³ Wolfe, R.J., Fall, J.A. and M. Riedel. 2009. The subsistence harvest of harbor seals and sea lions by Alaska Natives in 2008. Alaska Native Harbor Seal Commission and Alaska Department of Fish and Game Division of Subsistence, Technical Paper No. 347, Anchorage.

Bethel (BETH-ul)

People and Place

*Location*¹⁷⁶

Bethel is located at the mouth of the Kuskokwim River, 40 mi inland from the Bering Sea. It lies in the Yukon Delta National Wildlife Refuge, 400 mi west of Anchorage. The area encompasses 43.8 sq mi of land and 5.1 sq mi of water. Bethel was incorporated as a Second-class city in 1957, is located in the Bethel Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*¹⁷⁷

In 2010, there were 6,080 residents, ranking Bethel 17th of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population grew by 30%. Between 2000 and 2009, the population grew by 6.1% with an average annual growth rate of -0.13%, somewhat lower than the statewide 0.75% and indicative of a slowing rate of growth. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported an estimated 200 transient or seasonal workers living in Bethel in 2010. Seasonal workers typically live in the community from June through September, and the population peaks in July and August as well as December and January. These population peaks are somewhat to mostly driven by employment in the fishing sectors. Information regarding population trends can be found in Table 1.

Bethel's population was predominately Yup'ik Eskimo in 2010. In that year, 65.0% of residents identified themselves as American Indian or Alaska Native, compared to 61.8% in 2000; 23.3% identified themselves as White, compared to 26.8% in 2000; 2.5% identified themselves as Asian, compared to 2.9% in 2000; 0.9% identified themselves as Black or African American, compared to 0.9% in 2000; 0.4% identified themselves as Native Hawaiian or Other Pacific Islander, compared to 0.2% in 2000; 7.3% identified themselves as two or more races, compared to 6.9% in 2000; and 0.6% identified themselves as some other race, compared to 0.5% in 2000. In addition, 2.2% of residents identified themselves as Hispanic or Latino, compared to 1.7% in 2000.

In 2010, the average household size was 3.04, a decrease from 3.1 in 1990 and 3.65 in 2000. In that same year there were 2,364 total housing units, an increase from 1,624 in 1990 and 1,990 in 2000. Of those households surveyed in 2010, 35.8% were owner-occupied, compared to 37.6% in 2000; 44.4% were renter-occupied, compared to 49.8% in 2000; 13.7% were vacant, compared to 9.4% in 2000; and 6% were occupied seasonally, compared to 3.1% in 2000. In 2010, 321 residents were living in group quarters, compared to 241 in 2000.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

Gender distribution in Bethel was relatively equal in 2010 at 51.9% male and 48.1%. This was similar to both the distribution statewide (52.0% male, 48.0% female) and distribution in 2000 (52.5% male, 47.5% female). The median age that year was 28.7 years, which was younger than the statewide median of 33.8 years and similar to the 2000 median of 29.1 years.

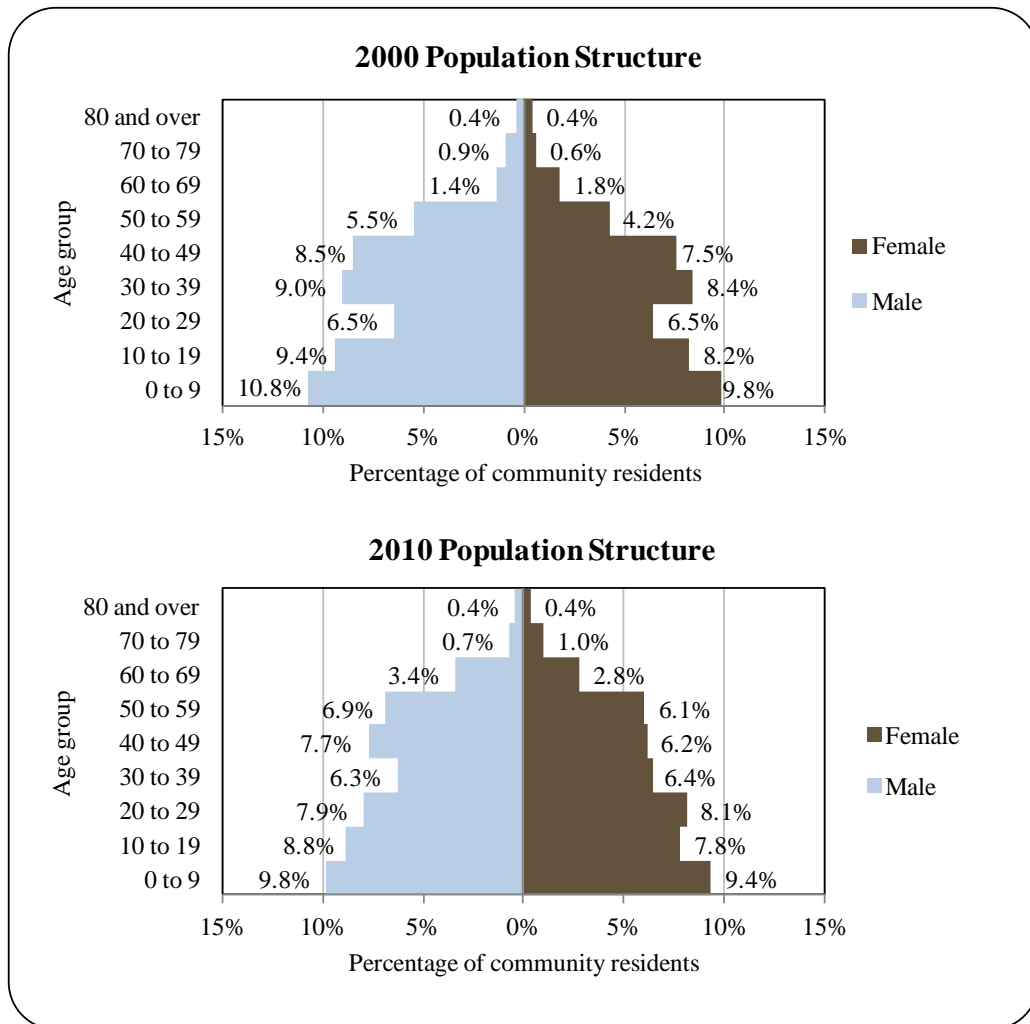

Figure 1. Racial and Ethnic Composition, Bethel: 2000-2010 (U.S. Census).

Overall, the population structure in both 2010 and 2000 was expansive. In addition, cohorts maintained their overall structure as they aged, possibly indicating a stable population. In 2010, 35.8% of residents were under the age of 20, compared to 38.2% in 2000; 8.7% were over the age of 59, compared to 5.5% in 2000; 39.6% were between the ages of 39 and 59, compared to 43.1% in 2000; and 16.0% were between the ages of 20 and 29, compared to 13.0% in 2000.

Gender distribution by age cohort was slightly more even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred in the 40 to 49 range (7.7% male, 6.2% female), followed by the 10 to 19 (8.8% male, 7.8% female) and 50 to 59 (6.9% male, 6.1% female) ranges. Of those three, the greatest relative gender difference occurred in the 40 to 49 range. Information regarding trends in Bethel’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Bethel Based on the 2000 and 2010 U.S. Decennial Census.

According to the U.S. Census' 2006-2010 American Community Survey (ACS),¹⁷⁸ an estimated 91.7% of the population in Bethel aged 25 and over held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in 2010, an estimated 3.6% of the population had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 4.7% of the population had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 26.5% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 5.7% had an Associate's degree, compared to an estimated 8% of Alaska residents overall; an estimated 14.8% had a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 11% had a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*¹⁷⁹

The area around what is now Bethel was originally occupied by Yup'ik Eskimos around 2,000 years ago. At that time, the area provided a strategic trading route along the Yukon-Kuskokwim (Y-K) Delta region, connecting many communities located on the two rivers. The original settlement "Mamterillermuit" was located across the river from modern day Bethel. In 1880, the U.S. Census recorded 29 people living in Mamterillermuit. At that time the community was primarily an Alaska Commercial Trading post. On the advice of a local shaman, the original site was moved across the river, and a Moravian mission was constructed. After the purchase of Alaska in 1867, trading posts were established in Fort Komakovsky and Vinasale. By the late nineteenth century, Bering Sea Eskimos and Nunivak Islanders traveled to Bethel to trade, and around the turn of the century a medical facility, post office, and federal school were constructed. In 1912, the U.S. Army Corps of Engineers mapped a deep water channel, and by 1915 ocean liners began visiting Bethel regularly. Around that point Bethel had been established as a regional hub for the Y-K Delta region, and by the late 1930s, the region's center for aviation and government administration. After World War II, Bethel's city government was organized, and it became the largest community in western and arctic Alaska by the 1980s. Today, Bethel's culture is strongly rooted in Yup'ik tradition and subsistence activities continue to be a central component of community cohesion. As a regional hub, many people come from surrounding villages to meet, work, and network in a setting where traditional and modern values are interwoven.

Bethel has one property on the National Register of Historic Places. The First Mission House was constructed in 1885 and was the first Moravian mission in southwest Alaska.¹⁸⁰

¹⁷⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Natural Resources and Environment

Precipitation averages 16 inches per year, and snowfall averages 50 inches per year. Summer temperatures range from 42 to 62 °F (6 to 17 °C). Winter temperatures range from -2 to 19 °F (-19 to -7 °C).¹⁸¹

Bethel is located in the Yukon Delta National Wildlife Refuge (YDNWR) which covers 19 million acres of the upper and lower Y-K Delta region.¹⁸² Bethel itself is located on lowland alluvial deposits comprised of mud, silt, sand, gravel, and various organics; similar to conditions found on coastal plains found in much of western Alaska. The landscape in these lowland areas is populated with shallow circular and oxbow lakes, streams, and sloughs. Upland areas consist of silt deposits covered by a shallow permafrost layer. Vegetation in the area is characteristic of poorly drained, moist tundra. Vegetation types include dwarf shrubs, mosses, lichens, forbs, grasses, and herbs. In areas along the Kuskokwim River, thickets of alder, willow, and birch can be found. Most of the area surrounding Bethel is classified as wetland habitat.¹⁸³ In terms of wildlife, the area is probably best known for the abundant species of waterfowl. Many migratory birds make use of the wetlands for nesting. Terrestrial mammals in the area include moose, wolves, red and arctic fox, snowshoe hare, beaver, muskrat, and caribou. Marine and freshwater fish include all five species of Pacific salmon, sheefish, smelt, whitefish, burbot, northern pike, Dolly Varden char, rainbow trout, arctic grayling, herring, halibut, tomcod, and flounder.¹⁸⁴

Natural resources in the area include several mineral locations within 100 mi of Bethel. These include placer deposits of gold, and a mercury project at Arsenic Creek.¹⁸⁵ Other mineral projects in the area include Bogus Creek and Nyak gold prospects to the east.¹⁸⁶

Natural hazards in the area primarily include bank erosion and flooding.¹⁸⁷ Bethel is located on an oxbow curve in the Kuskokwim River, making it susceptible to erosion. When the city was founded it was protected by several islands; however, by 1939 the islands had eroded and Bethel was left unprotected. In addition, steep banks of unconsolidated silty soils are left susceptible to erosive forces as permafrost retreats. Much of Bethel lies within a floodplain, which is inundated annually. Elevations below 17 ft are at high risk of flooding due to seasonal ice jams and poorly drained soils. Bulkheads and pilings have been constructed to mitigate impacts; however, undercutting continues to be an issue.¹⁸⁸

According to the Alaska Department of Environmental Conservation (DEC), there are no significant environmental remediation sites active in Bethel.¹⁸⁹

Current Economy¹⁹⁰

Bethel serves as the regional hub for 56 villages in the Y-K Delta. Food, fuel, transportation, medical care, and other services for the region are provided by Bethel. Subsistence activities contribute substantially to villager's diets, particularly salmon, freshwater fish, game birds, and berries. Poor fish returns since 1997 have significantly affected the community.¹⁹¹

In a survey conducted by the AFSC in 2011, community leaders reported that Bethel's economy relies upon mining, fishing, ecotourism, and sport hunting and fishing. While the community relies mostly on employment in the fishing sectors, 1,300 residents are employed at the regional hospital making it the largest contributor to local employment.

Top employers in Bethel for 2010¹⁹² include Yukon Kuskokwim Health Corporation, Lower Kuskokwim School District, State of Alaska, Association of Village Council Presidents (AVCP), City of Bethel, Omni Enterprises Inc., AVCP Housing Authority, AK Commercial Company, University of Alaska, and Hageland Aviation Services Inc.

In 2010,¹⁹³ the estimated per capita income in Bethel was \$29,220 and the estimated median household income was \$86,935, compared to \$20,267 and \$57,321 in 2000, respectively. After accounting for inflation by converting the 2000 values to 2010 dollars,¹⁹⁴ the real per capita income (\$26,651) and real median household income (\$75,376) indicate an overall increase in individual and household earnings between 2000 and 2010. Bethel's per capita income and median household income in 2010 was significantly higher than the Bethel Census Area as a whole (\$18,584 per capita income, \$52,214 median household income), highlighting the community's relative weight within the region's cash economy. In 2010, Bethel ranked 65th of 305 communities who reported per capita earnings, and 19th of 299 communities for which median household earnings were reported.

Bethel's small population size may have prevented the ACS from accurately portraying economic conditions.¹⁹⁵ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$112.53 million in total wages in 2010.¹⁹⁶ When matched with the population in 2010, the per capita income equals \$18,507; suggesting that caution should be used when comparing 2010 ACS estimates with the 2000 Census.¹⁹⁷ However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

¹⁹⁰ Unless otherwise noted, all monetary data are reported in nominal values.

¹⁹¹ See footnote 181.

¹⁹³ U.S. Census. American Community Survey 2006-10 estimates.

¹⁹⁴ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹⁹⁵ See footnote 178.

¹⁹⁶ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

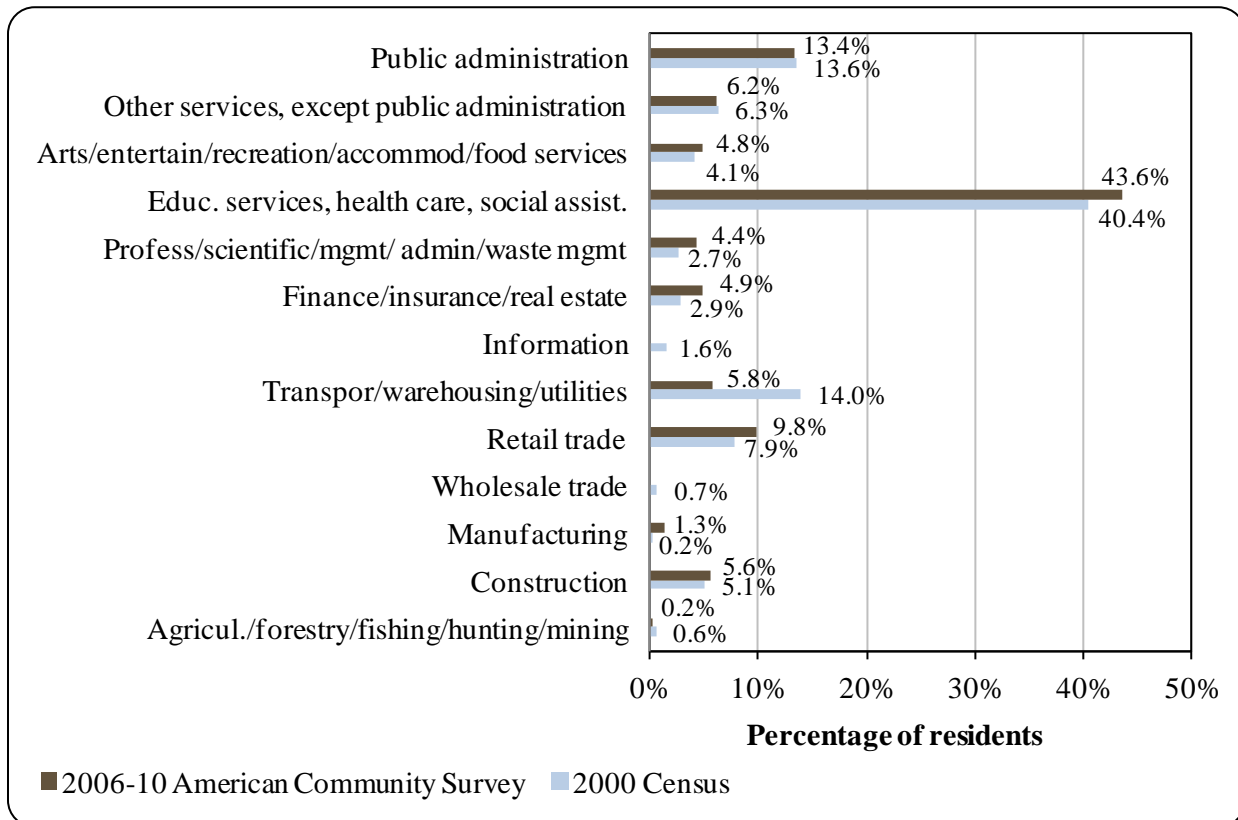

¹⁹⁷ See footnote 192.

According to 2006-10 ACS estimates,¹⁹⁸ 75.6% of residents aged 16 and older were part of the civilian labor force in 2010. The unemployment rate in Bethel was estimated at 7.6%, compared to an estimated 5.9% statewide; and 7.8% of the population was estimated to be living below the poverty level, compared to an estimated 9.5% statewide. Of those employed, 60.8% worked in the private sector, 37.8% worked in the public sector, and 1.4% was self-employed.

By industry, most (43.6%) employed residents were estimated to work in education services, health care, and social assistance sectors in 2010; followed by public administration sectors (13.4%) and retail trade sectors (9.8%). By occupation type, most (46.5%) employed residents were estimated to hold management or professional positions that year; followed by sales or office positions (22.1%); service positions (14.6%); natural resources, construction, or maintenance positions (9.4%); and production, transportation, or material moving positions (7.5%). Overall there was little variation in sector and occupational employment between 2000 and 2010. Information regarding employment trends can be found in Figures 3 and 4.

According to 2010 ALARI estimates,¹⁹⁹ most (31.2%) employed residents worked in education and health service sectors; followed by local government sectors (19.7%); trade, transportation, and utilities sectors (18.7%); and state government sectors (10.0%).

¹⁹⁸ See footnote 178.

¹⁹⁹ See footnote 192.

Figure 4. Local Employment by Occupation in 2000-2010, Bethel (U.S. Census).

Governance

Bethel was incorporated as a Second-class city in 1957. It has a mayoral form of government. In addition, there is a federally recognized Tribal government (Orutsararmuit Native Council) and an Alaska Native Claims Settlement Act (ANCSA) chartered Native village corporation (Bethel Native Corporation). The regional ANCSA chartered Native corporation is Calista Corporation. Additional organizations located within the community include the AVCP, a non-profit corporation which provides a range of services to the Y-K Delta region; and the Native Village of Napaimute. There are National Marine Fisheries Service (NMFS) and Alaska Department of Fish and Game (ADF&G) offices located within the community and the closest U.S. Bureau of Citizenship and Immigration Services (BCIS) offices is located in Anchorage, 400 mi east.

In 2010, the city administered a 6% sales tax, 3% bed tax, 6% alcohol tax, 6% gaming tax, and a motor vehicle registration tax. When adjusted from inflation,²⁰⁰ municipal revenues increased 34.6% between 2000 and 2010 from \$5.63 million to \$9.80 million. In 2010, most local revenue came from sales taxes, gaming fees, taxi permits, and services charges. Most outside revenues came from payments in lieu of taxes, community revenue sharing, and federal stimulus. Sales tax revenue accounted for 76.0% of total municipal revenue in 2010, compared to 64.6% in 2000. State allocated Community Revenue Sharing accounted for 4.0% of total municipal revenues, compared to 3.2% from State Revenue Sharing in 2000. Bethel received several state and federal fisheries-related grants between 2000 and 2010, including \$15,500 for a slush bag delivery and installation system, \$600,000 for the appropriation and deferred maintenance costs of a state-owned dock, and \$500,000 for a small boat harbor dredge project. Information regarding municipal budget trends can be found in Table 2.

²⁰⁰ Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>

Infrastructure

*Connectivity and Transportation*²⁰¹

The state-owned Bethel Airport is the regional transportation center and is served by a number of passenger airlines, cargo carriers, and numerous air taxi services. Bethel is the third busiest state-owned airport in Alaska. It offers 6,400-ft long by 150-ft wide and 4,000-ft long by 75 ft wide asphalt runways and a 1,860-ft long by 75-ft wide gravel crosswind runway. Two float plane bases (Hangar Lake and H Marker Lake) are nearby. The Port of Bethel includes a small boat harbor, drydock storage, and up to 5,000 ft of transient moorage on the seawall. River travel is the primary means of local transportation in the summer, and it becomes a 150-mi ice road to surrounding villages in the winter. A barge service based in Bethel provides goods to the Kuskokwim villages. There are 16 mi of graded dirt roads maintained by the City and 22 mi of paved roads maintained by the State Department of Transportation (DOT). Public transportation services include taxi service, bus service, and boat shuttle service.²⁰² Roundtrip airfare²⁰³ between Bethel and Anchorage in June 2012 was \$360.

*Facilities*²⁰⁴

Public facilities are managed through nine departments, and provide a range of services including general city operations; finance services, including permitting and licensing; planning services; water, wastewater, and waste disposal; communications infrastructure; police and fire services; youth center; several parks, trails and boardwalks; and port and harbor infrastructure including a cargo dock, petro port, small boat harbor, float plane beach, and seawall. Fuel supply is provided by Crowley and Delta Western, electricity is provided by the Bethel Utilities Corporation via six 2,500-kW diesel generators, telephone services are provided by United Utilities, Inc. and GCI, internet is provided by GCI, a museum and community center is maintained by the AVCP, and a library is operated by the City in cooperation with the University of Alaska.

⁵ Alaska Department of Community and Rural Affairs. (n.d.). *Community Funding Database*. Retrieved April 15, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_Grants.htm.

In a survey conducted by the AFSC in 2011, community leaders reported the community had 1,400 ft in public dock space available for permanent moorage and 240-ft of moorage space for transient vessels. Vessels up to 350-ft can use moorage in Bethel. Dock infrastructure is capable of handling regulated vessels, including rescue vessels, fuel barges, hazardous materials, tugs, and freight barges. Typically, commercial vessels under 125-ft use Bethel as a base of operations during the fishing season. Infrastructure projects completed between 2000 and 2010 include dockside electricity, roads serving dock space, haul out facilities, roads, water and sewer pipelines, water treatment, fire department improvements, school improvements, telephone service improvements, and post office improvements. Projects currently in progress or under development as of 2011 include a barge landing area, new dock spaces, dock improvements, dockside utilities, breakwater, harbor dredging, general utilities improvements, alternative energy, landfill improvements, public safety improvements, and communications improvements. Fisheries-related businesses within the community include fishing gear sales, boat repair services (electrical, welding, and mechanical), small vessel haulout services, commercial fishing moorage, recreational fishing moorage, tackle sales, drydock storage, fish lodging, boat fuel sales, fishing gear repair, ice (provided, but no sales), and air taxi. Residents of Bethel go to Kodiak, Homer, Seward, and Seattle for fisheries-related businesses and services not available in the community. A food bank, job placement services, and public subsidized housing are all available in the city.

*Medical Services*²⁰⁵

The Yukon-Kuskokwim Delta Regional Hospital is a qualified Acute Care and long-term care facility which provides regional services to 56 communities around the Y-K Delta. The Bethel Family Clinic is a qualified Emergency Care Center and Primary Health Care facility. Additional specialized care includes alcohol treatment and prevention services, and other outpatient services. Regional Emergency Medical Services (EMS) are also available within the community.

*Educational Opportunities*²⁰⁶

Bethel has a total of 6 schools within the city which provide a K-12 education. In 2011, there were a total of 1,375 students enrolled and 90 teachers, system-wide. In addition, the Kuskokwim campus of the University of Alaska Fairbanks (UAF) is located in Bethel, providing outreach and distance education services to the region. Finally, Yuut Elitnaurviat, a local non-profit corporation, provides regional vocational and on-the-job training.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvesting has been important to residents of the Bethel area for thousands of years. Subsistence salmon harvesting continues to be a primary economic activity along the Kuskokwim River.²⁰⁷ In addition to salmon, spring harvests of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.²⁰⁸

Fisheries participation in the Lower Kuskokwim Delta dates back thousands of years to the original Central Yup'ik occupants. Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. During early years, local salmon were cured and salted and by 1920, the largest commercial season to-date took place on the Kuskokwim, with five operators processing approximately 35,000 Chinook salmon that year. In 1922, there were four salteries operating near the mouth of the Kuskokwim, processing Chinook and sockeye salmon. The Kuskokwim area was closed to all fishing for export from 1926 through 1929. In 1930, regulations were modified to allow commercial fishing in part of Kuskokwim Bay. A floating cannery operated for that year, and by 1932, three companies engaged in commercial fishing. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. Information on commercial fishing during the late 1930s through the 1950s is limited. However in 1952, poor salmon runs prompted the closure of the

Kuskokwim River and Bay. Management was finally shifted to the State of Alaska in 1960, and commercial fishing resumed.²⁰⁹

At the time of statehood in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.²¹⁰ Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.²¹¹

Commercial catch of herring for bait began in Alaska around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.²¹²

On the lower Kuskokwim, subsistence sockeye, chum, and Chinook harvesting typically begins by June 1st, and is concluded by mid-July. Coho and pink salmon are harvested in August and September. Fishing effort is based from either a fish camp or from a home village. Drift gill nets, fish wheels, and rods and reels are used for harvesting. Soon after river ice breaks up in May, smelt move into the lower Kuskokwim area. Residents use fine-meshed nets to catch smelt, and thread them through willow sticks before drying and smoking them. Whitefish, sheefish, Arctic grayling, and northern pike are harvested year-round. Blackfish and burbot are harvested during fall and winter months. Dolly Varden are typically harvested from June through December; while trout are typically harvested in the early spring and summer, and again in the late summer and early fall. Spotted seal, bearded seal, ringed seal, and walrus are harvested in the late spring.^{213,214}

The fishing sectors provide one of the few sources of revenue in the region not originating from government sources. However, over the past 20 years, the contribution of commercial fishing in has fallen due to poor runs and prices. Since the early 1990s, declines in

prices and landings have cost the community millions of dollars in lost revenue; however, prices have rebounded somewhat in recent years.²¹⁵ Bethel is located in Federal Reporting Area 514, International Pacific Halibut Commission (IPHC) Regulatory Area 4E, and the Bering Sea Sablefish Regulatory District. In addition, the community is eligible to participate in the Community Development Quota (CDQ) program and is represented by the Coastal Villages Region Fund (CVRF). The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the Bering Strait and Aleutian Islands region.²¹⁶ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ.

In a survey conducted by the AFSC in 2011, community leaders reported that between 2005 and 2010, Bethel saw an increase in the number of commercial fishing vessels in the community; however, the number of vessels less than 35 ft long has declined due to fuel prices. In addition, although the community itself does not participate in the fisheries management process in Alaska, it is represented by CVRF in regional fisheries issues.

Processing Plants

Kuskokwim Seafoods is a small processing facility in Bethel that started in 2010 in order to provide a market to local salmon fishers to help them sell their catch closer to home.²¹⁷ Kuskokwim Seafoods processes four salmon species: Chinook, sockeye, chum and coho.²¹⁸

Fisheries-Related Revenue

In 2010, Bethel received \$1.87 million in fisheries-related revenue from the Shared Fisheries Business Tax, Fisheries Resource Landing Tax, harbor usage fees, port/dock usage fees, and marine fuels taxes, compared to \$1.2 million in 2000. After accounting for inflation,²¹⁹ total fisheries-related revenue grew by 21% between 2000 and 2010. Harbor usage fees have consistently provided the most revenue annually, compared to Shared Fisheries Landing Tax revenue, which has declined substantially between 2000 and 2010. In a survey conducted by the AFSC in 2011, community leaders reported that there are no fishing-industry related taxes or fee programs that support local services and infrastructure. In addition, there were no reports of Bethel receiving funds from CVRF in 2010; however, CVRF typically provides support each year to its communities through educational scholarships, jobs, and other community services. Information regarding fisheries-related revenue trends can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

Commercial fishing, particularly in salmon fisheries in Kuskokwim and Bristol Bay, is an important part of the local economy in Bethel. In 2010, 233 residents, or 3.8% of the population, held 238 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 218 residents held 225 CFEC permits. Of the CFEC permits held in 2010, 87% were for salmon, compared to 88% in 2000; 12% were for herring, compared to 9% in 2000; and 1% were for “other” finfish, compared to 1% in 2000. In addition, one resident held one License Limitation Program (LLP) permit for groundfish that year, although it was not actively fished. No residents held Federal Fisheries Permits (FFP) since between 2006 and 2010. Two residents held 958 shares of halibut quota in 2010; however, no quota share accounts were held and no quota allotment was given. The number of halibut quota shares peaked in 2002 and 2003 when 51,151 quota shares were held on one account. No residents held sablefish or crab quota between 2010 and when the programs began.

In 2010, 140 residents held commercial crew licenses, compared to 199 in 2000. In addition, residents held majority ownership of 33 vessels, compared to 55 in 2000. Of the CFEC permits held in 2010, 45% were actively fished, compared to 61% in 2000. This varies by fishery from 52% of salmon permits to 0% of herring and “other” finfish permits. No herring permits were actively fished between 2006 and 2010. No “other” finfish permits were actively fished between 2000 and 2010. No LLP groundfish permits were fished between 2005 and 2010. Fisheries prosecuted in 2010 by Bethel residents included: Bristol Bay drift gillnet and Lower Yukon gillnet salmon.²²⁰

In 2010, 1.25 million lbs of salmon valued at \$781,809 ex-vessel was landed in Bethel, compared to 3.70 million lbs valued at \$1.27 million in 2000; an increase of \$0.16 per pound landed after adjusting for inflation²²¹ and without considering the species composition of landings. Landings in Bethel peaked in 2009 at 3.93 million lbs valued at \$1.97 million ex-vessel. In 2010, Bethel ranked 38th of 67 Alaskan communities in terms of reported lbs landed and 41st in terms of ex-vessel value of landings. Residents reported landings 237,593 lbs of salmon valued at \$218,883 ex-vessel in 2010, compared to 444,516 lbs valued at \$274,549 ex-vessel in 2000; an increase of \$0.07 per pound landed after adjusting for inflation²²² and without considering the species composition of landings. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Sportfishing, while less significant than commercial and subsistence fishing, is nevertheless an important part of Bethel's fisheries involvement. In 2010, there were no active sport fish guide businesses, compared to 2 in 2000. In addition, residents held 7 sport fish guide licenses that year, compared to 6 in 2000. The number of sport fish guide licenses held in Bethel peaked in 2003 and 2004 at 9 each year. The number of sportfishing licenses sold in the city increased steadily between 2000 and 2010, with 1,799 sold in 2010 compared to 943 in 2000. In addition, 1,058 sportfishing licenses were sold to residents in 2010, compared to 814 in 2000.

Bethel is located in the Kuskokwim River and Bay Drainage ADF&G Harvest Survey Area which includes the Kuskokwim River drainage and all waters flowing into Kuskokwim Bay. While saltwater survey data is somewhat limited, 2008 saw a peak of 108 resident angler days fished. In 2010, there were a total of 19,455 freshwater angler days fished, compared to 19,990 in 2000. In that year, non-Alaska residents accounted for 72.1% of freshwater angler days fished, compared to 67.0% in 2000.

According to ADF&G Harvest Survey data, private anglers in Bethel target all five species of Pacific salmon, rainbow trout, Dolly Varden char, whitefish, burbot, arctic grayling, northern pike, halibut, and razor clams. There is no kept/released charter information available for Bethel.

In a survey conducted by the AFSC in 2011, community leaders reported that most recreational fishing in the community is either shore based or private-vessel based. Marine species targeted by private vessels include chum, king, coho, and sockeye salmon. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Kuskokwim Area subsistence salmon fisheries rank as one of the largest in the State of Alaska, accounting for over 50% of the state's Chinook salmon harvests. More than 2,000 households in the Kuskokwim Area annually harvest salmon for subsistence use from June through August. ADF&G Division of Subsistence studies indicate that wild fish account for 85% of the total subsistence-harvested fish and wildlife resource in Kuskokwim River communities; with salmon accounting for up to 53% of the total annual subsistence harvest.²²³

Interviews of subsistence users conducted in 2008 indicated that fishing effort was concentrated during the week ending June 15, and extends through the week ending July 6. This period typically coincides with Chinook abundance. The majority of subsistence harvesters use gillnets and to a lesser degree, rod and reel gear types.²²⁴ Subsistence fishing and hunting are practiced in Bethel although detailed data is limited and information gathered by the ADF&G regarding household subsistence participation is unavailable.

Of the species listed by ADF&G in Table 13, Chinook salmon were harvested most, followed by coho, chum, sockeye, and pink salmon. In 2008, 88,757 salmon were harvested, accounting for 8.5% of statewide subsistence salmon harvests that year. In 2000, a total of 59,461 salmon were harvested. Salmon harvests peaked in 2008. In 2010, 8 residents held

²²⁴ Ibid.

Subsistence Halibut Registration Certificates (SHARC), compared to 10 in 2003. In that year, an estimated 560 lbs was harvested on 1 SHARC, compared to an estimated 44 lbs in 2000. Subsistence halibut harvests peaked in 2006 at an estimated 1,432 lbs. Between 2000 and 2010, an estimated 5 sea otters were harvested and 9 walrus. No information is available regarding subsistence sea lion, harbor seal, or spotted seal harvests. Information regarding subsistence trends can be found in Table 12 through 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders reported that some of the current challenges for the portion of Bethel's economy that is based on fishing include limited moorage and shoreside space for commercial fishing. Community leaders reported that management actions by state and federal agencies have been fair; however, a lack of fish has affected Bethel significantly.

Chefnak (chuh-FORE-nuck)

People and Place

*Location*²²⁵

Chefnak is located on the south bank of the Kinia River, at its junction with the Keguk River, in the Yukon-Kuskokwim Delta. Chefnak is 98 mi southwest of Bethel and 490 mi southwest of Anchorage. The area encompasses 5.7 sq mi of land and 0.8 sq mi of water. The community was incorporated as a Second-class city in 1974, is located within the Bethel Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*²²⁶

In 2010, there were 418 residents, ranking Chefnak 131st of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population grew by 30.6%. Between 2000 and 2009, the population grew by 20.56% with an average annual growth rate of 1.05%; which was slightly higher than the statewide average annual growth rate of 0.75% and indicative of steady growth. However, this figure does not account for the dip in population between the 2009 state estimate and 2010 census number, which brought the total population closer to what it was in 2000.

In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there were more than 475 permanent residents estimated to be living in Chefnak in 2010. Also in that year, approximately 500 seasonal or transient workers were living in the community. Peaks in population are typically seen between May and August, and are somewhat driven by employment in fishing sectors. Further information regarding population trends can be found in Table 1.

Chefnak was predominantly Yup'ik Eskimo in 2010.²²⁷ In that year, 95.7% of residents identified themselves as American Indian or Alaska Native, compared to 93.4% in 2000; 3.3% identified themselves as White, compared to 2.0% in 2000; 0.2% identified themselves as Black or African American, compared to 0.0% in 2000; and 0.7% identified themselves as two or more races, compared to 4.6% in 2000 (Figure 1).

In 2010, the average household size was 4.54, compared to 5.0 in 1990 and 5.25 in 2000. In that year, there were 99 total housing units, compared to 79 in 1990 and 82 in 2000. Of the households surveyed in 2010, 52.5% were owner-occupied, compared to 80.5% in 2000; 40.4% were renter-occupied, compared to 11.0% in 2000; 4.0% were vacant, compared to 7.3% in 2000; and 3.0% were occupied seasonally, compared to 1.2% in 2000. There were no reports of residents living in group quarters between 1990 and 2010.

Figure 1. Racial and Ethnic Composition, Chefnak: 2000-2010 (U.S. Census).

Gender distribution in 2010 was even at 50.2% male and 49.8% female. This was more even than both the distribution statewide (52.0% male, 48.0% female) and in 2000 (51.5% male, 48.5% female). The median age that year was 23.6 years, which was significantly younger than the statewide median of 33.8 years, and somewhat older than the 2000 median of 20.8 years.

Compared with 2000, the population structure in 2010 was somewhat less expansive. In that year, 42.5% of residents were under the age of 20, compared to 48.1% in 2000; 9.2% were

over the age of 59, compared to 6.4% in 2000; 32.2% were between the ages of 30 and 59, compared to 31.4% in 2000; and 16.0% were between the ages of 20 and 29, compared to 14.2% in 2000.

Gender distribution by age cohort was less even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred in the 20 to 29 range (9.8% female, 6.2% male), followed by 30 to 39 (6.9% male, 4.3% female) and 40 to 49 (6.7% male, 5.0% female) ranges. Information regarding trends in Chefnak’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Chefnak Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-10 American Community Survey (ACS)²²⁸ estimated that 74.7% of the population aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 20.7% had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 4.6% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 12.6% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 2.9% had an Associate's degree, compared to an estimated 8% of Alaska residents overall; no residents were estimated to have a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 3.4% had a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*²²⁹

The Native people of the Yukon-Kuskokwim (Y-K) Delta region have followed a traditionally nomadic, subsistence lifestyle dating back centuries. Extensive trade networks throughout the Y-K Delta were established prior to contact with Russian explorers in the late nineteenth century, and by the time of contact the Native people in the region already had access to Eurasian goods from trade routes across the Bering Strait. *Pastuliarraq*, near present-day Kotlik, was a trading center which connected these routes with the lower Y-K Delta region.

The nineteenth century was a time of European expansion and development in the region and with it came waves of disease epidemics which had disastrous effects on the Native peoples in the area. In the early twentieth century, the influence of missionaries coinciding with the influenza epidemics of 1900 and 1912 drastically changed the social and cultural identity of an entire generation within the region.

The village of Chefnak was not established in its current location until the mid-twentieth century, when Alexie Amagiqchik founded a small general store at the site. He had moved from a village on the Bering Sea to the new location one mi inland to escape potential floodwaters. Others from the original village followed and settled in Chefnak. The city was incorporated in 1974.²³⁰

Natural Resources and Environment

Chefnak is located in a marine climate. Precipitation averages 22 in, with 43 in of snowfall annually. Summer temperatures range from 41 to 57 °F (5 to 14 °C). Winter temperatures range 6 to 24 °F (-14 to -4 °C).²³¹ The community lies within the Clarence Rhode National Wildlife Refuge, established for migratory waterfowl protection.

²²⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²³⁰ See footnote 225.

²³¹ Ibid.

The geography of the Y-K Delta region is characterized by sub-arctic tundra, tidal wetlands, and boreal forests. The region contains more than 400,000 charted lakes and ponds. Soils around Chefnak consist of alluvial delta sediments and coastal marine deposits. The soil is fine grained and poorly drained. Permafrost in the area varies in depth and while there is limited local data, regional depths can extend to around 600 ft in some areas. The active layer is estimated to range between 1.5 and 3 ft deep, depending on conditions. Coastal areas are classified typically as wet tundra consisting of marshes, swamps, and water ponds. Vegetation in tundra areas consists of sedges, grass, dwarf shrub, and peatland. Fish in the area include all five species of Pacific salmon, boreal smelt, arctic cisco, northern pike, blackfish, stickleback, sheefish, burbot, and whitefish. Terrestrial wildlife includes bear, moose, hares, beaver, mink, muskrat, otter, fox, weasel, and caribou. Aquatic mammals include seals, walrus, and several species of whale. In addition, the Y-K delta is renowned as one of the most productive waterfowl breeding areas in the world.²³²

On a regional level, natural hazards present in coastal areas of western Alaska include storm urges, flooding, shoreline erosion, and sea level rise.²³³ While Chefnak is not located directly on the coast, it is subject to marine influences due to its close proximity. Snow-drifting is a potential hazard due to strong prevailing winds during the winter and low vegetation.

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation sites active in 2010.²³⁴

Current Economy²³⁵

Chefnak is largely dependent on a subsistence economy, with employment opportunities limited to part time and seasonal work. The local seafood processor provides some employment when in operation. Top employers in 2010²³⁶ included the Lower Kuskokwim School District, Chefnak Traditional Council, Chefnarmute Inc., Coastal Villages Seafoods Inc., City of Chefnak, Yukon Kuskokwim Health Corp. 90, Naterkaq Light Plant, Chefnak Water & Sewer Supply, Rural Alaska Community Action Program, and Association of Village Council Presidents. In a survey conducted by the AFSC in 2011, community leaders reported that an estimated 20 to 30 permanent residents worked in the local seafood processing industry in 2010.

In 2010,²³⁷ the estimated per capita income was \$11,562 and the estimated median household income was \$39,583, compared to \$8,474 and \$35,556 in 2000, respectively. However, after accounting for inflation,²³⁸ the adjusted per capita income (\$11,143) and adjusted

Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²³⁸ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

median household income (\$46,756) indicate that individual earnings have stayed the same while household earnings declined. In 2010, Chefnak ranked 248th of 305 communities reporting per capita earnings and 193rd of 299 communities reporting median household earnings.

Chefnak's small population size may have prevented the ACS from accurately portraying economic conditions.²³⁹ Another way of understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$3.01 million in total wages in 2010.²⁴⁰ When compared with the population in 2010, the per capita income equals \$7,202, suggesting that caution should be used when comparing 2010 ACS estimates with the 2000 Census.²⁴¹ In addition, the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.²⁴² However, it should be noted that American Community Survey and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates,²⁴³ 62.3% of residents aged 16 and over were part of the civilian labor force in 2010. In that year, the estimated unemployment rate was 15.6%, compared to an estimated 5.9% statewide; and an estimated 24.2% of residents were estimated to be living below the poverty line, compared to an estimated 9.5% statewide. However, there is the possibility that unemployment and poverty statistics are likely inaccurate given the small population of 418. The ALARI database indicates that the unemployment rate in 2010 was 24.6% based on unemployment claimants.

Of those employed in 2010,²⁴⁴ an estimated 43.0% worked in the private sector and an estimated 57.0% worked in the public sector. By industry, most (37.7%) of those employed were estimated to work in education service, health care, and social assistance sectors in 2010; followed by public administration sectors (22.8%); transportation, warehousing, and utilities sectors (11.4%); and retail trade sectors (11.4%). By occupation type, most (28.9%) employed residents were estimated to hold service positions that year; followed by sales or office positions (25.4%); management or professional positions (21.9%); natural resources, construction, or maintenance positions (13.2%); and production, transportation, or material moving positions (9.6%). Between 2000 and 2010, there were significant proportional increases in public administration, finance, insurance, and real estate sectors; while were proportional declines in education service, health care and social assistance sectors. Information regarding employment trends can be found in Figures 3 and 4.

No individuals characterized themselves as working in natural resource based industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

²³⁹ See footnote 228.

²⁴⁰ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

²⁴³ See footnote 228.

²⁴⁴ See footnote 237.

According to 2010 ALARI estimates, most (40.1%) employed residents worked in local government sectors; followed by trade, transportation, and utilities sectors (25.3%) and manufacturing sectors (10.1%).

Figure 3. Local Employment by Industry in 2000-2010, Chefnak (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Chefnak (U.S. Census).

Governance

Chefnak is a Second-class city with a mayoral form of government. In addition, there is a U.S. Bureau of Indian Affairs (BIA) recognized Tribal government (Village of Chefnak) and Alaska Native Claims Settlement Act (ANCSA) chartered Native village corporation (Chefnakmute Inc.). The regional ANCSA Native Corporation representing Chefnak is the Calista Corporation. The closest Alaska Department of Fish and Game (ADF&G) and National Marine Fisheries Services (NMFS) offices are located in Bethel, 98 mi northeast. The closest

U.S. Bureau of Citizenship and Immigration Services office is located in Anchorage, 490 mi northeast.

Chefnak administered a 2% sales tax in 2010. When adjusted for inflation,²⁴⁵ total municipal revenues increased 86.1% between 2000 and 2010 from \$417,064 to \$1.0 million. In 2010, most locally generated revenues were collected from utility rents, gaming fees, and sales taxes. Most outside revenues were collected from Community Revenue Sharing and payments in lieu of taxes. In that year, sales tax accounted for 4.5% of total municipal revenues, compared to 4.3% in 2000. State allocated Community Revenue Sharing accounted for 11.9% of total municipal revenues in 2010, compared to 6.4% from State Revenue Sharing in 2000. Between 2000 and 2010, there were no state or federal fisheries-related grants awarded to Chefnak. Information regarding municipal revenue trends can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Chefnak from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$417,064	\$18,130	\$26,566	n/a
2001	\$323,673	\$13,438	\$25,359	n/a

Infrastructure

*Connectivity and Transportation*²⁴⁶

A state-owned 2,500-ft long by 28-ft wide gravel airstrip provides chartered and private air access year-round, and a seaplane base is available. Although there are no docking facilities, a number of fishing boats and skiffs are used for local travel. “Snowmachines” are relied upon during the winter. Winter trails are marked to Kipnuk, 20 mi southeast and Kasigluk 83 mi northeast. Roundtrip airfare between Anchorage and Chefnak in June 2012 was \$724.²⁴⁷

*Facilities*²⁴⁸

One well and a water treatment plant serve 12 watering points. The treated water is undrinkable due to saltwater intrusion. Residents drink melted ice cut from a local pond in the winter and rain catchment the rest of the year. High snow drifts make the boardwalk impassable for winter haul service. The community has requested a grant for a new water treatment plant. The school is in the process of establishing its own water system using reverse osmosis to treat the salty water. Public safety services are provided by Chefnak police department. Fire and rescue services are provided by Chefnak volunteer fire department. Additional public facilities include a school gym, community center, and school library. Communications services include local and long distance telephone, internet, local and cable television, and local radio.

In a survey conducted by the AFSC in 2011, community leaders reported that infrastructure projects completed or still in progress as of 2010 included a fish cleaning station, jetty, diesel powerhouse, water treatment facilities, public safety improvements, telephone service, fire department improvements, school improvements, and post office improvements. In addition, projects under development include airport improvements, water and sewer pipelines, alternative energy systems, land fill, and a barge landing area. There is no public dock space available for permanent and transient moorage, and vessels under 35 ft typically use Chefnak as their base of operations. Fuel barges were the only regulated vessel type being handled by Chefnak’s port infrastructure as of 2010. Fisheries-businesses and services in the area include a seafood processing plant, fishing gear sales, boat repair (electrical, welding, mechanical services, machine shop), tackle sales, bait sales, commercial cold storage facilities, boat fuel sales, and air taxi services. Residents travel to Bethel and Anchorage for businesses and services not available locally.

*Medical Services*²⁴⁹

The Chefnak Clinic is a Primary Health Care facility and Community Health Aid Program (CHAP) site. Acute, specialized, and long-term care is provided in Bethel.

²⁴⁹ Ibid.

*Educational Opportunities*²⁵⁰

Chaputnguak School offers preschool through 12th grade instruction. In 2011, there were 163 students enrolled and 13 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Like many communities on the Y-K Delta, Chefnak has an extensive history of involvement in subsistence fisheries. Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.²⁵¹ However, the salmon resource is not as easily accessible for communities along the Bering Sea coast as in other regions of Alaska.²⁵²

Today, subsistence activities continue to be an important part of the community's identity; however, commercial fishing has also taken root as a driver of the local economy. In a survey conducted by the AFSC in 2011, community leaders reported that there have been a lot less charter and private boats, as well as vessels greater 35 ft in length between 2005 and 2010. Chefnak does not participate in the fisheries management process in Alaska.

Chefnak is located in Federal Reporting Area 415, International Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory District. The community is eligible for participation in the Community Development Quota (CDQ) program and represented by the Coastal Villages Region Fund (CVRF). The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the Bering Strait and Aleutian Islands region.²⁵³ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ.

Processing Plants

The Coastal Villages Seafoods fish processing plant in Chefnak is a CDQ operation and a subsidiary of the CVRF. This facility processes halibut in June and July.²⁵⁴ Coastal Villages Seafoods processing facilities (including the other facilities in Quinhagak, Toksook Bay, Mekoryuk, Tununak, Kipnuk, Hooper Bay, and Platinum) also process black cod, Pacific cod, King and Snow crab, salmon (Chinook, chum, coho, sockeye).²⁵⁵ CVRF maintains a local community service center that helps local fishing families maintain, repair, service, and modify their boats, motors, and fishing gear. The local plant provides free room and board to its fish processing workers, as well as transportation to and from the plant site and a cash bonus for all those who complete their contracts.²⁵⁶

Fisheries-Related Revenue

The community of Chefnak took in very little fisheries-related revenue between 2000 and 2010. Revenues that were collected came from raw fish taxes and Shared Fisheries Landings taxes for the most part. In a survey conducted by the AFSC in 2011, community leaders reported that revenues that were collected from fisheries-related sources were put towards roads, water and wastewater systems, and police and fire services. It is not known if the community received any funds from CVRF in 2010. Information regarding fisheries-related revenue trends can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that the halibut season runs on average between June 1st and August 15th. Gear types used by commercial fishing vessels that used Chefnak as their base of operations during the fishing season include longline, gill net, and rod and reel. In 2010, 36 residents, 8.6% of the population, held 48 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 30 residents held 59 CFEC permits. In that year, 65% of CFEC permits issued were for halibut; compared to 46% in 2000; 19% were for herring, compared to 41% in 2000; and 17% were for salmon, 14% in 2000. Between 2000 and 2010, no residents held Federal Fishery Permits (FFP) or License Limitation Program (LLP) permits. No residents held halibut, sablefish, or crab quota between 2010 and when the programs began.

In 2010, 14 residents held commercial crew licenses, compared to 21 in 2000. In addition, residents held majority ownership of 35 vessels, compared to 33 in 2000. Of the CFEC permits held in 2010, 63% were actively fished, compared to 41% in 2000. This varied by fishery from 81% of halibut permits, to 63% of salmon and 0% of herring permits. Herring permit activity had been in decline since 2000 when 38% of permits were actively fished.

²⁵⁴ Coastal Villages Seafood. (n.d.). Retrieved from: <http://coastalvillages.org/>.

²⁵⁵ Alaska Seafood Marketing Institute (n.d.) Retrieved from <http://alaskaseafood.org/industry/suppliers/detail.cfm?Supplier=419>.

²⁵⁶ See footnote 254.

Conversely, halibut permit activity increased during that time. Fisheries prosecuted by Chefnak residents in 2010 included: statewide longline, mechanical jig, and hand troll halibut; and Bristol Bay drift gillnet salmon.

Landings made in Chefnak in 2009 and 2010 are considered confidential. In 2010, residents landed 22,697 lbs of halibut valued at \$72,342 ex-vessel, compared to 12,298 lbs valued at \$15,383 ex-vessel; an increase of \$1.43 per pound after adjusting for inflation.²⁵⁷ In that same year, 270,487 lbs of salmon were landed valued at \$248,649 ex-vessel, compared to 339,705 lbs valued at \$224,000 ex-vessel in 2000; an increase of \$0.01 per pound after adjusting for inflation²⁵⁸ and without considering the species composition of landings. Information regarding commercial fishing trends can be found in Tables 4 through 10.

²⁵⁷ Inflation calculated using Producer Price Index for unprocessed and packaged fish, Bureau of Labor Statistics, <http://www.bls.gov/ppi/#data>

Recreational Fishing

Chefnak is located in the Kuskokwim River and Bay Drainages ADF&G Harvest Survey Area, which includes all waters flowing into Kuskokwim Bay. In a survey conducted by the AFSC in 2011, community leaders reported that no recreational fishing takes place in the area. In addition, there were no active sport fish businesses or guides located in the community between 2000 and 2010. However, in 2010, 18 sportfishing licenses were sold in the community, compared to 20 in 2006. In that same year, 30 sportfishing licenses were sold to residents, compared to two in 2000.

In 2010, there was a total of 19,455 freshwater angler days fished, compared to 19,940 in 2000. In that year, non-Alaska residents accounted for 72.1% of the freshwater angler days fished, compared to 67.1% in 2000. Data regarding saltwater angler days fished is limited; however, resident angler days fished in the survey area peaked in 2008 with 108. ADF&G data on species targeted by local private anglers are unavailable. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Most residents in the community practice a subsistence lifestyle, which supplements diets and incomes as well as sustaining community identity. ADF&G data on subsistence is limited, and there is no information available on household participation in subsistence fisheries. Records on subsistence salmon, marine invertebrates, and non-salmon fish harvests are limited to 2004, when 63 salmon were taken. In 2010, 14 residents held Subsistence Halibut Registration Certificates (SHARC), compared to 20 in 2003. In that year an estimated 371 lbs of halibut was harvested on 3 SHARC, compared to 3,492 lbs on all 20 SHARC in 2003. The steep decline in reported halibut harvests since 2003 is related to the decline in SHARC cards fished. Between 2000 and 2010, an estimated four walrus were harvested, with reports of one being harvested in 2010. Data are unavailable for Steller sea lion, harbor seal, and spotted seal harvests. Information regarding subsistence participation can be found in Tables 12 through 15.

Eek (EEK)

People and Place

*Location*²⁵⁹

Eek lies on the south bank of the Eek River, 12 mi east of the mouth of the Kuskokwim River. It is 35 air mi south of Bethel and 420 mi west of Anchorage. The area encompasses 0.9 sq mi of land and 0.1 sq mi of water. Eek was incorporated as a Second-class city in 1970, is located in the Bethel Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*²⁶⁰

In 2010, there were 296 residents ranking Eek 165th of 352 communities in terms of population size. Overall, between 1990 and 2010 the population grew by 16.5%. Between 2000 and 2009, the population grew by 0.71% with an average annual growth rate of -0.58, which was less than the statewide average of 0.75% and indicative of a fairly consistent population size. Information regarding population trends can be found in Table 1.

Eek's population is predominately Yup'ik Eskimo. In 2010, 97.6% of residents identified themselves as American Indian or Alaska Native, compared to 95.7% in 2000. Also in that year, 2.4% of residents identified themselves as White, compared to 3.2% in 2000. In addition, 1% of residents identified themselves as Hispanic or Latino in 2010, compared to 0.4% in 2000. Information regarding Eek's racial and ethnic composition can be found in Figure 1.

In 2010, the average household size was 3.25, compared to 3.50 in 1990 and 3.68 in 2000. In that year, there were a total of 101 housing units, compared to 80 in 1990 and 83 in 2000. Of the households surveyed in 2010, 64% were owner occupied, compared to 80% in 2000; 26% were renter-occupied, compared to 12% in 2000; 7% were vacant, compared to 8% in 2000; and 3% were occupied seasonally, compared to 0% in 2000. Since 1990, there have been no reports of residents living in group quarters.

The gender distribution in Eek was slightly skewed in 2010 at 53.0% male and 47.0% female, and was similar the distribution statewide (52.0% male, 48.0% female) and slightly more even than the distribution in 2000 (54.6% male, 45.4% female). The median age in 2010 was 27.5 years, which was younger than the statewide median of 33.8 years and slightly older than the 2000 median of 24 years.

Figure 1. Racial and Ethnic Composition, Eek: 2000-2010 (U.S. Census).

Compared with 2000, the population structure in 2010 was slightly less expansive, indicating a shift towards a more aged population. In that year, 40.9% of residents were under the age of 20, compared to 44.3% in 2000; 13.6% were over the age of 59, compared to 9.1% in 2000; 33.8% were between the ages of 30 and 59, compared to 32.8% in 2000; and 11.8% were between the ages of 20 and 29, compared to 14% in 2000.

Overall, gender distribution by age cohort was more even in 2010 than in 2000, with slight male biases along most age ranges. The greatest absolute gender difference occurred in the 60 to 69 range (5.1% male, 3.4% female), followed by the 0 to 9 range (10.5% female, 8.8% male) and 30 to 39 range (6% male, 4.4% female). Of those three, the greatest relative gender difference occurred within the 60 to 69 range. Information regarding trends in Eek’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Eek Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)²⁶¹ estimated that 57% of residents aged 25 and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 26.4% of residents had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 16.5% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 12.4% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 3.3% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 4.1% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall. No residents were estimated to hold an Associate's degree in 2010.

*History, Traditional Knowledge, and Culture*²⁶²

The area around what is now Eek was originally occupied by Yup'ik Eskimos around 2,000 years ago. At that time, the area provided a strategic trading route along the Yukon-Kuskokwim (Y-K) Delta region, connecting many communities located on the two rivers. The village was originally located on the Apokok River. It moved to its present location in the 1930s when constant flooding and erosion forced relocation. A U.S. Bureau of Indian Affairs (BIA) school and a Moravian church were constructed at the new site. A post office was established in 1949. The city was incorporated in 1970.

Natural Resources and Environment²⁶³

Eek is located in a marine climate. Annual precipitation averages 22 inches, with an annual average of 43 inches of snowfall. Summer temperatures average 41 to 57 °F (5 to 14 °C); winter temperatures average 6 to 24 °F (-14 to -4 °C).

The community is located in the Yukon Delta National Wildlife Refuge (YDNWR) which covers 19 million acres of the upper and lower Yukon Delta region.²⁶⁴ Eek itself is located on lowland alluvial deposits comprised of mud, silt, sand, gravel, and various organics; similar to conditions found on coastal plains found in much of western Alaska. The landscape in these lowland areas is populated with shallow circular lakes, streams, and sloughs. Vegetation in the area is characteristic of poorly drained, moist tundra. Vegetation types include dwarf shrubs, mosses, lichen forbs, grasses, and herbs. In areas along the Eek River, thickets of alder, willow, and birch can be found. In terms of wildlife, the area is probably best known for the abundant species of waterfowl. Many migratory birds make use of the wetlands for nesting. Terrestrial mammals in the YDNWR include moose, wolves, red and arctic fox, snowshoe hare, beaver, muskrat, and caribou. Marine and freshwater fish include all five species of Pacific salmon,

²⁶¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²⁶² See footnote 259.

²⁶³ Ibid.

²⁶⁴ U.S. Fish and Wildlife Service. (n.d.). *Yukon Delta National Wildlife Refuge*. Retrieved January 6, 2012 from: <http://www.fws.gov/refuges/profiles/index.cfm?id=74540>.

sheefish, smelt, whitefish, burbot, northern pike, Dolly Varden char, rainbow trout, arctic grayling, herring, halibut, tomcod, and flounder. Marine mammals include Pacific walrus, spotted seals, ringed seals, Pacific bearded seals, porpoise, fur and harbor seals, and beluga, fin, gray, killer, and minke whales.²⁶⁵

Natural resources present in the area consist of fish and wildlife resources and the ecosystems that sustain them within the YDNWR. Eek's position on a wetland delta coupled with the area's designation as a national wildlife refuge precludes mineral and oil development outside Alaska Native Claims Settlement Act (ANCSA) and Alaska National Interest Lands Conservation Act (ANILCA) Native selected lands. Most historic mineral claims were located in the Kilbuck Mountains, southeast of Eek. In addition, several "grandfathered" oil lease applications are on file with the U.S. Bureau of Land Management (BLM), and they have yet to be released.²⁶⁶

Environmental hazards present in Eek include flood, wildfire, earthquake, tsunami, severe weather, and erosion. Of those hazards, flooding and severe weather have the highest probability of occurrence.²⁶⁷

According to the Alaska Department of Environmental Conservation (DEC), there were no significant environmental remediation sites active within Eek in 2010.²⁶⁸

Current Economy²⁶⁹

Eek's economy is heavily subsistence based since year round wage employment is limited. A few full-time positions are available at the school, city, and village office. Commercial fishing is a large contributor to the seasonal wage economy. Top employers²⁷⁰ in 2010 included: Lower Kuskokwim School District, City of Eek, Iqfijouaq Company Inc., Eek Traditional Council, Yukon Kuskokwim Health Corporation, Association of Village Council Presidents (AVCP) Housing Authority, Costal Villages Region Fund, Association of Village Council Presidents, and Ridge Contracting Inc.

In 2010,²⁷¹ the estimated per capita income was \$10,626 and the estimated median household income was \$17,350, compared to \$8,957 and \$17,500 in 2000, respectively. However, after accounting for inflation by converting 2000 values into 2010 dollars,²⁷² the real per capita income (\$11,778) and real median household income (\$23,012) indicate declines in both individual and household earnings. In 2010, Eek ranked 263rd of 305 communities from which per capita income was estimated, and 285th of 299 communities from which median household income was estimated.

²⁷⁰ Alaska Department of Labor (n.d.). *Alaska Local and Regional Information Network*. Retrieved January 20, 2012 from: <http://live.laborstats.alaska.gov/alari/>.

²⁷¹ U.S. Census American Community Survey 2006-2010 estimates.

²⁷² Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Although Eek's small population size may have prevented the ACS from accurately portraying economic conditions, this decrease in per capita income is confirmed by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$2.29 million in total wages in 2010.²⁷³ When matched with the population in 2010, the per capita income equals \$7,721, which is somewhat similar to the ACS estimate for 2010. In addition, the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.²⁷⁴ However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates,²⁷⁵ 51.2% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, an unemployment was estimated at 15.9%, compared to an estimated 5.9% statewide; and an estimated 27.9% of residents lived below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed, an estimated 31% worked in the private sector while an estimated 69% worked in the public sector.

By industry, most (34.5%) employed residents were estimated to work in education service, health care, or social assistance sectors in 2010; followed by retail trade sectors (25.9%); transportation, warehousing, and utilities sectors (17.2%); and public administration sectors (17.2%) (Figure 3). By occupation type, most (34.5%) employed residents were estimated to hold management or professional positions; followed by sales or office positions (34.5%); service positions (20.7%); production, transportation or material moving positions (5.2%); and natural resources, construction, or maintenance positions (5.2%) (Figure 4). Between 2000 and 2010 there were significant shifts in industry representation in those years. Notable declines occurred in arts, entertainment, recreation, accommodations, food services, and private service sectors; while significant gains occurred in transportation, warehousing, utilities, and retail trade sectors. However, it should be noted that sampling techniques may not have captured the true scope of industry representation.²⁷⁶ According to 2010 ALARI estimates, most (52.7%) employed residents worked in local government sectors; followed by trade, transportation, and utilities sectors (17.6%); and financial service sectors (8.4%).²⁷⁷

²⁷³ ALARI estimates are based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

²⁷⁷ See footnote 270.

Figure 3. Local Employment by Industry in 2000-2010, Eek (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Eek (U.S. Census).

No individuals characterized themselves as working in natural resource based occupations or industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly. Further information regarding employment trends can be found in Figures 3 and 4.

Governance

Eek is a Second-class city with a mayoral form of government. There is a Bureau of Indian Affairs recognized Tribal council and Iqfijouaq Company is the local ANCSA Native village corporation. Calista Corporation is the regional ANCSA Native corporation. The closest Alaska Department of Fish and Game (ADF&G) and National Marine Fisheries Service (NMFS) offices are located in Bethel, 35 mi north. The closest U.S. Bureau of Citizenship and Immigration Services office is located in Anchorage, 420 mi east.

In 2010, Eek administered a 2% sales tax. When adjusted for inflation,²⁷⁸ total municipal revenues declined by 34.4% between 2000 and 2010 from \$442,367 to \$375,342. Inflation adjusted revenues peaked in 2001 at \$458,952 (Table 2). In 2010, most locally generated revenues were collected from utility rents, followed by Alaska Village Electric Cooperative reimbursements, sales taxes, and gaming. Most outside revenues were collected from Community Revenue Sharing and payments in lieu of taxes.

²⁷⁸ Inflation calculated using the 2010 Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

In 2010, sales tax revenue accounted for 8.7% of the municipal budget, compared to 3.9% in 2000. State allocated Community Revenue Sharing accounted for 29.3% of the total municipal budget in 2010, compared to 6.1% in 2000 from State Revenue Sharing. Information regarding municipal finances can be found in Table 2.

Infrastructure

*Connectivity and Transportation*²⁷⁹

A state-owned 3,243-ft long by 60-ft wide gravel airstrip provides chartered and private air access. A dock is available. Roundtrip airfare between Anchorage and Bethel in June 2012 was \$360.²⁸⁰ Charter flights to Eek are available by appointment. A seaplane base is also available on the Eek River. Fishing boats, skiffs, and snowmobiles machines are used for local transportation to Bethel and other villages. There is a one-mile gravel road in the city. Winter trails are marked to Quinhagak (39 mi), Eek Island (15 mi), and the Kwethluk River (45 mi). Barges deliver fuel and supplies during the summer months.

*Facilities*²⁸¹

The City and Village have formed a joint utility commission. Water is derived from Eek River and is treated and stored in a tank at the “washeteria.” A few homes have tanks that provide running water to the kitchen, but houses do not have additional plumbing. Rain catchment systems and ice melt are also used for drinking water. “Honeybuckets” are collected by the city and sewage is disposed of in a sewage lagoon. Public safety services are provided by Village Public Safety Office (VPSO) and state troopers in Bethel. Fire and rescue services are provided by VPSO and city volunteer fire department. Electricity is provided by diesel generator. Other public facilities include a community hall and gym. Communications services available include local and long distance telephone, local and cable television, and internet.

*Medical Services*²⁸²

Eek Health Clinic provides basic health care and is a Community Health Aid Program (CHAP) site. The nearest hospital is located in Bethel.

*Educational Opportunities*²⁸³

Eek School provides preschool through 12th grade instruction. As of 2011, there were 89 students enrolled and 9 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Fisheries participation in the Lower Kuskokwim Delta dates back thousands of years to the original Central Yup'ik occupants. Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. During early years, local salmon were cured and salted and by 1920, the largest commercial season to-date took place on the Kuskokwim, with five operators processing approximately 35,000 Chinook salmon that year. In 1922, there were four salteries operating near the mouth of the Kuskokwim, processing Chinook and sockeye salmon. The Kuskokwim area was closed to all fishing for export from 1926 through 1929. In 1930, regulations were modified to allow commercial fishing in part of Kuskokwim Bay. A floating cannery operated for that year, and by 1932, three companies engaged in commercial fishing. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. Information on commercial fishing during the late 1930s through the 1950s is limited. However in 1952, poor salmon runs prompted the closure of the Kuskokwim River and Bay. Management was finally shifted to the State of Alaska in 1960, and commercial fishing resumed.²⁸⁴

At the time of statehood in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.²⁸⁵ Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.²⁸⁶

Commercial catch of herring for bait began in Alaska around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.²⁸⁷

On the lower Kuskokwim, subsistence sockeye, chum, and Chinook harvesting typically begins by June 1st, and is concluded by mid-July. Coho and pink salmon are harvested in August and September. Fishing effort is based from either a fish camp or from a home village. Drift gill

nets, fish wheels, and rods and reels are used for harvesting. Soon after river ice breaks up in May, smelt move into the lower Kuskokwim area. Residents use fine-meshed nets to catch smelt, and thread them through willow sticks before drying and smoking them. Whitefish, sheefish, Arctic grayling, and northern pike are harvested year-round. Blackfish and burbot are harvested during fall and winter months. Dolly Varden are typically harvested from June through December; while trout are typically harvested in the early spring and summer, and again in the late summer and early fall. Spotted seal, bearded seal, ringed seal, and walrus are harvested in the late spring.^{288,289}

Eek is located in Federal Reporting Area 514, International Pacific Halibut Commission Regulatory Area 4E, and the Bering Sea Sablefish Regulatory District. Eek is eligible to participate in the Community Development Quota program and is represented by the Coastal Villages Region Fund.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Eek does not have a registered processing plant. The nearest shoreside seafood processors are located in Quinhagak and Bethel.

Fisheries-Related Revenue

Between 2000 and 2010, Eek received fisheries-related revenue from raw fish taxes, Shared Fisheries Business Taxes, and Fisheries Resource Landing Taxes. In 2010, \$196 was collected, compared to \$1,249 in 2000. Information regarding fisheries-related revenue trends can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In 2010, 43 residents, or 14.5% of the population, held 49 permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 47 residents held 55 CFEC permits. Of the CFEC permits held in 2010, 87% were for salmon, compared to 80% in 2000 and 13% were for herring, compared to 13% in 2000. Between 2000 and 2010, no residents held License Limitation Program (LLP) groundfish or crab permits or Federal Fisheries Permits (FFP). In addition, no residents held halibut, sablefish, or crab quota shares between 2000 and 2010.

Residents held 49 commercial crew licenses in 2010 (16.6% of the total population), compared to 51 in 2000. Also in that year, residents held majority ownership of 27 vessels, compared to 31 in 2000. Of the CFEC permits issued in 2010, 80% were actively fished, compared to 82% in 2000. This varied by fishery from 91% of salmon permits being actively fished to 0% of herring permits. Fisheries prosecuted by Eek residents in 2010 included Bristol

Bay drift gillnet and Kuskokwim gillnet salmon. Between 2000 and 2010, no landings were made in Eek. However, landings were made by residents of Eek in other locations. In 2010, residents landed 98,461 lb of salmon valued at \$87,481, compared to 152,599 lb valued at \$85,469; an increase of \$0.12 per pound after accounting for inflation²⁹⁰ and without considering the species composition of landings. Salmon landings by residents peaked in 2009 at 223,980 lb valued at \$140,147. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Due to Eek's remote location and lack of sportfishing and visitor infrastructure, non-Alaska resident recreational fishing is limited. Between 2000 and 2010, there were no sport fish guide businesses operating in Eek between 2000 and 2010. In 2010, 76 sportfishing licenses were sold to residents and 86 were sold in the community, compared to 34 and 26 in 2000, respectively.

Eek is located in the Kuskokwim River and Bay drainages ADF&G Harvest Survey Area which includes the Kuskokwim River drainage and all waters following into Kuskokwim Bay, as well as adjacent waters north from Cape Newenham to the Naskonat Peninsula. In 2010, there were a total of 19,455 freshwater angler days fished, compared to 19,990 in 2000. In that year, non-Alaska residents accounted for 72.1% of angler days fished, compared to 67.0% in 2000. Survey data for saltwater angler days fished is not available for 2010. No kept/released charter information is available for Eek. Information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

Subsistence activities are practiced widely in Eek and are an important aspect of daily life in the community. According to 2009 ADF&G estimates, 77% of overall subsistence salmon harvests on the Kuskokwim River occurred in the lower Kuskokwim area, which includes Eek.²⁹¹ According to a 2005 ADF&G survey²⁹², an estimated 18% of households participated in halibut subsistence activities while an estimated 60% participated in non-salmon fish subsistence activities. Per capita subsistence harvest that year was estimated at 550.5 lb. According to ADF&G's *Community Subsistence Information System*,²⁹³ species which residents of Eek harvest or use include Arctic char, Bering cisco, blackfish, broad whitefish, burbot, Dolly Varden, grayling, herring, humpback whitefish, lamprey, least cisco, Pacific tom cod, rainbow trout, rockfish, round whitefish, sheefish, smelt, stickleback, and sucker.

Of the species documented by ADF&G in Table 13, Chinook salmon were harvested most often, although there was a significant decline in reported harvests in 2006 and 2007. In 2007, residents reported harvesting 256 salmon, compared to 4,114 in 2000. Reported salmon harvests peaked in 2002 at 5,343 fish. This decline may be attributed to a sharp drop in returned subsistence salmon permits in 2006 and 2007.

In 2010, 6 residents held Subsistence Halibut Registration Certificates (SHARC), compared to 21 in 2003. In that year, an estimated 80 lb of halibut was harvested on two SHARC, compared to an estimated 608 lb on eight SHARC cards in 2003. Subsistence halibut harvests peaked in 2004 at an estimated 3,780 lb. No information on sea mammal harvests is available for Eek. Information regarding subsistence trends can be found in Tables 12 through 15.

Goodnews Bay

People and Place

*Location*²⁹⁴

The community is located on the north shore of Goodnews Bay at the mouth of the Goodnews River. It is 116 air miles south of Bethel, 110 miles northwest of Dillingham, and 400 miles west of Anchorage. Goodnews Bay is located in the Bethel Census Area and the Bethel Recording District. The City encompasses 3.2 square miles of land and 0 square miles of water.

*Demographic Profile*²⁹⁵

In 2010, there were 243 residents in Goodnews Bay, ranking it the 180th largest community in Alaska in terms of population size. Between 1990 and 2010, the population increased by 9.9%. Between 2000 and 2009, the population increased by 9.4% with an average annual growth rate of -0.85%, which was under the statewide average of 0.75%. However, the population has remained relatively stable over time (Table 1). In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that the permanent population in 2010 was over 300, which was significantly greater than what is reported in the 2010 Decennial Census for that year. On average, seasonal workers live in Goodnews Bay from June through July, and population peaks are somewhat attributed to employment in fisheries sectors.

No significant changes in the racial and ethnic composition were observed between 2000 and 2010 (Figure 1). In 2010, the majority of Goodnews Bay residents identified themselves as American Indian and Alaska Native (94.7%), compared to 92.6% in 2000; 4.5% identified themselves as White, compared to 5.7% in 2000; 0.8% identified themselves as of two or more races, compared to 1.7% in 2000; 0.4% identified themselves as Hispanic or Latino, compared to 0.0% in 2000; 0.0% identified themselves as of some other race, compared to 0.0% in 2000; 0.0% identified themselves as Black or African American, compared to 0.0% in 2000; 0.0% identified themselves as Native Hawaiian and Other Pacific Islander, compared to 0.0% in 2000; and 0.0% identified themselves as Asian, compared to 0.0% in 2000.

In 2010, the average household size was 3.20, compared to 3.60 in 1990 and 3.24 in 2000. In that year, there were a total of 82 housing units, compared to 72 in 1990 and 87 in 2000. Of the households surveyed in 2010, 56% were owner-occupied, compared to 30% in 2000; 37% were renter-occupied, compared to 52% in 2000; 2% were vacant, compared to 17% in 2000; and 5% were occupied seasonally, compared to 1% in 2000. No residents lived in group quarters between 1990 and 2010.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

In 2010, the gender distribution in Goodnews Bay was biased towards males at 55.6% male and 44.4% female. This was less even than both the distribution statewide (52.0% male, 48.0% female), and the distribution in 2000 (51.3% male, 48.7% female). In that year, the median age was 26.8 years, which was younger than both the statewide median of 33.8 years, and 2000 median of 30.7 years.

Figure 1. Racial and Ethnic Composition, Goodnews Bay: 2000-2010 (U.S. Census).

The population structure was somewhat irregular in both 2000 and 2010; however, in both years it could be described as expansive. In 2010, 36.7% of residents were under the age of 20, compared to 41.3% in 2000; 10.3% were over the age of 59, compared to 11.3% in 2000; 34.5% were between the ages of 30 and 59, compared to 39.5% in 2000; and 18.5% were between the ages of 20 and 29, compared to 7.8% in 2000.

Gender distribution by age cohort was less even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within the 0 to 9 range (12.8% male, 8.2% female), followed by the 30 to 39 (5.8% male, 1.2% female) and 20 to 29 (11.1% male, 7.4% female) ranges. Of those three, the greatest relative gender difference occurred within the 30 to 39 range. Information regarding population structure trends can be found in Figure 2.

Figure 2. Population Age Structure in Goodnews Bay Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)²⁹⁶ estimated that 58.2% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. If accurate, this estimate highlights a significant difference between local educational attainment, and that of the state as a whole. Also in that year, an estimated 22.6% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 19.2% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 15.3% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 4% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 2.3% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Stone tools and implements found from the Norton Tool tradition indicates that the Goodnews Bay/Platinum area has been occupied continuously for at least 2,000 years.²⁹⁷ One site, at nearby Security Cove, shows evidence of possible habitation dating to 4,000 or 5,000 years ago. Historical inhabitants of the region utilized fish and marine mammal resources, as well as caribou.²⁹⁸ The original inhabitants of the coastal area between the Kuskokwim River mouth and Chavgan Bay were known as the *Kukowogamiut*, and the Goodnews Bay area may also have been used by the *Togiagamiut*, who historically populated the Togiak/Dillingham area from Nanvak Bay east to Cape Constantine.²⁹⁹

Captain James Cook was the first European to make contact with the indigenous peoples of this region, when his expedition encountered them in kayaks north of Cape Newenham on July 16, 1778. Russians established fur trading in the region in the following century. Gold was discovered in the 1890s in Alaska. By the turn of the century, mineral discoveries in the Goodnews Bay area brought a flood of miners to the region.³⁰⁰

Yup'ik Eskimos referred to Goodnews Bay as the village of *Mumtraq*. The community was forced to relocate in the early 20th century due to storm surges and constant flooding. In the 1930s, a government school and post office were built, and the City was incorporated in 1970. A high school was built in 1979.³⁰¹

As a traditional Yup'ik village, Goodnews Bay residents practice a subsistence, trapping, and fishing lifestyle. The Native People of Mumtraq (Goodnews Bay) have always had strong values that centers around the Yup'ik culture. Current values in the community are strongly

²⁹⁶ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

informed by Yup'ik culture, yet residents still exhibit a strong need for economic, physical, and spiritual independence upon themselves. The sale, importation, and possession of alcohol is banned in the village. Bureau of Indian Affairs schools operated from the 1930s until 1980, when the State of Alaska built a high school in 1979, under the newly established Lower Kuskokwim School District.³⁰²

Natural Resources and Environment

Goodnews Bay is located in a transitional climatic zone and is impacted by both continental and marine influences. Average annual precipitation is 22 inches, with 43 inches of snowfall. Summer temperatures range from 41 to 57 °F (5 to 14 °C); winter temperatures average 6 to 24 °F (-14 to -4 °C).³⁰³

The discovery of white gold platinum in the Goodnews Bay area was made in 1926 by a villager from Kakanagamute, a village in Chagvan Bay (south of Goodnews Bay), and shortly after placer mining operations began, with the eventual development of the Goodnews Bay Mining Company in 1934. The mining company supplied platinum for the Johnson, Matthey and Company, Inc. in New York, and the crude platinum was shipped in moose-hide or calfskin bags called “pokes” which were then doublesacked in canvas for transport.³⁰⁴

A wide variety of fish and wildlife are present around Goodnews Bay. The coastal waterways consist of birds, seal, whale, walrus and many varieties of fish. The bay and offshore waters are a major herring fishery, drawing residents of many other villages during the height of the season. Goodnews River is home to Chinook, sockeye, chum, pink, and coho salmon. Other species such as rainbow trout, Arctic grayling, Dolly Varden, and Arctic char can be found in the Goodnews River. To the west, Steller sea lions are present in the offshore waters. Village lands are bounded on the north, south, and east by the Togiak National Wildlife Refuge, which was initially created in 1980 as part of a larger collection of public land withdrawals. The Refuge itself provides critical habitat for threatened and endangered species including spectacled eider, Steller's eider, and Steller sea lion.³⁰⁵

Black bears, brown bears, moose, wolverines, wolves, red and arctic foxes, land otters, mink, marten, weasel, lynx, beavers, muskrat, and hares inhabit the Goodnews Bay area. The Yukon-Kuskokwim Delta is an important migratory route for numerous species of waterfowl and other migratory birds, and provides suitable habitat for various predatory, game, shore, and songbirds, including gyrfalcons, peregrine falcons, ptarmigan, snipes, cranes, and loons. A rookery is located south of Goodnews Bay at Cape Newenham; species include horned and tufted puffins and glaucous-winged gulls.³⁰⁶

Goodnews Bay is also surrounded by wetland habitat used for migratory birds in the spring and fall. Essential Fish Habitat in the Goodnews Bay area includes the Goodnews River and its tributaries. No other Essential Fish Habitat was identified by the National Marine Fisheries Service (NMFS) in the Goodnews Bay area. No wild and scenic rivers are located in

the vicinity of Goodnews Bay. Consultation with the U.S. Fish and Wildlife Service, NMFS, and the Alaska Department of Fish and Game (ADF&G) will be required for development in the community.³⁰⁷

The Native Village of Goodnews Bay entered into a 638 contract with the Bureau of Indian Affairs to manage the Natural Resources Program for the Village of Goodnews Bay. The purpose of the Natural Resources Program is to ensure the protection, conservation, and sustainable utilization of the natural resources of the Tribe, to promote a healthy and clean environment, and promote Native co-management of these resources. The goal of the Natural Resource program is to enhance and protect the natural resources the Tribe depends on for subsistence and economic needs. The primary objectives are to provide the necessary services, liaison, and detailed follow through to achieve protection and enhancement of the Tribes natural resources.³⁰⁸

The general geology of the area consists of older coastal deposits of interlayered alluvial and marine sediments including coastal delta deposits. The area surrounding the community is characterized by low mountains, plateaus, and a generally rolling topography. Goodnews Bay is located on lowland coastal areas which are underlain by isolated masses of permafrost with a predominant presence of fine-grained deposits. Soils conditions in Goodnews Bay generally exhibit features of recently glaciated valleys consisting of small lakes and streams, moraines, and gravelly outwash terraces. Frost features such as frost scars, low mounds, and solifluction lobes are frequent. The Goodnews Bay area is primarily flat, surrounded by tundra and muskeg, with irregular shaped moraine knolls and ridges, and dotted with lakes and water bodies. The community is located in a coastal plain, consisting of lowland tundra. Low bush willow's make up a majority of the trees within the outlying area. Birch trees line the riverbanks all the way up to the Goodnews Lake, some 35 miles east of the village of Goodnews Bay.³⁰⁹

Local natural hazards come primarily in the form of flooding and erosion. Most flooding in the area is a result of storm surges. Although located within a relatively protected bay, erosion is most prevalent along the coastline around Goodnews Bay.³¹⁰ Snowdrifts are of concern due to scarce vegetation and frequent high winds. The Goodnews River is prone to flooding, and flood events occurred in 2004, 1989, and 1979. All flood events resulted from wind-driven waves.³¹¹

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation projects active in Goodnews Bay in 2010.³¹²

Current Economy³¹³

The community of Goodnews Bay relies on a mixed subsistence and cash economy. Important subsistence resources for local community members include salmon, seal, walrus, birds, berries, moose, and bear. Residents also depend on seasonal employment including

³¹³ Unless otherwise noted, all monetary data are reported in nominal values.

commercial fishing, ivory carving, and other Native arts and crafts. Many residents engage in trapping.³¹⁴ The city, school, local businesses, and commercial fishing provide the majority of the income, supplemented by subsistence activities.³¹⁵ In a survey conducted by the AFSC in 2011, community leaders reported that fishing is the natural resource-based industry on which Goodnews Bay's economy most depends. In 2010, Goodnews Bay residents held commercial fishing permits for salmon and herring roe fisheries (see the *Commercial Fisheries* section).

Based on household surveys conducted for the 2006-2010 ACS,³¹⁶ In 2010, the estimated per capita income in Goodnews Bay was estimated to be \$9,908, and the estimated median household income was \$30,313. These numbers represent increases from the per capita and median household income levels reported in 2000 (\$6,851 and \$16,250, respectively). If inflation is taken into account by converting the 2000 values to 2010 dollars,³¹⁷ the real per capita income in 2000 (\$9,009) is shown to have been very similar to the 2010 per capita income estimate, while there appears to have been a real increase in household income, from a \$21,369 real median household income. In 2010, Goodnews Bay ranked 278th of 305 Alaskan communities with per capita income data, and 245th in median household income, out of 299 Alaskan communities with household income data that year.

However, Goodnews Bay's small population size may have prevented the ACS from accurately portraying economic conditions.³¹⁸ An alternative understanding of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Goodnews Bay in 2010 is \$7,061.^{319,320} Given that this figure is lower than the 2010 ACS estimate, caution should be used when citing per capita income stability in Goodnews Bay between 2000 and 2010. These relatively low per capita income estimates are reflected in the fact that the community was recognized as "distressed" by the Denali Commission,³²¹ prioritizing it for economic assistance. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

³²¹ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from: www.denali.gov.

Based on the 2006-2010 ACS, in 2010, a much lower percentage of Goodnews Bay residents (42.9%) were estimated to be in the civilian labor force than in the civilian labor force statewide (68.8%). In the same year, 38.6% of local residents were estimated to be living below the poverty line, more than 3 times higher than the poverty rate in Alaska overall (9.5%). The unemployment rate in Goodnews Bay was 12.1%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment, based on the ALARI database, indicates that the unemployment rate in Goodnews Bay was much higher in 2010 (23.7%), more than double the statewide unemployment rate estimate of 11.5%.³²² As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Also based on the 2006-2010 ACS, a majority of the Goodnews Bay civilian labor force was estimated to be employed in the public sector (66.2%), along with 17.6% in the private sector, and 16.2% estimated to be self-employed. There were 74 people aged 16 and over that were estimated to be employed in the civilian labor force. These workers were spread relatively evenly across six industries, with 31.1% estimated to be working in public administration (31.1%), 21.6% in educational services, health care, and social assistance, 13.5% in retail trade, 13.5% in transportation, warehousing, and utilities, 12.2% in finance and insurance, real estate, rental, and leasing, and 8.1% in services other than public administration. Occupations in which the greatest percentages of the workforce were estimated to be employed were management, business, science, and arts (55.4%) and sales and office occupations (25.7%). Compared to 2000, employment in arts, entertainment, recreation, and accommodation and food service industries appears to have been eliminated, along with employment in construction industries. At the same time, a significant amount of employment in finance and insurance industries appears to have developed between 2000 and 2010. Information regarding employment trends can be found in Figures 3 and 4.

It should be noted that no individuals were estimated to be working in natural resource-based occupations or industries that include fishing in 2010. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

³²² See footnote 319.

Figure 4. Local Employment by Occupation in 2000-2010, Goodnews Bay (U.S. Census).

Governance

Goodnews Bay is a 2nd Class City, and is not located in an organized borough. The City was incorporated in 1970. It has a Manager, or “Strong Mayor”, form of government, with a seven-person city council including the Mayor, a nine-member school board, and several municipal employees. The City administers a 3% sales tax.³²³ However, no sales tax revenue was reported between 2000 and 2010. Total annual municipal revenues remained relatively stable between 2000 and 2010. In addition to locally-generated revenue sources, the City received on

³²³ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

average \$25,000 in State Revenue Sharing contributions in the early half of the decade. When the Community Revenue Sharing Program was instituted, the City received substantially more revenue, earning a total of \$104,162 in 2010 (Table 2).

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Goodnews Bay from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵

Goodnews Bay was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Native Village of Goodnews Bay. The Native village corporation is Kuitsarak, Incorporated, which manages 115,200 acres of land.³²⁴ Goodnews Bay belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.³²⁵

Goodnews Bay is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-

³²⁴ Ibid.

determination and self-governance and to work to protect tribal culture and traditions.³²⁶ The AVCP is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.³²⁷ AVCP is made up of 56 villages and 45 village corporations.³²⁸

The closest offices of the ADF&G and the Alaska Department of Commerce, Community, and Economic Development are located in Bethel and Dillingham. Anchorage offers the closest offices of the NMFS, Alaska Department of Natural Resources (DNR), and U.S. Bureau of Citizenship and Immigration Services.

Infrastructure

Connectivity and Transportation

A state-owned 2,835-foot long by 80-foot wide gravel airstrip is available for chartered or private planes year-round. However, regularly scheduled flights must be taken from or to Dillingham. As of June 2012, roundtrip airfare from Anchorage to Dillingham (the nearest airport to Goodnews Bay) was \$428.³²⁹ There are no docking facilities, although locals use boats and skiffs extensively during the summer months. Snowmachines are the primary means of travel during the winter. Winter trails are marked along the Coastal Trail (60.3 mi) and the Arolik Trail (60.1 mi). Barges deliver fuel and other supplies during the summer months.³³⁰

*Facilities*³³¹

The City Multi-Purpose building, which was built in 1970 and is 3,240 square feet, serves as the village clinic, Head Start program, mental health office, drug and alcohol prevention program and city offices, the washeteria, water plant, Coastal Villages Region Fund office, and utilities office. The Kuitsarak, Inc. Corporation operates a cooperative store and bulk fuel facility. The store was built in 1997 and it is 5,664 square feet. The village post office also operates out of the building. Visitor accommodations include Daniel Schouten B&B. Public safety services are provided by local Village Public Safety Officer and state troopers based in Bethel. Fire and rescue services are provided by city volunteer fire and Goodnews Bay first responders. Additional public facilities include a community hall and school library.

³³¹ The Native Village of Goodnews Bay. (2005). *Goodnews Bay Community Plan*. Retrieved October 19, 2012 from: <http://www.commerce.state.ak.us/dca/plans/GoodnewsBay-GCP-2005.pdf>.

Communications services include local and long distance telephone, internet (school only), local and cable television, and local radio.³³²

The Goodnews Bay power plant is currently equipped with two peak load generator sets capable of individually meeting the current peak load requirements. One of the highest output units, an Allis Chalmers 685Is, is no longer manufactured. Based upon the 2006 peak load projection from the latest Power Requirements Study, the power plant will not have redundant peak load engine capacity beyond the next 2 years. The Goodnews Bay power plant is also equipped with two remote radiators which provide redundant cooling capacity along with a separate heat exchanger for transfer of heat to the adjacent water plant. The Goodnews Bay tank farm has adequate useable fuel storage capacity to meet the annual requirements of the next 2-year period.

In April of 2004 a door-to-door survey was conducted to obtain the community's opinion of the current facilities located in Goodnews Bay. Facilities in the survey included: airstrip, tribal and city offices, power plant, community hall, water treatment plant, landfill and sewage lagoon, walkways, armory, high school, dock, health clinic, post office, trailmarks and the local gas station. The results from the survey indicate that the majority of those surveyed were displeased with the current barge landing area (or lack thereof). Residents were equally dissatisfied with the existing airstrip and the landfill and sewage lagoon. Local residents were more satisfied with the existing post office, power plant and gas station.

In a survey conducted by the AFSC in 2011, community leaders reported that public facilities projects completed between 2000 and 2010 included water and sewer pipelines, sewage treatment, water treatment, new landfill/solid waste site, public safety improvements, emergency response improvements, school improvements, telephone service improvements, and post office improvements. Public facilities projects under development in 2010 included a barge landing area and broadband internet access. Fisheries-related businesses and services available locally include fishing gear sales, boat repair (welding, mechanical services), fish lodges, and boat fuel sales. According to community leaders, there is no dock space available for permanent or transient moorage.

*Medical Services*³³³

Bristol Bay Area Health Corporation (BBAHC) provides primary health care services in Goodnews Bay through the Community Health Aid Program (CHAP). BBAHC has provided health care services for the Bristol Bay region under the Alaska Tribal Health Compact with federal Indian Health Services (IHS) funding and grants. The City of Goodnews Bay owns and maintains the clinic with IHS lease funds and operates on a referral basis for medical, dental, behavioral health and human services. Goodnews Bay has two full-time CHAP employees trained to deal with emergencies and provide the general health care to village residents and are often Emergency Medical Technicians. The CHAPs receive direction from physicians located at the Dillingham Kakanak Hospital, in which residents go to for higher level of care. Residents are also referred to the Alaska Native Medical Center or a private hospital in Anchorage for higher level of care. Telemedicine through the internet has become a major factor in improved health care at the community level. Goodnews Bay receives itinerant care including dentists who travel to the village four weeks per year, a public health nurse, pediatrician and doctor who visit

³³² See footnote 330.

³³³ Ibid.

quarterly, and optometry, audiology and behavioral health. The Native Village of Goodnews Bay is currently in the process of re-activating the Indian Child Welfare Act program for the community.

*Educational Opportunities*³³⁴

Goodnews Bay has one school, the Rocky Mountain School, which offers preschool through 12th grade instruction. In 2011, there were a total of 59 students enrolled and 9 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvests have been important to residents of the Goodnews Bay area for thousands of years.³³⁵ Most subsistence activities are conducted from seasonal camps, where residents spend the majority of the spring and summer months. In the spring, spotted, ringed, and bearded seals have historically been hunted until the first salmon runs in June. In addition, beluga whale have occasionally been harvested. During summer subsistence season, residents net salmon, smelt, herring, and capelin along the Goodnews River. During fall and winter months, smelt, Dolly Varden, blackfish, burbot, northern pike, and Arctic char are harvested.³³⁶

Goodnews Bay is located in District 5 (Goodnews Bay) of the Kuskokwim salmon fishery. In 1996, the Coastal Villages Regional Fund (CVRF) was created as part of six regional non-profit corporations formed under the newly implemented Community Development Quota (CDQ) program. The CVRF represents 20 member communities within the region from Platinum to Scammon Bay. Its mission is to improve social conditions in member communities through fisheries development, and has assisted Goodnews Bay by providing a tender vessel to Platinum for local salmon and herring fisheries. The CVRF also operates a shoreside seafood processing facility in nearby Platinum. In 1998, the community was impacted by the Western Alaska Fisheries Disaster, and commercial fishermen received just under \$40,000 in financial relief.³³⁷

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels

and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.³³⁸

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.³³⁹

Goodnews Bay is located in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Given the community's location outside the Gulf of Alaska, it is not eligible for the Community Quota Entity program. However, it is eligible to participate in the CDQ program and is represented by the CVRF. In a survey by the AFSC in 2011, community leaders reported that Goodnews Bay participates in the fisheries management process in Alaska through a representative who sits on regional fisheries advisory and/or working group run by ADF&G, and through cooperation with the U.S. Fish and Wildlife Service.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Goodnews Bay does not have a registered processing plant. The closest seafood processor is located in Platinum.

Fisheries-Related Revenue

Between 2000 and 2010, fisheries-related revenue collected by Goodnews Bay was minimal. In 2010, known fisheries-related revenue totaled \$275, compared to \$1,186 in 2000. Between 2000 and 2010, fisheries-related revenues were at their highest in 2001, totaling \$9,815. Raw fish tax collections made up the majority of known fisheries-related revenues between 2000 and 2010, followed by shared fisheries business tax collections, which ranged from \$84 to \$5,139 between 2000 and 2010. Further information of known fisheries-related revenue for Goodnews Bay is provided in Table 3.³⁴⁰ In a survey conducted by the AFSC in 2011, community leaders reported that Goodnews Bay received \$10,000 from the CVRF in 2010.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

³⁴⁰ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In 2010, 47 Goodnews Bay residents (equivalent to 19.3% of the local population) held a total of 59 Commercial Fisheries Entry Commission (CFEC) permits, including 27 salmon permits, 24 herring permits, and 8 halibut permits (Table 4). Most recently, residents have engaged in statewide halibut fisheries using longline vessels under 60 feet and dinglebar trolling, herring gill net fishing on Nelson Island, roe herring gill net fishing in Goodnews Bay, salmon drift and set gill net fishing in Bristol Bay, and salmon gill net fishing in Kuskokwim. In a survey conducted by the AFSC in 2011, community leaders reported that the number of commercial fishing vessels (under 35 feet long) within the community increased between 2005 and 2010. In addition, commercial salmon fishermen from other communities often use Goodnews Bay as a base of operation during fishing seasons.

In 2010, 19 fishing vessels were primarily owned by Goodnews Bay residents and 39 residents held a commercial crew license, compared to 31 vessels primarily owned by residents and 37 crew license holders in 2000. Between 2000 and 2010, the number of vessels primarily owned by Goodnews Bay residents declined by 38.7%, and the number of vessels homported also declined by 53.5% during that time period. In 2010, non-confidential ex-vessel landings by resident totaled \$92,050, compared to \$40,122 in 2000. Non-confidential pounds landed were at their lowest in 2009, and at their highest in 2004 (Table 10). By species, residents landed 111,677 pounds of salmon valued at \$92,050 ex-vessel in 2010, compared to 93,443 pounds valued at \$38,120 ex-vessel in 2000; an increase of \$0.26 per pound ex-vessel after adjusting for inflation,³⁴¹ and without considering the species composition of landings. Residents landed 150,455 pounds of herring valued at \$7,657 ex-vessel, compared to 21,143 pounds valued at \$2,002 in 2000; a decrease of \$0.08 per pound ex-vessel after adjusting for inflation.³⁴² Between 2000 and 2010, no fish buyers or shoreside processors reported activity or the intent to operate out of Goodnews Bay. Following this, no landings were recorded in the community during this timeframe (Tables 5 and 9).

Between 2000 and 2010, no Federal Fisheries Permits (FFP) or License Limitation Program permits (LLP) were held by Goodnews Bay residents in federal crab or groundfish fisheries (Table 4). In that time period, however, residents did hold federal quota share accounts in federal catch share fisheries for halibut, but not for sablefish or crab (Tables 6 through 8). In 2010, there was one halibut quota share account holder who held a total of 5,155 shares, compared to two account holders holding 13,287 shares in 2000.

¹ Net pounds refers to the landed weight recorded in fish tickets.

² Totals only represent non-confidential data.

Recreational Fishing

Between 2000 and 2010, a limited amount of recreational fishing activity was reported out of Goodnews Bay. Although no active sport fish guide businesses were present during this period, from 2002 to 2010 at least one licensed sport fish guide was registered in the community each year. Between 2000 and 2010, the number of residents that purchased sportfishing licenses (irrespective of the point of sale) steadily increased from 6 in 2000 to 35 in 2010. However, no sportfishing licenses were sold in Goodnews Bay itself until 2010. The Alaska Statewide Harvest Survey,³⁴³ conducted by ADF&G between 2000 and 2010, did not report information regarding species targeted by Goodnews Bay sport fishermen. However, the survey did list species targeted in freshwater by sport fishermen in nearby Quinhagak: Chinook, coho and sockeye salmon, and Dolly Varden.

Goodnews Bay is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-resident angler days fished per year, and between 0 and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). Further information about the sportfishing trends in and near Goodnews Bay is displayed in Table 11.

Subsistence Fishing

Many Native people in Goodnews Bay region continue the traditional ways of their ancestors, living a subsistence lifestyle and maintaining their cultural beliefs. Subsistence users rely on the plants and wildlife as a source of food, clothing, and raw materials. Residents harvest all five species of Pacific salmon, rainbow trout, Dolly Varden, Arctic char, lake trout, Arctic grayling, rainbow smelt, burbot, Bering cisco, least cisco, round whitefish, pigmy whitefish, northern pike, and Alaska blackfish. Popular subsistence areas include the Goodnews River and accompanying drainages, Goodnews Lake, Goodnews Bay, and other ponds, lakes, and drainages throughout the region. Marine species harvested in coastal areas by residents include starry flounder, yellow fin sole, Pacific and saffron cod, Pacific tomcod, Pacific halibut, and Pacific herring. Pacific walrus, spotted seals, ringed seals and Pacific bearded seals are hunted on the ice during the spring, and some seal hunting continues during summer months in bays and estuaries. In a survey conducted by the in 2011, community leaders reported that the most

important subsistence marine and aquatic resources included salmon, marine mammals, halibut, and herring.³⁴⁴

No information is available from ADF&G between 2000 and 2010 regarding the percentage of Goodnews Bay households participating in the harvest of various subsistence resources, or per capita subsistence harvest (Table 12). However, data were available regarding total subsistence harvests of salmon, halibut, and walrus.

From 2000 to 2008, the number of subsistence salmon permits issued to Goodnews Bay each year households increased from 53 to 73. In contrast, the number of salmon permits that were reported as actively fished declined over the period. Of the five salmon species, residents reported harvesting the greatest quantities of sockeye salmon. Sizeable annual harvests of Chinook, coho, and chum salmon were also reported. A small number of pink salmon were reported harvested in two years of the 2000-2008 period. Further information about subsistence salmon permits and harvest of marine invertebrates and non-salmon fish is presented in Table 13.

Between 2003 and 2010, the number of residents participating in subsistence halibut fisheries declined significantly. In 2000, 17 residents held Subsistence Halibut Registration Certificates (SHARC), compared to 4 in 2010. The total number of pounds reported harvest also declined over the period, although in 2010, the volume of halibut harvested was higher than preceding years. Information about halibut subsistence harvest is presented in Table 14.

Limited information is reported regarding marine mammal harvest in Goodnews Bay between 2000 and 2010. Two walrus were harvested in 2000 and one was harvested 2001. No data were reported by management agencies regarding subsistence harvest of sea otter, beluga whale, polar bear, spotted seal, harbor seal, or Steller sea lion (Table 15).

Although little information was available regarding subsistence activities in Goodnews Bay in recent decades, an earlier ADF&G household subsistence survey conducted in the nearby village of Quinhagak (about 67 miles north of Goodnews Bay) provides insight in to subsistence harvest patterns in the region. During the 1982 season, species of non-salmon fish harvested by the greatest percentage of Quinhagak households included: Dolly varden (100% of households reported harvesting), cod (100%), smelt (75%), cisco (50%), and blackfish (8%). The species of marine mammal reported to be harvested by the greatest number of Quinhagak households that year included: ringed seal (50% of household reported harvesting), spotted seal (50%), bearded seal (25%), and Steller sea lion (17%).³⁴⁵

Additional Information

In a survey conducted by the AFSC in 2011, community leaders reported concerns that the commercial trawl fishery is impacting the Goodnews River subsistence salmon fishery. They emphasized that the bycatch of Chinook, sockeye, and chum salmon negatively affects the livelihoods of both local commercial and subsistence fishermen. When asked what potential future fisheries policy or management actions concerns Goodnews Bay the most, community

leaders reported that future restriction of subsistence fishing and commercial fishing due to low salmon escapement would have the most significant impact.

Kasigluk (ka-SEE-ga-luck)

People and Place

*Location*³⁴⁶

Kasigluk is on the Johnson River in the Kuskokwim River Delta, 26 miles northwest of Bethel. The community is comprised of Old and New Kasigluk, surrounded by the Johnson River and a network of lakes. Kasigluk is located in the Bethel Census Area and the Bethel Recording District.

*Demographic Profile*³⁴⁷

In 2010, there were 569 Kasigluk residents, ranking Kasigluk 104th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population increased by 33.9%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 9.7%, with an average annual growth rate of 0.89%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 4.1%, with an average annual growth rate of 4.06%, which was over the statewide average of 0.75%.³⁴⁸ In 2010, the majority of Kasigluk residents identified themselves as American Indian and Alaska Native (94.7%), with 3.3% identifying themselves as White. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1. According to a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that approximately 20 seasonal workers or transients are present in Kasigluk throughout the year in addition to the population of permanent residents. They also reported that the population of Kasigluk reaches an annual peak between August and September.

The average household size in Kasigluk increased from 4.7 in 1990 to 5.38 in 2000, and then decreased slightly to 5.04 persons per household in 2010. The total number of occupied housing units increased more consistently, from 89 in 1990 to 101 in 2000, and 113 in 2010. Of the 121 housing units surveyed for the 2010 U.S. Census, 54.5% were owner-occupied, 38.8% were rented, and 6.6% were vacant or used only seasonally. Between 1990 and 2010, no Kasigluk residents lived in group quarters.

In 2010, the gender makeup in Kasigluk was 53.1% male and 46.9% female, slightly more weighted toward males than the population of the state as a whole, which was 52% male and 48% female. The median age in Kasigluk was estimated to be 21.8 years, lower than both the

U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. Also in 2010, 8.9% of the Kasigluk population was age 60 or older. The overall population structure of Kasigluk in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)³⁴⁹ estimated significantly fewer (68.6%) residents aged 25 and over held a high school diploma or higher degree in 2010, when compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 23.6% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 7.7% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 15.5% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; 2.6% of resident held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 2.6% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

³⁴⁹ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Figure 2. Population Age Structure in Kasigluk Based on the 2000 and 2010 U.S. Decennial Census.

2000 Population Structure

2010 Population Structure

History, Traditional Knowledge, and Culture

Yup'ik Eskimos have inhabited the Yukon-Kuskokwim delta for thousands of years. Historically, Yup'ik people were very mobile, traveling with the migration of game, fish, and plants. Ancient settlements and seasonal camps contained small populations, with numerous settlements throughout the region consisting of extended families or small groups of families.³⁵⁰ Residents of Kasigluk and two nearby villages, Atmautluak (8 miles east of Kasigluk) and Nunapitchuk (2 ½ miles northeast of Kasigluk), are collectively known as the Akulmiut, a subgroup of Yup'ik Eskimo.³⁵¹ These three 'tundra villages' were enumerated as one village in the 1940 U.S. Census, with a total population of 66. Later, in the 1970 U.S. Census, the populations of Kasigluk, Nunapitchuk, and Atmautluak were again recorded as one village, under the name "Akolmiut," with a population of 526. This 1970 population is now assigned under 'Nunapitchuk' in Census records. Today, subsistence activities remain a focal point of local culture in Kasigluk and the other tundra villages. The sale, importation, and possession of alcohol are banned in the Kasigluk.³⁵²

Natural Resources and Environment

Kasigluk is located within a maritime climate zone. The area's precipitation averages 16 inches annually, with average snowfall of 50 inches. Summer temperatures range from 42 to 62 °F, and winter temperatures range from -2 to 19 °F.³⁵³ The terrain of the Lower Kuskokwim River region is characterized as a level to rolling delta plain crossed by many river channels, meander scars, oxbow lakes, sloughs, and thousands of lakes. The area is underlain by permafrost, preventing drainage.³⁵⁴

Kasigluk is located within the boundaries of the Yukon Delta National Wildlife Refuge. The Refuge was established "to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity."³⁵⁵

Geological formations in the Kasigluk area are not indicative of metallic mineral deposits. The greatest concentration of known mineral occurrences in the Lower Kuskokwim River region is located east of Kasigluk, in the region of the Kilbuk Mountains. In addition, four

exploratory oil wells were drilled near Nunavakpak Lake, southwest of Kasigluk. These wells were dry and have been plugged and abandoned.³⁵⁶

According to a local hazard mitigation plan published by the City of Bethel in 2008, the Kasigluk area is at high risk of floods, severe weather, and erosion. The threat of earthquakes is also noted. The plan addresses the role of climate change in exacerbating threats from flooding and erosion. Warming temperatures have led to thawing permafrost. This has caused severe subsidence, which constrains development of resources, transportation and utility systems, and community expansion. In addition, delayed formation of protective shore ice along the coast leaves shorelines more vulnerable to fall storms and storm surges, resulting in increased flooding and erosion.³⁵⁷

According to the Alaska Department of Environmental Conservation, there were no notable active environmental cleanup sites located in Kasigluk as of August 2012.³⁵⁸

Current Economy³⁵⁹

In Kasigluk, a majority of employment is provided by the school, commercial fishing, retail businesses, and village government.³⁶⁰ According to a survey conducted by the AFSC in 2011, community leaders indicated that fishing is the most important natural-resource based industry in Kasigluk. Between 2000 and 2010, the number of Kasigluk residents holding state Commercial Fisheries Entry Commission (CFEC) averaged 46 per year, equivalent 8.5% of the total local population on average. A majority of CFEC permits were held in the Kuskokwim River salmon gillnet fishery (see *Commercial Fisheries* section). Subsistence activities also contribute significantly to household diets.³⁶¹ In the 2011 AFSC survey, community leaders reported that humpback whitefish and Alaska blackfish are two of the most important subsistence resources. They indicated that whitefish are harvested using set nets in nearby lakes and rivers, and Alaska blackfish are harvested using traps in local streams.

Based on household surveys for the 2006-2010 ACS, in 2010,³⁶² the per capita income in Kasigluk was estimated to be \$11,355 and the median household income was estimated to be \$37,500. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$7,194 and \$31,500, respectively). If inflation is taken into account by converting the 2000 values to 2010 dollars,³⁶³ real per capita income in 2000 was \$9,460 and real median household income was \$41,422, revealing that while the per capita income estimate showed a real increase, median household income is estimated to have decreased slightly over

³⁵⁶ See footnote 351.

Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

³⁶³ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

the period. In 2010, Kasigluk ranked 252nd of 305 Alaskan communities with per capita income data that year, and 203rd in median household income, out of 299 Alaskan communities with household income data.

However, Kasigluk's small population size may have prevented the ACS from accurately portraying economic conditions.³⁶⁴ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Kasigluk in 2010 is \$5,872.^{365,366} This estimate is lower than the 2000 per capita income reported in by the U.S. Census, suggesting that caution is warranted when citing an increase in per capita income in Kasigluk between 2000 and 2010. The lower per capita income estimate derived from the ALARI database is supported by the fact that the community was recognized as "distressed" by the Denali Commission in 2011,³⁶⁷ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a much lower percentage of Kasigluk residents were estimated to be in the civilian labor force (49.2%) than in the civilian labor force statewide (68.8%). Also in 2010, 25.7% of Kasigluk residents were estimated to be living below the poverty line, compared to a 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 14%, more than double statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 27.1%, more than double the statewide unemployment rate estimate of 11.5%.^{368,369}

Also based on the 2006-2010 ACS, a majority of workers were estimated to be employed in the public sector (65.5%), along with 34.5% in the private sector. Of the 116 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in educational services, health care, and social assistance (52.6%), public administration (13.8%), transportation, warehousing, and utilities (11.2%), and retail trade (10.3%). None of the civilian labor force was estimated to be working in agriculture, forestry, fishing, hunting, and mining in 2010. However, the number of individuals employed in the fishing industry is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

³⁶⁴ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³⁶⁹ Ibid.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 236 employed residents in Kasigluk in 2010, of which 77.5% were employed in local government, 11.4% in education and health services, 3.8% in financial activities, 2.1% in trade, transportation, and utilities, 0.8% in natural resources and mining, 0.8% in manufacturing, 0.4% in information, 0.4% in leisure and hospitality, 0.4% in state government, and 2.1% in other industries.³⁷⁰ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Kasigluk was incorporated as a city in 1982 but was dissolved on October 21, 1996 in favor of the traditional Village Council. Kasigluk is not located in an organized borough. No taxes are administered as there is no local taxing authority.³⁷¹ Given that Kasigluk is not a municipality, no information is reported regarding municipal revenue sources between 2000 and 2010 (Table 2).

Kasigluk was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Kasigluk Traditional Elders Council. The Native village corporation is Kasigluk, Incorporated, which manages 115,200 acres of land.³⁷² Kasigluk belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.³⁷³

Kasigluk is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”³⁷⁴ The AVCP is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.³⁷⁵ AVCP is made up of 56 villages and 45 village corporations.³⁷⁶

The closest offices of the Alaska Department of Fish and Game (ADF&G) and Alaska Department of Commerce, Community, and Economic Development (DCCED) are located in Bethel. A National Marine Fisheries Service (NMFS) field office is located in Bethel and a main office is located in Anchorage. The nearest offices of the Alaska Department of Natural Resources and the Bureau of Citizenship and Immigration Services are located in Anchorage.

Infrastructure

Connectivity and Transportation

A state-owned 3,000 feet long by 60 feet wide gravel airstrip provides chartered or private air transportation year-round.³⁷⁷ As of June 2012, roundtrip airfare from Anchorage to Kasigluk was \$592.³⁷⁸ Locals use skiffs in the summer and snowmobiles, ATVs, and dogsleds in the winter to travel to Bethel and other nearby villages. Winter trails exist to nearby Nunapitchuk (2 ½ miles to the northeast) and Atmautluak (8 miles east), as well as a longer winter trail to Chefornak, a village 83 miles southwest of Kasigluk, near the coast of the Yukon-Kuskokwim Delta on the Kinia River.³⁷⁹

According to the 2011 AFSC survey, community leaders reported that no docking facilities are present in Kasigluk, and the only vessels that can be accommodated locally are barges. Barges from Bethel deliver fuel and supplies during summer months. It is also important to note that a dock, small boat harbor, and seaplane base are located nearby in Nunapitchuk.³⁸⁰

Facilities

Homes in Kasigluk are not plumbed, and residents are reliant on the Village Council-operated washeteria for bathing and laundry. Filtered and chlorinated well water is available to be hauled to homes from the washeteria. Individual wells are also in use, and homes in Akula

³⁸⁰ Ibid.

Heights use the school well. Honeybuckets are hauled to sewage bunkers. The Village Council operates a landfill and provides refuse collection services in the village.³⁸¹ According to the 2011 AFSC survey, community leaders reported that improvements to water and sewer pipelines, water treatment, and the landfill are currently in progress.

Kasigluk and nearby villages have historically been known for their high fuel prices. The Alaska Village Electric Cooperative (AVEC) currently provides electricity to 53 remote Alaskan villages, including Kasigluk, using diesel generators. Given rising fuel prices, AVEC has been introducing wind turbines to some of the remote villages it serves. In Kasigluk, wind power now supplements the existing diesel power grid, reducing the price per kilowatt hour from 37 cents to 25 cents in Kasigluk.³⁸²

Police services in Kasigluk are provided by the Village Police Department, as well as state troopers stationed in Bethel. Fire and rescue services are provided by the Nick J. Slim Memorial Volunteer Firefighters. Additional community facilities include a community building, village bingo hall, and school library.³⁸³ According to the 2011 AFSC survey, community leaders also noted the presence of a U.S. post office. They also indicated that telephone service is available in the community, and that broadband internet service is expected to be available within the next 10 years. Current internet service is provided by United Utilities Inc, and the Village of Kasigluk also serves as a local cable provider.³⁸⁴

Despite the lack of docking facilities in Kasigluk, residents are highly involved in subsistence and commercial fisheries, and in the 2011 AFSC survey, community leaders reported the presence of some fisheries-related services in the 2011 AFSC survey. According to the survey, boat repair services available locally include welding, mechanical services, and a machine shop. In addition, community leaders indicated that fishing gear, bait and tackle, and boat fuel are sold in Kasigluk.

Medical Services

The Kasigluk Health Clinic is owned by the Village Council and operated by the Yukon Kuskokwim Health Corporation. The Clinic provides residents with basic medical services. It is a Community Health Aide Program site, and a health aide provides emergency service. Outside emergency services have air and river access.³⁸⁵ The nearest hospital is located in Bethel.

Educational Opportunities

There are two schools in Kasigluk that offer preschool through 12th grade education. As of 2011, the Akiuk Memorial School had 87 students and 9 teachers, and the Akula Elitnaurvik School had 107 students and 8 teachers.³⁸⁶

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence fishing has been important to residents of the Kasigluk area for thousands of years.³⁸⁷ Subsistence salmon harvest continues to be a primary economic activity along the Kuskokwim River. In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.³⁸⁸ In addition to saltwater fisheries, community leaders in Kasigluk indicated in the 2011 AFSC survey that whitefish and blackfish are important inland subsistence resources as well.

Commercial harvest of salmon first took place in the Kuskokwim River in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. When Alaska became a state in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s, commercial salmon fisheries in the Kuskokwim River were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current state dictated management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.³⁸⁹

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.³⁹⁰

Kasigluk is located closest to the Lower Kuskokwim salmon fishing district (District 1). The closest marine area to Kasigluk, Kuskokwim Bay, is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Kasigluk is a member of the Coastal Villages Region Fund (CVRF), a Community Development Quota group that promotes employment opportunities for residents as well as participation in the Bering Sea crab and groundfish fisheries.³⁹¹ Kasigluk is not eligible to participate in the Community Quota Entity program. In the 2011 AFSC survey, community leaders reported that Kasigluk does not actively participate in the fisheries management process

in Alaska. Community leaders also indicated that a current challenge for Kasigluk's fishing economy is the late commercial fishing schedule.

Processing Plants

The ADF&G 2010 Intent to Operate list did not list a registered processing plant in Kasigluk. According to the 2011 AFSC survey, community leaders confirmed this, noting that the location of Kasigluk on the Johnson River is not accessible to a majority of vessels, with the exception of fuel barges. It is important to note that, according to ADF&G's 2010 Intent to Operate list, a small processing facility was located in nearby Bethel. The plant, run by Kuskokwim Seafoods LLC, was started in 2010 to provide a market to local salmon fishers to help them sell their catch closer to home. Kuskokwim Seafoods processes four species of salmon: Chinook, sockeye, chum, and coho.³⁹²

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue in Kasigluk (Table 3).

Commercial Fishing

Between 2000 and 2010, Kasigluk residents participated in commercial fisheries as crew members, vessel owners, and state permit holders. Trends in local commercial fishing activity generally declined over the period, with the number of crew license holders falling from 51 in 2000 to 2 in 2006, and then rebounding to 39 by 2010. The number of vessels primarily owned by residents declined from 16 in 2000 to 5 in 2010, and the number of vessels homeported in Kasigluk also declined, from 13 in 2000 to 7 in 2010. There were no fish buyers or shore-side processors in Kasigluk during the 2000-2010 period, no vessels were reported to land catch in the community, and no local landings or revenue were reported. This information about the commercial fishing sector in Kasigluk is presented in Table 5. These declining trends were echoed in the 2011 AFSC survey, in which community leaders reported that a lot less people were commercial fishing and there were fewer commercial fishing boats in Kasigluk overall than 5 years earlier. More specifically, they indicated that there were a lot less boats over 60 feet in length, while there were a lot more smaller vessels (under 35 feet in length) compared to 5 years prior. Community leaders also reported that the most common gear used by fishing vessels based out of Kasigluk is small whitefish nets.

The number of commercial fishing permits held in Kasigluk also declined slightly between 2000 and 2010. In 2000, there were 49 permit holders in Kasigluk holding a total of 50 state Commercial Fisheries Entry Commission (CFEC) permits. A majority of these permits (45) were held in the Kuskokwim salmon gillnet fishery, along with 1 Bristol Bay salmon drift gillnet permit, and 4 herring gillnet permits. The herring permits included two for the Goodnews Bay roe and food/bait gillnet fishery and two for the Cape Avinof herring roe fishery. Starting in 2002, the only salmon permits held were for the Kuskokwim gillnet fishery, and the only remaining herring permits were held in the Goodnews Bay roe and food/bait fishery. It is

³⁹² Kuskokwim Seafoods LLC. (n.d.). *Homepage*. Retrieved August 2011 from <http://kuskokwimseafoods.com/>.

important to note that no herring permits were actively fished by Kasigluk residents in any year during the 2000-2010 period. The percentage of salmon permits that were actively fished declined from 83% in 2000 to a low of 51% in 2004, and then increased again to 71% of all permits actively fished in 2010. This information about CFEC permits is presented in Table 4.

Between 2000 and 2010, no Kasigluk residents held federal License Limitation Permits or Federal Fisheries Permits (Table 4). In addition, no Kasigluk residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab during the period (Tables 6 through 8). Given the lack of fish buyers and shore-side processors (Table 5), no landings or ex-vessel revenue were generated in the community during the 2000-2010 period (Table 9). With regard to landings and ex-vessel revenue generated by Kasigluk residents, including all delivery locations, information is considered confidential during the 2000-2010 period due to the small number of participants (Table 10).

Recreational Fishing

According to the 2011 AFSC survey, community leaders indicated that no sportfishing activity takes place locally. This is reflected in the fact that no active sport fish guide businesses were present in Kasigluk between 2000 and 2010, and no licensed sport fish guides resided in the community. However, local residents participated in sportfishing during the 2000-2010 period, purchasing between 20 and 104 sportfishing licenses per year (irrespective of point of sale). The number of sportfishing licenses purchased in the community of Kasigluk itself was very close to the number purchased by residents, indicating that sportfishing does not draw a significant number of visitors to Kasigluk (Table 11).

The Alaska Statewide Harvest Survey,³⁹³ conducted by ADF&G between 2000 and 2010, did not provide information regarding the species targeted by private anglers on the Johnson River near Kasigluk. However, the survey did note the following species as targeted by private anglers in Napakiak, one of the nearby communities located on the main stem of the Kuskokwim River: Dolly Varden, northern pike, and whitefish. Given the lack of sport fish guide businesses in Kasigluk, no kept/release log book data were reported for sportfishing charters out of Kasigluk between 2000 and 2010.³⁹⁴

Kasigluk is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the regional sportfishing activity is displayed in Table 11.

Subsistence Fishing

Subsistence activities are fundamental to the way of life in Kasigluk.³⁹⁵ Fish has historically been the basis of the Akulmiut³⁹⁶ economy. Northern pike, whitefish, and Alaska blackfish were the primary subsistence fishery resources in the 19th century, and the harvest of salmon increased in importance during the 20th century.³⁹⁷ According to a survey conducted by the AFSC in 2011, community leaders indicated that fishing is still the most important natural-resource based industry in Kasigluk, and that whitefish and blackfish remain two of the most important aquatic subsistence resources. Additional species of freshwater fish found in the region including rainbow trout, lake trout, and Dolly Varden. Rainbow trout occur in the Kasigluk River; the Kuskokwim River is the approximate northern limit of the range of rainbow trout.³⁹⁸

No information is available from ADF&G between 2000 and 2010 regarding the percentage of Kasigluk households participating in the harvest of various subsistence resources or per capita subsistence harvest (Table 12). In addition, no data are available regarding harvest of marine invertebrates and non-salmon fish (Table 13), Pacific halibut (Table 14), or marine mammals (Table 15) during the 2000-2010 period. Some information is available between 2000 and 2010 regarding subsistence salmon permits, however. From 2000 to 2008, the number of Kasigluk households that were issued subsistence salmon permits varied between 129 and 136 per year. For those years in which harvest numbers were reported, an average of 1,306 Chinook, 878 chum, 668 coho, and 573 sockeye salmon were harvested by Kasigluk households per year using subsistence salmon permits. This information is presented in Table 13.

Although minimal information was available regarding subsistence harvests in the village of Kasigluk, subsistence harvests by residents of Kasigluk follow the pattern of seasonal harvests of the community Nunapitchuk,³⁹⁹ so it is useful to consider subsistence data recorded for Nunapitchuk to shed light on Kasigluk subsistence patterns as well. Results of an ADF&G subsistence survey conducted in 2005 show that 4% of Nunapitchuk households participated in Pacific halibut subsistence and 53% of Nunapitchuk households participated in non-salmon fish subsistence (other than halibut), and the total pounds of non-salmon fish harvested by Nunapitchuk residents for subsistence purposes was 89,846 that year.⁴⁰⁰

A 1983 ADF&G subsistence survey considered subsistence harvest by Akulmiut residents of all three tundra villages, Nunapitchuk, Kasigluk, and Atmautluak. Together, the population of the three villages totaled 1,000 in 1983. Residents of these three communities were found to use an area of approximately 2,500 to 3,000 square miles for subsistence harvest of fish and wildlife resources. In 1983, 100% of households reported harvesting pike, 94% reported harvesting whitefish, 77% reported harvest of burbot, 53% reported harvest of blackfish, and

12% reported harvest of sheefish. In addition, the 1983 ADF&G survey found that 29% of households reported harvesting seal for subsistence purposes that year. No information was provided regarding the species of seal harvested.⁴⁰¹ Kuskokwim Bay is an important site for both seal and beluga whale hunts. In addition, waterfowl are an important subsistence resource during spring, late summer, and early fall.⁴⁰²

Kipnuk (KIP-nuck; A.K.A. Kanganak)

People and Place

*Location*⁴⁰³

Kipnuk is located on the west bank of the Kugkaktlik River in the Yukon-Kuskokwim River Delta, 85 air miles southwest of Bethel and approximately 485 air miles west of Anchorage. It lies 4 miles inland from the Bering Sea coast. Kipnuk is located in the Bethel Census Area and the Bethel Recording District.

*Demographic Profile*⁴⁰⁴

In 2010, there were 639 residents in Kipnuk, making it the 97th largest of 352 total Alaskan communities with recorded populations that year. The population of Kipnuk increased by 37.0% between 1990 and 2000, and stayed stable through 2010, with an overall population increase of 35.6% between 1990 and 2010. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 4.2%, with an average annual growth rate of 0.01%, significantly below than the statewide average of 0.75%.

In 2010, the majority of Kipnuk residents identified themselves as American Indian and Alaska Native (97.7%), along with 2.0% that identified as White, and just under 1% of the population identified with two or more races. Other racial and ethnic groups were not represented in Kipnuk in 2000 or 2010. There was little change in racial and ethnic composition between 2000 and 2010; there was a small increase in the percentage of the population identifying as American Indian and Alaska Native, and a commensurate decrease in the number of individuals identifying with two or more races between 2000 and 2010. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Kipnuk was 4.18, a decrease from 4.7 persons per household in 1990 and 2000. The number of households in Kipnuk increased over time, from 99 in 1990 and 137 in 2000, to 153 occupied housing units in 2010. Of a total of 176 housing units surveyed for the 2010 U.S. Decennial Census, 123 (69.9%) were owner-occupied households and 30 (17%) were renter-occupied. In that same year, 23 housing units (13.1%) were vacant, compared to 11% of total housing units in 2000. In 1990, two Kipnuk residents were reported to be living in group quarters. This number fell to zero in 2000 and 2010.

Figure 1. Racial and Ethnic Composition, Kipnuk: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Kipnuk was 52.1% male and 47.9% female, nearly identical to the gender distribution statewide (52.0% male, 48.0% female). Also in 2010, the median age was estimated to be 21.9 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska of 33.8 years. That year, 9% of the Kipnuk population was age 60 or older. Compared with 2000, the population structure in 2010 became more constricted. In that year, 46.6% of residents were under the age of 20, compared to 49.1% in 2000; 9.1% were over the age of 59, compared to 7.1% in 2000; 31.1% were between the ages of 30 and 59, compared to 31.4% in 2000; and 13.1% were between the ages of 20 and 29, compared to 12.4%

in 2000. Age distribution by gender cohort was slightly more even in 2010 than in 2000. In 2010, the greatest absolute gender difference occurred within the 20 to 29 age range (7.7% male, 5.5% female), closely followed by the 40 to 49 age range (6.9% male, 4.8% female). The overall population structure of Kipnuk in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Kipnuk Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)⁴⁰⁵ estimated that 72.4% of residents aged 25 and over held a high school diploma or higher degree in 2010, significantly less than the estimated 90.7% of Alaska residents overall. Also in that year, an estimated 15.6% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 11.9% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 18.4% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; 5.4% of resident held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and no residents held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Kipnuk is a traditional Yup'ik Eskimo community, maintaining a subsistence lifestyle. The Native people of the Yukon-Kuskokwim (Y-K) Delta region traditionally followed a nomadic, subsistence lifestyle. Extensive trade networks throughout the Y-K Delta were established prior to contact with Russian explorers in the late 19th century, and by the time of contact the Native people in the region already had access to Eurasian goods from trade routes across the Bering Strait. *Pastuliarraq*, near present-day Kotlik, was a trading center which connected these routes with the lower Y-K Delta region. The 19th century was a time of European expansion and development in the region and with it came waves of disease epidemics which had disastrous effects on the Native peoples in the area. In the early 20th century, the influence of missionaries coinciding with the influenza epidemics of 1900 and 1912 drastically changed the social and cultural identity of an entire generation within the region.⁴⁰⁶ According to Bureau of Indian Affairs records, the village of Kipnuk was established around 1922. Today, commercial fishing is an important source of income in Kipnuk. The sale and importation of alcohol is banned in the village.⁴⁰⁷

Natural Resources and Environment

The community is located in a marine climate. Annual precipitation averages 22 inches, with 43 inches of snowfall annually. Summer temperatures range from 41 to 57 °F, and winter temperatures average from 6 to 24 °F.⁴⁰⁸ Kipnuk is located 4 miles from the coast, on the south shore of the Kugkaktlik River, a meandering stream that originates about 30 miles inland.⁴⁰⁹ The

⁴⁰⁵ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

entrance to the Kuguklik River is partially protected by a system of barrier islands that extend south of Kinak Bay, including Kwigluk, Pingerbek, and Kikegtek Islands.⁴¹⁰

The geography of the mainland Y-K Delta is characterized by sub-arctic tundra, tidal wetlands, and boreal forests. The delta plain is crossed by many river channels, meander scars, oxbow lakes, sloughs, and contains more than 400,000 charted lakes. Drainage in the Kipnuk area is limited by fine soils and a permafrost layer underlying the tundra complex. Permafrost in the area varies, and while there is limited local data, regional depths can extend to around 600 feet in some areas. The active permafrost layer is estimated to range between 1.5 and 3 feet deep, depending on conditions. Coastal areas of the delta are classified typically as wet tundra consisting of marshes, swamps, and water ponds.^{411,412}

Fish in the area include all five species of Pacific salmon, boreal smelt, Arctic cisco, northern pike, blackfish, stickleback, sheefish, burbot, and whitefish. Terrestrial wildlife includes bear, moose, hares, beaver, mink, muskrat, otter, fox, weasel, and caribou. Aquatic mammals include seals, walrus, and several species of whale. In addition, the Y-K Delta is renowned as one of the most productive waterfowl breeding areas in the world.⁴¹³

Kipnuk is located within the 22 million acre Yukon Delta National Wildlife Refuge (NWR). The NWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” NWR lands are open to sport and subsistence hunting and fishing.⁴¹⁴

Natural hazards that have been identified to be present in the Bethel Census Area include flooding, earthquakes, and severe weather.⁴¹⁵ Communities in the region are also suffering from severe erosion of both riverbanks and coastal shorelines, and are susceptible to tundra fires.^{416,417} Flooding and erosion rates, as well as rates of permafrost thawing, are exacerbated by climate change. In 2011, Kipnuk was awarded a \$50,000 State Hazard Impact Assessment grant to identify and define climate-change related hazards in the community and to develop a mitigation plan. Kipnuk is located on a badly eroding bend of the Kuguklik River. Community structures in Kipnuk that may be impacted by erosion, flooding, and permafrost thawing hazards include

homes, commercial and public buildings, power generation facilities, bulk fuel storage, boardwalks, and communication infrastructure.⁴¹⁸

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation sites active in Kipnuk as of September 2012.⁴¹⁹ However, it is important to note that a number of contamination concerns have been encountered during preparation for the construction of a new school in Kipnuk. These have included removing and treating effluent and sludge from the previous sewage lagoon, determining the extent of contaminated surface soils from the community's fuel tank farm, and managing demolition of existing structures at the site of the new school that may contain hazardous materials such as asbestos, lead paint, mercury, or polychlorinated biphenyls (PCBs). In addition, the ground in Kipnuk is permeated with methane gas, possibly from thawing of permafrost, an old buried landfill, or leakage from the sewage lagoon.⁴²⁰

Current Economy⁴²¹

Local government and utilities provide a majority of wage employment in Kipnuk,⁴²² along with seasonal activities such as fishing and construction. Subsistence activities also provide a foundation for the local economy and lifestyle. Coastal Villages Seafoods, Inc., a subsidiary of the regional Community Development Quota (CDQ) group, the Coastal Villages Region Fund (CVRF), operates a seafood processor in Kipnuk that processes halibut and salmon.⁴²³ In 2000, 99 Kipnuk residents held state commercial fishing permits, equivalent to 15% of the total local population, and the number of crew licenses holders (82) was equivalent to 13% of the population. These numbers declined over the decade, with 45 permit holders in 2010 (equivalent to 7% of the total local population), and 31 crew license holders (5% of the population). See the *Commercial Fishing* section for more information. Trapping is also a source of income in Kipnuk.⁴²⁴

Based on household surveys conducted for the 2006-2010 ACS,⁴²⁵ in 2010, per capita income in Kipnuk was estimated to be \$11,123 and the median household income was estimated to be \$34,792, compared to \$8,589 and \$34,375 reported in 2000, respectively. Taking inflation

into account by converting the 2000 values to 2010 dollars,⁴²⁶ the real per capita income in 2000 is shown to have been \$11,294 and the real 2000 median household income was \$45,203. This shows that per capita income stayed stable over the period, while there appears to have been a real decrease in median per capita income. In 2010, Kipnuk ranked 262nd of 305 Alaskan communities with per capita income that year, and 225th out of 299 Alaskan communities with household income data.

However, Kipnuk's small population size may have prevented the ACS from accurately portraying economic conditions.⁴²⁷ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Kipnuk in 2010 is \$7,540.⁴²⁸ This estimate is lower than the 2000 per capita income reported in by the U.S. Census, suggesting that caution is warranted when citing an per capita income stability in Kipnuk between 2000 and 2010. The lower per capita income estimate derived from the ALARI database is reflected in the fact that the community was recognized as "distressed" by the Denali Commission in 2011,⁴²⁹ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, 58.5% of the Kipnuk population age 16 and older was estimated to be in the civilian labor force, lower than the statewide rate of 68.8%. That year, approximately 23.7% of local residents were living below the poverty line, 2.5 times the rate of Alaskans overall (9.6%), and the unemployment rate was estimated to be 12.7%, more than double the statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in Kipnuk in 2010 was 26.1%, more than twice the ALARI statewide unemployment rate estimate of 11.5%.⁴³⁰

Also based on the 2006-2010 ACS, almost half of the Kipnuk workforce was estimated to be employed in the private sector (49.2%), with the other half employed in the public sector (48.1%), and the remaining 2.8% estimated to be self-employed. Out of 181 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest number worked in educational services, health care and social services (41.4%), retail trade (30.4%), transportation, warehousing and utilities (15.5%), and public administration (5%) industries (Figure 3). In 2010, 2.2% of the workforce was also estimated to be working in the agriculture, forestry, and fishing industries. The number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly.

⁴²⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁴²⁷ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁴²⁸ See footnotes 422 and 425.

⁴²⁹ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

⁴³⁰ See footnote 422.

Compared to employment statistics in 2000, the distribution of employment by industry appears to have remained stable in some key categories in Kipnuk, with a similar percentage of the work force employed in education, health care, and social assistance services. Some of the most notable shifts were a greater than 50% decrease in the number of individuals employed in public administration, and a more than doubling of percentage employed in retail trade. In addition, several industries that had small employment numbers in 2000 appear to no longer be represented in 2010, including arts, entertainment, recreation, accommodation, and food services, finance, and information industries (Figure 3).

Viewing employment from the perspective of occupation, 2006-2010 ACS estimates indicate that the highest percentages of the Kipnuk workforce were employed in sales and office occupations (37.6%) and management, business, science, and arts occupations (35.9%). In addition, 9.9% of the civilian labor force was estimated to be employed in production, transportation, and material moving service occupations, 9.4% in service occupations, and 7.2% in natural resources, construction, and maintenance occupations. Between 2000 and 2010, the percentage of the workforce employed in sales and office occupations increased by over 50%, while the percentage employed in service occupation decreased by almost 50% and the percentage employed in management/professional occupations decreased by almost 20%. This information about employment by occupation is presented in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Kipnuk (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Kipnuk (U.S. Census).

The 2010 ALARI estimate of employment by industry mirrors 2006-2010 ACS estimates, with high percentages of the labor force working in government and trade, transportation, and utilities positions. Economic data compiled in the ALARI database indicate that there were 295 employed residents in Kipnuk in 2010, of which 44.4% were employed in local government, 22.7% were employed in trade, transportation, and utilities, 7.8% in education and health services, 7.5% in manufacturing, 3.7% in financial activities, 1.4% in construction, 0.7% in leisure and hospitality, 0.7% in state government, 0.3% in natural resources and mining, 0.3% in information, and 10.5% in other industries.⁴³¹ ACS estimates conflict somewhat with economic data compiled in the ALARI database, which shows the greatest number of Kipnuk residents employed in production, transportation, and material moving occupations, along with a high number employed in service occupations. It should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Governance

Kipnuk is an unincorporated community and is not located in an organized borough. There is no taxing authority in Kipnuk,⁴³² and no municipal revenue information was reported by the community between 2000 and 2010. The community did receive State Revenue Sharing contributions of between \$3,000 and \$4,000 per year from 2000 to 2003, as well as a \$474,525 grant from the U.S. Economic Development Administration (EDA) in 2001 to assist with construction of a new halibut processing facility (see *Processing Plants* section for more information). Details about these selected community revenue sources are presented in Table 2.

Kipnuk was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Native Village of Kipnuk. The local village Native corporation is Kugkaktlik, Limited, which manages 115,200 acres of land. Kipnuk belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and

lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.⁴³³

Kipnuk is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”⁴³⁴ The AVCP is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.⁴³⁵ AVCP is made up of 56 villages and 45 village corporations.⁴³⁶

The closest offices of the Alaska Department of Fish and Game (ADF&G) and Alaska Department of Commerce, Community, and Economic Development are located in Bethel. A National Marine Fisheries Service (NMFS) field office is located in Bethel and a main office is located in Anchorage. The nearest offices of the Alaska Department of Natural Resources and the Bureau of Citizenship and Immigration Services are located in Anchorage.

Infrastructure

Connectivity and Transportation

Kipnuk offers a state-owned 2,120 feet long by 35 feet wide gravel airstrip, with scheduled air taxi service and available charter services. As of June 2012, roundtrip airfare from Anchorage to Kipnuk costs \$726.⁴³⁷ A seaplane base is also available. Boats and skiffs are used by residents for local travel during the summer, with snowmobiles in the winter. Winter trails lead to Tuntutuliak (77 miles), Chefornak (20 miles), and Kwigillingok (35 miles). Although there is no dock, barges from Bethel deliver cargo each summer.⁴³⁸

Facilities

Electricity in Kipnuk is provided by the Kipnuk Light Plant, a diesel plant operated by the Village Council. Water is supplied from a 210,000 gallon water storage tank, which is filled from a reservoir on a nearby lake and maintained by the Village Council and the school. Homes in Kipnuk are not plumbed. Residents haul filtered and chlorinated water to their homes from several watering points throughout the community. The Village Council provides honeybuckets haul service, and sewage is deposited in a sewage lagoon. Some outhouses are also in use in Kipnuk.⁴³⁹ In 2009, the Alaska Native Tribal Health Consortium received a grant from the U.S. Environmental Protection Agency for construction of a new sewage lagoon in Kipnuk to meet Clean Water Act standards.^{440,441} The old sewage lagoon was affected by flooding and overflow events.⁴⁴² The Village Council also offers refuse collection services and maintains a Class III unpermitted landfill.⁴⁴³

Other community facilities in Kipnuk include the Kanganak Community Hall is located in Kipnuk, a volunteer fire department, and a school library. Safety services are provided by the Village Public Safety Officer stationed in Kipnuk. The nearest state trooper post is in Bethel.

⁴³⁷ Airfare was calculated using lowest fare. <http://www.travelocity.com> (retrieved November 22, 2011).

⁴⁴³ See footnote 438.

Visitor accommodations are not available in Kipnuk. Local and long-distance telephone service, cable, and internet access are all available locally.⁴⁴⁴ Kipnuk also has a post office.

With regard to fisheries-related infrastructure, no dock infrastructure is available in Kipnuk.⁴⁴⁵

Medical Services

The Kipnuk Clinic, owned by the Village Council and operated by the Yukon Kuskokwim Health Corporation, provides residents with basic medical services. The clinic is a Community Health Aid Program site. The health aide provides emergency services in the community. Outside Emergency Services have coastal and air access.⁴⁴⁶ The nearest hospital is located in Bethel.

Educational Opportunities

There is one school in the Kipnuk, which offers a preschool through 12th grade education. As of 2011, the Chief Paul Memorial School had with 211 students and 14 teachers. Kipnuk is located in the Lower Kuskokwim School District.⁴⁴⁷

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Harvest of marine resources has been important to residents of the Kipnuk area since prehistory. Yup'ik Eskimo people were historically very mobile, following the migration and seasonal availability of subsistence resources.⁴⁴⁸ Today, subsistence harvest remains fundamental to the way of life and economy in Kipnuk, and commercial fisheries are also an important source of income.⁴⁴⁹ Between 2000 and 2010, residents of Kipnuk were involved in commercial fisheries for herring, halibut, and salmon (see *Commercial Fishing* section).

Kipnuk is located near the Kuskokwim River. Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. When Alaska became a state in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s, commercial salmon fisheries in the Kuskokwim River were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels, and salmon prices decreased. Current state-

⁴⁴⁹ See footnote 438.

dictated management is focused on sustainability of salmon runs, ensuring first that subsistence needs are met followed by providing opportunity for commercial harvest of available surpluses.⁴⁵⁰

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. The largest aggregation of herring in Alaska spawns along the northern shore of Bristol Bay, near the village of Togiak. Spawning herring are harvested using purse seines and gillnets in the Togiak sac roe fishery. A spawn-on-kelp harvest is also taken in Togiak. Along the coast of the Y-K Delta there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁴⁵¹

Commercial exploitation of halibut first extended into the Bering Sea region in 1928 after development of diesel engines, which allowed fishing vessels to undertake longer trips.⁴⁵² Today, Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

The closest marine area to Kipnuk, Kinak Bay, is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Kipnuk is a member of the CVRF, a CDQ group that promotes employment opportunities for residents as well as participation in the Bering Sea crab and groundfish fisheries.⁴⁵³ Kipnuk is not eligible to participate in the Community Quota Entity program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Coastal Villages Seafoods operates a seafood processing plant in Kipnuk. The facility was constructed during the summer of 2002,⁴⁵⁴ funded by a grant from the EDA (see *Governance* section). The Kipnuk facility processes halibut from June to July. Coastal Villages maintains a local community service center that helps local fishing families maintain, repair, service, and modify their boats, motors, and fishing gear. The local plant provides free room and board to its fish processing workers, as well as transportation to and from the plant site and a cash bonus for all those who complete their contracts.⁴⁵⁵

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue in Kipnuk (Table 3).

Commercial Fishing

During the 2000-2010 period, Kipnuk residents were active in commercial fisheries for herring, halibut, and salmon. They participated in fisheries for these species as state permit holders, vessel owners, and crew license holders, with declining participation numbers over the decade. In 2000, 99 Kipnuk residents held state issued Commercial Fishery Entry Commission (CFEC) permits, 85 residents held commercial crew licenses, and 90 vessels were primarily owned by a Kipnuk resident. By 2010, 45 Kipnuk residents were CFEC permit holders, 31 held crew licenses, and 34 vessels were primarily owned by residents. The number of vessels that were homeported in Kipnuk also decreased steadily through this period. Permit information is presented in Table 4, and other statistics about the commercial fishing sector in Kipnuk are presented in Table 5.

In 2010, 45 Kipnuk residents held a total of 61 CFEC permits, including 24 halibut permits, 21 salmon permits, and 14 herring permits. The number of herring permits held by Kipnuk residents decreased substantially over the 2000-2010 period, from a high of 89 permits held by 89 permit holders in 2000 to a low of 3 permits held by 2 permit holders in 2008, rebounding slightly by 2010. Salmon permit numbers declined very slightly over the period, while halibut permit numbers remained stable despite greater yearly variability.

Throughout the 2000-2010 period, salmon CFEC permits were held in the Kuskokwim gillnet and Bristol Bay drift gillnet fisheries, with a much higher rate of active permits in the Bristol Bay fishery. In 2010, herring CFEC permits were held in the Nelson Island gillnet fishery, the Cape Avinof and Goodnews Bay roe herring gillnet fisheries, and the Bristol Bay spawn-on-kelp hand-picking fishery. No herring permits were actively fished from 2006 to 2010. From 2000 to 2005, all active herring permits were fished in the Cape Avinof roe herring gillnet fishery, with 63 active permits in 2000 declining to 14 by 2005. Halibut permits were held in the statewide hand troll fishery, the statewide longline fishery using vessels under 60 feet in length, and the statewide mechanical jig fishery. The total number of halibut permits held were spread relatively evenly across these three gear types, and the rate at which the gear types were actively fished was similar across gear types as well. It is important to note that very few halibut permits were actively fished in the earlier years of the 2000-2010 period. The increase in the number of halibut permits actively fished starting in 2003 may be related to the construction of the new halibut processing plant in Kipnuk, which was completed in 2002.⁴⁵⁶

Between 2000 and 2010, no Federal Fisheries Permits or federal License Limitation Permits were held by Kipnuk residents (Table 4), and no Kipnuk residents held participated in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 through 8).

In addition to commercial fishing activity, the community of Kipnuk is engaged in seafood processing. Starting in 2002, one shore-side processing facility was located in Kipnuk (see *Processing Plants* section). No locally operating fish buyers were reported between 2000 and 2008, and no vessels were reported to make landings during those years. However, in 2009

⁴⁵⁶ See footnote 454.

and 2010, one fish buyer was reported to be present, and 19 vessels were reported to have delivered landings in Kipnuk. In 2010, Kipnuk ranked 60th in landings and 58th in ex-vessel revenue out of 67 Alaskan ports that received landings in 2010. Total landings and revenue in Kipnuk is considered confidential for 2009 or 2010 due to the small number of fish buyers in operation (Table 5).

Given the lack of fish buyers in Kipnuk between 2000 and 2008, no landings or ex-vessel revenue were reported in the community during those years. Given the small number of fish buyers present in 2009 and 2010, landings in Kipnuk in these two years is considered confidential for all species except crab, which received no landings (Table 9). In addition to local landings in Kipnuk, vessel owners based out of Kipnuk made landings in various ports between 2000 and 2010. In the case of salmon, halibut, and herring landings, data can be reported in most years, but in some years is considered confidential due to the small number of participants, and information is considered confidential for all other management groups in all years of the period. For those years in which data can be reported, salmon landings averaged 352,931 net pounds per year, with an average ex-vessel revenue of \$234,548 per year. From 2000 to 2005, prior to the precipitous drop in herring permit activity, herring landings averaged 303,747 net pounds per year, valued on average at \$20,690. Not including 2001 and 2002 when few halibut permits were fished, halibut landings by Kipnuk vessel owners averaged 7,778 net pounds per year, valued on average at \$21,991. This information about landings and revenue generated by Kipnuk vessel owners is presented in Table 10.

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses or licensed sport fish guides were present in Kipnuk. A small number of Kipnuk residents purchased sportfishing licenses during this period, varying between 7 and 33 per year. For most years during the period, no sportfishing licenses were sold within the community of Kipnuk. This indicates that Kipnuk is not a center of sportfishing activity in the Y-K delta region, and that Kipnuk residents must travel elsewhere to prepare for sportfishing activity.

The Alaska Statewide Harvest Survey,⁴⁵⁷ conducted by ADF&G between 2000 and 2010, did not provide information regarding the species targeted by private anglers in on the Kugkaktlik River near Kipnuk. No kept/release log book data were reported for fishing charters out of Nunapitchuk between 2000 and 2010.⁴⁵⁸ However, Kipnuk is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale (Table 11). Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between 0 and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year).

Subsistence Fishing

Historically, Yup'ik Eskimos along the Bering Sea coast harvested herring, marine mammals, Pacific halibut, salmon, flounder, and a variety of freshwater fish species.⁴⁵⁹ Traditionally, dried herring has also been an important protein source for residents of Bering Sea communities such as Kipnuk, where salmon are not as readily available as in other regions.⁴⁶⁰ Today, subsistence harvest remains a fundamental aspect of the local economy and culture. Marine mammals are harvested throughout the year, except for the short days of December and January and the peak of subsistence salmon harvest during summer. Subsistence herring harvest is primarily conducted during May and June.⁴⁶¹

No information was reported by ADF&G between 2000 and 2010 regarding per capita subsistence harvest or the percentage of Kipnuk households utilizing various marine resources for subsistence purposes (Table 12). Likewise, no information was reported about total pounds of marine invertebrates or non-salmon fish harvested for subsistence purposes in Kipnuk (Table 13).

However, information was reported by ADF&G regarding both subsistence salmon permits and Subsistence Halibut Registration Certificates (SHARC) issued in Kipnuk for some years during the 2000-2010 period. Between 2000 and 2008, the number of subsistence salmon permits issued to Kipnuk households stayed very consistent, fluctuating between 175 and 177 per year. Subsistence salmon harvest was relatively low compared to communities along the Kuskokwim and Yukon Rivers, and areas further south in Alaska (Table 13). For those years in which harvest data were reported, coho and chum salmon were the most heavily harvested species, averaging 154 and 108 fish harvested per year, respectively. Smaller numbers of sockeye and Chinook salmon were reported as harvested in some years. No pink salmon were reported harvested between 2000 and 2008.

Between 2003 and 2010, the number of SHARC cards issued to Kipnuk residents declined from 89 to 12. The highest harvest volume of subsistence halibut during the reported period took place in 2007, when 64 SHARC cards were fished with a total harvest of 17,364 pounds of halibut. This was much higher than harvest in other years during the period (Table 14).

Bering Sea coastal communities, including Kipnuk, are known to harvest sea mammals year-round,⁴⁶² and residents of other communities in the region have traditionally traveled to Kipnuk and other coastal villages to participate in subsistence harvest of walrus and seal.⁴⁶³ Data reported by the U.S. Fish and Wildlife Service between 2000 and 2007 indicate that an average of 5 walrus were harvested per year by Kipnuk households (39 total walrus during this period). No data were reported by management agencies regarding harvest of beluga whale, sea otter, sea lion, or seal species by Kipnuk residents between 2000 and 2010 (Table 15).

Kongiganak (kahn-GIG-uh-nuk)

People and Place

*Location*⁴⁶⁴

Kongiganak is located on the west shore of Kuskokwim Bay, west of the mouth of the Kuskokwim River. It lies 70 miles southwest of Bethel and 451 miles west of Anchorage. The community occupies 1.7 square miles of land and 0.2 square miles of water. Kongiganak is unincorporated, is located within the Bethel Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*⁴⁶⁵

In 2010, there were 439 inhabitants in Kongiganak, making it the 130st largest of 352 total Alaskan communities with recorded populations that year (Table 1). Overall between 1990 and 2010, the population increased by 49.3%. Between 2000 and 2009, the population grew by 29.5% with an average annual growth rate of 1.8%; which was higher than the statewide average of 0.75% and indicative of relatively robust growth. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that there were 10 temporary residents living in Kongiganak in 2010. Population peaks are somewhat driven by employment in fisheries sectors.

Kongiganak is a traditional Yup'ik Eskimo village. Racial and ethnic composition changed little between 2000 and 2010 (Figure 1). In 2010, 95.7% of residents identified themselves as American Indian or Alaska Native, compared to 95.8% in 2000; 2.1% identified themselves as White, compared to 2.8% in 2000; and 2.3% identified themselves as two or more races, compared to 1.4% in 2000. In addition, 1.8% of residents identified themselves as Hispanic or Latino, compared to 1.7% in 2000.

In 2010, the average household size in Kongiganak was 4.67, compared to 4.90 in 1990 and 4.54 in 2000. In that year, there were a total of 102 housing units, compared to 67 in 1990 and 90 in 2000. Of the households surveyed in 2010, 42% were owner-occupied, compared to 50% in 2000; 50% were renter-occupied, compared to 38% in 2000; 7% were vacant, compared to 11% in 2000; and 1% were occupied seasonally, compared to 1% in 2000. No residents lived in group quarters between 1990 and 2010.

In 2010, the gender distribution was somewhat male biased at 54.0% male and 46.0% female. This was somewhat less even than the distribution statewide (52.0% male, 48.0% female), and similar to the distribution in 2000 (54.6% male, 45.4% female). The median

age that year was 23.9 years, which was significantly younger than the statewide median of 33.8 years and slightly older than the 2000 median of 21.8 years.

Figure 1. Racial and Ethnic Composition, Kongiganak: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Kongiganak Based on the 2000 and 2010 U.S. Decennial Census.

The population structure was significantly expansive in both 2010 and 2000. In 2010, 43.6% of residents were under the age of 20, compared to 47% in 2000; 7.7% were over the age of 59, compared to 5.3% in 2000; 33.4% were between the ages of 30 and 59, compared to 35.3% in 2000; and 15.2% were between the ages of 20 and 29, compared to 12.3% in 2000.

Gender distribution by age cohort was slightly more even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within the 20 to 29 age range (8.9% male, 6.3% female), followed by the 10 to 19 age range (10.7% male, 8.7% female) and the 60 to 69 age range (6.6% male, 4.3% female). However, the difference in males and females in the 0 to 9 age range decreased to 0.4% in 2010 from 3.6% in 2000. Further information regarding trends in Kongiganak’s population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS)⁴⁶⁶ estimated that 77.1% of residents aged 25 and over held a high school diploma

⁴⁶⁶ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the

or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 10.6% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 12.4% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 16.5% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; 2.4% of resident held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and no resident held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

The Native people of the Yukon-Kuskokwim Delta region have followed a traditionally nomadic, subsistence lifestyle dating back centuries. Extensive trade networks throughout the Yukon-Kuskokwim Delta were established prior to contact with Russian explorers in the late nineteenth century, and by the time of contact the Native people in the region already had access to Eurasian goods from trade routes across the Bering Strait. *Pastuliarraq*, near present-day Kotlik, was a trading center which connected these routes with the lower Yukon-Kuskokwim Delta region.⁴⁶⁷

The nineteenth century was a time of European expansion and development in the region and with it came waves of disease epidemics which had disastrous effects on the Native peoples in the area. In the early twentieth century, the influence of missionaries coinciding with the influenza epidemics of 1900 and 1912 drastically changed the social and cultural identity of an entire generation within the region.⁴⁶⁸

The area has been occupied historically by Yup'ik Eskimos. The village was permanently settled in the late 1960s by former residents of Kwigillingok, who were seeking higher ground to escape periodic flooding. Kongiganak has a fishing and subsistence lifestyle and culture. The sale, importation, and possession of alcohol is banned in the village.⁴⁶⁹

Natural Resources and Environment

Kongiganak is located in a marine climate. Annual precipitation averages 22 inches, with 43 inches of snowfall annually. Summer temperatures range from 41 to 57 °F, and winter temperatures average 6 to 24 °F.

The entire Kuskokwim River system covers approximately 52,000 square miles of southwest Alaska, or 11 % of all the land area of Alaska. The river system originates on the northwest flank of the Alaska Range, where glacial streams merge to form the meandering, silt-laden Kuskokwim River which flows southwest between the high alluvial terraces. Fast, clear tributaries enter the river from the western Alaska Range. The river courses a broad valley, laden

population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁴⁶⁷ Association of Village Council Presidents. (2000). *2000 Yukon-Kuskokwim Strategic Plan*. Retrieved January 12, 2012 from: <http://www.commerce.state.ak.us/dca/plans/YukonKuskokwimDelta-EDP-2000.pdf>.

⁴⁶⁸ Ibid.

with tundra ponds and lakes, until finally emptying into the Bering Sea, at a point nearly 40 miles southwest of Bethel, Alaska.⁴⁷⁰

Kongiganak is part of the Lower Kuskokwim Resource Conservation and Development region which encompasses the area from the boundary of the Lower Kuskokwim Regional Educational Attendance Area (defined by the villages of Newtok on Baird Inlet, Kasigluk, and Nunapitchuk on the Johnson River and Tuluksak on the Kuskokwim River) including the villages of Chevak and Hooper Bay to the north; the Kuskokwim River downriver of Tuluksak to the east; the Ahklun and Kilbuck Mountains to the south; and the Bering Sea to the west. There are 27 communities located in this portion of southwest Alaska. The population is over 15,000, of which approximately 6,000 live in Bethel, the regional center. No roads connect any of the communities to each other—mechanized access is by air, boat, or snow-machine only. Most communities are located along the Kuskokwim River or near the Bering Sea. The area also includes Nunivak and Nelson Islands. There are no major agricultural or industrial enterprises on the Yukon-Kuskokwim Delta due to poor soil conditions and the area's remoteness from major markets in the rest of the state. Local residents use this remote area primarily for subsistence hunting, fishing, and gathering purposes.⁴⁷¹

The Yukon-Kuskokwim Delta is an alluvial flood plain. The Kuskokwim River is the second largest drainage area in the state of Alaska. The glacially turbid mainstem is approximately 900 miles long, originating from the interior headwaters of the Kuskokwim Mountains and the shadows of the Alaska Range. The Kuskokwim River flows in a southwest direction to the Bering Sea. The sparsely populated Kuskokwim drainage has population centers at Bethel, Aniak, and McGrath, in addition to numerous villages along its length, including Kwigillingok.⁴⁷²

Kongiganak is located within the boundaries of the Yukon Delta National Wildlife Refuge (NWR). The Yukon Delta NWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” Most of the Refuge is a vast, flat wetland/tundra complex dotted by countless ponds, lakes, and meandering rivers. Approximately half of the Yukon Delta NWR is covered by water. Many streams and sloughs are former tributaries of the two major rivers. Some forest habitat is present along rivers and in the Kilbuck Mountains, located in the southeastern part of the Refuge. Moose, caribou, brown bear and black bear can be found in this mountain range, which rises to between 2,000 and 4,000 feet in elevation.⁴⁷³

Kongiganak is also approximately 50 miles across the Kuskokwim Bay from the Togiak NWR and the Wood-Tikchik State Park. Togiak NWR covers 4.7 million acres, of which the northern 2.3 million acres are designated as Togiak Wilderness Area. Like the Yukon Delta NWR, the Togiak NWR protects the habitat of a wide array of birds, fish and mammals. East of

Togiak NWR, Wood-Tikchik is the largest state park in the United States. The Togiak NWR includes a diversity of terrain and ecosystems. The Wood River and Tilchik systems host all five species of Pacific salmon, along with rainbow trout, grayling, lake trout, Arctic char, Dolly Varden and northern pike. Tilchik Lake is an important site for whitefish subsistence harvest. Moose, caribou and brown bear are common in the park, along with black bear in a limited area of the park. Small game present in the area includes beaver, muskrat, otter, fox, wolverine, mink and porcupine. Ground squirrels and marmots are abundant, along with a variety of resident and migratory waterfowl and land birds.⁴⁷⁴

Current Economy⁴⁷⁵

As a region, western Alaska is characterized by the lowest per capita income and highest unemployment rate in the state. Obstacles to local economic development are complex. Unemployment and underemployment are chronic problems and wage employment opportunities are rare and often restricted to seasonal work. The poverty rate approaches elevated levels in most villages, and many residents rely on public assistance. Subsistence activities are adopted not only as way to supplement income, but as a way of life which combats social stressors associated with high wage unemployment. Subsistence activities are interwoven into the social and cultural fabric of western Alaska communities and are imperative to cultural identity as much as to village survival. The economic value of subsistence is very difficult to calculate. Most food and goods harvested cannot be sold so value is derived from substitute goods. However, many goods are without an obvious market substitute, so even this proves difficult.⁴⁷⁶

In 2010,⁴⁷⁷ the estimated per capita income was \$7,842 and the estimated median household income was \$33,542, compared to \$9,881 and \$33,250 in 2000. After adjusting for inflation by converting 2000 values into 2010 dollars,⁴⁷⁸ the real per capita income (\$12,993) and real median household income (\$43,723) indicate a significant decline in both personal and household earnings. In 2010, Kongiganak ranked 297th of 305 communities from which per capita income was estimated, and 226th of 299 communities from which median household income was estimated. This ranks Kongiganak among communities with the lowest per capita income in the state.

Kongiganak's small population size may have prevented the American Community Survey from accurately portraying economic conditions.⁴⁷⁹ Another way of understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce

⁴⁷⁴ Alaska Dept. of Natural Resources. (n.d.) Wood-Tilchik State Park website. Retrieved December 6, 2011 from <http://dnr.alaska.gov/parks/units/woodtik.htm>.

⁴⁷⁵ Unless otherwise noted, all monetary data are reported in nominal values.

⁴⁷⁶ See footnote 471.

⁴⁷⁷ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁴⁷⁸ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁴⁷⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Development (DOLWD). According to the ALARI database, residents earned \$2.47 million in total wages in 2010.^{480,481} When matched with the 2010 Decennial Census population, the per capita income equaled \$5,629, which was less than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Decennial Census figures. This is supported by the fact that the community was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁴⁸² However, it should be noted that American Community Survey and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates,⁴⁸³ 56.1% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 21.1%, compared to 5.9% statewide; and an estimated 30.2% of residents lived below the poverty level, compared to an estimated 9.5% of Alaska residents overall. Again, Kongiganak’s small population size may have prevented the ACS from accurately portraying unemployment. Based on 2010 ALARI estimates, which were based on unemployment insurance claimants, the unemployment rate (27.2%) was approximately one and a quarter times that of the ACS estimate.

Of those employed, an estimated 31.3% worked in the private sector, an estimated 65.0% worked in the public sector, and an estimated 3.8% were self-employed. By industry, most (39.9%) employed residents were estimated to work in education services, health care, and social assistance sectors; followed by public administration (25.1%) and retail trade sectors (10.4%) (Figure 3). Between 2000 and 2010, there were significant proportional declines in arts, entertainment, recreation, accommodations, food services, agriculture, forestry, fishing, hunting, and mining sectors. Conversely, there were significant proportional gains in public administration and other service sectors. According to 2010 ALARI estimates, most (44.2%) employed residents worked in local government sectors; followed by trade, transportation, and utilities (21.4%) and financial service sectors (9.3%).

By occupation type, most (54.6%) employed residents were estimated to hold management or professional positions; followed by natural resources, construction, or maintenance positions (14.2%); sales or office positions (13.1%); service positions (9.3%); and production, transportation, or material moving positions (8.7%) (Figure 4). Between 2000 and 2010, there were significant proportional gains in the number of residents employed in management and professional positions. Conversely, there were significant proportional declines in the number of residents holding service positions.

No individuals characterized themselves as working in natural resource based industries that include fishing in 2010. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

⁴⁸⁰ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

Governance

Kongiganak is an unincorporated community and is not located within an organized borough. The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Kongiganak is the Calista Corporation, and the local ANCSA chartered non-profit is the Association of Village Council Presidents. The ANCSA chartered village corporation is Qemirtalek Coast Corporation. The Bureau of Indian Affairs recognized traditional council for Kongiganak is the Kongiganak Traditional Council. Kongiganak is also a member of the Bering

Sea Elders Advisory Group (BSEAG), whose mission is “to bring together elders as one voice to protect our traditional ways of life, the ocean web of life that supports the resources we rely on, and our children’s future.”⁴⁸⁴ The BSEAG was established in 2007 due to the elders’ concerns about the proximity of bottom trawling to some of their villages in the Yukon-Kuskokwim and Bering Strait regions, and the potential movement of industrial fisheries into northern Bering Sea Waters.

Kongiganak is unincorporated and unable to administer taxes or collect local fees. However, between 2000 and 2003, traditional council received State Revenue Sharing funds totaling \$15,189. Information regarding municipal finances can be found in Table 2.

The closest Alaska Department of Fish and Game (ADF&G) and National Marine Fisheries Service (NMFS) offices are located in Bethel, 70 miles northeast. The closest U.S. Bureau of Citizenship and Immigration Services office is located in Anchorage, 451 miles east.

Infrastructure

*Connectivity and Transportation*⁴⁸⁵

Residents of Kongiganak utilize air, water, and land travel to reach other communities. A state-owned 1,885-foot long by 35-foot wide gravel airstrip is available, and charter flights are available from a variety of providers including ERA Alaska, Grant Aviation, Ryan Air Service, and Yute Air. As of June 2012, roundtrip airfare from Anchorage to Kongiganak cost \$674.

Snowmobiles, boats, and skiffs provide local transportation to Bethel and other area villages. Winter trails exist to Kwigillingok (11.1 miles) and Tuntutuliak (29 miles). There are no docking facilities in Kongiganak; barges deliver cargo once or twice each summer.

Facilities

Electricity in Kongiganak is provided by a diesel powerhouse owned by the Puvurna Power Company. The Village Council provides disposal bunkers for honeybuckets and operates both a pre-treatment plant and a sewage lagoon for waste disposal. Kongiganak homes and facilities use treated surface water hauled from the washeteria operated by the Village Council. No homes have complete plumbing. Some residents use rain catchment during the summer and ice melt in the winter. Water is filtered and chlorinated by the village council before distribution from a central watering point or through water truck delivery.⁴⁸⁶ A multipurpose, community hall is available in Kongiganak.

The nearest Village Public Safety Officer (VPSO) is stationed in Kongiganak,⁴⁸⁷ and the nearest state trooper post is in Bethel.⁴⁸⁸ A volunteer fire department in Kongiganak provides fire protection services. Kongiganak does not have a post office, but telephone service and internet access are provided by United Utilities Inc. and AT&T.

With regard to fisheries-related infrastructure, the DOLWD community profile of Levelock states there are no docking facilities in Kongiganak.⁴⁸⁹ Community leaders declined to elaborate on fishing-related infrastructure and businesses operating in Kongiganak in the 2011 AFSC survey.

Medical Services

The Lillian E. Jimmy Memorial Health Clinic operated by the Yukon Kuskokwim Health Corporation provides residents with basic medical services. Emergency Services have coastal and air access. Emergency service is provided by a health aide. The closest hospital services are located in Bethel.

Educational Opportunities

Ayagina'ar Elitnaurvik offers preschool through 12th grade instruction. As of 2011, there were 144 students enrolled and 12 teachers.⁴⁹⁰

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Harvest of marine resources has been important to residents of the Kongiganak area since prehistory. Yup'ik Eskimo people were historically very mobile, following the migration and seasonal availability of subsistence resources.⁴⁹¹ Subsistence salmon harvest continues to be a primary economic activity along the Kuskokwim River. In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.⁴⁹²

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s, commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current state dictated management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.⁴⁹³

Commercial catch of herring for bait began in Alaska around 1900, and herring sac roe fisheries developed in the late 1970s.⁴⁹⁴ The largest aggregation of herring in Alaska spawns along the northern shore of Bristol Bay, near the village of Togiak and to the south of Kongiganak. Spawning herring are harvested using purse seines and gillnets in the Togiak sac roe fishery. A spawn-on-kelp harvest is also taken, primarily by local residents. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁴⁹⁵

⁴⁹⁴ See footnote 492.

⁴⁹⁵ Ibid.

Kongiganak is located in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. The community is not eligible for the Community Quota Entity program. Kongiganak participates in the Community Development Quota program through the Coastal Villages Regional Fund (CVRF), which promotes training and employment opportunities for residents, provides community and development programs for member villages, and offers loans to facilitate involvement of locals in Bering Sea crab and groundfish fisheries.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Kongiganak does not have a registered processing plant. The closest seafood processor is located in Goodnews Bay, 68 miles southeast.

Fisheries-Related Revenue

Between 2000 and 2010, there was no known fisheries-related revenue received by the community of Kongiganak.

Commercial Fishing

Most residents in Kongiganak fish from within the Kuskokwim River drainage and from local drainages that drain into Kuskokwim Bay. Chinook salmon enter the Kuskokwim River in late May, while chum and sockeye salmon begin their entry in mid-June. Chinook and sockeye salmon runs decline rapidly in early July. Chum salmon run entry begins to decline in late July when coho salmon runs begin. Coho salmon run through August and September. Kuskokwim River Chinook are primarily harvested for subsistence purposes, although commercial Chinook fisheries do occur in Kuskokwim Bay.⁴⁹⁶

The Kuskokwim Area commercial fishery was generally stable from 1985 to 1996. Beginning in 1997, the value of salmon, particularly chum salmon, began to decline. This led to decreased fishing effort and number of fish harvested. Furthermore, poor Chinook and chum salmon returns from 1999 through 2001 resulted in increased fishery restrictions. Chinook and chum abundances rebounded in the mid-2000s; however, poor market conditions continued along with limited seafood processing capacity. The opening of a new fish processor in Platinum in 2009 led to local market improvements.⁴⁹⁷

In 1984, commercial herring fishing was initiated in the Nunivak Island District by emergency order. Kuskokwim area herring fisheries developed rapidly in response to strong herring sac roe markets. However, by 1990, stocks began to decline from increased pressure on the fishery. In response, harvest levels were reduced until recruitment levels increased in the late 1990s. After stocks peaked in 1997-1999, market conditions began to falter, and effort was reduced through the 2006 season. The decline in markets for herring sac roe continued through 2010, with no commercial herring harvests occurring in the Kuskokwim area since 2006.⁴⁹⁸

⁴⁹⁶ Brazil, C., Bue, D., Carroll, H., and Elison, T. (2011). *2010 Kuskokwim Area Management Report*. Retrieved August 24, 2012 from: <http://www.adfg.alaska.gov/FedAidpdfs/FMR11-67.pdf>.

⁴⁹⁷ Ibid.

⁴⁹⁸ Ibid.

Between 2000 and 2010, the number of commercial fishing permits held within the community followed a declining trend. In 2010, 26 residents, or 5.9% of the population, held 26 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 31 residents held 38 CFEC permits. Most notably, there was a significant decline in CFEC permits between 2000 and 2003 before leveling off. Of the permits held in 2010, 81% were for salmon, compared to 68% in 2000; 15% were for herring, compared to 18% in 2000; and 4% were for halibut, compared to 13% in 2000. Both halibut and herring permit ownership and activity was in steady decline during those years as the fisheries became less popular locally. Between 2000 and 2010, no residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits. In addition, no residents held federal halibut, sablefish, or crab quota shares between 2000 and 2010.

Residents held 24 commercial crew licenses in 2010, compared to 38 in 2000; which was also the year that resident held commercial crew licenses peaked. Also in 2010, residents held majority ownership of 13 vessels, compared to 24 in 2000; which was also the year that local vessel ownership peaked. Of the CFEC permits held in 2010, 54% were actively fished, compared to 55% in 2000. This varied by fishery from 67% of salmon permits, to 0% of halibut and herring permits. Herring permits were actively fished in 2000, 2001, and 2003. Halibut permits were actively fished in 2000 and 2008. Overall permit activity peaked in 2000. Fisheries prosecuted in 2010 by Kongiganak residents included: Bristol Bay drift gillnet salmon and Kuskokwim gillnet salmon.⁴⁹⁹

Between 2000 and 2010, no landings were reported in Kongiganak. Landings reported by residents are confidential with the exception of salmon landings between 2000 and 2003. In 2003, residents landed 122,225 pounds of salmon valued at \$59,923 ex-vessel, compared to 180,998 valued at \$116,599 in 2000; a decrease of \$0.15 per pound landed after adjusting for inflation,⁵⁰⁰ and without considering the species composition of landings. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Local information on sportfishing is limited, and Kongiganak’s remote location likely limits the amount of tourism-based sportfishing occurring within the community. In a survey conducted by the AFSC in 2011, community leaders reported that there is no recreational fishing taking place locally.

Most recreational fishing that does occur in the area takes place in clear-water tributaries of the Kuskokwim River, and sportfishing effort likely originates from other communities. Depending on conditions and time of year, private anglers target several species of Pacific salmon, rainbow trout, Dolly Varden, Arctic grayling, northern pike, and sheefish.⁵⁰¹

In 2010, residents held 29 sportfishing licenses and 26 sportfishing licenses were sold in the community, compared to 7 and 6 in 2000, respectively. Between 2000 and 2010, there were no sport fish guide business nor any sport fish guide licenses issued.

Kongiganak is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater. In 2010, there were 19,455 total angler days fished, compared to 19,990 in 2000. Total freshwater angler days fished peaked in 2004 at 25,391. Non-Alaska residents accounted for 72.1% of freshwater angler days fished in 2010, compared to 67.0% in 2000. Information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

The subsistence salmon fishery in the Kuskokwim region is one of the largest and most important in the State. As of 2010, approximately 1,700 households in the Kuskokwim area annually harvest for salmon. Households that do not directly participate in subsistence harvests, often participate through cutting, drying, smoking, and other preservation activities.⁵⁰²

Along the lower Kuskokwim River, subsistence Chinook fishing begins by June 1, and is concluded by mid-July. Drift gill nets, set gill nets, fishwheels, and rod and reel are used for harvesting Chinook in Kuskokwim drainages.⁵⁰³ Historically, Kuskokwim River chum and sockeye salmon have been primarily harvested for commercial use. However, elevated subsistence harvests occur when Chinook are limited. Kuskokwim river coho are harvested in the late summer following Chinook; however, coho salmon are primarily harvested for commercial

use, accounting for over half of the District 1 (Lower Kuskokwim River) ex-vessel value in 2009.⁵⁰⁴

Pacific herring is an extremely important subsistence fishery for residents of Kongiganak. Harvest data specific to the community was gathered between 1976 and 1985. In 1976, residents harvested an estimated 11 tons of subsistence herring, while only harvesting a small fraction (1 ton) the next year. Subsistence herring harvests peaked in 1980 and 1982 at an estimated 13.2 tons in both years. In 1985, the most recent survey year, residents harvested an estimated 4.6 tons of subsistence herring.⁵⁰⁵ More recent data pertaining to nearby Nelson Island villages estimates herring harvests at approximately 110 tons annually.⁵⁰⁶ In a survey conducted by the AFSC in 2011, community leaders reported that salmon, seal, and walrus were the three most important aquatic subsistence resources to local residents.

Recent ADF&G subsistence data is limited, and information regarding local subsistence participation by household is unavailable. Of these species listed by ADF&G in Table 13, residents reported harvesting chum salmon most often, followed closely by Chinook, sockeye, coho, and pink salmon. In 2008, residents reported harvesting 6,915 salmon, compared to 5,277 in 2000. Reported salmon harvests peaked in 2008. In that year, Chinook salmon accounted for 37.1% of reported salmon harvests and chum accounted for 29.1%. In 2010, 6 residents held Subsistence Halibut Registration Certificates (SHARC) issued by NMFS, compared to 12 in 2003. In that year, an estimated 150 pounds of halibut was harvested using 1 SHARC, compared to an estimated 1,602 pounds using 12 SHARC in 2000. Estimated halibut harvests peaked in 2004 at 2,958 pounds harvested on 10 SHARC. Information on marine mammal harvests is limited. Data regarding marine mammal harvests are limited. However, information available highlights a significant use of walrus compared with many western Alaska communities. Between 2000 and 2010, an estimated 13 walruses were harvested, with one to two harvested almost every year. Further information regarding known subsistence harvesting trends can be found in Tables 12 through 15.

Kwethluk (KWEETH-luk)

People and Place

*Location*⁵⁰⁷

Kwethluk is a Yup'ik community located 12 air miles east of Bethel on the Kwethluk River at the junction with the Kuskokuok Slough of the Kuskokwim River. It is the second largest community along the Lower Kuskokwim River. The area encompasses 10.0 square miles of land and 1.7 square miles of water. Kwethluk was incorporated in 1975, is located in the Bethel Census area, and is not under the jurisdiction of a borough.

*Demographic Profile*⁵⁰⁸

In 2010, there were 721 residents in Kwethluk, ranking it the 85th largest of 352 Alaskan communities in terms of population size. Overall between 1990 and 2010, the population increased by 29.2%. While the community has continued to grow since 1990, the growth rate has slowed in recent years with the community adding only eight residents between 2000 and 2010. Between 2000 and 2009, the population grew by 1.4% with an average annual growth rate of -0.1%, which was less than the statewide average of 0.75% and indicates very little population change. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that on average, there are seasonal or temporary residents living in Kwethluk from June through late September. Peaks in the seasonal population are attributed to local construction projects, and is not driven by employment in fisheries sectors. Furthermore, community leaders report the annual peak in population for Kwethluk coincides with the July 4th activities and Slavic Christmas week in July and January, respectively. Community leaders estimated the seasonal workforce and transient population to be roughly 10 to 15 people. Further information regarding population trends can be found in Table 1.

Kwethluk is predominately a Yup'ik community. In 2010, 94.2% of residents identified themselves as American Indian or Alaska Native, compared to 92.8% in 2000; 2.2% identified themselves as White, compared to 4.8% in 2000; 0.1% identified themselves as Asian, compared to 0.3% in 2000; and 3.5% identified themselves as two or more races, compared to 2.0% in 2000. Further information regarding racial and ethnic trends can be found in Figure 1.

In 2010, the average household size was 4.19, compared to 4.30 in 1990 and 4.66 in 2000. In that year, there were a total of 231 housing units, compared to 138 in 1990 and 199 in 2000. Of the households surveyed in 2010, 54% were owner-occupied, compared to 54% in 2000; 20% were renter-occupied, compared to 13% in 2000; 4% were vacant, compared to 7% in

2000; and 21% were occupied seasonally, compared to 17% in 2000. No residents lived in group quarters between 1990 and 2010.

In 2010, the gender distribution of Kwethluk was 52.1% male and 47.9% female. This was in line with the gender distribution statewide (52.0% male, 48.0% female), and slightly more even than the gender distribution in 2000 (53.9% male, 46.1% female). The median age that year was 23.4 years, which was lower than the statewide median of 33.8 years and older than the 2000 median of 19.6 years.

Figure 1. Racial and Ethnic Composition, Kwethluk: 2000-2010 (U.S. Census).

Compared with 2000, the population structure in 2010 was relatively less expansive. However, the overall structure remained similar between those years. In 2010, 44.3% of residents were under the age of 20, compared to 50.4% in 2000; 9.7% were over the age of 59, compared to 7.2% in 2000; 31.2% were between the ages of 30 and 59, compared to 29.8% in 2000; and 14.8% were between the ages of 20 and 29, compared to 12.5% in 2000.

Gender distribution by age cohort was slightly more even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within the 0 to 9 age range (11.9% male, 10.0% female), followed by the 20 to 29 (7.9% male, 6.9% female) and 40 to 49 (5.8% male, 5.0% female) ranges. Of those three, the greatest relative gender difference occurred within the 0 to 9 age range. The 30 to 39 age range was evenly split with 5.8% identifying as female and 5.8% identifying as male. Other age brackets, such as 10 to 19 (11.3% male, 11.1% female) and 70 to 79 (1.3% male, 1.2% female), presented only slight variations. Further information regarding trends in Kwethluk’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Kwethluk Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)⁵⁰⁹ estimated that 75.4% of residents aged 25 and over held a high school diploma or higher degree in 2010, which is significantly less than the estimated 90.7% of Alaska residents overall. Also in that year, an estimated 14.7% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 9.9% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 19.3% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; 9.6% of resident held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 1.7% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Human occupation of the Kuskokwim area dates back as far as 11,000 years as the first nomadic inhabitants migrated from Asia. Approximately 4,000 years ago, the northern Arctic Small Tool tradition migrated from the north, into the lower Kuskokwim region. Semi-permanent occupation of the Kuskokwim Delta occurred approximately 1,600 years ago.⁵¹⁰

The Yup'ik (*Kusquqvagmiut*) Eskimo culture of the region has been organized around terrestrial and marine resources and trading has historically been an important part of the regional economy, and an extensive trade network was established throughout the Yukon-Kuskokwim region since well before European contact. During their peak, trade routes throughout the region extended as far as Siberia, and by the time Russian fur traders set up trading posts in the area an extensive trade network throughout the Norton Sound had already been established.⁵¹¹ The village of Pastuliarraq, next to the Pastolik River east of present day Kotlik became a trading hub for region. The salmon fishermen of the lower and middle Kuskokwim River regularly traded salmon for seal oil from coastal villages.⁵¹²

Kwethluk is predominantly a Yup'ik Eskimo village that practices a subsistence lifestyle. Archaeological finds indicate that the area has been inhabited since prehistoric times. The name Kwethluk is derived from the Yup'ik word "Kuiggluk," meaning "dangerous river." In the late 1860s and early 1870s, Russian Orthodox missionaries from Russian Mission founded a small congregation. The Moravian Church built a chapel in 1896 and a Russian Orthodox church was built in 1912. Influenza devastated the region in 1900, and the populations villages further up the

⁵⁰⁹ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Kwethluk River (including the former village of *Cinqineq*) were decimated. Only seven families in Kwethluk survived the epidemic.⁵¹³

Discovery of gold in nearby creeks in 1909 attracted prospectors until 1911, when disappointing yields were produced. One placer gold deposit on the upper Kwethluk River continued to produce until it was exhausted in the early 1940s. A Moravian orphanage, located three miles upriver, provided children services between 1930 and the early 1970s. In 1939, the villagers owned 31,000 reindeers and harvested the herd for food and skins. The tuberculosis epidemic of the late 1930s impacted the local population. The community has a post office since 1947, and a store since 1948. The City was incorporated in 1975.

Residents of Kwethluk continue to rely on a traditional lifestyle, much like in the past. Historic caribou hunting areas and seasonal subsistence camps continue to be used. Before the widespread use of contemporary hunting and fishing technologies, Kwethluk hunters would travel to hunting camps in the spring, and construct skin boats for the return trip following the breakup of river ice. By the 1950s, wooden skiffs and outboard motors were starting to be utilized. In the 1970s, aluminum hulled boats became a common source of travel between villages and subsistence camps. Around that time, the U.S. Bureau of Land Management began collecting information pertaining to subsistence use areas in order to facilitate Native allotment applications that were flowing in following the 1971 Alaska Native Claims Settlement Act (ANCSA). Twenty-eight Kwethluk residents filled allotment applications for 29 parcels along the Kwethluk River and other portions of the Yukon Delta and Togiak national wildlife refuges.⁵¹⁴

Natural Resources and Environment⁵¹⁵

Kwethluk's annual precipitation averages 16 inches, with snowfall of 50 inches. Summer temperatures average from 42 to 62 °F (6 to 17 °C); winter averages are -2 to 19 °F (-19 to -7 °C). Extremes have been recorded from -46 to 86 °F (-41 to 30 °C). The Kuskokwim is typically ice-free from June through October.

The entire Kuskokwim River system covers approximately 52,000 square miles of southwest Alaska. The River courses a broad valley, laden with tundra ponds and lakes, until finally emptying into the Bering Sea. The lower Yukon-Kuskokwim Delta encompassing Kwethluk is an area of low elevation and shallow relief. The terrain is mostly made up of flat and low rolling plains crossed with low gradient streams, tributaries, sloughs, floodplains, wetlands, and shallow lakes. Most of the lower Yukon-Kuskokwim Delta was ice-free during the last major ice age. Sediments in the area are loamy or sandy textured fluvial and alluvial deposits. Soils are poorly drained and typically overlay a layer of permafrost.⁵¹⁶ Vegetation includes tall and low shrub types dominated by willow and alder. Wet tundra, characterized by hydrophilic

vegetation as well as water tolerant sedges and grasses. White spruce and balsam polar can be found in well-drained areas. Paper birch is also present.⁵¹⁷

Kwethluk is located on Calista Corporation land encompassed by the Yukon Delta National Wildlife Refuge, which provides spawning, rearing, feeding, and wintering habitat for a range of terrestrial and aquatic wildlife.⁵¹⁸ A significant portion of at least 19 waterfowl species and 30 common shorebird species depend on the area. The first week in May brings Canada geese, whistling swans, white-fronted geese, and various other species. Species of fish include salmon, smelt, whitefish, Dolly Varden, sheefish, northern pike, blackfish, and burbot. Terrestrial mammals include black bear, moose, mink, land otter, red fox, beaver, snowshoe hare, and tundra hare. Four species of hair seal are found along the coast and upstream in the Kuskokwim River. Walrus and Steller sea lions can be found along the Kuskokwim Delta coast.⁵¹⁹

Regional mineral resources include zinc, gold, silver, lead, antimony, tungsten, tin, copper, nickel, mercury, and platinum.⁵²⁰ Near Kwethluk, the Calista Corporation maintains several mineral prospects near Red Devil. The Red Devil mineral district historically produced 75,000 tons of mercury, and twice as much antimony. More recent interest by Calista Corporation is aimed at development of a mercury-gold system, with secondary arsenic and stibnite potential.⁵²¹ Downriver, Platinum and Goodnews Bay are sites of gravel and rock quarry projects.⁵²²

There are several natural hazards affecting the Yukon-Kuskokwim Delta region. These hazards include flooding, river bank erosion and destabilization, brush fire, and soil destabilization due to permafrost melt. Spring flooding is a major factor contributing to natural hazards in the area. As melt-off and ice jamming occurs during spring break-up, flooding and erosion occur and climate change is thought to be a continuing factor in the seasonality and severity of flooding in the region. In addition, variation in the active permafrost layer caused by climate change and urban development further compound impacts from flood events.⁵²³ Localized flooding and erosion is of ongoing concern to Kwethluk. The riverbank in the eastern and central portion of the village is consistently subjected to erosion, and homes are in danger from bank destabilization. Exposed sewage pits are also posing an environmental hazard as they are eroded.⁵²⁴

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation projects active within Kwethluk in 2010.⁵²⁵

Current Economy⁵²⁶

Kwethluk has a mixed cash/subsistence economy. Fishing, hunting, and gathering are popular activities along with some commercial fishing and employment opportunities through the school and government organizations. Some of the largest employers include the Lower Kuskokwim School District, Kwethluk Incorporated, the City of Kwethluk, and the Native store.⁵²⁷ In a survey conducted by the AFSC in 2011, community leaders reported that Kwethluk's economy is dependent on fishing, sport hunting and fishing, and subsistence.

In 2010,⁵²⁸ the estimated per capita income was \$14,522 and the estimated median household income was \$40,625, compared to \$6,503 and \$25,417 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,⁵²⁹ the real per capita income (\$8,551) and real median household income (\$25,417) indicate significant increases in both individual and household earnings. In 2010, Kwethluk ranked 211th of 305 communities from which per capita income was estimated, and 186th of 299 communities from which median household income was estimated.

However, Kwethluk's small population size may have prevented the ACS from accurately portraying economic conditions.⁵³⁰ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$4.97 million in total wages in 2010.⁵³¹ When matched with the 2010 Decennial Census population, the per capita income equals \$6,898, which is significantly less than the 2010 ACS estimate and similar to what was reported in 2000.⁵³² This is supported by the fact that the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁵³³ However, it should be noted that ACS and DOLWD data

⁵²⁵ Alaska Dept. of Environmental Conservation. (n.d.). *Contaminated Sites Program*. Retrieved October 23, 2012 from: <http://dec.alaska.gov/spar/csp/list.htm>.

⁵²⁶ Unless otherwise noted, all monetary data are reported in nominal values.

⁵²⁷ See footnote 517.

⁵²⁸ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁵²⁹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁵³⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁵³¹ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

⁵³² Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

⁵³³ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from: www.denali.gov.

are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates, 48.8% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 8.2%, compared to 5.9% statewide; and an estimated 18.0% of residents were living below the poverty level, compared to an estimated 9.5% of Alaska residents overall. Again, Kwethluk's small population size may have affected the ACS's ability to accurately capture economic conditions. According to 2010 ALARI estimates, the local unemployment was 25.1% based on unemployment insurance claimants.⁵³⁴

Of those employed, the 2006-2010 ACS estimated that 27.3% worked in the private sector, 69.4% worked in the public sector, and 3.3% were self-employed. By industry, most (39.9%) of employed residents were estimated to work in education, health care, and social assistance sectors; followed by public administration sectors (25.1%) and retail trade sectors (10.4%). Between 2000 and 2010 there was very little proportional variation in industry sector employment. The most significant proportional change occurred within education services, health care, and social assistance sectors (Figure 3). Another source of employment information comes from the 2010 ALARI estimates, most (71.8%) employed residents worked in local government sectors; followed by other non-specified sectors (8.2%) and trade, transportation, and utilities sectors (7.5%). No individuals characterized themselves as working in natural resource based industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

Figure 3. Local Employment by Industry in 2000-2010, Kwethluk (U.S. Census).

⁵³⁴ See footnote 532.

Figure 4. Local Employment by Occupation in 2000-2010, Kwethluk (U.S. Census).

By occupation type, most (54.6%) employed residents were estimated to hold management or professional positions in 2010, followed by natural resources, construction, or maintenance positions (14.2%); sales or office positions (13.1%); service positions (9.3%); and production, transportation, or material moving positions (8.7%). Between 2000 and 2010, there were significant proportional increases to the number of natural resources, construction, maintenance, management, and professional positions; and significant proportional declines to the number of service positions (Figure 4).

Governance

Kwethluk is a second-class city with a mayoral form of government. There is a seven-member city council, nine-member school board, and six municipal employees. In addition, there is a U.S. Bureau of Indian Affairs recognized tribal government. The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Kwethluk is the Calista Corporation, and the local ANCSA chartered non-profit is the Association of Village Council Presidents. The ANCSA chartered village corporation is Kwethluk, Inc. The sale and importation of alcohol is banned in Kwethluk. The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish and Game (ADF&G), and Bureau of Citizenship and Immigration Services are all located within Bethel.

The City collected a 5% sales tax in 2010. When adjusted for inflation,⁵³⁵ municipal revenues declined by 10.3% between 2000 and 2010, from \$541,436 to \$628,239. Annual revenues varied significantly between those years, reaching their lowest point in 2005 at \$199,781 before rebounding. In 2010, most locally generated from sales tax revenues, utility rents, and rentals. Most outside revenues were generated from state revenue sharing funds, and payments in lieu of taxes. In that year, sales tax revenues accounted for 12.9% of total revenues, compared to 16.1% in 2000. In addition, state allocated Community Revenue Sharing accounted for 21.5% of total revenues, compared to 8.5% from State Revenue Sharing in 2000.

State and federal grants awarded between 2000 and 2010 included \$21,733 for dock construction and \$28,604 for a barge landing facility. Further information regarding municipal finances can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Kwethluk from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-related Grants (State and Federal) ⁵
2000	\$541,436	\$87,032	\$45,914	n/a
2001	\$327,524	\$94,064	\$27,172	n/a

⁵³⁵ Inflation calculated using 2010 Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Infrastructure

Connectivity and Transportation

Kwethluk is dependent on air transportation for year-round movement of freight and passengers. A state-owned 3,199-foot long by 75-foot wide gravel airstrip and a seaplane base are available. Flights are available through a variety of companies including ERA Alaska, Ryan Air Service, and Yute Air. The price of a roundtrip ticket by plane from Kwethluk to Anchorage in early June 2012 was \$574.⁵³⁶ Barge services deliver cargo during the summer. There are no docking facilities. Snowmachines, ATVs, and skiffs are used for local travel, and the river becomes an ice road during winter. Air taxi and ice road taxi services are available. Winter trails are marked to Eek (45 miles), Three Step Mountain (55 miles), and Columbia Creek (49 miles).

Facilities

Electricity in Kwethluk is provided by a diesel powerhouse owned by Kwethluk, Inc., the ANCSA-chartered village corporation. The community currently has plans to develop alternative energy sources and plans to complete this within the next 10 years. The City of Kwethluk provides water treatment, honeybucket haul, and refuse services. The City also operates a washeteria. None of the 147 homes have complete plumbing, but many residents have steambaths. Residents haul water for household use. There are sewage container disposal bins; these are hauled to the sewage lagoon. The school and teachers' housing operate individual systems.

In a survey conducted by the AFSC in 2011, community leaders reported that Kwethluk is currently in the process of building a barge landing area, constructing new dock facilities, building roads to the dock spaces, and installing pilings. These projects are all slated to be completed within the next 10 years. Currently, there are no docking facilities in Kwethluk, and only riverfront mooring exists on Kwethluk River exists at this time. However, community leaders report haul out facilities and an Environmental Protection Agency (EPA)-certified boat cleaning station already exist in the community. In addition, Kwethluk has plans to build dry dock facilities within the next 10 years. Community leaders indicated no boat repair services, infrastructure, or other fisheries-related businesses are available in Kwethluk, and residents typically travel to Bethel or Anchorage, Alaska and Seattle, Washington to access fisheries-related businesses and services that are not available locally.

The nearest village public safety officer is stationed in Kwethluk,⁵³⁷ and the nearest state trooper post is in Bethel.⁵³⁸ The City also maintains its own police force and fire department. In a survey conducted by the AFSC in 2011, community leaders reported that Kwethluk also has a post office, telephone service is in place, and broadband internet access is currently being established.

⁵³⁶ Airfare was calculated using lowest fare. <http://www.travelocity.com> (retrieved November 22, 2011).

Medical Services

The Betty Guy Memorial Clinic provides residents with basic medical services and is operated by the Yukon-Kuskokwim Health Corporation. Emergency Services have river air and floatplane access. Emergency service is provided by a health aide. The nearest hospital is located in Bethel.

Educational Opportunities

Ket'acik/Aapalluk Memorial School offers preschool through 12th grade instruction. As of 2011, there were 247 students enrolled and 15 teachers employed.⁵³⁹

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Fisheries participation in the Lower Kuskokwim Delta dates back thousands of years to the original Central Yup'ik occupants. Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. During early years, local salmon were cured and salted and by 1920, the largest commercial season to date took place on the Kuskokwim River, with five operators processing approximately 35,000 Chinook salmon that year. In 1922, there were four salteries operating near the mouth of the Kuskokwim, processing Chinook and sockeye salmon. The Kuskokwim area was closed to all fishing for export from 1926 through 1929. In 1930, regulations were modified to allow commercial fishing in part of Kuskokwim Bay. A floating cannery operated for that year, and by 1932, three companies engaged in commercial fishing. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. Information on commercial fishing during the late 1930s through the 1950s is limited. However in 1952, poor salmon runs prompted the closure of the Kuskokwim River and Bay. Management was finally shifted to the State of Alaska in 1960, and commercial fishing resumed.⁵⁴⁰

At the time of statehood in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on

sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.⁵⁴¹

Commercial catch of herring for bait began in Alaska around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁵⁴²

On the lower Kuskokwim River, subsistence sockeye, chum, and Chinook harvesting typically begins by June 1st, and is concluded by mid-July. Coho and pink salmon are harvested in August and September. Fishing effort is based from either a fish camp or from a home village. Drift gill nets, fish wheels, and rods and reels are used for harvesting. Soon after river ice breaks up in May, smelt move into the Lower Kuskokwim area. Residents use fine-meshed nets to catch smelt, and thread them through willow sticks before drying and smoking them. Whitefish, sheefish, Arctic grayling, and northern pike are harvested year-round. Blackfish and burbot are harvested during fall and winter months. Dolly Varden are typically harvested from June through December; while trout are typically harvested in the early spring and summer, and again in the late summer and early fall. Spotted seal, bearded seal, ringed seal, and walrus are harvested in the late spring.^{543,544}

Kwethluk has a long subsistence fishing tradition dating back to pre-European contact. Historically, the Yup'ik of the Yukon-Kuskokwim Delta region relied on many species of anadromous and freshwater fish. In more recent years, commercial and subsistence fishing have become an important part of the local economy and culture. While the community lacks the infrastructure needed for commercial landings, many residents possess commercial fishing licenses. Harvests by Kwethluk residents are landed in other communities within the region possessing harbor and processing facilities.

Kwethluk is located in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. The community is not eligible for the Community Quota Entity program given its distance from the Gulf of Alaska. In addition, Kwethluk is not eligible to participate in the Community Development Quota program. In a survey conducted by the AFSC in 2011, community leaders reported that Kwethluk participates in the fisheries management process in Alaska through a representative who sits on regional fisheries advisory and/or working groups run by ADF&G and a representative that participates in the Federal Subsistence Board or Federal Subsistence Regional Advisory Council process.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Kwethluk does not have a registered shoreside processing plant. The closest shoreside processor is located in Bethel.

Fisheries-Related Revenue

Between 2000 and 2010, known fisheries-related revenues totaled \$7,698 has come from the Shared Fisheries Business Tax, raw fish taxes, and the Fisheries Resource Landing Tax. Earnings have stayed relatively stable; however, they have not totaled more than \$1,000 in a given year since 2001. In addition, 2010 was the first year for which revenue was reported from the Fisheries Resource Landing Tax. For more information on known fisheries-related revenues for Kwethluk between 2000 and 2010, see Table 3.

Commercial Fishing

Information on commercial fishing activity in Kwethluk is limited to that provided by community leaders in a survey conducted by the AFSC in 2011. Community leaders reported that the commercial salmon season typically runs from June 27th through August 20th. Drift gill nets are the gear type commonly used locally.

In 2000, 63 residents held 70 permits issued by the Commercial Fisheries Entry Commission (CFEC), which was also the year in which the number of permits held in the community peaked. In 2010, 60 residents, or 8.3% of the population, held 62 CFEC permits. Of the CFEC permits held in 2010, 89% were for salmon, compared to 81% in 2000; and 11% were for herring, compared to 19% in 2000. Of the CFEC permits held in 2010, 58% were actively fished, compared to 71% in 2000. This varied by species from 65% of salmon permits, to 0% of herring permits. Permit activity peaked in 2000 at 82% of salmon permits and 23% of herring permits. Kuskokwim gillnet salmon was the only fishery prosecuted by Kwethluk residents in 2010.⁵⁴⁵

Between 2000 and 2010, no residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits. In addition, residents did not participate in federal halibut, sablefish, or crab catch share programs between 2000 and 2010.

Residents held 27 commercial crew licenses in 2010, compared to 57 in 2000; when the number of commercial crew licenses peaked locally. In addition, residents held majority ownership of 5 vessels in 2010, compared to 25 in 2000. Both the number of commercial crew licenses, and the number of vessels owned by residents significantly declined between 2000 and 2010.

There were no fish buyers registered in Kwethluk and no shoreside processors that filed fish tickets between 2000 and 2010. Given this, there were no recorded landings made in Kwethluk during this time period. In addition, any landings made by residents during this time period are considered confidential and may not be reported.

Recreational Fishing

Like other communities in the Yukon-Kuskokwim Delta, Kwethluk’s proximity to Bethel attracts many private anglers to the area. Community leaders reported in 2011 that a lot more private boats owned by outfitters from Bethel were operating in the area than 5 years previously. In 2010, residents held 130 sportfishing licenses, compared to 64 in 2000. Between 2000 and 2010, no sportfishing licenses were sold in the community. In addition, there were no registered sport fish guides or charter businesses operating during those years. However, the community’s lack of accommodations and recreational fishing services limit visitations by non-Alaska resident anglers. Because of this, most sportfishing in the area by non-residents is likely based out of Bethel.

Kwethluk is located within Alaska Sport Fishing Survey Area V –Kuskokwim River and Bay. This area includes all drainages flowing into Kuskokwim Bay as well as saltwater from Cape Newenham north to Naskonat Peninsula. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. The majority of sportfishing targets freshwater fisheries and in 2010, resident and non-Alaska resident angler days fished totaled 19,455, compared to 19,990 in 2000. In that year, non-Alaska residents accounted for 72% of total angler days fished, compared to 67% in 2000. The Kuskokwim River’s popularity among non-Alaska residents and the fact that most local residents typically engage in subsistence fishing likely contributed to the high ratio of non-Alaska resident to resident anglers between 2000 and 2010. According to ADF&G’s Harvest Survey data between 2000 and 2010, local private anglers target king and coho salmon, rainbow trout, and Dolly Varden char. Trends regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Kuskokwim Area subsistence salmon fisheries rank as one of the largest in the State of Alaska, accounting for over 50% of the state’s Chinook salmon harvests. More than 2,000 households in the Kuskokwim Area annually harvest salmon for subsistence use. ADF&G Division of Subsistence studies indicate that wild fish account for 85% of the total subsistence-harvested fish and wildlife resource in Kuskokwim River communities; with salmon accounting for up to 53% of the total annual subsistence harvest.⁵⁴⁶

Interviews of subsistence users conducted in 2008 indicated that fishing effort was concentrated during the week ending June 15, and extends through the week ending July 6. This period typically coincides with Chinook abundance. The majority of subsistence harvesters use gillnets and to a lesser degree, rod and reel gear types.⁵⁴⁷

Subsistence activities are central to Kwethluk’s lifestyle and are practiced year round. Salmon, moose and caribou are dietary staples. Most families travel to fish camps during the summer months to cut, dry, and smoke fish for food to be used during the winter and into next

⁵⁴⁶ Carroll, M. C. and E. Patton. 2010. Lower Kuskokwim River Inseason Subsistence Salmon Catch Monitoring, 2008. Fishery Management Report No. 10-09. Retrieved August 16, 2012 from: <http://alaska.fws.gov/asm/pdf/fisheries/reports/06-3062008.pdf>.

⁵⁴⁷ Ibid.

year.⁵⁴⁸ In 1987, household subsistence harvests averaged 3,860 pounds of edible weight. Per capita harvests averaged 800 pounds of edible weight. In addition, 70% of households were involved in harvesting or processing salmon for subsistence use. Throughout 1986, there were 52 salmon fishing camps being used for processing and preserving salmon. Salmon comprised 53% of the total community harvest of wildlife, and salmon harvests that year totaled 229,063 pounds of edible weight. Non-salmon fish contributed 32% of the total edible pounds of wildlife harvested in 1986. Species included northern pike, whitefish, sheefish, Dolly Varden, trout, blackfish, smelt, Arctic grayling, and burbot.⁵⁴⁹

An area that used to harbor one of the largest concentrations of Kwethluk salmon camps was located along the west bank of the Kuskokuak Slough; however, the area has since eroded into the Slough. From the late 1950s to early 1980s, at least 14 camps were located along the Kwethluk River. Erosion and stream migration typically plagues many fish camp sites, at times forcing relation. Popular subsistence fishing areas in 1986 included the Kuskokwim River proper, between Kwethluk and Akiachak, the mouth of the Gweek River, Kuskokuak Slough, Napaskiak Slough, and the Kwethluk and Akulikutak rivers. Historically, salmon were harvested using traps, spears, dipnets, and gillnets. Fish traps are no longer favored, and spears are typically used in swift, clear water tributary streams. Rod and reel and setnets are popular today.⁵⁵⁰

Data pertaining to household participation in subsistence activities is unavailable, as is data pertaining to marine mammal and halibut harvests. Of the species reported by ADF&G in Table 13, residents reported harvest Chinook salmon the most often, followed by chum, sockeye, coho, and pink salmon. In 2008, residents reported harvesting 26,777 salmon on 33 subsistence salmon permits, compared to 16,929 on 109 permits in 2000. In that year, reported salmon harvests peaked thanks to significant increases in both Chinook and coho salmon harvests. In addition, harvest effort was more concentrated as significantly less subsistence salmon permits were returned compared to other years.

According to ADF&G *Community Subsistence Information System* data, species Kwethluk residents historically harvested or used include: ringed seal, spotted seal, blackfish, burbot, Dolly Varden, Arctic grayling, lake trout, northern pike, rainbow trout, sheefish, smelt, and whitefish. In a survey conducted by the AFSC in 2011, community leaders reported that important subsistence resources include all five species of Pacific salmon, local non-salmon fish, moose, bear, caribou, birds, berries, roots, and other plants. Information regarding subsistence trends can be found in Table 12 through 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders expressed concerns over bycatch by Bering Sea trawl fisheries, and impacts it may have on salmon runs on the Kuskokwim River and its tributaries. Specifically, there is concern regarding reduced salmon runs and habitat damage. When asked about the effects that fisheries policies and management actions have had on Kwethluk, community leaders felt that the North Pacific Fishery Management Council (NPFMC) favors commercial fishing practices in the Bering Sea that disrupt local fishing practices. They also report that restrictions to local subsistence/commercial salmon fisheries are hurting the community.

When asked how past or current fisheries policy or management actions have affected Kwethluk, community leaders reported that past management actions have resulted in severely depleted Yukon and Kuskokwim River subsistence/commercial fisheries. They contend that Bering Sea fisheries need to be restricted until salmon numbers recover. Current runs are depleted and returning fish are small.

In closing, community leaders stated that Kwethluk has been involved with their tribal members, staff, and community resources, in trying to protect and facilitate salmon returns over the years though using inter-village cooperation and traditional knowledge developed over time.

Kwigillingok (kwih-GILL-in-gawk)

People and Place

*Location*⁵⁵¹

Kwigillingok, sometimes referred to as “Kwig,” is on the western shore of Kuskokwim Bay near the mouth of the Kuskokwim River on the Yukon-Kuskokwim Delta. It lies 77 miles southwest of Bethel and 388 miles west of Anchorage. The village of Kongiganak is nearby. Kwigillingok is located in the Bethel Recording District.

*Demographic Profile*⁵⁵²

In 2010, there were 321 residents, ranking Kwigillingok 158th of 352 Alaskan communities with recorded populations that year. Overall, between 1990 and 2010, the population grew by 15.5%. Between 2000 and 2009, the population increased by 8% with an average annual growth rate of 1.25%, nearly twice statewide average of 0.75%. Data from the 2010 Decennial Census indicate that the population declined slightly from 2000. However, with the exception of the spike in 2009, the estimated population has decreased every year since 2007 based on Alaska Department of Labor and Workforce Development (DOLWD) population estimates. Further information regarding population trends can be found in Table 1.

Kwigillingok is a traditional Yup'ik Eskimo village. In the 2010 Decennial Census, the vast majority of Kwigillingok residents identified themselves as American Indian and Alaska Native (95%), along with 3.4% identifying themselves as White, and 1.6% individuals identifying with two or more races. No Kwigillingok residents identified themselves as Hispanic in 2010. Those who identified themselves as White made up 1.3% more of the population in 2010 compared to 2000, and American Indian and Alaska Natives made up 2.6% less of the population, while the percentage of individuals identifying with two or more races increased between 2000 and 2010 by 1.3%. Further information regarding race and ethnicity can be found in Figure 1.

In 2010, the average household size in Kwigillingok was 3.89, a slight decrease from 4.4 in 1990 and 4.63 in 2000. Also in 2010, there were a total of 106 housing units, compared to 78 in 1990 and 78 in 2000. Of those households surveyed in 2010, 47.2% were owner-occupied, compared to 78.2% in 2000; 30.2% were renter-occupied, compared to 15.4% in 2000; 22.6% were vacant, compared to 6.4% in 2000; and 3.8% were occupied seasonally, compared to 0% in 2000. There were also 2 residents living in group quarters in 2010, compared to 0 in 2000.

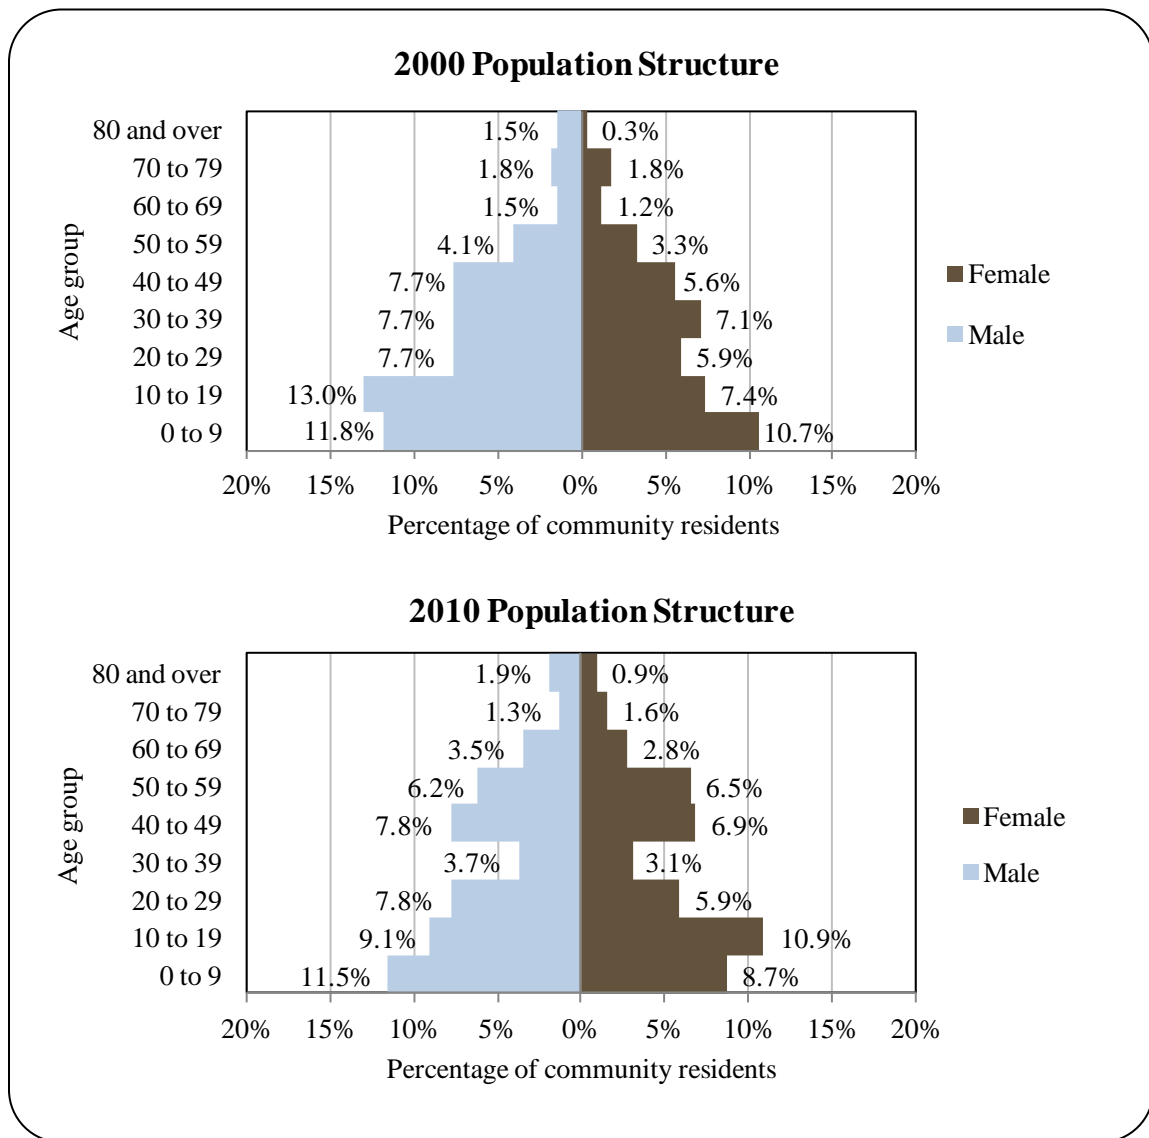

Figure 1. Racial and Ethnic Composition, Kwigillingok: 2000-2010 (U.S. Census).

There were more males than females recorded in 2010 (52.8% male, compared to 47.4% female), roughly in proportion to the gender distribution statewide (52% male, 48% female), and more evenly balanced than Kwigillingok's 2000 distribution (56.8% male, 43.2% female). The median age in 2010 was 26.9, which was younger than the statewide median of 33.8 but similar the village's median age in 2000 (26.0 years). In 2010, 40.2% of residents were under the age of 20, compared to 42.9% in 2000. Also in 2010, 11.9% of residents were over the age of 59, compared to 8.0% in 2000.

Gender distribution by age cohort was relatively even in both 2000 and 2010. In 2010, the greatest absolute gender difference occurred in the 60 to 69 range (2.7% male, 1.5% female), followed by the 20 to 29 range (9.6% male, 6.6% female) and 0 to 9 range (15.4% male, 11.4% female). Of those three, the greatest difference relative to cohort size occurred in the 0 to 9 range. In 2000, the greatest absolute gender difference also occurred in the 60 to 69 range (3.7% male, 2% female), followed by the 50 to 59 range (4% male, 2.4% female), the 30 to 39 range (9.4% male, 6.4% female), and the 10 to 19 range (13.8% male, 9.4% female). Of those four, the greatest difference relative to cohort size occurred in the 10 to 19 year old range. Further information regarding population structure trends can be found in Figure 2.

Figure 2. Population Age Structure in Kwigillingok Based on the 2000 and 2010 U.S. Decennial Census.

According to the 2006-10 American Community Survey (ACS),⁵⁵³ in terms of educational attainment, an estimated 73.3% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 17% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 9.8% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 10.5% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 2.6% held an Associate's degree, compared to an estimated 8% of Alaska residents overall; an estimated 1.3% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 0.7% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

The first record of the village was in 1927 on the map of the Annual Report of the Governor of Alaska, when it was identified as "Quillingok." A Moravian church was established around 1920. The area has long been occupied by the Yup'ik Eskimos and is still a traditional village with an active subsistence lifestyle.^{554,555}

Natural Resources and Environment

Kwigillingok is located in a marine climate. Annual precipitation averages 22 inches, with 43 inches of snowfall annually. Summer temperatures range from 41 to 57 °F, and winter temperatures average 6 to 24 °F.⁵⁵⁶

The entire Kuskokwim River system covers approximately 52,000 square miles of southwest Alaska, or 11 % of all the land area of Alaska. The river system originates on the northwest flank of the Alaska Range, where glacial streams merge to form the meandering, silt-laden Kuskokwim River which flows southwest between the high alluvial terraces. Fast, clear tributaries enter the river from the western Alaska Range. The river courses a broad valley, laden with tundra ponds and lakes, until finally emptying into the Bering Sea, at a point nearly 40 miles southwest of Bethel, Alaska.⁵⁵⁷

Kwigillingok is part of the Lower Kuskokwim Resource Conservation and Development region which encompasses the area from the boundary of the Lower Kuskokwim Regional Educational Attendance Area (defined by the villages of Newtok on Baird Inlet, Kasigluk, and Nunapitchuk on the Johnson River and Tuluksak on the Kuskokwim River) including the villages of Chevak and Hooper Bay to the north; the Kuskokwim River downriver of Tuluksak to

⁵⁵³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

the east; the Ahklun and Kilbuck Mountains to the south; and the Bering Sea to the west. There are 27 communities located in this portion of southwest Alaska. The regional population is over 15,000, of which approximately 6,000 live in Bethel, the regional center. No roads connect any of the communities to each other—mechanized access is by air, boat, or snowmobile only. Most communities are located along the Kuskokwim River or near the Bering Sea. The area also includes Nunivak and Nelson Islands. There are no major agricultural or industrial enterprises on the Yukon-Kuskokwim Delta due to poor soil conditions and the area's remoteness from major markets in the rest of the state. Local residents use this remote area primarily for subsistence hunting, fishing, and gathering purposes.⁵⁵⁸

Kwigillingok is located within the boundaries of the Yukon Delta National Wildlife Refuge (YDNWR). The YDNWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” Most of the YDNWR is a vast, flat wetland/tundra complex dotted by countless ponds, lakes, and meandering rivers. Approximately half of the refuge is covered by water. Many streams and sloughs are former tributaries of the two major rivers. Some forest habitat is present along rivers and in the Kilbuck Mountains, located in the southeastern part of the YDNWR, to the east of Kwigillingok. Moose, caribou, brown bear and black bear can be found in this mountain range, which rises to between 2,000 and 4,000 feet in elevation.⁵⁵⁹

Kwigillingok is also approximately 50 miles across the Kuskokwim Bay from the Togiak National Wildlife Refuge (TNWR) and the Wood-Tikchik State Park. TNWR covers 4.7 million acres, of which the northern 2.3 million acres are designated as Togiak Wilderness Area. Like the YDNWR, the TNWR protects the habitat of a wide array of birds, fish and mammals. East of TNWR, Wood-Tikchik is the largest state park in the United States. The park includes a diversity of terrain and ecosystems. The Wood River and Tilchik systems host all five species of Pacific salmon, along with rainbow trout, grayling, lake trout, Arctic char, Dolly Varden and northern pike. Tilchik Lake is an important site for whitefish subsistence harvest. Moose, caribou and brown bear are common in the park, along with black bear in a limited area of the park. Small game present in the area includes beaver, muskrat, otter, fox, wolverine, mink and porcupine. Ground squirrels and marmots are abundant, along with a variety of resident and migratory waterfowl and land birds.⁵⁶⁰

The Kuskokwim River generally freezes in October, and breakup is complete by mid-June. Warming temperatures have also led to thawing permafrost in the Kuskokwim area. Permafrost in the Yukon-Kuskokwim Delta varies in depth. While there is limited local data, permafrost depth in the region is known to extend to around 600 feet in some areas, with an active layer estimated to range between 1.5 and 3 feet deep depending on conditions.⁵⁶¹ Thawing permafrost can cause severe subsidence, which constrains development of resources, transportation and utility systems, and community expansion. Communities located along the

Kuskokwim River are also at high risk of flooding, erosion, and severe weather, and at low risk of wildfire and earthquakes.^{562,563}

According to the Alaska Department of Environmental Conservation,⁵⁶⁴ there were no significant environmental remediation projects active in Kwigillingok in 2010.

Current Economy⁵⁶⁵

Most employment in Kwigillingok is with the school, village government, stores, or commercial fishing. However, a local arts cooperative markets local handicrafts, and income is further supplemented by subsistence activities.⁵⁶⁶

Kwigillingok's top employers in 2010 included the Kwigillingok IRA Council; the Lower Kuskokwim School District; the Native Village of Kwigillingok; Kwik Incorporated; Yukon-Kuskokwim Health Corporation 90; the Kwig Power Co.; Coastal Villages Seafoods Inc; the Coastal Villages Region Fund; Qayanek; and the AVCP Housing Authority.⁵⁶⁷ In 2010, the per capita income in Kwigillingok was estimated at \$10,376, and the median household income was estimated at \$40,833, compared to \$7,577 and \$36,250 in 2000, respectively.⁵⁶⁸ After accounting for inflation by converting 2000 values to 2010 dollars,⁵⁶⁹ the real per capita income (\$9,964) and real median household income (\$47,668) indicate a fall in both individual and household earnings.⁵⁷⁰ In 2010, Kwigillingok ranked 249th of 305 communities from which per capita income was estimated, and 149th of 299 communities from which median household income was estimated. Although Kwigillingok's small population size may have prevented the ACS from accurately portraying economic conditions, this decrease in per capita income is confirmed by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the DOLWD. According to the ALARI database, the per capita income in Kwigillingok in 2010 was \$8,959, which also indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.⁵⁷¹ This is supported by the fact that the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

In 2010, 46.7% of residents aged 16 or older were estimated to be in the civilian labor force, compared to 68.8% in the civilian labor force statewide. In the same year, the

⁵⁶⁹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁵⁷⁰ See footnote 553.

⁵⁷¹ See footnote 567.

unemployment rate was estimated to be 10.7% in Kwigillingok, compared to a statewide unemployment rate of 5.9%, and approximately 24.1% of local residents were estimated to be living below the poverty line in 2010, compared to 9.5% of Alaska residents overall. It should be noted that income and poverty statistics are based on wage income and other money sources; the relatively low income figures and high poverty rates reported for Kwigillingok are not reflective of the value of subsistence to the local economy.

Also based on the 2006-2010 ACS, 37% of the Kwigillingok workforce was estimated to be employed in the private sector, along with an estimated 63% in the public sector. Of the 54 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number were estimated to be working in educational services, health care and social assistance (44.4%), transportation, warehousing, public administration (20.4%), retail trade (16.7%), public administration (11.1%), and information (7.4%). An estimated 0% of the civilian labor force was working in agriculture, forestry, fishing, hunting and mining; however, the number of individuals employed in farming, fishing and forestry industries is probably underestimated in census statistics (see *Commercial Fisheries* section below). Fishermen may hold another job and characterize their employment accordingly. As with income and poverty statistics, employment figures reported for Kwigillingok are not reflective of the value of subsistence to the local economy. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Kwigillingok (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Kwigillingok (U.S. Census).

Governance

Kwigillingok is unincorporated and is not part of an organized borough. Because Kwigillingok is unincorporated, the community has no city or borough “officials,” and there is no local taxing authority. Given this, a municipal budget was not available between 2000 and 2010. The community received State Revenue Sharing between 2000 and 2003, ranging from a low of \$3,631 in 2003, to a high of \$4,170 in 2000. Kwigillingok did not receive fisheries-related state or federal grants between 2000 and 2010, nor did the village receive a Community Benefits Share from its Community Development Quota (CDQ) entity (Coastal Villages Regional Fund) in 2010. Information regarding municipal finances can be found in Table 2.

Kwigillingok was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Native Village of Kwigillingok. There is also an ANCSA chartered Native Village Corporation (Kwik Incorporated); Calista Corporation is the regional ANCSA Corporation.

Kwigillingok is also a member of the Bering Sea Elders Advisory Group (BSEAG), whose mission is “to bring together elders as one voice to protect our traditional ways of life, the ocean web of life that supports the resources we rely on, and our children’s future.”⁵⁷² The BSEAG was established in 2007 due to the elders’ concerns about the proximity of bottom trawling to some of their villages in the Yukon-Kuskokwim and Bering Strait region, and the potential movement of industrial fisheries into northern Bering Sea Waters.

The closest Office of the Alaska Department of Fish and Game (ADF&G) is located in Dillingham, and the closest Alaska Department of Commerce, Community and Economic Development is located in Bethel. A National Marine Fisheries Service (NMFS) field office is also located in Bethel, and a larger office is located in Anchorage. The nearest Alaska Department of Natural Resources and U.S. Bureau of Citizenship and Immigration Services offices are located in Anchorage.

Infrastructure

Connectivity and Transportation

The Lower Kuskokwim River is a remote area of Alaska. There are no roads, except within some cities and villages on the Kuskokwim River. Kwigillingok itself has no roads.⁵⁷³ In summer, residents use skiffs and other boats for travel to Bethel and other nearby villages. Snowmobiles and all-terrain vehicles provide transportation during winter. Winter trails are marked to Kipnuk (38 miles) and Kongiganak (11.1 miles).⁵⁷⁴

There are no docking facilities in the Village, but there is a state-owned, public-use seaplane base (the Kwigillingok Seaplane Base) located in the Kwigillingok River which measures 2,000 feet long by 300 feet wide. No services of any type are provided at the base, but there is a beaching area on the river bank adjacent to the Village.⁵⁷⁵ Furthermore, there is a state-owned public-use airport (Kwigillingok Airport) with a gravel airstrip that measures 2,510 feet

long by 60 feet wide.⁵⁷⁶ Improvements are currently underway for this airport to create a 3,300 foot gravel runway, taxiway, apron, airport lighting system, and two single bay snow removal equipment buildings.⁵⁷⁷ Airline services are provided by Era Aviation, Alaska Grant Aviation, Ryan Air Service, and Yute Air.⁵⁷⁸ The price of round-trip airfare between Anchorage and Kwigillingok in June 2012 was \$714,⁵⁷⁹ and the price of round-trip airfare between Bethel and Kwigillingok was \$328.⁵⁸⁰

*Facilities*⁵⁸¹

Water is currently derived from snow melt and a lake reservoir and is treated and hauled by residents from the washeteria which is operated by the Village Council. The school operates its own surface water treatment facility but shares a sewage lagoon with the washeteria. Homes are not plumbed. Honeybuckets are disposed of by residents. Electricity is provided by the Kwig Power Company. Refuge collection services are unavailable, and the Village Council operates the landfill. Public safety services are provided by the Village Public Safety Officers (VPSO), the Native Village Police Department, and troopers in Bethel. Fire and rescue services are provided by the State VPSO Fire Department.⁵⁸² Public services available in Kwigillingok include medical services, job placement services, publicly subsidized housing, a community hall, and school library. Communications services include cable television and internet, radio, local television, and local and long distance telephone.⁵⁸³

*Medical Services*⁵⁸⁴

One health clinic, the Kwigillingok Health Clinic, is located in the community. The nearest hospital (Yukon-Kuskokwim Delta Regional Hospital) is located in Bethel.⁵⁸⁵ Emergency services have coastal and air access. Emergency service is provided by a health aide.⁵⁸⁶

*Educational Opportunities*⁵⁸⁷

The Kwigillingok School, part of the Lower Kuskokwim School District, accommodates grades kindergarten through 12th grade and is the only school in the community. In 2011, there were approximately 119 students enrolled and 7 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Harvest of marine resources has been important to residents of the Kwigillingok area since prehistory. Yup'ik Eskimo people were historically very mobile, following the migration and seasonal availability of subsistence resources.⁵⁸⁸ Subsistence salmon harvest continues to be a primary economic activity along the Kuskokwim River. In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.⁵⁸⁹

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s, commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current state dictated management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.⁵⁹⁰

Commercial catch of herring for bait began in Alaska around 1900, and herring sac roe fisheries developed in the late 1970s.⁵⁹¹ Between 2000 and 2010, Kwigillingok residents held permits in the roe and gillnet herring fisheries of Cape Avinof and Bristol Bay.^{592,593} (For more information see the *Commercial Fisheries* section of this profile.) The largest aggregation of herring in Alaska spawns along the northern shore of Bristol Bay, near the village of Togiak. Spawning herring are harvested using purse seines and gillnets in the Togiak sac roe fishery. A

spawn-on-kelp harvest is also taken, primarily by local residents. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁵⁹⁴

Kwigillingok is located in Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. The Village is a member of the Coastal Villages Regional Fund, a CDQ group that promotes training and employment opportunities for residents, community and development programs for member villages, and offers loans to facilitate involvement of locals in Bering Sea crab and groundfish fisheries. The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the Bering Strait and Aleutian Islands region.⁵⁹⁵ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ.

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Kwigillingok. The closest processing plants are in Bethel and Dillingham.

Fisheries-Related Revenue

Between 2000 and 2010, no data were reported about fisheries-related revenue received from taxes or fees in Kwigillingok (Table 3). However, in a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that the village did receive an unspecified amount of state and federal funding during 2010.

Commercial Fishing

Between 2000 and 2010, Kwigillingok residents participated in commercial fisheries as crew members, vessel owners and permit holders. In 2010, 24 Kwigillingok residents held a total of 26 Commercial Fisheries Entry Commission (CFEC) permits, including 16 salmon permits in the Kuskokwim gillnet fishery, and 3 herring permits in the Cape Avinof roe and gillnet herring fishery.⁵⁹⁶ These permit numbers decreased steadily overall between 2000 and 2010 (from 55 permits in 2000 to 26 permits in 2010), and the number of permits fished dropped considerably over that period. In 2000, 35% of the 20 herring permits held were actively fished. However, herring permit activity declined significantly in years following, falling to 0% by 2004. No herring permits were actively fished between 2004 and 2010. Halibut permit activity remained low between 2000 and 2010, with no more than one permit active in any given year. No halibut permit activity was recorded between 2005 and 2010. In terms of total CFEC permits held in Kwigillingok, salmon accounted for not only most of the permits held, but most of the permits actively fished as well. In 2010, salmon permits accounted for 88.5% of permits held locally,

compared to 50.6% in 2000. In that year 30% of the 23 salmon permits held were actively fished, compared to 46% of the 28 held in 2000. Permit ownership remained steady, although activity declined early in the decade. Between 2000 and 2010, no Kwigillingok residents held either Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP). Information about permits held by Kwigillingok residents is presented in Table 4. Likewise, no Kwigillingok residents participated in the federal halibut, sablefish or crab catch share fisheries between 2000 and 2010 (Tables 6, 7 and 8).

In 2010, a total of 20 Kwigillingok residents held commercial crew licenses and 11 fishing vessels were primarily owned by Kwigillingok residents. The number of crew license holders fluctuated during the decade, with 26 in 2000 falling to between seven and 12 in 2002-2004, and climbing again to 20 in 2010. The number of vessels owned by Kwigillingok residents declined substantially from 2000, when 31 vessels were owned. The number of vessels homeported in Kwigillingok followed a similar pattern, with 25 in 2000 and only eight in 2010. According to a survey conducted by the AFSC in 2011, community leaders indicated that the only vessels using Kwigillingok as a base of operations during the fishing season were gillnet and longline boats under 35 ft in length. Information about the commercial fishing sector in Kwigillingok is presented in Table 5.

No landings or ex-vessel revenue were recorded in Kwigillingok (Tables 5 and 9), given the lack of fish buyers in the community (Table 5). Information about landings and ex-vessel revenue generated by vessels owned by Kwigillingok residents is largely considered confidential between 2000 and 2010, with the exception of herring harvest data for 2000 and salmon harvest data in 2000, 2001, 2005, 2006 and 2009. In the 2000, Kwigillingok vessel owners landed over 210,000 pounds of salmon, nearly twice as much as the amount landed the next year. Furthermore, in 2000, the ex-vessel value of the catch for salmon was \$138,691, while it was only worth \$44,710. Even when compensating for the smaller harvest, this total reflects lower prices and possibly a different species catch composition. Salmon landings rose again in 2009, with a total harvest of 165,185 pounds for an ex-vessel value of \$129,955. This higher catch is significant given the fewer total vessels owned by Kwigillingok residents in 2009 (11) compared to 31 vessels owned in 2000. Information about commercial harvest and ex-vessel revenue earned by vessel owners residing in Kwigillingok is presented in Table 10.

Recreational Fishing

Between 2000 and 2010 there were no active sport fish guide businesses or licensed sport fish guides in Kwigillingok. However, according to a survey conducted by the AFSC in 2011, community leaders indicated that residents of Kwigillingok did participate in sportfishing. Between 2000 and 2010, the number of Kwigillingok residents who purchased sportfishing licenses varied between 0 and 31 in any given year. Also, starting in 2010, sportfishing licenses were sold in the community. In that year, Kwigillingok residents purchased 18 sportfishing licenses (irrespective of point of sale) and 9 of those were sold in the community. According to the 2011 AFSC survey, community leaders noted that gear or tackle stores were also present in the community. The Alaska Statewide Harvest Survey,⁵⁹⁷ conducted by ADF&G between 2000 and 2010, noted the following species as targeted by private anglers in Kwigillingok: pink salmon, chum salmon, Chinook salmon, coho salmon, sockeye salmon, halibut, shrimp, and clam.

Kwigillingok is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-resident angler days fished per year, and between 0 and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,625 – 17,582 angler days per year) than Alaska resident anglers (4,236 – 9,152 angler days per year). This information about the sportfishing sector in and near Kwigillingok is displayed in Table 11.

Subsistence Fishing

In a survey conducted by the AFSC in 2011, Kwigillingok community leaders indicated that salmon, halibut, clams, herring, marine mammals, and white fish are some of the most important subsistence resources utilized by local residents. No information is available from ADF&G regarding the percentage of households using different subsistence resources between 2000 and 2010, or about per capita subsistence harvest (Table 12).

However, data are available through 2008 regarding subsistence salmon permits (Table 13). Between 2000 and 2008, the number of individuals in Kwigillingok who were issued subsistence salmon permits varied between 71 and 95 individuals per year. Specific harvest amounts were only available in 2004, and in that year Chinook, chum and sockeye salmon were harvested. No information was reported regarding subsistence harvest of marine invertebrates and non-salmon fish (not including halibut.)

Between 2005 and 2010, Kwigillingok residents participated in the Subsistence Halibut Registration Certificates (SHARC) program, although in a limited capacity. During that time, between 45 and 48 residents were issued SHARC, and between 10 and 42 SHARC were fished. In 2009, 31 of 45 SHARC were fished, although no harvest information is available. In 2010, the number of SHARC issued declined significantly to three, and none were reported active that year (Table 14). In terms of marine mammal harvests, an estimated seven walrus were harvested between 2000 and 2010 (Table 15).

Additional Information

According to legend passed down by elders, the Village was at a spot where there was no river, but over time one was formed when a man dug a trench to retrieve a necklace lost by his daughter at the edge of a lake.⁵⁹⁸

Lower Kalskag (Lower KAL-skag)

People and Place

*Location*⁵⁹⁹

Lower Kalskag is located on the north bank of the Kuskokwim River, 2 miles downriver from Upper Kalskag. It lies 26 miles west of Aniak, 89 miles northeast of Bethel, and 350 miles west of Anchorage. The community is located in the Bethel Census Area and Kuskokwim Recording District. The City of Lower Kalskag encompasses 1.3 square miles of land and 0.4 square miles of water.

*Demographic Profile*⁶⁰⁰

In 2010, there were 282 inhabitants in Lower Kalskag, making it the 167th largest of 352 total Alaskan communities with recorded populations that year. The town did not appear in U.S. Census records until the 1940s. Overall between 1990 and 2010, the population of Lower Kalskag remained relatively stable, decreasing by only 3.1%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents fell by 6%, with an average annual growth rate of -0.98%. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that Lower Kalskag's population has a yearly peak during summer months, between June and September. They said that approximately 28 seasonal workers are present in the community during this period. According to the survey, seasonal population fluctuations are not driven by employment in fishing sectors.

In 2010, a majority of Lower Kalskag residents identified themselves as American Indian and Alaska Native (92.2%), along with 2.5% that identified as White, and 5.0% identifying with two or more races. None of Lower Kalskag's residents identified themselves as Hispanic in 2010. Individuals identifying as White made up 1.1% more of the population in 2010 compared to 1990, although the overall percentage of White residents decreased from 4.5% in 2000 to 2.5% in 2010. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Lower Kalskag was 3.76, a decline from 4.05 persons per household in 2000 and 4.3 persons per household in 1990. The number of households in Lower Kalskag has increased over time, from 67 occupied households in 1990 and 66 in 2000, to 75 in 2010. Of the 82 housing units surveyed for the 2010 U.S. Decennial Census, 64.6% were owner-occupied, 26.8% were rented, and 8.5% were vacant or used only seasonally. Between 1990 and 2010, no residents of Lower Kalskag lived in group quarters.

² Alaska Department of Labor. 2011. *Current population estimates for Alaskan Communities*. Retrieved April 15, 2011, from <http://labor.alaska.gov/research/pop/popest.htm>.

Figure 1. Racial and Ethnic Composition, Lower Kalskag: 2000-2010 (U.S. Census).

In 2010, the gender makeup of Lower Kalskag’s population was more heavily female than most Alaskan communities (51.4% female and 48.6% male). In contrast, the state population as a whole was 52% male and 48% female that year. The median age of Lower Kalskag residents was 25.8 years, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, there was a relatively even spread of males and females across age categories in Lower Kalskag. In 2010, the age groups most heavily skewed toward females were 0 to 19 and 40 to 49 years, while there were more men in age groups 20 to

29 and 60 to 69. Only 9.2% of Lower Kalskag’s population was age 60 or older in 2010. The overall population structure of Lower Kalskag in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to American Community Survey (ACS) estimates,⁶⁰¹ 78.3% of Lower Kalskag residents aged 25 and over held a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 14.7% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 7% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 10.9% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 0% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 14.7% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 0% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

Figure 2. Population Age Structure in Lower Kalskag Based on the 2000 and 2010 U.S. Decennial Census.

⁶⁰¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

The site of Lower Kalskag was originally used as a fish camp for families from Kalskag, 2 miles to the northeast. In 1930, people began to establish year-round homes. The Russian Orthodox residents of Upper Kalskag, a predominantly Roman Catholic village, moved to Lower Kalskag in the 1930s because of religious differences. The Russian Orthodox Chapel of St. Seraphim was built in 1940. A school was built in 1959, followed by a post office in 1962, a sawmill in 1965, and a power plant in 1969. A new church was built in the late 1970s. The City of Lower Kalskag was incorporated in 1969.⁶⁰² The sale and importation of alcohol are banned in the community.⁶⁰³

Natural Resources and Environment

The climate of Lower Kalskag is semi-arctic with maritime influences from the Bering Sea. Annual precipitation averages 19 inches, with 60 inches of snowfall. Temperatures range between -55 and 87 °F. The Kuskokwim River is ice-free from mid-June through October.⁶⁰⁴

The community is located less than 100 miles from the boundary of Wood-Tikchik State Park, the largest state park in the United States. The State Park includes a diversity of terrain and ecosystems. The Wood River and Tilchik systems host all five species of Pacific salmon, along with rainbow trout, grayling, lake trout, Arctic char, Dolly Varden char and northern pike. Tilchik Lake is an important site for whitefish subsistence harvest. Moose, caribou, and brown bear are common in the park, along with black bear in a limited area of the park. Small game present in the area includes beaver, muskrat, otter, fox, wolverine, mink, and porcupine. Ground squirrels and marmots are abundant, along with a variety of resident and migratory waterfowl and land birds.⁶⁰⁵

There are many gold deposits along the Kuskokwim River. Donlin Gold, approximately 70 miles northeast of the Lower Kalskag, is one of the largest gold deposits in the world, with probable reserves estimated at 33.6 million oz of gold. In March 2010, Donlin Creek LLC renegotiated its lease with Calista Corporation, securing additional land to allow for future expansion and extending the lease to 2031.⁶⁰⁶ Other smaller mine sites are scattered around the area, including Stuyahok and Arnold Kako to the north of Lower Kalskag, and Bogus Creek and Nyac to the south.⁶⁰⁷ A majority of the surface land in proposed mining areas is owned by the Kuskokwim Corporation, the local Native village corporation, and the subsurface land is owned by the regional Native corporation, Calista Corporation.⁶⁰⁸

Natural hazards identified in the Lower Kalskag area include high risk of flooding, erosion, and severe weather, and low risk of wildfire and earthquakes.⁶⁰⁹

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Lower Kalskag as of May 2012.⁶¹⁰

Current Economy⁶¹¹

Lower Kalskag's economy is predominantly based on subsistence activities. Salmon, moose, black bear, porcupine, and waterfowl are utilized.⁶¹² In 2010, top employers in the community in 2010 were the Lower Kalskag Traditional Council, the Cities of Lower Kalskag and Upper Kalskag, the school district, the Tuluksak Native Store, the Association of Village Council Presidents (AVCP), the Yukon-Kuskokwim Health Corporation, and several private companies.⁶¹³ The Alaska Department of Natural Resources and U.S. Bureau of Land Management firefighting also provide some seasonal income.⁶¹⁴ In a survey conducted by the AFSC in 2011, community leaders reported that a majority of Lower Kalskag residents rely primarily on subsistence fishing, and a few also engage in commercial fishing activities.

Based on household surveys conducted for the 2006-2010 ACS,^{615,616} in 2010, the per capita income in Lower Kalskag was estimated to be \$11,966, and the median household income was estimated to be \$44,250. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$7,654 and \$25,625, respectively). This is true even when accounting for inflation by converting the 2000 values to 2010 dollars,⁶¹⁷ revealing a real per capita income in 2000 of \$10,065, and a real median household income of \$33,697. In 2010, Lower Kalskag ranked 240th of 305 Alaskan communities with per capita income data that year, and 165th in median household income, out of 299 Alaskan communities with household income data.

Lower Kalskag's small population size may have prevented the ACS from accurately portraying economic conditions.⁶¹⁸ A potentially more accurate understanding of per capita income is obtained from economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development

⁶⁰⁹ City of Aniak and Bechtol Planning and Development (2005). *The City of Aniak, Alaska: All-Hazards Mitigation Plan*. Retrieved February 9, 2012 from

⁶¹⁴ See footnote 602.

⁶¹⁵ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁶¹⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁶¹⁷ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁶¹⁸ See footnote 616.

(DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Lower Kalskag in 2010 is \$5,609,⁶¹⁹ which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000. This decline in income is reflected in the fact that the community was recognized as “distressed” by the Denali Commission,⁶²⁰ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a smaller percentage of Lower Kalskag residents were estimated to be in the civilian labor force (63.5%) than the civilian labor force statewide (68.8%). In the same year, approximately 16% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 22%, compared to a statewide unemployment rate of 5.9%. An alternative estimate of unemployment is based on the ALARI database, which indicates that the 2010 unemployment rate in Lower Kalskag was 26.6%, more than two times the ALARI statewide unemployment rate estimate of 11.5%.⁶²¹

Based on household surveys conducted for the 2006-2010 ACS, the greatest number of workers were estimated to be employed in the public sector (54.5%), and the remaining 45.5% were estimated to be working in the private sector. Of the 66 people aged 16 and over that were estimated to be employed in the civilian labor force, the majority worked in educational services, health care and social assistance sector (63.6%), while 15.2% were estimated to be working in public administration, and 4.5% each in retail trade and in transportation, warehousing and utilities. The occupations in which the greatest percentages of the workforce were estimated to be employed were service (51.5%), production, transportation, and material moving (25.8%), and management, business, science, and arts occupations (18.2%). No Lower Kalskag residents were estimated to be working in fishing-related industries or occupations in 2010. The number of individuals employed by fishing is probably underestimated in census statistics, as fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 135 employed residents in Lower Kalskag in 2010, of which 74.8% were employed in local government, 5.2% were employed in education and health services, 3.7% in natural resources and mining, 3.7% in construction, 3% in professional and business services, 2.2% in trade, transportation, and utilities, 1.5% in financial activities, and 5.9% in other industries.⁶²² As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Governance

Lower Kalskag is a 2nd Class City, and is not part of an organized borough. The City was incorporated in 1969 and has a Strong Mayor form of government, which includes a seven-person city council, including the mayor, a seven-person advisory school board, and several municipal employees.⁶²³ The City of Lower Kalskag did not administer any local taxes, and no sales tax revenue was reported between 2000 and 2010. Annual community revenue initially declined from \$161,689 in 2000 to a low of \$46,000 in 2006, but rebounded to \$174,052 by

⁶²³ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

2010. The City received State Revenue Sharing contributions of between \$26,000 and \$37,500 per year from 2000 to 2003, and Community Revenue Sharing contributions of just over \$100,000 per year in 2009 and 2010. Locally generated revenues included lease fees from federal and state facilities on city lands and bingo/pull tab sales. In addition to the State and Community Revenue Sharing programs, other outside revenue sources included job training, community policing grants, and suicide prevention grants, as well as funds from the Payment In Lieu of Taxes program. No state or federal fisheries-related grants were reported to contribute to community revenue between 2000 and 2010. Information about selected aspects of Lower Kalskag’s municipal revenue is presented in Table 2.

Lower Kalskag was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Village of Lower Kalskag. The Native village corporation is The Kuskokwim Corporation, which manages 92,160 acres of land and represents numerous villages in the Lower Kuskokwim area. The regional Native corporation to which Lower Kalskag belong is the Calista Corporation.⁶²⁴

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Lower Kalskag from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$161,689	n/a	\$31,336	n/a

Lower Kalskag is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”⁶²⁵ The AVCP is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.⁶²⁶ AVCP is made up of 56 villages and 45 village corporations.⁶²⁷

The closest office of the Alaska Department of Fish and Game (ADF&G), Alaska Department of Commerce, Community and Economic Development, and a field office of the National Marine Fishery Service (NMFS) are located in Bethel, 89 miles to the southwest. A main office of NMFS is located 350 miles to the east in Anchorage, along with the closest offices of the Bureau of Citizenship and Immigration Services and Alaska Department of Natural Resources.

Infrastructure

Connectivity and Transportation

A state-maintained 4.2-mile gravel road connects the Cities of Lower and Upper Kalskag, although the communities are not connected to a wider road network. Commercial barge lines deliver fuel and other bulk supplies in the summer. Passengers and other freight arrive by air through year-round scheduled daily air services. The state-owned 3,172-ft-long by 75-ft-wide gravel airstrip is shared by Upper Kalskag and Lower Kalskag. The price of a roundtrip ticket by plane from the Kalskag Airport to Anchorage in early June 2012 was \$464.⁶²⁸ Winter trails exist to Russian Mission (40 miles) and Aniak (26 miles).⁶²⁹

Facilities

An 85-ft well provides water, which is treated and piped to most homes and the school. The school, clinic, and over 40% of homes use individual septic tanks and have complete plumbing. A 10,000-gallon community septic tank allows for piped sewage collection in part of the village. Refuse is burned or buried at a landfill located between Upper Kalskag and Lower Kalskag. A diesel powerhouse provides electricity to the village, operated by AVEC (the Alaska Village Electric Cooperative). Police services are provided by state troopers stationed in Aniak,

and local fire and rescue services are provided by volunteers in the village. Lower Kalskag has a community hall, a school gymnasium that is closed during the summer, and a school library.⁶³⁰

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that no dock space is available for permanent or public moorage. However, a barge landing area was completed in August 2011 to receive fuel, gravel and freight barges. Community leaders also reported that the community currently has a U.S. post office, full telephone service and broadband internet access, and that improvements are underway on water and sewer pipelines and water treatment. In addition, they noted that affordable housing, job placement services, and disability home care are provided in Lower Kalskag. Community leaders indicated that residents typically travel to nearby villages of Upper Kalskag, Aniak, and Bethel to access fisheries-related businesses and services not available in Lower Kalskag.

Medical Services

Health services in Lower Kalskag are provided by the Crimet Phillips Sr. Clinic, which is operated by the Yukon Kuskokwim Health Corporation and owned by the Village Council. Emergency Services have river and air access. Local emergency service is provided by a health aide.⁶³¹ The closest hospital is located in Bethel.

Educational Opportunities

There are two schools located in Lower Kalskag: George Morgan Sr. High School (grades 6-12) and Zackar Levi Elementary School (grades 1-8). In 2010 the high school had 6 teachers and was attended by 49 students, while the elementary school had 4 teachers and enrollment of 61 students.⁶³²

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Lower Kalskag was originally utilized as a summer fish camp by residents of Upper Kalskag. Subsistence fishing for salmon, along with subsistence hunting for birds and land mammals, has historically formed basis of the local economy.⁶³³ According to the 2011 AFSC survey, community leaders reported that subsistence fishing remains one of the most important sources of food for local residents, while a few residents also participate in commercial and sportfishing activities.

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s, commercial salmon

⁶³⁰ Ibid.

⁶³¹ Ibid.

⁶³² Alaska Department of Education and Early Development. 2012. Statistics and Reports. Retrieved April 24, 2012 from <http://eed.alaska.gov/stats/>.

⁶³³ See footnote 629.

fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.⁶³⁴

In Alaska, commercial catch of herring for human consumption began in 1878, commercial harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gill net sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁶³⁵

Lower Kalskag is located along the Kuskokwim River, in District 2 of the Kuskokwim salmon fishery. The Kuskokwim River empties into Kuskokwim Bay and the Bering Sea. Although Lower Kalskag is over 100 miles inland, it is worth noting that the nearest marine area is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Lower Kalskag is not eligible to participate in the CQE (Community Quota Entity) program, and because the community is located more than 50 miles inland from the ocean, it is not eligible to participate in the CDQ (Community Development Quota) program.

According to the 2011 AFSC survey, community leaders reported that Lower Kalskag participates in fisheries management processes in Alaska. The two primary ways in which the community is engaged in management processes are through 1) sending a representative to sit on a regional fisheries advisory and/or working group run by ADF&G, and 2) sending a representative to participate in the Federal Subsistence Board of Federal Subsistence Regional Advisory Council process. They also reported that one of the primary concerns of local officials is that salmon escapement be managed effectively to allow sufficient volume of salmon upriver for subsistence harvest by inland communities such as Lower Kalskag.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Lower Kalskag does not have a registered processing plant. In the 2011 AFSC survey, community leaders reported that commercial fishermen must deliver their catch to processing facilities downriver in Bethel.

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue sources in Lower Kalskag (Table 3). Although not specifically related to fishing, it is worth noting that Lower Kalskag's municipal revenue did include money from fuel sales: in the year

⁶³⁴ Clark, McGregor, Mecum, Krasnowski and Carroll 2006. Kuskokwim Commercial Salmon Fishery. In *The Commercial Salmon Fishery in Alaska*. Alaska Dept. of Fish and Game, Pgs. 105-146. Retrieved December 28, 2011 from http://www.adfg.alaska.gov/static/home/library/PDFs/afrb/clarv12n1_p4.pdf.

⁶³⁵ Woodby, Doug, Dave Carlile, Shareef Siddeek, Fritz Funk, John H. Clark, and Lee Hulbert (2005). *Commercial Fisheries of Alaska*. Alaska Dept. of Fish and Game, Special Publication No. 05-09. Retrieved December 29, 2011 from <http://www.adfg.alaska.gov/FedAidPDFs/sp05-09.pdf>.

2000 the City received \$110,550 from sale of fuel, \$1,398 in 2008, \$4,250 in 2009 and \$28,000 in 2010.⁶³⁶ Additionally, in a survey conducted by the AFSC in 2011, community leaders reported that in 2010, Lower Kalskag received \$373,035 in funding or grants and \$161,800 in special allocations from the Coastal Villages Regional Fund (CVRF), one of six CDQ entities. CVRF represents 20 member communities within 50 miles of the Bering Sea coast, ranging from Platinum in the south to Scammon Bay in the north.

Commercial Fishing

Lower Kalskag is located over 100 miles up the Kuskokwim River. Even though it is not a coastal community, the local economy depends on fisheries resources, especially the runs of chum, Chinook, coho, and sockeye salmon that return to the Kuskokwim River each year. In a survey conducted by the AFSC in 2011, community leaders reported that a majority of local residents rely heavily on subsistence hunting and fishing, and that a few residents also participate in commercial fisheries.

There were no shore-side processors or fish buyers in Lower Kalskag between 2000 and 2010, and as a result there were no direct landings of fisheries resources and no ex-vessel revenue was generated in Lower Kalskag during this period (Tables 5 and 9). Community leaders noted in the 2011 AFSC survey that commercial fishermen from Lower Kalskag deliver their catch in Bethel. From 2000 to 2010, between three and five residents of Lower Kalskag held Commercial Fisheries Entry Commission (CFEC) each year. A majority were salmon permits, held in the Kuskokwim and Lower Yukon gill net fisheries, and one permit was also held each year in the Goodnews Bay roe herring gill net fishery. The number of Kuskokwim salmon gill net permits declined from three held in 2000 to two held each year from 2001 and 2010. None of these permits were actively fished between 2000 and 2010. One gill net permit was also held in the Lower Yukon salmon fishery during four years of the 2000-2010 period, and the permit was actively fished in 2000 and 2004-2005 (Table 4).

Over the same period, no Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) were issued to residents of Lower Kalskag (Table 4), and no quota share accounts were held by Lower Kalskag residents in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 to 8).

Several Lower Kalskag residents were reported to be involved in commercial fisheries as crew and vessel owners between 2000 and 2010. In 2000, 2003, and 2010, one resident per year held a commercial fishing crew license. From 2000 to 2004, one Lower Kalskag resident per year was the primary owner of a fishing vessel. Also from 2000 to 2004, one vessel per year was homeported in Lower Kalskag. According to the 2011 AFSC survey, community leaders reported that commercial fishing boats using Lower Kalskag as a base of fishing operations were all under 35 ft in length, and were gillnetters primarily involved in the salmon fishery. These characteristics of the Lower Kalskag fishing sector are presented in Table 5. Information about landings and ex-vessel revenue earned by Lower Kalskag vessel owners is considered confidential between 2000 and 2004 due to the small number of participants, and after 2004 no landings and revenue were attributable to vessels from Lower Kalskag. This information is presented in Table 10.

Recreational Fishing

Between 2000 and 2010, there were no active sport fish guide businesses located in Lower Kalskag. One licensed sport fish guide did reside in Lower Kalskag in 2000 and 2001, but starting in 2002 no licensed sport fish guides were present in the community. In 2010, Lower Kalskag residents purchased 44 sportfishing licenses (irrespective of point of sale), although no licenses were sold in the City of Lower Kalskag itself.⁶³⁷ In a survey conducted by the AFSC in 2011, community leaders reported that both Alaska resident and non-Alaska resident sport fishermen fish out of Lower Kalskag using private boats, and target chum, Chinook, coho, and sockeye salmon, whitefish, rainbow trout, and Arctic grayling. The Alaska Statewide Harvest Survey,⁶³⁸ conducted by ADF&G between 2000 and 2010, noted the following species targeted by sport fishermen in Lower Kalskag: coho salmon, whitefish, and northern pike. No kept/release log book data were reported for fishing charters out of Lower Kalskag between 2000 and 2010.⁶³⁹

Lower Kalskag is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between 0 and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 to 17,582 angler days per year) than Alaska resident anglers (5,166 to 9,152 angler days per year). This information about the sportfishing sector in and near Lower Kalskag is displayed in Table 11.

Subsistence Fishing

Subsistence hunting and fishing forms the basis of the economy in Lower Kalskag.⁶⁴⁰ In a survey conducted by the AFSC in 2011, Lower Kalskag community leaders reported that a greater portion of the community is engaged in subsistence fishing for consumption than commercial fishing, and the most important marine resources harvested by residents include chum salmon, Chinook salmon, and whitefish. No information is available from ADF&G regarding the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010, or the per capita consumption of subsistence resources in the community (Table 12).

However, data are available from 2000 and 2008 regarding subsistence salmon permits held in Lower Kalskag. Between 2000 and 2008, the number of Lower Kalskag households that were issued subsistence salmon permits varied between 62 and 89 per year. Chinook, chum, and sockeye were the three most heavily harvested salmon species, with an average of 1,744 Chinook, 1,528 chum, and 728 sockeye reported harvested per year. In addition, an average of 371 coho salmon was also harvested each year in Lower Kalskag (Table 13). No information was

⁶⁴⁰ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

reported by management agencies regarding subsistence harvest of marine invertebrates and non-salmon fish (Table 13) or marine mammals (Table 15) between 2000 and 2010.

Although Lower Kalskag is located over 100 miles from the ocean, several residents did participate in the subsistence fishery for Pacific halibut. Three Subsistence Halibut Registration Certificates (SHARC) were issued to Lower Kalskag residents in 2004, and two were issued in 2005. However, no information was reported about how many of these SHARC cards were fished or how many lb of halibut were harvested by these individuals in these years (Table 14).

People and Place

Location

Mekoryuk is situated at the mouth of Shoal Bay, on the north shore of Nunivak Island in the Bering Sea. The Island lies 30 miles off the mainland coast. The community is located about 149 air miles west of Bethel and 553 miles west of Anchorage. The Island's 1.1 million acres are included in the 20-million-acre Yukon Delta National Wildlife Refuge (NWR), and the southern half of the Island has been designated as the Nunivak Wilderness Area. The City of Mekoryuk encompasses 7.4 square miles of land and 0.1 square miles of water, all of which is located within the boundaries of the NWR. Mekoryuk is in the Bethel Census Area and Cape Nome Recording District.^{641,642}

*Demographic Profile*⁶⁴³

In 2010, there were 191 residents in Mekoryuk, making it the 191st largest of 352 communities in Alaska with recorded populations that year. Overall between 1990 and 2010, the population of Mekoryuk rose by 7.9%. According to Alaska Department of Labor estimates, the population of permanent residents peaked at 220 individuals in 2006, and then declined again to 174 residents by 2009 (Table 1). The population decline in the last years of the decade is reflected in a negative average annual growth rate between 2000 and 2009 of -1.2% (Table 1).

In 2010, the majority of the population of Mekoryuk identified themselves as American Indian and Alaska Native (93.2%), along with 3.3% who identified as White, and 6.2% identifying with two or more races. In addition, 0.5% of Mekoryuk's population identified themselves as Hispanic in 2010. The percentage of the population identifying as White increased between 1990 and 2000, from 0.6% to 3.3%, and remained stable in 2010 at 3.1% (Figure 1).

The number of households in Mekoryuk increased between 1990 and 2000, from 63 to 73, followed by a slight decrease to 70 occupied housing units in 2010. The average household size in Mekoryuk was 2.73 in 2010, a slight decrease from 2.88 persons per household in 2000 and 2.8 persons per household in 1990. Of the 86 housing units surveyed for the 2010 Decennial Census, 40.7% were owner-occupied, 40.7% were rented, and 18.6% were vacant or used only seasonally. Between 1990 and 2010, no residents of Mekoryuk lived in group quarters.

In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that the population of Mekoryuk reaches its peak during the summer, in August. They reported that approximately 70 seasonal workers or transients are

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

present during summer months, and that population fluctuations are not driven by employment in the commercial fishing sector.

In 2010, the gender makeup of Mekoryuk’s population was more heavily weighted toward males (56.7% male and 43.3% female) than the state population as a whole, which was 52% male and 48% female. The median age of Mekoryuk residents was 40.5 years, older than the national average of 36.8 years and the median age for Alaska of 33.8 years. In 2010, the age groups most skewed toward males were 40 to 49 and 50 to 59, while there was a relatively even spread of males and females across other age categories in Mekoryuk, and slightly more females in the 20 to 29 age group. Approximately 16.2% of Mekoryuk’s population was age 60 or older in 2010. The overall population structure of Mekoryuk in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Mekoryuk Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to 2006-2010 American Community Survey (ACS) estimates,⁶⁴⁴ 75.4% of Mekoryuk residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 17.7% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 6.9% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 23.8% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 3.1% were estimated to have an Associate's degree, compared to 8% of Alaska residents overall; 7.7% were estimated to have a Bachelor's degree, compared to 17.4% of Alaska residents overall; and 3.8% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Historically, the Native Eskimo people present in the area of Mekoryuk have been the Yup'ik peoples, specifically the Nuniwarmiut people who are Cup'ig Eskimos. Nunivak Island itself has been peopled for at least 2,000 years. In 1821, the first outside contact occurred with the Russian American Company. The Company documented 400 people living in 16 villages on the Island. In 1874 a summer village camp by the name of "Koot" was noted at the modern day site of Mekoryuk. There was an epidemic in 1900 which decimated the population. Only four families in the village survived. An Eskimo missionary built the Evangelical Covenant Church in the 1930s in the village, and a Bureau of Indian Affairs (BIA) school was built in 1939. The school attracted people to relocate from other parts of the Island to the village.⁶⁴⁵

An Eskimo-Russian trader introduced reindeer for commercial purposes in 1920. In the 1940s, the operation was purchased by the BIA, and in 1945 a slaughterhouse was constructed. The reindeer were bred with caribou from Denali Park, resulting in animals that are larger and more difficult to handle than other reindeer in the State of Alaska. In 1934, 34 musk oxen from Greenland were brought to Nunivak Island in an effort to save the animal from extinction. Presently the herd numbers at around 500 musk oxen, not including calves from the herd that have been relocated to start herds in other areas of Alaska. In 1940, a U.S. post office opened in the village. During this time period, traditional ceremonies and beliefs were still practiced by the Native people. Women lived in semi-subterranean sod houses and men lived in one or more men's community houses.⁶⁴⁶ Extensive change came to the Island in the 1950s and 1960s. In 1957, an airstrip was built and the Territorial Guard was formed, which caused men from Nunivak Island to go to Fort Richardson in Anchorage for training. By 1957, the only permanent community left on the Island was Mekoryuk, and around this time many of the families moved to the community of Bethel to be closer to a high school. Families returned seasonally to Mekoryuk for fishing and sea mammal hunting in the late spring. The City of Mekoryuk was incorporated

⁶⁴⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁶⁴⁵ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

⁶⁴⁶ *Ibid.*

in 1969. In 1978, a high school was constructed in the community.⁶⁴⁷ The sale, importation, and possession of alcohol are banned in the community.⁶⁴⁸

Natural Resources and Environment

The Bering Sea, which surrounds Nunivak Island, strongly influences the local climate. Foggy and stormy weather are frequent. Average annual precipitation is 15 inches, and annual snowfall averages 57 inches. In the summer, high temperatures average 48 to 54 °F, and winter high temperatures range from 37 to 44 °F. Extremes have been recorded from 76 to -48 °F.⁶⁴⁹

The entirety of Nunivak Island (1.1 million acres) is included in the Yukon Delta NWR. The NWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskox, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” Nunivak Island is characterized by 100 to 450-ft-high coastal bluffs and immense sand dunes (up to more than 100 ft) backing sandy beaches along the southern coast, and rocky shores, saltwater lagoons, and eelgrass beds in other areas. The shores are frequented by migratory birds and sea mammals.^{650,651}

Nunivak Island is of volcanic origin. The interior of the island contains lava flows and craters, some holding deep lakes. The famous herds of Nunivak reindeer and great shaggy musk oxen reside on the large upland plateau, a landscape dominated by tundra rising 500 to 800 ft above sea level. The reindeer, a cross between reindeer and caribou from Denali National Park, are owned and managed by the Village of Mekoryuk. The musk oxen were introduced from Greenland in 1935, following the extinction of the Alaskan musk ox around 1865.^{652,653} Today, the herd numbers around 500,⁶⁵⁴ and a permit system is used to determine which hunters will be allowed to shoot a few each year.⁶⁵⁵

According to the Coastal Management Plan for the Ceñaliulriit Coastal Resource Services Area, which includes Nunivak Island, high risk natural hazards in the area include flooding, erosion, storm surges, sea ice, and thawing of permafrost.⁶⁵⁶

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Mekoryuk as of May 2012.⁶⁵⁷

Current Economy⁶⁵⁸

In Mekoryuk, major employers include the school, local and regional government and non-profit organizations, commercial fishing, construction, and service industries. Reindeer herding and value-added processing is an important source of local employment, as is Coastal Villages Seafoods, Inc., which processes halibut and salmon in Mekoryuk.^{659,660} Many families earn income from trapping and Native crafts, such as spinning and knitting qiviut (musk ox underwool).⁶⁶¹ According to a survey conducted by the AFSC in 2011, community leaders reported that commercial fishing is the primary resource-based industry on which the economy depends. In addition, most families in Mekoryuk engage in subsistence fishing, and most have fish camps. Subsistence activities focus on salmon, reindeer, and seal meat and oil.⁶⁶² In the AFSC survey, community leaders noted that halibut is also an important subsistence resource.

Based on household surveys for the 2006-2010 ACS,⁶⁶³ in 2010, the per capita income in Mekoryuk was estimated to be \$23,827 and the median household income was estimated to be \$34,792. This represents a sizeable increase from the per capita income reported in the year 2000 (\$11,958), but only a slight increase from the median household income reported in 2000 (\$30,833). If inflation is taken into account by converting the 2000 values to 2010 dollars,⁶⁶⁴ the 2010 median household income estimate is revealed to in fact be lower than the real median household income in 2000 (\$40,545), while the 2010 per capita income estimate remains significantly higher than the real per capita income in 2000 of \$15,725. In 2010, Mekoryuk ranked 120th of 305 Alaskan communities with per capita income data that year, and 214th in median household income, out of 299 Alaskan communities with household income data.

Although Mekoryuk's small population size may have prevented the ACS from accurately portraying economic conditions,⁶⁶⁵ the 2010 ACS per capita income estimate is supported by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Mekoryuk

Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁶⁶⁴ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁶⁶⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

in 2010 is \$10,150.⁶⁶⁶ This is slightly lower than the 2006-2010 ACS estimate, and provides additional evidence that per capita income declined slightly in Mekoyruk from 2000 to 2010. This decline is reflected in the fact that the community was recognized as “distressed” by the Denali Commission, indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁶⁶⁷ It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a similar percentage of Mekoryuk residents was estimated to be in the civilian labor force (67.3%) as in the civilian labor force statewide (68.8%). In the same year, 22.4% of local residents were estimated to be living below the poverty line, compared to an estimated 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 13%, compared to a statewide unemployment rate of 5.9%. An alternative estimate of unemployment is based on the ALARI database, which indicates that the 2010 unemployment rate in Mekoryuk was 32%, compared to a statewide unemployment rate estimate of 11.5%.⁶⁶⁸

Also based on the 2006-2010 ACS, the greatest number of workers were estimated to be employed in the private sector (56.8%), while 36.4% were employed in the public sector and 6.8% were self-employed. Of the 88 people aged 16 and over that were estimated to be employed in the civilian labor force, the industries in which the greatest numbers were estimated to be working included public administration (18.2%), transportation, warehousing, and utilities (15.9%), other services except public administration (14.8%), educational services, health care, and social assistance (12.5%), and manufacturing (11.4%). The occupations in which the greatest percentages of the workforce were estimated to be employed were management/professional (36.4%), sales/office (18.2%), and natural resource/construction/maintenance (18.2%). Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

It is important to note that the number of individuals employed by fishing is probably underestimated in census statistics, as fishermen may hold another job and characterize their employment accordingly. Although 16 workers were estimated to be employed in natural resource/construction/maintenance occupations (18.2%), a breakdown of this category reveals that 0 individuals were employed in farming, fishing, and forestry occupations. Likewise, 0% of the civilian labor force was estimated to be employed in agriculture agriculture, forestry, and fishing industries in 2010.

Figure 3. Local Employment by Industry in 2000-2010, Mekoryuk (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Mekoryuk (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 122 employed residents in Mekoryuk in 2010, of which 41.8% were employed in local government, 22.1% in financial activities, 16.4% in trade, transportation, and utilities, 8.2% in manufacturing, 3.3% in education and health services, 3.3% in natural resources and mining, 0.8% in information, 0.8% in professional and business services, and 3.3% in other industries.⁶⁶⁹ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

⁶⁶⁹ Ibid.

Governance

Mekoryuk was incorporated as a 2nd Class City in 1969. The City has a Strong Mayor form of government, which includes a seven-person city council, including the mayor, a nine-person advisory school board, and several municipal employees. The City is not part of an organized borough. The City enforces a 4% sales tax, but administers no other taxes.⁶⁷⁰ In addition to sales tax revenues, other locally-generated revenue sources during the 2000-2010 period included state and federal lease fees, equipment rentals, and revenues from water/sewer service fees, the washeteria,⁶⁷¹ and cable TV service. Outside revenue sources included various state revenue sharing programs, including State Revenue Sharing program contributions from 2000 to 2003 (approximately \$25,000 each year) and a \$105,000 Community Revenue Sharing program contribution in 2010. The City also received state revenue sharing funding from other sources, including the Shared Fisheries Business Tax and raw fish tax refunds (see the *Fisheries-Related Revenue* section of this profile), and federal revenue sharing from the Payment In Lieu of Taxes program. Grants were also received by the City in some years, including grants for job training, community policing, suicide prevention, and infrastructure development, including funds for a washeteria upgrade, equipment purchases, and for the library. It is also important to note that Mekoryuk received state and federal fisheries-related grants in some years to assist with design, construction, and dredging of the small boat harbor. Information about selected revenue streams in Mekoryuk is presented in Table 2.

Mekoryuk was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the BIA, is the Native Village of Mekoryuk. The Native village corporation is the Nunivak Island Mekoryuk Alaska (NIMA) Corporation, which manages 115,200 acres of land. The regional Native corporation to which Mekoryuk belongs is the Calista Corporation.⁶⁷²

The non-profit cultural heritage office of the Village of Mekoryuk, Nuniwarmit Piciryarata Tamaryalkuti, offers cultural program and undertakes projects to “strengthen our peoples’ (Cup’ig Eskimo) cultural identity – especially young people – through the development of specific cultural resources relating to Cup’ig history and Native language.”⁶⁷³

⁶⁷⁰ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

⁶⁷¹ “Washeteria” is another word for laundromat. In Alaska, washeterias often include shower facilities.

⁶⁷² See footnote 670.

Mekoryuk is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”⁶⁷⁴ The AVCP is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.⁶⁷⁵ AVCP is made up of 56 villages and 45 village corporations.⁶⁷⁶

The closest offices of the Alaska Department of Fish and Game (ADF&G) and the Alaska Department of Commerce, Community and Economic Development are located in Bethel. A National Marine Fisheries Service (NMFS) field office is also located in Bethel, and a

main office is located in Anchorage. The nearest U.S. Bureau of Citizenship and Immigration Services and Alaska Department of Natural Resources offices are in Anchorage.

Infrastructure

Connectivity and Transportation

The community is very dependent upon air transport for cargo, mail, and passenger services. A 3,070-ft state-owned gravel runway provides year-round access to Mekoryuk.⁶⁷⁷ The approximate cost to travel by air roundtrip to Anchorage from Mekoryuk in early June 2012 was \$726.⁶⁷⁸ Goods are delivered to the community either once or twice a year from Bethel by barges. The shoreline is protected from the extreme waves of the Bering Sea by a breakwater. Local residents use ATVs, boats, and snowmobiles for travel within the community.⁶⁷⁹

Facilities

A diesel powerhouse operated by the Alaska Village Electric Cooperative provides electricity to the Village.⁶⁸⁰ In 2010, two wind turbines were erected along the road between the Village and the airport, and a new control module was installed next to the existing AVEC powerhouse. The new turbines are expected to generate up to 50% of the energy normally generated by the diesel fuel in the community.⁶⁸¹ Water is provided to Mekoryuk residents by the City, with the exception of the school, which has its own well.⁶⁸² The City draws water from the Mekoryuk River using a submersible pump laid on the bottom. The water is stored in an earth-lined impoundment and is then distributed to two watering points near the water treatment plant. Approximately 90% of homes receive water through a flush tank haul system operated by the City. Wastewater is discharged to a newly permitted, two-cell sewage lagoon.⁶⁸³ The community washeteria, operated by the City, has piped disposal directly to the sewage lagoon. The landfill in the community is also operated by the City.⁶⁸⁴ Police services are provided by the City Public Safety Office and the VPSO (Village Public Safety Officer) stationed in Mekoryuk.^{685,686} The nearest state trooper post is located in Emmonak.⁶⁸⁷ Additional facilities located in Mekoryuk include a City Hall, City Volunteer Fire Department, City Public Safety Office holding cell, a

school gymnasium, and a library. Phone, internet, and cable services are all available in Mekoryuk.⁶⁸⁸

With regard to fisheries-related infrastructure, in 2009, improvements were completed to the small boat harbor in Mekoryuk. The project involved dredging the shoreline to improve moorage and navigation, and reinforcement of the side slope of the harbor.⁶⁸⁹ However, according to a survey conducted by the AFSC in 2011, community leaders reported that no dock space is currently available for moorage of permanent, transient, or public vessels. They also reported that a breakwater and fish cleaning station have been present in Mekoryuk since the 1990s, and that the open beach is used for boat haul-outs and barge access. A site for a potential deep-water port facility on the northeast side of Nunivak Island has also been identified. The U.S. Army Corps of Engineers is currently studying the feasibility of building a port and barge landing facility at the site. The Village of Mekoryuk has identified a route through NIMA (Nunivak Island Mekoryuk Alaska) Corporation lands for potential construction of a port access road.⁶⁹⁰

Medical Services

Health care is available at the Mekoryuk Health Clinic, which is owned by the City and operated by the Yukon-Kuskokwim Health Corporation. Emergency Services have coastal and air access. Emergency service is provided by a health aide.⁶⁹¹ The nearest hospital is located in Bethel.

Educational Opportunities

There is one school in the City, Nuniwarmiut School, which teaches Kindergarten through 12th grade. As of 2011, the school had a total of 31 students and 5 teachers.⁶⁹² Nuniwarmiut School is a Cup'ig language immersion school, offering a bilingual education, and involves elders in teaching the youth about culture and language.⁶⁹³

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prior to the arrival of Europeans, subsistence hunting and fishing was the basis of the economy for people living on Nunivak Island and surrounding areas of the Yukon-Kuskokwim Delta. Today almost all local families continue to engage in subsistence activities, and most have fish camps. Salmon and seal meat and oil are some of the most important marine resources

utilized by residents.⁶⁹⁴ In a survey conducted by the AFSC in 2011, community leaders also noted the importance of halibut as a subsistence resource. Subsistence activities are combined with employment in commercial fishing and processing.⁶⁹⁵

Between 2000 and 2010, a majority of commercial fishing permits held by Mekoryuk residents were for halibut and herring fisheries (Table 4). Commercial exploitation of halibut first extended into the Bering Sea region in 1928 after development of diesel engines, which allowed fishing vessels to undertake longer trips.⁶⁹⁶ Today, Pacific halibut fisheries are managed under the International Pacific Halibut Commission. Commercial catch of herring for human consumption began in Alaska in 1878, harvest for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon-Kuskokwim coast there are six commercial gill net sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁶⁹⁷ Mekoryuk is located in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Mekoryuk participates in the Community Development Quota (CDQ) program. In 1995, management of the Pacific halibut and sablefish fisheries shifted from limited entry to a catch share program. The program includes allocation of the annual Total Allowable Catch (TAC) of halibut and sablefish via Individual Fishing Quota (IFQ). In the Bering Sea – Aleutian Islands (BSAI) region, quota shares are also allocated to six CDQ non-profit organizations representing 65 communities in Western Alaska.⁶⁹⁸ The CDQ non-profit representing the Native Village of Mekoryuk is the Coastal Villages Region Fund (CVRF), which promotes employment opportunities for residents as well as participation in the Bering Sea crab and groundfish fisheries. In 2010, the CVRF received an allocation of 348,000 lb of CDQ halibut quota. Seventy percent of this quota was allocated for harvest within Area 4E, and the remaining 30% was allocated for harvest within Area 4D.⁶⁹⁹ Total BSAI sablefish CDQ allocations in 2009 and 2011 were 5.3 million lb in each year. No sablefish CDQ report was available from NOAA for the 2010 season.⁷⁰⁰ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the CDQ allocations.⁷⁰¹

CVRF is also active at the local level, operating a fish processing plant in Mekoryuk.^{702,703} The community is not eligible to participate in the Community Quota Entity (CQE) program. According to the 2011 AFSC survey, community leaders reported that Mekoryuk does not actively participate in fisheries management processes in Alaska.

Processing Plants

Coastal Villages Seafood, LLC, a subsidiary of CVRF, currently operates a halibut processing facility in Mekoryuk. The plant was first constructed in the 1980s and operated by Bering Sea Reindeer Products, Inc., which also operated a reindeer processing plant. It was purchased in 1999 by Coastal Villages Seafood. In 2004, with CDQ grant funding, a new processing plant was constructed. The presence of a plant provides the opportunity for fishermen to sell their catch to a local market. Processed halibut are flown to Bethel for air transport to the fresh market.⁷⁰⁴

The Mekoryuk facility processes halibut from June through August. CVRF maintains a local community service center that helps fishing families maintain, repair, service, and modify their boats, motors, and fishing gear. The local plant provides free room and board to its fish processing workers, as well as transportation to and from the plant site and a cash bonus for all those who complete their contracts.⁷⁰⁵

Fisheries-Related Revenue

According to information provided in Mekoryuk's annual municipal budget between 2000 and 2010, the primary sources of fisheries-related revenue in Mekoryuk were a raw fish tax and Shared Fisheries Business Tax. In 2010, Mekoryuk received \$82 in raw fish tax and \$85 from the Shared Fisheries Business Tax, as well as \$96 from the Fisheries Resource Landing Tax. 2010 was the only reported year in which revenue was earned from the Fisheries Resource Landing Tax. Information about selected fisheries-related revenue sources is found in Table 3.⁷⁰⁶

It is also important to note that the CVRF uses fisheries revenue from the CDQ program to provide grants, scholarships and training, and other financial assistance to fishermen and residents of member villages.⁷⁰⁷ In the 2011 AFSC survey, community leaders reported receiving \$16,120 in funding or grants and \$5,960 in special allocations from CVRF in 2010.

Commercial Fishing

According to the 2011 AFSC survey, community leaders reported that commercial fishing is the natural resource-based industry upon which Mekoryuk's economy is most dependent. In 2010, there were 58 Mekoryuk residents holding a total of 100 Commercial

⁷⁰⁷ See footnote 702.

Fisheries Entry Commission (CFEC) permits, including 40 halibut permits (12 statewide hand troll and 28 statewide longline) and 60 permits in the Nelson Island, Nunivak Island, Goodnews Bay, and Norton Sound herring gill net fisheries. In prior years, several halibut fisherman also used mechanical jig gear. Of the total 100 permits held in 2010, only 30 were actively fished that year, all of which were halibut permits; none of the 60 herring permits held by Mekoryuk in 2010 were actively fished. The use of herring permits declined steeply during the first half of the 2000-2010 period. In 2000, 58% of the 64 herring permits were actively fished, declining to 2% actively fished in 2005, and 0% fished between 2006 and 2010. The total number of CFEC halibut permits also declined slightly over the period, from 48 of 52 permits (92%) fished in 2000, to 30 of 40 total permits (75%) fished in 2010.

It is important to note that Mekoryuk residents also occasionally held CFEC permits in other fisheries during this period, including one salmon permit held in 2000 in the Bristol Bay drift gill net fishery, and one held in 2007 and 2008 in the Kuskokwim River gill net fishery. The Bristol Bay permit was actively fished in 2000, but the Kuskokwim permits were not actively fished in either 2007 or 2008. One groundfish permit was held in 2000 and 2004 (longline vessel under 60 ft in length, statewide), but was not actively fished in either year. No residents of Mekoryuk held Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) between 2000 and 2010. Information about state and federal fisheries permits held by Mekoryuk residents is presented in Table 4.

In addition to CFEC permits, several Mekoryuk residents held quota share accounts in the federal halibut catch share fishery between 2000 and 2010. In 2000 and 2001, two accounts were held, with a total of 210,470 halibut quota shares. The number of quota shares held generally increased during the 2000-2010 period, although the number of quota share accounts held fell to one in 2006. The annual halibut individual fishing quota (IFQ) allotment increased slightly in the first half of the decade, and then decreased starting in 2007. Between 2000 and 2010, no residents of Mekoryuk held quota share accounts in federal catch share fisheries for sablefish or crab. Information about federal catch share participation is presented in Tables 6 through 8.

In 2010, a total of 38 Mekoryuk residents held commercial crew licenses, 35 fishing vessels were primarily owned by residents, and 31 vessels landed catch in Mekoryuk. With the exception of the number of vessels landing catch in the community, these numbers represent a decline in fishing activity since 2000, when 50 Mekoryuk residents held crew licenses and 47 vessels were owned by residents. Information about the commercial fishing sector in Mekoryuk is presented in Table 5. According to the 2011 AFSC survey, community leaders reported that commercial fishing boats using Mekoryuk as a base of fishing operations were longliners under 35 ft in length. When asked to describe changes in the fleet over time, they noted that fishing boats have been increasing in capacity. It is also important to note that, in addition to longline fishing gear, community leaders identified “fishing poles” as a common gear type used in Mekoryuk.

Although a fish processing plant was registered in the Mekoryuk each year from 2000 to 2010, a fish buyer was only reported to be present in 2009 and 2010 (Table 5). The only species landed in Mekoryuk in 2009 and 2010 was halibut, and landings volume and ex-vessel revenue information is considered confidential due to the small number of participants (Table 9). Mekoryuk ranked 51st in landings and 49th in ex-vessel revenue out of 67 Alaskan communities that received commercial fisheries landings in 2010. Table 10 presents information about landings and ex-vessel revenue earned by vessel owners residing in Mekoryuk, including all delivery locations. In 2010, Mekoryuk vessel owners landed 125,491 net lb of halibut, valued at

\$395,219 in ex-vessel revenue. In 2005, the last year that Mekoryuk vessel owners participated in the herring fishery, 209,656 net lb of herring were landed, generating \$11,112 in ex-vessel revenue. Herring landings and ex-vessel revenue are considered confidential beginning in 2006, and information about other fisheries is considered confidential in all years between 2000 and 2010.

Recreational Fishing

Between 2000 and 2010, there were no active sport fish guide businesses in Mekoryuk, although one licensed sport fish was present in 2000 and again in 2003. In 2010, Mekoryuk residents purchased 32 sportfishing licenses (irrespective of point of sale), although no licenses were sold in the City of Mekoryuk itself.⁷⁰⁸ In a survey conducted by the AFSC in 2011, community leaders reported that few non-Alaska residents fish recreationally out of Mekoryuk, and sportfishing by local residents primarily targets pink, chum, and coho salmon, and Pacific halibut. The Alaska Statewide Harvest Survey,⁷⁰⁹ conducted by ADF&G between 2000 and 2010, did not provide further information about species targeted by private anglers in Mekoryuk. No kept/release log book data were reported for fishing charters out of Mekoryuk between 2000 and 2010.⁷¹⁰

Mekoryuk is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Mekoryuk is displayed in Table 11.

Subsistence Fishing

Almost all families in Mekoryuk engage in subsistence and hunting activities, in combination with employment in commercial fishing and processing and other industries. Salmon, reindeer, and seal meat and oil are all important staples.⁷¹¹ In a survey conducted by the AFSC in 2011, Mekoryuk community leaders said that halibut is also one of the most important subsistence resources utilized by local residents.

No information is available from ADF&G regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010 (Table 12). However, a 1990 subsistence survey previously found that 59% of Mekoryuk households were involved in harvest of herring and herring sac roe. The survey also found that 100% of households used these resources, indicated the presence of a sharing network in Mekoryuk.⁷¹²

⁷¹¹ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

⁷¹² Alaska Department of Fish and Game (2011). *Community Subsistence Information System (CSIS)*. ADF&G Division of Subsistence. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sb/CSIS/> (Accessed February 2011).

Between 2000 and 2008, subsistence salmon permits were issued to between 63 and 95 households per year in Mekoryuk. Of harvests that were reported, chum was the most heavily harvested salmon species over time, with an average of 1,062 chum harvested per year. No information was reported regarding subsistence harvest of marine invertebrates and non-salmon fish during the 2000-2010 period. This information about subsistence fisheries is presented in Table 13.

Mekoryuk residents were very active in the Subsistence Halibut Registration Certificates (SHARC) program. Between 2003 and 2005, 15 permits were issued to Mekoryuk residents each year, declining to 5 or 6 permits issued per year from 2008 to 2010. The largest volume of halibut was reported harvested in 2005 (2,966 lb), when 15 SHARC cards were issued and 13 were returned. In 2010, two of the six SHARC cards were fished, and 410 lb of halibut were harvested. This information about the subsistence halibut fishery is presented in Table 14.

According to data from the U.S. Fish and Wildlife Service, residents of Mekoryuk also participated in subsistence hunting of walrus and beluga between 2000 and 2010. The greatest number of walrus were reported harvested in 2004 (6 animals), along with one or two walrus harvested in 6 other years during the period. Beluga harvest was also reported in 2007 and 2010. It is of note that beluga harvest numbers reported here represent a combined harvest by the communities of Mekoryuk and Tununak. No information was available from management agencies regarding harvest of sea otter, polar bear, Steller sea lion, harbor seal, or spotted seal during the 2000-2010 period. Information about subsistence harvest of marine mammals is presented in Table 15.

⁴ Note that Beluga harvest numbers reported here represent a combined harvest total for the communities of Mekoryuk and Tununak.

Additional Information⁷¹³

The Alaska Department of Fish and Game compiled the following history of the extinction and reintroduction of muskoxen to Alaska. Nunivak Island plays an important role in their reintroduction:

“The return of muskoxen to Alaska is an important success story in wildlife conservation. The original Alaska muskoxen disappeared in the mid-or late 1800s as they had much earlier in Europe and Asia. Overhunting likely contributed to their demise, at least in some areas. By the 1920s, muskox distribution was reduced to arctic Canada and East Greenland where a high take by whalers, hide hunters, and Natives continued. Concern over the impending extinction of the species worldwide led to a move to restore a protected population to Alaska. In 1930, 34 muskoxen captured in East Greenland were brought to Fairbanks. In 1935 and 1936, all survivors and their calves were transported from Fairbanks to Nunivak Island and released. Muskoxen thrived on Nunivak Island and increased from 31 in 1936 to an estimated 750 by 1968.

Muskoxen from Nunivak Island were intended to provide stock for relocating animals to formerly occupied ranges. Nunivak Island muskoxen have been transplanted to the Arctic National Wildlife Refuge, Cape Thompson, the Seward Peninsula, Nelson Island, and to Wrangel Island and the Taimyr Peninsula in Russia. Additional animals have been donated to zoos and other institutions.

Most of the transplanted animals quickly adapted to their new surroundings and increased. Further transplants may be considered in the future. However, dispersal from previously translocated herds will be the primary method by which future range expansion occurs.

By 2000, the muskox population in Alaska had grown to approximately 3,800: 650 on Nunivak Island, 250 on Nelson Island, 550 in north-central and northeastern Alaska, 450 in northwestern Alaska, 1,800 on the Seward Peninsula, 100 on the Yukon-Kuskokwim Delta, and an additional 105 animals in captivity in domestic herds, research herds, and the Alaska Zoo in Anchorage. The Nunivak Island and Nelson Island populations have been stabilized by hunting. Between 2000 and 2006, the population in northcentral and northeastern Alaska declined to about 200 muskoxen. Causes of the decline are currently under investigation. The other wild populations are expected to continue to increase and to expand their range.

Hunting of muskoxen under a limited permit system is conducted on Nunivak Island and Nelson Island. Muskoxen are considered a unique and valuable trophy. Muskox meat is highly valued among those who have tried it. This hardy survivor of the ice ages is an important attraction to tourists, photographers, researchers, and students of wildlife.

The soft brownish wool-like underhair, or “qiviut,” has been called the rarest fiber in the world. A domestic muskox herd at Palmer is farmed exclusively for the production of qiviut, but Eskimos on Nunivak Island collect the naturally shed wool clinging to bushes and tundra plants, and spin it by hand.”

⁷¹³ See footnote 661.

Napakiak (nuh-PAH-key-ack)

People and Place

Location

Napakiak is located at the mouth of the Kuskokwim River, 9 miles southwest of Bethel.⁷¹⁴ It is on an island between the Kuskokwim River and Johnson's Slough. The City encompasses 4.7 square miles of land and 0.3 square miles of water. Napakiak is in the Bethel Census Area and the Bethel Recording District.⁷¹⁵

*Demographic Profile*⁷¹⁶

In 2010, there were 354 inhabitants in Napakiak, making it the 148th largest of 352 total Alaskan communities with recorded populations that year. The town first appeared in U.S. Census records in 1900. Between 1990 and 2010, the population of Napakiak remained relatively stable, with an overall increase of 11.3%. According to Alaska Department of Labor population estimates, the population of permanent residents decreased by 4.5% between 2000 and 2009, with an average annual growth rate of -0.68%. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that Napakiak's population remains constant throughout the year, and is not at all driven by employment in fishing sectors. They also reported that Napakiak does not see seasonal workers.

In 2010, a majority of Napakiak residents identified themselves as American Indian and Alaska Native (97.2%), along with 2.8% that identified themselves as White. Both of these groups made up a greater percentage of the population in 2010 than in 2000, when 96% of residents identified themselves as American Indian and Alaska Native, 1.4% identified as White, and several other ethnicities were also represented in Napakiak, including 1.7% of the population that identified as Black or African American and 0.8% identifying with more than one race (0.8%). In 2000, 0.3% of the population also identified as Hispanic. These groups no longer appeared to be present in Napakiak in 2010. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Napakiak was 3.69, a slight decrease from 3.9 persons per household in 1990 and 3.92 in 2000. The total number of households in Napakiak increased steadily over time, from 81 in 1990 to 90 in 2000, and 96 occupied housing units by 2010. Of the 114 housing units surveyed for the 2010 Decennial Census, 68.4% were owner-occupied, 15.8% were renter-occupied, and 15.8% of all housing units were vacant or used only

seasonally. Between 1990 and 2010, no residents of Napakiak were reported to be living in group quarters.

In 2010, the gender makeup of Napakiak’s population (54% male and 46% female) was more weighted toward males than the population of the state as a whole, which was 52% male and 48% female. The median age of Napakiak residents was 24.6 years, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the age group most heavily skewed toward males was 20 to 29 years, while there was a relatively even spread of males and females across other age categories in Napakiak. In 2010, 11.8% of Napakiak’s population was age 60 or older. The overall population structure of Napakiak in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Napakiak Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁷¹⁷ 58.2% of Napakiak residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 24.9% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 16.9% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 24.3% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 4.2% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 3.7% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 2.1% were

⁷¹⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Yup'ik Eskimos have inhabited the Yukon-Kuskokwim area for thousands of years. Historically, the Yup'ik people were very mobile, traveling with the migration of game, fish and plants. The ancient settlements and seasonal camps contained small populations, with numerous settlements throughout the region consisting of extended families or small groups of families.⁷¹⁸ The first European report of the village of Napakiak was in 1878 by an employee of the U.S. Coast and Geodetic Survey named E.W. Nelson, although at that time the village was located downriver at the mouth of the Johnson River. The Moravian Church constructed a chapel in Napakiak in the 1920s.⁷¹⁹ In 1939, a Bureau of Indian Affairs school began operating in Napakiak. In 1946 the first store was opened. The National Guard Armory was built in 1960, and the following year the first post office was established.⁷²⁰ Napakiak was incorporated as a 2nd Class City in 1970. In 1973, the first airstrip was constructed, enabling year-round access to the community. Today, Napakiak remains a predominantly Yup'ik village with a strong sense of Native identity. Subsistence practices remain foundational to the local economy and culture.⁷²¹ The sale, importation, and possession of alcohol are banned in the community.⁷²²

Natural Resources and Environment

Napakiak is influenced by storms in the Bering Sea and also by inland continental weather. Average annual precipitation is 16 inches, with 50 inches of snowfall. Summer high temperatures average 59 to 62 °F, and winter highs average 11 to 19 °F. Extremes from 86 to -46 °F have been recorded. The Kuskokwim River is typically ice-free from June through October.⁷²³ Erosion from the Kuskokwim River has forced a number of buildings to be relocated and currently threatens the school and additional buildings in the community. Each year riverbank erosion claims approximately 70 ft of land.⁷²⁴

Napakiak is located within the boundaries of the Yukon Delta National Wildlife Refuge (NWR). The NWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” Most of the NWR is a vast, flat wetland/tundra complex dotted by countless ponds, lakes, and meandering rivers.

⁷¹⁸ Alaska Native Heritage Center. 2008. *Yup'ik & Cup'ik - Who We Are*. Retrieved December 8, 2011 from http://www.alaskanative.net/en/main_nav/education/culture_alaska/yupik/.

⁷²³ See footnote 719.

⁷²⁴ See footnote 720.

Approximately half of the NWR is covered by water. Many streams and sloughs are former tributaries of the two major rivers. Some forest habitat is present along rivers and in the Kilbuck Mountains, located in the southeastern part of the NWR, directly east of Napakiak. Moose, caribou, brown bear, and black bear can be found in this mountain range, which rises to between 2,000 and 4,000 ft in elevation.⁷²⁵

Both the Togiak NWR and Wood-Tikchik State Park are located less than 100 miles southeast of Napakiak. Togiak NWR covers 4.7 million acres, of which the northern 2.3 million acres are designated as the Togiak Wilderness Area. Like the Yukon Delta NWR, the Togiak NWR protects the habitat of a wide array of birds, fish, and mammals. East of Togiak NWR, Wood-Tikchik is the largest State Park in the country. The State Park includes a diversity of terrain and ecosystems. The Wood River and Tikchik systems host all five species of Pacific salmon, along with rainbow trout, grayling, lake trout, Arctic char, Dolly Varden char, and northern pike. Tikchik Lake is an important site for whitefish subsistence harvest. Moose, caribou, and brown bear are common in the State Park, along with black bear in a limited area. Small game present in the area includes beaver, muskrat, otter, fox, wolverine, mink, and porcupine. Ground squirrels and marmots are abundant, along with a variety of resident and migratory waterfowl and land birds.⁷²⁶

According to a local hazard mitigation plan conducted by the City of Bethel in 2008, the Napakiak area is at high risk of floods, severe weather, and erosion. The threat of earthquakes is also noted. The plan addresses the role of climate change in exacerbating threats from flooding and erosion. Warming temperatures have led to thawing permafrost. This has caused severe subsidence, which constrains development of resources, transportation and utility systems, and community expansion. In addition, delayed formation of protective shore ice along the coast leaves shorelines more vulnerable to fall storms and storm surges, resulting in increased flooding and erosion.⁷²⁷

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Napakiak as of May 2012.⁷²⁸

Current Economy

Subsistence harvest activities are central to the Napakiak economy. Subsistence foods provide an estimated 50% of the local diet. Most families have fish camps. Salmon, waterfowl, moose, bear, and seals are among the most important resources.⁷²⁹ As of 2010, wage employment opportunities in Napakiak were provided by local government offices, the school district, local and regional Native corporations and non-profit organizations, the Yukon-Kuskokwim Health Corporation, Coastal Villages Seafoods (see the *Processing Plants* section of

this profile), and several local businesses.⁷³⁰ Seasonal commercial fishing, construction projects, trapping, and crafts also provide income.⁷³¹ In 2010, 45 residents (equivalent to 12.7% of the local population) held commercial fishing permits, primarily for herring roe and salmon gill net fisheries.

Based on household surveys conducted for the 2006-2010 ACS,⁷³² in 2010, the per capita income in Napakiak was estimated to be \$11,023 and the median household income was estimated to be \$37,250. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$7,319 and \$28,750, respectively). The increase in per capita income remains even if inflation is taken into account by converting the 2000 values to 2010 dollars,⁷³³ showing a real 2000 per capita income of \$9,624. However, the real 2000 median household income of \$37,806 suggests that household income has remained stable over the period. In 2010, Napakiak ranked 255th of 305 Alaskan communities with per capita income data that year, and 205th in median household income, out of 299 Alaskan communities with household income data.

However, Napakiak's small population size may have prevented the ACS from accurately portraying economic conditions.⁷³⁴ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Napakiak in 2010 is \$5,593.⁷³⁵ This estimate is lower than the 2000 per capita income reported in by the U.S. Census, suggesting that caution is warranted when citing an increase in per capita income in Napakiak between 2000 and 2010. The lower per capita income estimate derived from the ALARI database is reflected in the fact that the community was recognized as "distressed" by the Denali Commission in 2011,⁷³⁶ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a smaller percentage of Napakiak residents was estimated to be in the civilian labor force (52.1%) compared to the percentage of Alaskans in the civilian labor force statewide (68.8%). That year, 34.1% of Napakiak residents were estimated to be living below the poverty line, compared to a 9.5% of Alaska residents overall, and the

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁷³³ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁷³⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁷³⁵ See footnotes 730 and 732.

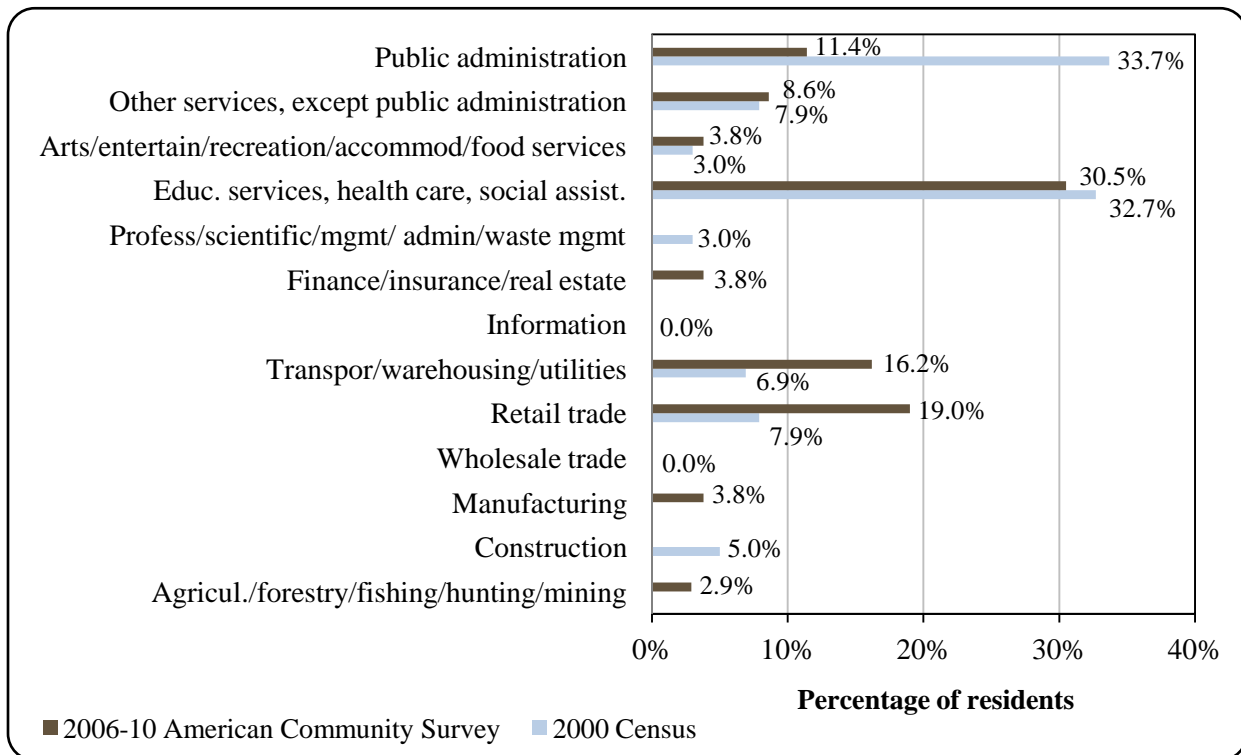

⁷³⁶ Denali Commission (2011). *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

unemployment rate was estimated to be 15.4%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in Napakiak in 2010 was 28.5%, compared to a statewide unemployment rate estimate of 11.5%.⁷³⁷

Also based on the 2006-2010 ACS, a majority of workers were estimated to be employed in the public sector (58.1%), along with 39% estimated to be employed in the private sector and 2.9% self-employed. Of the 105 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in the following industries: educational services, health care, and social assistance (30.5%), retail trade (19%), and transportation, warehousing, and utilities (16.2%). Occupations in which the greatest percentages of the workforce were employed were management/professional (30.5%), sales/office (24.8%), and service occupations (23.8%). Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

It is important to note that the number of individuals employed by fishing is probably underestimated in census statistics, as fishermen may hold another job and characterize their employment accordingly. In 2010, none of the civilian labor force was estimated to be working in agriculture, forestry, fishing, hunting, and mining in 2010, and 13.3% of the workforce was estimated to be employed in natural resource/construction/maintenance occupations. A breakdown of this occupational category reveals that this 13.3% was employed in construction and extraction or installation and repair occupations, while 0% of the workforce was employed in farming, fishing, and forestry occupations.

Figure 3. Local Employment by Industry in 2000-2010, Napakiak (U.S. Census).

⁷³⁷ See footnote 730.

Figure 4. Local Employment by Occupation in 2000-2010, Napakiak (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 122 employed residents in Napakiak in 2010, of which 54.7% were employed in local government, 20.1% in trade, transportation, and utilities, 6.3% in financial activities, 6.3% in education and health services, 3.8% in manufacturing, 2.5% in state government, 1.9% in construction, 1.3% in natural resources and mining, and 3.1% in other industries.⁷³⁸ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Governance

Napakiak was incorporated as a 2nd Class City in 1970, and is not located in an organized borough. The City has a Strong Mayor form of government, including a seven-person city council, including the mayor, a nine-person advisory school board, and several municipal employees. The City administers a 4% sales tax.⁷³⁹ In addition to sales tax revenues, other locally-generated revenue sources in Napakiak included water and sewer and “washeteria”/sauna⁷⁴⁰ service fees, bingo and pull tab receipts, and building and equipment rentals. Outside revenue sources included various state and federal revenue sharing programs and grants in some years, including federal salmon disaster funds received through the Magnuson Stevens Act in 2000, 2001, and 2002. The City received approximately \$25,000 per year in contributions from the State Revenue Sharing program from 2000 to 2003, and over \$100,000 per year from the Community Revenue Sharing program in 2009 and 2010. Additional revenue sharing funds were received during the 2000-2010 period from the state Safe Communities program and the federal Payment in Lieu of Taxes program.

Annual revenues reported in Certified Financial Statements were generally between \$300,000 and \$600,000 during the 2000-2010 period. The relatively high municipal revenue total reported in 2000 can partly be explained by over \$100,000 in federal salmon disaster funds received by Napakiak under the Magnuson Stevens Act. Smaller amounts of Magnuson Stevens funds were also granted in 2001 and 2002. The spike in municipal revenue in 2003 to over \$6

⁷³⁸ Ibid.

⁷⁴⁰ “Washeteria” is another word for laundromat. In Alaska, washeterias often include shower facilities.

million can be explained by a \$5.5-million-dollar grant from the State of Alaska’s Village Safe Water program that year. Information about selected municipal revenue sources in Napakiak is presented in Table 2.

Napakiak was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Native Village of Napakiak. The Native village corporation is the Napakiak Corporation, which manages 115,200 acres of land.⁷⁴¹ Napakiak belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.⁷⁴²

Napakiak is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”⁷⁴³ The AVCP is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.⁷⁴⁴ AVCP is made up of 56 villages and 45 village corporations.⁷⁴⁵

The closest office of the Alaska Department of Fish and Game (ADF&G) to the community is located in Bethel. A National Marine Fisheries Service (NMFS) field office is located in Bethel and a main office is located in Anchorage. The nearest offices of the Alaska Department of Natural Resources, the Alaska Department of Commerce, Community, and Economic Development, and the Bureau of Citizenship and Immigration Services are located in Anchorage.

Infrastructure

Connectivity and Transportation

Access to Napakiak is primarily by air. The state owns and operates a 3,269-ft by 60-ft lighted gravel runway in the community.⁷⁴⁶ As of April 2012, roundtrip airfare between Bethel and Napakiak with Yute Air was \$162,⁷⁴⁷ and the approximate cost of roundtrip airfare from Bethel to Anchorage in early June 2012 was \$368.⁷⁴⁸ In addition, seaplane landing areas are located on the Kuskokwim River and Johnson Slough. The Kuskokwim River is used as a transportation thoroughfare throughout the year. In summer months, the River provides water access to the community. There are no docking facilities, but barges deliver cargo from Bethel during the summer months,⁷⁴⁹ and a hovercraft is used year-round to bring cargo and mail to Napakiak.⁷⁵⁰ In winter months the River is used as an ice road for travel to surrounding villages.⁷⁵¹ In addition to the ice road, a 9-mile winter trail is marked overland between Napakiak and Bethel.⁷⁵²

Facilities

Water in Napakiak is derived from a well and is chlorinated and filtered. The community does not have a piped water system. The City operates a central hauling point for water distribution as well as a water truck for delivery. The school has its own well. The City also operates the sewer system. As of 2010, 54 households used a flush/haul system, including plumbing for sinks and low-flush toilets. Other households use “honeybuckets”.⁷⁵³ A sewage lagoon is used for sewage treatment. The City operates a landfill and provides refuse collection services. Electricity is transmitted by overhead lines from Bethel Utilities and purchased and distributed locally by Ircinraq Power Company.⁷⁵⁴ In 2006, Napakiak was awarded \$3,000,000 from the U.S. Department of Agriculture to upgrade these power lines from a single to a triple line system. A back-up generator is also present in Napakiak in the event of a blackout in Bethel.⁷⁵⁵ Napakiak is also equipped with a back-up generator in case of emergencies or a blackout in Bethel.⁷⁵⁶ Public safety services are provided by two VPSOs (Village Public Safety Officers)⁷⁵⁷ and four Tribal Public Officers.⁷⁵⁸ The nearest state trooper post is located in Bethel.⁷⁵⁹

Community buildings include a fire station used by the Volunteer Fire Department and a city Public Safety Building which hosts office space for the Tribal Court, social services, and houses a public safety jail with four cells.⁷⁶⁰ The Village Council is in the process of constructing a community hall. Currently a school gymnasium and library are available. The City operates a washeteria.⁷⁶¹ According to a survey conducted by the AFSC in 2011, community leaders reported that Napakiak also has a U.S. post office and telephone service, and that broadband internet access, road improvements, and a new landfill are in progress.

With regard to fishing-related infrastructure, no docking facilities are available in Napakiak.⁷⁶² In the 2011 AFSC survey, community leaders reported that fuel is available for sale in the community, but no other fishing related businesses or services are located in Napakiak. They noted that a barge landing area will be completed in the next 10 years.

Medical Services

A local health clinic is owned by the City and operated in conjunction with the Yukon-Kuskokwim Health Corporation. The Napakiak Health Clinic is a Community Health Aide Program site. Emergency Services have river and air access. Emergency service is provided by a health aide.⁷⁶³ The nearest hospital is located in Bethel.

⁷⁵³ A “honeybucket” is an indoor bucket used as a toilet in houses without plumbing.

Educational Opportunities

There is one school in the community, which offers Kindergarten through 12th grade instruction. As of 2011, the William N. Miller School had a total of 110 students and 7 teachers.⁷⁶⁴ The school building received renovations in 2009. River erosion threatens to damage the school building in the near future. The school owns seven storage buildings and seven teacher housing units.⁷⁶⁵

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Napakiak area for thousands of years.^{766,767} Subsistence salmon harvest continues to be a primary economic activity along the Kuskokwim River. In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.⁷⁶⁸

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s, commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels, and salmon prices decreased.⁷⁶⁹ A fishery disaster was declared in 2012, following severe declines in Chinook salmon returns on the Kuskokwim River, as well as to the Yukon River and Cook Inlet river systems. That year, commercial and subsistence fisheries on the Kuskokwim River were substantially restricted to meet Chinook conservation goals. ADF&G, the Alaska Board of Fisheries, and constituents are working together to develop a conservation plan that restricts Chinook harvest while allowing for greater harvest of more abundant species, including gear and other management restrictions.⁷⁷⁰

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s.⁷⁷¹ Between 2000 and 2010, Napakiak residents held permits in the Goodnews Bay roe and food/bait herring fishery and the Bristol Bay spawn on kelp, hand pick herring fishery. (For more information see the *Commercial Fisheries* section of this profile.) The largest aggregation of herring in Alaska spawns along the northern shore of Bristol Bay, near the village of Togiak. Spawning herring are harvested using purse seines and gill nets in the Togiak sac roe fishery. A spawn-on-kelp harvest is also taken, primarily by local residents. Along the Yukon/Kuskokwim coast there are six commercial gill net sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁷⁷²

Napakiak is located in the Lower Kuskokwim salmon fishing district (District 1). The closest marine area to Napakiak, Kuskokwim Bay, is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Napakiak is a member of the Coastal Villages Region Fund (CVRF), a Community Development Quota (CDQ) group that promotes employment opportunities for residents as well as participation in the Bering Sea crab and groundfish fisheries.⁷⁷³ Napakiak is not eligible to participate in the Community Quota Entity (CQE) program. According to a survey conducted by the AFSC in 2011, community leaders reported that Napakiak is not directly involved in fisheries management processes in Alaska.

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Napakiak. In Napakiak's 2010 Community Plan, one of the current economic objectives is to explore the possibility of opening a fish processing plant in the community with the assistance of the CVRF board.⁷⁷⁴

The 2010 Intent to Operate list does list *a small processing facility in nearby Bethel. The plant, run by Kuskokwim Seafoods LLC*, was started in 2010 to provide a market to local salmon fishers to help them sell their catch closer to home. Kuskokwim Seafoods processes four salmon species: Chinook, sockeye, chum, and coho.⁷⁷⁵ As of 2012, Coastal Village Seafoods, a subsidiary of CVRF, also operated a fish-buying operation along the Kuskokwim, with a tender often located upriver at Napaskiak.⁷⁷⁶

Fisheries-Related Revenue

According to information provided in annual municipal budgets between 2000 and 2010, the primary sources of fisheries-related revenue in Napakiak were a raw fish tax and the Shared

⁷⁷¹ See footnote 768.

⁷⁷⁶ Personal communication, Nick Souza, Coastal Village Seafoods, April 27, 2012.

Fisheries Business Tax. In 2010, Napakiak received \$0 in raw fish tax and \$99 from the Shared Fisheries Business Tax. In addition, \$111 was earned in 2010 from the Shared Fisheries Business Tax, the only year in which revenue was reported from this revenue source (Table 3).⁷⁷⁷

It is also important to note that CVRF uses fisheries revenue from their CDQ revenue to provide grants, scholarships and training, and other financial assistance to fishermen and residents of member villages.⁷⁷⁸ However, in a survey conducted by the AFSC in 2011, community leaders reported that Napakiak did not receive funding or grants from CVRF in 2010.

Commercial Fishing

Between 2000 and 2010, Napakiak residents participated in commercial fisheries as crew members, vessel owners, and permit holders. In 2010, there were 45 Napakiak residents holding a total of 52 Commercial Fisheries Entry Commission (CFEC) permits, including 39 salmon permits in the Kuskokwim gill net fishery, and 13 herring permits in the Goodnews Bay roe and food/bait fishery and the Bristol Bay spawn on kelp, hand pick fishery. These permit numbers were stable between 2000 and 2010, although the percentage of permits that was actively fished varied considerably over the period. Three out of 10 herring permits (30%) were fished in 2000, but between 2001 and 2010, none were actively fished. After 2000, when 80% of salmon permits were actively fished, the number fell to five permits fished (14%) in 2002. By 2005 the number of salmon permits actively fished rebounded to greater than 50% and stayed consistent through the remainder of the 2000-2010 period. It is important to note that, between 2001 and 2003, one halibut permit (vessel under 60 ft, statewide) was also held by a Napakiak resident. However, the halibut permit was not fished in any of these 3 years. Between 2000 and 2010, no Napakiak residents held either Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP). Information about permits held by Napakiak residents is presented in Table 4. Likewise, no Napakiak residents held quota share accounts or quota shares in federal halibut, sablefish, or crab catch share fisheries between 2000 and 2010 (Tables 6 through 8).

In 2010, a total of 31 Napakiak residents held commercial crew licenses and 6 fishing vessels were primarily owned by Napakiak residents. This represents a substantial decline in vessel ownership from 2000, when 21 vessels were primarily owned by Napakiak residents. The number of crew license holders fluctuated during the decade, beginning with 47 in 2000, falling to between 1 and 5 in 2002-2004, and climbing again to 31 in 2010. The number of vessels homeported in Napakiak followed a similar pattern to vessel ownership, with 22 homeported in Napakiak in 2000, and only 7 in 2010 (Table 5). According to a survey conducted by the AFSC in 2011, community leaders indicated that the only vessels using Napakiak as a base of operations during the fishing season were gill net boats under 35 ft in length.

No landings or ex-vessel revenue were recorded in Napakiak between 2000 and 2010 (Table 9), given the lack of fish buyers in the community during this period (Table 5). Information about landings and ex-vessel revenue generated by vessels owned by Napakiak residents is largely considered confidential between 2000 and 2010 due to the small number of participants, with the exception of salmon harvest data in 2000, 2001, and 2009 (Table 10). In the first 2 years, Napakiak vessel owners landed over 57,000 net lb of salmon per year. In 2000,

⁷⁷⁷ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

⁷⁷⁸ Coastal Villages Region Fund website. (n.d.). *Home page*. Retrieved December 12, 2011 from <http://www.coastalvillages.org/>.

the ex-vessel value of the catch was \$31,107, while it was only valued at \$20,904 in 2001, reflecting lower prices and possibly a different species makeup of the catch. Salmon landings were much lower in 2009, with a harvest of 15,311 net lb and an ex-vessel value of \$6,807. This lower catch reflects the fewer total vessels owned by Napakiak residents in 2009 (7) compared to 21 vessels owned in 2000 and 2001.

Recreational Fishing

According to a survey conducted by the AFSC in 2011, community leaders indicated that very little sportfishing takes place in Napakiak. No active sport fish guide businesses were present in Napakiak between 2000 and 2010, and no licensed sport fish guides resided in the community. However, residents of Napakiak did participate in sportfishing. Between 2000 and 2010, the number of Napakiak residents that purchased sportfishing licenses varied between 13 and 74 per year. Sportfishing licenses were not sold in the City of Napakiak. According to the 2011 AFSC survey, community leaders noted that no gear or tackle stores were present in the community, so residents need to travel to other cities in the region to purchase both sportfishing gear and licenses. The Alaska Statewide Harvest Survey,⁷⁷⁹ conducted by ADF&G between 2000 and 2010, noted the following species as targeted by private anglers in Napakiak: Dolly Varden char, northern pike, and whitefish. No kept/release log book data were reported for fishing charters out of Napakiak between 2000 and 2010.⁷⁸⁰

Napakiak is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between 0 and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Napakiak is displayed in Table 11.

Subsistence Fishing

Almost all families in Napakiak engage in subsistence and hunting activities in combination with employment in commercial fishing and at the local school and government offices. Subsistence foods provide an estimated 50% of the local diet.⁷⁸¹ In a survey conducted by the AFSC in 2011, Napakiak community leaders indicated that Chinook, sockeye, and chum salmon are some of the most important subsistence resources utilized by local residents.

No information is available from ADF&G regarding the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010, or about per capita subsistence harvest (Table 12). However, data are available through 2008 regarding subsistence salmon permits. Between 2000 and 2008, the number of Napakiak households issued subsistence salmon permits varied from 75 to 97 per year. Chinook, chum, and sockeye salmon were the most heavily harvested species over time, with the top harvested species varying from year to year. There were also a large number of coho salmon harvested, with increasing harvest in the second half of the decade. Some pink salmon were also harvested. No information was reported regarding subsistence harvest of marine invertebrates and non-salmon fish (not

⁷⁸¹ Alaska Dept. of Comm. and Rural Affairs (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

including halibut). Information about subsistence salmon permits, marine invertebrates, and non-salmon fish is presented in Table 13.

Between 2003 and 2007, several Napakiak residents participated in the Subsistence Halibut Registration Certificates (SHARC) program. Three residents were issued SHARC cards each year between 2003 and 2006, and two residents were issued cards in 2007. However, no information was reported about the number of SHARC cards that were returned or the total lb of subsistence halibut harvested by Napakiak residents during these years. This information about the subsistence halibut fishery is presented in Table 14. No information is available from management agencies about subsistence harvest of marine mammals by Napakiak residents between 2000 and 2010 (Table 15).

Napaskiak (nuh-PASS-key-ack)

People and Place

*Location*⁷⁸²

Napaskiak is located along Napaskiak Slough, on the east bank of the Kuskokwim River, seven miles south of Bethel. The City encompasses 3.5 square miles of land and 0.4 square miles of water. Napaskiak is located in the Bethel Census Area and Bethel Recording District.

*Demographic Profile*⁷⁸³

In 2010, there were 405 inhabitants in Napaskiak, making it the 137th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population of Napaskiak has increased by 23.5%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 9.7%, with an average annual growth rate of 0.89%. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that approximately 30 seasonal workers are present in Napaskiak between April and October, and the population reaches its annual peak in August. They also indicated that this population peak is not at all driven by employment in fishing sectors.

In 2010, a majority of Napaskiak residents identified themselves as American Indian and Alaska Native (96.5%), and 3.0% identified as White. Compared to 2000, individuals identifying as American Indians and Alaska Natives made up 1% less of the population in 2010, while those identifying as White made up 1.5% more of the population. In 2000, there were several other ethnicities represented in Napaskiak, including individuals identifying as Asian (0.3%) and with two or more races (0.8%). In addition, in 2000, 0.3% of the population identified as Hispanic. These additional ethnic groups no longer appeared to be present in Napaskiak in 2010. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Napaskiak was 4.31, similar to the 1990 household size of 4.4 persons per household, but a decline from 4.76 persons per household in 2000. The number of households in Napaskiak increased over time, with 74 in 1990, 82 in 2000, and 94 occupied housing units in 2010. Of the 135 housing units surveyed for the 2010 U.S. Census, 55.5% were owner-occupied, 14.1% were rented, and 30.4% were vacant or used only seasonally. Between 1990 and 2010, no residents of Napaskiak lived in group quarters.

Figure 1. Racial and Ethnic Composition, Napaskiak: 2000-2010 (U.S. Census).

In 2010, the gender makeup of Napaskiak’s population (51.5% male and 48.6% female) was more gender balanced than the state population as a whole, which was 52% male and 48% female. The median age of Napaskiak residents was 22.6 years, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 9.5% of Napaskiak’s population was age 60 or older. The overall population structure of Napaskiak in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Napaskiak Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁷⁸⁴ 64.8% of Napaskiak residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 22.8% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 12.3% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 9.9% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 5.6% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 1.9% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 4.9% were

⁷⁸⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Yup'ik Eskimos have inhabited the Kuskokwim area for thousands of years. Historically, Yup'ik people were very mobile, traveling with the migration of game, fish and plants. Ancient settlements and seasonal camps contained small populations, with numerous settlements throughout the region consisting of extended families or small groups of families.⁷⁸⁵ Today, subsistence practices remain important to the way of life in Napaskiak.⁷⁸⁶

The site of Napaskiak was traditionally used as a fish camp by residents of the winter village of Oovingiyuk, located a mile upstream on the same side of the river. Napaskiak was chosen as a camp because a sandbar was present in front of the village that facilitated dip net harvest of smelt. When the course of the river began to erode the area of Oovingiyuk, residents moved permanently to Napaskiak. Residents of Eekchuk, another village one mile downstream, also relocated to Napaskiak at that time.⁷⁸⁷

The village of Napaskiak was first reported by the U.S. Coast & Geodetic Survey in 1867. The 1880 U.S. Census reported a population of 196.⁷⁸⁸ Moravian missionaries established a mission in nearby Bethel in 1885 and began spending time in Napaskiak. They intended to build a mission school in the village, but the plans did not materialize. Napaskiak residents were noted as being unreceptive to mission workers when they were stationed in the village in the late 1890s. The people of Napaskiak built a Russian Orthodox church in 1931, and the Bureau of Indian Affairs opened a school in the village in 1939.⁷⁸⁹ The City was incorporated in 1971.⁷⁹⁰ The sale and importation of alcohol are banned in the community.⁷⁹¹

Natural Resources and Environment

Napaskiak is strongly influenced by storms and patterns in the Bering Sea and also by inland continental weather. Average annual precipitation is 16 inches, with 50 inches of snowfall. Summer temperatures range from 42 to 62 °F, and winter temperatures average -2 to 19 °F. The Kuskokwim River is typically ice-free from June through October.⁷⁹²

Napaskiak is located within the boundaries of the Yukon Delta National Wildlife Refuge (NWR). The Yukon Delta NWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for

⁷⁹² See footnote 786.

continued subsistence uses; and to ensure water quality and necessary water quantity.” Most of the Yukon Delta NWR is a vast, flat wetland/tundra complex dotted by countless ponds, lakes, and meandering rivers. Approximately half of the NWR is covered by water. Many streams and sloughs are former tributaries of the two major rivers. Some forest habitat is present along rivers and in the Kilbuck Mountains, located in the southeastern part of the Yukon Delta NWR, directly east of Napaskiak. Moose, caribou, brown bear, and black bear can be found in this mountain range, which rises to between 2,000 and 4,000 ft in elevation.⁷⁹³

Togiak NWR and Wood-Tikchik State Park are both located less than 100 miles southeast of Napaskiak. Togiak NWR covers 4.7 million acres, of which the northern 2.3 million acres are designated as Togiak Wilderness Area. Like the Yukon Delta NWR, Togiak NWR protects the habitat of a wide array of birds, fish, and mammals. East of Togiak NWR, Wood-Tikchik is the largest State Park in the country. The State Park includes a diversity of terrain and ecosystems. The Wood River and Tikchik systems host all five species of Pacific salmon, along with rainbow trout, Arctic grayling, lake trout, Arctic char, Dolly Varden char, and northern pike. Tikchik Lake is an important site for whitefish subsistence harvest. Moose, caribou, and brown bear are common in the State Park, along with black bear in limited area. Small game present in the area includes beaver, muskrat, otter, fox, wolverine, mink, and porcupine. Ground squirrels and marmots are abundant, along with a variety of resident and migratory waterfowl and land birds.⁷⁹⁴

According to a local hazard mitigation plan conducted by the City of Bethel in 2008, the Napaskiak area is at high risk of floods, severe weather, and erosion. The threat of earthquakes is also noted. The plan addresses the role of climate change in exacerbating threats from flooding and erosion. Warming temperatures have led to thawing permafrost. This has caused severe subsidence, which constrains development of resources, transportation and utility systems, and community expansion. In addition, delayed formation of protective shore ice along the coast leaves shorelines more vulnerable to fall storms and storm surges, resulting in increased flooding and erosion.⁷⁹⁵

According to the Alaska Department of Environmental Conservation (DEC), there are no notable active environmental cleanup sites located in Napaskiak as of May 2012.⁷⁹⁶

Current Economy⁷⁹⁷

The economy of Napaskiak is largely based on traditional subsistence harvest practices.⁷⁹⁸ According to a survey conducted by the AFSC in 2011, community leaders reported that the community also depends on commercial fishing. In 2000, the number of Napaskiak residents holding state Commercial Fisheries Entry Commission (CFEC) permits was equivalent

to 11.5% of the total local population, declining to 8% by 2010 (see *Commercial Fishing* section). Community leaders reported that the local Chinook salmon fishery takes place between May and July, the chum salmon fishery between June and August, the sockeye salmon fishery between June and September, and the coho salmon fishery between August and September. They also indicated that recreational fishing is not an important sector in Napaskiak.

In addition to fishing, top employers in Napaskiak in 2010 included the school district, local city and tribal government offices, local and regional Native corporations and non-profit organizations, the Yukon Kuskokwim Health Corporation, the Kuskokwim-area Community Development Quota (CDQ) group (see *History and Evolution of Fisheries* section), the DEC's Village Safe Water program, and the Rural Alaska Community Action Program (RurAL CAP).⁷⁹⁹

Based on household surveys conducted for the 2006-2010 ACS,⁸⁰⁰ in 2010, the per capita income in Napaskiak was estimated to be \$15,263 and the median household income was estimated to be \$57,917. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$8,162 and \$31,806, respectively). This is true even when accounting for inflation by converting the 2000 values to 2010 dollars,⁸⁰¹ revealing the real per capita income in 2000 to be \$10,733 and the real median household income to be \$41,824. In 2010, Napaskiak ranked 202nd of 305 Alaskan communities with per capita income data that year, and 84th in median household income, out of 299 Alaskan communities with household income data.

However, Napaskiak's small population size may have prevented the ACS from accurately portraying economic conditions.⁸⁰² An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Napaskiak in 2010 is \$8,762.⁸⁰³ This estimate is lower than the 2000 per capita income reported in by the U.S. Census, suggesting that caution is warranted when citing an increase in per capita income in Napaskiak between 2000 and 2010. The lower per capita income estimate derived from the ALARI database is reflected in the fact that the community was recognized as "distressed" by the Denali Commission in 2011,⁸⁰⁴ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based

on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

In 2010, a lower percentage of Napaskiak residents were estimated to be in the civilian labor force (58.6%) than were in the civilian labor force statewide (68.8%). In the same year, 10.8% of local residents were estimated to be living below the poverty line, compared to a 9.5% of Alaska residents, and the unemployment rate was estimated to be 7.7%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in Napaskiak in 2010 was 18.2%, compared to a statewide unemployment rate estimate of 11.5%.⁸⁰⁵

Also based on the 2006-2010 ACS, a majority of workers were estimated to be employed in the public sector (53.1%), and the remaining 46.9% in the private sector. Of the 113 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number were estimated to be working in the following industries: educational services, health care, and social assistance (44.2%), public administration (15.9%), and transportation, warehousing, and utilities (13.3%). Occupations in which the greatest percentages of the workforce were employed were management/professional (35.4%) and sales/office occupations (27.4%). Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

It is important to note that the number of individuals employed by fishing is probably underestimated in census statistics, as fishermen may hold another job and characterize their employment accordingly. In 2010, only 3.5% of the civilian labor force was estimated to be working in farming, fishing, and forestry-related industries and occupations. (Note that a breakdown of the natural resource/construction/maintenance occupation category reveals that 4 workers, or 3.5% of the total civilian labor force, were employed in farming, fishing, and forestry occupations).

Figure 3. Local Employment by Industry in 2000-2010, Napaskiak (U.S. Census).

⁸⁰⁵ See footnote 799.

Figure 4. Local eEmployment by Occupation in 2000-2010, Napaskiak (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 199 employed residents in Napaskiak in 2010, of which 50.8% were employed in local government, 13.1% in education and health services, 12.6% in financial activities, 5% in state government, 4% in trade, transportation, and utilities, 3% in manufacturing, 1% in natural resources and mining, 0.5% in information, 0.5% in leisure and hospitality, and 9.5% in other industries.⁸⁰⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Governance

Napaskiak is a 2nd Class City and is not part of an organized borough. The City was incorporated in 1971 and has a Strong Mayor form of government, which includes a seven-person city council, including the mayor, a nine-person advisory school board, and several municipal employees. As of 2010, the City of Napaskiak did not administer any local taxes.⁸⁰⁷ Local revenue sources during the 2000-2010 period included electric utility service fees, clinic lease payments from the Indian Health Service, and other building rentals. Outside revenue sources included state revenue sharing payments, including approximately \$25,000 per year from the State Revenue Sharing Program in the first part of the decade, and almost \$120,000 per year from the Community Revenue Sharing program in 2009 and 2010. The City also received revenue sharing from the federal Payment In Lieu of Taxes program in most years, as well as from state raw fish tax refund payments (see the *Fisheries-Related Revenue* section of this profile for more information). No state or federal fisheries-related grants were reported to contribute to city revenue between 2000 and 2010. Total municipal revenues were much higher in 2009 and 2010 than in previous years during the decade. According to Certified Financial Statements for these years, this was in primarily due to a jump in total local enterprise revenues. Information about selected aspects of Napaskiak’s municipal revenue is presented in Table 2.

⁸⁰⁶ Ibid.

Napaskiak was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Native Village of Napaskiak. The Native village corporation is Napaskiak, Incorporated, which manages 115,200 acres of land.⁸⁰⁸ Napaskiak belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.⁸⁰⁹

Napaskiak is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”⁸¹⁰ The AVCP is one of the 12

regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.⁸¹¹ AVCP is made up of 56 villages and 45 village corporations.⁸¹²

The closest offices of the Alaska Department of Fish and Game (ADF&G) and the Alaska Department of Commerce, Community, and Economic Development are located in Bethel. A National Marine Fisheries Service (NMFS) field office is located in Bethel and a main office is located in Anchorage. The nearest offices of the Alaska Department of Natural Resources and the U.S. Bureau of Citizenship and Immigration Services are also in Anchorage.

Infrastructure

Connectivity and Transportation

A state-owned 3,000-ft-long by 60-ft-wide gravel airstrip and seaplane landing area west of the village provide charter and general aviation access year-round.⁸¹³ Service from Bethel to Napaskiak is provided daily by Grant Aviation⁸¹⁴ and Yute Air.⁸¹⁵ Ryan Air Service also provides air freight delivery services three days per week.⁸¹⁶ The price of a roundtrip ticket between Bethel and Napaskiak on Grant Aviation or Yute Air as of March, 2012 was approximately \$160.^{817,818} The approximate cost to travel by air roundtrip to Anchorage from Bethel in early June 2012 was \$368.⁸¹⁹ Many residents have fishing boats, and skiffs are used in the summer for subsistence fishing and travel to Bethel and other nearby villages. Snow machines and ATVs are used in winter. Barges deliver goods during the summer months. In winter months the river is used as an ice road for travel to surrounding villages. A winter trail is marked along the River to Bethel.⁸²⁰

Facilities

Napaskiak's water system is operated by the Village Council. Water is derived from a well, filtered, and chlorinated. The school has its own well but needs a new water treatment system. Some households utilize a flush/haul service, while other residents haul treated water from one of two watering points. Occasional water shortages require residents to haul water from ponds or rivers or to collect rainwater. Some homes have tanks with running water for the kitchen, but very few have complete plumbing. The sewer system is also operated by the Village

Council. “Honeybuckets”⁸²¹ are utilized by a majority of residents. Honeybuckets are disposed of by residents in bunkers at various locations. Sewage is then pumped from the bunkers and transported to the sewage lagoon. Some households also use outhouses.⁸²² In a survey conducted by the AFSC in 2011, community leaders reported that work is under way to construct water and sewer pipelines.

The City of Napaskiak operates a landfill and provides refuse collection services. A diesel powerhouse provides electricity, operated by Napaskiak Electric Utility.⁸²³ Public safety services are provided by two VPSOs (Village Public Safety Officers).⁸²⁴ The nearest state trooper post is located in Bethel.⁸²⁵ A volunteer fire department is also present in the community. Facilities also include a holding cell, a city office building, a “washeteria”⁸²⁶ operated by the City, and a library at the school.⁸²⁷ In the 2011 AFSC survey, community leaders noted that Napaskiak has a U.S. post office. Telephone, cable, and broadband internet services are available in the Village.⁸²⁸

With regard to fisheries-related infrastructure, community leaders reported in the AFSC survey in 2011 that 1,000 ft of dock space is available for transient vessels to moor, but no dock space is available for public or permanent vessels. They also noted that boat fuel and tackle are available for sale in Napaskiak. They said that residents travel to Bethel to access fisheries-related businesses and services not available in Napaskiak.

Medical Services

A local health clinic is owned by the City and operated in conjunction with the Yukon-Kuskokwim Health Corporation. The Elena Alexis Memorial Clinic is a Community Health Aide Program site. Emergency Services have river and air access. Emergency service is provided by a health aide.⁸²⁹ The nearest hospital is located in Bethel.

Educational Opportunities

There is one school in the community, which offers preschool through 12th grade instruction. As of 2011, the Z. John Williams Memorial School had a total of 152 student and 11 teachers.⁸³⁰ In addition, RurAL CAP runs a Head Start program in Napaskiak that serves children aged 3 to 5 years.⁸³¹

⁸²¹ A “honeybucket” is an indoor bucket used as a toilet in houses without plumbing.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Napaskiak area for thousands of years.⁸³² Subsistence salmon harvest continues to be a primary economic activity along the Kuskokwim River.⁸³³ In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.⁸³⁴

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels, and salmon prices decreased.⁸³⁵ A fishery disaster was declared in 2012, following severe declines in Chinook salmon returns on the Kuskokwim River, as well as to the Yukon River and Cook Inlet river systems. That year, commercial and subsistence fisheries on the Kuskokwim River were substantially restricted to meet Chinook conservation goals. ADF&G, the Alaska Board of Fisheries, and constituents are working together to develop a conservation plan that restricts Chinook harvest while allowing for greater harvest of more abundant species, including gear and other management restrictions.⁸³⁶

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gill net sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.⁸³⁷ Between 2000 and 2010, Napaskiak residents held permits in the Goodnews Bay and Nelson Island roe and food/bait herring fisheries. (For more information see the *Commercial Fisheries* section of this profile.)

Napaskiak is located in the Lower Kuskokwim salmon fishing district (District 1). The closest marine area to Napaskiak, Kuskokwim Bay, is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Napaskiak is a member of the Coastal Villages Region Fund (CVRF), a CDQ

group that promotes employment opportunities for residents, as well as participation in the Bering Sea crab and groundfish fisheries.⁸³⁸ Napaskiak is not eligible to participate in the Community Quota Entity (CQE) program.

In a survey conducted by the AFSC in 2011, community leaders noted local concern about ineffective salmon bycatch management in ocean fisheries. They also indicated that rising fuel prices present a challenge to the local fishing economy, and local fishermen are negatively impacted by increasing regulation of local fisheries and subsistence closures.

Processing Plants

The 2010 ADF&G Intent to Operate list does not list a registered processing plant in Napaskiak. The 2010 Intent to Operate list does list a small processing facility in nearby Bethel. The plant, run by Kuskokwim Seafoods LLC, was started in 2010 to provide a market to local salmon fishers to help them sell their catch closer to home. Kuskokwim Seafoods processes four salmon species: Chinook, sockeye, chum, and coho.⁸³⁹ As of 2012, Coastal Village Seafoods, a subsidiary of CVRF, also operated a fish-buying operation along the Kuskokwim, with a tender often located at Napaskiak.⁸⁴⁰

Fisheries-Related Revenue

According to information provided in Napaskiak's annual municipal budget between 2000 and 2010, fisheries-related revenue sources in the community included a raw fish tax and Shared Fisheries Business Tax. The City also received funding from the Fisheries Resource Landing tax in one year during the 2000-2010 period. In 2010, Napaskiak received \$107 from the Shared Fisheries Business Tax and \$120 from the Fisheries Resource Landing tax, and no revenue was reported from a raw fish tax. Information about selected fisheries-related revenue sources is presented in Table 3.⁸⁴¹

It is also important to note that CVRF uses fisheries revenue from the CDQ program to provide grants, scholarships and training, and other financial assistance to fishermen and residents of member villages.⁸⁴² In a survey conducted by the AFSC in 2011, community leaders reported that Napaskiak received funding or grants from CVRF in 2010. However, the amount of funding or grants was not reported.

Commercial Fishing

Between 2000 and 2010, Napaskiak residents participated in commercial fisheries as crew members, vessel owners, and permit and quota share account holders. In 2010, there were 36 Napaskiak residents holding a total of 35 Commercial Fisheries Entry Commission (CFEC)

⁸⁴⁰ Personal communication, Nick Souza, Coastal Village Seafoods, April 27, 2012.

⁸⁴¹ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

⁸⁴² Coastal Villages Region Fund website. (n.d.). *Home page*. Retrieved December 12, 2011 from <http://www.coastalvillages.org/>.

permits, including 33 salmon permits and 2 herring permits. That year, 1 salmon permit was held in the Bristol Bay drift gill net fishery, and the remaining 32 were held in the Kuskokwim gill net fishery. One of the 2010 herring permits was held in the Goodnews Bay roe and food/bait gill net fishery, and the other was held in the Nelson Island roe and food/bait gill net fishery. In 2010, 74% of salmon permits and 0% of herring permits were actively fished. It is important to note that one salmon permit was also held from 2000 to 2004 in the statewide power gurdy troll fishery, and was actively fished from 2000 to 2002. Earlier in the 2000-2010 period, Napaskiak residents also held herring permits in the Cape Avinof roe herring fishery (2000-2005). One of seven Cape Avinof herring permits was actively fished in 2000.

In addition to salmon and herring fisheries, several Napaskiak residents also held CFEC halibut permits in some years between 2000 and 2010, with a peak of three halibut permits held in 2005. That year, two of the halibut permits were held in the statewide hand-troll halibut fishery and one was held in the statewide longline vessel under 60 ft fishery. Two out of three halibut permits were actively fished in 2005. No halibut permits were held by Napaskiak residents in 2010 (Table 4).

Salmon CFEC permit numbers were relatively stable between 2000 and 2010, although the number of permits fished declined by over a third between 2000 and the middle of the decade, then rebounded by 2009 and 2010. The number of herring permits held and actively fished declined over the decade. Nine herring permits were held in 2000, declining to two by 2010. One herring permit was actively fished in the year 2000, but no herring permits were fished by Napaskiak residents from 2001 to 2010. Halibut permits were held in 2000 and 2001 and again between 2003 and 2007. There were 4 years between 2000 and 2007 in which at least one halibut permit was actively fished (Table 4).

Between 2000 and 2010, no Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) were held by Napaskiak residents. During the same period, 103 quota shares were consistently held by Napaskiak residents in the federal halibut catch share fishery, although no quota share account holders were reported. No Napaskiak residents held quota share accounts or quota shares in federal sablefish or crab catch share fisheries between 2000 and 2010. Information about state and federal fisheries permits held by Napaskiak residents is presented in Table 4, and information about federal catch share participation is presented in Tables 6 through 8.

In 2010, a total of 22 Napaskiak residents held commercial crew licenses and 3 fishing vessels were primarily owned by Napaskiak residents. The number of crew license holders fluctuated during the decade, with a low of 14 in 2002 and a high of 30 in 2000. The number of vessels owned by Napaskiak residents in 2010 (3) represents a substantial decline from the year 2000, when 13 vessels were owned. The number of vessels homeported in Napaskiak also declined over the period, from eight in 2000 to only one in the middle of the decade, and two between 2007 and 2010. According to a survey conducted by the AFSC in 2011, community leaders indicated that the only vessels using Napaskiak as a base of operations during the fishing season were gill net boats under 35 ft in length. Information about the commercial fishing sector in Napaskiak is presented in Table 5.

No fish buyers or shore-side processors were present in Napaskiak between 2000 and 2010 (Table 5), and no local landings or ex-vessel revenue were recorded during the period (Table 9). Information about landings and ex-vessel revenue generated by vessels owned by Napaskiak residents is considered confidential between 2000 and 2010 due to the small number of participants. This information is presented in Table 10.

Recreational Fishing

According to a survey conducted by the AFSC in 2011, community leaders indicated that very little sportfishing takes place in Napaskiak. No active sport fish guide businesses were present in Napaskiak between 2000 and 2010, and no licensed sport fish guides resided in the community. However, some residents of Napaskiak did participate in sportfishing. Between 2000 and 2010, the number of Napaskiak residents that purchased sportfishing licenses varied between 17 and 93 per year. No sportfishing licenses were sold in the City of Napaskiak. According to the 2011 AFSC survey, community leaders noted that fishing tackle was available for purchase in the community, but licenses and other gear must be purchased elsewhere. The Alaska Statewide Harvest Survey,⁸⁴³ conducted by ADF&G between 2000 and 2010, noted the following species as targeted by private anglers in Napaskiak: coho salmon in freshwater and Pacific halibut in saltwater. Given the lack of charter businesses, no kept/release log book data were reported for fishing charters out of Napaskiak between 2000 and 2010.⁸⁴⁴

Napaskiak is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between 0 and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Napaskiak is displayed in Table 11.

Subsistence Fishing

Almost all families in Napaskiak engage in subsistence and hunting activities in combination with employment in commercial fishing, at the school, and at local businesses.⁸⁴⁵ In a survey conducted by the AFSC in 2011, Napaskiak community leaders said that all five salmon species and seal are some of the most important marine subsistence resources utilized by local residents.

No information is available from ADF&G regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010 (Table 12). However, data are available from 2000 to 2008 regarding subsistence salmon permits. During this period, between 79 and 103 households per year in Napaskiak were issued subsistence salmon permits. Chinook were the most heavily harvested salmon species over time, followed by chum and sockeye, and several dozen pink salmon in some years. No information was reported regarding subsistence harvest of marine invertebrates and non-salmon fish (not including halibut). Information about subsistence salmon permits, marine invertebrates, and non-salmon fish is presented in Table 13.

⁸⁴⁵ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

No information was reported by management agencies regarding participation by Napaskiak residents in the Subsistence Halibut Registration Certificate (SHARC) program (Table 14) or subsistence harvest of marine mammals between 2000 and 2010 (Table 15).

Although very little information was available regarding subsistence activities in Napaskiak in recent decades, a study was conducted in the nearby village of Kwethluk in 1986. The study found that, in addition to salmon, residents harvested the following fish species: whitefish, Dolly Varden char, Arctic grayling, smelt, blackfish, rainbow trout, northern pike, burbot, and sheefish. Kwethluk residents also harvested several marine mammal species, including spotted seal, bearded seal, ringed seal, and walrus. These resources were shared between households and between communities, including Napaskiak. Resources specifically noted as received from Napaskiak residents to Kwethluk included whitefish, bearded seal, walrus, and seal oil, while cranberries and brown bear were gifted from Kwethluk residents to Napaskiak.⁸⁴⁶

Newtok (NOO-tock)

People and Place

Location

Newtok is located on the Ninglick River, north of Nelson Island in the Yukon-Kuskokwim Delta. It is located 94 miles northwest of Bethel, in the Bethel Census Area and Bethel Recording District. The community encompasses 6.1 square miles of land and 2.3 square miles of water.⁸⁴⁷ As a result of progressing erosion problems, the Newtok Traditional Council is in the process of relocating the Village to a new location on the end of Nelson Island. The new site is called Mertarvik.⁸⁴⁸

*Demographic Profile*⁸⁴⁹

In 2010, there were 354 inhabitants in Newtok, making it the 148th largest of 352 total Alaskan communities with recorded populations that year. The town first appeared in U.S. Census records in the 1950s with 69 inhabitants. Overall between 1990 and 2010, the population of Newtok increased by 71%. A majority of this growth occurred between 1990 and 2000, although the population continued to increase after 2000. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 10.6%, with an average annual growth rate of 0.79%.

In 2010, a majority of Newtok residents identified themselves as American Indian and Alaska Native (96%), while 2.8% identified as White, 0.3% as Asian, and 0.8% identified with two or more races. Also in 2010, 0.3% of Newtok residents identified themselves as Hispanic. Those who identified themselves as White made up 0.3% less of the population in 2010 compared to 2000, those identifying as American Indian and Alaska Natives in 2010 made up 0.7% more of the population, and those identifying with two or more races decreased by 0.8% over the decade. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010 the average household size in Newtok was 5.06, a decrease from 5.96 persons per household in 2000, but an overall slight increase from 4.9 in 1990. The total number of households in Newtok increased from 42 in 1990 to 63 in 2000, and 70 occupied housing units in 2010. Of the 72 housing units surveyed for the 2010 U.S. Census, 81.9% were owner-occupied, 15.3% were renter-occupied, and only 2.7% were vacant or used only seasonally. Between 1990 and 2010, no residents of Newtok lived in group quarters.

Figure 1. Racial and Ethnic Composition, Newtok: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Newtok was 55.6% male and 44.4% female, even more skewed toward males than the population of Alaska as a whole in 2010, which was 52% male and 48% female. The median age in Newtok was 20.4 years in 2010, much lower than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. The age of residents between 2000 and 2010 was highly biased towards people under the age of 20. In 2010, there were more males than females in all age groups, except 80 and over. In 2010, 11% of Newtok

residents were age 60 or older in 2010. The overall population structure of Newtok in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁸⁵⁰ 73.6% of Newtok residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 18.2% of residents aged 25 and older were estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 8.2% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 13.2% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 0% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 6.3% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 4.4% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

Figure 2. Population Age Structure in Newtok Based on the 2000 and 2010 U.S. Decennial Census.

⁸⁵⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Newtok is a Yup'ik Eskimo village. Indigenous people have lived on the Bering Sea coast for at least 2,000 years. The people of Newtok and Nelson Island are known as *Qaluyaarmiut*, or “dip net people”. The name Newtok (*Niugtag* in Yup'ik) means “rustling of grass”, appropriate for a village located on a sweeping bend of the Ninglick River.⁸⁵¹

In 1841-1842, a Russian naval officer, Lieutenant Lavrenty Zagoskin, was the first to explore the lower Yukon and briefly came into contact with the Qaluyaarmiut.⁸⁵² Russian Orthodox missionaries established a mission on the Yukon River in 1845, and Moravian missionaries arrived in Bethel in 1885.⁸⁵³ Contact with outside people and customs became more consistent during the 1950s, when the Territorial Guard began sending volunteers to Bethel for 2 weeks of training each year. During this period, the indigenous population was exposed to disease, and tuberculosis became a major health problem in the area.⁸⁵⁴

Newtok was first reported in 1949 by the U.S. Geologic Survey after residents of Old Kealavik, a site across the river, relocated to Newtok to escape seasonal flooding.⁸⁵⁵ A school was built in Newtok in 1958, serving students through middle school. High school students were required to travel to Bethel, St. Mary's, Sitka, Anchorage, or the Lower 48 to continue their educations until a high school was constructed in Toksook Bay in 1976.^{856,857} The City of Newtok was incorporated in 1976, although it was later dissolved in 1997 in favor of the traditional council government.⁸⁵⁸ Until the 1960s, Newtok had remained primarily a winter camp for residents. Starting in the 1970s, with the addition of a school, clinic, airstrip, and modern housing, Newtok's population remained in the village year-round.⁸⁵⁹ Relative isolation from outside influences has allowed Newtok to retain traditions and customs to a greater degree than in other parts of Alaska. Residents of the Village have an active subsistence lifestyle. The sale and importation of alcohol is banned in the village.⁸⁶⁰

Due to severe erosion of river and ocean shorelines in Newtok, in 1994 community leaders began considering Village relocation, and by 1996 they had selected a new site on Nelson Island, called Mertaryik, located 5 miles from the current Village. The name means “getting water from the spring” in Yup'ik. An agreement was negotiated in 2003 with the U.S. Fish and Wildlife Service (FWS) to exchange land at the new site, which was part of the Yukon Delta National Wildlife Refuge (NWR).

⁸⁵⁹ See footnote 851.

⁸⁶⁰ See footnote 857.

Natural Resources and Environment

Newtok is located in a marine climate zone. Average annual precipitation is 17 inches, and snowfall averages 22 inches per year. Temperatures range between 42 and 59 °F in the summer, and 2 and 19 °F in the winter.⁸⁶¹

The community of Newtok is within the boundaries of the Yukon Delta NWR. The NWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” NWR lands are open to sport and subsistence hunting and fishing. The most productive wildlife habitat is the coastal region between the Newtok area and the Askinuk Mountains to the north. Nelson Island is the second largest island within the boundaries of the NWR. The southern portion of the island is low-lying and covered with small lakes and streams, while the northern portion, near the new village site, hosts more rugged terrain, with several peaks over 1,300 feet in elevation. The Bering Sea coast at Newtok is characterized by sandy beaches that merge into active sand dunes greater than 100 feet in height. The dunes are particularly susceptible to erosion.⁸⁶²

Erosion and flooding threats from both coastal and river shorelines are the primary cause of Newtok relocation efforts. Erosion rates have been exacerbated by thawing permafrost, declining sea ice protection, increased storm surge exposure and increasing temperatures.⁸⁶³ Erosion rates on the Ninglick River averaged 68 feet per year between 1954 and 2003, with a total loss of approximately 3,320 linear feet of land in front of the village. Erosion rates are expected to increase due to the effects of climate change, as sea level rises and offshore ice pack retreats. Newtok is also susceptible to tundra fire, severe weather and earthquake hazards.⁸⁶⁴

The Alaska Department of Environmental Conservation (DEC) did not list active environmental cleanup sites located in Newtok as of May 2012.⁸⁶⁵

Current Economy⁸⁶⁶

Employment in Newtok is provided by the school, clinic, village services, and commercial fishing.^{867,868} Between 2000 and 2010, Newtok residents were most active in fisheries for halibut and herring, as well as some activity in salmon fisheries. The number of Newtok residents holding state Commercial Fisheries Entry Permits (CFEC) was equivalent to

⁸⁶⁷ See footnote 857.

⁸⁶⁸ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

9% of the total local population in 2000, declining to 6% by 2010. In 2000, the number of crew license holders and fishing vessel owners were each equivalent to 9% of the local population, declining to just over 2% each by 2010 (see *Commercial Fishing* section). Subsistence fishing and trapping activities supplement income.⁸⁶⁹

Based on household surveys conducted for the 2006-2010 ACS,⁸⁷⁰ in 2010, the per capita income in Newtok was estimated to be \$9,128 and the median household income was estimated to be \$40,000. This represents an increase in the median household income reported in the year 2000 (\$32,188), and a slight decrease reported per capita income in 2000 (\$9,514). If inflation is taken into account by converting 2000 values to 2010 dollars,⁸⁷¹ both per capita income and median household income in 2010 are revealed to have decreased from real 2000 income levels (real per capita of \$12,511 and real median household income of \$42,511). In 2010, Newtok ranked 285th of 305 Alaskan communities with per capita income data that year, and 189th in median household income, out of 299 Alaskan communities with household income data.

Although Newtok's small population size may have prevented the ACS from accurately portraying economic conditions,⁸⁷² additional evidence for a decrease in per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Newtok in 2010 is \$5,301.⁸⁷³ This decline in income between 2000 and 2010 is reflected in the fact that the community was recognized as "distressed" by the Denali Commission,⁸⁷⁴ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2000-2010 ACS, in 2010, 53.2% of residents aged 16 or older were estimated to be in the civilian labor force, compared to 68.8% in the civilian labor force statewide. In the same year, 22.8% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 5.1%, compared to a statewide unemployment rate of 5.9%. An alternative estimate of unemployment is based on the ALARI database, which indicates that the 2010 unemployment rate in Newtok was 13.4%, compared to a statewide unemployment rate estimate of 11.5%.⁸⁷⁵

⁸⁷⁵ See footnote 868.

Also based on the 2006-2010 ACS, 63.5% of the Newtok workforce was estimated to be employed in the public sector, along with 36.5% in the private sector. Of the 104 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number were estimated to be working in educational services, health care, and social assistance (51%), retail trade (20.2%), and public administration (15.4%). Only 2.9% of the civilian labor force was estimated to be working in agriculture, forestry, fishing, hunting, and mining. However, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Newtok (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Newtok (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 158 employed residents in Newtok in 2010, of which 59.5% were employed in local government, 16.5% in trade, transportation, and utilities, 10.8% in manufacturing, 4.4% in financial activities, 4.4% in education and health services, 1.3% in natural resources and mining, 1.3% in information, 0.6% in professional and business services, 0.6% in leisure and hospitality, and 0.6% in other industries.⁸⁷⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Newtok is an unincorporated community and is not located in an organized borough. A city government incorporated in 1976, but was dissolved in 1997 in favor of the traditional village council government. Newtok does not have any taxing authority, and no information was available about municipal revenue between 2000 and 2010. The community did receive \$3,000-\$4,000 per year in State Revenue Sharing contributions between 2000 and 2003. In addition, the Newtok Village Council received \$800,000 for construction of a barge ramp, dock and staging facilities in 2006 from the Economic Development Association. Construction began in 2008. This infrastructure is primarily intended to support relocation efforts.⁸⁷⁷ Information about selected aspects of Newtok's community revenue sources is presented in Table 2.

Although not reflected in Table 2 as it is not a fisheries-related grant, it is important to note that the Village also received a grant from the Denali Commission to develop a community, water and sewage layout plan for the new village site. As of 2012, construction of homes at the new site was scheduled to be underway.⁸⁷⁸

Newtok was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is Newtok Village. The Native village corporation is Newtok Native Corporation, which manages 96,160 acres of land. The regional Native corporation to which Newtok belongs is the Calista Corporation.⁸⁷⁹

Newtok is also a member of the Association of Village Council Presidents (AVCP), a tribal non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to "promote tribal self-determination and self-governance and to work to protect tribal culture and traditions."⁸⁸⁰ The AVCP is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad

Infrastructure

Connectivity and Transportation

Newtok is not connected to the rest of Alaska by road, and is primarily accessible by air or water. A state-owned, 2,202 feet long by 35 feet wide gravel airstrip provides air access.⁸⁸³ Era Aviation provides scheduled commercial service to Newtok. The price of a roundtrip ticket from Newtok to Anchorage in early June of 2012 was \$726.⁸⁸⁴ A seaplane base is also available. Boats, skiffs, and snowmobiles are used for local transportation and subsistence activities. Winter snowmobile trails are marked to nearby villages of Chevak, Tununak, Toksook Bay, Nightmute, and Manaryarapiaq. Barges deliver cargo to Newtok during ice-free summer months.⁸⁸⁵

Facilities

A diesel power plant, owned by Ungusrag Power Company and operated by the Village Council, provides electricity to Newtok. Water is pumped from a lake into a water treatment plant. Houses are not plumbed, so individuals haul water from a storage tank that serves as a central watering point. There is also a community well source, and some individuals have wells as well. The Village Council operates a washeteria. Honeybuckets are in use throughout the Village, and a sewage lagoon is used for sewage treatment. Refuse collection services are provided by the Village Council. A landfill is available, although the Department of Transportation (DOT) has determined that it is located too close to the airport. No police are stationed in Newtok.⁸⁸⁶ The nearest state trooper posts are in Bethel, St. Mary's, and Emmonak,⁸⁸⁷ and the nearest Village Public Safety Officers (VPSO) are stationed in Chevak, Nunapitchuk, and Toksook Bay.⁸⁸⁸ Fire/rescue services in Newtok are provided by a volunteer fire department. Other community facilities include a Community Hall. The school allows public use of its library. Internet and telephone service is available in Newtok, but there is no cable provider. The community is in the process of relocating and rebuilding facilities at a site on Nelson Island.⁸⁸⁹

Medical Services

The local health clinic, the Manguan Health Clinic, is operated by the Yukon-Kuskokwim Health Corporation. The Clinic is a Community Health Aide Program site.

⁸⁸⁹ See footnote 885.

Emergency Services have coastal and air access. Emergency services are provided by a health aide.⁸⁹⁰ The nearest hospital is located in Bethel.

Educational Opportunities

Newtok has one school, Ayaprun School, which offers a pre-school through 12th grade education. As of 2011, there were 8 teachers and 137 students attending the school.⁸⁹¹

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Harvest of marine resources has been important to residents of the Newtok area since prehistory. Yup'ik Eskimo people were historically very mobile, following the migration and seasonal availability of subsistence resources.⁸⁹² Subsistence fishing and hunting continue to be an important supplement to cash employment for Newtok residents.⁸⁹³ Between 2000 and 2010, residents of Newtok were involved in commercial fisheries for herring, halibut, and salmon (Table 4).

Newtok is located near the Kuskokwim River. Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.⁸⁹⁴ However, the salmon resource is not as easily accessible for communities along the Bering Sea coast as in other regions of Alaska.⁸⁹⁵

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. There are six commercial gillnet sac roe districts along the Yukon/Kuskokwim coast, including Nelson Island and Nunivak Island. However, harvests of herring have been declining in this region in recent years, in part due to lack of processing capacity in the area. A significant subsistence herring harvest also occurs at Nelson Island.⁸⁹⁶

⁸⁹⁶ Ibid.

Commercial exploitation of halibut first extended into the Bering Sea region in 1928 after development of diesel engines, which allowed fishing vessels to undertake longer trips.⁸⁹⁷ Today, Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

Newtok is located on the Ninglick River in the Yukon-Kuskokwim Delta. The coastal area adjacent to Newtok is encompassed by Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Newtok is a member of the Coastal Villages Region Fund (CVRF), a Community Development Quota (CDQ) group that promotes employment opportunities for residents as well as participation in the Bering Sea crab and groundfish fisheries.⁸⁹⁸ The Village is not eligible to participate in the Community Quota Entity program.

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Newtok. However, according to the list, Coastal Villages Seafood, LLC, a subsidiary of CVRF, currently operates processing facilities in several nearby villages, including Mekoryuk, Hooper Bay, Kipnuk, and Quinhagak.

Fisheries-Related Revenue

No data were reported about fishing-related revenue received by the community of Newtok from municipal, state, or federal sources between 2000 and 2010 (Table 3).

Commercial Fishing

Between 2000 and 2010, Newtok residents were most engaged in fisheries for Pacific halibut and herring, and also participated to a lesser degree in salmon fisheries. During this period, local residents participated in State fisheries as permit holders, crew license holders, and vessel owners.

In 2010, 22 Newtok residents held a total of 29 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). These included 11 halibut permits (6 statewide hand-troll permits and 5 statewide longline permits for vessels under 60 feet in length), 15 herring permits (Nelson Island herring roe and foot/bait gillnet fishery, and Nunivak Island herring roe and foot/bait gillnet fishery), and 3 salmon permits (Bristol Bay drift gillnet and Lower Yukon gillnet). Of these, in 2010, 82% of halibut permits were fished (9 out of 11), and 0% of herring and salmon permits were fished. The last year in the 2000-2010 period in which a herring permit was actively fished by a Newtok vessel owner was 2006, and the last year a salmon permit was actively fished was 2008. The number of halibut permits and halibut permit holders decreased by almost half between 2000 and 2010, but the number of actively fished permits remained stable over the period. The number of herring permits held remained stable between 2000 and 2010, although the number that were actively fished declined precipitously

⁸⁹⁷ Thompson, William F. and Norman L. Freeman (1930). *History of the Pacific Halibut Fishery*. Report of the International Fisheries Commission. Number 5. Retrieved June 1, 2012 from <http://www.iphc.int/publications/scirep/Report0005.pdf>.

⁸⁹⁸ Coastal Villages Region Fund (n.d.). *Homepage*. Retrieved December 12, 2011 from <http://www.coastalvillages.org/>.

starting in 2001. The number of salmon permits held decreased steadily, from six in 2000 to three in 2010, and the number of permit holders followed a similar trend. No Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) were issued to Newtok residents between 2000 and 2010. Information about CFEC, FFP and LLP permits is presented in Table 4. Finally, between 2000 and 2010, no quota share accounts or quota shares were held by Newtok residents in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 through 8).

In 2010, 8 Newtok residents held crew licenses, a significant decrease from 28 licenses held in the year 2000. The number of Newtok residents that were the primary owner of a fishing vessel decreased between 2000 and 2010, from 28 in 2000 to 9 in 2010. The number of vessels homeported in Newtok followed the same trend, with 22 in 2000 and only 8 in 2010. These characteristics of the commercial fishing sector are presented in Table 5.

In 2010, Newtok vessel owners landed 7,352 net pounds of halibut, earning \$23,159 in ex-vessel revenue. Information about herring landings and revenue is considered confidential for all years except 2000 due to the small number of participants. In 2000, Newtok vessel owners landed 192,296 net pounds of herring for an ex-vessel value of \$19,037. Information about salmon landings and revenue is considered confidential between 2000 and 2010 due to the small number of participants. Information about landings and ex-vessel revenue generated by Newtok vessel owners is presented in Table 10. Since no fish buyers or shore-side processing facilities were located in Newtok, no local landings and revenue were generated in the community between 2000 and 2010 (Table 9). Newtok vessel owners delivered their catches elsewhere.

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses or licensed sport fish guides were located in Newtok. However, sportfishing licenses were sold in the community from 2007 to 2010, with between 12 and 64 licenses sold per year. Between 2000 and 2010, Newtok residents purchased between 2 and 49 sportfishing licenses (irrespective of point of sale). In some years, the number of sportfishing licenses sold in Newtok was greater than the number of licenses purchased by residents of Newtok, indicating that a small number of non-local sport fishermen may use Newtok as a base of fishing activity.

The Alaska Statewide Harvest Survey,⁸⁹⁹ conducted by ADF&G between 2000 and 2010, does not provide information about species targeted by private anglers in Newtok. No kept/release log book data were reported for fishing charters out of Newtok between 2000 and 2010.⁹⁰⁰ Newtok is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Newtok is displayed in Table 11.

Subsistence Fishing

Historically, Yup'ik Eskimos along the Bering Sea coast harvested herring, marine mammals, Pacific halibut, salmon, flounder, and a variety of freshwater fish species.⁹⁰¹ Traditionally, dried herring is an important protein source for residents of Bering Sea communities, including Newtok, where salmon are not as readily available as in other regions.⁹⁰² Subsistence harvest remains a fundamental aspect of Newtok's local economy and culture today.⁹⁰³

No information was reported by ADF&G between 2000 and 2010 regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes (Table 12). However, a 1990 subsistence survey conducted by ADF&G found that 51% of Newtok households harvested herring and herring sac roe for subsistence

⁹⁰¹ Fienup-Riordan, A.1994. *Boundaries and Passages: Rule and Ritual in Yup'ik Eskimo Oral Tradition*. Norman: University of Oklahoma Press.

purposes, and 100% of Newtok households used these resources, indicating sharing of herring and sac roe between households. That year, a total of 15,865 pounds of herring were reported harvested by Newtok residents for subsistence purposes, for a per capita harvest of 77 pounds.⁹⁰⁴

Information was reported by ADF&G regarding both subsistence salmon permits and Subsistence Halibut Registration Certificates (SHARC) issued to residents of Newtok during the 2000-2010 period. Between 2000 and 2008, 79 subsistence salmon permits were issued to Newtok households each year. Subsistence salmon harvests were relatively low compared to communities along the Kuskokwim and Yukon Rivers and areas further south in Alaska. In 2000, six permits were returned, and sockeye were the most heavily harvested salmon species. This information is presented in Table 13. Between 2003 and 2010, the number of SHARC cards issued to Newtok residents varied between one and five. In 2005, one SHARC card was returned and 204 pounds of halibut were reported harvested (Table 14).

Little information was reported by management agencies about subsistence harvest of marine mammals between 2000 and 2010. According to data reported by NMFS, in 2002, one beluga whale was harvested, and according to data reported by the U.S. Fish and Wildlife Services, one walrus was harvested in 2006. No data were reported by management agencies regarding subsistence harvest of sea otter, polar bear, Steller sea lion, harbor seal, or spotted seal between 2000 and 2010. Information about marine mammal harvests is presented in Table 15. No information was reported about harvest of pounds of marine invertebrates or non-salmon fish harvested for subsistence purposes in Newtok (Table 13).

Additional Information

Nelson Island was named after Edward W. Nelson, the man who conducted the first detailed exploration of the area in 1878-1879.⁹⁰⁵

Nightmute (NITE-myoot)

People and Place

*Location*⁹⁰⁶

Nightmute is located on Nelson Island, in the Yukon-Kuskokwim Delta. It is located 18 miles upriver from Toksook Bay, and 100 miles west of Bethel, in the Bethel Census Area and Bethel Recording District. The City encompasses 97 square miles of land and 4.6 square miles of water.

*Demographic Profile*⁹⁰⁷

In 2010, there were 280 inhabitants in Nightmute, making it the 168th largest of 352 total Alaskan communities with recorded populations that year. The town first appeared in U.S. Census records in the 1940s with 78 inhabitants. Overall between 1990 and 2010, the population of Nightmute increased by 83%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 26.9%, with an average annual growth rate of 1.7%. In 2010, a majority of Nightmute residents identified themselves as American Indian and Alaska Native (94.6%), along with 5% that identified as White and 0.4% identifying with two or more races. Also in 2010, 2.5% of Nightmute residents identified themselves as Hispanic. Individuals indentifying as White made up 0.3% less of the population in 2010 compared to 2000, and those identifying as American Indian and Alaska Natives made up 2.8% more of the population, while the percentage of individuals identifying with two or more races decreased between 2000 and 2010 by 2.5%. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010 the average household size in Nightmute was 4.75, a slight increase from 4.43 persons per household in 2000, but an overall decrease from 5.2 persons per household in 1990. The total number of households in Nightmute increased over time, from 29 in 1990 to 47 in 2000, and 59 occupied housing units in 2010. Of the 61 housing units surveyed for the 2010 U.S. Census, 73.8% were owner-occupied, 30% were renter-occupied, and only 3.3% were vacant or used only seasonally. Between 1990 and 2010, no residents of Nightmute lived in group quarters.

⁹⁰⁷ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

In 2010, the gender makeup in Nightmute was 52.5% male and 47.5% female, only slightly more skewed toward males than the population of Alaska as a whole, which was 52% male and 48% female. The median age in Nightmute was 22.9 years in 2010, much lower than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the age groups 0-9 and 40-49 years had notably more males than females. There were slightly more women than men in age groups 10-19 and 20-29 years. Also in 2010, 8.7% of Nightmute residents were age 60 or older. The overall population structure of Nightmute in 2000 and 2010 is shown in Figure 2.

Figure 1. Racial and Ethnic Composition, Nightmute: 2000-2010 (U.S. Census).

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁹⁰⁸ 58% of Nightmute residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 25.5% of residents aged 25 and older were estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 16.6% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 8.9% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 3.2% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 3.2% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 0% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

Figure 2. Population Age Structure in Nightmute Based on the 2000 and 2010 U.S. Decennial Census.

⁹⁰⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Nightmute is a Yup'ik Eskimo village. The people of Nelson Island are known as *Qaluyaarmiut*, or “dip net people.” The Qaluyaarmiut have lived on the Bering Sea coast for at least 2,000 years.⁹⁰⁹ In 1841-1842, a Russian naval officer, Lieutenant Lavrenty Zagoskin, was the first to explore the lower Yukon and briefly came into contact with the Qaluyaarmiut.⁹¹⁰ Russian Orthodox missionaries established a mission on the Yukon River in 1845, and Moravian missionaries arrived in Bethel in 1885.⁹¹¹ Contact with outside people and customs became more consistent during the 1950s, when the Territorial Guard began sending volunteers to Bethel for two weeks of training each year. During this period, the indigenous population was exposed to disease, and tuberculosis became a major health problem in the area.⁹¹²

The traditional fish camp for the people of Nightmute is called Umkumiut. In 1964, many residents relocated to the present site of Toksook Bay to more easily access cost-effective goods. Those that remained make up most of the current population of Nightmute.^{913,914} Because of the Village's relative isolation from outside influences, traditions and customs have been retained in Nightmute to a greater degree than in other parts of Alaska. Residents of the Village have an active subsistence lifestyle.⁹¹⁵ The sale, importation, and possession of alcohol are banned in the community.⁹¹⁶

Natural Resources and Environment

Nightmute is located in a marine climate zone. Average annual precipitation is 22 inches, and snowfall averages 43 inches per year. Temperatures range between 41 and 57 °F in the summer, and 6 and 24 °F in the winter.⁹¹⁷

Nightmute is located on Nelson Island, the second largest island within the Yukon Delta National Wildlife Refuge (NWR). The southern portion of the Island, where Nightmute is located, is low-lying and covered with small lakes and streams. The northern portion of the Island hosts more rugged terrain, with several peaks over 1,300 feet in elevation. The Bering Sea coast along the Yukon-Kuskokwim delta is characterized by sandy beaches that merge into active sand dunes greater than 100 feet in height. The dunes are particularly susceptible to erosion.⁹¹⁸

⁹¹⁸ U.S. Fish and Wildlife Service (2011). *Yukon Delta National Wildlife Refuge website*. Retrieved December 8, 2011 from <http://yukondelta.fws.gov/>.

The Yukon Delta NWR was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” NWR lands are open to sport and subsistence hunting and fishing. The most productive wildlife habitat is the coastal region between Nelson Island and the Askinuk Mountains to the north.⁹¹⁹

Natural hazards that have been identified to be present in the Bethel Census Area include flooding, earthquakes, and severe weather.⁹²⁰ Communities in the region are also suffering from severe erosion of both riverbanks and coastal shorelines, and are susceptible to tundra fires.^{921,922}

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Nightmute as of May 2012.⁹²³

Current Economy⁹²⁴

Employment in Nightmute is provided by local government offices, local and regional Native corporations and non-profit organizations, the school, social services, commercial fishing, and construction.^{925,926} Between 2000 and 2010, Nightmute residents were most active in fisheries for halibut and herring, as well as some activity in salmon fisheries. The number of Nightmute residents holding state Commercial Fisheries Entry Commission (CFEC) permits was equal to 16% of the total local population in 2000, declining to 9% of the local population by 2010. Over the same period, the percentage of the local population holding crew licenses decreased from 10.5% in 2000 to 1% in 2010, and the number of local residents who were primary owners of fishing vessels decreased from 15% of the local population to 5% (see *Commercial Fisheries* section). Almost all families engage in subsistence fishing activities to supplement cash employment.⁹²⁷

Based on household surveys for the 2006-2010 ACS,⁹²⁸ in 2010, the per capita income in Nightmute was estimated to be \$12,198 and the median household income was estimated to be \$54,063. This represents an increase in per capita income, from \$9,396 reported in 2000, and an

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

increase in median household income, from \$35,938 reported in 2000. However, if inflation is taken into account by converting 2000 values to 2010 dollars,⁹²⁹ real per capita income in 2000 (\$12,356) is shown to be similar to the 2010 income estimate, while the 2010 median household income estimate still shows an increase from real median household income in 2000 (\$47,258). In 2010, Nightmute ranked 239th of 305 Alaskan communities with per capita income data that year, and 105th in median household income, out of 299 Alaskan communities with household income data.

Nightmute's small population size may have prevented the ACS from accurately portraying economic conditions.⁹³⁰ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Nightmute in 2010 is \$6,784.⁹³¹ This estimate is lower than the 2000 per capita income reported in by the U.S. Census, providing additional evidence that per capita income in Nightmute did not increase between 2000 and 2010. The fact that per capita income did not increase over the 2000-2010 period is reflected in the fact that the community was recognized as "distressed" by the Denali Commission in 2011,⁹³² indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, 65.6% of Nightmute residents aged 16 or older were estimated in the civilian labor force, compared to 68.8% of Alaskans estimated to be in the civilian labor force statewide. In the same year, 23.8% of local residents were estimated to be living below the poverty line in 2010, compared to 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 8%, compared to a statewide unemployment rate of 5.9%. An alternative estimate of unemployment is based on the ALARI database, which indicates that the 2010 unemployment rate in Nightmute was 18.5%, compared to a statewide unemployment rate estimate of 11.5%.⁹³³

Also based on the 2006-2010 ACS, 52.1% of the Nightmute workforce was estimated to be employed in the public sector, along with 40.3% in the private sector, 5.6% self-employed, and 2.1% unpaid family workers. Of the 144 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number were estimated to be working in public administration (30.6%), retail trade (25.7%), and educational services, health care, and social assistance (21.5%). None of the civilian labor force was estimated to be working in agriculture, forestry, fishing, hunting, and mining in 2010. However, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This

⁹²⁹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁹³⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁹³¹ See footnotes 926 and 928.

⁹³³ See footnote 926.

information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Nightmute (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Nightmute (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 124 employed residents in Nightmute in 2010, of which 61.3% were employed in local government, 12.9% in trade, transportation, and utilities, 8.9% in financial activities, 5.6% in education and health services, 4.8% in professional and business services, 0.8% in manufacturing, 0.8% in natural resources and mining, 0.8% in leisure

and hospitality, 0.8% in state government, and 3.2% in other industries.⁹³⁴ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Nightmute was incorporated in 1974 as a 2nd Class City and is not located in an organized borough. The City has a Strong Mayor form of government, with a seven-person city council, including the mayor, a nine-person advisory school board, and several municipal employees. The City administers a 2% sales tax.⁹³⁵ In addition to sales tax revenues, other locally-generated income sources in Nightmute include building leases, building and equipment rentals, water and sewer service fees, airport maintenance contracts from the State, bingo/pull tabs receipts, and fuel sales in the last few years of the decade. Outside revenue sources during the 2000-2010 period included various shared revenues from state and federal sources, as well as small grants in some years. The community received approximately \$25,000 per year from the State Revenue Sharing program between 2000 and 2003, and just over \$100,000 per year from the Community Revenue Sharing program in 2009 and 2010. Some shared state funds were received from fisheries-related tax refunds (see the *Fisheries-Related Revenue* section). No information was reported about fisheries-related grants received by the City during the 2000-2010 period. The increase in total municipal revenues in the later years in the decade can be explained in part by the large Community Revenue Sharing contributions as well as a large increase in local fuel sales. Information about selected aspects of Nightmute's revenue sources is presented in Table 2.

Nightmute was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Native Village of Nightmute. The Native village corporation is Chinuruk, Incorporated, which manages 69,120 acres of land. The regional Native corporation to which Nightmute belongs is the Calista Corporation.⁹³⁶

Nightmute is also a member of the Association of Village Council Presidents (AVCP), a tribal non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”⁹³⁷ The AVCP is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.⁹³⁸ AVCP is made up of 56 villages and 45 village corporations.⁹³⁹

Infrastructure

Connectivity and Transportation

Nightmute is not connected to the rest of Alaska by road, and is primarily accessible by air or water. A state-owned, 1,600 feet long by 35 feet wide gravel airstrip provides air access.⁹⁴⁰ Era Aviation provides scheduled commercial service to Nightmute. The price of a roundtrip ticket from Nightmute to Anchorage in early June of 2012 was \$578.⁹⁴¹ A seaplane base is also available. Fishing boats, skiffs, snowmobiles, and ATVs are used for local transportation and subsistence activities. Winter trails are marked to nearby villages of Toksook Bay, Cak'caa, and

⁹⁴⁰ See footnote 935.

⁹⁴¹ These prices were calculated on November 21, 2011 using kayak.com.

Baird Inlet. Nightmute does not have docking facilities. Cargo and supplies are lightered up the Tuqsuk River during summer months.⁹⁴²

Facilities

A diesel power plant, operated by the Alaska Village Electric Cooperative (AVEC), provides electricity in Nightmute. Water is derived from a community well source and chlorinated. The City of Nightmute provides a small water facility which serves as a central watering point for the City. Honeybuckets are used in Nightmute. The City provides water and sewer haul services. A sewage pumper and sewage lagoon are used for sewage treatment. The school has its own sewage lagoon.⁹⁴³

Community facilities include a city jail and city/community hall. The school offers public use of its library. Safety services are provided by City Village Police Officers (VPO) in Nightmute and state troopers stationed in Bethel. Fire and rescue services are provided by a volunteer fire department and a city ambulance. Phone and internet service are provided in Nightmute, but cable service is not available.⁹⁴⁴

In 2004, the Nightmute Traditional Council reported that a variety of projects were underway to make improvements to facilities and services in Nightmute, including airport and road improvements, development of housing, addition of utility poles, consolidation of the AVEC tank farm, improved internet service, and feasibility studies related to solid waste and water and sewer improvements. They also noted that they were pursuing establishment of a fishery support center in partnership with the Coastal Villages Region Fund (CVRF), the Community Development Quota (CDQ) entity to which Nightmute belongs (see *History and Evolution of Fisheries* section below).⁹⁴⁵

Medical Services

Medical services are provided by the Nightmute Health Clinic, operated by the Yukon-Kuskokwim Health Corporation. The Clinic is a Community Health Aide Program site. Emergency Services have coastal and air access. Emergency services are provided by the Community Health Aide.⁹⁴⁶ The nearest hospital is located in Bethel.

Educational Opportunities

Nightmute has one school. The Nightmute School offers a pre-school through 12th grade education. As of 2011, there were 9 teachers and 102 students attending the school.⁹⁴⁷

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Harvest of marine resources has been important to residents of the Nightmute area since prehistory. Yup'ik Eskimo people were historically very mobile, following the migration and seasonal availability of subsistence resources.⁹⁴⁸ Subsistence fishing and hunting continue to be an important supplement to commercial fishing and other cash employment for Nightmute residents.⁹⁴⁹ Between 2000 and 2010, residents of Nightmute were involved in commercial fisheries for herring, halibut and salmon (Table 4).

Nightmute is located near the Kuskokwim River. Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.⁹⁵⁰ However, the salmon resource is not as easily accessible for communities along the Bering Sea coast as in other regions of Alaska.⁹⁵¹

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. There are six commercial gillnet sac roe districts along the Yukon/Kuskokwim coast, including Nelson Island and Nunivak Island. However, harvests of herring have been declining in this region in recent years, in part due to lack of processing capacity in the area. A significant subsistence herring harvest also occurs at Nelson Island.⁹⁵²

Commercial exploitation of halibut first extended into the Bering Sea region in 1928 after development of diesel engines, which allowed fishing vessels to undertake longer trips.⁹⁵³ Today, Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

The coastal area around Nelson Island is encompassed by Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Nightmute is a member of the Coastal Villages Region Fund (CVRF), a Community Development Quota (CDQ) group that promotes employment opportunities for residents as well as participation in the Bering Sea crab and groundfish fisheries.⁹⁵⁴ The community is not eligible to participate in the Community Quota Entity program.

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Nightmute. However, processing facilities operated by Coastal Villages Seafood, LLC, a subsidiary of CVRF, were listed in several nearby villages, including Mekoryuk, Hooper Bay, Kipnuk, and Quinhagak.

Fisheries-Related Revenue

On average between 2000 and 2010, the City of Nightmute received \$360 per year from fisheries-related taxes and fees. These revenue sources include a raw fish tax and the Shared Fisheries Business Tax. Table 3 shows the annual revenue for these categories.⁹⁵⁵

Commercial Fishing

Between 2000 and 2010, Nightmute residents were most engaged in fisheries for halibut and herring, and also participated to a lesser degree in salmon fisheries. During this period, local residents participated in state and federal fisheries as permit and quota share holders, crew license holders, and vessel owners. The number of Nightmute residents holding state Commercial Fisheries Entry Commission (CFEC) permits was equivalent to 16% of the total local population in 2000, declining to 9% of the local population by 2010.

In 2010, 25 Nightmute residents held a total of 32 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). These included 10 halibut permits (6 statewide hand-troll permits and 5 statewide longline permits for vessels under 60 feet in length), 20 herring permits (Nelson Island herring roe and foot/bait gillnet fishery, and Nunivak Island herring roe and foot/bait gillnet fishery), and 2 salmon permits (Bristol Bay drift gillnet and Bristol Bay set gillnet). Of these, in 2010, 50% of halibut permits were actively fished (5 out of 10), 50% of salmon permits were actively fished (the drift gillnet permit was active), and 0% of herring and permits were actively fished.

The number of halibut permits and halibut permit holders decreased by half between 2000 and 2010, and the number of active permits decreased by two-thirds, from 15 in 2000 to 5 in 2010. The number of herring permits held remained stable between 2000 and 2010, although the number that were actively fished declined steadily, from 13 in 2000 to zero by 2007. The number of salmon permits held decreased steadily from six in 2000 to two in 2010, and the number of permit holders followed a similar trend. No Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) were issued to Nightmute residents between 2000 and 2010. This information about CFEC, FFP, and LLP permits is presented in Table 4.

In 2000 and 2001, 1,072 halibut quota shares were held by Nightmute residents in the federal halibut catch share fishery, but no information was available about number of quota share holders or the halibut individual fishing quota (IFQ) allotment associated with the quota shares. Between 2000 and 2010, no quota share accounts or quota shares were held by Nightmute residents in federal catch share fisheries for sablefish or crab. Information about federal catch share participation is presented in Tables 6 through 8.

⁹⁵⁵ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

In 2010, 2 Nightmute residents held crew licenses, a significant decrease from 22 licenses held in the year 2000. The number of Nightmute residents that were the primary owner of a fishing vessel decreased between 2000 and 2010, from 31 in 2000 to 13 in 2010. The number of vessels homeported in Nightmute followed the same trend, with 27 in 2000 and only 10 in 2010. These characteristics of the commercial fishing sector are presented in Table 5.

In 2010, Nightmute vessel owners landed 22,371 net pounds of halibut, earning \$69,869 in ex-vessel revenue. In 2006, the last year during the 2000-2010 period in which a herring permit was actively fished by a community member, Nightmute vessel owners landed 129,240 net pounds of herring with a total ex-vessel revenue of \$7,237. Information about salmon landings and revenue are considered confidential throughout the 2000-2010 period due to the small number of participants. Information about landings and ex-vessel revenue generated by Nightmute vessel owners is presented in Table 10. Since no fish buyers or shore-side processing facilities were present in Nightmute between 2000 and 2010 (Table 5), no local landings or ex-vessel revenue were reported (Table 9).

Recreational Fishing

Between 2000 and 2010, there were no active sport fish guide businesses or licensed sport fish guides in Nightmute. In 2009, five sportfishing licenses were sold in the City, but in general no licenses were sold locally between 2000 and 2010. Between 2000 and 2010, Nightmute residents purchased between 5 and 30 sportfishing licenses (irrespective of point of sale).

The Alaska Statewide Harvest Survey,⁹⁵⁶ conducted by ADF&G between 2000 and 2010, did not provide information about species targeted by private anglers in Nightmute. No kept/release log book data were reported for fishing charters out of Nightmute between 2000 and 2010.⁹⁵⁷ Nightmute is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Nightmute is displayed in Table 11.

Subsistence Fishing

Historically, Yup'ik Eskimos along the Bering Sea coast harvested herring, marine mammals, Pacific halibut, salmon, flounder, and a variety of freshwater fish species.⁹⁵⁸ Traditional dried herring is an important protein source for residents of Bering Sea communities such as Nightmute, where salmon are not as readily available as in other regions.⁹⁵⁹ Subsistence harvest remains a fundamental aspect of Nightmute's local economy and culture today.⁹⁶⁰

No information was reported by ADF&G between 2000 and 2010 regarding per capita subsistence harvest or the percentage of Nightmute households utilizing various marine resources for subsistence purposes (Table 12). However, a 1990 subsistence survey conducted by ADF&G found that 67% of Nightmute households harvested herring and herring sac roe for subsistence purposes, and 100% of Nightmute households used these resources, indicating sharing of herring and sac roe between households. In 1990, 35,065 pounds of herring were

harvested by Nightmute residents for subsistence purposes, for a per capita harvest of 215 pounds.⁹⁶¹

Information was reported by ADF&G regarding both subsistence salmon permits and Subsistence Halibut Registration Certificates (SHARC) issued in Nightmute during the 2000-2010 period. Between 2000 and 2008, the number of subsistence salmon permits issued to Nightmute households varied between 46 and 68 per year. Subsistence salmon harvest was relatively low compared to communities along the Kuskokwim and Yukon Rivers, and areas further south in Alaska. In 2000, six salmon permits were returned, and sockeye were the most heavily harvested salmon species. This information is presented in Table 13. Between 2003 and 2010, the number of SHARC cards issued to Nightmute residents declined from 29 to 2. In 2003, 18 SHARC cards were fished with a total of 6,634 pounds harvested. In 2009, 1 permit was fished, and a total of 126 pounds of halibut were reported harvested (Table 14).

No information was reported by management agencies regarding subsistence harvest of marine mammals by Nightmute residents during the 2000-2010 period (Table 15). Likewise, no information was reported about total pounds of marine invertebrates or non-salmon fish harvested for subsistence purposes in Nightmute (Table 13).

Additional Information

Nelson Island was named after Edward W. Nelson, the man who conducted the first detailed exploration of the area in 1878-1879.⁹⁶²

Nunapitchuk (*noo-nah-PIT-chuck*; a.k.a. *Akolmiut*)

People and Place

*Location*⁹⁶³

Nunapitchuk is located on both banks of the Johnson River, 22 miles northwest of Bethel in the Yukon-Kuskokwim Delta. Nunapitchuk is in the Bethel Recording District and Bethel Census Area. The City encompasses 7.9 square miles of land and 0.7 square miles of water.

*Demographic Profile*⁹⁶⁴

In 2010, there were 496 inhabitants in Nunapitchuk, making it the 119th largest of 352 total Alaskan communities with recorded populations that year. The community first appeared in U.S. Census records in 1920 with 134 inhabitants. Overall between 1990 and 2010, the population of Nunapitchuk increased by 31.2%. According to Alaska Department of Labor population estimates, between 2000 and 2009, the population of permanent residents increased by 15.7%, with an average annual growth rate of 1.33%. In 2010, a majority of Nunapitchuk residents identified themselves as American Indian and Alaska Native (95.8%), while 2.4% identified as White, and 1.8% identified with two or more races. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Nunapitchuk was 4.0, a slight decrease from 4.44 in 2000, but the same as the average in 1990. The total number of households in Nunapitchuk increased steadily over time, from 87 in 1990 to 110 in 2000, and 124 occupied housing units in 2010. Of the 132 housing units surveyed for the 2010 Decennial Census, 58.3% were owner-occupied, 35.6% were renter-occupied, and 6.1% of all housing units were vacant or used only seasonally. Between 1990 and 2010, no residents of Nunapitchuk were reported to be living in group quarters.

In 2010, the gender makeup of Nunapitchuk's population (53.6% male and 46.4% female) was more weighted toward males than the population of the State as a whole, which was 52% male and 48% female. That year, the median age of Nunapitchuk residents was 22.9 years, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the age groups most skewed toward males were ages 10-19 and 50-59 cohorts, while there was a relatively even spread of males and females across other age categories. Also in 2010, 8% of Nunapitchuk's population was age 60 or older. The overall population structure of Nunapitchuk in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Nunapitchuk Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁹⁶⁵ 65.7% of Nunapitchuk residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 19.7% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 14.6% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 19.7% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 2% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 11.1% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and

⁹⁶⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

1.5% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Yup'ik Eskimos have inhabited the Yukon-Kuskokwim area for thousands of years. Historically, the Yup'ik people were very mobile, traveling with the migration of game and fish resources. Ancient settlements and seasonal camps contained small populations, with numerous settlements throughout the region consisting of extended families or small groups of families.⁹⁶⁶ Residents of Nunapitchuk and two nearby villages, Atmautluak and Kasigluk, are collectively known as the Akulmiut, a sub-group of Yup'ik Eskimo.⁹⁶⁷ Nunapitchuk was first listed in the 1920 U.S. Census with a population of 134. The community was incorporated as a 2nd Class City in 1969. During the 1970 U.S. Census, Nunapitchuk, Atmautluak, and Kasigluk were enumerated as one village, called "Akolmiut." Today, subsistence activities remain a focal point of local culture. The sale, importation, and possession of alcohol are banned in the village.⁹⁶⁸

Natural Resources and Environment

Nunapitchuk is located within a maritime climate zone. Each year, the area averages 16 inches of precipitation and 50 inches of snowfall. Summer temperatures range from 42 to 62 °F, and winter temperatures run from -2 to 19 °F.⁹⁶⁹ The terrain of the Lower Kuskokwim River region is characterized as a level to rolling delta plain crossed by many river channels, meander scars, oxbow lakes, sloughs, and thousands of lakes. The area is underlain by permafrost, preventing drainage.⁹⁷⁰

Nunapitchuk is located within the boundaries of the Yukon Delta National Wildlife Refuge (NWR). The NWR was established "to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity."⁹⁷¹

Geological formations in the Nunapitchuk area are not indicative of metallic mineral deposits. The greatest concentration of known mineral occurrences in the Lower Kuskokwim River region is located east of Nunapitchuk, in the region of the Kilbuk Mountains. In addition,

four exploratory oil wells were drilled near Nunavakpak Lake, just southwest of Nunapitchuk. These wells were dry and have been plugged and abandoned.⁹⁷²

According to a local hazard mitigation plan published by the City of Bethel in 2008, the Nunapitchuk area is at high risk of floods, severe weather, and erosion. The threat of earthquakes is also noted. The plan addresses the role of climate change in exacerbating threats from flooding and erosion. Warming temperatures have led to thawing permafrost. This has caused severe subsidence, which constrains development of resources, transportation and utility systems, and community expansion. In addition, delayed formation of protective shore ice along the coast leaves shorelines more vulnerable to fall storms and storm surges, resulting in increased flooding and erosion.⁹⁷³

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Nunapitchuk as of July 2012.⁹⁷⁴

Current Economy⁹⁷⁵

In 2010, top employers of Nunapitchuk residents included local government offices, the Lower Kuskokwim School District, the local village Native corporation, regional health and other service providers, utilities, and the State of Alaska.⁹⁷⁶ Commercial fishing and subsistence activities are also important for local economy and culture.⁹⁷⁷ Between 2000 and 2010, the number of Nunapitchuk residents holding state Commercial Fisheries Entry Commission (CFEC) varied between 52 and 56, equivalent to between 10% and 11.5% of the total local population. A majority of CFEC permits were held in the Kuskokwim set gillnet fishery (see *Commercial Fisheries* section).

Based on household surveys for the 2006-2010 ACS,⁹⁷⁸ in 2010, the per capita income in Nunapitchuk was estimated to be \$12,321 and the median household income was estimated to be \$38,281. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$8,411 and \$29,286, respectively). If inflation is taken into account by converting the 2000 values to 2010 dollars,⁹⁷⁹ real per capita income in 2000 was \$10,999 and real median household income was \$38,511, revealing that while per capita income shows a real increase, median household income remained stable over the period. In 2010, Nunapitchuk ranked 236th of 305 Alaskan communities with per capita income data that year, and 198th in median household income, out of 299 Alaskan communities with household income data.

⁹⁷⁸ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁹⁷⁹ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

However, Nunapitchuk's small population size may have prevented the ACS from accurately portraying economic conditions.⁹⁸⁰ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Nunapitchuk in 2010 is \$6,541.⁹⁸¹ This estimate is lower than the 2000 per capita income reported in by the U.S. Census, suggesting that caution is warranted when citing an increase in per capita income in Nunapitchuk between 2000 and 2010. The lower per capita income estimate derived from the ALARI database is reflected in the fact that the community was recognized as "distressed" by the Denali Commission in 2011,⁹⁸² indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a lower percentage of Nunapitchuk residents were estimated to be in the civilian labor force (66.1%) than was in the civilian labor force statewide (68.8%). Also in 2010, 22.5% of Nunapitchuk residents were estimated to be living below the poverty line, compared to a 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 18.5%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 28.9%, compared to a statewide unemployment rate estimate of 11.5%.⁹⁸³

Also based on the 2006-2010 ACS, a majority of workers were estimated to be employed in the public sector (58.6%), along with 35.7% in the private sector, and 5.7% estimated to be self-employed. Of the 140 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in educational services, health care, and social assistance (48.6%), public administration (17.1%), and retail trade (14.3%). None of the civilian labor force was estimated to be working in agriculture, forestry, fishing, hunting, and mining in 2010. However, the number of individuals employed in farming, fishing and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 226 employed residents in Nunapitchuk in 2010, of which 70.8% were employed in local government, 7.1% in education and health services, 4% in trade, transportation, and utilities, 3.1% in state government, 1.1% in financial activities, 1.3% in information, 0.4% in leisure and hospitality, 0.4% in natural resources and

⁹⁸⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Governance

Nunapitchuk was incorporated as a 2nd Class City in 1969 and is not part of an organized borough. A 4% sales tax is collected by the City. The City has a Strong Mayor form of government, including a seven-person city council which includes the Mayor, a nine-person advisory school board, and several municipal employees. The City administers a 4% sales tax, and no other taxes.⁹⁸⁵ In addition to sales tax revenues, other locally-generated revenue sources in Nunapitchuk include building leases, building and equipment rentals, service fees from the washeteria/sauna, water/sewer, and garbage collection, and bingo and pull tab receipts. Outside revenue sources during the 2000-2010 period included various state and federal revenue sharing programs, including state fish tax refunds (see the *Fisheries-Related Revenue* section of this profile), contributions from the federal Payment in Lieu of Taxes program, and contributions from the State Revenue Sharing and Community Revenue Sharing programs. Nunapitchuk received contributions from the State Revenue Sharing program of approximately \$30,000 per year between 2000 and 2003, and larger contributions from the state Community Revenue Sharing program in 2009 and 2010. No information was reported regarding receipt of fisheries-related grants in Nunapitchuk during this period. Information about selected aspects of Nunapitchuk’s municipal revenue is presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Nunapitchuk from 2000 to 2010.

Nunapitchuk was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Native Village of Nunapitchuk. The Native village corporation is Nunapitchuk, Limited, which manages 115,200 acres of land.⁹⁸⁶ Nunapitchuk belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.⁹⁸⁷

Nunapitchuk is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”⁹⁸⁸ The AVCP is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.⁹⁸⁹ AVCP is made up of 56 villages and 45 village corporations.⁹⁹⁰

The closest offices of the Alaska Department of Fish and Game (ADF&G) and Alaska Department of Commerce, Community, and Economic Development (DCCED) are located in Bethel. A National Marine Fisheries Service (NMFS) field office is located in Bethel and a main office is located in Anchorage. The nearest offices of the Alaska Department of Natural Resources (DNR) and the Bureau of Citizenship and Immigration Services are located in Anchorage.

Infrastructure

Connectivity and Transportation

A state-owned 2,420 feet long by 75 feet wide gravel airstrip provides chartered or private air access year-round.⁹⁹¹ The approximate cost to travel by air roundtrip to Anchorage from Nunapitchuk in early June 2012 was \$588.⁹⁹² A dock, small boat harbor, and seaplane landing area are available on the Johnson River. Snowmobiles, ATVs, and dogsleds are used in winter months. Winter trails exist to Atmautluak (7 miles) and Akula Heights (2.5 miles).⁹⁹³

Facilities

Water in Nunapitchuk is derived from a community well and is filtered and chlorinated. Some homes have a flush/haul system, with water delivery and tank hauling services. Other households haul their own water from a central community tap, and use honeybuckets. Honeybuckets are emptied into sewage containers located throughout the City, and these are emptied into one of two sewage lagoons (one on either side of the river). Some outhouses are also in use. The City provides piped water to the school. Teachers' housing, located in the old school building, has an independent water and sewer system. The City operates a landfill and provides refuse collection services. Electricity is provided in the community by a diesel powerhouse, operated by the Rural Electrification Administration (REA) Co-op.⁹⁹⁴ With funding received from the Denali Commission, a new bulk fuel tank farm and automated, fuel-efficient power plant was built in Kasigluk in 2006, along with three 100kW wind turbines. Power is provided to Nunapitchuk via an electric intertie from Kasigluk.⁹⁹⁵

Police services are provided in Nunapitchuk by two Village Public Safety Officers (VPSO) stationed locally,⁹⁹⁶ as well as a City Village Police Officer and state troopers stationed in Bethel. Fire and rescue services are provided by the state troopers, VPSOs, the City, and a volunteer fire department. Additional community facilities include a City Recreation Center, a Community Building, and a school library. Internet, cable, and telephone service are available in Nunapitchuk.⁹⁹⁷

Medical Services

A local health clinic is owned by the City and operated in conjunction with the Yukon-Kuskokwim Health Corporation. The Eliza Maxie Memorial Clinic is a Community Health Aide Program site. Emergency Services have river, air, and floatplane access. Emergency service is provided by a health aide.⁹⁹⁸ The nearest hospital is located in Bethel.

Educational Opportunities

There is one school in the community, which offers preschool through 12th grade. As of 2011, the Anna Tobeluk Memorial School had a total of 178 students and 13 teachers.⁹⁹⁹ In addition, the Rural Alaska Community Action Program (RurAL CAP) runs Head Start (ages 3 to 5 years) and Early Head Start (birth to 3 years) programs in Nunapitchuk.¹⁰⁰⁰

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Nunapitchuk area for thousands of years.¹⁰⁰¹ Subsistence salmon harvest continues to be a primary economic activity along the Kuskokwim River. In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.¹⁰⁰²

Commercial harvest of salmon first took place in the Kuskokwim River in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. When Alaska became a state in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s, commercial salmon fisheries in the Kuskokwim River were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels, and salmon prices decreased. Current state-dictated management is focused on sustainability of salmon runs, ensuring first that subsistence needs are met, and providing opportunity for commercial harvest of available surpluses.¹⁰⁰³

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Between 2000 and 2010, Nunapitchuk residents held permits in the Goodnews Bay roe and foot/bait herring fishery and the Bristol Bay spawn on kelp, hand pick herring fishery. (For more information see the *Commercial Fisheries* section of this profile.) The largest aggregation of herring in Alaska spawns along the northern shore of Bristol Bay, near the village of Togiak. Spawning herring are harvested using purse seines and gillnets in the Togiak sac roe fishery. A spawn-on-kelp harvest is also taken, primarily by local residents. Along the coast of the Yukon-Kuskokwim Delta there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.¹⁰⁰⁴

Nunapitchuk is located closest to the Lower Kuskokwim salmon fishing district (District 1). The closest marine area to Nunapitchuk, Kuskokwim Bay, is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Nunapitchuk is a member of the Coastal Villages Region Fund (CVRF), a Community Development Quota group that promotes employment opportunities for

¹⁰⁰⁴ See footnote 1002.

residents as well as participation in the Bering Sea crab and groundfish fisheries.¹⁰⁰⁵ Nunapitchuk is not eligible to participate in the Community Quota Entity program.

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Nunapitchuk. However, the Intent to Operate list does list *a small processing facility in nearby Bethel. The plant, run by Kuskokwim Seafoods LLC, was started in 2010 to provide a market to local salmon fishers to help them sell their catch closer to home. Kuskokwim Seafoods processes four salmon species: Chinook, sockeye, chum, and coho.*¹⁰⁰⁶

Fisheries-Related Revenue

According to information provided in Nunapitchuk's annual municipal budget between 2000 and 2010, the primary sources of fisheries-related revenue in Nunapitchuk were a raw fish tax and the Shared Fisheries Business Tax. In 2010, Nunapitchuk received \$100 in raw fish tax revenues and \$116 from the Shared Fisheries Business Tax. That year, the City also received \$130 from the Fisheries Resource Landing Tax. During the 2000-2010 period, 2010 was the only year in which revenue was reported from the Shared Fisheries Business Tax. Information about fisheries-related revenue is presented in Table 3.¹⁰⁰⁷

It is also important to note that the CVRF uses fisheries revenue from CDQ revenue to provide grants, scholarships and training, and other financial assistance to fishermen and residents of member villages.¹⁰⁰⁸

Commercial Fishing

Between 2000 and 2010, Nunapitchuk residents participated in commercial fisheries as crew members, vessel owners, and permit holders. In 2010, 54 Nunapitchuk residents held a total of 56 Commercial Fisheries Entry Commission (CFEC) permits, including 46 salmon permits in the Kuskokwim River gillnet fishery, 2 salmon permits in the Bristol Bay drift gillnet fishery, 7 permits in the Goodnews Bay herring roe and foot/bait fishery, and 1 permit in the Bristol Bay herring spawn on kelp, hand pick fishery. These permit numbers were stable between 2000 and 2010, although the percentage of permits that were actively fished declined in both salmon and herring fisheries over the period. Two out of six herring permits (33%) were actively fished in 2000, but starting in 2001 none were fished. After the year 2000, when 42 out of 51 (82%) salmon permits were actively fished, the number fell to 19 out of 50 fished (38%) in 2003. By 2010, the number had climbed again to 28 out of 48 salmon permits actively fished (58%). It is important to note that, in the year 2000, one 'other finfish' CFEC permit was also held by a resident of Nunapitchuk. The permit was held for the statewide freshwater fish set gillnet fishery.

¹⁰⁰⁶ Kuskokwim Seafoods LLC. (n.d.). *Homepage*. Retrieved August 2011 from <http://kuskokwimseafoods.com/>.

¹⁰⁰⁷ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

¹⁰⁰⁸ See footnote 1005.

Between 2000 and 2010, no Nunapitchuk residents held either Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP). Information about permits held by Nunapitchuk residents is presented in Table 4. Likewise, no Nunapitchuk residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab between 2000 and 2010. Information about federal catch share participation is presented in Tables 6 through 8.

In 2010, a total of 42 Nunapitchuk residents held commercial crew licenses and 3 fishing vessels were primarily owned by Nunapitchuk residents. The number of crew license holders fluctuated during the decade, with 61 in 2000 falling to 11 in 2003, and climbing again to 42 in 2010. The number of vessels owned by Nunapitchuk residents declined substantially from 2000, when 14 vessels were owned, to 3 owned in 2010. The number of vessels homeported in Nunapitchuk followed a similar pattern, with 12 in 2001 and only 2 in 2010.

No landings were recorded in Nunapitchuk between 2000 and 2010 (Table 9), given the lack of fish buyers in the community (Table 5). Information about landings and ex-vessel revenue generated by vessels owned by Nunapitchuk residents (irrespective of delivery locations) is largely considered confidential between 2000 and 2010 due to the small number of participants, with the exception of salmon harvest data in 2005. That year, Nunapitchuk vessel owners landed 84,540 net pounds of salmon, valued at \$31,681 in ex-vessel revenue. Information about commercial harvest and ex-vessel revenue earned by vessel owners residing in Nunapitchuk is presented in Table 10.

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses or licensed sport fish guides were present in Nunapitchuk. However, residents of Nunapitchuk did participate in sportfishing. Between 2000 and 2010, the number of Nunapitchuk residents that purchased sportfishing licenses (irrespective of point of sale) varied between 27 and 80 per year. Between 2000 and 2003, no sportfishing licenses sold locally. However, starting in 2004, license sales were reported, varying between 34 and 100 licenses sold per year from 2004 to 2010. The fact that a greater number of licenses were sold in the City than were purchased by Nunapitchuk residents indicates that sport fisheries brought a small influx of non-locals to the community.

The Alaska Statewide Harvest Survey,¹⁰⁰⁹ conducted by ADF&G between 2000 and 2010, did not provide information regarding the species targeted by private anglers on the Johnson River near Nunapitchuk. However, the survey did note the following species as targeted by private anglers in Napakiak, located on the main stem of the Kuskokwim River: Dolly Varden char, northern pike, and whitefish. No kept/release log book data were reported for fishing charters out of Nunapitchuk between 2000 and 2010.¹⁰¹⁰

Nunapitchuk is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Nunapitchuk is displayed in Table 11.

Subsistence Fishing

Subsistence activities are a focal point of Nunapitchuk culture.¹⁰¹¹ Results of a subsistence survey conducted by ADF&G in 1983 suggest that the community has a high dependence on fish resources, including all five species of Pacific salmon, as well as a variety of non-salmon fish.¹⁰¹² In the 1983 survey, 100% of households reported harvesting pike, 94% reported harvesting whitefish, 77% reported harvest of burbot, 53% reported harvest of blackfish, and 12% reported harvest of sheefish. In addition, the 1983 ADF&G survey found that 29% of households reported harvesting seal for subsistence purposes that year. No information was provided regarding the species of seal harvested.¹⁰¹³ Kuskokwim Bay is an important site for both seal and beluga whale hunts. In addition, waterfowl are an important subsistence resource

¹⁰¹³ Alaska Department of Fish and Game. 2011. *Community Subsistence Information System (CSIS)*. ADF&G Division of Subsistence. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sb/CSIS/> (Accessed February 2011).

during spring, late summer, and early fall. A 1989 ADF&G study of subsistence territory found that Nunapitchuk residents used an area of approximately 2,500 to 3,000 square miles for subsistence harvest of fish and wildlife resources.¹⁰¹⁴

A subsistence survey conducted by ADF&G in 2004 found that 4% of Nunapitchuk households participated in Pacific halibut subsistence and 53% of Nunapitchuk households participated in non-salmon fish subsistence (other than halibut). No information was reported regarding the species of non-salmon fish included in this harvest. Likewise, no information was reported regarding the percentage of households participating in salmon, marine mammal, or marine invertebrate subsistence that year, and no information was reported regarding per capita subsistence in the community that year (Table 12). However the total pounds of non-salmon fish harvested by Nunapitchuk residents for subsistence purposes was reported for 2004: 89,846 pounds (Table 13).

Data are available during the 2000-2010 period regarding subsistence salmon permits. From 2000 to 2008, the number of Nunapitchuk households that were issued subsistence salmon permits varied between 102 and 115 per year. On average, 4,899 chum, 3,732 Chinook, 1,905 sockeye, and 711 coho salmon were harvested per year. Between 2005 and 2007, harvest of several pink salmon per year was also reported. Information about subsistence salmon permits and harvest is presented in Table 13.

One Subsistence Halibut Registration Certificate (SHARC) was issued to a Nunapitchuk resident each year in 2004 and 2005. However, no information was reported about the number of SHARC cards that were returned or the total pounds of subsistence halibut harvested by Nunapitchuk residents during these years (Table 14). In addition, no information was reported by management agencies regarding subsistence harvest of marine mammals by Nunapitchuk residents between 2000 and 2010 (Table 15).

Oscarville (a.k.a. Kuiggayagaq)

People and Place

*Location*¹⁰¹⁵

Oscarville is located on the north bank of the Kuskokwim River, directly across the river from the community of Napaskiak. It lies 6 miles southwest of Bethel and 401 miles west of Anchorage. Oscarville is located in the Bethel Recording District and Bethel Census Area.

*Demographic Profile*¹⁰¹⁶

In 2010, there were 70 inhabitants in Oscarville, making it the 280th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population of Oscarville increased by 22.8%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 78.7%, with an average annual growth rate of 7.48%. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that three seasonal workers are present in Oscarville for approximately three months during the summer to work at the cannery. In addition, they estimated that three local residents also work at the shore-side processing facility. Community leaders also indicated that population fluctuations in Oscarville are mostly driven by activity and employment in fishing sectors.

In 2010, a majority of Oscarville residents identified themselves as American Indian and Alaska Native (91.4%), while 2.9% identified themselves as White, 1.4% identified themselves as Asian, and 4.3% identified with two or more races. No residents of Oscarville identified themselves as Hispanic in 2000 or 2010. The percentage of the community identifying themselves as White fluctuated substantially in recent decades, with 8.8% in 1990, 0% in 2000, and 2.9% in 2010. The percentage of the community that identified as American Indian or Alaska Native increased from 91.2% to 98.4% in 2000, then declined to 91.4% by 2010. It is important to note that, if counting individuals who identified themselves as Native and those who identified as Native in combination with one or more races, 100% of the Oscarville population identified themselves as Native in the year 2000. In addition, a small Asian population appears to have come to Oscarville between 2000 and 2010. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

Between 1990 and 2010, the number of occupied households in Oscarville remained constant at 15. Over the same period, the average household size increased, from 3.8 persons per household in 1990 to 4.07 in 2000, and 4.67 in 2010. Of the 30 housing units surveyed for the 2010 U.S. Census, 40% were owner-occupied, 10% were rented, and 50% were vacant or used only seasonally. Between 1990 and 2010, no residents of Oscarville were estimated to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Oscarville: 2000-2010 (U.S. Census).

In 2010, the gender makeup of Oscarville’s population (52.8% male and 47.2% female) was slightly less gender balanced than the state population as a whole, which was 52% male and 48% female. That year, the median age of Oscarville residents was 22.5 years, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 8.6% of Oscarville’s population was 60 or older. The overall population structure of Oscarville in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Oscarville Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),¹⁰¹⁷ 58.1% of Oscarville residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 21% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 21% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 19.4% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 0% were estimated to have an Associate's degree, compared to 8% of Alaska residents overall; 0% were estimated to have a Bachelor's degree, compared to 17.4% of Alaska residents overall; and 0% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Yup'ik Eskimos have inhabited the Kuskokwim area for thousands of years. Historically, Yup'ik people were very mobile, traveling with the migration of game and fish resources. Ancient settlements and seasonal camps contained small populations, with numerous settlements throughout the region consisting of extended families or small groups of families.¹⁰¹⁸ Today, Oscarville residents continue to practice a subsistence lifestyle, along with some commercial fishing.¹⁰¹⁹

The village of Oscarville was first reported in the U.S. Census in 1940 with a population of 11. The community was founded in 1908 when Oscar Samuelson and his wife, a Yup'ik from the Nushagak region, moved from Napaskiak across the river and opened a trading post. A few Native families settled nearby and the site came to be known as Oscarville. Samuelson managed the store for 45 years, until his death in 1953. By 1955, there were 13 homes and two warehouses in the village. The Samuelsons continued to operate the store until 1975 when it was sold. The store finally closed in the early 1980s. A school was built by the Bureau of Indian Affairs (BIA) in 1964.¹⁰²⁰

Natural Resources and Environment

Oscarville is strongly influenced by storms and patterns in the Bering Sea and also by inland continental weather. Average annual precipitation is 16 inches, with 50 inches of snowfall. Summer temperatures range from 42 to 62 °F, and winter temperatures average -2 to 19 °F. The Kuskokwim River is typically ice-free from June through October.¹⁰²¹

Oscarville is located within the boundaries of the Yukon Delta National Wildlife Refuge (NWR). The Yukon Delta NWR was established “to conserve fish and wildlife populations and

¹⁰¹⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁰²¹ Ibid.

habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” Most of the Yukon Delta NWR is a vast, flat wetland/tundra complex dotted by countless ponds, lakes, and meandering rivers. Approximately half of the NWR is covered by water. Many streams and sloughs are former tributaries of the two major rivers. Some forest habitat is present along rivers and in the Kilbuck Mountains, located in the southeastern part of the Yukon Delta NWR, directly east of Oscarville. Moose, caribou, brown bear, and black bear can be found in this mountain range, which rises to between 2,000 and 4,000 feet in elevation.¹⁰²²

Both Togiak NWR and Wood-Tikchik State Park are located less than 100 miles southeast of Oscarville. Togiak NWR covers 4.7 million acres, of which the northern 2.3 million acres are designated as Togiak Wilderness Area. Like the Yukon Delta NWR, the Togiak NWR protects the habitat of a wide array of birds, fish and mammals. East of Togiak NWR, Wood-Tikchik State Park is the largest state park in the United States. The park includes a diversity of terrain and ecosystems. The Wood River and Tikchik systems host all five species of Pacific salmon, along with rainbow trout, grayling, lake trout, Arctic char, Dolly Varden, and northern pike. Tikchik Lake is an important site for whitefish subsistence harvest. Moose, caribou, and brown bear are common in the park, along with black bear in limited area of the park. Small game present in the area includes beaver, muskrat, otter, fox, wolverine, mink, and porcupine. Ground squirrels and marmots are abundant, along with a variety of resident and migratory waterfowl and land birds.¹⁰²³

According to a local hazard mitigation plan conducted by the City of Bethel in 2008, the Oscarville area is at high risk of floods, severe weather, and erosion. The threat of earthquakes is also noted. The plan addresses the role of climate change in exacerbating threats from flooding and erosion. Warming temperatures have led to thawing permafrost. This has caused severe subsidence, which constrains development of resources, transportation and utility systems, and community expansion. In addition, delayed formation of protective shore ice along the coast leaves shorelines more vulnerable to fall storms and storm surges, resulting in increased flooding and erosion.¹⁰²⁴

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Oscarville as of May 2012.¹⁰²⁵

Current Economy¹⁰²⁶

In a survey conducted by the AFSC in 2011, community leaders reported that the Oscarville economy is highly dependent on fishing. Subsistence harvest provides most food sources in Oscarville. Important subsistence resources include salmon, waterfowl, moose, bear,

¹⁰²⁶ Unless otherwise noted, all monetary data are reported in nominal values.

and seals.¹⁰²⁷ Between 2000 and 2009, one state fishery permit was held each year in the Kuskokwim salmon gillnet fishery. Community leaders reported in the AFSC survey that the local salmon fishery takes place in August and September. In addition to fishing activity, top local employers in Oscarville in 2010 included the school, regional health care and social service providers, and the regional Community Development Quota (CDQ) group, the Coastal Villages Region Fund (CVRF).¹⁰²⁸ Trapping and handicrafts also provide some income.¹⁰²⁹

Based on household surveys conducted for the 2006-2010 ACS,¹⁰³⁰ in 2010, the per capita income in Oscarville was estimated to be \$9,973 and the median household income was estimated to be \$57,813. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$5,824 and \$8,125, respectively). The increase in income remains substantial even if inflation is taken into account by converting the 2000 values to 2010 dollars,¹⁰³¹ revealing a real per capita income in 2000 of \$7,658 and a real median household income of \$10,684. In 2010, Oscarville ranked 276th of 305 Alaskan communities with per capita income data that year, and 85th in median household income, out of 299 Alaskan communities with household income data.

Although Oscarville's small population size may have prevented the ACS from accurately portraying economic conditions,¹⁰³² the 2010 ACS per capita income estimate is supported by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Oscarville in 2010 is \$8,182.¹⁰³³ This is very close to the 2006-2010 ACS estimate, and provides additional evidence that per capita income increased in Oscarville between 2000 and 2010. Despite this apparent increase in per capita income, in 2010, the community was recognized as "distressed" by the Denali Commission in 2011,¹⁰³⁴ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a smaller percentage of Oscarville residents were estimated to be in the civilian labor force (58.5%) than were estimated to be in the civilian labor

force statewide (68.8%). In the same year, 54.7% of local residents were estimated to be living below the poverty line, compared to a 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 24.6%, compared to a statewide unemployment rate of 5.9%. A very different picture of unemployment is provided by data compiled on the ALARI database, which indicates that a very low percentage of the Oscarville population was unemployed in 2010 (5.7%), compared to a statewide unemployment rate estimate of 11.5%.¹⁰³⁵

Also based on the 2006-2010 ACS, a majority of Oscarville workers were estimated to be employed in the public sector (59.1%), with the remaining 40.9% in the private sector. Of the 22 people aged 16 and over that were estimated to be employed in the civilian labor force, 59.1% were estimated to be working in educational services, health care, and social assistance, 22.7% in agriculture, forestry, fishing, hunting, and mining, and 18.2% in public administration. No Oscarville residents were estimated to be working in agriculture, forestry, fishing, hunting, and mining in 2010. However, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 26 employed residents in Oscarville in 2010, of which 38.5% were employed in local government, 19.2% in financial activities, 15.4% in educational and health services, and 26.9% in other industries.¹⁰³⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

¹⁰³⁶ Ibid.

Figure 4. Local Employment by Occupation in 2000-2010, Oscarville (U.S. Census).

Governance

Oscarville is an unincorporated community, and is not part of an organized borough.¹⁰³⁷ No taxes are collected in the community.¹⁰³⁸ Because it is not incorporated and there is no taxing authority, no municipal revenue or sales tax revenue was reported for Oscarville between 2000 and 2010. The community did not receive State or Community Revenue Sharing contributions between 2000 and 2010, and no state or federal fisheries-related grants were reported during the period. Information about selected revenue sources in Oscarville is presented in Table 2.

Oscarville was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the BIA, is the Oscarville Traditional Village. The Native village corporation is the Oscarville Native Corporation, which manages 69,120 acres of land.¹⁰³⁹ Oscarville belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.¹⁰⁴⁰

Oscarville is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”¹⁰⁴¹ The AVCP is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these

Infrastructure

Connectivity and Transportation

Oscarville relies on Napaskiak for passenger, mail, and cargo services throughout the year. During the summer residents use skiffs to pick up mail in Napaskiak or to shop in Bethel. Snow machines and ATVs are used in winter, when the river serves as an ice road. A winter trail is marked along the river to Bethel. The community can be periodically isolated during breakup

¹⁰⁴² U.S. Government Accountability Office. 2005. *Alaska Native Villages: Report to Congressional Addressees and the Alaska Federation of Natives*. Retrieved February 7, 2012 from <http://www.gao.gov/new.items/d05719.pdf>.

and freezeup.¹⁰⁴⁴ Commercial air service from Bethel to Napaskiak is provided daily by Grant Aviation¹⁰⁴⁵ and Yute Air.¹⁰⁴⁶ Ryan Air Service also provides air freight delivery services three days per week.¹⁰⁴⁷ The price of a roundtrip ticket between Bethel and Napaskiak on Grant Aviation or Yute Air as of March 2012 was approximately \$160.¹⁰⁴⁸ The approximate cost to travel by air roundtrip to Anchorage from Bethel in early June 2012 was \$368.¹⁰⁴⁹ Barge services deliver goods directly to Oscarville once a year.¹⁰⁵⁰

Facilities

Water in Oscarville is retrieved from a community well operated by the Village Council. The water is filtered and chlorinated and stored at the washeteria. No water delivery services are available, and local residents haul water from the washeteria. There is no piped water or sewer system. Residents use honeybuckets and outhouses, and a sewage lagoon is also located near the community. The Village Council operates a landfill in Oscarville, but no refuse collection services are provided. Bethel Utilities Corporation provides electricity via a diesel powerhouse. There are no police, fire, or rescue services stationed in Oscarville.¹⁰⁵¹ Two Village Public Safety Officers¹⁰⁵² and a volunteer fire department are located across the river in Napaskiak, and a state trooper post is located nearby in Bethel. Few community facilities or services are located in Oscarville. Residents travel across the river to Napaskiak to use the post office. Additional community facilities available in Napaskiak include a library at the school, a city office building, and a holding cell. Telephone service is available in Oscarville, but no internet or cable providers offer service locally.¹⁰⁵³

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that no dock space is available in Oscarville. They indicated that the only boats present in Oscarville are up to 24 feet in length. Community leaders also indicated that no fisheries-related businesses and services are available locally, and community members travel to Napaskiak, Napaskiak, or Bethel to access necessary services.

Medical Services

A local health clinic is owned by the Village Council and operated in conjunction with the Yukon-Kuskokwim Health Corporation. The Oscarville Health Clinic is a Community Health Aide Program site. Emergency Services have river and helicopter access. Emergency service is provided by a health aide.¹⁰⁵⁴ The nearest hospital is located in Bethel.

Educational Opportunities

There is one school in the community, which offers preschool through 12th grade. As of 2011, the Qugcuun Memorial School had a total of 28 student and 7 teachers.¹⁰⁵⁵

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Oscarville area for thousands of years.¹⁰⁵⁶ Subsistence salmon harvest continues to be a primary economic activity along the Kuskokwim River.¹⁰⁵⁷ In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs is an important subsistence resource for coastal Alaskan communities.¹⁰⁵⁸

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood in 1959, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.¹⁰⁵⁹

Oscarville is located in the Lower Kuskokwim salmon fishing district (District 1). The closest marine area to Oscarville, Kuskokwim Bay, is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Oscarville is a member of the CVRF, a CDQ group that promotes employment opportunities for residents, as well as participation in the Bering Sea crab and groundfish fisheries.¹⁰⁶⁰ Oscarville is not eligible to participate in the Community Quota Entity (CQE) program. In a survey conducted by the AFSC in 2011, community leaders indicated that Oscarville does not actively participate in fisheries management processes in Alaska.

¹⁰⁶⁰ Coastal Villages Region Fund (n.d.). *Homepage*. Retrieved December 12, 2011 from <http://www.coastalvillages.org/>.

Processing Plants

The 2010 ADF&G Intent to Operate list does not list a registered processing plant in Oscarville. According to a survey of processing plants conducted by the AFSC in 2011, a small processing facility is located in nearby Bethel. The plant, run by Kuskokwim Seafoods LLC, was started in 2010 to provide a market to local salmon fishers to help them sell their catch closer to home. Kuskokwim Seafoods processes four salmon species: Chinook, sockeye, chum and coho.¹⁰⁶¹ As of 2012, Coastal Village Seafoods, a subsidiary of CVRF, also operated a fish-buying operation along the Kuskokwim River, with a tender often located across from Oscarville at Napaskiak.¹⁰⁶²

Fisheries-Related Revenue

Between 2000 and 2010, no data were reported about fisheries-related revenue received by Oscarville (Table 3).¹⁰⁶³ It is also important to note that CVRF uses fisheries revenue from their CDQ revenue to provide grants, scholarships and training, and other financial assistance to fishermen and residents of member villages.¹⁰⁶⁴ However, in the 2011 AFSC survey, community leaders reported that Oscarville did not receive funding or grants from CVRF in 2010.

Commercial Fishing

Between 2000 and 2009, one Commercial Fisheries Entry Commission (CFEC) permit was held by an Oscarville resident each year, and no CFEC permits were held in 2010 (Table 4). In addition, during the 2000-2010 period, no Oscarville residents held commercial crew licenses, and no residents were the primary owner of a fishing vessel. However, one fishing vessel was reported to be homeported in Oscarville from 2000 to 2003. According to a survey conducted by the AFSC in 2011, community leaders indicated that the only fishing vessels based out of Oscarville were 24 feet in length or shorter, and the most common gear type used was gillnet. No fish buyers or shore-side processors were located in the community during this period (Table 5).

For all years between 2000 and 2009, the CFEC permit was held in the Kuskokwim salmon gillnet fishery (Table 4). The permit was actively fished in 4 years during this period, including 2001 and 2007-2009. During the 2000-2010 period, no Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP) were held by Oscarville residents in federal crab or groundfish fisheries, and no quota share accounts or quota shares were held in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 through 8).

Given that no fish buyers or processors were present in the community of Oscarville from 2000 to 2010 (Table 5), no landings or ex-vessel revenue were recorded during the period (Table 9). In addition, since no fishing vessels were primarily owned by Oscarville residents, no information was reported about landings and ex-vessel revenue generated by Oscarville vessel owners (Table 10).

Recreational Fishing

According to a survey conducted by the AFSC in 2011, community leaders indicated that very little sportfishing takes place in Oscarville. No active sport fish guide businesses were present in Oscarville between 2000 and 2010, and no licensed sport fish guides resided in the community. Given the lack of charter businesses, no kept/release log book data were reported for fishing charters out of Oscarville between 2000 and 2010.¹⁰⁶⁵ Further, no Oscarville residents were reported to have purchased sportfishing licenses between 2000 and 2010, and no fishing licenses were sold in Oscarville (Table 11). However, when asked to identify species targeted by local sportfishing activity, community leaders indicated in the AFSC survey that chum, Chinook, coho, and sockeye salmon are local sport species. The Alaska Statewide Harvest Survey,¹⁰⁶⁶ conducted by ADF&G between 2000 and 2010, did not report any information about species targeted by recreational fishermen in Oscarville. However, the survey noted the following species targeted by private anglers in nearby Napaskiak and Napakiak: coho salmon, Dolly Varden char, whitefish, and northern pike in freshwater, and Pacific halibut in saltwater.

Oscarville is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between 0 and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Oscarville is displayed in Table 11.

Subsistence Fishing

Subsistence harvest activities are an integral part of the Oscarville lifestyle and provide most of the food sources for local families.¹⁰⁶⁷ Salmon is the primary subsistence fish for most Kuskokwim River communities. Whitefish are also an important resource that are primarily harvested in spring and fall, but are available year-round.¹⁰⁶⁸ Waterfowl, moose, bear, and seals are also utilized by Oscarville residents.¹⁰⁶⁹

Based on an ADF&G subsistence survey, in 2010, 95% of Oscarville households participated in salmon subsistence, 66% participated in marine mammal subsistence, and 87% participated in non-salmon fish subsistence (not including halibut). No information was reported regarding participation in halibut or marine invertebrate subsistence. The ADF&G subsistence

¹⁰⁶⁹ See footnote 1067.

survey estimated per capita annual subsistence harvest of land and sea-based resources in Oscarville to be 2,140 that year (Table 12).

Additional data are available from ADF&G regarding subsistence salmon permits and total subsistence harvest by Oscarville households from 2000 through 2008 regarding subsistence salmon permits. Between 2000 and 2008, the number of Oscarville households that were issued subsistence salmon permits varied from 13 to 20 per year. Chinook and chum were the most heavily harvested species during this period, with an average of 1,202 Chinook and 1,063 chum harvested per year. In addition, an average of 682 sockeye were harvested per year, along with over 100 coho and over 50 pink salmon per year. No information was reported regarding total subsistence harvest of marine invertebrates and non-salmon fish (not including halibut) (Table 13).

No information was reported regarding participation by Oscarville residents in the Subsistence Halibut Registration Certificate (SHARC) program during the 2000-2010 period (Table 14). Likewise, no data were reported by management agencies regarding subsistence harvest of marine mammals between 2000 and 2010 (Table 15).

In addition to the information reported here regarding Oscarville subsistence harvest patterns, a study conducted in the nearby village of Kwethluk in 1986 provides some insight into area subsistence practices. The study found that, in addition to salmon, Kwethluk residents harvested the following fish species: whitefish, Dolly Varden char, Arctic grayling, smelt, blackfish, rainbow trout, northern pike, burbot, and sheefish. Kwethluk residents also harvested several marine mammal species, including spotted seal, bearded seal, ringed seal, and walrus. These resources were shared between households, and between communities in the region.¹⁰⁷⁰

Platinum

People and Place

*Location*¹⁰⁷¹

Platinum is located on the Bering Sea coast, below Red Mountain on the south spit of Goodnews Bay. It lies 11 miles from the City of Goodnews Bay, 123 miles southwest of Bethel, and 440 miles west of Anchorage. Platinum is located in the Bethel Recording District and Bethel Census Area. The City encompasses 44.6 square miles of land and 0.1 square miles of water.

*Demographic Profile*¹⁰⁷²

In 2010, there were 61 residents in Platinum, making it the 188th largest of 352 Alaskan communities with populations recorded that year. Overall between 1990 and 2010, the population of Platinum stayed relatively stable, decreasing by three residents (4.7%). However, it is important to note that the population declined by more than one-third between 1990 and 2000, and rebounded in population between 2000 and 2010. According to Alaska Department of Labor estimates, the population continued to decline between 2000 and 2007, with a population decrease of 14.6%, before increasing by 62.9% from 2007 to 2009. The average annual growth rate between 2000 and 2009 was 4.92%, reflecting this large population rebound in the final years of the decade.

According to a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that an additional 200 seasonal workers or transients are present each year in Platinum. They indicated that these workers are generally present during summer months, between June and September, and also reported that population fluctuations in Platinum are entirely driven by employment in fishing sectors.

In 2010, a majority of the population of Platinum identified themselves as American Indian or Alaska Native (88.5%), while 4.9% identified as White, 1.6% as Asian, and 4.9% identified with two or more races. In addition, 4.9% of Platinum residents identified as Hispanic in 2010. The percentage of the population identifying as White increased slightly between 1990 and 2000, from 6.3% to 7.3%, and then declined to 4.9% in 2010. The percentage of the population identifying as American Indian and Alaska Natives decreased over time, from 92.2% in 1990 and 90.2% in 2000, to 88.5% in 2010. Over the same period, the percentage of the population identifying with two or more races increased slightly. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Figure 1. Racial and Ethnic Composition, Platinum: 2000-2010 (U.S. Census).

In 2010, the average household size in Platinum was 3.21 persons per household, an increase from household size in 1990 (2.9 persons per household) and 2000 (2.41 per household). The number of households in Platinum decreased slightly from 22 in 1990 to 17 in 2000, and then increased to 19 by 2010. Of the 31 housing units surveyed for the 2010 Decennial Census, 16.1% were owner-occupied, 45.2% were rented, and 38.7% were vacant or used only seasonally. Between 1990 and 2010, no residents of Platinum lived in group quarters.

In 2010, the gender makeup of Platinum’s population was much more weighted toward males (60.7% male, 30.3% female) than the population of Alaska as a whole, which was 52% male and 48% female. The age groups that were particularly heavily skewed toward males in Platinum were ages 0 to 9, 10 to 19, and 40 to 49. The percentage of the population in each of these age groups appears unusually high, but is important to note that a low total population can inflate percentages. For example, there were 10 boys between the ages of 0 and 9 living in Platinum in 2010. Out of a total of 61 individuals in the community, they made up 16.4%, which seems more substantial than the number of individual themselves. It is important to note that the population was more gender balanced in the year 2000, with 51.2% males and 48.8% females that year. In 2010, the median age of Platinum residents was 31.3 years, younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. That year, 18% of Platinum’s population was between 60 and 79 years of age, and no residents were 80 or older. The overall population structure of Platinum in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Platinum Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),¹⁰⁷³ 57.9% of Platinum residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 21.1% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 21.1% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 0% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 0% were estimated to have an Associate's degree, compared to 8% of Alaska residents overall; 0% were estimated to have a Bachelor's degree, compared to 17.4% of Alaska residents overall; and 0% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture

Archaeological evidence indicates the Platinum/Goodnews Bay area has been occupied continuously for at least 2,000 years. One site, south of Platinum at Security Cove, shows evidence of possible habitation dating to 4,000 or 5,000 years ago. Historical inhabitants of the region utilized fish and marine mammal resources, as well as caribou.¹⁰⁷⁴ The original inhabitants of the coastal area between the Kuskokwim River mouth and Chavgan Bay were known as the Kukowogamiut, and the Platinum area may also have been used by the Togiagamiut, who historically populated the Togiak/Dillingham area from Nanvak Bay east to Cape Constantine.¹⁰⁷⁵ The present City of Platinum is located near a traditional Yup'ik Eskimo village site called Arviq,¹⁰⁷⁶ meaning 'bowhead whale.'¹⁰⁷⁷

Captain James Cook was the first European to make contact with the Native peoples of this region, when his expedition encountered Natives in kayaks north of Cape Newenham on July 16, 1778. Russians established fur trading in the region in the following century. Gold was discovered in the 1890s in Alaska. By the turn of the century, mineral discoveries in the Goodnews Bay area brought a flood of miners to the Platinum region.¹⁰⁷⁸ The modern community of Platinum was established shortly after traces of platinum were discovered by an Eskimo named Walter Smith in 1926 in the Salmon River valley.¹⁰⁷⁹

Platinum grew alongside the developing of mining operations in the area. Between 1927 and 1934, several small placer mines¹⁰⁸⁰ were operating on creeks in the area. Approximately

¹⁰⁷³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁰⁷⁹ See footnotes 1075 and 1076.

¹⁰⁸⁰ A "placer" mineral deposit is a deposit of sand or gravel in the bed of a river or lake, containing particles of valuable minerals. (Source: Merriam-Webster dictionary online.)

3,000 ounces of platinum were mined over that period, with a value of about \$48 per ounce. A post office opened in 1935. The “big strike” occurred in October of 1936, which brought a stampede of prospectors for “white gold.” The potential resource claims proved to be too deep for hand-mining methods and were eventually extracted by larger companies. The largest, Goodnews Mining Company, eventually acquired title to over 150 claims. In 1937, a large dredge was built at the mining site, about 10 miles from the Village of Platinum. The company also constructed bunkhouses, a recreation hall, offices, shops, and a cafeteria. Platinum developed as a “company town,” with the store, water, and electricity supplied by the mine. A school opened in 1960. By 1975, 545,000 ounces of platinum had been mined at the site, and a city government was formed. The mine was later sold to Hanson Properties, who estimated reserves of over 500,000 ounces of platinum. The mine ceased operations in 1990.¹⁰⁸¹

Because the community was founded as a commercial center and has always seen an influx of outsiders, local traditions have not been retained as much as in other villages in the region. Platinum is one of the few Eskimo villages in the region in which the first language of the children is English. However, subsistence activities remain important in the community alongside the cash economy. The sale and importation of alcohol is banned in the village.¹⁰⁸²

Natural Resources and Environment

Platinum has a marine climate. Average annual precipitation is 22 inches, with 43 inches of snowfall. Summer highs range from 53 to 57 °F, and winter highs average 6 to 9 °F. Extremes have been measured from -34 to 82 °F.¹⁰⁸³ Platinum is situated on the southern spit at the entrance to Goodnews Bay. The landscape in Platinum and north of Goodnews Bay is characterized by flat tundra and wetlands. South of Platinum, the coast is characterized by sea cliffs. The ground is underlain either by discontinuous permafrost or ground with isolated masses of permafrost.¹⁰⁸⁴

Protected areas in the Platinum area include the Togiak National Wildlife Refuge (NWR), Cape Newenham State Game Refuge, and Wood-Tikchik State Park. The Alaska National Interest Lands Conservation Act (ANILCA) of 1980 expanded the existing Cape Newenham NWR and renamed it Togiak NWR. The City of Platinum is located less than 5 miles from the boundary of the Togiak NWR. In addition, ANILCA designated the northern 2.3 million acres of the 4.7 million-acre NWR as the Togiak Wilderness Area. The NWR is home to 31 land mammal and 17 marine mammal species. Land mammals include two caribou herds (the Nushagak Peninsula and the Mulchatna herds), wolves, moose, brown and black bears, wolverines, red foxes, marmots, beavers, and porcupines. The coastline is home to seals, sea lions, walrus, and whales. In addition, the NWR provides habitat for at least 201 bird species.¹⁰⁸⁵

The boundary of the Cape Newenham State Game Refuge is located less than 10 miles southeast of Platinum. The Game Refuge was established in 1972.¹⁰⁸⁶ One of the most important natural features of the Game Refuge is Chavgan Bay. Herring spawn on eelgrass in the Bay, and

hundreds of thousands of ducks, geese and shorebirds stop there during migrations to and from nesting grounds in the Arctic. Platinum residents use the Cape Newenham State Game Refuge area for subsistence harvest. The Game Refuge provides habitat for a similar array of land and marine mammals found in the Togiak NWR.¹⁰⁸⁷

Wood-Tikchik State Park is located approximately 100 miles east of Platinum. It is the largest state park in the United States, covering 1.6 million acres. The park includes a diversity of terrain and ecosystems, including a series of alpine lakes. The Wood River and Tilchik systems host all five species of Pacific salmon, along with rainbow trout, grayling, lake trout, arctic char, Dolly Varden, and northern pike. Tikchik Lake is an important site for whitefish subsistence harvest.¹⁰⁸⁸

The Goodnews Bay region is rich in mineral deposits. From 1928 to 1975, the Platinum area was the U.S.'s only primary producer of platinum, producing at least 650,000 ounces of platinum group metals and 72,600 ounces of gold. Most of this came from placer deposits in the Salmon River south of Platinum.¹⁰⁸⁹ Indeed, Platinum received its name from this mining activity and developed as a mining company town.¹⁰⁹⁰ In addition to land-based mining exploration, a number of Offshore Prospecting Permit applications have been filed for exploration in Goodnews Bay and outside waters with interest in exploring platinum and gold potential in marine sediments.¹⁰⁹¹

Reserves of oil and natural gas are also thought to be present on the outer continental shelf in the Bristol Bay Basin, which runs along the northern edge of the Aleutian Islands and Alaska Peninsula.¹⁰⁹² However, given the importance of Bristol Bay fisheries to the nation and the proximity of the Bristol Bay Basin to a number of protected areas, in March 2010 Secretary of the Interior Ken Salazar removed the area from oil and gas leasing for the 2007-2012 program.¹⁰⁹³ The Platinum Traditional Village submitted a resolution to show its opposition to opening Bristol Bay to offshore oil and gas development, "because of high risk for harm to the marine resources and way of life."¹⁰⁹⁴ On March 31, 2010, President Obama withdrew the Bristol Bay area of the North Aleutian Basin from oil and gas leasing, whether for exploratory or production purposes, through 2017.¹⁰⁹⁵

Natural hazard risks in the Platinum area include flooding, wildfire, earthquakes, volcanic activity, and severe weather.¹⁰⁹⁶ According to the Alaska Department of Environmental Conservation, no active environmental cleanup sites are located in Platinum as of July 2012.¹⁰⁹⁷

Current Economy¹⁰⁹⁸

As stated previously, the community of Platinum originally grew around development of nearby platinum mining operations. The platinum mine ceased operations in 1990. Today, Platinum is a major supplier of gravel to communities in the region.¹⁰⁹⁹ In 2010, top local employers included local government offices, the Lower Kuskokwim School District, seafood processing, the Native village corporation, construction, and health services.¹¹⁰⁰ Subsistence activities are also important in Platinum, including harvest of marine mammals, salmon, and waterfowl.¹¹⁰¹

Based on household surveys conducted for the 2006-2010 ACS,¹¹⁰² in 2010, the per capita income in Platinum was estimated to be \$14,100 and the median household income was estimated to be \$17,500. This was an increase compared to the per capita income reported in 2000 (\$7,632), but a decrease from the reported median household income (\$21,250 in 2000). If inflation is taken into account by converting the 2000 values to 2010 dollars,¹¹⁰³ the real per capita income in 2000 is shown to have been \$10,036 and the real median household income was \$27,943, revealing an even greater decrease in household income between 2000 and 2010. In 2010, Platinum ranked 213th of 305 Alaskan communities with per capita income data that year, and 284th in median household income, out of 299 Alaskan communities with household income data.

Platinum's small population size may have prevented the ACS from accurately portraying economic conditions.¹¹⁰⁴ An alternative estimate of 2010 per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Platinum in

¹⁰⁹⁶ State of Alaska. 2002. *Hazard Mitigation Plan*. Retrieved February 8, 2012 from <http://biotech.law.lsu.edu/blaw/DOD/manual/.%5CFull%20text%20documents%5CState%20Authorities%5CAla.%20SHMP.pdf>.

Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹¹⁰³ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹¹⁰⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

2010 is \$10,958.¹¹⁰⁵ This estimate is lower than the ACS estimate, suggesting that caution is warranted when citing an increase in per capita income in Platinum between 2000 and 2010. However, the ALARI estimate is similar to the real per capita income reported in 2000, providing evidence that per capita income may have remained stable over this period. In 2010, Platinum did not meet the Denali Commission’s criteria of a “distressed” community.¹¹⁰⁶ It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a lower percentage of Platinum residents was estimated to be in the civilian labor force (44.4%) than in the civilian labor force statewide (68.8%). In the same year, 55.6% of local residents were estimated to be living below the poverty line, compared to a 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 29.6%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment based on the ALARI database indicates that the unemployment rate in 2010 was 26.2%, compared to a statewide unemployment rate estimate of 11.5%.¹¹⁰⁷

Also based on the 2006-2010 ACS, four people aged 16 and older were estimated to be employed in the civilian labor force. Compared to 2000, this represents a substantial decline in the workforce, from 22 to 4. In addition, it is important to note that many fewer industries and occupations were represented in 2010 than in 2000. In 2010, all four individuals in the civilian labor force (100% of the workforce) were estimated to be working in the private sector, in educational services, health care, and social assistance industries and management/professional occupations. While the concentration of the workforce in fewer industries and occupations may be due to a real population decline in Platinum, it is also important to note that the sampling methods utilized by the U.S. Census Bureau were altered between 2000 and 2010. The shift in sampling methods may also account for some of the differences observed in employment estimates.¹¹⁰⁸ It is also important to note that, while none of the civilian labor force was estimated to be working in fishing-related industries or occupations in 2010, the number of individuals employed by fishing may be underestimated in census statistics. For example, in 2010, 15 Platinum residents (equivalent to approximately 25% of the total local population) held state commercial fishing permits, almost four times the number of residents estimated by the Census Bureau to be employed in the civilian labor force that year. It is important to note that high unemployment rates may not capture fishing employment given the seasonal nature of commercial fishing activity. ACS employment estimates by industry are presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 31 employed residents in Platinum in 2010, of which 45.2% were employed in local government, 19.4% in trade, transportation, and utilities, 12.9% in manufacturing, 9.7% in education and health services, 6.5% in construction, 3.2% in state government, and 3.2% in other industries.¹¹⁰⁹ As with income statistics, it should be noted that ACS and DOLWD employment statistics do not reflect activity in the subsistence economy.

Governance

Platinum is a 2nd Class City and is not part of an organized borough. The City was incorporated in 1975 and has a Strong Mayor form of government, which includes a seven-person city council including the Mayor, a nine-person advisory school board, and a City Clerk. As of 2010, the City did not administer any taxes.¹¹¹⁰ Locally-generated revenue sources in Platinum between 2000 and 2010 included land leases, equipment rental, electric utility service fees, electric utility subsidy, and state-contracted services in some years. Outside revenue sources included shared funds from revenue sharing

¹¹¹⁰ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

programs and grants in some years. From 2000 to 2002, Platinum received State Revenue Sharing contributions of just over \$25,000 per year, and in 2009 and 2010 received Community Revenue Sharing contributions of just under \$100,000 per year. Some shared funds were received from state fish tax refunds (see the *Fisheries-Related Revenue* section of this profile). Small grants were received in some years from the State of Alaska for infrastructure projects including upgrades to the community facility, washeteria, and electric utility. No fisheries-related grant revenue was reported between 2000 and 2010. Refer to Table 2 for details on selected community finances from 2000 to 2010.

Platinum was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Platinum Traditional Village. The Native village corporation is Arviq Incorporated, which manages 69,120 acres of land. Platinum belongs to the Calista Corporation, the regional Native corporation of the lower Yukon River, the central and lower Kuskokwim River, and the Bering Sea coast from the mouth of the Yukon River south to Cape Newenham.¹¹¹¹

Platinum is also a member of the Association of Village Council Presidents (AVCP), a tribal 501(c)(3) non-profit organization headquartered in Bethel that serves communities in the

¹¹¹¹ Calista Corporation (n.d.). *Region/Land Description*. Retrieved December 6, 2011 from http://www.calistacorp.com/about/region_description.html.

Yukon-Kuskokwim Delta. At the request of villages, AVCP provides social services, human development and culturally relevant programming to “promote tribal self-determination and self-governance and to work to protect tribal culture and traditions.”¹¹¹² The AVCP is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.¹¹¹³ AVCP is made up of 56 villages and 45 village corporations.¹¹¹⁴

The closest offices of the Alaska Department of Fish and Game (ADF&G) and the Alaska Department of Commerce, Community, and Economic Development are located in Bethel and Dillingham. Anchorage offers the closest offices of the National Marine Fisheries Service (NMFS), Alaska Department of Natural Resources, and U.S. Bureau of Citizenship and Immigration Services.

Infrastructure

Connectivity and Transportation

Platinum relies heavily on air transportation for passengers and mail and cargo service. There are two gravel airstrips. One is state-owned and 3,300 feet long by 75 feet wide, with a 1,924 feet long by 40 feet wide crosswind runway. The second is a private, gravel airstrip at the platinum mine site which is 2,000 feet long by 75 feet wide.¹¹¹⁵ As of April 2012, the cost of roundtrip airfare on Yute Air between Platinum and Bethel was \$410.¹¹¹⁶ The price of a roundtrip ticket by plane from Bethel to Anchorage in early June of 2012 was \$368.¹¹¹⁷ A seaplane landing site is also available near Platinum, and barge services deliver goods twice a year. Boats, snowmobiles, and ATVs are used for local travel and subsistence activities.¹¹¹⁸

A 6.8-mile road to the south connects Platinum to the platinum ore fields of the Salmon River, but there is no road connection between Platinum and other areas of the State. A coastal trail connects Platinum with Goodnews Bay and Quinhagak and extends northward to Bethel. Additional trails connect Goodnews Bay southeast to Togiak, and north to Carter Creek, Indian River, and Jacksmith Creek, and to the Faro and Keno Creek area of the Arolik River.¹¹¹⁹

Facilities

Water in Platinum is derived from a surface water source as well as a community well and individual wells. There is no piped water or sewer system in Platinum. During the summer,

¹¹¹⁹ See footnote 1115.

untreated water is hauled from approximately fifteen watering points throughout the Village. During winter, residents dig holes in the ice to draw water. Seven U.S. Department of Housing and Urban Development housing units have individual water wells, septic systems, and complete plumbing. Other homes use outhouses or honeybuckets, the latter of which are disposed of in seepage pits. The City of Platinum operates a landfill and provides refuse collection services. The City also operates the electric service that was originally operated by the mining company. Electricity is generated by a diesel powerhouse. Broadband internet, telephone, and cable services are available in Platinum. Internet is only available at the school. A volunteer fire department operates in Platinum.¹¹²⁰ Police services are provided by Village Public Safety Officers (VPSO) stationed in both Platinum and Goodnews Bay.¹¹²¹ The nearest state trooper post is in Bethel.¹¹²² According to a survey conducted by the AFSC in 2011, community leaders reported that a post office is also present in Platinum. Community leaders also indicated that improvements in water treatment and water and sewer pipelines are planned to be completed within the next 10 years.

With regard to fishing-related infrastructure, community leaders reported in the 2011 AFSC survey that a fish processing plant is located in Platinum (see *Processing Plants* section below). They also noted the presence of a barge landing area and dock, although they indicated that no dock space is available for permanent or transient vessel moorage. Since 2008, the dock has been served by electricity and water. Community leaders reported that Platinum can receive fuel barges and gravel haulers, but does not have the capacity to handle other regulated vessels. In addition, community leaders noted that a fish cleaning station was completed in 2008, and boat fuel sales are available in Platinum. For fisheries-related businesses and services not available in Platinum, community leaders indicated that local residents most commonly travel to Goodnews Bay, Quinhagak, or Bethel.

Medical Services

A local health clinic is owned by the City and operated by the Bristol Bay Area Health Corporation. The Platinum Village Clinic is a Community Health Aide Program site. Emergency Services have coastal and air access. Emergency service is provided by a health aide.¹¹²³ The nearest hospital is located in Bethel.

Educational Opportunities

There is one school in the community, which offers Kindergarten through 12th grade. As of 2011, the Arviq School had a total of 12 student and 2 teachers.¹¹²⁴

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Platinum-Goodnews Bay area for thousands of years.¹¹²⁵ In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs was an important subsistence resource for coastal people in this region.¹¹²⁶

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.¹¹²⁷

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.¹¹²⁸ Coastal Villages Seafood (CVS), a subsidiary of the Community Development Quota (CDQ) group for the area, opened a new processing facility in Platinum in 2009 (see *Processing Plants* section). CVS considered reviving the Cape Newenham herring fishery and processing herring at a new facility. However, the herring fishery planned for Coastal Villages' districts was cancelled in 2010 due to expectation of large financial losses,¹¹²⁹ and does not appear to be financially viable in the near future.¹¹³⁰

Platinum is located in District 5 of the Kuskokwim salmon fishery (Goodnews Bay district), Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Platinum is a member of the Coastal Villages Region Fund (CVRF), the CDQ group for Kuskokwim Delta and Bering Sea communities from Cape Newenham to Scammon Bay. CVRF promotes employment opportunities for residents, as

¹¹³⁰ Personal communication, Nick Souza, Coastal Villages Seafoods, April 16, 2012.

well as participation in the Bering Sea crab and groundfish fisheries.¹¹³¹ Platinum is not eligible to participate in the Community Quota Entity (CQE) program. In a survey conducted by the AFSC in 2011, community leaders indicated that Platinum does not actively participate in fisheries management processes in Alaska.

Processing Plants

ADF&G's 2010 Intent to Operate List does not list a registered processing plant in Platinum, and no fish buyers or shore-side processing facilities were recorded in Platinum on ADF&G fish tickets or NMFS Weekly Production Reports. However, according to a survey conducted by the AFSC in 2011, community leaders in Platinum reported that a new shore-side processing facility is present in Platinum. The CVRF reports that construction was completed on the new Coastal Villages Seafood (CVS) processing facility in Platinum in 2009.¹¹³² CVS is a subsidiary of the CVRF, the CDQ group for the Yukon-Kuskokwim region.¹¹³³

This new "Goodnews Bay Regional Processing Plant" reportedly housed 125 workers in 2009, and had 225 employees in 2010.¹¹³⁴ The Platinum facility currently processes salmon between June and August.¹¹³⁵ In 2010, herring processing was planned at the Platinum facility, but the herring fishery planned for CVSS' districts was canceled that year and is not expected to resume in the near future.¹¹³⁶ As of 2011, the Platinum facility also started processing halibut.¹¹³⁷ CVS processing facilities process halibut in June and July.¹¹³⁸ CVS has additional processing facilities in Quinhagak, Toksook Bay, Mekoryuk, Tununak, Cheforak, Kipnuk, and Hooper Bay.¹¹³⁹

Fisheries-Related Revenue

According to information provided in Platinum's annual municipal budget, between 2000 and 2010, Platinum received revenue from a raw fish tax and the Shared Fisheries Business Tax. In 2010, Platinum received \$90 from raw fish tax and \$72 from the Shared Fisheries Business Tax. Information about fisheries-related revenue is presented in Table 3.¹¹⁴⁰

According to a survey conducted by the AFSC in 2011, these revenue sources are used in part to help fund the City Office. It is also important to note that the CVRF uses fisheries revenue from the CDQ program to provide grants, scholarships and training, and other financial

assistance to fishermen and residents of member villages.¹¹⁴¹ However, in the 2011 AFSC survey, community leaders did not specifically report receipt of funding or grants from CVRF in 2010.

Commercial Fishing

Between 2000 and 2010, Platinum residents participated in commercial fisheries as permit holders, vessel owners, and crew license holders. According to a survey conducted by the AFSC in 2011, community leaders indicated that the most important local commercial fishery is for salmon, with a season running between June and August.

In 2010, 15 Platinum residents (equivalent to 25% of the local population) held a total of 21 Commercial Fisheries Entry Commission (CFEC) permits, including 9 salmon permits, 10 herring permits, and 2 halibut permits. That same year, seven fishing vessels were primarily owned by Platinum residents and one resident held a commercial crew license. While the number of permit holders and CFEC permits held increased between 2000 and 2010 (Table 4), vessel ownership and the number of crew licenses held in Platinum decreased over the period. The number of vessels homeported in Platinum also declined, from 10 in 2000 to 5 in 2010 (Table 5). According to the 2011 AFSC survey, community leaders indicated that vessels using Platinum as a base of operation were typically between 60 and 125 feet in length, and the most common gear type was gillnet.

Of nine total salmon CFEC permits held by Platinum residents in 2010, six were for the Kuskokwim drift gillnet fishery, two were held in the Bristol Bay drift gillnet fishery, and one was held in the Bristol Bay set gillnet fishery. Six salmon permits were actively fished that year (66%), including four Kuskokwim drift gillnet permits, one Bristol Bay drift gillnet permit, and the Bristol Bay set gillnet permit.

Of the herring CFEC permits held in 2010, all 10 were for the Goodnews Bay district herring roe and food/bait gillnet fishery. No herring permits were actively fished in 2010. The last year during the 2000-2010 period in which a herring permit was actively fished by a Platinum resident was 2006, when one of seven herring permits was fished. The number of herring permits held decreased from 10 in the year 2000 to 7 held from 2004 to 2008. The subsequent rebound in permit numbers to 10 in 2010 may reflect expectations that herring fisheries would reopen in the district, although the fishery planned for 2010 was cancelled.¹¹⁴²

Halibut CFEC permits were held by Platinum residents in 2003, 2004, 2009, and 2010. All of these permits were held in the statewide longline fishery using vessels under 60 feet in length. The only year during the 2000-2010 period in which a Platinum permit holder actively fished a halibut permit was 2009. In 2010, two Platinum residents held halibut permits, but neither was actively fished (Table 4).

Between 2000 and 2010, no Federal Fisheries Permits (FFP) or License Limitation Program permits (LLP) were held by Platinum residents in federal crab or groundfish fisheries. In addition, no federal quota share accounts were held by Platinum residents in federal catch share fisheries for halibut, sablefish, or crab during this period. Information about federal permits is presented in Table 4, and information about federal catch share participation is presented in Tables 6 through 8.

¹¹⁴¹ See footnote 1131.

¹¹⁴² Coastal Villages Region Fund. 2010. *Herring Fishery Cancelled*. Retrieved April 11, 2012 from <http://coastalvillages.org/current-issues/herring-fishery-cancelled>.

According to Alaska Processors' Weekly Production Reports, no fish buyers or shore-side processors were present in Platinum between 2000 and 2010 (Table 5). This is contrary to information provided on the CVRF website and by Platinum community leaders in the 2011 AFSC survey, which a new processing facility reportedly began operating in Platinum in 2009 (see the *Processing Plants* section). Despite the presence of a processor in the community, no landings or ex-vessel revenue data are available between 2000 and 2010 (Table 9).

Most information about landings and ex-vessel revenue generated by vessels owned by Platinum residents is considered confidential between 2000 and 2010 due to the small number of participants, with the exception of salmon landings in the year 2000. That year, Platinum vessel owners landed a 70,836 net pounds of salmon (irrespective of delivery location). These landings were valued at \$31,620 in ex-vessel revenue. Information about commercial harvest and ex-vessel revenue earned by vessel owners residing in Platinum is presented in Table 10.

Table 3. Known Fisheries-Related Revenue (in U.S. Dollars) Received by the Community of Platinum: 2000-2010.

Revenue source	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses were present in Platinum and no licensed sport fish guides resided in the community. However, several Platinum residents did participate in sportfishing activities. Between 2000 and 2010, the number of Platinum residents that purchased sportfishing licenses varied from 0 to 12 per year (irrespective of point of sale), and the number of sportfishing licenses sold in Platinum varied from 0 to 8 per year. The fact that the number of local residents purchasing sportfishing licenses was generally higher than the number of licenses sold in the community each year indicates that sportfishing is not a tourism draw to Platinum.

This conclusion is echoed by results of a survey conducted by the AFSC in 2011. In the survey, community leaders indicated that sportfishing activity in the Platinum area consists primarily of local residents fishing from private boats or from riverbanks. Community leaders also reported that the species most commonly targeted by sport fishermen in Platinum are Chinook, coho, and sockeye salmon, halibut, and clams.

The Alaska Statewide Harvest Survey,¹¹⁴³ conducted by ADF&G between 2000 and 2010, did not report information regarding species targeted by Platinum sport fishermen. However, the survey did list species targeted in freshwater by sport fishermen in nearby Quinhagak: Chinook, coho and sockeye salmon, and Dolly Varden. Given the lack of charter businesses, no kept/release log book data were reported for fishing charters out of Platinum between 2000 and 2010.¹¹⁴⁴

Platinum is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Platinum is displayed in Table 11.

Subsistence Fishing

Subsistence harvest has been important to Yup'ik Eskimos living in the Platinum area for thousands of years.¹¹⁴⁵ Today, subsistence activities remain an important part of the lifestyle.¹¹⁴⁶ Local subsistence harvest activity targets marine mammals, salmon, and some waterfowl and eggs. Pacific walrus, spotted seals, ringed seals, and Pacific bearded seals are hunted on the ice during the spring, and some seal hunting continues during summer months in bays and estuaries.¹¹⁴⁷

No information is available from ADF&G regarding per capita subsistence harvest or the percentage of households utilizing various marine resources for subsistence purposes between 2000 and 2010 (Table 12). However, data are available from ADF&G regarding total annual subsistence harvest of salmon between 2000 and 2008. During this period, subsistence salmon permits were issued to between 15 and 17 Platinum households per year. On average, coho and sockeye salmon were the most heavily harvested species, with small but consistent Chinook and chum harvests in these years as well. A small pink salmon harvest was reported for only 2 years between 2000 and 2008. No information was reported regarding subsistence harvest of marine invertebrates and non-salmon fish (not including halibut). Additional information about subsistence salmon permits and harvest of marine invertebrates and non-salmon fish is presented in Table 13.

Several Platinum residents participated in the Subsistence Halibut Registration Certificates (SHARC) program during the 2000-2010 period. From 2003 to 2007, one or two SHARC cards were issued to Platinum residents per year. No information was reported regarding the number of SHARC cards returned or the total pounds of halibut harvested for subsistence purposes in those years (Table 14).

Limited information was reported by management agencies regarding marine mammal harvest in Platinum between 2000 and 2010. The U.S. Fish and Wildlife Service reported harvest of one walrus by Platinum residents in 2001. No information was reported in any other year regarding walrus, beluga whale, sea otter, polar bear, Steller sea lion, harbor seal, or spotted seal (Table 15).

Although little information was available from ADF&G regarding subsistence activities in Platinum in recent decades, a survey was conducted by ADF&G in the nearby village of Quinhagak regarding subsistence harvest of marine mammals and non-salmon fish (not including halibut) during the 1982 season. The species of non-salmon fish harvested by the greatest percentage of Quinhagak households that year included: Dolly Varden (100% of households reported harvesting), cod (100%), smelt (75%), cisco (50%), and blackfish (8%). Marine mammal species reported to be harvested by the greatest number of Quinhagak households included: ringed seal (50% of household reported harvest), spotted seal (50%), bearded seal (25%), and Steller sea lion (17%).¹¹⁴⁸

Quinhagak (QUINN-uh-hawk)

People and Place

*Location*¹¹⁴⁹

Quinhagak, also known as Kwinhagak, is on the Kanektok River on the east shore of Kuskokwim Bay, less than a mile from the Bering Sea coast. It lies 71 miles southwest of Bethel. Quinhagak is located in the Bethel Recording District, the Bethel Census Area, and is not located within an organized Borough. The community encompasses 4.7 square miles of land and 0.6 square miles of water.

*Demographic Profile*¹¹⁵⁰

Based on the 2010 U.S. Decennial Census, there were 669 residents in Quinhagak, making it the 94th largest of 352 total Alaskan communities with recorded populations that year. Overall, between 1990 and 2010, the population has increased by 22.5%. The Quinhagak annual growth rate between 2000 and 2009 was 1.47%, indicating a slow rate of population growth. The change in population from 1990 to 2010 is provided in Table 1.

In 2010, the majority of the residents of Quinhagak identified themselves as American Indian or Alaska Native (93.4%), with the remaining racial composition as follows: two or more races (3.7%), White (2.2%), Native Hawaiian or Other Pacific Island (0.4%), and some other race (0.1%). In addition, 0.4% of the residents of Quinhagak identified themselves as Hispanic or Latino. The percentage of Quinhagak residents identifying themselves as American Indian or Alaska Native decreased by 2.6% between 2000 and 2010, with corresponding increases in the percentage of the population identifying themselves as two or more races, Native Hawaiian or Other Pacific Islander, and some other race. The change in racial and ethnic composition in Quinhagak from 2000 to 2010 is provided in Figure 1.

Based on household surveys conducted for the U.S. Census, the average household size was estimated to be 4.05, a figure that remained the same in 2010 (4.05), but is slightly larger than the average household size in 1990 (3.90). There has been an increase in the number of households in Quinhagak from 127 in 1990 to 137 in 2000 to 165 in 2010. Of the 187 housing units surveyed for the 2010 Decennial Census, 134 were owner-occupied, 31 were renter-occupied, and 22 housing units were vacant. In 2010, no residents of Quinhagak were reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Quinhagak: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Quinhagak Based on the 2000 and 2010 U.S. Decennial Census.

In 2010, the gender makeup was fairly even, at 52% male and 48% female, identical to the gender makeup of the state as a whole. The median age in Quinhagak was 24.0 years, lower than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. The greatest percentage of residents fell within the age category 0-29 years old, with the percentages decreasing steadily with age. Relatively few people were 60 or older. The overall population structure of Quinhagak in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),¹¹⁵¹ an estimated 54.3% of residents aged 25 or older held a high school diploma or higher degree, compared with 90.7% of Alaska residents overall. Also in 2010, an estimated 17.9% of the population had a less than ninth grade education, compared to 3.5% of Alaska residents overall; an estimated 27.7% had a 9th to 12th grade education but no diploma, compared

¹¹⁵¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

to 5.8% of Alaska residents overall; an estimated 40.3% had a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; an estimated 11.2% had some college but no degree, compared with 27.8% of Alaska residents overall; an estimated 0.8% held an Associate's degree, compared with 8% of Alaska residents overall; an estimated 0.8% held a Bachelor's degree, compared to 17.4% of Alaska residents overall; and an estimated 1.1% had a graduate or professional degree, compared to 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*¹¹⁵²

The Yup'ik name for Quinhagak is Kuinerraq, meaning “new river channel.” Quinhagak is a long-established village whose origin has been dated to 1000 AD. It was the first village on the lower Kuskokwim to have sustained contact with Europeans. Gavril Sarichev reported the village on a map in 1826. After the purchase of Alaska in 1867, the Alaska Commercial Company sent annual supply ships to Quinhagak with goods for Kuskokwim River trading posts. Supplies were brought to shore from the ship and stored in a building on Warehouse Creek. A Moravian mission was built in 1893. There were many non-Natives in the village at that time; most were waiting for boats to go upriver. In 1904, a mission store opened, followed by a post office in 1905 and a school in 1909. Between 1906 and 1909, over 2,000 reindeer were brought in to the Quinhagak area. They were managed for a time by the Native-owned Kuskokwim Reindeer Company, but the herd had scattered by the 1950s. In 1915, the Kuskokwim River was charted, so goods were barged directly upriver to Bethel. In 1928, the first electric plant opened; the first mail plane arrived in 1934. The City was incorporated in 1975.

The community is primarily Yup'ik Eskimos who fish commercially and are active in subsistence food gathering. The sale, importation, and possession of alcohol are banned in the village.

Natural Resources and Environment¹¹⁵³

Quinhagak is located in a marine climate. Precipitation averages 22 inches a year, with 43 inches of snowfall. Summer temperatures average 41 to 57 °F (5 to 14 °C), and winter temperatures average 6 to 24 °F (-14.4 to -4.4 °C). Extreme temperatures have been measured from -34 °F to 82 °F (-37 to 27.8 °C).

Quinhagak is located near the Togiak National Wildlife Refuge (Refuge), an area that is managed by the U.S. Fish and Wildlife Service (FWS). The following information is from the FWS.¹¹⁵⁴ The Refuge totals 4.7 million acres - an area about the size of the states of Connecticut and Rhode Island combined. Almost half of these lands, the northern 2.3 million acres, are designated as the Togiak Wilderness Area. This constitutes the second largest contiguous Wilderness Area within the National Wildlife Refuge System. The Refuge was established to conserve fish and wildlife populations and habitats in their natural diversity including salmon, marine birds and mammals, migratory birds, and large mammals, to fulfill international treaty obligations; to provide for continued subsistence use; and to ensure necessary water quality and

¹¹⁵² Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

¹¹⁵³ Ibid.

¹¹⁵⁴ U.S. Fish and Wildlife Service. 2011. *Togiak National Wildlife Refuge*. Retrieved from <http://togiak.fws.gov/> on April 9, 2012.

quantity. Special values of the Refuge include the Togiak Wilderness Area, the Kanektok, Goodnews and Togiak river drainages, and sportfishing. The wild lands of the refuge, including the Togiak Wilderness Area, provide valuable and diverse habitat for the fish and wildlife that make the area their home. The conservation of freshwater streams and rivers, wetland and alpine tundra, boreal forests, and coastal cliffs and beaches allow an amazing diversity of species to find suitable homes here. The lands also offer amazing opportunities for recreation and education.¹¹⁵⁵

The Refuge protects habitat that produces nearly 3 million Chinook, sockeye, chum, pink and coho salmon, and 27 other fish species. These fish species are the primary subsistence resource for residents of seven local villages. Fishery resources in this area of Alaska are economically important for commercial fisheries valued at over 8 million dollars, as well as a 6 million dollar sport fishery. Ensuring that adequate numbers of each fish species are allowed to spawn in each drainage is key to this region's aquatic and terrestrial ecosystems. The Refuge also contains prime habitat for several other fish species, including rainbow trout, Arctic grayling, Dolly Varden, and Arctic char. Anglers come from around the world for an opportunity to pursue these prized fish species.

The Refuge is working to further our understanding of these fish species. The Refuge conserves habitat for at least 201 staging, migrating, or breeding bird species. Bird species groups include landbirds, shorebirds, seabirds, raptors, and waterfowl. Birds from the North American Pacific Flyway and several Asiatic routes funnel through the area. It is home to more than 30 species of terrestrial mammals. With a wide variety of habitats, the Refuge supports brown bear, moose, caribou, wolves, and many smaller mammals. The Nushagak Peninsula, in the southeastern portion of the Refuge, was the site of a 1988 caribou reintroduction, and the caribou population continues to grow. Moose populations on the refuge have increased substantially in recent years as well, much to the delight of local people. Lynx and wolverines continue their elusive ways, seldom seen except for tracks they leave in the snow. In addition, 17 species of marine mammals are found along the coastline. The Refuge has haulout sites that provide animals a place to rest after feeding forays in the Bering Sea. Cape Peirce, on the southwestern tip of the Refuge, is one of only two regularly used land-based haulouts for Pacific walrus in North America. Up to 12,000 male walrus may haul out here at one time. Endangered Steller sea lions use haulouts within the Refuge, as do harbor and spotted seals. Marine and terrestrial mammals are important food resources for local village residents, and are important in the local tourism economy as well.¹¹⁵⁶

Current Economy¹¹⁵⁷

Most of the employment in Quinhagak is with the school, government services, or commercial fishing. Trapping, basket weaving, skin sewing, and ivory carving also provide income. Subsistence remains an important part of residents' livelihoods; seal and salmon are staples of the diet. Coastal Villages Seafood LLC processes halibut and salmon in Quinhagak.¹¹⁵⁸

¹¹⁵⁶ U.S. Fish and Wildlife Service. 2011. *Togiak National Wildlife Refuge: Wildlife*. Retrieved from <http://togiak.fws.gov/wildlife.htm> on April 9, 2012.

¹¹⁵⁷ Unless otherwise noted, all monetary data are reported in nominal values.

¹¹⁵⁸ See footnote 1152.

According to the 2006-2010 ACS,¹¹⁵⁹ the per capita income in Quinhagak in 2010 was estimated at \$10,422, and the median household income in 2010 was estimated at \$30,833, compared to \$8,127 and \$25,156 in 2000, respectively. After accounting for inflation by converting the 2000 values to 2010 dollars,¹¹⁶⁰ the real per capita income (\$10,687) and the real median household income in 2000 (\$33,080) indicate that per capita income stayed relatively stable between 2000 and 2010, while median household income decreased during that same period. However, Quinhagak's small population size may have prevented the ACS from accurately portraying economic conditions.¹¹⁶¹ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, the per capita income in Quinhagak in 2010 was \$6,863, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.¹¹⁶² This is supported by the fact that the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.¹¹⁶³ However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

In 2010, Quinhagak ranked 266th out of 305 Alaskan communities with per capita income that year, and 241st out of 299 Alaskan communities with household income data. Based on the ACS, in that same year, 58.9% of the civilian population aged 16 and over was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 25.8%, compared to the statewide unemployment rate of 5.9%. Approximately 38.9% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; the relatively low income figures and high poverty rates reported for Quinhagak are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Quinhagak. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 30.7%.

Based on household surveys conducted for the 2006-2010 ACS, the greatest percentage of workers was employed in the public sector (56.4%), while 43.6% were employed in the private sector in 2010. Out of 181 people aged 16 and over that were employed in the civilian labor force in 2010, the greatest percentage worked in public administration (27.8%), education services, health care, and social assistance (22.2%), retail trade (14.1%), transportation, warehousing, and utilities (11.6%), and construction (11.6%). Only 6.6% of the labor force worked in arts, entertainment, recreation, accommodations, and food services, 2.5% worked in

¹¹⁵⁹ See footnote 1151.

¹¹⁶⁰ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹¹⁶¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹¹⁶² Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

other services, except public administration, 2.0% worked in manufacturing, and 1.5% worked in agriculture, forestry, fishing, hunting, and mining. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in farming, fishing, and forestry industries is probably underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Quinhagak (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Quinhagak (U.S. Census).

Governance

Quinhagak is a Second-class city, governed by a mayor and city council, and is not located within an organized Borough. Quinhagak was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native Village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Native Village of Kwinhagak. The Native village corporation is Qanirtuuq, Incorporated, which manages 115,200 acres of land received under ANCSA. Quinhagak is also a member of the Calista Corporation, the regional Native corporation.¹¹⁶⁴

The City of Quinhagak administered a 3% sales tax in 2010.¹¹⁶⁵ When adjusted for inflation,¹¹⁶⁶ total municipal revenues declined by 48.3% between 2000 and 2010 from \$5.45 million, to \$3.64 million. However, local revenues were heavily influenced by outside revenue sources between those years, which contributed to yearly variability. In contrast, inflation adjusted general fund revenues remained relatively constant. In 2010 general fund revenues were collected predominately from state revenue sharing sources, sales tax revenues, and other sources. However, general fund revenues accounted for only 22.3% of total municipal revenues that year. Most (33.1%) municipal revenues came from Federal Housing and Urban Development grants. Other sources included BIA, Indian Health Services, and Indian Community Development Block Grant renovation funds.¹¹⁶⁷

Sales tax revenues accounted for 15.0% of total general fund revenues in 2010, compared to 8.6% in 2000. Also in that year, state allocated Community Revenue Sharing accounted for 16.0% of general fund revenues, compared to 4.1% from State Revenue Sharing in 2000.

In 2000, Quinhagak received \$200,000 in fisheries-related grants for work on the salmon processing plant. In 2002, Quinhagak received a \$50,000 grant for harbor feasibility and design and a \$750,000 grant for harbor pre-construction.

The nearest offices of the Alaska Department of Fish and Game (ADF&G) and the Alaska Department of Commerce, Community, and Economic Development are located in Bethel. The nearest offices of the National Marine Fisheries Service (NMFS), Alaska Department of Natural Resources (DNR), Bureau of Citizenship and Immigration Services (BCIS), and U.S. Immigration and Customs Enforcement are located in Anchorage.

Infrastructure

*Connectivity and Transportation*¹¹⁶⁸

Quinhagak relies on air transportation for passenger mail and cargo service. A state-owned 4,000 foot long by 75 foot wide gravel airstrip is available. Float planes land on the Kanektok River. A harbor and dock serves barge deliveries of heavy goods at least twice per year. Boats, all-terrain vehicles, snowmobiles, and some vehicles are used for local transportation. Quinhagak is not connected to the state of Alaska road system. Winter trails are marked to Eek (39 miles) and Goodnews (39 miles). In June 2012, roundtrip airfare to Anchorage was approximately \$680.¹¹⁶⁹

*Facilities*¹¹⁷⁰

All services are provided by the Native Village of Kwinhagak, under an agreement with the City. Services include water, sewage collection, and operation of the Class 3 landfill. Water

¹¹⁶⁸ See footnote 1164.

¹¹⁶⁹ Airfare was obtained on the travel website <http://www.travelocity.com> for a round-trip ticket for travel from June 1 to June 8, 2012. Retrieved on December 1, 2011.

¹¹⁷⁰ See footnote 1164.

is derived from a well near the Kenektok River. Forty homes are served by a flush/haul system. An old Bureau of Indian Affairs (BIA) building has been renovated as a new washeteria and health clinic. The school and washeteria are connected directly to the water plant. Eighty-nine households still haul water and use honeybuckets, a 5-gallon form of an outhouse. The Village also operates a community center, and the school has a portable pool and a library. A City Village Police Officer and two Village Public Safety Officers provide law enforcement services locally, along with state troopers stationed in Bethel.

*Medical Services*¹¹⁷¹

The Quinhagak (Kwinhagak) Clinic provides medical care and is operated by the Native Village of Kwinhagak and owned by the Village Council. The facility is a Community Health Aid Program site. Alternate health care is available through the Quinhagak Emergency Medical Services (EMS) Quick Response Team. Emergency services have coastal air and floatplane access. Emergency service is provided by a health aide. The nearest hospital is located in Bethel.

*Educational Opportunities*¹¹⁷²

There is one school in Quinhagak that provides instruction for students from pre-school through 12th grade. In 2011, Kuinerrarmiut Elitnaurviat had 13 teachers and 225 students.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest has been important to residents of the Kuskokwim Bay area for thousands of years.¹¹⁷³ In addition to salmon, spring harvest of herring roe on kelp or hemlock boughs was an important subsistence resource for coastal people in this region.¹¹⁷⁴ Today, subsistence remains an important part of residents' livelihoods. Salmon and seal are both staples of the local diet.¹¹⁷⁵ In addition, between 2000 and 2010, Quinhagak residents participated in commercial fisheries for salmon, halibut, and herring.

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest

¹¹⁷⁵ See footnote 1164.

levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management by ADF&G is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.¹¹⁷⁶ Quinhagak is located in District 4 of the Kuskokwim salmon fishery (the Quinhagak fishing district, a marine fishing district that encompasses five miles of shoreline adjacent to the village of Quinhagak).

Commercial exploitation of halibut first extended into the Bering Sea region in 1928 after development of diesel engines, which allowed fishing vessels to undertake longer trips.¹¹⁷⁷ Today, Pacific halibut fisheries are managed under the International Pacific Halibut Commission. Quinhagak is located in Pacific Halibut Fishery Regulatory Area 4E.

Commercial catch of herring for human consumption began in 1878 in Alaska, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island, and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.¹¹⁷⁸

The community is also located in Federal Statistical and Reporting Area 514 and the Bering Sea Sablefish Regulatory Area. Quinhagak is a member of the Coastal Villages Region Fund (CVRF), the Community Development Quota (CDQ) group for Kuskokwim Delta and Bering Sea communities from Cape Newenham to Scammon Bay. CVRF promotes employment opportunities for residents, as well as participation in the Bering Sea crab and groundfish fisheries.¹¹⁷⁹ Quinhagak is not eligible to participate in the Community Quota Entity program. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that Quinhagak received \$20,000 in funding or grants and \$10,000 in special allocations from CVRF in 2010.

Processing Plants

According to the ADF&G's 2010 Intent to Operate list, Coastal Villages Seafoods (CVS), a subsidiary of the CVRF, one seafood processing plant was located in Quinhagak. However, CVS ceased operation of the plant in 2010 due to various reasons, including the strain the facility placed on local water supply and the short window of time available to make deliveries each day due to fast-changing tides. The closure of the Quinhagak plant coincided with the opening of a new processing facility in Platinum, located approximately 50 miles to the south.¹¹⁸⁰

This new facility in Platinum, known as the “Goodnews Bay Regional Processing Plant,” currently processes salmon between June and August.¹¹⁸¹ CVS also has processing facilities in Toksook Bay, Mekoryuk, Tununak, Chefnak, Kipnuk, and Hooper Bay. Many of these facilities process halibut in June and July.^{1182,1183} In 2010, herring processing was planned at the Platinum facility, but the herring fishery planned for CVSs’ districts was canceled that year and is not expected to resume in the near future.^{1184,1185}

Fisheries-Related Revenue

In 2010, Quinhagak received \$39,807 from fisheries-related taxes and fees (Table 3).¹¹⁸⁶ These revenue sources include the Shared Fisheries Business Tax and a marine fuel sales tax. Revenue from fisheries-related taxes and fees varied between 2000 and 2010, increasing from \$807 in 2000 to \$39,807 in 2010. Table 3 shows the historical annual revenue for each of these categories.

In a survey conducted by the AFSC in 2011, community leaders reported that harbor maintenance, hospital/medical clinic/emergency response, educational scholarships, roads, and police/enforcement/fire protection are all at least partially funded by fisheries-related revenue sources.

Commercial Fishing

In 2010, 94 Quinhagak residents held 109 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). Salmon permits made up 82% of the CFEC permits issued in 2010, compared with 62% in 2000. Residents of Quinhagak also held CFEC permits for halibut and herring in 2010, though none of the herring permits were fished in that year. There were no Quinhagak residents holding Federal Fisheries Permits between 2000 and 2010. Overall, 72% of the commercial fishing permits issued to Quinhagak residents were actively fished, including 85% of the salmon permits recorded as fished and 25% of the halibut permits fished. In 2010, salmon CFEC permits were issued for the Bristol Bay drift gill net and set gill net fisheries and the Kuskokwim gill net fishery. Halibut CFEC permits were issued in 2010 for the statewide hand troll and mechanical jig fisheries. Twelve residents held herring CFEC permits in 2010, though none of those permits were recorded as fished. All herring CFEC permits issued in 2010 were for the Goodnews Bay roe herring gill net fishery. Information on permits and permit holders by species is presented in Table 4.

Also in 2010, 15 vessels landed catch in Quinhagak and there were 46 registered crew license holders. In 2009, eight vessels landed catch in Quinhagak and there were 60 registered

¹¹⁸⁶ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

crew license holders. Between 2000 and 2008, there were no vessels recorded as landing catch in Quinhagak. During that same period, the number of crew license holders varied from 38 to 56. Information on characteristics of the commercial fishing sector in Quinhagak is presented in Table 5. There were no Quinhagak residents holding Individual Fishing Quota (IFQ) account shares between 2000 and 2010 for halibut (Table 6) or sablefish (Table 7) and no Quinhagak residents holding IFQ account shares for crab between 2005 and 2010 (Table 8).

Between 2000 and 2008, no landings were recorded in Quinhagak. In 2009 and 2010, data regarding total pounds landed and ex-vessel value of 2010 landings were considered confidential due to the small number of participants (Table 9). In 2010, Quinhagak ranked 35th in total landings out of 67 communities that received landings in that year and 37th overall for the total ex-vessel revenue earned in the community. Landings recorded by Quinhagak residents were considered confidential between 2000 and 2010 due to a small number of participants, with the exception of halibut landings between 2000-2004 and 2006-2009, herring landings in 2000, and salmon landings in 2000-2001 and 2003-2010. Landings and ex-vessel revenue for these species varied considerably during the years for which data were available. Information on landings and ex-vessel revenue reported by Quinhagak residents is presented in Table 10.

In a survey conducted by the AFSC in 2011, community leaders reported that Quinhagak is home to a lot more commercial fishing boats compared to five years prior.

Recreational Fishing

Based on estimates reported in the ADF&G Statewide Harvest Survey, Chinook salmon, coho salmon, sockeye salmon, and Dolly Varden are caught by private anglers in Quinhagak.¹¹⁸⁷ In addition, according to survey conducted by the AFSC in 2011, community leaders indicated that the following saltwater species are targeted by recreational fishermen that use boats based in Quinhagak: chum salmon, Chinook/king salmon, coho/silver salmon, sockeye/red salmon, and halibut.

A total of 20 sportfishing licenses were sold to residents of Quinhagak (irrespective of the location of the point of sale) in 2010. In comparison, a total of 16 sportfishing licenses were sold in Quinhagak. No sportfishing licenses were sold locally between 2000 and 2004. Sportfishing licenses sales remained relatively high until 2010, when sales declined significantly. The number of sportfishing licenses sold to residents remained relative stable between 2000 and 2010, with the exception of 2005, when sales peaked at 48. No locally registered sport fish guide businesses were active between 2000 and 2010.

Quinhagak is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Quinhagak is displayed in Table 11.

Subsistence Fishing

Subsistence remains an important part of residents' livelihoods. Seal and salmon are staples of the diet.¹¹⁸⁸ While data were not available for 2000-2010 in terms of the percentage of households utilizing various marine resources for subsistence purposes or per capita subsistence harvest (Table 12), other data clearly indicate a reliance of Quinhagak residents on subsistence resources (Tables 13 and 14). There is considerable annual harvest of salmon by Quinhagak households holding subsistence salmon permits (Table 13).

In 2008, the last year for which data are available regarding subsistence salmon permits, the total subsistence harvest of salmon appeared to increase from previous years even though the number of subsistence salmon permits returned in that year was less than the number of permits returned in previous years. The most important salmon species recorded by permit holders included Chinook, sockeye, and coho salmon, in order of importance. Halibut harvests were extremely variable between 2003 and 2010. Years when reported harvests were significant included 2003 (an estimated 1,164 pounds on 12 SHARC), and 2005 (an estimated 2,907 pounds on 10 SHARC). All other years were significantly lower, and no harvests were reported in 2009 or 2010. Permit ownership and activity also significantly declined between 2003 and 2010.

¹¹⁸⁸ See footnote 1149.

Finally, an estimated 7 walrus and 4 beluga whales were harvested between 2000 and 2010 (Table 15).

According to a survey conducted by the AFSC in 2011, community leaders reported that fur seals, salmon, and beluga whales are the three most important subsistence marine or aquatic resources for residents of Quinhagak. Although no data were reported during the 2000-2010 period, a survey conducted by the ADF&G Division of Subsistence in the early 1980s provides some information about species harvested for subsistence purposes by Quinhagak residents. In 1982, Quinhagak households reported harvesting several species of marine mammal (bearded seal, ringed seal, spotted seal, and Steller sea lion. Species of non-salmon fish (not including halibut) that were harvested for subsistence purposes by Quinhagak households in 1982 included blackfish, cisco, cod, Dolly Varden, and smelt.¹¹⁸⁹ According to the ADF&G *Community Subsistence Information System*,¹¹⁹⁰ “other” (non-salmon, non-halibut) species which Quinhagak residents harvest or acquire through other means include bearded seal, ringed seal, spotted seal, Steller sea lion, blackfish, cisco, cod, Dolly Varden, and smelt.

Red Devil

People and Place

*Location*¹¹⁹¹

Red Devil is located on both banks of the Kuskokwim River, at the mouth of Red Devil Creek. It lies 75 air miles northeast of Aniak, 161 miles northeast of Bethel, and 250 miles west of Anchorage. Red Devil is located in the Kuskokwim Recording District and the Bethel Census Area, but is not located within an organized Borough. The total area of Red Devil is 26.4 square miles, of which 24.2 square miles is land and 2.2 square miles is water.

*Demographic Profile*¹¹⁹²

In 2010, there were 23 residents in Red Devil, making it the 324th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population decreased by 57%. Between 2001 and 2009, the population fell by 8.3%;¹¹⁹³ however, according to the U.S. Census the population fell by 48% between 2009 and 2010. The Red Devil average annual growth rate between 2000 and 2009 was -1.56%, indicating a slow rate of decline. The change in population from 1990 to 2010 is shown in Table 1.

The majority of residents of Red Devil in 2010 identified themselves as American Indian or Alaska Native (43.5%), with 39.1% of the population identifying themselves as two or more races, and 17.4% of the population identifying themselves as White. There were no residents of Red Devil that identified themselves as Hispanic in 2010. The percentage of the population identifying themselves as American Indian or Alaska Native remained relatively stable between 2000 and 2010, with the percentage of residents identifying themselves as White experiencing a large decline. The percentage of residents identifying themselves as two or more races experienced a large increase during this same period. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size was estimated to be 1.92, a decrease from 2.82 in 2000 and 2.9 in 1990. The number of estimated households also decreased from 18 in 1990 to 17 in 2000 to 12 in 2010. Of the 23 housing units surveyed for the 2010 Decennial Census, nine were owner-occupied and three were renter-occupied, with 11 housing units that were vacant. Throughout this period no residents of Red Devil were reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Red Devil: 2000-2010 (U.S. Census).

In 2010, the gender makeup was very slightly skewed, at 52% male and 48% female, exactly the same as that of the state as a whole. The median age in Red Devil was 50.5 years, higher than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. The greatest percentage of residents fell within the age category 50-69 years old, with the next largest percentage for the age category 10-19 years old. Relatively small percentages of residents made up the remaining age categories. The population age structure of Red Devil in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Red Devil Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, in 2010, according to the 2006-2010 American Community Survey (ACS),¹¹⁹⁴ an estimated 37.5% of residents aged 25 and over held a high school diploma or higher degree, compared to 90.7% of Alaska residents overall. Also in 2010, 62.5% of residents were estimated to have less than a ninth grade education, compared to 3.5% of Alaska residents overall; and 37.5% of residents were estimated to hold a high school diploma or equivalent, compared to 27.4% of Alaska residents overall.

¹¹⁹⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*¹¹⁹⁵

The village was named after the Red Devil Mine, established in 1921 by Hans Halverson when numerous mercury (quicksilver) deposits were discovered in the surrounding Kilbuck-Kuskokwim Mountains. By 1933, the mine was producing substantial quantities of mercury. Although the mine changed ownership twice over the years, it continued to operate until 1971. The mine produced some 2.7 million pounds of mercury during its operation. A post office was established in 1957, and a state school opened in 1958. Red Devil is a mixed population of Yup'ik Eskimos, Tanaina Athabascans, and non-Natives. Subsistence activities are prevalent. The sale of alcohol is prohibited, although importation and possession are allowed.

Natural Resources and Environment

The climate in Red Devil is continental with temperatures ranging between -58 and 90 °F (-50 to 32.2 °C). Annual snowfall averages 85 inches, with total precipitation of 20 inches. High winds often cause flight delays in fall and winter. The Kuskokwim River is ice-free from mid-June through October.¹¹⁹⁶

The Bureau of Land Management (BLM) began addressing hazardous materials and physical safety hazards resulting from the mining operations at the Red Devil Mine in 1987. The following information was obtained from the BLM information page on the Red Devil Mine.¹¹⁹⁷ Initial efforts focused on removing the remaining processing chemicals, polychlorinated biphenyls (PCBs) in transformers, and backfilling open mine shafts and adits. In 2002, the derelict mine buildings and mercury production facilities were demolished and disposed in on-site one-time use landfills. From 2003 through 2006, BLM focused available funding on cleanup of spilled fuel from the mine's large above ground storage tanks. With funds provided under the American Recovery and Reinvestment Act, the petroleum cleanup advanced into final stages during 2009-2010.

Less visible, but perhaps more impacting, is the potential long-term environmental effect metals mining and processing left behind after the mine played out. The primary metals of concern at the Red Devil Mine include mercury, arsenic, antimony, and lead. Metals may leach from the tailings and enter ground and surface waters. Flooded underground mine works allow groundwater to come in contact with remaining ore and host rock, which in turn can then enter surface water and/or impact drinking water quality. The metals and their bio-available decomposition products can bio-accumulate in the food web, potentially affecting human health and the environment.

In 2008, the BLM, in cooperation with the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (DEC), began a Remedial Investigation and Feasibility Study of the site. The purpose of this investigation is to characterize the site, determine what potential risks the mine site may have on human health and the environment, and determine what needs to be done to mitigate those risks.

¹¹⁹⁵ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

¹¹⁹⁶ Ibid.

¹¹⁹⁷ Bureau of Land Management (n.d.). *Red Dog Mine*. Retrieved December 9, 2011 from http://www.blm.gov/ak/st/en/fo/ado/hazardous_materials/red_devil_mine.html.

A mining explosives storage magazine (powder house) was discovered during fieldwork at the site in July 2010. Contracted ordnance technicians investigated the partially collapsed structure for explosives and residue. The powder house did not contain explosives, so it was dismantled and the wood burned.

Current Economy¹¹⁹⁸

Since the closure of the mercury mine in 1971, employment opportunities have been limited. Income is supplemented by subsistence activities, BLM firefighting, or work in the commercial fishing industry. Salmon, bear, moose, caribou, rabbit, waterfowl, and berries are harvested in season.¹¹⁹⁹

Based on the 2006-2010 ACS,¹²⁰⁰ the per capita income and median household income in Red Devil in 2010 were not available. In 2000, the per capita income in Red Devil was \$5,516 and the median household income was \$10,938. After accounting for inflation by converting the 2000 dollars to 2010 dollars,¹²⁰¹ the real per capita income in 2000 was \$7,253 and the real median household income in 2000 was \$14,383. However, Red Devil's small population size may have prevented the ACS from accurately portraying economic conditions.¹²⁰² A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, the per capita income in Red Devil in 2010 was \$3,671, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.¹²⁰³ This is supported by the fact that the community was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.¹²⁰⁴ However, it should be noted that ACS and DOLWD data are based on wage earnings and do not take into account the value of subsistence within the local economy. In addition, an estimate based on the ALARI database indicates that the unemployment rate in 2010 was 4.3%.

Based on the 2006-2010 ACS, data regarding the percentage of the civilian population age 16 and over in the civilian labor force were not available. However, according to the ACS, an estimated 70% of the civilian employed population was employed in education services, health care, and social assistance. The remaining 30% of the civilian employed population was estimated to be employed in transportation, warehousing, and utilities. No individuals characterized themselves as working in natural resource based occupations or industries that include fishing (Figures 3 and 4). However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

¹¹⁹⁸ Unless otherwise noted, all monetary data are reported in nominal values.

Figure 4. Local Employment by Occupation in 2000-2010, Red Devil (U.S.Census).

Governance

Red Devil is an unincorporated community that is not part of an organized borough. Red Devil was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Red Devil Traditional Council. The Native village corporation is the Kuskokwim Corporation, which manages 69,120 acres of land and represents numerous villages in the Lower Kuskokwim area. The regional Native corporation to which Red Devil belong is the Calista Corporation.¹²⁰⁵

Since Red Devil is unincorporated, it does not administer any sales tax or maintain a municipal budget with community revenue and expenditures. In addition, Red Devil is not part of an organized borough, so there is no borough sales tax. Between 2000 and 2010, Red Devil did not receive any revenue from State or Community Revenue Sharing contributions or from fisheries-related grants (Table 2).

The nearest offices of the Alaska Department of Fish and Game (ADF&G) and the Department of Commerce, Community, and Economic Development are located in Bethel. The nearest office of the Alaska Department of Natural Resources is located in McGrath, and the nearest offices of the National Marine Fisheries Service (NMFS), Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement are located in Anchorage.

Infrastructure

Connectivity and Transportation

Red Devil is not accessible by road. The Kuskokwim River serves as a major transportation link and supply route for bulk supplies and fuel oil during the summer. In the winter, the frozen river is used as an ice road by snowmobiles for travel to neighboring villages. A 4,801 feet long by 75 feet wide gravel airstrip provides year-round access. It is owned and operated by the state. Scheduled weekday service is available.¹²⁰⁶ In June 2012, roundtrip airfare to Anchorage was \$916.¹²⁰⁷

*Facilities*¹²⁰⁸

Water is derived from individual wells or hauled from the school well. Four of the 17 occupied homes are fully plumbed. Sewage is disposed of on an individual basis, city-wide refuse collection is not available. The school and teacher's housing uses individual septic tanks and drain fields; others use pit privies. Electricity is provided by the Middle Kuskokwim Electric Cooperative and is produced by a diesel generator. Police services are provided by state troopers stationed downriver in Aniak, and fire fighting services are provided by a Volunteer Fire Department.

*Medical Services*¹²⁰⁹

Health care is provided by the Red Devil Clinic – Clara Morgan Sub-Regional Clinic in Aniak. The clinic is operated by the Yukon Kuskokwim Health Corporation and owned by the village council. Alternate health care is available at the Sleetmute Health Clinic. Emergency services have river and air access. The nearest hospitals are located in Bethel and Dillingham.

*Educational Opportunities*¹²¹⁰

There is one school in Red Devil that provides instruction to students from pre-school through 12th grade. However, as of 2011, the school did not have any students or teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Red Devil is located some distance up the Kuskokwim River (161 miles northeast of Bethel, Alaska). The community is located along the Kuskokwim River, in District 3 of the

¹²⁰⁶ Ibid.

Kuskokwim salmon fishery. The Kuskokwim River empties into Kuskokwim Bay and the Bering Sea. Although Red Devil is an inland river community, it is worth noting that this Kuskokwim Bay is included in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Red Devil is not eligible to participate in the Community Quota Entity program, and because the community is located more than 50 miles inland from the ocean, it is not eligible to participate in the Community Development Quota program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Red Devil does not have a registered processing plant. The nearest processing plant is located in Bethel.

Fisheries-Related Revenue

Given that Red Devil had no taxing authority and did not manage a community budget, Red Devil did not receive any revenue from fisheries-related taxes and fees between 2000 and 2010 (Table 3).¹²¹¹

Commercial Fishing

Between 2000 and 2010, there were no fish buyers or shore-side processors, and no vessels recorded landings in Red Devil (Table 5). No Federal Fisheries Permit holders or Commercial Fisheries Entry Commission (CFEC) permit holders resident in Red Devil (Table 4). In addition, no residents of Red Devil held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab between 2000 and 2010 (Tables 6, 7, and 8).

¹²¹¹ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Recreational Fishing

There were no charter fishing businesses or guides active in Red Devil between 2000 and 2010, though there was one sport fish guide business registered in the community in 2000 and in 2001. A total of four sportfishing licenses were sold to residents of Red Devil in 2010 (irrespective of the location of the point of sale). In comparison, there were no sportfishing licenses sold in Red Devil in 2010, indicating that Red Devil residents likely traveled elsewhere to participate in recreational fishing (Table 11).

Red Devil is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Red Devil is displayed in Table 11.

Subsistence Fishing

Red Devil is a mixed population of Yup'ik Eskimos, Tanaina Athabascans, and non-Natives. Subsistence activities are prevalent. Red Devil residents supplemented their income through subsistence activities, BLM firefighting, or work in the commercial fishing industry. Salmon, bear, moose, caribou, rabbit, waterfowl, and berries are harvested in season.¹²¹² Data were not available regarding the percentage of households utilizing various marine resources for subsistence purposes or per capita subsistence harvest between 2000 and 2010 (Table 12), nor were data available from management agencies regarding subsistence halibut fishing participation (Table 14), subsistence harvest of various marine mammal species (Table 15).

However, some data were available regarding annual subsistence salmon harvest. In 2008, the most recent year in which data were reported, 18 subsistence salmon permits were issued to Red Devil households, of which seven were reported as fished (Table 13). Harvest was reported for Chinook, chum, coho, and sockeye salmon. Between 2000 and 2008, the number of subsistence salmon permits issued varied between 12 and 18, with 7 to 15 of those subsistence salmon permits were returned in those years. The amount of each species of salmon harvested for subsistence purposes varies from year to year. Subsistence harvest participation data for salmon, marine invertebrates, and non-salmon fish (not including halibut) are presented in Table 13.

Toksook Bay (TOOK-sook or TUCK-sook)

People and Place

*Location*¹²¹³

Toksook Bay, also known as Nunakauyak, is one of several villages located on Nelson Island, which lies 115 miles northwest of Bethel. The community is on Kangirlvar Bay, across the water from Nunivak Island. The community of Tununak is about 8 miles to the northwest. Toksook Bay is located in the Bethel Recording District and the Bethel Census Area, but is not located within an organized Borough. The community encompasses 33.1 square miles of land and 40.9 square miles of water.

*Demographic Profile*¹²¹⁴

In 2010, there were 590 inhabitants in Toksook Bay, making it the 101st largest of 352 total Alaskan communities with recorded populations that year. Between 2000 and 2009, the population of Toksook Bay grew by 12.03% with an average annual growth rate of 0.73%, indicating a slow rate of growth. The change in population between 1990 and 2010 is presented in Table 1.

Almost all of Toksook Bay residents identified themselves as American Indian and Alaska Native in 2010 (92%). Other ethnic groups present in Toksook Bay in that year included: White (4.4%), two or more races (2%), some other race (1%), Hispanic or Latino (1%), Black or African American (0.3%), and Asian (0.2%). Between 2000 and 2010, the percentage of the population identifying themselves as American Indian and Alaska Native decreased by 2.4%, with another decrease in the percentage of the population identifying themselves as two or more races. During this period there were corresponding increases in the percentage of the population identifying themselves as White, some other race, Asian, Black or African American, and Hispanic or Latino. Changes in racial and ethnic composition between 2000 and 2010 are presented in Figure 1.

The average household size in Toksook Bay in 2010 was 4.72, an increase from 4.7 persons per household in 1990 and a decrease from 5.02 in 2000. The total number of households in Toksook Bay increased from 88 in 1990 to 106 in 2000 to 125 occupied housing units by 2010. Of the 135 housing units surveyed for the 2010 Decennial Census, 79 were owner-occupied, 46 were renter-occupied, and 10 were vacant or used only seasonally. Throughout this period no residents of Toksook Bay were reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Toksook Bay: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Toksook Bay was 53.4% male and 46.6% female, slightly more skewed than the state as a whole (52% male, 48% female). The median age was estimated to be 21.1 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the largest percentage of the population fell within the age category 0-19 years old, with the next largest percentage falling in the age category 30-49 years old. Relatively few individuals were age 70 or older in 2010. The overall population structure of Toksook Bay in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Toksook Bay Based on the 2000 and 2010 U.S. Decennial Census.

According to the 2006-10 American Community Survey,¹²¹⁵ in terms of educational attainment, 68.3% of Toksook Bay residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 26.7% of residents aged 25 and older were estimated to have less than a ninth grade education, compared to 3.5% of Alaska residents overall; 5% were estimated to have a ninth to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 31.7% were estimated to have a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; 23.3% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 3.4% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 3.7% were estimated to have a Bachelor’s degree, compared to 17.4% of

¹²¹⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Alaska residents overall; and 6.3% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture^{1216,1217}

The Nelson Island area has been inhabited and utilized by Yup'iks for thousands of years. Contact was first made with Russian fur traders in the Nushagak area in 1818. Toksook Bay was established in 1964 along the Tuqsuk River by residents of Nightmute. Cyril Chanar, Tom Sunny, and Nasgauq Tangaq were the earliest inhabitants. Toksook Bay was settled to be more accessible to the annual freighter ship, the North Star. The city was incorporated in 1972. Today, Toksook Bay is a traditional Yup'ik Eskimo community with a reliance on fishing and subsistence activities. The sale and importation of alcohol is banned in the village. Yup'ik is the primary language spoken in Toksook Bay, with English as secondary.

Natural Resources and Environment

Toksook Bay is located in a marine climate. Annual precipitation averages 22 inches, with 43 inches of snowfall. Summer temperatures range from 41 to 57 °F (5 to 13.9 °C), and winter temperatures run 6 to 24 °F (-14.4 to -4.4 °C).¹²¹⁸

Toksook Bay is located on Nelson Island, the second largest island within the Yukon Delta National Wildlife Refuge (Refuge). The southern portion of the island, where Toksook Bay is located, is low-lying and covered with small lakes and streams. The northern portion of the island hosts more rugged terrain, with several peaks over 1,300 feet in elevation. The Bering Sea coast along the Yukon-Kuskokwim River delta is characterized by sandy beaches that merge into active sand dunes greater than 100 feet in height. The dunes are particularly susceptible to erosion.¹²¹⁹

The Refuge was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” Refuge lands are open to sport and subsistence hunting and fishing. The most productive wildlife habitat is the coastal region between Nelson Island and the Askinuk Mountains to the north.¹²²⁰

Natural hazards that have been identified to be present in the Bethel Census Area include flooding, earthquakes, and severe weather.¹²²¹ Communities in the region are also suffering from

severe erosion of both riverbanks and coastal shorelines, and are susceptible to tundra fires.^{1222,1223}

Current Economy¹²²⁴

Commercial fishing and the school, city, and tribal council are the primary income producers. Subsistence activities supplement income and provide essential food sources. In 2010, 77 residents held commercial fishing permits for herring roe and salmon net fisheries. Coastal Villages Seafood, Inc., processes halibut and salmon in Toksook.¹²²⁵ Top employers in 2010¹²²⁶ included Nunakuiak Yup'ik Corp., Lower Kuskokwim School District, Nunakuyak Traditional Council, Coastal Villages Seafoods Inc., AVCP Housing Authority, Yukon Kuskokwim Health Corp. 90, City of Toksook Bay, Bayview General Merchandise, Coastal Villages Region Fund, and Association of Village Council Presidents.

In 2010, per capita income in Toksook Bay was estimated to be \$15,326 and the median household income was estimated to be \$53,750, compared to \$8,761 and \$30,208 in 2000, respectively. Taking inflation into account by converting the 2000 values to 2010 dollars,¹²²⁷ the real per capita income in 2000 is shown to have been \$11,521 and the real 2000 median household income was \$39,723. This shows that there was a real increase in both per capita and median household income during this period. In 2010, Toksook Bay ranked 201st of 305 Alaskan communities with per capita income that year, and 110th of 299 Alaskan communities with household income data. However, Toksook Bay's small population size may have prevented the American Community Survey from accurately portraying economic conditions.¹²²⁸ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, the per capita income in Toksook Bay in 2010 was \$7,463, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000. This is supported by the fact that the community was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.¹²²⁹ However, it should be noted that American Community Survey and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

Based on the 2006-2010 American Community Survey, in the same year, 63.4% of the population age 16 and older was estimated to be in the civilian labor force, compared to the

¹²²⁷ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹²²⁸ See footnote 1215.

¹²²⁹ Denali Commission. 2011. Distressed Community Criteria 2011 Update. Retrieved April 16, 2012 from: www.denali.gov.

statewide rate of 68.8%. The local unemployment rate was 21.7%, compared to the statewide unemployment rate of 5.9%. Approximately 13% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; figures reported for Toksook Bay are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Toksook Bay. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 20.3%.

Based on household surveys conducted for the 2006-2010 American Community Survey, the greatest percentage of workers was employed in the public sector (57%), while 35.1% were employed in the private sector, 4.1% were self-employed, and 3.7% were unpaid family workers. Out of 242 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest percentage worked in educational services, health care, and social assistance (40.2%), public administration (18.9%), and retail trade (18.5%). Smaller percentages of the workforce were employed in other services except public administration (5.8%), arts, entertainment, recreation, accommodation, and food service (4.6%), information (1.2%), transportation, warehousing, and utilities (6.2%), and construction (4.6%). No individuals indicated that they work in natural resource based industries or occupations that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Toksook Bay (U.S. Census).

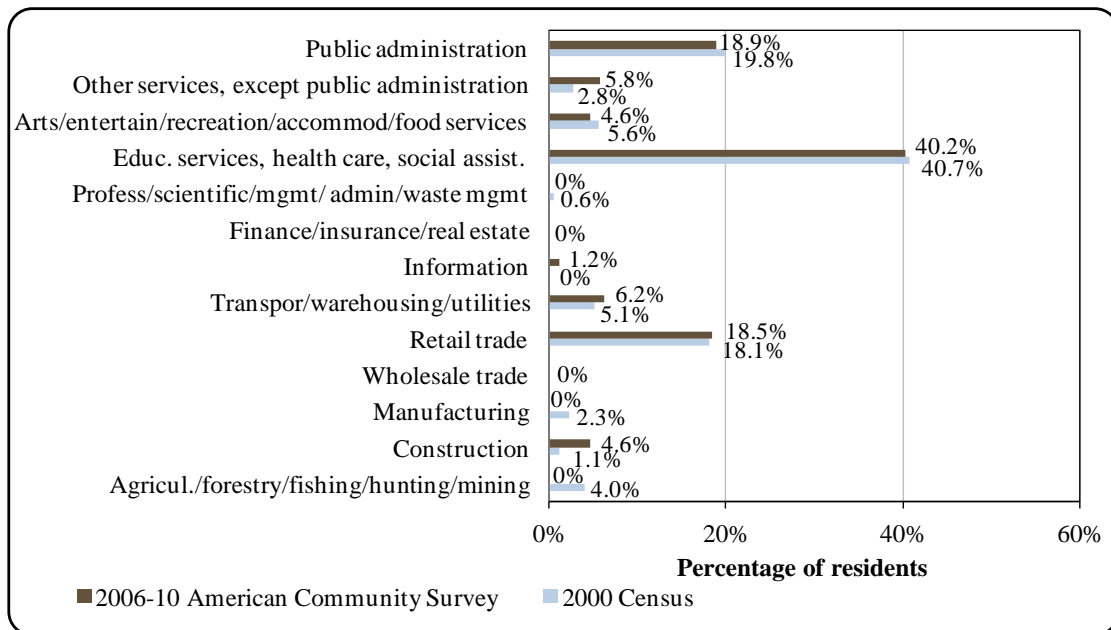

Figure 4. Local Employment by Occupation in 2000-2010, Toksook Bay (U.S. Census).

Governance

Toksook Bay administers a 2% sales tax. With the exception of 2006, municipal revenue figures for 2000 through 2010 were taken from *Community Financial Statements* (CFS).¹²³⁰ In that year, no CFS was available. When adjusted for inflation,¹²³¹ total municipal revenues increased by 7.1% between 2000 and 2010 from \$656,785, to \$909,555. In 2010, locally generated funds accounted for 77.2% of the total municipal budget. Most (64.3%) locally generated revenues came from enterprise services including gaming (\$374,658), and utilities (\$76,789); followed by contracted services (9.0%); and sales tax revenues (5.9%). “Other” contributions accounted for 18.2% of locally generated revenues. Most (61.0%) outside revenues were collected from state allocated Community Revenue Sharing. Payments in lieu of taxes accounted for the remainder of outside revenues. Overall, sales tax revenues accounted for 4.6% of total municipal revenues in 2010, compared to 4.3% in 2000. Also in that year, Community Revenue Sharing accounted for 13.8% of total municipal revenues, compared to 4.1% from State Revenue Sharing in 2000. In addition, Toksook Bay received two fisheries-related grants between 2000 and 2010 for a seawall and trash bins. Information about selected aspects of Toksook Bay’s community revenue is presented in Table 2.

Toksook Bay is a Second-class city that is not located within an organized borough. In addition, the community was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is Nunakuiak Yup’ik Corporation. The regional native corporation to which Toksook Bay belongs is the Calista Corporation. The region Calista Corporation serves is a vast and beautiful corner of the world. Tucked between two of Southwest Alaska’s mightiest rivers – the Yukon and the Kuskokwim – this unique isolated area is the traditional home of the state’s indigenous Yup’ik, Cup’ik and Athabascan people, Calista Corporation’s shareholders. The Calista Region encompasses 57,000 square miles and is the second largest ANCSA region in land size. The land entitlement to Calista, however, is only 6.5 million acres - less than 20 % of the land area. Approximately 75 % of the land within the

¹²³⁰ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Financial Documents Delivery System*. Retrieved April 15, 2011 from http://www.commerce.state.ak.us/dcra/commfin/CF_FinRec.cfm.

¹²³¹ Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Region is owned by the U.S. Fish and Wildlife Service. Most of the remaining lands are owned by federal and state governments, with a very small amount privately owned. Surrounded by mostly federally owned lands, the Region is about the size of New York State. It encompasses nearly 10 % of Alaska’s land area and is comprised of 56 federally recognized tribes. There are no roads that connect the region with the rest of Alaska. Because everything must be flown or barged to each community, the cost of food, fuel, transportation and energy are extraordinarily high. Calista Corporation works hard and partners with many to improve and enrich the way of life for its Shareholders and Descendants.¹²³²

Infrastructure

Connectivity and Transportation

A state-owned 3,218 foot long by 60 foot wide gravel airstrip provides year-round scheduled and chartered service. Fishing boats, skiffs, snowmobiles, and all-terrain vehicles (ATVs) are used by residents for local travel. Winter trails with markers exist to Nightmute (20 miles), Tununak (8 miles), Newtok (40 miles), and Chefnak (50 miles). There are no docking facilities, but boat haul-out services are available. Barges deliver goods during the summer months.¹²³³ The cost of round-trip airfare between Toksook Bay and Anchorage in June 2012 was \$756.¹²³⁴

*Facilities*¹²³⁵

Water is derived from a well and infiltration gallery and is treated and stored in a 212,000-gallon tank, then piped throughout the community. A gravity piped sewer system also serves most households. Most occupied homes have complete plumbing. However, several homes have failed plumbing and haul water and honeybuckets. The city collects refuse and maintains the unpermitted landfill. The traditional council operates the washeteria.

Law enforcement services are provided by a Village Public Safety Officer, tribal police officers, and state troopers located in Bethel, which is approximately 105 miles away. Fire and rescue services are provided by the state/city Village Public Safety Officer and volunteer fire department. The city hall houses a multi-purposes community facility, and the Yukon-Kuskokwim Health Corporation provides home care to some local elders. There is also a school library in Toksook Bay.

*Medical Services*¹²³⁶

Medical care is provided by the Toksook Bay Subregional Clinic, which is owned by the Village Council and operated by the Yukon Kuskokwim Health Corporation. The clinic is a Community Health Aid Program site. Emergency services have coastal and air access and are provided by a health aide. The nearest Acute Care Facility and Emergency Care Center is located in Bethel.

Educational Opportunities

The Nelson Island Area School provides instruction to students from pre-school through 12th grade. In 2011 the school had 225 students and 13 teachers.¹²³⁷ Toksook Bay is also a Head Start site.¹²³⁸

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Toksook Bay is located on Nelson Island and is on Kangirivar Bay, across the water from Nunivak Island.¹²³⁹ The area is located in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Toksook Bay participates in the Community Development Quota (CDQ) program through the Coastal Villages Region Fund (CVRF). The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the Bering Strait and Aleutian Islands region.¹²⁴⁰ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ. The community is located in Federal Reporting Area 508, International Pacific Halibut Commission (IPHC) Regulatory Area 4E, and the Bering Sea Sablefish Regulatory District. The mission of CVRF is to provide the means for development of its member communities by sensibly creating tangible, long-term opportunities for all residents who want to fish and work. On behalf of the 20 member communities, CVRF has grown to be the largest seafood owner/operator headquartered in Alaska. CVRF is now able to take a broader and more balanced approach to managing the Kuskokwim Delta and Bering Sea seafood resources. For its residents, CVRF must continue to protect its fisheries and its investments in these fisheries, grow in a strategic and sustainable manner, and remain adaptable to take advantage of all positive opportunities. CVRF's investments in the Bering Sea, particularly the pollock fishery, enables CVRF to provide fishing opportunities in salmon, halibut, and herring in the region.¹²⁴¹

In 2003, a halibut processing plant was built and a Fisheries Support Center was constructed in 2006. Coastal Villages Seafoods, a CVRF subsidiary, hired 36 residents of Toksook Bay in 2007. In that year, Toksook Bay was the second top producing halibut plant in Alaska. Halibut, herring, salmon, and numerous mammals including seal and musk-ox are

harvested for subsistence purposes. The nearby community of Nightmute maintains historical subsistence fish camps on the edges of Toksook Bay.¹²⁴²

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there was one processing plant operating in Toksook Bay in 2010. The Coastal Villages Seafoods, LLC fish processing plant in Toksook Bay is a CDQ operation, a subsidiary of the CVRF. The Toksook Bay facility processes halibut in June and July. CVRF maintains a local community service center that helps local fishing families maintain, repair, service, and modify their boats, motors, and fishing gear. The local plant provides free room and board to its fish processing workers, as well as transportation to and from the plant site and a cash bonus for all those who complete their contracts.¹²⁴³

Fisheries-Related Revenue

Between 2000 and 2010, Toksook Bay received fisheries-related revenue from the raw fish tax and the Shared Fisheries Business Tax. Amounts of revenue received from these sources varied widely from year to year. In all years except 2000 and 2010, the total revenue received from fisheries-related sources was minimal compared to total municipal revenue.¹²⁴⁴ Information on known fisheries-related revenue received by Toksook Bay between 2000 and 2010 is presented in Table 3.

Commercial Fishing

In 2010, Toksook Bay ranked 54th in landings and 52nd in ex-vessel value out of 67 communities that received commercial fisheries landings. That year, the total amount of pounds landed and the associated ex-vessel value was considered confidential due to a small number of participants.

A total of 87 Toksook Bay residents held 114 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC) for other shellfish, halibut, herring, groundfish, and salmon. Of these, 42 permits were reported as fished, the majority in the halibut fishery. The majority of halibut CFEC permits issued in 2010 were for the statewide longline fishery using vessels under 60 feet, with the remainder issued for the statewide hand troll fishery and the statewide mechanical jig fishery. Overall between 2000 and 2010, the number of CFEC permits, permit holders, and permits reported as fished has decreased. While there were 61 herring permits and one groundfish permit in 2010, none of those permits were reported as fished in that year. Nearly all the herring CFEC permits issued in 2010 were for the Nelson Island gill net fishery, with the remainder issued for the Nunivak Island gill net fishery. The groundfish CFEC permit was issued for the statewide miscellaneous saltwater finfish longline fishery using vessels under 60 feet. For both the halibut and salmon CFEC fisheries, the number of permits, permits held, and permits reported as fished decreased between 2000 and 2010. Salmon CFEC

¹²⁴² Rural Alaska Community Action Program. (2008). *Toksook Bay Community Plan*. Retrieved July 11, 2012 from: <http://www.commerce.state.ak.us/dca/plans/ToksookBay-CP-2008.pdf>.

¹²⁴³ Coastal Villages Seafoods. (n.d.). Company website. Retrieved April 15, 2012 from <http://coastalvillages.org/>.

¹²⁴⁴ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

permits issued in 2010 were for the Bristol Bay drift gill net fishery. There was one Federal Fisheries Permit held in Toksook Bay in both 2009 and 2010, though that permit was not reported as fished. Information on permits and permit holders by species between 2000 and 2010 is presented in Table 4.

The number of crew license holders in Toksook Bay varied between 19 and 82 between 2000 and 2010, with 33 crew license holders in 2010. During this period, the number of fish buyers in Toksook Bay varied between one and five, with one fish buyer in Toksook Bay in 2010. Throughout this period, there has been one shore-side processing facility located in Toksook Bay. Both the number of commercial fishing vessels owned by community residents and the number of vessels homeported in the community decreased between 2000 and 2010. The number of vessels landing catch in Toksook Bay varied between 2000 and 2010, but decreased overall during this period. The total net pounds landed in Toksook Bay and the ex-vessel value of those landings was considered confidential between 2000 and 2010 due to a small number of participants, with the exception of landings and ex-vessel value in 2003 and 2004. Both landings and ex-vessel value were more than twice as large in 2003 as they were in 2004. Information on characteristics of the commercial fishing sector in Toksook Bay between 2000 and 2010 is presented in Table 5.

Between 2000 and 2010, an average of 49,545 halibut quota shares were held by residents of Toksook Bay; however, there was no Individual Fishing Quota (IFQ) allotment associated with those shares during this period. Information on halibut quota and IFQ between 2000 and 2010 is presented in Table 6. There were no sablefish quota shares held between 2000 and 2010 (Table 7) and no crab quota shares held between 2005 and 2010 (Table 8) in Toksook Bay.

As stated previously, information on landed pounds and ex-vessel revenue in Toksook Bay between 2000 and 2010 is considered confidential for all species in all years with the exception of crab between 2000 and 2010 (though there were no landings of crab recorded during this period) and halibut in 2003 and 2004. Information on landed pounds and ex-vessel revenue by species in Toksook Bay between 2000 and 2010 is presented in Table 9. Landings recorded by Toksook Bay residents are also considered confidential during this period with the exception of halibut and salmon between 2000 and 2010 and herring between 2000 and 2006. Landings and ex-vessel revenue of all three species were variable during this period. Information on landed pounds and ex-vessel revenue by community residents between 2000 and 2010 is presented in Table 10.

¹ Net pounds refers to the landed weight recorded in fish tickets.

² Totals only represent non-confidential data.

Recreational Fishing

There were no Toksook Bay residents holding sport fish guide licenses or active sport fish guide business in Toksook Bay between 2000 and 2010. In 2010, there were 82 sportfishing licenses sold to Toksook Bay residents (irrespective of the location of the point of sale), representing 13.8% of the population, an increase from 16 licenses sold in 2000. In most years between 2000 and 2010, the number of sportfishing licenses sold in the community was greater than the number of licenses sold to community residents, indicating the potential that visitors to Toksook Bay pursue recreational fishing activities.

The Alaska Statewide Harvest Survey,¹²⁴⁵ conducted by ADF&G between 2000 and 2010, did not provide information about species targeted by private anglers in Toksook Bay. In addition, since no sportfishing businesses were present in town, no kept/released log book data were reported for fishing charters out of Toksook Bay between 2000 and 2010.¹²⁴⁶ However, information is available about both saltwater and freshwater sportfishing activity at a regional scale. Toksook Bay is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Between 2000 and 2010, saltwater sportfishing activity in this region was minimal, with between 0 and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Toksook Bay is displayed in Table 11.

Subsistence Fishing

Toksook Bay is a traditional Yup'ik Eskimo community with a reliance on fishing and subsistence activities. Subsistence activities supplement income and provide essential food sources.¹²⁴⁷ Data were not reported between 2000 and 2010 for subsistence participation by household and species or per capita subsistence harvest (Table 12).

In years for which data were reported between 2000 and 2010, an average of 121 subsistence salmon permits was issued to Toksook Bay households, with an average of 21 permits returned each year. Chum salmon were the primary species harvested for subsistence (an average of 553 chum per year), along with several hundred Chinook, coho, pink, and sockeye salmon each year (Table 13). Data were not reported during this period for subsistence harvest of marine invertebrates or non-salmon fish (not including halibut).

Between 2003 and 2010, the number of Subsistence Halibut Registration Certificate (SHARC) cards issued to Toksook Bay residents decreased substantially, from an average of 530 per year between 2003 and 2007 to an average of 33 in 2008 and 2010. The number of permits fished each year varied significantly between 2000 and 2010, from 9 to 206 in any given year. In

¹²⁴⁷ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

2010, 32 SHARC were issued, 10 were fished, and 1,250 pounds of halibut were reported as harvested. This is a large decline from 2003, when 532 SHARC were issued, 54 were fished, and 24,500 pounds of halibut were reported as harvested. Information about subsistence halibut harvest is presented in Table 14.

Information about subsistence harvest of marine mammals was reported between 2000 and 2010. In those years, beluga whales and walrus were among the marine mammals harvested by Toksook Bay residents. This is of note as Toksook Bay is one of only a few communities where walrus are reported to be harvested. In terms of marine mammal harvests, an estimated 49 beluga whales and 38 walrus were harvested between 2000 and 2010. While walrus harvests were spread out over the years, beluga harvests were concentrated on 2007, when 20 were harvested (Table 15). Finally, the ADF&G Division of Subsistence reported that herring (food and sac roe) are harvested or used for subsistence in Toksook Bay.¹²⁴⁸

Tuluksak (too-LOOK-sack)

People and Place

*Location*¹²⁴⁹

Tuluksak lies on the south bank of the Tuluksak River at its junction with the Kuskokwim River. The village is 35 miles northeast of Bethel. Tuluksak is located in the Bethel Recording District and the Bethel Census Area, but is not located within an organized Borough.

*Demographic Profile*¹²⁵⁰

In 2010, there were 373 inhabitants in Tuluksak, making it the 145th largest of 352 total Alaskan communities with recorded populations that year. Between 2000 and 2009, the population of Tuluksak grew by 10.05% and had an average annual growth rate of 0.48%, indicating a slow rate of annual growth. The change in population from 1990 to 2010 is provided in Table 1.

Almost all Tuluksak residents identified themselves as American Indian and Alaska Native in 2010 (94.9%). Other ethnic groups present in Tuluksak that year included two or more races (0.8%), Black or African American (0.3%), and White (4%). The percentage of the population identifying themselves as American Indian and Alaska Native, Black or African American, and as two or more races increased between 2000 and 2010, with corresponding decreases in the percentages of the population identifying themselves as Asian and White during this period. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

The average household size in Tuluksak increased from 4.8 in 1990 to 4.98 in 2000, then decreased to 4.05 persons per household in 2010. The total number of households in Tuluksak increased from 74 in 1990 to 86 in 2000 to 92 occupied housings units in 2010. Of the 99 housing units surveyed for the 2010 Decennial Census, 63 were owner-occupied, 29 were renter-occupied, and seven were vacant or used only seasonally. Throughout this period no residents of Tuluksak were reported to be living in group quarters.

In 2010, the gender makeup in Tuluksak was 53.6% male and 46.4% female, slightly more skewed than the state as a whole (52% male, 48% female). The median age was estimated to be 26.6 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the largest percentage of the population fell within the age category zero to 9 years old, with the next largest percentage falling within the category 10 to 19 and 20 to 29 age groups (both of which comprised 16.9% of the population). Relatively few individuals were age 70 or older. The overall population structure of Tuluksak in 2000 and 2010 is shown in Figure 2.

Figure 1. Racial and Ethnic Composition, Tuluksak: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Tuluksak Based on the 2000 and 2010 U.S. Decennial Census.

According to the 2006-10 American Community Survey,¹²⁵¹ in terms of educational attainment, 74.6% of Tuluksak residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 16.7% of residents aged 25 and over were estimated to have less than a ninth grade education, compared to 3.5% of Alaska residents overall; 8.8% were estimated to have a ninth to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 59.6% were estimated to have a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; and 15% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall. There were no Tuluksak residents estimated to have earned an Associate’s degree, Bachelor’s degree, or graduate or professional degree in 2010.

¹²⁵¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*¹²⁵²

The name was first published in 1861 as "Tul'yagmyut," an Eskimo word meaning "related to loon". The 1880 U.S. Census noted a population of 150 living in the village. A city government was formed in 1970 but was dissolved on March 7, 1997. Tuluksak is a traditional Yup'ik Eskimo village with a fishing and subsistence livelihood. The sale, importation, and possession of alcohol is banned in the village.

Natural Resources and Environment

Annual precipitation averages 16 inches in this area, with 50 inches of snowfall. Summer temperatures range from 62 to 42 °F (16.7 to 5.6 °C); winter temperatures range from 19 to -2 °F (-7.2 to -18.9 °C).¹²⁵³

The lower Yukon-Kuskokwim River Delta (Y-K Delta), where Tuluksak is located, is an area of low elevation and shallow relief. The terrain is mostly made up of flat and low rolling plains crossed with low gradient streams, tributaries, sloughs, floodplains, wetlands, and shallow lakes. Most of the lower Y-K Delta was ice-free during the last major Ice Age. Sediments in the area are loamy or sandy textured fluvial and alluvial deposits. Soils are poorly drained and typically overlay a layer of permafrost.¹²⁵⁴

Tuluksak is located on Calista Corporation land encompassed by the Yukon Delta National Wildlife Refuge, which provides spawning, rearing, feeding, and wintering habitat for a range of terrestrial and aquatic wildlife.¹²⁵⁵ Terrestrial wildlife of economic and cultural importance include: waterfowl and gamebirds, moose, wolf, wolverine, bear, mink, beaver, muskrat, otter, fox, beaver, muskrat, muskox, hares, voles, ermines, squirrels, lemmings, shrews, and weasels.¹²⁵⁶ Aquatic resources include Chinook, chum, pink, sockeye, and coho salmon, whitefish, burbot, northern pike, blackfish, smelt, lamprey, char, grayling, trout, sculpin, stickleback, and longnose sucker.¹²⁵⁷

Regional mineral resources include zinc, gold, silver, lead, antimony, tungsten, tin, copper, nickel, mercury, and platinum.¹²⁵⁸ Upriver from Tuluksak, Calista Corporation is undertaking several mineral and oil and gas projects near Red Devil. Downriver, Platinum and Goodnews Bay are sites of more mineral projects.¹²⁵⁹

There are several natural hazards affecting the Y-K Delta region.¹²⁶⁰ These hazards include flooding, river bank erosion and destabilization, brush fire, and soil destabilization due to permafrost melt. Spring flooding is a major factor contributing to natural hazards in the area. As

¹²⁶⁰ See footnote 1256.

melt-off and ice jamming occurs during spring break-up, flooding and erosion occur and climate change is thought to be a continuing factor in the seasonality and severity of flooding in the region. In addition, variation in the active permafrost layer caused by climate change and urban development further compound impacts from flood events.¹²⁶¹

Current Economy¹²⁶²

The primary employers in Tuluksak are the school, and village government and services. Some commercial fishing also occurs. Subsistence activities provide most food sources for local residents. There is also a village store.¹²⁶³ Top employers in 2010¹²⁶⁴ included Tuluksak Native Company, Yupiit School District, Knik Construction Inc., Tuluksak Native Store, Association of Village Council Presidents Housing Authority, Association of Village Council Presidents, Yukon Kuskokwim Health Corp. 90, Early Childhood Leadership Team Inc., Kwikpak Fisheries LLC, and Village Safe Water Tuluksak Project.

In 2010, per capita income in Tuluksak was estimated to be \$7,767 and the median household income was estimated to be \$35,417, compared to \$7,132 and \$31,563 in 2000, respectively. Taking inflation into account by converting the 2000 values to 2010 dollars,¹²⁶⁵ the real per capita income in 2000 is shown to have been \$9,378 and the real 2000 median household income was \$41,505. This shows that both per capita income and median household income decreased between 2000 and 2010. In 2010, Tuluksak ranked 299th of 305 Alaskan communities with per capita income that year, and 212th out of 299 Alaskan communities with household income data. Although Tuluksak's small population size may have prevented the American Community Survey from accurately portraying economic conditions, this decrease in per capita income is confirmed by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, the per capita income in Tuluksak in 2010 was \$7,570. This is supported by the fact that the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. However, it should be noted that American Community Survey and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

Based on the 2006-10 American Community Survey, 53.8% of the population age 16 and over was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 48.2%, compared to the statewide unemployment rate of 5.9%. Approximately 32.8% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; the relatively low income figures and high poverty rates reported for Tuluksak are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of

¹²⁶¹ See footnote 1254.

¹²⁶² Unless otherwise noted, all monetary data are reported in nominal values.

¹²⁶³ See footnote 1252.

¹²⁶⁵ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Tuluksak. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 34.2%.

Based on household surveys conducted for the 2006-2010 American Community Survey, the greatest percentage of workers was employed in the public sector (78.8%), while 16.2% were employed in the private sector and 5.1% were self-employed. Out of 99 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest percentage worked in educational services, health care, and social assistance (37.9%), other services, except public administration (15.2%), and retail trade (17.4%). Smaller percentages of the workforce were employed in public administration (9.8%), arts, entertainment, recreation, accommodations, and food services (9.1%), information (3%), transportation, warehousing, and utilities (3.8%), and construction (3.8%). No individuals reported themselves to be working in natural resource based industries or occupations that include fishing. However, given the data reported in *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Tuluksak (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Tuluksak (U.S. Census).

Governance

Tuluksak is an unincorporated community that is not located within an organized Borough. Because of Tuluksak’s unincorporated status, no municipal taxes were administered between 2000 and 2010 (Table 2). However, Tuluksak did not receive any Community Revenue Sharing contributions between 2000 and 2010. Tuluksak also did not receive any known fisheries-related grants during this period.

Tuluksak was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is Tulkisarmute, Incorporated. The regional Native corporation to which Tuluksak belongs is the Calista Corporation. The region Calista Corporation serves is a vast and beautiful corner of the world. Tucked between two of Southwest Alaska’s mightiest rivers – the Yukon and the Kuskokwim – this unique isolated area is the traditional home of the state’s indigenous Yup’ik, Cup’ik and Athabascan people, Calista Corporation’s shareholders. The Calista Region encompasses 57,000 square miles and is the second largest ANCSA region in land size. The land entitlement to Calista, however, is only 6.5 million acres - less than 20% of the land area. Approximately 75 % of the land within the Region is owned by the U.S. Fish and Wildlife Service. Most of the remaining lands are owned by federal and state governments, with a very small amount privately owned. It encompasses nearly 10 % of Alaska’s land area and is comprised of 56 federally recognized tribes. There are no roads that connect the region with the rest of Alaska. Because everything must be flown or barged to each community, the cost of food, fuel, transportation and energy are extraordinarily high. Calista Corporation works hard and partners with many to improve and enrich the way of life for its Shareholders and Descendants.¹²⁶⁶

The nearest offices of Alaska Department of Fish and Game (ADF&G) and Alaska Department of Commerce, Community and Economic Development are located in Bethel. A National Marine Fisheries Service (NMFS) field office is also located in Bethel, and a larger office is located in Anchorage. The nearest Alaska Department of Natural Resources, Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement offices are located in Anchorage.

Infrastructure

Connectivity and Transportation

Tuluksak can be accessed by a state-owned 2,461 foot long by 30 foot wide gravel airstrip year-round. There are no docking facilities, although cargo barges deliver during the summer. Residents use fishing boats, skiffs, snowmobiles, and ATVs for local transportation. Tuluksak is not connected to the state road system.¹²⁶⁷ Round-trip airfare between Tuluksak and Anchorage in June 2012 was \$618.¹²⁶⁸

*Facilities*¹²⁶⁹

Treated well water is hauled by residents. Only one watering point, with storage capacity of less than 7,000 gallons, serves the entire community, washeteria, clinic, and school. The washeteria was rehabilitated in 1996, but water shortages limit its use. Residents have a honeybucket collection service and a central honeybucket disposal facility - no homes are plumbed. Law enforcement is provided by state troopers in Bethel and fire and rescue services

are provided by volunteers. Tuluksak has a community hall, a high school gym, and a public/school library.

*Medical Services*¹²⁷⁰

Health care is provided by the Tuluksak Clinic, which is owned by the Village Council and operated by the Yukon Kuskokwim Health Corporation. The clinic is a Community Health Aid Program (CHAP) site. Emergency services have river and air access and are provided by a health aide. The nearest Acute Care facility and Emergency Care Center is located in Bethel.

*Educational Opportunities*¹²⁷¹

The Tuluksak School provides instruction to students from pre-school through 12th grade. In 2011 the school had 162 students and 15 teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.¹²⁷²

Commercial catch of herring for bait began in Alaska around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.¹²⁷³

On the lower Kuskokwim, subsistence sockeye, chum, and Chinook harvesting typically begins by June 1st, and is concluded by mid-July. Coho and pink salmon are harvested in August and September. Fishing effort is based from either a fish camp or from a home village. Drift gill

¹²⁷³ Woodby, Doug, Dave Carlile, Shareef Siddeek, Fritz Funk, John H. Clark, and Lee Hulbert. 2005. *Commercial Fisheries of Alaska*. Alaska Dept. of Fish and Game, Special Publication No. 05-09. Retrieved December 29, 2011 from <http://www.adfg.alaska.gov/FedAidPDFs/sp05-09.pdf>.

nets, fish wheels, and rods and reels are used for harvesting. Soon after river ice breaks up in May, smelt move into the lower Kuskokwim area. Residents use fine-meshed nets to catch smelt, and thread them through willow sticks before drying and smoking them. Whitefish, sheefish, Arctic grayling, and northern pike are harvested year-round. Blackfish and burbot are harvested during fall and winter months. Dolly Varden are typically harvested from June through December; while trout are typically harvested in the early spring and summer, and again in the late summer and early fall. Spotted seal, bearded seal, ringed seal, and walrus are harvested in the late spring.^{1274,1275}

Tuluksak lies on the south bank of the Tuluksak River at its junction with the Kuskokwim River. The village is 35 miles northeast (inland) of Bethel. Due to its inland location, Tuluksak is not located within any Federal Statistical and Reporting Area, Pacific Halibut Fishery Regulatory Area, or Sablefish Regulatory Area. Tuluksak is located closest to Federal Statistical and Reporting Area 514, International Pacific Halibut Commission (IPHC) Regulatory Area 4E, and the Bering Sea Sablefish Regulatory District. Because of its inland location in Western Alaska, Tuluksak is also not eligible for the Community Quota Entity or Community Development Quota programs.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Tuluksak does not have a registered processing plant. The nearest registered processing plant is located in Bethel.

Fisheries-Related Revenue

Between 2000 and 2010, no data were reported about fisheries-related revenue received by Tuluksak (Table 3).

Commercial Fishing

In 2010, there were 31 Tuluksak residents holding 31 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC) for the halibut, herring, and salmon fisheries. While the total number of CFEC permits and permit holders remained relatively stable between 2000 and 2010, the number of permits reported as fished each year varied widely, from two in 2009 to 24 in 2000. In 2010, 11 CFEC permits were reported as fished. The majority of permits held (29) were for the salmon fishery, which maintained a stable number of permits and permit holders during this period, with the number of permits reported as fished varying from year to year. The majority of salmon CFEC permits in 2010 were for the Kuskokwim gill net fishery, with the remainder issued for the Bristol Bay drift gill net fishery and the Lower Yukon gill net fishery. There was one halibut CFEC permit and one herring CFEC permit held in 2010, but neither of those permits was reported as fished. The halibut permit was issued for the statewide longline fishery using vessels under 60 feet and the herring permit was issued for the

¹²⁷⁵ Andrews, E.; and Coffing, M. (1986). *Kuskokwim River Subsistence Chinook Fisheries: An Overview*. Retrieved July 12, 2012 from: <http://www.nativeknowledge.org/db/files/tp146.htm>.

Bristol Bay herring spawn on kelp hand-picking fishery. There were no Tuluksak residents holding Federal Fisheries Permits or License Limitation Program (LLP) permits during this period. Information about permits and permit holders by species is presented in Table 4.

There were 21 crew license holders in Tuluksak in 2010. Between 2000 and 2010, the number of crew license holders in the community varied considerably, with four crew license holders in 2002 and 48 in 2000. There were no fish buyers or shore-side processing facilities located in Tuluksak between 2000 and 2010. During this period, an average of eight vessels were primarily owned by Tuluksak residents each year, while between three and five vessels were homeported in the community each year between 2000 and 2010. There were no vessels landing catch in the community during this period, thus there were no landings reported between 2000 and 2010. Information on characteristics of the commercial fishing sector in Tuluksak is presented in Table 5.

There were no community residents holding quota share accounts for halibut (Table 6) or sablefish (Table 7) between 2000 and 2010, and no residents holding quota share accounts for crab between 2005 and 2010 (Table 8). As previously stated there are no landings or associated ex-vessel revenue reported in Tuluksak between 2000 and 2010 (Table 9). Landings recorded by Tuluksak residents are considered confidential due to a small number of participants between 2000 and 2010 for all species, with the exception of salmon landings in 2001 (48,223 pounds landed bringing \$18,007 in ex-vessel revenue). Information on landings and ex-vessel revenue by Tuluksak residents is presented in Table 10.

Recreational Fishing

Between 2000 and 2010, there were no active sport fish guide businesses located in Tuluksak, and no community residents held sport fish guide licenses. Given this, no kept/released log book data were reported for sportfishing charters out of Tuluksak between 2000 and 2010.¹²⁷⁶ The number of sportfishing licenses sold to community residents (irrespective of the location of the point of sale) increased substantially from seven in 2000 to 99 in 2010. There were no sportfishing licenses sold within the community between 2000 and 2009, indicating the potential that Tuluksak residents traveled to other areas or nearby communities if they want to participate in sportfishing activities. However, in 2010, there were 86 sportfishing licenses sold in Tuluksak.

Further indicating the potential of residents to participate in sportfishing in other communities, the Alaska Statewide Harvest Survey,¹²⁷⁷ conducted by ADF&G between 2000 and 2010, reported that Chinook salmon and coho salmon are targeted by private anglers residing in Tuluksak. Tuluksak is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Tuluksak is displayed in Table 11.

Subsistence Fishing

Tuluksak is a traditional Yup'ik Eskimo village with a fishing and subsistence livelihood. Subsistence activities provide most food sources for local residents.¹²⁷⁸ Data on subsistence participation by household and species and per capita subsistence harvest were not reported between 2000 and 2010 (Table 12).

In years for which data were reported between 2000 and 2010, an average of 81 subsistence salmon permits was issued to Tuluksak households, with an average of 49 permits returned to ADF&G each year. Chinook salmon and chum salmon were the primary species harvested under returned subsistence permits (an average of 2,710 Chinook and 2,455 chum per year), along with sockeye salmon and coho salmon (Table 13). Data were not reported on the per capita harvest of marine invertebrates or non-salmon fish during this period. Data were not reported on the subsistence harvest of marine invertebrates, halibut or other fish (Tables 13 and 14), or subsistence harvest of marine mammals between 2000 and 2010 (Table 15).

Tuntutuliak (*tun-too-TOO-lee-ack*)

People and Place

*Location*¹²⁷⁹

Tuntutuliak is on the Qinaq River, approximately three miles from its confluence with the Kuskokwim River and about 40 miles from the Bering Sea coast. It lies 40 miles southwest of Bethel and 440 miles west of Anchorage. Tuntutuliak is located in the Bethel Recording District, the Bethel Census Area, and is not located within an organized Borough.

*Demographic Profile*¹²⁸⁰

In 2010, there were 408 inhabitants in Tuntutuliak, making it the 136th largest of 352 total Alaskan communities with recorded populations that year. Between 2000 and 2009, the population of Tuntutuliak grew by 3.78% with an average annual growth rate of 0.32%, indicating a slow rate of growth during the period. The change in population from 1990 to 2010 is provided in Table 1.

Almost all Tuntutuliak residents identified themselves as American Indian and Alaska Native (95.8%). Other ethnic groups present in Tuntutuliak in that year included White (2.9%) and two or more races (1.2%). The percentages of the population identifying themselves as American Indian and Alaska Native and Hispanic or Latino decreased between 2000 and 2010, with corresponding increases in the percentages of the population identifying themselves as White and as two or more races. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

The average household size in Tuntutuliak increased from 4.2 persons per household in 1990 to 4.4 in 2000, then decreased to 4.25 in 2010. The total number of households increased from 70 in 1990 to 84 in 2000 to 96 occupied housing units in 2010. Of the 106 housing units surveyed for the 2010 Decennial Census, 59 were owner-occupied, 37 were renter-occupied, and 10 units were vacant or used only seasonally. Throughout this period no residents of Tuntutuliak were reported to be living in group quarters.

In 2010, the gender makeup in Tuntutuliak was 52.9% male and 47.1% female, similar to the state as a whole (52% male, 48% female). The median age was estimated to be 21.4 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. The greatest percentage of the population fell within the age category 0 to 19 years in 2010, with the next largest percentage of the population in the age group 20 to 39 years. Relatively few individuals were age 60 or older in both 2000 and 2010. The overall population structure of Tuntutuliak in 200 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Tuntutuliak Based on the 2000 and 2010 U.S. Decennial Census.

According to the 2006-10 American Community Survey,¹²⁸¹ in terms of educational attainment, 56.2% of Tuntutuliak residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 32% of residents aged 25 and older were estimated to have less than a ninth grade education, compared to 3.5% of Alaska residents overall; 11.8% were estimated to have a ninth to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 37.3% were estimated to have a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; and 19% were estimated to have some college but no degree, compared to

¹²⁸¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

28.3% of Alaska residents overall. No residents of Tuntutuliak were estimated to have an Associate's degree, Bachelor's degree, or graduate or professional degree in 2010.

*History, Traditional Knowledge, and Culture*¹²⁸²

The village's Yup'ik name is Tuntutuliaq, meaning "place of many reindeer." It was originally located four miles to the east and called Qinaq, as noted in 1879 by Edward Nelson, who noted 175 residents at that time. In 1908, a Moravian missionary visited the village and reported 130 people living there. In 1909, a Bureau of Indian Affairs school was built, and the first teacher was well-liked in the community. Due to lack of confidence in the subsequent teachers, the school was closed in 1917, and was moved to the village of Eek. It is thought that some Qinaq villagers may have moved to Eek so their children could attend school. In 1923, the first Moravian chapel was built with lumber and other support from Eek. In the late 1920s, a trading post and store was opened by John Johnson. The community moved to its present site on higher ground and was renamed Tuntutuliak in 1945. The Bureau of Indian Affairs built a new school in the community in 1957. A post office opened in 1960.

Tuntutuliak is a traditional Yup'ik Eskimo village with a fishing and subsistence lifestyle. Salmon and seal are important food sources. Children are taught in Yup'ik until the third grade and then classes are taught in English. The sale, importation, and possession of alcohol is banned in the village.

Natural Resources and Environment¹²⁸³

Tuntutuliak's summer temperatures average from 42 to 62 °F (5.6 to 16.7 °C), and winter temperatures average -2 to 19 °F (-18.9 to -7.2 °C). Extremes have been recorded from 86 to -46 °F (30 to -43.3 °C). Annual precipitation averages 16 inches, with 50 inches of snow.

The lower Yukon-Kuskokwim River Delta (Y-K Delta), where Tuntutuliak is located, is an area of low elevation and shallow relief. The terrain is mostly made up of flat and low rolling plains crossed with low gradient streams, tributaries, sloughs, floodplains, wetlands, and shallow lakes. Most of the lower Y-K Delta was ice-free during the last major Ice Age. Sediments in the area are loamy or sandy textured fluvial and alluvial deposits. Soils are poorly drained and typically overlay a layer of permafrost.¹²⁸⁴

Tuntutuliak is located on Calista Corporation land encompassed by the Yukon Delta National Wildlife Refuge, which provides spawning, rearing, feeding, and wintering habitat for a range of terrestrial and aquatic wildlife.¹²⁸⁵ Terrestrial wildlife of economic and cultural importance include: waterfowl and gamebirds, moose, wolf, wolverine, bear, mink, beaver, muskrat, otter, fox, beaver, muskrat, muskox, hares, voles, ermines, squirrels, lemmings, shrews, and weasels.¹²⁸⁶ Aquatic resources include Chinook, chum, pink, sockeye, and coho salmon,

whitefish, burbot, northern pike, blackfish, smelt, lamprey, char, grayling, trout, sculpin, stickleback, and longnose sucker.¹²⁸⁷

Regional mineral resources include zinc, gold, silver, lead, antimony, tungsten, tin, copper, nickel, mercury, and platinum.¹²⁸⁸ Upriver from Tuntutuliak, Calista Corporation is undertaking several mineral and oil and gas projects near Red Devil. Downriver, Platinum and Goodnews Bay are sites of more mineral projects.¹²⁸⁹

There are several natural hazards affecting the Yukon-Kuskokwim Delta region.¹²⁹⁰ These hazards include flooding, river bank erosion and destabilization, brush fire, and soil destabilization due to permafrost melt. Spring flooding is a major factor contributing to natural hazards in the area. As melt-off and ice jamming occurs during spring break-up, flooding and erosion occur and climate change is thought to be a continuing factor in the seasonality and severity of flooding in the region. In addition, variation in the active permafrost layer caused by climate change and urban development further compound impacts from flood events.¹²⁹¹

Current Economy¹²⁹²

The school, various services, commercial fishing, and fish processing provide most of the income. Trapping, basket weaving, skin-sewn products, and other Native handicrafts also provide cash. Subsistence foods comprise a majority of the diet, and about one-half of families go to a fish camp each summer.¹²⁹³ Top employers in 2010¹²⁹⁴ included Lower Kuskokwim School District, Qinarmit Corp., Association of Village Council Presidents, AVCP Housing Authority, TTC/EPA, Yukon Kuskokwim Health Corp. 90, Tuntutuliak Traditional Council, Paul Andrews Trading Post, Tuntutuliak Community Services Association, and Pavila Store.

According to the 2006-10 American Community Survey (ACS),¹²⁹⁵ per capita income in Tuntutuliak was estimated to be \$10,349 and the median household income was estimated to be \$34,464, compared to \$7,918 and \$25,500 in 2000, respectively. Taking inflation into account by converting the 2000 values to 2010 dollars,¹²⁹⁶ the real per capita income in 2000 is shown to have been \$10,412 and the real 2000 median household income was \$33,532. This shows that, while per capita income decreased slightly between 2000 and 2010, there was a slight increase in household income during this period. In 2010, Tuntutuliak ranked 270th of 305 Alaskan communities with per capita income that year, and 216th out of 299 Alaskan communities with household income data. Although Tuntutuliak's small population size may have prevented the American Community Survey from accurately portraying economic conditions, this decrease in per capita income is confirmed by economic data compiled by the Alaska Local and Regional

¹²⁹⁵ See footnote 1281.

¹²⁹⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, the per capita income in Tuntutuliak in 2010 was \$6,335, significantly less than the ACS estimates. This is supported by the fact that the community was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. However, it should be noted that American Community Survey and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

Based on the American Community Survey, in the same time frame, 49.8% of the population age 16 and older was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 30.8%, compared to the statewide unemployment rate of 5.9%. Approximately 36.6% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; the relatively low income figures and high poverty rates reported for Tuntutuliak are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Tuntutuliak. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 26.7%.

Based on household surveys conducted for the 2006-2010 American Community Survey, the greatest percentage of workers was employed in the private sector (56.8%), while 43.2% were employed in the public sector. Out of 74 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest percentage worked in educational services, health care, and social assistance (38%), transportation, warehousing, and utilities (17%), and public administration (16%). Smaller percentages of the population were employed in finance, insurance, and real estate (5%), information (8%), retail trade (5%), construction (4%), and agriculture, forestry, fishing, hunting, and mining (5%). However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry and occupation are presented in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Tuntutuliak (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Tuntutuliak (U.S. Census).

Governance

Tuntutuliak is an unincorporated community that is not located within an organized Borough. Because of Tuntutuliak’s unincorporated status, no municipal taxes were administered between 2000 and 2010. Tuntutuliak did receive State Revenue Sharing contributions in 2000, 2001, and 2003 ranging from approximately \$3,600 to approximately \$4,100. Tuntutuliak did not receive any fisheries-related grants between 2000 and 2010. Information about selected aspects of Tuntutuliak’s community revenue is presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Tuntutuliak from 2000 to 2010.

Tuntutuliak was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is Tuntutuliak Land, Limited. The regional Native corporation to which Tuntutuliak belongs is the Calista Corporation. The region Calista Corporation serves is a vast and beautiful corner of the world. Tucked between two of Southwest Alaska’s mightiest rivers – the Yukon and the Kuskokwim – this unique isolated area is the traditional home of the state’s indigenous Yup’ik, Cup’ik and Athabascan people, Calista Corporation’s shareholders. The Calista Region encompasses 57,000 square miles and is the second largest ANCSA region in land size. The land entitlement to Calista, however, is only 6.5 million acres - less than 20 % of the land area. Approximately 75 % of the land within the Region is owned by the U.S. Fish and Wildlife Service. Most of the remaining lands are owned by federal and state governments, with a very small amount privately owned. Surrounded by mostly federally owned lands, the Region is about the size of New York State. It encompasses nearly 10 % of Alaska’s land area and is comprised of 56 federally recognized tribes. There are no roads that connect the region with the rest of Alaska. Because everything must be flown or barged to each community, the cost of food, fuel, transportation and energy are extraordinarily high. Calista Corporation works hard and partners with many to improve and enrich the way of life for its Shareholders and Descendants.¹²⁹⁷

¹²⁹⁷ Calista Corporation. 2011. *Shareholder Overview: Our History*. Retrieved on May 11, 2012 from <http://www.calistacorp.com/shareholders/shareholder-overview>.

The nearest offices of Alaska Department of Fish and Game (ADF&G) and Alaska Department of Commerce, Community and Economic Development (DCCED) are located in Bethel. A National Marine Fisheries Service (NMFS) field office is also located in Bethel, and a larger office is located in Anchorage. The nearest Alaska Department of Natural Resources (DNR), Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement offices are located in Anchorage.

Infrastructure

Connectivity and Transportation

Tuntutuliak relies on air transportation for passengers, mail, and cargo service. A state-owned 3,025 foot long by 75 foot wide gravel runway and a public seaplane base on the Qinaq River are available. Barge services deliver goods approximately six times a year. Boats and snowmobiles are used for local travel. Winter trails are marked to Kipnuk (77 mi), Toundra (60 mi), and Kongiganak (29 mi).¹²⁹⁸ In June 2012, round-trip airfare between Tuntutuliak and Anchorage was \$626.¹²⁹⁹

*Facilities*¹³⁰⁰

A flush/haul system, unpermitted landfill, sewage lagoon, and 4-mile sanitation boardwalk are available. The school has its own well and sewage lagoon. Law enforcement services are provided by a Village Public Safety Officer (VPSO) and by state troopers in Bethel. Fire and rescue services are provided by a state VPSO, and a volunteer fire department with Project Code Red Equipment. There is a Village Council jail, a community hall, and a school library in Tuntutuliak.

*Medical Services*¹³⁰¹

Medical care is provided by the Kathleen Daniel Memorial Clinic, which is owned by the Village Council and operated by the Yukon Kuskokwim Health Corporation. The clinic is a Community Health Aid Program site. Emergency services have coastal and air access and are provided by a health aide. The closest Acute Care facility and qualified Emergency Care Center is located in Bethel.

¹³⁰¹ Ibid.

*Educational Opportunities*¹³⁰²

The Lewis Angapak Memorial School provides instruction to students from pre-school through 12th grade. The first 3 years of instruction are entirely in Yup'ik, with remaining years primarily in English. In 2011 the school had 155 students and 10 teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Commercial harvest of salmon first took place in the Kuskokwim area in 1913, although in the early years it was a quasi-commercial fishery with limited distribution. Catch was dried and sold as food for sled dogs during the 1930s when dog teams were the primary means of hauling freight to villages in Western Alaska. At the time of statehood, commercial fishing districts were defined along the Kuskokwim River. In the 1960s and 1970s commercial salmon fisheries in the Kuskokwim were still considered experimental, and management efforts focused on increasing commercial use while ensuring continued supply for subsistence use. Harvest levels continued to increase until the mid-1990s, after which time fishing effort, harvest levels and salmon prices decreased. Current management is focused on sustainability of salmon runs, ensuring subsistence needs are met, and with a precautionary approach, providing opportunity for commercial harvest of available surpluses.¹³⁰³

Commercial catch of herring for bait began in Alaska around 1900, and herring sac roe fisheries developed in the late 1970s. Along the Yukon/Kuskokwim coast there are six commercial gillnet sac roe districts: Security Cove, Goodnews Bay, Cape Avinof, Nelson Island, Nunivak Island and Cape Romanzof. Harvests in these areas have been declining in recent years, in part due to lack of processing capacity in the region.¹³⁰⁴

On the lower Kuskokwim, subsistence sockeye, chum, and Chinook harvesting typically begins by June 1st, and is concluded by mid-July. Coho and pink salmon are harvested in August and September. Fishing effort is based from either a fish camp or from a home village. Drift gill nets, fish wheels, and rods and reels are used for harvesting. Soon after river ice breaks up in May, smelt move into the lower Kuskokwim area. Residents use fine-meshed nets to catch smelt, and thread them through willow sticks before drying and smoking them. Whitefish, sheefish, Arctic grayling, and northern pike are harvested year-round. Blackfish and burbot are harvested during fall and winter months. Dolly Varden are typically harvested from June through December; while trout are typically harvested in the early spring and summer, and again in the

late summer and early fall. Spotted seal, bearded seal, ringed seal, and walrus are harvested in the late spring.^{1305,1306}

Tuntutuliak is on the Qinaq River, approximately three miles from its confluence with the Kuskokwim River and about 40 miles from the Bering Sea coast.¹³⁰⁷ Tuntutuliak is adjacent to Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Tuntutuliak participates in the Community Development Quota (CDQ) Program through the Coastal Villages Region Fund (CVRF). The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the Bering Strait and Aleutian Islands region.¹³⁰⁸ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ. The community is located in Federal Reporting Area 508, International Pacific Halibut Commission (IPHC) Regulatory Area 4E, and the Bering Sea Sablefish Regulatory District. The mission of CVRF is to provide the means for development of its member communities by sensibly creating tangible, long-term opportunities for all residents who want to fish and work. On behalf of the 20 member communities, CVRF has grown to be the largest seafood owner/operator headquartered in Alaska. CVRF is now able to take a broader and more balanced approach to managing the Kuskokwim Delta and Bering Sea seafood resources. For its residents, CVRF must continue to protect its fisheries and its investments in these fisheries, grow in a strategic and sustainable manner, and remain adaptable to take advantage of all positive opportunities. CVRF's investments in the Bering Sea fisheries enables CVRF to provide fishing opportunities in salmon, halibut, and herring in the region.¹³⁰⁹ The community is not eligible for the Community Quota Entity program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Tuntutuliak does not have a registered processing plant. The nearest processing plant is located in Bethel.

Fisheries-Related Revenue

Between 2000 and 2010, no data were reported about fisheries-related revenue received by Tuntutuliak (Table 3).

Commercial Fishing

In 2010, 54 community residents held 65 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC) for salmon net, herring roe, and halibut fisheries. Overall between 2000 and 2010, the total number of CFEC permits issued to community residents declined while the number of permit holders remained relatively stable. The number of permits reported as fished decreased during this period. The majority of the CFEC permits issued between 2000 and 2010 were for the salmon fishery (an average of 44 per year), and the number of salmon permits and permit holders remained relatively stable during this period. The number of salmon CFEC permits reported as fished each year was variable. In 2010, the majority of the salmon CFEC permits issued were for the Kuskokwim gill net fishery, with the remainder issued for the Bristol Bay drift gill net fishery. The number of herring CFEC permits declined slightly during the period while the number of permit holders remained relatively stable, though herring CFEC permits were only reported as fished in 2000 and 2003. In 2010, permits were issued for the Goodnews Bay and Cape Avinof roe herring gill net fisheries. The number of halibut CFEC permits declined substantially between 2000 and 2010, as did the number of permit holders. One halibut CFEC permit was reported as fished in each of the following years: 2003, 2004, and 2009. In 2010, one CFEC permit was issued for the statewide long line fishery using vessels under 60 feet. There were no Tuntutuliak residents holding Federal Fisheries Permits or License Limitation Program (LLP) permits during this period. Information on commercial fishing permits and permit holders by species between 2000 and 2010 is presented in Table 4.

The number of crew license holders decreased from 47 to 4 between 2000 and 2003, then increased again to a total of 53 crew license holders in Tuntutuliak in 2010, representing 12.9% of the population. There were no fish buyers or shore-side processing facilities located in Tuntutuliak between 2000 and 2010. Both the number of commercial fishing vessels owned primarily by Tuntutuliak residents and the number of vessels homeported in Tuntutuliak decreased between 2000 and 2010. There were no vessels landing catch in the community between 2000 and 2010, and thus there are no commercial landings or ex-vessel values to report during this period. Information on characteristics of the commercial fishing sector in Tuntutuliak is presented in Table 5.

There were no Tuntutuliak residents holding quota shares for halibut or sablefish between 2000 and 2010 (Tables 6 and 7), and no community residents holding crab quota shares between 2005 and 2007 (Table 8). As previously stated there were no commercial landings or associated ex-vessel revenue recorded in the community between 2000 and 2010 (Table 9). Commercial landings by Tuntutuliak residents were considered confidential between 2000 and 2010 for all species due to a small number of participants, with the exception of herring landings in 2000 and salmon landings in 2000, 2004, 2005, and 2007. Information on landings and associated ex-vessel revenue by community residents between 2000 and 2010 is presented in Table 10.

Table 3. Known Fisheries-Related Revenue (in U.S. Dollars) Received by the Community of Tuntutuliak: 2000-2010.

Recreational Fishing

Between 2000 and 2010, there were no Tuntutuliak residents holding sport fish guide licenses and there were no sport fish guide businesses located in Tuntutuliak. Given this, no kept/released log book data were reported for fishing charters out of Tuntutuliak between 2000 and 2010.¹³¹⁰ The number of sportfishing licenses sold to community residents (irrespective of the location of the point of sale) varied considerably during this period, with 9 licenses issued in 2004 and 74 licenses issued in 2009. The number of sportfishing licenses sold within the community also varied from 0 between 2002 and 2004 to 73 in 2009. In 2010, there were 24 sportfishing licenses sold to Tuntutuliak residents and 20 sportfishing licenses were sold in the community. In most years, the number of licenses sold in the community was only slightly lower than the number sold to community residents, indicating the potential that a few community residents may travel to other communities to participate in sportfishing activities.

The Alaska Statewide Harvest Survey,¹³¹¹ conducted by ADF&G between 2000 and 2010, did not report any species as targeted by private anglers in Tuntutuliak. Tuntutuliak is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Tuntutuliak is displayed in Table 11.

Subsistence Fishing

Tuntutuliak is a traditional Yup'ik Eskimo village with a fishing and subsistence lifestyle. Salmon and seal are important food sources. Subsistence foods comprise a majority of the diet for community residents.¹³¹²

In 2005, the only year that a subsistence survey was conducted by ADF&G in the community of Tuntutuliak between 2000 and 2010, 23% of households were recorded as using halibut for subsistence, while 52% of households were using non-salmon fish (other than halibut). Information on subsistence participation for other species and per capita subsistence harvest was not reported during this period. Information on subsistence participation by household and species is presented in Table 12.

In years for which data were reported between 2000 and 2010, an average of 83 subsistence salmon permits was issued to Tuntutuliak residents, with an average of 61 of those permits returned (Table 13). Chinook salmon were the primary species harvested under subsistence permits (an average of 3,401 Chinook per year), followed closely by chum salmon (an average of 2,917 per year), along with sockeye salmon (an average of 1,479 per year), coho

¹³¹² Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

salmon (an average of 1,352 per year), and pink salmon (an average of 72 per year). In 2005, the per capita harvest of non-salmon fish was 100,681 pounds in Tuntutuliak (Table 13). Data were not reported on the subsistence harvest of marine invertebrates (Table 13), halibut (Table 14), or subsistence harvest of marine mammals (Table 15).

The ADF&G Division of Subsistence reported that the following species of non-salmon fish were used for subsistence in Tuntutuliak during this period: Arctic char, Bering cisco, blackfish, broad whitefish, burbot, Dolly Varden, grayling, herring, humpback whitefish, lamprey, least cisco, Pacific tom cod, pike, rainbow trout, rockfish, round whitefish, sheefish, smelt, stickleback (needlefish), and sucker.¹³¹³

Tununak (too-NOO-nuck)

People and Place

*Location*¹³¹⁴

Tununak is located in a small bay on the northeast coast of Nelson Island, 115 miles northwest of Bethel and 519 miles northwest of Anchorage. Tununak is located in the Bethel Recording District and the Bethel Census Area and is not located within an organized Borough.

*Demographic Profile*¹³¹⁵

In 2010, there were 327 inhabitants in Tununak, making it the 155th largest of 352 total Alaskan communities with recorded populations that year. Between 2000 and 2009, the population of Tununak grew by 1.54%, with an average annual growth rate of 0.79%, indicating a slow rate of population growth (Table 1).

Figure 1. Racial and Ethnic Composition, Tununak: 2000-2010 (U.S. Census).

Most Tununak residents identified themselves as American Indian and Alaska Native in 2010 (94.5%). Other ethnic groups present in Tununak in that year included White (4%) and two or more races (1.5%). Between 2000 and 2010, the percentage of the population identifying themselves as American Indian and Alaska Native decreased by 0.3%, while the percentage of the population identifying themselves as two or more races also decreased. There was a corresponding increase in the percentage of the population identifying themselves as White during this period (Figure 1).

The average household size in Tununak in 2010 was 3.89, a decrease from 4 persons per household in 1990 and 3.96 in 2010. The total number of households in Tununak increased from 78 in 1990 to 82 in 2000 to 84 occupied housing units in 2010. Of the 90 housing units surveyed for the 2010 Decennial Census, 64 were owner-occupied, 20 were renter occupied, and six were vacant. Throughout this period no residents of Tununak were reported to be living in group quarters.

In 2010, the gender makeup in Tununak was 58.7% female and 41.3% male, slightly more skewed than the state as a whole (52% male, 48% female). The median age was estimated to be 24.6 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the largest percentage of the population fell within the age category 10 to 19 years old, with the next largest percentage falling within the age category 0 to 9 years old. Relatively few individuals were age 70 or over in 2010. The overall population structure of Tununak in 2000 and 2010 is shown in Figure 2.

According to the 2006-10 American Community Survey,¹³¹⁶ in terms of educational attainment, 78.1% of Tununak residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 18.4% of residents aged 25 and older were estimated to have less than a ninth grade education, compared to 3.5% of Alaska residents overall; 3.6% were estimated to have a ninth to 12th grade

¹³¹⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

education but no diploma, compared to 5.8% of Alaska residents overall; 45.4% were estimated to have a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; 25.5% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 1.5% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; and 5.6% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall.

Figure 2. Population Age Structure in Tununak Based on the 2000 and 2010 U.S. Decennial Census.

*History, Traditional Knowledge, and Culture*¹³¹⁷

In 1878, Nelson Island was named after Edward Nelson, a Smithsonian naturalist who noted six people, including one non-Native trader, living in Tununak. In 1889, the Jesuits opened a small chapel and school. They found the villagers difficult to convert due to the migratory nature of their traditional culture and because the shamans were still quite powerful. The mission closed in 1892. In 1925 a government school was built, and a Northern Commercial Company store was opened in 1929. From 1934 to 1962, a missionary named Father Deshout lived on Nelson Island. His long-standing relationship and work with the people in the area had a great influence. The 1950s brought great changes to the islanders' lifestyle, through their involvement with the Territorial Guard and work in fish canneries, high schools, and healthcare treatment for tuberculosis. For many, this was their first exposure outside the community. By the 1970s, snowmobiles were replacing dog-sled teams, and the last qasgiq (men's community house) was abandoned. The city was incorporated in 1975, but it was dissolved on February 28, 1997, in favor of traditional council governance.

Tununak is a traditional Yup'ik Eskimo village, with an active fishing and subsistence lifestyle. The sale and importation of alcohol is banned in the village.

Natural Resources and Environment¹³¹⁸

The village is located in a marine climate. Average annual precipitation is 17 inches, with 28 inches of snowfall. Summer temperatures can range from 42 to 59 °F (5.6 to 15 °C), and winter temperatures average 2 to 19 °F (-16.7 to -7.2 °C). Extremes have been recorded from 80 to -35 °F (26.7 to -37.2 °C).

Tununak is located on Nelson Island, the second largest island within the Yukon Delta National Wildlife Refuge (Refuge). The southern portion of the island is low-lying and covered with small lakes and streams. The northern portion of the island hosts more rugged terrain, with several peaks over 1,300 feet in elevation. The Bering Sea coast along the Yukon-Kuskokwim River delta is characterized by sandy beaches that merge into active sand dunes greater than 100 feet in height. The dunes are particularly susceptible to erosion.¹³¹⁹

The Refuge was established “to conserve fish and wildlife populations and habitats in their natural diversity, including, but not limited to shorebirds, seabirds, tundra swans, emperor, white-fronted and Cackling Geese, black brant and other migratory birds, salmon, muskoxen, and marine mammals; to fulfill treaty obligations; to provide the opportunity for continued subsistence uses; and to ensure water quality and necessary water quantity.” Refuge lands are open to sport and subsistence hunting and fishing. The most productive wildlife habitat is the coastal region between Nelson Island and the Askinuk Mountains to the north.¹³²⁰ Natural hazards that have been identified to be present in the Bethel Census Area include flooding,

¹³¹⁷ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

¹³²⁰ Ibid.

earthquakes, and severe weather.¹³²¹ Communities in the region are also suffering from severe erosion of both riverbanks and coastal shorelines, and are susceptible to tundra fires.^{1322,1323}

Current Economy¹³²⁴

Employment is primarily with the school district, village corporation, stores, and commercial fishing. Trapping and Native crafts also generate cash for many families, and subsistence activities are an important contributor to villagers' diets. Seal meat, seal oil, and herring are the staples of the diet. Beluga whale and walrus are also hunted. Residents participate in a lottery to hunt musk-ox on Nelson and Nunivak Islands. In 2010, 46 residents held commercial fishing permits. Coastal Villages Seafood, Inc., processes halibut and salmon in Tununak.¹³²⁵ Top employers in 2010¹³²⁶ included Lower Kuskokwim School District, Tununak IRA Traditional Council, Coastal Villages Seafoods Inc., Tununrmiut Rinit Corp., Yukon Kuskokwim Health Corp. 90, Rural Alaska Community Action Program, Coastal Villages Region Fund, Tununak Native Store, United Utilities Inc., and Association of Village Council Presidents.

In 2010, per capita income in Tununak was estimated to be \$12,364 and the median household income was estimated to be \$30,628, compared to \$7,653 and \$25,000 in 2000, respectively. Taking inflation into account by converting the 2000 values to 2010 dollars,¹³²⁷ the real per capita income in 2000 is shown to have been \$10,064 and the real 2000 median household income was \$32,875. This shows that per capita income increased over the period, while there was a decrease in the median household income. In 2010, Tununak ranked 234th of 305 Alaskan communities with per capita income that year, and 242nd of 299 Alaskan communities with household income data. However, Tununak's small population size may have prevented the American Community Survey from accurately portraying economic conditions.¹³²⁸ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, the per capita income in Tununak in 2010 was \$5,794, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in

¹³²⁷ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹³²⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

2000.¹³²⁹ This is supported by the fact that the community was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.¹³³⁰ However, it should be noted that American Community Survey and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Tununak. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 24.4%.

Based on the 2006-2010 American Community Survey, 70.2% of the population age 16 and older was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 28.7%, compared to the statewide unemployment rate of 5.9%. Approximately 29.9% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; the relatively low income figures and high poverty rates reported for Tununak are not reflective of the value of subsistence to the local economy.

Based on household surveys conducted for the 2006-2010 American Community Survey, the greatest percentage of workers was employed in the public sector (63.7%), while 36.3% were employed in the private sector. Out of 124 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest percentage worked in educational services, health care, and social assistance (32.7%), public administration (29.6%), and retail trade (15.4%). Smaller percentages of the workforce were employed in other services except public administration (8%), arts, entertainment, recreation, accommodation, and food services (2.5%), professional, scientific, management, administration, and waste management (1.9%), finance, insurance, and real estate (1.9%), transportation, warehousing, and utilities (3.1%), and construction (4.9%). However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

¹³²⁹ See footnote 1326.

Figure 4. Local Employment by Occupation in 2000-2010, Tununak (U.S. Census).

Governance

Tununak is an unincorporated town that is not located within an organized Borough. Because of Tununak’s unincorporated status, no municipal taxes were administered between 2000 and 2010. However, Tununak did receive State Revenue Sharing contributions of approximately \$3,700 in 2001 and 2003. Tununak did not receive any fisheries-related grants between 2000 and 2010. Information about selected aspects of Tununak’s community revenue is presented in Table 2.

Tununak was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The local village Native corporation is Tununrmiut Rinit Corporation. The regional Native corporation to which Tununak belongs is the Calista Corporation. The region Calista Corporation serves is a vast and beautiful corner of the world. Tucked between two of Southwest Alaska’s mightiest rivers – the Yukon and the Kuskokwim –

this unique isolated area is the traditional home of the state’s indigenous Yup’ik, Cup’ik and Athabascan people, Calista Corporation’s shareholders. The Calista Region encompasses 57,000 square miles and is the second largest ANCSA region in land size. The land entitlement to Calista, however, is only 6.5 million acres - less than 20 % of the land area. Approximately 75 % of the land within the Region is owned by the U.S. Fish and Wildlife Service. Most of the remaining lands are owned by federal and state governments, with a very small amount privately owned. Surrounded by mostly federally owned lands, the Region is about the size of New York State. It encompasses nearly 10 percent of Alaska’s land area and is comprised of 56 federally recognized tribes. There are no roads that connect the region with the rest of Alaska. Because everything must be flown or barged to each community, the cost of food, fuel, transportation and energy are extraordinarily high. Calista Corporation works hard and partners with many to improve and enrich the way of life for its Shareholders and Descendants.¹³³¹

The nearest offices of Alaska Department of Fish and Game (ADF&G) and Alaska Department of Commerce, Community and Economic Development are located in Bethel. A National Marine Fisheries Service (NMFS) field office is also located in Bethel, and a larger office is located in Anchorage. The nearest Alaska Department of Natural Resources (DNR), Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement offices are located in Anchorage.

Infrastructure

Connectivity and Transportation

Tununak relies on air transportation for passengers, mail, and cargo service. A state-owned 1,778 ft long by 30 ft wide gravel airstrip is available. Barges deliver goods two to four times each summer, and goods are lightered to shore. Boats, snowmobiles, and ATVs are used for local travel.¹³³² Round-trip airfare between Tununak and Anchorage in June of 2012 was \$768.¹³³³

*Facilities*¹³³⁴

Water is derived from Muskox Creek. A flush/haul system provides services to some homes. Some residents currently haul water from six watering points. The community relies on the washeteria for laundry and bathing. The school provides its own piped water system, and sewage discharges to the village drainfield. Law enforcement services are provided by a Village Public Safety Officer (VPSO) and state troopers in Bethel. Tununak also has a community hall.

*Medical Services*¹³³⁵

Medical care is provided by the Tununak Clinic, which is owned by the Village Council and operated by the Yukon Kuskokwim Health Corporation. The clinic is a Community Health Aid Program (CHAP) site. Emergency services have coastal and air access and are provided by a health aide. The closest Acute Care facility and qualified Emergency Care Center is located in Bethel.

*Educational Opportunities*¹³³⁶

The Paul T. Albert Memorial School provides instruction to students in pre-school through 12th grade. In 2011 the school had 131 students and 9 teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Tununak is located on Nelson Island on Tununak Bay, across the water from Nunivak Island.¹³³⁷ The area is located in Federal Statistical and Reporting Area 514, Pacific Halibut Fishery Regulatory Area 4E, and the Bering Sea Sablefish Regulatory Area. Toksook Bay

participates in the Community Development Quota (CDQ) program through the Coastal Villages Region Fund (CVRF). The CDQ program was implemented to help alleviate economic distress in rural communities in western Alaska by allocating a percentage of halibut, crab, and groundfish to six CDQ non-profit organizations representing 65 communities in the Bering Strait and Aleutian Islands region.¹³³⁸ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ. The community is located in Federal Reporting Area 508, International Pacific Halibut Commission (IPHC) Regulatory Area 4E, and the Bering Sea Sablefish Regulatory District. The mission of CVRF is to provide the means for development of its member communities by sensibly creating tangible, long-term opportunities for all residents who want to fish and work. On behalf of the 20 member communities, CVRF has grown to be the largest seafood owner/operator headquartered in Alaska. CVRF is now able to take a broader and more balanced approach to managing the Kuskokwim Delta and Bering Sea seafood resources. For its residents, CVRF must continue to protect its fisheries and its investments in these fisheries, grow in a strategic and sustainable manner, and remain adaptable to take advantage of all positive opportunities. CVRF's investments in Bering Sea fisheries enables CVRF to provide fishing opportunities in salmon, halibut, and herring in the region.¹³³⁹

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there was one processing plant operating in Tununak in 2010. The Coastal Villages Seafoods fish processing plant in Tununak is a CDQ operation, a subsidiary of the Coastal Villages Region Fund. The Tununak facility processes halibut in June and July. CVRF maintains a local community service center that helps local fishing families maintain, repair, service and modify their boats, motors, and fishing gear. The local plant provides free room and board to its fish processing workers, as well as transportation to and from the plant site and a cash bonus for all those who complete their contracts.¹³⁴⁰

Fisheries-Related Revenue

Between 2000 and 2010, no data were reported about fisheries-related revenue received by Tununak (Table 3).

Commercial Fishing

Tununak ranked 57th in landings and 55th in ex-vessel revenue out of 67 Alaskan communities that received commercial fisheries landings in 2010. In 2010, a total of 58 Tununak residents held 75 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC) for the halibut, herring, and salmon fisheries. There were 28 CFEC permits

¹³³⁸ Fina, M. (2011). Evolution of Catch Share Management: Lessons from Catch Share Management in the North Pacific. *Fisheries*, Vol. 36(4). Retrieved September 12, 2012 from http://www.fakr.noaa.gov/npfmc/PDFdocuments/catch_shares/Fina_CatchShare_411.pdf.

¹³³⁹ Coastal Villages Region Fund (2010). *CVRF: Who We Are*. Retrieved on May 11, 2012 from <http://www.coastalvillages.org/>.

reported as fished in 2010 (37%). Between three and four salmon CFEC permits were issued each year to between three and five Tununak residents, however the only years in which salmon CFEC permits were reported as fished were 2000, 2003, and 2007. Salmon CFEC permits were issued in 2010 for the Bristol Bay drift gill net and Kuskokwim gill net fisheries. In 2010, there were 34 halibut CFEC permits issued to 30 permit holders, with 28 permits (82%) reported as fished. The majority (20) of these permits were issued for the statewide hand troll fishery, with the remainder issued for the statewide longline fishery using vessels under 60 feet and the statewide mechanical jig fishery. The number of halibut CFEC permits, permit holders, and permits reported as fished decreased between 2000 and 2010. There were 37 herring CFEC permits issued to 36 Tununak residents in 2010, though none of the permits issued that year were reported as fished. Nearly all of these permits were issued for the Nelson Island gill net fishery, with one permit issued for the Nunivak Island gill net fishery. Overall between 2000 and 2010, the number of herring CFEC permits and permit holders remained relatively stable, though there were no herring CFEC permits reported as fished in 2005 or between 2007 and 2010. Information on permits and permit holders by species is presented in Table 4.

There was only 1 crew license holder in Tununak in 2010, a substantial decline from 23 crew license holders in 2000. Though there was a shore-side processing facility located in Tununak between 2000 and 2010, the only two years in which a fish buyer was recorded in the community during this period were 2009 and 2010. The number of commercial fishing vessels owned by Tununak residents and the number of vessels homeported in the community both decreased between 2000 and 2010. There were 34 vessels recorded as landing catch in the community in 2009 and 40 vessels in 2010, though the landings and ex-vessel revenue in those years were considered confidential due to a small number of fish buyers. There were no vessels landing catch in the community between 2000 and 2008. Information on characteristics of the commercial fishing sector in Tununak is presented in Table 5.

Between 2000 and 2010, there were 4,454 halibut quota shares were held by residents of Tununak, however there was no Individual Fishing Quota allotment associated with those shares during this period. Information on halibut quota holdings between 2000 and 2010 is presented in Table 6. There were no sablefish quota shares held between 2000 and 2010 (Table 7) and no crab quota shares held between 2005 and 2010 (Table 8) in Tununak.

As stated previously, there were no commercial landings recorded in Tununak between 2000 and 2008. Landings and associated ex-vessel revenue in 2009 and 2010 was considered confidential due to a small number of participants (Table 9). Landings by Tununak residents were considered confidential for all species and all years between 2000 and 2010 except halibut between 2000 and 2010 and herring between 2000 and 2004 and in 2006. Landings and ex-vessel revenue for both species varied widely during this period. Information on landed pounds and ex-vessel revenue by Tununak residents between 2000 and 2010 is presented in Table 10.

Recreational Fishing

There were no residents of Tununak holding sport fish guide licenses between 2000 and 2010, and no active sport fish guide business located in Tununak during this period. Given this, no kept/released log book data were reported for fishing charters out of Tununak between 2000 and 2010.¹³⁴¹ In 2010, there were 56 sportfishing licenses sold to Tununak residents (irrespective of the location of the point of sale), an increase from 6 licenses sold to community residents in 2000. During this period there were no sportfishing licenses sold within the community, indicating the potential that Tununak residents travel to other areas or nearby communities to participate in sportfishing activities.

The Alaska Statewide Harvest Survey,¹³⁴² conducted by ADF&G between 2000 and 2010, did not provide information about species targeted by private anglers in Tununak. However, Tununak is located within Alaska Sport Fishing Survey Area V – Kuskokwim River and Bay Drainages and information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, saltwater sportfishing activity was minimal, with between zero and 28 non-Alaska resident angler days fished per year, and between zero and 108 Alaska resident angler days fished per year. A majority of sportfishing activity occurred in freshwater, with non-Alaska resident anglers fishing consistently more angler days (12,624 – 17,582 angler days per year) than Alaska resident anglers (5,166 – 9,152 angler days per year). This information about the sportfishing sector in and near Tununak is displayed in Table 11.

Subsistence Fishing

Trapping and Native crafts generate cash for many families, and subsistence activities are an important contributor to villagers’ diets. Seal meat, seal oil, and herring are the staples of the diet. Beluga whale and walrus are also hunted. Residents participate in a lottery to hunt musk-ox on Nelson or Nunivak Islands.¹³⁴³

Data were not reported regarding subsistence participation at the household level or per capita subsistence harvest in Tununak between 2000 and 2010. However, data are reported on total subsistence harvests at the species level. In years for which data were reported for salmon harvests between 2000 and 2010, an average of 101 subsistence salmon permits was issued to Tununak residents, with an average of four permits returned. Coho salmon were the primary species harvested for subsistence (an average of 34 coho per year), along with Chinook salmon, chum salmon, and sockeye salmon (Table 13). Data on subsistence harvest of marine invertebrates and non-salmon fish were not reported during this period.

Between 2004 and 2008, an average of 69 Subsistence Halibut Registration Certificate (SHARC) were issued to Tununak residents, although in only 11 were issued in both 2009 and

¹³⁴³ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

2010. The number of SHARC reported as fished averaged 36 between 2004 and 2007, but in 2008 there were 8 permits reported as fished and in 2009 there were 7 permits reported as fished. By 2010, only two SHARC were fished. The reported annual subsistence harvest of halibut averaged 3,520 pounds per year between 2004 and 2008, with 488 pounds of subsistence halibut harvest reported in 2009, and 190 pounds in 2010. Information about subsistence harvest of halibut is presented in Table 14.

Although anecdotal reports of seal and walrus harvests are known, only three walrus were officially reported harvested for subsistence use in 2002, but no other data reported for subsistence harvest of marine mammals between 2000 and 2010 (Table 15).

The ADF&G Division of Subsistence reported that unknown species of marine invertebrates were used for subsistence in Tununak during this period. Marine mammals reported as harvested for subsistence use included bearded seal, ribbon seal, ringed seal, spotted seal, and Steller sea lion. Non-salmon fish reported as harvested for subsistence use included: blackfish, burbot, capelin (grunion), Dolly Varden, flounder, herring, herring roe, herring sac roe, herring spawn on kelp, Pacific cod (gray), Pacific tomcod, pike, sculpin, sheefish, smelt, stickleback (needlefish), unknown smelt, whitefish, and wolf fish.¹³⁴⁴

Hydaburg	Point Baker	

* Includes Juneau City and Borough, plus Douglas and Auke Bay.

** Includes Ward Cove

People and Place

Location

Occupying 35,138 square miles, the Southeast Alaska region trails in a thin coastal strip of land from Yakutat in the northwest (59.547° N Lat.) to Prince of Wales in the southeast (55.208° N Lat.), and borders the Canadian province of British Columbia and the Yukon Territory.

Demographic Profile

Southeast Alaska includes seven boroughs (Yakutat, Ketchikan Gateway, Haines, Wrangell, Sitka, Petersburg, and Juneau) and two census areas (Hoonah-Angoon and Prince of Wales-Hyder). A total of 28 communities met profiling criteria; of which 12 had populations in excess of 500, and 5 had populations in excess of 2,000 in 2010. Large population centers include the cities of Sitka, Ketchikan, and Juneau.

In 2010, Southeast Alaska has approximately 72,000 residents, most of whom are concentrated in the region's larger cities of Juneau, Sitka, and Ketchikan. Approximately 67% of the region's residents are White, while approximately 22% identified themselves as at least part American Indian or Alaska Native.¹

Juneau, the state capital, has a population of approximately 31,000² and a good share of the economic activity of the region. The backbone of the regional economy is commercial fishing. Major commercial fleets are based in the large ports of Sitka, Yakutat, Petersburg, Wrangell, and Ketchikan, but even smaller communities have sizable fleets. In addition, many communities have commercial fish processing plants and storage facilities. The timber industry also constitutes an important part of the regional economy. A growing tourist industry, bolstered by increasing cruise ship stopovers, is becoming an important source of revenue; approximately half a million tourists visit Southeast Alaska by cruise ship annually.

In general, the economy of Southeast Alaska is well developed in comparison to other regions in Alaska, owing to its proximity to the lower 48 states and its history of commercial fishing and resource extraction. In 2010, the regional per capita income was estimated to be around \$29,500 and the median household income was estimated to be around \$59,000. Of those aged 16 and over, an estimated 70.9% were considered part of the civilian labor force in 2010. Most (21.3%) were estimated to work in education service, health care, and social assistance sectors; followed by public administration (16.3%) and retail trade (12.2%) sectors. Unemployment was estimated at 7.0% in 2010.³

History

Human occupation of Southeast Alaska is dated back to approximately 10,300 years ago according to evidence of human remains and tools found in On Your Knees cave on the northern tip of Prince of Wales Island.⁴ Traditionally, Southeast Alaska was a patchwork of territories occupied by Tlingit, Haida, and Tsimshian peoples, with Tlingit groups occupying much of the northern region. Tlingit oral history dates occupation of Bartlett Cove, in northern Southeast Alaska, to 4,500 years ago,⁵ and oral histories told by the Huna people of Chichigof Island tell of times when glaciers filled all of Glacier Bay.⁶ Fish traps found along the Chilkoot River, near Haines, are dated to approximately 2,100 years ago.⁷ Originally occupied by Tlingit peoples, Haida Indians moved into the southern portion of Southeast Alaska from Haida Gwaii (British Columbia's Queen Charlotte Islands) during the 1700s. On Prince of Wales Island they established multiple settlements, taking advantage of the Island's rich resources, including abundant sea otters.⁸ Tsimshian villages were located in southern Southeast Alaska at Hyder and Halibut Bay.⁹

In the late 18th century, Russian and English fur traders came to the area, and in 1799, a Russian trading post was built in present day Sitka. While initially embraced by the local indigenous population, Russian occupation eventually led to what would be the first of many conflicts between Russians/Americans and local Native peoples.

The late 1800s and early 1900s was a period of expansion brought on by resource extraction. The first salmon cannery in Alaska was established in Klawock in 1868, with others following shortly thereafter.¹⁰ Alaska's first halibut fishery started in 1896 in the Wrangell Narrows, and in 1900, the Icy Straits Packing Company began processing catch in Petersburg. In 1907, the Tongass National Forest was established, creating a single management unit for 6.8 million acres of forestlands.¹¹ Timber harvesting went on to become a definitive industry in several Southeast Alaska communities. Ketchikan Spruce Mills opened in 1903 in support of the local salmon cannery, and the Ketchikan Pulp Company was established in 1954.¹² Both the Wrangell Lumber Company, and Sitka's Alaska Pulp Corporation began operations in the 1950s.^{13,14} By 1915, the Treadwell Mine in Juneau was approaching the height of its

production, before it was flooded and operations largely ceased. The Alaska-Juneau mine would go on to become the largest gold mine in the world by 1920.¹⁵

During World War II, many mines shuttered due to labor shortages. Timber harvesting boomed in response to the U.S. Military's need for spruce. By the 1950s, the timber industry became more profitable than both the mining and commercial fishery industries. Lumber mills in Ketchikan, Sitka, and Wrangell operated at peak production during this time. By the 1960s, a focus on mounting economic pressures on Native Alaskans from increased regulations on fish traps and growing timber sales become part of a larger statewide narrative leading to the passage of the Alaska Native Claims Settlement Act in 1971. Following its passage, the Act allowed for the formation of regional and local Native for-profit corporations and land entitlements from which resources could be extracted.¹⁶

As a majority of land in Southeast Alaska is still managed by the federal government, land use and management disputes remain common today. Many communities continue to maintain a large aspect of their original character, despite rapid and widespread changes to the region. In part, this level of diversity is how the Southeast Alaska region has become, despite its smaller geographic extent, a dense patchwork of boroughs and census areas.

Natural Resources and Environment

Spectacular amounts of precipitation are the hallmark of weather in Southeast Alaska. The region is in the maritime climate zone, which is characterized by mild, wet weather. With some exceptions, many communities receive well over 120 inches (10 feet) of rain annually. The northern portion of the region also receives heavy snowfall. In the summer, average temperatures range from 50 to 65°, and average winter temperatures range from 29 to 40°.¹⁷

Much of Southeast Alaska lies within the vast Tongass National Forest, a coastal rain forest covering almost 17 million acres of dense Western hemlock and Sitka spruce stands. Hundreds of islands interlaced by deep fjords, straits, sounds, and channels hug Alaska's rugged Coast Mountains which range from 1,500 to 15,000 feet in height. The region's geology is complex; shaped by both volcanism and glaciation. At their maximum some 40,000 years ago, the region's extensive glaciers carved the irregular coastlines, narrow fjords and bays, and marine terraces characteristic of modern day Southeast Alaska. Today, the 1,500 square mile Juneau Icefield holds much of the remnants of the region's glaciated past. In addition, alpine glaciers still cover much of the Yakutat and Glacier Bay areas and Stikine Icefield, east of Wrangell.¹⁸

Natural resources within Southeast Alaska are both diverse and abundant. The region's geology contains highly mineralized areas supporting profitable gold, silver, platinum, zinc, and molybdenum deposits. Sources of marble, limestone, lead, and nickel are also present. Southeast's diverse network of ecosystems support over 300 species of mammals, birds,

amphibians, and reptiles, as well as 18 species of marine mammals, 37 freshwater or anadromous fish, and 36 species of marine invertebrates. Timber resources are extensive, with historic and cotemporary harvests occurring in Juneau, Sitka, Wrangell, Ketchikan, and Prince of Wales Island. While timber harvesting activities have been scaled back significantly since the early twentieth century, the U.S. Forest Service has in recent years begun to increase the number of timber sales on federal lands. Timber harvesting also occurs on private lands, much of which are owned by Sealaska, Southeast Alaska's regional Alaska Native Claims Settlement Act (ANCSA) chartered for-profit corporation.¹⁹

Governance

Southeast Alaska includes seven boroughs (Yakutat, Ketchikan Gateway, Wrangell, Haines, Sitka, Petersburg, and Juneau) and two census areas (Hoonah-Angoon and Prince of Wales-Hyder). As a result of this organizational structure, many communities located in census areas rather than boroughs are responsible for administrative tasks, such as tax collection and the provision of services. A notable administrative anomaly in the region is Metlakatla, a Tsimshian community located in the only federal Indian Reservation Alaska. The reservation encompasses all 86,000 acres of Annette Island.²⁰ This land is the only federal reservation for indigenous peoples in Alaska, since other groups acquired land entitlements through Native Associations during the ANCSA in 1971.²¹

Another unique aspect of Southeast Alaska's institutional framework is the Tongass National Forest, the largest in the nation, which covers much of the region and comes with federally mandated regulations governing resource extraction and conservation.²²

Despite the low proportion of Alaska Natives in the southeast relative to other regions in Alaska, Alaska Native governing bodies are an important and powerful part of regional government. The Sealaska Corporation, a regional for-profit Native Corporation organized under ANCSA, is the largest private landowner in Southeast Alaska.²³ Alaska Natives in many communities also belong to the Central Council Tlingit and Haida Tribes of Alaska, the regional non-profit Native Corporation. In addition, many communities also have Native village councils and village corporations.

Involvement in North Pacific Fisheries

Fishing has long been the backbone of the regional economy in Southeast Alaska. In fact, the rise and fall of the region's population has been correlated with the economic cycles of commercial fishing. Commercial fishing, in particular, accounts for a good portion of the

regional economy. Major commercial species include all five species of Pacific salmon, halibut, herring, groundfish, crab, and other shellfish.²⁴

Historically, fishing began in the region with the opening of a salmon saltery on Prince of Wales Island in 1878. By 1900, Southeast Alaska was contributing a third of Alaska's total processed salmon.²⁵ Herring oil and meal fisheries began in the 1880 and a large herring reduction facility was operated outside of Angoon until 1930.²⁶ The herring bait fishery began around 1900, and a sac roe fishery in the 1970s.²⁷ In addition, it was during the 1970s that sablefish, lingcod, and Pacific cod fisheries began to gain popularity. In recent years, geoduck and sea cucumber harvests have been increasing in reaction to increased market demand.²⁸

The larger ports in Southeast Alaska—including Yakutat, Juneau, Sitka, Wrangell, Petersburg, and Ketchikan—serve as hubs in the regional commercial fishing sector. These ports account for thousands of registered crew members, thousands of commercial permit holders, and hundreds of vessels. In addition, they act as processing centers for the majority of fish caught in the region.^{29,30,31}

The dozens of smaller communities in Southeast Alaska are by no means left out of the commercial fishing picture. They account for a significant share of the region's registered crew members, vessel owners, and permit holders. In addition, many small communities have commercial fish processing plants or small-scale processing and storage facilities.³²

Sportfishing is also a vital part of the regional economy in Southeast Alaska, and one that is growing in importance. Fishermen come from all over Alaska, as well as Canada, the lower 48 states, and around the world to fish the productive waters in the area. Major sport species include all five species of Pacific salmon, Pacific halibut, trout, steelhead, and char (Dolly Varden).³³ In 2010, approximately 147,000 sportfishing licenses total were sold in the Southeast Alaska

communities profiled in this section. A large portion of these (approximately 77,000) were sold in Juneau.³⁴

In addition, most communities in the region participate to some degree in subsistence fishing. Smaller communities, and those with a higher proportion of Alaska Native residents, tend to rely more heavily on subsistence resources. Salmon, and particularly sockeye salmon, is the most widely used subsistence resource.³⁵ Other resources commonly used for subsistence include Pacific halibut, shellfish, rockfish, and marine mammals.^{36,37}

Regional Challenges

The particular challenges that face Southeast Alaska are, to a large extent, the result of the region's heavy reliance on natural resources. The first challenge is posed by changing patterns of timber harvesting and timber management. Most timber harvesting takes place on land held either by the Tongass National Forest or by Sealaska, the regional Native Corporation. Overall, timber harvesting has been in decline due to increased operating costs and weak domestic demand. Foreign price for exotic woods such as spruce remains high, encouraging small export markets.³⁸

Another major challenge of the past several decades has been instability in salmon prices resulting from the rise of farmed salmon on international markets. From the years of 1990 to 2000, the number of salmon fishermen declined by 37% which also resulted in a decline in the number of opportunities for crew members. Processors in many cases have dealt with this collapse in salmon prices with plant closures and the consolidation of operations, including the ceasing of salmon operations by the Wards Cove Packing Company in 2002.³⁹ However, since 2002, salmon ex-vessel prices and value have rebounded as a result of new marketing efforts and techniques, new product forms, improved quality, and development of new markets. In addition, an increase in the price of farmed salmon on the world market after 2002 meant reduced price competition, since buyers no longer had a cheaper alternative to wild salmon.⁴⁰

Angoon (an-GOON)

People and Place

*Location*⁴¹

Angoon is the only permanent settlement on Admiralty Island, located on the southwest coast at Kootznahoo Inlet. Angoon is 55 mi southwest of Juneau and 41 mi northeast of Sitka. The area encompasses 22.5 sq mi of land and 16.1 sq mi of water. Angoon was incorporated into a Second-class city in 1963, is located in the Hoonah-Angoon Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*⁴²

In 2010, there were 459 residents ranking Angoon 127th of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population fell by 28.1%. Between 2000 and 2009, the population fell by 22.7% with an average annual growth rate of -1.52%, which was significantly lower than the statewide average of 0.75% and indicative of a population in steady decline. Information regarding population trends can be found in Table 1.

The racial composition of Angoon is predominately Tlingit Native. In 2010, 75.8% of residents identified themselves as American Indian or Alaska Native, compared to 82.0% in 2000. Also in that year, 12.4% of residents identified themselves are two or more races, compared to 4.5% in 2000; 10.5% identified themselves as White, compared to 11.4% in 2000; 0.9% identified themselves as Black or African American, compared to 0.5% in 2000; and 0.4% identified themselves as some other race, compared to 1.4% in 2000. In addition, 7.8% of residents identified themselves as Hispanic or Latino, compared to 5.4% in 2000. Information regarding race and ethnicity in Angoon can be found in Figure 1.

In 2010, the average household size was 2.75, a decrease from 4.0 in 1990 and 3.11 in 2000. In that year, there were a total of 256 housing units, compared to 166 in 1990 and 221 in 2000. Of the households surveyed in 2010, 33% were owner-occupied, compared to 47% in 2000; 32% were renter-occupied, compared to 37% in 2000; 16% were vacant, compared to 5% in 2000; and 19% were occupied seasonally, compared to 11% in 2000. There were no reports of residents living in group quarters between 1990 and 2010.

The gender distribution in 2010 was somewhat skewed at 57.5% male and 42.5% female, which was less even than the distribution statewide (52.0% male, 48.0% female) and distribution in 2000 (52.4% male, 47.6% female). The median age that year was 39.1, which was older than the statewide median of 33.8 and 2000 median of 32.2.

Figure 1. Racial and Ethnic Composition, Angoon: 2000-2010 (U.S. Census).

When compared with 2000, the population structure in 2010 was less expansive. In that year, 28.3% of residents were under the age of 20, compared to 36.8% in 2000; 17.3% were over the age of 59, compared to 11.7% in 2000; 41.1% were between the ages of 30 and 59, compared to 40.4% in 2000; and 13.1% were between the ages of 20 and 29, compared to 11% in 2000.

Gender distribution by age cohort was less even in 2010 than in 2000, with male biases along most age ranges. The greatest absolute gender difference that year occurred within 50 to 59

range (11.3% male, 5.0% female), followed by the 20 to 29 (8.5% male, 4.6% female) and 60 to 69 (6.7% male, 3.7% female) ranges. Of those three, the greatest relative gender difference occurred in the 50 to 59 range. Information regarding Angoon’s population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS) estimated that 72.3% of residents aged 25 and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 2% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 25.7% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 28.2% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 5.9% held an Associate’s degree, compared to an estimated 8% of Alaska residents overall; an estimated 8.5% held a Bachelor’s degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 7.3% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

Figure 2. Population Age Structure in Angoon Based on the 2000 and 2010 U.S. Decennial Census.

*History, Traditional Knowledge, and Culture*⁴³

The Tlingit peoples have occupied Admiralty Island for millennia. Plentiful resources supported the rich cultural and social traditions typical of Northwest Coast tribes. Prior to European and American contact, ownership over land and resources were managed by clan and house groups.

In the late eighteenth-century, Russian and English fur traders came to the area. Fur trapping and trading were major non-traditional economic activities in the Angoon area from the late 1700s to mid-1800s. During this time, the people of Angoon flourished. However, around the time of Alaska's purchase in 1867, fur resources greatly declined and were replaced by fishing and fish processing. The first salmon cannery in Alaska was established in Klawock in 1878, with others following shortly thereafter. However, during that time whaling attracted more commercial interest in the Chatham Strait than fishing. Between 1880 and 1882 The Northwest Trading Company established a trading post and whale processing plant at the nearby community of Killisnoo. Company labor was largely provided by members of the Hutsnuwu tribe, who were brought from Angoon and from the nearby village of Neltushkin. The Northwest Trading Company's venture into the whaling business proved not very successful, and tensions rose over poor working conditions and complaints of worker exploitation.

The tension took a dark turn after a Hutsnuwu man was killed following a premature whale harpoon detonation. This occurred a relatively short time after another Angoon laborer was killed by a fallen tree. A demand for payment in blankets was made by the family, as was customary in such a situation. Since the demand for such payment was ignored or misinterpreted by the company, additional crewmembers onboard the whaling vessel took two White men as hostages and threatened to hold them until payment of 200 blankets was made. The Northwest Trading Company, with backing from the U.S. Navy, rejected the demands and in turn demanded payment of 400 blankets from the village as punishment. Furthermore, they threatened that if the 400 blankets were not delivered by the following morning, the village would be destroyed. On October 26, 1882, The Navy carried out its threat and shelled Angoon after their demands were not met. In 1973, \$90,000 was paid as compensation to Angoon and a formal apology was given in 1982 by Assistant Secretary of the Navy, John Herrington. The Northwest Trading Company later switched to herring fishing and produced salted herring for food, oil, and fertilizer. However, the company went bankrupt in 1885 and was reorganized as the Alaska Oil and Guano Company, and later as the Alaska Fish Salting and By-Products Company.

In 1928, the village of Killisnoo was destroyed by fire, razing approximately 30 buildings and prompting most residents to return to Angoon. The herring processing plant shut down in 1930 as it was no longer able to operate profitably. A formal Tribal government was organized in 1939 under the 1936 Indian Reorganization Act (IRA). The city was incorporated in 1963. After the passage of the Alaska Native Claims Settlement Act (ANCSA) in 1971, Angoon formed Kootznoowoo Incorporated and was given the opportunity to select trust lands within the area. Archeological and historic sites in the area documented by the Sealaska Corporation in 1975 include several village and harbor sites located both within Angoon as well as Killisnoo Island.⁴⁴

⁴⁴ R&M Engineering, Inc. (2004). *Angoon Airport Reconnaissance Study*. Retrieved April 9, 2012 from: http://dot.alaska.gov/sereg/projects/angoon_airport/assets/2004_Recon_Study/2004_recon_study.pdf.

Natural Resources and Environment

Angoon's maritime climate is characterized by cool summers and mild winters. Summer temperatures range from 45 to 61 °F (7 to 16 °C). Winter temperatures range from 25 to 39 °F (-4 to 4 °C). Extremes in temperature have been recorded, ranging from a low of -6 to a high of 77 °F (-21 to 25 °C). Angoon receives much less precipitation than is typical of Southeast Alaska, averaging 43 inches annually. Annual snowfall averages 63 inches. Strong north winds during winter months cause rough seas, which at times prevent aircraft landings.⁴⁵

Angoon is located on the west coast of Admiralty Island, across the Chatham Strait from Chichagof and Baranof Islands. The city is located within the Alexander Archipelago, a large network of islands and inlets created from extensive glaciations during the last Ice Age. Admiralty Island's terrain is rugged; however, mountains located on the island are not as high as those located on the mainland or on neighboring Baranof Island. Bedrock in the area is principally marble, schist, and phyllite metamorphic rock. Overlaying soils consist mostly of gravelly loams. There is typically a 6 to 12 in duff layer on top of silt and gravel loams.⁴⁶

Angoon is located within the Tongass National Forest and is surrounded by vast mixed spruce and hemlock forests. Forest areas roughly extend from sea level to 1,500 ft of elevation, with a mix of 60% western hemlock, 30% Sitka spruce, and small amounts of red alder and yellow cedar. Thin or poorly drained soils found in alpine areas support hemlock, lodgepole pine, and Alaska yellow cedar. Basins and poorly drained areas support muskeg or bog environments. Groundcover includes a variety of mosses, berries, menziesiam, devil's club, skunk cabbage, and other shrubs.⁴⁷

Terrestrial mammals include Sitka black tail deer, brown bear, otter, beaver, mink, weasel, and other rodents. Marine mammals include seals, sea lion, whale, porpoise, killer whale, and sea otter. Freshwater or anadromous fish include Dolly Varden, rainbow and cutthroat trout, and all five species of Pacific salmon.⁴⁸ Marine fish include halibut, sablefish, rockfish, Pollock, Atka mackerel, Pacific lamprey, and herring.⁴⁹

For the most part, natural resources available to residents of Angoon include marine and freshwater fisheries and environmental services that sustain a range of resources from fisheries, to recreation and tourism. While timber leasing on much of Admiralty Island is prohibited under the Alaska National Interest Lands Conservation Act (ANILCA),⁵⁰ timber resources can still be harvested on ANCSA selected land.⁵¹ In addition, future federal land exchanges may make timber projects possible. There are no mineral projects in the vicinity of Angoon, although Greens Creek, an active silver-zinc-lead mine, is located northwest of the village.

Angoon is relatively protected from most environmental hazards with the exception of earthquakes and tsunamis. Although there is no historical precedence of damaging earthquakes

in the area, the community is located within close proximity of the Chatham Strait fault.⁵²

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation projects active in Angoon as of 2010.⁵³

Current Economy⁵⁴

Commercial fishing is a major source of income and a shellfish farm was funded by state and federal grants. The Chatham School District is the primary employer. Subsistence remains an important part of the lifestyle. Local resources include deer, salmon, bear, halibut, shellfish, geese, seaweed, and berries.⁵⁵ Timber harvesting on Prince of Wales Island provides seasonal employment, and the Greens Creek mine provides additional jobs, although employment at the mine is largely focused on nearby Juneau. Tourism is a growing industry, and Whalers Cove on Killisnoo Island employs approximately 75 seasonal employees. This destination sportfishing lodge offers attractions ranging from guided sportfishing to eco-tours. Angoon residents have expressed interest in further developing cultural and heritage tourism opportunities to complement existing sportfishing, lodging, and guiding businesses.⁵⁶ Top employers⁵⁷ in 2010 included: Chatham School District, Angoon Community Association, City of Angoon, Whalers Cove Lodge, Hecla Greens Creek Mining Company, Central Council Tlingit and Haida, Southeast Alaska Regional Health Consortium, Angoon Trading Company, Tlingit Haida Regional Housing Authority, and Catholic Community Services Inc.

In 2010,⁵⁸ the estimated per capita income was \$18,175 and the estimated median household income was \$23,350, compared to \$11,357 and \$29,861 in 2000; respectively. However, after accounting for inflation by converting 2000 values to 2010 dollars,⁵⁹ the real per capita income (\$14,934) and real median household income (\$39,267) indicate an increase in individual earnings and decrease in household earnings. In 2010, Angoon ranked 167th of 305 communities from which per capita income was estimated, and 265th of 299 communities from which household income was estimated. It should be noted that income and poverty statistics are based on wage income and other money sources; figures reported for Angoon are not reflective of the value of subsistence to the local economy.

Angoon's small population size may have prevented the ACS from accurately portraying economic conditions.⁶⁰ Another understanding of per capita income is obtained through

⁵² See footnote 43.

⁵⁸ U.S. Census Bureau (n.d.). Profile of selected social, economic and housing characteristics of all places within Alaska. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁵⁹ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁶⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (ADOLWD). According to the ALARI database, the per capita income in 2010 was \$ 8,285,⁶¹ which indicates an overall decrease in per capita income compared to the real per capita income values reported by the 2006-2010 ACS.⁶² In addition, Angoon was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁶³

According to 2006-2010 ACS estimates, 56.6% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 10.6%, compared to an estimated 5.9% statewide; and an estimated 35.3% of residents were living below the poverty level, compared to an estimated 9.5% of Alaska residents overall. Of those employed, an estimated 46.1% worked in the private sector, an estimated 47.2% worked in the public sector, and an estimated 6.7% were self-employed.

Angoon’s economy is relatively diverse. By industry, most (36.5%) employed residents were estimated to work in education service, health care, and social assistance sectors in 2010; followed by agriculture, forestry, fishing, hunting, and mining sectors (16.9%); transportation, warehousing, and utilities sectors (11.8%), and arts, entertainment, recreation, accommodations, and food service sectors (11.8%). By occupation type, most (35.4%) employed residents were estimated have management or professional positions, followed by service positions (19.1%); natural resources, construction, or maintenance positions (18%); sales or office positions (16.9%); and production, transportation, or material moving positions (10.7%). Employment by industry varied somewhat between 2000 and 2010, with moderate increases in transportation, warehousing, utilities, agriculture, forestry, fishing, hunting, and mining sectors. Employment by occupation type remained relatively unchanged in that time. Information regarding local employment trends can be found in Figures 3 and 4.

According to 2010 ALARI estimates,⁶⁴ most (45.5%) employed residents worked in local government sectors; followed by education and health service (14.6%); leisure and hospitality (12.6%); and trade, transportation, and utilities (10.6%) sectors.

⁶¹ Does not account for self-employed or federally employed residents.

Governance

Angoon is a Second-class city with a mayoral form of government. There is a U.S. Bureau of Indian Affairs (BIA) recognized Tribal council, and Kootznoowoo Inc. is the ANCSA chartered Native village corporation. Sealaska is the regional ANCSA chartered Native corporation. There are Alaska Department of Fish and Game (ADF&G) and National Marine Fisheries Service (NMFS) offices located in Angoon. The closest U.S. Bureau of Citizenship and Immigration Services (BCIS) office is located in Juneau, 55 mi northeast.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Angoon from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$1,356,957	n/a	\$20,967	n/a
2001	\$1,377,457	n/a	\$20,181	n/a
2002	\$640,157	\$69,706	\$20,182	\$47,890
2003	\$564,613	\$100,471	\$20,317	\$26,819
2004	\$483,178	\$124,648	-	n/a

Angoon did not administer any municipal taxes in 2010. In that year, there was \$701,154 collected in total municipal revenues, compared to \$1.36 million in 2000. Total municipal revenues peaked in 2002 at \$1.4 million. Total municipal revenues include revenues generated locally, state/federal revenue sharing, capital/special projects, and grants. Most locally generated revenues come from sales taxes, utility rents, and interest earnings. State/federal payments primarily come in the form of state administered Community Revenue Sharing, and payments in lieu of taxes administered by the U.S. Bureau of Land Management. Angoon received \$118,167 in state allocated Community Revenue Sharing in 2010; accounting for 16.8% of the total municipal budget that year. This was a proportional increase from 2000, when \$20,967 of State Revenue Sharing accounted for 1.5% of the total municipal budget. State and federal fisheries-related grants received by Angoon between 2000 and 2010 included \$75,000 for a fish cleaning station, \$314,000 for city dock and harbor repair and expansion, and \$23,000 in general funding for fisheries. Information regarding municipal finances can be found in Table 2.

Infrastructure

*Connectivity and Transportation*⁶⁵

Angoon can be reached by sea or by air. There is an unattended floatplane float and helicopters generally land at the high school ball field or beach. Winter winds can make landing difficult in Favorite Bay, rendering the floatplane facility inaccessible at times. The floatplane dock is 200 ft long by 16 ft wide and is accessible by motor vehicle, ATV, and boat. There is an Alaska Marine Highway ferry terminal located in Angoon, and ferries serve the community two to three times per week in the summer, and weekly during winter, fall, and spring months. Goods are shipped to Angoon from Seattle or Juneau via Alaska Marine Lines and the state ferry system. Roundtrip airfare between Juneau and Angoon in June 2012 was \$260.⁶⁶

*Facilities*⁶⁷

The Tillinghast Lake reservoir provides water, which is treated and piped throughout the community. Angoon has had a piped system since 1977, and over 95% of homes have complete plumbing. Piped sewage is processed at a secondary treatment plant that directs flow to an ocean outfall. A 500,000-gal water tank has been constructed at the plant. The city collects refuse and hauls it to the landfill, located approximately 2 mi from Angoon. The Tlingit-Haida Regional Electric Authority, a non-profit subdivision of the state, operates 3 diesel-fueled generators in Angoon. Angoon's harbor facilities include a deep draft dock, a small boat harbor with 45 berths, and a state ferry terminal. Fisheries-related infrastructure includes a city-owned cold storage facility. Visitor accommodations include the Kootznahoo Inlet Lodge, Whales Cove Sportfishing Lodge, Favorite Bay Inn, Thayer Lake Lodge, and Sophie's Place Bed & Breakfast. Public safety services are provided by the City Public Safety Department and a Village Public Safety Officer (VPSO). Fire and rescue services are provided by the City Public Safety Department and Angoon Volunteer Fire Department. Additional public facilities include a youth center, community center, and library. Communications services include local and long distance telephone, internet, local and cable television, and radio.

Medical Services

Jessie Jim Health Center provides primary, dental, and behavioral health services and is a Community Health Aid Program (CHAP) site. Additional acute, long term and alternative healthcare services are provided in Juneau.

Educational Opportunities

Angoon School provides kindergarten through 12th grade instruction. As of 2011, there were 78 students enrolled and 9 teachers employed. Chatham Correspondence provides distance learning opportunities ranging from kindergarten through 12th grade. As of 2011 there was 1 student enrolled.⁶⁸

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Participation in fisheries began with traditional summer subsistence camps by Hutznuwu Tlingits located at Eliza Harbor on the southeast shore of Admiralty Island and extending north to Point Marsden, near Hawk Inlet. In the late nineteenth-century, commercial fishing moved into the Angoon area. After the decline of the local whaling industry, the Northwest Trading Company switched to herring, and produced salted herring for human consumption, oil, and use as fertilizer. When the company went bankrupt in 1885, it was reorganized into the Alaska Oil and Guano Company. Herring continued to be processed on Killisnoo Island until market conditions ceased operations in 1930. After the closure of the Killisnoo herring reduction plant, many residents from Angoon worked at various salmon canneries throughout the Chatham Strait area. In 1947 Angoon purchased the Hood Bay Canning Company, and plans were established to move the entire community permanently to Hood Bay in order to take advantage of the new acquisition. However, the plans never came into fruition, and the cannery was destroyed by fire in 1961. Instead, salmon caught by the Angoon seine fleet was canned at Hawk Inlet for a number of years under an annual agreement with Peter Pan Seafoods, Inc.⁶⁹

Today, the community remains heavily involved in commercial, recreational, and subsistence fisheries. The city owns a cold storage facility and the Angoon Community Association (ACA) owns seafood processing equipment within the building. However, high operating costs due to the lack of a freshwater supply and electrical power led to the plant's closure in the 1990s.⁷⁰

Angoon is located in Federal Reporting Area 659, International Pacific Halibut Commission Regulatory Area 2C, and the Eastern Gulf of Alaska (GOA) Sablefish Regulatory District. The community is eligible to participate in the Community Quota Entity (CQE) program and is represented by the Admiralty Island Community Quota Entity. The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated an apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became

⁶⁹ Alaska Consultants Inc. (1976). *City of Angoon Comprehensive Development Plan*. Retrieved April 6, 2012 from: <http://www.commerce.state.ak.us/dca/plans/Angoon-CP-1976.pdf>.

⁷⁰ See footnote 65.

increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors led to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.⁷¹

As of Fall 2013, the Admiralty Island Community Quota Entity had not yet purchased any commercial halibut IFQ or non-trawl groundfish License Limitation Program permits for lease to eligible community members. However, the non-profit had acquired four halibut charter permits for lease to community members.⁷²

Processing Plants

According to the 2010 Alaska Department of Fish and Game's Intent to Operate list, Angoon does not have a registered processing plant. The closest shore-based seafood processing facility is located in Juneau.

Fisheries-Related Revenue

Between 2000 and 2010, Angoon collected fisheries-related revenue from raw fish taxes, Shared Fisheries Business Taxes, and harbor usage fees. In 2010, \$18,967 was collected, compared to \$12,524 in 2000. Fisheries-related revenue peaked in 2003 at \$19,860. Information regarding fisheries-related revenue trends can be found in Table 3. It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In 2010, 57 residents, or 12.4% of the population, held 57 permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 75 residents held 107 CFEC permits. Of the CFEC permits held in 2010, 89% were for salmon, compared to 65% in 2000; 7% were for halibut, compared to 22% in 2000; and 4% were for crab, compared to 2% in 2000. In addition, six residents held six License Limitation Program (LLP) crab permits, although none were actively fished. Residents held 254,576 shares of halibut quota on 11 accounts in 2010, compared to 489,465 shares held on 31 accounts in 2000. A total of 155,966 shares of sablefish quota were held on one account between 2000 and 2005. No residents held crab quota share between 2010 and when the program began (Tables 6 to 8).

Residents held nine commercial crew licenses in 2010, compared to 23 in 2000. Also in that year, residents held majority ownership of 13 vessels, compared to 75 in 2000 (Table 5). Of the CFEC permits issued in 2010, 12% were actively fished, compared to 43% in 2000 (Table 4).

⁷¹ North Pacific Fishery Management Council (2010). *Review of the Community Quota Entity (CQE) Program under the Halibut/Sablefish IFQ Program*. Retrieved October 23, 2012 from: <http://www.fakr.noaa.gov/npfmc/PDFdocuments/halibut/CQEREport210.pdf>.

⁷² NOAA Fisheries. (2013). *Community Quota and License Programs and Community Quota Entities*. Retrieved October 30, 2013 from <http://alaskafisheries.noaa.gov/ram/cqp.htm>.

This varied by fishery from 75% of halibut permits, to 50% of crab and 6% of salmon permits. Fisheries prosecuted by residents in 2010 included southeast Alaska pot Dungeness crab, statewide longline halibut, and statewide hand and power troll salmon.⁷³

Although no landings were made in Angoon in 2010, landings were made to local buyers between 2000 and 2009 (Tables 9 and 10). However, information on these landings are considered confidential. In 2008, residents of Angoon landed 15,644 lbs of salmon valued at \$39,055 ex-vessel, compared to 208,040 lbs valued at \$97,817 in 2000; an increase of approximately \$1.11 per pound landed after accounting for inflation⁷⁴ and without considering the species composition of landings. Also in that year, residents landed 9,857 lbs of halibut valued at \$42,829, compared to 44,097 lbs valued at \$117,771 in 2000; an increase of approximately \$0.67 per pound landed after accounting for inflation.⁷⁵

Recreational Fishing

Recreational fishing is a major contributor to Angoon's economy. Whaler's Cove, a lodge on Killisnoo Island, reported that it contributed approximately \$53,000 in local taxes and about \$534,000 in payroll in 2000.⁷⁶ In 2010, there were five sport fish guide businesses operating in Angoon, compared to six in 2000. In that year, residents were sold 155 sportfishing licenses and 205 sportfishing licenses were sold in the community, compared to 176 and 863 in 2000, respectively.

Angoon is located in the Juneau ADF&G Sport Fishing Survey Area which includes all waters, including drainages, from Cape Fanshaw to Point Sherman, including all of Admiralty Island. In 2010, there were a total of 85,128 saltwater angler days fished, compared to 112,896 in 2000. In that year, non-residents accounted for 23.5% of angler days fished, compared to 28.5% in 2000. In addition, there was a total of 15,005 freshwater angler days fished in 2010, compared to 15,585 in 2000. In that year, non-residents accounted for 27.8% of angler days fished, compared to 24.9% in 2000. According to ADF&G Harvest Survey data, local private anglers target all five species of Pacific salmon, Dolly Varden char, cutthroat trout, rainbow trout, Pacific halibut, rockfish, Pacific cod, sablefish, Dungeness crab, Tanner crab, and hardshell clams. ADF&G 2010 charter log data reported that charter vessels landed 176 Chinook salmon, 2,656 coho salmon, 844 halibut, 3 lingcod, 701 rockfish, 41 sablefish, and 512 unidentified salmon. Information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

A 1996 study found that Angoon residents harvested an estimated 224 lbs of subsistence resources per capita. Subsistence resources harvested included fish, land mammals, marine mammals, birds and eggs, marine invertebrates, and local vegetation. In 1996 79.7% of households surveyed were found to be harvesting salmon, 82.4% were found to be harvesting fish other than salmon, 32.4% were found to be harvesting marine mammals, and 89.2% were found to be harvesting marine invertebrates.⁷⁷ More current data on subsistence participation is limited, and information on household participation between 2000 and 2010 is unavailable. Of the species listed by ADF&G in Table 13, sockeye salmon are harvested most often, followed by coho, pink, chum, and Chinook salmon. In 2008, residents reported harvesting 800 salmon, compared to 5,010 reported in 2000. Reported salmon harvests peaked in 2003 at 5,760 fish. In 2010, 109 residents were issued Subsistence Halibut Registration Certificates (SHARC), compared to 151 in 2003. In that year, an estimated 18,751 lbs of halibut was harvested on 47 SHARC cards, compared to an estimated 20,283 lbs on 80 in 2003. Estimated subsistence halibut harvests peaked in 2004 at 42,679. Between 2000 and 2008, an estimated 462 harbor seals were harvested. In addition, an estimated one sea lion was harvested in 2000. Information regarding subsistence trends can be found in Tables 12 through 15.

Coffman Cove (KOFF-man)

People and Place

*Location*⁷⁸

Coffman Cove is on the northeast coast of Prince of Wales Island (POW) in Southeast Alaska. It lies 73 mi northeast of Ketchikan and 42 mi southeast of Wrangell. The area encompasses 10.4 sq mi of land and 4.5 sq mi of water. Coffman Cove was incorporated as a Second-class city in 1989, is located in the Prince of Wales-Hyder Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*⁷⁹

In 2010, there were 176 residents ranking Coffman Cove 209th of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population fell by 5%. Between 2000 and 2009, the population fell by 23.6%, with an average annual growth rate of -1.8%, less than the statewide average of 0.75% and indicative of a slow rate of decline. However, the population recovered slightly in 2010, attributed to a 15.8% increase in population between 2009 and 2010. Information regarding population trends can be found in Table 1.

The racial composition of Coffman Cove is predominately White with 94.3% of residents indicating themselves as such in 2010, compared to 87.4% in 2000. Also in that year, 4.0% of residents identified themselves as American Indian or Alaska Native, compared to 2.5% in 2000; and 1.7% identified themselves as two or more races, compared to 4.0% in 2000. In addition, 1.1% of residents identified themselves as Hispanic or Latino, compared to 1.0% in 2000. Information regarding racial and ethnic trends can be found in Figure 1.

In 2010, the average household size in Coffman Cove was 1.98, compared to 2.3 in 1990 and 2.56 in 2000. In that year, there were 168 household units total, compared to 81 in 1990 and 99 in 2000. Of the households surveyed in 2010, 44% were owner-occupied, compared to 51% in 2000; 9% were renter-occupied, compared to 13% in 2000; 14% were vacant, compared to 25% in 2000; and 33% were occupied seasonally, compared to 11% in 2000. No residents lived in group quarters between 1990 and 2010.

The gender distribution in 2010 was somewhat skewed at 59.7% male and 40.3% female. This was more skewed than the distribution statewide (52% male, 48% female), and less skewed than the distribution in 2000 (62.7% male, 37.3% female). The median age that year was 50.0 years, which was significantly higher than both the statewide median of 33.8 years and the 2000 median of 40.3 years.

Figure 1. Racial and Ethnic Composition, Coffman Cove: 2000-2010 (U.S. Census).

The population structure was constricted in both 2000 and 2010. In 2010, 18.8% of residents were under the age of 20, compared to 22.5% in 2000; 23.3% were over the age of 59, compared to 10.0% in 2000; 52.7% were between the ages of 30 and 59, compared to 54.7% in 2000; and 5.2% were between the ages of 20 and 29, compared to 12.5% in 2000. Overall, older cohorts showed age transitions consistent with a stable population, while younger cohorts—most notably the 10 to 19 range—showed some attrition between 2000 and 2010. This may indicate a lower incidence of youth retention in Coffman Cove.

Gender distribution by age cohort was more even in 2010 than in 2000, with male biases among each age range. In that year, the greatest absolute gender difference occurred within the 10 to 19 range (8.5% male, 2.3% female), followed by the 50 to 59 (15.3% male, 11.4% female) and 70 to 79 (5.1% male, 1.7% female) ranges. Of those three, the greatest relative gender difference occurred within the 10 to 19 range. Information regarding trends in Coffman Cove’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Coffman Cove Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)⁸⁰ estimated that 92.6% of residents aged 25 years and over held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also during this time frame, an estimated 7.4% of residents had a 9th to 12th grade education, compared to an estimated 5.8% of Alaska residents overall; an estimated 35.2% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; and an estimated 3.7% had a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall. No residents were estimated to have less than a 9th grade education, an Associate's degree, or a Bachelor's degree in 2010.

*History, Traditional Knowledge, and Culture*⁸¹

The site was named in 1886 by Lt. Cdr. A.S. Snow of the U.S. Navy for Lt. Dewitt Coffman, a member of his party. Coffman Cove was first settled as a logging camp in the 1950s and was owned and operated by Mike and Leta Valentine. Land was made available for private ownership through selection under the Alaska Statehood Act. Coffman Cove's pioneer lifestyle and clean, safe environment were featured on ABC's "20/20" television program in 1984, prompting a deluge of mail from persons around the country wanting to relocate.

Natural Resources and Environment

The area is dominated by a cool maritime climate. Summer temperatures range from 46 to 70 °F (8 to 21 °C). Winter temperatures range from 32 to 42 °F (0 to 6 °C).⁸²

Coffman Cove is located in the Tongass National Forest, which covers 16.8 million acres of rainforest in southeast Alaska. Like all of southeast Alaska, POW's topography was sculpted by immense glaciation during the last ice age. Thousands of years of post-glacial ecological succession created one of the most biologically productive rainforests in the world. Vegetation is dominated by mixed spruce-hemlock stands with areas of red alder and cedar.⁸³ Muskegs are found in depressions and shallow slopes where drainage is poor. The rainforests of southeast Alaska are habitat to a wide range of wildlife. Local terrestrial wildlife include shrews, voles, marmots, ground squirrels, beaver, black bears, porcupine, Sitka black tail deer, marten, fishers, and river otter.⁸⁴ Local fish species include Pacific halibut, all five species of Pacific salmon, herring, Pacific lamprey, lingcod, Atka mackerel, Walleye pollock, black and yelloweye rockfish, sablefish, salmon sharks, smelt, cutthroat trout, steelhead trout, and Dolly Varden

⁸⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

char.⁸⁵ Marine mammals present include porpoise, Steller sea lion, harbor seals, and several species of whale.⁸⁶

Timber and minerals make up the majority of natural resources present on POW. Although the timber industry has been decline, the regional Alaska Native Claims Settlement Act (ANCSA) Native corporation, Sealaska, has active timber developments on the Island.⁸⁷ In addition, Viking Lumber acquired 3,422 acres of commercial timber from the U.S. Forest Service in 2009. Mineral developments in the area include the Niblack and Bokan Mountain mineral projects. The Niblack project is a copper-zinc-silver prospect which was in the final stages of exploration as of 2011.⁸⁸ Bokan Mountain mineral area is a source of uranium and rare earths on the southern portion of POW. Formally the site of the Ross-Adams mine, this site produced an estimated 94,500 tons of uranium ore from 1957 to 1971. Exploration for additional minerals in the area began again in 2007.⁸⁹ A final natural resource is Coffman Cove's plentiful environmental services and scenic beauty. These ecosystem services range from providing essential habitat for many forms of plants and animals, to providing recreational opportunities for residents and non-residents alike.⁹⁰

Coffman Cove's protected location reduces the impact of most natural hazards. Still, tsunami's caused by earthquakes or landslides remain a potential hazard.⁹¹ Earthquakes have been classified as a moderate risk by the U.S. Army Corps of Engineers and it is projected that an earthquake could cause major regional damage.⁹²

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation projects active locally in 2010.⁹³

Current Economy⁹⁴

During the timber industry's peak, Coffman Cove served as a principal supplier for the Ketchikan Pulp Company's pulp mill. However, the industry's influence on the regional economy began to decline with the shuttering of sawmills in Haines, Sitka, and Wrangell in the 1990s, and finally ending with the closure of Ketchikan's pulp mill in 1997. As of 2010, the southeast timber industry was significantly reduced leaving Coffman Cove's economy in a state of transition. A community once heavily influenced by corporate and governmental policy surrounding the timber industry, now found itself in the unique position of re-inventing its

⁹⁴ Unless otherwise noted, all monetary data are reported in nominal values.

economy around commercial fishing, tourism, and entrepreneurship. This was characterized by emerging niche fisheries including geoduck and sea urchin harvesting, as well as oyster farming.⁹⁵ Top employers for 2010⁹⁶ included City of Coffman Cove, Southeast Island School District, Southeast Road Builders Inc., Papac Alaska Logging Inc., Douglas Home Builders, Carter & Carter Enterprises Inc., Alaska Power & Telephone Co., Venture Travel LLC, Colaska Inc., and State of Alaska.

In 2010,⁹⁷ the estimated per capita income in Coffman Cove was \$22,943 and the estimated median household income was \$22,045, compared to \$23,249 and \$43,750 in 2000, respectively. After accounting for inflation by converting the 2000 values to 2010 dollars,⁹⁸ the real per capita income (\$30,572) and real median household income (\$57,531) indicate significant declines in both individual and household earnings. In 2010, Coffman Cove ranked 119th of 305 communities from which per capita income was estimated, and 257th of 299 communities from which median household income was estimated.

Coffman Cove's small population size may have prevented the ACS from accurately portraying economic conditions.⁹⁹ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$2.02 million in total wages in 2010.¹⁰⁰ When matched with the population in 2010, the per capita income equals \$11,450, which was significantly less than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Census figures.¹⁰¹ In addition, the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.¹⁰² However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006 to 2010 estimates,¹⁰³ 44.4% of the population aged 16 and over was part of the civilian labor force. In that year, unemployment was estimated at 0.0%, compared to an estimated 5.9% statewide; and an estimated 17.2% of residents were living below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed in 2010, an estimated 66.7% worked in the private sector, with an estimated 33.3% in the public sector.

By industry, most (50.0%) employed residents were estimated to work in retail trade sectors in 2010; followed by transportation, warehousing, and utilities sectors (25.0%); manufacturing sectors (16.7%); and public administration sectors (8.3%). By occupation type, most (41.7%) employed residents were estimated to hold service positions that year; followed by

¹⁰³ See footnote 80.

natural resources, construction, or maintenance positions (25.0%); production, transportation, or material moving positions (16.7%); and sales or office positions (16.7%). Overall, there was a significant shift in employment both by industry sector and occupation type between 2000 and 2010. Those employed in agriculture, forestry, fishing, hunting, and mining sectors dropped from 50.5% in 2000, to 0% in 2010. Those reductions may reflect the decline of the local timber economy, since residents employed in commercial fishing sectors often are not captured by the U.S. Census as fishermen may hold another job and characterize their employment accordingly. In addition, the surge in retail sector employment and service positions may reflect efforts to diversify the local economy in the wake of the timber industry collapse. Information regarding employment trends can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Coffman Cove (U.S. Census).

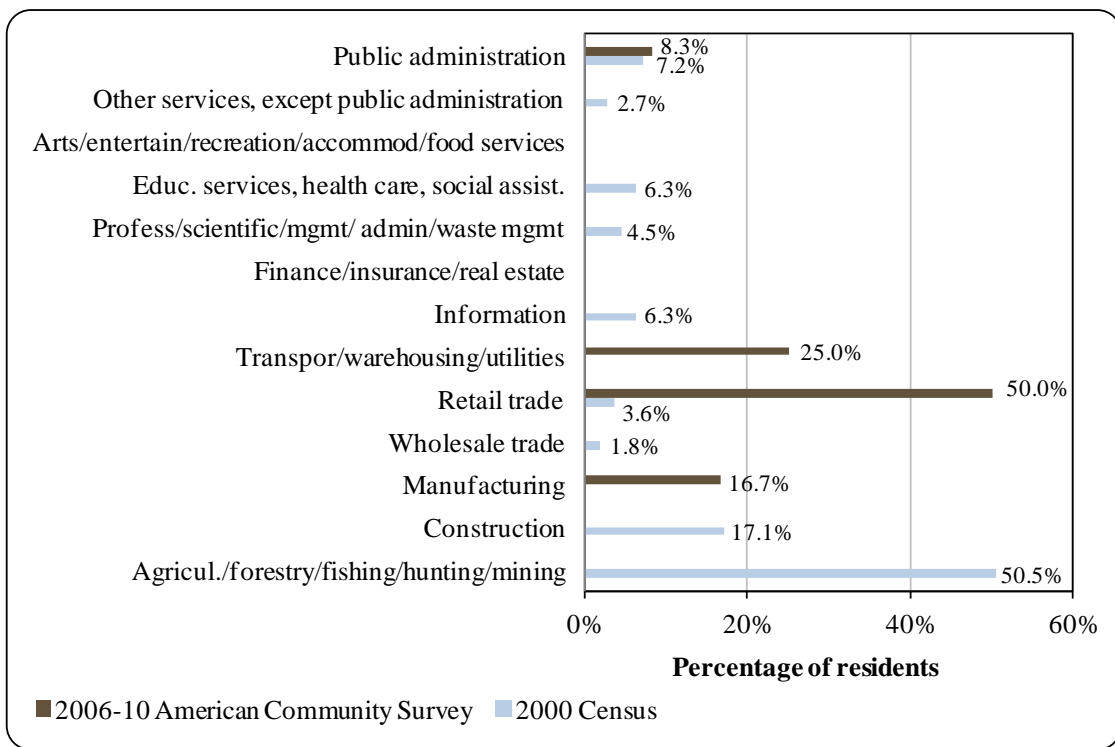

Figure 4. Local employment by occupation in 2000-2010, Coffman Cove (U.S. Census).

Governance

Coffman Cove is a Second-class city with a mayoral form of government. The city does not possess a U.S. Bureau of Indian Affairs (BIA) recognized Native village council or an ANCSA chartered Native village council. The closest Alaska Department of Fish and Game (ADF&G) office is located in Craig, 38 mi southeast. The closest National Marine Fisheries Service (NMFS) office is located in Petersburg 55 mi north. The closest U.S. Bureau of Citizenship and Immigration Services (BCIS) office is located in Ketchikan, 73 mi southwest.

When adjusted for inflation,¹⁰⁴ total municipal revenues increased 267% between 2000 and 2010, from \$700,329 to \$3.32 million. It should be noted that 2010 was somewhat anomalous in that Coffman Cove received several sizable capital grants including \$1.6 million awarded from the Denali Commission, and \$750,000 from the Alaska Economic Development Administration. Most locally generated revenues that year were collected from gravel and land sales. No municipal taxes were administered that year. In terms of outside revenues, Coffman Cove received state revenues from Community Revenue Sharing and raw fish tax refunds. Federal revenues came from National Forest receipts, payments in lieu of taxes, and fish enhancement grants. Community Revenue Sharing comprised 3.1% of total municipal revenue in 2010, compared to 4.7% from State Revenue Sharing in 2000.

Fisheries-related state and federal grants received by Coffman Cove between 2000 and 2010 included \$1.6 million for construction of a harbor, \$156,236 for city float dock construction, \$1.09 million for construction of a dock, \$25,000 for a vessel storage design project, \$775,000 for dock utilities construction, and \$140,000 for harbor dock expansions. Information regarding municipal finances can be found in Table 2.

Infrastructure

*Connectivity and Transportation*¹⁰⁵

The state ferry landing at Hollis provides access to the POW road system. The Inter-Island Ferry Port Authority built a ferry terminal in Coffman Cove, but the ferry no longer runs to and from the community. A state-owned seaplane base is available with scheduled air service from Ketchikan three times a week. The nearest landing strip is in Klawock, 32 mi south. A boat launch and dock are available. Freight arrives by cargo plane, barge, and ship and by road from Craig. The price of roundtrip airfare between Ketchikan and Craig via Taquan Air was \$250 as of November 2011.¹⁰⁶ There is a local ferry planned for completion in 2013 which will connect Wrangell, Petersburg, and Coffman Cove.

¹⁰⁴ Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Facilities

Coffman Cove uses a piped sewage system, surface water source, a water treatment system, and a storage tank supply the piped water system. A total of 107 homes now have complete plumbing. The city has refuse pickup service and hauls the garbage to Klawock. Local accommodations include Misty Sea Charters & Lodging, Coffman Cove Adventures, and Bearbuck Bed and Breakfast. Police services are provided by State Troopers based in Klawock. Internet services, local and long distance telecommunications, and television services are available locally.¹⁰⁷ Additional local businesses and services include an RV park, laundry and shower services, grocer, gift shops, take-out restaurant, liquor store, bar, cabin and boat rentals, vehicle rentals, and welding services.

As part of its community revitalization goals, Coffman Cove has been under a period of rapid development since 2000. Current or completed infrastructure projects outlined in the city's 2002 *Economic Recovery Action Plan*¹⁰⁸ include small boat harbor upgrades and expansion, boat launch ramp, harbormaster office, retail marine fuel facility, marine industrial park, boat haul out facility and grid, boat storage and repair, commercial welding and machine shop, marine

bulkhead with barge ramp, highway and road access improvements, improvements to ferry and seaplane facilities, water/sewer extensions, telecommunication and electrical grid improvements, a new school and medical clinic, recreation facilities, and an updated community center.

*Medical Services*¹⁰⁹

Currently there are no medical facilities located in Coffman Cove, although limited emergency care is provided by Coffman Cove Fire and Emergency Management Services. However, the Seaview Medical Center in Craig is a qualified Emergency Care Center.

*Educational Opportunities*¹¹⁰

Howard Valentine School offers Preschool through 12th grade instruction. As of 2011, there were 12 students in enrolled and 2 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Commercial harvest of salmon began in Southeast Alaska in the late 1870.¹¹¹ In the 1880s, a commercial fishery began for halibut in the inside waters of Southeast Alaska, with sablefish targeted as a secondary fishery.¹¹² Today, Southeast Alaska salmon fisheries utilize purse seine, drift gillnet, troll, and set gillnet gear. The highest volume of salmon landings in the region are harvested by purse seine gear, although the species harvested are typically pink and chum, the salmon species with lowest ex-vessel value. Other salmon fisheries target the higher value species (e.g., sockeye, coho, and Chinook). Because of Southeast Alaska's proximity to British Columbia, as well as many trans-boundary rivers that cross from Canada into Alaskan waters, salmon management in the region is governed to a large degree by the Pacific Salmon Treaty which was originally negotiated in 1985, and renegotiated in 1999 with increased emphasis on implementation of abundance-based management strategies.¹¹³

State-managed sablefish fisheries currently take place in the inside waters of Chatham and Clarence Straits, north of Meyers Chuck. Pacific halibut fisheries in Southeast Alaska are managed by the International Pacific Halibut Commission (IPHC). Pacific cod and lingcod are also harvested in Southeast Alaska under state regulations, independent of federal fisheries for these species. Halibut and Pacific cod fisheries utilize longline gear, while the Southeast Alaska lingcod fishery uses dinglebar troll gear, a salmon power troll gear modified with a heavy metal bar to fish for groundfish. Management of the Southeast Alaska lingcod fishery includes a winter

¹⁰⁹ See footnote 105.

¹¹³ See footnote 111.

closure for all users (except longliners) to protect nest-guarding males. Demersal rockfish are caught as bycatch in the halibut longline and trawl fisheries. A small directed fishery for flatfish (other than halibut) has also taken place in Southeast inside waters in recent decades, but effort has declined since 1999.

Shrimp trawl fisheries in Southeast Alaska primarily target northern shrimp and sidestripe shrimp, although the market for northern shrimp has declined in recent years with the closure of the primary processing facility in Petersburg in 2006.¹¹⁴ A pot fishery for spot shrimp has also grown in Southeast Alaska since the 1990s. Commercial dive fisheries for red sea cucumber and sea urchin began near Ketchikan in the early 1980s. A dive fishery for geoduck clams began around the same time, and all three fisheries are now managed by ADF&G according to Fishery Management Plans. Sea cucumbers and sea urchin are hand-picked by divers, while geoduck divers use handheld water jets to remove substrate from around the clams.

While traditionally a logging town, Coffman Cove has been rapidly developing its commercial and recreational fisheries economy in recent years. The salmon gillnet fishery is perhaps the most important local commercial fishery, with many vessels from Seattle using the community as a base of operations during seasons. Other fisheries active in the Coffman Cove area include shrimp, sea cucumber, sea urchin, and halibut.¹¹⁵ The community is located in Federal Reporting Area 659, International Pacific Halibut Commission (IHPC) Regulatory Area 2C, and the Eastern Gulf of Alaska (GOA) Sablefish Regulatory District.

Coffman Cove is eligible to participate in the Community Quota Entity (CQE) program and is represented by the Coffman Cove Community Quota Entity, its local non-profit. The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.¹¹⁶

As of Fall 2013, the Coffman Cove Community Quota Entity had not yet purchased any commercial halibut IFQ or non-trawl groundfish License Limitation Program permits. However, the non-profit had acquired four halibut charter permits for lease to community members.¹¹⁷

Processing Plants

Canoe Lagoon Oyster Co. processes Alaska Sterling oysters at its Coffman Cove processing plant.¹¹⁸ No other processing plants are located within the community. The nearest fish processing plant is located in Wrangell, 37 mi northeast.

Fisheries-Related Revenue

The bulk of fisheries-related revenue being collected in Coffman Cove comes from harbor usage fees. The amount collected by such fees increased steadily between 2000 and 2010, with \$22,000 collected in 2009. In addition to harbor fees, the city received funds from Shared Fisheries Business Taxes, and Fisheries Resource Landing Taxes. Data on harbor usage fees for 2010 is unavailable. Information regarding fisheries-related revenues can be found in Table 3.¹¹⁹

Commercial Fishing

In 2010, 6 residents, or 3.4% of the population, held a total of 8 permits issued by the Commercial Fisheries Entry Commission (CFEC), which was unchanged from 2000. Of the CFEC permits held that year, 50% were for salmon, compared to 75% in 2000; 13% were for halibut, compared to 0% in 2000; 25% were for “other” shellfish, compared to 13% in 2000; and 13% were for crab, compared to 13% in 2000. Between 2000 and 2010, no residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) groundfish or crab permits. Residents last held halibut quota shares in 2003, when 1 account held 584 shares. No residents held sablefish or crab quota between 2010 and when the programs began.

Four residents held crew licenses, compared to 9 in 2000. In addition, residents held majority ownership of 4 commercial vessels in that year, compared to 9 in 2000. Of the CFEC permits held in 2010, 38% were actively fished, which was the same as in 2000. This varied by fishery from 100% of halibut permits, to 50% of “other” shellfish, 25% of salmon, and 0% of crab permits. Fisheries prosecuted in 2010 include southeast drift gillnet salmon and dive sea cucumber, and statewide longline halibut.¹²⁰

No landings were reported in the community between 2000 and 2010, although landings were made by residents during that time. In 2006, residents landed a total of 153,347 lbs of salmon valued at \$117,812 ex-vessel, compared to 196,173 lbs valued at \$119,449 ex-vessel in 2003. This represented an approximate \$0.03 increase in price per pound ex-vessel after adjusting for inflation¹²¹ and without taking into account the species composition of landings. All other landings are considered confidential. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Sportfishing is a growing industry in Coffman Cove. The city’s close proximity to Ketchikan makes it a popular and accessible destination for non-resident anglers. Private pleasure boats continue to increase in numbers within the Inside Passage. As Coffman Cove continues to develop its tourism infrastructure, it is expected that this trend will continue.¹²² In 2010, Coffman Cove had 4 active sport fish guide businesses registered in the community, compared to 2 in 2000. In addition, residents held five sport fish guide licenses that year, compared to one in 2000. Residents held 109 sportfishing licenses in 2010, compared to 130 in 2000, and 19 sportfishing licenses were sold in the community, compared to 387 in 2000. It should be noted that 2010 experienced a significant drop in sportfishing licenses sold in the community compared to previous years.

Coffman Cove is located in the Prince of Wales ADF&G Harvest Survey Area which includes all marine waters and drainages from Cape Chacon to Sumner Strait; and from Clarence Island westward. In 2010 there was a total of 51,312 saltwater angler days fished, compared to 49,074 in 2000. In that year, non-Alaska residents accounted for 74.4% of angler days fished, compared to 67.3% in 2000. In regards to freshwater, there were a total of 15,138 angler days fished in 2010, compared to 19,654 in 2000. In that year, non-Alaska residents accounted for 70.4% of angler days fished, compared to 45.9% in 2000. According to ADF&G Harvest Survey data, species targeted by private anglers in Coffman Cove include Chinook, coho, sockeye, and pink salmon, cutthroat trout, Pacific halibut, rockfish, lingcod, Pacific cod, other finfish, Dungeness crab, hardshell clams, and shrimp. Charter log data collected by ADF&G¹²³ showed that in 2010, 34 Chinook salmon were kept, 656 coho salmon were kept, 523 halibut were kept, 11 lingcod were kept, 216 rockfish were kept, and 4 sablefish were kept. Information regarding sportfishing trends can be found in Table 11.

Table 11. Sport Fishing Trends, Coffman Cove: 2000-2010.

Subsistence Fishing

Subsistence fishing information is limited, and data on household participation in subsistence activities are unavailable. However, according to ADF&G reports, halibut is harvested the most often by residents, followed by sockeye salmon (Tables 13 & 14). According to ADF&G's *Community Subsistence Information System*,¹²⁴ species which residents of Coffman Cove harvests or use include abalone, cockles, chitons, king crab, box crab, butter clams, Dungeness crab, geoducks, sea urchin, horse clams, limpets, octopus, oysters, littleneck clams, razor clams, scallops, shrimp, squid, Tanner crab, mussels, sea cucumber, fur seal, harbor seal, Steller sea lion, black rockfish, brook trout, buffalo sculpin, cutthroat trout, dogfish, Dolly Varden, eulachon, grayling, herring, lingcod, Pacific cod, Pacific tom cod, rainbow trout, Irish lord, red rockfish, rock greenling, sablefish, sea perch, silver smelt, skates, steelhead, flounder, shark, sole, and pollock.

In 2010, 46 residents held Subsistence Halibut Registration Certificates (SHARC), compared to 39 in 2003. In that year, an estimated 2,678 lbs of halibut were harvested on 19

¹²⁴ Alaska Department of Fish and Game. 2011. *Community Subsistence Information System (CSIS)*. ADF&G Division of Subsistence. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sb/CSIS/> (Accessed February 2011).

SHARC cards, compared to an estimated 5,197 lbs on 39 SHARC cards in 2003. This represented a significant decline from previous years in the number of SHARC fished and pounds harvested. Estimated halibut harvests peaked in 2004 at 6,194 lbs. In terms of salmon harvests, residents reported that 32 sockeye salmon were harvested in 2008, compared to 287 reported in 2000. Reported salmon harvests peaked in 2001 at 560 fish. There was a significant decline in the number of subsistence salmon permits held between 2004 and 2008, when compared with 2000 through 2003. Data on subsistence marine mammal harvests between 2000 and 2010 is unavailable. Information regarding subsistence trends can be found in Tables 12 through 15.

Craig

People and Place

*Location*¹²⁵

Craig is located on a small island off the west coast of Prince of Wales Island (PWI) and is connected by a short causeway. It lies 56 mi northwest of Ketchikan, 750 mi north of Seattle, and 220 mi south of Juneau. The area encompasses 6.7 sq mi of land and 2.7 sq mi of water. Craig was incorporated as a First-class city in 1922, is located in the Prince of Wales-Hyder Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*¹²⁶

In 2010, there were 1,201 residents, ranking Craig 59th of 352 communities in terms of population size. Between 1990 and 2010 the population declined by 4.7%. Between 2000 and 2009, the population fell by 18.8% with an average annual growth rate of -1.4%, which was significantly below the statewide average of 0.75% and reflective of the steep population decline between 2000 and 2006. In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that there were 400 seasonal or transient workers living in Craig in 2010. On average, seasonal workers live in Craig from June through August, with the population peaking in August. This peak in population is mostly driven by employment in the fishing sectors. Information regarding population trends can be found in Table 1.

The racial and ethnic composition of Craig is relatively diverse. In 2010, 65% of residents identified themselves as White, 20% as American Indian or Alaska Native, and 13.3% as two or more races. Other races represented in the community that year each made up less than one-percent of the population. Residents identifying themselves as Hispanic or Latino contributed to 3.2% of the population in 2010. Racial and ethnic composition in Craig changed little between 2000 and 2010. Overall, there were slight increases in residents identifying themselves as two or more races and Hispanic or Latino, and slight declines in those identifying themselves as White and American Indian or Alaska Native. Information regarding Craig's racial and ethnic composition is found in Figure 1.

In 2010, the average household size was 2.53, compared to 2.8 in 1990 and 2.63 in 2000. In that year, there were a total of 537 housing units, compared to 504 in 1990 and 580 in 2000. Of the households surveyed in 2010, 58% were owner-occupied, compared to 61% in 2000; 30% were renter-occupied, compared to 29% in 2000; 6% were vacant, compared to 8% in 2000; and 7% were occupied seasonally, compared to 2% in 2000. There were 13 residents living in group quarters in 2010, compared to 23 in 2000.

Figure 1. Racial and ethnic composition, Craig: 2000-2010 (U.S. Census).

The gender distribution in 2010 was skewed at 55% male and 45% female. This was slightly less even than the distribution statewide (52% male, 48% female) and similar to the distribution in 2000 (54.5% male, 45.5% female). The median age that year was 36.4 years, which was slightly higher than the statewide and 2000 median of 33.8 years.

Compared with 2000, the 2010 population structure was slightly less expansive. Age transitions were consistent with a relatively stable population, meaning that cohorts aged while

still mostly retaining their structural character. In 2010, 29.8% of residents were under the age of 20, compared to 33.9% in 2000. Also in that year, 13.1% of residents were over the age of 59, compared to 7.3% in 2000; 44.1% were between the ages of 30 and 59, compared to 47.5% in 2000; and 13.2% were between the ages of 20 and 29, compared to 11.4% in 2000.

Overall, gender distribution by age cohort was more uneven in 2010 than in 2000. In that year, the greatest absolute gender difference occurred in the 10 to 19 range (8.6% male, 5.2% female), followed by the 60 to 69 (6.2% male, 3.6% female) and 0 to 9 (8.9% male, 7.1% female) ranges. Of those three, the greatest relative gender difference occurred in the 60 to 69 range. Information regarding Craig’s population structure can be found in Figure 2.

Figure 2. Population age structure in Craig based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census 2006-2010 American Community Survey (ACS)¹²⁷ estimated that 92.9% of residents aged 25 and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 0.7% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 6.4% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 31.5% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 6.4% held an Associate's degree, compared to an estimated 8% of Alaska residents overall; an estimated 15.8% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 7.4% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*¹²⁸

Human occupation of PWI is believed to date back around 10,300 years, according to archaeological records associated with human remains and bone tools found at On Your Knees cave on the northern tip of the island.¹²⁹ Previous to White settlement, Tlingit and Haida Natives were the sole occupants of the Craig area, taking advantage of the abundant resources in the area. In 1907, Craig Miller and eight Haida men built a fish saltery on Fish Egg Island, which consisted of several shacks and tents for workers. A permanent saltery and cold storage facility was constructed between 1908 and 1911, along with 20 to 25 houses. In 1912, a cannery was built along with a school, post office, and sawmill. World War I increased the demand for canned salmon and lumber, and seafood processing in the area peaked in 1917. Craig's economy began to decline following World War I; however, the community continued to diversify in response, becoming the center of island government and commerce. In 1922, Craig was detached from the Tongass National Forest allowing it to petition for a municipal government.

The price of salmon dropped significantly during the depression years prompting a fishermen strike in protest. In 1935, a second seafood processor was opened. During that time, Works Progress Administration and Civilian Conservation Corps projects established as part of the New Deal provided additional employment in Craig. These projects included construction of the Craig-Klawock highway as well as several U.S. Forest Service (USFS) trails. By 1939, Craig had a year-round population of 505. Many residents left Craig during World War II because of the draft and wartime industrial booms in Sitka and Seattle. By 1950, Craig's population had dipped to 374. The population continued to decline in the 1950s with the destruction of the Libby cannery to fire and a reduced fishing industry.

In 1954, the Ketchikan Pulp Company mill opened and while it had no immediate impact on Craig's economy, it did lead to increased logging and USFS personnel on the island. The 1960's saw yet another slump for Craig's economy resulting from several years of poor salmon runs. During that time, nearby Klawock maintained the only operating seafood processor on PWI

¹²⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹²⁸ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

while Craig acted as a maintenance center for the Columbia Ward Fishing fleet.

Efforts to improve economic conditions by the Craig Development Corporation and West Coast Development Association in the late 1960s and early 1970s resulted in the construction of a new cold storage facility and sawmill. During this time, Craig began to establish itself as a regional government and commercial center. Improvements to local infrastructure were made including a road to Hollis, Alaska Marine Highway System link, utilities improvements, new high school, and Klawock airport. In 1971, the Alaska Native Claims Settlement Act (ANCSA) led to the formation of Shaan-Seet, the local Native village corporation, which expanded timber activities on Tribal lands.

By 1980, Craig's population had swelled to 1,637 due to increased employment in fishing, seafood processing, logging, and timber processing. Construction increased as capital projects grew Craig as a regional center.¹³⁰ The Head Sawmill, built in 1972, was sold in the early 1990s to Viking Lumber.¹³¹

Today, Craig remains the economic and governmental center of PWI. There are many historically significant resources in the area. Petroglyphs can be found in north Shelter Cove. Saint Philip Island, Point Incarnation, and Fishegg Island all have historic villages and cemeteries. Finally, there are several historic buildings including the old cannery bunkhouses, communications office, and radio tower.¹³²

Natural Resources and Environment

PWI is dominated by a cool, moist, maritime climate. Summer temperatures range from 49 to 63 °F (9 to 17 °C). Winter temperatures range from 32 to 42 °F (0 to 6 °C). Average annual precipitation is 120 inches, and average annual snowfall is 40 inches. Gale winds are common in the fall and winter months.¹³³

Craig is located in a basin surrounded by mountains, Mt. Sunnahae being the tallest at 2,920 ft. Steep topography surrounds the community which slopes down to sea level. Most of the soils in the area are derived from a mix of volcanic rock, glacial deposits, and sandy alluvium.¹³⁴ Organic soils are mostly found in the form of muskegs which are located at various elevations, mostly around drainage basins. Vegetation is dominated by mixed stands of Sitka spruce and hemlock. Shrubs common to the area include salmonberry, thimbleberry, devil's club, blueberry, rusty menziesia, and salal. Ground cover is comprised mostly of mosses, ferns, bunchberry, twisted stalk, and deer berry. Alders are found along many stream banks and disturbed areas. Interspersed muskegs are populated with mosses, sedges, and rushes. Intertidal and subtidal areas support growths of algae, kelp beds, and eel grass.¹³⁵

Commercially important fish include pollock, Pacific halibut, Pacific ocean perch, sablefish, turbot, sole, rockfish, herring, all five species of Pacific salmon, Dolly Varden char, and cutthroat and steelhead trout. Common marine mammals include Steller sea lions, harbor

¹³⁵ See footnote 132.

seals, Dall's and harbor porpoises, and killer whales. Terrestrial mammals include Sitka black tailed deer, wolf, marten, mink, river otter, and black bear. Birds include many species of shorebirds and marine birds.¹³⁶

Additional natural resources in the area include timber and ecosystem services derived from local habitats. The 2009 Logjam timber sale opened up 3,422 acres of the Tongass National Forest to commercial harvesting with a potential yield of 73 million board feet.¹³⁷ Sealaska, the regional ANSCA corporation for southeast Alaska, also has active timber developments within Tribal lands on the island.¹³⁸ Local estuaries, riparian areas, and eel grass beds provide important feeding and rearing habitat for a range of commercially important species.¹³⁹ In addition to important habitat, these areas provide valuable recreation resources for the community's tourism economy.¹⁴⁰ Mineral developments in the area include the Niblack and Bokan Mountain mineral projects. The Niblack project is a copper-zinc-silver prospect which was in the final stages of exploration as of 2011.¹⁴¹ Bokan Mountain mineral area is a source of uranium and rare earths on the southern portion of PWI.

Craig is protected against many natural hazards due to its sheltered position. However, earthquakes have been classified as a moderate risk by the U.S. Army Corps of Engineers and it is projected that regional damage caused by an earthquake would be major.¹⁴² Damage from earthquakes would likely come from shaking, tsunamis, seiches, and landslides.

The Alaska Department of Environmental Conservation had an active cleanup site in Craig as of 2005. The Craig Radio State, operated by the U.S. Army from 1918 to 1962, was used by the U.S. Air Force for both telephone and telegraph communications. Following a 2004 removal of fuel storage tanks, high levels of benzene and diesel organics were found in both the soil and groundwater. While the groundwater at the site was not used for drinking, the contaminants were found to be migrating off-site. Remediation measures were taken and as of 2009 remaining contaminants were contained.¹⁴³

Current Economy¹⁴⁴

In a survey conducted by the AFSC in 2011, community leaders reported that Craig's economy is dependent on mining, logging, fishing, ecotourism, sportfishing and hunting, and energy. The economy of Craig has historically been dependent on the commercial fishing industry and more recently on both the fishing and timber harvest industries. A cycle of boom and bust has dominated Craig's past; however, its economy has become more stable and has actually improved with stable fisheries management, expansion of the timber industry, and increased employment in the public and private sectors serving the needs of primary industries. Economic expansion and diversification are still desired as declines in the timber industry and in state and federal spending occur.¹⁴⁵ With the expansion of Craig as a regional center, tourism and service-related industries have continued to offer opportunities for increased employment.¹⁴⁶

Craig acts as a staging area for the west PWI seine fleet, and many businesses and services associated with maintaining commercial fleets prosper in the summer months. Other businesses such as retail, accommodations, and food services, benefit indirectly as well due to increased traffic from commercial fishing and private vessels. Craig's second main resource sector, timber production, operates at a fraction of the scale it once did when Louisiana Pacific had a large presence in the area. Current timber extraction on public lands is limited; however, Sealaska continues to harvest timber on ANCSA ceded lands. Timber prices and export market demand bottomed out in 1982, and poor market conditions have continued. Many jobs in Craig are tied in one way or another to resource extraction sectors. This includes transportation, communications, utilities, retail, public administration, and construction. Craig survived the boom and bust environment of its past, and through diversification has secured a stable regional economy.¹⁴⁷ Top employers¹⁴⁸ in 2010 included: Craig City School District, City of Craig, AK Commercial Co., Community Connections Inc., Ruth Anns Restaurant, State of Alaska, AK Power & Telephone Co., Southeast Alaska Regional Health Consortium, Tribal Transportation Department, and Inter-Island Ferry Authority.

In 2010,¹⁴⁹ the estimated per capita income in Craig was \$25,263 and the estimated median household income was \$47,813, compared to \$20,176 and \$45,298 in 2000, respectively. However, after accounting for inflation by converting 2000 values to 2010 dollars,¹⁵⁰ the real per capita income (\$26,531) and real median household income (\$59,566) indicate a slight decline in individual earnings, and significant decline in household earnings. In that year, Craig ranked 105th of 305 communities from which per capita income was estimated, and 143rd of 299 communities from which median household income was estimated.

Craig's small population size may have prevented the ACS from accurately portraying

¹⁴⁴ Unless otherwise noted, all monetary data are reported in nominal values.

¹⁴⁵ See footnote 140.

Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹⁵⁰ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

economic conditions.¹⁵¹ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$14.85 million in total wages in 2010.¹⁵² When matched with the population in 2010, the per capita income equals \$12,366, which was significantly lower than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Census figures.¹⁵³

According to 2006-2010 ACS estimates,¹⁵⁴ 74.3% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 5.0%, compared to an estimated 5.9% statewide; and an estimated 19.7% of residents were living below the poverty line, compared to an estimated 9.6% statewide. Of those employed in the civilian labor force, an estimated 67.1% worked in the private sector, an estimated 19.5% worked in the public sector, and an estimated 13.3% were self employed. By industry, sector employment was relatively diverse in 2010. In that year, most (18.7%) employed residents were estimated to work in education services, health care, and social assistance sectors; followed by retail trade sectors (18.5%); and transportation, warehousing, and utilities sectors (17.6%) (Figure 3). Compared with 2000, significant increases occurred in retail trade, transportation, warehousing, and utilities sectors. However, there was a significant drop in the percentage of those estimated to be employed in agriculture, forestry, fishing, hunting, and mining sectors from 24.2% in 2000, to an estimated 7.6% in 2010. Causes for this drop could be related to declines in the timber industry. However, it should be noted that sampling techniques used for the American Community Survey may not have captured the true scope of industry representation. Much of Craig's resource economy is mobile and seasonal; therefore Census data may capture economic characteristics active at different times of the year.

By occupation type, most (26.1%) employed residents were estimated to be working sales or office positions in 2010; followed by service positions (21.4%); management and professional positions (20.9%); natural resources, construction, and maintenance positions (16.2%); and production, transportation, and material moving positions (15.4%) (Figure 4). Again, there was a steep decline in the percentage of residents working natural resources, construction, and maintenance positions from 25.8% in 2000.

¹⁵¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁵² ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

Figure 4. Local Employment by Occupation in 2000-2010, Craig (U.S. Census).

Governance

Craig is a First-class city with a mayoral form of government. There is a seven-member city council, five-member school council, five-member planning commission, and five municipal employees. There is a U.S. Bureau of Indian Affairs (BIA) recognized Native village council (Craig Community Association) and ANCSA chartered Native village corporation (Shaan-Seet Incorporated). The regional ANCSA chartered Native corporation is Sealaska. There is an Alaska Department of Fish and Game (ADF&G) office located in Craig. The closest National Marine Fisheries Service (NMFS) and U.S. Bureau of Citizenship and Immigration Services (BCIS) offices are located in Ketchikan, 56 mi southeast.

In 2010, the city administered a 5% sales tax and 6 mill property tax. When adjusted for

inflation,¹⁵⁵ total municipal revenues remained virtually unchanged between 2000 and 2010, from \$3.1 million in 2000, to \$4.0 million in 2010. Revenue years in-between were somewhat more variable, ranging from a low of \$2.4 million in 2005, to a high of \$8.1 million in 2001. Municipal revenues in 2001 were somewhat anomalous in that \$5.8 million was collected in inter-governmental revenue that year (significantly higher than other years). Most locally generated revenues come from sales and property taxes. Outside revenues are collected from Community Revenue Sharing, payments in lieu of taxes, and leases.

Craig received \$151,217 in state allocated Community Revenue Sharing in 2010, which accounted for 3.8% of municipal revenues that year. This represented a proportional increase from 2000 when \$35,774 in State Revenue Sharing accounted for 1.2% of total revenues. State and federal fisheries-related grants received by Craig between 2000 and 2010 included: \$5.8 million for harbor projects, \$2 million for cold storage construction, \$1.3 million for cannery and cold store improvements, \$250,000 for haulout facilities, \$50,000 for a hatchery project, \$51,314 for a public icehouse, and \$89,000 for acquisition of a hydraulic boat trailer. Information regarding municipal finances can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Craig from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$3,080,645	\$1,344,493	\$35,774	n/a
2001	\$8,130,047	\$1,310,261	\$31,426	\$89,000
2002	\$3,843,230	\$1,201,047	\$32,545	\$750,000
2003	\$3,904,091	\$1,231,647	\$25,986	\$5,051,314
2004	\$3,861,966	\$1,240,569	-	n/a
2005	\$2,381,969	\$1,301,354	-	\$300,000
2006	\$2,874,199	\$1,394,532	-	\$2,300,000
2007	\$2,723,253	\$1,232,048	-	\$1,000,000
2008	\$3,014,798	\$1,440,913	-	n/a
2009	\$3,078,059	\$1,450,799	\$152,983	\$50,750
2010	\$3,993,408	\$1,398,509	\$151,217	n/a

¹⁵⁵ Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Infrastructure

Connectivity and Transportation

Scheduled air transportation to Ketchikan is available from the nearby Klawock Airport. A state-owned seaplane base at Klawock Inlet and a U.S. Coast Guard heliport are maintained in Craig. Most passenger and light cargo transportation is done by float plane. Roundtrip airfare between Craig and Ketchikan is \$250 via Taquan Air.¹⁵⁶ The state ferry serves Hollis, 30 mi away, and enables transportation of passengers, cargo, and vehicles to the island. There are two small boat harbors at North Cove and South Cove, a small transient float and dock in the downtown area, and a boat launch ramp at North Cove. The J.T. Brown Marine Industrial Center was completed in 2006 and includes a dock and boat launch. Freight arrives by cargo plane, barge, and ferry in Hollis. A paved road exists between Hollis, Craig, Klawock, and the airport.¹⁵⁷

Facilities

All households are fully plumbed. Water is supplied by a dam on North Fork Lake and is then treated, stored in a tank, and piped to homes. Sewage is collected by a piped gravity system and receives primary treatment before discharge into Bucareli Bay. Refuse is collected and deposited in Klawock's landfill. The City also participates in annual hazardous waste collection events. Alaska Power & Telephone Co. owns and operates diesel power systems and a hydroelectric facility at Black Bear Lake, which provides electricity to many island communities. Public safety services are provided by city police and local state troopers. Fire and rescue services are provided by Craig EMS and PWI EMS. Additional local services include Craig Recreation Center, a city pool, three libraries, cable television, broadband internet, visitor accommodations, and a range of visitor accommodations, restaurants, and attractions.¹⁵⁸

Craig has several harbor facilities designed for a range of uses. In a survey conducted by the AFSC in 2011, community leaders reported that there is 1,500 ft of dock space available for permanent moorage, and 1,000 ft of dock space available for transient moorage. Vessels up to 150 ft in length can use moorage at one of Craig's three public docks. Types of regulated vessels of which Craig is capable of handling include rescue vessels, fuel barges, and vessels carrying hazardous materials. The Craig Coastal District contains several public and private marina facilities. These include: North Cove, which is a deep-water marina meant to meet commercial fishing needs; South Cove, which is a recreational marina; City Float, which provides commercial and recreational moorage; False Island, purposed for industrial and marine transportation; and the Ward Cove Packing Site, which provides additional commercial and recreational moorage. There are also boat launches at North Cove and False Island.¹⁵⁹

In a survey conducted by the AFSC in 2011, community reported that infrastructure projects currently in development or completed within the last 10 years include: a fish cleaning

station, pilings, and improvements to water and sewer systems. Fisheries-related support services and businesses located in Craig include: fish processing, fishing gear sales, fishing gear manufacturing, boat repair (electrical, welding, mechanical services, machine shop, hydraulics), haulout facilities (less than 60 tn), tidal grid, commercial fishing vessel moorage, recreational fishing vessel moorage, tackle sales, bait sales, commercial cold storage, dry dock storage, fish lodges, fishing related bookkeeping, boat fuel sales, fishing gear repair, fishing gear storage, ice sales, seaplane services, and air-taxi services. Public services available include medical services, food bank, job placement services, and publicly subsidized housing. Residents typically depend on Wrangell, Ketchikan, and Seattle for businesses and services not available locally.

*Medical Services*¹⁶⁰

Craig Medical Clinic and Prince of Wales Public Health Center provide general and emergency care for the region. Additional services include diagnostic imaging, mental health services, and a variety of health screenings. Additional health services are available in Ketchikan.

*Educational Opportunities*¹⁶¹

Craig Elementary School offers preschool through 5th grade instruction. As of 2011, there were 161 students enrolled and 12 teachers employed. Craig Middle School offers 6th through 8th grade instruction. As of 2011, there were 69 students enrolled and 6 teachers employed. Craig High School offers 9th through 12th grade instruction. As of 2011, there were 83 students enrolled and 11 teachers employed. Craig Alternative High School offers 9th through 12th grade instruction. As of 2011, there were eight students enrolled and one teacher employed. PACE Correspondence School offers kindergarten through 12th grade correspondence instruction. As of 2011 there were 319 students enrolled and 5 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Traditionally, local Tlingits had fished the PWI area for thousands of years. In the mid-seventeenth century, Haidas moved into PWI from the Queen Charlotte Islands in British Columbia. Fish and shellfish were abundant in the area and salmon, halibut, steelhead, cod, Dolly Varden, and eulachon were economically important species.¹⁶² Commercial fishing began in the late nineteenth Century with the construction of a salmon cannery in Klawock in 1878. Cannery construction expanded throughout southeast Alaska and by 1920 there were more than 100 in operation, including one in Craig built in 1912. Sockeye salmon were the major species taken and soon populations became depleted. Traps were used until the late 1950s and contributed to the steep declines in salmon stocks. While gear types were becoming increasingly

¹⁶⁰ See footnote 157.

¹⁶² Alaska History and Cultural Studies. (n.d.). *Alaska's Heritage: Tlingits settle in Southeast Alaska*. Retrieved March 5, 2012 from: <http://www.akhistorycourse.org/articles/article.php?artID=149>.

regulated following statehood, entry into fisheries was not and stocks continued to decline until record low levels in 1972. This decline helped promote limited entry permit systems.¹⁶³ Craig's participation in North Pacific fisheries continued to expand as salmon stocks recovered following the crash in 1970s.

In a survey conducted by the AFSC in 2011, community leaders reported that Craig participates in the fisheries management process in Alaska through a representative that participates in Federal Subsistence Board or Federal Subsistence Regional Advisory Council processes. In addition, Craig relies on regional organizations, such as the Southeast Conference, to provide information on fisheries management issues. Finally, Craig financially supports the Alaska Trollers Association, which is a regional industry advocacy organization. According to community leaders, current challenges facing the portion of Craig's economy based on fishing involve a reduction in available halibut stock for commercial and charter harvest, high energy/fuel prices, and cost of expanding water treatment and distribution to seafood processors. Past or current fisheries policy which has affected Craig the most includes changes to the Pacific Salmon Treaty, declining halibut stocks, and impacts on dive and commercial crab fisheries relating to sea otter management. As of 2010, sea otter management was of chief concern to Craig, specifically relating to how it was impacting commercial fishing in the area.

The City is eligible to participate in the Community Quota Entity program and is represented by the PWI Community Holding Corporation. However, as of Fall 2013, the CQE non-profit had not yet acquired commercial halibut Individual Fishing Quota (IFQ), halibut charter permits, or non-trawl groundfish License Limitation Program permits for lease to eligible community members.¹⁶⁴

The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.¹⁶⁵

Craig is located in Federal Reporting Area 659, International Pacific Halibut Commission (IPHC) Regulatory Area 2C, and the Eastern Gulf of Alaska Sablefish Regulatory District.

Processing Plants

ADF&G's 2010 Intent to Operate list shows that Absolute Fresh Seafoods has a fish processing operation in both Craig and Ketchikan, but no information about an Absolute Fresh Seafoods Inc facility in either Craig or Ketchikan was available on the company website, only in Sitka. Absolute Fresh Seafoods Inc. was founded in 2003 and is a family-owned operation based in Sitka.¹⁶⁶ Absolute Fresh Seafoods as a company in general processes salmon (Chinook, coho), crab (king, Dungeness), spot prawns and scallops.¹⁶⁷

According to ADF&G's 2010 Intent to Operate list, Craig Fisheries has a seafood processing plant in Craig. Its parent company E.C. Phillips & Sons in general processes sablefish, clam, geoduck, halibut, herring, lingcod, rockfish, and all five species of Pacific salmon.¹⁶⁸ The original plant opened in 1940 and eventually burnt down. The current plant was built in 1982. The plant employs a maximum of 10 workers each year and relies on public water services, power/electricity, gas, and waste management services.¹⁶⁹

Noyes Island Smokehouse also operates a seafood processing facility in Craig. The company in general processes clam, geoduck, lingcod, rockfish, shrimp, prawns, and all five species of Pacific salmon.¹⁷⁰ Operations began in 2006 and the plant relies on public docks, water services, power/electricity, gas, and waste management services. They primarily smoke fish and employ a maximum of 15 employees each year.¹⁷¹

Finally, Silver Bay Seafoods processes salmon, crab, halibut and herring at its facility in Craig. The plant opened in 2009 employs a maximum of 200 workers during its salmon season.¹⁷² It is a predominantly fishermen-owned company, with nearly 100 Alaska fishermen comprising the majority of the ownership.¹⁷³ The plant relies on public docks, water services, power/electricity, and waste management services.¹⁷⁴

Fisheries-Related Revenue

In 2010, fisheries-related revenue was collected from raw fish taxes, Shared Fisheries Business Taxes, harbor usage fees, port/dock usage fees, and fees from fishing gear storage on public lands. Total fisheries-related revenue for that year was \$368,189, an increase from \$245,903 in 2000. Total revenues collected from raw fish taxes and Shared Fisheries Business Taxes fluctuated between 2000 and 2010, while fees collected from public harbor usage grew steadily. In a survey conducted by the AFSC in 2011, community leaders reported that \$150,000 was collected in 2010 from leasing public and tribal lands to members of the fishing industry.

¹⁷⁴ See footnote 169.

Fisheries-related revenues collected by the city are used to support harbor maintenance and harbor waste disposal. Information regarding fisheries-related revenue trends can be found in Table 3.

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that the summer troll season typically lasts from July 1st to September 15th, the summer seine season typically runs from July 5th to August 31st, the winter troll season typically lasts from October 15th to April 30th, and the Individual Fishing Quota (IFQ) season typically lasts from March 10th, to October 15th. Gear types typically used by residents include pots, long lines, gill nets, purse seines, and troll.

There were 125 residents who held commercial crew licenses in 2010, compared to 149 in 2000. In addition, residents held majority ownership of 146 vessels that year, compared to 234 in 2000. In 2010, 191 residents, or 15.9% of the population, held 332 permits issued by the Commercial Fisheries Entry Commission (CFEC). This represented 1.5% of total CFEC permit holders and 2.6% of total CFEC permits issued statewide that year. In 2000, 225 residents held 464 CFEC permits, representing 1.7% of total CFEC permit holders and 2.2% of total CFEC permits issued statewide that year. Of the CFEC permits issued in 2010, 41% were for salmon, compared to 33% in 2000; 20% were for other shellfish, compared to 16% in 2000; 16% were for herring, compared to 18% in 2000; 12% were for halibut, compared to 12% in 2000; 6% were for groundfish, compared to 10% in 2000; 3% were for crab, compared to 2% in 2000; and 3% were for sablefish, compared to 3% in 2000. Of the CFEC permits issued in 2010, 59% were actively fished, compared to 50% in 2000. This varied by fishery from 100% of sablefish permits, to 24% of groundfish. Fisheries prosecuted by Craig residents in 2010 included: southeast Alaska pot Dungeness crab, statewide longline halibut, southeast Alaska purse seine herring, southeast Alaska impounded herring roe-on-kelp, southeast Alaska longline demersal shelf rockfish, southeast Alaska dive geoduck, southeast Alaska pot shrimp, southeast Alaska dive sea cucumber, statewide longline sablefish, southeast Alaska purse seine, and drift gillnet salmon, Bristol Bay drift gillnet salmon, Kodiak set gillnet salmon, and statewide hand and power troll salmon.¹⁷⁵

Also in 2010, 23 residents held 25 License Limitation Program (LLP) groundfish permits, of which 20% were actively fished; and 27 residents held 27 Federal Fisheries Permits (FFP), of which 48% were actively fished. In 2010, 46 accounts held 1,794,208 shares of halibut quota, compared to 1,564,245 shares held by 58 accounts in 2000. A total of 11 sablefish quota share accounts held 748,766 shares in 2010, compared to 629,683 shares held by 11 accounts in 2000. No residents have held crab quota since the program began.

In 2010, 3.1 million pounds of fish was landed in Craig with a combined ex-vessel value of \$9.7 million, compared to 1.4 million pounds valued at \$1.9 million in 2000. This represented an approximate 281% increase in revenues after accounting for inflation.¹⁷⁶ In that year, Craig ranked 30th of 65 communities reporting landings, and 23rd of 65 communities in terms total ex-

¹⁷⁵ Alaska Commercial Fisheries Entry Commission. (2011). Alaska commercial fishing permits, permit holders, and vessel licenses, 2000 – 2010. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. [URL not publicly available as some information is confidential.]

¹⁷⁶ Inflation calculated using the 2010 Producer Price Index for unprocessed and packaged fish, Bureau of Labor Statistics, <http://www.bls.gov/ppi/#data>.

vessel revenue. Based on non-confidential CFEC data found in Table 9, shellfish were the most profitable species landed in 2010, followed by salmon and other groundfish. In that year, 882,123 lb of shellfish were landed in Craig valued at \$5 million ex-vessel, compared to 1 million pounds valued at \$959,019 in 2000; an increase of \$4.41 per pound landed after accounting for inflation¹⁷⁷ and without considering the species composition of landings. This significant increase was likely driven by the growing geoduck fishery in Craig.¹⁷⁸ Salmon landings in 2010 totaled 1.8 million pounds and were valued at \$3.3 million ex-vessel, compared to 2.4 million pounds valued at \$3.2 million in 2004; an increase of \$0.06 per pound after adjusting for inflation¹⁷⁹ and without considering the species composition of landings. Other groundfish landings in 2010 totaled 111,445 lb valued at \$120,726 ex-vessel, compared to 63,397 lb valued at \$66,331 ex-vessel in 2003.

For landings made by residents of Craig in 2010, salmon was the most profitable. In that year, 3.3 million pounds were landed valued at \$3.7 million ex-vessel, compared to 2.3 million pounds valued at \$1.4 million in 2000; an increase of \$0.28 per pound landed after accounting for inflation¹⁸⁰ and without considering the species composition of landings. Shellfish landings totaled 330,900 lb and were valued at \$1.5 million ex-vessel, compared to 699,620 lb valued at \$1.1 million in 2000; an increase of \$2.46 per pound after accounting for inflation¹⁸¹ and without considering the species composition of landings. Finally, residents landed 173,674 lb of halibut valued at \$823,668 in 2010, compared to 360,347 lb valued \$917,331 in 2000; an increase of \$1.24 per pound after accounting for inflation.¹⁸² Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Craig's relatively short distance from Ketchikan and the fact that is the economic center of PWI makes it an attractive destination for recreational anglers. The City possesses numerous visitor accommodations and attractions, including fish lodges and charter operators. In 2010, there were 19 active sport fish guide businesses registered in the city, and 37 residents had sport fish guide licenses. The number of active sport fish guide businesses remained relatively unchanged between 2000 and 2010, peaking in 2007 at 26. Compared with previous years, there was a slight decline in the number of sport fish guide licenses held by residents in 2010. The number of sportfishing licenses sold in the community has been steadily growing from 877 in 2000, to 3,179 in 2010 and the number of sportfishing licenses sold in the city peaked at 4,787 in 2007. In addition, 937 sportfishing licenses were sold to residents, compared to 1,049 in 2000.

Craig is located within the Prince of Wales ADF&G Harvest Survey Area which includes all waters and drainages from Cape Chacon to Sumner Strait and from Clarence Island westward. In 2010 there was a total of 51,312 saltwater angler days fished, compared to 49,074 in 2000. In that year, non-Alaska residents accounted for 74.4% of angler days fished, compared to 67.3% in 2000. In terms of freshwater, there was a total of 15,138 angler days fished in 2010, compared to 19,654 in 2000. In that year, non-Alaska residents accounted for 70.4% of angler days fished, compared to 45.9% in 2000.

According to ADF&G Harvest Survey data, private anglers in Craig target all five species of Pacific salmon, rainbow trout, Dolly Varden char, cutthroat trout, Pacific halibut, rockfish, lingcod, Pacific cod, steelhead trout, Dungeness crab, Tanner crab, razor clams, hardshell clams, shrimp, and other shellfish. In a survey conducted by the AFSC in 2011, community leaders reported that resident private anglers target pink, king, and coho salmon, halibut, rockfish, crab, shrimp, clams, and lingcod. Recreational fishing is typically done by charter vessel, locally owned private vessel, shore or dock, and private vessels owned by non-Alaska residents. In 2010, charter operators harvested 4,320 king salmon, 14,540 coho salmon, 6,857 halibut, 1,023 lingcod, 11,511 rockfish, 45 sablefish, 3 sharks, and 14 sockeye salmon.¹⁸³ Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Traditionally, salmon, halibut, steelhead, cod, Dolly Varden, shellfish and eulachon were all harvested by Tlingit and Haida on PWI.¹⁸⁴ Today, the city of Craig is not directly dependent on subsistence resources. However, subsistence lifestyles remain important to many members of the community. Subsistence information is limited and data is unavailable on household participation in subsistence harvesting. According to ADF&G's *Community Subsistence Information System*,¹⁸⁵ species which residents of Craig harvest or use include abalone, cockles, chitons, blue king crab, brown king crab, butter clams, Dungeness crab, geoducks, sea urchin, horse clams, limpets, octopus, oysters, Pacific littleneck clams, razor clams, red king crab, scallops, shrimp, squid, starfish, Tanner crab, mussels, sea cucumber, fur seal, harbor seal, Steller sea lion, black rockfish, brook trout, sculpin, cutthroat trout, dogfish, Dolly Varden, eulachon, grayling, herring, greenling, lingcod, Pacific cod, Pacific tom cod, rainbow trout, Irish lord, red rockfish, sablefish, sea bass, sea perch, silver smelt, skates steelhead, flounder, shark, sole, and pollock.

Of the species listed by ADF&G in Table 13, sockeye salmon are harvested most often, followed by coho salmon, pink salmon, chum salmon, and Chinook salmon. In 2008, a total of 2,010 salmon were reported harvested, a significant decline from 6,768 in 2000. Halibut make up a significant amount of subsistence harvests in Craig. In 2010, 510 residents were issued Subsistence Halibut Registration Certificates (SHARC), compared to 429 in 2003. In that year, 35,041 lb were harvested on 166 SHARC, compared to 45,658 lb harvested on 210 SHARC in 2003. Halibut harvests peaked in 2004, when an estimated 98,297 lb was harvested on 246 SHARC.

Between 2000 and 2010, an estimated 315 sea otters were harvested; between 2000 and 2008, an estimated 215 harbor seals harvested; and 2004, an estimated three sea lions were harvested. Marine mammal harvests declined significantly in 2006. Information regarding subsistence trends can be found in Tables 12 through 15.

Edna Bay

People and Place

*Location*¹⁸⁶

Edna Bay is located on the southeast coast of Kosciusko Island, northwest of Prince of Wales Island (PWI), in Southeast Alaska. It lies 90 mi northwest of Ketchikan. The community occupied 10 sq mi of water and 27 sq mi of land. Located in the Prince of Wales-Hyder Census Area, Edna Bay has not been incorporated into a municipality nor is it under the jurisdiction of a borough.

*Demographic Profile*¹⁸⁷

In 2010, there were 42 residents, ranking Edna Bay 303rd of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population declined by 51.2%. Between 2000 and 2009, the population remained the same although there was an average annual growth rate of -0.73 indicating slight variation during those years. Information regarding population trends can be found in Table 1.

The racial composition of Edna Bay is predominately White. In 2010, 97.6% of residents identified themselves as White, compared 95.9% in 2000. In addition, 2.4% of residents identified themselves as Black or African American, compared to 0% in 2000. Racial and ethnic composition remained mostly unchanged between 2000 and 2010. Information regarding race and ethnicity in Edna Bay can be found in Figure 1.

In 2010, the average household size was 2.33, compared to 3.4 in 1990 and 2.58 in 2000. In that year, there were 32 total housing units in the community, compared to 29 in 1990 and 40 in 2000. Of the households surveyed in 2010, 53% were owner-occupied, compared to 40% in 2000; 3% were renter-occupied, compared to 8% in 2000; 16% were vacant, compared to 30% in 2000; and 28% were occupied seasonally, compared to 23% in 2000. There were no reports of residents living in group quarters between 1990 and 2010.

Gender distribution in Edna Bay was significantly skewed in 2010 at 61.9% male and 38.1% female, and was notably more uneven compared to the statewide distribution (52.0% male, 48.0% female) and similar to the distribution in 2000 (61.2% male, 38.8% female). The median age that year was 53, which was significantly higher than the statewide median of 33.8 and 2000 median of 36.8. Gender distribution by age cohort was more uneven in 2010 than in 2000. The greatest absolute gender difference that year occurred in the 50 to 59 range (31% male, 11.9% female), followed by the 10 to 19 (7.1% male, 0% female) and 30 to 39 (4.8% female, 0% male) ranges. However, it should be noted the because of the small and variable

population, changes in gender distribution by age cohort were somewhat erratic making it difficult to discern a trend.

When compared with 2000, the population structure in 2010 was much more constrictive. In that year, 9.5% of residents were under the age of 20, compared to 32.6% in 2000. In addition, 26.2% of residents were over the age of 59, compared to 10.2% in 2000; 54.9% were between the ages of 30 and 59, compared to 49% in 2000; and 9.5% were between the ages of 20 and 29, compared to 8.1% in 2000. Information regarding the population structure of Edna Bay can be found in Figure 2.

In terms of educational attainment, the U.S. Census' 2006 to 2010 American Community Survey¹⁸⁸ (ACS) estimated that 100% of residents aged 25 and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 45.8% of residents had some college but no degree, compared to an estimated 28.3% of Alaska residents overall. No residents were estimated to hold any post-secondary degrees.

¹⁸⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

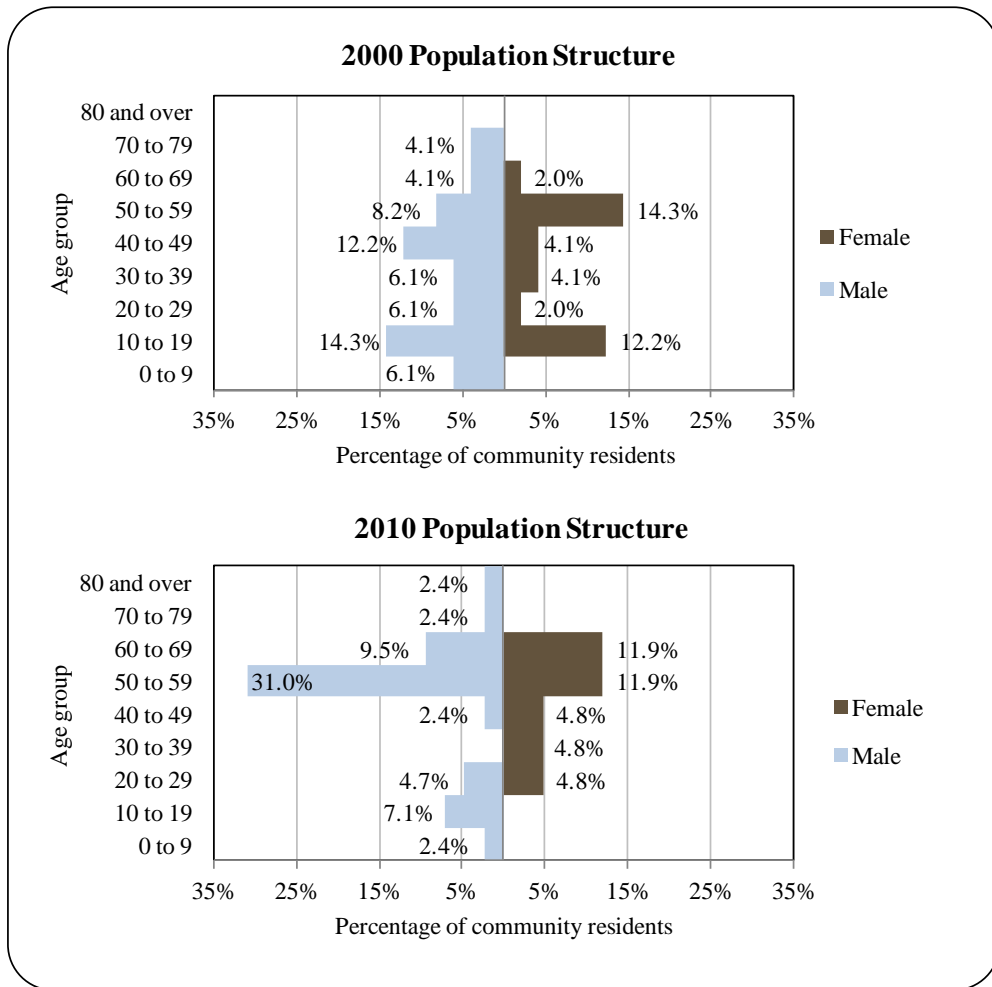

Figure 2. Population Age Structure in Edna Bay Based on the 2000 and 2010 U.S. Decennial Census.

History, Traditional Knowledge, and Culture^{189,190}

Edna Bay was originally identified in the 1904 U.S. Coast and Geodetic Survey and settlement was enabled by a state land disposal sale. Founded around fishing and timber harvesting, the community's population swelled to 135 during the timber industry's peak in the 1950s and 1960s. However, as the industry declined through the late 1970s, so did Edna Bay's population. By the 1980 Census, only six residents were documented. The community's population recovered and today, Edna Bay is characterized by its commercial fishing and subsistence culture.

Natural Resources and Environment

The area is dominated by a cool maritime climate characterized by mild winters and cool summers. Average temperatures in the summer range from 46 to 70 °F (8 to 21 °C); winter temperatures range from 32 to 42 °F (0 to 6 °C).¹⁹¹

Islands within the Prince of Wales archipelago are characterized by steep topography. Most soils are compiled from a mix of volcanic rock, glacial deposits, and sandy alluvium. Organic soils are found around drainage basins and muskegs. The area around Edna Bay is covered with a heavily forested mix of spruce and hemlock. Shrubs and groundcover include salmonberry, thimbleberry, devil's club, blueberry, rusty menziesia, salal, mosses, ferns, bunchberry, twisted stalk, and deer berry.¹⁹²

Commercially important fish within the area include pollock, Pacific halibut, Pacific ocean perch, sablefish, turbot, sole, rockfish, herring, and all five species of Pacific salmon. Common marine mammals include Steller sea lions, harbor seals, Dall and harbor porpoise, and whales. Terrestrial animals include Sitka black tailed deer, wolf, bear, mink, and marten.¹⁹³

Timber resources in the area are vast, and timber sales are beginning to increase following the industry crash of the 1970s. As of 2011, the Alaska Division of Forestry 5-year timber sales plan announced approximately 1 billion board feet available for purchase within the Southern Southeast Area (including the Ketchikan, Wrangell, Petersburg, and PWI areas) each year through 2015 in addition to larger sales planned in the Edna Bay area. Larger sales included both a proposed 119 acre sale near Naukati Bay in 2011 and a 21 billion board foot sale on Kosciusko Island in 2015.¹⁹⁴ Documented mineral deposits include a possible lead deposit near the abandoned town of Tokeen to the east of Edna Bay.¹⁹⁵

Edna Bay is protected against many natural hazards due to its sheltered position. Edna Bay lacks a hazard mitigation plan; however, Craig can be used as a proxy as conditions are very similar. Earthquakes have been classified as a moderate risk by the U.S. Army Corps of

Engineers and it is projected that regional damage caused by an earthquake would be major.¹⁹⁶ Damage from earthquakes would likely be the result of ground shaking, tsunamis, seiches, and landslides.

Current Economy¹⁹⁷

The community of Edna Bay has few opportunities for wage employment and many residents are self-employed. Commercial fishing is an important local source of seasonal employment and with the prospect of future timber sales, employment in timber sectors may soon return as well. The top employer¹⁹⁸ in 2010 was Southeast Island School District.

In 2010¹⁹⁹ the estimated per capita income was \$19,619 and the estimated median household income was \$75,385, compared to \$58,967 and \$44,583 in 2000, respectively. After accounting for inflation by converting 2000 values into 2010 dollars,²⁰⁰ the real per capita income (\$77,541) and real median household income (\$58,626) indicate that declines in both individual and household earnings. It should be noted that due to Edna Bay's small population size, ACS sampling methods may not have been able to accurately capture conditions within the community. Using the ACS estimates for 2006 to 2010, Edna Bay ranked 153rd of 305 communities from which per capita income was estimated; and 34th of 299 communities from which median household income was estimated.

Another way of understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$193,203 in total wages in 2010. When matched with the population in 2010, the per capita income equals \$4,600, which was a significant decline from both the 2010 ACS estimate. However, it should be noted that ALARI estimates are based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents. In addition, Edna Bay was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.²⁰¹ However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates,²⁰² 60.8% of residents aged 16 and over were part of the civilian labor force. In that year, unemployment was estimated at 21.6%, compared to

²⁰² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

an estimated 5.9% statewide; and no residents were estimated to be living under the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed, an estimated 15% worked in the private sector, an estimated 20% worked in the public sector, and an estimated 65% were self-employed. If accurate, ACS estimates of self-employed residents would seriously undermine the reliability of ALARI estimates for Edna Bay for reasons already mentioned.

By industry, most of those employed were estimated to work retail trade sectors in 2010 (65%); followed by education service, health care, and social assistance sectors (20%); and information sectors (15%) (Figure 3). By occupation type, most were estimated to hold sales or office positions (65%); followed by service positions (20%); and management or professional positions (15%) (Figure 4). Overall there were significant differences in representation in both industry sectors and occupation types between 2000 and 2010. Most notable were the sizable decreases in agriculture, forestry, fishing, hunting, and mining sectors; and natural resources, construction, and maintenance occupations. There was also a marked increase in the retail trade sector. It should be noted again that extreme differences could be attributed to Edna Bay’s population size and ACS sample methods. In addition, many resource based sectors, including commercial fishing, are seasonal or transient. This makes tracking them by conventional ACS survey methods difficult in some instances.

According to 2010 ALARI estimates,²⁰³ most (30%) employed residents worked in local government sectors; followed by natural resources and mining (20%); and information (20%) sectors.

²⁰³ See footnote 198.

Figure 4. Local Employment by Occupation in 2000-2010, Edna Bay (U.S. Census).

Governance

Edna Bay is not incorporated into a municipality or under the jurisdiction of a Borough. In addition, the community was not included in the Alaska Native Claims Settlement Act (ANCSA) nor does it possess a U.S. Bureau of Indian Affairs (BIA) recognized Tribal village council. The only governing body in the community is the Edna Bay Community Association (EBCA). Edna Bay does not collect public revenue; however, the community did receive State Revenue Sharing funds until the program ended in 2003. In addition, \$25,000 in state/federal grants was awarded that year for a dock and access project (Table 2).

The closest Alaska Department of Fish and Game (ADF&G) office is located in Craig, 40 mi southeast. The closest National Marine Fisheries Service (NMFS) office is located in Petersburg, 65 mi northeast. The closest U.S. Bureau of Citizenship and Immigration Services (BCIS) is located in Ketchikan, 90 mi southeast. Information regarding municipal finances can be found in Table 2.

Infrastructure

Connectivity and Transportation

Transportation and cargo services are provided by float plane or boat from Craig, Ketchikan, or Petersburg. As of 2011, roundtrip airfare between Ketchikan and Edna Bay was \$354 via Taquan Air.²⁰⁴ Edna Bay is not connected to the PWI road system. A dock and harbor with breakwater are available.²⁰⁵ Naukati Bay is the closest community to Edna Bay connected to a road system. That community is approximately 30 to 45 min away by boat. Craig is an additional 30 min drive from there, and offers most services unavailable in Edna Bay.²⁰⁶ Roundtrip airfare between Anchorage and Ketchikan in June 2012 was \$461.²⁰⁷

Facilities

There are no community facilities. All residents use individual untreated water sources such as springs or rain catchment. A few houses are connected to a central septic tank; the

majority use outhouses or leach fields. Approximately half of the homes are plumbed. There is no central electric system. Visitor accommodations include the Sunrise Lodge, Edna Bay Lodge and Charters, and Richter Rentals. Public safety services are provided by state troopers based out of Ketchikan. Fire and rescue services are provided by Edna Bay Emergency Medical Services (EMS), Edna Bay Search and Rescue, and PWI Area EMS.²⁰⁸ There is a state dock system, island phone services, broadband internet, post office, local store, transport services, and a log transfer site.²⁰⁹

*Medical Services*²¹⁰

Beyond local EMS, no medical services are located in Edna Bay. Craig Medical Clinic is the closest medical facility, and Ketchikan General Hospital provides a wider range of services.

*Educational Opportunities*²¹¹

The Edna Bay School offers kindergarten through twelfth grade instruction. As of 2011, there were 10 students in enrolled and 2 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Commercial harvest of salmon began in Southeast Alaska in the late 1870s.²¹² In the 1880s, a commercial fishery began for halibut in the inside waters of Southeast Alaska, with sablefish targeted as a secondary fishery.²¹³ Today, Southeast Alaska salmon fisheries utilize purse seine, drift gillnet, troll, and set gillnet gear. The highest volume of salmon landings in the region are harvested by purse seine gear, although the species harvested are typically pink and chum, the salmon species with lowest ex-vessel value. Other salmon fisheries target the higher value species (e.g., sockeye, coho, and Chinook). Because of Southeast Alaska's proximity to British Columbia, as well as many trans-boundary rivers that cross from Canada into Alaskan waters, salmon management in the region is governed to a large degree by the Pacific Salmon Treaty which was originally negotiated in 1985, and renegotiated in 1999 with increased emphasis on implementation of abundance-based management strategies.

State-managed sablefish fisheries currently take place in the inside waters of Chatham and Clarence Straits, north of Meyers Chuck. Pacific halibut fisheries in Southeast Alaska are managed by the International Pacific Halibut Commission (IPHC). Pacific cod and lingcod are

²⁰⁸ See footnote 205.

²¹³ Woodby, Doug, Dave Carlile, Shareef Siddeek, Fritz Funk, John H. Clark, and Lee Hulbert (2005). *Commercial Fisheries of Alaska*. Alaska Department of Fish and Game, Special Publication No. 05-09. Retrieved December 29, 2011 from <http://www.adfg.alaska.gov/FedAidPDFs/sp05-09.pdf>.

also harvested in Southeast Alaska under state regulations, independent of federal fisheries for these species. Halibut and Pacific cod fisheries utilize longline gear, while the Southeast Alaska lingcod fishery uses dinglebar troll gear, a salmon power troll gear modified with a heavy metal bar to fish for groundfish. Management of the Southeast Alaska lingcod fishery includes a winter closure for all users (except longliners) to protect nest-guarding males. Demersal rockfish are caught as bycatch in the halibut longline and trawl fisheries. A small directed fishery for flatfish (other than halibut) has also taken place in Southeast inside waters in recent decades, but effort has declined since 1999.

Shrimp trawl fisheries in Southeast Alaska primarily target northern shrimp and sidestripe shrimp, although the market for northern shrimp has declined in recent years with the closure of the primary processing facility in Petersburg in 2006.²¹⁴ A pot fishery for spot shrimp has also grown in Southeast Alaska since the 1990s. Commercial dive fisheries for red sea cucumber and sea urchin began near Ketchikan in the early 1980s. A dive fishery for geoduck clams began around the same time, and all three fisheries are now managed by ADF&G according to Fishery Management Plans. Sea cucumbers and sea urchin are hand-picked by divers, while geoduck divers use handheld water jets to remove substrate from around the clams.

While traditionally a logging town, Coffman Cove has been rapidly developing its commercial and recreational fisheries economy in recent years. The salmon gillnet fishery is perhaps the most important local commercial fishery, with many vessels from Seattle using the community as a base of operations during seasons. Other fisheries active in the Coffman Cove area include shrimp, sea cucumber, sea urchin, and halibut.²¹⁵

Following the timber industry decline, commercial fishing became an increasingly important source of income for local residents. While there is no local seafood processing facilities, several residents do hold commercial fishing permits. Subsistence fishing is also an important supplement for the limited wage economy. Edna Bay is located in Federal Reporting Area 659, International Pacific Halibut Commission (IHP) Regulatory Area 2C, and the Eastern Gulf of Alaska (GOA) Sablefish Regulatory District.

Edna Bay is eligible for participation in the Community Quota Entity (CQE) program. The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the

²¹⁴ Alaska Department of Fish and Game (2012). *Northern Shrimp Species Description*. Retrieved April 2, 2012 from <http://www.adfg.alaska.gov/index.cfm?ADFG=northernshrimp.printerfriendly>.

CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.²¹⁶

Edna Bay participates in the CQE program through Edna Bay Community Fisheries. The CQE non-profit was established at the recommendation of the Edna Bay Community Association. As of Fall 2013, Edna Bay Community Fisheries had not yet purchased any commercial halibut IFQ or non-trawl groundfish License Limitation Program permits. However, the non-profit had acquired four halibut charter permits for lease to community members.²¹⁷

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Edna Bay does not have a registered processing plant. The closest seafood processing plant is located in Klawock.

Fisheries-Related Revenue

No fisheries-related revenue was reported in Edna Bay between 2000 and 2010 (Table 3).

Commercial Fishing

In 2010, 13 residents, or 31% of the population, held 22 permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 13 residents held 25 CFEC permits. Of the CFEC permits issued in 2010, 59% were for salmon, compared to 46% in 2000; 9% were for sablefish; compared to 0% in 2000; 18% were for halibut, compared to 29% in 2000; and 9% were for shellfish, compared to 8% in 2000. In addition, three residents held three License Limitation Program (LLP) groundfish permits of which one was active. Finally, 5 accounts held 248,631 shares of halibut quota in 2010, compared to 195,861 shares held by 7 accounts in 2000. No residents have held sablefish or crab quota share since the programs began.

There were two residents who held commercial crew licenses in 2010, compared to seven in 2000. In addition, residents held majority ownership of 11 vessels that year, compared to 9 in 2000. Of the CFEC permits issued in 2010, 41% were actively fished, compared to 36% in 2000. This varied by fishery from 100% of sablefish permits, to 50% of halibut and 38% of salmon permits. Fisheries prosecuted by residents of Edna Bay in 2010 included: statewide longline halibut, northern and southern southeast longline sablefish, and statewide hand and power troll salmon. Between 2000 and 2010, given a lack of fish buyers, no landings were reported in Edna Bay. However, residents of Edna Bay reported landings in other locations during that time. In 2010, residents landed 243,007 lb of salmon valued at \$232,987 ex-vessel, compared to 75,228 lb valued at \$89,513 in 2000; a decrease of \$0.67 per pound landed after accounting for inflation²¹⁸ and without considering the species composition of fish landed. Data on additional landings in 2010 are considered confidential due to a limited number of participants. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Recreational fishing out of Edna Bay is somewhat limited due to poor accessibility. However, PWI continues to attract more private anglers and Edna Bay has the potential to attract both Alaska residents and non-Alaska residents due to its proximity to Craig. While recreational fishing infrastructure is somewhat limited, there are visitor accommodations available. In 2010, there was one sport fish guide business active in Edna Bay. No sport fish guide businesses were active between 2000 and 2009. Also in 2010, 32 sportfishing licenses were sold in the community, compared to 13 in 2000. In addition, 28 sportfishing licenses were sold to residents, which was unchanged from 2000, although there were some interannual fluctuations between 2000 and 2010.

Edna Bay is located within the Prince of Wales ADF&G Harvest Survey Area which includes all waters and drainages from Cape Chacon to Sumner Strait and from Clarence Island westward. In 2010 there was a total of 51,312 saltwater angler days fished, compared to 49,074 in 2000. In that year, non-Alaska residents accounted for 74.4% of angler days fished, compared to 67.3% in 2000. In terms of freshwater, there was a total of 15,138 angler days fished in 2010, compared to 19,654 in 2000. In that year, non-Alaska residents accounted for 70.4% of angler days fished, compared to 45.9% in 2000.

According to ADF&G Harvest Survey data,²¹⁹ local private anglers target Chinook, coho, and pink salmon, Pacific halibut, rockfish, and hardshell clams. In 2010, there were nine charter businesses operating in Edna Bay. Number and species of fish kept by charter vessels that year included 155 Chinook salmon, 3,322 coho salmon, 1,296 halibut, 315 lingcod, 4,312 rockfish, and 5 sablefish. Information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

Although not traditionally a subsistence-based community, residents of Edna Bay still rely on subsistence resources to supplement incomes and diet. ADF&G information on subsistence activity in Edna Bay is limited, and data on subsistence participation by household is unavailable as is recent information on total harvests of salmon, non-salmon fish, and marine invertebrates by residents. According to ADF&G's *Community Subsistence Information System*,²²⁰ species which Edna Bay residents harvest or use include abalone, cockles, chitons, blue king crab, brown king crab, butter clams, Dungeness crab, geoducks, urchins, horse clams, limpets, octopus, oyster, littleneck clams, razor clams, red king crab, scallops, shrimp, squid, Tanner crab, mussels, sea cucumber, fur seal, harbor seal, Steller sea lion, black rockfish, brook trout, cutthroat trout, dogfish, Dolly Varden, eulachon, grayling, herring, lingcod, Pacific cod, Pacific tom cod, rainbow trout, Irish lord, red rockfish, greenling, sablefish, sea perch, silver smelt, skates, steelhead, flounder, sculpin, shark, sole, and pollock.

Of the species documented by ADF&G, halibut made up the majority of fish harvested

²¹⁹ Alaska Department of Fish and Game. (2011). Alaska Sport Fishing Survey results, 2000 – 2010. ADF&G Division of Sport Fish, Alaska Statewide Harvest Survey project. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sf/sportfishingsurvey/> (Accessed September 2011).

²²⁰ Alaska Department of Fish and Game. 2011. Community Subsistence Information System (CSIS). ADF&G Division of Subsistence. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sb/CSIS/> (Accessed February 2011).

by residents. In 2010, 28 residents were issued Subsistence Halibut Registration Certificates (SHARC), compared to 17 in 2003. In that year, an estimated 1,661 lb of halibut was harvested, compared to an estimated 2,111 lb in 2003. Data on marine mammal harvesting is unavailable. Information on subsistence trends can be found in Tables 12 through 15.

Elfin Cove

People and Place

*Location*²²¹

Elfin Cove lies on the northern shore of Chichagof Island, approximately 33 mi west of Hoonah and 70 mi by air and 85 mi by boat west of Juneau. The community is only accessible by small seaplane or boat. The community occupies 0.13 sq mi of land. Elfin Cove is located in the Hoonah-Angoon Census Area and is not incorporated into a municipality or under the jurisdiction of a borough.

*Demographic Profile*²²²

In 2010, there were 20 residents, ranking Elfin Cove 327th of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population declined by 64.9%. Between 2000 and 2009, the population dropped by 21.9% with an average annual growth rate of -3.11%; much lower than the statewide average of 0.75% and indicative of steady decline. In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that there were 25 permanent and 290 seasonal residents living in Elfin Cove in 2010. On average, seasonal workers live in Elfin Cove from May through September. The population peaks during June through August and is entirely driven by employment in fishing sectors. Population fluctuations are tied to the commercial and recreational fishing industries. Information regarding population trends can be found in Table 1.

The racial composition of Elfin Cove was predominately White in 2010, although more diverse than it was in 2000. In that year, 70.0% of residents identified themselves as White, compared to 93.8% in 2000; 5% identified themselves as American Indian or Alaska Native, compared to 0% in 2000; and 25% identified themselves as two or more races, compared to 3.1% in 2000. Between 2000 and 2010, no residents identified themselves as Hispanic or Latino. Information regarding Elfin Cove's racial and ethnic composition can be found in Figure 1.

In 2010, the average household size was 1.54, a decrease from 2.4 in 1990 and 2.13 in 2000. In that year, there were a total of 28 housing units, compared to 44 in 1990 and 35 in 2000. Of the households surveyed in 2010, 39% were owner-occupied, compared to 37% in 2000; 7% were renter-occupied, compared to 6% in 2000; 7% were vacant, compared to 29% in 2000; and 46% were occupied seasonally, compared to 29% in 2000. Since 1990 there have been no reports of residents living in group quarters.

Figure 1. Racial and Ethnic Composition, Elfin Cove: 2000-2010 (U.S. Census).

The gender distribution was significantly skewed in 2010 at 70.0% male and 30.0% female, and much more uneven than both the distribution statewide (52% male, 48% female) and distribution in 2000 (59.4% male, 40.6% female). The median age was 55 years, which was much older than the statewide median of 33.8 years and somewhat older than the 2000 median of 47.5 years.

Population structures in both 2000 and 2010 were heavily influenced by the community's small population size. In 2010, 15% of residents were under the age of 20, compared to 18.8% in

2000; 35% were over the age of 59, compared to 25.1% in 2000; and 49.9% were between the ages of 30 and 59, compared to 56.4% in 2000. No residents were between the ages of 20 and 29 during either the 2000 or 2010 Decennial Census.

Gender distribution by age cohort was more uneven in 2010 than in 2000. In that year, the greatest absolute gender difference occurred in the 50 to 59 range (30% male, 5% female), followed by the 40 to 49 (9.9% male, 0% female) and 30 to 39 (5% female, 0% male) ranges. Of those three, the greatest relative gender differences occurred in both the 40 to 49 and 30 to 39 ranges. It should be noted that because of Elfin Cove’s small and variable population, discerning trends in population structure is difficult. Information regarding Elfin Cove’s population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS)²²³ estimated that 100% of residents aged 25 and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. No residents were estimated to hold a post-secondary degree.

Figure 2. Population Age Structure in Elfin Cove Based on the 2000 and 2010 U.S. Decennial Census.

²²³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*²²⁴

Elfin Cove's location made it a natural choice for fishermen seeking shelter from storms. By 1909, the area had been given the name "Gunk Hole" after an East Coast term describing a good harbor with a narrow, rocky entrance.

In 1927, a fish buyer set up in the cove with two boats. Soon after, E.O. "Ernie" Swanson retired his fox farm at nearby Three-Hill Island to set up a fish buying station at the Gunk Hole. His business consisted of log floats and a small shore side warehouse. Eventually, more docks were built in the inner harbor, and in 1933 the first cabin was constructed followed by a bath house. Ernie expanded the business by starting a general store, dock, and a restaurant.

There are several accounts as to the origin of Elfin Cove's name. One story recounts that the first postmaster, Ruth Swanson, didn't want the job unless the community name was changed from "The Gunk Hole"; so in 1935 the community changed its name to Elfin Cove after Ernie's boat. Another story recounts that Ruth Swanson chose the name Elfin Cove because the misty, forested place would be an appropriate habitat for elves.

The community continued to grow, and in 1947, the official population was 75. John Lowell, another fish buyer, arrived in the 1940s and built a second dock, warehouse, store and restaurant. By 1960, the population remained around 60. At this time, the community obtained power from a diesel electric generator supplemented by hydroelectric power from a Pelton wheel. Wood and coal burners were mostly replaced by oil stoves for heat.

In the 1980s, the electric system was upgraded, a water system was installed, and a community building and school were built. However, the school was forced to close in 1998 due to low enrollment. Today, Elfin Cove is a town centered on commercial fishing, tourism, and sportfishing.

Natural Resources and Environment²²⁵

Elfin Cove has a maritime climate characterized by cool summers, mild winters and a high amount of precipitation. The average summer temperature generally ranges from 46 to 60 °F (8 to 16 °C). Average winter temperatures range from 29 to 40 °F (-2 to 4 °C). Annual precipitation is about 103 inches and average snowfall is about 99 inches.

The local topography consists of relatively gentle slopes and an irregular coastline. Elfin Cove provides easy access to the Fairweather, Cross Sound and Icy Strait fishing grounds. Located near Cross Sound at the north end of the "Inside Passage," Elfin Cove is an important area to seek shelter from storms and a refueling stop for commercial fishermen, recreational fishermen, and private boaters. The community's strategic location provides the last stop for vessels traveling north across the Gulf of Alaska and the first stop for those traveling south from the Gulf. It is also first landfall for many sailing vessels traveling from the South Pacific.

Soils in the area are typically thin. Exposed bedrock is composed of granite and greywacke. Shorelines consist of boulder and cobble beaches and unconsolidated alluvial sediments. Local vegetation is consistent with southeast Alaska temperate rain forest. Dominant conifers include Sitka spruce and western hemlock. Mountain hemlock and Alaska cedar may

²²⁴ Community of Elfin Cove Non-profit Corporation; Southeast Strategies; and Glenn Gray and Associates. (2007). *Elfin Cove Community Plan*. Retrieved March 27, 2012 from: <http://www.commerce.state.ak.us/dca/plans/ElfinCove-CP-2007.pdf>.

²²⁵ Ibid.

also be found in area. Sitka alders typically grow along the coast and disturbed areas. Undergrowth consists of blueberries, huckleberries, devil's club, and moss. Muskegs support sedges, mosses, Labrador tea, and stunted lodgepole pines and mountain hemlock. Terrestrial mammals include brown bears, Sitka black-tailed deer, martin, mink, and otter. Marine mammals include seals, sea lions, sea otters, Dall's porpoise, and humpback whales. Fish include all five species of Pacific salmon, halibut, sablefish, rockfish, herring, flatfish, and shellfish. There is also an abundance of bird species present in the area.

The west coast of Chichagof Island supports a mineralized area known as the "Chichagof Gold Belt." Former mines in the area include the Western Chichagof Mine near Klag Bay and the Hurst-Chichigof Mine at Kimshan Cove. No oil resources have been identified in the Elfin Cove area. In addition, no timber resources are harvested on a commercial level in the area.

Elfin Cove is relatively protected from many types of environmental hazards. Localized flooding can occur; however, damage is not common. The community has been classified as a Zone 3 seismic probability, and a 6 to 8.8 magnitude earthquake is possible. Records indicate that the last large earthquake struck the area in 1958 when a magnitude 7.9 earthquake occurred in Lituya Bay, approximately 50 mi northwest of Elfin Cove. Tsunami hazards near Elfin Cove are high due to its proximity to fault lines and the Pacific Ocean. Finally, landslides can pose a threat, as proven by a 1996 slide which damaged local infrastructure.

According to the Alaska Department of Environmental Conservation, no significant environmental remediation projects were active locally in 2010.²²⁶

Current Economy²²⁷

Elfin Cove's mixed economy is largely based on commercial and recreational fishing. Most employed residents work private sector wage positions or are self-employed. While fishing is a mainstay in Elfin Cove, employment can also be found in fisheries support services as well as transportation, service, professional, and hospitality sectors. Tourism is another important industry in Elfin Cove. In 2007, there were a total of 28 stops by small cruise ships, and private pleasure craft frequent the area. In addition, there are many sportfishing lodges and charter businesses in the area which provide a seasonal boost the local economy. However, permanent residents have noted that many of the tourism related businesses are operated by seasonal residents. Because of this, the community does not benefit to the extent it would if more tourism businesses and services were owned and operated locally.²²⁸ Top employers²²⁹ in 2010 included the Community of Elfin Cove and Elfin Cove Utility.

In 2010,²³⁰ the estimated per capita income was \$19,178 and estimated median household income was \$9,375, compared to \$15,089 and \$33,750 in 2000, respectively. However, after

²³⁰ U.S. Census Bureau (n.d.). Profile of selected social, economic and housing characteristics of all places within Alaska. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

accounting for inflation by converting 2000 values to 2010 dollars,²³¹ the real per capita income (\$19,842) and real median household income (\$44,381) indicate that while individual earnings remained unchanged, household earnings dropped significantly. In 2010, Elfin Cove ranked 161st of 305 communities from which per capita income was estimated, and last of 299 communities from which median household income was estimated.

Elfin Cove's small population size may have prevented the ACS from accurately portraying economic conditions.²³² A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$112,934 in total wages in 2010.²³³ When matched with the population in 2010, the per capita income equals \$5,647, which is significantly less than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Census figures.²³⁴ In addition, community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.²³⁵ However, it should be noted that ACS and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates,²³⁶ 44.4% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 16.7%, compared to an estimated 5.9% statewide; and an estimated 55.6% of residents lived below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed, an estimated 100% worked in the private sector. It is likely that these figures overestimate the proportion of residents working in the private sector, as many self-employed according to a 2007 Community Comprehensive Plan.²³⁷

By industry, 100% of residents were estimated to work in retail trade sectors, compared to 0% in 2000. By occupation type, 100% of residents were estimated to hold sales or office positions, compared to 20% in 2000. There was significant homogenization of both sector employment and occupations held between 2000 and 2010. However, those estimates conflict with both the 2010 labor analyses conducted by the DOLWD²³⁸ and with economic conditions detailed in the 2007 Community Comprehensive Plan already mentioned.²³⁹ Because of this, it is likely that 2010 ACS estimates do not accurately reflect local employment conditions. According to DOLWD, 36.4% of employed residents worked in trade, transportation or utilities sectors; 18.2% worked in professional or business sectors; 18.2% worked in state government sectors;

²³¹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²³² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²³³ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

²³⁸ See footnote 229.

²³⁹ See footnote 224.

and 27.3% worked in local government sectors. Again, it should be noted that DOLWD analyses did not account for self-employed residents or those employed by the federal government. Overall, there is not adequate information available to discern a trend in local employment. The 2007 Elfin Cove Comprehensive Plan²⁴⁰ emphasized the fact that most full-time residents are self-employed, which was not reflected in either ALARI or ACS estimates. Information regarding local employment can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Elfin Cove (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Elfin Cove (U.S. Census).

²⁴⁰ Ibid.

Governance

Elfin Cove is an unincorporated community which is not under the jurisdiction of an organized borough. For official purposes, Elfin Cove is located in the Sitka Recording District and Hoonah-Angoon Census Area. Because of Elfin Cove’s status there are no city or borough officials in the city nor are there municipal or borough finances dispersed to the community. The local governing body is the Community of Elfin Cove. Elfin Cove received State Revenue Sharing funds until 2003 when the program ceased (Table 2).

Elfin Cove was not included in the Alaska Native Claims Settlement Act (ANCSA). As such, there is not a federally recognized Native village council, nor is there an ANCSA chartered Native village corporation. The closest National Marine Fisheries Service (NMFS) and Alaska Department of Fish and Game (ADF&G) offices are located in Juneau, 70 mi east. The closest U.S. Bureau of Citizenship and Immigration Services office is located in Ketchikan, 267 mi southeast. Information regarding municipal finances can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Elfin Cove from 2000 to 2010.

Infrastructure

Connectivity and Transportation

A state-owned seaplane base is available, and is scheduled for state-funded improvements. Roundtrip airfare between Juneau and Elfin Cove in June 2012 was \$340.²⁴¹ Moorage for 25 marine vessels is available. Skiffs are the primary means of local transportation. The state ferry lands at nearby Pelican. Freight arrives by plane or boat.²⁴²

Facilities

Most of the homes are fully plumbed using individual surface water collection systems and septic tanks with leachfields or beach outfall. A tank holds captured spring water. Due to the geography of the area, a landfill does not exist and is not feasible. Residents currently use an unregulated refuse burn area on tidelands. Public safety is provided by state troopers based in Juneau. Fire and rescue services are provided by Elfin Cove Fire Department. Communications services include local and long distance telephone, and local television and radio. Additional facilities include the Elfin Cove museum.²⁴³ There are six lodges operating within Elfin Cove which offer visitor accommodations, as well as Coho's Bar and Grill and the Hobbit Hole Guest House in the Inian Islands.

In a survey conducted by the AFSC in 2011, community leaders reported that there is 1,000 ft of public dock space available for permanent and transient vessel moorage. Vessels up to 150 ft long can use moorage, including rescue vessels, cruise ships, fuel barges, and vessels containing hazardous materials. Commercial fishing vessels which use Elfin Cove as a base of operation during fishing seasons are typically 60 ft long or under. Infrastructure projects completed as of 2010 included dockside electrical services, diesel power improvements, emergency response improvements, and fire department improvements. Infrastructure projects planned as of 2010 included dock improvements, new pilings, harbor dredging, broadband internet access, water and sewer pipelines, alternative energy projects, and public safety improvements. Local fisheries-related businesses and services include: fishing gear sales, boat repair, haulout facilities, small vessel (< 60 tn) tidal grid, commercial and recreational fishing vessel moorage, tackle sales, fishing lodges, boat fuel sales, fishing gear storage, seaplane service, smoked fish processor, and shipwright. In addition, there is a local carpenter, fuel dock manager, bookkeeper, storekeeper, electrical utility manager, electrical engineer, and postmaster. Residents typically go to Sitka, Hoonah, or Juneau for services unavailable locally. The number of commercial fishing vessels that stop in Elfin Cove remained unchanged between 2005 and 2010; however, there has been a decline in the amount of supplies purchased locally. There was a slight increase in the number of charter vessels; however, it is not expected to continue due to the economy and halibut restrictions. There has been an increase in visits by large pleasure craft.

²⁴¹ Airfare was calculated using lowest fare from www.travelocity.com. (Retrieved November 22, 2011).

Medical Services

There is no clinic located in Elfin Cove. Medical services are provided by Elfin Cove Emergency Medical Services. The closest hospital is located in Juneau.

Educational Opportunities

There are no schools located in Elfin Cove.²⁴⁴

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Historically, commercial fishing was tied to Icy Strait, Glacier Bay, and the outer coast (including Lituya Bay). The Bartlett Cove cannery built in 1890, and Dundas Bay Cannery built in 1900 predated seafood processing in Excursion Inlet. In the 1940s, two fish traps were located in Icy Strait waters off Point Dundas and Point Gustavus. Crab and halibut fisheries were developed around the same time. The earliest report of shrimp fishing in Glacier Bay was in 1952. Salmon, halibut, crab, and shrimp fishing remained small-scale into the 1970s; however, by the 1980s fishing was intensified. In 1975 the International Pacific Halibut Commission (IPHC) reduced the halibut season from 128 days to 5 days. On opening day of halibut season in 1983, over 100 longliners were estimated to be in Glacier Bay.

During this time, the U.S. National Park Service (NPS) was reassessing its management of commercial fishing in National Parks. Friction between fishermen and the NPS intensified over an opinion in 1982 by the Interior Department Solicitor concluding that commercial fishing should not be allowed in Glacier Bay under the Alaska National Interest Lands Conservation Act (ANILCA). This was interpreted based on the prohibition of non-recreational commercial uses of wilderness areas contained under the Wilderness Act of 1964. This also created contention between the NPS and Alaska Attorney General's Office over jurisdiction of submerged lands and authority to regulate commercial fishing in park waters. Alaska's Attorney General argued that submerged lands had been transferred to the state under the Alaska Statehood Act; a claim which was rejected by the Interior Department.

Proposed rules outlining the closure of Glacier Bay to commercial fishing was submitted to the Federal Register by the NPS in 1983. Commercial fishermen argued that the proposed rules were arbitrarily targeting commercial vessels, as sportfishing was not included and the regulations initially proposed by the NPS were ultimately abandoned under political pressure. Negotiations began between the NPS, commercial fishing industry, environmental interests, and other interested parties over new regulations. It was the goal of the NPS to come to an agreement with stakeholders over which areas to exclude from the proposed wilderness area. While consensus was never reached, the negotiations did produce a foundation for the NPS's wilderness recommendation. However, regulations established that same year by the Redwood National Park Act of 1978 prohibiting commercial fishing in National Parks went unnoticed and un-contested by most NPS and Alaska officials. Although then Interior Department Solicitor Roy Spadley Jr. claimed that regulations did not apply to Glacier Bay, NPS officials were skeptical.

²⁴⁴ Alaska Department of Education and Early Development. (2012). *Statistics and Reports*. Retrieved April 24, 2012 from <http://eed.alaska.gov/stats/>.

By the late 1980s, the NPS was facing intense scrutiny by both Alaska's congressional delegation and the Reagan administration over ANILCA and humpback whale protection measures limiting vessel entrance into Glacier Bay. At that time, commercial fishing had grown to the point that the NPS felt conditions were threatening their mandate to preserve the park as an ecological reserve. In addition, defunding by congress made it difficult for the agency to fulfill its mandates while addressing the interests of stakeholders. In 1988, the NPS completed the wilderness recommendation Environmental Impact Statement (EIS) and presented it for public comment. The chosen recommendation favored a phased termination of commercial fishing for NPS waters. This was influenced by the NPS's waning political capital and the endless political difficulties and litigation that would likely result from the complex management approach born from negotiations in 1983. By 1989, residents of Hoonah were pursuing subsistence fishing rights in Glacier Bay; a tactic which non-Native fishermen from Gustavus, Hoonah, Elfin Cove, and Pelican would attempt as well. In 1990, it was decided that commercial fishing would be phased out in Glacier Bay and ending on December 31, 1997. The phase-out was implemented to lessen the economic impact on communities dependent on fisheries within the park. However, traditional and accustomed subsistence practices were still allowed within the park under ANILCA, as on all federal lands and navigable waters.²⁴⁵

The waters of Cross Sound and Icy Strait contain substantial fishery resources. Commercial fisheries in the Elfin Cove area are mostly salmon hand and power troll fisheries, with peak season running late June through September. Other fisheries include longline halibut, sablefish and other groundfish. Elfin Cove is located near a heavily traveled passage to and from the Gulf of Alaska (GOA), making it a popular location for passing vessels to stop.²⁴⁶

In a survey conducted by the AFSC in 2011, community leaders reported that Elfin Cove participates in the fisheries management process in Alaska through a representative who sits on regional fisheries advisory and/or working groups run by ADF&G. In addition, the community participates through its support of Southeast Conference as well as relies on regional organizations for advocacy. Finally, Elfin Cove is eligible for participation in the Community Quota Entity (CQE) program and is represented by the Elfin Cove Community Quota Entity. However, as of Fall 2013, the CQE non-profit had not yet acquired commercial halibut Individual Fishing Quota (IFQ), halibut charter permits, or non-trawl groundfish License Limitation Program permits for lease to eligible community members.²⁴⁷

The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease

their quota rather than fish it due to low profit margins and high quota value. These factors lead decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.²⁴⁸

Elfin Cove is located in Federal Reporting Area 659, International Pacific Halibut Commission (IPHC) Regulatory Area 2C, and the Eastern GOA Sablefish Regulatory District.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there was one shore-based processor in Elfin Cove in 2010. Patti's FP Smokers is a small processing facility that began operating in 1996. The owner buys between 30 and 35 fish a week and only from fisherman that are close friends.²⁴⁹ In addition to the one shore side fish processor, there were nine fish buyers based in Elfin Cove in 2010.

Fisheries-Related Revenue

Between 2000 and 2010, Elfin Cove did not collect or receive any fisheries-related revenue (Table 3).

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that salmon seasons typically run from January through December, halibut and sablefish run typically from March through November, and lingcod run typically in May. Gear types generally used by residents include pots, longline, purse seines, troll, and dinglebar.

In 2010, 28 residents, held 28 permits issued by the Commercial Fisheries Entry Commission (CFEC), compared to 31 and 58 in 2000, respectively. Again, it should be noted that Elfin Cove's population is highly seasonal, which likely accounts for discrepancies between the number of resident CFEC permit holders and 2000 Decennial Census calculated population. Fisheries prosecuted in 2010 by residents of Elfin Cove included: statewide longline halibut and sablefish, statewide dinglebar troll lingcod, statewide hand troll salmon, and statewide power troll salmon.²⁵⁰ Of the CFEC permits issued in 2010, 63% were for salmon, compared to 60% in 2000; 2% were for groundfish, compared to 9% in 2000; 4% were for sablefish, compared to 5% in 2000; 27% were for halibut, compared to 21% in 2000; 2% were for crab, compared to 5% in 2000; and 2% were for shellfish, compared to 0% in 2000. In addition, eight residents held nine License Limitation Program (LLP) groundfish permits and four residents held four Federal

²⁴⁹ This information is based on the results of a processing plant survey conducted by the Alaska Fisheries Science Center in 2011.

²⁵⁰ Alaska Commercial Fisheries Entry Commission. (2011). *Alaska commercial fishing permits, permit holders, and vessel licenses, 2000 – 2010*. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. [URL not publicly available as some information is confidential.]

Fisheries Permits (FFP). In 2010, 12 account holders, or 60% of the 2010 Decennial Census calculated population, held 826,634 shares of halibut quota and 2 account holders held 533,480 shares of sablefish quota. No residents held crab quota share between 2010 and when the program began. The amount of locally held halibut and sablefish quota increased steadily between 2000 and 2010, with shares of both peaking in 2009.

There were 11 residents, or 55% of the 2010 Census calculated population, who held commercial crew licenses in 2010, compared to 18 in 2000. In addition, residents held majority ownership of 25 vessels, compared to 53 in 2000. In that year, 67% of permits held were fished, compared to 60% in 2000. This varied by fishery from 100% of groundfish, halibut, and sablefish permits fished, to 43% of salmon and 0% of crab and other shellfish.

In 2010, a total of 5,543 lb of fish were landed in Elfin Cove, valued at \$6,236 ex-vessel. This represented a significant decrease from 2005 when landings peaked at 23,402 lb valued at \$58,943 ex-vessel. Of the 67 Alaskan communities reporting landings, Elfin Cove ranked 62nd in terms of pounds landed and 66th in terms of total ex-vessel value of landings.

By fishery, all landings in Elfin Cove were considered confidential in 2010 with the exception of salmon. In that year, 4,543 lb were landed valued at \$4,356 ex-vessel, compared to 17,411 lb valued at \$35,853 in 2004; a decrease of \$1.76 per pound landed after accounting for inflation²⁵¹ and without considering the species composition of fish landed. Salmon prices in Elfin Cove were at their lowest in 2009 at \$0.53 per pound landed ex-vessel after accounting for inflation²⁵² and without considering the species composition landed. In addition, when ex-vessel revenues from landings in Elfin Cove peaked in 2005, only a small fraction was from salmon. Non-confidential landings by residents of Elfin Cove in 2010 included halibut, salmon, and “other” groundfish. In that year, residents landed 325,965 lb of salmon valued at \$558.830 ex-vessel, compared to 777,557 lb valued at \$515,766 in 2000; an increase of \$0.80 per pound overall after accounting for inflation²⁵³ and without considering the species composition of landings. Also in that year, 58,835 lb of halibut were landed valued at \$282,367, compared to 82,891 lb valued at \$217,781 in 2000; an increase of \$1.19 per pound overall after accounting for inflation.²⁵⁴ Finally, 17,933 lb of other groundfish were landed valued at \$30,271 total, compared to 18,827 lb valued at \$16,349 in 2000. Further information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Sportfishing makes up a large portion of Elfin Cove's seasonal economy. Many lodges in the area offer accommodations, meals, tours, and charter fishing. A 2005 study by the University of Alaska's Institute of Social and Economic Research reports that Elfin Cove area lodges served about 1,500 clients and earned between \$4.5 to \$5.2 million in that year.²⁵⁵ In addition, there are several bed and breakfasts and guest houses located in the area, which help support the local sportfishing economy. In 2010, there were seven registered sport fish guide businesses active, compared to seven in 2000. Twelve sport fish guide licenses were issued that year, compared to nine in 2000. In addition, there were a total of 18 licensed charter operators in Elfin Cove. The number of active sport fish guide business registered in Elfin Cove peaked in 2001 at 10. In 2010, charter vessels harvested 864 Chinook salmon, 3,739 coho salmon, 2,349 halibut, 182 lingcod, 5,961 rockfish, 5 sockeye salmon, and 971 "other" salmon.

In 2010, 25 sportfishing licenses were sold to residents, compared to 53 in 2000. In addition, 1,100 sportfishing licenses were sold in the community, compared to 899 in 2000. Local sales of sportfishing licenses peaked in 2008 at 1,433 (Table 11).

Elfin Cove is located in the Glacier Bay ADF&G Harvest Survey Area which includes all waters of Alaska, including drainages, south of Cape Fairweather to and including Chichagof drainages into Icy Strait and Cross Sound, west of Point Couverden and the Haines Borough boundary. In 2010, there were a total of 29,025 saltwater angler days fished and 2,990 freshwater angler days fished, compared to 38,126 and 3,249 in 2000, respectively. In that year, non-Alaska residents accounted for 80.4% of saltwater angler days fished, compared to 57.8% in 2000. In addition, non-Alaska residents accounted for 78.5% of freshwater angler days fished, compared to 37.9% in 2000. According to ADF&G Harvest Survey data,²⁵⁶ local private anglers target king, coho, pink, and chum salmon, Dolly Varden char, cutthroat trout, Pacific halibut, rockfish, lingcod, Dungeness crab, Tanner crab, and shrimp.

In a survey conducted by the AFSC in 2011, community leaders reported that recreational fishermen on private vessels target all five species of Pacific salmon, halibut, rockfish, crab, sablefish, shrimp, clams, salmon shark, lingcod, and Pacific cod. Sportfishing is typically done by charter boats, resident and non-resident owned private boat, and by shore. Information regarding sportfishing trends can be found in Table 11.

Subsistence Fishing

Subsistence resources are important to permanent residents of Elfin Cove although the community does have opportunities for wage employment and access to general provisions. While not as dependent as some rural subsistence-based communities, residents of Elfin Cove participate in subsistence activities to help supplement both diet and income. Subsistence is part of the local culture as year-round residents take pride in the fact that they remain in the community following the commercial fishing and tourism seasons.²⁵⁷ In a survey conducted by the AFSC in 2011, community leaders reported that the three most important subsistence resources harvested by residents include halibut, deer, and shrimp.

Data regarding subsistence participation is limited. No information is available regarding subsistence participation by household or per capita subsistence harvest. Historically, few salmon harvests are reported by residents according to ADF&G records (Table 13). Between 2000 and 2010, residents reported harvesting 137 sockeye salmon, 14 pink salmon, 44 chum salmon, and 4 Chinook salmon. In 2008, six residents, or 30.0% of the population, held subsistence salmon permits. In 2000, eight residents, or 25.0% of the population, reported harvesting 54 salmon. That was also the year that reported salmon harvests peaked.

On the other hand, a significant portion of the population (14 residents) held Subsistence Halibut Registration Certificates (SHARC) in 2010. In that year, 5 SHARC holders reported harvests of 680 lb of halibut, compared to 858 harvested with 6 SHARC in 2003. Subsistence halibut harvests peaked in 2004 at 2,308 lb. No information is available regarding marine invertebrates, other fish or marine mammal harvests. Information regarding subsistence trends can be found in Tables 12 through 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders expressed several concerns regarding their local fisheries-based economy. When questioned on challenges facing the portion of Elfin Cove's economy based on fishing, leaders stated that the current regulatory and economic environment is hostile to local businesses. In addition, a lack of key infrastructure including an ice machine, local fish buyer, and freight handler all increase local operating costs. There is also a lack of fisheries-related tax revenue coming into the community.

When questioned on the impacts that fisheries policies or management actions have had on Elfin Cove, leaders expressed that most actions have made it more difficult for businesses to be competitive. Specifically halibut restrictions, enforcement, and environmental regulations have created burdens which have not been offset by revenue increases.

When questioned on past or current fisheries policies or management actions that have affected Elfin Cove the most, leaders said that the implementation of quota systems resulted in increased competition for local resources from outside the community. In addition, limitations on charter halibut landings are putting strain on local charter businesses.

Overall, community leaders expressed that fisheries policy and management needs to take into account impacts on local economies, in addition to businesses. The community's economy is distressed and there is not enough support to meet management and policy requirements.

Excursion Inlet

People and Place

*Location*²⁵⁸

Excursion Inlet is located in the Haines Borough, on the west coast of Lynn Canal, 38 mi northwest of Juneau. The area encompasses 56.8 sq mi of land and 0.1 sq mi of water. Excursion Inlet is not incorporated, although it is under the jurisdiction of the Haines Borough.

*Demographic Profile*²⁵⁹

In 2010 there were 12 residents, ranking Excursion Inlet 341st of 352 Alaskan communities in terms of population size. Between 2000 and 2009 the population grew by 10.0% with an average annual growth rate of 4.57%, which was much greater than the statewide average of 0.75%. However, it should be noted that both overall population growth and average annual growth were significantly affected by the community's small population. Information regarding population trends can be found in Table 1.

Racial and ethnic composition in 2010 was predominately White. In that year, 75% of residents identified themselves as White, compared to 100% in 2000; and 25% identified themselves as two or more races, compared to 0% in 2000. In addition, 8.3% of residents identified themselves as Hispanic or Latino in 2010, compared to 0% in 2000. Information regarding racial and ethnic trends can be found in Figure 1.

In 2010, the average household size was 2.0, compared to 1.25 in 2000. In that year, there were a total of 71 housing units, compared to 85 in 2000. Of the households surveyed in 2010, 6% were owner-occupied, compared to 7% in 2000; 3% were renter-occupied, compared to 2% in 2000; 7% were vacant, compared to 1% in 2000; and 85% were occupied seasonally, compared to 89% in 2000. No residents were reported to be living in group quarters between 2000 and 2010.

Gender distribution in 2010 was even at 50.0% male and 50.0% female. This was more even than the statewide distribution (52.0% male, 48.0% female) and significantly more even than the distribution in 2000 (80.0% male, 20.0% female). The median age that year was 36.5 years, which was somewhat older than the statewide median of 33.8 years and significantly younger than the 2000 median of 60.0 years.

Figure 1. Racial and Ethnic Composition, Excursion Inlet: 2000-2010 (U.S. Census).

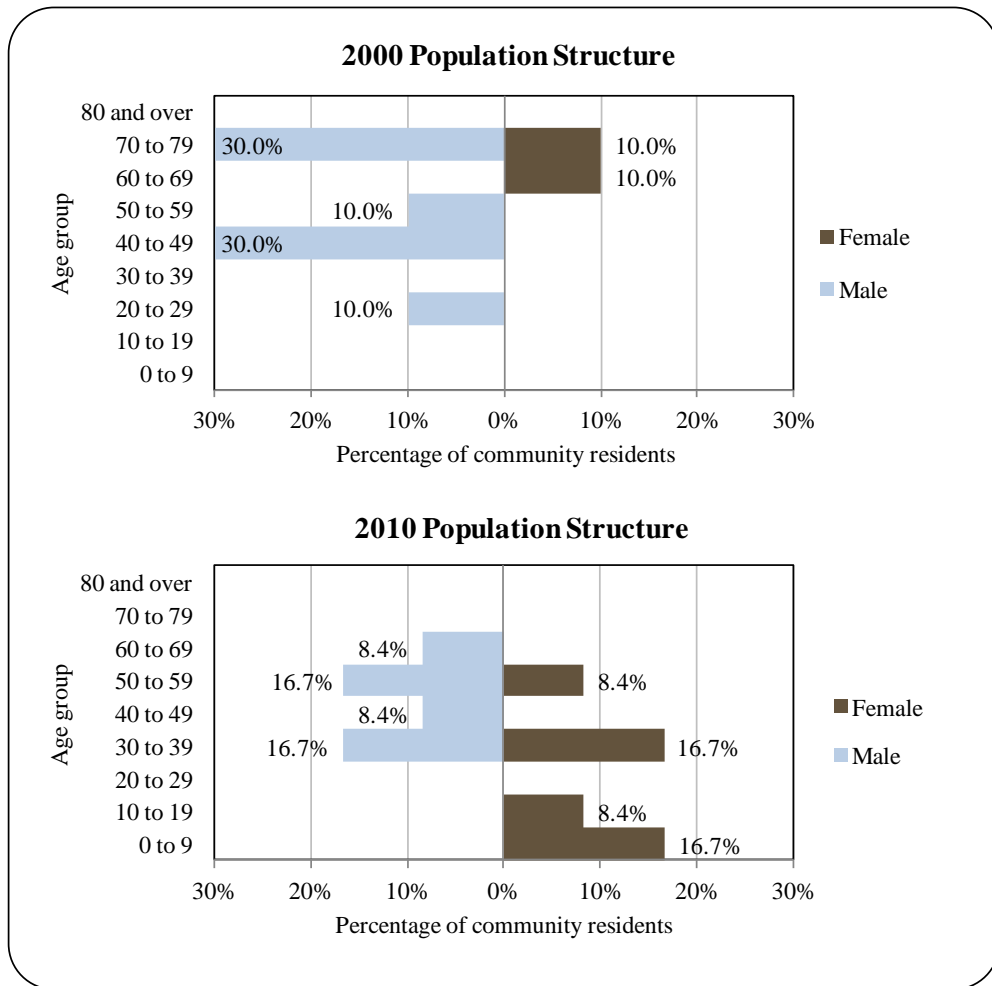

Gender distribution by age cohort was more even in 2010 than in 2000. In that year, female biases occurred in the 0 to 9 and 10 to 19 ranges, while male biases occurred in the 40 to 49, 50 to 59, and 60 to 69 ranges. Information regarding Excursion Inlet’s population structure can be found in Figure 2.

The population of Excursion Inlet is too small to discern a trend in its structure. In 2010, 25.1% of residents were under the age of 20, compared to 0.0% in 2000; 8.4% were over the age of 59, compared to 50.0% in 2000; and 66.9% were between the ages of 30 and 59, compared to 40.0% in 2000. No residents were between the ages of 20 and 29 in both 2000 and 2010.

In terms of educational attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS) did not report estimates for 2010.

Figure 2. Population Age Structure in Excursion Inlet Based on the 2000 and 2010 U.S. Decennial Census.

History, Traditional Knowledge, and Culture

According to oral history, the Woosh-Kee-Tawn Tlingits were the first occupants of Excursion Inlet. However, they were forced to abandon the area following a flood.²⁶⁰ This account is similar to other oral histories in the area describing a period of glacial recession and outburst flooding in the Glacier Bay region beginning around 5,800 years ago.²⁶¹

Two salmon canneries were originally built in Excursion Inlet in 1908. In 1935, Pacific American Fisheries (PAF) closed its plant. The other cannery facility burned in 1948. In 1941, the U.S. Army surveyed the area from a planned military facility. In 1942, construction of a trans-shipment point was started which would bring military supplies to Excursion Inlet. These supplies would then be transferred to military complexes in Kodiak and the Aleutians. The Army commandeered portions of the old cannery site without the permission of PAF. At peak construction, 2,760 civilians and 860 Army personnel were employed.²⁶² The military site was decommissioned in 1945 and offered land and remaining structures up for sale in 1946 and again in 1949. The Alaska Native Brotherhood and Sisterhood of Hoonah purchased one of the buildings, and repurposed it as a meeting hall. In 1948, PAFs Oregon and Puget Sound plants were destroyed in a fire. After losing those facilities, PAF converted a Landing Ship Tank vessel into a freezer and processing barge, which operated in Excursion Inlet for the 1949 and 1950 seasons. Land based seafood processing resumed in 1951.²⁶³ The site was later purchased in 1965 by Ward Cove Packing Co., a Ketchikan based company. However, Ward Cove was forced to cease Alaska salmon operations in 2002 due to market conditions. The site was then purchased by Ocean Beauty Seafoods in 2003.

Natural Resources and Environment

The area has a maritime climate characterized by cool summers and mild winters. Average summer temperatures range from 46 to 76 °F (8 to 24 °C); winter temperatures range from 13 to 36 °F (-11 to 2 °C).²⁶⁴

Excursion Inlet's topography was heavily shaped by glaciers. The Chilkat Peninsula is composed of Mesozoic greenstones, volcanic sandstones, mudstone, chert, and limestone. Soils are generally well drained, and include a thick organic layer over silts and gravels. The community itself is built on alluvial deposits. High relief topography surrounds the community. Densely forested areas comprise of a mix of Sitka Spruce and Western Hemlock. These stands dominate much of the environment, with limited concentrations of primarily birch hardwoods populating disturbed areas. Alpine tundra vegetation occurs above 3,000 ft. Understory

vegetation consist of berry bushes, devil’s club, alders, and willows.²⁶⁵

Terrestrial mammals and fur-bearers in the region include brown and black bear, mountain goat, wolf, lynx, mink, martin, muskrat, otter, weasel, and wolverine. Marine mammals include humpback and orca whales, dolphin, seals, and sea lions. Economically or culturally important fish species include all five species of Pacific salmon, halibut, Dolly Varden, cutthroat trout, rockfish, herring, cod, sablefish, shrimp, and crab.²⁶⁶

Minerals found in the greater Haines Borough include gold, zinc, lead, copper, silver, barite, iron ore, and titanium. Marble, clay, sand, and gravel are also present. Regional mineral projects include the Porcupine Mineral District, Glacier Creek, and Kensington Gold Mine. Six prospects of gold, copper, silver, zinc, barite, and cobalt are found on the Chilkat Peninsula.

Excursion Inlet is relatively protected from most environmental hazards. However, the community is susceptible to earthquakes, coastal flooding, tsunamis or seiche waves, and mass wasting (land slides).²⁶⁷

According to the Alaska Department of Environmental Conservation,²⁶⁸ there were no significant contaminated sites or environmental cleanup operations within Excursion Inlet as of 2010.

Current Economy²⁶⁹

Excursion Inlet’s economy is almost entirely focused on the Ocean Beauty Excursion Inlet Cannery, which began operations in 2003. The 2006-2010 ACS did not report employment or income estimates for 2010 nor did the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD).²⁷⁰ Because of this, trend data are unavailable. In 2000, 100% of employed residents worked in manufacturing sectors and 100% held management or professional positions. Information regarding local employment can be found in Figures 3 and 4.

Figure 4. Local Employment by Occupation in 2000-2010, Excursion Inlet (U.S. Census).

Governance

Excursion Inlet is unincorporated, which bars it from administering any taxes or fees. In addition, the community was not included in the Alaska Native Claims Settlement Act (ANCSA) nor is it a federally recognized Native village. However, the community is under the jurisdiction of the Haines Borough, which administered a 5.5% sales tax, 11.26 mills median property tax, and 4% accommodations tax in 2010. The closest National Marine Fisheries Service, Alaska Department of Fish and Game (ADF&G), and U.S. Bureau of Citizenship and Immigration Services offices are located in Juneau, 38 mi southeast.

Infrastructure

*Connectivity and Transportation*²⁷¹

The area is not accessible by road. A public seaplane base is available. Scheduled flights are available through Wings of Alaska. Roundtrip airfare between Juneau and Excursion Inlet in June 2012 was \$150.²⁷²

*Facilities*²⁷³

No public facilities or services exist in Excursion Inlet. Less than 10% of all homes in this area are used year-round. All lack complete plumbing.

*Medical Services*²⁷⁴

No medical services are available in Excursion Inlet. The closest hospital is located in Juneau.

*Educational Opportunities*²⁷⁵

No education services are available in Excursion Inlet.

Involvement in North Pacific Fisheries

*History and Evolution of Fisheries*²⁷⁶

Historically, commercial fishing in the area was tied to Icy Strait, Glacier Bay, and the outer coast (including Lituya Bay). The Barlett Cove cannery built in 1890, and Dundas Bay Cannery built in 1900 predated seafood processing in Excursion Inlet. In the 1940s, two fish traps were located in Icy Strait waters off Point Dundas and Point Gustavus. Crab and halibut fisheries were developed around the same time. The earliest report of shrimp fishing in Glacier Bay was in 1952. Salmon, halibut, crab, and shrimp fishing remained small-scale into the 1970s; however, by the 1980s fishing was intensified. In 1975, the International Pacific Halibut Commission (IPHC) reduced the halibut season from 128 days to 5 days. On opening day of halibut season in 1983, over 100 long liners were estimated to be fishing in Glacier Bay.

During this time, the U.S. National Park Service (NPS) was reassessing its management of commercial fishing in National Parks. Friction between fishermen and the NPS intensified over an opinion in 1982 by the Interior Department Solicitor contending that commercial fishing should not be allowed in Glacier Bay under the Alaska National Interest Lands Conservation Act (ANILCA). This was interpreted based on the prohibition of non-recreational commercial uses of wilderness areas contained under the Wilderness Act of 1964. This created contention between the NPS and Alaska Attorney General's Office over jurisdiction of submerged lands and authority to regulate commercial fishing in park waters. Alaska's Attorney General argued that submerged lands had been transferred to the state under the Alaska Statehood Act; a claim which was rejected by the Interior Department.

Proposed rules outlining the closure of Glacier Bay to commercial fishing was submitted to the Federal Register by the NPS in 1983. Commercial fishermen argued that the proposed rules were arbitrarily targeting commercial vessels, as sportfishing was not included. The regulations initially proposed by the NPS were ultimately abandoned under political pressure. Negotiations began between the NPS, commercial fishing industry, environmental interests, and other interested parties over new regulations. It was the goal of the NPS to come to an agreement with stakeholders over which areas to exclude from the proposed wilderness area. While consensus was never reached, the negotiations did produce a foundation for the NPS's wilderness recommendation. However, regulations established that same year by the Redwood National Park Act of 1978 prohibiting commercial fishing in National Parks went unnoticed and un-contested by most NPS and Alaska officials. Although then Interior Department Solicitor Roy Spadley Jr. claimed that regulations did not apply to Glacier Bay, NPS officials were skeptical.

By the late 1980s, the NPS was facing intense scrutiny by both Alaska's congressional delegation and the Reagan administration over ANILCA and humpback whale protection measures limiting vessel entrance into Glacier Bay. At that time, commercial fishing had grown

²⁷⁵ Alaska Department of Education and Early Development. (2012). *Statistics and Reports*. Retrieved April 24, 2012 from <http://eed.alaska.gov/stats/>.

²⁷⁶ Catton, T. (1993). *Glacier Bay Administrative History*. Retrieved May 25, 2012 from <http://www.gustavushistory.org/articles/booksnarticles.aspx>.

the point that the NPS felt conditions were threatening their mandate to preserve the park as an ecological reserve. In addition, defunding by a hostile congress made it difficult for the agency to fulfill its mandates while addressing the interests of stakeholders. In 1988, the NPS completed the wilderness recommendation Environmental Impact Statement and presented it for public comment. The chosen recommendation favored a phased termination of commercial fishing for NPS waters. This was influenced by the NPS's waning political capital and the endless political difficulties and litigation that would likely result from the complex management approach born from negotiations in 1983. By 1989, residents of Hoonah were pursuing subsistence fishing rights in Glacier Bay; a tactic which non-Native fishermen from Gustavus, Hoonah, Elfin Cove, and Pelican would attempt as well. In 1990, it was decided that commercial fishing would be phased out in Glacier Bay and ending on December 31, 1997. The phase-out was implemented to lessen the economic impact on communities dependent on fisheries within the park. However, traditional and accustomed subsistence practices were still allowed within the park under ANILCA, as on all federal lands and navigable waters.

The area around Excursion Inlet is located in Federal Reporting Area 659, International Pacific Halibut Commission Regulatory Area 2C, and the Eastern Gulf of Alaska (GOA) Sablefish Regulatory District.

Processing Plants

Ocean Beauty acquired the Excursion Inlet seafood processing facility in 2003. The plant itself was established in 1908 by another company. The Ocean Beauty plant generally operates from late June to mid-September and processes pink and chum salmon, as well as salmon roe, salmon caviar, halibut and black cod. The Excursion Inlet facility provides free room and board as well as free air transportation from and to Seattle to all seafood processing workers who fulfill their contractual obligations. Living accommodations include access to laundry facilities as well as free weekly linen laundry service, and shared bathroom facilities. Ocean Beauty also provides free protective work clothing to its workers.²⁷⁷

Fisheries-Related Revenue

No fisheries-related revenue was collected in Excursion Inlet between 2000 and 2010 (Table 3).

Commercial Fishing

In 2010, one resident, or 8.3% of the population, held one salmon permit issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, four residents held two salmon and two crab CFEC permits. No residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits between 2000 and 2010. In addition, no residents held halibut, sablefish, or crab quota share between 2010 and when the programs began.

No residents held commercial crew licenses in 2010, compared to one in 2000. In addition, no residents held primary ownership of any vessels that year, compared to three in 2000. Of the CFEC permits held in 2010, none were actively fished, compared to 25% in 2000.

²⁷⁷ Ocean Beauty. (n.d.). Retrieved May 2012 from <http://www.oceanbeauty.com/about/xip.htm>.

No permits were actively fished between 2004 and 2010.

In 2010, 7.73 million pounds of salmon were landed in Excursion Inlet valued at \$5.36 million, compared to 12.21 million pounds valued at \$3.71 million in 2005; an increase of \$0.35 per pound after adjusting for inflation²⁷⁸ and without considering the species composition of landings. All other years are considered confidential. Landings reported by residents of Excursion inlets are considered confidential for 2000 through 2005. No landings were reported by residents between 2006 and 2010. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Recreational fishing is not an important part of Excursion Inlet's economy. Between 2000 and 2003, there was one registered sport fish guide business. In addition, there were no registered charter operators in the community between 2000 and 2010. One resident held a sportfishing license in 2010, compared to four in 2000. No sportfishing licenses were sold in the community between 2000 and 2010 (Table 11).

Excursion Inlet is located in the Glacier Bay ADF&G Harvest Survey Area which includes all waters of Alaska, including drainages, south of Cape Fairweather to and including Chichagof drainages into Icy Strait and Cross Sound, west of Point Couverden and the Haines Borough boundary. In 2010, there were at total of 29,025 saltwater angler days fished and 2,990 freshwater angler days fished, compared to 38,126 and 3,249 in 2000, respectively (Table 11). In that year, non-Alaska residents accounted for 80.4% of saltwater angler days fished, compared to 57.8% in 2000. In addition, non-Alaska residents accounted for 78.5% of freshwater angler days fished, compared to 37.9% in 2000.

Table 11. Sport Fishing Trends, Excursion Inlet: 2000-2010.

Subsistence Fishing

Subsistence fishing was once an important way of life for the Tlingit people who originally lived in the area. However, Excursion Inlet is not considered a subsistence based community by more recent standards. Information regarding subsistence participation is extremely limited. No data are available for household participation in subsistence activities. The only recorded data for salmon harvests comes from 2000 when residents reported harvesting 20 sockeye salmon on two subsistence salmon permits. Between 2003 and 2007, two residents held Subsistence Halibut Registration Certificates (SHARC), although no halibut was harvested in those years. No data are available regarding marine mammal harvests. Information regarding subsistence trends can be found in Tables 12 through 15.

Table 12. Subsistence Participation by Household and Species, Excursion Inlet: 2000-2010.

Gustavus (*gus-TAY-vuhs*)

People and Place

*Location*²⁷⁹

Gustavus lies on the north shore of Icy Strait at the mouth of the Salmon River at the base of the St. Elias Mountains, 48 air miles northwest of Juneau. City lands are surrounded on three sides by Glacier Bay National Park and Preserve, and on one side by the waters of Icy Strait to the south. Gustavus is located in the Hoonah-Angoon Census Area and the Juneau Recording District. The area encompasses 29.2 square miles of land and 10.0 square miles of water.

*Demographic Profile*²⁸⁰

In 2010, there were 442 residents in Gustavus, ranking it the 128th of 352 communities in Alaska in terms of population size. Overall, between 1990 and 2000, the population increased by 5.8% and between 2000 and 2009 there was an average annual growth rate of 0.08%, reflecting slow growth over the decade with small declines in some years (Table 1). In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that 350 seasonal workers or transients are also present in Gustavus, primarily between the months of May and September. They also indicated that Gustavus experiences an annual population between June and August, which is somewhat driven by employment in fishing sectors.

Very few changes were seen in the racial and ethnic composition of the population between 2000 and 2010. The majority of the population in both years was White. In 2010, the majority of Gustavus residents identified themselves as White (91.4%), compared to 89.3% in 2000; 4.3% identified themselves as of two or more races in 2010, compared to 4.4% in 2000; 2.7% identified themselves as American Indian and Alaska Native, compared to 4.2% in 2000; 1.6% identified themselves as Hispanic or Latino in 2010, compared to 1.4% in 2000; 0.2% identified themselves as of some other race in 2010, compared to 1.6%; 1.1% identified themselves as Asian in 2010, compared to 0.2% in 2000; 0.2% identified themselves as Native Hawaiian and Other Pacific Islander in 2010, compared to 0.2% in 2000; and 0.0% identified themselves as Black or African American in 2010, compared to 0.0% in 2000 (Figure 1).

Figure 1. Racial and Ethnic Composition, Gustavus: 2000-2010 (U.S. Census).

The number of households in Gustavus increased steadily with the increase in population, from 101 occupied housing units in 1990 to 199 in 2000, and 212 in 2010. Between 1990 and 2000, the average number of persons per household increased from 2.5 to 2.89, and then declined to 2.08 by 2010. Of the 488 total housing units surveyed for the 2010 U.S. Census, 36.7% were owner-occupied, 6.8% were rented, and 56.6% were vacant. Of 276 vacant housing units, 194 were vacant due to seasonal use. Between 1990 and 2000, no Gustavus residents were reported to be living in group quarters.

Figure 2. Population Age Structure in Gustavus Based on the 2000 and 2010 U.S. Decennial Census.

In 2010, the gender makeup in Gustavus was 50.6% male and 49.3% female, similar to the balance of the state population as a whole (52% male, 48% female). That year, the median age was estimated to be 49.1 years, higher than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, a smaller percentage of Gustavus residents were under the age of 20 (19.7%) compared to 27.3% in 2000, and a higher percentage was age 60 or older (24.9%) compared to 8.2% in 2000. The overall population structure of Gustavus in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)²⁸¹ estimated that 94.4% of Gustavus residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, 2.6% had less than a 9th grade education, compared to an estimated 3.5% of

²⁸¹ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Alaskan residents overall; an estimated 3.1% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 14.1% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; 3.8% held an Associate's degree, compared to an estimated 8% of Alaskan residents overall; 28.2% held a Bachelor's degree, compared to an estimated 17.4% of Alaskan residents overall; and 17.9% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

According to local legend, the ancestral home of the Hoonah (Huna) people was in Glacier Bay, and was destroyed by advancing glaciers. Historical accounts suggest that Tlingit people of the Huna Kaawu^{282,283} occupied the northern portion of Chichigof Island and the mainland shore of Cross Sound and Icy Strait.²⁸⁴ Oral traditions tell of times when the glaciers extended out of Glacier Bay as far as Point Adolphus, and people traveled under the ice back and forth in Icy Strait.²⁸⁵ When Captain George Vancouver visited Icy Strait in 1794, the Grand Pacific Glacier completely covered the entrance to Glacier Bay. By 1916, the glacier had retreated 65 miles from the entrance to the Bay.²⁸⁶

Tlingit oral history also tells of a village, known as “Sand Mountain Town,” that was located in Bartlett Cove before the Little Ice Age, 4,500 years ago. Just west of the City of Gustavus, the Woosh-Keetan Tlingit inhabited a clan house at Point Gustavus (“Clay Point”) until 1922. Many fish camps and summer camps were also located in the Gustavus area, between Bartlett cove and Excursion Ridge. American homesteaders first arrived in 1913. Originally, three couples settled there, and the population fluctuated between 2 and 30 people over the following three decades. A timber mill was built by the Parker family, producing between 20 and 60 thousand board feet per year during the 1930s. The family also staked a gold claim in Glacier Bay at Ptarmigan Creek and began exploration there. Early homesteaders also lived from subsistence farming, cattle ranching, trapping, and hunting.²⁸⁷

Glacier Bay National Monument was established by President Calvin Coolidge in 1925. Homesteaders appealed to keep their land, and the Gustavus area was excluded from the Monument.²⁸⁸ However, in 1939, the area of the Monument was increased from 1,820 square

²⁸² ‘Kaawu’ is a locally distinct terminology equating to the term ‘Kwaan’ used throughout the Tlingit Nation. (Source: Langdon, Steve J (2006). *Traditional Knowledge and Harvesting of Salmon by Huna and Hinyaa Tlingit: Final Report*. U.S. Fish and Wildlife Service, Fisheries Information Service Project 02-104. Retrieved October 10, 2012 from <http://alaska.fws.gov/asm/pdf/fisheries/reports/02-104final.pdf>.)

²⁸³ ‘Kwaan’ is a Tlingit socio-geographical term meaning “inhabitants of,” literally a contraction of the Tlingit verb “to dwell.” It is most commonly used to refer to a geographic region consisting of those areas controlled by clans or house groups residing in a single winter village or several closely situated winter villages (Source: Thornton, T. 1997). *Know Your Place: The Organization of Tlingit Geographic Knowledge*. *Ethnology*, Vol. 36, No. 4.)

²⁸⁸ See footnote 284.

miles to 3,850, swallowing Gustavus, and many homesteaders moved away. New life was breathed into the community after the U.S. Army constructed a runway at Gustavus during World War II. Largely due to the presence of the Gustavus airfield, the National Park Service made nearby Bartlett Cove the headquarters of Glacier Bay National Monument in 1952. In 1955, President Eisenhower signed a proclamation that reopened 8,210 acres to homesteading. By 1958, the Gustavus School had reopened with 8 students.²⁸⁹ Glacier Bay National Monument became a National Park in 1980 with the passage of the Alaska National Interest Lands Conservation Act (ANILCA). The City of Gustavus was incorporated on April 1, 2004.²⁹⁰

In addition to its permanent residents, many Juneau residents have seasonal-use homes in Gustavus.²⁹¹ The community is known as the “Gateway to Glacier Bay National Park and Preserve,”²⁹² and offers many tourism amenities and recreation opportunities, such as sportfishing and hunting, kayak tour companies, whale watching, lodges, and a golf course. Many local residents choose to live in Gustavus because of the unique lifestyle it affords, including the natural beauty, and opportunity to live a subsistence lifestyle. As one report of the community indicates, many residents “choose Gustavus for its remoteness and simplicity while others would prefer to bring more of the modern world in.”²⁹³

Until 1998, Gustavus was located on federal land, within the boundaries of Glacier Bay National Park and Preserve. The Glacier Bay National Park Boundary Adjustment Act of 1998 provided for the exchange of federal and state lands, and allowed Gustavus to seek city status.²⁹⁴ Gustavus was incorporated as a 2nd Class City in 2004.²⁹⁵ Some National Park lands are still located within City Limits, and Gustavus receives “Payment In Lieu of Taxes” money from the federal government in exchange for its control of this land.²⁹⁶ Gustavus was named after Point Gustavus, located just west of the City.²⁹⁷

Natural Resources and Environment

Gustavus is located in a maritime climate zone characterized by cool summers and mild winters. Summer temperatures range from 52 to 63 °F and winter temperatures from 26 to 39 °F. Most of the City is located on the “Gustavus Flats,” a flat area formed by the outwash from the glacier.²⁹⁸ The Gustavus flats continue to grow due to isostatic rebound of the land after the retreat of the glaciers. The eastern portion of the City boundary climbs up Excursion Ridge, an area that was not carved by the glacier and as a result has thicker soil, old-growth hemlock-spruce forest, and muskeg ecosystems. To the west, the Bartlett Cove area was scraped clean by glaciers, and the land is in early stages of succession. Spruce forest, alder brush, and meadows

are characteristic of this area, and some hemlock has begun to fill breaks in the spruce forest.²⁹⁹ Inside Glacier Bay, the landscape is characterized by steep U-shaped, glacier-carved valleys. The Fairweather Mountain Range rises up steeply in the background.³⁰⁰

Gustavus is located at the southern entrance to Glacier Bay National Park and Preserve, which encompasses approximately 3,225,284 acres of mountains, ice fields, glaciers, and marine waters, including over 2.6 million acres of designated wilderness area. Glacier Bay shifted from National Monument status to a National Park and Preserve in 1980 with passage of ANILCA. The Park and Preserve begins at Gustavus and stretches north and west through the Fairweather and Saint Elias Mountain Ranges as far as Yakutat and Dry Bay. The glacier extended all the way to the mouth of Glacier Bay in 1794, when Captain George Vancouver explored the region. Today, the Bay provides a laboratory for scientists to study the way the landscape and animal and plant communities return to areas of the land and sea so recently covered by glaciers. A diversity of land and marine mammals, birds and fish are present in the Park and Preserve, including humpback, gray, and minke whales, orca whales, Dall's porpoise, harbor porpoise, Steller sea lions, harbor seals, sea otters, moose, bear, wolves, coyotes, mountain goats, smaller furbearers, 240 species of birds, and almost 200 species of fish.³⁰¹

Other protected areas near Gustavus include the West Chichigof-Yakobi Wilderness and the Pleasant/Lemesurier/Inian Islands Wilderness. In addition, a large portion the Chichigof Roadless Area, which runs north-south through the central portion of Chichigof Island, is managed under land-use designation II (LUD II), which would be “permanently managed in a roadless state to retain their wildland characteristics”.³⁰² The West Chichigof-Yakobi Wilderness Area was also designated in 1980 under the ANILCA. The Wilderness Area encompasses 265,286 acres of western Chichigof Island and Yakobi Island. The West Chichigof-Yakobi Wilderness is characterized by intricate bays, lagoons, estuaries, muskeg meadows, and natural hot springs.³⁰³ Southwest of Gustavus, a group of islands in Cross Sound make up the Pleasant/Lemesurier/Inian Islands Wilderness. This Wilderness Area, totaling 23,151 acres, was designated in 1990.³⁰⁴

Natural hazards in Gustavus include high risk of severe weather – including wind and heavy precipitation – flooding, erosion, landslides, avalanche, earthquake, and drought, as well as medium risk from wildfire and tsunami and seiche events, and low risk of impacts from volcanic activity.³⁰⁵ According to the Alaska Department of Environmental Conservation, there

are no notable active environmental cleanup sites located in Gustavus as of October 2012.³⁰⁶

Current Economy³⁰⁷

In the 2011 AFSC survey, community leaders reported that important economic drivers in Gustavus include fishing, ecotourism, sport hunting and fishing, and some logging and timber milling. The local economy is highly seasonal, and the population of the community almost doubles in summer months. Park headquarters and a Visitor Information Center for Glacier Bay National Park are located in Bartlett Cove, 10 miles northwest of Gustavus. The community of Gustavus is known as a “Gateway to Glacier Bay National Park.”³⁰⁸ In addition to companies offering Glacier Bay tours, a number of sport fish charter, moose hunting, whale watching and kayaking companies cater to summer tourists, along with several lodges and bed and breakfasts. The City also has a 9-hole golf course. Other employment opportunities are available from the National Park Service, school, airport, and several other small businesses. A number of Gustavus residents also participate in commercial fishing, and subsistence harvest is an important part of the local lifestyle.³⁰⁹

Based on household surveys conducted for the 2006-2010 ACS,³¹⁰ in 2010, the per capita income in Gustavus was estimated to be \$34,128 and the median household income was estimated to be \$50,750. These numbers represent increase from the per capita and median household incomes reported in the year 2000 (\$21,089 and \$34,766, respectively). The increase remains after inflation is taken into account by converting the 2000 values to 2010 dollars,³¹¹ revealing a real per capita income in 2000 of \$27,732 and a real median household income of \$45,717. In 2010, Gustavus ranked 37th of 305 Alaskan communities with per capita income data that year, and 127th in median household income, out of 299 Alaskan communities with household income data.

However, Gustavus’ small population size may have prevented the ACS from accurately portraying economic conditions.³¹² An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Decennial Census, the resulting per capita income estimate for Gustavus in 2010 is

³¹¹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

³¹² While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

\$6,463.^{313,314} This estimate is lower than the per capita income reported by the 2000 Decennial Census, suggesting that caution is warranted when citing an increase in per capita income between 2000 and 2010 based on 2006-2010 ACS estimates. This lower per capita income estimate derived from the ALARI database is reflected in the fact that the community was recognized as “distressed” by the Denali Commission in 2011,³¹⁵ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should also be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a similar percentage of Gustavus’ population (65.8%) was estimated to be in the civilian labor force compared to the civilian labor force statewide (68.8%). In the same year, 5.7% of Gustavus residents were estimated to be living below the poverty line, under the statewide rate of 9.5%, and the local unemployment rate was estimated to be 2%, under the statewide unemployment rate of 5.9%. An additional estimate of unemployment based on the ALARI database suggests a slightly higher unemployment rate of 14.5% in 2010, just over the ALARI statewide unemployment rate estimate of 11.5%.³¹⁶

Also based on the 2006-2010 ACS, just over half of Gustavus’ workforce was estimated to be employed in the private sector (53.2%), along with 29% in the public sector, 17.5% estimated to be self-employed, and 0.4% as unpaid family workers. Of the 252 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in arts, entertainment, recreation, accommodation, and food service industries (32.9%), along with 14.3% estimated to be employed in educational services, health care, and social assistance, 12.3% in retail trade, 11.9% in transportation, warehousing, and utilities, 8.7% in public administration, 8.3% in finance and insurance, real estate, rental, and leasing, and 7.1% in construction industries (Figure 3). The most notable shifts in employment by industry between 2000 and 2010 were a more than doubling of employment in retail trade and more than six times the employment in finance and insurance, real estate, rental, and leasing industries. Declines were observed in manufacturing, construction, and ‘other services’ (not including public administration). In 2010, 2.4% of the Gustavus workforce was also estimated to be employed in agriculture, forestry, fishing, hunting, and mining industries. It is also important to note that the number of individuals employed in the fishing industry is likely underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly.

When looking at employment from the perspective of occupation, there were shifts between 2000 and 2010 toward greater employment in management and professional occupations (36% increase) and natural resource, construction, and maintenance occupations (40.2% increase), as well as a 52.7% decrease in the percentage of the workforce employed in sales and office occupations (Figure 4).

Figure 3. Local Employment by Industry in 2000-2010, Gustavus (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Gustavus (U.S. Census).

ALARI employment data conflict somewhat with 2006-2010 ACS estimates, showing a greater percentage of the workforce employed in trade, transportation, and utilities and government service industries. According to the ALARI database, there were 136 employed residents in Gustavus in 2010, of which 29.4% were employed in trade, transportation industries, 23.5% in local government, 11.8% in leisure and hospitality, 10.3% in construction, 8.8% in state government, 4.4% in professional and business services, 3.7% in education and health services, 2.9% in natural resources and mining, 2.2% in information, 1.5% in financial activities,

and 1.5% in other industries.³¹⁷ It is not surprising that many local residents are employed in the tourism industry given that in recent years some 400,000 tourists visit Glacier Bay annually, the great majority on cruise ships that often accommodate more than 2,000 passengers.³¹⁸ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Gustavus was incorporated in 2004 as a 2nd Class City. It has a manager, or “Strong Mayor”, form of government, with a seven-person city council including the Mayor, a five-person school board, and several municipal employees. The City is not located in an organized borough. Gustavus was not included under the Alaska Native Claims Settlement Act (ANCSA), and is not federally recognized as a Native village. However, many Native residents of the area are shareholders in the regional Native corporation for Southeast Alaska, Sealaska Corporation.³¹⁹

Reporting of municipal revenue began in the last 3 months of the 2004 fiscal year, following the incorporation of the City of Gustavus. Beginning in 2005, total municipal revenues reported in Table 2 below reflect the full fiscal year. The City collects a 3% sales tax and a 4% bed tax, but no property tax is collected. The City also levies a \$10 Fishbox tax,³²⁰ which applies to “packaged fish and/or seafood caught or taken and retained by fish charter customers as part of the fish charter.”³²¹ Following incorporation of the City in 2004, annual municipal revenues followed an increasing trend through the end of the decade. In addition to local tax revenues, locally-generated revenue in Gustavus between 2004 and 2010 came from sources including building and land leases, library income, gaming income, fundraising, interest income, and from the Disposal and Recycling Center and Community Chest. The Disposal and Recycling Center accepts recyclables and also deposits items in a landfill for a fee. The Community Chest is a local second-hand store. Proceeds from the volunteer-staffed store benefit the Disposal and Recycling Center.³²²

Outside revenue sources during the 2005-2010 period included shared funds from state and federal sources, as well as grants. Federal shared funds came from the Payment in Lieu of Taxes program, and state funds came from the Community Revenue Sharing program in 2009 and 2010, as well as fish tax refunds (see the *Fisheries-Related Revenue* section for details). It is important to note that, before Gustavus was incorporated, the community received small State Revenue Sharing contributions, averaging approximately \$3,700 annually between 2000 and 2004. A number of fisheries-related grants were received by Gustavus in the second half of the

decade. These included \$220,000 in 2006 from the U.S. Economic Development Administration for a ramp at the barge landing site. Also that year, the Alaska Department of Commerce, Community and Economic Development (DCCED)'s Division of Community and Regional Affairs awarded \$150,000 for planning and design of a dock and boat launch. In 2008, the Denali Commission granted a total of \$95,200 and the Alaska Department of Transportation and Public Facilities (DOT&PF) provided \$4,800 for design of a small boat float. In 2009, Gustavus received \$812,500 from the Denali Commission for a transient vessel mooring facility, and in 2010, the DOT&PF provided an additional \$2 million toward public docks and floats.

The closest offices of the Alaska Department of Fish and Game (ADF&G), Alaska Department of Natural Resources (DNR), National Marine Fisheries Service (NMFS), Alaska Department of Commerce, Community, and Economic Development, and U.S. Bureau of Citizenship and Immigration Services are all located in Juneau. In addition, the National Park Service maintains Glacier Bay National Park headquarters and a Visitor Information Station for boaters and campers in Bartlett Cove, 10 miles northwest of Gustavus.³²³

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Gustavus from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	n/a	n/a	\$4,170	n/a
2001	n/a	n/a	\$3,707	n/a
2002	n/a	n/a	\$3,681	n/a
2003	n/a	n/a	\$3,631	n/a
2004	\$50,024*	n/a	n/a	n/a
2005	\$286,059	\$86,965	n/a	n/a
2006	\$688,077	\$241,402	n/a	\$370,000
2007	\$970,966	\$212,116	n/a	n/a
2008	\$1,211,784	\$251,591	n/a	\$100,000
2009	\$553,146	\$223,260	\$118,854	\$812,500
2010	\$885,211	\$198,286	\$118,618	\$2,000,000

Note: * In 2004, the reported revenue reflects the last three months of the fiscal year only.

Infrastructure

Connectivity and Transportation

Gustavus is accessible by air or water. The state-owned airport has two asphalt runways, one of which is 6,271 feet long and 150 feet wide, and the other which is 3,146 feet long and 60 feet wide.³²⁴ Between early June and late August, Alaska Airlines provides daily jet service to Gustavus,³²⁵ and smaller air taxis and charter flights are available year-round. In addition, float planes land at Bartlett Cove, 10 miles northwest of Gustavus by road.³²⁶ As of June 2012, roundtrip airfare on Alaska Airlines from Anchorage to Juneau was \$399.³²⁷ The lowest cost roundtrip ticket on Alaska Airlines in summer 2013 between Juneau and Gustavus was \$147,³²⁸ and as of November 2012, a roundtrip flight on a smaller air carrier between Juneau and Gustavus was \$178.³²⁹

In addition to air travel, Gustavus is accessible by private boat or ferry. As of November, 2010, the Alaska Marine Highway began providing bi-weekly summer service and weekly winter service to Gustavus.^{330,331,332} Small boats, including smaller cruise ships, often dock in Gustavus in the summer.³³³ Except for the largest cruise ships, a majority of tourists pass through the City of Gustavus on their way to tours of Glacier Bay Park and Preserve, giving Gustavus the title, “Gateway to Glacier Bay National Park.”³³⁴ Freight is primarily delivered by air or landing craft.³³⁵

Facilities

Half of the year-round homes in Gustavus are fully plumbed with individual water wells and private septic tanks. A community well source is available to provide water for remaining households. Outhouses are used by these remaining homes. Some concerns have been raised about water quality in Gustavus, given shallow wells and the presence of individual septic systems in the community. The school purchases water from the National Park Service. The City operates a landfill but does not provide refuse collection services; residents must haul their own garbage. Electricity in Gustavus is provided by a diesel powerhouse operated by the Gustavus

Electric Company.³³⁶ According to the 2011 AFSC survey, community leaders indicated that improvements to the diesel powerhouse have been completed in the last 10 years, as well as the addition of a hydroelectric energy source. Construction of the Falls Creek Hydroelectric facility at Falls Creek was completed in 2009. The facility generates 800 kW of electricity, and is connected via a 5-mi long buried transmission cable to the existing diesel powerhouse.³³⁷

Police services are provided by state troopers stationed in Juneau. Fire and rescue services are provided by Gustavus Emergency Response and the Glacier Bay National Park Volunteer Fire Department. Additional community infrastructure includes a Community Building and two libraries, one public and one located at the local school. Telephone and internet service are available in Gustavus, but no cable providers offers local service.³³⁸

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that about 300 feet of dock space is available for transient vessel moorage (150 feet on either side of the float). Larger vessels of up to 400 feet in length can also access moorage at the Alaska Ferry dock. Community leaders reported that Gustavus has capacity to handle rescue vessels (i.e. Coast Guard), ferries, and fuel barges. The broad mudflats of the Salmon River are also used as an unofficial ‘boat harbor’. Skiffs can enter the River at high tide on tides of at least +8 feet. Larger vessels can enter the River during high tide, but must anchor offshore or tie up at the Gustavus dock, the National Park Service dock in Bartlett Cove, or in Hoonah.³³⁹

In the 2005 Gustavus Strategic Plan, the Gustavus dock was identified as “the lifeline of the community.” The dock was originally constructed in 1962, and although various improvements and repairs have been carried out through the years, but by the mid-2000s the dock was in poor condition.³⁴⁰ A number of grants have been received from state and federal funding sources for upgrades to public docks, floats, and barge landing areas in the last 5 years,³⁴¹ and in the 2011 AFSC survey, community leaders reported that construction of a breakwater, new dock space, and a barge landing area was expected to be completed later that year.

Community leaders also reported in the 2011 AFSC survey that a number of fisheries-related businesses and services are present in Gustavus. These include boat repair services (electrical, welding, and mechanical services), sale of bait and tackle for sportfishing and sale of boat fuel, a small cold storage facility, and a processing facility geared toward sport catch, as well as a number of fishing lodges. For fisheries-related businesses and services not available in Gustavus, community leaders indicated that residents travel to Juneau, Hoonah, or Excursion Inlet.

Medical Services

Local residents access medical services at the Gustavus Community Clinic, a qualified Emergency Care Center. The Clinic is owned and operated by the Gustavus Community Association. Emergency services have coastal, air, and floatplane access, as well as limited highway access. Emergency service is provided by volunteers, and alternative health care is provided by Gustavus Emergency Response.³⁴² The nearest hospital is located in Juneau.

Educational Opportunities

There is one school in Gustavus, which offers Kindergarten through 12th grade. As of 2011, the Gustavus School had 57 students and 5 teachers. Gustavus is located in the Chatham School District.³⁴³

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The Hoonah Tlingit historically used Glacier Bay and the Gustavus area for fish camps, and subsistence harvest of fisheries resources was a foundation of life in the region.^{344,345} Salmon were perhaps the most important resource for the Tlingit. Traditionally, fish trap, gaffs, and spears were used to catch salmon. Steelhead, herring, herring eggs, ooligans (eulachon), and Dolly Varden were also caught and eaten. The Tlingit also utilized marine mammals (e.g., seal), deepwater fish (e.g., halibut), marine invertebrates (e.g., ‘gumboot’ chitons), and sea plants (e.g., seaweed, beach asparagus and goose tongue). A system of property ownership was in place over harvesting places, including streams, halibut banks, berry patches, hunting areas, intertidal areas, and egg harvesting sites.^{346,347}

Commercial harvest of salmon began in Southeast Alaska in the late 1870s.³⁴⁸ Bartlett Cove was the site of a salmon saltery in the early 1880s, and by 1889 a salmon cannery began operations at the site, owned by Bartlett Bay Packing Company. The cannery was purchased in 1897 by Icy Strait Packing Company, owned by a pioneering canneryman named Peter Buschmann. However, planned improvements to the cannery facility were abandoned in 1901, in part because of the remoteness of the location and difficulties with ice, and also because Buschmann was nearly bankrupt. Icy Strait Packing Company was sold to Pacific Packing and

Navigation Company, which in turn went bankrupt in 1903.³⁴⁹ No large-scale processors have operated at Bartlett Cove or at Gustavus since that time; although smaller businesses offer processing services (see the *Processing Plants* section for details).

Today, Southeast Alaska salmon fisheries utilize purse seines, drift gillnets, trolls, and set gillnet gear. The highest volume of salmon landings in the region are harvested by purse seines, although the species harvested are typically pink and chum, the salmon species with lowest ex-vessel value. Other salmon fisheries target the higher value species (i.e., sockeye, coho, and Chinook). Because of Southeast Alaska's proximity to British Columbia, as well as many trans-boundary rivers that cross from Canada into Alaskan waters, salmon management in the region is governed to a large degree by the Pacific Salmon Treaty. The Treaty was originally negotiated in 1985, and renegotiated in 1999 with increased emphasis on implementation of abundance-based management strategies.³⁵⁰

In the 1880s, a commercial fishery began for halibut in the inside waters of Southeast Alaska. The U.S. and Canada signed the Convention for the Preservation of the Halibut Fishery of the North Pacific Ocean in 1923, and since the Convention took effect in 1924, Pacific halibut fisheries have been managed by the International Pacific Halibut Commission.³⁵¹ Halibut fisheries are restricted to use of hook and line gear, although a limited number of halibut can be caught and retained as incidental catch in salmon troll fisheries and sablefish trap fisheries, as well as bycatch in a variety of fisheries using diverse gear types.^{352,353} Sablefish were first harvested in Southeast Alaska as bycatch in the halibut fishery.³⁵⁴ By the 1930s, several state-managed sablefish fisheries began in Southeast inside waters, including a fishery in Chatham Strait. Sablefish are harvested using longline or pot gear, and the state fisheries that take place in inside waters are managed independently of the federal fishery.³⁵⁵

In 1995, management of Alaskan halibut and sablefish fisheries shifted from limited entry to a system of Individual Fishing Quotas (IFQ). Motivations for the shift included overcapitalization, short seasons, and the derby-style fishery that led to loss of product quality and safety concerns. As a result of program implementation, the number of shareholders and total vessels participating in the halibut and sablefish fisheries declined substantially, and product quality has improved. This shift to catch shares has been controversial, raising concerns about equity of catch share allocation, reduced crew employment needs, and loss of quota from

coastal communities to outside investors.³⁵⁶

Pacific cod and lingcod are also harvested in Southeast Alaska under state regulations, independent of federal fisheries for these species. Pacific cod fisheries utilize longline gear, while the Southeast Alaska lingcod fishery uses dinglebar troll gear, a salmon power troll gear modified with a heavy metal bar to fish for groundfish. Management of the Southeast Alaska lingcod fishery includes a winter closure for all users (except longliners) to protect nest-guarding males. Demersal rockfish are caught as bycatch in the halibut longline and trawl fisheries. A small directed fishery for flatfish (other than halibut) has also taken place in Southeast inside waters in recent decades, but effort has declined since 1999.³⁵⁷

Crab fisheries in Southeast Alaska target red, golden and blue king crab, Tanner crab, and Dungeness crab.³⁵⁸ Glacier Bay was an important center of early Dungeness crab harvests in Southeast Alaska. Commercial harvest of Dungeness crab began in Southeast Alaska in 1909, and the first processing facility was built in Petersburg in 1921. In 1924, a Dungeness crab cannery began operating in Hoonah, and a large portion of the crab harvested came from Glacier Bay.³⁵⁹ Larger-scale commercial crab fisheries did not begin in Southeast Alaska until the 1950s.³⁶⁰

A pot-gear fishery for spot shrimp (*Pandalus platyceros*) has grown in Southeast Alaska since the 1990s, and dive fisheries for sea cucumber and sea urchin also developed in recent decades.³⁶¹ The impact of an increasing sea otter population in Southeast Alaska on stocks of Dungeness crab, sea cucumber, and sea urchin has led to significant economic losses in these fisheries in recent years.³⁶²

When President Calvin Coolidge proclaimed Glacier Bay a National Monument in February, 1925, fisheries were of little interest to the ecologists and other scientists who hoped to see the glaciers and fjords protected.³⁶³ However, concern grew about the impact of commercial fisheries on the ability of the Park Service to preserve the Park as an ecological reserve. With the passage of the Wilderness Act of 1964 and ANILCA in 1980, the National Monument became a National Park and Preserve, including In 1983, the National Park Service (NPS) proposed a rule that would close waters in the wilderness designated areas (referred to here as ‘wilderness waters’) to all forms of commercial fishing, and prohibit trawling in all areas of the Glacier Bay National Park. Local fishermen were angered and dismayed by this proposal, and NPS officials eventually discarded this original proposal. In 1983-1984, NPS officials negotiated with representatives of the State of Alaska, as well as Park employees, commercial fishermen, and environmentalists, but no agreement was reached. In 1990, a regulation was proposed to prohibit commercial fishing in wilderness waters, and to allow commercial fishing in non-wilderness

waters of the Park until December 31, 1997. This regulation was intended to provide enough time for fishermen to plan ahead for the change.³⁶⁴ The number of Dungeness crab permits held by Gustavus residents declined significantly after fishing ceased in Glacier Bay in 1997.³⁶⁵ In addition to closure of commercial fisheries, subsistence harvest of fish and wildlife is prohibited within the boundaries of Glacier Bay National Park and Preserve.^{366,367}

Gustavus is located in Pacific Halibut Fishery Regulatory Area 2C and Federal Statistical and Reporting Area 659. The closest federal Sablefish Regulatory Area is “Southeast Outside.” Gustavus is eligible to participate in the Community Quota Entity (CQE) program, but as of October 2012, no CQE non-profit had been established for Gustavus.³⁶⁸ Gustavus is not eligible to participate in the Community Development Quota program.

In a survey conducted by the AFSC in 2011, community leaders reported that Gustavus community members are actively engaged in fisheries management processes in Alaska through providing comments on management practices. When asked to describe challenges facing Gustavus’ fishing economy, community leaders noted limited moorage for larger vessels, lack of a fish processor or ice availability, and the challenge of establishing sustainable harvest levels for all species. When asked about past fisheries management decisions that have had the greatest impact on the community, community leaders pointed to the closure/restrictions of fishing in Glacier Bay. Community leaders also indicated that future decisions with the potential to impact Gustavus include management of commercial charter and sportfishing activity, and also emphasized the critical importance of maintaining access to subsistence, or ‘personal use’, fishing opportunities for Gustavus residents.

Processing Plants

Based on ADF&G’s 2010 Intent to Operate List, there was one shore-side processing plant operating in Gustavus. According to a survey of plant managers conducted by the AFSC in 2011, Pep’s Packing is a family-run fish processing and smoking facility in Gustavus that began operations in 1992. Pep’s is centrally located in the community and specializes in custom processing (mostly smoking) of halibut and Chinook salmon caught during fishing charter. Pep, the owner, prides herself in being a native Gustavite who provides employment to her townspeople.³⁶⁹

Fisheries-Related Revenue

Following its incorporation in 2004, the City began receiving fisheries-related revenue in 2006. Sources of fisheries-related revenues received between 2006 and 2010 included the Shared Fisheries Business Tax, harbor usage fees, the City Fishbox tax, and launch ramp fees. In 2010, known fisheries-related revenue totaled \$1,207,546. Information about selected fisheries-related revenue sources in Gustavus between 2000 and 2010 is presented in Table 3.³⁷⁰

Commercial Fishing

Between 2000 and 2010, Gustavus residents were engaged in commercial fishing as state and federal permit holders, quota share account holders, vessel owners, and crew license holders. According to the 2011 AFSC survey, community leaders indicated that salmon and halibut are two of the most important commercial fisheries for local fishermen, with emphasis on salmon troll and halibut longline fisheries. They reported that salmon trolling takes place almost all year, and the halibut season is generally March through November. In addition to these important fisheries, Gustavus residents also held permits in crab, groundfish fisheries (lingcod, sablefish, demersal shelf rockfish, and miscellaneous saltwater finfish), and ‘other shellfish’ fisheries (shrimp, sea cucumber, sea urchin, and geoduck) between 2000 and 2010 (Table 4).

The total number of state and federal permits held by Gustavus residents remained relatively stable between 2000 and 2010 (Table 4), as did the number of crew license holders. In contrast, the number of vessels that were primarily owned by Gustavus residents showed a decreasing trend over the period, from 50 in 2000 to 26 in 2010. The number of vessels homeported in Gustavus also decreased, from 43 in 2000 to 25 in 2010. In the 2011 AFSC survey, community leaders echoed this decrease, indicating there were fewer commercial fishing boats in Gustavus compared to five years earlier. The number of commercial vessels delivering landings in Gustavus varied widely, ranging from a high of 18 in 2000 to a low of 3 in 2003. While the number of shore-side processors operating in the community between 2000 and 2010 remained relatively stable (1 in all years except 2002, when 2 processors were present) (Table 5).

Of 65 Commercial Fisheries Entry Commission (CFEC) permits held by Gustavus permit holders in 2010, 34 (52.3%) were held in salmon fisheries, 11 (16.9%) in halibut fisheries, 11 (16.9%) in crab fisheries, 6 (9.2%) in shellfish fisheries, 2 (3.1%) in sablefish fisheries, and 1 (1.5%) in other groundfish fisheries. Permit numbers are presented in Table 4, and more details regarding permit types and trends are provided below.

Of 34 salmon CFEC permits held in 2010, a majority (21) were statewide troll permits, 11 were statewide power gurdy troll permits, 1 was for the Southeast drift gillnet, and 1 was held in the Yakutat set gillnet fishery. That year, 47 (50%) of these salmon permits were actively fished. The number of salmon permit holders and the total number of permits held increased slightly between 2000 and 2010, and the percentage of permits actively fished also stayed stable or increased slightly. Troll permits were held in all years during the period, while the Yakutat set gillnet permit was held from 2002 to 2010, and the Southeast drift gillnet permit was held from 2007 to 2010.

In 2010, all of the 11 halibut CFEC permits held by Gustavus residents were for the statewide longline fishery, using vessels under 60 feet in length. In 2000 and 2001, several

³⁷⁰ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

halibut permits were also held in the statewide longline fishery using vessels greater than 60 feet in length. Both the number of permit holders and the total number of permits held increased in the first half of the 2000-2010 period, and then declined to close to 2000 levels by 2010. The percentage of halibut permits actively fished varied between 77% and 100%, with a slightly increasing trend over time.

Of the 11 crab CFEC permits held in 2010, 6 were held for Southeast Dungeness crab, 4 for Southeast Tanner crab, and 1 for Southeast brown king/Tanner crab. The Dungeness and king/Tanner permits were associated with pot gear, while the strictly Tanner crab permits were for ring net gear. The number of Dungeness crab permits decreased slightly, from eight in 2000 to six in 2010, while the number of Tanner crab permits decreased from seven to four. Other than 2010, the only years in which combined king/Tanner crab permits were held were 2000, 2008, and 2009. The number of permit holders and total crab permits held declined slightly over the period, and the percentage of crab permits that were actively fished was variable, with a low of 11% in 2007 and a high of 44% in 2008.

In 2000, five sablefish CFEC permits were held in Gustavus, including three in the statewide longline fishery using vessels over 60 feet in length, one in the statewide fishery (not including Southeast or Prince William Sound) using vessels under 60 feet in length, and one in the Northern Southeast longline fishery. The number of sablefish permits declined steadily to one by 2010, which was held in the statewide longline fishery (not including Southeast or Prince William Sound). The percentage of sablefish permits that were actively fished was high in all years, varying from 75% to 100%.

Like sablefish, the number of other groundfish permits decreased between 2000 and 2010, 11 in 2000 to 1 in 2010, and the number of groundfish permit holders decreased from five to one over this period. Groundfish permits held in 2000 included three demersal rockfish permits (one Southeast permit associated with longline gear for use on vessels under 60 feet in length, one Southeast permit for longline on vessels over 60 feet, and one statewide mechanical jig permit), two lingcod permits (one statewide longline and one statewide mechanical jig), and six ‘miscellaneous saltwater finfish’ permits (three statewide longline permits for use on vessels under 60 feet in length, two statewide longline for use on vessels over 60 feet, and one statewide mechanical jig). In 2010, the only groundfish permit was held in the statewide lingcod fishery, and was associated with dinglebar troll gear.

In 2010, Gustavus residents also held ‘other shellfish’ permits in the Southeast sea cucumber and geoduck dive fisheries and the Southeast pot gear shrimp fishery. The number of shrimp permits held increased from one between 2000 and 2007 to two from 2008-2010. One shrimp permit was actively fished from 2008 to 2010. The number of sea cucumber permits increased from two in 2000 to three between 2001 and 2010, and two of these permits were actively fished in each year during the period. One geoduck permit was held in 2000 and 2001 and from 2006 to 2010, but was not actively fished in any of these years. In addition to these fisheries, two permits were held in 2000 in the Southeast dive fishery for sea urchin, but were not actively fished that year. Overall, there was a slight increasing trend in shellfish permit holders, while the total number of shellfish permits remained even at six, after a slight decrease in the middle of the decade. CFEC permit numbers are presented in Table 4.

In addition to CFEC permit, Gustavus residents also held federal License Limitation Program (LLP) permits and Federal Fisheries Permits (FFP) between 2000 and 2010. In 2010, seven Gustavus residents held a total of 7 LLP permits in federal groundfish fisheries. Of these, two were actively fished that year (28%). The number of groundfish LLPs held remained very

stable over the decade. No crab LLPs were held in Gustavus between 2000 and 2010. Also in 2010, four Gustavus residents held a total of four FFPs, of which one was actively fished (25%). Information about federal fisheries permits is also presented in Table 4.

In the year 2000, 15 Gustavus residents held quota share accounts in the federal halibut catch share fishery. This number increased to a high of 20 in 2007, and then declined to 13 by 2010. Total quota shares rose from 519,800 in 2000 to a peak of 713,421 in 2004, and then declined to a low of 475,093 in 2009. The annual halibut individual fishing quota (IFQ) allotment increased by approximately 8% higher than 2000 levels by 2004, and then decreased to approximately 36% below 2000 levels in 2010. Sablefish catch share participation was more stable, with three quota share account holders in all years except 2005 and 2009, when two Gustavus residents held accounts. Total sablefish quota shares also remained stable, increasing slightly from 478,951 in 2000 to 499,356 in 2010. Sablefish IFQ allotment increased to 20% above 2000 levels in 2004 before decreasing to 16% below 2000 levels by 2010. No quota share accounts or quota shares were held by Gustavus residents in federal crab catch share fisheries between 2005 and 2010. Further information about federal catch share participation is presented in Tables 6 through 8.

Gustavus also had one shore-side processor throughout the decade and a second processor in 2002. The number of fish buyers present each year in Gustavus fluctuated between a high of five and low of one. The greatest volume of landings, for those years in which data can be reported, was delivered in 2006. That year, 95,918 net pounds were delivered for a total ex-vessel revenue of \$71,304. Information about local landings and revenue is considered confidential in six years during the period due to the small number of fish buyers present in Gustavus in those years. In 2010, when four fish buyers were present, 3,257 net pounds were delivered in Gustavus, for a total ex-vessel revenue of \$13,187. That year, Gustavus ranked 64th in landings and 62nd in ex-vessel revenue out of 67 Alaskan communities that received commercial fisheries landings that year. Further information about the commercial fishing sector in Gustavus is presented in Table 5.

At the species level, a majority of landings and ex-vessel revenue information in Gustavus is considered confidential due to the small number of participants in these fisheries. Salmon landings can be reported in 2006, 2007, and 2010, with the greatest landings volume reported in 2006 with 89,142 net pounds of salmon valued at \$46,651 in ex-vessel revenue (Table 9).

More information can be reported regarding landings delivered by Gustavus vessel owners, including all delivery locations. Landings of salmon and halibut can be reported for all years, while ‘other groundfish’ landings can be reported in eight years, and crab landings can be reported in 2000 only. On average between 2000 and 2010, Gustavus vessel owners landed 181,223 net pounds of salmon and 79,411 net pounds of halibut. These landings were valued, respectively, at \$273,576 and \$250,112 in ex-vessel revenue, on average. For those years in which information can be reported for ‘other groundfish’, an average of 4,756 net pounds was landed, with an average ex-vessel revenue of \$2,990. In 2000, 16,505 net pounds of crab were landed, with total ex-vessel revenue of \$39,124. Further information about landings and ex-vessel revenue generated by Gustavus vessel owners is presented in Table 10.

Recreational Fishing

According to the 2011 AFSC community survey, Gustavus community leaders reported that a majority of sportfishing activity takes place on charter boats and using private boats owned by both local residents and non-residents. They indicated that some of the most important species targeted by sport fishermen include Chinook and coho salmon, halibut, and crab. In addition, community leaders emphasized the importance of charter halibut and charter salmon fisheries, noting them as two of the most important local fisheries, along with commercial halibut and salmon fisheries. Community leaders also indicated that sport hunting and fishing is one of the most important local industries in Gustavus.

Between 2000 and 2010, the number of active sport fish guide businesses located in Gustavus remained relatively stable, varying between 10 and 14 operating per year. The number of licensed sport fish guides registered in the community appears to have declined slightly, from 27 in 2000 to 17 in 2010. The total number of sportfishing licenses sold in the community increased dramatically over the period, from 610 sold in 2000 to between 1,000 and 2,000 sold each year in the last 5 years of the decade. The number of sportfishing licenses sold to Gustavus residents was much lower than total local sales, averaging 224 per year, reflecting the large number of tourists that come to Gustavus each year and participate in sportfishing activities.

The Alaska Statewide Harvest Survey,³⁷¹ conducted by ADF&G between 2000 and 2010, noted the following species targeted by private anglers in Gustavus: in freshwater, coho, chum, pink, and sockeye salmon, Dolly Varden, and cutthroat trout; in saltwater, Chinook, chum, coho, sockeye, pink, and chum salmon, Dolly Varden, cutthroat trout, Pacific halibut, rockfish, lingcod, Pacific cod, and smelt. The survey also noted sport harvest of Dungeness and Tanner crab, hardshell clams, and shrimp by Gustavus residents. Kept/released statistics from charter logbook data reported by ADF&G³⁷² show that salmon and halibut were the most important charter targets out of Gustavus, and that coho and pink salmon made up the greatest portion of charter salmon catch. On average between 2000 and 2010, 6,074 halibut, 3,472 coho salmon, and 2,210 pink salmon were kept per year. Other species that were also caught during charters out of Gustavus between 2000 and 2010 included Chinook, chum, and sockeye salmon, yelloweye, pelagic, and other rockfish, lingcod, sablefish, and several sharks. It is also important to note that halibut was by far the most often released species during charters, with an average of 6,732 halibut released per year between 2000 and 2010 during Gustavus charter trips.

Gustavus is located within Alaska Sport Fishing Survey Area G – Glacier Bay. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. In saltwater, non-Alaska resident anglers fished consistently more days than Alaska resident anglers, while in freshwater the two groups fished about the same number of angler days on average. Saltwater sportfishing was much more important in this region than freshwater between 2000 and 2010. Information about the sportfishing sector in and near Gustavus is displayed in Table 11.

Subsistence Fishing

During a public meeting in Gustavus in preparation for the community's 2005 Strategic Plan, the freedom and opportunity to live a subsistence lifestyle was identified as one of the primary positive values of the Gustavus way of life.³⁷³ According to the 2011 AFSC survey, community leaders indicated that halibut, salmon, and shellfish are three of the most important aquatic resources utilized by Gustavus residents for subsistence. Community leaders also emphasized the importance of subsistence harvest opportunities to the way of life in Gustavus, and indicated that maintaining subsistence opportunities is one of the community's most important policy concerns related to future fisheries management.

Between 2000 and 2010, no information was reported by ADF&G regarding the percentage of Gustavus households utilizing various marine resources for subsistence purposes or per capita subsistence harvest (Table 12). However, information is available from an earlier ADF&G subsistence survey regarding the percentage of Gustavus households involved in the harvest of non-salmon fish, marine invertebrates, and marine mammals in 1987. That year, the species of marine invertebrates harvested by the greatest percentage of Gustavus households included Dungeness crab (64% of households reported harvesting), clams (31%), Tanner crab (16%), king crab (13%), octopus (10%), shrimp (6%), and sea urchin (4%). Species of non-salmon fish harvested by the greatest percentage of Gustavus households in 1987 included Dolly Varden (45% of households harvested), Pacific cod (29%), flounder (16%), rockfish (15%), and herring (4%). In addition, 4% of Gustavus households participated in harvest of herring roe in spawn on kelp fisheries in 1987.³⁷⁴ It is important to note that in many cases, the number of households reporting use of these subsistence resources was greater than the number involved in harvest, indicating the presence of sharing networks in Gustavus.

Information was reported by ADF&G regarding subsistence harvest of salmon in Gustavus during the 2000-2010 period. In 2008, the most recent year for which salmon subsistence data are available, 22 subsistence salmon permits were issued to Gustavus households, of which 20 were returned. The highest number of subsistence salmon permits was issued in 2001 and 2002 (26 permits), and the lowest number was issued in 2007 (11 permits). Sockeye salmon were the most heavily harvested species, with an average of 233 sockeye taken per year. Smaller numbers of chum and pink salmon were harvested in most years, and subsistence harvest of Chinook and coho was reported in 2008 only.³⁷⁵ Information about subsistence salmon harvest is presented in Table 13, while no information was available regarding marine invertebrate or non-salmon fish (other than halibut) harvest during the 2000-2010 period.

Information was also available from ADF&G between 2003 and 2010 about subsistence halibut harvest in Gustavus. In 2003, 52 Subsistence Halibut Fishing Certificates (SHARC) were issued to residents of Gustavus. This number increased to a high of 81 SHARC cards issued to residents in 2009, but declined again to 58 in 2010. The number of SHARC cards that were actively fished varied between 20 and 46 per year. Maximum halibut harvest during the 2003-

³⁷⁵ *Ibid.*

2010 period took place in 2005, when 8,357 pounds were reported harvested on 37 active SHARC cards. Total halibut harvests appear to have declined through the second half of the decade. This information about subsistence halibut harvest is presented in Table 14.

No information was available from management agencies regarding subsistence harvest of marine mammals by Gustavus residents between 2000 and 2010 (Table 15).

Haines (haynz)

People and Place

*Location*³⁷⁶

Haines lies on the shores of the Lynn Canal, on the Chilkat Peninsula between the Chilkoot and Chilkat Inlets. The town is bordered by the spectacular Chilkat Mountain Range on the west and the Coast Range on the east. The historic routes to the Klondike gold fields – the Chilkat, Chilkoot, and White Pass trails – are located north of the community. Haines Census Designated Place (CDP) encompasses 13.2 square miles of land and 7.4 square miles of water. Haines CDP is located within the Borough of Haines and Haines Recording District.

*Demographic Profile*³⁷⁷

In 2010, there were 1,713 residents in Haines CDP, ranking it the 51st largest community in terms of population size. Overall, between 1990 and 2010, the population has increased by 38.3%. Between 2000 and 2009, the population decreased by 10.5% with an average annual growth rate of -0.85%, which was under the statewide average of 0.75% and indicative of steady decline (Table 1). It is important to note that, until 2002, the populations reported in this profile reflect the previous City of Haines. Following formation of the Borough of Haines, the City was dissolved, and the population numbers reported reflect Haines CDP.

In 2010, the majority of residents of Haines CDP identified themselves as White (81.1%), compared to 79.6% of residents in the City of Haines in 2000; 11.2% identified themselves as American Indian and Alaska Native in 2010, compared to 13.9% in 2000.; 6.0% identified themselves as of two or more races, compared to 5.1% in 2000; 0.6% identified themselves as Black or African American, compared to 0.2% in 2000; 0.5% identified themselves as Asian, compared to 0.7% in 2010; 0.6% identified themselves as of some other race, compared to 0.4% in 2000; and 0.0% identified themselves as Native Hawaiian and Other Pacific Islander, compared to 0.1% in 2000. In addition, 1.7% of residents in Haines CDP identified themselves as Hispanic or Latino in 2010, compared to 1.5% of residents of the City of Haines in 2000 (Figure 1).

In 2010, the average household size in Haines CDP was 2.19, compared to 2.50 in 1990 and 2.40 in 2000 in the City of Haines. In that year, there were a total of 902 housing units, compared to 527 in 1990 and 895 in 2000. Of the households surveyed in 2010, 59% were owner-occupied, compared to 57% in 2000; 28% were renter-occupied, compared to 25% in 2000; 7% were vacant, compared to 11% in 2000; and 6% were occupied seasonally, compared to 5% in 2000. No residents lived in group quarters in 2010, compared to three in 2000.

Figure 1. Racial and Ethnic Composition, Haines: 2000-2010 (U.S. Census).

The gender distribution was virtually even in both 2000 and 2010, at 50.0% male and 50.0% female both years. In 2010, the statewide gender distribution was 52.0% male, 48.0% female. The median age in Haines in 2010 was 46.2 years, which was significantly higher than the statewide median of 33.8 years, and somewhat higher than the median age in 2000 of 40.2 years.

The population structure was constrictive in both 2000 and 2010, and cohorts showed age transitions consistent with a stable population between those years. This means that as each cohort aged, they generally maintained their overall structure. In 2010, 22.3% of residents were under the age of 20, compared to 28.4% in 2000; 24.7% were over the age of 59, compared to 15.7% in 2000; 44.4% were between the ages of 30 and 59, compared to 48.2% in 2000; and 8.7% were between the ages of 20 and 29, compared to 7.4% in 2000.

Gender distribution by age cohort was similar in both 2000 and 2010. In 2010, the greatest absolute gender difference occurred within the 70 to 79 range (3.8% female, 2.8% male), followed by the 10 to 19 (6.4% male, 5.5% female) and 50 to 59 (9.6% male, 8.8% female) cohorts. Of those three, the greatest relative gender difference occurred within the 70 to 79 range. Further information regarding population structure can be found in Figure 2.

Figure 2. Population Age Structure in Haines Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)³⁷⁸ estimated that 93.5% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 0.9% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 5.5% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 22.6% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; an estimated 23.5% held a Bachelor's degree, compared to an estimated 17.4% of Alaskan residents overall; and an estimated 13.6% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

The original Tlingit name for Haines was Deishu, which meant “end of the trail”. Occupation of the Haines area likely began between 5,000 to 10,000 years ago, based on archaeological evidence found throughout southeast Alaska. Local fish traps found along the Chilkoot River are dated to approximately 2,100 years ago, and remains of houses, some over 800 years old, can be found throughout the Chilkat Valley. Oral histories can also trace a long tradition of Tlingit occupation within the region.³⁷⁹

The local geography afforded traditional Tlingit inhabitants control over strategic trade routes linking coastal areas to the interior mainland. This allowed them to maintain a position of middleman in the regional fur and eulachon oil trade. The Chilkat Valley had many village sites historically; however, only two remain today.³⁸⁰

Europeans began exploring the area in the late 1700s. In 1794, Joseph Whidbey led a small group up the Lynn Canal to Chilkat Inlet. The village of Klukwan, 20 miles up the Chilkat River, originally had a population of several thousand. By the mid 1800s, the Hudson Bay Company was attempting to access an interior trade route through the Chilkoot Valley, and a fort was built on the Pelly River. However, Chilkoot warriors lead by chief Kohklux attacked and razed the fort on August 21, 1852.³⁸¹

There are several sites linked to historic villages throughout the Chilkat Valley. A village site located along the Chilkoot River was occupied by three clans: Lukaax'adi, Kaagwaantaan, and Shangukeidi. During the 1860s there were 30 houses located along the west bank of the River, and more were located on the east bank. However, a landslide which occurred between 1881 and 1890 destroyed the east village. Disease took its toll on the west side, and by 1882 only 8 houses and 127 residents had survived.³⁸²

Haines was named in honor of Francina Haines of the Presbyterian Home Missions Board. S. Hall Young was the first missionary to the area in 1879, accompanied by his friend John Muir. The purpose of their trip was to scout a location for a mission and a school.

³⁷⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

In 1892, Jack Dalton established a toll road on the Tlingit trade route into the interior to cash in on gold-seekers and others heading north into Canada. The Dalton Trail, as it became known, reached over the Chilkat Pass and followed the same general route as the current Haines Highway. Haines grew as a mining supply center during the Klondike Gold Rush in the late 1890s.³⁸³

With a growing border dispute between the U.S.-Canada, an army post was commissioned in 1898 to provide a U.S. military presence in the region. Fort William H. Seward was garrisoned in 1903, and became a major component of Haines economy for many years. The fort was decommissioned in 1947, and was purchased by a group of war veterans with hopes of creating an arts and commerce community. The buildings still stand and are a distinctive landmark of Haines. They are now privately owned homes, accommodations, restaurants, galleries, and shops.³⁸⁴

In the 1940s and 1950s, Haines became an important transportation link between the Haines Highway (which links to the Alaska highway system) and the Alaska Marine Highway System. Also in the early 1950s, a pipeline and military fuel storage facility was constructed at Tanani Point. An 8-inch pipeline, which operated for 20 years, ran over 600 miles to Fort Wainwright near Fairbanks.³⁸⁵

In 1968, the Haines area was incorporated into the only 3rd Class Borough in the State, which provided it taxation authority for the purpose of education. In 1970, Fort Seward (renamed Port Chilkoot) merged with Haines to become a single municipality. In 1975, the Haines Borough expanded to annex the seafood processing facility at Excursion Inlet. In 2002, Borough residents voted to consolidate the 1st Class City of Haines and the 3rd Class Haines Borough into a single Unified Home Rule Borough.³⁸⁶

Natural Resources and Environment

Haines is surrounded on all sides by mountains and water. Rising high above the town are the Takinsha Mountains and Chilkat Range to the south, Takshanuk Mountains to the north, and Coast Range to the east across the Lynn Canal. Heading northwest from Haines is the Chilkat River. This River is located in an immense valley carved out long ago by glaciers. To the east is the Lynn Canal, another area that once held glaciers. The Lynn Canal, or Lynn Fjord, is one of the longest and deepest fjords in the world. The fjord measures 60 miles long and more than 2,000 feet deep. Remnants of Haines' glacial history can still be seen in Rainbow and Davidson Glaciers in the Chilkat Range.³⁸⁷

Geology of Chilkat Peninsula consists of Mesozoic greenstones, volcanic sandstones, mudstone, chert, and limestone. These assemblages lie on top of older lower to middle Paleozoic carbonates. Glaciers deposited sand and gravel till into carved river valleys, and sediment originating in the Chilkat Valley can be found deposited as far south as Berner's Bay, north of Juneau. The Chatham Strait fault, which starts near Haines and follows the Lynn Canal south,

³⁸⁷ Ibid.

has not been active since the mid-Tertiary period.³⁸⁸

The Haines area is dominated by thick stands of Sitka Spruce and Western Hemlock. Valleys and riparian areas are populated by concentrations of cottonwood and birch. Above 3,000 feet, alpine tundra is the only vegetation found. Alder, dwarf maple, willow, berry bushes, and devils club cover the dense understory, and muskeg forms in poorly drained lowlands. Terrestrial mammals include moose, brown and black bear, mountain goat, lynx, mink, martin, muskrat, river otter, weasel, porcupine, and wolverine. Commercially important aquatic species include all five species of Pacific salmon, Dolly Varden, halibut, cutthroat trout, eulachon, and various shellfish including crab, shrimp, and clams. Marine mammals that live in the area include humpback and killer whales, harbor and Dall's porpoise, harbor seals, and Steller sea lions.³⁸⁹

Minerals found in the area include gold, zinc, lead, copper, silver, barite, iron ore, and titalum. Marble, clay, sand, and gravel are also found. Mining exploration increased significantly after 1988, mostly by Canadian mining companies and U.S. subsidiaries. Recent geological surveys have found that extensive marine volcanic rock units of unknown size and grades exist near Haines. This volcanic belt may have extensive mineral deposits; however, exploration is still in its early phase. The Porcupine District encompasses the original Haines mining district, and by 1930 about \$1.25 million worth of placer gold was taken. Approximately 75 lode and 6 placer claims remain active. The Big Nugget Mine on Porcupine Creek is popular with recreational miners and panners. Adjacent to placer claims are several copper, lead, zinc, gold, and barite deposits. There is interest in the Glacier Creek mineral area by Rubicon Mineral and their subsidiary, Toquima Minerals Corporation. The Klukwan Iron Ore Deposit had been under consideration for development since the 1970s; however, the land was eventually put into environmental trust and is no longer open for development. The Kensington Gold Mine is located within the City and Borough of Juneau at Sherman Point 20 miles south of Haines. The large development is a chief employer of many Southeast Alaska residents.³⁹⁰

Although no road connects directly to these glaciers, beautiful views can be seen from Mud Bay Road through Chilkat State Park. Haines is known as "The Valley of the Eagles." Year-round resident eagles total approximately 400 but the population swells to over 3,500 in the autumn months of October through December when a late run of chum salmon in the Chilkat River provides the eagles with a plethora of fish to eat. This natural phenomenon is highlighted each November with the Alaska Bald Eagle Festival featuring guided eagle viewing, educational tours, programs, and photo workshops.³⁹¹
