵ According to a survey conducted by the AFSC in 2011, community leaders indicated the Nikolski economy relies heavily on sport hunting and fishing. They reported that the species targeted by sport fishermen in the Nikolski area include sablefish, Pacific halibut, and coho and pink salmon. They also indicated that all recreational fishing activity takes place using charter vessels, and neither local residents nor visitors use private vessels for sport purposes.

Sportfishing data reported by ADF&G suggests that, during the 2000-2010 period, one active sport fish guide businesses was only registered in Nikolski in 2004 and 2005. However, licensed sport fish guides were present in the community from 2000 to 2008. The number of Nikolski residents that purchased sportfishing licenses during the 2000-2010 period (irrespective of point of sale) varied between zero and five per year, and no sportfishing licenses were sold in Nikolski.

Nikolski is located within Alaska Sport Fishing Survey Area R – Alaska Peninsula / Aleutian Islands. Information is only available for saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, sportfishing activity varied considerably. For saltwater sportfishing, non-Alaska resident angler days fished varied between 1,603 and 4,126 days per year during this period, while Alaska resident angler days fished varied between 3,261 and 12,721 days per year. Alaska resident anglers fished consistently more saltwater days than non-Alaska resident anglers during this period. In contrast, non-Alaska resident anglers fished more angler days in freshwater in the Alaska Peninsula / Aleutian Islands region on average (18,462 per year on average) than Alaska resident anglers (15,290 per year on average). This information about the sportfishing sector in and near Nelson Lagoon is also displayed in Table 11.

The Alaska Statewide Harvest Survey,⁴³⁶ conducted by ADF&G between 2000 and 2010, did not include information about species targeted by private anglers in Nikolski, and no kept/release log book data were reported for fishing charters out of Nikolski in 2010.

Subsistence Fishing

Historically, the primary focus of Unangan subsistence activity was harvest of marine mammals, including seal, sea lion, and sea otter. Sea otters were harvested primarily for their pelts and to provide materials for clothing and jewelry. The traditional subsistence diet was supplemented by harvest of birds, waterfowl, fish, roots, berries, and marine life living on reefs in the region. Today, subsistence remains an important supplement to the income of Nikolski residents. Salmon, halibut, seals, and ducks are currently important subsistence resources.⁴³⁷

No information is available from ADF&G between 2000 and 2010 regarding per capita subsistence harvest, the percentage of households utilizing salmon, halibut, marine mammals, marine invertebrates, or non-salmon fish (not including halibut) for subsistence purposes (Table 12). Some data were reported regarding subsistence salmon permits. At least one Nikolski household was issued a subsistence salmon permit each year from 2000 to 2002, and again from 2006 to 2008. Relatively few salmon were reported harvested overall. Sockeye was the most heavily harvested salmon species by Nikolski households. This information is presented in Table 13.

No information is available regarding harvests of marine invertebrates and non-salmon fish from 2000 to 2010 (Table 13). An earlier ADF&G subsistence survey was conducted in Nikolski in 1990. Results of that survey provide some details regarding subsistence harvest patterns of marine invertebrate, marine mammal, and non-salmon fish species. According to the survey, species of marine invertebrates harvested by Nikolski residents in 1990 included butter, horse, Pacific littleneck, and razor clams; blue mussels; cockles; limpets; snails; red and unknown chitons; scallops; sea urchin; sea cucumber; Dungeness, hair, king, and Tanner crab; octopus; and shrimp. Of these species, the highest percentage of households harvested unknown chitons (36%), octopus (36%), limpets (14%), and blue mussels (7%). A greater percentage of households reported using several of these species than reported engaging in harvest, suggesting that sharing networks are present in Nikolski to distribute these resources among households. Species of non-salmon fish harvested by Nikolski residents in 1990 included Dolly Varden, rainbow trout, grayling, mackerel, Pacific cod, sablefish, Pacific tomcod, black and unknown rockfish, walleye pollock, Irish lord, bullhead and unknown sculpin, flounder, sole, smelt, greenling, and herring. The survey also noted harvest of greenling roe and herring roe. The greatest percentage of households reported harvesting Dolly Varden (71%), greenling (57%), Pacific cod (50%), and bullhead sculpin (14%). As in the case of marine invertebrates, in many cases a greater percentage of households reported using non-salmon fish species than were engaged in harvest, again suggesting the presence of sharing networks. In addition, Nikolski residents harvested the following species of marine mammal in 1990: blue whales, gray whales, humpback whales, minke whales, sei whales, an unknown species of whale, fur seals, and Steller sea lions.⁴³⁸

Between 2003 and 2009, data were reported by ADF&G regarding Subsistence Halibut Registration Certificates (SHARC). From 2003 to 2007, the number of SHARC cards issued to Nikolski residents varied between 16 and 18, declining to 2 recorded SHARC cards issued per

⁴³⁷ Alaska Dept. of Comm. and Rural Affairs (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

year in 2008 and 2009. The number of SHARC cards reported to be actively fished was highest in 2006. That year, 18 cards were fished and 2,250 pounds of halibut were harvested. The highest subsistence halibut harvest was reported in 2005. That year, 3,984 pounds of halibut were harvested with 15 active SHARC cards. This information about the subsistence halibut fishery is presented in Table 14.

Some information about marine mammal harvest was also reported by management agencies during the 2000-2010 period. Subsistence harvest of marine mammals was high in Nikolski relative to the community’s population. As noted above, community leaders reported in the AFSC survey in 2011 that harbor seals are a primary subsistence resource for residents of Nikolski. Based on data reported by ADF&G, the number of harbor seals harvested varied from 2 to 17 per year, and several Steller sea lions were also harvested in most years during the period. No information was reported by management agencies regarding beluga whale, sea otter, walrus, polar bear, or spotted seal harvest between 2000 and 2010. This information about subsistence harvest of marine mammals by Nikolski residents is presented in Table 15.

Port Moller

People and Place

Location

Port Moller is located on the Bristol Bay side of the Alaska Peninsula, 30 miles east of Nelson Lagoon and approximately 525 miles southwest of Anchorage. The site is located in the Aleutian Islands Recording District and the Aleutians East Borough Census Area.

Demographic Profile

A full demographic profile was not completed for Port Moller because sufficient information could not be obtained. Port Moller was selected for profiling given the presence of a shore-side processor where landings were made between 2000 and 2010 (see selection criteria in methods section). However, because it is not treated as a census designated place (CDP) by the U.S. Census, the Alaska Department of Commerce, Community, and Economic Development (DCCED), or other data sources, it was not possible to gather the same demographic information for Port Moller that is contained in the other community profiles.

Port Moller is a seasonal community based around the operations of a remote salmon processing (freezing) plant that is owned and operated by Peter Pan Seafoods. According to a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, plant managers indicated approximately 400 individuals are present as seasonal workers each year, including cannery employees and fishermen. They reported that workers are present between May and September, with an annual population peak in June and July. According to the cannery managers, population fluctuations are entirely driven by employment in fishing sectors.

No information is available from the U.S. Census or the Alaska Department of Labor regarding the population of Port Moller (Table 1). It has generally been regarded to have no resident population.⁴³⁹ However, as of December 2012, the Peter Pan Seafoods cannery office manager reported that the winter watchman resides at the cannery year-round, bringing the permanent population of Port Moller up to 1 individual.⁴⁴⁰

History, Traditional Knowledge, and Culture

Port Moller is located near the historical site of the Hot Springs Village archaeological excavations,⁴⁴¹ which indicate a human presence over 4,000 years old.⁴⁴² Evidence from shell middens indicates that historical peoples living in the area hunted marine and terrestrial mammals and birds, fished, and gathered marine invertebrates. Sea mammals utilized by past inhabitants included four kinds of seals, walrus, sea lion, and whales. Fish species included salmon, cod, halibut, flounder, herring, shark, and sculpin, and invertebrate species included mollusks, clams and mussels, and sea urchins.⁴⁴³

As of 1880, Port Moller was inhabited by Aleut people, although the village was located near the transition between Aleut and Eskimo settlement, and may have been used by both groups.^{444,445} Some Aleut people remained at the Port Moller village into the early 1900s.

⁴⁴¹ The Hot Spring Village is located 7 miles by skiff from the Peter Pan Seafoods cannery. This location information was provided by the Peter Pan Seafoods cannery office manager during community review of the profile. Feedback received July 19, 2012.

Norman Orloff was born in Port Moller and lived there as a young child. Before he passed away, Mr. Orloff spoke of watching the church at Port Moller collapse in the 1940s. During that period, the outside Bering Sea beach had changed course and destroyed many of the village homes. The people living in Port Moller were closely associated with the village at Bear River, just north of Port Moller. In 1965, some Aleut families originating from Bear River, Port Moller, and Herendeen Bay moved to Nelson Lagoon to live year-round following construction of a school there.⁴⁴⁶

In 1912, a Bellingham-based salmon packing company called Pacific American Fisheries (PAF) built a cannery just inside the Entrance Point sand spit in Moller Bay.⁴⁴⁷ The Port Moller facility was PAF's third Alaskan cannery, following the 1908 construction of a facility in Excursion Inlet in Southeast Alaska and a King Cove facility in 1911. In 1965, the major portion of PAF's assets was sold to a consolidated firm of Peter Pan Seafoods and Taiyo Gyogyo KK.⁴⁴⁸ Peter Pan Seafoods continues to operate the facility today.

Natural Resources and Environment

The Port Moller region has a maritime climate, with cool summers, relatively warm winters, and rain. Frequent and dramatic weather changes occur, with a constant prevailing wind of 20 to 25 mph. Snowfall averages 57 inches per year, with a total annual precipitation of approximately 33 inches. January temperatures average 25 °F, and July temperatures average 50 °F. Port Moller is located near the western tip of the Alaska Peninsula, on the northern coast bordering Bristol Bay. The northern and central portions of the Peninsula are generally flat and contain many lakes, while the southern portion is mountainous.⁴⁴⁹

Protected areas in the vicinity of Port Moller include the Alaska Peninsula National Wildlife Refuge (NWR) and Alaska Maritime NWR. The Alaska Peninsula NWR and Alaska Maritime NWR were both established under the Alaska National Interest Land Conservation Act (ANILCA) of 1980. With a total area of 3.7 million acres, the Alaska Peninsula NWR extends as far west as False Pass and east beyond Chignik Bay, and includes a separate unit south of Ugashik. It hosts a dramatic landscape of towering mountain peaks, including a number of active volcanoes, rolling tundra, and rugged coastlines. Salmon return to the rivers of the Alaska Peninsula NWR, supporting brown bear populations. Other land mammals include wolverine, the 7,000-animal Northern Alaska Peninsula caribou herd, wolves, and moose. It is of note that no black bears are found in the Alaska Peninsula NWR. Marine mammals living along the coastline include sea otters, harbor seals, sea lions, and migrating whales. The Alaska Peninsula NWR also provides important habitat for migrating birds.⁴⁵⁰

⁴⁴⁵ Dumond, D., L. Conton, and H. Shields. 1975. "Eskimos and Aleuts on the Alaska Peninsula: A Reappraisal of Port Moller Affinities." *Arctic Anthropology*, 12(1).

⁴⁴⁶ Historical information provided by the Peter Pan Seafoods cannery office manager during community review of this profile. Feedback received July 19, 2012.

⁴⁴⁹ Alaska Department of Natural Resources. April 2005. *Bristol Bay Area Plan for State Lands*. Retrieved January 4, 2012 from <http://dnr.alaska.gov/mlw/planning/areaplans/bristol/index.htm>.

⁴⁵⁰ U.S. Fish and Wildlife Service. (n.d.). *Alaska Peninsula National Wildlife Refuge*. Retrieved March 23, 2012 from <http://www.fws.gov/refuges/profiles/index.cfm?id=74512>.

The Alaska Maritime NWR hosts a similar array of species in the Alaska Peninsula region. However, it contains a greater diversity overall, as it stretches from the tip of the Aleutian Islands to the Southeast Alaska Panhandle, and includes St. Matthew Island in the Bering Sea, Hagemeister Island in northern Bristol Bay, and two units bordering the Chukchi Sea. It was created in part to promote a program of scientific research on marine ecosystems. The Alaska Maritime NWR “protects breeding habitat for seabirds, marine mammals and other wildlife on more than 2,500 islands, spires, rocks and coastal headlands.”⁴⁵¹

In addition, the 131,269 acre Port Moller Critical Habitat Area was established in 1972. The area was created to protect habitat that supports migratory stopover areas for large number of ducks, geese, and shorebirds in the spring on their way to northern nesting grounds and in the fall on their return to southern wintering areas.^{452,453}

There are more than 100 prospects and mineral occurrences in the Port Moller region, primarily on the southern portion of the Alaska Peninsula. Mineral deposits include silver-gold, gold, copper, copper molybdenum, and lead-zinc. The most significant deposits include the Pyramid prospect (copper), the Apollo-Sitka and Shumagin prospects (gold), and Centennial prospect (polymetallic). The Port Moller region also has high potential for oil and gas development.⁴⁵⁴ Reserves of oil and natural gas are also thought to be present on the outer continental shelf in the Bristol Bay Basin along the northern edge of the Aleutian Islands and Alaska Peninsula. However, given the importance of Bristol Bay fisheries to the nation and the proximity of the Bristol Bay Basin to a number of protected areas, in March 2010, Secretary of the Interior Ken Salazar removed the area from oil and gas leasing for the 2007-2012 program.⁴⁵⁵ On March 31, 2010, President Obama withdrew the Bristol Bay area of the North Aleutian Basin from oil and gas leasing, whether for exploratory or production purposes, through 2017.⁴⁵⁶

Natural hazards with the potential to impact Port Moller include earthquakes, tsunamis, severe weather, erosion, and volcanoes.⁴⁵⁷ The Port Moller Hot Spring Village site, a prehistoric Aleut/Eskimo settlement, is listed on the National Register of Historic Places.⁴⁵⁸ According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Port Moller as of July 2012.⁴⁵⁹

Current Economy

According to a survey conducted by the AFSC in 2011, cannery managers indicated that fishing is the primary industry upon which the Port Moller economy depends. The Peter Pan Seafoods salmon cannery in Port Moller employs in a crew of over 150 people each summer,⁴⁶⁰ and provides a market for a sizeable fishing fleet. Port Moller also has a seasonal field office of the Alaska Department of Fish and Game (ADF&G). Port Moller is not considered a CDP according to the U.S. Census, and no information is reported regarding employment and income statistics.

Governance

Port Moller is not considered a CDP according to the U.S. Census. No information was reported regarding municipal revenue sources between 2000 and 2010 (Table 2). There are no governing bodies in Port Moller.

A seasonal field office of ADF&G is located in Port Moller. The office operates between May and September. The nearest year-round ADF&G office is located in Sand Point. Dillingham has the nearest office of the Alaska Department of Commerce, Community, and Economic Development. The closest National Marine Fisheries Service (NMFS) and U.S. Bureau of Citizenship and Immigration Services offices are located in Unalaska and Anchorage. Anchorage also has the closest office of the Alaska Department of Natural Resources.

⁴⁶⁰ Results of a survey of processor plant managers conducted by the AFSC in 2011.

Infrastructure

Connectivity and Transportation

Port Moller is accessible via water or air. A private gravel airstrip is located at Port Moller, and the bay is accessible by floatplane. A few miles of roads and trails extend around the vicinity of Port Moller.⁴⁶¹ During the summer, Port Moller receives barge deliveries every two weeks from Seattle that supply not only the cannery at Port Moller, but also nearby communities such as Nelson Lagoon.⁴⁶²,⁴⁶³ As of early June 2012, roundtrip airfare from Anchorage to Port Moller, with a connection in King Salmon, cost \$1130.⁴⁶⁴

Facilities

Since the Peter Pan Seafoods cannery at Port Moller is a remote facility, it must be self sufficient in providing for all housing, food, electricity, water, and other supplies.⁴⁶⁵ According to a survey conducted by the AFSC in 2011, cannery managers reported that there are no other outside businesses or support services beyond those provided by Peter Pan Seafoods. They indicated that facilities and services provided at the cannery include a store, stockroom, machine shop, medical clinic, air strip, mess hall, and boat storage. These facilities are open from May through September only, and are available to the Peter Pan Seafoods fleet only, although they are available to transient vessels on an emergency basis for fuel, repairs, and/or medical needs. No police force is stationed at the cannery. The nearest state trooper post is located in Cold Bay.⁴⁶⁶

Cannery managers indicated in the 2011 AFSC survey that ongoing maintenance takes place on local utilities, including telephone and internet service, local roads, a diesel powerhouse, sewage and water treatment, the solid waste disposal site, and the breakwater. Improvements are ongoing to the emergency response system as well.

In addition to cold storage and seafood processing, a variety of fisheries-related facilities and services are available at the Port Moller cannery. Although no dock space is available, cannery managers indicated that the fishing fleet and tenders can tie up directly to the pilings of the dock. The existing dock facilities are capable of handling rescue vessels, such as the Coast Guard, fuel barges, and other smaller barges and freighters.

Cannery managers indicated that boat repair services at Port Moller include electrical, welding, mechanical services, machine shop, and hydraulics, as well as marine refrigeration services. Drydock storage, haul-out facilities, and a tidal grid are available for small boats (less

than 20 tons).⁴⁶⁷ Cannery managers noted that fishing gear, fuel, and ice are sold at the facility. They also indicated that improvements are ongoing to a barge landing area, fish cleaning station, the existing dock structure, water and electricity serving the dock, and haulout facilities. According to managers, Port Moller community members travel to King Cove, Homer, or Seattle to access fisheries-related businesses and services not available in Port Moller.

Medical Services

The Port Moller Medical Clinic, run at Peter Pan Seafoods' cannery facility, is a qualified emergency care center.⁴⁶⁸ However, it is important to note that the clinic is open seasonally from May to mid-September each year.⁴⁶⁹ The nearest hospitals are located in Dillingham and Kodiak.

Educational Opportunities

No schools were present in Port Moller between 2000 and 2010.⁴⁷⁰

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest was historically important for indigenous people living in the Port Moller area. Archaeological evidence at an old village site at Port Moller indicate that local Aleut peoples hunted sea mammals, fished, and collected marine invertebrates, in addition to hunting land mammals. Salmon were one of the most important subsistence resources.⁴⁷¹ Soon after the purchase of Alaska by the United States in 1867, commercial exploitation of salmon was initiated. The first salmon saltery was built in 1868, and the first cannery was established in 1869.⁴⁷² The Port Moller salmon cannery was constructed by PAF in 1912.⁴⁷³ In a survey conducted by the AFSC in 2011, cannery managers indicated that the primary local fishery targets salmon, with a season running from June through September.

Port Moller is located in Federal Statistical and Reporting Area 512 and the Bering Sea Sablefish Regulatory Area. The immediate marine area is closed to Pacific halibut harvest. According to a survey conducted by the AFSC in 2011, cannery managers reported that Port

⁴⁶⁷ During community review of this profile, the Peter Pan Seafoods cannery office manager noted that the tidal grid only has the capacity to handle boats less than 20 tons. Feedback received July 19, 2012.

Moller actively participates in fisheries management processes in Alaska. They indicated that Port Moller has a paid staff member that attends North Pacific Fishery Management Council and/or Board of Fisheries meetings as well as a representative that sits on regional fisheries advisory and/or working groups run by ADF&G. In addition, they noted that Port Moller financially supports research organizations, industry coalitions, and trade associations, including the Alaska Seafood Marketing Institute and Concerned Area M Fishermen, an organization of salmon drift gillnetters and local Alaska Peninsula communities that works with the Alaska Board of Fisheries to advocate for preservation of Alaska Peninsula Fisheries.⁴⁷⁴

In the 2011 AFSC survey, cannery managers outlined challenges they observe to Port Moller's fishing economy. These include 1) increased fuel costs, which create direct and indirect impacts through the higher cost of goods and shipping, 2) the cost of complying with state and federal regulations such as Occupational Safety and Health Act, Oil Spill Response, Ammonia Response, and hazardous materials, and 3) the variability of fish catch volume and fish prices.

When asked which fisheries policies or management actions have affected Port Moller, cannery managers indicated that the opening of the Outer Port Heiden district by the Alaska Board of Fisheries resulted in the fleet moving north, allowing increased fishing area, but also leading to greater travel distance for tenders and overall reduction in the quality of fish. They also responded that effective ADF&G management and conservation ethic have provided consistent salmon runs for many years. Finally, a management action that had the greatest impact on Port Moller in recent years was the closure of the Nelson Lagoon area to salmon fishing in July 2010 due to low escapement. The loss of income from this fishery was hard on fishermen from the community of Nelson Lagoon, and also affected Peter Pan Seafoods/Port Moller as their processor. Further, cannery managers indicated that the 2011 salmon run was unusually poor, and harvest in Nelson Lagoon and the Bear River area in 2012 was even worse. There is concern that flooding in past years may have contributed to decreased viability of eggs and fry in the parent year of the 2011 and 2012 runs. These fluctuations in the fishery are of concern because the commercial salmon industry is the only economy sustaining Port Moller.⁴⁷⁵

Regarding potential future fisheries policy or management actions, cannery managers responded with concern about any activity that may affect habitat or close fishing areas, threatening the Port Moller facility's ability to operate. For example, they listed oil exploration, mining contamination, or closure due to protected or endangered species as possible events that would affect Port Moller's operations in the future.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there was one registered processing facility in Port Moller. Peter Pan Seafoods operates a remote processing (freezing) plant, which primarily processes sockeye salmon, as well as small amounts of Chinook, coho, and chum salmon. During the season, which runs from May through September, the Port Moller facility "supports a fleet of 105 drift gill netters and 30 set netters, both resident and non-resident fishermen."⁴⁷⁶ There are no year-round residents in Port Moller, but according to an AFSC

survey of plant managers in 2011, during peak production (from June through August) the crew is made up of 165 people. The Port Moller facility is self-sufficient and provides all housing and food for its workforce as well as its own electricity, water and other supplies.⁴⁷⁷

Fisheries-Related Revenue

Port Moller is not considered a CDP according to the U.S. Census. No information was reported regarding fisheries-related revenue sources between 2000 and 2010 (Table 3). However, according to a survey conducted by the AFSC in 2011, cannery managers indicated that \$2,000 in revenue was earned from dock use fees in 2010.

Commercial Fishing

Port Moller's primary engagement in commercial fisheries is through processing. Between 2000 and 2010, one shore-side processing facility operated in Port Moller, and the number of fish-buyers varied from one to three per year. Port Moller ranked 23rd with regard to landings volume, and 26th in ex-vessel revenue, out of 67 Alaskan ports that received landings in 2010. The number of vessels delivering catch in Port Moller varied from 50 to 171 per year, and the number of vessels homeported increased from 6 in 2000 to 12 in 2009 and 2010. According to a survey conducted by the AFSC in 2011, cannery managers reported that vessels basing out of Port Moller during the fishing season were primarily between 35 and 125 feet in length, with larger vessels serving as tenders. They observed that over the last 5 years the fleet has remained relatively stable, although the buyback associated with crab rationalization led to a decline in the number of vessels between 61 and 125 feet in length to hire for tendering. The gear type used by fishing vessels based out of Port Moller is principally gill net.

Port Moller is generally considered to have no permanent residents, although cannery managers indicated in the 2011 AFSC survey that one individual lives at the site year-round. Between 2000 and 2010, at least one individual held a state Commercial Fisheries Entry Commission (CFEC) permit registered to an address in Port Moller from 2007 to 2010, and at least one fishing vessel owner registered the vessel at an address in Port Moller from 2000 to 2001 and from 2007 to 2010. The CFEC permit was held in the Peninsula-Aleutian salmon drift gillnet fishery. During the 2000-2010 period, no Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) were registered in Port Moller. Likewise, no quota share accounts in the federal halibut, sablefish or crab catch share fisheries were registered to Port Moller addresses between 2000 and 2010. Information about CFEC, FFP, and LLP permits is presented in Table 4, information about the commercial fishing sector in Port Moller is presented in Table 5, and information about federal catch share participation is presented in Tables 6 through 8.

Because there were three or fewer fish-buyers active in Port Moller each year from 2000 to 2010 (Table 5), information about landings and ex-vessel revenue generated in Port Moller is considered confidential due to the small number of participants (Table 9). Likewise, information about landings and ex-vessel revenue generated by vessels registered to a Port Moller address is considered confidential, given that fewer than three vessels were registered per year in 2000, 2001 and 2007-2010 (Table 10).

Recreational Fishing

Limited sportfishing activity was reported in Port Moller during the 2000-2010 period. No active sport fish guide businesses were registered in Port Moller in any year during the decade, although at least one licensed sport fish guide was present in most years. Between 2003 and 2010, an average of 81 sportfishing licenses were sold in Port Moller, almost all of which were sold to individuals that were not residents of Port Moller. Only one license was purchased by a Port Moller resident in 2009 (Table 11). The office at the Peter Pan Cannery is the only ADF&G sportfishing license vendor in Port Moller, and typically fewer than 10 licenses are sold by the office each year. The higher numbers of licenses reported to have been sold in some years during the 2000-2010 period may reflect license sales at fishing lodges that are located in the Port Moller area, but not in the community itself.⁴⁷⁸

According to a survey conducted by the AFSC in 2011, cannery managers indicated that sportfishing takes place using private boats owned by local residents or non-residents, as well as fishing from the shore or dock. They reported that the most popular recreational species in Port Moller are Chinook and sockeye salmon, halibut, and crab.

Port Moller is located within Alaska Sport Fishing Survey Area R – Alaska Peninsula/Aleutian Islands. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, sportfishing activity varied considerably. For saltwater sportfishing, non-Alaska resident angler days fished varied between 1,603 and 4,126 during this period, while Alaska resident angler days fished varied between 3,261 and 12,721 days. Alaska resident anglers fished consistently more saltwater days than non-Alaska resident anglers during this period. In contrast, non-Alaska resident anglers fished more angler days in freshwater in the Alaska Peninsula/Aleutian Islands region on average (18,462 per year on average) than Alaska resident anglers (15,290 per year on average) (Table 11). The Alaska Statewide Harvest Survey,⁴⁷⁹ conducted by ADF&G between 2000 and 2010, did not include information about species targeted by private anglers in Port Moller, and no kept/release log book data were reported for fishing charters out of Port Moller between 2000 and 2010.⁴⁸⁰

Subsistence Fishing

According to a survey conducted by the AFSC in 2011, three of the most important marine subsistence resources used by Port Moller community members are sockeye salmon, halibut, and king crab. Between 2000 and 2010, no information was reported by management agencies regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes (Table 12). Likewise, no information was reported regarding total harvest of marine invertebrates or non-salmon fish (not including halibut) (Table 13), subsistence halibut harvest (Table 14) or marine mammal harvest (Table 15). However, ADF&G did report information regarding annual subsistence salmon harvest in some years during the 2000-2010 period. According to ADF&G, from 2005 to 2008, between one and three subsistence salmon permits were issued to Port Moller households each year. Sockeye was the primary salmon species harvested, with between 200 and 500 fish harvested per year for those years in which data were available (Table 13).

Additional Information

The historic eruption of Mt. Katmai volcano took place on June 6, 1912, during the first year of operation of the Port Moller cannery. The cannery was in total darkness for several days as a result of the eruption, although no ash fell in the area because the wind was blowing away from the cannery.⁴⁸¹

Saint George

People and Place

Location^{482,483}

Saint George is located on the northeast shore of Saint George Island, the southern-most of the four Pribilof Islands. It lies 47 miles south of Saint Paul Island, 750 air miles west of Anchorage, and 250 miles northwest of Unalaska. Saint George is located in the Aleutian Islands Recording District and the Aleutians West Census Area, and is not located within an organized Borough. The community encompasses 34.8 square miles of land and 147.6 square miles of water.

*Demographic Profile*⁴⁸⁴

In 2010, there were 102 residents in Saint George, making it the 245th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population has decreased by 27%. The Saint George average annual growth rate between 2000 and 2009 was -3.18%, indicating a slow rate of decline. The change in population from 1990 to 2010 is provided in Table 1.

The majority of residents of Saint George in 2010 identified themselves as American Indian and Alaska Native (88.2%), with the remaining racial composition as follows: White (9.8%), Hispanic or Latino (1.0%), and two or more races (2.0%). The percentage of the population that identified themselves as American Indian and Alaska Native decreased by 3.9% between 2000 and 2010, with corresponding increases in the percentage of the population identifying themselves as White, Hispanic or Latino, and two or more races during that period. The change in racial and ethnic composition from 2000 to 2010 is provided in Figure 1 below.

In 2010, the average estimated household size in Saint George was 2.33, a decrease from 3.0 in 1990 and 2.98 in 2000. There has been a slight overall decrease in the estimated number of households from 45 in 1990, increasing slightly to 51 in 2000, and decreasing to an estimated 42 households in 2010. Of the 61 total housing units surveyed for the 2010 Decennial Census, 22 were owner-occupied, 20 were renter-occupied, and 19 were vacant. Throughout this period, four residents of Saint George were reported to be living in group quarters. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that Saint George's population is composed entirely of year-round residents.

Figure 1. Racial and Ethnic Composition, Saint George: 2000-2010 (U.S. Census).

In 2010, the gender makeup of Saint George was 58% male and 42% female, slightly skewed compared to the state as a whole (52% male, 48% female). The median age in Saint George was 39 years, higher than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the greatest percentage of residents fell within the age category 40-59 years old, with the next largest percentage for the age category 10-29 years old. Relatively few people were age 70 or older. The overall population structure of Saint George in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Saint George Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁴⁸⁵ 96.9% of residents aged 25 and over were estimated to hold a high school diploma or higher degree, compared to 90.7% of Alaskan residents overall. Also in 2010, an

⁴⁸⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

estimated 3.1% of the population had a less than ninth grade education, compared with 3.5% of Alaskan residents overall; an estimated 50% of the population held a high school diploma or equivalent, compared with 27.4% of Alaskan residents overall; an estimated 28.1% of residents had some college but no degree, compared with 28.3% of Alaskan residents overall; an estimated 9.4% held an Associate’s degree, compared with 8% of Alaskan residents overall; and an estimated 9.4% of residents held a Bachelor’s degree, compared with 17.4% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Saint George’s population is predominantly Aleut and Eskimo.⁴⁸⁶ Historically, the Aleuts traveled to the Pribilof Islands seasonally for hunting. Inspired by traditional Aleut stories, Gavriiff Pribilof of the Russian fur trading company, Lebedov Lastochkin Co., went on a search for the legendary “Seal Islands.” After a three-year search, Pribilof landed on Saint George Island in 1786, and named the island after his vessel. The following year, Pribilof and his party landed on the larger island to the north, which was named ‘Saint Peter and Saint Paul Island’ in honor of the day they made landfall – the Feast of Saints Peter and Paul. It is now known as Saint Paul Island.^{487,488} In 1788, the Russian American Company enslaved and relocated Aleuts from Siberia, Atka, and Unalaska to the Pribilofs to hunt fur seals. Their descendants continue to live on these two islands today.⁴⁸⁹

The United States’ purchase of Alaska from Russia in 1867 included the Pribilof Islands. Soon after the purchase, in 1868, the Islands were declared a special Federal Reserve with the purpose of managing fur seals and other fur-bearing species, and the federal government began to contract seal harvest to private companies.⁴⁹⁰ In 1870, the U.S. Government awarded the Alaska Commercial Company a 20-year sealing lease, and they provided housing, food, and medical care to the Aleuts in exchange for seal harvesting. In 1890, a second 20-year lease was awarded to the North American Commercial Company. However, fur seals were severely over-harvested, and poverty ensued. The 1910 Fur Seal Act ended private leasing on the islands and placed the community and fur seals under the U.S. Bureau of Fisheries. Food and clothing were scarce, social and racial segregation was practiced, and working conditions were poor.⁴⁹¹

During World War II, the Pribilof Aleuts were moved to Funter Bay on Admiralty Island in Southeast Alaska as part of the emergency evacuation of residents from the Bering Sea. Unlike other Aleutian residents, they were confined in an abandoned cannery and mine camp at Funter Bay. Later, in 1979, the Aleut Islanders received \$8.5 million in partial compensation for

⁴⁹¹ See footnote 486.

the unfair and unjust treatment the federal administration subjected them to from 1870 to 1946.⁴⁹²

With Alaska Statehood in 1959, 70% of revenues from the commercial fur seal hunt began to go to the State of Alaska. This decrease in federal revenue, in combination with an unexplained decline in productivity of the seal population in the 1960s, led the federal government to begin phasing out of the Pribilof Islands. Federal sealing operations were consolidated in Saint Paul in 1972, leaving Saint George as a research station to monitor the status of the fur seal population. Many Saint George residents chose to relocate to Saint Paul or left the Pribilof Islands entirely, but a majority remained in the community.⁴⁹³

In 1983, Congress passed the Fur Seal Act Amendments, which brought government control of the commercial seal harvest and the federal presence in the Pribilof Islands to an end. The City of Saint George was incorporated in 1983, and responsibility for providing community services in Saint George and management of the fur seals was left to local entities. To help develop and diversify the local economy, \$8 million was provided to Saint George by the federal government.⁴⁹⁴ Today, the Marine Mammal Protection Act provides that marine mammals may be taken by Native Alaskans living in Alaska if such taking is 1) for subsistence purposes; or 2) is done for the purpose of creating and selling authentic native articles of handicrafts and clothing...; and 3) in each case, is not accomplished in a wasteful manner.⁴⁹⁵ Residents of Saint George continue to harvest approximately 500 fur seals per year for the purpose of subsistence, along with a variety of other subsistence resources including halibut and marine invertebrates. The community is also working to develop commercial fisheries and tourism.⁴⁹⁶

Today, residents are working to develop commercial fisheries and tourism.⁴⁹⁷ In a survey conducted by the AFSC in 2011, community leaders reported that Saint George has yet to fully transition their economy “from that of fur seals to that of fisheries.” Community leaders also expressed that “there has been inefficient attention and activity” to help the community of Saint George “despite Congressional mandates” to do so according to the Fur Seal Act Amendments of 1983.

Natural Resources and Environment

Saint George is the second-largest of the Pribilof Islands, at approximately 40 square miles in area. Like the other Pribilofs, Saint George Island is of volcanic origin, built by basalt lava flows 1.6 to 2.2 million years ago.⁴⁹⁸ The Island is ringed by 50 miles of steep cliffs rising up to 300 meters above sea level. These cliffs provide extensive habitat for ledge-nesting

seabirds.⁴⁹⁹ The climate of Saint George is controlled by the cold waters of the Bering Sea. Its maritime location results in cool weather year-round and a narrow range of mean temperatures, varying from 24 to 52 °F (-4.4 to 11.1 °C). Average annual precipitation is 23 inches, with 57 inches of snowfall. Cloudy, foggy weather is common during summer months.⁵⁰⁰

Information from the Saint George Tanaq Corporation indicates that, each summer, more than one million northern fur seals congregate on the shores of the Pribilof Islands. This is the largest gathering of marine mammals anywhere in the world. Approximately 250,000 of these animals, as well as a number of harbor seals and Steller sea lions, are found on Saint George Island. Northern fur seals spend most of the year ranging throughout the Pacific Ocean waters of the Soviet Union, Japan, Canada, and the United States, but when it comes time to breed they must come ashore. Seventy percent of the world's northern fur seal population chooses the cool, moist climate and rocky beaches of the Pribilofs for breeding, returning each year to the very beaches where they were born. Soon after coming ashore in spring, female seals give birth to their pups. Throughout the summer the beaches are vibrant with activity; seal pups playing, mother seals swimming out to sea to feed, and bulls fighting off competitors.⁵⁰¹

An international fur treaty, signed initially in 1911, safeguards the seals from being hunted at sea. The treaty stipulates that the United States and Russia must each restrict their sealing activities to the Pribilof and Commander Islands, and in return for accepting a ban on pelagic sealing, the United States, Russia, Japan, and Canada each receive a share of the pelts taken during the yearly commercial harvests. Commercial harvests, however, have ceased in recent years and the communities of Saint George and Saint Paul now undertake small subsistence harvests each summer. Most experts believe that without the treaty the seals would now be endangered. In 1910, prior to acceptance of the treaty, the seal herd reached its lowest level at about 300,000 animals. Today the total seal population numbers close to a million. If the treaty were to be abolished many people believe the seals would once again be hunted at sea, by fishermen who contend the seals reduce fish stocks and by those who want the seals for their valuable fur. Environmental groups including the Sierra Club and National Audubon Society cite the international fur seal treaty as an outstanding example of wildlife conservation management.⁵⁰²

According to the Alaska Department of Environmental Conservation (DEC), petroleum contamination has been identified at a number of properties on Saint George Island currently or previously owned by NOAA and its predecessor agencies, including residential and commercial areas of Saint George. Removal of contaminated soil began in 2006. Restoration activities are conducted according to an agreement between NOAA and the DEC. As of 2008, NOAA planned to apply for 'closed out' and 'conditionally closed' status on the Saint George sites, which would involve institutional controls and a long-term monitoring plan.⁵⁰³

Current Economy⁵⁰⁴

The federally-controlled fur seal industry dominated the economy of the Pribilof Islands until 1983.⁵⁰⁵ As of 2010, top local employers included local government offices, the Native village corporation (Saint George Tanaq Corporation), private construction companies, Peninsula Airways, Inc., a private fuel company, and the Pribilof School District.⁵⁰⁶ Additionally, in a survey conducted by the AFSC in 2011, community leaders reported that the economy of Saint George relies upon commercial fishing, with primary emphasis on the halibut fishery. The Saint George Aquaculture Association also has salmon and shellfish programs. Subsistence harvest remains important in the community. Villagers harvest 500 fur seals each year for subsistence purposes. Halibut, reindeer, marine invertebrates, plants, and berries also contribute to the local diet.⁵⁰⁷

According to the 2006-2010 ACS,⁵⁰⁸ the estimated per capita income in Saint George in 2010 was \$19,242 and the estimated median household income was \$46,875, compared to \$21,131 and \$57,083 in 2000, respectively. However, after accounting for inflation by converting the 2000 values to 2010 dollars,⁵⁰⁹ the real per capita income (\$27,787) and household income (\$75,063) indicated a substantial estimated decrease in both figures between 2000 and 2010. However, Saint George's small population size may have prevented the ACS from accurately portraying economic conditions.⁵¹⁰ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database, the per capita income in Saint George in 2010 was \$14,224, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.⁵¹¹

In 2010, Saint George ranked 159th of 305 Alaskan communities with per capita income that year, and 152nd out of 299 Alaskan communities with household income data. Based on the 2006-2010 ACS, in the same year, 47.4% of the population age 16 and over was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was zero, compared to the statewide unemployment rate of 5.9%. Approximately 17.2% of local residents were living below the poverty line in 2010, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; the relatively low income figures and high poverty rates reported for Saint George are not reflective of the value of subsistence to the local economy. In addition, these unemployment

⁵⁰⁴ Unless otherwise noted, all monetary data are reported in nominal values.

⁵⁰⁵ See footnote 500.

⁵⁰⁸ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁵⁰⁹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁵¹⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁵¹¹ See footnotes 506 and 508.

and poverty statistics are likely inaccurate given the small population of Saint George.⁵¹² An additional estimate of unemployment is based on the ALARI database, which suggests a higher unemployment of 16.9% in 2010, compared to a statewide unemployment rate estimate of 11.5%.⁵¹³

Based on household surveys conducted for the 2006-2010 ACS, the greatest number of workers was employed in the private sector (66.7%), with 33.3% employed in the public sector. Out of the 18 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest number worked in the following industries: transportation, warehousing, and utilities (27.8%), public administration (22.2%), construction (22.2%), education services, health care, and social assistance (11.1%), and wholesale trade (11.1%). When employment is considered in terms of occupation, a majority of workers were estimated to be employed in management and professional occupations (55.6%). Information about employment by industry is presented in Figure 3, and is broken down by occupation in Figure 4. No individuals characterized themselves as working in natural resource based occupations or industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in farming, fishing, and forestry industries may be underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly.

Figure 3. Local Employment by Industry in 2000-2010, Saint George (U.S. Census).

Governance

Saint George is a 2nd Class City and is not located within an organized borough. The City does not administer sales or property tax, but a 3% raw fish tax is collected. Annual municipal revenues reported in the City’s certified financial statements varied considerably from year to year. In addition to the raw fish tax revenues, locally-generated income sources in Saint George between 2000 and 2010 included charges for services such as electricity, water and sewer, refuse collection, equipment and building rentals, and harbor moorage, wharfage, lighterage, and storage. Outside revenue sources included state and federal grants and shared revenues. Sources of shared revenue included the State Revenue Sharing program (over \$25,000 per year from 2000 to 2003) and the Community Revenue Sharing program (just over \$100,000 per year in 2009 and 2010). Several fisheries-related grants were received by the City during the 2000-2010 period. These included \$10 million in 2002 and \$2.5 million in 2003 from the U.S. Army Corps of Engineers for use in harbor improvements/feasibility design and construction and harbor entrance channel deepening/construction, \$2 million in 2005 from the U.S. Economic Development Administration for construction of a new fish processing plant, and \$143,742 in Federal Emergency Management Agency (FEMA) disaster recovery assistance in 2006 following severe storms in October 2006.⁵¹⁴ The FEMA disaster funding was directed toward harbor planning and engineering. Information about selected municipal funding sources is displayed below in Table 2.

In addition to the City of Saint George, the community was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native Village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Aleut Community of Saint George Island. The Tribe is combined with Saint Paul as the Pribilof Islands Aleut Communities of Saint Paul and Saint George Islands. The Native village corporation for the Aleut Community of Saint George Island is the Saint George Tanaq Corporation, which manages 128,666 acres of land.⁵¹⁵ The Saint George Tanaq Corporation is involved in the local tourism industry on the island, offering both accommodations and guide services. The

⁵¹⁴ U.S. Dept. of Homeland Security. 2006. “New Disaster Declaration to Help Alaska Recover from October Storms.” *FEMA Website*. Retrieved July 9, 2012 from <http://www.fema.gov/news/newsrelease.fema?id=32110>.

Corporation also owns several subsidiary environmental, energy, and resource conservation consulting companies that provide services locally. The affiliated Tanaq Foundation provides educational scholarships to shareholders.⁵¹⁶ Many members of the Aleut Community of Saint George Island are also shareholders in the Aleut Corporation, the regional Native corporation of the eastern Alaska Peninsula, Aleutian and Pribilof Islands.⁵¹⁷

The Aleut Community of Saint George Island is also part of the Aleutian Pribilof Islands Association (APIA). The mission of APIA is to promote self-sufficiency and independence of the Unangax by advocacy, training, technical assistance, and economic enhancement, as well as to assist in meeting health, safety, and well-being of each Unangax community; and to promote, strengthen, and preserve the Unangax cultural heritage.⁵¹⁸

A field station of the National Marine Fisheries Service (NMFS) is located on Saint George Island, and the nearest larger NMFS office is located in Dutch Harbor, along with an office of the Alaska Department of Fish and Game (ADF&G). The nearest office of the Alaska Department of Commerce, Community, and Economic Development is located in Dillingham. The nearest offices of the U.S. Immigration and Customs Enforcement, Bureau of Citizenship and Immigration Services, and Alaska Department of Natural Resources are located in Anchorage.

Infrastructure

Connectivity and Transportation

Saint George is accessible only by air and sea. There are two airstrips: one is owned by the City, and the other, with a 4,980-ft-long by 150-ft-wide gravel runway, is owned by the State. Scheduled flights are provided to Saint Paul and the Alaska mainland. Most freight and supplies are delivered by ship from Anchorage on a monthly or bimonthly schedule; cargo from Seattle arrives five or six times a year. There are three docks: one is operated by the village corporation and an inner harbor and dock are located in Zapadni Bay, 5 miles from the City.⁵¹⁹ Roundtrip airfare to Anchorage in June 2012 was \$797.⁵²⁰

Facilities

There is a piped water and sewer system with four wells and 250,000 gallons of storage that provides water for the community and the harbor. All residences in the community are connected to the system and are plumbed. Sewage outfall discharges into the harbor. The City provides refuse collection services. Electricity is provided by the Saint George Municipal Electric Utility, which is operated by the city and powered by diesel generators. Law enforcement services are provided by Village Public Safety Officers in Dillingham, and fire and rescue services are provided by the Saint George EMS/First Responders. The City also maintains a city public safety building, a community center, and a school gym and library.⁵²¹

In a survey conducted by the AFSC in 2011, community leaders reported that Saint George has a barge landing area and a dock served by electricity, water, and roads, in addition to fuel tanks at the dock. Community leaders also noted that Saint George has a jetty, an airport/seaplane base, water and sewer pipelines, sewage treatment, water treatment, a landfill/solid waste site, telephone service, and a post office. While community leaders also reported that there is no dock space available for permanent vessels to moor, there is 200 ft of dock space available for transient vessels up to 200 ft in length.

Medical Services

The Saint George Clinic, which is owned by the Village Council and operated by the Aleutian Pribilof Island Association, Inc. (APIA), provides medical care to the residents of Saint George. The clinic is a Community Health Aid Program site. Emergency services have coastal and air access and are provided by volunteers.⁵²² The nearest hospital is in Dillingham.

*Educational Opportunities*⁵²³

There is one school, the Saint George School, which provides instruction for students from pre-school through 12th grade. In 2011, the school had 10 students and 1 teacher.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The Pribilof Islands were historically used by Aleut people as a seasonal fishing and hunting site. Since the Aleuts were brought to Saint George Island by the Russians in the late 1700s, and permanent year-round settlements were established there, subsistence harvest of fur seal meat has remained fundamental to the local diet. Commercial fur seal harvest was also the basis of the wage economy in Saint George until 1983, when the U.S. Government ended the commercial seal harvest. Subsistence harvest of fur seals is governed by the Fur Seal Act of 1966 and the Marine Mammal Protection Act of 1972. Amendments were added to these Acts in 1985 and 1986, respectively, with the purpose “to limit the take of fur seals to a level providing for the subsistence needs of the Pribilof Aleuts using humane harvesting methods, and to restrict taking by sex, age, and season for herd management purposes.”⁵²⁴ Fur seal harvest is permitted for both subsistence purposes and for native handicrafts and clothing.⁵²⁵ Residents of Saint George utilize fur seals for both purposes today.^{526,527} In addition to fur seal, residents of Saint George have historically harvested seal, sea lion, and halibut for subsistence purposes.⁵²⁸

Saint George is located within Pacific Halibut Fishery Regulatory Area 4C, Federal Statistical and Reporting Area 513, and the Bering Sea Sablefish Regulatory Area. Today, the primary fishery in which Saint George residents are engaged is the commercial halibut fishery, while a small number participate in sablefish and other groundfish fisheries. Commercial exploitation of halibut and groundfish first extended into the Bering Sea region in the late 1920s after development of diesel engines, which allowed fishing vessels to undertake longer trips.⁵²⁹

In 1995, management of the Pacific halibut and sablefish fisheries shifted from limited entry to a catch share program. The program includes allocation of the annual Total Allowable

Catch (TAC) of halibut and sablefish via Individual Fishing Quota (IFQ). In the Bering Sea – Aleutian Islands (BSAI) region, quota shares are also allocated to six Community Development Quota (CDQ) non-profit organizations representing 65 communities in Western Alaska.⁵³⁰ The CDQ non-profit representing the tribal community of Saint George is the Central Bering Sea Fishermen’s Association (CBSFA). In 2010, The CBSFA received an allocation of 690,625 pounds of CDQ halibut quota, all of which was allocated for harvest within Area 4C, the Subarea within which the Pribilof Islands are located.⁵³¹ However, a halibut Catch Sharing Plan developed for Areas 4C, 4D, and 4E provides that Area 4C allocations can be harvested in either Area 4C or 4D to provide additional harvesting opportunities to fishermen in Area 4C.⁵³² Total BSAI sablefish CDQ allocations in 2009 and 2011 were 1.3 million lbs in each year. No sablefish CDQ report was available from NOAA for the 2010 season.⁵³³ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the CDQ allocations.⁵³⁴ Saint George is not eligible to participate in the Community Quota Entity program.

In a survey conducted by the AFSC in 2011, community leaders indicated that Saint George actively participates in fisheries management processes in Alaska through sending a representative to participate in North Pacific Fishery Management Council (NPFMC) committees or advisory groups. In addition, they indicated that Saint George relies on regional organizations, such as the Southwest Alaska Municipal Conference, to provide information on fisheries management issues.

In the 2011 AFSC survey, Saint George community leaders outlined challenges that face the portion of the Saint George economy that relies on commercial fishing. They reported that fishing activity is currently limited due to incomplete development of the harbor and related infrastructure. They expressed the opinion that the U.S. Department of Commerce has not yet met obligations outlined in the Fur Seal Act Amendments of 1983 – to help transition Saint George’s economy from fur seal harvest to fisheries. According to the community leaders, this transition has not yet taken place, and the community requires direct fish/crab quota allocations and sufficient funding to complete necessary infrastructure development to allow development of commercial fishery activity. They also expressed the desire that the Fur Seal Act Amendments be recognized as “applicable law” under the Magnuson-Stevens Fishery Conservation and Management Act and by the NPFMC. They also noted high fuel costs as a limitation to development of local fisheries activity.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Saint George did not have a registered processing plant. That year, the nearest registered processing plant was located in Saint Paul.

However, it is important to note that, in 2008, APICDA Joint Ventures, Inc. (AJV) reached an agreement with Snopac Products, Inc. to purchase all of Snopac's crab processor quota shares and processing equipment located in Saint George. Snopac had not actively processed crab in Saint George since 2000. Local community leaders hoped the purchase would help revitalize the local economy.⁵³⁵

In addition, between 1999 and 2009, Puffin Seafoods, L.L.C. operated in Saint George. The facility, co-owned by AJV and the Saint George Fishermen's Association, purchased halibut caught by local Saint George fishermen from the Area 4C halibut CDQ allocation. Puffin Seafoods was dissolved in 2009. A new company was scheduled to be formed in 2010 around planned construction of a new seafood processing facility on Saint George Island.^{536,537} Federal grant money (\$2 million) was received from the EDA in 2005 toward construction of the new processing facility. According to the APICDA, the new facility was slated to be a joint venture between AJV and Snopac Products, Inc.⁵³⁸

Fisheries-Related Revenue

Between 2000 and 2010, Saint George received fisheries-related revenue from various sources, including a raw fish tax, the Shared Fisheries Business Tax, the Fisheries Resource Landing Tax, and harbor usage fees, although data for some years for various revenue sources were not available (Table 3). The amount of revenue obtained from fisheries-related sources between 2000 and 2010 varied widely, from a high of \$763,896 in 2000 to \$10,213 in 2010.⁵³⁹

In a survey conducted by the AFSC in 2011, community leaders reported that maintaining the harbor and water and wastewater systems are at least partially supported or funded by the Shared Fisheries Business Tax. They also reported that Saint George received \$120,000 in funding or grants and \$23,000 in special allocations from a CDQ entity in 2010.

Commercial Fishing

While residents of Saint George held Federal Fisheries Permits and halibut, sablefish, and groundfish Commercial Fisheries Entry Commission (CFEC) permits, only the halibut permits were reported as actively fished during each year from 2000 to 2010 (Table 4). The percentage of halibut permits reported as fished in each year varied during that period from 33% to 100%. In

⁵³⁹ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the City's financial statements.

2010, halibut CFEC permits were issued for the statewide longline vessel fishery using vessels under 60 ft. Sablefish CFEC permits were issued in 2010 for the statewide longline vessel fishery using vessels under 60 ft, and groundfish CFEC permits were issued for the statewide miscellaneous saltwater finfish longline fishery using vessels under 60 ft.

Between 2000 and 2010, data regarding total lbs landed and ex-vessel value are considered confidential due to the small number of participants (Table 5). However, there were five vessels owned by Saint George residents and homeported in Saint George, with three vessels landing catch in Saint George in 2010. That same year, there were five crew license holders in Saint George, and one fish buyer. The number of crew license holders, fish buyers, vessels owned primarily by residents, vessels homeported, and vessels landing catch in Saint George has varied between 2000 and 2010. In addition, from between 2001 and 2008, one registered shore-side processing facility was located in Saint George (see *Processing Plants* section above).

In 2010, there were eight halibut quota share holders in Saint George, holding a total of 146,384 shares of halibut quota and 29,579 lbs of halibut Individual Fishing Quota (IFQ) allotment (Table 6). Between 2000 and 2010, the number of halibut quota share holders decreased from 15 to 8, with corresponding decreases in the number of shares of halibut quota (383,289 to 146,384) and lbs of IFQ (97,796 to 29,579) held by Saint George residents. Between 2000 and 2010, no residents of Saint George held sablefish or crab quota share accounts or quota shares (Tables 7 and 8).

In a survey conducted by the AFSC in 2011, community leaders reported that commercial fishing boats under 35 ft use Saint George as their base of operations during the fishing season.

Recreational Fishing

The ADF&G Statewide Harvest Survey does not include the Pribilof Islands (including Saint George) in their survey regions; therefore, there are no data available on private angler harvest trends from the Statewide Harvest Survey for this area. The nearest survey region is the Alaska Peninsula/Aleutian Islands area.

In a survey conducted by the AFSC in 2011, community leaders reported that recreational fishing takes place on private boats owned by local residents, with halibut, rockfish, crab, and Pacific cod as the primary target species.

In 2010, there were no active sport fish guide businesses or licensed sport fish guides present in Saint George. While no sportfishing licenses were sold in the community, a total of one sportfishing license was sold to a resident of Saint George (irrespective of the location of the point of sale). The number of sportfishing licenses sold to residents of Saint George between 2000 and 2010 varied between one and four (Table 11).

Subsistence Fishing

Villagers harvest 500 fur seals each year for subsistence purposes. Halibut, reindeer, marine invertebrates, plants, and berries also contribute to the local diet.⁵⁴⁰ According to a survey conducted by the AFSC in 2011, subsistence harvest is done by residents of Saint George and the three most important marine or aquatic resources are fur seals, halibut, and Pacific cod.

Data are not available during the 2000-2010 period regarding per capita subsistence harvest in Saint George, the percentage of Saint George households that utilized various marine resources for subsistence purposes, or total harvest of marine invertebrates or non-salmon fish (not including halibut) (Tables 12 and 13). Some information is available from an earlier subsistence survey about species of marine invertebrates, marine mammals, and non-salmon fish used by Saint George conducted by the ADF&G Division of Subsistence. Based on the survey, in 1994, the following species of marine invertebrates, marine mammals, and non-salmon fish were used for subsistence in Saint George: blue king crab, blue mussels, butter clams, hair crab, limpets, octopus, Pacific littleneck clams (steamers), razor clams, sea cucumber, sea urchin, snails, Tanner crab, snow crab, unknown king crab, and unknown Tanner crab. Marine mammals reported as harvested for subsistence use included fur seal (communal), fur seal (other), harbor seal, Steller sea lion, unknown seal, and unknown whale. Non-salmon fish reported as harvested for subsistence use included: Dolly Varden, lake trout, Pacific cod (gray), pike, rainbow trout, sablefish (black cod), sheefish, unknown flounder, unknown greenling, unknown rockfish, and unknown sculpin.⁵⁴¹

Data were available during the 2000-2010 period regarding annual subsistence harvest of halibut. Between 2003 and 2010, the number of Subsistence Halibut Registration Certificate (SHARC) cards issued by NMFS decreased from 31 to 4 (Table 14). In 2010, 14 of the 26 SHARC cards issued that year were reported as actively fished, for a total of 686 lbs of halibut harvested that year. This total represents a large decrease from 2007, when 3,736 lbs of halibut were harvested on 14 active SHARC cards.

In addition, limited data are available regarding the subsistence harvest of marine mammals between 2000 and 2010. Based on information reported by ADF&G, the number of Steller sea lions harvested by Saint George residents varied from 6 to 12 per year between 2000 and 2008. No information was reported by management agencies regarding subsistence harvest of harbor seal, spotted seal, beluga whale, sea otter, or walrus (Table 15).

In addition, no information was reported regarding annual subsistence harvest in Saint George between 2000 and 2010 (Table 13).

Saint Paul

People and Place

Location^{542,543}

The community of Saint Paul is located on a narrow peninsula on the southern tip of Saint Paul Island, the largest of the four Pribilof Islands. It lies 47 miles north of Saint George Island, 240 miles north of the Aleutian Islands, 300 miles west of the Alaska mainland, and 750 air miles west of Anchorage. Saint Paul is located in the Aleutian Islands Recording District. The community encompasses 40.3 square miles of land and 255.2 square miles of water.

*Demographic Profile*⁵⁴⁴

In 2010, the U.S. Census determined that there were 479 residents in Saint Paul, making it the 122nd largest of 352 total Alaskan communities with recorded populations that year. However, the 2006-2010 American Community Survey (ACS) estimated that Saint Paul had 1,065 residents in 2010. The difference between the two population figures is likely due to the presence of seasonal workers, which play an important role in the economy of Saint Paul, and the timing of when the U.S. Census surveys were done in the community. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that an estimated 300 seasonal workers or transients live in Saint Paul for part of the year, mostly working in the construction, tour guide, and fishing industries (e.g., snow crab, halibut, and king crab). They also indicated that the population of Saint Paul reaches an annual peak in January when transient processors are present, and that the population peak is entirely driven by fisheries-related employment.

Based on the Alaska Department of Labor estimate of permanent residents, the average annual growth rate for Saint Paul between 2000 and 2009 was -1.64%, indicating slow population decline. Overall between 2000 and 2009, the population of Saint Paul decreased by 13.72%. The change in population from 1990 to 2010 is detailed in Table 1.

A majority of residents of Saint Paul in 2010 identified themselves as American Indian or Alaska Native (82.3%), while 11.1% identified themselves as White, 0.6% as Asian, 0.6% as 'some other race', 0.4% as Black or African American, 0.4% as Native Hawaiian or other Pacific Islander, and 4.8% identified as two or more races. In addition, 3.5% identified themselves as Hispanic or Latino in 2010. Compared to 2000, the percentage of the population identifying themselves as American Indian or Alaska Natives was 3.6% lower in 2010, and the percentages

⁵⁴⁴ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

of the population identifying themselves as White and Native Hawaiian or other Pacific Islander also decreased over this period (by 1.9% and 0.4%, respectively). During the same period, the population of Saint Paul experienced corresponding increases in the percentage of the population identifying themselves as Asian, Hispanic or Latino, Black or African American, and two or more races. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Saint Paul was 2.81, a slight decrease from 3.6 in 1990 and 2.88 in 2000. However, there has been an overall increase in the total number of occupied households since 1990, from 154 in 1990 to 177 in 2000 to 162 in 2010. Of the 190 housing units surveyed for the 2010 Decennial Census, 91 were owner-occupied, 71 were renter-occupied, and 28 were vacant. There were 24 Saint Paul residents reported as living in group quarters in 2010.

The gender makeup in Saint Paul was slightly skewed in 2010, at 53% male and 47% female, similar to the state as a whole (52% male, 48% female). The population between 20 and 69 was slightly male biased both in 2000 and 2010. The median age in Saint Paul was 34.4 years, lower than the U.S. national average of 36.8 years and higher than the median age for Alaska, 33.8 years. The greatest percentage of residents fell within the age category 0-19 years old, with the next largest percentage for the category 40-59 years old. Relatively few people were 70 or older (Figure 2).

Figure 1. Racial and Ethnic Composition, Saint Paul: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Saint Paul Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 ACS,⁵⁴⁵ 74% of Saint Paul residents age 25 and over were estimated to hold a high school diploma or higher, compared with 90.7% of Alaska residents overall. Also in 2009, 11.9% of the population had less than a ninth grade education, compared to 3.5% of Alaska residents overall; 14.1% had a 9th to 12th grade education but no diploma, compared with 5.8% of Alaska residents overall; 45.4% had a high school diploma or equivalent, compared with 27.4% of Alaska residents overall; 7% had some college but no degree, compared with 28.3% of Alaska residents overall; 10.2% held an Associate's degree, compared with 8% of Alaska residents overall; 11.1% held a Bachelor's degree, compared with 17.4% of Alaska residents overall; and 0.3% held a graduate or professional degree, compared with 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Saint Paul's population is predominantly Unangan Aleut.⁵⁴⁶ Historically, the Aleuts traveled to the Pribilof Islands seasonally for hunting. Inspired by traditional Aleut stories, Gavriiff Pribilof of the Russian fur trading company, Lebedov Lastochkin Co., went on a search for the legendary "Seal Islands." After three years, Pribilof landed on Saint George Island in 1786, and named the island after his vessel. The following year, Pribilof and his party landed on the larger island to the north, which was named 'Saint Peter and Saint Paul Island' in honor of the day they made landfall – the Feast of Saints Peter and Paul. It is now known simply as Saint Paul Island.⁵⁴⁷ In 1788, the Russian American Company enslaved and relocated Aleuts from Siberia, Atka, and Unalaska to the Pribilofs to hunt fur seals. Their descendants continue to live on these two islands today.⁵⁴⁸

The United States' purchase of Alaska from Russia in 1867 included the Pribilof Islands. Soon after the purchase, in 1868, the Islands were declared a special Federal Reserve with the purpose of managing fur seals and other fur-bearing species, and the federal government began to contract seal harvest to private companies.⁵⁴⁹ In 1870, the U.S. government awarded the Alaska Commercial Company a 20-year sealing lease, and they provided housing, food, and medical care to the Aleuts in exchange for seal harvesting. In 1890, a second 20-year lease was awarded to the North American Commercial Company. However, fur seals were severely over-harvested, and poverty ensued. The 1910 Fur Seal Act ended private leasing on the Islands and placed the community and fur seals under the U.S. Bureau of Fisheries. Food and clothing were scarce, social and racial segregation was practiced, and working conditions were poor.⁵⁵⁰

⁵⁴⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁵⁴⁶ Information updated by a representative of the Aleut Community of Saint Paul Island during community review of this document, July 2012.

⁵⁵⁰ See footnote 548.

During World War II, the Pribilof Aleuts were moved to Funter Bay on Admiralty Island in Southeast Alaska as part of the emergency evacuation of residents from the Bering Sea. Unlike other Aleutian residents, they were confined in an abandoned cannery and mine camp at Funter Bay. Conditions were poor, with crowded quarters and inadequate heat and sanitation, leading to high rates of illness. Many elderly and young people died during this period. Later, in 1979, the Aleut Islanders received \$8.5 million in partial compensation for the unfair and unjust treatment the federal administration subjected them to from 1870 to 1946.^{551,552}

In 1983, Congress passed the Fur Seal Act Amendments, which brought government control of the commercial seal harvest and the federal presence in the Pribilof Islands to an end. Responsibility for providing community services and management of the fur seals was left to local entities. To help develop and diversify the local economy, \$12 million was provided to Saint Paul by the federal government. Commercial harvesting of fur seals on Saint Paul ceased in 1985.⁵⁵³ Today, the Marine Mammal Protection Act provides that marine mammals may be taken by Native Alaskans living in Alaska if such taking is 1) for subsistence purposes; or 2) is done for the purpose of creating and selling authentic native articles of handicrafts and clothing; and 3) in each case, is not accomplished in a wasteful manner.⁵⁵⁴ Residents of Saint Paul harvest fur seals for the purpose of both subsistence and Native arts and crafts.^{555,556}

Although subsistence has not historically been the focus of the local culture, today seal – and other resources such as halibut – are shared and exchanged with relatives living in other communities for salted or smoked salmon.⁵⁵⁷ The American Orthodox Church⁵⁵⁸ historically played a strong role in community cohesiveness. The sale of alcohol is limited to the tribal-owned package store and the tavern.⁵⁵⁹

Natural Resources and Environment

The climate of Saint Paul is sub-arctic maritime. The location in the Bering Sea results in cool weather year-round and a narrow range of mean temperatures, varying from 19 to 51 °F (-7.2 to 10.6 °C). Average annual precipitation is 25 inches, with snowfall of 56 inches. Heavy fog is common during summer months.⁵⁶⁰ Saint Paul is the largest of the four Pribilof Islands and lies the furthest north. It is approximately 16 miles long and 9 miles wide, with a maximum elevation of 655 ft. The Island is of volcanic origin, and the topography is characterized by lava

flows, volcanic cones, and volcanic debris. Inland, a tundra complex overlies the volcanic soil, made up of lichens, mosses, wildflowers, rock jasmine, Chickweed, and low-lying willows and scrubs. Along some stretches of the coastline, the volcanic rock is covered by coastal dunes and marine deposits inside shallow bays. In other coastal areas, headlands rise above sheer cliffs.^{561,562}

Wildlife present on Saint Paul Island includes over 248 species of migratory birds, blue fox (a sub-species of Arctic fox), and reindeer (descendants of a domesticated herd from the early 1900s).⁵⁶³ A majority of the northern fur seal in the Pribilof Islands have their rookeries on Saint Paul Island. Most of the Island is owned by the village Native corporation, Tanadgusix Corporation (TDX), which provides wildlife viewing tours.⁵⁶⁴ In 1982, a portion of Saint Paul Island known as the ‘seabird cliffs’ was purchased by the federal government to be added to the Pribilof Unit of the Alaska Maritime National Wildlife Refuge (NWR).⁵⁶⁵ Including all of its units, the Alaska Maritime NWR spans four time zones,⁵⁶⁶ stretching from the Aleutian Islands to the Chuckchi Sea Coast to the Southeast Alaska Panhandle. It was created in part to promote a program of scientific research on marine ecosystems. The Alaska Maritime NWR “protects breeding habitat for seabirds, marine mammals, and other wildlife on more than 2,500 islands, spires, rocks, and coastal headlands.”⁵⁶⁷

Natural hazards with the potential to impact the community of Saint Paul include earthquakes, tsunamis, severe weather, flooding, and erosion. The primary flooding risk in Saint Paul is from storm surges, which occur when ocean water is driven onshore by high winds during storms. Flooding events and coastal storms are the primary causes of coastal erosion on Saint Paul Island. Severe weather events that are likely to affect Saint Paul include severe winds, winter storms, heavy snow, and ice storms. Severe winds are a regular occurrence, resulting in extensive damage to structures in the community. Extreme cold temperatures are also common in the region. The probability of an earthquake in the area is considered low to moderate. There is minimal risk of tsunami damage to Saint Paul.⁵⁶⁸

According to the Alaska Department of Environmental Conservation (DEC), petroleum contamination has been identified at a number of properties on Saint Paul Island currently or previously owned by NOAA and its predecessor agencies. Restoration activities have been conducted according to an agreement between NOAA and the DEC, and currently no further remedial action is planned. Contaminated soil has been excavated and long-term soil and

groundwater monitoring is in place. Residents of Saint Paul obtain drinking water from a clean source located two miles north of the City.

Current Economy⁵⁶⁹

The federally-controlled fur seal industry dominated the economy of the Pribilofs until 1985, when commercial fur seal harvest came to an end.⁵⁷⁰ According to a survey conducted by the AFSC in 2011, Saint Paul community leaders indicated that the local economy has transitioned from fur-seal harvest to servicing the commercial fishing industry. They reported that fisheries are the primary economic driver in Saint Paul, and emphasized the importance of fish and crab processing to the local economy. Saint Paul is a port for the Central Bering Sea fishing fleet, and major harbor improvements have fueled economic growth. Several offshore processors are serviced out of Saint Paul, and shore-side plants process cod, crab, and halibut.⁵⁷¹ The Central Bering Sea Fishermen's Association (CBSFA) operates a cooperative in conjunction with the F/V Saint Paul, Trident Seafoods, and American Seafoods. Trident Seafoods is one of the top local employers.⁵⁷² A number of local residents are also involved in commercial fisheries as vessel owners, permit and quota share account holders, and crew license holders (see *Commercial Fisheries* section).

In addition to fisheries and seafood processing, top employers in Saint Paul in 2010 included the City of Saint Paul, the Tribal Government of Saint Paul, the local Native village corporation, Tanadgusix Corp., the Aleutian Pribilof Islands Association Inc., the Pribilof School District, local retailers, dredging and marine construction, and Peninsula Airways, Inc.⁵⁷³ In addition, fur seal rookeries and more than 210 species of nesting sea birds attract several hundred visitors to this remote location each year. Subsistence is also important to the local economy. Residents utilize halibut, fur seals (1,645 may be taken each year), reindeer, ducks, seabirds, marine invertebrates, plants, and berries for subsistence purposes.⁵⁷⁴

Based on the 2006-2010 ACS,⁵⁷⁵ the estimated per capita income in Saint Paul in 2010 was \$26,198, and the estimated median household income in 2010 was \$38,125, compared to \$18,408 and \$50,750 in 2000, respectively. However, after accounting for inflation by converting the 2000 values to 2010 dollars,⁵⁷⁶ the real per capita income (\$24,206) increased between 2000 and 2010, while the real median household income (\$66,736) decreased substantially during the same period. In 2010, Saint Paul ranked 93rd of 305 Alaskan communities with per capita income that year, and 200th of 299 Alaskan communities with household income data.

⁵⁶⁹ Unless otherwise noted, all monetary data are reported in nominal values.

⁵⁷⁵ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁵⁷⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

However, Saint Paul's small population size may have prevented the ACS from accurately portraying economic conditions.⁵⁷⁷ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Saint Paul in 2010 is \$13,628.⁵⁷⁸ This estimate is lower than both reported per capita income in 2000 and the 2010 ACS estimate, suggesting that caution is warranted when citing a real increase in per capita income in Saint Paul based on ACS estimates. Saint Paul did not meet the Denali Commission's primary criteria as a "distressed community" in 2010.⁵⁷⁹ It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a much higher percentage of Saint Paul residents was estimated to be in the civilian labor force (91.4%) than in the civilian labor force statewide (68.8%). In the same year, 17.7% of local residents were estimated to be living below the poverty line, almost double the rate of Alaska residents overall (9.5%), and the unemployment rate was estimated to be 1.5%, much lower than the statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 15.5%, compared to a statewide unemployment rate estimate of 11.5%.⁵⁸⁰

Based on the 2006-2010 ACS, the greatest number of workers was estimated to be employed in the private sector (96.1%), while 3.8% worked in the public sector, and 0.1% of workers were self-employed. Out of 866 people age 16 or older that were estimated by the 2006-2010 ACS to be in the civilian labor force, a majority worked in manufacturing industries (90.2%). Only small percentages of the population were estimated to work in other industries. Compared to 2000, the distribution of employment was much more concentrated in manufacturing in 2010, and a number of industries were no longer represented in employment estimates. It is important to keep in mind that the small population of Saint Paul may affect the representativeness of 2006-2010 ACS estimates, which could explain the dramatic shift in employment statistics between 2000 and 2010.⁵⁸¹ This information about employment by industry is presented in Figure 3.

Employment statistics by occupation show similar trends, with a large increase in production, transportation, and material moving occupations between 2000 and 2010, and a dramatic reduction in employment in natural resource, construction, and maintenance, service, and management and professional occupations. The percentage of the workforce estimated to be employed in sales and office occupations remained stable between 2000 and 2010. Employment is broken down by occupation in Figure 4.

⁵⁷⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁵⁷⁸ See footnotes 572 and 575.

⁵⁷⁹ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

⁵⁸⁰ See footnote 572.

⁵⁸¹ See footnote 577.

It is important to note that the number of individuals employed in fishing-related occupations and industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly.

Figure 3. Local Employment by Industry in 2000-2010, Saint Paul (U.S. Census).

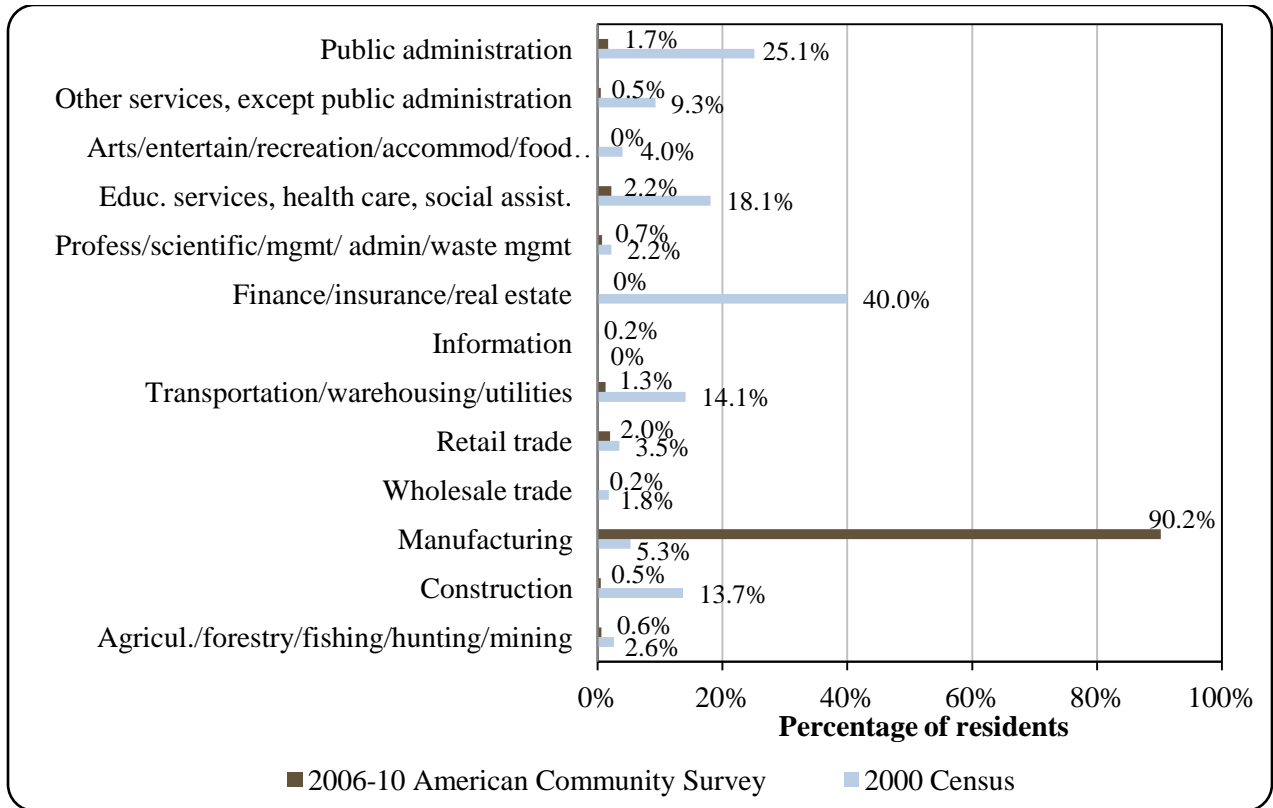

Figure 4. Local Employment by Occupation in 2000-2010, Saint Paul (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 230 employed residents in Saint Paul in 2010, of which 47.4% were employed in local government, 11.3% in financial activities, 9.6% in trade, transportation, and utilities, 8.7% in education and health services, 8.3% in manufacturing, 5.7% in construction, 2.2% in professional and business services, 0.9% in state government, 0.4% in leisure and hospitality, and 5.7% in other industries.⁵⁸² As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Saint Paul is a 2nd Class City governed by a mayor and a city council and is not located within an organized borough. The City has a “Strong Mayor” form of government, with a seven-person city council including the mayor, a five-person school board, five-person planning commission, and several municipal employees. As of 2010, the City administered a 3% sales tax and a raw fish tax, and did not administer a property tax.^{583,584} In addition to sales tax revenues, other locally-generated revenue sources in Saint Paul during the 2000-2010 period included local raw fish tax revenue, and charges for services such as day care, building rentals, equipment rental and repairs, emergency medical services, and financial services. Outside revenue sources included shared funds from the State of Alaska, a contract for maintenance of the airport, and a variety of capital and special project grants. Sources of shared revenue included the State Revenue Sharing program from 2000 to 2003 (between \$30,000 and \$40,000 per year), the state Community Revenue Sharing program in 2009 and 2010 (just under \$120,000 each year), and the state fish tax refunds, among others. Grants were received from state and federal agencies for capital projects, including a number of fisheries-related grants. These U.S. Army Corps of Engineers funding for harbor upgrades, a local boat basin project, improvements to the Saint Paul small boat harbor, harbor improvements (processor space), and construction of a small boat harbor (Phases I, II, and III), and U.S. Economic Development Agency funding for harbor dredging. Other grants included a Bureau of Indian Affairs (BIA) funding for a road project and state funds for remodel and repair of buildings, renovation of the local boat basin, and fire and public safety upgrades. Information about select aspects of revenue sources in Saint Paul is presented in Table 2. Also see the *Fisheries-Related Revenue* section for more information about local and state fish tax revenues.

Saint Paul was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native Village. The authorized traditional entity, recognized by the BIA, is the Aleut Community of Saint Paul Island. The Tribe is combined with Saint George as the ‘Pribilof Islands Aleut Communities of Saint Paul and Saint George Islands’. The Native village corporation for the Aleut Community of Saint Paul Island is the Tanadgusix Corporation (TDX), which manages 154,376 acres of land.⁵⁸⁵ The TDX Corporation owns several subsidiary

Infrastructure

Connectivity and Transportation

Saint Paul is accessible by sea and air only. Most supplies and freight arrive by ship. There is a breakwater, 700 ft of dock space, and a barge off-loading area. Regularly scheduled flights are also available. The state-owned asphalt runway is 6,500 ft long and 150 ft wide.⁵⁸⁹ Round-trip airfare to Anchorage for travel during June 2012 was \$797.⁵⁹⁰

Facilities

Water is supplied by wells and an aquifer and is treated. There are two wooden tanks; one is 500,000 gallons, and the other is 300,000 gallons. All 175 homes and facilities are connected to the piped water and sewer system and are fully plumbed. The City provides refuse collection services. A landfill, burn box, and sludge and used oil disposal site are available.⁵⁹¹ In the 2011 AFSC survey, community leaders reported that a water treatment facility is in use, improvements to water and sewer pipelines are expected in 2013, and a new landfill is expected to be in use by 2020. Electricity in Saint Paul is provided by a diesel powerhouse. A small wind turbine has been erected and currently provides power and hot water to the village corporation's airport facility and hotel, but it is not yet connected to the municipality's electric grid. Police services are provided in Saint Paul by the City Police Department, and fire and rescue services are provided by Saint Paul Emergency Medical Services (EMS) Rescue Squad. Other community facilities include a youth center sponsored by the village corporation, a city auditorium, a school gymnasium and school library, and a public library. In addition, the APIA sponsors a senior center meals program.⁵⁹² In the 2011 AFSC survey, community leaders also noted the presence of a food bank, a small recreation center, and a limited publicly subsidized housing program. Community leaders also noted that many public social services are primarily accessible to permanent residents, which some services, such as the library and medical facilities, are also available for seasonal processing workers.

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that Saint Paul has four docks. Since the late 1980s, the city dock has been served by electricity and water, and has been connected to the road system since 1984. A breakwater was completed at the city dock in 1990, and fuel tanks have been available since 1994; Trident's dock has had a breakwater and been connected to these various amenities since 1994; other local docks are expected to receive electricity and water, as well as a breakwater, within the next 10 years. In addition, a fish cleaning station and haul out facilities are expected to be available within the next 10 years. A barge landing area has also been in place in Saint Paul since before 2000. In total, community leaders reported that 450 ft of dock space is available for transient vessel moorage at Saint Paul harbor facilities, but no dock space is available for permanent vessel moorage. Vessels up to 200 ft long may use moorage in Saint Paul, though those vessels

must have a shallow draft. They also indicated that Saint Paul facilities are capable of handling small rescue boats, small cruise ships, and fuel barges.

Community leaders also reported in the 2011 AFSC survey that a variety of fisheries-related businesses and services are available in Saint Paul. These include fish processing plants and commercial cold storage, fishing gear storage, gear repair (for halibut longline gear only), moorage of small recreational vessels, haulout facilities for small boats (less than 60 tons), sale of bait, boat fuel, and ice, and very limited sale of fishing gear. For those fisheries-related businesses and services not available in Saint Paul, community leaders indicated that local residents most frequently travel to Unalaska, Anchorage, or Seattle.

Medical Services

Medical services are provided to the community by the Saint Paul Health Center, which is owned by the Regional Health Corporation and operated by the APIA. The health center is a Community Health Aid Program site. The clinic is a qualified Emergency Care Center, and emergency services have coastal and air access. Alternate health care is provided by the Saint Paul Emergency Medical Services Rescue Squad. Emergency service is provided by 911 telephone service volunteers and a health aide.⁵⁹³ The nearest hospital is located in Dillingham, but most local residents travel to Anchorage to access medical facilities there.⁵⁹⁴

Educational Opportunities

The Saint Paul School provides instruction for students from pre-school through 12th grade. In 2011 the school had 78 students and 10 teachers.⁵⁹⁵ Online distance learning classes are also available for through the University of Alaska.⁵⁹⁶

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The Pribilof Islands were historically used by Aleut people as a seasonal fishing and hunting site. Since the Aleuts were brought to Saint George Island by the Russians in the late 1700s, and permanent year-round settlements were established there, subsistence harvest of fur seal meat has remained fundamental to the local diet. Commercial fur seal harvest was also the basis of the wage economy in Saint Paul until 1983, when the U.S. government ended the commercial seal harvest. Subsistence harvest of fur seals is governed by the Fur Seal Act of 1966 and the Marine Mammal Protection Act of 1972. Amendments were added to these Acts in 1985 and 1986, respectively, with the purpose “to limit the take of fur seals to a level providing for the subsistence needs of the Pribilof Aleuts using humane harvesting methods, and to restrict taking

by sex, age, and season for herd management purposes.⁵⁹⁷ Fur seal harvest is permitted for both subsistence purposes and for native handicrafts and clothing.⁵⁹⁸ Residents of Saint Paul utilize fur seals for both purposes today.^{599,600} In addition to fur seal, residents of Saint Paul have historically harvested seal, sea lion, and halibut for subsistence purposes.⁶⁰¹

Saint Paul is located within Pacific Halibut Fishery Regulatory Area 4C, Federal Statistical and Reporting Area 513, and the Bering Sea Sablefish Regulatory Area. Today, the greatest number of Saint Paul residents participates in the commercial halibut fishery, while a smaller number of residents are also involved in fisheries for groundfish, crab, and salmon.

Commercial exploitation of halibut and groundfish first extended into the Bering Sea region in the late 1920s after development of diesel engines, which allowed fishing vessels to undertake longer trips.⁶⁰² Today, Pacific halibut fisheries are managed under the International Pacific Halibut Commission. In 1995, management of the Pacific halibut and sablefish fisheries shifted from limited entry to a catch share program. The program includes allocation of the annual Total Allowable Catch (TAC) of halibut and sablefish via Individual Fishing Quota (IFQ). In the Bering Sea – Aleutian Islands (BSAI) region, quota shares are also allocated to six Community Development Quota (CDQ) non-profit organizations representing 65 communities in Western Alaska.⁶⁰³ The CDQ non-profit representing the tribal community of Saint Paul is the Central Bering Sea Fishermen’s Association (CBSFA). In 2010, The CBSFA received an allocation of 690,625 lbs of CDQ halibut quota, all of which was allocated for harvest within Area 4C, the Subarea within which the Pribilof Islands are located.⁶⁰⁴ However, a halibut Catch Sharing Plan developed for Areas 4C, 4D, and 4E provides that Area 4C allocations can be harvested in either Area 4C or 4D to provide additional harvesting opportunities to fishermen in Area 4C.⁶⁰⁵ Total BSAI sablefish CDQ allocations in 2009 and 2011 was 1.3 million lbs in each year. No sablefish CDQ report was available from NOAA for the 2010 season.⁶⁰⁶ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain

portion of the CDQ allocations.⁶⁰⁷ Saint Paul is not eligible to participate in the Community Quota Entity program.

Bering Sea crab fisheries also play an important role in the local economy in Saint Paul, which is the location of one of the largest crab processing plants in the region.⁶⁰⁸ Large scale commercial exploitation of crab in the Bering Sea began in the 1950s with the development of king crab fisheries. The Pribilof Islands were an historical center of the red king crab fishery, and also one of the few sites where larger concentrations of blue king crab are found.⁶⁰⁹ In the 1960s, a fishery for hair crab also developed in the Pribilof Islands, originally pioneered by the Japanese, and taken over by American vessels beginning in 1979.⁶¹⁰ Other commercial crab species that are distributed in the Bering Sea include golden king crab, Tanner crab, snow crab, grooved Tanner crab, triangle Tanner crab, and scarlet king crab.⁶¹¹ A number of these crab stocks are in depressed condition. Low stock abundance has led to the closure of the Pribilof Island red and blue king crab fisheries^{612,613} and the Bering Sea hair crab fishery⁶¹⁴ through the last decade. Bering Sea and Aleutian Islands crab stocks are jointly managed by the North Pacific Fishery Management Council (NPFMC) and ADF&G.⁶¹⁵

Most BSAI king, Tanner, and snow crab fisheries were included under a 2005 rationalization program. The program was proposed in response to overcapitalization and very short seasons in these fisheries. The crab rationalization program allocated harvest shares to historical license holders as well as to CDQ non-profit entities. In addition, processors were issued processing shares, and community interests were protected through community landing requirements. Regional landing requirements have been particularly important in maintaining landings in remote communities such as Saint Paul. The crab rationalization program has been credited with improving safety and fuel savings in BSAI crab fisheries, and also resulted in a significant reduction of the total number of vessels involved in the fishery. For many communities, a problematic result of the program has been a dramatic reduction in employment for crew members.⁶¹⁶

In the 2011 AFSC survey, community leaders indicated that the community of Saint Paul participates in the fisheries management process in Alaska through a variety of mechanisms. The Mayor and many other residents of Saint Paul⁶¹⁷ attend North Pacific Fisheries Management Council meetings and/or Board of Fisheries meetings, and a representative of Saint Paul

participates in North Pacific Fisheries Management Council committees or advisory groups. In addition, Saint Paul relies on regional organizations to provide information on fisheries management issues. Saint Paul also supports research organizations, industry coalitions, and trade associations, such as the CBSFA.

When asked to comment on challenges facing Saint Paul's fisheries economy, community leaders indicated that reduced government funding threatens continued maintenance of the breakwater, harbor dredging and other continuous infrastructure maintenance needs, as the fishing industry itself cannot fully finance these efforts. In addition, CDQ quota allocations were identified as a primary issue affecting the community. Community leaders reported that the community protections component of the crab rationalization program has been critical for Saint Paul. They reported that the CDQ program is a major contributor to the community through the CBSFA's outreach and social programs. When asked to comment on past or future fisheries management actions that affect Saint Paul, community leaders emphasized the importance of fishery management to prevent stock collapse. Specifically, potential future management actions of concern to the community of Saint Paul include the right of first refusal, emergency relief, and crab stock research. These issues have the potential to affect Saint Paul positively or negatively, depending on their outcomes.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there were three shore-side processors in Saint Paul, and nine fish buyers, including Peter Pan Seafoods, Inc., Trident Seafoods Corporation, Royal Aleutian Seafoods, Inc., 57 Degrees North/Central Bering Sea Fishermen's Association, Aleutia, and Aleutian Pribilof Island Community Development Association (APICDA) Joint Venture, Inc.

57 Degrees North is a subsidiary of CBSFA and began operations in 1990.⁶¹⁸ CBSFA's mission in Saint Paul is "to develop a viable, self-sustaining, independent fisheries development organization," and the company has purchased a large amount of CDQ crab quota shares.⁶¹⁹ 57 Degrees North does not actually own and operate a seafood processing facility. The plant contracts with Saint Paul's Trident Seafoods Corporation to use Trident's actual physical processing facility.

Trident Seafoods was founded in 1973, and by the year 2000 was employing 4,000 people annually throughout Alaska and the Pacific Northwest. Trident's Saint Paul operation, which began in 1995, is the largest crab production facility in the world.⁶²⁰ In addition to snow and hair crab, it processes Chinook salmon, halibut, sablefish, Pacific cod, and pollock.⁶²¹ In 2010, the plant employed between three and 260 workers, with the largest number of workers employed between January and March.⁶²² Trident provides room and board at a nominal cost for processing plant workers as well as free air transportation to Saint Paul from Seattle and back.

⁶¹⁸ This information is based on the results of a survey of processing plant managers conducted by the Alaska Fisheries Science Center in 2011.

Fisheries-Related Revenue

Saint Paul receives fisheries-related revenue from a local raw fish tax, the Shared Fisheries Business Tax, the Fisheries Resources Landing Tax, harbor usage fees, and, in 2010, fees from leasing of land for storage, marine fuel sales tax, and wharfage (Table 3). The amount of fisheries-related revenue received by Saint Paul from these sources varied widely between 2000 and 2010, with a high of almost \$3 million in 2010.⁶²³

In the 2011 AFSC survey, community leaders reported that revenue from fisheries-related sources at least partially supported or funded harbor maintenance, roads, police, enforcement, fire protection, and general administration. In addition, community leaders reported that the Aleut Community of Saint Paul received \$23 million in funding or grants from their CDQ non-profit, the CBSFA, in 2010. They indicated that funding from the CBSFA pays for services to the local halibut fleet, such as dock launch and retrieval, crane operation and maintenance, special processing equipment, dock security, refuse removal, and dock lighting.

Commercial Fishing

The community of Saint Paul is highly engaged in processing these species. In 2010, Saint Paul Island ranked 18th in landings and 13th in ex-vessel revenue out of 67 Alaskan ports that received landings in 2010. That year, nine fish buyers were present locally, and three shore-side processing facilities were in operation. In total, 19,417,036 net lbs were landed at Saint Paul Island processing facilities in 2010, generating a total of \$33,480,688 in ex-vessel revenue (Table 5). The higher ranking with respect to ex-vessel revenue reflects the relatively high value of species landed and processed on Saint Paul Island. In the 2011 AFSC survey, community leaders indicated that the most important fishing seasons in Saint Paul include opilio crab from January through April, Bristol Bay king crab from October through November, halibut from June through September, and Saint Matthews Island blue king crab between in September and October.

In addition to processing, Saint Paul residents were also involved in commercial fisheries between 2000 and 2010 as permit and quota share account holders, vessel owners, and crew license holders. Over this period, the total number of state-issued Commercial Fisheries Entry Commission (CFEC) permits held in Saint Paul decreased from 43 in 2000 to between 23 and 26 held between 2004 and 2010. The total number of permit holders also decreased, from approximately 30 in 2000 and 2001 to 21 in 2010. In all years during this period, a majority of CFEC permits were held for halibut. Early in the decade, Saint Paul residents also held several CFEC permits for sablefish, groundfish, and ‘other shellfish.’ The groundfish permits were held for ‘miscellaneous saltwater finfish’, and the ‘other shellfish’ permit was held for octopi/squid. Of these, two groundfish permits were actively fished in 2000 only. In addition, one salmon CFEC permit was held in all years during the 2000-2010 period in the Atka/Amlia Islands set gillnet fishery, but was not actively fished in any of these years. One Lower Yukon salmon gillnet permit was held and actively fished in 2007, and one Bristol Bay drift gillnet permit was held in 2009 and 2010, and actively fished in 2009.

In all years between 2000 and 2010, a majority of halibut CFEC permits held in Saint Paul were associated with longline gear for use on vessels under 60 ft in length, while a small number were also associated with hand troll gear or longline gear on vessels over 60 ft in length.

⁶²³ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

A high percentage of halibut permits were actively fished each year by Saint Paul residents. Information about CFEC permits is presented in Table 4.

In addition to CFEC permits, Saint Paul residents held federal License Limitation Program (LLP) permits in groundfish and crab fisheries as well as Federal Fisheries Permits (FFP). A higher number of LLP permits were held in 2003 and 2004. In both of these years 100% of the 5 crab LLP permits were actively fished, while 71% (five out of seven) groundfish LLPs were actively fished. A smaller number of LLP permits were held in other years during the 2000-2010 period. FFP were held in from 2008 to 2010 only, and one FFP was actively fished in each of these years (Table 4).

In 2010, 16 Saint Paul residents held quota share accounts in the federal catch share fishery for halibut and were allocated individual fishing quota (IFQ). While the number of halibut IFQ shareholders decreased between 2000 and 2010, the overall number of halibut quota shares held increased slightly during the same period. Despite this increase, the overall halibut IFQ allotment (in lbs) decreased between 2000 and 2010 (Table 6). No residents of Saint Paul held quota share accounts in the federal sablefish catch share fishery between 2000 and 2010 (Table 7). One resident of Saint Paul held a quota share account in a federal crab catch share fishery in 2009 and 2010, although no crab quota share accounts holders were present in Saint Paul from 2005 to 2008. In 2009 and 2010, the number of crab quota shares held remained stable and the annual IFQ allotment increased slightly (Table 8).

Between 2000 and 2010, there was an overall decrease in the number of Saint Paul residents who held crew licenses, as well as the number of vessels owned primarily by Saint Paul residents and vessels homeported in Saint Paul. In a survey conducted by the AFSC in 2011, community leaders reported that only halibut vessels under 60 ft using long line and jig line (by hand or by fishing pole) use Saint Paul as their base of operations during the fishing season, since all the crab vessels that land catch in Saint Paul are transient vessels. Community leaders also noted that there are fewer crab boats in Saint Paul since the 1999 snow crab population crash and subsequent crab rationalization, fewer local halibut boats as the population has declined, fewer cod as prices have dropped, and fewer pollock (trans-shipping) as quota allocations dropped or as fishing grounds moved.

While the number of fish buyers and shore-side processing facilities in Saint Paul remained stable between 2000 and 2010, the number of vessels landing catch in Saint Paul increased substantially, from 68 to 119. Corresponding with this increase in vessels landing catch in Saint Paul, total net lbs landed and ex-vessel value of those landings also increased between 2000 and 2010. Overall landings and revenue data are reported for all years in the 2000-2010 period except 2002 and 2005-2007; data for these four years are considered confidential due to the small number of fish buyers present (Table 5).

At the level of individual fisheries, landings and ex-vessel value information in for landings in Saint Paul is considered confidential for most years due to a small number of participants (Table 9). When considering landings and ex-vessel value generated by Saint Paul vessel owners between 2000 and 2010, including deliveries in multiple ports, most data were also confidential, with the exception of halibut landings (and Pacific cod in the year 2000 only). Landings and ex-vessel value of halibut between 2000 and 2010 varied considerably with no discernible trend (Table 10).

Recreational Fishing

The ADF&G Statewide Harvest Survey does not include the Pribilof Islands (including Saint Paul) in their survey regions; therefore, there are no data available on sportfishing by private anglers from the Statewide Harvest Survey for this area. The nearest survey region is the Alaska Peninsula/Aleutian Islands area. According to a survey conducted by the AFSC in 2011, community leaders indicated that halibut are targeted by recreational fishermen using private boats owned by local residents. The ADF&G reports that Chinook salmon, coho salmon, sockeye salmon, Dolly Varden char, northern pike, halibut, rockfish, Pacific cod, razor clams, and hardshell clams are targeted by recreational anglers in Saint Paul.

In 2010, there were no sport fish guide businesses or sport fish guide licenses held by residents of Saint Paul. Also in 2010, there were seven sportfishing licenses sold to residents of Saint Paul (irrespective of the location of the point of sale) and no sportfishing licenses sold within the community. The number of sportfishing licenses sold to Saint Paul residents decreased overall between 2000 and 2010. A small number of licenses were sold in Saint Paul in some years during this period (Table 11).

Table 11. Sport Fishing Trends, Saint Paul: 2000-2010.

Subsistence Fishing

Long before the permanent settlement of the Pribilof Islands, Aleut people began traveling here seasonally to hunt. Following the establishment of permanent villages, subsistence has remained central to local culture. Today, halibut and seal are shared and exchanged with relatives living in other communities for salted or smoked salmon.⁶²⁴ In a survey conducted by the AFSC in 2011, community leaders reported that halibut, reindeer, fur seals, and sea lions are some of the most important subsistence resources utilized by residents of Saint Paul. Although information about fur seals is not reported in the Tables below, it is important to emphasize that fur seals are an important component of local subsistence harvest. Saint Paul residents are permitted to harvest up to 1,645 fur seals per year in Saint Paul for subsistence purposes.⁶²⁵

No information is available from ADF&G regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010 (Table 12). However, data were available regarding annual subsistence fishing participation for salmon and halibut. Between 2000 and 2008, one or two households held subsistence salmon permits in some years, and no details were reported regarding the total number or species of salmon harvested (Table 13). More detailed information is available regarding halibut subsistence harvest during this period. Between 2003 and 2010, the number of Saint Paul residents holding a valid Subsistence Halibut Registration Certificate (SHARC) issued by NMFS declined from 250 to 41 (Table 14). The data show that the number of SHARC cards fished and the amount of halibut harvested (in lbs) also decreased between 2003 and 2010.

Limited information was reported by management agencies regarding subsistence harvest of marine mammal species between 2000 and 2010. According to ADF&G, between 2000 and 2008, 17 Steller sea lions were harvested on average each year for subsistence purposes. No information was available from NMFS regarding beluga whale harvest, from the U.S. Fish and Wildlife Service regarding sea otter, walrus, or polar bear harvest, or from ADF&G regarding harvest of harbor seal or spotted seal (Table 15).

In addition to the data reported in Tables 12 through 15, an early 1990s survey conducted by the ADF&G provides additional information regarding species of marine invertebrates, marine mammals, and non-salmon fish harvested by Saint Paul residents. According to the survey, in 1994, marine invertebrate species harvested by Saint Paul households included blue king crab, blue mussels, butter clams, hair crab, limpets, octopus, Pacific littleneck clams, razor clams, sea cucumber, sea urchin, snails, Tanner crab, snow crab, unknown king crab, and unknown Tanner crab. Marine mammals reported as harvested for subsistence use included fur seal (communal), fur seal (other), harbor seal, Steller sea lion, unknown seal, and unknown whale. Non-salmon fish species reported as harvested for subsistence use included: Dolly Varden, lake trout, Pacific cod, pike, rainbow trout, sablefish, sheefish, flounder, greenling, rockfish, and sculpin.⁶²⁶

Sand Point

People and Place

*Location*⁶²⁷

Sand Point is situated on Humboldt Harbor on Popof Island, located off the southern coast of the Alaska Peninsula. The community is 570 air miles southwest of Anchorage. Sand Point is in the Aleutian Islands Recording District, the Aleutians East Census Area, and the Aleutians East Borough. The City boundaries encompass 7.8 square miles of land and 21.1 square miles of water.

*Demographic Profile*⁶²⁸

In 2010, the U.S. Census determined that there were 976 residents in Sand Point, making it the 67th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population has increased by 5.15%. The Sand Point annual growth rate between 2000 and 2009 was 0.3%, indicating a slow rate of growth. The change in population between 1990 and 2010 is detailed in Table 1.

A majority of residents of Sand Point in 2010 identified themselves as American Indian or Alaska Native (39%), with the remaining racial composition as follows: Asian (34.7%), White (17%), Hispanic or Latino (6.1%), two or more races (5.2%), Black or African American (2.5%), some other race (1.3%), and Native Hawaiian or other Pacific Islander (0.2%). The percentage of the population identifying themselves as American Indian or Alaska Native decreased by 3.3% between 2000 and 2010, with decreases also reported in the percentages of the population identifying themselves as White (10.7%), Hispanic or Latino (7.5%), some other race (0.9%), and Native Hawaiian or other Pacific Islander (0.1%). During the same period, there were increases in the percentage of the population identifying themselves as Asian (11.5%), Black or African American (1%), and two or more races (2.5%). The change in racial and ethnic composition from 2000 to 2010 is provided in Figure 1 below.

In 2010 the average household size was estimated to be 2.54, a slight decrease from 2.8 in 1990 and 2.67 in 2000. However, there has been a slight overall increase in total estimated number of households, from 242 in 1990 to 229 in 2000 to 246 in 2010. Of the 290 housing units surveyed for the 2010 Decennial Census, 146 were owner-occupied, 100 were renter-occupied, and 44 were vacant. An estimated 350 Sand Point residents were living in group quarters in 2010. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that an estimated 1,500 people come to Sand Point each year as seasonal workers or transients, primarily to work in the cannery or on fishing boats.

Figure 1. Racial and Ethnic Composition, Sand Point: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Sand Point was skewed, at 62.5% male and 37.5% female, much more heavily skewed than the state as a whole (52% male, 48% female). The age classes between 20 and 59 are more heavily skewed towards males. The median age in Sand Point was 40.1 years, higher than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. The greatest percentage of residents fell within the age category 40-59 years old, with the next largest percentage for the age category 20-39 years old. Relatively few people were 70 or older (Figure 2).

Figure 2. Population Age Structure in Sand Point Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁶²⁹ 66.3% of Sand Point residents aged 25 and over were estimated to hold a high school diploma or higher degree, compared to 90.7% of Alaskan residents overall. Also in 2010, 19.8% of Sand Point residents had less than a ninth grade education, compared with 3.5% of Alaska residents overall; 13.9% had a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 29.2% had a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; 16% had some college but no degree, compared to 28.3% of Alaska residents overall; 12.9% held an Associate's degree, compared with 8% of Alaska residents overall; 7.3% held a Bachelor's degree, compared with 17.4% of Alaska residents overall; and 0.8% held a graduate or professional degree, compared with 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Sand Point is located in the Shumagin Islands, which are thought to take their name from a Russian sailor named Mikita Shumagin who accompanied Vitus Bering in his exploration of the Pacific. The Island on which Sand Point is located, Popof Island, was named after Russian fur traders Silva and Ivan Popof who traded and hunted furs there in the 1760s. The Aleutian Islands and western portion of the Alaska Peninsula have been inhabited by Aleut people for thousands of years. Prior to the arrival of Europeans, the population of Aleuts in the Sand Point region is estimated to have ranged between 12,000 and 20,000 people. Following the arrival of Russian explorers and fur traders, the population of Aleuts declined by 80 or 90 percent as a result of disease, warfare, malnutrition, and forced labor as sea otter hunters.⁶³⁰

The present community of Sand Point was founded in 1898 as a cod fishing a trading station by a San Francisco fishing company. The original inhabitants included Scandinavian fishermen and Aleuts from surrounding villages. In the early 1900s, Sand Point served as a repair and supply center for gold mining operations including the Apollo Mine on nearby Unga Island. After both the mining and fur industries declined, the local economy turned to fish processing.^{631,632,633} In 1931, Alaska Pacific Salmon Company opened a salmon cannery on Humboldt Harbor, several miles from the community of Sand Point,⁶³⁴ and Aleutian Cold Storage built a halibut processing plant in 1946.⁶³⁵

The Sand Point city government was incorporated in 1966. Today, Sand Point is home to the largest fishing fleet in the Aleutian Chain, and commercial fishing is a fundamental element

⁶²⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaska communities with small populations that have a low probability of being adequately sampled.

of local culture. The fish processing industry brings a large seasonal transient population.⁶³⁶ Likewise, subsistence activities are foundational to local culture, and participation in subsistence harvest is very common among local residents. Important local subsistence resources include salmon and a variety of other fish, and land mammals such as moose and caribou.⁶³⁷ The history of Russian involvement in the area is reflected in the presence of the St. Nicholas Chapel, a Russian Orthodox Church that was built in 1933 and is now on the National Register of Historical Places.⁶³⁸

It is of note that many shareholders enrolled as members of Pauloff Harbor and Unga Native village corporations have relocated and now live in Sand Point.⁶³⁹

Natural Resources and Environment

The Shumagin Island group is of volcanic origin, and is made up of 15 primary islands and many smaller islands.⁶⁴⁰ Popof Island rises to a maximum elevation of 1,480 ft. Its coastline is rocky and irregular with many cliffs and bluffs and few protected bays.⁶⁴¹ Popof Island is naturally treeless. Vegetation consists primarily of tundra and alder and willow shrub.⁶⁴² Sand Point is located in a maritime climate zone. Temperatures range from -9 to 76 °F (-22.8 to 24.4 °C). Annual snowfall averages 52 inches, and annual precipitation averages 44.68 inches.⁶⁴³

Popof Island is home to numerous bird species, including eagles, cormorants, kittiwakes, puffins, and ptarmigans. Marine mammal species in the area include sea otters, sea lions, seals, and migrating whales. Terrestrial mammal species include ermine, mink, and ground squirrels. A large herd of buffalo is also present on Popof Island, managed by the local Native village corporation (Shumagin Corporation).^{644,645} The buffalo were first introduced in 1955 by private individuals,⁶⁴⁶ and are now managed by the local Native village corporation of the Qagan Tayagungin Tribe, the Shumagin Corporation.⁶⁴⁷

Sand Point is located within the Alaska Peninsula unit of the Alaska Maritime National Wildlife Refuge (NWR). In total, the Alaska Maritime NWR stretches from the tip of the Aleutian Islands to the Southeast Alaska Panhandle, and includes St. Matthew Island in the Bering Sea, Hagemester Island in northern Bristol Bay, and two units bordering the Chukchi Sea. It was created in part to promote a program of scientific research on marine ecosystems. The Alaska Maritime NWR “protects breeding habitat for seabirds, marine mammals, and other wildlife on more than 2,500 islands, spires, rocks, and coastal headlands.”⁶⁴⁸

The Qagan Tayagungin Tribe Environmental Department was developed in 2000 with funding from the Environmental Protection Agency's Indian General Assistance Program funds. Many projects have been done with these program funds over the years including an Abandoned Drum Clean-up in collaboration with the City of Sand Point and the Unga Tribe, an Environmental Youth Group that meets weekly, annual Earth Day fairs, water testing in Sand Point's salmon streams, working with Aleutian Housing to have energy assessments done on houses in Sand Point, developing environmental education, and more. The Qagan Tayagungin Tribe Environmental Department was recognized and given an award for helping to improve the environmental health of the community and making a difference in Alaska at the 14th Annual Alaska Tribal Conference on Environmental Management in 2008.⁶⁴⁹

Natural hazards to which Sand Point has been identified to have high vulnerability include earthquakes and volcano activity. The community has also been classified at medium vulnerability to tsunamis and severe weather events.⁶⁵⁰

According to the Alaska Department of Environmental Conservation, there were no notable active environmental cleanup sites located in the Sand Point area as of March 2013.⁶⁵¹

Current Economy⁶⁵²

Sand Point is home to the largest fishing fleet in the Aleutian Chain. A Trident Seafood plant processes bottomfish species, pollock, salmon, grinds fish meal and provides fuel and other services. Peter Pan Seafoods owns a storage and transfer station. Locals participate in subsistence consumption of fish and caribou.⁶⁵³ In addition to the seafood industry, top local employers in Sand Point in 2010 included the Aleutians East Borough School District, local government offices, the Shumagin Corporation, health and other community services, local retailers, Peninsula Airways, Inc., and the State of Alaska.⁶⁵⁴

According to the 2006-2010 ACS,⁶⁵⁵ the estimated per capita income in Sand Point in 2010 was \$22,610, and the estimated median household income in 2010 was \$63,750, compared to \$21,954 and \$55,417 in 2000, respectively. However, after accounting for inflation by converting the 2000 values to 2010 dollars,⁶⁵⁶ the real per capita income (\$28,869) and the real median household income in 2000 (\$72,873) indicate a substantial decrease in these income measures between 2000 and 2010. However, Sand Point's small population size may have

⁶⁵⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

prevented the ACS from accurately portraying economic conditions.⁶⁵⁷ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Decennial Census, the resulting per capita income estimate for Sand Point in 2010 is \$7,920, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2010.⁶⁵⁸

In 2010, Sand Point ranked 130th of 305 Alaskan communities with per capita income that year, and 68th out of 299 Alaskan communities with household income data. Based on the ACS, in the same year, 92.8% of the population age 16 and older was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 5.8%, compared to the statewide unemployment rate of 5.9%. Approximately 9% of local residents were living below the poverty line in 2010, compared to 9.6% of Alaskan residents overall. It should be noted that income and poverty statistics are based on wage income and other money sources; figures reported for Sand Point are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Sand Point. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 16.6%.

Based on the 2006-2010 ACS, the greatest percentage of workers was employed in the private sector (94.1%), while 3.9% worked in the public sector and 2.1% were self-employed. Of the 1060 people age 16 and over that were estimated to be in the civilian labor force in 2010, a majority was estimated to work in the manufacturing industry (82.2%). Only small percentages of the population were estimated to work in other industries. Compared to 2000, the distribution of employment was much more concentrated in manufacturing in 2010. It is important to keep in mind that the small population of Sand Point may affect the representativeness of 2006-2010 ACS estimates, which could explain the dramatic shift in employment statistics between 2000 and 2010.⁶⁵⁹ This information about employment by industry is presented in Figure 3.

Employment statistics by occupation show similar trends, with a large increase in production, transportation, and material moving occupations between 2000 and 2010, and a reduction in employment in other occupations. Employment is broken down by occupation in Figure 4. In 2010, 2.8% of the workforce was estimated to be employed in natural resource industries that include fishing, and 3.3% was estimated to work in natural resource occupations that could include fishing. It is important to note that the number of individuals employed in fishing is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly, given the data reported in the *Commercial Fishing* section below.

⁶⁵⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaska communities with small populations that have a low probability of being adequately sampled.

⁶⁵⁸ See footnotes 654 and 655.

⁶⁵⁹ See footnote 657.

Figure 3. Local Employment by Industry in 2000-2010, Sand Point (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Sand Point (U.S. Census).

Governance

The City of Sand Point is a 1st Class City governed by a mayor and city council. It is located within the Aleutians East Borough. As of 2010, the City administered a 3% sales tax, a 7% bed tax, and a 2% raw fish tax (in addition to the 2% raw fish tax administered by the Borough).⁶⁶⁰ In addition to local tax revenues, other locally-generated revenue sources in Sand Point during the 2000-2010 period included building and equipment rentals, business license fees, harbor revenues from moorage, wharfage, use of the lift, and storage, and receipts from bingo/pull tab/concessions. Outside revenue sources included shared funds from various state and federal programs, as well as grants. Shared funds were received from the State Revenue Sharing program from 2000 to 2003 (just over \$25,000 per year) and the Community Revenue Sharing program in 2009 and 2010 (approximately \$145,000 per year). Of the grants received during the 2000-2010 period, several were fisheries-related. These included grants for harbor improvements and construction, in addition to a ferry dock warehouse, a city dock warehouse, and float construction for the harbor.

More than \$1 million in sea lion mitigation funds contributed to higher than average total municipal revenue in 2002. According to city leaders, sea lion mitigation payments were used to build a warehouse for fishermen and to assist in payment of utility bills.⁶⁶¹ The higher total in 2006 can be explained by receipt of a more than \$2 million grant from the Denali Commission for construction of a new health clinic in Sand Point. Information about selected revenue sources is presented in Table 2. Also see the *Fisheries-Related Revenue* section for more information about shared state fish tax revenues.

Many Native community members residing in Sand Point are members of the three Native Tribes located in the community. The Qagan Tayagungin Tribe of Sand Point Village, the Native Village of Unga, and Pauloff Harbor Village were all included under the Alaska Native Claims Settlement Act (ANCSA), and are federally recognized by the Bureau of Indian Affairs. Three Native village corporations are also located in Sand Point. The Shumagin Corporation is the village corporation associated with the Qagan Tayagungin Tribe, the Unga Corporation is associated with the Native village of Unga, and the Sanak Corporation is associated with the Pauloff Harbor Tribe.⁶⁶² Many members of the Tribes are also shareholders in the Aleut Corporation, the regional Native corporation of the eastern Alaska Peninsula, Aleutian and Pribilof Islands.⁶⁶³

In addition, the Tribes are members of the Aleutian Pribilof Islands Association (APIAI), one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.⁶⁶⁴ APIAI provides services including cultural heritage, health, education, social, psychological, employment, vocational training, environment, natural

resources, and public safety services.⁶⁶⁵ Additionally, a company called Eastern Aleutian Tribes, Inc., formed in 1991, provides medical, dental, and behavioral health services to the three Native Tribes in Sand Point as well as four other Aleut Tribes from the Aleutian Islands and Alaska Peninsula.⁶⁶⁶

The Alaska Department of Fish and Game (ADF&G) has an office in Sand Point. Dillingham has the nearest office of the Alaska Department of Commerce, Community, and Economic Development. The closest National Marine Fisheries Service (NMFS) and U.S. Bureau of Citizenship and Immigration Services offices are located in Unalaska and Anchorage. Anchorage also has the closest office of the Alaska Department of Natural Resources.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Sand Point from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$3,340,445	\$397,888	\$27,275	n/a
2001	\$3,737,101	\$360,360	\$26,308	\$70,000
2002	\$5,363,671	\$326,640	\$26,303	\$2,700,000
2003	\$2,932,229	\$342,075	\$28,465	n/a
2004	\$2,030,458	\$466,137	n/a	\$10,000,000
2005	\$3,055,154	\$483,742	n/a	n/a
2006	\$6,159,831	\$633,862	n/a	n/a

Infrastructure

Connectivity and Transportation

Sand Point has a state-owned airport with a 5,213 ft long by 150 ft wide asphalt runway. Direct flights to Anchorage are available. Marine facilities include a 25-acre boat harbor with four docks, 134 boat slips, a harbormaster office, barge off-loading area, and a 150-ton lift. Regular barge services supply the community. The state ferry operates between Sand Point and

Unalaska, Akutan, False Pass, Cold Bay, and King Cove between May and October.⁶⁶⁷ According to a representative of the Qagan Tayagungin Tribe, residents of Sand Point were paying \$1,094 for a roundtrip airfare between Sand Point and Anchorage as of Fall 2013.⁶⁶⁸

Facilities

The Sand Point water supply is derived from Humboldt Creek and is filtered and chlorinated. The City operates a piped water and sewer system that serves 170 households and 22 businesses, all of which are fully plumbed. The City also operates a landfill which has been relocated in recent years.⁶⁶⁹ Electricity is provided to the community by TDX Power, a subsidiary of the Tanadgusix Corporation, the Native village corporation of the Aleut Community of Saint Paul. TDX Power operates a diesel powerhouse in Sand Point, supplemented by two large windmills.⁶⁷⁰ Fire and rescue services are provided by Sand Point Emergency Medical Services (EMS). The City Police Department provides local law enforcement service.⁶⁷¹ The nearest state trooper post is located in the City of Cold Bay.⁶⁷²

In a survey conducted by the AFSC in 2011, community leaders reported that a number of infrastructure projects have been completed in the last 10 years, including a fish cleaning station, a barge landing area, roads serving the dock space, pilings, a breakwater, harbor dredging, a jetty, dry dock space, haulout facilities, broadband internet access, roads, an airport/seaplane base, water and sewer pipelines, a diesel powerhouse, sewage treatment, water treatment, a new landfill/solid waste site, a community center/library, a police department, emergency response, fire department, and school, telephone service, and a post office. In addition, community leaders indicate that projects in progress include electricity serving the dock, water serving the dock, and alternative energy. Projects planned for the next ten years include construction of new dock space, improvements to existing dock structures, fuel tanks at the dock, and an EPA certified boat cleaning station. In the same survey, community leaders report that Sand Point has 1800 ft of dock space available for both permanent and transient vessels up to 127 ft long. Sand Point is capable of handling rescue vessels, cruise ships, ferries, and fuel barges. For fisheries-related businesses and services not available in Sand Point, community leaders indicated that residents typically travel to Anchorage, Seward, or Kodiak.

Medical Services

Medical services are provided by the Sand Point Community Health Clinic, which is owned by the City and operated by the Eastern Aleutian Tribes, Inc. The clinic is a Community Health Aid Program site.⁶⁷³ According to an Emergency Trauma Technician stationed in Sand Point, the nearest qualified Emergency Care Center is located in Cold Bay. The nearest hospital is located in Dillingham. However, the only direct flights out of Sand Point go to Anchorage, and

all medivac flights bring patients to hospitals in Anchorage.⁶⁷⁴ Emergency Services have limited marine and air access, and are provided by 911 Telephone Service volunteers and a health aide. Alternate health care is available through Sand Point Emergency Medical Services.⁶⁷⁵

*Educational Opportunities*⁶⁷⁶

The Sand Point School provides instruction for students from pre-school through 12th grade. In 2011, the school had 133 students and 14 teachers. Students in Sand Point also have access to the Aleutians East Correspondence School for grades 7 through 12, though in 2010, the school did not have any students enrolled or any teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Sand Point area for thousands of years. Villages and fish camps were often located at mouths of streams for access to both fresh water and abundant salmon runs.⁶⁷⁷ During Alaska's Russian period, salmon remained a subsistence resource, but soon after the purchase of Alaska by the United States in 1867, commercial exploitation of salmon was initiated.⁶⁷⁸ Herring was one of the earliest commercial fisheries, along with salmon, during the period when the product was salted for storing and shipment.⁶⁷⁹ Halibut and groundfish fisheries began to develop in the Alaska Peninsula region by the 1920s with the development of diesel engines, which allowed fishing vessels to undertake longer trips.^{680,681}

Between 2000 and 2010, Sand Point residents were highly engaged in federal and state fisheries for groundfish and crab, as well as state fisheries for salmon, halibut, and herring. Groundfish and crab fisheries that occur within 3 nautical miles (nmi) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nmi in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction. Pacific halibut fisheries are managed under the International Pacific Halibut Commission. The Peninsula-Aleutian salmon fishery is managed by ADF&G. Sand Point is located in Federal Statistical and Reporting Area 610, the Western Gulf of Alaska (GOA) Sablefish Regulatory Area, Pacific

Halibut Fishery Regulatory Area 3B, and the Southeastern District of the South Peninsula subarea of the Peninsula-Aleutian salmon fishery.

Groundfish fisheries target a variety of species, including pollock, Pacific cod, sablefish, Atka mackerel, lingcod, and various rockfish and flatfish species. In addition to federal groundfish fisheries that take place in the Central and Western Gulf of Alaska (GOA), parallel fisheries takes place in the South Alaska Peninsula region for Pacific cod, walleye pollock, and Atka mackerel. Parallel fisheries take place at the same time as the federal fisheries for these species, and the Total Allowable Catch (TAC) set by NMFS applies to both fisheries. In addition to the parallel Pacific cod fishery, beginning in 1997, a ‘state-waters fishery’ for Pacific cod was initiated in the South Alaska Peninsula area. It is managed under a guideline harvest limit (GHL) determined by ADF&G, and is not conducted as a parallel fishery. ADF&G also has separate GHL’s and seasons for sablefish, lingcod, black rockfish, and blue rockfish fisheries in the western GOA region.⁶⁸²

Herring are harvested for bait in the vicinity of Unalaska when Togiak-spawning herring are in residence during the summer feeding period. On occasion, a herring sac roe fishery occurs near Port Moller when aerial surveys determine that a sufficient quantity of herring is present, and if processing capacity is available. Red and golden king crab and Tanner crab occur throughout the Bering Sea and Aleutian Islands, as well as the Gulf of Alaska. The Alaska Peninsula and eastern Aleutian Islands are a historical center of the Dungeness crab fishery.⁶⁸³

Sand Point participates in the Community Quota Entity (CQE) program, and has established a CQE non-profit called Aleutia, Inc. As of Fall 2013, Aleutia, Inc. held four non-trawl groundfish License Limitation Program permits for lease to eligible community members, but had not acquired commercial halibut Individual Fishing Quota or halibut charter permits.⁶⁸⁴ In addition, in 2008, Aleutia, Inc. purchased processor quota shares.⁶⁸⁵ For more information see the *Processing Plants* section below.

Sand Point is not eligible to participate in the Community Development Quota (CDQ) program. In a survey conducted by the AFSC in 2011, community leaders reported that the annual variation in population in Sand Point is “entirely” driven by employment in the fishing sectors and that Sand Point’s economy relies on fishing and on sport hunting and fishing.

Processing Plants

ADF&G’s 2010 Intent to Operate list indicated that Trident Seafoods was the only processing plant operating in Sand Point that year. Trident Seafoods Corporation was founded in 1973, and by the year 2000 was employing 4,000 people annually throughout Alaska and the Pacific Northwest. Its Sand Point facility is located on Popof Island in the Shumagin Islands and began operations in 1979.⁶⁸⁶ The plant operates year-round and processes Pacific cod, sablefish, halibut, pollock, salmon, other assorted bottomfish, and crab. The facility employs between 50 and 420 employees depending on the season.⁶⁸⁷ Their peak season is from January to April (during which time they have about 400 employees) and they process gray cod and pollock

⁶⁸⁷ Ibid.

during this time. The Sand Point facility provides room and board at a nominal cost for processing plant workers as well as free air transportation to Sand Point from Seattle and back.⁶⁸⁸

It is important to note that, between 2005 and 2007, the CQE entity for Sand Point - Aleutia, Inc. – was also registered on ADF&G's Intent to Operate list. In addition to processing and marketing sockeye salmon caught by local fishermen, Aleutia, Inc. provides support and education to fishermen. In 2008, Aleutia purchased processor quota shares of Bristol Bay red king and Tanner crab and signed an agreement for the crab to be processed by Peter Pan Seafood in King Cove, Alaska.⁶⁸⁹ According to testimony by Aleutia marketing consultant Karen Montoya to the North Pacific Fisheries Management Council in February, 2010, the contract signed in 2008 led to significant losses on the part of Aleutia, and the CQE non-profit was engaged in efforts to renegotiate contract terms.⁶⁹⁰

Fisheries-Related Revenue

Sand Point receives fisheries-related revenue from a 2% city raw fish tax, the Shared Fisheries Business Tax, the Fisheries Resource Landing Tax, and the Extraterritorial Fish Tax. In addition, in a survey conducted by the AFSC in 2011, community leaders reported that Sand Point received revenue from fees associated with fishing gear storage on public land in 2010. In the same survey, community leaders indicated that the following public services are at least partially supported by revenue from fisheries-related sources: harbor maintenance, hospital/medical clinic/emergency response, roads, social services, water and wastewater systems, and police/enforcement/fire protection.

Revenue received from fisheries-related sources is detailed in Table 3. The amount of revenue received from the raw fish tax between 2000 and 2010 remained relatively stable, while the revenue received from the Shared Fisheries Business Tax increased substantially during that same period. Also between 2000 and 2010, revenue received from the fisheries resource landing tax went from zero to a high of \$34,120 in 2009, remaining high at \$22,721 in 2010. Revenue received from the extraterritorial fish tax also varied annually between 2000 and 2010, ranging from \$11,222 in 2008 to a high of \$85,000 in 2010. The total fisheries-related revenue received by Sand Point varied considerably between 2000 and 2010 (Table 3).⁶⁹¹

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders indicated that Sand Point does not participate in the fisheries management process in Alaska. In addition, community leaders stated that commercial fishing boats from those under 35 ft to those over 125 ft that use Sand Point as their base of operations during the fishing season use the following gear types: trawl, pots, longline, gillnet, and purse seines. In 2010, 122 Sand Point residents held a total of 309 commercial fishing permits. Number of permits held and total permit holders declined slightly between 2000 and 2009, before rebounding to close to 2000 levels in 2010. In 2010,

⁶⁸⁸ Trident Seafoods Company. *Alaska Plants: Sand Point*. Retrieved on May 2, 2012 from http://www.tridentseafoods.com/company/plants_alaska.php#Saint.

⁶⁸⁹ See footnote 685.

⁶⁹⁰ Aleutians East Borough. March 16, 2012. Testimony offered to the North Pacific Fisheries Management Council by Karen Montoya, Feb. 2010. Published in Fish News. Retrieved July 9, 2012 from <http://www.aleutianseast.org>.

⁶⁹¹ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Sand Point residents held groundfish and crab License Limitation Program (LLP) permits, Federal Fisheries Permits, and crab, halibut, herring, groundfish, and salmon Commercial Fisheries Entry Commission (CFEC) permits. Between 2000 and 2010, the number of groundfish LLP permits decreased slightly, though the number of permits reported to be actively fished remained relatively consistent throughout the period. The number of crab LLP permits held by Sand Point residents also decreased during the same time period, and no crab LLP permits were recorded as actively fished between 2005 and 2010. The number of Federal Fisheries Permits held by Sand Point residents also decreased between 2000 and 2009, though the number and percentage of permits reported as actively fished remained relatively constant.

The number of crab CFEC permits and the percentage of those permits reported as fished remained relatively low between 2000 and 2009 (with the exception of 2001 and 2005), but increased substantially in 2010. In 2010, crab CFEC permits were issued for the Alaska Peninsula Dungeness crab pot gear fishery using vessels under 60 ft, the Bristol Bay king crab pot gear fishery using vessels 60 ft or over, and the Bering Sea (using vessels 60 ft or over) and Peninsula-Aleutians (using vessels under 60 ft) Tanner crab pot gear fisheries.

The number of shellfish and sablefish CFEC permits remained low or at zero between 2000 and 2010, with varying percentages of permits reported as fished in years where those permits were held. The number of halibut CFEC permits held by Sand Point residents decreased slightly between 2000 and 2010, though the number of permits reported as fished remained stable during that period. In 2010, all but one of the halibut CFEC permits were issued for the statewide longline fishery using vessels under 60 ft, with the remaining permit issued for the statewide mechanical jig fishery.

The number of herring CFEC permits held decreased steadily between 2000 and 2010, and none of those permits were reported as fished between 2005 and 2010. Herring CFEC permits were issued in 2010 for the herring (roe and food/bait) purse seine fishery in Cook Inlet, and the Peninsula-Aleutians roe herring purse seine and herring for bait/food purse seine fisheries.

The number of groundfish CFEC permits held decreased from 2000 to 2010, and while the number of permits reported as fished has varied during this period, the 2010 number of permits fished was similar to that in 2000. Groundfish CFEC permits were issued in 2010 for the following miscellaneous saltwater finfish fisheries: statewide and Gulf of Alaska longline fisheries using vessels under 60 ft, statewide and Gulf of Alaska pot gear fisheries using vessels under 60 ft, statewide and Gulf of Alaska mechanical jig fisheries, statewide and Gulf of Alaska otter trawl fisheries using vessels under 60 ft, statewide otter trawl fishery using vessels between 90 and 125 ft, and the Gulf of Alaska pot gear fishery using vessels 60 ft or over.

The number of salmon CFEC permits held remained relatively stable between 2000 and 2010, though the number of permits reported as fished decreased during the same period. In 2010, the majority of the salmon CFEC permits were issued for the Peninsula-Aleutians set gill net and purse seine fisheries. The remainder of the salmon CFEC permits was for the Prince William Sound and Peninsula-Aleutians drift gill net fisheries, the southeast purse seine fishery, the Lower Yukon gill net fishery, and the statewide power gurdy troll fishery. Data regarding commercial fishing permits held and percentages of those permits reported as fished are detailed in Table 4.

In 2010, there were 162 residents of Sand Point holding crew licenses, a decrease from the 224 crew license holders in 2000. The number of fish buyers in Sand Point has been variable between 2000 and 2010, though the number of shore-side processing facilities in Sand Point did

not change during that time. Both the number of vessels owned primarily by Sand Point residents and the number of vessels homeported in Sand Point have both decreased substantially between 2000 and 2010, and the number of vessels landing catch in Sand Point has been variable during the same period. While the landings and ex-vessel value of catch landed in Sand Point are considered confidential in some years due to a small number of participants, for years between 2000 and 2010 in which data were available both the landings and ex-vessel value have remained relatively stable (Table 5).

While the number of halibut quota share account holders and amount of annual individual fishing quota (IFQ) allotment have both decreased between 2000 and 2010, the number of halibut quota shares held decreased only slightly during this period (Table 6). The number of sablefish quota share holders has remained at either one or two between 2000 and 2010, though the number of quota shares and annual number of lbs of IFQ allotment have both decreased substantially – both a decrease overall between 2000 and 2010 and a major decrease from ten-year highs in 2003 and 2004 (Table 7). While the number of crab quota share holders increased by just one, from two to three, between 2005 and 2010, the number of crab quota shares held increased more than tenfold during this period (from 253,569 to 4,097,380), as did the annual IFQ allotment (from 1,517 lbs to 142,125 lbs) (Table 8).

With the exception of landings and ex-vessel value for salmon in 2002, 2004-2006, and 2010, the landings and ex-vessel value of catch landed in Sand Point between 2000 and 2010 are considered confidential due to a small number of participants (Table 9). For years in which salmon data are not confidential, both landings and ex-vessel value decreased during over the course of the years reported. For landings and ex-vessel value of catch landed by Sand Point vessel owners, data on landings and ex-vessel value for the species reported are variable from year to year (Table 10). Overall, however, total landings and ex-vessel value for all non-confidential species and years indicate that landings and ex-vessel value have decreased slightly between 2000 and 2010.

Recreational Fishing

Based on available ADF&G sportfishing statistics, minimal sportfishing activity was reported in Sand Point between 2000 and 2010. One active sport fish guide business was registered in the community in 2002 only, while between two and four licensed sport fish guides were reported to be present from 2000 to 2004. No businesses or licensed guides were present from 2005 to 2010. In 2010, 71 sportfishing licenses were sold in the community of Sand Point, of which 56 licenses were purchased by community residents (Table 11). According to a representative of the Qagan Tayagungin Tribe, the low number of licenses purchased by residents underestimates the amount of sportfishing activity engaged in by residents of Sand Point. For example, a large number of youth in the community actively participate in sportfishing, and individuals under the age of 16 are not required to purchase a sportfishing license. In addition, there is limited or no enforcement related to sportfishing in Sand Point, resulting in a lower total number of licenses purchased. The tribal representative anticipates that purchases of sportfishing licenses will increase as a local sportfishing derby continues to grow.⁶⁹²

Sand Point is located within Alaska Sport Fishing Survey Area R – Alaska Peninsula / Aleutian Islands. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, sportfishing activity in this region varied considerably. For saltwater sportfishing, non-Alaska resident angler days fished varied between 1,603 and 4,126 during this period, while Alaska resident angler days fished varied between 3,261 and 12,721 days. Alaska resident anglers fished consistently more saltwater days than non-Alaska resident anglers during this period. In contrast, non-Alaska resident anglers fished more angler days in freshwater in the Alaska Peninsula / Aleutian Islands region on average (18,462 per year on average) than Alaska resident anglers (15,290 per year on average). This information about the sportfishing sector in and near Sand Point is also displayed in Table 11.

In a survey conducted by the AFSC in 2011, community leaders confirmed this by reporting that Chinook, coho, and sockeye salmon, halibut, crab, shrimp, and clams are targeted by recreational fishermen that use boats based in Sand Point. Community leaders also noted that some recreational fishing in Sand Point takes place on charter/party boats, private boats owned by local residents, and private boats owned by non-residents.

Subsistence Fishing

According to a survey conducted by the AFSC in 2011, community leaders indicated that salmon, halibut, and crab are the three most important subsistence marine or aquatic resources to the residents of Sand Point. Data were not available from ADF&G regarding per capita subsistence harvest or the percentage of Sand Point households that utilized various marine resources for subsistence purposes between 2000 and 2010 (Table 12). Some data were available from management agencies, however, regarding total subsistence harvest numbers of salmon, halibut and some marine mammals. These data are presented below. However, it is important to note that, according to a representative of the Qagan Tayagungin Tribe, these subsistence data that are available from management agencies significantly underestimate the level of engagement of local residents in subsistence harvest; not all residents engaged in salmon and halibut subsistence harvest acquire subsistence permits, and even fewer return surveys.⁶⁹³

Available data about annual subsistence salmon harvest show a decrease between 2000 and 2010 in the number of subsistence salmon permits issued, the number of those permits reported as fished, and the number of salmon harvested (Table 13). Available data regarding annual subsistence halibut fishing participation, based on participation in the Subsistence Halibut

⁶⁹³ See footnote 692.

Registration Certificate (SHARC) program, show an overall increase between 2003 and 2007 in the number of SHARC cards issued and the number actively fished. The total lbs of halibut reported harvested was at its maximum in 2005, when 1,581,787 lbs were harvested on 5,941 active SHARC cards. The number of SHARC cards issued and actively fished declined subsequent to 2007, along with the lbs of halibut harvested per year (Table 14).

Finally, some information was reported by various management agencies regarding subsistence harvest of marine mammals by Sand Point residents between 2000 and 2010. According to available data provided by the U.S. Fish and Wildlife Service (FWS), between one and five sea otters were harvested (for those years in which data were reported). The FWS also reported harvest of one walrus by Sand Point residents in 2010 only. In addition, ADF&G reported Steller sea lion harvest ranging from 1 to 8 animals per year and harbor seal harvest ranging from 4 to 49 animals per year (for those years in which data were reported). No information was reported by NMFS regarding beluga whale harvest, and ADF&G did not report harvest of spotted seal by Sand Point residents between 2000 and 2010. This information about marine mammal harvest in Sand Point is presented in Table 15.

Although no information is available during the 2000-2010 period regarding total marine invertebrate and non-salmon fish harvest by Sand Point residents (Table 13), some species-level information is provided from a 1992 subsistence survey conducted by the ADF&G Division of Subsistence. Results of the survey indicate that the following species of marine invertebrates were used for subsistence in Sand Point in 1992: black (small) chitons, butter clams, cockles, Dungeness crab, hair crab, horse clams (gaper), king crab, limpets, mussels, octopus, Pacific littleneck clams (steamers), pinkneck clams, razor clams, red (large) chitons, scallops, sea cucumber, sea urchin, shrimp, snails, Tanner crab, and unknown crab. Non-salmon fish species reported as harvested for subsistence in 1992 included: black rockfish, brook trout, burbot, capelin (grunion), cutthroat trout, Dolly Varden, eel, eulachon (hooligan candlefish), greenling, herring, herring roe/unspecified, herring spawn on kelp, lingcod, mackerel, Pacific cod (gray), pike, rainbow smelt, rainbow trout, red rockfish, sablefish (black cod), sea perch, sheefish, skates, smelt, starry flounder, steelhead, unknown char, unknown cod, unknown flounder, unknown greenling, unknown rockfish, unknown sculpin, unknown smelt, unknown sole, unknown whitefish, walleye pollock, whitefish, and yellowfin sole. In addition, marine mammals reported as harvested for subsistence in 1992 included harbor seal, Steller sea lion, and unknown whale.⁶⁹⁴

Unalaska (un-uh-LASS-kuh)

People and Place

*Location*⁶⁹⁵

Unalaska overlooks Iliuliuk Bay and Dutch Harbor on Unalaska Island in the Aleutian Chain. It lies 800 air mi from Anchorage (a two- to three-hour flight) and 1,700 mi northwest of Seattle. The name Dutch Harbor is often applied to the portion of the city on Amaknak Island, which is connected to Unalaska Island by bridge. Unalaska is located within the Aleutians West Census Area and is not under the jurisdiction of a borough. The community encompasses 111.0 sq mi of land and 101.3 sq mi of water.

*Demographic Profile*⁶⁹⁶

In 2010, there were 4,376 residents in Unalaska, making it the 26th largest of 352 total Alaskan communities with recorded populations that year. Between 2000 and 2009, the Alaska Department of Labor and Workforce Development (DOLWD) estimated that the average annual growth rate was -1.81%, indicating a declining population. This was reflected in the overall growth rate of -14.5%. However, the U.S. Decennial Census indicated that the population of Unalaska increased between 2000 and 2010. Based on both estimates, the population of Unalaska increased between 1990 and 2010. The change in population between 1990 and 2010 is provided in Table 1.

In a survey conducted by NOAA’s Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that approximately 2,500 seasonal or transient workers come to Unalaska each year. Community leaders also noted that the population of Unalaska reaches its annual peak between January 15th and April 1st each year (during Pollock “A” Season), and that this annual peak in population is “entirely” driven by employment in the fishing sectors.

In 2010, a majority of Unalaska residents identified themselves as White (39.2%) and Asian (32.6%). Other ethnic groups present in Unalaska that year included Hispanic or Latino (15.2%), some other race (7.4%), Black or African American (6.9%), American Indian and Alaska Native (6.1%), two or more races (5.6%), and Native Hawaiian and Other Pacific Islander (2.2%). Between 2000 and 2010, the percentage of the population identifying themselves as White, American Indian and Alaska Native, and some other race decreased, with corresponding increases in the percentage of the population identifying themselves as Asian, two or more races, Native Hawaiian and Other Pacific Islander, Black or African American, and Hispanic or Latino. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

The average household size in Unalaska in 2010 was 2.46, a slight decrease from 2.50 persons per household in 1990 and 2.51 in 2000. The total number of households in Unalaska increased from 575 in 1990 to 834 in 2000 and 927 in 2010. Of the 1,106 households surveyed in 2010, 21% were owner-occupied, compared to 19% in 2000; 63% were renter occupied, compared to 66% in 2000; 13% were vacant, compared to 11% in 2000; and 3% were occupied seasonally, compared to 4% in 2000. Also in that year, 2,099 residents lived in group quarters, compared to 2,192 in 2000.

Figure 1. Racial and Ethnic Composition, Unalaska: 2000-2010 (U.S. Census).

In 2010, the gender distribution in Unalaska was 68.4% male and 31.6% female, which was substantially more skewed than the state as a whole (52.0% male, 48.0% female), and similar to the distribution in 2000 (66.1% male, 33.9% female). The median age that year was 40.7 years, which was higher than both the statewide median of 33.8 years, and 2000 median of 36.5 years. The largest percentage of the population fell within the age group 40 to 59 years old, with the next largest percentage in the age group 20 to 39 years old. Relatively few individuals were age 70 or older, and only a small percentage of the population was age 19 or younger. The overall population structure of Unalaska in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Unalaska Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the 2006-10 American Community Survey (ACS)⁶⁹⁷ estimated that 65.3% of Unalaska residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, 22.1% were estimated to have less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; 12.5% were estimated to have a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; 30.2% were estimated to have a high school diploma or equivalent, compared to an estimated 27.4% of Alaska residents overall; 22.7% were estimated to have some college but no degree, compared to an estimated 28.3% of Alaska residents overall; 3.2% were estimated to have an Associate's degree, compared to an estimated 8.0% of Alaska residents overall; 7.7% were estimated to have a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and 1.6% were estimated to have a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*⁶⁹⁸

It is believed that the first inhabitants to the area came across the Bering Land Bridge approximately 10,000 years ago. Archaeological sites on Anangula Island, near Nikolski, are thought to be around 8,000 years old and provide some of the earliest evidence of human occupation of the area.⁶⁹⁹

Russian ships first reached the Aleutians in 1741, lured by the abundance of fur bearing animals. At the time of Russian contact, there was thought to be around 16,000 Aleut inhabitants on the island chain, and more than 3,000 Unangan (known since the Russian era as "Aleuts") lived in 24 settlements on Unalaska and Amaknak Islands in 1759.⁷⁰⁰ During the beginning of Russian occupation, many social and cultural upheavals took place in the Aleutians, often to the detriment of the indigenous population. Many local inhabitants were placed into slavery, while most others feel victim to diseases brought from Europe.⁷⁰¹ Unalaska became a Russian trading port for the fur seal industry in 1768. In 1787, many hunters and their families were enslaved and relocated by the Russian American Company to the Pribilof Islands to work the fur seal harvest.⁷⁰²

By the late eighteenth century, the Aleutians had for the most part been abandoned by Russians in favor of eastern trapping grounds. However, several strategic outposts remained including one in Iliuliuk Harbor. In 1825, the Russian Orthodox Church of the Holy Ascension of Christ was constructed. The founding priest, Ivan Veniaminov, composed the first Aleut writing system with local assistance and translated scripture into Aleut. Since Aleuts were not

⁶⁹⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁷⁰¹ See footnote 699.

⁷⁰² See footnote 698.

forced to give up their language or culture by the Russian Orthodox priests, the church became strong in the community. By 1830 and 1840, however, only 200 to 400 Aleuts lived in Unalaska.

By 1850, Russians abandoned the outpost due to the diminished availability of furs. American influence in Alaska increased as people migrated northward; drawn by furs, fishing, and whaling. Dutch harbor flourished in the 1880s as a coaling station and commercial trade center. The Klondike Gold Rush of the 1890s brought many ships to Dutch Harbor, lured by its position as a gateway to the gold fields of northwest Alaska. By the turn of the twentieth century, several seafood processors may have been in operation processing herring, salmon, and whale meat.⁷⁰³

As coal began to be replaced by oil as ship fuel, the coal trade began to diminish in Dutch Harbor. Fox farming became popular throughout the Aleutians in 1910, which brought economic relief to Unalaska until the Great Depression of the 1930s saw the demise of the fur industry.

The City of Unalaska was incorporated in March 1942. Dutch Harbor Naval Station and Fort Mears were established in Unalaska as diplomatic relations with the Japanese deteriorated. Other military installations were established on Hog Island and remote locations throughout the area. Permanent facilities including a major hospital complex, docking and fueling facilities, submarine drydocking and repair facilities, an airport, and extensive living and recreational facilities were built to serve military personnel stationed in Unalaska. During this time, many Native residents were evacuated to Southeast Alaska communities. On June 3, 1942, Japanese naval forces bombarded Dutch Harbor, damaging or destroying several facilities and killing dozens of U.S. military personnel. Following the war, many villages returned only to find their villages severely damaged or destroyed. The population of Unalaska following the conflict was reported to be about 300.⁷⁰⁴

Interest in fishery resources in the Aleutians began to increase around 1950 with the harvesting and processing of halibut, salmon, and king crab. The growth of the king crab fishery in the early 1960s greatly improved the local economic condition. Unalaska became a rapidly-growing and culturally-diverse community, primarily focused on fishing and fish-processing activities. Subsistence activities are important to both the Unangan community and many long-term non-Native residents, as well.

Unalaska has four sites that appear on the National Register of Historic Places. These include the Church of the Holy Ascension, the Dutch Harbor Naval Operating Base and Fort Mears, the S.S. *Northwestern* shipwreck site, and the Sitka Spruce Plantation.⁷⁰⁵

Natural Resources and Environment

January temperatures range from 25 to 35 °F (-3.9 to 1.7 °C); summers range from 43 to 53 °F (6.1 to 11.7 °C). Average annual precipitation is 58 inches. The mean wind speed is 17 mph.⁷⁰⁶ In a survey conducted by the AFSC in 2011, community leaders reported that Unalaska's economy relies on the following natural resource-based industries: fishing, ecotourism, and sport hunting and fishing.

⁷⁰⁶ See footnote 698.

The Aleutian Range was formed by volcanic outpourings which began around sixty million years ago, and have continued to shape the region since. Erosive forces shaped Unalaska Island, lending to its current, tempered form. Less than a million years ago, volcanic activity on the island diminished, and glaciers and streams began eroding the slopes of the then rugged landscape. The summit of Makushin Volcano eventually collapsed to form a caldera. Periods of glaciations covered most of the high country south of Makushin Volcano and smaller glaciers covered lower parts of the island. Much of Unalaska Island's surface has been scoured by glaciers, leaving cirques. Soils are generally thin and consist of glacial moraine and till, which is gravelly and unsorted in nature. Alluvial deposits exist around drainages, especially around Unalaska Creek. The Unalaska townsite is located on alluvial deposits resulting from stream deposition and wave formed beach deposits. Organic soils are humus and clay rich overlying volcanic materials. Much of the island's topography is steep and unsuitable for development. Groundforms vary from broad, flat valleys and coastlines, to steep mountainous ridges.⁷⁰⁷

Vegetation found in Unalaska consists primarily of alpine tundra. The cool climate, windy conditions, shallow soils, topography, and relative isolation prevent the establishment of larger vegetation types. Lowland areas support the diverse populations of lichens, heaths, and other tundra vegetation; while steeper slopes support less. Plant species include blueberry, crowberry, lichens, small shrubs, herbs, ferns, mosses, and grasses. Trees in the area were introduced artificially. Wildlife found in the Unalaska vicinity includes Steller sea lions, harbor seals, sea otters, and a variety of small terrestrial mammals, birds, and fish.⁷⁰⁸

Unalaska and the surrounding areas are home to a diverse array of wildflowers, berries, and medicinal plants, and wildlife such as seabirds, bald eagles, and a number of endemic birds not often seen outside the Aleutian Islands. Much of the land on Unalaska is privately owned by the Native-owned Ounalashka Corporation, and a land-use permit is required before visitors may explore the area. Makushin Volcano, at 6,680 ft, is the highest point on the island. The volcano steams regularly, but has not had an eruption since an ash discharge in 1980. The city, state, and private industry are investigating possibilities for tapping into the geothermal energy produced by the volcano.⁷⁰⁹

Natural hazards include earthquakes, tsunamis or seiches, and erosion caused by extreme weather events or land disturbance. Earthquake potential is considered high due to the elevated seismicity of the region. Unalaska falls within earthquake zones 3 and 4, which carry a high risk of substantial seismic damage. While tsunamis present a threat, the city is located north side of Unalaska Island which may lessen impacts of waves originating around the Aleutian Megathrust fault. Finally, there is the potential for flooding and erosion along coastal areas of Unalaska Island as well as throughout the Unalaska Creek valley. Damming and obstructions downstream of Unalaska Creek may produce more frequent flooding within upstream areas.⁷¹⁰

According to the Alaska Department of Environmental Conservation (DEC), there was one significant environmental remediation site active at Rocky Point, outside Dutch Harbor. As of 2002, the DEC reported hydrocarbon contaminants within groundwater, including diesel and gasoline range organics. Sources of contaminates include pre- and post-World War II fuel

⁷⁰⁷ Trych, Nyman & Hayes (1977). *City of Unalaska, Alaska: Recommended Community Development Plan*. (Retrieved June 12, 2012 from: <http://www.commerce.state.ak.us/dca/plans/Unalaska-CP-1977.pdf>.)

⁷¹⁰ See footnote 707.

storage sites, which were operated under multiple entities. It is estimated that the history of these tank farms spans over 60 years, and that the facilities have been the site of numerous spills, leaks, and releases. The DEC has been working with Chevron, Delta Western, and the U.S. Army Corps. of Engineers since 1989 to identify the source and extent of contamination, as well as any responsible parties. As of 2002, ground and surface water contaminants were not believed to be a public health threat.⁷¹¹

Current Economy⁷¹²

Unalaska's economy is based on commercial fishing, fish processing, and fleet services, such as fuel, repairs, maintenance, trade, and transportation. The community enjoys a strategic position as the center of a rich fishing area and is used for transferring cargo between Pacific Rim trading partners. The Great Circle shipping route from major U.S. west coast ports to the Pacific Rim passes within 50 mi of Unalaska, and Dutch Harbor provides natural protection for fishing vessels. Onshore and offshore processors provide some local employment. However, non-resident workers are usually brought in during the peak season. In 2010, 31 residents held commercial fishing permits. Westward Seafoods, Unisea, Alyeska Seafoods, Icicle Seafoods, Trident Seafoods, and Royal Aleutian Seafoods process the commercial catch. Unalaska also has a small tourist industry.⁷¹³ Top employers in 2010⁷¹⁴ included Unisea, Westward Seafoods, the City of Unalaska, Horizon Lines of Alaska LLC, the Unalaska School District, Alyeska Seafoods, Safeway Inc., Pacific Stevedoring Inc., WSTN Pioneer Inc., and American President Lines Ltd.

In 2010,⁷¹⁵ the per capita income in Unalaska was estimated to be \$25,353 and the median household income was estimated to be \$80,625, compared to \$24,676 and \$69,539 in 2000, respectively. Taking inflation into account by converting the 2000 values to 2010 dollars,⁷¹⁶ the real per capita income in 2000 is shown to have been \$32,449 and the real 2000 median household income was \$91,443. This shows that both per capita and household income decreased between 2000 and 2010. In 2010, Unalaska ranked 102nd of 305 Alaskan communities with per capita income that year, and 25th of 299 Alaskan communities with household income data.

However, Unalaska's small population size may have prevented the ACS from accurately portraying economic conditions.⁷¹⁷ Another understanding of per capita income is obtained

⁷¹⁵ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁷¹⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁷¹⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by DOLWD. According to the ALARI database, residents earned a \$66.92 million in total wages in 2010.⁷¹⁸ When matched with the population in 2010, the per capita income equals \$15,293, suggesting that caution should be used when comparing 2010 ACS estimates with the 2000 Census.⁷¹⁹ Again, because labor force data presented by DOLWD does not include self-employed residents, many residents working in fisheries sectors may not have been captured by estimates. This is an especially important consideration concerning Unalaska.

Based on the 2006-10 ACS,⁷²⁰ 97.3% of the population aged 16 and older was estimated to be in the civilian labor force, compared to a statewide rate of 68.8%. The local unemployment rate was 2.2%, compared to the statewide unemployment rate of 5.9%. Approximately 11.5% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; figures reported for Unalaska are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Unalaska. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 23.6%.

Based on household surveys conducted for the 2006-2010 ACS,⁷²¹ the greatest percentage of workers were employed in the private sector (95.0%), while 3.8% of workers were employed in the public sector and 1.1% were self-employed. By industry, most (82.6%) employed residents were estimated to work in manufacturing sectors in 2010; followed by transportation, warehousing, and utilities sectors (5.7%); and education service, health care, and social assistance sectors (2.0%). By occupation type, most (70.6%) employed residents were estimated to hold production, transportation, or material moving positions; followed by service positions (7.8%); management or professional positions (7.4%); natural resources, construction, or maintenance positions (7.4%); and sales or office positions (6.8%). Between 2000 and 2010 there was a significant proportional increase in employment in manufacturing sectors as well as in production, transportation, and material moving occupations. This may be attributed to evolving economic conditions; however, it may also be attributed to sampling, coverage, or measurement error within the ACS sample as a result of a high number of transient residents residing within the city. Unalaska is known to be one of the top commercial fishing ports in Alaska. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in farming, fishing, and forestry may be underestimated in Census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

According to 2010 ALARI estimates,⁷²² most (46.4%) of employed residents work in manufacturing sectors; followed by trade, transportation, and utilities (23.5%) and local government sectors (14.4%).

⁷¹⁸ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

Governance

Unalaska is a First-class city that is not located within an organized borough. The city administers a 2% sales tax and a 2% raw fish tax. The total municipal revenue received by Unalaska in 2010 was approximately \$29.0 million, an amount which has increased overall since the year 2000. General fund revenues peaked in 2009 at approximately \$34.9 million. Sales tax revenue received by the city also increased between 2000 and 2010, though the peak years of sales tax revenue were in 2008 and 2009. Unalaska received State and Community Revenue

Sharing between 2000 and 2003 of approximately \$100,000-129,000 per year, and in 2009 and 2010, the amount of approximately \$278,000 per year. In addition, Unalaska received fisheries-related grants between 2000 and 2010 for projects including an assessment of fish and other biological waste from Unalaska Fish Oil, harbor and navigation improvements and construction, funds toward boat harbor maintenance, and funds toward improvements and construction for the Unalaska Little South America (LSA) harbor. Information about selected aspects of Unalaska’s community revenue is presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Unalaska from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$19,413,550	\$3,269,242	\$129,402	\$5,000
2001	\$22,170,479	\$3,625,064	\$103,053	n/a
2002	\$20,015,517	\$5,233,203	\$106,462	\$7,500,000
2003	\$20,193,196	\$5,906,859	\$106,094	\$7,500,000
2004	\$22,933,930	\$6,350,610	-	n/a
2005	\$20,097,405	\$7,646,280	-	n/a
2006	\$21,895,565	\$6,049,831	-	\$5,324,500
2007	\$24,196,040	\$6,297,674	-	n/a
2008	\$31,338,570	\$11,036,560	-	n/a
2009	\$34,903,838	\$10,431,035	\$277,152	\$1,500,000
2010	\$28,984,464	\$8,733,038	\$279,655	n/a

Unalaska was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Ounalashka Corporation. Unalaska also is represented by the Aleut Corporation, a regional Native corporation. The Aleut Corporation is committed to promoting economic, cultural, and social growth for its shareholders through its subsidiaries, partnerships and foundation. The Aleut Corporation is one of the 13 regional Native corporations that were established in 1972 under ANCSA. The Aleut Corporation received a settlement of \$19.5 million, 66,000 acres of surface lands, and 1.572 million acres of subsurface estate. Lands selected by the Aleut Corporation include areas on the Alaska Peninsula and the Aleutian, Shumagin, and Pribilof Islands. Among the Corporation’s holdings is the village site of Attu and numerous historical and cemetery sites throughout the Aleut Region. Operations of the Aleut Corporation and subsidiaries include Government Contracting, Telecommunications,

Environmental Remediation, Fuel Sales, and Real Estate Management. The Company also participates in various partnerships, joint ventures and other business activities.⁷²³

Both the Alaska Department of Fish and Game (ADF&G) and the National Marine Fisheries Service (NMFS) hold offices in Unalaska. The nearest office of the Alaska Department of Natural Resources is located in Homer. The nearest office of the Alaska Department of Commerce, Community, and Economic Development is located in Dillingham. The nearest offices of the Bureau of Citizenship and Immigration Services and U.S. Immigration and Customs Enforcement are located in Anchorage.

Infrastructure

Connectivity and Transportation

Daily scheduled flights serve the community at the state-owned 3,900 ft long by 100 ft wide paved runway. A seaplane base is also available. In June 2012, round-trip airfare between Unalaska and Anchorage was \$958.⁷²⁴ The state ferry operates on a bi-monthly schedule from Kodiak between April and October. There are 10 major docks in Unalaska; three are operated by the city. The International Port of Dutch Harbor serves fishing vessels and shipping, with 5,200 ft of moorage and 1,232 ft of floating dock. The small boat harbor provides 238 moorage slips. The Unalaska Marine Center and U.S. Coast Guard dock offers cargo, passenger, and other port services.⁷²⁵

*Facilities*⁷²⁶

Water is supplied by a dam at Pyramid Creek and Unalaska Creek and a water reservoir at Icy Creek. It is then chlorinated and stored in a tank. All homes and on-shore fish processors are served by the city's piped water system. Piped sewage receives primary treatment before discharge into Unalaska Bay. Nearly all households have plumbing; a few homes use septic tanks or privies. The city has a class-1 lined 6-acre landfill and baler; recycling and hazardous waste disposal is provided. All shore-based processors generate their own electrical power.

Law enforcement is provided by the city police department, a state troopers post, and a Village Public Safety Officer. Fire and rescue services are provided by the Unalaska Fire/Emergency Medical Services and the Unalaska Search and Rescue Divers. The city maintains a community center, city hall, and city jail. Senior services are provided by the Unalaska Senior Citizens, Incorporated, and the Father Ishmail Gromoff Senior Center. There are both public and school libraries in Unalaska, and Unalaska also has the Museum of the Aleutians and the Aleutian World War II Historical Park.

According to a survey conducted by the AFSC in 2011, community leaders reported that the following infrastructure projects have been completed within the past 10 years: fish cleaning

⁷²³ Aleut Corporation: Corporation (n.d.). *Homepage*. Retrieved on May 11, 2012 from <http://www.aleutcorp.com/index.php>.

⁷²⁴ Airfare was obtained on the travel website <http://www.travelocity.com> for a round-trip ticket for travel from June 1 to June 8, 2012. Retrieved on December 1, 2011.

⁷²⁶ Ibid.

station, improvements to existing dock structure, electricity serving the dock, water serving the dock, harbor dredging, dry dock space, a jetty, and a school. Community leaders also noted that the following infrastructure projects are in progress: barge landing area, construction of new dock space, and a breakwater. In the same survey, community leaders noted that Unalaska has 7,026 ft of space available for permanent vessels to moor and 2,305 ft of dock space available for transient vessels, and that vessels up to 200 ft long can use moorage in Unalaska including rescue vessels, cruise ships, ferries, and fuel barges. Community leaders reported that public moorage facilities earned \$501,313 in revenue in 2010.

*Medical Services*⁷²⁷

Medical services are provided by the Oonalaska Wellness Center, which is owned by a Tribal non-profit and operated by the Aleutian Pribilof Island Association, Incorporated. The center is a Community Health Aid Program site. The center is a qualified Emergency Care Center. Emergency services have limited highway, marine, and airport access and are provided by 911 telephone services volunteers and a health aide. Alternate health care is provided by the Unalaska Fire/Emergency Management Services. The nearest qualified Emergency Care Center is located in Akutan and the nearest hospital is located in Soldotna.

*Educational Opportunities*⁷²⁸

There are two schools in Unalaska. Eagle's View Elementary School provides instruction to students in pre-school through sixth grade. In 2011 the school had 212 students and 17 teachers. The Unalaska Junior/Senior High School provides instruction to students in grades seven through 12. In 2011 the school had 203 students and 15 teachers.

Involvement in North Pacific Fisheries

*History and Evolution of Fisheries*⁷²⁹

In the early 20th century, seafood processing of salmon, herring, and salt cod was established in Unalaska; although major fisheries were not established until the late 1920s. By the 1940s, the military presence in the region overshadowed commercial fishing, and Dutch Harbor was mostly repurposed as a naval port.

Following World War II the community entered a period of economic depression until the 1960s when halibut, salmon, and king crab fisheries began to develop in earnest. During the 1970s, the Bering Sea/Aleutian Islands (BSAI) king crab fishery brought about an economic boom. During that time, there was a dramatic increase in the number of commercial fishing vessels and seafood processors within the community.

By 1979, the Port of Dutch Harbor was a leading U.S. commercial fishing port as crab harvests boomed during the 1970s. Between 1975 and 1977, the Tanner crab harvest jumped

⁷²⁷ Ibid.

⁷²⁸ Alaska Department of Education and Early Development. (2012). *Statistics and Reports*. Retrieved April 24, 2012 from <http://eed.alaska.gov/stats/>.

⁷²⁹ City of Unalaska (2005). *Unalaska Economic Development Plan*. Retrieved June 12, 2012 from: <http://www.commerce.state.ak.us/dca/plans/Unalaska-EDP-2004.pdf>.

from 7 million lbs to an estimated 50 million lbs. King crab harvests grew to an excess of 60 million lbs by 1977.⁷³⁰ The king crab fishery continued to sustain a local boom until stocks collapsed in the early 1980s. The collapse led to an economic bust until 1986, when Unalaska transitioned to a groundfish-based economy. Rapid growth occurred in the BSAI pollock fishery between 1988 and 1992.

By 1992, Dutch Harbor was the number one U.S. port in amount and value of commercial fish landed. In the years following, the commercial fishing and fish processing industry grew rapidly and diversified. Today, major varieties of fish processed in Unalaska include king, Tanner (*bairdi*) and snow (*opilio*) crab, pollock, Pacific cod, salmon, herring, halibut, sablefish, turbot, Atka mackerel, and rockfish.

Although the majority of Unalaska residents depend on income derived directly or indirectly from the commercial fishing and fish processing industry, few have ownership interest in major sea-food related firms. Many of the largest shore-side fish processors are wholly- or partially-owned by Japanese interests. Many other large processor vessels (motherships), or floating processor barges are owned by non-Alaskan firms. Many commercial vessels are non-Alaskan owned as well, although this trend has been changing.

Unalaska is located in the Aleutian Island Chain. The area is included in Federal Statistical and Reporting Area 610, Pacific Halibut Fishery Regulatory Area 4A, and the Western Gulf of Alaska Sablefish Regulatory Area. Unalaska is not eligible to participate in the Community Development Quota or Community Quota Entity programs.

In a survey conducted by the AFSC in 2011, community leaders reported that Unalaska participates in the fisheries management process in Alaska through a paid staff member who attends North Pacific Fishery Management Council (NPFMC) and/or Board of Fisheries meetings, a representative who participates in NPFMC committees or advisory groups, and a representative who sits in on regional fisheries advisory and/or working groups conducted by ADF&G. In addition, Unalaska relies on regional organizations to provide information on fisheries management issues. Finally, Unalaska financially supports research organization, industry coalitions, and trade associations related to North Pacific fisheries.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, two processing facilities were in operation in Unalaska. Alyeska Seafood Inc. is a shore-based processor that began operations in Unalaska in 1986. The plant employs a between 50 and 500 workers each year. The plant provides living accommodations to the majority of its employees and can accommodate 500 people.⁷³¹ Unisea Inc. is a large processing facility that began operations in Unalaska in 1975. The plant employs between 400 and 1,250 workers each year. In 2010, the plant employed a total of 1,222 in the months of February and March.⁷³²

⁷³⁰ Trych, Nyman & Hayes (1977). *City of Unalaska, Alaska: Recommended Community Development Plan*. (Retrieved June 12, 2012 from: <http://www.commerce.state.ak.us/dca/plans/Unalaska-CP-1977.pdf>.)

⁷³¹ This information is based on the results of a survey of processing plant managers conducted by the Alaska Fisheries Science Center in 2011.

⁷³² *Ibid.*

Fisheries-Related Revenue

Unalaska receives fisheries-related revenue from a 2% raw fish tax, the Shared Fisheries Business Tax, the Fisheries Resource Landing Tax, and harbor usage fees. The total fisheries-related revenue received by Unalaska increased slightly between 2000 and 2010.⁷³³ In 2010, fisheries-related revenue peaked at approximately \$19.8 million, compared to approximately \$11.0 million in 2000. Information about reported fisheries-related revenue received by the community of Unalaska between 2000 and 2010 is provided in Table 3.

In a survey conducted by the AFSC in 2011, community leaders reported that the following public services are at least partially supported or funded by the raw fish tax, Shared Fisheries Business Tax, Fisheries Resource Landing Tax, or the marine fuel sales tax: maintaining the harbor, hospital/medical clinic/emergency response, educational scholarships, roads, social services, water and wastewater systems, roads, and police/enforcement/fire protection.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In Unalaska in 2010, there were 42 permit holders that held a total of 95 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC) for crab, halibut, herring, sablefish, groundfish, and salmon. Overall, the number of CFEC permits and permit holders decreased between 2000 and 2010, though the number of permits reported as fished remained relatively stable. Between 2000 and 2010, the number of crab CFEC permit holders and permits held remained relatively stable, as did the number/percentage of permits reported as fished. Crab CFEC permits issued in 2010 were for the Cook Inlet Dungeness crab pot fishery, the westward Dungeness crab pot fishery using vessels 60 ft in length or over, the Dutch Harbor, Aleutian CDQ (Aleutian Pribilof Island Community Development Association), Bering Sea, and Bristol Bay king crab pot fisheries using vessels 60 ft or over. Other crab CFEC permits issued in 2010 were for the Dutch Harbor Tanner crab pot fishery using vessels under 60 ft, the Peninsula-Aleutians, Dutch Harbor, and Bering Sea Tanner crab pot fisheries using vessels 60 ft or over, and the Kodiak Tanner (*bairdi*) crab pot fishery using vessels up to 120 ft. The number of salmon CFEC permits and permit holders increased between 2000 and 2010, though the percentage of those permits reported as fished actually decreased during this period. Salmon CFEC permits issued in 2010 were for the Prince William Sound, Chignik, and Peninsula-Aleutians purse seine fisheries, the Prince William Sound, Peninsula-Aleutians, and Bristol Bay drift gill net fisheries, the Peninsula-Aleutians set gill net fishery, and the statewide hand troll fishery. The number of groundfish and halibut CFEC permits and permit holders decreased between 2000 and 2010, though in both fisheries the percentage of permits reported as fished increased during this period. Halibut CFEC permits issued in 2010 were for the statewide longline vessel fisheries using vessels under 60 ft and 60 ft or over. Groundfish CFEC permits issued in 2010 were for the following statewide miscellaneous saltwater finfish fisheries: longline using vessels under 60 ft, pot gear using vessels under 60 ft, mechanical jig, longline

⁷³³ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

vessels 90 ft or over, otter trawl using vessels between 90 and 125 ft, and otter trawl using vessels over 125 ft. The number of sablefish and herring CFEC permits and permit holders experienced an increase followed by a decrease between 2000 and 2010. Sablefish permits issued in 2010 were for the statewide longline and pot gear fisheries using vessels under 60 ft. Herring CFEC permits issued in 2010 were for the Bristol Bay roe herring (purse seine and gill net) fisheries and the Alaska Peninsula herring food/bait gillnet fishery. During that same period, the percentage of sablefish CFEC permits reported as fished increased, while the percentage of herring CFEC permits reported as fished decreased.

The number of Federal Fisheries Permits and permit holders increased and then decreased between 2000 and 2010, while the percentage of those permits reported as fished increased overall during that same period. There were 17 permit holders that held 22 groundfish License Limitation Program (LLP) permits in 2010, representing an increase in number of permits and permit holders between 2000 and 2010. The number of groundfish LLP permits reported as fished also increased during this period. Also in 2010, there were five individuals holding seven crab LLP permits, both of which represent a slight increase from the amount of permits and permit holders in 2000. Between 2000 and 2010, the number of crab LLP permits reported as fished remained between zero and three each year. Information on commercial fishing permits and permit holders by species between 2000 and 2010 is presented in Table 4.

In 2010, there were 181 crew license holders, 14 fish buyers, and seven shore-side processing facilities in Unalaska, all of which represent decreases from the number of crew license holders (197), fish buyers (29), and shore-side processing facilities (8) in 2000. Between 2000 and 2010 there was also an overall decrease in the number of vessels owned primarily by Unalaska residents and in vessels homeported in Unalaska. The number of vessels landing catch in Unalaska also decreased between 2000 and 2010, as did the total number of net lbs landed in Unalaska. The amount of ex-vessel value of the catch landed in Unalaska briefly increased between 2000 and 2010, though in 2010 the amount of ex-vessel revenue from catch landed in Unalaska was similar to the amount of ex-vessel revenue in 2000. Information regarding characteristics of the commercial fishing sector in Unalaska between 2000 and 2010 is provided in Table 5. Unalaska was the top port in Alaska in landings and ex-vessel revenue in 2010, ranking first in landings and ex-vessel revenue out of 67 Alaskan communities that received commercial fisheries landings.

Between 2000 and 2010, the number of halibut quota share account holders and the number of quota shares held increased substantially, though the halibut Individual Fishing Quota (IFQ) allotment (in lbs) increased only slightly (Table 6). The number of sablefish quota share account holders increased and then decreased between 2000 and 2010, as did the number of quota shares held and the sablefish IFQ allotment (Table 7). Between 2005 and 2010, the number of crab quota share account holders decreased from three to two, while the total number of quota shares and the crab IFQ allotment increased slightly (Table 8).

For at least some years between 2000 and 2010, the number of lbs landed (and the associated ex-vessel revenue) for finfish, herring, and salmon is considered confidential due to a small number of participants. For years and species for which data are not considered confidential, the total number of lbs landed in Unalaska decreased overall between 2000 and 2010. Both landings and associated ex-vessel revenue decreased steadily between 2000 and 2010 for halibut, herring, other groundfish, and Pacific cod landed in Unalaska. In contrast, landings and associated ex-vessel revenue increased steadily for sablefish during this same period. For other shellfish and pollock, landings and associated ex-vessel revenue experienced an increase

followed by a decrease during this period. Information on landings and ex-vessel revenue by species in Unalaska between 2000 and 2010 is presented in Table 9.

When landings and ex-vessel revenue are examined by vessel owner residence, for vessels owned by Unalaska residents, both overall landings and overall ex-vessel value increased between 2000 and 2010. During this period, landings and ex-vessel revenue for crab, finfish, herring, other groundfish, other shellfish, pollock, and sablefish are considered confidential for some or all years due to a small number of participants. For years in which data were available, both landings and associated ex-vessel revenue increased between 2000 and 2010 for crab, halibut, herring, Pacific cod, and salmon. While landings of other shellfish increased between 2000 and 2010, the ex-vessel revenue of those landings decreased during the same period. Also between 2000 and 2010, the landings and associated ex-vessel revenue for other groundfish and sablefish both decreased. Information on landed lbs and ex-vessel revenue by species by Unalaska residents between 2000 and 2010 is presented in Table 10.

In a survey conducted by the AFSC in 2011, community leaders reported that commercial fishing vessels between 35 and 60 ft, from 61 to 125 ft, and over 125 ft use Unalaska as their base of operations during the fishing season. Community leaders also noted that the predominant gear types used by these vessels include: trawl, pots, longline, gillnet, purse seine, and jig. In the same survey, community leaders reported that, for fishing-related businesses that are not available in Unalaska, people travel to Seattle, WA, Kodiak, AK, and Seward, AK.

Table 3. Known Fisheries-Related Revenue (in U.S. Dollars) Received by the Community of Unalaska: 2000-2010.

Recreational Fishing

In 2010, there were two sport fish guide businesses active in Unalaska, and two sport fish guide licenses were held by residents. Both the number of sport fish guide businesses and the number of sport fish guide licenses decreased between 2000 and 2010. Log book data for sportfishing charters out of Unalaska between 2000 and 2010 reported that the following species were kept/released on charters during this period: halibut, lingcod, other rockfish, pink salmon, pelagic rockfish, and shark.⁷³⁴

In 2010, there were 542 sportfishing licenses sold to Unalaska residents (irrespective of the location of the point of sale), a number which declined steadily between 2000 and 2010. However, in 2010 there were 1,163 sportfishing licenses sold in Unalaska, representing an overall increase between 2000 and 2010. This indicates the potential that visitors to Unalaska are participating in recreational fishing activities.

Unalaska is located within the Alaska Sport Fishing Survey Area R – Alaska Peninsula/Aleutian Islands. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, sportfishing activity in this region varied considerably. For saltwater sportfishing, non-Alaska resident angler days fished varied between 1,603 and 4,126 during this period, while Alaska resident angler days fished varied between 3,261 and 12,721 days. Alaska resident anglers fished consistently more saltwater days than non-Alaska resident anglers during this period. In contrast, non-Alaska resident anglers fished more angler days in freshwater in the region (18,462 on average) than Alaska resident anglers (15,290 on average). This information about the sportfishing sector in and near Unalaska is also displayed in Table 11.

The Alaska Statewide Harvest Survey, conducted by ADF&G between 2000 and 2010, noted the following species targeted by private anglers in Unalaska: all five species of salmon, Dolly Varden, Pacific halibut, rockfish, Pacific cod, Tanner crab, and razor clam.⁷³⁵

According to a survey conducted by the AFSC in 2011, community leaders reported that recreational fishing in Unalaska takes place from charter/party boats, private boats owned by local residents, private boats owned by non-residents, shore-based or dock fishing by local residents, shore-based or dock fishing by non-residents, and fishing on lakes, in rivers, and on ocean banks. In the same survey, community leaders indicated that the following saltwater species are targeted by recreational fishermen that use boats based in Unalaska: pink salmon, chum salmon, Chinook salmon, coho salmon, sockeye salmon, halibut, rockfish, crab, black cod/sablefish, shrimp, and octopus.

Subsistence Fishing

Subsistence activities are important to the Unangan community and to many long-term non-Native residents of Unalaska.⁷³⁶ According to a survey conducted by the AFSC in 2011, community leaders reported that the more important subsistence marine or aquatic resources to the residents of Unalaska are sockeye salmon, halibut, coho salmon, and crab. While data on subsistence participation by household and species were not available between 2000 and 2010 (Table 12), data are available for total harvest of subsistence resources at the species level.

According to 2005 U.S. Fish and Wildlife Service (USFWS)⁷³⁷ interviews, Unalaska residents reported that overall, local salmon numbers had diminished compared to decades prior. Poor conditions of local fish, including observed cysts or burns, had lead residents to suspect that waste outfalls and industrial pollutants were impacting local fish stocks. The effects of the Kuroshima oil spill in 1997 were also believed to have impacted shellfish populations. Several respondents mentioned the local practice of beached whale harvests. Other marine mammals mentioned in 2002 interviews included a heavy dependence on harbor seal, Steller sea lion, and Pribilof Islands' northern fur seals. Residents subsisting on these resources will often venture out in search of halibut, and will bring a rifle in case a seal presents itself. There is perceived competition with the commercial fishing industry for subsistence resources. Local residents complain of seasonal or transient residents crowding local subsistence areas and depleting fish stocks.

In 2008, the most recent year for which data were available for salmon harvesting, there were 199 subsistence salmon permits issued to Unalaska residents, a value which ranged from 172 subsistence salmon permits issued in 2007 to 226 permits issued in 2002. Also in 2008, 158 of the subsistence salmon permits were reported as fished. Subsistence salmon harvest between 2000 and 2008 included Chinook salmon, chum salmon, coho salmon, pink salmon, and sockeye salmon, though the amount of each species harvested for subsistence use varied from year to year during this period. Sockeye salmon were the primary species harvested under subsistence permits between 2000 and 2008 (Table 13). Information regarding subsistence harvest of marine invertebrates and non-salmon fish was not available during this period.

Between 2003 and 2009, the number of Subsistence Halibut Registration Certificate (SHARC) cards issued increased overall, as did the number of SHARC cards reported as fished. The number of pounds of halibut harvested for subsistence purposes using SHARC cards also increased during this period. However, in 2010 there was a significant drop in the number of SHARC held, SHARC fished, and halibut harvested. In that year, an estimated 12,610 pounds of halibut was harvested on 55 SHARC, compared to an estimated 29,306 pounds harvested on 76 SHARC in 2009. Information regarding subsistence halibut harvests can be found in Table 14.

Information about subsistence harvest of marine mammals was available between 2000 and 2008, with the exception of 2007. No known harvesting of beluga whales, sea otters, or walrus for subsistence purposes occurs in Unalaska. Harvest data were reported for sea lion and harbor seal harvest between 2000 and 2008, though the numbers of each species harvested decreased substantially during that period. The number of sea lions harvested decreased from 49

in 2000 to 3 in 2008, and the number of harbor seals harvested decreased from 34 in 2000 to 0 in 2008. Information on subsistence harvest of marine mammal resources is provided in Table 15.

Additional Information

The Museum of the Aleutians in Unalaska is the only archaeological research and museum storage facility for the Aleutian region. The Aleutian World War II Visitor Center contains informational exhibits about the men and women who served in the US Armed Forces in the Aleutian Islands during World War II, as well as about the removal and internment of the Unangax (Aleuts) during the war.⁷³⁸

When asked in a survey conducted by the AFSC in 2011 to describe the effects seen on Unalaska as a result of fisheries policies or management actions, community leaders reported that regulations resulting from the 2010 Steller sea lion protection measures have had impacts on harvesters, processors, and fishery support sector businesses. In addition, restrictive bycatch regulations on various species have impacted harvests, processors, and fisheries support sector businesses. Finally, Essential Fish Habitat closures have had impacts on Aleutian and Pribilof Island area. Positive impacts include catch share programs for pollock, crab, halibut, and sablefish.

According to community leaders, future salmon bycatch restrictions for chum salmon in the Bering Sea would have the potential to impact the Eastern Bering Sea Pollock “B” season. That season constitutes 60% of the annual Eastern Bering Sea pollock allocation. If restrictions result in the closure of the entire “B” season, impacts on Unalaska’s economy are expected.

People and Place

Location

The majority of interior Alaskan communities lie on the banks of the middle and upper branches of the Yukon and Kuskokwim rivers as well as their tributaries. The vast area ranges from the community of Anvik (62.66° N by -160.21° W) to the Canadian border, and as far north as the community of Wiseman (67.41° N by -150.11° W). Fairbanks (64.84° N by -147.72° W) is the region's largest city and economic hub.

Demographic Profile

Interior Alaska consists of one borough (Fairbanks Northstar Borough), and two census areas (Southeast Fairbanks Census Area and Yukon-Koyukuk Census Area). A total of 14 communities met our criteria for profiling, of which only 5 exceeded 500 residents in 2010. In that year, the regional population was 110,198, of which 28.6% lived in the city of Fairbanks.¹

In 2010, 74.5% of residents identified themselves as White, 14.5% identified themselves as at least part American Indian or Alaska Native, 5.5% identified themselves as at least part Black or African American, 3.9% identified themselves as at least part Asian, and 0.7% identified themselves as at least part Native Hawaiian or Other Pacific Islander. In addition, 5.4% of residents identified themselves as Hispanic or Latino. It should be noted that most residents who identified themselves as White in 2010 were concentrated within the Fairbanks Northstar Borough, which is also where 88.6% of the region's total population resides. Because of this, region-wide statistics mask demographics found outside the region's population centers. For example, only 22.2% of residents within the Yukon-Koyukuk Census Area identified themselves as White, while 76.4% identified themselves as at least part American Indian or Alaska Native.²

Rural communities within the region have a mixed cash and subsistence economy. However, for most communities subsistence is the dominant form of livelihood. Many communities rely on construction, mining, and commercial fishing for seasonal wage employment. Permanent wage positions within smaller communities are often tied to the local government or schools. The communities of Coldfoot and Wiseman are dependent on traffic along the Dalton Highway. These communities depend on tourism, commercial trucking, and public lands management for employment. The city of Galena acts as a regional center for western interior Alaska, providing air transportation, retail, and government employment. The Fairbanks region includes Fairbanks, Two Rivers, North Pole, Delta Junction, and Nenana, and is the economic hub for interior Alaska. Major sectors include retail, transportation, mineral and petroleum support services, agriculture, governance, and military services.³ In 2010, overall regional per capita income was estimated at \$25,555 and overall median household income was estimated at \$65,813. Again, there were significant differences between rural and urban areas.

² Ibid.

³ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

Fairbanks Northstar Borough had an estimated per capita income of \$30,395 and estimated median household income of \$79,824; while the Yukon-Koyukuk Census Area had an estimated \$18,614 and \$45,463 respectively.⁴

*History*⁵

Evidence of early human occupation of the southern Brooks Range is estimated to stretch back approximately 8,500 to 11,000 years according to Paleo-Arctic sites found in the upper Kobuk River region and Anaktuvuk Pass.⁶ Evidence of Proto-Athabaskan-Eyak traditions within the Yukon River region date back at least 6,000 years.⁷ Many distinct Athabaskan language groups populate interior Alaska including Deg Hit'an, Holikachuk, Koyukon, Kuskokwim, Tanana, Ahtna, Gwich'in, Han, and Tanacross.⁸ Extensive trade networks existed, connecting interior Athabaskans with coastal groups around the Norton Sound and Siberia.

In 1790, the Lebedev-Lastochkin Company began exploring the lower Yukon River in an effort to expand its fur trade operations. Soon after, the Russian-American Company began exploiting the area, and as resources declined effort was expanded into the western interior. By 1845, the Hudson's Bay Company had begun operating on the Porcupine River, and soon furs were being traded with Athabaskans along the upper Yukon River. In the latter part of the nineteenth century, the Western Union Telegraph Company began exploring the region as part of an effort to create a global telegraph network. Since attempts to run a telegraph line under the Atlantic Ocean had failed, it was decided that a line would instead be connected to Siberia via a cable running through the Bering Sea. Part of this undertaking involved the forming of an expeditionary team to collect information about the land through which the line would pass. This was the first time Americans explored Alaska's interior. Competition for furs escalated in the region, and by 1883 the Alaska Commercial Company held a monopoly, and the price of furs dropped. In 1886, gold was discovered at Fortymile River, and prospectors soon began filling the new mining district. As mining grew, so did the Yukon River's importance as a regional transportation route. Riverboats operated by the Alaska Commercial Company and the North American Trading and Transportation Company became the principle means of getting into interior Alaska.

By the start of the twentieth century, most prospectors were broke and the volatile fur trade left many competing for resources and wealth. By this time, Episcopalian and Roman Catholic missionaries had traveled throughout the interior, establishing mission schools. Economic hardship and the pressures of assimilation prompted many Athabaskans to abandon their semi-nomadic lifestyles for more permanent settlements where work could be found. Swelling populations of miners caused concern within the U.S. Government that violence could

ensue if food or resources became scarce. In response to these concerns, several military posts were established along the Yukon River to keep order if needed.

In 1902, word spread of gold in the Tanana River valley. A settlement was established, and as word spread, more prospectors entered the region. By 1903, the settlement which would eventually become the city of Fairbanks had 1,200 residents. In addition to gold, the Tanana River Valley supported an experimental agricultural project headed by Dr. Charles Georgeson. Georgeson estimated that 100,000 acres of the Tanana region were suitable for crop production and dairy farming. By 1900, more than 300 bushels of potatoes were being cultivated.

By 1915, construction of a railroad connecting Fairbanks with Seward was underway. Tanana Athabaskans expressed concern over warnings by the U.S. Government concerning the impending influx of White settlers following the railroad's completion. It was also at that time, when the Tanana rejected proposals to establish a reservation system, which had significant implications on how U.S. Government-Alaska Native relations would evolve. The 1920s saw a revival of the fur industry as global demand peaked. Trappers would find seasonal work selling furs to the Alaska Commercial Company or to auctioneers in Seattle. It was also in the 1920s that the Alaska Railroad was completed, intensifying development of the Fairbanks region. The Tanana coal fields were being developed, and construction began on the 72-mile long "Davidson Ditch" which would bring 81 million gallons of water per day from the Chatanika River to the Fairbanks gold fields.

World War II brought intense development to the interior of Alaska. The Alaska Highway was built, linking Fairbanks with Canada and the rest of the contiguous United States. Military construction continued following the war's end, including Fort Wainwright and Eielson Air Force Base. Territorially operated airstrips were established in most villages, and air travel became a major method of transportation. This established Fairbanks as a regional transportation hub.

Land encroachment conflicts with Athabaskan groups began to rise during the 1960s resulting from proposals for a pipeline running from Prudhoe Bay to Valdez, effectively bifurcating important subsistence areas. The Alaska Native Claims Settlement Act (ANCSA) was passed in 1971 as a compromise, and 12 million acres of land and \$48.5 million was given to Doyon Ltd., interior Alaska's regional Native corporation. Work began on the pipeline in 1973, and a construction boom ensued. In 1977, the pipeline's completion caused a recession in Fairbanks, as many workers remained.

Today, the region remains closely tied to its resources. Many small traditional communities along the regions drainages depend principally upon subsistence resources. Other communities were established more recently around mining developments or along the highway system. These communities are largely dependent on the oil fields of northern Alaska and tourism. Fairbanks remains the economic and transportation hub for the region.

Natural Resources and Environment

Interior Alaska's weather is characterized by extremes. Winter temperatures average -12° F; summer temperatures average 61° F. But the seasonal temperature swing in this region is one of the widest on earth, with recorded winter lows of -78° F and summer highs of 93° F -- a swing of 171 degrees. The latitude in Interior Alaska also makes for a high degree of seasonal

variability of sunlight, with 4 hours of daylight in the winter and 21 hours of daylight in the summer. Precipitation in the region is relatively low, averaging 11.3 inches per year.⁹

Alaska's interior covers a vast and diverse range of environments. Much of the region was free of glacial ice during the Pleistocene and consists of various terrains ranging from rolling hills and flat lowlands sandwiched between the Alaska Range to the south, and the Brooks Range to the north. Much of the region has been shaped by the region's two major drainages: the Yukon and Kuskokwim rivers, which have left a series of oxbow and shallow circular lakes covering much of the flat lowlands. A relatively short growing season supports the spruce-dominated taiga forest which covers much of interior Alaska and northern Canada. Riparian areas are colonized by alder, willow, poplar, and aspen. Disturbed areas and bog environments are covered with willow, sedges, birch and Labrador-tea. Shrub communities are common in areas affected by wildfires. Continuous permafrost covers much of the region. Terrestrial wildlife includes beaver, mink, river otter, muskrat, marten, grizzly bear, black bear, wolf, red fox, caribou, moose, and snowshoe hare.¹⁰ Fishery resources include Arctic char, broad whitefish, burbot, Chinook salmon, coho salmon, chum salmon, Dolly Varden, Arctic grayling, humpback whitefish, lake trout, least cisco, longnose sucker, northern pike, rainbow trout, round whitefish, and sheefish.¹¹

Mineral resources within the region include gold, zinc, mercury, antimony, copper, molybdenum, tungsten, tin, silver, and lead. Extensive coal beds are also found throughout the region. Major mineral projects include: Donlin Gold, Nixon Fork, Usibelli Coal, Fort Knox, Pogo, Money Knob, Old Smokey, Livengood, and Fortymile.¹² The Tanana River Valley supports harvestable timber resources as well areas fit for crop cultivation.¹³

Governance

Regional governance is tied heavily to Fairbanks; although, Anvik, Grayling, Shageluk, and Holy Cross are significantly closer to the western Alaskan hub of Bethel. The City of Fairbanks hosts the seat for the Fairbanks Northstar Borough. In 2010, the Borough administered an 11.43 mills property tax, 8% accommodations tax, 8% tobacco tax, and 4% alcohol tax. Doyon Ltd., based in Fairbanks, is the regional ANCSA chartered Native corporation and has a land entitlement of 12.5 million acres and over 18,600 shareholders.¹⁴ The Fairbanks Native Association is the regional ANCSA chartered non-profit. With the exception of Coldfoot, Two Rivers, and Wiseman, every community profiled within the region is incorporated into a municipality. In addition, the communities of Anvik, Fort Yukon, Galena, Grayling, Holy Cross, Nenana, Shageluk, and Tanana have federally recognized Tribal councils and ANCSA chartered village corporations.

Grayling is the only community profiled within the region that is eligible for participation in the federal Community Development Quota (CDQ) program, and is represented by the Yukon Delta Fisheries Development Association. CDQ groups distribute a portion of commercial fishing proceeds to their various member communities and sponsor economic and infrastructural development.

Involvement in North Pacific Fisheries

Fisheries participation in interior Alaska is tied closely to the Yukon, Koyukuk, and Tanana rivers. Commercial salmon fishing is permitted within the 1,200 mile long main stem of the Yukon River, although most commercial fishing occurs within the River's lower reaches. Commercial fishing is also permitted in the lower 225 miles of the Tanana River, and lower 12 miles of the Anvik River. Large Chinook, chum, and coho salmon harvests from 1919 to 1921 led to the closure of commercial fishing on the Yukon River from 1925 to 1931 due to concerns over subsistence availability. Fishing was allowed again in 1932, but under tighter regulations. During the 1970s and 1980s, many residents began integrating commercial fishing with subsistence fishing; retaining a portion of their harvests for personal use.¹⁵ Due to salmon stock declines between 1998 and 2002, significant reductions in harvest limits have been made. Escapement limits and cross-border commitments to Canada have limited both commercial and subsistence Chinook salmon harvests for communities located on middle and upper Yukon drainages. In most upper Yukon River drainages, summer chum salmon are difficult to market because of transportation costs and flesh degradation caused by prolonged exposure to freshwater and sexual maturity. However, salmon roe quality is considered excellent.¹⁶

In 2010, there was one shoreside seafood processor in the region, located in Fairbanks;¹⁷ however, landings made that year are considered confidential.¹⁸ At the same time, residents of profiled communities landed a total of 5.99 million pounds of fish valued at \$5.24 million.¹⁹ In 2010, residents of the region held 365 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC), of which 43.6% were held in Fairbanks. However, only 30.1% of total permits held were actively fished. Of the total CFEC permits held in 2010, 75.3% were for salmon.²⁰ A total of 1.56 million shares of halibut and 696,651 shares of sablefish quota were held by residents of the region in 2010. Halibut quota was held by residents in the

communities of Fairbanks, Delta Junction, and North Pole, while sablefish quota was only held by residents in the communities of Fairbanks and Delta Junction.²¹

In 2012, historically low Chinook returns prompted fishery closures and restrictions not seen in over 80 years. In that year, the commercial Chinook fishery, which had an average annual harvest value of \$1.5 million, was completely shut down. The commercial chum salmon fishery, which had been experiencing a rebound after years of depressed market conditions, was also severely restricted. Subsistence harvests were also severely restricted, causing concern in many communities over how to meet subsistence requirements before winter.²²

Subsistence is relied upon heavily in rural interior Alaska communities to supplement diets and income. Popular subsistence species include Chinook, chum, and coho salmon, Arctic grayling, broad and round whitefish, northern pike, burbot, and least cisco.²³ In 2008, residents within the region reported harvesting 129,939 salmon using 3,960 subsistence salmon permits issued by the Alaska Department of Fish and Game. At 52,224 fish, sockeye salmon accounted for the majority of reported harvests despite their limited availability in Yukon River drainages. However, it should be noted that 98.5% of reported sockeye harvests occurred in Fairbanks, Delta Junction, and North Pole. Many residents of these communities may have traveled to different locations to conduct harvests. At 50,297 fish, chum salmon accounted for the majority of reported salmon harvests in the remaining communities, followed by Chinook salmon.²⁴

Recreational fishing is a popular activity along the Yukon and Tanana rivers. Most recreational fishing effort is based out of Fairbanks due to its accessibility and developed visitor infrastructure. The Tanana River Management Area offers fishing opportunities for lake trout, Dolly Varden, Arctic grayling, burbot, Chinook and coho salmon, northern pike, rainbow trout, and sheefish.²⁵ The Yukon Drainage Management Area covers the entirety of the Yukon River drainage excluding the Tanana River. Popular species targeted include Arctic grayling, Dolly Varden, northern pike, burbot, late trout, rainbow trout, sheefish, and all five species of Pacific salmon.²⁶

In 2010, 32,599 sportfishing licenses were sold in profiled communities within the region, of which 79.3% were sold in Fairbanks alone. In that year, residents held a total of 27,894 sportfishing permits, most of which were held in Fairbanks and North Pole. There were a total of 30 registered sport fish guide businesses in the region, 14 of which were registered in

Fairbanks. Other communities with registered sport fish guide businesses included Anvik, Delta Junction, Galena, Holy Cross, North Pole, and Two Rivers.²⁷

Regional Challenges

Seafood market accessibility and limited access to subsistence and commercial fishery resources are two major challenges facing interior Alaska communities. Many communities along the Yukon River have expressed interest in enhancing their local fisheries economy through increased marketing and processing capacity.²⁸ However, due to their remoteness, it is exceedingly difficult for many communities to get products to markets. Chinook salmon are considered a regional subsistence staple, and are preferred over chum or coho salmon. However, escapement requirements and low returns have limited harvesting, and recent poor returns have placed stress on many communities. The recent 2012 Chinook salmon crash exposes how vulnerable communities are to fluctuations in salmon runs.

Challenges facing the Fairbanks region include the residual effects of the 1970s oil boom, and its dependence on the military and extractable resources. The City's rapid growth during construction of the Trans-Alaska oil pipeline translated to an increase in cost of living, income disparity, and other associated social and economic challenges. Although mining and oil extraction industries are well established in the region, changing market and regulatory environments can lead to unforeseen and widespread impacts to the local economy.²⁹

Anvik (AN-vick)

People and Place

*Location*³⁰

Anvik is located in Interior Alaska on the Anvik River, west of the Yukon River, 34 mi north of Holy Cross and 350 mi northwest of Anchorage. The area encompasses 9.5 sq mi of land and 2.4 sq mi of water. Anvik was incorporated as a second-class city in 1969. The community is located in the Yukon-Koyukuk Census Area and is not under the jurisdiction of a borough.

*Demographic Profile*³¹

In 2010, there were 85 residents in Anvik, ranking it 263rd of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population grew by 3.7%. However, between 2000 and 2009, the population fell by 27.9% with an average annual growth rate of -3.13%; well below the statewide average annual growth rate of 0.75% and indicative of a declining population. Information regarding population trends can be found in Table 1.

The population of Anvik was predominately Ingalik Athabaskan in 2010.³² In that year, 92.9% of residents identified themselves as American Indian or Alaska Native, compared to 90.4% in 2000; 3.5% identified themselves as White, compared to 8.7% in 2000; and 3.5% identified themselves as two or more races, compared to 0.0% in 2000. Information regarding Anvik's racial and ethnic composition can be found in Figure 1.

In 2010, the average household size was 2.58, compared to 2.5 in 1990 and 2.67 in 2000. In that same year, there were a total of 46 housing units, compared to 47 in 1990 and 49 in 2000. Of the households surveyed in 2010, exactly half were owner occupied, compared to 69.4% in 2000; 21.7% were renter occupied, compared to 10.2% in 2000; 13% were vacant, compared to 10.2% in 2000; and 15.2% were occupied seasonally, compared to none in 2000. Since 1990 there have not been any reports of residents living in group quarters.

Gender distribution was skewed in 2010 at 54.1% male and 45.9% female. This was less even than the distribution statewide (52.0% male, 48.0% female) and similar to the distribution in 2000 (54.8% male, 45.2% female). The median age that year was 29.8 years, which was younger than the statewide median of 33.8 years, and similar to the 2000 median of 28.5 years.

Figure 1. Racial and Ethnic Composition, Anvik: 2000-2010 (U.S. Census).

The 2010 population structure was similar to 2000; although Anvik’s small population size resulted in some irregularity. In that year, 36.5% of residents were under the age of 20, compared to 41.2% in 2000; 16.6% were over the age of 59, compared to 7.8% in 2000; 32.9% were between the ages of 30 and 59, compared to 40.5% in 2000; and 14.1% were between the ages of 20 and 29, compared to 10.6% in 2000.

Gender distribution by age cohort was less even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred in the 10 to 19 range (10.6% male, 4.7% female), followed by the 20 to 29 (9.4% female, 4.7% male) and 30 to 39 (9.4% male, 4.7% female) ranges. Of those three, the greatest relative gender difference occurred in the 10 to 19 range. Information regarding trends in Anvik's population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)³³ estimated that 68.1% of residents aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 21.3% had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 10.6% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; and an estimated 34.0% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall. No residents were estimated to hold a post-secondary degree in 2010.

*History, Traditional Knowledge, and Culture*³⁴

Historically, Anvik was a Deg Hit'an Athabaskan village, although it has also been referred to as Ingalik Athabaskan. Deg Hit'an translates as "the People of this area", describing those who historically lived in the Anvik-Shageluk area encompassing parts of the Anvik River, Innoko River, and areas along the Yukon River from Anvik to Holy Cross. Previous to contact with Russians and Americans, the area supported an extensive trade network connecting coastal and inland river communities. The Unalakleet people traded with the Sledge and King Island people, who in turn traded with Russian posts on the Kolyma River in Siberia. The Anvik River also provided a trade route between the lower Yukon area and the Norton Sound. Items traded often included dried and smoked fish, wooden tubs, dishes, bowls, and furs. First contact was reported in January of 1834 by Russian explorer Andrei Glazanov, who counted approximately 240 people living in the village. Within 4 years of Glazanov's visit, a smallpox epidemic swept through southwest Alaska and by 1842, the estimated population of 1,000 in the Anvik-Shageluk area had diminished to 699 according to the Russian explorer, Zagoskin. Anvik suffered extensive disease outbreaks in the years following European contact and the population declined by 20% between 1900 and 1914. During this time, many surviving residents and orphans of the epidemic moved from the old village of Tthogi qay xitl'ot, across the river to present day Anvik. By 1915, the old village was used only as a summer fish camp and later as a dog staging area.

Today the village is a contemporary subsistence community that maintains strong ties to its traditions. The traditional Deg Xinag Athabaskan dialect was fluently spoken by one elder in the community as of 2003 and revitalization efforts are in place. The sale of alcohol is prohibited in the community.

³³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Figure 2. Population Age Structure in Anvik Based on the 2000 and 2010 U.S. Decennial Census.

Natural Resources and Environment

The climate of Anvik is continental, and characterized by temperature extremes ranging from -60 to 87 °F (-51 to 31 °C). Total precipitation averages 21 inches per year, and snowfall averages 110 inches per year. The Yukon River is ice-free from June through October.³⁵

Anvik is located at the confluence of the Anvik and Yukon rivers. The Anvik watershed includes a portion of the eastern flank of the Nulato hills, a north-south running range extending from the lower Yukon Delta to the Kotzebue Sound. The area is characterized by lowland wet tundra with meandering rivers, and scattered oxbow and shallow lakes. Uplands consist of

³⁵ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

forested terraces, flat plains, and high bluffs. The community site itself occupies a natural levee of silt loam and fine sand.³⁶

Vegetation includes spruce stands which follow the Yukon River. Well-drained soils support white spruce, paper birch, and quaking aspen along slopes. Lowlands are forested with dwarf black spruce, sedges, mosses, and stunted shrubs. Mixed stands of balsam poplar, cottonwood, willow, and alder brush populate floodplains. Edible and useful plants include cranberries, blueberries, salmon or cloud berries, rose hips, Indian potatoes, wild celery, wild onion, wild rhubarb, and sour dock.³⁷

Anvik is approximately 13 mi south of the Innoko National Wildlife Refuge, which covers 3.85 million acres and provides habitat to a number of fish, waterfowl, big game, and fur-bearers. Terrestrial wildlife includes moose, bear, wolves, lynx, wolverine, river otter, beaver, porcupine, caribou, snowshoe hare, red fox, red squirrel, marten, muskrat, weasel, mink, shrews, voles, and mice. Aquatic wildlife includes king, coho, and chum salmon, northern pike, Dolly Varden, Arctic grayling, burbot, and whitefish.³⁸

Mineral deposits in the area include Wolf Creek Mountain mercury/antimony deposit to the west, Stuyahok and Arnold Kako gold deposits to the southwest, and McLeod copper/molybdenum deposit to the northeast.³⁹ A large-scale gold operation is being developed by Donlin Gold north of Crooked Creek to the southeast of Anvik. The mine is projected to operate for 25 years, with over 33 million ounces of gold speculated to be in the area.⁴⁰

Potential natural hazards to the community include flooding and bank erosion, wildfire, and earthquakes. Flood potential in the downtown area is high due to ice jamming and rapid snow melt. In addition, the seismic zone that Anvik is located in has the potential to produce earthquakes greater than magnitude 6 on the Richter scale.⁴¹

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation projects active in Anvik in 2010.⁴²

Current Economy⁴³

Anvik has a mix of both a cash and subsistence economy; however, subsistence is the dominant form of livelihood for residents. When not participating in subsistence gathering or harvesting, residents earn income through seasonal and part time work, home gardening, or trapping. Local guiding businesses provide opportunities for residents to participate in the sportfishing and hunting sectors. Donlin Gold has increased employment in the region since it began a major mining project to the southeast.⁴⁴ Top employers in 2010⁴⁵ included Iditarod Area

School District, Anvik Traditional Council, City of Anvik, Deloy Ges Inc., and Doyon Drilling Inc.

In 2010,⁴⁶ the estimated per capita income was \$10,799 and the estimated median household income was \$14,583, compared to \$8,081 and \$21,250 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,⁴⁷ the real per capita income (\$10,626) and real median income (\$27,943) indicate that while individual earnings remained unchanged, household income declined. In 2010, Anvik ranked 260th of 305 communities from which per capita income was estimated, and 292nd of 299 communities from which median household income was estimated.

Anvik's small population size may have prevented the ACS from accurately portraying economic conditions.⁴⁸ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$842,849 in total wages in 2010.⁴⁹ When matched with the 2010 population, the per capita income equals \$9,916; suggesting that caution should be used when comparing 2010 ACS estimates with the 2000 Census.⁵⁰ In addition, the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.⁵¹

According to 2006-2010 ACS estimates,⁵² 88.5% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 28.8%, compared to an estimated 5.9% statewide; and an estimated 39.7% of residents lived below the poverty line, compared to an estimated 9.5% of Alaska residents overall. However, these unemployment and poverty statistics are likely inaccurate given the small population of 85. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 26.2%.⁵³ Of those employed in 2010, an estimated 67.7% worked in the private sector and an estimated 32.3% worked in the public sector.

By industry, most (45.2%) employed residents were estimated to work in retail trade sectors in 2010; followed by education services, health care, and social assistance sectors (32.3%); transportation, warehousing, and utilities sectors (12.9%); and agriculture, forestry, fishing, hunting, and mining sectors (9.7%). By occupation type, most (32.3%) employed

⁴⁶ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁴⁷ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁴⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁴⁹ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

⁵⁰ See footnote 45.

⁵² See footnote 48.

⁵³ See footnote 45.

residents were estimated to hold sales or office positions that year; followed by production, transportation, or material moving positions (25.8%); service positions (16.1%); management or professional positions (16.1%); and natural resources, construction, or maintenance positions (9.7%). There were significant variations in both industry sector employment and occupation types between 2000 and 2010. While it is possible that those shifts were attributed to changes in economic conditions, it is more likely that ACS sampling techniques did not accurately capture the scope of industry representation, which may account for the extreme variations. Information regarding employment trends can be found in Figures 3 and 4.

According to 2010 ALARI estimates,⁵⁴ most (72.5%) of employed residents were estimated to work in local government sectors; followed by financial sectors (7.8%) and natural resources and mining sectors (5.9%).

Figure 3. Local Employment by Industry in 2000-2010, Anvik (U.S. Census).

⁵⁴ Ibid.

Governance

Anvik is a Second-class city with a mayoral form of government. In addition, there is a U.S. Bureau of Indian Affairs (BIA) recognized Native village council (Anvik Village) and Alaska Native Claims Settlement Act (ANCSA) chartered village Native corporation (Deloy Ges, Inc.). The regional ANCSA chartered Native Corporation is Doyon Ltd. The closest ADF&G and National Marine Fisheries Service (NMFS) offices are located in Bethel, 139 mi southwest. The closest U.S. Bureau of Citizenship and Immigration Services (BCIS) office is located in Anchorage, 350 mi southeast.

In 2010, total municipal revenue peaked at \$206,064, compared to \$85,069 in 2000. In 2010, no taxes were administered by the city. However, state-allocated Community Revenue Sharing accounted for 48.4% of total municipal revenues that year, compared to 30.0% from State Revenue Sharing in 2000. In addition, there were several state and federal fisheries-related grants awarded to Anvik between 2000 and 2010 including, \$37,500 for a roe processing plant and \$371,600 for fish processing equipment and power access. Information regarding municipal budget trends can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Anvik from 2000 to 2010.

Infrastructure

Connectivity and Transportation

The Anvik River, west of the Yukon River, allows access to the community during the summer by barge or float plane. The city would like to develop additional dock and harbor facilities. The state-owned 4,000-ft long by 75-ft wide, gravel airstrip provides year-round access. Three mi of local roads are used by All Terrain Vehicles (ATVs), snowmachines, and dog teams.⁵⁵ Roundtrip airfare between Anchorage and Anvik in June 2012 was \$646.⁵⁶

⁵⁵ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

⁵⁶ Airfare was calculated using lowest fare. Source: <http://www.travelocity.com> (retrieved November 22, 2011).

Facilities

The majority of homes have new individual water wells, piped sewage disposal, and complete plumbing. Treated well water is also available at the “washeteria.” Funds have been requested to complete the remaining unserved homes. In total, 13 homes need plumbing, 16 homes need a septic tank, and 4 new water wells need to be drilled. Blackwell School connected to the city water system when its own well went dry in 1999. The school has its own drainfield.⁵⁷ Additional businesses and services include fuel storage, a community center, fuel sales, a general store, and a teen center. Satellite communication services are provided by Bush Tell and AT&T. Internet services are provided by GCI. Alaska Rural Communications Services (ARCS) provides public television and KSKO public radio broadcasts regionally via transmitter. In addition, residents often use VHF (Very High Frequency) radios to communicate with neighboring communities. Visitor accommodations include Chase Enterprises Lodge and Anvik City Building and School. Public safety services are provided by Village Public Safety Office (VPSO) and state troopers based in Aniak. Fire and rescue services are provided by VPSO and Anvik volunteer fire department. Additional public facilities include a community hall, school gym, museum, and school/community library.⁵⁸

As of 2004, Anvik lacked commercial lodging/accommodations, restaurant/food services, and transportation rental and repair services. The community has plans to develop barge docking, vessel landing, barge staging, and vessel storage infrastructure.⁵⁹

Medical Services

The Anvik Health Clinic is a Primary Health Facility and Community Health Aid Program (CHAP) site. Acute and long term care is provided in Bethel.⁶⁰ Mental health services are provided in nearby McGrath and secondary or intermediate healthcare is provided in Aniak.⁶¹

Educational Opportunities

The Blackwell School provides a preschool through 9th grade education. As of 2011, there were 16 students enrolled and 3 teachers employed.⁶² K-12 education services are provided in McGrath. In addition, the University of Alaska Fairbanks (UAF) offers secondary educational opportunities through Interior-Aleutian Campus (IAC) McGrath Center.⁶³

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Historically, residents of the lower-middle Yukon River region followed seasonal subsistence practices, utilizing seasonal camps. This continued until missionary and governmental influences encouraged more sedentary lifestyles. However, mobility continued to be important for communities within the region, maintaining kinship ties and shared subsistence practices.

While subsistence harvesting remains the dominant form of fisheries participation practiced by residents, the community has also been developing both its commercial and recreational sectors. Residents of Anvik have held commercial fisheries permits since 1980,⁶⁴ and landings have historically been made in the community. Sport fish guide businesses in the area also provide services to private anglers. In 2003, residents participated in a brief Arctic lamprey opening using dip nets or locally made eeling sticks. Landings from this fishery were transported 20 mi upriver to Grayling and sold to Kwikpak Fisheries for \$1.25 per lb.⁶⁵ Anvik is located within the Yukon Fisheries Management Area District 4A and Alaska Game Management Unit 21E. Although the community is ineligible to participate in the Community Development Quota (CDQ) program, it is represented regionally through the Western Interior Regional Advisory Council on subsistence issues, as well as through the G.A.S.H. (Grayling, Anvik, Shageluk, Holy Cross) advisory committee to ADF&G.

The first recorded commercial harvest of salmon on the Yukon River took place in 1918, and early harvests were relatively large. Concerns about providing sufficient salmon resources for subsistence harvest led to limitations on commercial salmon fishing during several periods, including a complete commercial fishing closure on the Yukon River between 1925 and 1931. In the 1980s, concerns about possible overharvest of Chinook runs led to reduced commercial fisheries in the late 1980s and 1990s. Poor returns of Chinook salmon in the late 1990s and early 2000s resulted in restrictive management of the commercial fishery and complete closure in 2001 to ensure subsistence resources.⁶⁶ Yukon River Chinook runs showed signs of improvement for several years following the 2001 commercial closure, but restricted commercial harvest in 2008 and complete closure of Chinook harvest in 2009 led to declaration of a fishery disaster that year.⁶⁷ A fishery disaster was again declared for the 2012 season, when the commercial Chinook salmon fishery was closed and subsistence fishery was significantly restricted. ADF&G, the Alaska Board of Fisheries and constituents are working together to develop a conservation plan that restricts Chinook harvest while allowing for greater harvest of more abundance species, including gear and other management restrictions.⁶⁸

Currently, commercial salmon fishing takes place along the entire 1,200 miles of the main stem of the Yukon River, as well as 225 miles of the Tanana River. There are 7 fishing districts, 10 sub-districts and 28 statistical areas. Fishing takes place with set and drift gillnets, and fish wheels are also allowed in Upper Yukon districts (Districts 4, 5, and 6). Subsistence fishermen also most often utilize these gear types. Many subsistence fishermen are also commercial fishermen.⁶⁹

Processing Plants

According to the 2010 Alaska Department of Fish and Game's Intent to Operate list, the company Bonasila Inc. operates a seafood processing plant called Bonasila Roe Plant in Anvik.

Fisheries-Related Revenue

Between 2000 and 2010, Anvik did not record any fisheries-related revenue. Information regarding fisheries-related revenue trends can be found in Table 3.

Commercial Fishing

In 2010, 11 residents, or 12.9% of the population, held a total of 14 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 14 residents held 15 CFEC permits. Of the CFEC permits held in 2010, salmon made up 71%, compared to 100% in 2000; and "other" finfish made up 29%, compared to 0% in 2000. Between 2000 and 2010, no residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits. In addition, no residents held halibut, sablefish, and crab quota between 2010 and when the programs began.

No residents held commercial crew licenses in 2010, compared to one in 2000. In addition, no residents held majority ownership of any commercial vessels, compared to eight in 2000. Overall, 14% of the CFEC permits issued were actively fished in 2010, compared to 0% in 2000. This ranged by fishery from 50% of "other" finfish permits, to 0% of salmon permits. In that year, CFEC permits were fished exclusively in the statewide freshwater set gillnet fishery. Overall, permit activity remained relatively low between 2000 and 2010, averaging approximately 6% of total permits held between those years. No permits were fished between 2000 and 2002, as well as 2004 and 2005. Permit activity peaked in 2009 at 27% of total permits held, despite the fact that the total number of permits held remained relatively constant over the decade. This was entirely credited to a spike in salmon permit activity.

No landings were reported in Anvik in 2010; although landings were made in 2007 and 2008. Salmon landings peaked in 2007 when 32,057 lbs of salmon were landed in Anvik with an ex-vessel value of \$16,678. However, the value per-pound peaked in 2009, when 27,771 lbs of salmon was valued at \$17,780 in ex-vessel. Data regarding landings by residents between 2000 and 2009 are considered confidential. No landings were reported by residents in 2010. Information regarding commercial fishing trends can be found in Tables 4 through 10.

¹ Net lbs refers to the landed weight recorded in fish tickets.

² Totals only represent non-confidential data.

Recreational Fishing

Anvik's remote location limits recreational fishing by non-Alaska residents; however, this has not prevented sportfishing outfitters from providing opportunities for both resident and non-Alaska resident private anglers. As of 2010, the Anvik River Lodge was the only sportfishing business in the area, although it was not registered as active that year. In that year, 31 residents held sportfishing licenses and 184 sportfishing licenses were sold in the community, compared to 22 and 74 in 2000, respectively. Sportfishing license sales peaked in 2010. According to ADF&G Harvest Survey data,⁷⁰ northern pike is the only species targeted by private anglers. However, there are further reports of chum, king, pink, and coho salmon, Arctic char, Dolly Varden char, and Arctic grayling being targeted.⁷¹ There is no kept/released charter log data available for Anvik.

Anvik is located in the Yukon River Drainage ADF&G Harvest Survey Area which includes all Yukon River drainages, from the south side of the Brooks Range to the Bering Sea, from the Canadian border to the Bering Sea, and all drainages of the Koyukuk and Alatna rivers. In 2010, there were a total of 9,134 freshwater angler days fished, compared to 11,223 in 2000. In that year, non-Alaska residents accounted for 43.6% of angler days fished, compared to 29.8% in 2000. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Subsistence resources are heavily relied upon by residents to supplement incomes, preserve traditional values, and bolster a sense of community. Anvik's mixed subsistence/cash economy grew from a hunter-gatherer economy that existed in the area prior to Russian-American contact. The community participates in subsistence fishing, hunting, trapping, and gathering. According to ADF&G,⁷² an estimated 46% of households surveyed participated in non-salmon fish subsistence activities in 2002, totaling 174.23 lbs per capita. That same year, an estimated 46% of households surveyed were harvesting terrestrial mammals, totaling 104.32 lbs per capita. Non-salmon fish harvested by residents include whitefish, inconnu, northern pike, Arctic grayling, Longnose sucker, burbot, Alaska blackfish, and Arctic lamprey. Non-salmon fish are harvested year-round, with pre-breakup (March and April) pike, whitefish, and sheefish harvests commonly occurring. Following breakup, dipnets are commonly used to fish for whitefish during their spring migration. Through May and June, gillnets are used to harvest whitefish, pike, and sheefish. Although effort largely shifts to salmon during summer months, non-salmon fish continue to be harvested throughout the season. During the summer, residents also rely on fish wheels and hook and line gear.⁷³

Whitefish comprise the most significant portion of non-salmon fish harvested in the region. Five different types of whitefish: broad, humpback, round, and least and Bering cisco are harvested locally. Whitefish eggs are valued in many communities where they are made into “Caviar.” Whitefish oil can also be rendered to make fat ice cream, also known as “snow ice cream.” Historically, residents would dam portions of a creek or slough in the fall and dipnet whitefish from pools. Northern pike make up a significant portion of the annual non-salmon subsistence harvest in Anvik. They are highly accessible, and available throughout the year. Pike are also important figures in cultural life, and are imbued with spiritual significance. Blackfish are known as “survival fish” in many Yukon River communities, as they often fed residents during times when food was scarce. Residents of Anvik report fishing for blackfish in lakes and sloughs near the village. Primary harvesting methods include dipnets and traps. Unlike most other non-salmon fish in the region, Arctic lamprey run at specific and often inconsistent times making it difficult to determine when harvests should occur. They are often boiled and rendered for oil, smoked, frozen, jarred, or used as dog food. Arctic grayling do not constitute a large portion of non-salmon subsistence harvests. Near Anvik, grayling can be found in the Anvik and Bonasila rivers, where they are typically harvested by hook and line or net. Burbot are harvested primarily in winter months while the fish are wintering outside of the Yukon River’s main stem. Burbot livers are considered a delicacy, and fish are both consumed by residents, and used as dog food. Sheefish are important for their year-round availability and oil-rich flesh, and can be found

Game. Technical Paper No. 289. Retrieved March 7, 2013 from: <http://www.subsistence.adfg.state.ak.us/TechPap/tp289.pdf>.

traveling up the Anvik River in search of spawning habitat. Sheefish are harvested in fish wheels and nets either set in-river during the summer, or under the ice during the winter and early spring. Spring is the preferred harvest time due to high oil and fat content. When prepared, sheefish are typically rendered for oil, although they can also be dried, smoked, boiled, or frozen. Sheefish eggs are typically fried or boiled. Longnose suckers are not harvested in significant amounts, and are primarily used as dog food. Suckers are mostly caught as by-catch in nets intended for chum salmon or whitefish harvests.⁷⁴

Of the species listed by ADF&G in Table 13, chum salmon were harvested most by residents, followed by Chinook, coho, and pink salmon. In 2008, residents reported harvesting 2,153 salmon, compared to 835 in 2000. Reported salmon harvests peaked in 2007 at 7,807 fish. In that year, there was a significant increase in reported chum harvests. While chum harvests were variable between 2000 and 2008, reported Chinook harvests increased steadily from 205 to 1,433. In 2002, there was a reported 16,143 lbs of non-salmon fish harvested. Yukon River salmon are typically harvested between late May and early October. Chinook, chum, and coho salmon make up the majority of subsistence harvests on the Yukon, although Chinook are desired most for consumptive purposes. Declining Chinook returns prompted a region-wide disaster declaration in 2009. Depressed returns resulted in commercial and subsistence fishing restrictions each year between 2009 and 2012, ultimately leading to widespread commercial and subsistence closures in 2012.⁷⁵

There is no documentation available on local subsistence marine mammal or halibut harvests between 2000 and 2010. Information regarding subsistence trends can be found in Tables 12 through 15.

Coldfoot

People and Place

*Location*⁷⁶

Coldfoot is located at the mouth of Slate Creek on the east bank of the Middle Fork Koyukuk River. It lies at mile 175 of the Dalton Highway, formerly known as the North Slope Haul Road. The area encompasses 37.0 sq mi of land. Coldfoot is unincorporated, is located in the Yukon-Koyukuk Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*⁷⁷

In 2010, there were 10 residents living in Coldfoot, ranking it 343rd of 352 Alaskan communities in terms of population size. While the population was 13 in both 2000 and 2009, the average annual growth rate was -0.32%, which was lower than the statewide average of 0.75% and indicative of a variable population. Information regarding population trends can be found in Table 1.

In 2010, the majority of residents identified themselves as White (90%), while 10% identified themselves as American Indian or Alaska Native, compared to 2000 when 100% of residents identified themselves as White. Information regarding racial and ethnic trends can be found in Figure 1.

In 2010, the average household size was 1.67, compared to 2.17 in 2000. In that year, there were a total of 11 housing units, compared to 12 in 2000. Of the households surveyed in 2010, 18% were owner-occupied, compared to 0% in 2000; 36% were renter-occupied, compared to 50% in 2000; 0% were vacant, compared to 0% in 2000; and 45% were occupied seasonally, compared to 50% in 2000.

The gender distribution in 2010 was skewed at 60% male and 40% female. This was significantly more skewed than the distribution statewide (52% male, 48% female), and more even than the distribution in 2000 (69.2% male, 30.7% female). The median age in 2010 was 43.0 years, which was significantly older than the statewide median of 33.8 years and somewhat older than the 2000 median of 39.5 years.

Population structures in both 2000 and 2010 were irregular due to the small and transient population in Coldfoot. Gender distribution along age cohorts in 2010 was equal with the exception of the 50 to 59 range, which had a complete male bias (30% male, 0% female) and the 70 to 79 range, which had a complete female bias (10% female, 0% male). Information regarding population structure can be found in Figure 2.

*History, Traditional Knowledge, and Culture*⁷⁸

Occupation of the Brooks Range and northern Alaska can be traced back at least 10,000 years. During the last glacial maximum, successive waves of immigrants arrived in the Arctic, either through an ice free corridor connecting North America and Siberia, coastal routes along the Bering Land Bridge, or both.

The earliest traces of human occupation can be dated to approximately 8,500 to 11,000 years ago; however, there is some disagreement over ages within the archaeological record. Evidence related to an early American Paleo-Arctic tradition have been found in the vicinity of Itkillik Lake, the upper Kobuk River, and near Anaktuvuk Pass.⁷⁹

The northern Archaic people arrived in northern Alaska from southern forested regions about 6,500 years ago. By around 1,000 years ago, the Western Thule culture appeared in the archaeological record. The Thule spread throughout the Arctic, eventually reaching as far east as Greenland and Labrador. The Nunamiut culture, which occupied much of the Brooks Range and surrounding tundra, descended from the Thule. The south slope of the Brooks Range was traditionally occupied by central Athabaskan groups. In historic times, there were many interactions between northern Eskimo groups and central Athabaskan groups throughout the Brooks Range area.⁸⁰

In 1850, the central Brooks Range was still largely isolated from influences of European and American culture. The mountains were occupied by semi-nomadic bands of Nunamiut hunters. Kobuk Eskimos and Koyukon and Kutchin Athabaskans made seasonal journeys into the area as well. Principal activities during that time included hunting, fishing, and trading among coastal and interior groups. In the mid-1880s, American explorers began moving into the central Brooks Range. Around this time, waves of miners and trappers began occupying the area.⁸¹

Originally named Slate Creek, Coldfoot reportedly got its name in 1900 when gold prospectors traveled up the Koyukuk to this point, then got "cold feet," turned around, and departed. In 1902, Coldfoot had two roadhouses, two stores, seven saloons, and a gambling house. A post office was established in 1902 and was discontinued in 1912, when the mine and town were abandoned for mines in Nolan and Wiseman Creeks to the north.⁸²

Natural Resources and Environment⁸³

The climate of the area is strongly continental. Temperatures range from -14 to 50 °F (-26 to 10 °C). Annual precipitation averages 10 inches, and snowfall averages 63 inches per year.

Coldfoot is located in a valley within the southern portion of the Brooks Range and right outside the Gates of the Arctic National Park and Preserve (GANPP). The area is remote and rugged with ridges that reach elevations of 4,000 to 8,000 feet or more. The ridges are actually the northernmost expanse of the Rocky Mountain system. The geology of the region is shaped by tectonic uplift, deformation, folding, fracturing, and overlapping. Uplift, erosion, and heavy successive glaciations account for the landscape profile and U-shaped valleys. Subsurface geology consist of metamorphic quartz mica and chloritic schists which form belts along the south flanks of the Brooks Range.

Soils vary by location and are dependent on topography, aspect, fire history, drainage, permafrost, and parent material. Most mountainous areas in the region are characterized by thin, sandy soils. Hilly moraines and south-facing colluvial slopes consists of gravelly loams. There are also areas of thin peaty mat and occasional pockets of permafrost. Lower elevations are covered by a gray to brown silty loam overlain by a peaty organic layer. Soils often overlay continuous permafrost zones.

Regional vegetation is consistent with taiga (boreal forest), tundra, and shrub thicket types. Alpine tundra occurs in mountainous areas and may be populated with willows, dryas,

⁸³ Ibid.

heather, lichens, grasses, sedges, and herbs. Moist tundra is found in moderately drained foothills and along valleys. Cottongrass dominates landscapes. Other plants include grasses, dwarf birch, willows, and Labrador tea. Taiga reaches its northern limit at around the southern border of the Brooks Range. As such, spruce stands are scattered and mixed with hardwoods such as birch or aspen. Other vegetation includes willows, blueberry, cranberry, bearberry, crowberry, lichens, mosses, Labrador tea, and poplar.

Mammals within the GANPP include brown/grizzly bears, moose, lemmings, voles, ground squirrel, marmot, beaver, mink, otter, wolverine, fox, wolf, lynx, marten, snowshoe hare, moose, caribou, and Dall sheep. Freshwater fish include Arctic grayling, lake trout, northern pike, Arctic char, whitefish, sheefish, salmon, long-nosed sucker, burbot, nine-spined stickleback, and slimy sculpin.

Minerals found in the region include copper, gold, lead, and zinc. There are several polymetallic deposits located at Wiseman, Nolan Creek, and Michigan Creek.⁸⁴ Placer mines have operated historically around the Nolan-Hammond River areas outside of Wiseman.

Environmental hazards primarily come in the form of extreme cold events, permafrost melt, wildfire, and erosion. Solifluction, or soil creep, is common on moderate slopes and can be associated with permafrost thaw. Smoke and haze associated with forest and tundra fires can degrade local air quality and irritate sensitive respiratory systems.

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation sites active in Coldfoot as of 2010.⁸⁵

Current Economy⁸⁶

Most employment is in the form of government and services to road travelers. There are motels, a restaurant, a gas and service station, an RV park and dump station, a state trooper post, a State Fish & Wildlife officer, and a U.S. Bureau of Land Management field office.⁸⁷

Coldfoot was not included in the 2006-2010 ACS and because of this; economic estimates are not available for 2010. However, the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD) reported on economic characteristics for that year.⁸⁸ In that year, \$400,460 was reported in total wages,⁸⁹ which results in a per capita income of \$40,046 when matched with the 2010 Census population. In 2000,⁹⁰ the per capita income in Coldfoot was \$42,620 and the median household income was \$61,250; however, after adjusting for inflation by converting

⁸⁹ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

⁹⁰ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data). Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

2000 values to 2010 dollars,⁹¹ per capita income and median household income totals \$56,045 and \$80,543, respectively. It should be noted that the number of employed residents estimated by ALARI in 2010 exceeds the total population recoded in the 2010 Census. Because of this, the 2010 per capita estimate should be considered with caution.

According to 2010 ALARI estimates, 61.5% of employed residents worked in leisure or hospitality sectors; 15.4% worked in natural resources or mining sectors; 7.7% worked in construction sectors; 7.7% worked in trade, transportation, or utilities sectors; and 7.7% worked in state government. In 2000,⁹² 60% of employed residents worked in retail trade and 40% worked in construction. Information regarding employment can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Coldfoot (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Coldfoot.

⁹¹ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁹² See footnote 90.

Governance

Coldfoot is unincorporated and not under the jurisdiction of a borough. In addition, the community was not included in the Alaska Native Claims Settlement Act (ANCSA) of 1971 and is not represented by a federally recognized Native traditional council. Because of its unincorporated status, Coldfoot is unable to levy taxes or keep a municipal budget (Table 2).

The closest Alaska Department of Fish and Game (ADF&G) and U.S. Bureau of Citizenship and Immigration Services offices are located in Fairbanks, 183 mi southeast. The closest National Marine Fisheries Service (NMFS) office is located in Anchorage, 419 mi south.

Infrastructure

*Connectivity and Transportation*⁹³

Coldfoot is located on the Dalton Highway. There is a state-owned 4,000-ft long by 100-ft wide gravel runway. Air charter services are available by appointment from Fairbanks. Local air services include Wright Air, which provides air charter services by appointment.

⁹³ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

*Facilities*⁹⁴

Residents use individual wells and septic tanks. There is no community-wide system. Visitor accommodations include Coldfoot Services and Arctic Acres Inn. Public safety services are provided by a local state trooper post. No other public services are available.

*Medical Services*⁹⁵

No medical services are provided within Coldfoot. The closest medical facilities are located in Fairbanks.

*Educational Opportunities*⁹⁶

No schools are located within Coldfoot.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Very little information is available regarding Coldfoot's historic participation in North Pacific fisheries. Several residents held sportfishing licenses in 2010. No residents held commercial fishing permits between 2000 and 2010.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Coldfoot does not have a registered processing plant. The closest seafood processing plant is located in Fairbanks.

Fisheries-Related Revenue

Coldfoot did not collect any fisheries-related taxes or fees between 2000 and 2010 (Table 3).

Commercial Fishing

Data on commercial fishing permits, vessel ownership, and crew licenses suggest that no commercial fishing of any kind was conducted by residents of Coldfoot between 2000 and 2010. This lack of activity is reflected in the fact that no data are reported in Tables 4 through 10.

Recreational Fishing

Recreational fishing is not a major contributor to Coldfoot’s economy, and is practiced primarily by local residents. No sport fish guide businesses were active in the community between 2000 and 2010, and no residents held sport fish guide licenses. In addition, no sportfishing licenses were sold in the community during that time. In 2010, residents purchased six sportfishing licenses (irrespective of point of sale), compared to 17 in 2000 (Table 11).

Table 11. Sport Fishing Trends, Coldfoot: 2000-2010.

Coldfoot is located in the Yukon River Drainage ADF&G Harvest Survey Area which includes all Yukon River drainages from the south side of the Brooks Range to the Bering Sea, from the Canadian border to the Bering Sea, and all drainages of the Koyukuk River and Alatna River. In 2010 there was a total of 9,134 freshwater angler days fished, compared to 11,223 in 2000 (Table 11). Of those, non-Alaska residents accounted for 43.6%, compared to 29.8% in 2000.

Subsistence Fishing

No information is available from management agencies regarding the extent of Coldfoot’s participation in subsistence fisheries between 2000 and 2010 (Tables 12 to 15).

Table 12. Subsistence Participation by Household and Species, Coldfoot: 2000-2010.

Delta Junction

People and Place

*Location*⁹⁷

Delta Junction is located at the convergence of the Richardson and Alaska Highways, approximately 95 mi southeast of Fairbanks and 236 mi northeast of Anchorage. The city developed along the east bank of the Delta River, south of its junction with the Tanana River. The area encompasses 17.3 sq mi of land and no water. Delta Junction was incorporated as a Second-class city in 1960, is part of the Southeast Fairbanks Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*⁹⁸

In 2010, there were 958 residents in Delta Junction, ranking it 68th of 352 Alaskan communities in terms of population size. Overall, between 1990 and 2010 the population grew by 46.9%. Between 2000 and 2009, the population grew by 34.3% with an average annual growth rate of 7.2%, which was significantly greater than the statewide average of 0.75% and indicative of rapid population growth. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there were 4,800 people living in Delta Junction in 2010, of which 800 were seasonal or transient according to state Permanent Fund Dividend (PFD) filings. This number vastly exceeds U.S. Census figures and could possibly include residents from nearby Fort Greely or the surrounding area. Employment brought to the area by the Pogo Mine and Fort Greely missile defense program may be driving this number as well. The population typically reaches its annual peak in August and is not at all driven by employment in fisheries sectors. Information about population trends can be found in Table 1.

The racial composition of Delta Junction is predominately White, with 88.1% of residents identifying themselves as such in 2010, compared to 91.4% in 2000. Also in that year, 3.2% of residents identified themselves as American Indian or Alaska Native, compared to 4% in 2000; 1.8% identified themselves as Black or African American, compared to 1.1% in 2000; 1.1% identified themselves as Asian, compared to 1% in 2000; and 4.2% identified themselves two or more races, compared to 2.4% in 2000. Residents identifying themselves as Native Hawaiian and Other Pacific Islander or some other race each made up less than 1% of the population in both 2000 and 2010. Hispanic or Latino residents made up 4.7% of the population in 2010 compared to 0.8% in 2000.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

In 2010, the average household size was 2.83, compared to 2.69 in 2000 and 2.6 in 1990. In that year, there were 517 total housing units, compared to 422 in 2000 and 413 in 1990. Of the households surveyed in 2010, 40% were owner occupied, compared to 42% in 2000; 33% were renter-occupied, compared to 32% in 2000; 21% were vacant, compared to 19% in 2000; and 6% were occupied seasonally, compared to 7% in 2000. There were no reports of residents living in group quarters between 1990 and 2010.

Figure 1. Racial and Ethnic Composition, Delta Junction: 2000-2010 (U.S. Census).

Compared with 2000, the population structure in 2010 was more stationary, with less variation among age cohorts. In that year, 30.3% of residents were under the age of 20, compared to 35.6% in 2000; 13.5% were over the age of 59, compared to 11.8% in 2000; 40.3% were between the ages of 30 and 59, compared to 44.5% in 2000; and 15.6% were between the ages of 20 and 29, compared to 7.9% in 2000.

The gender distribution of Delta Junction was somewhat skewed in 2010 at 54.9% male and 45.1% female (Figure 2). This was slightly less even than the statewide distribution that year (52% male, 48% female) as well as the 2000 distribution (52.9% male, 47.1% female). The median age in 2010 was 32.4, which was similar to the statewide median of 33.8 and younger than the 2000 median of 36.

Gender distribution by age cohort was slightly more even in 2010 than it was in 2000, with most cohorts reflecting male biases. In that year, the greatest absolute gender difference occurred in the 10 to 19 range (9.1% male, 5.3% female), followed by the 50 to 59 (7.9% male, 5.8% female) and 40 to 49 (7.7% male, 6.3% female) ranges. Of those three, the greatest relative gender difference occurred in the 10 to 19 range. Information regarding population structure can be found in Figure 2.

Figure 2. Population Age Structure in Delta Junction Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the 2006-2010 American Community Survey (ACS)⁹⁹ estimated that in 2010, an estimated 94.9% of residents aged 25 and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 2.2% had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 2.9% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 36.5% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 10.3% held an Associate's degree, compared to an estimated 8.0% of Alaska residents overall; an estimated 11.2% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 8.3% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*¹⁰⁰

Tanana Athabascan Indians occupied this site throughout most of the nineteenth and early twentieth Centuries. In 1899, the U.S. Army sent parties to investigate the Susitna, Matanuska, and Copper River valleys to find the best route for a trail north from Valdez through the Copper River Valley. By 1901, the army had completed the Trans-Alaska Military Road, which extended from Valdez to Eagle. In 1902, gold was discovered in the Tanana Valley, and shortly after, a spur trail was created from Gulkana on the Valdez-Eagle route to the new mining camp in Fairbanks. This trail became the Valdez-Fairbanks Trail. The Sullivan Roadhouse was built in 1905 by John and Florence Sullivan on a part of the Valdez-Fairbanks Trail known as the Donnelly-Washburn Cut-Off. This section of the trail was considered by many to be too steep, so the Alaska Road Commission built a new road which was 4 mi from the Sullivan Roadhouse. The Sullivans tore the roadhouse apart and rebuilt it alongside the new road.

Ongoing mining activity just north of Delta Junction in the Tenderfoot area and the Chisana Gold Strike of 1913 brought many prospectors and other travelers through the area. The Delta Junction area soon became known as Buffalo Center for the American bison that were transplanted there from the National Bison Range in Montana in 1928. In 1942, construction of the Alaska Highway began, and the Fort Greely military base was completed 5 mi to the south. In 1946, a dairy farm was established and in 1953, beef cattle were brought in by homesteaders. Delta Junction was incorporated as a Second-class city in 1960. Construction of the Trans-Alaska Pipeline between 1974 and 1977 brought a dramatic upswing to the population and economy. In August 1978, the state initiated the Delta Agricultural Project I, a 60,000-acre demonstration agricultural project. Twenty-two parcels, averaging 2,700 acres in size were sold by lottery. Today, Delta Junction is largely centered on agriculture and the military.

⁹⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁰⁰ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

Natural Resources and Environment

This area of Interior Alaska experiences seasonal extremes. The average low temperature in January is -11 °F (-24 °C). The average high during July is 69 °F (21 °C). Recorded temperature extremes range from a low of -63 °F (-53 °C) to a high of 92 °F (33 °C). Average annual liquid equivalent precipitation is 12 inches, with an average annual snowfall of 37 inches.¹⁰¹

Delta Junction lies in the Tanana subregion of the Yukon River system and is located on a level river terrace within the Tanana lowlands. Glacial deposits and alluvium cover tracts of gentle slopes with little relief aside from periodic dunes and moraine. Soils in the area are nutrient rich and suitable for crop cultivation. These soils are primarily derived from glaciers and are a composite of partially decomposed organic materials overlying sandy loams and gravel. In addition, a shallow permafrost table is present in several locations where soils are poorly drained. Vegetation generally consists of a mix of wooded areas and shrub-lands. Well drained areas support stands of paper birch, quaking aspen, and white spruce. Poorly drained soils support alder, black spruce, willow, mosses, and sedges. Shrub areas include American green alder, Sitka alder, rose, cranberry, bunchberry, dogwood, and Labrador tea. Horsetails, lichens, ferns, and grasses populate the undergrowth. Woodland areas are home to wildlife such as black and grizzly bears, and moose. Fur-bearers include fox, lynx, wolves, otter, mink, marten, weasel, beaver, muskrat, and snowshoe hare. Tanana Valley drainages support grayling, northern pike, and chum, coho, and Chinook salmon.¹⁰²

Mineral resources in the region include deposits of silver, gold, tungsten, tin, molybdenum, zinc, and coal.¹⁰³ Sumitomo Metal Mining Pogo LLC operates the Pogo gold mine 38 mi northeast of Delta Junction.¹⁰⁴ Spruce and aspen provide ample timber resources for the region. The Tanana Valley 2011-2015 timber harvest schedule set aside 5,805 acres for timber sales for those years.¹⁰⁵ Agriculture is very important to the region. There is an estimated 150,000 acres of land suitable for agricultural development and crops such as potatoes, hardy vegetables, perennial grasses, oats, and barley are grown in the area. As of 2004, 102,000 acres of cropland were being cultivated in the area. Delta Junction also has one of four United States Department of Agriculture approved slaughterhouses in the state.

A range of outdoor activities are available to visitors including fishing, hunting, hiking, camping, and sightseeing. In addition, the community's location on the junction of the Richardson and Alaska Highways make it accessible to highway travelers.¹⁰⁶ Local attractions include Sullivan Road House, Rika's Roadhouse, Big Delta State Historical Park, the Alaska Pipeline, and several state recreation areas.

While Delta Junction is susceptible to most environmental hazards present in interior Alaska, threats from wildfire and crop damage resulting from invasive weeds and insects are of particular concern to the area. On average, 3,775 sq km burn in wildfires annually in Alaska,

¹⁰⁶ See footnote 102.

90% of which occur in interior Alaska.¹⁰⁷ These wildfires threaten timber stocks and population centers, as well as impact air quality in the area. There have been observations of over 35 invasive plant species in the Delta Junction area.¹⁰⁸ In 2003, cultivators reported no significant insect problems and only localized weed infestations.¹⁰⁹

While the Alaska Department of Environmental Conservation reports that no significant environmental remediation sites were active in Delta Junction in 2010, cleanup efforts were underway in nearby Fort Greely for soil and ground water contaminants. As of 2005, 59 sites throughout Fort Greely remained active.¹¹⁰

Current Economy¹¹¹

The economy of the Delta Junction region is diversified among agriculture, tourism, military, logging, and mining sectors. In 2001, Fort Greely was designated as a site for a national missile defense system, which substantially boosted the local economy following the planned closure of the base in 1995. Construction jobs related to the project brought hundreds of workers to the area and construction of the Pogo Mine site in 2004 brought additional employment.¹¹² Other major employers include the Delta/Greely School District and Alyeska Pipeline Services. Several state and federal highway maintenance staff are located in Delta Junction. There are also a number of small businesses that provide a variety of services. Delta Junction's location at the junction of two major highways has brought development based on services to travelers. Local farms produce barley, other grains and forage, potatoes, dairy products, cattle, and hogs. Wild buffalo are hunted by lottery only. Some private businesses provide buffalo and elk hunts. Lynx, fox, coyote, mink, and beaver are trapped. Ice fishing, skiing, and snow machining are winter sports, as is dog sledding, which is used for recreational transportation and trapping.¹¹³ Top employers¹¹⁴ in 2010 included: Delta/Greely School District, Wolverine Services LLC, Boeing Service Company, Norcon Inc., State of Alaska, Bechtel Construction Company, IGA Food Cache LLC, First Student Management LLC, Alaska Home Care Inc., and The Boeing Company.

In 2010,¹¹⁵ the estimated per capita income in Delta Junction was \$33,716 and the estimated median household income was \$85,139, compared to \$19,171 and \$43,500 in 2000,

respectively. After accounting for inflation by converting 2000 values with 2010 dollars,¹¹⁶ the real per capita income (\$25,210) and real median household income (\$57,202) indicate a significant rise in both individual and household incomes. In that year, Delta Junction ranked 39th of 305 communities from which per capita income was estimated, and 23rd of 299 communities from which median household income was estimated.

Delta Junction's small population size may have prevented the ACS from accurately portraying economic conditions.¹¹⁷ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD).¹¹⁸ According to the ALARI database, residents earned \$17.15 million in total wages in 2010.¹¹⁹ When matched with the population in 2010, the per capita income equals \$17,903, which is significantly lower than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Census figures.¹²⁰

According to 2006-2010 ACS estimates,¹²¹ 73.7% of residents aged 16 years and older were part of the civilian labor force and 3.2% were in the armed forces. In that year, unemployment was estimated at 10.4%, compared to an estimated 5.9% statewide; and 8.2% of residents were estimated to be living below the poverty level, compared to an estimated 9.5% of Alaska residents overall. Of those employed in the civilian labor force, an estimated 68.4% worked in the private sector, and estimated 21.4% worked in the public sector, and an estimated 10.2% were self-employed. By industry, Delta Junction's economy was relatively diverse. Most employed residents were estimated to be working in professional, scientific, management, administrative or waste management sectors (26.5%); followed by education services, health care and social assistance sectors (15.9%) and manufacturing sectors (10.2%). According to 2010 ALARI estimates, most (18.0%) employed residents worked in professional and business services; followed by local government (15.5%); trade, transportation, and utilities (14.8%); and construction sectors (9.7%).

In 2010,¹²² 1.2% of employed residents were estimated to be working in agriculture, forestry, fishing, hunting, and mining sectors. By occupation type, an estimated 35.8% held management or professional positions, an estimated 27.7% held sales or office positions, an estimated 17.5% held natural resources, construction, or maintenance positions, an estimated 15.5% held service positions, and an estimated 3.5% held production, transportation, or material moving positions.

While there were only modest differences in employment by occupation type between 2000 and 2010, there were significant differences in employment by industry. In 2010, there were notable increases in estimated employment in professional, scientific, management,

¹¹⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹¹⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹¹⁸ See footnote 114.

¹¹⁹ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

¹²⁰ See footnote 114.

¹²¹ See footnote 117.

¹²² See footnote 115.

administrative, waste management, and manufacturing sectors. In that same year, there were also notable decreases in estimated employment in public administration, education services, health care, social assistance, and retail trade sectors. There is a possibility that these shifts resulted from jobs created by the Fort Greely missile defense program and Pogo mine; however, it should be noted that sampling techniques may not have captured the true scope of industry representation, particularly in resource based sectors. Information regarding employment trends can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Delta Junction (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Delta Junction (U.S. Census).

Governance

Delta Junction is a Second-class city with a mayoral form of government. Delta Junction was not included in the Alaska Native Claims Settlement Act (ANCSA) and is not represented by a federally recognized Native traditional council. There is an Alaska Department of Fish and Game (ADF&G) office located in Delta Junction. The closest National Marine Fisheries Service (NMFS) office is located in Anchorage, 236 mi southwest. The closest U.S. Bureau of Citizenship and Immigration Services (BCIS) office is located in Fairbanks, 95 mi northwest.

In 2010, Delta Junction did not administer any taxes. The total municipal budget that year was \$1.54 million, compared to \$573,517 in 2000; representing a 108% increase in revenues after accounting for inflation.¹²³ Most locally generated revenues were collected from landfill lease fees and various other municipal leases. Most outside revenues were collected from payments in lieu of taxes and Community Revenue Sharing.

In 2010, the city received \$149,973 in state allocated Community Revenue Sharing, which accounted for 10% of the total municipal budget in 2010. In 2000, \$25,923 in State Revenue Sharing accounted for 5% of the total municipal budget for that year. Between 2000 and 2010, Delta Junction did not receive any state or federal fisheries-related grants. Information regarding municipal finances can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Delta Junction from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵

Infrastructure

Connectivity and Transportation

Delta Junction is accessible by the Alaska and Richardson Highways. Buses provide transportation to Fairbanks and Whitehorse. The city offers a 2,500-ft long by 60-ft wide gravel airstrip with a 1,600-ft long by 60-ft wide dirt crosswind strip. There are five other privately-owned airstrips in the vicinity. Plans are underway for joint use of the Allen Airfield on Fort Greely. Snowmobiles are used for recreation.¹²⁴ Roundtrip airfare between Anchorage and Fairbanks in June 2012 was \$230.¹²⁵ Charter service to Delta Junction from Fairbanks is available by appointment, however rates vary.

Facilities

Households have individual septic systems, which range from 150 to 350 ft deep. Some residents use rain catchment systems. The Delta School has its own well-water system. Almost all homes are fully plumbed. Businesses and residences are dispersed over a large area, so a community system is not practical. Refuse is collected by a private firm, Delta Sanitation, and is deposited in the city-owned permitted landfill. The laundromat, Delta Laundry, is also operated privately. The city operates a sewage pit at the landfill site. Visitor accommodations are plentiful and include motels, lodges, campgrounds, and Recreational Vehicle parks. Public safety services are provided by the City Public Safety Office and a local state trooper post. Fire and rescue services are provided by the Delta Rescue Squad and Rural Deltana Volunteer Fire department. There is a gym pool, and movie theater at Fort Greely. There is one public library and three school libraries. Telephone, cable television, and broadband internet are all available.¹²⁶

In a survey conducted by the AFSC in 2011, community leaders reported that infrastructure projects completed since 2000 or under development include a new landfill or solid waste site, a new community center, and improvements to schools and the fire department. Delta Junction is located inland and does not possess port or harbor facilities. For businesses and services not available in Delta Junction, residents go to Valdez, Homer, and Kenai.

*Medical Services*¹²⁷

Basic health care is provided by the Delta Junction Family Medical Center and Delta Junction Public Health Center. The clinic is a qualified Emergency Care Center. Additional acute, long-term, or specialized services are provided by Fairbanks Memorial Hospital in Fairbanks.

¹²⁵ Airfare was calculated using lowest fare from www.travelocity.com. (Retrieved November 22, 2011).

¹²⁶ See footnote 124.

¹²⁷ Ibid.

Educational Opportunities

Delta Cyber School offers kindergarten through 12th grade instruction remotely. As of 2011, there were 175 students in attendance and 4 teachers employed. Delta Junction Elementary offers preschool through 5th grade instruction. As of 2011, there were 283 students in attendance and 19 teachers employed. Delta Junction Senior High School offers 9th through 12th grade instruction. As of 2011, there were 205 students in attendance and 17 teachers employed. Gerstle River School offers preschool through 12th grade instruction. As of 2011, there were 22 students in attendance and 3 teachers employed. New Horizons High School offers grade instruction. As of 2011, there were 12 students in attendance and one teacher employed.¹²⁸ The University of Alaska Fairbanks (UAF) offers cooperative extension services in association with Partners for Progress in Delta, Inc. Programs focus on vocational training for positions in local mining and defense sectors.¹²⁹

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

History of participation in North Pacific Fisheries in the Tanana River Subregion is centered on subsistence harvesting. The original Tanana Athabascans in the area utilized a wide range of subsistence resources, including fish from the Tanana and Yukon Rivers. Until the twentieth century, Tananas would migrate throughout the region, taking advantage of seasonal resources. While the introduction of market economies in the area encouraged a more sedentary lifestyle, subsistence was still an important part of daily life. Today, grayling, whitefish, northern pike, and salmon are harvested for both subsistence and recreational purposes.¹³⁰ Chinook, chum, and coho salmon are caught as well. In a survey conducted by the AFSC in 2011, community leaders reported that Delta Junction participates in the fisheries management process in Alaska through a representative that sits on regional fisheries advisory and/or working groups run by ADF&G.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Delta Junction does not have a registered processing plant. Processing of recreational catch in the area is largely done by individual guide services. The closest registered seafood processing plant is located in Fairbanks. Santa's Smokehouse operates a family owned and operated plant in Fairbanks called Interior Alaska Fish Processors which processes halibut and all five species of salmon. Interior Alaska Fish Processors also processes sport-caught fish and game, and it smokes sport-caught salmon (all species but pink).¹³¹

Fisheries-Related Revenue

Between 2000 and 2010, Delta Junction did not report any fisheries-related revenue from taxes for fees with the exception of \$1,610 collected in Shared Fisheries Business Taxes in 2006. Information regarding fisheries-related revenues can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

Although the city itself is not involved in commercial fisheries, many of its residents are. In 2010, 22 residents, or 2.3% of the population, held 48 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). Five residents, held six CFEC permits in 2000. Overall number of permits increased steadily between 2000 and 2010, as did the number of permit holders. Of the CFEC permits held in 2010, 38% were for salmon, compared to 50% in 2000; 21% were for groundfish, compared to 17% in 2000; 19% were for sablefish, compared to 0% in 2000; 2% were for herring, compared to 0% in 2000; 15% were for halibut, compared to 33% in 2000; 4% were for crab, compared to 0% in 2000; and 2% were for other shellfish, compared to 0% in 2000. Also in 2010, three residents held four License Limitation Program (LLP) groundfish permits, and four residents held five Federal Fisheries Permits (FFP). The amount of halibut quota share being held in the community grew significantly from 1,987 shares on 2 accounts in 2000, to 1.2 million shares on 6 accounts in 2010. Also in 2010, residents held 412,778 shares of sablefish quota on 5 accounts, compared to 43,752 shares on 2 accounts in 2001. No residents held crab quota between 2010 and when the program began.

There were 19 residents who held commercial crew licenses in 2010, compared to 4 in 2000. In addition, residents held majority ownership of 14 vessels that year, compared to 24 in 2000. Of the CFEC permits issued in 2010, 67% were actively fished, compared to 33% in 2000. This varied by fishery from 89% of sablefish permits, to 86% of halibut, 67% of salmon, 60% of groundfish, and 0% of herring, crab, and “other” shellfish permits. Also in that year, 100% of groundfish LLP and 80% of FFP were fished. Overall permit activity averaged 74.1% between 2001 and 2010. Fisheries prosecuted by residents of Delta Junction in 2010 included: statewide longline halibut; statewide longline miscellaneous saltwater finfish; Gulf of Alaska longline miscellaneous finfish; statewide longline sablefish; Prince William Sound drift gillnet salmon; Cook Inlet drift gillnet salmon; and Alaska Peninsula drift gillnet salmon.¹³²

Between 2000 and 2010 there were no recorded landings in Delta Junction. However, there were landings made by residents of Delta Junction in other locations during that time. Based on non-confidential data provided in Table 9, the most profitable species landed by residents in 2010 was halibut. In that year, 316,546 lb was landed valued at \$1.4 million, compared to 148,976 lb valued at \$436,469 in 2003; an increase of \$0.46 per pound landed after accounting for inflation.¹³³ Salmon was the next most profitable species landed in 2010. In that

Recreational Fishing

Recreational fishing is an important industry in Delta Junction. However, only one registered sport fish guide business was active at a time between 2000 and 2010 (with the exception of 2003, when there were two). The number of sport fish guide licenses held in the community declined significantly during that time from 31 in 2000 and 3 in 2010. This was likely attributed with the fact that the total number of registered sport fish guide businesses (active and inactive) declined as well during that period. The number of sportfishing licenses held by residents increased steadily from 1,396 in 2000, to 1,729 in 2010, with an average of 1,502 (note that the number of sportfishing licenses sold to residents greatly exceeds total population estimates). The number of sportfishing licenses sold in the community averaged at 69 between 2000 and 2009, before jumping to 2,502 in 2010. No kept/released charter log data are available for Delta Junction.

Delta Junction is located in Tanana River Drainage ADF&G Harvest Survey Area which includes the entire Tanana River watershed. In 2010, there was a total of 96,859 freshwater angler days fished, compared to 121,763 in 2000. Non-Alaska resident anglers accounted for 9.3% of angler days fished that year, compared to 9.5% in 2000. Combined angler days fished peaked in 2000. According to ADF&G harvest survey data, local private anglers target all five species of Pacific salmon, rainbow trout, Dolly Varden char, whitefish, burbot, Arctic grayling, and northern pike. There is no kept/released charter information available for Delta Junction. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that many residents participate in subsistence fishing on the Gulkana and Copper Rivers. Because of this, there is concern over management of Copper River salmon. Of chief concern is the level of salmon escapement related to Gulf of Alaska commercial fishing and Gulkana River fish wheels. Of the species reported by ADF&G in Table 13, residents reported sockeye salmon harvesting the most, followed by coho and Chinook. In 2008, 6,354 salmon were harvested, compared to 6,058 in 2000. In that year, 6,048 sockeye salmon were harvested, compared to 5,723 in 2000. Three residents were issued Subsistence Halibut Registration Certificates (SHARC) by NMFS in 2005; however, no halibut was harvested that year. No data is available regarding subsistence participation by household, or subsistence harvests of marine invertebrates, non-salmon/halibut fish, and marine mammals. Information regarding subsistence trends can be found in Tables 12 through 15.

Fairbanks (FAIR-banks)

People and Place

*Location*¹³⁷

Fairbanks is located in central Alaska. This centrality though, seems more geographical than social or economical. The city, which is part of the Fairbanks North Star Borough and located in the Fairbanks Recording District, was founded on the banks of the Chena River in the Tanana Valley and in the very heart of interior Alaska. Fairbanks is 45 minutes away by plane from Anchorage and three hours from Seattle. It lies 358 road mi north of Anchorage. The area encompasses 31.9 sq mi of land and 0.8 sq mi of water. The arctic daylight variations have an important impact on Fairbanks lifestyle: 21 hours of daylight between May 10th and August 2nd each summer, and less than four hours of daylight between November 18th and January 24th each winter.

*Demographic Profile*¹³⁸

In 2010, there were 31,535 residents living in Fairbanks, ranking it the second largest city in Alaska. Between 1990 and 2010, the population increased by 2.2%. There was a slight decline in population from 2009 to 2010, but in general the population of Fairbanks remained unchanged. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that on average, there are seasonal workers living in Fairbanks from April through September. The population peaks between June and August; however, they are not thought to be driven by employment in fisheries sectors.

In 2010, the majority of Fairbanks residents identified themselves as White (66.1%), compared to 67.0% in 2000. Also in that year, 10.0% of residents identified themselves as American Indian or Alaska Native, compared to 10.0% in 2000; 9.0% identified themselves as Black or African American, compared to 11.0% in 2000; 3.6% identified themselves as Asian, compared to 3.0% in 2000; 0.8% identified themselves as Native Hawaiian and Other Pacific Islander, compared to 1.0% in 2000; 7.9% identified themselves as two or more races, compared to 7.0% in 2000; 2.6% identified themselves as some other race, compared to 2.0% in 2000. In addition, 9.0% of residents identified themselves as Hispanic or Latino, compared to 6.0% in 2000. Further information regarding trends in race and ethnicity can be found in Figure 1.

Figure 1. Racial and Ethnic Composition, Fairbanks: 2000-2010.

In 2010, the average household size was 2.52, a slight decline from 2.60 in 1990 and 2.56 in 2000. In that year, there were a total of 13,056 housing units, compared to 12,537 in 1990 and 12,357 in 2000. Of the households surveyed in 2010, 32% were owner-occupied, compared to 31% in 2000; 57% were renter-occupied, compared to 58% in 2000; 10% were vacant, compared to 9% in 2000; and 1% were occupied seasonally, compared to 1% in 2000. In addition, 2,518 residents lived in group quarters in 2010, compared to 1,899 in 2000.

In 2010, the gender makeup of Fairbanks was 53.2% male and 46.7% female. This was similar to the gender distribution statewide (52.0% male, 48.0% female) and less even than the distribution in 2000 (51.3% male, 48.7% female). The median age was 27.9 years, which was less than both state (33.8 years) and national (36.8 years) median age estimates.

Compared with 2000, the population structure in 2010 was somewhat more constricted. In that year, 28.8% of residents were under the age of 20, compared to 32.8% in 2000; 11.0% were over the age of 59, compared to 8.9% in 2000; 34.9% were between the ages of 30 and 59, compared to 36.3% in 2000; and 25.4% were between the ages of 20 and 29, compared to 22.0% in 2000.

Age distribution by age cohort was slightly less even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within the 20 to 29 age range (15.1% male, 10.3% female), followed by the 30 to 39 (7.3% male, 6.5% female) and 0 to 9 (8.7% male, 8.1% female) ranges. Of those three, the greatest relative gender difference occurred in the 20 to 29 range. Further information regarding trends in Fairbanks' population structure can be found in Figure 2.

Figure 2. Population Age Structure in Fairbanks in 2000 and 2010 (U.S. Census).

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)¹³⁹ estimated that 89.3% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 3.3% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 7.4% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 30.8% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 11.8% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 6.7% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*¹⁴⁰

The Fairbanks region, the Tanana Valley, had been inhabited by Tanana Athabaskans for thousands of years prior to European interests. Tanana Athabaskans were strictly territorial and used hunting and gathering practices in their semi-nomadic way of life and dispersed habitation patterns. The boundaries of such systems of life were, presumably, fairly fluid and it may explain some references to the presence in the area of Koyukon Athabaskans, the northwest neighbors.

In 1901, E. T. Barnette established a trading post on the banks of the Tanana River, approximately seven miles from its confluence with the Yukon River. This trading post would later become the city of Fairbanks. Throughout its history, Fairbanks has been a boom and bust town. In 1902, rumors of gold in creeks around Fairbanks started to spread. Prospectors began to flood into Fairbanks, leading to the community's first population boom. Fairbanks was incorporated in 1903, and Barnette was elected as mayor. By 1908 there were 18,500 people living within the Fairbanks mining district. Mining prospects began to decline shortly after, and by 1920, the population had shrunk to 1,100. Advancements in mining led to a mining revival, and mining remained the region's most important industry until World War II. By the 1940s, a construction boom was underway as the military constructed airfields, roads, and communications systems. The 1968 Prudhoe Bay oil lease sale brought on an economic boom to Fairbanks, prompting the regional population to swell to over 74,000 people. Wages soared, and many oil workers received up to \$1,500 per week. However, the oil recession of 1978 devastated the local economy and by 1979, local unemployment was at 20%. Oil revenues recovered between 1980 and 1986, resulting in yet another boom environment in Fairbanks. Today, the city remains heavily reliant on oil, construction, military, and government services. The continuing uncertainty of the oil industry has a particularly significant effect on the city, compared to other communities in Alaska.¹⁴¹

¹³⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Natural Resources and Environment

Interior Alaska experiences seasonal temperature extremes. Average January temperatures range from -19 to -2 °F (-28 to -19 °C); average July temperatures range from 53 to 72 °F (12 to 22 °C). Annual precipitation averages 11.5 inches with 67.8 inches of snowfall. Temperatures have been recorded as low as -62 °F (-52 °C) in mid-winter and as high as 96 °F (36 °C) in summer. During the winter months, if the temperature drops below -20 °F (-29 °C), ice fog can occur. Fairbanks is known for its lingering summer days. When the solstice arrives, there are more than 22 hrs of daylight.¹⁴²

Fairbanks is located within the Tanana River valley, between the Alaska Range to the south, and the Yukon-Tanana Uplands to the north/northwest. Lowlands consist of moraines and outwash fans deposited by glaciers from the Alaska Range. The mountainous region to the south consists of alpine glaciers, U-shaped valleys, moraines, and alluvial fans. The Yukon-Tanana Uplands rise up to 2,000 ft above the valley floors, and consist of rounded, even-topped, unglaciated ridges with gentle slopes. Soils include alluvial and active floodplain deposits of gravel, sand, and silt. Upland areas consist of glacial deposits. Organic soils include brown and black peat, and organic silts. Permafrost in the area is discontinuous and varies in depth.¹⁴³

The broad outwash plain, south of Fairbanks, is populated by many drainages with small lakes occurring at blockages. The region provides habitat for animals relying on aquatic or riparian habitats including mink, marten, muskrat, beaver, and river otter. Streams are important spawning areas for Chinook, coho, and chum salmon. northern pike, whitefish, and burbot are common in larger lakes and rivers. Arctic grayling are common in smaller streams. Boreal forests dominate the landscape. Black spruce is found in bog environments, while white spruce and balsam poplar line rivers. Tall willow, resin birch, and alder shrub stands are scattered throughout the area. Permafrost flats support birch-heath shrubs and sedge tussocks. Low shrubs include resin birch, Labrador-tea, bog blueberry, and low-bush cranberry. There are over forty non-native plant species in the Tanana River Valley. Common invasive plant species include common dandelion, foxtail barley, and annual hawksbeard. Boreal forests in the area support moose, caribou, wolves, black bears, brown bears, weasel, lynx, marten, mink, red squirrels, and other rodents. Avian species in the area include black-capped and boreal chickadees, common redpolls, gray jays, ravens, black-backed and three-toed woodpeckers, northern flickers, hawk owls, horned owls, ptarmigan, and grouse.¹⁴⁴

Fishery resources include Arctic char, broad whitefish, burbot, Chinook salmon, coho salmon, chum salmon, Dolly Varden, Arctic grayling, humpback whitefish, lake trout, least cisco, longnose sucker, northern pike, rainbow trout, round whitefish, and sheefish.

Mineral resources include Fort Knox Gold Mine, which produces about 363,000 ounces of gold per year. Pogo Gold development is located 115 mi east of Fairbanks. Placer mines exist in the area, although on a small scale. Fourteen known or prospective mineral deposits exist east

¹⁴⁴ Ibid.

of Fairbanks. The Tanana Valley State Forest contains approximately 1.8 million acres of forestland. In 2003, 1.77 million acres of lands were designated as harvestable.¹⁴⁵

Flooding and wildfire are the most prevalent environmental hazards in the area, although permafrost melt and land subsidence hazards have been increasing. Fires are common, and are mostly caused by summer lightning strikes along the foothills. Frequent flooding across active floodplains of the Tanana results in erosion and alluvial bar formation.¹⁴⁶

There are several notable environmental remediation sites located in and around Fairbanks according to the Alaska Department of Environmental Conservation (DEC).¹⁴⁷ The former Arctic Surplus Salvage Yard was treated for a wide range of surface soil and groundwater contaminants, including volatile and semi-volatile organic and inorganic compounds, polychlorinated biphenyls (PCBs), chlorinated pesticides, dioxins, lead, furans, and trichloroethylene (TCE). Cleanup was concluded in 2004, and the site is now available for industrial or commercial use. Contaminates do remain, and restrictions are in place to prevent people from coming into contact with hazardous materials.

Groundwater around Eielson Air Force Base has been contaminated with lead and volatile organic compounds such as trichloroethylene (TCE), benzene, and tetrachloroethylene (PCE). In addition, oils, solvents, and fuels have been discharged into the soils. Remediation efforts commenced in the 1990s, and contaminated soil was excavated and treated. Soil caps were put in place to limit human exposure. A fishing restriction was put in place for Garrison Slough, and people are advised against coming in contact with the water. As of 2012, most sites were in a long-term monitoring program to ensure that contaminate plumes are contained.

Petroleum contamination was first discovered at the derelict Universal Recycling Center in 1993 during a solid waste inspection. There was also evidence of possible dioxin contamination. Cleanup of the property commenced in 2005, and contaminated soils were removed. Groundwater monitoring was conducted in 2007, and no contaminants of concern were observed above cleanup levels.

In 2005, construction of a 54-acre housing project on Fort Wainwright unearthed an area with extensive polychlorinated biphenyl (PCB) contamination. As of 2009, all excavated materials from the construction site were tested for contamination and removed for treatment. Military related munitions were also found in the area and removed. Numerous groundwater monitoring wells were installed between 2005 and 2008.

Current Economy¹⁴⁸

Gold mining and exploration figures strongly in Fairbanks' social and environmental history. In 1901, a trading post was established on the Chena River and soon afterwards gold was discovered in the area and a new wave of the gold rush was underway. Prospectors inundated the trading post and the city of Fairbanks emerged around the old steamboat landing banks. The town, named after Indiana Senator Charles Fairbanks, boomed along with many other mining field communities. The passage of a local government law in 1900, which regularized

¹⁴⁸ Unless otherwise noted, all monetary data are reported in nominal values.

incorporation procedures and authorized the use of certain fees by city councils and school districts, gave Fairbanks security and tools to avoid the collapse that other boom towns suffered after the gold rush.

During the twentieth century, two major events transformed Fairbanks and the rest of Alaska: the Second World War and the oil boom of the seventies. In both cases major flow of resources and infrastructure construction fueled the growth and consolidation of Fairbanks as one of the main urban centers of the state. In the 1940s, initiated by the war effort and concern about the Japanese threat, the Alaska-Canada (Alcan) Highway was built. In the 1970s, coinciding with a world's oil shortage, the Trans-Alaska oil pipeline was established.

Fairbanks provides supplies, as well as private and public services, to most of interior Alaska and thus plays a central role in the region. This centrality is fundamental to understanding the organization and composition of Fairbanks' economic system. By virtue of this centrality Fairbanks has a high density of public institutions: City, Borough, state and federal government services of all sorts. The Eielson Air Force Base and Fort Wainwright are both large government service employers.

On a more local basis, tourism is also a significant part of the economy. The recently developed tourism sector attracts an estimated 325,000 visitors to Fairbanks each summer. The Alaska Railroad brings a significant number of summer visitors to the Fairbanks area from Anchorage and southcentral Alaska. The Tanana Chiefs Conference opened the Chena River Convention Center, which provides space for attracting a variety of events to the area, and several organizations teamed together to construct the Morris Thompson Cultural and Visitor Center.¹⁴⁹

The Tanana Valley is one of the most productive agriculture regions in the state. During the 1990s, Tanana Valley farmers planted 58.8% of the total acreage farmed in Alaska, which accounted for 33.1% of total crop production during that time. In addition, the number of farms in the Fairbanks North Star Borough increased by 4% between 1997 and 2002. Mining is a large contributor to the local economy. The amount of refined gold in the Eastern Interior Region of Alaska increased between 2000 and 2006, from 392,862 ounces to 474,900 ounces. Fairbanks functions as an important staging area for oil and gas exploration, development, and production in Alaska's northern and interior regions. The area is the midpoint of the 800-mi Trans-Alaska Pipeline System that runs south from Prudhoe Bay to Valdez. The pipeline also supplies refineries located within the Borough and the Alaska North Slope. In addition, oil and gas deposits comparable to those of Cook Inlet have been identified in the Yukon Flats region. The United States Geological Survey (USGS) reports that the region 200 mi from Fairbanks contains 5.5 trillion cubic feet of natural gas and 173 million barrels of oil.¹⁵⁰ Top employers in 2010¹⁵¹ included: the Fairbanks North Star School District, University of Alaska, State of Alaska, Banner Health System, Fred Meyer Stores Inc., Tanana Chiefs Conference, Safeway Inc., Fairbanks North Star Borough, and Fairbanks Gold Mining Inc.

¹⁴⁹ See footnote 145.

¹⁵⁰ Fairbanks North Star Borough (2008). *Comprehensive Economic Development Strategy*. Retrieved July 20, 2012 from: <http://www.commerce.state.ak.us/dca/plans/FairbanksNorthStarBorough-EDP-2008.pdf>.

¹⁵¹ Alaska Department of Labor and Workforce Development (n.d.). Alaska Local and Regional Information Database. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

In 2010,¹⁵² the estimated per capita income was \$26,373 and the estimated median household income was \$51,320, compared to \$19,814 and \$40,577 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,¹⁵³ the real per capita income (\$26,055) and real median household income (\$53,358) indicate that while individual earnings remained relatively unchanged, household earnings increased. In 2010, Fairbanks ranked 92nd of 305 communities from which per capita income was estimated, and 124th of 299 communities from which median household income was estimated.

According to the 2006-2010 ACS, an estimated 59.9% of residents aged 16 and older were part of the civilian labor force in 2010 and an estimated 12.9% were in the employed in the Armed Forces. In that year, unemployment was estimated at 4.5%, compared to an estimated 5.9% statewide; and an estimated 11.0% of residents were living below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed in the civilian labor force, an estimated 73.1% worked in the private sector, an estimated 22.1% worked in the public sector, an estimated 4.7% were self-employed, and an estimated 0.1% were unpaid family workers.

By industry, most (20.2%) employed residents were estimated to work in education services, health care, and social assistance sectors in 2010; followed by retail trade sectors (20.0%); arts, entertainment, recreation, accommodations, and food service sectors (11.7%); and construction sectors (10.2%) (Figure 3). Agriculture, forestry, fishing, and mining sectors made up 1.5% of sector employment in 2010. However, this may not accurately portray the importance of fisheries within the community, as is reflected in the *Commercial Fisheries* section.

By occupation type, most (30.4%) employed residents were estimated to hold sales or office positions in 2010; followed by management or professional positions (27.2%); service positions (19.6%); natural resources, construction, or maintenance positions (13.0%); and production, transportation, or material moving positions (9.8%) (Figure 4).

¹⁵² U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹⁵³ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Figure 3. Local Employment by Industry in 2000-2010, Fairbanks (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Fairbanks (U.S. Census).

Overall, there were areas of significant variation in sector and occupational employment between 2000 and 2010. Most notably, there were significant proportional declines in professional, scientific, management, administrative, and waste management sectors; while there were significant proportional increases in public administration and retail trade sectors. In addition, there were significant proportional declines in the number of service positions; while there were significant proportional increases in the number of management and professional positions.

Governance

Fairbanks was incorporated in 1903 and is a Home Rule City. The city imposes a 0.057% property tax and an 8% tax on tobacco. The Borough also implements property and tobacco taxes, 0.15% and 8%, respectively. In 2010, the City did not administer a sales tax. The total community revenue in 2010 was \$30,218,824, which increased by \$8,184,230 compared to 2000.¹⁵⁴ The state administered Community Revenue Sharing program allocated \$1,726,227 to Fairbanks in 2010, which is more than five times the amount allocated in 2000 (Table 2).

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Fairbanks from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$22,140,114	n/a	\$300,533	n/a
2001	\$20,054,115	n/a	\$265,458	n/a

Fairbanks was not included in the Alaska Native Settlement Act (ANCSA) of 1971 and is not represented by a federally recognized Native traditional council. However, several Alaska Native institutions are based in Fairbanks. These include regional and local corporations as well as village councils: Denakkanaaga Inc. (regional Native non-profit.-Tribal Elders Council for Doyon Region), Doyon Limited (regional Native corporation), Fairbanks Native Association (regional Native non-profit providing social services) and the Tanana Chiefs Conference (regional health corporation-non-profit for Doyon Ltd.). Other local or regional institutions of the area are the Interior Regional Housing Authority (Housing Authority) the Alaska Sea Otter

Commission and the Fairbanks Community Food Bank. Permanent offices of both Alaska Department of Fish and Game (ADF&G) and Bureau of Customs and Immigration Services are located in Fairbanks. The nearest National Marine Fisheries Service office is in Anchorage.

Federal agencies with offices located within the Borough include U.S. District Court, Appellate Court, U.S. Fish & Wildlife Service, Federal Aviation Administration, U.S. Customs Service, Internal Revenue Service, Bureau of Land Management, National Parks Service, U.S. Department of Agriculture, and the U.S. Postal Service.

Infrastructure

Connectivity and Transportation

Fairbanks connects Anchorage with the North, Interior Alaska and Canada. It lies at the confluence of the Richardson Highway, George Parks Highway, Steese Highway, and Elliott Highway. Another major route, the Dalton Highway (formerly the North Slope Haul road) to Prudhoe Bay, begins about 75 mi north of town. The Alaska Railroad connects Fairbanks to Anchorage and Seward at the shoreline of the Gulf of Alaska.

The city is also easily reachable by air. The state-owned Fairbanks International Airport is regularly serviced by Alaska Airlines, Air North, Warbelow's Air Ventures, Larry's Flying Service, Marina Air, Frontier Flying Service, Arctic Circle Adventure, Midnight Sun Aviation, Interior Alaska Adventures, Tanana Air Service, Tatonduck Outfitters and Wright Air Service. The facility has an 11,800-ft asphalt runway, a heliport and a seaplane landing strip. A public seaplane base is also located on the Chena River. In addition, there are several privately-owned airstrips and heliports in the vicinity. Roundtrip airfare between Fairbanks and Anchorage in June 2012 was \$256.¹⁵⁵

Due to its geographic and climatic features, Fairbanks must import most of the goods that its population consumes. Goods are transported to Fairbanks by air and truck along the Alaska Railroad. The Borough operates a public transportation system, and cab companies and rental car services are available. Each summer, this city receives more than 300,000 visitors and has a correspondingly wide variety of accommodation possibilities.

Facilities

Fifteen circulating pump stations distribute treated water throughout the greater Fairbanks area. City water, sewer, and electric systems are operated by private companies. The Chena power site has four steam turbines fueled by coal and one oil-fueled generator. Garbage collection services are provided by the city for a fee, and refuse is hauled to the Class 1 Borough landfill on South Cushman. Fort Wainwright operates its own landfill. Fairbanks offers a wide range of visitor accommodations and attractions, comparable with other cities its size. Public safety services include city police and local state troopers. Fire and rescue services are provided by local fire department and Emergency Medical Services (EMS); Fort Wainwright Fire and EMS, Fairbanks Northstar Borough Fire and EMS, and U.S. Bureau of Land Management (BLM) Alaska Fire Service. Legal services include State Superior Court, District Court,

¹⁵⁵ Airfare was calculated using lowest fare. Source: <http://www.travelocity.com> (retrieved November 22, 2011).

Appellate Courts, and Fairbanks Correctional Center. Several community, youth, and senior service centers are available. Thirty-eight libraries are available, and five museums.¹⁵⁶

There are three undersea fiber optic cable systems which connect Alaska to the contiguous United States. Two systems connect Fairbanks to this undersea network. Communications services are provided by Alaska Communications Systems (ACS), General Communications Inc. (GCI), and AT&T/Alascom. Services include local and long distance telephone, cable, and broadband internet.¹⁵⁷

In a survey conducted by the AFSC in 2011, community leaders reported infrastructure projects completed between 2000 and 2010, or in progress as of 2010. These projects included new dock space, dock improvements, broadband internet improvements, road improvements, alternative energy projects, public safety improvements, fire service improvements, improvements to education services, and a state-run sport fish hatchery. As of 2010, there was 30 ft of dock space available for transient moorage at Fairbanks Northstar Borough Pioneer Park. Vessels up to 24 ft in length can use moorage in Fairbanks. Community leaders noted that there were less charter/party boats observed in Fairbanks in 2010 than in 2005. This was partially attributed to the Tanana Queen Riverboat halting service.

According to the 2011 AFSC survey, fisheries-related businesses and services available locally include fish processors, sportfishing gear sales, boat repair (welding and mechanical services), small vessel haul-out facilities, tackle sales, bait sales, commercial cold storage, vessel fuel sales, and air taxi services. Community leaders also noted that residents travel to Nenana, Valdez, and Seward for businesses and services not available locally. Additional public services include food banks, soup kitchens, job placement services, and publically subsidized housing.

Medical Services

Healthcare services in Fairbanks are provided by the Fairbanks Memorial Hospital, the Interior Neighborhood Health Clinic, Chief Andrew Isaac Health Center, Bassett Army Community Hospital/Fort Wainwright. In addition specialized care is provided by FNA Regional Center for Alcohol & Other Addictions, Fairbanks Pioneers' Home, and the Denali Center.

Educational Opportunities

As of 2011, the Fairbanks school district has 35 schools, a total of 872 teachers, and 14,285 students enrolled. The student-teacher ratio was 17.6.¹⁵⁸ The city is also home to the University of Alaska Fairbanks (UAF), which was founded in 1917 and as of 2010 had a total of 11,034 enrolled students.¹⁵⁹ UAF offers seven major research units including the Agricultural and Forestry Experiment Station, Arctic Region Supercomputing Center, the Geophysical Institute, the Institute of Marine Science, the Institute of Arctic Biology, the Institute of Northern Engineering, and the International Arctic Research Center. UAF offers 163 degree and 24

certificates in 114 disciplines, and is the only doctoral degree granting institution in Alaska. UAF also encompasses eight regional campuses in rural and urban locations throughout the state. This includes campuses in Dillingham, Kotzebue, Bethel, Nome, the Interior-Aleutians Campus, and the Rural College.¹⁶⁰

Involvement in North Pacific Fisheries

*History and Evolution of Fisheries*¹⁶¹

Although the city of Fairbanks is over 300 mi from the Alaska coastline, it has historical ‘long distance’ involvement in the commercial fishing industry. The city is home to a substantial number of vessel owners, commercial permit holders, and registered crew members. There is also a commercial fish processing plant. In short, Fairbanks is proof that Alaska’s commercial fishing industry is as much about networks and inter-community linkages as it is about location.

Much of the sportfishing effort in the area takes place within the Tanana River ADF&G Management Area. The Tanana River is the second largest tributary system of the Yukon River. The Chena, Salcha, Chatanika, and Delta Clearwater rivers, Minto Flats, Harding, Fielding, and Table lakes, and various stocked waters are all popular areas for recreational and subsistence fishing. The most commonly targeted species include Chinook and coho salmon, Arctic grayling, burbot, northern pike, lake trout, and stocked rainbow trout.

The Chena River supports one of the largest Chinook salmon populations in the Alaskan portion of the Yukon River drainage. Adult Chinook enter the Tanana River between late June and the second week of July. The run ends in late July or early August. Chum salmon are primarily available in July and August and are typically targeted or caught incidentally along with Chinook. The Salcha River supports the largest Chinook salmon population in the Tanana River drainage. Run characteristics are similar to those found in the Chena River. However, coho salmon are not found in the Salcha River drainage.

Coho salmon migrate into small tributaries on the south side of the Tanana River drainage, and tributaries near Delta Junction host some of the largest known coho spawning concentrations in the Yukon River drainage. The Delta Clearwater River supports the largest recreational coho fishery within the Tanana River drainage. Coho are the last of the salmon species to enter the Yukon River system. They typically enter around mid-September, and runs peak by mid-October. Some have even reported seeing coho spawning as late as January. Spring fed tributaries in the area provide ideal habitat for juvenile coho.

During the late 1970s and mid-1980s, the Chena River Arctic grayling fishery was the largest in the state. During the latter part of the 1980s, the bag limit for Arctic grayling decreased following poor stock levels, and the fishery began to decline somewhat. The fishery was further restricted to catch-and-release by the Alaska Board of Fisheries in 1994, and fishing effort dropped off considerably. Stock assessments in 2005 showed a stable population; however, it is unlikely that the population would be able to sustain a large annual harvest similar to historic levels. Other Arctic grayling fisheries within the Tanana River drainage are found within the Chatanika River, Nenana River, Salcha River, Fielding Lake, the Goodpaster River, the Tok River drainage, Shaw Creek, and the Richardson Clearwater River.

¹⁶⁰ See footnote 157.

¹⁶¹ Brase, A. L. J., and B. Baker. 2011. *Fishery Management Report for Recreational Fisheries in the Tanana River Management Area, 2009*. Retrieved July 23, 2012 from: <http://www.adfg.alaska.gov/FedAidpdfs/FMR11-17>.

The Minto Flats, located about 35 mi west of Fairbanks, is a popular northern pike fishing and waterfowl hunting area. The Minto Lakes are thought to support the majority of the northern pike sport fishery within the Tolovana River drainage. During the winter, much of the waters within the Flats become anoxic, forcing fish to move to waters within the Chatanika and Tolovana rivers or other tributaries. From 1984 to 1986, the total harvest of northern pike from the Minto Flats area doubled, and many females were caught during the winter ice fishing season. After 1987, sportfishing for northern pike was closed between October 15 and May 31, and the bag limit was reduced. Estimated sport catch of northern pike peaked in 1994. Northern pike is also common in many smaller lakes, sloughs, and tributaries throughout the Tanana River drainage.

Burbot are commonly caught by set-line through ice during the winter. Prior to 1988, there was no bag limit for burbot if taken by hook and line. There was a 10 fish per day limit for fish taken by spear or bow and arrow. However, in 1988, bag limits of 15 fish per day in flowing waters, and 5 fish per day in lakes were established. Before regulations were established, burbot fishing primarily occurred in the Fielding and Tangle Lakes system. From 1981 to 1984, burbot harvests averaged 330 fish per year in those systems. Low recruitment eventually led to restrictions on catch.

The Chatanika River supports a large population of whitefish (humpback and least cisco). The only major whitefish sport fishery occurs on the Chatanika River. This fishery historically took place in September. Both humpback and least cisco were harvested, as were a small number of round whitefish. The fishery became very popular in the 1980s. Prior to 1988, the fishery was unregulated. However, as with many other recreational fisheries in the area, the implementation of regulations followed a decline in harvest levels in the late 1980s.

Lakes containing wild lake trout in the Tanana River Management Area include Harding, Fielding, Two Bit, Landmark Gap, Glacier, Sevenmile, and the Tangle lakes system. A new state-run hatchery began to produce a small number of lake trout in 2009.

While very little of Fairbanks' municipal revenue is fishing-related (Table 3), Fairbanks residents are engaged in North Pacific fisheries via their purchase and use of permits for a range of species (Table 4) and individual fishing quotas for halibut and sablefish (Tables 6 and 7). Salmon is the most targeted species, with 134 salmon permits issued to residents of Fairbanks in 2010.

Because Fairbanks is located more than 50 mi from the coast, the community is not located within a Federal Statistical and Reporting Area, a Pacific Halibut Fishery Regulatory Area, or a Sablefish Regulatory Area. Fairbanks is not eligible to participate in the Community Development Quota program or the Community Quota Entity program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, one shoreside processing facility was in operating in Fairbanks. Santa's Smokehouse operates a family owned and operated plant in Fairbanks called Interior Alaska Fish Processors, which processes halibut and all five species of Pacific salmon.¹⁶² Interior Alaska Fish Processors also processes sport-caught fish and game, and it smokes sport-caught salmon (all species but pink).¹⁶³

Fisheries-Related Revenue

Fisheries-related revenue received by the City of Fairbanks is minimal, only including a small amount of revenue raised from the Shared Fisheries Business Tax (Table 3).

Commercial Fishing

In 2010, 146 residents, or less than 1% of the population, held 159 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 145 residents held 167 CFEC permits. Of the CFEC permits held in 2010, 85% were for salmon, compared to 77% in 2000; 7% were for herring, compared to 7% in 2000; 4% were for halibut, compared to 10% in 2000; 2% were for “other” shellfish, compared to 2% in 2000; and less than 1% were for sablefish, “other” groundfish, and crab. In addition, two residents held two Federal Fisheries Permits (FFP) and two residents held two License Limitation Program (LLP) groundfish permits. In 2010, residents held 376,376 shares of halibut quota on 15 accounts, compared to 457,129 shares on 22 accounts in 2000. Also in that year, residents held 283,873 shares of sablefish quota on one account, compared to 0 shares on one account in 2000. No residents held crab quota between 2010 and when the program began.

Residents held 79 commercial crew licenses in 2010, compared to 81 in 2000. In addition, residents held majority ownership of 30 vessels, compared to 102 in 2000. Of the CFEC permits held in 2010, 25% were actively fished, compared to 31% in 2000. This varied by fishery from 100% of halibut and sablefish permits, to 24% of salmon permits, 9% of herring permits, and 0% of “other” shellfish, “other” finfish, and groundfish permits. In addition, 50% of FFP and 0% of LLP were actively fished. Fisheries prosecuted by Fairbanks residents in 2010 included: statewide longline and mechanical jig halibut, statewide longline sablefish, southeast Alaska drift gillnet salmon, Bristol Bay drift gillnet salmon, Cook Inlet set gillnet salmon, Kodiak set gillnet salmon, Lower Yukon gillnet salmon, Norton Sound gillnet salmon, and statewide power troll salmon.

No landings were made in Fairbanks in 2000 and 2001, and landings between 2002 and 2010 are considered confidential. Landings made by Fairbanks residents in 2010 are considered confidential, with the exception of salmon. In that year, residents landed 1.09 million pounds of salmon valued at \$1.41 million ex-vessel; compared to 578,459 lb valued at \$347,747 ex-vessel in 2000; an increase of \$0.47 per pound landed after adjusting for inflation¹⁶⁴ and without considering the species composition of landings. Revenue from salmon landings peaked in 2010. In 2009, residents landed 23,222 lb of halibut valued at \$75,955 ex-vessel, compared to 13,455 lb valued at \$35,207 ex-vessel in 2000; a decrease of \$0.05 per pound landed after adjusting for inflation.¹⁶⁵ Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Due to the inland geographic location of Fairbanks, saltwater sport fishermen must travel a great distance to the coast, making freshwater sportfishing a more common form of recreational fishing in Fairbanks. The Tanana River watershed is a popular destination for private anglers, and a description of recreational fisheries was provided in the *History and Evolution of Fisheries* section.

In 2010, around 19% of sport fish guide businesses registered in Fairbanks were active, compared to 21% in 2000. The number of sport fish guide licenses held in the community declined significantly during that period from 105 in 2000, to 32 in 2010. The number of sportfishing licenses issued to residents has steadily increased, from 16,969 licenses in 2000 to 18,729 licenses in 2010. The number of sportfishing licenses sold in the community has increased as well, with 25,854 licenses sold in 2010 compared to 9,589 in 2000 (Table 11). Fairbanks is located within Alaska Sport Fishing Survey Area U – Tanana River drainage. This area includes the entire Tanana River watershed. Information is available about freshwater sportfishing activity only at this regional scale. In 2010, there were a total of 96,859 freshwater angler days fished, compared to 121,763 in 2000. In that year, non-Alaska residents accounted for 9.3% of total angler-days fished, compared to 10.4% in 2000.

According to ADF&G Harvest Survey data, local private anglers target all five species of Pacific salmon, landlocked salmon, rainbow trout, Dolly Varden, cutthroat trout, whitefish, burbot, Arctic grayling, northern pike, sheefish, Pacific halibut, rockfish, lingcod, Pacific cod, shark, smelt, steelhead trout, “other” finfish, Dungeness crab, Tanner crab, razor clams, hardshell clams, and shrimp.¹⁶⁶ No kept/released charter logbook data are available for Fairbanks. In a survey conducted by the AFSC in 2011, community leaders reported that local recreational fishing effort is done by charter boat, private boat, or by shore. Both residents and non-Alaska residents participate in recreational fisheries. Typically, Chinook salmon are the most popular species targeted. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Evidence of historic use of the Tanana River was documented by early Euro-American explorers. The subsistence fishery was essentially unrestricted until a regulatory system was put into place in 1964. In the beginning, permits were issued on an individual basis with no harvest limits or eligibility criteria. In 1971, the first harvest limits for salmon were imposed. These limits were 25 Chinook and 200 “other salmon” per person. Since then, restrictions on numbers of fish and fishing periods have been increased.¹⁶⁷

Many Fairbanks area residents participate in personal use fisheries on the Tanana River. In a 1980 ADF&G survey of Tanana River fishermen, 76.9% of respondents indicated that they lived in the greater Fairbanks area. Of those surveyed that year, 58.5% reported that subsistence harvest activities account for “half” or “some” of their annual meat consumption. Only 7.8% reported that subsistence activities account for “all” of their annual meat consumption.¹⁶⁸

In 2008, the city issued 3,077 subsistence salmon permits, which had grown slightly from 2,560 permits in 2000. Based on the subsistence salmon permits that were returned to ADF&G in 2008, sockeye salmon appeared to be by far the most common salmon species harvested for subsistence, with an estimated total of 35,765 harvested in 2008. Fairbanks residents also

¹⁶⁷ Caulfield, R. A. 1981. *Final Report of the Survey of Permit holders in the Tanana River Subsistence Salmon Permit Fishery*. Retrieved July 12, 2012 from: <http://www.subsistence.adfg.state.ak.us/TechPap/tp014.pdf>.

¹⁶⁸ Caulfield, R. A. 1980. *Interim Report on the Survey of Permit holders in the Tanana Subsistence Permit Fishery*. Retrieved July 12, 2012 from: <http://www.arlis.org/docs/vol1/10883183.pdf>.

reported subsistence harvests of Chinook, chum and coho salmon. Pink salmon were estimated to be the least harvested salmon for subsistence, with 41 harvested in 2008 (Table 13).

Residents of Fairbanks also rely on the use Subsistence Halibut Registration Certificates (SHARC) for subsistence harvest of halibut. In 2010, 7 SHARC were issued and an estimated 140 lb of halibut was harvested using one SHARC, compared to an estimated 567 lb harvested using 4 SHARC in 2004. In terms of marine mammal harvests, a total estimate of nine sea otters were harvested by residents in 2006 and 2007. In addition, an estimated three walrus were harvested by residents in 2000; however, no reports of walrus harvests in subsequent years are available. No information is available about harvests of other marine mammal species. Further information regarding subsistence trends can be found in Tables 12 through 15.

Fort Yukon

People and Place

*Location*¹⁶⁹

Fort Yukon is located at the confluence of the Yukon and Porcupine Rivers, about 145 air miles northeast of Fairbanks. Fort Yukon is located in the Yukon-Koyukuk Census Area and the Fairbanks Recording District. The area encompasses 7.0 square miles of land and 0.4 square miles of water.

*Demographic Profile*¹⁷⁰

In 2010, there were 583 residents in Fort Yukon, ranking it the 102nd largest community in Alaska. Overall, between 1990 and 2010, the population has increased by 0.52%. However, between 2000 and 2009, the population declined by 1.7% with an average annual growth rate of -0.02%, which was below the statewide average of 0.75% and indicative of an almost flat population trend. Information regarding population trends can be found in Table 1.

The majority of Fort Yukon residents are Gwich'in Athabascan. In 2010, the majority (89.2%) of Fort Yukon residents identified themselves as American Indian or Alaskan Native, compared to 86.0% in 2000. Also in that year, 7.7% of residents identified themselves as White, compared to 11.0% in 2000; 0.5% identified themselves as Native Hawaiian and Other Pacific Islander, compared to 0.0% in 2000; 0.5% identified themselves as Black or African American, compared to 0.0% in 2000; 0.2% identified themselves as Asian, compared to 0.0% in 2000; 1.7% identified themselves as two or more races, compared to 3.0% in 2000; and 0.2% identified themselves as some other race, compared to 0.0% in 2000. In addition, 0.3% identified themselves as Hispanic or Latino, compared to 1.0% in 2000. As noted in Figure 1, even the most significant changes (increase in the Native population and decrease in the White population) are relatively minor overall. Further changes in racial and ethnic composition from 2000 to 2010 are shown in Figures 1.

In 2010, the average household size was 2.4, a slight decline from 2.8 in 1990 and 2.6 in 2000. There has been an increase of occupied households, from 205 in 1990 to 225 in 2000 to and 246. Of those occupied households surveyed in 2010, 72.7% were owner-occupied and of the 325 housing units reported in Fort Yukon, 24.3% were considered vacant. There were five residents living in group quarters in 2000, compared to two in 2010.

Figure 1. Racial and Ethnic Composition, Fort Yukon: 2000-2010 (U.S. Census).

In 2010, the gender makeup was 55.7% male and 44.2% female, and somewhat similar to the gender makeup of the state as a whole (52% male, 48% female; see Figure 2). In 2000, the gender makeup was 52.9% male and 47.1% female. The median age in 2010 was 33.7 years, which is slightly lower than both the U.S. national average of 36.8 years and the statewide average of 33.8 years.

The overall population structure of Fort Yukon in 2000 and 2010 is shown in Figure 1. In 2010, there was a relatively even spread of males and females across each age category, though the 10 to 19 and 50 to 59 age groups show the greatest difference in the spread of males and females. For example, in 2010, the 10 to 19 age group was 10.1% males and 6.5% females, and the 50 to 59 age group was 8.8% males and 5.7% females. This represents a significant change from the population structure in 2000, when there were a significantly disproportionate percentage of males in the population than females in the 0 to 9, 10 to 19, and 40 to 49 age categories. In addition, in 2000, there were relatively few residents in the male 50 to 59 age range (0.6%), whereas in 2010, 8.8% of the males were in this age category.

Figure 2. Population Age Structure in Fort Yukon Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)¹⁷¹ estimated that 71% of residents aged 25 and over held a high school diploma or higher degree in 2010, slightly less than the 91% of Alaskan residents overall that held a high school diploma or higher degree. Also in 2010, 13% of the population had less than a 9th grade education, compared to 4% of Alaskan residents overall; 16% had a 9th to 12th grade education but no diploma, compared to 6% of Alaskan residents overall; 31% had some college but no degree, compared to 28% of Alaskan residents overall; 5% earned an Associate's degree, compared to 8% of Alaskan residents overall; 2% earned a Bachelor's degree, compared to 17% of Alaskan residents overall; and 2% earned a graduate or professional degree, compared to 10% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

The indigenous peoples of the territory surrounding Fort Yukon are primarily descendants of the Yukon Flats, Chandalar River, Birch Creek, Black River, and Porcupine River Gwich'in Athabascan tribes. Originally known as *Gwicyaa Zhee* or "house on the flats", the modern community of Fort Yukon took shape around a Hudson Bay Company outpost in Russian territory built by Alexander Murray in 1847. The Fort became an important trade center for the Gwich'in Indians, who inhabited the vast lowlands of the Yukon Flats and River valleys. By 1862, a mission school had been established.¹⁷²

Following the 1867 purchase of Alaska by the United States, in 1869 an American trapper named Moses Mercer with the Alaska Commercial Company took over operation of Fort Yukon from the Hudson Bay Company. American missionaries and trappers passed through Fort Yukon in the early years of American ownership, and the gold rush brought prospectors in the 1870s. In addition, some local economic activity was generated by the fur trade of the 1800s and whaling off the Arctic coast in the late 1800s and early 1900s. A post office was established in 1898. The Native population of the community was also impacted by major disease epidemics during this period. The first hospital was constructed in 1914 by the Episcopal Church, and the first plane landed in Fort Yukon in 1921. Much of the original settlement was destroyed in a large flood in 1949, and many residents and community buildings were moved to a new site on higher ground, east of the original town site. The U.S. Air Force built an aircraft control and warning site in Fort Yukon in 1955. Today, most residents of Fort Yukon are Gwich'in Indians.¹⁷³ Subsistence harvest activities are important to the local culture.¹⁷⁴

¹⁷¹ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Natural Resources and Environment

Fort Yukon lies above a large geologic basin, the Yukon Basin. Winters are long and harsh, and the summers short but warm. After freeze-up of the Yukon River, the plateau is a source of cold, continental arctic air. Daily minimum temperatures between November and March are usually below 0 °F, and extended periods of -50 to -60 °F are common. Summer high temperatures range from 65 to 72 °F, and a high of 97 °F has been recorded. Total annual precipitation averages 6.6 inches, with 43.4 inches of snowfall. The Yukon River is ice-free from the end of May through mid-September.¹⁷⁵

Fort Yukon is located in the Yukon Flats, a 13,700-square-mile area of wetlands, forest, bog, and low-lying ground centered on the confluence of the Yukon River, Porcupine River, and Chandalar River in central Alaska. The area is characterized by meandering river channels, oxbow lakes, sloughs, alluvial fans, thaw lakes, sink holes, and sand dunes. Permafrost is present in the region, although discontinuous; the Yukon Flats region is a boundary zone between continuous permafrost to the north and areas of discontinuous permafrost to the south. The Yukon Flats lowland is bounded on the south by the Yukon-Tanana Upland Plateau, on the east by the Porcupine Plateau, on the north by the southern foothills of the Brooks Range, and on the northwest by the Hodzana Highland.¹⁷⁶

Small deposits of gold were discovered between Fort Yukon and Fort Selkirk in the 1870s.¹⁷⁷ However, according to the Alaska Department of Natural Resources and Division of Geological and Geophysical Surveys, there are no significant mineral deposits or mining activity in the Fort Yukon area.^{178,179}

According to the Alaska Department of Environmental Conservation (DEC), no notable environmental remediation sites were active in Fort Yukon as of 2012.¹⁸⁰ However, it is important to note that the U.S. Air Force Long Range Radar site in Fort Yukon was the focus of a remedial investigation in the early 1990s because of concern over contaminated groundwater and soil at the site. A human health assessment concluded that the level of toxins at the site posed no public health risk and the DEC determined no further action at the site was required.¹⁸¹

Current Economy 182

City, state, and federal agencies and the Native corporation are the primary employers in Fort Yukon. Specifically, the top employers in 2010¹⁸³ included Yukon Flats School District, Council of Athabascan Tribal Governments, Native Village of Fort Yukon, City of Fort Yukon

¹⁸³ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved June 15, 2012 from <http://live.laborstats.alaska.gov/alari/>.

Public Health Facility, City of Fort Yukon, Alaska Commercial Company, Tanana Chiefs Conference, Cruz Construction Inc., Gwandak Public Broadcasting Inc., and the Gwitchyaa Zhee Native Corporation. The school district is the largest employer. Winter tourism is becoming increasingly popular. The Bureau of Land Management (BLM) operates an emergency firefighting base at the airport and the U.S. Air Force operates a White Alice Communications System in Fort Yukon. Trapping and Native handicrafts also provide income. Residents rely on subsistence foods – salmon, whitefish, moose, bear, caribou, and waterfowl provide most meat sources.

The 2006-2010 American Community Survey (ACS)¹⁸⁴ estimated 212 residents as employed in that time period. An estimated 68.0% of residents aged 16 years and over were part of the civilian labor force in 2010. In that year, unemployment was estimated at 14.6%, compared to 5.9% statewide; and an estimated 20.6% of residents were living below the poverty line, compared to an estimated 9.5% of Alaskan residents overall. Of those employed in 2010, an estimated 28.8% worked in the private sector and an estimated 71.2% worked in the public sector.

In 2010, the estimated per capita income was \$15,350 and the estimated median household income was \$37,083, compared to \$13,360 and \$29,375 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,¹⁸⁵ the real per capita income (\$17,568) and real median household income (\$38,628) indicate that both individual earnings and household earnings increased slightly. In 2010, Fort Yukon ranked 165th of 305 communities from which per capita income was estimated, and 243rd of 299 communities from which median household income was estimated.

Fort Yukon's small population size may have prevented the ACS from accurately portraying economic conditions.¹⁸⁶ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development.¹⁸⁷ According to the ALARI database, residents earned \$6.96 million in total wages in 2010.¹⁸⁸ When paired with the 2010 Decennial Census population, the per capita income is \$11,943, which was significantly less than the 2010 ACS estimate and suggests that caution is warranted when citing an increase in per capita income in Fort Yukon based on ACS data.

Fort Yukon's economy was relatively diverse in 2010. By industry, most (33.5%) employed residents were estimated to work in public administration sectors; followed by education services, health care, and social assistance sectors (26.9%); and construction sectors (10.8%) (Figure 3). Compared with 2000, significant proportional increases occurred in construction, transportation, warehousing, and utilities sectors. However, there was a significant

¹⁸⁴ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹⁸⁵ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹⁸⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁸⁷ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

¹⁸⁸ See footnote 183.

drop in the percentage of the workforce estimated to be employed in agriculture, forestry, fishing, hunting, and mining sectors from 4.2% in 2000, to an estimated 0.0% in 2010.

By occupation type, most (35.4%) employed residents were estimated to hold management or professional positions in 2010; followed by natural resources, construction, or maintenance positions (29.2%); sales or office positions (14.2%); service positions (13.7%); and production, transportation, and material moving positions (7.5%) (Figure 4). Compared to 2000, significant proportional decreases occurred in sales and office occupations, and significant proportional increases occurred in natural resource, construction, and maintenance occupations. According to ALARI estimates, in 2010, residents were mostly employed as construction workers (20.3%), laborers and freight, stock, and material movers (17.8%), and teachers (14.5%).¹⁸⁹

Governance

Fort Yukon is a 2nd Class City governed by a manager, or “Strong Mayor”, form of government. There are seven city council members including the Mayor, seven school board members, and five municipal employees. The City administers a 3% sales tax. It was incorporated in 1959 and is not located in an organized borough.¹⁹⁰ The total municipal revenue increased over the decade, from \$1.8 million in 2000 to \$2.6 million in 2010. In addition to sales tax revenues, other locally-generated income sources in Fort Yukon during the 2000-2010 period included charges for city services such as water and sewer, construction, and the liquor store, rental revenue, gaming proceeds, and investment earnings. Outside revenue sources included various sources of shared revenue from the State of Alaska as well as state and federal grants. Shared revenue programs State Revenue Sharing (2000-2003) and Community Revenue Sharing (2010 and 2009). Although sizeable intergovernmental grant funding was received in Fort Yukon each year, none were reported to be fisheries-related. See Table 2 below for more details on selected revenue streams for Fort Yukon from 2000 to 2010.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Fort Yukon from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵

Fort Yukon was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Gwichyaa Zhee Gwitch'in Tribe (formerly known as the Gwichyaa Zhee Gwitch'in Tribe).¹⁹¹ The local village Native corporation is Gwichyaa Zhee Corporation, which manages 214,479 acres of land. The regional Native corporation to which Fort Yukon belongs is Doyon, Limited. In addition, offices of the Canyon Village Traditional Council and the Council of Athabascan Tribal Governments, Incorporated are located in Fort Yukon. The Canyon Village Traditional Council was included under ANCSA, but has not yet received a land conveyance.¹⁹²

The Gwichyaa Zhee Gwitch'in Tribe and Canyon Village Traditional Council are both members of the Tanana Chiefs Conference, a tribal 501(c)(3) non-profit organization headquartered in Fairbanks. It is a consortium of 42 villages of Interior Alaska that works to meet “the health and social service challenges for more than 10,000 Alaska Natives spread across a region of 235,000 square miles in Interior Alaska.” The non-profit provides health and tribal development services, as well as educational and employment services to individuals of member tribes.¹⁹³ The Tanana Chiefs Conference is one of the 12 regional Alaska Native non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.¹⁹⁴ In addition, Both Gwichyaa Zhee and Canyon Village Tribal Councils are members of the Council of Athabascan Tribal Governments (CATG), a grassroots organization founded in 1985 to promote tribal self-governance. CATG provides health and education services to communities, and its Natural Resources Department manages “self-governance Annual Funding Agreements” with the U.S. Fish and Wildlife Service and U.S. Bureau of Land Management.¹⁹⁵

The closest offices of the Alaska Department of Natural Resources, Alaska Department of Fish and Game (ADF&G), Alaska Department of Commerce, Community, and Economic Development, and U.S. Bureau of Citizenship and Immigration Services are located in Fairbanks. Anchorage hosts the nearest office of the National Marine Fisheries Service (NMFS).

Infrastructure

Connectivity and Transportation

Fort Yukon is accessible by air year-round and by barge on the Yukon and Porcupine Rivers during the summer months. Heavy cargo is brought in by barge from the end of May through mid-September. There is a barge off-loading area but no dock. Riverboats and skiffs are used for recreation, hunting, fishing, and other subsistence activities. A state-owned 5,810 foot

long by 150 foot wide lighted gravel airstrip is available.¹⁹⁶ As of June 2012, roundtrip airfare from Anchorage to Fort Yukon costs \$599.¹⁹⁷ Hospital Lake, adjacent to the airport, is used by floatplanes. There are 17 miles of local roads and over 100 automobiles and trucks. The city transit bus system provides transport throughout the town. Snowmobiles and dog sleds are used on area trails or the frozen river, which becomes an ice road to nearby villages during winter.¹⁹⁸

Facilities

Electricity in Fort Yukon is provided by Gwitchyaa Zhee Utilities, which is operated by the Village corporation. Water is derived from two wells and is treated and stored in a 110,000-gallon tank. A combination of piped water, water delivery, and individual wells serve households. A flush/haul system, septic tanks, honey buckets, and outhouses are used for sewage disposal. Approximately half of all homes are plumbed. The piped water system and household septic tanks were installed in 1984. The Bureau of Land Management (BLM) operates an emergency firefighting base at the airport and the U.S. Air Force operates a White Alice Communications System in Fort Yukon. The City also has a youth center and a community center gym. In addition, a tribal council hall is under construction. The City maintains its own police force, fire department, and has an Emergency Medical Services (EMS) and Rescue Squad.¹⁹⁹

Medical Services

Medical services in Fort Yukon include the Fort Yukon Public Health Office and the Yukon Flats Health Center, both of which are operated by the Council of Athabascan Tribal Governments. The Yukon Flats Health Center is a qualified emergency care center. As an isolated town/sub-regional center, Fort Yukon is part of the Interior Emergency Medical Services Region. Emergency Services include river and air access and are within 30 minutes of a higher-level satellite health care facility. Emergency service is provided by 911 telephone service volunteers and a health aide. The nearest hospital is located in Fairbanks.

Educational Opportunities

The city of Fort Yukon has one school, which offers a pre-school through 12th grade education. As of 2011, the Fort Yukon School had 117 students and 14 teachers. In that same year, the Yukon Flats School District had a total of 7 schools, 31 teachers, and 264 students. The student/teacher ratio was 9.6, and 95% of students were Alaska Native.²⁰⁰

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Fishing in Fort Yukon is shaped by a deep history of salmon fishing along the Yukon River. Historically, salmon was harvested for subsistence purposes by indigenous people living along the Yukon and Tanana Rivers, as well as for food for sled dogs. The first recorded commercial harvest of salmon in the Yukon River fishery took place in 1918, and early harvests were relatively large. Concerns about providing sufficient salmon resources for subsistence harvest led to limitations on commercial salmon fishing during several periods, including a complete commercial fishing closure between 1925 and 1931. In the 1980s, concerns about possible overharvest of Chinook runs led to reduced commercial fisheries in the late 1980s and 1990s along the Yukon River. Poor returns in the late 1990s and early 2000s resulted in restrictive management of the commercial fishery and complete closure in 2001 to ensure subsistence resources.²⁰¹ Yukon River Chinook runs showed signs of improvement for several years following the 2001 commercial closure, but low returns required restricted commercial harvest in 2008 and complete closure of Chinook harvest in 2009. A fishery disaster was declared that year.²⁰² A fishery disaster was again declared for the 2012 season, when the commercial Chinook salmon fishery was closed and subsistence fishery was significantly restricted. ADF&G, the Alaska Board of Fisheries, and constituents are working together to develop a conservation plan that restricts Chinook harvest while allowing for greater harvest of more abundance species, including gear and other management restrictions.²⁰³

Like Yukon Chinook salmon runs, chum salmon runs have seen poor returns since 1998. A relatively strong run in 2007 led to some effort to redevelop the Yukon chum fishery, but this process is challenged by the need to reduce incidental harvest of co-migrating Chinook salmon. Further, beginning in 2008, the fall chum salmon run has not been large enough to provide for commercial opportunity. From 2008 to 2010, management actions have been taken to delay commercial fishing to provide for escapement and subsistence use.²⁰⁴

In years when commercial salmon fishing is open, fishing is allowed along the entire 1,200 miles of the main stem of the Yukon River, as well as 225 miles of the Tanana River. There are 7 fishing districts, 10 subdistricts, and 28 statistical areas. Fort Yukon is located in the Upper Yukon Area of the Yukon Salmon Fishery, in Subdistrict 5d. Chinook, chum, and coho are the three species of salmon that have significant runs far into Interior Alaska and Canada. Fishing in the Upper Yukon Area takes place using drift gillnets and fish weirs.²⁰⁵ Participation

²⁰⁵ See footnote 201.

rates by commercial fishermen on the middle and upper Yukon River have been much lower and more variable than on the lower Yukon River.²⁰⁶

The history and present involvement of Fort Yukon in commercial fishing is minimal, yet residents do engage in recreational and subsistence fishing. For example, in 2010, residents held a total of 176 sportfishing licenses and many residents were engaged in subsistence fishing, with salmon species being the most targeted for subsistence fishing, with 174 subsistence salmon permits issued in 2007 (see the *Recreational Fishing* and *Subsistence Fishing* sections of this profile). In 2010, one commercial salmon permit was issued, with one permit holder (see the *Commercial Fishing* section). In short, Fort Yukon is proof that communities of Alaska's interior rely on fishing, especially salmon resources, to thrive, even if their engagement in the commercial fishing sector is minimal.

Given that Fort Yukon is more than 400 miles from the coast, no federal fisheries regulatory areas are located within the immediate vicinity. Fort Yukon is not eligible for the Community Quota Entity program or the Community Development Quota program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Fort Yukon does not have a registered shore-side processing plant. The nearest processing plant is in Fairbanks.

Fisheries-Related Revenue

Based on the best available data and reporting system, Fort Yukon yielded no fisheries-related revenue between 2000 and 2010 (Table 3).

Commercial Fishing

While commercial salmon fishing is allowed along the entire 1,200-mile length of the mainstem Yukon River, Fort Yukon's involvement in commercial fishing is minimal. Between 2000 and 2010, one resident held one Upper Yukon salmon permit issued by the Commercial Fisheries Entry Commission (CFEC). However, that permit was not actively fished during those years. No residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits between 2000 and 2010. In addition, no residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab between 2000 and 2010. No commercial landings were reported in Fort Yukon between 2000 and 2010, nor did any residents of Fort Yukon report any commercial landings during this time period. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Between 2000 and 2010, there were no active sport fish guide businesses or licensed sport fish guides present in Fort Yukon. However, a large number of Fort Yukon residents participated in sportfishing activities during this period. In 2010, a total of 176 Fort Yukon residents were issued sportfishing licenses (irrespective of point of sale), which represents approximately 30% of the population in that year. In most years between 2000 and 2010, fewer sportfishing licenses were sold in Fort Yukon than were issued to Fort Yukon residents, suggesting that some local residents travel elsewhere to undertake recreational fishing activities. Between 2000 and 2010, the number of sportfishing permits issued to Fort Yukon residents has ranged from 21 to 176, and the number of sportfishing licenses sold in the community during this same ranged from 0 to 155.

Fort Yukon is located within the Yukon River Drainage Alaska Sport Fishing Survey Area. Saltwater fishing in the region was minimal. There were no saltwater angler days fished reported in this survey area between 2004 and 2010. Between 2000 and 2004, the number of saltwater angler days fished by non-Alaska residents decreased from 81 in 2000 to 17 in 2004, but was minimal nonetheless. The number of saltwater angler days fished by Alaska residents was also minimal and was highly variable between 2000 and 2003, and there were no saltwater angler days fished by Alaska residents between 2004 and 2010. Freshwater fishing in the region was much more significant. Between 2000 and 2010, freshwater angler days fished varied considerably for both Alaska residents and non-Alaska residents. Alaska residents fished consistently more angler days in freshwater in this region between 2000 and 2010, averaging 7,355 angler days fished per year compared to an average of 3,861 angler days fished by non-Alaska residents. Further information about the sportfishing sector in and near Fort Yukon is presented in Table 11.

Subsistence Fishing

Subsistence fishing by residents of Fort Yukon is heavily focused on salmon on the Yukon River, and non-salmon fish also play an important role. Summer salmon subsistence activities are usually in full swing by June and early July as Chinook salmon begin to arrive and are harvested using set gill nets and fish wheels. The Chinook salmon run is followed by the chum salmon in mid-August. Northern pike and Arctic grayling are harvested with rod and reel, while sheefish are harvested in nets along with salmon. Fish wheels are used mainly in the late summer and fall for the late chum run, whereas nets are preferred for Chinook salmon. Freshwater fish species continue to be harvested throughout the winter. Along with the species noted above, common freshwater fish species utilized by Fort Yukon residents include several species of whitefish, cisco, burbot, and longnose sucker.²⁰⁷

Limited information is available from ADF&G regarding the participation of Fort Yukon households in subsistence harvest: 29% of households were estimated to participate in subsistence harvest of non-salmon fish in 2005, but no estimates were available regarding other

²⁰⁷ Sumida, V. A., and D. B. Anderson,. (1990). *Patterns of Fish and Wildlife Harvest for Subsistence in Fort Yukon, Alaska*. Alaska Dept. of Fish and Game Technical Paper No. 179. Retrieved November 1, 2012 from <http://www.arlis.org/docs/vol1/A/31109074.pdf>.

subsistence resources (Table 12). However, detailed information is available regarding subsistence harvest of salmon. Between 2000 and 2008, the number of subsistence salmon permits issued to Fort Yukon households ranged from 151 to 174. In 2008, the year for which the most recent data were available, Fort Yukon residents were estimated to have harvested 1,991 Chinook salmon, 14,482 chum salmon, 1,618 coho salmon, and 196 pink salmon, compared to 2000 when 976 Chinook salmon, 331 chum salmon, 120 coho salmon, and four sockeye salmon were harvested (Table 13).

According to ADF&G *Community Subsistence Information System* (CSIS) data, Fort Yukon residents have historically harvested or used non-salmon fish species including burbot, cisco, Dolly Varden, Arctic grayling, whitefish, trout, lamprey, northern pike, sheefish, and longnose sucker. The only official documentation of harvests of these species between 2000 and 2010, however, was in 2005, when harvest of almost 16,000 lbs of non-salmon fish was reported (Table 13).

No data were reported by management agencies regarding subsistence harvest of halibut (Table 14) or marine mammal species (Table 15) during the 2000-2010 period.

Additional Information

Fort Yukon is situated 8 miles north of the Arctic Circle, and is home to the largest Athabascan Village in the Interior. Many Native residents belong to the Gwich'in Indian Tribe. Fort Yukon rests on the most northern point of the Yukon River and visitors can find air services and tours to the Arctic Circle.

Galena (guh-LEE-nuh)

People and Place

*Location*²⁰⁸

Galena is located on the north bank of the Yukon River, 45 miles east of Nulato and 270 air miles west of Fairbanks. It lies northeast of the Innoko National Wildlife Refuge. Galena is located in the Yukon-Koyukuk Census Area and the Nulato Recording District. The City encompasses 17.9 square miles of land and 6.1 square miles of water.

*Demographic Profile*²⁰⁹

In 2010, there were 470 residents in Galena, ranking it the 126th largest community in Alaska. Overall, between 1990 and 2000, the population has decreased by 43.6%. Between 2000 and 2009, the population decreased by 16.4% with an average annual growth rate of -2.36%, which was well under the statewide average of 0.75% growth. Information regarding population trends can be found in Table 1. In 2010, the majority of Galena residents identified themselves as American Indian and Alaska Native (63.6%), with 29.4% identifying themselves as White, 6.2% identifying themselves as of two or more races, 2.3% identified themselves as Hispanic or Latino, 0.6% identified themselves as Asian, and 0.2% identified themselves as of some other race. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Galena was 2.47. Also in 2010, there were a total of 190 occupied housing units, a slight decrease compared to 216 in 2000. Of those households surveyed in 2010, 51.1% were owner-occupied and 20.8% were renter-occupied. In that same year, 28.0% were vacant, compared to 16.6% in 2000. There were no residents living in group quarters in 2010, compared to 63 in 2000.

In 2010, the gender makeup in Galena was 51.2% male and 48.7% female, very similar to the state as a whole (52% male, 48% female). The median age was estimated to be 36.8 years, the same as the U.S. national average of 36.8 years and higher than the median age for Alaska, 33.8 years. The overall population structure of Galena in 2000 and 2010 is shown in Figure 2. In 2010, there was a relatively even spread of males and females across each age category, though the 50 to 59 age groups show the greatest difference in the spread of males and females. For example, in 2010, the 50 to 59 age group was 5.5% males and 8.7% females. This represents a significant change from the population structure in 2000, when there were more males in the population than females in all age categories. In addition, the percentage of the population that was age 60 or older more than doubled between 2000 (6.4%) and 2010 (14.8%).

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)²¹⁰ estimated that 86.8% of Galena residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 5.3% of residents aged 25 and older were estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 7.9% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 25.7% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 3.9% were estimated to have an Associate's degree, compared to 8% of Alaska residents overall; 10.2% were estimated to have a Bachelor's degree, compared to 17.4% of Alaska residents overall; and 12.2% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*²¹¹

The Native peoples who have occupied the interior areas of Alaska have historically been the Athabaskan peoples whose prototype language was likely present in interior Alaska and the Yukon by at least 6000 B.C.²¹² The Koyukon Athabascans had spring, summer, fall, and winter camps throughout the Galena area as they followed wild game migrations. Twelve distinct summer fish camps have historically been situated on the Yukon River between the Koyukuk River and the Nowitna River. In 1918, Galena was established near an Athabaskan fish camp named Henry's Point. Lead ore mines were located nearby the community and Galena became a supply and trans-shipment point for the mines. Athabascans from the nearby community of Loudon, located 14 miles north, began moving to Galena in 1920 to work hauling freight for the mines or to sell wood. Many of Galena's current residents were originally from Loudon or are descendants of Loudon inhabitants.

In the mid-1920s a school was built in Galena, and a post office opened in 1932. In 1941-1942, during World War II, a military air field was built adjacent to the civilian airport, and the two facilities shared the runway and flight line facilities. This air field was designated Galena Air Force Station shortly after the split of the U. S. Air Force from the U. S. Army, which occurred as a result of the National Security Act of 1947. During the 1950s, the construction of additional military facilities at Galena and the nearby Campion Air Force Station, in support of Galena's mission as a forward operating base under the auspices of the 5072nd Air Base Group, headquartered at Elmendorf Air Force Base, near Anchorage, provided improvements to the airport and the local infrastructure, causing economic growth for the area.

In 1971, the year Galena was incorporated, another severe flood occurred which caused the community to move to Alexander Lake, approximately 1.5 miles east of the original site. At "New Town," the name for the new location, a city government was formed and new houses, schools, and facilities were built. During the mid 1970s the City established the Alexander Lake Subdivision and sold lots to the public. By 1978, a number of homes, a new medical clinic and high school were constructed in the new subdivision.

In the 1980s, the City installed a piped water and sewer system, cable television became available, and the State began a major river bank erosion project. It was also during this time that the U.S. Fish and Wildlife Service located refuge management staff in the community.²¹³

In 1993, the Air Force Station in Galena closed and the former military facilities are currently used by the Galena School District as a boarding school. These facilities are maintained under contract by Chugach Development Corporation.

Today, Galena's population is mixed Athabaskan and other non-Native Alaskan. Traditional festivals attract visitors from other river villages.

Natural Resources and Environment

The community of Galena is located on the north bank of the Yukon River in an area known as the Koyukuk flats region, an extensive lowland covering about 4,000 square miles at the conflux of the Yukon and Koyukuk Rivers. One characteristic of these lowlands is the numerous thaw lakes, or lakes formed by water that melts on top of permafrost, and dry lakes. The dry lakes are well drained soils, without permafrost. The vegetation of the region is, for the most part, a typical boreal forest, which includes black spruce bogs that have poorly drained soils, low brush bog comprised of tamarack, rose, grasses, sedges, rushes, fireweed, berries, mosses, and lichens, and stands of cottonwood and white spruce. This diversity has resulted in intermittent permafrost.²¹⁴

The Northern Unit of the Innoko National Wildlife Refuge (NWR; known locally as the Kaiyuh Flats) encompasses 750,800 acres. Located south of the Yukon River, its northeastern boundary is directly across the river from Galena. Established by the Alaska National Interest Lands Conservation Act in 1980, the Innoko NWR is meant to conserve fish and wildlife populations and habitats in their natural diversity including, but not limited to, waterfowl, peregrine falcons, other migratory birds, black bear, moose, furbearers, and other mammals and salmon.²¹⁵ Galena is also headquarters for the Koyukuk NWR, which was also established in 1980. The Koyukuk NWR is home to a wide variety of birds, mammals and fish of the boreal forest. Thousands of waterfowl, primarily wigeon, pintail, scaup, white-fronted geese and Canada geese are joined by both trumpeter and tundra swan on the Koyukuk's lush breeding grounds each spring. Streams and lakes in the Koyukuk NWR also sustain large fish populations that support subsistence, commercial and sport fisheries. Chinook, coho and chum salmon migrate up the waters of the Yukon River and its tributaries, including the Koyukuk River. Resident fish, such as the predatory northern pike, spend their entire lives in refuge waters. The Koyukuk NWR's mosaic of forests, woodlands, tundra and grasslands are home to many northern mammals, from majestic moose to tiny shrews and voles. More than 140 bird species, 30 mammal species, and 14 fish species occur within the Koyukuk NWR.²¹⁶

Lead and gold mining has played a significant role in Galena's social and environmental history. In fact, some residents of Galena worked at the Illinois Creek gold mine, which opened in 1997 and is 50 miles southwest of Galena, until it closed in 2005. According to the Alaska Department of Natural Resources and Division of Geological and Geophysical Surveys, there are no mineral deposits currently being mined in Galena.²¹⁷

The area around Galena experiences a cold, continental climate with extreme temperature differences. The average daily high temperature during July is in the low 70s; the average daily low temperature during January ranges from 10 to below 0 °F. Sustained temperatures of -40 °F are common during winter. Extreme temperatures have been measured from -64 to 92 °F. Annual precipitation averages 12.7 inches, with 60 inches of snowfall. The Yukon River is ice-free from

mid-May through mid-October. Erosion and flooding have long been environmental risks present in the community of Galena.²¹⁸

According to the Alaska Department of Environmental Conservation, there were no notable environmental remediation sites active in 2010.²¹⁹

Current Economy²²⁰

Galena serves as the transportation, government, and commercial center for the western Interior. Federal, state, city, school, and village government jobs dominate, but Galena has many other jobs in air transportation and retail businesses. In 2010, 12 residents held commercial fishing permits. Other seasonal employment, such as construction work and Bureau of Land Management firefighting, provide some income.

The 2006-2010 American Community Survey (ACS)²²¹ estimated that 258 residents were employed in 2010, with 72.1% of residents aged 16 years in civilian labor force in 2010. In that year, unemployment was estimated at 5.1%, compared to 5.9% statewide; and an estimated 11.2% of residents were living below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed in 2010, an estimated 64.0% worked in the private sector and an estimated 19.0% worked in the public sector and 0.0% of residents were self-employed.

In 2010, the estimated per capita income was \$25,994 and the estimated median household income was \$56,250, compared to \$22,143 and \$61,125 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,²²² the real per capita income (\$29,118) and real median household income (\$80,379) indicate that both individual earnings and household earnings increased. In 2010, Galena ranked 96th of 305 communities for which per capita income was estimated, and 94th of 299 communities for which median household income was estimated.

However, Galena's small population size may have prevented the ACS from accurately portraying economic conditions.²²³ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development.²²⁴

²²⁰ Unless otherwise noted, all monetary data are reported in nominal values.

²²¹ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²²² Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²²³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²²⁴ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

According to the ALARI database, residents earned \$8,992,335 million in total wages in 2010.²²⁵ When paired with the 2010 Decennial Census population, the per capita income is \$15,424 which was significantly less than the 2006-2010 ACS estimate and suggests that caution should be used when using ACS data.

Based on the 2006-2010 American Community Survey, by industry, most (48.4%) employed residents were estimated to work in education services, health care, and social assistance sectors; followed by public administration sectors (20.9) and transportation, warehousing and utility sectors (15.5%) (Figure 3). Compared with 2000, significant proportional increases occurred in finance, insurance, and real estate sectors, public administration sectors, construction, transportation, warehousing, and utilities sectors, and education services, health care, and social assistance sectors. However, there was a significant drop in the percentage of those estimated to be employed in arts, entertainment, recreation, accommodation, and food service sectors from 8.7% in 2000, to an estimated 0.0% in 2010.

By occupation type, most (39.5%) employed residents were estimated to hold management or professional positions in 2010; followed by sales or office positions (22.1%); service positions (15.9%); production, transportation, and material moving positions (15.1%); and natural resources, construction, or maintenance positions (7.4%). Compared to 2000, significant proportional decreases occurred in natural resources, construction, or maintenance positions, and significant proportional increases occurred in production, transportation, and material moving positions. According to ALARI estimates, in 2010, trade workers, construction workers, and state government workers made up the majority of occupations.²²⁶

Governance

Galena is a 1st Class City and was incorporated in 1971. The City has a Manager form of government with a six-person city council including the Mayor, a five-person school board, and various municipal employees. Galena is not located within an organized borough. As of 2010, the City administered a 3% sales tax and did not levy a property tax.²²⁷ In addition to local tax revenues, locally-generated income sources in Galena between 2000 and 2010 included charges

²²⁷ Alaska Dept. of Comm. and Rural Affairs (n.d.). *Community Database Online*. Retrieved March 26, 2012 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

for city public utilities and other services, fines, investment income, and land sales. Outside revenue sources included various sources of shared revenue as well as state and federal grants. In the early half of the decade (2000-2003), the City received some revenue from the State Revenue Sharing program. The State Revenue Sharing program ceased in 2004 and was replaced in 2008 by the Community Revenue Sharing program. Other shared revenues came from the SAFE Communities program (utilities, infrastructure, public safety, etc.), federal Payment In Lieu of Taxes dollars, and state raw fish tax refund dollars in 2001 only (see the *Fisheries-Related Revenue* section). Municipal revenues were higher than average in 2002 as a result of over \$6 Million in capital project grant funding for projects including water and sewer upgrades, a swimming pool, shop, and utilidor, the Galena Health Center, and a regional Vocational Education Center. The City also received \$1.99 total fisheries-related grant funding in 2005, 2007, and 2009 to design and construct a barge dock. See Table 2 below for more details on selected municipal, state or federal revenue streams for Galena from 2000 to 2010.

Galena was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Galena Village, also known as Louden Tribal Council. The local village Native corporation is Gana-A’Yoo, which manages 115,200 acres of land. The regional Native corporation to which Galena belongs is Doyon, Limited.²²⁸

The Galena Village is a member of the Tanana Chiefs Conference, a tribal 501(c)(3) non-profit organization headquartered in Fairbanks. It is a consortium of 42 villages of Interior Alaska that works to meet “the health and social service challenges for more than 10,000 Alaska Natives spread across a region of 235,000 square miles in Interior Alaska.” The non-profit provides health and tribal development services, as well as educational and employment services to individuals of member tribes.²²⁹ The Tanana Chiefs Conference is one of the 12 regional Alaska Native non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.²³⁰

The closest office of the Alaska Department of Fish and Game (ADF&G) is located within the city of Galena. The nearest Bureau of Citizenship and Immigration Services office is located in either Anchorage or Nome. Anchorage is also home to the nearest National Marine Fisheries Service (NMFS) office.

Infrastructure

Connectivity and Transportation

Galena is reachable by air, water, and land. The community functions as a regional transport center for neighboring villages. A 7,254 foot paved and lighted runway, as well as a 2,786 foot gravel ski strip next to the main runway are present in the community. The state-owned Edward G. Pitka Sr. Airport provides the only year-round access.²³¹ As of June 2012, roundtrip airfare from Anchorage to Galena costs \$585.²³² Cargo barges are able to access the community on the river from mid-May through mid-October. A boat launch was recently completed. Locals use pickups, cars, snowmobiles, skiffs, and ATVs for transportation. The frozen rivers are used for travel during the winter to Ruby, Koyukuk, Kaltag, and Nulato. There is a winter trail to Huslia.²³³

Facilities

Electricity in Galena is provided by the City of Galena and water is derived from wells and is treated. Twenty-eight residences and the school are connected to a piped water and sewer system. One-hundred-ten households use a flush/haul system. Twenty households use honeybuckets, and others have individual septic tanks. Refuse collection and a landfill are provided by the City. The City began operating the landfill, located on the former Campion Air Force Station grounds, in 1997. There is a 200,000 gallon reservoir and a community leach field.

Medical Services

The primary medical clinic in Galena is the Edgar Nollner Health Center/Galena Public Health Office. The clinic is a qualified Emergency Care Center. X-Ray Laboratory Dental X-Ray and Dark Room are available. Galena is an isolated town/Sub-Regional Center it is found in the Interior Emergency Management Services Region. Emergency Services include limited highway river and airport access. Emergency service is provided by volunteers and a health aide. Telephone 911 service is available for response to fire only.²³⁴

*Educational Opportunities*²³⁵

As of 2012, the Galena City School district consisted of four schools, the Galena Interior Learning Academy (9th thru 12th grades, 183 students and 13 teachers), Interior Distance Education of Alaska (pre-school thru 12th grade, 3,626 students and 31 teachers), Sidney C. Huntington Elementary (pre-school thru 6th grade, 61 students and 8 teachers), and the Sidney C. Huntington Jr./Sr. High School (7th thru 12th grades, 50 students and 13 teachers).

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Galena's fishing history is tied to a deep history of salmon fishing along the Yukon River. Indigenous people living along the Yukon and Tanana Rivers have long harvested salmon for subsistence purposes. Salmon was used for personal subsistence as well as food for sled dogs. The first recorded commercial harvest of salmon in the Alaskan portion of the Yukon River took place in 1918, and early harvests were relatively large. Concerns about providing sufficient salmon resources for subsistence harvest led to limitations on commercial salmon fishing during several periods, including a complete commercial fishing closure between 1925 and 1931. In the 1980s, concerns about possible overharvest of Chinook runs led to reduced commercial fisheries in the late 1980s and 1990s along the Yukon. Poor returns in the late 1990s and early 2000s resulted in restrictive management of the commercial fishery and complete closure in 2001 to ensure subsistence resources.²³⁶ Yukon River Chinook runs showed signs of improvement for several years following the 2001 commercial closure, but low returns required restricted commercial harvest in 2008 and complete closure of Chinook harvest in 2009. A fishery disaster was declared that year.²³⁷ A fishery disaster was again declared for the 2012 season, when the commercial Chinook salmon fishery was closed and subsistence fishery was significantly restricted. ADF&G, the Alaska Board of Fisheries, and constituents are working together to develop a conservation plan that restricts Chinook harvest while allowing for greater harvest of more abundance species, including gear and other management restrictions.²³⁸

Like Yukon Chinook salmon runs, chum salmon runs have seen poor returns since 1998. A relatively strong run in 2007 led to some effort to redevelop the Yukon chum fishery, but this process is challenged by the need to reduce incidental harvest of co-migrating Chinook salmon. Further, beginning in 2008, the fall chum salmon run has not been large enough to provide for commercial opportunity. From 2008 to 2010, management actions have been taken to delay commercial fishing to provide for escapement and subsistence use.²³⁹

Some Yukon River communities have witnessed declining salmon runs and blame bycatch trends in the Bering Sea commercial fisheries. In 2008, the Yukon River Drainage Fisheries Association united key stakeholders in western Alaska to work through the North Pacific Fishery Management Council (NPFMC) toward the common goal of getting a hard cap put into place that would limit salmon bycatch in the Bering Sea/Aleutian Islands pollock fishery.²⁴⁰ For several years, the Bering Sea pollock industry has been working on developing a Chinook salmon excluder device for trawl gear, which allows salmon to escape from the trawl

²⁴⁰ Yukon River Drainage Fisheries Association (n.d.). *What we do: Accomplishments*. Retrieved August 10, 2012 from <http://www.yukonsalmon.org/whatwedo/accomplishments.htm>.

net underwater, while retaining pollock. The success of such devices relies on the different swimming behaviors of pollock and Chinook salmon. Through experimental fishery permits authorized by the NPFMC and NOAA Fisheries, various iterations have been tested, and their voluntary use by pollock skippers is increasing. Recently, the Gulf of Alaska (GOA) pollock industry has begun to consider how the Bering Sea Chinook salmon excluder might be adapted for the smaller GOA pollock fleet.²⁴¹

In years when commercial salmon fishing is open, fishing is allowed along the entire 1,200 miles of the main stem of the Yukon River, as well as 225 miles of the Tanana River. There are 7 fishing districts, 10 sub-districts and 28 statistical areas. Galena is located in the Upper Yukon Area of the Yukon salmon fishery, in District 4. Chinook, chum, and coho are the three species of salmon that have significant runs far into Interior Alaska and Canada. Fishing on the Upper Yukon takes place using drift gillnets and fish weirs.²⁴²

Galena is not eligible to participate in the Community Development Quota (CDQ) program or the Community Quota Entity (CQE) program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Galena does not have a registered shoreside processing plant. The nearest processing plant is in Unalakleet.

Fisheries-Related Revenue

Between 2000 and 2010, the only known fisheries-related revenue for the community of Galena was \$153 from Shared Fisheries Business Tax collections (Table 3).²⁴³

Commercial Fishing

Between 2000 and 2010, residents held a minimal number of permits issued by the Commercial Fisheries Entry Commission (CFEC). Of those permits issued, a majority were held in the Yukon River salmon fishery. In that time period, the number of salmon CFEC permit holders ranged from 25 to 31 and there was one herring CFEC permit holder each year between 2000 and 2010. Of the salmon CFEC permits issued in 2010, the majority were using fishwheels on the upper Yukon, with the remainder using gillnets on the upper Yukon and in Kotzebue. Of the herring CFEC permits issued in 2010, residents participated in gill net fishing in Norton Sounds. No residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits between 2000 and 2010. In addition, no CFEC permits were fished between 2000 and 2004, 2007, and 2009 to 2010. Also no residents held halibut, sablefish, or crab quota shares between 2000 and 2010 (Tables 6 to 8). Finally, between 2000 and 2010, no Galena residents made commercial landings, nor earned any ex-vessel revenue (Tables 9 and 10). All data on ex-vessel revenue earned by Galena residents between 2000 and 2004, as well as 2006, is confidential, so reporting trends for these time periods is not possible.

²⁴¹ North Pacific Fisheries Management Council (n.d.). *Salmon Bycatch*. Retrieved August 16, 2012 from <http://www.fakr.noaa.gov/npfmc/bycatch-controls/SalmonBycatch.html>.

²⁴² See footnote 236.

²⁴³ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Between 2000 and 2010, the number of vessels homeported has ranged from zero to five, with five in 2003, and zero in 2010. The number of vessels primarily owned by Galena residents has followed a similar trend, with five in 2003 and zero in 2010. Between 2000 and 2010 the number of crew license holders has ranged from zero to two. As of 2010, there are no fish buyers or shoreside processors in Galena. Since no fish buyers were located in Galena, there were no fish landed and no revenue earned (Table 5).

Table 3. Known Fisheries-Related Revenue (in U.S. Dollars) Received by the Community of Galena: 2000-2010.

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses were registered in Galena. Over the same period, the number of licensed sport fish guides present in the community declined from 10 to 2. The number of sportfishing licenses sold to Galena residents (irrespective of point of sale) varied from 117 to 208 per year. Only a small number of licenses was sold in the community of Galena (zero to seven sold per year), indicating that most Galena residents travel to other communities to prepare for sportfishing activity. This may also indicate that sportfishing does not draw a large number of visitors to Galena.

Galena is located within Alaska Sport Fishing Survey Area Y – Yukon River drainages. Information is available about freshwater sportfishing activity only at this regional scale and saltwater fishing in the region was minimal given the distance of most of the Survey Area from the Bering Sea. In fact, from 2005 to 2010 no saltwater angler days were reported fished by either Alaska resident or non-Alaska resident anglers. Freshwater fishing in the region was much more significant. During the 2000-2010 period, freshwater angler days fished varied considerably for both Alaska residents and non-Alaska residents. Alaska residents fished consistently more angler days in freshwater in this region than non-Alaska residents, averaging 7,355 angler days fished per year compared to an average of 3,861 angler days fished by non-Alaska residents. This information about the sportfishing sector in and near Galena is presented in Table 11.

Subsistence Fishing

Residents of Galena have been largely involved in subsistence salmon fisheries on the Yukon River. In addition to the salmon resource that is available during summer months,²⁴⁴ Galena residents have historically harvested or used non-salmon species including burbot, cisco, Dolly Varden char, Arctic grayling, whitefish, trout, lamprey, northern pike, sheefish, and sucker.²⁴⁵

Based on a household subsistence survey conducted by ADF&G, in 2010, 45% of Galena households were estimated to participate in salmon subsistence, along with 20% participating in halibut subsistence, 4% in marine invertebrate subsistence, and 52% in non-salmon fish (not including halibut) subsistence. No estimate was reported that year regarding participation in marine mammal subsistence. Additional estimates were available for 2006, when 6% of Galena households participated in halibut subsistence and 16% in non-salmon fish subsistence. In 2010, per capita subsistence harvest of land and sea-based resources by Galena residents was estimated

²⁴⁴ Alaska Department of Fish and Game (n.d.). *Yukon River Management: Fishing Information*. Retrieved August 8, 2010 from <http://www.adfg.alaska.gov/index.cfm?ADFG=ByAreaSubsistenceYukon.fishingInfo>.

²⁴⁵ Alaska Department of Fish and Game. 2011. *Community Subsistence Information System (CSIS)*. ADF&G Division of Subsistence. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sb/CSIS/> (Accessed February 2011).

to be over 1,000 pounds (Table 12). Total harvest estimates of marine invertebrates and non-salmon fish in 2010 were estimated be 208 pounds and 108,780 pounds, respectively. An estimate of total non-salmon fish harvest was also available for 2006, when Galena residents reported harvest of 110,216 pounds of non-salmon fish (Table 13). It is of note that much of the subsistence harvest of whitefish is often used for dog food. As with the community of Tanana, approximately 200 miles to the east of Galena, the patterns of non-salmon fish harvest and use appear to reflect the community's focus on harvesting large quantities of fish for dog food. Whitefish species usually make up the majority of these harvests, and that these harvests are not exclusively used to feed dogs, but also provide a food source for households.²⁴⁶

Details are also available from 2000-2008 regarding subsistence salmon permits. During this period, the number of households that were issued salmon permits declined from 217 to 186, while the total number of permits returned varied between 44 and 64 per year. The primary salmon species targeted by Galena residents for subsistence were Chinook, chum, and coho. Pink and sockeye salmon were also harvested in some years during the period in small quantities. The highest volume Chinook harvest occurred in 2004, and coho salmon harvests were greatest in 2003 and 2004. The highest volume chum harvests during the 2000-2010 period occurred in 2005 (Table 13).

No Subsistence Halibut Registration Certificates (SHARC) were issued to residents of Galena between 2003 and 2010 (Table 14). In addition, no data were available from management agencies regarding marine mammal harvest was (Table 15).

Grayling (GRAY-leeng)

People and Place

*Location*²⁴⁷

Grayling is located in Interior Alaska on the west bank of the Yukon River, east of the Nulato Hills. It is 18 air miles north of Anvik. Grayling is located in the Yukon-Koyukuk Census Area and the Kuskokwim Recording District. The area encompasses 10.9 square miles of land and 0.1 square miles of water.

*Demographic Profile*²⁴⁸

In 2010, there were 194 residents in Grayling, making it the 195th largest of 352 communities in Alaska with recorded populations that year. Between 1990 and 2000, the population decreased by 6.7%. According to Alaska Department of Labor estimates, the population continued to decline after 2000, with a low of 152 permanent residents recorded in 2008. However, the population appeared to increase again after 2008, returning to 2000 levels by 2010 (Table 1). According to a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that a small number of seasonal workers or transients are present each year in Grayling (10 individuals) during summer months. They also indicated that the annual population peak in June and July is mostly driven by employment in commercial and subsistence fishing.

In 2010, the majority of Grayling residents identified themselves as American Indian and Alaska Native (87.1%), compared to 88.1% in 2000; 6.7% identified themselves as White in 2010, compared to 7.2% in 2000; 6.2% identified themselves as of two or more races in 2010, compared to 4.1% in 2000; 0.0% identified themselves as Hispanic or Latino, compared to 1.0% in 2000; and for both 2000 and 2010, 0.0% of residents identified themselves as Asian, Native Hawaiian and Other Pacific Islander, Black or African American, or of some other race. Further information regarding trends in racial and ethnic composition from 2000 to 2010 can be found in Figure 1.

The number of households in Grayling increased between 1990 and 2010, from 51 occupied housing units in 1990 and 2000 to 55 in 2010. The population decline can be observed in the declining size of these households, from 4 persons per household in 1990 to 3.8 in 2000, and 3.53 in 2010. Of the 63 housing units surveyed in 2010, 57.1% were owner-occupied, 30.2% were rented, and 12.7% were vacant. No Grayling residents were reported to be living in group quarters between 1990 and 2010.

Figure 1. Racial and Ethnic Composition, Grayling: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Grayling was 51% male and 48.9% female, similar to the gender distribution of the State as a whole (52% male, 48% female). That year, the median age was estimated to be 23.4 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, a smaller percentage of Grayling residents were under the age of 20 (42.3%) compared to 51% in 2000, and a higher percentage was age 60 or older (10.3%) compared to 9.3% in 2000. The overall population structure of Grayling in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Grayling Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS)²⁴⁹ estimated that 54.4% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 26.7% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 18.9% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 10% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; no resident held a Bachelor’s degree, compared to an estimated 17.4% of Alaskan residents overall; and an estimated 3.3% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

²⁴⁹ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

The Grayling area was historically used for summer fish camps by the Deg Hit'an Athabascan people of the Anvik-Shageluk area (Ingalik) as well as the Doy Hit'an Athabascan (Holikachuk) who inhabited winter villages on the Innoko River north of Shageluk.^{250,251} During the summer of 1900, the steamer Nunivak stopped at Grayling and recorded 65 Native people living there. At that time, the people were suffering from epidemics of measles and influenza.²⁵² According to reports from the visit of the Nunivak, Grayling also had a store and a large wood yard to supply steamers at that time. Between 1962 and 1966, the inhabitants of the village of Holikachuk relocated to Grayling. Holikachuk was susceptible to spring flooding, and low water levels in the fall made the return trip from Yukon Fish camps to the winter village difficult. Today, the population of Grayling is made up of both Ingalik and Holikachuk Athabascan people. The village of Grayling is a contemporary subsistence community that maintains strong ties to its traditions. The sale of alcohol is prohibited in the community.²⁵³

Natural Resources and Environment

The climate of Grayling is continental, with long, cold winters and relatively warm summers. Temperature extremes range between -60 to 87 °F. Annual snowfall averages 110 inches, with 21 inches of total precipitation. The Yukon River is ice-free from June through October.²⁵⁴ Low-lands along the Yukon and Innoko rivers are made up of vast marshy flatland, with some forest cover of balsam poplar, willow, and alder within active floodplains. Well drained, south-facing upland slopes host forests of white spruce, paper birch, and quaking aspen, while permafrost, stunted black spruce, and tundra is typical of the poorly drained cold soils of north-facing slopes.²⁵⁵ Since Grayling is located in the Yukon River Basin, it is in a zone at risk of melting permafrost, which is expected to accelerate in the next 20 to 30 years if present warming trends continue, leading to large-scale environmental changes in the hydrology and water quality of the Yukon River and its major tributaries.²⁵⁶

Grayling is within the boundaries of the Innoko National Wildlife Refuge (NWR). One of the primary motivations for creation of the NWR was its importance as a waterfowl area in interior Alaska, noted for its wetlands that provide nesting, resting and staging areas. In addition, the NWR offers excellent raptor and moose habitat. The Innoko Refuge is made up of two units, totaling 4.6 million acres. The area was also established to fulfill treaty obligations and provide the opportunity for continued subsistence uses. Refuge lands are open to sport and subsistence hunting and fishing, as well as trapping.

Local terrestrial wildlife includes moose, bear, wolves, lynx, wolverine, river otter, beaver, porcupine, caribou, snowshoe hare, red fox, red squirrel, marten, muskrat, weasel, mink, shrews, voles, and mice.²⁵⁷ Anadromous fish species found in the Grayling area include all five Pacific salmon species, Arctic lamprey, smelt, Arctic cisco, and additional freshwater species include northern pike, blackfish, stickleback, burbot and five species of whitefish.²⁵⁸ Edible and useful plants include cranberries, blueberries, salmon or cloud berries, rose hips, Indian potatoes, wild celery, wild onion, wild rhubarb, and sour dock.²⁵⁹

The Yukon-Kuskokwim delta is rich in mineral deposits. Gold was discovered in the Klondike area of the upper Yukon River in 1896, and prospectors began searching closer to Grayling – along the Innoko River – in 1898. Commercial quantities of gold were discovered in the Innoko Valley in 1906.²⁶⁰ As of 2010, the Iditarod and Innoko mining districts have produced more than 2.3 million ounces of gold.²⁶¹ Currently, a large-scale gold operation is being developed by Donlin Gold north of Crooked Creek, to the southeast of Grayling. The mine is projected to operate for 25 years, with over 33 million ounces of gold speculated to be in the area.²⁶² Additional mineral deposits in the region include Wolf Creek Mountain mercury/antimony deposit and Stuyahok and Arnold Kako gold deposits to the southwest, and McLeod copper/molybdenum deposits to the northeast.²⁶³

Natural hazard risks in the Yukon-Koyukuk Census Area include flooding, wildfire, earthquakes, snow and avalanche, severe weather, landslides and erosion. Shallow earthquakes in the region would be considered ‘intraplate’ earthquakes, which can have a magnitude of up to 7.0 on the Richter scale.²⁶⁴

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Grayling as of October, 2012.²⁶⁵

Current Economy²⁶⁶

Grayling has a mixed cash and subsistence economy. Subsistence is the dominant livelihood for many residents, including subsistence fishing, hunting, trapping, and berry picking. Important subsistence resources for Grayling residents include salmon, moose, black bear, small game, and waterfowl. Most wage employment is found through seasonal work.²⁶⁷ Some residents are also involved in commercial fisheries. According to the 2011 AFSC survey,

²⁶⁷ See footnote 253.

community leaders reported that commercial and subsistence fishing are the most important natural resource-based industries in Grayling. They indicated that a new commercial fishery for Arctic lamprey (eel) began in 2003, and also expressed the hope that new commercial fishing opportunities will be developed in the region (see *History and Evolution of Fisheries* section).

Based on household surveys for the 2006-2010 ACS,²⁶⁸ in 2010, the per capita income in Grayling was estimated to be \$8,138 and the median household income was estimated to be \$32,656. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$7,049 and \$21,875, respectively). However, if inflation is taken into account by converting the 2000 values to 2010 dollars,²⁶⁹ the real per capita income estimate in 2010 is shown to be \$9,269, slightly lower than the 2000 figure. The real median household income estimate is \$28,765, still lower than the 2006-2010 ACS estimates for 2010. In 2010, Grayling ranked 293rd of 305 Alaskan communities with per capita income data that year, and 231st in median household income, out of 299 Alaskan communities with household income data.

Grayling's small population size may have prevented the ACS from accurately portraying economic conditions.²⁷⁰ However, additional evidence for a decrease in per capita income between 2000 and 2010 is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Grayling in 2010 is \$5,369.^{271,272} The relatively low per capita income estimates for Grayling in 2010 from both data sources are reflected in the fact that the community was recognized as "distressed" by the Denali Commission,²⁷³ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It is important to note that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of personal use and subsistence within the local economy.

In 2010, a much smaller percentage of Grayling residents was estimated to be in the civilian labor force (36.1%) compared to the civilian labor force statewide (68.8%). In the same year, 13% of local residents were estimated to be living below the poverty line, higher than the statewide poverty rate estimate of 9.5%, and the unemployment rate was estimated to be 14.3%, more than twice the statewide unemployment rate of 5.9%.²⁷⁴ An additional estimate of

²⁶⁸ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. ²⁷⁴ See footnote 272.

unemployment is based on the ALARI database, which shows a local unemployment rate of 24.3%, more than twice the state rate estimate of 11.5%.²⁷⁵

Also based on the 2006-2010 ACS, three-quarters of the employed civilian workforce in Grayling was estimated to be employed in the public sector (75%), while the remaining 25% was estimated to be employed in the private sector. Out of 32 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the 62.5% worked in educational services, health care and social services, 12.5% in public administration, 9.4% in retail trade, 9.4% in finance and insurance, and real estate and rental and leasing, and 6.3% in transportation, warehousing, and utilities industries (Figure 3). Compared to employment statistics in 2000, the most notable shifts in the distribution of employment by industry included an increased concentration of employment in education services, health care, and social services and public administration industries, and an apparent disappearance of arts, entertainment, recreation, accommodation, and food services (from 11.5% of the workforce in 2000 to 0% in 2010), and agriculture, forestry, fishing, hunting, and mining industries (from 3.8% of the workforce in 2000 to 0% in 2010). It is important to note that the number of individuals employed in the fishing industry is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly.

ALARI industry employment statistics differ slightly from ACS estimates, showing the highest percentage of employed residents (66.3%), and the next highest percentage working in education and health services (10.9%). In addition, ALARI estimates show a greater diversity of employment than ACS estimates, with 8.7% of the local workforce employed in trade, transportation, and utilities industries, 3.3% in manufacturing, 3.3% in financial activities, 2.2% in natural resources and mining, 2.2% in construction, 1.1% in professional and business services, 1.1% in state government, and 1.1% in other industries.²⁷⁶

Viewing employment from the perspective of occupation, 2006-2010 ACS estimates indicate that the highest percentages of the Grayling workforce were employed in service occupations in 2010 (50%). This represents a large increase from 15.4% of the total workforce employed in service occupations in 2000. The increase in employment in natural resource/construction/maintenance occupations was also substantial, from 0% in 2000 to 15.2% in 2010. These increases were balanced by decreased percentages of the workforce employed in other occupations in 2010 compared to 2000 (Figure 4).

²⁷⁵ See footnote 271.

Figure 4. Local Employment by Occupation in 2000-2010, Grayling (U.S. Census).

Governance

Grayling is a 2nd Class City and is not located within and organized borough. The City was incorporated in 1969, and has a manager, or “Strong Mayor,” form of government, with a seven-person city council including the Mayor, a seven-person school board, and several municipal employees. No sales or property taxes are administered by the City.²⁷⁷ Locally-generated income sources during the 2000-2010 period included facilities leases, room and equipment rentals, and water, sewer, and washeteria service fees. Outside revenue sources included various shared revenues from state and federal programs, as well as capital project grants. The City received state contributions from the State Revenue Sharing program from 2000 to 2003 (approximately \$25,000 per year), and contributions from the Community Revenue Sharing program in 2009 and 2010 (just over \$100,000 per year), as well as telephone/electric co-op refunds and funds from the SAFE Communities program (local police, public safety, fire, and utilities funding). Grayling also received shared funds from both the state and federal Payment In Lieu of Taxes programs in some years during the 2000-2010 period. Capital/special projects grants were received toward upgrades to community facilities such as the washeteria and community hall, purchase and repair of heavy equipment, road maintenance, and other community projects. Between 2000 and 2010, no fisheries-related grants were received by the City of Grayling. This information about selected revenue streams is presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Grayling from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$107,418	n/a	\$23,948	n/a

Grayling was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Organized Village of Grayling. The Native village corporation is the Hee-Yea-Lingde Corporation, which manages 92,160 acres of land. The regional Native corporation to which Grayling belongs is Doyon, Limited.²⁷⁸

Grayling is also a member village of the Tanana Chiefs Conference, a tribal 501(c)(3) non-profit organization headquartered in Fairbanks. It is a consortium of 42 villages of Interior Alaska that works to meet “the health and social service challenges for more than 10,000 Alaska Natives spread across a region of 235,000 square miles in Interior Alaska.” The non-profit provides health and tribal development services, as well as educational and employment services to individuals of member tribes.²⁷⁹ The Tanana Chiefs Conference is one of the 12 regional Alaska Native nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.²⁸⁰

The closest offices of the Alaska Department of Fish and Game (ADF&G) are located in Emmonak and Bethel, although the Emmonak office is only open during the summer season. The closest office of the Alaska Department of Commerce, Community and Economic Development is also in Bethel. However, the Anchorage and Fairbanks offices of these agencies may be more accessible to people living in Grayling than the coastal villages. Anchorage has the nearest offices of the National Marine Fisheries Service (NMFS), Alaska Department of Natural Resources, and U.S. Bureau of Citizenship and Immigration Services.

Infrastructure

Connectivity and Transportation

Grayling is accessible year-round by air. The State owns and operates a 2,315 ft long by 60 ft wide gravel runway.²⁸¹ According to the 2011 AFSC survey, community leaders reported that improvements to the airport were completed within the last 10 years. As of fall, 2012, roundtrip airfare between Grayling and Anchorage was \$640.²⁸² During summer months, the community is also accessible by water, and receives both riverboat and barge service. Residents travel between Grayling and other area villages by skiff during summer, and ATVs, snowmobiles, and dog teams are common modes of overland transportation in the region. Currently there are no roads in Grayling.²⁸³ However, in the 2011 AFSC survey, community leaders noted that some roads are expected to be completed in the next 10 years.

²⁸³ See footnote 277.

Facilities

Water in Grayling is derived from an infiltration gallery²⁸⁴ at Grayling Creek, and is treated and stored before being distributed to homes via a city-operated pipe system. The piped water system serves all households in the village, and all but three residences are connected to the piped sewer system. The City maintains a sewage lagoon for collection and treatment of sewage. A landfill is also maintained by the City, but public refuse collection services are not provided. Individuals must haul their own garbage. Electricity in Grayling is provided by a diesel powerhouse operated by the Alaska Village Electric Cooperative.²⁸⁵ In the 2011 AFSC survey, community leaders indicated that improvements to the diesel powerhouse and the landfill have been completed in the last 10 years, and improvements to water and sewer treatment and pipe systems are planned to be completed within the next 10 years. In addition, community leaders indicated that alternative energy sources are expected to be added within the next 10 years.

Police service is provided by state troopers stationed in Aniak. Fire and rescue services are provided by the City Volunteer Fire Department. Additional community facilities include the Native village corporation building, and a teen center. Telephone service is available throughout the village, and internet is currently available at the school building only. No cable providers offer service locally.²⁸⁶ In the 2011 AFSC survey, community leaders also noted the presence of a U.S. post office, and indicated that broadband internet is expected within the next 10 years.

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that no dock space is available in Grayling. However, there is a barge landing area in the village, and community leaders indicated that vessels of up to 150 feet in length can be accommodated. Fuel barges are the primary vessel type that utilizes the barge landing area, and they indicated that the number of fuel barges visiting Grayling has increased over the past five years. Community leaders also reported that both boat fuel and fishing tackle are available for sale in Grayling, and indicated that residents most commonly travel to Emmonak, Galena, or Fairbanks to access fisheries-related businesses and services not available locally.

Medical Services

Medical services are provided locally at the Grayling Clinic. The clinic is owned by the City and operated by the Yukon-Kuskokwim Health Corporation. It is a Community Health Aid Program site. Emergency services have river and air access to Grayling, and local emergency service is provided by the health aide.²⁸⁷ The nearest hospital is located in Bethel.

²⁸⁴ Infiltration galleries are a type of well constructed near rivers or ponds to collect infiltrated surface waters. Since the water infiltrates through a layer of soil/sand, it is significantly free from suspended impurities including microorganisms usually present in surface water. (Definition retrieved February 22, 2012 from http://phys4.harvard.edu/~wilson/arsenic/conferences/Feroze_Ahmed/Sec_3.htm.)

Educational Opportunities

One school is located in Grayling. The David Louis Memorial School offers preschool through 12th grade, and as of 2011 had 45 student and 5 teachers. Grayling is located in the Iditarod Area School District.²⁸⁸

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Deg Hit'an (Ingalik) and Doy Hit'an (Holikachuk) people have long fished the waters in and around Grayling for subsistence purposes. Historically, the Grayling area was utilized for summer fish camps by residents of the winter village sites of Shageluk and Holikachuk. Chinook salmon was the most important food fish, while chum and coho salmon were processed into dried fish, and chum salmon was an important food for sled dogs. The Deg Hit'an primarily used large basket traps for salmon harvest. They also used dip nets, which they would hold in the water as they drifted down river with the current in canoes. Coho fishing commonly continued into September, and some Deg Hit'an and Doy Hit'an people made fall trips to the coast to trade dried fish. In October, people returned to winter villages and began to focus on ice-gillnet fishing for whitefish, as well as harvest of northern pike, burbot, and Arctic lamprey.²⁸⁹

The first recorded commercial harvest of salmon on the Yukon River took place in 1918, and early harvests were relatively large. Concerns about providing sufficient salmon resources for subsistence harvest led to limitations on commercial salmon fishing during several periods, including a complete commercial fishing closure on the Yukon River between 1925 and 1931. In the 1980s, concerns about possible overharvest of Chinook runs led to reduced commercial fisheries in the late 1980s and 1990s. Poor returns of Chinook salmon in the late 1990s and early 2000s resulted in restrictive management of the commercial fishery and complete closure in 2001 to ensure subsistence resources.²⁹⁰ Yukon River Chinook runs showed signs of improvement for several years following the 2001 commercial closure, but restricted commercial harvest in 2008 and complete closure of Chinook harvest in 2009 led to declaration of a fishery disaster that year.²⁹¹ A fishery disaster was again declared for the 2012 season, when the commercial Chinook salmon fishery was closed and subsistence fishery was significantly restricted. ADF&G, the Alaska Board of Fisheries and constituents are working together to develop a conservation plan that restricts Chinook harvest while allowing for greater harvest of more abundance species, including gear and other management restrictions.²⁹²

Like Yukon Chinook salmon runs, chum salmon runs have seen poor returns since 1998. A relatively strong run in 2007 led to some effort to redevelop the Yukon chum fishery, but this process is challenged by the need to reduce incidental harvest of co-migrating Chinook salmon. Further, beginning in 2008, the fall chum salmon run has not been large enough to provide for commercial opportunity. From 2008 to 2010, management actions have been taken to delay commercial fishing to provide for escapement and subsistence use.²⁹³

In years when commercial salmon fishing is open, fishing is allowed along the entire 1,200 miles of the main stem of the Yukon River, as well as 225 miles of the Tanana River. There are 7 fishing districts, 10 subdistricts, and 28 statistical areas. Fishing takes place with set and drift gillnets, and fish wheels are also allowed in Upper Yukon districts (Districts 4, 5, and 6). Subsistence fishermen also most often utilize these gear types. Many subsistence fishermen are also commercial fishermen.²⁹⁴

In addition to salmon fishing, a commercial fishery for Arctic lamprey (also referred to as ‘eel’) began in November 2003 in the Grayling region. The annual lamprey run is brief, and the fishery lasts for only a few days each year. Eels are caught using dip nets or ‘eeling sticks’, and are brought to Grayling to be sold to the fish buyer, Kwik’pak Fisheries, LLC.²⁹⁵ Kwik’pak Fisheries is a subsidiary of the Community Development Quota (CDQ) group for the Yukon region, the Yukon Delta Fisheries Development Association (YDFDA).

Grayling is located in District 4 of the Upper Yukon River salmon fishery. It is also important to note that the ocean area into which the Yukon River flows is encompassed by Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Grayling is a member of the YDFDA, the CDQ group for the Yukon Delta. Grayling is not eligible to participate in the Community Quota Entity program.

In the 2011 AFSC survey, community leaders indicated that Grayling does not actively participate in fisheries management processes in Alaska. However, Grayling is represented regionally through the Western Interior Regional Advisory Council on subsistence issues, as well as through the G.A.S.H. (Grayling, Anvik, Shageluk, Holy Cross) advisory committee to ADF&G. Community leaders reported in the 2011 AFSC survey that a decline in commercial fishing activity in Grayling since the 1980s and 1990s has had a negative impact on the community, and expressed the hope that additional commercial fishing activity and job opportunities will be developed in Grayling.

Processing Plants

According to the ADF&G’s 2010 Intent to Operate list, Grayling does not have a registered processing plant. The nearest shore-side processing facility is a salmon roe processing facility in Anvik operated by Bonasila, Inc.²⁹⁶

In the 2011 AFSC community survey, community leaders reported that Kwik’pak Fisheries, LLC purchases eels harvested in the winter freshwater commercial fishery near Grayling. Kwik’pak Fisheries offers employment, training, and educational opportunities to area

residents and their families, and works to “enable Yupik families to continue the traditional lifestyle their people have practiced for thousands of years...fishing, hunting and living off the land.”²⁹⁷

Fisheries-Related Revenue

Between 2000 and 2010, no known fisheries-related revenue was generated in Grayling (Table 3).

Commercial Fishing

Between 2000 and 2010, Grayling residents participated in commercial fisheries as state permit holders, crew license holders, and vessel owners. The number of crew license holders declined over the period, from six in 2000 to one in 2010, while the number of Grayling residents that were the primary owner of a fishing vessel remained stable at one per year (with zero vessel owners reported in 2004). There was also one vessel homeported in Grayling in all years except 2004 (Table 5). In the 2011 AFSC survey, community leaders indicated that the only fishing vessels that base out of Grayling are under 35 feet in length, and typically use gillnet or beach seine gear. Community leaders also noted that the number of commercial fishing boats has remained stable over the past 5 years, although they reported that there are more boats under 35 feet in length than 5 years ago.

During the 2000-2010 period, Grayling residents held state-issued Commercial Fisheries Entry Commission (CFEC) permits in Upper Yukon salmon fisheries, including gillnet and fish wheel permits. The number of salmon permit holders and total salmon permits held both remained relatively stable over this period, with between 10 and 12 salmon permit holders and between 10 and 11 total permits held. However, few salmon permits were actively fished during the 2000-2010 period. In 2007, one Upper Yukon fish wheel permit was active, and in 2009, one Upper Yukon fish wheel and one Upper Yukon gillnet permit were actively fished. Beginning in 2003 with the start of the Arctic lamprey fishery, between 9 and 25 Grayling residents held ‘other finfish’ permits per year. In 2003 and 2010, 80% of total ‘other fishfish’ permits were actively fished, while 58% of other finfish permits were actively fished on average between 2003 and 2010. Information about CFEC permits in Grayling is presented in Table 4.

No Grayling residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits from 2000 to 2010 (Table 4). In addition, no residents participated in federal catch share fisheries for halibut, sablefish, or crab during this period (Tables 6, 7, and 8).

According to data reported by ADF&G and NMFS, no fish buyers or shore-side processing facilities were reported in Grayling during the 2000-2010 period, and no landings or revenue were recorded in the community (Table 5). However, this information conflicts with reports that Kwik’pak Fisheries, LLC has been purchasing Arctic lamprey in Grayling since 2003.²⁹⁸ However, given the lack of fish buyers reported in Grayling, landings or ex-vessel revenue information was also not lacking in the community during the 2000-2010 period (Table 9). Information about landings and revenue earned by vessel owners residing in Grayling, including all delivery locations, is considered confidential in most years due to the small number of participants (Table 10).

Recreational Fishing

According to results of the 2011 AFSC survey, sportfishing in Grayling primarily occurs using private boats, and a majority of activity is by local residents. Between 2000 and 2010, no active sport fish guide businesses or licensed sport fish guides were present in Grayling. Until 2007, sportfishing licenses were not sold in the community, but between 2008 and 2010, an average of 37 licenses were sold per year. A greater number of licenses were sold in Grayling than were sold to Grayling residents in those years, indicating that despite the lack of active guide businesses, some non-resident private anglers may participate in sportfishing near Grayling (Table 11).

A number of guide business offer sportfishing trips in the Innoko River targeting northern pike, although these guide businesses are not based in Grayling. Sport fishermen often catch pike weighing more than 20 pounds in the area. Local residents in Grayling and other area

communities are concerned about the impact of increased recreational fishing activity on pike stocks.^{299,300}

The Alaska Statewide Harvest Survey,³⁰¹ conducted by ADF&G between 2000 and 2010, noted sport harvest of Arctic grayling in Grayling. No kept/release log book data were reported for fishing charters out of Grayling between 2000 and 2010.³⁰²

Grayling is located within Alaska Sport Fishing Survey Area Y – Yukon River Drainage. Information is available about both saltwater and freshwater sportfishing activity at this regional scale (Table 11). Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 81 non-Alaska resident angler days fished per year, and between 0 and 89 Alaska resident angler days fished per year. The low numbers reported for saltwater sportfishing make sense given that a majority of residents in Yukon drainage communities live a great distance from the ocean, and fishing activities take place primarily in fresh water. Between 2000 and 2010, Alaska resident anglers in the Yukon River drainage consistently fished more days in freshwater (4,783 –10,400 angler days per year) than non-resident anglers (2,573–5,761 angler days per year).

Subsistence Fishing

In the 2011 AFSC survey, community leaders indicated that Chinook, chum, and coho salmon are three of the most important subsistence fishing resources in Grayling. Non-salmon fish are also essential subsistence resources. Local fishers harvest Arctic lamprey and burbot in the Yukon River near Grayling, and travel further upstream to fish for pike, whitefish, and sheefish. Grayling residents also still travel to areas near the old village of Holikachuk to fish for pike, sheefish, whitefish, and blackfish in the lakes systems of the upper Innoko River.³⁰³ Northern pike has been identified as a particularly important subsistence species, and increased attention has been paid to management of pike stocks given poor returns of salmon to the Yukon River in recent years.³⁰⁴

According to data reported in ADF&G's Community Subsistence Information System, 68% of Grayling households were estimated to participate in harvest or use of non-salmon fish in

³⁰³ Brown, Caroline, Burr, John, Elkin, Kim, and Walker, Robert. (2005). *Contemporary Subsistence Uses and Population Distribution of Non-Salmon Fish in Grayling, Anvik, Shageluk, and Holy Cross*. Retrieved October 24, 2012 from <http://www.subsistence.adfg.state.ak.us/TechPap/tp289.pdf> .

2002, while no estimates were reported regarding the percentage of households participating in subsistence harvest of salmon, halibut, marine mammals, or marine invertebrates, or the per capita subsistence harvest in Grayling between 2000 and 2010 (Table 12). In 2002, total estimated non-salmon fish harvest was reported to be 46,379 lbs (Table 13).

ADF&G also reported information regarding subsistence salmon permits issued to Grayling households between 2000 and 2008. During this period, the number of permits issued was relatively stable from year to year, varying between 46 and 50 per year, while the number of permits returned varied from 14 to 24 per year. Chinook and chum salmon were the two most heavily harvested salmon species during this period, averaging 1,610 Chinook and 1,244 chum harvested per year. Several hundred coho were also harvested in most years, and some pink and sockeye salmon harvest was reported in some years as well (Table 13).

No information was reported by management agencies regarding subsistence harvest of halibut (Table 14) or marine mammal species (Table 15) by residents of Grayling between 2000 and 2010.

Holy Cross

People and Place

*Location*³⁰⁵

Holy Cross is located in Interior Alaska on the west bank of Ghost Creek Slough off the Yukon River. It is 40 miles northwest of Aniak, 420 miles southwest of Fairbanks, and 330 miles northwest of Anchorage. Holy Cross is located in the Yukon-Koyukuk Census Area and the Kuskokwim Recording District. The area encompasses 31.3 square miles of land and 6.2 square miles of water.

*Demographic Profile*³⁰⁶

In 2010, there were 178 residents in Holy Cross, making it the 206th largest of 352 communities in Alaska with recorded populations that year. Overall between 1990 and 2010, the population decreased by 35.7%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents decreased by 17.6% (Table 1). The average annual growth rate during this period was -0.80%, representing a steady decline over time. According to a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported a slightly higher year-round population in Holy Cross in 2010 (250 year-round residents) than the U.S. Census figure, and indicated that no seasonal workers or transients are present in the community at any point during the year. They also indicated that Holy Cross reaches an annual population peak when subsistence fishermen return from subsistence harvest activities in late summer or fall.

In 2010, a majority of Holy Cross residents identified themselves as American Indian and Alaska Native (91.6%), while 4.5% identified themselves as White, and 3.9% identified as two or more races (Figure 1). Compared to 2000, the percentage of the population that identified as American Indian and Alaska Native decreased by approximately 5%, while the percentages of the population identifying as either White or mixed race increased proportionally.

With the decline in population between 1990 and 2010, the total number of households declined from 86 to 64, and the average number of persons per household also decreased from 3.2 to 2.78 over the period. It is of note that the total number of occupied households in 2000 was the same as the number in 2010 (64), while household sizes were higher in 2000, with an average of 4 occupants per housing unit. Of the 93 housing units surveyed for the 2010 Decennial Census, 57% were owner-occupied, 35.5% were renter-occupied, and 7.5% were vacant. No Holy Cross residents were reported to be living in group quarters between 1990 and 2010.

Figure 1. Racial and Ethnic Composition, Holy Cross: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Holy Cross was 51.6% male and 48.3% female, similar to the population of the State as a whole, which was 52% male and 48% female. The median age was estimated to be 31 years in 2010, slightly lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 36.6% of the population was under the age of 20, and 11.8% of the Holy Cross population was age 60 or older. The population of Holy Cross was older on average in 2010 than in 2000, when 41.4% of the population had been under the age of 20 and 9.3% had been aged 60 or older. The slight decline in the percentage of the

population under the age of 20 could account for some of the decrease in household size observed between 2000 and 2010. The overall population structure of Holy Cross in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)³⁰⁷ estimated that 85.8% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 6.7% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 7.5% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 22.5% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; 2.5% of resident were estimated to have a Bachelor's degree, compared to 17.4% of Alaskan residents overall; and no Holy Cross residents were estimated to have a graduate or professional degree, compared to 9.6% of Alaskans overall.

Figure 2. Population Age Structure in Holy Cross Based on the 2000 and 2010 U.S. Decennial Census.

³⁰⁷ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Holy Cross is an Deg Hit'an Athabascan village, within the Ingalik language group.³⁰⁸ The culture of the Lower Yukon Deg Hit'an people was heavily influenced by the neighboring Kwikpamiut Eskimos, whose territory began just downriver from Holy Cross. The mouth of the Innoko River is thought to have been one of the primary locations of trade exchanges between the Yukon Eskimos and the Deg Hit'an.³⁰⁹ With regard to material culture, the Deg Hit'an Athabascan people's reliance of salmon fishing more closely resembled Eskimo tradition than that of Athabascan people living further inland.³¹⁰

First contact with Europeans in the Holy Cross region took place during an 1840s expedition led by Lt. Lavrentiy A. Zagoskin of the Russian-American Company, who was directed to explore the Yukon, Kuskokwim, and Innoko Rivers to locate possible portages in the Yukon-Kuskokwim delta.^{311,312} At the time of European contact, the communities of 'Anilukhtapak' and 'Koserefsky' were located near the present site of Holy Cross.³¹³ Several decades later, during an expedition through the Yukon delta during the winter of 1878-1879, American Edward Nelson reported a village called 'Askhomute' near the present site of Holy Cross, with a population at that time of 30 residents.^{314,315}

In 1888, a Roman Catholic missionary named Father Aloysius Robaut established a mission and boarding school at Holy Cross in 1888. Ingalik Indians from the surrounding area migrated to Holy Cross to be near the mission.^{316,317} The U.S. Postal Service opened a post office there in 1899 under the name of Koserefsky. The name of the village was changed to Holy Cross in 1912 after the mission.³¹⁸ The Yukon gold rush of the late 1800s brought a flood of American prospectors passing through the Holy Cross area. Gold was discovered in the Innoko Valley in 1906, increasing the importance of Holy Cross as a waystation during the early 1900s.³¹⁹

In the 1930s the Yukon River changed course, and an extensive sandbar began to form in front of the village of Holy Cross. By the mid-1940s, Holy Cross was only accessible via a narrow, shallow slough.^{320,321} Today, the slough is known as 'Ghost Creek Slough'.³²² The mission boarding school was closed in 1956, and the original mission and several other original

buildings were torn down at that time.³²³ The City of Holy Cross was incorporated in 1968. Today, subsistence and commercial fishing-related activities remain important to residents. The sale of alcohol is banned in the village.³²⁴

Natural Resources and Environment

Holy Cross is located in the Innoko Lowlands, an area of low tundra plains that extends from the Yukon-Kuskokwim Delta northeast between the Kaiyuh and Kuskokwim mountain ranges. Many navigable rivers run through the lowlands, including the Innoko River itself, which enters the Yukon River near Holy Cross.³²⁵ The tundra is covered by many sloughs and small lakes. The climate of Holy Cross is continental. Temperature extremes range from -62 and 93 °F. Annual snowfall averages 79 inches, with 19 inches of total precipitation per year. The Yukon River is ice-free from June through October.³²⁶

The diversity of animal species present in the Innoko Lowlands is typical of interior Alaska, including black and brown bear, moose, caribou, beaver, mink, lynx, fox, porcupine, river otter, muskrat, wolf, wolverine, marten, hare, squirrel, and weasel. The three species of salmon most common in the Yukon and its tributaries are Chinook, chum, and coho. Other freshwater fish found in area rivers and lakes include Arctic grayling, Dolly Varden, northern pike, blackfish, and burbot. The area provides nesting grounds for many bird species, including a variety of ducks, geese, swans, cranes, and loons. Bird species that overwinter include grouse and rock and willow ptarmigan.³²⁷

Protected areas near Holy Cross include the Yukon Delta and Innoko National Wildlife Refuges (NWR). The eastern boundary of the Yukon Delta NWR is located less than 20 miles south of Holy Cross and the Innoko NWR is located just to the north, along the eastern bank of the Yukon River between Grayling and Koyuk. Both areas were established in 1980 with the passage of the Alaska National Interest Lands Conservation Act. The 22-million acre Yukon Delta NWR provides essential habitat for waterfowl and migratory birds, including some of the most productive subarctic goose habitat. In addition, the refuge supports muskox, caribou, brown and black bear, wolves, and moose, salmon, and marine mammals.³²⁸ One of the primary motivations for creation of the Innoko NWR was its importance as a waterfowl area in interior Alaska, noted for its wetlands that provide nesting, resting and staging areas. In addition, this NWR offers excellent raptor and moose habitat. The Innoko NWR is made up of two units, totaling 4.6 million acres.³²⁹ These areas were also established to fulfill treaty obligations and provide the opportunity for continued subsistence uses. NWR lands are open to sport and subsistence hunting and fishing, as well as trapping.³³⁰ In addition to these NWR, Holy Cross is

³³⁰ See footnotes 328 and 329.

located approximately 80 miles east of the eastern boundary of the Andreafsky Wilderness Area, which covers slightly more than 5% of the Yukon Delta NWR.³³¹

The Yukon-Kuskokwim delta is rich in mineral deposits. Gold was discovered in the Klondike area of the upper Yukon River in 1896, and prospectors began searching closer to Holy Cross – along the Innoko River – in 1898. Commercial quantities of gold were discovered in the Innoko Valley in 1906.³³² As of 2010, the Iditarod and Innoko mining districts have produced more than 2.3 million ounces of gold.³³³

Natural hazard risks in the Yukon-Koyukuk Census Area include flooding, wildfire, earthquakes, snow and avalanche, severe weather, landslides and erosion. Shallow earthquakes in the region would be considered ‘intraplate’ earthquakes, which can have a magnitude of up to 7.0 on the Richter scale.³³⁴

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Holy Cross as of September 2012.³³⁵

Current Economy³³⁶

According to the 2011 AFSC survey, community leaders indicated that commercial and subsistence fishing are the primary economic activities in Holy Cross. The summer fishing season is the peak of the seasonal economy, along with construction and local capital improvement projects. There are also approximately 50 full-time jobs in the community.³³⁷

Based on household surveys for the 2006-2010 ACS,³³⁸ in 2010, the per capita income in Holy Cross was estimated to be \$12,358 and the median household income was estimated to be \$25,833. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$8,542 and \$21,875, respectively). If inflation is taken into account by converting the 2000 values to 2010 dollars,³³⁹ 2010 per capita income estimate remains slightly higher than the real 2000 per capita income of \$11,233. In contrast, the 2010 median household income estimate is revealed to be a decrease from the real 2000 median household income of \$28,765. In 2010, Holy Cross ranked 258th of 305 Alaskan communities with per capita income data that year, and 258th in median household income, out of 299 Alaskan communities with household income data.

³³⁹ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

However, Holy Cross's small population size may have prevented the ACS from accurately portraying economic conditions.³⁴⁰ The slight increase in per capita income suggested by the 2006-2010 ACS is not supported by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Holy Cross in 2010 is \$6,861.^{341,342} This discrepancy suggests that caution is warranted when citing an increase in per capita income in Holy Cross between 2000 and 2010. The relatively low per capita income estimates for Holy Cross in 2010 from both data sources are reflected in the fact that the community was recognized as "distressed" by the Denali Commission,³⁴³ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It is important to note that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of personal use and subsistence within the local economy.

In 2010, a much smaller percentage of Holy Cross residents was estimated to be in the civilian labor force (43.8%) compared to the civilian labor force statewide (68.8%). In the same year, 40.6% of local residents were estimated to be living below the poverty line, more than four times the statewide poverty rate of 9.5%, and the unemployment rate was estimated to be 16.1%, more than twice the statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which shows a local unemployment rate of 24.3%, more than twice the state rate estimate of 11.5%.³⁴⁴

Also based on the 2006-2010 ACS, just over half of the employed civilian workforce in Holy Cross was estimated to be employed in the public sector (50.9%), while 43.4% were employed in the private sector, and the remaining 5.7% were estimated to be self-employed. Out of 53 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest number worked in educational services, health care and social services (45.3%), construction (15.1%), transportation, warehousing and utilities (13.2%), public administration (9.4%), professional, scientific, management, and administrative and waste management services (5.7%), and agriculture, forestry, and fishing industries (5.7%) (Figure 3). The number of individuals employed in the fishing industry is probably underestimated in Census statistics; fishermen may hold another job and characterize their employment accordingly. Compared to employment statistics in 2000, the most notable shifts in the distribution of employment by industry included a decline in careers categorized as 'other services' and an increase in retail trade, construction, and agriculture, forestry, fishing, hunting, and mining industry employment.

³⁴⁰ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

³⁴³ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

³⁴⁴ See footnote 341.

ALARI industry employment statistics differ from ACS estimates, with the highest percentage of employed residents (59.3%) reported to be working in local government in 2010, along with 24.7% employed in education and health services, 4.9% working in trade, transportation, and utilities, 3.7% in natural resources and mining, 2.5% in construction, 1.2% in financial activities, 1.2% in professional and business services, 1.2% in state government, and 1.2% in other industries.³⁴⁵

Viewing employment from the perspective of occupation, 2006-2010 ACS estimates indicate that the highest percentages of the Holy Cross workforce were employed in sales and office occupations (32.1%) and service occupations (30.2%), along with 22.6% employed in natural resources, construction, and maintenance occupations, 15.1% in management, business, science, and arts occupations, and 0% in production, transportation, and material moving service occupations (Figure 4). Between 2000 and 2010, the percentage of the workforce employed in sales and office occupations increased by approximately 50%, and the percentages employed in service occupations and natural resources, construction, and maintenance occupations also increased notably. There was a 100% decline in the number of individuals estimated to be working in production, transportation, and material moving occupations between 2000 and 2010.

According to the ALARI database, top occupations in Holy Cross in 2010 were laborers and freight, stock, and material movers (16 workers), and community and social service specialists (6 workers).³⁴⁶ Discrepancies between 2006-2010 ACS and ALARI statistics can be explained in part by different category definitions. It is also important to note that, as with income statistics, ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Holy Cross is a 2nd Class City located in an unorganized borough. The City was incorporated in 1698, and has a manager or “Strong Mayor” form of government, with a seven-person city council including the Mayor, a seven-person school board, and several municipal employees. No sales or property taxes are administered by the City.³⁴⁷ Locally-generated revenue sources during the 2000-2010 period included state-contracted services, building and equipment rentals, water, sewer, and washeteria service fees, land leases, concessions, and bingo and pull tab receipts. The City also received shared revenues from the state and federal government. State shared funds included contributions from the State Revenue Sharing program from 2000 to 2003 and from the Community Revenue Sharing program in 2009 and 2010, as well as Municipal Energy Assistance, Telephone / Electric Co-op tax refunds, and the SAFE Communities program (funding for public safety, fire, utilities, infrastructure, etc.). Federal revenue sharing dollars came from the Payment In Lieu of Taxes program. Holy Cross also received capital/special project grants in some years during the 2000-2010 period. Between 2000 and 2010, no fisheries-related grants were received by the City of Holy Cross. This information about selected revenue streams is presented in Table 2.

Holy Cross was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is Holy Cross Village. The Native village corporation is Deloycheet, Incorporated, which manages 138,727 acres of land. The regional Native corporation to which Holy Cross belongs is Doyon, Limited.³⁴⁸

Holy Cross is also a member village of the Tanana Chiefs Conference, a tribal 501(c)(3) non-profit organization headquartered in Fairbanks. It is a consortium of 42 villages of Interior Alaska that works to meet “the health and social service challenges for more than 10,000 Alaska Natives spread across a region of 235,000 square miles in Interior Alaska.” The non-profit provides health and tribal development services, as well as educational and employment services

³⁴⁷ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

³⁴⁸ Ibid.

to individuals of member tribes.³⁴⁹ The Tanana Chiefs Conference is one of the 12 regional Alaska Native nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.³⁵⁰

The closest offices of the Alaska Department of Fish and Game (ADF&G) are located in Emmonak and Bethel, although the Emmonak office is only open during the summer season. The closest office of the Alaska Department of Commerce, Community and Economic Development is also in Bethel. However, the Anchorage and Fairbanks offices of these agencies may be more accessible to people living in Holy Cross than the coastal villages. Anchorage has the nearest offices of the National Marine Fisheries Service (NMFS), Alaska Department of Natural Resources, and U.S. Bureau of Citizenship and Immigration Services.

Infrastructure

Connectivity and Transportation

Holy Cross can be accessed by air and water. The State owns and operates a 4,000 feet long by 100 feet wide gravel airstrip.³⁵¹ As of early June, 2012, roundtrip airfare between Holy Cross and Anchorage was \$584.³⁵² Residents use private boats for fishing, subsistence, and recreation.³⁵³ According to a survey conducted by the AFSC in 2011, community leaders reported that all vessels used in Holy Cross are under 35 feet in length. Holy Cross is serviced by barge during the summer months.³⁵⁴ Plans are currently being developed for relocation of the barge landing site due to sediment fill slowly making the existing landing site inaccessible.³⁵⁵ In addition to air and water access, local residents have access to 7.5 miles of local roads. Motor bikes, 3-wheelers, snowmobiles, and dog teams are common modes of overland transportation.³⁵⁶

Facilities

The City of Holy Cross operates a piped water and sewer system which serves 71 housing units and the local school. Water is sourced from a deep well and chlorinated before it is distributed. Residents of housing units not connected to the piped system haul water from the washeteria. The City operates a sewage lagoon for piped sewage, and some households use individual septic tanks or outhouses, or haul honeybuckets. The City operates a landfill, but does not provide refuse collection services. Individuals are responsible for hauling their own garbage. Electricity in Holy Cross is provided by an Alaska Village Electric Cooperative diesel powerhouse, operated by the REA Coop.³⁵⁷ Police services in Holy Cross are provided by state troopers stationed 40 miles upriver in Aniak. The City operates a jail. Fire and rescue services are provided by the City Volunteer Fire Department. Additional community facilities include the Holy Cross Community Hall, a school gymnasium, and a school/community library. Community services include an elder nutrition program. Local and long-distance telephone service is available in Holy Cross. Internet service is available at the school only. No cable providers offer service locally.³⁵⁸

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that no dock space is available in Holy Cross. However, smaller vessels (up to 24 feet in length) are in use in Holy Cross, and fuel barges can also be accommodated at the barge landing site. Community leaders reported that no fisheries-related businesses and services are

available in Holy Cross, with the exception of fishing gear repair and storage, which local residents do themselves.

Medical Services

Basic medical services are provided in Holy Cross at the Theresa Demientieff Health Clinic. The clinic is owned by the Village Council and operated by the Yukon Kuskokwim Health Corporation. It is part of the Community Health Aid Program. Emergency services have river and air access in Holy Cross. Emergency services are provided by the health aide.³⁵⁹ The nearest hospital is located in Bethel.

Educational Opportunities

There is one school in Holy Cross which offers a preschool through 12th grade education. As of 2011, the Holy Cross School had 41 students and 4 teachers.³⁶⁰

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence salmon fishing has long provided a basis for life in Deg Hit'an communities of the Lower Yukon River. Chinook salmon were the most important food fish, while chum and coho salmon were processed into dried fish, and chum salmon was an important food for sled dogs. The Deg Hit'an primarily used large basket traps for salmon harvest. They also used dipnets, which they would hold in the water as they drifted down river with the current in canoes. Villagers from Koserefsky and Anilukhtakpuk (formerly located near Holy Cross) most often had fish camps on the eastern bank of the Yukon River.³⁶¹

The first recorded commercial harvest of salmon on the Yukon River took place in 1918, and early harvests were relatively large. Concerns about providing sufficient salmon resources for subsistence harvest led to limitations on commercial salmon fishing during several periods, including a complete commercial fishing closure on the Yukon River between 1925 and 1931. In the 1980s, concerns about possible overharvest of Chinook runs led to reduced commercial fisheries in the late 1980s and 1990s.³⁶²

Poor returns of Chinook salmon in the late 1990s and early 2000s resulted in restrictive management of the commercial fishery and complete closure in 2001 to ensure subsistence resources.³⁶³ Yukon River Chinook runs showed signs of improvement for several years following the 2001 commercial closure, but restricted commercial harvest in 2008 and complete

³⁶³ Ibid.

closure of Chinook harvest in 2009 led to declaration of a fishery disaster that year.³⁶⁴ A fishery disaster was again declared for the 2012 season, when the commercial Chinook salmon fishery was closed and subsistence fishery was significantly restricted. ADF&G, the Alaska Board of Fisheries, and constituents are working together to develop a conservation plan that restricts Chinook harvest while allowing for greater harvest of more abundant species, including gear and other management restrictions.³⁶⁵

Like Yukon Chinook salmon runs, chum salmon runs have seen poor returns since 1998. A relatively strong run in 2007 led to some effort to redevelop the Yukon chum fishery, but this process is challenged by the need to reduce incidental harvest of co-migrating Chinook salmon. Further, beginning in 2008, the fall chum salmon run has not been large enough to provide for commercial opportunity. From 2008 to 2010, management actions have been taken to delay commercial fishing to provide for escapement and subsistence use.³⁶⁶

In years when commercial salmon fishing is open, fishing is allowed along the entire 1,200 miles of the main stem of the Yukon River, as well as 225 miles of the Tanana River. There are 7 fishing districts, 10 subdistricts, and 28 statistical areas. Fishing takes place with set and drift gillnets, and fish wheels are also allowed in Upper Yukon districts (Districts 4, 5, and 6). Subsistence fishermen also most often utilize these gear types. Many subsistence fishermen are also commercial fishermen.³⁶⁷

Some commercial fishing also takes place in the area for “freshwater fish”, which may target species such as Arctic char, northern pike, rainbow trout, Dolly Varden char, and sheefish.³⁶⁸

Holy Cross is located in District 3 of the Lower Yukon River salmon fishery. It is also important to note that the ocean area into which the Yukon River flows is encompassed by Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Holy Cross is not eligible to participate in the Community Quota Entity program or the Community Development Quota program.

In the 2011 AFSC survey, community leaders reported that Holy Cross actively participates in fisheries management processes in Alaska through sending a representative to sit on a regional fisheries advisory and/or working group run by ADF&G. When asked to report challenges faced by the fishing economy, community leaders indicated that Holy Cross has been negatively impacted by reduced fishing hours, outlawing fish wheels, the reduction of legal mesh size in the salmon gillnet fishery, and the lack of a processing facility in District 3 of the Lower Yukon River salmon fishery. Without a processing facility, local fishermen have difficulty making money in the commercial salmon fishery. Community leaders also indicated that Holy Cross has been negatively impacted by salmon by-catch in the high seas pollock fishery, and expressed the opinion that the high seas harvest should be shut down for several years as an experiment to find out whether Chinook salmon begin to come back in higher numbers.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Holy Cross does not have a registered processing plant. In the 2011 AFSC survey, community leaders indicated that there hasn't been a processing plant in District 3 of the Lower Yukon River salmon fishery for many years, and expressed the desire for a processing facility to be developed in District 3 to provide greater economic opportunity in the region.

According to the 2010 Intent to Operate list, the nearest processing facilities were located in Anvik (approximately 40 miles upriver in District 4) and Saint Mary's (approximately 180 miles downriver in District 2). In Anvik, Bonasila, Inc. operates a salmon roe processing facility, and Boreal Seafoods, Inc. is a registered processing plant in Saint Mary's that purchases salmon from local fishermen, with processing focused on Chinook, chum, and coho.³⁶⁹

Fisheries-Related Revenue

Between 2000 and 2010, there was little known fisheries-related revenue generated in Holy Cross. The only known source was the Shared Fisheries Business Tax, which generated a total of \$329 between 2000 and 2010. No other known fisheries-related revenue was reported during this period (Table 3).³⁷⁰

Commercial Fishing

Holy Cross is a river fishing community, located approximately 275 miles up the Yukon River. The primary fisheries resource available to Holy Cross fishermen is salmon. Between 2000 and 2010, Holy Cross residents participated in commercial salmon fishery as permit holders, crew license holders, and vessel owners. The number of vessels homeported in Holy Cross each year was typically slightly higher than the number of vessels reported to be primarily owned by Holy Cross residents. According to a survey conducted by the AFSC in 2011, community leaders reported that commercial fishing boats using Holy Cross as a base of fishing operations were all under 35 feet in length and were mostly gillnetters. No fish buyers or processing facilities were located in the community, and no landings were delivered locally. Information about the commercial fishing sector in Holy Cross is presented in Table 5.

During the 2000-2010 period, all but one Commercial Fisheries Entry Commission (CFEC) permit held in Holy Cross were for Yukon River salmon gillnet fisheries. In 2008, one permit was also held for freshwater fish ('other finfish'), but was not actively fished that year. In all years during the decade, a majority of salmon permits were held in the Lower Yukon River gillnet fishery, with a smaller number held in the Upper Yukon River gillnet fishery. The only salmon permits that were actively fished between 2000 and 2010 were for the Lower Yukon River. The total number of salmon permit holders and number of permits held remained stable through the decade. However, the number of permits that were actively fished showed a declining trend. No permits were actively fished in 2001-2002 and 2008-2010. The lack of permit activity in these years is explained by complete closures of the commercial Chinook

³⁶⁹ Boreal Fisheries. 2009. *Homepage*. Retrieved May 31, 2012 from <http://www.borealfish.com/>.

³⁷⁰ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

fishery in 2001 and 2009, and restricted commercial fishing effort in other years (see *History and Evolutions of Fisheries* section). This information about CFEC permits is presented in Table 4.

Between 2000 and 2010, no residents of Holy Cross held Federal Fisheries Permits (FFP), License Limitation Program permits (LLP), or participated in federal halibut, sablefish, or crab catch share fisheries. Information about federal permits held by Holy Cross residents is presented in Table 4, and information about federal catch share participation is presented in Tables 6 through 8.

Given the lack of fish buyers and shore-side processing facilities in Holy Cross between 2000 and 2010, no landings or revenue information is reported in the community (Table 9). Information about landings and ex-vessel revenue earned by Holy Cross vessel owners between 2000 and 2010 is considered confidential due to the small number of participants (Table 10).

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses were registered in Holy Cross. However, several licensed sport fish guides were present in the community each year. The number of licensed guides varied between four and one per year, with a declining trend over the period. The number of sportfishing licenses purchased by Holy Cross residents (irrespective of point of sale) ranged from 48 to 71 per year. The number of licenses purchased by residents each year was slightly higher than the total number of licenses sold in Holy Cross, with the exception of 2009 and 2010 (Table 11).

In a survey conducted by the AFSC in 2011, community leaders reported that sport fishermen in Holy Cross primarily target chum, Chinook, and coho salmon. The Alaska Statewide Harvest Survey,³⁷¹ conducted by ADF&G between 2000 and 2010, also noted sport harvest of sockeye salmon in Holy Cross, as well as harvest of razor clams by Holy Cross recreational fishers. No kept/release log book data were reported for sportfishing charters out of Holy Cross between 2000 and 2010.³⁷²

Holy Cross is located within Alaska Sport Fishing Survey Area Y – Yukon River Drainage. Information is available about both saltwater and freshwater sportfishing activity at this regional scale (Table 11). Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 81 non-resident angler days fished per year, and between 0 and 89 Alaska resident angler days fished per year. The low numbers reported for saltwater sportfishing make sense given that a majority of residents in Yukon drainage communities live a great distance from the ocean, and fishing activities take place primarily in fresh water. Between 2000 and 2010, Alaska resident anglers in the Yukon River drainage consistently fished more days in freshwater (4,783 – 10,400 angler days per year) than non-resident anglers (2,573 – 5,761 angler days per year).

Subsistence Fishing

Historically, subsistence harvest has been foundational to the economy and culture of the Deg Hit’an Athabascan people. Salmon were of primary importance, as well as a secondary dependence on large and small game animals.³⁷³ Today, subsistence and fishing-related activities remain important to the economy and way of life of Holy Cross residents.³⁷⁴ Fish are the most reliable subsistence resource in the lower-middle Yukon River region. In addition to salmon, non-salmon fish are a vital component of the subsistence fish harvest, partly due to their year-round availability. Non-salmon fish species harvested by residents of Holy Cross include whitefish, sheefish, northern pike, Arctic grayling, longnose sucker, burbot, Alaska blackfish, and Arctic lamprey.³⁷⁵

Alaska Dept. of Fish and Game, Tech. Paper No. 289. Retrieved October 4, 2012 from <http://www.subsistence.adfg.state.ak.us/TechPap/tp289.pdf>.

According to data reported in ADF&G’s Community Subsistence Information System, in 2002, 21% of Holy Cross households were estimated to participate in harvest or use of non-salmon fish, while estimates were not reported regarding the percentage of households participating in salmon, halibut, marine mammal, or marine invertebrate subsistence, or the per capita subsistence harvest in Holy Cross between 2000 and 2010 (Table 12). In 2002, total estimated non-salmon fish harvest was reported to be 5,310 pounds (Table 13).

ADF&G also reported information regarding subsistence salmon permits issued to Holy Cross households between 2000 and 2008. During this period, the number of permits issued was relatively stable from year to year, varying between 48 and 65 per year, while the number of permits returned varied from 21 to 36 per year. Chinook were by far the most heavily harvested salmon species during this time period, averaging 2,395 Chinook taken per year. Chum and coho were the next most heavily harvested species, averaging 803 and 135 fish harvested per year, respectively. A small number of pink and sockeye salmon were also reported as harvested in some years during the period (Table 13).

No information was reported by management agencies regarding subsistence harvest of halibut (Table 14) or marine mammal species (Table 15) by residents of Holy Cross between 2000 and 2010.

Nenana (nuh-NAN-uh)

People and Place

*Location*³⁷⁶

Nenana is located in Interior Alaska, 55 road miles southwest of Fairbanks on the George Parks Highway. Nenana is located at mile 412 of the Alaska Railroad, on the south bank of the Tanana River, just east of the mouth of the Nenana River. It lies 304 road miles northeast of Anchorage. The City encompasses 6.0 square miles of land and 0.1 square miles of water. Nenana is in the Yukon-Koyukuk Census Area and the Nenana Recording District.

*Demographic Profile*³⁷⁷

In 2010, there were 378 inhabitants in Nenana, making it the 141st largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population of Nenana decreased by 3.8%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents decreased by 12.2%, with an average annual growth rate of -0.74%. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that approximately 24 individuals were present in Nenana as seasonal or transient workers between March and October. They indicated that the yearly population peak in Nenana occurs between June and August each year, and that population fluctuations are slightly driven by employment in fishing sectors.

In 2010, a majority of Nenana residents identified themselves as White (56.1%), while 37.6% identified themselves as American Indian or Alaska Native, 0.3% as Asian, 0.3% as Black or African Americans, and 5.6% of residents identified with two or more races. In addition, 0.5% of Nenana residents identified themselves as Hispanic in 2010. Compared to 2000, residents identifying as American Indians and Alaska Natives made up 3.4% less of the population in 2010, while those identifying as White made up 5.4% more of the population. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Nenana was 2.21. Overall, this represents a slight decrease from the 1990 average of 2.8 persons per household, but an increase from 1.99 persons per household in 2000. The number of households in Nenana has increased over time, from 140 households in 1990 and 159 in 2000, to 171 occupied housing units in 2010. Of the 215 total housing units surveyed for the 2010 U.S. Decennial Census, 53% were owner-occupied, 26.5% were rented, and 20.5% were vacant or used only seasonally. From 1990 to 2010, no residents of Nenana lived in group quarters.

Figure 1. Racial and Ethnic Composition, Nenana: 2000-2010 (U.S. Census).

In 2010, the gender makeup of Nenana’s population (50.8% male and 49.2% female) was more gender balanced than the population of the State as a whole, which was 52% male and 48% female. That year, the median age of Nenana residents was 48 years, much older than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 24.7% of Nenana’s population was age 60 or older. The overall population structure of Nenana in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Nenana Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),³⁷⁸ 85.3% of Nenana residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also in 2010, 4.7% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 10% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 31.3% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 6.9% were estimated to have an Associate’s degree, compared to 8% of Alaskan residents overall; 8.8% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaskan residents overall; and 3.8% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

³⁷⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*³⁷⁹

Nenana is in the western-most portion of Tanana Athabascan territory. It was first known as Tortella, an interpretation of the word “Toghotthele,” which means “mountain that parallels the river.” The Nenana Valley of Central Alaska is the site of one of the earliest archaeological sites in North America, dating between about 11,000 and 12,000 years old.³⁸⁰ The site of the City of Nenana was historically used by Athabascan Indians for summer subsistence and mid-winter ceremonial activities.³⁸¹ Interpretations of the name Nenana in the Athabascan language include, “easy place to camp,” or “camp between the rivers.”³⁸² By the late 1800s, the Native people had established a small village with permanent dwellings there.³⁸³

Contact between Europeans and residents of the Tanana Valley began around 1850, following the establishment of a fort at Fort Yukon in 1847 by Russian fur traders. Another fort was established at “Nuklukayet,” at the confluence of the Yukon and Tanana Rivers, in 1860.³⁸⁴ The first non-Native explorers to enter the Tanana Valley were Allen, Harper, and Bates in 1875 and 1885. The discovery of gold in Fairbanks in 1902 brought intense activity to the region.³⁸⁵ The juncture of river and railroad transportation made Nenana a center for commerce in the region during the gold rush and railroad construction period.³⁸⁶

Because of available transportation, Nenana became the headquarters for St. Mark’s Episcopal Mission,³⁸⁷ which was built upriver in 1905, followed by a mission school in 1907.³⁸⁸ Native children from other communities, such as Minto, attended school in Nenana. A post office opened in 1908. By 1909, there were about 12,000 residents in the Fairbanks area, most drawn by gold mining activities.³⁸⁹ Settlement of a non-Native population in Nenana occurred with the construction of the Alaska Railroad between 1916 and 1923,³⁹⁰ doubling the town’s population.³⁹¹ The community incorporated as a City in 1921. The railroad depot was completed in 1923, when President Warren Harding drove the golden spike at the north end of the 700-foot steel bridge over the Tanana River, which created a transportation link to Fairbanks and Seward.³⁹²

During the 1925 diphtheria epidemic in Nome, serum from Anchorage was transported to Nenana by train before being sent by dogsled to Nome. According to local records, 5,000

residents lived in Nenana during this time.³⁹³ A dramatic decline in population followed the completion of the railroad, primarily due to the departure of non-Natives, and also due to an influenza epidemic in 1920 in which one fourth of the Indian population perished.³⁹⁴ Completion of the railroad was also followed by an economic slump. The population in 1930 was recorded at 291.³⁹⁵

Today, the City attracts independent travelers in search of fuel and supplies, the Alaska Railroad Museum, the Golden Railroad Spike Historic Park and Interpretive Center, the historical St. Mark's Episcopal Church, Iditarod dog kennels, and the Alfred Starr Museum & Cultural Center. The Nenana Ice Classic, a contest established in 1917 to guess when the ice will break in the Nenana River each year, is a statewide event.³⁹⁶

Natural Resources and Environment

Nenana has a cold, continental climate with an extreme temperature range. The average daily maximum during summer months is 65 to 70 °F; the daily minimum during winter is well below 0 °F. The highest temperature ever recorded was 98 °F, and the lowest was -69 °F. Average annual precipitation is 11.4 inches, with 48.9 inches of snowfall. Nenana is located on the Tanana River, which is ice-free from mid-May to mid-October.³⁹⁷ The Tanana River, meaning “river trail” in Athabascan, is an important tributary of the Yukon River.³⁹⁸ Runs of Chinook, chum, and coho salmon return to the Yukon and Tanana Rivers each year, spawning as far inland as the headwaters of the Yukon River in Canada.³⁹⁹

Nenana is located one mile west of the border of a western segment of Tanana Valley State Forest, and four miles south of the border of the Minto Flats State Game Refuge. The Game Refuge is nestled among scattered segments of the State Forest, which totals 1.78 million acres and stretches along the Tanana River from near the Canadian border to Manley Hot Springs. Almost 90% of the State Forest is covered by hardwood and hardwood-spruce type forests, with high representation of paper birch, quaking aspen, balsam poplar, black and white spruce, and tamarac. Almost 7% of the forest is shrub land, covered primarily in willow.⁴⁰⁰

The Minto Flats State Game Refuge encompasses 500,000 acres. It was established in 1988 for the protection and enhancement of fish and wildlife, and to guarantee hunting, fishing, and trapping opportunities. The landscape is a mosaic of ponds, oxbows, stream channels, and wetland and upland vegetation, providing habitat for waterfowl, big game, and furbearers, as well as anadromous and resident freshwater fish species. The area has traditionally been and

remains an important area for harvesting fish, wildlife, and other resources for Athabascan Indians and others living in the Nenana area.⁴⁰¹

Natural hazard risks in the Nenana area include flooding, wildfire, earthquakes, snow and avalanche, severe weather, landslides and erosion. Shallow earthquakes in the area of Nenana would be considered ‘intraplate’ earthquakes, which can have a magnitude of up to 7 on the Richter scale. There have been three magnitude 7 earthquakes in the Fairbanks area in the past 90 years.⁴⁰² In late July, 2008, the Tanana River flooded, damaging residential septic, water systems and basements, washing out culverts, and temporarily shutting down Alaska Railroad train service.⁴⁰³

Interior Alaska is dotted with mineral deposits. No mining projects are located directly in Nenana, but the greater Tanana-Fairbanks region has deposits of gold, copper, silver, tin, tungsten, and antimony.⁴⁰⁴ To the south of Nenana, Usibelli Coal Mine, Inc. has been producing coal since the 1940s.⁴⁰⁵

According to the Alaska Department of Environmental Conservation (DEC), one active environmental cleanup site was located in Nenana as of May 2012. In 1991, petroleum contamination was identified in the soil and groundwater near an underground storage tank (UST) system at A-Frame Services in Nenana. In 1993, the UST system was removed and soils were excavated and treated. Ongoing groundwater monitoring indicates that the contaminated plume is stable and decreasing in concentration. To date, contaminants have not been detected above Maximum Contaminant Levels in a drinking water well located at the facility.⁴⁰⁶

Current Economy⁴⁰⁷

Over 40% of year-round jobs in Nenana are government-funded, including employment with the City, Tribe, Nenana School District, Yukon-Koyukuk School District, and Department of Transportation highway maintenance. As the center of rail-to-river barge transportation for Interior Alaska, Nenana has a strong seasonal private-sector economy. Crowley Marine is the major private employer in Nenana, providing supplies and fuel to over 40 villages along the Tanana and Yukon Rivers each summer. Subsistence foods, such as salmon, moose, caribou (by permit), bear, waterfowl, and berries play an important role. A number of Nenana residents are also involved in commercial salmon fisheries.^{408,409} Between 2000 and 2010, the percentage of

Nenana residents holding state Commercial Fisheries Entry Commission (CFEC) permits was equivalent to between 6% and 7% of the population per year, although a smaller percentage were actively fished each year (see *Commercial Fishing* section).

Based on household surveys conducted for the 2006-2010 ACS,⁴¹⁰ in 2010, the per capita income in Nenana was estimated to be \$25,479 and the median household income was estimated to be \$56,250. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$17,334 and \$33,333, respectively). Income levels in 2010 remain slightly higher than 2000 levels even when inflation is taken into account by converting the 2000 values to 2010 dollars,⁴¹¹ revealing a real 2000 per capita income of \$22,794 and real 2000 median household income of \$43,832. In 2010, Nenana ranked 101st of 307 Alaskan communities with per capita income data that year, and 96th in median household income, out of 305 Alaskan communities with household income data.

Nenana's small population size may have prevented the ACS from accurately portraying economic conditions.⁴¹² An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Nenana in 2010 is \$17,455,⁴¹³ similar to the per capita income reported for the year 2000. This suggests that caution is warranted when citing an increase in per capita income in Nenana between 2000 and 2010, but provides additional evidence for income stability in the community during this period. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

This evidence of income stability is reflected in the fact that Nenana did not meet the Denali Commission's primary criteria for a "distressed community" in 2010. However, Nenana did make a list of additional communities that meet the distressed classification when a plus/minus 3% formula is used.⁴¹⁴

Based on the 2006-2010 ACS, in 2010, a slightly lower percentage of Nenana residents were estimated to be in the civilian labor force (64.4%) than in the civilian labor force statewide (68.8%). In the same year, 20.9% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate was estimated to be 15.2%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the

unemployment rate in 2010 was 19.9%, compared to a statewide unemployment rate estimate of 11.5%.⁴¹⁵

Also based on the 2006-2010 ACS, the greatest number of workers was estimated to be employed in the private and public sectors (47.8% and 46.6%, respectively). Of the remaining 5.6%, 1.7% were estimated to be self-employed and 3.9% to be unpaid family workers. Of the 178 people aged 16 and over that were employed in the civilian labor force, the majority was estimated to be working in the public administration (32%) and educational services, health care, and social assistance (20.2%). Only 3.9% of the civilian labor force was estimated to be working in agriculture, forestry, fishing, hunting, and mining in 2010. However, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 224 employed residents in 2010, of which 25.4% were employed in local government, 21% in leisure and hospitality, 15.6% in trade, transportation, and utilities industries, 12.9% in educational and health services, 8.9% in construction, 4.5% in professional and businesses services, 4.5% in natural resources and mining, 4.5% in financial activities, 1.3% in state government, 0.4% in information, and 0.9% in other industries.⁴¹⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Nenana is a Home Rule City which was incorporated in 1921. It is not included in an organized borough. The City has a Strong Mayor form of government, with a seven-person city council including the mayor, a seven-person advisory school board, and four municipal employees. The City administers a 4% sales tax and a 12.0 mills property tax.⁴¹⁷ Annual municipal revenue totals generally increased over the 2000-2010 period. In addition to sales and property tax revenues, locally-generated revenue sources in Nenana include building rentals and leases, traffic fines, and charges for local services and events. Outside revenue sources include a variety of revenue sharing programs and grants. Nenana received contributions from the State Revenue Sharing program each year from 2000 to 2004, ranging from \$27,540 to \$40,000 per year, and Community Revenue Sharing contributions of approximately \$120,000 per year in 2009 and 2010. Revenues were also received from the federal Payment in Lieu of Taxes program. It is also important to note that Nenana received an \$850,000 grant from the Denali Commission in 2007 for upgrades to the Nenana Tug and Barge Port.⁴¹⁸ Information about selected aspects of Nenana’s municipal revenue is presented in Table 2.

Nenana was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Nenana Native Association. The Native village corporation is Toghothtele Corporation, which manages 138,240 acres of land. The regional Native corporation to which Nenana belongs is Doyon, Limited.⁴¹⁹

Nenana is also a member of the Tanana Chiefs Conference, a tribal 501(c)(3) non-profit organization headquartered in Fairbanks. It is a consortium of 42 villages of Interior Alaska that works to meet “the health and social service challenges for more than 10,000 Alaska Natives spread across a region of 235,000 square miles in Interior Alaska.” The non-profit provides health and tribal development services, as well as educational and employment services to individuals of member tribes.⁴²⁰ The Tanana Chiefs Conference is one of the 12 regional Alaska

Native nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.⁴²¹

The closest offices of the Alaska Department of Natural Resources, Alaska Department of Fish and Game (ADF&G), Alaska Department of Commerce, Community, and Economic Development, and U.S. Bureau of Citizenship and Immigration Services are located in Fairbanks, 55 miles northeast of Nenana by road. Anchorage hosts the nearest office of the National Marine Fisheries Service (NMFS).

Infrastructure

Connectivity and Transportation

Nenana is accessible by road, railroad, river, and air. The community is located on the George Parks Highway, the road connecting Wasilla and Fairbanks. The railroad provides daily freight service. The Nenana Municipal Airport offers a 4,600 feet long by 100 feet wide lighted asphalt runway and a gravel runway that doubles as a ski strip in the winter, which measures 2,520 feet by 60 feet. There is also a float pond with parking basins for float planes.⁴²² The airport receives air taxis and is open to transient and local general aviation. No scheduled commercial flights serve Nenana.⁴²³ Fairbanks is located 55 miles away by road, and the price of a roundtrip ticket by plane from Fairbanks to Anchorage in early June of 2012 was \$247.⁴²⁴ Daily buses to Fairbanks and Anchorage are available year-round.⁴²⁵

The Nenana Port Authority operates the dry cargo loading and unloading facilities, dock, bulkhead, and warehouse. The Tanana River is shallow, with a maximum draft for loaded river barges of 4.5 feet. There is a public boat launch with a recreational area to provide access to the Nenana and Tanana rivers.⁴²⁶

Facilities

The City of Nenana operates a piped water and sewer system. Water is derived from a deep well, treated, and then distributed throughout the community via circulating loops. A piped gravity system collects sewage, which is treated at a secondary treatment plant. Most of the City is connected to the piped water and sewer system, which serves a total of 215 homes as well as the school. The remaining homes have individual wells and septic systems, and some use outhouses. Refuse is collected by a private firm and hauled to the Denali Borough regional landfill, located approximately 30 miles south along the George Parks Highway. A diesel powerhouse, operated by Golden Valley Electric Association, provides electricity to the City. Telephone and internet service is available in Nenana, but no cable company provides service locally.⁴²⁷

Public safety services are provided by state troopers stationed in Nenana, and fire/rescue services are provided by the Nenana Volunteer Fire Department and Emergency Medical Services (EMS). Nenana is home to the Nenana District Court system. Other community facilities include a youth/recreation center, a community center, senior housing, a small exercise room, a museum (the Alfred Starr Nenana Cultural Center) and both a public and a school library.⁴²⁸ According to a survey conducted by the AFSC in 2011, community leaders reported additional public services available in Nenana, including a food bank and publicly subsidized housing.

With regard to fishing-related infrastructure, community leaders reported in the 2011 AFSC survey that 1,400 feet of dock space is available for permanent vessel moorage, and 800 feet of dock space is available for transient vessel moorage, with dock facilities served by both road access and water. They said the harbor is dredged and a jetty is in place, and that vessels up to 120 feet in length can use moorage at Nenana. Community leaders also indicated that haulout and dry dock services are available for vessels less than 60 tons, and that boat fuel, bait, and tackle are for sale in Nenana. According to the survey, Fairbanks is the primary destination for access to fisheries-related businesses and services not provided in Nenana.

Medical Services

Local health care is provided by the Nenana Clinic, which is owned by the Village Council non-profit and operated by the Tanana Chiefs Conference. The Nenana Clinic is a Community Health Aide Program (CHAP) site. Nenana also has a mental health clinic. Emergency Services have highway, river and airport access. Emergency service is provided by 911 Telephone Service volunteers and a health aide. Auxiliary health care is provided by the Nenana Volunteer Fire/EMS Department.⁴²⁹ A number of hospitals are located 55 miles away in Fairbanks.

Educational Opportunities

The Nenana City School District operates one local school and a correspondence program. The Nenana City School and the CyberLynx Correspondence Program both serve preschool through 12th grade. As of 2011, the Nenana City School had 200 students and 18 teachers.⁴³⁰ The CyberLynx Correspondence Program had 951 students and seven teachers that same year.⁴³¹ The Nenana Student Living Center, one of three statewide boarding facilities for high school students, provides housing to up to 88 students from around Alaska.⁴³²

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Indigenous people living along the Yukon and Tanana Rivers have long harvested salmon for subsistence purposes. Salmon was used for personal subsistence as well as food for sled dogs. The first recorded commercial harvest of salmon in the Alaskan portion of the Yukon River took place in 1918, and early harvests were relatively large. Concerns about providing sufficient salmon resources for subsistence harvest led to limitations on commercial salmon fishing during several periods, including a complete commercial fishing closure between 1925 and 1931. In the 1980s, concerns about possible overharvest of Chinook runs led to reduced commercial fisheries in the late 1980s and 1990s along the Yukon. Poor returns in the late 1990s and early 2000s
