NOAA Technical Memorandum NMFS

The National Marine Fisheries Service's Alaska Fisheries Science Center uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series reflect sound professional work and may be referenced in the formal scientific and technical literature.

The NMFS-AFSC Technical Memorandum series of the Alaska Fisheries Science Center continues the NMFS-F/NWC series established in 1970 by the Northwest Fisheries Center. The NMFS-NWFSC series is currently used by the Northwest Fisheries Science Center.

ABSTRACT

This document profiles 196 fishing communities in Alaska with information on social, economic and fisheries characteristics. Various federal statutes, including the Magnuson-Stevens Fishery Conservation and Management Act and the National Environmental Policy Act, among others, require agencies to examine the social and economic impacts of policies and regulations. These profiles serve as a consolidated source of baseline information for assessing community impacts in Alaska.

The communities profiled in this document were selected through a quantitative process that assessed involvement in North Pacific fisheries. Demographic and fisheries data from the year 2009, the most recent year for which data were available when community selection occurred, were used to determine fisheries involvement. Data envelopment analysis was used as a quantitatively rigorous method to rank communities based on their overall engagement and/or dependence in North Pacific fisheries (including commercial, recreational and subsistence fisheries). Engagement was defined as the value of each indicator as a percentage of the total present in the state, for example, the percent of all fishing vessels registered in the state that are owned by residents of a given community. Dependence was then defined as a per capita measurement of each indicator within the community, reflecting the importance of fishing to residents. The quantitative indicators used to represent commercial fisheries participation included commercial fisheries landings (e.g., landings, number of processors, number of vessels delivering to a community), communities that are the registered homeports of vessels participating in the fisheries, and communities that are home to documented participants in the fisheries (e.g., crew license holders, state and federal permit holders, and vessel owners). The indicators used to represent recreational fisheries participation included sportfish licenses sold in the community, sportfish licenses held by residents, and the number of charter businesses and guides registered in the community. The indicators used to represent subsistence fisheries participation included participation in the Subsistence Halibut Registration Certificate program, number of subsistence salmon permits issued to households in the community, and local marine mammal harvests. A community was selected to be profiled when it surpassed the median index score on either the ranking of community dependence or engagement.

Each community profile is given in a narrative format that includes six sections: *People and Place*, *Natural Resources and Environment*, *Current Economy*, *Governance*, *Infrastructure*, and *Involvement in North Pacific Fisheries*. *People and Place* includes information on location, demographics (including age and gender structure of the population, racial and ethnic make-up), education, housing, and local history. *Natural Resources and Environment* presents a description of the natural resources in the vicinity of the community, as well as specific information on local parks and preserves, resource exploration opportunities (e.g., mining and fishing), natural hazards and nearby environmental contamination sites. *Current Economy* analyzes the principal contributions to the local economy, including the distribution of occupations and industries that employ residents, as well as unemployment and poverty statistics. *Governance* lays out information regarding city classification, taxation, Native villages, corporations, and other organizations, proximity to fisheries management and immigration offices, and details regarding municipal revenue and fisheries-related grants received by each community. *Infrastructure* covers connectivity and transportation, facilities (e.g., water, waste, electricity, schools, police), medical services, and educational opportunities. *Involvement in North Pacific Fisheries* details community activities in commercial fishing (e.g., processing, permit holdings, and vessel

ownership), recreational fishing, and subsistence fishing. The term ‘community’ was defined based on Census place-level geographies where possible, and communities were grouped only when constrained by fisheries data. In total, profiles were written for 188 individual communities. Regional characteristics and fisheries issues are briefly described in regional introductions.

FOREWORD

The Alaska Fisheries Science Center (AFSC) has published this enlarged and updated technical memorandum entitled *Community Profiles for North Pacific Fisheries – Alaska* in order to provide a broad and reliable socioeconomic overview of those communities in Alaska that are engaged in harvesting fishery and aquatic resources. This report creates profiles of selected Alaskan communities that are comprehensive, thorough, and accurate, and that can be used by the National Marine Fisheries Service, the North Pacific Fishery Management Council, and other related state and federal agencies to shape government policy and to evaluate the social and economic impact of existing regulations on these communities. In order to generate these complex community profiles, the AFSC relies on the Alaska Fisheries Information Network (AKFIN) to acquire and process the best available data on Alaska commercial, recreational, and subsistence fisheries. Using a complex database management system, AKFIN is able to process a vast quantity of diverse data into functional information that allows AFSC to construct fact-based community profiles which can guide state and federal agencies in developing and deploying the most effective policies for the Alaska fisheries.

Under the direction of the Pacific States Marine Fisheries Commission (PSMFC), AKFIN was established in 1997 in response to the pressing demand for a comprehensive information management center that would be able to process, store and distribute the growing volume of data being accumulated by the Alaska fisheries. AKFIN functions as an intermediary network that supports the collection and processing of fisheries' statistics gathered in Alaska. Moreover, AKFIN consolidates this information within a single comprehensive database, provides value-added analysis and interpretation, and then disseminates this information to fishery analysts, managers, and scientists. AKFIN operates in accordance with the objectives of the PSMFC, which is to support and promote policies that contribute to the conservation, development, and management of our fishery resources in Alaska and on the West Coast of the United States.

Robert Ryznar
AKFIN Program Manager

INTRODUCTION

Purpose

This document profiles 196 Alaska communities significantly involved in commercial, recreational and subsistence fisheries in Alaska, including state waters, and federal waters in the Bering Sea, the Aleutian Islands, the Gulf of Alaska, the Beaufort Sea and Chukchi Sea. For the purposes of this project, these areas are collectively referred to as the North Pacific.

Fishing Communities in Law and Policy

A variety of federal laws make clear the imperative for the National Marine Fisheries Service to consider the human communities that are involved in fisheries. National Standard Eight of the Magnuson-Stevens Fishery Conservation and Management Act (MSFCMA) states:

Conservation and management measures shall, consistent with the conservation requirements of this Act (including the prevention of overfishing and rebuilding of overfished stocks), take into account the importance of fishery resources to fishing communities in order to (A) provide for the sustained participation of such communities, and (B) to the extent practicable, minimize adverse economic impacts on such communities.

In addition, the National Environmental Policy Act requires that agencies assess the impacts of major federal actions on the environment, including the human environment. Typically, an Environmental Impact Statement will include a description of the social environment, and an assessment of the impacts of alternative policy choices on that environment.

Other laws and policies mandating attention to impacts on human communities include Executive Order 12898 on Environmental Justice, which directs agencies to assess impacts that may disproportionately affect low income and minority populations, Executive Order 12866 on Regulatory Planning and Review, which requires agencies to assess the costs and benefits of proposed regulations and alternatives, and the Regulatory Flexibility Act (RFA), which requires agencies to assess impacts of proposed policies on regulated small entities, meaning small businesses, organizations, and governmental jurisdictions as defined in the RFA and the Small Business Act.¹

In order to facilitate implementation of these laws, and improve available information on affected communities, the National Marine Fisheries Service (NMFS) has engaged in a nationwide effort to profile fishing communities. Analysis of social impacts often uses a geographic

¹ “‘Small businesses’ are defined in section 3 of the Small Business Act, 15 U.S.C. . 632, and in the SBA's regulations at 13 C.F.R. 121.201 (2002). 5 U.S.C. 601(3). . . . ‘Small organizations’ are any not-for-profit enterprises that are independently owned and operated and not dominant in their fields (for example, private hospitals and educational institutions). 5 U.S.C. 601(4). ‘Small governmental jurisdictions’ are governments of cities, counties, towns, townships, villages, school districts, or special districts with a population of less than 50,000. The size standard used by the Small Business Administration to define small businesses varies by industry; however, the SBA uses the “fewer than 500 employees” cut off when making an across-the-board classification.” Quoted from the U.S. Equal Employment Opportunity Commission *Regulatory Flexibility Act Procedures* posted at <http://www.eeoc.gov/policy/regflexibilityact.html>.

scale larger than the community, such as county or region, to analyze the data because that is the geographic level at which much of the data is available, and because the resources are not available to conduct an analysis with finer geographical resolution. Detailed analysis at the community level usually focuses on those communities which are likely to experience the most significant impacts -- an approach that is entirely appropriate given the limited time allotted for most impact assessments. Thus, there are dozens of communities which may be impacted by policy matters that cannot be analyzed on an individual basis. Because the North Pacific already has regional economic profiles² and detailed community-level profiles of some places most heavily involved in federal fisheries,³ the profiles given here may be particularly useful in providing basic information on some of the fishing communities not included in these other reports.

Fishing Community Profiles

The profiles of Alaskan fishing communities in this document are part of this national endeavor, and represent the first update to the original document published in 2005.⁴ The fisheries considered in these profiles include both state and federal fisheries in the commercial, recreational and subsistence sectors. From the perspective of a community dependent on or engaged in fishing, whether a particular fishery is under state or federal jurisdiction is of less importance to the health and resilience of the community than the strength and sustainability of the fishery itself. Furthermore, it can sometimes be challenging to identify from available databases whether a documented fish delivery was taken under a state or federal fishery, particularly where there are parallel seasons for the same species and gear types, and much of the available information concerning involvement in fisheries is not fishery-specific. Finally, this combined state and federal approach was the recommended method for the national profiling project, so the Alaska Fisheries Science Center profiles will be compliant with the larger effort.

The communities profiled in the document were selected by a quantitative assessment method described in detail below. This method was based on commercial, recreational and subsistence fisheries data, recognizing that in the life of a community, one, two or all three types of fishing may be of great importance socially, culturally, and economically. These community profiles include information on all three types of fishing activities as part of the narrative.

Related Projects

Many communities outside of Alaska are also highly involved in North Pacific fisheries. In 2004, the AFSC and the Northwest Fisheries Science Center (NWFSC) undertook a joint project to profile communities in Washington, Oregon, California and other states that are

² "Regional Profiles in the North Pacific Groundfish Fisheries" prepared for the National Marine Fisheries Service and the North Pacific Fishery Management Council by Northern Economics, Inc. and EDAW, Inc. posted at http://www.fakr.noaa.gov/npfmc/misc_pub/NorthernEconomics/RegionalProfile.pdf.

³ Community-level profiles are included in the Social Impact Assessment sections of various NMFS Environmental Impact Statements, e.g., Alaska Groundfish Fisheries Revised DRAFT Programmatic Supplemental Environmental Impact Statement, September 2003 posted at <http://www.fakr.noaa.gov/sustainablefisheries/seis/intro.htm>.

⁴ These community profiles were published as NOAA Technical Memorandum NMFS-AFSC-160 in December 2005.

involved in commercial fisheries. In addition to descriptions of the communities, the profiles included descriptions of local involvement in both North Pacific and West Coast fisheries. In addition, the AFSC is involved in creating more in-depth profiles of significant fishing communities, based on rapid assessment procedures and ethnographic fieldwork in a limited number of communities.

Other NMFS Regional Offices and Science Centers have also profiled communities involved in commercial and recreational fisheries. Eventually, the NMFS will create a national database of fishing community information that will be updated on a regular basis.

The profiling of communities involved in fishing is related to, but is not necessarily the same as, the designation of Fishing Communities according to the definitions of the MSFCMA. The process for designating MSFCMA Fishing Communities is at present being discussed by NMFS social science staff. It will likely bear similarities to the process used in this project to decide which communities to profile, but it will also have significant differences. The results of the MSFCMA Fishing Communities designation process may have an effect on which communities are selected for profiling when this document is updated.

Finally, there are a number of projects that have been undertaken by Fishery Management Councils, Commissions, and other fisheries management and information groups which involve narrative profiling of fishing communities. These include the just-released *West Coast Marine Fishing Communities* by Jennifer Langdon-Pollock of the Pacific States Marine Fisheries Commission (funded by NMFS and the Pacific Fisheries Management Council),⁵ the 2001 *New England's Fishing Communities* by Madeleine Hall-Arber et al. at the MIT Sea Grant Program,⁶ funded by the Marine Fisheries Initiative of the National Marine Fisheries Service, and the 2004 *Mid-Atlantic Fishing Communities* by Bonnie McCay et al.⁷

Acknowledgments

This project could not have been completed without the generous assistance of a number of people and institutions. The AFSC provided funding, staff time, and support services for this project. Pacific States Marine Fisheries Commission provided personnel, administrative support, and expertise, under a cooperative agreement with AFSC. The Alaska Fisheries Information Network (AKFIN), provided data and advice. The NMFS Alaska Regional Office, the Commercial Fisheries Entry Commission, the Alaska Department of Fish and Game, the U.S. Fish and Wildlife Service (USFWS), U.S. Census Bureau, Alaska Department of Labor and Workforce Development (DOLWD), the Alaska Department of Community and Rural Affairs (DCRA) and the Alaska Department of Commerce, Community, and Economic Development (DCCED) provided an extensive amount of data through both online sources and by filling special requests. These institutions also provided advice and clarification when needed.

In addition, the team wishes to acknowledge the following people who provided advice or assistance in the early stages of the update: Allison Durland, Christina Package, Jennifer Sepez, the community leaders and representatives who attended brainstorming sessions in community meetings held in summer 2010, the staff of the AFSC Economics and Social Science Working Group, Ben Muse, Andy Varner, Bryan Tilt, Ed Glazier, Gunnar Knapp, Jennifer Gilden, Kit Dahl, John Petterson, Mike Downs, Stephen Weidlich, Michael Jepson, Nicole Kimball, Mark Fina, Paula Cullenberg, Sally Bibb, Scott Miller, Shelly Wright and Steve Jacob. Special thanks are due for the editing assistance of Gary Duker and James Lee. These individuals helped inform and improve this work, but the authors alone are responsible for any errors contained herein.

METHODS

The task of preparing a document about the Alaskan communities involved in North Pacific fisheries, an area of vast scale and diversity, was a daunting one, and one whose complexity is reflected in the research methods used to select communities to be profiled in this document. Fortunately, the fisheries of the North Pacific, large and lucrative as they are, have had a wealth of information collected about them. Our task was to compile these disparate sources of information in order to produce a document that could serve as baseline data for policy analysts and decision-makers, and a starting point for social scientists conducting more complex analytical research. In this section, the research methods, including the community selection process, data sources, and how the data was treated, are explained in detail. In many cases, online publically-available data sources were used, and are cited as such in footnotes. In other cases, specific data requests were made to agencies in order to obtain the necessary information. This section also discusses some of the methodological challenges our team encountered during the course of the project, and how they were resolved.

Determining Fishing Dependence and Engagement

There are hundreds of communities in Alaska involved to some extent in commercial, recreational and/or subsistence fishing. Quantitative selection criteria were used in order to reduce the number of communities to be profiled to a manageable list consisting of those with the most involvement in commercial, recreational and/or subsistence fisheries.

Communities were selected according to two different measurements of fishery participation, following the methods used to select communities in the earlier profiling efforts of the NWFSC (hereafter named the West Coast Profiling Project).⁸ These measurements include 1) the community's dependence on fishing and 2) the community's engagement in a specific fishery. The selection process continues to represent an experimental approach towards quantifying fishing involvement.

⁸ Norman, Karma, Jennifer Sepez, Heather Lazrus, Nicole Milne, Christina Package, Suzanne Russell, Kevin Grant, Robin Petersen Lewis, John Primo, Emile Springer, Megan Styles, Bryan Tilt and Ismael Vaccaro. (2007). *Community profiles for West Coast and North Pacific Fisheries: Washington, Oregon, California, and other U.S. States*. U. S. Dep. Commer., NOAA Tech. Memo. NMFS-NWFSC-85, 602 p.

However, this is not the only way of estimating participation nor is it the singular approach sanctioned by NMFS. In effect, the project described here presents a novel and defensible means of quantifying the legal language spelled out in the MSFCMA:

The term "fishing community" means a community which is substantially dependent on or substantially engaged in the harvest or processing of fishery resources to meet social and economic needs, and includes fishing vessel owners, operators, and crew and United States fish processors that are based in such community. 16 U.S.C. 1802 §3 (16).

This definition includes commercial, recreational and subsistence fishing. As such, data from all three types of fishing were included in the selection criteria used here. In this project, the terms *dependence* and *engagement* are quantitatively defined in accordance with the definitions used in the West Coast Profiling Project, and then used in the community selection process for profile production. A community's dependence on fishing is:

a measure of the level of participation in a fishery relative to other community activities, and relative to all other communities linked to fishing in some way.

A community's engagement in fishing is:

a measure of the level of participation relative to the overall level of participation in a fishery.

In this study, dependence has been determined through a comparison of community involvement in commercial, recreational, and subsistence fishing to community population. Engagement is determined by comparing indicators that measure a community's participation in a fishery or fisheries relative to the aggregate participation in fisheries across the state of Alaska. Engagement refers to community participation by specific fishery, which required separation of data by fishery for each data element (e.g., weight or value of landings). In this case, all landings made in a community are broken down by fishery, and the community's relative involvement in a specific fishery is measured.

The specific fisheries used to indicate engagement represent the major fisheries management plan (FMP) categories of the North Pacific Fishery Management Council (e.g., Bering Sea/Aleutian Islands king and Tanner crabs, Bering Sea and Aleutian Islands (BSAI) groundfish, Gulf of Alaska (GOA) groundfish, scallops), other major fisheries in Alaska (halibut, herring, salmon), and all remaining fisheries in Alaska divided between finfish and shellfish (i.e., other finfish, other shellfish). Throughout each community profile, time series data between 2000 and 2010 were used to provide a look at how communities have changed their involvement in fishing over time.

Determining fishing dependence and engagement involves considering multiple dimensions of fishing history, infrastructure, specialization, social institutions, and gentrification trends in addition to economic characteristics. Due to the limitations of the methods used to select communities, our quantitative measurements of dependence and engagement have been based only on commercial, recreational and subsistence fisheries data. Our expectation is that the methods used here captured most Alaska communities that would qualify as engaged or dependent on the basis of most North Pacific fisheries.

In recognition that fisheries-specific indicators only provide a partial picture of fishing involvement, we have included historical, demographic, and other qualitative information in the narrative profiles. Importantly, while each community profile is intended to stand alone, fishing communities are not economic or social isolates, but contributing partners to regional (and often international) networks of labor pools, marine services, fisheries knowledge, and other socioeconomic phenomena.⁹

Defining “Community”

An important aspect of this project is that it compiles data at the community level. However, it is not always clear what counts as a community, and what a community’s boundaries are. For the purposes of generating a list of communities from which to select, we generally considered as communities those localities listed as such in the various other databases we used. For the purposes of profiling, we generally treated as a community any location within the state of Alaska that the U.S. 2000 Decennial Census treats as a “place,”¹⁰ – either an incorporated community or a “census designated place” for unincorporated areas that are nonetheless recognized as place-level communities by the Census.

Some of the indicator data, however, involved self-reported information or data obtained directly from the state management agencies (e.g., Alaska Department of Fish and Game (ADF&G), Commercial Fisheries Entry Commission (CFEC)), often provided by persons who are not concerned with issues of place or community. Thus, every database includes both a creative array of spellings of community names, which needed to be standardized in order to correctly count data by community, and some of these communities are not recognized as ‘places’ by the Census. For spelling issues, the U.S. Geological Survey Geographical Names Information System was the final arbiter for disagreements.¹¹ Latitude and longitude information, where available in the data, was particularly helpful in determining whether two communities had similar names, or one community had multiple spellings. In the case of all data, community name spellings were standardized in the AKFIN database in a joint effort between AKFIN and AFSC staff.

Communities listed in the fisheries information databases which were not considered “places” by the Census -- and therefore did not have data for a place-level population -- were generally not included in the selection procedure. Some of these “communities,” such as “Bristol Bay,” arise in the data because a person recorded something other than a recognized community as their residence, or in the case of “Bristol Bay,” listed it as the homeport of their vessel. In other cases, the community or sub-community has been subsumed by a larger “place” in the U.S. Census. Where this latter situation was detected prior to the selection procedures, fisheries data for sub-communities were combined with fisheries data for the Census place-level community for the purpose of selection.

⁹ Sepez, J., K. Norman, A. Poole, B. Tilt. (2006). *Fish Scales: Scale and Method in Social Science for North Pacific and West Coast Fishing Communities*. Human Organization, Autumn.

¹⁰ “Place” refers to one of the geographies used by the U.S. Census Bureau, which include geographies generally larger than place, such as state and county, and geographies generally smaller than place, such as tract and block group.

¹¹ U.S. Geological Survey. (n.d.). *Geographical Names Information System*. Retrieved October 29, 2012 from <http://geonames.usgs.gov/>.

In addition, it is important to note that many communities in this document are extremely intertwined socially and economically with neighboring communities. It is also the case that community boundaries are defined and recognized differently by different agencies, and in different situations. We found that many of our data sources did not always correspond in their treatment of intertwined communities. Thus, for some communities, the fisheries-related data was available for two nearby places, while the U.S. Census gives place-level information that treats the two as one. In addition, we also encountered communities which were named in non-CFEC fisheries data (e.g., fish tickets or vessel registrations), but for which no Census information was available. We dealt with these cross-agency community designation disparities and other data gaps, on a case-by-case basis. More detailed information on each case is available in Table 1.

Table 1. Combined, Unrecognizable and Subsumed Communities.

Community*	Data Issues	Treated as separate places by:			Action
		CFEC	Census	Other	
Akhiok and Alitak Bay	There was no individual information available for Alitak Bay in the Census or the Alaska Department of Community and Rural Affairs (DCRA) Community Database. CFEC names it as a separate community, but does not separate the data from Akhiok data. Alitak Bay shows up separately in fish ticket data due to the presence of a processor.	No	No	Yes	Alitak Bay not profiled individually, but fishing information is included in the Akhiok profile. Alitak Bay is also discussed in sub-regional introduction for Kodiak.
Anchorage , Girdwood, Eagle River, Chugiak	Data for Anchorage, Girdwood, and Eagle River/Chugiak are given separately by the CFEC, but these are not treated as separate “places” in Census or other data. For crew data, the overall crew numbers are reported as combined (based on ADF&G data), but CFEC’s reported numbers for Girdwood and Eagle River/Chugiak are also reported.	Yes	No	No	Combined during selection procedures, general data reported as combined in Anchorage profile, followed by separated CFEC data.
Excursion Inlet and Funter Bay	Excursion Inlet and Funter Bay are named separately in the CFEC database, but information is only given for the two combined.	No	No	Yes	Combined in Excursion Inlet profile.
Hobart Bay (HB) , Idaho Inlet (II), and Skagway (S)	Hobart Bay, Idaho Inlet, and Skagway are all named separately in the CFEC database, but information is only given for the three combined. Hobart Bay and Skagway are treated as separate in all other data sources, while Idaho Inlet does not appear in other data sets.	No	HB = Yes II = No, S = Yes	HB = Yes II = No, S = Yes	Combined in Hobart Bay profile.

Table 1. Cont'd. Combined, Unrecognizable and Subsumed Communities.

Community*	Data Issues	Treated as separate places by:			Action
		CFEC	Census	Other	
Juneau (J) , Douglas (D)	Douglas was fully annexed into the Juneau City and Borough in 1970. Therefore, the U.S. Census has since combined demographic data for Douglas with Juneau. The CFEC also does not recognize Douglas as a separate place.	No	No	No	Combined in Juneau profile.
		CFEC	Census	Other	
Ketchikan (K) and Ketchikan East (KE) and Ward Cove (WC)	The CFEC names “Ketchikan East” separately, but does not give separate data for it. Ketchikan East is not recognized as a separate place by other data sources. CFEC data is given separately for Ward Cove and Ketchikan. We combined Ward Cove with Ketchikan data because Ward Cove does not appear separately in other (fish ticket and Census place-level) data.	K and KE = No, K and WC = Yes	No	No	Combined in Ketchikan profile.
Kodiak and Chiniak	Although the U.S. Census treats Kodiak and Chiniak as separate “places,” the CFEC does not give separate data for the two.	No	Yes	Yes	Combined in Kodiak profile.
Nome and Council	Council is considered an Alaska Native Village Statistical Area by the U.S. Census Bureau and provided no demographic information in 2010. In addition, the CFEC does not	No	No	No	Combined in Nome profile
Unalaska and Dutch Harbor	Although CFEC separates these data, U.S. Census does not treat Dutch Harbor as a separate “place.”	Yes	No	Yes	Combined for profile of “Unalaska/Dutch Harbor”
Whale Pass (WP) , Tokean (To), Tuxekan (Tu), and Noyes Island (NI)	Whale Pass, Tokean, Tuxekan, and Noyes Island are all named in the CFEC database, but information is only given for the five combined. Whale Pass and Port Protection are treated as separate places by the Census, but the others are not. Whale Pass and Port Protection also show up independently in fish ticket data, but the others do not.	No	WP = Yes, T, T and NI = No	WP = Yes To, Tu and NI = No	Combined in Whale Pass profile

*Bold indicates the main community that was profiled in this document. Other communities listed in the first column were subsumed into the bolded community’s profile. The parameters and constraints indicated in the Data Issues column ultimately drove the treatment of the communities as indicated in the Action column.

Data Envelopment Analysis

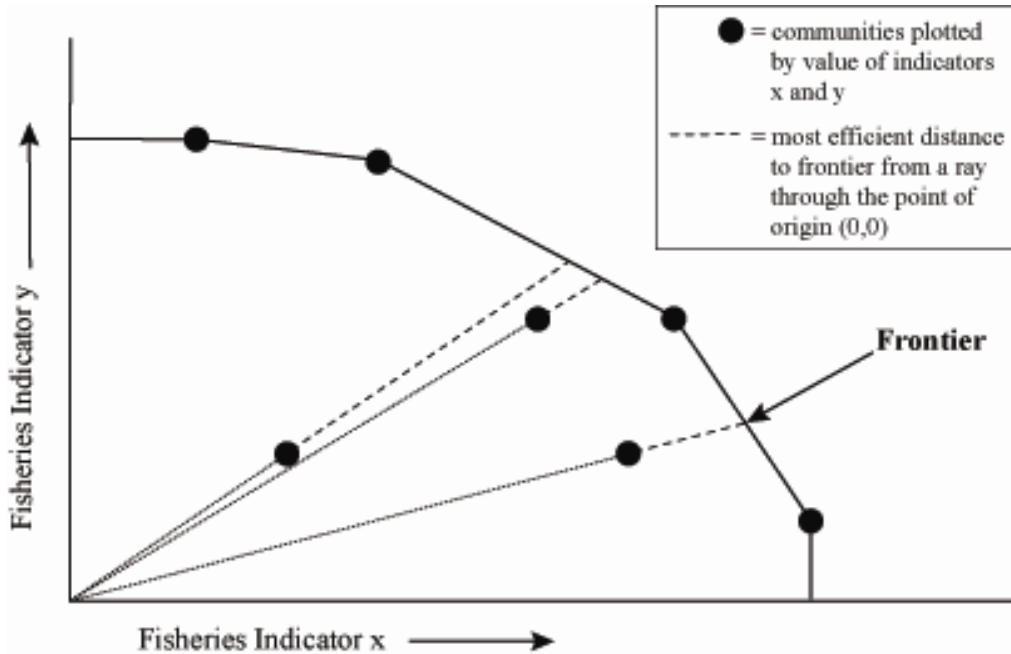

The number of communities to be profiled was determined using a quantitative selection process that entailed two steps. First, indicators were analyzed using a modeling technique referred to as Data Envelopment Analysis (DEA), an established analytical method that attributed a score to each community based on multiple indicators of participation in various fisheries. At its most basic, the DEA technique is a non-parametric approach to measuring participation and allows for the incorporation of multiple indicators simultaneously. Additionally, the method does not require a pre-determined structural relationship between inputs and outputs, which allows for flexibility in the estimation of a “frontier” of fisheries participation.

Typically, DEA produces an efficiency frontier for multiple quantitative indicators, and proximity to that frontier presents a means of comparing units for multiple measures at the same time (Figure 1). Each input is considered with a weight most suitable to that input. For each unit in the analysis, a series of relative efficiencies is obtained using both those weights most favorable to itself and those most favorable to other units in the analysis. Thus, the DEA model provided a means of analyzing and scoring communities according to their proximity to an efficiency frontier (Figure 1), wherein that proximity measured each individual community’s relative level of fisheries involvement.

An overall frontier of participation was estimated based on a community’s score for each indicator. As a result, communities that lie along the frontier have demonstrated strong participation according to the indicators in the model. Regardless of a community’s score either for dependence or engagement in North Pacific fisheries, the amount of attention devoted to profiling the particular community was not affected. All communities, once selected through the rank ordering of their DEA scores, were given the same treatment in the narrative profiles themselves.

In order to consider fishing *engagement* and *dependence* separately, we implemented two separate runs of the DEA model, both of which were output-oriented models. Datasets were selected on the basis of availability and informational value. The community selection process used particular indicators chosen from all the available datasets to best indicate a high level of involvement in fisheries. Indicators based on permit and harvest data from the year 2009 were used to measure a variety of types of involvement in North Pacific fisheries.

Figure 1. Graphic representation of the data envelopment analysis (DEA) model fisheries involvement frontier for two dimensions.

Source: Sepez, J., K. Norman, A. Poole, B. Tilt. (2006). *Fish Scales: Scale and Method in Social Science for North Pacific and West Coast Fishing Communities*. Human Organization, Autumn.

Twenty-one quantitative indicators of fishing dependence and 48 quantitative indicators of fishing engagement in North Pacific fisheries were used in the community selection process (Tables 2 and 3). The indicators include information specific to state- and federally-managed commercial, recreational and subsistence fisheries in Alaska, across various species and different types of involvement in those fisheries. These indicators allowed for consideration of communities that are engaged in or dependent on commercial, recreational and subsistence fisheries as well as just one or two categories of fishing. Additional data, which we were unable to include in the selection process for a variety of reasons, was included in the community profiles themselves (detailed below the *Profile Structure and Sources* section below).

Data inputs in the first run of the model, measuring *dependence*, were community populations,¹² and outputs were counts associated with each indicator (Table 2). In determining dependence, aggregated tallies of activity in all species categories were used and indicators were not broken down by specific fishery. For example, for the community of Sitka, in Southeast Alaska, the input was a population of 8,627, and outputs were counts of crew licenses and various types of fishing permits held in the community, charter guide businesses, and pounds of fish and marine mammals harvested for subsistence, to name a few.

In a second run of the model, in order to determine engagement, each data element was broken down by specific fishery to illustrate how important a particular community's participation is in that fishery relative to the participation of other communities. Data inputs were

¹² Alaska Department of Labor. (2011). *Current population estimates for Alaskan Communities*. Retrieved April 15, 2011, from <http://labor.alaska.gov/research/pop/popest.htm>.

all equalized to one. Outputs for each community were the proportions of each North Pacific fishery in which the community was in some way involved divided by the state total for that indicator (Table 3). For example, 5.6% of all crew licenses issued to Alaskan residents were issued to residents of Sitka.

Using these two DEA scores – for dependence and engagement – communities were then ranked based upon their proximity to the participation frontier, determined by their relative counts in each of the indicator categories. The valid results from both lists produced scores ranging between zero and one; one being the highest possible score and showing up on the frontier indicating higher dependency on or engagement in fishing, and zero being the lowest possible score and the farthest point from the frontier indicating lower dependency on or engagement in fishing. The ranked lists of communities were subsequently subjected to a median-based analysis in the second step of the selection process. The scores of the communities in each DEA model (the dependence and engagement models) were used to determine the median score for each model. The median threshold was selected as it provided the clearest method of selecting all communities that are commonly heavily involved in either commercial, recreational or subsistence fishing. Each community received two scores, one for engagement and one for dependence. A community was identified for profiling if it received at least one score above the median. The final list of profiled communities consists of those which demonstrated the highest involvement in commercial, recreational and subsistence fisheries in 2009, relative to the others.

Table 2. Outputs used in the DEA dependence model.

Commercial fishing indicators	
# of permit holders:	Total net pounds landed (all species) ⁴
• Gear permits ¹	Total ex-vessel value of landings (all species) ⁴
• Setnet permits ¹	# of vessels homeported in community ¹
• Federal fisheries permits ²	# of vessel owners registered in community ¹
• CFEC permits (all species) ¹	# of crew licenses issued to residents ⁵
• American Fisheries Act permits ²	
• Halibut quota share account holders ³	
• Sablefish quota share account holders ³	
• Crab quota share account holders ³

Scores generated from both models ranged from 0.000 to 1.000.¹³ The median score for the engagement model was 0.074, with 135 communities falling above the median, including 22 communities with a score of 1.000.¹⁴ The median score for the dependence model was 0.401, with 140 communities falling above the median, including 54 communities with a score of 1.000.¹⁵ A total of 39 communities fell above the median only in the engagement model, 37 fell above the median only in the dependence model, and 95 communities fell above the median in both models. In total, 171 unique communities fell above the median in one or both models (Table 4).

Based on a variety of other criteria, an additional 24 communities were profiled, for a total of 196 communities profiled for this project. This includes an additional 13 communities that did not meet the threshold for the DEA models; however, they were profiled in the previous version of the *Community Profiles for North Pacific Fisheries – Alaska*. These communities include Alitak Bay, Excursion Inlet, Fritz Creek, Hobart Bay, Ivanof Bay, Karluk, Kwigillingok, Port Moller, Port Protection, Prudhoe Bay, Twin Hills, Whale Pass and Willow. Since they were previously profiled, they are included in this updated version of the profiles as well. In addition, seven communities that are included in the Community Development Quota (CDQ) Program did not meet the threshold set for the DEA models, including Chevak, Ekuk, Ekwok, Levelock, Newtok, Portage Creek and Teller. Given their involvement in the CDQ program, they were also added to the list of communities to be profiled. Finally, an additional four communities were selected for profiling due to their participation in subsistence fisheries for which data was not available in 2009, including Akiak, Lower Kalskag, Shageluk and Tyonek. All communities profiled are presented in Figure 2.

¹³ Some invalid results were due to communities having no data for the specific indicators used in the DEA model (due to minimal fisheries involvement), or were due to non-convergence in the DEA model which could have occurred for various reasons (the particular indicator mix, the scale of the different indicators relative to other communities). These communities were removed after consideration. Invalid communities due to DEA Non-Convergence include: Butte, Coho, Eklutna, Fox River, Kalifornsky, Kupreanof, Lower Kalskag, Mendeltna, Pope-Vannoy Landing, Thoms Place, Tolsona.

¹⁴ Communities with engagement scores of 1.000 include: Anchorage, Bethel, Cordova, Craig, Emmonak, Gambell, Homer, Hooper Bay, Juneau, Ketchikan, Kiana, Kodiak, Kokhanok, Kotzebue, Petersburg, Petersburg, Saint Paul Island, Seward, Sitka, Togiak, Unalaska and Wrangell.

¹⁵ Communities with dependence scores of 1.000 include: Akutan, Alakanuk, Anchorage, Bethel, Chenega, Chignik, Chignik Lagoon, Cooper Landing, Cordova, Council, Dillingham, Edna Bay, Egegik, Elfin Cove, Emmonak, Gakona, Haines, Homer, Hoonah, Iliamna, Juneau, Kasilof, Kenai, Ketchikan, King Cove, Kodiak, Kotzebue, Larsen Bay, Manokotak, Mekoryuk, Meyers Chuck, Mountain Village, Naknek, Nelson Lagoon, North Pole, Old Harbor, Pelican, Petersburg, Pilot Point, Point Baker, Port Alexander, Saint Paul Island, Sand Point, Seward, Shishmaref, Sitka, Skwentna, Soldotna, South Naknek, Togiak, Tununak, Ugashik, Unalaska, Wasilla and Yakutat.

provided in each section. In cases where communities provided additional information about their involvement in North Pacific fisheries in the 2011 AFSC survey or where additional information was found, it was included in an *Additional Information* section at the end of the profile. Below, we outline how we compiled and used the data for each of these sections. We also discuss some of the methodological challenges we encountered along the way, and how we sought to resolve them.

People and Place

Each community is situated in time and space by providing information not only on the current condition of the community but also on its historical development. Each community is first described in terms of geographic location and demographics, followed by a brief account of local history. We used data from the U.S. Census Bureau,¹⁶ Alaska Department of Labor and Workforce Development,¹⁷ and the Alaska Department of Community and Rural Affairs (DCRA),¹⁸ as well as scholarly and popular works, to provide a rounded picture of each community. In addition, data related to seasonal and permanent population counts were provided from the 2011 AFSC survey.

The depth of information available at the community level was highly variable from place to place. A wealth of information is available, for example, about urban centers such as Anchorage and Juneau, while information about smaller and more remote communities is less readily available. This is reflected in the level of detail with which we were able to portray the history and development of each community and provide insight into the demographic composition of the communities. All profiles report the number of inhabitants, a short demographic evolution when possible, the gender structure, median age, educational attainment, racial and ethnic composition, and an indication of how many community members were born outside of the U.S. In addition, some profiles report further information if it helped to illustrate the character of the community, such as age structure, percentage of individuals living in family households,¹⁹ and ancestry.

To compile brief accounts of local history, historical information was gleaned from various relevant websites and print material, and was cross-checked for verification between multiple sources. Where we encountered a lack of historical information, we give the best possible illustration of a community's origins but likely do not adequately portray its past. In a few cases

¹⁸ The Alaska Department of Community and Rural Affairs (DCRA) provides perhaps the most comprehensive information about the social and economic characteristics of Alaskan communities, boroughs, and census areas. The DCRA maintains the *Community Database* at: http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

¹⁹ The U.S. Census Bureau provides this definition of household: "A household includes all of the people who occupy a housing unit. A housing unit is a house, an apartment, a mobile home, a group of rooms, or a single room occupied (or if vacant, intended for occupancy) as separate living quarters. Separate living quarters are those in which the occupants live separately from any other people in the building and that have direct access from the outside of the building or through a common hall. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated people who share living quarters."

community history has been reported at the Borough/Census Area level because we were unable to discover more detailed information.

Natural Resources and Environment

This section concentrated on providing an overview of the local climate and terrain, natural resources available locally and the state of the local environment. Information is also presented regarding local parks and protected areas, including the resources that they are designed to protect, natural resource based industries that are relied on locally, natural hazards and hazardous environmental clean-up sites.

Current Economy

For data on the current economic conditions in each community we consulted the U.S. Census Bureau,²⁰ the Alaska Department of Labor and Workforce Development (DOLWD)²¹ and the Denali Commission.²² The description of the current economy is useful for understanding where fishing stands in relation to other economic opportunities in a community, and predicting how a community might be affected when faced with a change in fishing patterns. Statistics are provided regarding important local job providers, any available information about community members' reliance on subsistence, inflation adjusted income, recognition of distressed status, poverty rates and the distribution of the labor force across various occupational and industry categories. We also report both the percentage of unemployed workers and the percentage in the labor force (not seeking work) in order to provide as complete a picture as possible of unemployment for each community. We faced several challenges during the process of combining data from these disparate sources. Information on unemployment from the DOLWD, for example, occasionally did not match the information reported by the U.S. Census and does not include self-employed or federally employed workers. As such, we routinely provide data from both sources. In addition, it should be noted here that the unemployment statistics have been calculated to report community residents who are in the labor force but are unemployed. This is in an attempt to differentiate it from the indicator with residents who are not in the labor force. However, the graphical representations of employment structure do not make this distinction in order to have all three measures as proportions of the total community population 16 years and above. Finally, the number reported for a community's employment in fishing is most likely an underestimate of the total number of fishermen in the community. The U.S. Census may not accurately capture this demographic as many fishermen are "self employed," an undistinguished category on the U.S. Census forms. Fishermen may also categorize themselves as employed in a different category than fishing if they fish for part of the year and hold another job for the rest of the year.

Table 5. Governance structures present among Alaskan communities.

Type of governance structure	Type	Description
1 st Class or Home Rule city	Municipal	A First Class City, or Home Rule City, must have at least 400 permanent residents.
2 nd Class City	Municipal	A Second Class City must have at least 25 resident voters.
Recording district	Municipal	The Alaska Court System established 34 recording districts established for the administration of a system for recording and filing of documents
Strong mayor form of government	Municipal	An elected mayor is given administrative authority for day to day operations of the community
Hired manager form of government	Municipal	The elected mayor is a figurehead or lobbyist with veto powers. A city manager would be hired by the mayor and city council to run the day to day operations
Village and Regional native corporation	Tribal	220 village and 13 regional corporations established under the Alaska Native Claims Settlement Act (ANCSA) that were awarded monetary and property compensation after the path of the Alaska pipeline was determined. These corporations provide economic and social benefits to their members, all of which are Alaska Natives and their descendents born before 1971.
Village Council	Tribal	Each federally recognized Alaska Native group has a village council to act as a politically representative body for the community. There are over 226 Native village councils in the state.

Governance

Governance structures can vary tremendously within Alaska, with city, borough, Native village, and state interests each represented by separate entities. For an explanation of tribal and municipal governance structures present in Alaskan communities, refer to Table 5. Principally, the local governance structure (both Native and municipal) is described as well as trends in the total municipal revenue, sales tax revenue, State and Community Revenue Sharing contributions, and fisheries-related grants over the 2000 to 2010 time period. Information is also provided regarding the location of the nearest offices of governmental organizations important to the fishing industry: NMFS,²³ the ADF&G,²⁴ the Alaska Department of Natural Resources (DNR), Department of Commerce, Community, and Economic Development (DCCED) and the U.S. Bureau of Citizenship and Immigration Services,²⁵ formerly known as Immigration and Naturalization Services. As the key bodies regulating fisheries, access to NOAA, ADF&G, DNR and DCCED can help with the flow and clarification of information (from research reports to

²³ NMFS' Alaska Regional Office website (<http://www.fakr.noaa.gov/default.htm>) provides a list of all branch offices in Alaska.

²⁴ The Alaska Department of Fish and Game website (<http://www.adfg.state.ak.us/>) provides a list of all branch offices in Alaska.

²⁵ The U.S. Bureau of Citizenship and Immigration Services lists most field offices in their Office Locator (https://egov.uscis.gov/crisgwi/go?action=offices.type&OfficeLocator.office_type=LO), although the website does not post a complete list of field offices.

grounds closures), as well as influencing a community's enfranchisement in a regulatory system. In addition, the location of permanent or semi-permanent U.S. Bureau of Citizenship and Immigration Services can affect the labor practices of industry, particularly the seafood processing sector, through level and intensity of monitoring, and may also affect use of local services by undocumented residents.

Infrastructure

The infrastructure section is an overview of the community's connectivity with other areas of the state, physical infrastructure that support the community, medical services and educational opportunities. In many cases, the primary rationale for offering descriptions of facilities is to reveal the accessibility of the outside world to community members, particularly with regard to communication and travel. This is especially significant given the emphasis on stakeholder participation in fisheries management, wherein frequent Fishery Management Council meetings are held in differing locations in each management region. Facilities descriptions also offer insight into a community's investment and dependence in the industry and the relative importance of particular assets. A community, for example, with one fish processing plant may be especially vulnerable to any fish allocation decisions in its associated region. In addition, information about schools, healthcare, utilities, and public safety facilities are important because such amenities may factor into people's decisions about where to live. Marine facilities are described where available to give an illustration of the physical infrastructure serving the local fishing industry in its commercial as well as recreational dimensions. This information has been primarily sourced from the websites of individual communities, the 2011 AFSC survey, harbors and marinas, and when possible or necessary, content has been supplemented by telephone communications with community staff.

More important than distance, in many ways, is cost of travel. Travelocity²⁶ and Kayak,²⁷ on-line travel planning services, as well as many small airline companies provided information on the cost of air travel between each community and Anchorage; costs were based on travel during June, 2012. Although Anchorage is not the only place one might need to travel to participate in governance or other aspects of fisheries management, it is such a travel hub for the state that costs for continuing on to locations such as Seattle or Washington, D.C. may be assumed to be uniform.

Descriptions of physical and even social infrastructure may have a tendency to treat communities in isolation. However, the ways in which a community is connected to other places is a critical element of how it functions. Connectivity or isolation can affect language, culture, trade, tourism, health, opportunity, and quality of life – though it is not always possible to say in what manner, as individuals differ in what they consider desirable. Connectivity or isolation can also be difficult to measure, as actual travel is always more than a matter of mere distances. Cost, for example, may be more prohibitive of travel than distance. Weather patterns and landing/docking facilities may also affect connectivity/isolation. If a community's air strip is inaccessible due to visibility or storm conditions for days at a time, price and distance may have less effect on participation in out-of-town business than weather windows. In addition, Anchorage is considered the central economic hub in Alaska, with the assumption that access to

²⁶ Prices were retrieved from Travelocity's home page at <http://www.travelocity.com>.

²⁷ Prices were retrieved from Kayak's homepage at <http://www.kayak.com>.

urban power centers is an important part of participation in North Pacific Fisheries, and that Anchorage is the most consistent and influential locus (though not the only one) of fisheries governance. Juneau, the state capital, is also important in this respect, but is less of an economic center. Seattle is also very important, except that, from some Southeast Alaska locations, most air trips to Seattle probably go through Anchorage.

Physical infrastructure – as the foundation of a logistical basis for supporting both economic and social activities – is also indicative of how a community may respond to change. The DCRA, community development plans and the 2011 AFSC survey provided detailed information on the physical facilities in each community, including marine, sea and land-based facilities. In addition, individual chambers of commerce, particularly for the larger communities, were consulted regarding local businesses and employment structures. Facilities information includes data on basic support systems such as roads, airports, docks, water, and electricity, as well as institutions which support the community such as and public safety offices. Information was also provided regarding locally and regionally available medical services and educational opportunities.

Involvement in North Pacific Fisheries

In nearly every case, the section on involvement in North Pacific fisheries is the longest and most detailed for each community. It was our goal to provide the most comprehensive information possible on commercial, recreational, and subsistence fishing practices for each community, based on available data. A significant amount of information is provided on the history and evolution of fisheries within each community as well as in the region surrounding the community. Characterization of fisheries is both in terms of the nature and degree of involvement. Sections are included that provide information on shore-side processing plants in the community and fisheries-related revenue that the community received between 2000 and 2010. The commercial fishing section contains information on vessel owners, crew members, commercial permits by species, geographic fishery and gear type, federal catch share program participation, as well as information on processing activities and landings both in the community and by residents of the community. This information was compiled from the CFEC²⁸ and NMFS Alaska Regional Office.²⁹ In addition, information provided in the 2011 AFSC survey regarding the most common gear types used, the seasonality of fishing in the community and the most important species to the community.

The recreational fishing section outlines the major sport species in each community, as well as sport license sales and charter and guiding services. ADF&G provided the data for this

²⁸ The Commercial Fisheries Entry Commission is an agency responsible for promoting the sustained-yield management of Alaska's fishery resources by regulating entry into the fisheries. CFEC provides logs of all fishing permits issued by the State of Alaska. Such a permit is required to land fish at a shore-based processor, even if the fish were taken in a federally-regulated fishery. Source: Alaska Department of Fish and Game, and Alaska Commercial Fisheries Entry Commission. (2011). *Alaska fish ticket data, commercial fishing permits, permit holders, and vessel licenses, 2000 – 2010*. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. [URL not publicly available as some information is confidential.]

section.^{30,31,32} Each profile includes data on the number of sport fish guide businesses, guide licenses issued to residents, sport fishing licenses issued to residents (irrespective of point of sale), and sport fishing licenses sold in the community (regardless of license holder residence). In addition, where available, information on the species caught by private anglers and guided charter clients was reported.^{33,34} Each community was associated with one of ADF&G's Alaska Sport Fishing Survey Areas, including reports of saltwater and freshwater angler days fished in the area by Alaskan residents and non-Alaska residents.

The subsistence fishing section provides a description of the importance of subsistence harvests to the community. Where available, data were reported regarding subsistence activities in each community, including per capita harvests, percentage of households using subsistence resources, permits held by residents or households (i.e., subsistence salmon permits and Subsistence Halibut Registration Certifications (SHARC)) and the composition of subsistence harvests (i.e., salmon, marine invertebrates, halibut, other fish and marine mammals). Data reported in this section were principally retrieved from the ADF&G Division of Subsistence,^{35,36,37,38} the U.S. Fish and Wildlife Service,³⁹ and published reports;⁴⁰ however, additional data from other available sources were available for specific communities and were reported.

Our team encountered various challenges while compiling data for the fisheries section. A principle issue for the team was that certain types of fisheries-related data in Alaska are confidential under NOAA Administrative Order 216-100 and Alaska Statute 16.05.815. The agreement between NMFS and ADF&G regarding the release of data obtained from state fish

tickets requires at least four individuals or firms for a given statistic in order for that statistic to be made public. Some of the communities profiled in this document therefore contain no data on fish landings. In such cases, the profile indicates that one or two or three fish buyers or vessels landing catch are present, but contains statements that indicate that fish landings associated with those fish buyers or vessels is considered confidential.

The subsistence fishing section brought unique challenges of its own. First, a shifting policy environment due to conflict between the State and the Federal governments has made the accounting of subsistence practices difficult. Federal authority was extended over subsistence management on federal waters in Alaska in 1999 under Title VIII of the Alaska National Interest Lands Conservation Act (ANILCA). An interagency Federal Subsistence Board is managing most federal subsistence fishing, except for subsistence halibut, which, as a marine species, is now regulated by NMFS in conjunction with the North Pacific Fishery Management Council. Thus, subsistence fishing in a given community may be taking place under any of three jurisdictions: the State of Alaska, the Federal Subsistence Board, and the National Marine Fisheries Service.

Second, much of the subsistence data available at the community level is collected through household surveys conducted by the ADF&G Division of Subsistence that are not necessarily collected every year. Therefore, the data provided represents estimates of subsistence harvests in a community rather than accurate numbers. For example, marine mammal subsistence data for Steller sea lions, harbor seals, and spotted seal are extrapolated based on years where observations were made, where if a survey accounted for eight harbor seals in 2006, and no observations were made in 2007, it was assumed that eight harbor seals would be a sufficient estimate for that year despite the fact that no survey was conducted. In addition, household surveys were not conducted in every year in every community. Therefore, the lack of data reported for a given community in some years does not necessarily mean that residents of that community did not harvest those subsistence resources. Likewise, when harvest data is reported as the same in subsequent years, it is not necessarily an accurate count. In addition, for many of the subsistence harvest data collected by ADF&G, estimates were not available at the time of publication for any years after 2008.

Third, we relied on the quantitative characterization of subsistence harvesting provided by the ADF&G Division of Subsistence electronic Community Subsistence Information System (CSIS). The CSIS provided adequate data for most of our selected communities; however, the data was collected during different years for different communities. Where more than one year of data was available for a community, we used the year designated as most representative of the community's practices by ADF&G. In addition, ADF&G subsistence data is often lacking for a given community – and this is particularly true for the communities selected in Western Alaska, where subsistence uses are known to be high. In some cases, additional data on wild food harvests were found in reports published about individual communities.⁴¹ Finally, it should be noted that the subsistence database contains harvest information for resources taken under a variety of regulations, including subsistence regulations, commercial fishery removals, and in some cases, recreational regulations. There is legitimate scholarly and policy debate over whether such harvests may all be considered subsistence. Although the CSIS uses the terminology of subsistence, it is probably more accurate to say that it reports on “home use” (J.

⁴¹ Reports published by ADF&G are located at <http://www.adfg.alaska.gov/sf/publications/>.

Fall, ADF&G Division of Subsistence, pers. comm. 2003). In some, but not all, communities, home use and subsistence use are essentially the same.

Finally, it was challenging to understand how ‘harvest’ and ‘use’ of subsistence resources were entered into a calculation and resulted in a ‘subsistence participation’ estimate in the ADF&G database. It is important to understand this caveat because it is hard to characterize what the data in fact represented (not harvest, not use... but some vague ‘participation’ estimate); for example, the term ‘participation’ does not necessarily mean ‘harvest participation,’ and could in fact refer to consumption of subsistence resources rather than actual harvesting activities.

Figures and Tables

In addition to the narrative community profiles, each community has an associated set of figures and tables that provide graphical and tabular displays of various data. The *People and Place* section includes a table showing population counts from 1990 to 2010 and figures showing the racial and ethnic composition and the population structure from 2000 to 2010. The *Current Economy* section includes figures that display changes in local employment by industry and occupation between 2000 and 2010. The *Governance* section provides a table showing annual municipal revenue, sales tax revenue, State and Community Revenue Sharing contributions and fisheries-related grants received by the community between 2000 and 2010. Finally, the *Involvement in North Pacific Fisheries* section includes 13 tables with annual fisheries-related data between 2000 and 2010, including the following:

- Known fisheries-related revenue (in U.S. dollars) received
- Permits and permit holders by species
- Characteristics of the commercial fishing sector
- Community participation in federal halibut fisheries (including quota share account holders, quota shares held, and Individual Fishing Quota (IFQ) allotment)
- Community participation in federal sablefish fisheries (including quota share account holders, quota shares held, and IFQ allotment)
- Community participation in federal crab fisheries in the Bering Sea and Aleutian Islands (including quota share account holders, quota shares held, and IFQ allotment)
- Landed pounds and ex-vessel revenue, by species
- Landed pounds and ex-vessel revenue, by species, by residents
- Sport fishing trends (including sport fish guide businesses, sport fish guide licenses, sport fishing licenses sold to residents, sport fishing licenses sold in the community and angler days fished in salt and freshwater by Alaskan residents and non-residents)
- Subsistence Participation by Household and Species
- Subsistence Fishing Participation for Salmon, Marine Invertebrates and Non-Salmon fish
- Subsistence Halibut Fishing Participation
- Subsistence Harvests of Beluga, Polar Bears, Sea Otters and Walrus
- Subsistence Harvests of Steller Sea Lions, Harbor Seals, and Spotted Seals

Community Comments

After drafting the Alaska community profiles, the profiling team made a substantial effort to solicit comments and suggestions for improvement to the draft from within NOAA and from representatives of the communities profiled. Initially, the draft introduction and methods section, along with a few example profiles, were circulated within NOAA for internal review. Comments were also sought from other social scientists. The introduction and methods section was then revised in response to these comments.

The process of requesting comments from communities began with the formulation of a list of official contacts within the community, compiled from DCRA's Community Database Online,⁴² as well as from internet searches for additional information. We included governmental bodies, such as city governments and village councils, as well as quasi-governmental resource management bodies such as village Native corporations and regional Native corporations. The goal was to involve a broad representation of any particular community, through official representative bodies, without creating an overwhelming task. The ability to locate contact information for the organizations was also a factor in compiling the list. Unfortunately, no contact information of any kind was located for six communities.⁴³ A total of 251 separate organizations were contacted by mail for the remaining 190 communities included in the profiling effort.

An initial email was sent out to the list of community contacts in August 2012 to inform them of the project and to provide them with an electronic draft of their community's profile. The email requested that if the recipient was not the correct person to review the profiles, that the correct person and contact information be indicated to the profiling team. Many contact people requested, by telephone, mail, email or fax, that the profiles be sent to someone else in the community. In response, we updated the contact list as appropriate. The email had the additional effect of alerting other people in the communities to the project and the request for comments, and many of these people requested information or copies of the profiles. Following this initial request, comments were received from ten communities. All comments were incorporated into the draft profiles for those communities.

Following this initial attempt, additional revisions were made to the profiling team and a second request for comments was sent to community contacts in November 2012. This time, all draft community profiles were posted to the AFSC website and communities were asked to download their profile from the website or to email us back for a copy by email, mail or fax. Overall, the reaction to the profiles project was positive and those community members who responded appeared to be enthusiastic about the profiling effort and appreciative of the opportunity to give suggestions. The content of the comments ranged from indicating that there were no corrections to be made, to providing a complex description of how subsistence in the village is affected by regulations, and providing whole sections to add to the profile from an already existing source. Some comments included a detailed review of the profile text, indicating such things as incorrect names, whereas others included few or no suggestions, and still others did not pertain directly to the text.

⁴² Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

⁴³ Communities that we were not able to find contact information for included Cold Foot, Council, Kaktovik, Nuiqsut, Petersville and Red Devil.

For the majority of comments, the corrections suggested were to the data elements included in the facilities and governance sections, specifically correcting such things as village school information, the type of garbage collection/disposal, barge service, harbor information, lodging, the borough the community is included in, number of city council members or type of government, heating method, health care center, taxes, plumbing, transportation, and so on. These comments were particularly welcomed by the profiling team, since our limited resources sometimes prevented us from gathering information in this level of detail. Corrections were also included for such things as misspellings, the year a particular event occurred, general history, sport fishing information (such as species and lodges), businesses located in the community, processor information, and changes to commercial fishing permit information.

Disagreements with the Census data (demographics and employment) were expressed somewhat frequently, as were problems with the aggregation of fishing data for multiple communities as presented by the CFEC. In such cases, data from published sources were still relied upon, even if changes were suggested, in order to maintain the same standard for all profiles. These comments prompted us to check our sources, and numerical changes were made only if a recording error had been made; however in some cases the qualitative description was changed based on the comments received.

The comments provided were incorporated into the text using the profiling team's best judgment. Community members were considered experts on their own communities; however, in a few cases the suggested changes or additions could not be made for reasons of length or uniformity. For suggestions regarding facilities, governance, and history, community members' comments were in most cases directly incorporated. The types of comments that could not be incorporated tended to be general suggestions for the complete document which were not feasible given the scope, time frame, and resources of the project. A number of these general suggestions were constructive and will be noted for future profiling efforts.

STATE OVERVIEW

At the time of community selection, the 2010 Decennial Census had not yet been conducted; therefore, communities were selected from the 2000 Decennial Census for inclusion. The 2000 Decennial Census reports a total of 349 "Places" in Alaska; these are cities, towns, and communities with populations.⁴⁴ This was the total pool of Alaskan communities from which we selected communities for inclusion in the profile project. Applying the selection criteria described in the Methods section of this document, we selected 196 communities for profiling. As a result, of the 349 Census-recognized Places in Alaska in 2000, just over half (55.9% of Census Designated Places) were profiled in this document.

These numbers say several things about the nature of community involvement in commercial fishing in Alaska. First, the breadth of fishing involvement is significant. Second, it is striking that half of all Alaskan communities were involved enough in fishing to meet the selection criteria for this project. This substantial degree of participation points toward the significance of fishery-related activity to the overall economy and social organization of Alaska.

⁴⁴ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data). Retrieved August 1, 2009 from <http://factfinder.census.gov/home/saff/main.html>. Website has since been updated to <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

This section of the profile document is meant to serve as an overview of the state as a whole. It provides aggregate information for these communities as well as a context in which to interpret this information.

People and Place

Location

Vast in scale and diverse in latitude and topography, Alaska exhibits tremendous variation in its climate, from maritime climatic zones in the Gulf of Alaska to arctic zones in the far north. All regions, however, are influenced to some extent by storms from the North Pacific Ocean as they move eastward from Asia. There is also a great deal of variability in Alaska's weather from one year to the next, primarily due to the shifting path of the jet stream.

Climate, topography and latitude all have an influence on the ecology of Alaska's different regions, and these ecological differences in turn determine the species composition of fish and patterns of human use. Alaska's diverse marine and terrestrial ecosystems provide habitat for 436 fish species, including 52 freshwater or anadromous species and 384 saltwater species.⁴⁵ From pelagic species to estuarine species to freshwater fish living in inland lakes and streams, Alaska produces a huge volume of aquatic life. The people who live in Alaska—Native groups whose ancestral history in the region stretches back thousands of years, and newly arrived residents alike—have co-evolved with Alaska's marine life, and have come to depend on it for their livelihoods.

Figure 2 shows the location of the 196 Alaskan communities selected for profiling in this document. Their geographical dispersion reflects several phenomena. From an ecological perspective, these communities, with a few exceptions, are located on or near the coastline where dependence on marine resources would be expected to be high. Their locations also reflect historical settlement patterns, first by Alaska Natives, and by Europeans beginning in the 18th century.

Demographic Profile

The communities selected for profiling all share a common reliance on fisheries-related activities, but represent a diversity of demographic, socio-economic and historical conditions. In terms of size, some communities are large municipalities that serve as regional economic hubs, such as Anchorage, while other communities are relatively isolated and have only a few dozen inhabitants. There are 145 city governments in Alaska⁴⁶ and 16 organized boroughs (Bockhorst 2001).⁴⁷ A First Class City, or Home Rule City, must have at least 400 permanent residents. A city may incorporate as Second Class if it has 25 voters. In the rest of the U.S., the difference between a 400-person and a 25-person (voter) community would hardly be recognized, since both communities would be considered quite small. But in Alaska, a population of 400 is

⁴⁵ Armstrong, Rober H. (1996) *Alaska's Fish: A guide to selected species*. Anchorage: Alaska Northwest Books.

relatively substantial. Of the 352 Census communities (Places) in Alaska with a positive population in 2010, 60.5% (213 communities) had fewer than 400 residents, while 8.8% (31 communities) had fewer than 25 residents (Table 6). Other States have a very small percentage of their populations living in communities of less than 400.

One of the most important stories that emerges from these community profiles is how quickly many Alaskan communities have experienced demographic change. Population numbers in certain communities have swelled in recent years, a trend that is in large measure driven by fisheries-related activities. Unalaska, for example, was transformed from a community of less than 200 in 1970 into a booming small city of 4,376 residents in 2010.⁴⁸ This dramatic transformation coincided with the Magnuson-Stevens Fisheries Management and Conservation Act’s “Americanization” of the groundfish fleet in North Pacific waters and the subsequent growth of the fish processing industry, both onshore and at sea. Communities in Southeast Alaska underwent a similar transformation in response to the growth of the international market in salmon, which has been tempered in recent years by foreign competition from the salmon farming industry. In general, communities that have experienced rapid population growth have also seen an influx of racial and ethnic minorities—particularly Asians and Latinos—as the fishing industry has become a global enterprise that draws labor from around the world. By contrast, many Native communities that participate in commercial fishing have lived in situ for centuries and have maintained relatively stable populations since the beginning of U.S. Census data collection. Some communities have experienced population decline in recent years as local economic conditions (especially those recently influenced by global trends) make getting by more difficult and opportunities elsewhere draw residents away.

Table 6. Census Places in Alaska by population size, and cumulative percent in 2010.

Population	Number of Census Places	Cum. %	Mean	Median	Min	Max
≤25	31	8.8%				
25-400	182	60.5%

or More Races) as well as ethnic categories (Hispanic or Non-Hispanic).⁴⁹ The profiles supply this snapshot for each selected Alaskan community, which is followed by a historical account of the community which helps explain and contextualize the contemporary composition of the specific communities' populations. For purposes of comparison, Table 7 provides the racial and ethnic distribution seen both across Alaska and the U.S.

One of the most interesting characteristics of Alaskan communities is the bi-modal nature of racial structure. Throughout the state, most commonly, communities either have a significant majority of the community that considers themselves White or a majority that considers themselves to be Alaska Native. For example, in the 2010 Decennial Census, 37.2% (132 communities) exhibited more than 75% White residents and 39.7% (141 communities) exhibited more than 75% Native Alaskan residents. Many of the profiled communities with the highest percentages of White residents are located in Southeast Alaska or on the Kenai Peninsula, both areas which had a large boom of White settlers partly because of resource extraction—Southeast Alaska in the late 1800s and early 1900s, and the Kenai Peninsula in the 1950s. Today, both areas are also the densest sites of sport fishing in the state, providing sport lodges and a plethora of guiding services. The communities with the highest percentages of Native residents are predominantly located in Western Alaska. Western Alaska is home to a predominantly Native population, in part because the region has a less extensive history of European colonization and natural resource extraction compared to other areas of the state.

The remaining categories of racial and ethnic groups are not nearly as abundant. The largest communities in the state contain higher percentages of Black or African American residents than many other communities (Fairbanks 11.2% in 2000 and 9% in 2010, Anchorage 5.8% and 5.6% in 2010, and Juneau 0.8% and 0.9% in 2010). The remaining communities with higher percentages of Black residents are located for the most part in on the Alaska Peninsula and Aleutian Islands.

The communities with the largest percentages of Asian residents are primarily major fishing ports with large fish processing plants. Fish processing remains an under-studied sector of Alaska's fisheries; however, according to anecdotal evidence, Asian migrant workers, particularly from the Philippines and other areas of Southeast and East Asia, make up a large portion of fish processing workers in many communities. Unalaska, for example, has a particularly high percentage of Asian processing workers (32.6% of the 2010 population). About 50.4% (46.7% in 2000) of the profiled communities did not include any Asian residents.

In 2010, only about 28.4% of communities included any Native Hawaiians or Other Pacific Islanders, compared to 27.3% in 2000. Many of the communities with the highest percentages of Native Hawaiian or Other Pacific Islanders are small communities where one person or one family can have a large impact on overall percentages.

⁴⁹ All data presented here on race and ethnicity was obtained from the following source: U.S. Census Bureau. (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Source: U.S. Census Bureau (2010). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 (Demographic Profile SF) Decennial Census. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

On average, Alaskan communities were only 1.8% Hispanic in 2000 and 2.1% Hispanic in 2010, with a range of 0% to 20.8% in both years. Communities with the highest percentage of Hispanic residents tend to be heavily involved in fish processing, which provides job opportunities for seasonal workers. Many of these communities are located on the Alaska Peninsula and the Aleutian Islands.

The ratio of men to women in many Alaskan communities tells the peculiar story of labor mobility in industries such as fishing and oil extraction. Most of the communities profiled in this document have more men than women, but this is particularly true of communities that rely heavily on fishing and fish processing. When compared to the overall U.S. population, which is approximately equally distributed between men and women (49.1% male in 2000 and 49.2% in 2010), and even when compared to the overall population of the State of Alaska (51.7% male in 2000 and 52.0% in 2010), a majority of the communities profiled in this document are more heavily skewed toward male residents. Over 70% in 2000 and 66% in 2010 of Alaskan communities had male percentage greater than the state average. A considerable number of those communities which have the highest ratio of men to women are located in Southwest Alaska (in the Alaska Peninsula and Aleutian Islands), and in Southeast Alaska. Both of these areas are

heavily involved in commercial fishing and fish processing, labor sectors that tend to be male-dominated.

By contrast, large communities, communities with less transient employment opportunities, and some traditional Native communities, tend to be much more balanced in terms of gender composition. Anchorage (50.6% male in 2000 and 50.8% in 2010), Ketchikan (50.4% male in 2000 and 50.8% in 2010), and Juneau (50.4% male in 2000 and 51.0% in 2010) are all relatively balanced in terms of gender composition and all have large populations by Alaska standards. These communities also have a wider variety of employment opportunities such as tourism, finance, real estate, communications, government, mining, timber, and oil and gas industries. These more metropolitan communities follow the relatively balanced gender pattern of other major metropolitan areas in the United States. Some remote and largely Native communities, such as Newhalen (50% male in 2000 and 48.4% in 2010) and Hooper Bay (49.7% male in 2000 and 51.5% in 2010), have very balanced gender structures as well, in part because of the somewhat more limited commercial fishing opportunities; neither community had a fish processing plant. Excursion Inlet, Nikolski, Portage Creek and Wiseman all have exactly balanced gender structures; each of these communities has a population under 100 and lack commercial crew or processing employment. Some communities have more females than males, but this is considerably less common, with only 10.4% of Alaskan communities having more than 50% women.

The age structure in many of Alaskan communities is also telling. The average median age of communities was 32.7 years in 2000 and 36.2 years in 2010, somewhat younger than the U.S. median of 35.3 years in 2000 and 37.2 in 2010. This indicates a slight trend toward a young working-age population with few elderly residents for the entire State of Alaska. Approximately 54% of Alaskan communities have a lower median age than the U.S. average. This is due in part to the physical demands of the work and the transient nature of employment in fishing and fish processing. It is also influenced by the relative absence of the elderly in the small coastal communities of Alaska, except in traditionally Native communities. These trends are also represented graphically in Figure 3.

Figure 3.-Population structure of the population as a whole in Alaska.

History of Alaska

Although the precise date of initial occupation of Alaska’s coastline is still somewhat in dispute, it is widely confirmed that people from northeast Asia came to Alaska during the peak of the last glacial period more than 10,000 years ago.⁵⁰ These early arrivals spread across the coastal (and later interior) lands of Alaska, and gave rise to quite different material cultures, languages, subsistence patterns and cultural identities. There are twenty Alaska Native languages from four distinct language families: Eskimo-Aleut, Tsimshian, Haida, and Athabaskan-Eyak-Tlingit. Migration, descent, and cultural diffusion over the millennia help to explain the complex cultural mosaic that is Native Alaska.

The history of contact between Europeans and Alaska Natives is turbulent and ever-changing. The first European to enter Alaskan territory was Vitus Bering, who, sent by Peter the Great of Russia in 1728, sailed into the strait that now bears his name. By the mid-18th century,

⁵⁰ Ames, Kenneth W. and Herbert D.G. Maschener. (1999). *Peoples of the Northwest Coast: Their Archaeology and Prehistory*. London: Thames and Hudson.

the intensive resource extraction that would characterize Alaska's colonial history had begun. Russian expeditions began harvesting North Pacific sea otters and fur seals in great quantities for the international market. This early contact for primarily economic purposes resulted in a long and significant cultural exchange; many coastal communities throughout Alaska have residents with Russian surnames and maintain a faith in the Russian Orthodox Church.

In 1867, the U.S. government purchased Alaska from Russia for \$7.2 million. The deal, signed by Secretary of State William H. Seward, was widely referred to as "Seward's Folly," as most U.S. citizens could see no use or value in acquiring 586,000 square miles of northern land.⁵¹ Throughout the mid- and late-19th century, gold was discovered in various locations, including near Sitka, Windham Bay, Gastineau, and, most famously, at the mouth of the Klondike River in 1897, beginning the great Klondike gold rush. Many North American towns and cities, including the metropolis of Seattle, owe their early population growth in part to the Alaskan gold rush, which brought supply-hungry miners, explorers and settlers to the area.

Military operations have long been an important part of Alaska's history. Early operations were in support of trading companies, targeting fractious Native groups, as with the shelling of Angoon in 1882. In 1942, during the height of World War II, the Japanese attacked Dutch Harbor where the U.S. had amassed a force 40,000, including civilian support personnel.⁵² The Japanese attacked and occupied the island of Attu, taking the Aleut residents back to Japan as prisoners.⁵³ The U.S. responded by forcibly evacuating the entire Aleut population and holding them in internment camps in Southeast Alaska for the duration of the war.⁵⁴ The war also precipitated the Alaska-Canada highway, built through about 1500 miles of Canadian wilderness in just eight months as an overland supply route to the territory, and used today by thousands of adventurous tourists each summer. In the 1960's and 70's, the United States used the Aleutian Islands as a nuclear weapons testing ground, exploding three devices including the largest underground nuclear explosion ever conducted by the United States.⁵⁵ Although the end of the Cold War changed Alaska's immediate strategic position, it is still a critical part of U.S. presence in the Pacific. Most recently, Adak was selected as a key site for the new U.S. missile defense system.

Beginning in the early 1900s, and expanding in the 1950s, oil extraction has been a mainstay of the state economy. With the completion of the Trans-Alaska Pipeline from Prudhoe Bay to Valdez in 1977, Alaskan oil began flowing in high volumes to the U.S. and international markets. In 1980, the Alaska Legislature established the Alaska Dividend Fund to distribute Permanent Fund earnings from oil extraction on the North Slope to Alaska residents. For all its benefits, the oil industry in Alaska also brings significant risks and liabilities. In what has become one of the most widely publicized environmental disasters and clean-up efforts in

history, the *Exxon Valdez* oil tanker ran aground on March 24, 1989, spilling 11 million gallons, and fouling shoreline from Prince William Sound to the Alaska Peninsula.

Marine species were among the earliest and most important of Alaska's commercial resources, especially marine mammals. The fur trade, based on sea otter and fur seals, drove the economics of the Russian colonial empire. Commercial whaling was an important factor in the late 19th century. Some marine mammal populations have recovered from over-exploitation, while other populations remain low or are declining, affecting subsistence users and commercial fisheries.

Commercial fisheries began in the mid 1800s with salted cod, salmon, and herring, and later canned salmon. Lucrative offshore fisheries were conducted by fishing fleets from Russia, Japan and Korea, until the 1976 Magnuson Fishery Conservation and Management Act claimed the area between 3 and 200 miles offshore as the exclusive economic zone of the U.S.⁵⁶ Crab and other shellfish, herring, halibut, salmon and groundfish have all contributed to this important industry for the state, supporting a fishing economy that ranges from family fishing operations to multinational corporations, and transforming the social landscape by the immigration of workers from around the world.

Alaska's economic, social and cultural milieu continues to evolve. Major industries including oil, military and commercial fishing remain tremendously important to the state's continued growth. At the same time, new sectors such as tourism have begun to contribute noticeably to Alaska's economy. Cruise ships, recreational fishing excursions, cultural tourism and eco-tourism are on the rise as people from around the world discover Alaska's unique character.

Current Economy

Important Economic Sectors

There were 304,851 Alaskan residents employed throughout the state in 2010, compared to 284,000 in 2000. The government sector—including federal, state and local levels—was the largest in terms of employment figures, with 70,260 jobs in 2010 and 74,500 jobs in 2000. In 2000, this was followed by services/miscellaneous (73,300), trade (57,000), transportation, communications and utilities (27,300), manufacturing (13,800, with seafood processing contributing the bulk of jobs at 8,300) and mining (10,300, with oil and gas extraction contributing the most jobs at 8,800).⁵⁷ This changed slightly in 2010 to where trade transportation and utilities (63,028 or 20.7%) providing the most jobs, followed by educational and health services (42,534 or 14.0%), leisure and hospitality (29, 835 or 9.8%) and professional and business services (25,777 or 8.5%).⁵⁸ Employment in commercial fishing has declined over

the past decade. Despite this decline, the commercial fishing and fish processing industries remain an important factor in Alaska’s employment picture.⁵⁹

Governance

The governance structure of Alaska differs from that of the rest of the U.S. The state is divided into 19 boroughs which are roughly analogous to counties in many other states, though certainly larger in terms of land and smaller in terms of population than a typical county. This includes four “unified municipalities” (Anchorage, Juneau, Sitka and Wrangell) that are borough-level jurisdictions. However, not every community is contained in an organized borough. In fact, over half of the state’s land mass is not included within the borders of the 18 organized boroughs, including the Municipality of Anchorage.⁶⁰ The remainder of the state is considered one ‘unorganized borough,’ which has been divided into 11 Census Areas.⁶¹ In all other states in the U.S., cities are organized within counties (except in the case of Louisiana, in which they are located within parishes). This higher level of governance can assist in providing various services at the local level, which may include jails and courts, housing, emergency, solid waste, transportation and additional community services.

Although fewer than 50% of Alaskan communities are located within organized boroughs, boroughs play a vital part in the governance and support of communities that are located within them. In the case of the Kenai Peninsula Borough, for example, the borough devotes a 2% consumer sales tax to the schools of the borough. Other typical responsibilities of borough-level government include: solid waste disposal, 911 communications, college funding, senior citizen funding, planning and zoning, solid waste disposal, education, and tax assessment and collection.⁶² Boroughs have the ability to institute taxes including such taxes as sales and use tax and property tax.

As described in Table 5, in Alaska, an incorporated place falls into one of three municipal classifications: home rule cities, first class cities, and second class cities. City classification depends largely on population. Home-rule and first-class cities must each have at least 400 residents, while second-class cities must have at least 25 registered voters. The municipal classification scheme determines the powers that municipalities may exercise, including the passage of land use regulation and the assessment and collection of taxes. Many Alaskan communities are unincorporated, and so do not fall under the municipal system, although most of these are nonetheless designated as Places by the Census. The communities profiled in this document are divided between various types of incorporation, but are made up largely of second-

class cities or unincorporated communities, although some first-class cities and unified home rule municipalities were selected for profiling.

Communities generate revenue in a variety of ways, including the implementation of taxes, the sale of permits, involvement in enterprise, and through outside funding programs. Incorporated communities have two types of municipal revenues: local operating revenues (generated from taxes, licenses/permits, service charges, bingo, enterprise, and other sources) and outside operating revenues (generated from federal operating revenues, state revenue sharing, state safe communities, state fish tax sharing, other state revenue, and other inter-government sources), and state/federal education funds. For many communities, much of their local operating revenue (and much of their total revenue in general) is generated by locally administered taxes, which may include sales tax, property tax, accommodations tax, bed tax, rental car tax, raw fish tax (see *Fish Taxes in Alaska* section), alcohol tax, tobacco tax, and gaming tax.

Unincorporated communities and communities located outside of organized boroughs are eligible for the State/Community Revenue Sharing program (as are communities which are incorporated which are in either an organized or unorganized borough). This program helps to fund public services including education, water and sewer, police, road maintenance, health care, and fire protection.⁶³

Alaska is the only state that does not collect state sales or income tax (sales tax in many cases is collected by cities and boroughs). However, other state taxes are in place including: alcoholic beverages, games of chance and contests of skill, conservation surcharge on oil, corporate net income, dive fishery management assessment, electric cooperative, estate (phased out in 2003), fisheries business, fishery resource landing, mining license, motor fuel, oil & gas property, oil and gas production, regulatory cost charge, salmon enhancement, salmon marketing (repealed in 2005), telephone cooperative, tire fee, tobacco, and vehicle rental tax. The largest percentage of General Fund taxes collected in 2000 by the State was made-up of oil and gas severance (production tax and conservation surcharge) which was 53% of the \$1,334,388,911 in total tax collections. A large percentage as well of the total taxes were from other oil and gas taxes: oil and gas property (20%) and oil and gas corporate (12%). The remaining pieces of the total tax collections were made-up of: other corporation (4%), fisheries business (3%), other fisheries (1%), motor fuel (3%), tobacco (1%), alcohol (1%), and other taxes (2%).⁶⁴ By comparison, in 2010, taxes on the oil and gas industry (production) made up a significantly larger percentage (76.7%) of all revenue collections. Other large tax contributors included oil and gas corporate income (11.4%), oil and gas property taxes (2.7%), other corporate income (1.9%), tobacco (1.7%), alcohol (0.7%), commercial passenger vessel (1.0%), and fisheries business (0.3%).⁶⁵

Village councils are the politically representative bodies of federally recognized Alaskan Native groups. A village council is either an Indian Reorganization Act (IRA) council or a

traditional council. There are over 226 Native village councils in the State of Alaska. Some communities which have village councils also have a municipal city government, and some do not. Many communities have additional layers of tribal representation through Alaska Native Claims Settlement Act (ANCSA) village and regional corporations that manage natural resources. There are 13 such Native regional corporations (12 for the state, and one to represent those living outside of Alaska), 168 village corporations, and four urban corporations. In addition, many Native villages are members of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were originally identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of social services to villages in their regions.⁶⁶

Infrastructure

The accessibility of Alaskan communities profiled in this document varies tremendously, largely due to significant varying levels of economic development across different regions of Alaska. While some communities such as Anchorage, Dutch Harbor/Unalaska, and Bethel have airport facilities capable of handling jet aircraft, others have only small airstrips; still others are accessible primarily by sea. Many small communities in the Bethel and Dillingham Census Areas of Western Alaska, for example, have no roads at all, relying primarily on marine and river transport, and in some places, winter ice landing strips; ground transportation in these areas is by ATVs in the summer and snowmobiles in the winter.

Similarly, there is a great deal of variation between the communities in terms of fisheries-related and other marine facilities, also reflecting significant differences in economic development. Some of the larger communities, such as Juneau and Kodiak, serve as major commercial fishing and seafood processing centers. These communities have more than one boat harbor with moorage for hundreds of vessels, several commercial piers as well as numerous shore-side processing plants. By contrast, many smaller coastal communities, especially in Western and Northern Alaska, lack dock and harbor facilities. Many of these communities do not have stores, and residents rely on coastal supply shipments by barge from Seattle. Where there are no harbor facilities, residents must use small skiffs to offload the supplies and lighter them to shore. Although fishing activity occurs in these areas and provides a vital source of employment and income, the relative underdevelopment of infrastructure and facilities remains a significant barrier to economic development.

In addition to marine facilities, there is tremendous variation in access to other types of facilities, such as hospitals, hotels, and shopping centers. A few large metropolises and many smaller micropolises serve as regional hubs, providing an array of services to surrounding villages.

⁶⁶ U.S. Government Accountability Office. 2005. *Alaska Native Villages: Report to Congressional Addressees and the Alaska Federation of Natives*. Retrieved February 7, 2012 from <http://www.gao.gov/new.items/d05719.pdf>.

Involvement in North Pacific Fisheries

Fish Taxes in Alaska

Taxes generated by the fishing industry, particularly the fish processing sector, are a very important revenue source for communities, boroughs and the state. The Fisheries Business Tax, begun in 1913, is levied on businesses that process or export fisheries resources from Alaska. The tax is generally levied on the act of processing, but it is often referred to as a “raw fish tax,” since it is based on the ex-vessel value paid to commercial fishers for their catch. Tax rates vary under the Fisheries Business Tax, depending on a variety of factors, including how well established the fishery is, and whether processing takes place on a shoreside or offshore processing facility. Although the Fisheries Business Tax is typically administered and collected by the individual boroughs, revenue from the tax is deposited in Alaska’s General Fund. According to state statute, each year the state legislature appropriates half the revenue from the tax to the municipality where processing takes place or to the Department of Community and Economic Development. The Fisheries Business Tax contributed \$18.2 million in fiscal year 2000 and \$32 million in fiscal year 2010 to total Alaska state revenue.⁶⁷

In addition to the Fisheries Business Tax, the state has collected the Fisheries Resource Landing Tax since 1993. This tax is levied on processed fishery resources that were first landed in Alaska, whether they are destined for local consumption or shipment abroad. This tax is collected primarily from catcher-processor and at-sea processor vessels that process fishery resources outside of the state’s three-mile management jurisdiction, but within the U.S. Exclusive Economic Zone, and bring their products into Alaska for transshipment to other locales. Fishery Resource Landing Tax rates vary from 1% to 3%, depending on whether the resource is classified as “established” or “developing.” According to state statute, all revenue from the Fishery Resource Landing Tax is deposited in the state’s General Fund, but half of the revenue is available for sharing with municipalities. The Fishery Resource Landing Tax contributed \$2.2 million in fiscal year 2000 and \$12.6 million in fiscal year 2010 to total Alaska state revenue. Taken together, the Fisheries Business Tax and the Fishery Resource Landing Tax make up only a small portion of Alaska’s budget, contributing only 0.3% of total state fiscal revenues in both 2000 and 2010.⁶⁸

In addition to these state taxes, many communities have developed local tax programs related to the fishing industry. These include taxes on raw fish transfers across public docks, fuel transfers, extraterritorial fish and marine fuel sales, and fees for bulk fuel transfer, boat hauls, harbor usage, port and dock usage, and storing gear on public land. There is no one source for data on these revenue streams; however, many communities report them in their annual municipal budgets. In addition, a request was made to communities to report this information in the 2011 AFSC survey. Where this information was provided, it has been reported in each community’s profile.

Commercial Fishing

The profiles in this document examine Alaskan communities and their involvement in North Pacific fisheries. Even with brief regional introductions, however, analysis at the community level of geography does not allow for the larger picture of fisheries in Alaska to emerge. In view of that, the following section examines statewide fisheries data in order to provide a rough picture of the larger fisheries context in which the selected communities operate.

In particular, fisheries in Alaska have a high volume of landings compared to other areas of the country. The industry supplies the largest source of employment in the state through harvesting and processing jobs, and the economic activity of fishing produces important sources of both private and public (tax) income. Each of these topics will be discussed more below. Together, they indicate that Alaska is a very important contributor to U.S. fisheries, and that the fishing industry is a very important aspect of Alaska's economy.

A notable characteristic of Alaska fisheries from a statewide perspective is that the types of fisheries conducted are fairly diverse. Groundfish, salmon, crab, and herring all make substantial contributions to the state's fishery profile, and except for herring, each of those resource groupings involves multiple species which can be very different from one another. These fisheries are engaged in by a diverse fishing fleet with vessels ranging in size from small skiffs to more than 300 feet. These vessels utilize many harvest methods, including pelagic trawl, bottom trawl, troll, longline, purse seine, drift gillnet, setnet, pot, jig, and other commercial gear types. Divided, as they are, by species, gear type, vessel size and management area, the state limited entry permit system issues harvest permits in 326 different categories.⁶⁹ However, this diversity at the state level does not necessarily translate to communities. While a few communities, such as Kodiak, participate in the broadest range of fisheries, most communities are sustained largely by a single dominant fishery and/or gear type.

The North Pacific's commercial fisheries have changed through time with increased technology, man-power, demand, and legislation. The 1860s saw the earliest commercial fishing efforts by U.S. vessels in Alaskan waters, primarily targeting Pacific cod.⁷⁰ After the purchase of Alaska from Russia in 1867, U.S. interest in Alaska fisheries increased. Salmon and herring were two of the earliest commercial fisheries in Alaska. In the late 1800s, the product was salted for storing and shipment.⁷¹ Improved canning technology and expanded markets led to dramatic growth in the Alaska salmon industry, with 59 canneries throughout Alaska by 1898 and 160 in operation by 1920.⁷² With the development of diesel engines, commercial fisheries for Pacific halibut and groundfish had also expanded north to the Gulf of Alaska (GOA) and into the Bering

Sea region by the 1920s.⁷³ Catch of herring for bait began around 1900. A boom in herring reduction for fish meal and oil took place from the 1920 to 1960s, and sac roe fisheries developed in the 1970s to provide high value product to Japanese markets. By the mid-1900s, fisheries were also developing for crab, shrimp and other shellfish, as well as an expanding variety of groundfish species. Substantial commercial exploitation of crab began in the 1950s with the development of Bering Sea king crab fisheries. Today, king crab harvests are well below their peak in 1980, when crab fisheries rivaled the highly profitable salmon industry in terms of landings value.⁷⁴

Between 2000 and 2009, groundfish were caught in the highest volume and accounted for the highest percentage of total landings revenue of all Alaskan fisheries. In particular, walleye pollock landings averaged 3 billion pounds through the 2000-2009 period, compared to an average of 680 million pounds of salmon landings per year. Although walleye pollock was valued at an average of only \$0.13 per pound during this period, pollock landings still accounted for the highest landings revenue of any fishery between 2000 and 2009, averaging \$371 million per year compared to \$262 million per year from salmon fisheries. Pacific cod fisheries produced the third greatest volume and landings value over the decade, averaging 520 million pounds harvested per year and an average of \$168 million in landings revenue. It is also important to note that sablefish had the highest average annual ex-vessel price between 2000 and 2009 (\$2.47), followed by crab (\$2.42), and Pacific halibut (\$2.33), although these fisheries accounted for smaller overall portions of total Alaska catch volume.⁷⁵

Salmon. The majority of commercial salmon are caught on a large fleet of small vessels using troll, gillnet, and purse seine gear. Salmon fisheries are restricted by a limited entry permit system. All five species of Pacific salmon found along the west coast of North America are harvested commercially: pink (humpback) salmon, sockeye (red) salmon, chum (dog) salmon, coho (silver) salmon, and Chinook (king) salmon.⁷⁶ The profitability of salmon for Alaskan fishermen has gone down greatly through the 1990s and early 2000s, brought about largely by the year-round availability of farmed salmon to the world, mostly grown in Chile and British Columbia, Canada (farming salmon is not allowed by law in the State of Alaska). Correspondingly, the value of fishermen's permits, vessels and gear, and the amount of money received for their catch also crashed, despite the fact that the commercial catches of wild Alaska salmon continue to be high. From the years of 1990 to 2000, the number of salmon fishermen declined by 37% which also resulted in a decline in the number of opportunities for crew members. Processors in many cases have dealt with this collapse in salmon prices with plant closures and the consolidation of operations, including the ceasing of salmon operations by the Wards Cove Packing Company in 2002.⁷⁷ However, since 2002, salmon ex-vessel prices and value have rebounded as a result of new marketing efforts and techniques, new product forms,

improved quality, and development of new markets. In addition, an increase in the price of farmed salmon on the world market after 2002 meant reduced price competition, since buyers no longer had a cheaper alternative to wild salmon.⁷⁸

Overall, Alaska's salmon runs remain relatively healthy as a result of good fisheries management, minimal freshwater habitat disturbance compared to highly developed regions further south on the west coast of North America, and favorable ocean conditions in recent decades.⁷⁹ However, it is important to note that specific stocks have experienced declines. For example, commercial fishery failures were declared on the Yukon and Kuskokwim Rivers and in the Cook Inlet in 2012 due to low Chinook salmon returns that year.⁸⁰ Previously, salmon fishery failures were also declared for Bristol Bay/Kuskokwim River in 1998, Bristol Bay/Kuskokwim River/Yukon River in 1999, Norton Sound/Kuskokwim River/Yukon River in 2000 and 2001, and the Yukon River in 2010.⁸¹ These poor salmon returns have adversely affected many rural Alaskan communities included in this document.

Herring. Herring has been important as subsistence for Alaska Natives for a very long time. As subsistence, it is still commonly utilized by Bering Sea villages in the dried form or as eggs gathered on hemlock boughs by those in the Southeast. The commercial herring fishery began in the Northwest by European settlers who salted the herring as a method of preservation. After World War I, the production of both pickled and salted herring peaked. In Alaska, around the 1920s plants sprung up from Kodiak to Craig to turn herring into meal and oil, or “reduce” the herring. As with other fisheries, the herring fishery hit a high in the 1920s and 1930s and has declined since. Stocks may have been impacted by the high catches during those years, but also another cheaper alternate for herring meal and oil, Peruvian anchoveta became dominant in the 1950s. By 1966, all of the Alaskan herring reduction plants had closed. In the 1960s and 70s, a herring food products foreign fishery was in place, but this was extinguished by the MSFCMA).

Today, herring is harvested for bait or for sac roe (for Japanese consumption (using purse seine or gillnet), and roe is also harvested in spawn on kelp fisheries (collected by scuba, rake, or by hand – or gathered on fronds from impounded herring).⁸² The largest aggregation of herring in Alaska spawns along the northern shore of Bristol Bay near the village of Togiak. Commercially exploitable quantities of herring are also found in Southeast Alaska, Kodiak, the Kuskokwim Delta and Norton Sound. Norton Sound has the northernmost fishery for Pacific herring. Although the Norton Sound herring spawning biomass has been relatively stable in

recent times, the market for herring roe has declined due to decreasing consumption of herring roe in Japan. Processor interest in the Norton Sound sac roe fishery has declined more than in other areas of the state, largely due to the timing of the fishery, which takes place later than sac roe fisheries elsewhere in the state and conflicts with the opening of the first salmon fisheries of the season. In addition, ice floes are often present in Norton Sound during the herring season. Along the Yukon-Kuskokwim coast, herring harvests have been declining in recent years, in part due to lack of processing capacity in the region.⁸³

In addition, large aggregations of herring were historically found in both Cook Inlet and Prince William Sound. However, Cook Inlet stocks never recovered from overfishing in the first half of the 20th Century,^{84,85} and Prince William Sound herring stocks collapsed in 1993 as a result of an outbreak of hemorrhagic septicemia virus, four years after the Exxon Valdez oil spill. The relationships between the oil spill, the virus, and the stock collapse remain unclear, and the population has shown little sign of recovery.^{86,87}

Groundfish and halibut. The earliest commercial venture by U.S. vessels in the North Pacific was in 1865, when the first schooner reached the Bering Sea to explore the Pacific cod resource. The Pacific cod fishery had its peak at about 1916 to 1920 and then declined until approximately 1950.⁸⁸ By the 1880s, the commercial fishery for halibut had also expanded north from Washington State and B.C. to the inside waters of Southeast Alaska, with sablefish targeted as a secondary fishery.⁸⁹ With the rise of diesel engines in the 1920s, the range of fishing vessels expanded, and more consistent commercial exploitation of halibut and groundfish extended into the Gulf of Alaska and Bering Sea regions.⁹⁰

The groundfish fisheries off of Alaska have been fished by a series of foreign nations; including Japan, Russia and Canada as major players. Canada was very active in the fishing of halibut in Alaska waters, but after 1980 the Canadian fishery in U.S. waters was phased out. Japan has been involved in flounder (yellowfin sole) and the pollock fishery, as has Russia. The flounder fisheries by both Japan and Russia declined with the collapse of yellowfin sole, with the peak in the fishery having been in 1960 at about 500,000 metric tons. More heavily targeted by both the Russians and the Japanese was the pollock fishery which started in the 1960s by Japanese trawlers. The peak of the pollock catch was in 1972 with over 1.7 million metric tons harvested by the Japanese in the Bering Sea. Russian maximum harvests of Pollock were also

during this time, but were on somewhat of a smaller scale of 300,000 metric tons per year. The Bering Sea was also fished during the 60s and 70s by a small Korean fleet. The maximum total foreign catch of pollock, flatfish, rockfish, cod, and other groundfish was in 1972 at 2.2 million metric tons. The foreign fleets also moved into the Gulf of Alaska in 1960 and targeted additional species. Additional foreign nations became involved and added to this time of overexploitation including: Taiwan, Poland, West Germany, and Mexico. By the 1970s it was in Alaska's obvious interest to control foreign involvement. The groundfish fishery was Americanized with the MSFCMA in 1976, and by 1991 the foreign fishers had been transitioned out and the entire American groundfish fisheries were harvested by U.S. vessels. The fisheries changed with the introduction of the first independent factory trawler in 1980 and subsequent over-harvest.⁹¹

Pacific halibut fisheries are managed under the International Pacific Halibut Commission (IPHC). Other federally managed groundfish species have been organized into a License Limitation Program (LLP) permitting system. In addition to federal groundfish fisheries, the state manages parallel fisheries for Pacific cod and walleye pollock along the southern coast of the Aleutian Islands and Alaska Peninsula, Kodiak Island, and Gulf of Alaska. The Total Allowable Catch (TAC) set by NMFS in each fishery applies to both federal and parallel harvest. In addition to federally-managed groundfish fisheries, beginning in 1997, 'state-waters fisheries' for Pacific cod were initiated in Prince William Sound, Cook Inlet, Chignik, Kodiak, and the southern Alaska Peninsula areas. Management plans for state-waters fisheries are approved by the Alaska Board of Fisheries (BOF), and guideline harvest limits (GHL) are set by the ADF&G. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, the ADF&G manages lingcod fisheries in both state and EEZ waters off Alaska, and beginning in 1998, management of black rockfish and blue rockfish in the GOA was transferred from NMFS to ADF&G.⁹²

In 1995, management of the commercial Alaskan halibut and sablefish fisheries shifted from limited entry to a system of catch shares. Motivations for the shift included overcapitalization, short seasons, and the derby-style fishery that led to loss of product quality and safety concerns. As a result of program implementation, the number of shareholders and total vessels participating in the halibut and sablefish fisheries declined substantially, and product quality has improved. This shift to catch shares has been controversial, raising concerns about equity of catch share allocation, reduced crew employment needs, and loss of quota from coastal communities to outside investors. The program includes allocation of the annual TAC of halibut and sablefish to commercial fishermen via Individual Fishing Quota (IFQ), and in the Bering Sea – Aleutian Islands (BSAI) region, quota shares are also allocated to six Community Development Quota (CDQ) non-profit organizations representing 65 communities in Western

⁹¹ See footnote 88.

⁹² Woodby, Doug, Dave Carlile, Shareef Siddeek, Fritz Funk, John H. Clark, and Lee Hulbert. (2005). *Commercial Fisheries of Alaska*. Alaska Dept. of Fish and Game, Special Publication No. 05-09. Retrieved December 29, 2011 from <http://www.adfg.alaska.gov/FedAidPDFs/sp05-09.pdf>.

Alaska.⁹³ Managers of CDQ organizations authorize individual fishermen and fishing vessels to harvest a certain portion of the allocated CDQ.⁹⁴

Although the 1995 catch share program implementation resulted in many benefits to commercial fishermen, processors, and support businesses, an unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out of smaller communities themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. While this issue had been addressed for the BSAI region through the CDQ program, these factors also lead to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries in other regions of Alaska. To address this issue, the North Pacific Fishery Management Council (NPFMC) implemented the Community Quota Entity (CQE) program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf. As of 2010, the Prince of Wales Island Community Holding Corporation, which represents Craig, was the only CQE non-profit that had purchased quota share.⁹⁵ More recently, at the October 2012 meeting of the NPFMC, Council members voted to approve a new catch sharing plan for halibut that would combine the allocations given to the commercial and recreational sectors;⁹⁶ however, as of the printing of this document, NMFS has not issued a final rule solidifying this new management structure.

Halibut and sablefish are primarily caught using longline gear on vessels of between approximately 50 to 100 feet in length,⁹⁷ although some state-managed sablefish fisheries in inside waters allow for use of pot, jig, hand-troll gear, or bottom-trawl gear.⁹⁸ Groundfish are still caught in trawl nets and some of this is delivered to onshore processors or floating processors, but the majority are caught on large catcher/processors the size of a football field and frozen at sea.⁹⁹ Today the groundfish fisheries are the largest in terms of both weight and value out of all the North Pacific fisheries. Walleye pollock independently accounted for almost half of all landings weight in North Pacific fisheries between 2000 and 2009,¹⁰⁰ and in fact the Eastern

Bering Sea pollock fishery is the largest ‘by-volume fishery’ in the U.S.¹⁰¹ Pacific cod was landed in the third greatest volume in Alaska over the decade, after salmon.¹⁰²

Walleye pollock remains a top volume fishery in Alaska despite limitations placed on the fishery due to concerns about Steller sea lion populations. Between the late 1970s and the early 1990s, Steller sea lion populations in the western Gulf of Alaska (GOA) and Aleutian Islands (AI) declined by almost 80%. Pollock is a primary food source for the Steller sea lion, and expansion of the high volume pollock fishery into the AI region in the 1970s was implicated in the decline.¹⁰³ In order to protect Steller sea lions, pollock fisheries management measures include time and area closures around critical sea lion habitat, and reductions in total allowable catch (TAC) that can be harvested from critical habitat areas.¹⁰⁴ In addition, NMFS listed the eastern Aleutian Islands population segment of Steller sea lions as endangered under the Endangered Species Act in 2011. Conflict still occurs, however, as the decision was legally challenged and NMFS is redoing its analysis regarding whether the population should continue to be listed.

Crab. Crab is commercially harvested in the North Pacific using pot gear or ring nets. The baited pots range in different sizes to catch different target species, and target species are also caught at varying depths ranging from 20m for Dungeness to as deep as 200-1000m for golden king crab. Seven species of crab are commercially caught in the North Pacific: red king crab (*Paralithodes camtschaticus*), blue king crab (*Paralithodes platypus*), golden king crab (*Lithodes aequispinus*), Tanner crab (*Chionoecetes bairdi*), snow crab (*Chionoecetes opilio*), hair crab (*Erimacrus isenbeckii*), and Dungeness crab (*Cancer magister*). Commercial fisheries for these species constitute approximately one-third of the total catch of crab in the U.S.¹⁰⁵

Red king crab stocks range from Norton Sound to the Bering Sea / Aleutian Island (BSAI) region, as well as the Gulf of Alaska and Southeast Alaska. Blue king crabs are more concentrated, with small populations around islands in the Bering Sea and areas of the Gulf of Alaska and Southeast Alaska. Golden king crabs are distributed along the Aleutian Island chain, the Bering Sea, and Gulf of Alaska, and are also harvested in Southeast Alaska. Tanner crabs are found in the eastern Bering Sea, Aleutian Islands, and Gulf of Alaska, while snow crab are found in the north and central regions of the Bering Sea.¹⁰⁶

Initially, Bering Sea crab stocks were targeted by Japanese trawlers starting in the late 1800s with a break during World War II, with Japanese fishers returning in the mid-1950s. In the 1920s American boats began fishing in Cook Inlet, Kodiak, and the Alaska Peninsula and the first crab cannery opened at that time. Crabbing was revolutionized with the freezing of catches which had never been done before. In 1959, tangle nets and trawlers were banned in the state of Alaska and it was necessary that crab fishermen find a new harvest method. Alaskan crabbers

¹⁰⁶ Ibid.

developed new pots based on those used by fishermen in the Lower 48, but immensely stronger – in the end weighing up to 800 pounds and reaching eight feet by three feet.¹⁰⁷

In the 1960s, the demand and price for crab increased and by the end of that decade the crab fisheries around the Alaska Peninsula and Kodiak had decreased and fishermen’s attention was focused on the eastern Bering Sea where “the average boat’s catch quadrupled from 1968 to 1978” and prices rose immensely “from 38 cents a pound to \$1.23 in four years.”¹⁰⁸ Fortunes could be made overnight or at least in a short derby-style crabbing season for both boat owners and crewmembers and money flowed freely. The peak of the lucrative Bristol Bay king crab fishery was in 1980, where 130 million pounds was landed by a fleet of 236 boats in fewer than six weeks, for an average amount landed per boat of \$500,000, and an average crew share of about \$10,000 per week. Suddenly, the next year the fishery crashed to only 34 million pounds landed, and in 1982 only 3 million were landed.¹⁰⁹ The cause of this collapse remains unclear, and king crab stocks have never recovered to the extremely high levels of 1980.¹¹⁰ In addition to king crab, Tanner crab harvests saw a peak in the late 1970s, while snow crab harvests increased in the 1980s and 1990s.¹¹¹

By the early 2000s, king and snow crab fisheries were highly overcapitalized. The entire Bristol Bay red king crab season lasted several days, and the Bering Sea snow crab fishery lasted less than 2 weeks each year. Due to concerns about crew safety and inefficiency in these fisheries, NMFS implemented a crab rationalization program in 2005. The crab rationalization program resulted in a reduction of fleet size and is credited with improved crew safety and reduced fuel consumption. The program also led to a dramatic reduction in the number of crew positions available in BSAI crab fisheries, which has led to hardship for crew members from remote communities lacking other sources of employment.¹¹²

Dungeness crab is also an important commercial species ranging from Southeast Alaska to the Aleutian Islands. Important centers of the Dungeness crab fishery were historically located in Prince William Sound, Cook Inlet, Kodiak, the Alaska Peninsula and eastern Aleutian Islands, and Southeast Alaska. However, Dungeness crab stocks in Prince William Sound, the Copper River delta and the Kachemak Bay area of Cook Inlet have declined to levels that no longer support commercial fisheries. The decline may be due to some combination of overfishing, sea otter predation, and unfavorable climatic conditions. Small commercial fisheries are still viable in Kodiak and Southeast Alaska. However, the expanding range of sea otters in Southeast Alaska has had a sizeable impact on Dungeness crab stocks in recent years, leading to significant harvest and economic losses.¹¹³

It is also important to mention the historical hair crab fishery that took place between the 1960s and 2000 near the Pribilof Islands. The fishery was started by the Japanese in the 1960s, and U.S. vessels began participating in 1979. However, the commercial fishery for hair crab was closed in 2000 due to low stock abundance. The stock remains depressed despite the closure.¹¹⁴

Other shellfish. In addition to North Pacific crab fisheries, a number of other shellfish species support commercial fisheries around Alaska. These include pot and trawl fisheries for shrimp, a dredge fishery for scallops, dive fisheries for sea urchin, sea cucumber, and Geoduck clams, and shovel fisheries for razor, littleneck, and other hardshell clams.

Pot fisheries targeting spot shrimp (*Pandalus platyceros*) currently take place in Southeast Alaska and Prince William Sound. The Prince William Sound spot shrimp fishery reopened in 2010 after being closed since the early 1990s due to low stock abundance. Spot shrimp stocks in Southeast Alaska are relatively stable, and annual harvest is capped at 800,000 pounds.^{115,116} Historically important trawl fisheries for northern shrimp (*Pandalus borealis*) are now closed following dramatic population declines in the late 1970s and 1980s.^{117,118} Today, shrimp trawl harvest is focused on sidestriped shrimp (*Pandalopsis dispar*), a larger and more valuable species.¹¹⁹

Weathervane scallops are harvested using dredges. Commercial scallop beds are located in the Gulf of Alaska, Bering Sea, and the Aleutian Islands. Given overharvest of scallop stocks throughout the world, Alaska's management of the scallop fishery is conservative, requiring 100% observer coverage in federal waters and scallop bycatch limits for crab vessels. Area closures are also common to protect bottom habitats from the impact of dredging.¹²⁰

Intertidal clam harvests in Alaska are concentrated along the sandy beaches of Cook Inlet, the Alaska Peninsula, and the Cordova area. Littleneck and other hardshell clams (cockles and butter clams) are dug by hand shovel, and razor clams are dug with shovels and 'guns'.¹²¹ In addition, a dive fishery for Geoduck clams has grown in Southeast Alaska in recent decades, after a market for Geoduck had already been established by fisheries in Washington State and B.C., Canada.¹²²

In addition, dive fisheries for sea urchin and sea cucumber take place in Southeast Alaska, as well as more limited harvests in the Kodiak Island and Alaska Peninsula regions. Red sea urchin is the primary target of the Southeast Alaska fishery, while green sea urchin is harvested in the Kodiak area. Red sea cucumber is the only commercially harvested species of

sea cucumber in Alaska.¹²³ As in the case of Southeast Alaska Dungeness crab stocks, the impact of an increasing sea otter population has led to significant economic losses in these fisheries in recent years.¹²⁴

Fish Landings and Processing

One notable aspect of many Alaskan fisheries is the high volume of processing activity that occurs offshore on floating processors. Because this document focuses on “fishing communities” as defined in the MSFMCA (16 U.S.C 38 §1802 (16) and further specified in NMFS guidelines,^{125,126} we are primarily concerned with inshore processing activity. Offshore activities are relevant insofar as they affect local communities through purchase and loading of goods and services, employment, employee furloughs, and processed product offloading. Fish processed offshore and offloaded in Alaska communities as processed product is converted into a whole fish weight by NOAA for statewide tabulation.¹²⁷ Offshore product is not credited to specific communities.

The amount of landings in each community depends in large part on the community’s proximity to productive fisheries, the size of the local fleet, and existing port facilities. In addition, the fish processing industry provides vital employment opportunities, income sources, and tax revenues for many Alaskan communities. In many cases, it is the most value-added point in the fishery process. Whether a community serves as a processing center, and whether fish processing is economically productive for a community, depend on a number of factors including location, population size, proximity to major fishing fleets, and the composition of species being processed.

Tables 8 and 9, below, list the top ten communities by weight and value of landings purchased by local fish buyers. Not surprisingly, in both 2000 and 2010, Dutch Harbor ranked highest both in terms of ex-vessel weight of landings and in terms of the monetary value of landings. In 2000, Akutan, ranked third in terms of weight, comes in behind Kodiak in terms of value. This is because Akutan is located along the Aleutian Island chain and processes primarily pollock and other groundfish species, a high volume, low per-unit value niche, while Kodiak processes salmon, halibut and other high-value species. This shows that geographic location affects community access to particular species of fishery resources, and this access in turn exerts an important influence on the community’s economic vitality. By 2010, processing in Kodiak activities had increased significantly, moving it ahead of Akutan in both pounds landed and ex-vessel value. But the changing order of communities between volume and value underscores the difference in fishery resource value.

¹²⁹ Ibid.

In addition to the value-per-unit factor affected by the types of fish processed, the structure of processing differs by community. For example, Akutan, with only a single shore-side processing facility present between 2000 and 2010, processed a greater volume of fish than Kodiak with its 13 shore-side processors in 2000 and 11 in 2010. This underscores the profitability of operating many small-scale specialty processors in a high per-unit value market such as Kodiak.

Of the 196 communities which were profiled, 65 communities included fish buyers that filed fish tickets with the CFEC in 2010 (Table 10). Twenty-four communities included more than 10 fish buyers, 20 communities had 3 to 10 fish buyers, 1 community had 2 fish buyers, 20 communities had 1 fish buyer, and 130 communities did not have an active fish buyer present in 2010.¹³⁰ Similarly few communities have shore-side processing facilities available to them. Again, of the 196 profiled communities, 66 had shore-side processing facilities that filed Intent to Operate declarations with ADF&G in 2010 (Table 10). Of these, two communities had more than 10 shore-side processing facilities, 8 had 6 to 10 shore-side facilities, 11 had 3 to 5 shore-side facilities, 7 had two shore-side facilities, and 38 had only one shore-side facility.

Labor in Alaska's Commercial Fishing Industry

The commercial fishing sector is the largest private employer in Alaska. The fishing industry provides a variety of employment opportunities, including fishing, processing, transport, and dock and harbor work. According to the CFEC, in 2000 there were 21,009 commercial permits sold for all fisheries in Alaska; 58% of which were actively fished. The number of permits issued to residents of Alaskan communities declined over the decade to 17,698 in 2010 with 56% being actively fished (Table 11).

The number of licensed crew members employed annually in Alaskan commercial fisheries has declined over recent decades, from more than 32,000 in 1993 to approximately 17,500 in 2003 to 11,387 in 2010, an average decrease of 5.7% per year during that period (Table 12).^{132,133} The decline is likely due to a combination of declining salmon prices, fishery management policy changes, and other factors. Although the majority of licensed crew members are Alaska residents (59%), the labor pool also draws from Washington (22%), other U.S. states, and around the world. The industry remains male-dominated, with women accounting for just 14% of licensed crew over the past decade. In addition, personnel turnover is high; the average crew member holds a license for just 1.8 years.¹³⁴ Similar declines were seen in the total number of vessels primarily owned by Alaskan residents, vessels homeported in Alaskan communities and vessels landing catch in Alaskan communities (Table 12).

The employment data collected by the U.S. Census noticeably under-represents those involved in the fishing industry. Despite the heavy reliance on data supplied by the Census for the composition of the profiles contained in this document, the employment data given on fishing was not reported in the profiles because of its visible deficiencies. The figures originate from Census form questions which are phrased in a way that likely deters answers from self-employed persons (as most fishermen are). In the results of the Census, agriculture, forestry, fishing and hunting were combined together into one reported figure, which makes it difficult to discern which individuals were involved in the fishing portion of the category. Also, when examining the total figure for the category which includes fishing, the number is simply too small to be accurate even when compared to just the number of individuals in a community which fished their permits.

Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. [URL not publicly available as some information is confidential.]

The numbers of CFEC permits fished/not fished are given in the profiles, however; as well as the number of community members which held a crew license. Processing sector employment data was not available to us at the community level and is not included in the profiles. However, processing sector data is available at a higher aggregation level, such as at regional levels. Employment information for the important offshore processing sector is also not discussed in the profiles because the effect on Alaska communities is indirect and is brokered for the most part out of Seattle. Information regarding Seattle and other West Coast fishing communities is provided in the community profiles produced for that region.¹³⁵

Finally, over the last two decades, a number of catch share programs have been implemented in Alaskan fisheries. Three of which were implemented with respect to federal fisheries for halibut, sablefish and crab. The community profiles specifically call out these three programs as they are perhaps the most important to residents of Alaskan fishing communities. Data is provided in each profile on the participation of residents in these fisheries. Statewide, these catch share fisheries have allotted a significant number of pounds to quota share holders that are residents in Alaskan communities. However, allocation of individual fishing quota (IFQ) has decreased steadily for both the halibut and sablefish programs from approximately 31.1 million pounds of halibut and 13.2 million pounds of sablefish in 2000 to approximately 23.6 million pounds of halibut and 10.7 million pounds of sablefish in 2010 (Tables 13 and 15). On the contrary, the annual allocation of IFQ in the federal crab fisheries increased substantially from approximately 8.8 million pounds at the beginning of the program in 2005 to approximately 19.1 million pounds in 2010 (Table 17).

When broken down to the community level, the quota shares and annual IFQ allocation held by Alaskan residents associated with all three of these federal catch share fisheries is concentrated in few communities (Tables 14, 16 and 18). In addition, significant consolidation of quota shares owned by Alaskans has occurred in the federal halibut fishery, where residents of 137 Alaskan communities owned quota shares in 2000, but only 84 Alaskan communities had residents who owned quota shares in 2010. Both the federal sablefish and crab fisheries maintained steady numbers of Alaskan communities that participated in these fisheries between 2000 and 2010. In 2000, 50 communities were allocated sablefish quota and 14 were allocated crab quota in 2005 (when the program commenced), compared to 49 and 15 in 2010, respectively.¹³⁶

Tables 14, 16 and 18 provide further information on the top ten communities with holdings in each of these federal fisheries. Between 2000 and 2010, the rankings of the top ten communities with regards to annual IFQ allocations in all three fisheries changed minimally. In fact for sablefish, the top five communities with IFQ stayed the same of this time period and for halibut, the top four communities remained the same. For both of these fisheries, the top ten communities with IFQ are concentrated in southcentral and southeastern Alaska, with the exception of Dillingham in Bristol Bay. With regards to crab, the rank of communities changed slightly; however the magnitude of IFQ and quota share holdings changed dramatically for some

communities. Anchorage residents, for example, increased their holdings of crab quota shares by almost five fold. In addition, the community of St. Paul acquired a significant number of holdings in the first five years of the program ranking it fourth in terms of IFQ allotment in 2010.

Recreational Fishing

Sport fishing continues to be an important part of Alaska’s economy. Opportunities for recreational fishing vary widely by region. Southeastern Alaska, Kodiak and the Kenai Peninsula are the most popular sport fishing destinations in the state; license sales and guide/charter businesses play a vital role in the local economies of these regions (Tables 19-21). In 2000, ADF&G sold 235,316 sport licenses, 16.9% of which were sold to visitors from other states or countries. The number of sport fish licenses sold almost doubled by 2010, where 441,044 licenses were sold, 52.9% of which were sold to visitors to the state indicating that almost the entire increase in licenses was due to license sales to visitors to the state.

The charter fishing industry, which caters to many of these out of state visitors, is especially strong in southcentral and southeast Alaska. The communities most active in catering to charter fishing have stayed relatively stable between 2000 and 2010, with Anchorage, Soldotna, and Sitka at the top, as well as other popular destinations such as Homer and Ketchikan (Table 20). However, it too has seen a relative decrease since 2000. Of the 196 profiled communities, 81 communities had charter businesses in 2010. Overall, the number of sport fish guide businesses in Alaska has dropped steadily from 2,002 in 2000 to 1,259 in 2010. The number of licensed sport fish guides has gone through an even stronger decrease. The number of guides between 2000 and 2004 remained relatively steady at approximately 3,300 and then dropped to a third that in 2005, likely due to the implementation of a 2-fish per person bag limit that was instituted by NOAA in 2005. In recent years, the number of licensed guides has continued to drop, although not as dramatically.

Table 19. Sport Fishing Trends in Alaskan Communities: 2000-2010.

Year	Sport Fish Guide Businesses in Alaska ¹	Sport Fish Guide Licenses Sold to residents of Alaska ¹	Sport Fishing Licenses Sold to residents of Alaska ²	Sport Fishing Licenses Sold in Alaskan communities ²
2000	2,002	3,169	195,527	235,316

The five species of Pacific salmon, halibut, steelhead, trout and northern pike are the most commonly fished sport species. Most other areas of the state offer sport fishing opportunities to some extent, but do not see the high volume of fishermen that the southeast and central regions attract. These other areas tend to offer less productive stocks of sport species and have more remote locations.

Although revenues generated from sport fishing license sales and guide/charter businesses are important, they are by no means the only forms of community development that stem from the sport fishing industry. Communities that have a reputation as good fishing locations also tend to be linked to the tourism industry in general, with more tourism infrastructure such as lodging accommodations, restaurants and other amenities. Sport fishing, in many cases, is merely one component of a growing tourism industry throughout the state.

Subsistence Fishing

Residents of many Alaskan communities participate in the harvest of fish, wildlife and other wild resources to a higher degree than in other parts of the U.S. A high reliance on subsistence resources characterizes many Native Alaskan communities, both as a source of sustenance and cultural identity.^{137,138} The subsistence way of life is also highly valued by non-Native residents of many Alaskan communities, and is often identified as a primary motivation for living in Alaska.^{139,140} In remote communities and places lacking full-time employment opportunities, subsistence resource use is typically high. Among several types of legally recognized uses of fish and wildlife (including subsistence, commercial and recreational), subsistence harvest is accorded the highest priority in Alaska by both the state and federal government.^{141,142}

The regulations governing the harvest of subsistence resources in Alaska are complex and changing. For many years, the federal government allowed the State of Alaska to manage subsistence harvesting on federal lands. Beginning in 1980 with the adoption of Title VIII of the Alaska National Interest Lands Conservation Act (ANILCA), “non-rural” area residents were prohibited from harvesting subsistence resources on federal lands and waters. A 1989 court case, *McDowell v. State of Alaska*, challenged this designation and a decade-long legal battle ensued. By 1999, the federal government had taken over subsistence management of its own lands and waters; residents of populated areas like the Matanuska-Susitna area and the Kenai Peninsula have been designated “non-rural” and are thus ineligible to harvest subsistence resources on

¹⁴² See footnote 140.

federal lands and waters. Residents of non-rural areas, however, are eligible to harvest subsistence resources on lands and waters of the State of Alaska.¹⁴³ This divided system of management between state and federal agencies, known as “dual management,” creates a patchwork of differing regulations mapped to the different jurisdictions. For State lands, the Board of Game and the Board of Fisheries, whose members are appointed by the governor and approved by the legislature, create subsistence regulations. For federal lands, the Federal Subsistence Board, whose membership is comprised of leaders from five federal agencies in Alaska and an appointee of the Secretary of Interior, create subsistence regulations.^{144,145}

Both the state and federal government designate eligibility to harvest subsistence resources based on customary and traditional uses and availability of alternative resources. In addition, the federal government considers residence when designating subsistence eligibility. Since 1992, in order to reduce resource pressure, the state government has designated several “non-subsistence areas” where subsistence fishing and hunting is not allowed. These areas include the Fairbanks area, the Anchorage-Mat-Su-Kenai area, Juneau and Ketchikan.¹⁴⁶ The federal government limits access to certain subsistence resources. Halibut, for example, may be harvested for subsistence only by residents of communities with customary and traditional uses of halibut who hold a Subsistence Halibut Registration Certificate (SHARC) issued by NMFS.¹⁴⁷ The state government issues permits for the subsistence harvest of salmon.¹⁴⁸

The majority of Alaskan communities participate in subsistence harvesting to some degree; however, limited documentation of subsistence harvests is available. Based on subsistence harvest surveys conducted by the ADF&G Division of Subsistence in communities throughout Alaska, in 2010, urban communities were estimated to have an average per capita subsistence harvest of 23 pounds per person per year, while rural communities were estimated to have an average per capita harvest of 316 pounds. In rural communities, 75%-98% of households were estimated to harvest fish and 48%-70% were estimated to harvest wildlife in 2010. It is important to note that a greater percentage of households were estimated to *use* subsistence resources in these communities (92%-100% using fish and 29%-92% using wildlife resources) than were estimated to participate directly in harvest, highlighting the importance of subsistence food sharing between households.¹⁴⁹ Subsistence sharing networks have been shown to exist both within and between communities.^{150,151}

The ADF&G subsistence surveys utilize several measures of participation in subsistence fishing, and we have reported on these measures in the community profiles. They include: the percentage of households participating in subsistence for various marine resources, the per capita yearly harvest of marine and terrestrial subsistence resources, and the total annual subsistence harvest of salmon and halibut. Based on these measures, there is tremendous variation in the amount and type of subsistence resources harvested in Alaska. This variation in volume of subsistence harvest can be clearly observed at the regional level. In 2010, the regions of Alaska with the highest per capita subsistence harvest were Western Alaska (490 pounds of useable weight harvested per person per year), the Arctic (436 pounds per person), and the Rural Interior (370 pounds per person).¹⁵²

Salmon is by far the widest relied upon subsistence resource in the state. In 2008 (the last year data was available), 220 communities harvested salmon for subsistence use, compared to 234 in 2000. The top ten salmon harvesting communities are widely spread across the state, ranging from Nome to Bethel to Kodiak and Anchorage (Table 23). By comparison, in 2009 (the last year data was available), 78 communities harvested halibut for subsistence use, compared to 80 in 2003 when the program started. The main halibut harvesting communities are located in Southcentral and Southeast Alaska from Kodiak towards the north to Hydaburg in the south. However, in recent years, residents of Unalaska on the Aleutian Islands chain have also recorded fishing for halibut for subsistence (Table 25). Tables 22 and 24 show the overall harvests of salmon, marine invertebrates, other fish (not including salmon and halibut), and halibut in the state.

Marine mammal harvests are also extremely important to many communities in Alaska. However, limited information is available about annual harvests by community. The information that was retrieved for use in these community profiles was obtained from ADF&G on seal and sea lion harvests, from the U.S. Fish and Wildlife Service for sea otter, walrus and polar bear harvests, and from the Alaska Beluga Whale Commission for beluga whale harvests. Tables 26 to 33 present overall harvests in the state and the top ten communities reporting harvests for each species. It is known that some communities in the northern areas of Alaska also hunt for whales for subsistence purposes; however, data on harvests by community was not available.

Overall, a total of 228 belugas were harvested in 2006 by residents of 26 communities, compared to 280 belugas harvested in 2000 by 25 communities. In general, harvests of belugas were consistent between 2000 and 2006, with the exception of a spike in 2001 to 415 whales harvested (Table 26). The top ten communities that reported harvesting belugas between 2000 and 2006 are exclusively located along the coast in Western and Northwestern Alaska (Table 27). At least 75% of all beluga harvests were made by the top ten harvesting communities.

In comparison, very few polar bears were harvested between 2000 and 2010. On average 51 polar bears were harvested each year with a maximum of 98 in 2002 and minimum of 14 in 2010. Since 2006, harvests of polar bears have been in decline, most likely due to its new status as threatened under the Endangered Species Act (Table 26). The number of communities harvesting polar bears is lower than any other subsistence resource, with only ten communities harvesting them in 2000 and five communities harvesting them in 2010. These low numbers

¹⁵¹ Brock, Mathew, Philippa Coiley-Kenner and the Sitka Tribe of Alaska. 2009. *A Compilation of Traditional Knowledge about the Fisheries of Southeast Alaska*. ADF&G Technical Paper No. 332. Retrieved March 30, 2012 from <http://alaska.fws.gov/asm/pdf/fisheries/reports/04-652Final.pdf>.

¹⁵² See footnote 149.

suggest that polar bear harvests are linked to only those communities that are within the range of the polar bear above the Arctic Circle (Table 28).

Similar trends are seen for the subsistence harvest of walrus. In 2010, 16 communities harvested walrus, compared to 33 in 2000; however, between 75.5% (in 2000) and 85.6% (in 2010) of total harvests in the state were undertaken by residents of Savoonga and Gambell on St. Lawrence Island. The rest of the harvests are undertaken by relatively few communities located in Western and Northwestern Alaska (Table 29). On average, 1,417 walrus are taken each year for subsistence use; however, these numbers too have been in decline in recent years (Table 26).

Finally, harvests of sea otters, sea lions, harbor seals and spotted seals are undertaken annually by relatively few communities. On average, 782 sea otters, 150 sea lions, 1,574 harbor seals and 149 spotted seals are taken annually for subsistence use (Table 26). In general for these four species, the same communities participate in harvest activities from year to year. In 2010, 27 communities harvested sea otters, compared to 26 in 2000. The top ten communities harvesting sea otters are generally located in Southcentral and Southeast Alaska (with the exception of Shishmaref in 2000) and have harvested up to 98.3% of all sea otters taken (Table 30). In 2008, 16 communities harvested sea lions, compared to 18 in 2000. The top ten communities harvesting sea lions are generally located the Aleutian Islands and on the Alaska Peninsula and generally account for 90% of all harvests (Table 31). In 2008, 48 communities harvested harbor seals, compared to 56 in 2000. Harbor seal harvest is generally more evenly dispersed among communities, with only 56-60% of total harbor seal harvests taken by the top ten communities. The communities harvesting the greatest number of harbor seals are spread out between Southcentral and Southeast Alaska (Table 32). Finally, six Alaskan communities reported harvests of spotted seals to ADF&G between 2000 and 2008. All of these communities are located in Western Alaska near the Kuskokwim River delta (Table 33).

Regional Introduction: Anchorage/ Matanuska-Susitna

Communities

Anchorage
Palmer
Petersville
Skwentna

Talkeetna
Wasilla
Willow

People and Place

Location

The Anchorage and Matanuska-Susitna (Mat-Su) area includes the Mat-Su Borough and Anchorage Municipality. The profiled communities in this sub-region are for the most part all located within about an hour travel by car of the City of Anchorage, which has made this one of the fastest growing regions in the state. This sub-region is situated at approximately 61° N. latitude and -149° W. longitude. The Matanuska-Susitna area is made up of thriving valley farmlands, whereas the Anchorage Municipality encompasses the largest city in Alaska which had a total of 291,826 inhabitants in the year 2010, approximately 41% of the population of entire state of Alaska.¹ Many of the communities are located off of Cook Inlet; however, some are located more inland in the lush agricultural countryside.

Demographic Profile and History

The area was historically occupied by Tanaina Indians, an Athabaskan Native group; however, today the Native population is very low in comparison to other areas in Alaska. A total of 11.1% of the population identified themselves as at least part Alaska Native or American Indian in Anchorage in the year 2010 and 9.5% of the population in the Matanuska-Susitna Borough overall. Overall, the combined population of both the Anchorage Municipality and Mat-Su Borough was 380,821 in 2010.² Recent development and growth has been mainly attributed to the closeness in proximity to the state's largest city of Anchorage.³ The metropolis of Anchorage accounts for about 76.6% of the population of the Anchorage/Mat-Su area⁴ and is the center of commerce for the entire state. The population of Anchorage includes the populations for Eagle River-Chugiak as well as Girdwood as reported by the U.S. Census.

Anchorage is the region's commerce center and has a largely diversified economy. Oil and gas industries, finance and real estate, transportation, communications, and government agencies are headquartered in Anchorage. Numerous visitor and tourist facilities and services are available. Over 13,000 military personnel are stationed at Fort Richardson and Elmendorf Air Force Base.⁵ The communities of Palmer and Wasilla have strong agricultural histories and also support other industries. Both of these areas continue to experience high levels of growth as Anchorage's population expands.^{6,7} The economy of Willow is based heavily on tourism and

sportfishing. Employment in Skwentna is for the most part available at the community store or school.⁸ All the profiled communities are tied to the commercial fishing sector, although Anchorage residents contribute the largest share to the local commercial fishing fleet and to the population of Alaska resident crew members that live in the region.

Natural Resources and Environment

The weather in the Anchorage/Mat-Su region varies quite a bit between those communities which are located near or on the water and those communities which are located farther inland. The inland communities, Palmer, Skwentna, Wasilla, and Willow have extreme temperatures during the winter months, ranging from -30 to 51 °F in January. Willow is very extreme in terms of snowfall, ranging between 48 to 150 inches per year and Skwentna has a higher average of snow as well with 70 inches per year. The other inland communities average about 50 inches per year of snow, about 16.5 inches of precipitation, and the temperatures in the summer range from about 37 to 85 °F. Coastal communities in the sub-region include Anchorage, Eagle River-Chugiak, and Girdwood and their winter temperatures range from about 8 to 21 °F, whereas their temperature in July ranges from about 51 to about 65 °F. The total average annual precipitation is approximately 15.9 inches in both Anchorage and Eagle River-Chugiak; however, Girdwood averages about 80 inches per year. The average snowfall is approximately 69 inches for all of these water-bordering communities.⁹

Much of the Mat-Su area is built on heavily glaciated sediments and alluvium. Subsurface geology consists of sedimentary rock typically found in lowland areas west of the Chugach Mountains. Upland areas consist of harder metamorphic and igneous rock. Surface materials consist of moraines, estuarine deposits, and bog deposits. Soils are made up primarily of silty loams.¹⁰

The diverse landscape is characterized by lowland marsh and tidal mudflats, subalpine and upland tundra, alpine meadows, taiga, mesic forest, barren rock, and icefields.¹¹ Most of the region is located in a transitional zone creating a mix of coastal and boreal vegetation communities. Coniferous stands dominated by Sitka spruce and mountain hemlock populate the coastal zones, while dwarf spruce birch, aspen, alder, and willow populate the boreal areas. Disturbed, lowland, or drainage areas typically consist of conifers mixed with cottonwood, willow, and birch. Upland muskegs and bogs consist of dwarf vegetation, shrubs, and sedges.^{12,13}

Mineral resources in the area include the Wishbone Hill coal deposit 40 miles northeast of Anchorage, and the Willow Creek mineral area 40 miles north. Usibelli Coal Mine Inc. has been conducting exploration and feasibility studies to determine the viability of developing Wishbone Hill.¹⁴ The Willow Creek mineral area, which has a history of producing several gold prospects, is also currently being assessed for further development.¹⁵ Numerous small lakes, streams, wetlands, and wooded areas provide a range of ecological services and recreation resources.

Coal, timber, and gravel make up the majority of exploitable natural resources in the Willow area. Coal deposits studied in the Houston area are sub-bituminous and characterized as low to medium grade.¹⁶ The Chuitna Coal Project, located to the southwest of Willow, produces 12 million tons of coal annually and is expected to have a productive lifespan of 25 years.¹⁷ Oil and gas sources are known to exist in the area. There are several shallow gas leases within the Willow area and additional exploration licenses have been issued within the Susitna Valley.¹⁸ There are several oil extraction project located within the Cook Inlet as well. Other coal gasification developments are focused primarily within the Beluga River area to the southwest. Gas storage was approved for the Ivan River area outside of Beluga.¹⁹ Geothermal energy sources are also thought exist in the area.

Governance

There are two boroughs in this sub-region: the Municipality of Anchorage and the Matanuska-Susitna Borough. The communities in this sub-region have varying types of city governments ranging from Anchorage's status of Unified Home Rule Municipality to Willow which is unincorporated.

The communities in this region were not included in the Alaska Native Claims Settlement Act (ANCSA) and are also not federally recognized as Native villages. However, because Anchorage is the main commercial center of the state, many Native regional corporations, Native village corporations, non-profits, community development quota organizations, economic development organizations, regional health corporations have their headquarters or an external office located in the city.

Involvement in North Pacific Fisheries

The Anchorage/Mat-Su sub-region is intimately linked to both commercial and recreational fishing industries. Many commercial permits are issued to its residents and many sport fishing licenses are sold in its borders annually. Information on subsistence on the other hand is not readily available for the most part because almost all of these communities are considered to be urban, and thus are not legally entitled to engage in subsistence harvests on federal land.

Anchorage is one of the main centers for commercial fishing in the state, providing a large amount of support services and businesses, many processing plants, the largest fleet in the state, a large number of resident crew members, and a large amount of permit holders in various fisheries. In the Anchorage/Mat-Su region, the main fisheries in terms of number of permit holders were salmon which had the largest participation overall, halibut, groundfish, herring, and a smaller amount of crab permits and other shellfish permits. In 2010, residents of profiled Mat-Su communities held a total of 1,617 fishing permits issued by the Commercial Fisheries Entry Commission. The vast majority of these permits (1,181) were held by Anchorage residents.²⁰

An extremely large number of sport fishing licenses were sold in profiled communities within the sub-region in the year 2010, totaling 137,647. Again, the vast majority were sold in Anchorage at 101,073.²¹ Many of these licenses, however, could have been purchased by tourists on their way to their final sport fishing destination, as most flights coming into the state pass through Anchorage and no distinction is made in records of permits sold in this regard. In addition there are many sport fishing guide businesses in operation within the communities, especially in Anchorage where there were 144 sport fish guide businesses in 2010.²²

Almost all communities profiled in the sub-region were considered urban areas and thus were not able to engage in subsistence activities on federal land, as mentioned above. In addition, little evidence of subsistence was available except for information regarding salmon subsistence permits. The amount of subsistence salmon permits are comparatively low for the area; however, frequently in urban settings subsistence can be disguised as sport fishing.²³

Regional Challenges

Because of the high number of permits issued to residents of the area for salmon, it is probable that many have been adversely affected by the recent falling salmon prices attributed to

Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle.

the expansion of aquaculture fish industries in other nations. Federal fishery disaster declarations have been made in 1997, 1998, 2000, 2010 and although no federal salmon disaster funds were allotted to the profiled communities in this region, it is likely that those which have permits for salmon in the Anchorage/Mat-Su area have been affected.²⁴ A city such as Anchorage may not demonstrate the devastating effects of falling salmon prices seen elsewhere because it has a larger budget and a robust tax base. However, the impacts on individuals may be significant.

Population migration patterns within the Anchorage/Mat-Su region have recently become a topic of interest for local and state governments, especially concerning migration from rural areas. In 2010, it was estimated that as much as 2% of rural areas with majority Alaska Native populations migrate annually to the Anchorage area either permanently or temporarily. In addition, there has been significant migration from the “Anchorage Bowl” area, to the greater Mat-Su region. During the 2000-2008 period, 14.5% of the average annual movement out of Anchorage was absorbed by the Mat-Su Borough. Changes in demographics due to population shifts can put pressure on public infrastructure and services. For the Mat-Su Valley, rapid population growth requires expansions of existing services. For the case of rural population flight, the specific demographic which is moving to Anchorage often does so in search of employment or to reduce their living expenses, and may require public assistance while adjusting.²⁵

Anchorage (ANG-kuh-ridge)

People and Place

*Location*²⁶

Anchorage, the most populated municipality in Alaska, is located in southcentral Alaska at the head of Cook Inlet, 576 mi northwest of Juneau and 1,400 mi northwest of Seattle. The area encompasses 1,697.2 sq mi of land and 263.9 sq mi of water. The city is surrounded by the rugged Chugach Mountains, Cook Inlet, and many miles of national forest land, state parks, and tidelands. Anchorage became a Unified Home Rule Municipality in 1975 and is located within its own borough.

*Demographic Profile*²⁷

In 2010, there were 291,826 residents, ranking Anchorage 1st of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population grew by 29.0%. Between 2000 and 2009, the population grew by 11.6% with an average annual growth rate of 0.81%, which was slightly higher than the statewide average of 0.75% and indicative of modest, steady growth.

The racial composition of Anchorage was predominately White in 2010. In that year, 66.0% of residents identified themselves as White, compared to 72.2% in 2000; 8.1% identified themselves as Asian, compared to 5.5% in 2000; 7.9% identified themselves as American Indian or Alaska Native, compared to 7.3% in 2000; 5.6% identified themselves as Black or African American, compared to 5.8% in 2000; 2.0% identified themselves as Native Hawaiian or Other Pacific Islander, compared to 0.9% in 2000; 8.1% identified themselves as two or more races, compared to 6.0% in 2000; and 2.3% identified themselves as some other race, compared to 2.2% in 2000. In addition, 7.6% of residents identified themselves as Hispanic or Latino, compared to 5.7% in 2000.

In 2010, the average household size in Anchorage was 1.60, compared to 2.60 in 1990 and 2.67 in 2000. In that year, there were a total of 113,032 housing units, compared to 94,153 in 1990 and 100,368 in 2000. Housing characteristics in 2010 were virtually the same as in 2000. In both years 57% of households were owner-occupied, 38% were renter-occupied, 4% were vacant, and 1% was occupied seasonally. In addition, 8,450 residents were reported to be living in group quarters in 2010, compared to 3,384 in 1990 and 7,014 in 2000.

Figure 1. Racial and Ethnic Composition, Anchorage: 2000-2010 (U.S. Census).

The gender distribution was relatively equal in 2010 at 50.8% male and 49.2% female. This was more even to the distribution statewide (52.0% male, 48.0% female), and similar to the distribution in 2000 (50.6% male, 49.4% female). The median age that year was 32.9 years, which was very similar to both the Alaska median of 33.8 years, and 2000 median of 32.4 years.

The population structure was stationary in both 2000 and 2010, although there was some overall aging within the total population in 2010, relative to 2000. In that year, 28.8% of

residents were under the age of 20, compared to 31.9% in 2000; 12.0% were over the age of 59, compared to 8.0% in 2000; 42.3% were between the ages of 30 and 59, compared to 45.5% in 2000; and 16.8% were between the ages of 20 and 29, compared to 14.4% in 2000.

Gender distribution by age cohort was slightly less even in 2010, with slight male biases occurring among most age ranges. In that year, the greatest absolute gender difference occurred in the 20 to 29 range (8.8% male, 8.0% female), followed by the 0 to 9 (7.5% male, 7.1% female) and 80 and over (0.9% female, 0.6% male) ranges. Of those three, the greatest relative gender difference occurred in the 80 and over range. Information regarding trends in Anchorage’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Anchorage Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS) estimated that 91.9% of residents aged 25 and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 3.0% had less than a ninth-grade education, compared an estimated 3.5% if Alaska residents overall; an estimated 5.1% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 27.8% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 8.3% held an Associate's degree, compared to an estimated 8.0% of Alaska residents overall; an estimated 21.4% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 11.6% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture^{28,29}

Dena'ina Athabascans inhabited the area when Captain James Cook first explored Cook Inlet in 1778. Located near the northern end of the Municipality, the village of Eklutna was one of eight winter settlements and is the last occupied Dena'ina village in the Anchorage area. During the summer, villagers moved down the Knik Arm to Ship Creek and Fire Island to fish. In the fall, they returned to Eklutna to hunt and trap.

Russian fur traders and missionaries were the first Europeans to occupy the Anchorage area. The discovery of gold in the 1880s and in Interior Alaska in 1922 sparked development in the area. Initially, most prospectors and traders just passed through on their way to other gold fields. Some stayed to prospect the area, resulting in a few mining camps and small settlements along Turnagain Arm, mostly around present day Girdwood.

Construction began in 1914 on a federal railroad from the port of Seward, 126 mi south of Anchorage, through the coalfields of Interior Alaska, to the gold claims near Fairbanks (358 mi north). The midpoint construction headquarters was Anchorage, and by July of 1915, thousands of job seekers and opportunists had poured into the area; living in a tent city on the banks of Ship Creek near the edge of the present downtown. That July produced the "Great Anchorage Lot Sale;" a land auction that shaped the future of the city. Some 655 lots were sold for \$148,000 total, and an average of \$225 each. A month later, the town voted to call itself Alaska City, but the federal government refused to change its name from Anchorage. The City of Anchorage was incorporated on November 23, 1920.

From 1939 to 1957, major military and government construction of roads, airports, and harbors throughout Alaska contributed to the growth of Anchorage. During World War II, Anchorage's strategic location made it well positioned for the construction of defense support facilities serving the North Pacific. In 1940, Fort Richardson and Elmendorf Air Force Base were constructed. During the same period, the construction of the Glenn and Alaska Highways gave Anchorage an overland link through Canada to the rest of the contiguous United States. The port was completed by the early 1960s. The Greater Anchorage Area Borough was formed on January 1, 1964.

The Good Friday earthquake of 1964 destroyed a large part of the city. During the 1970s, the development of the Prudhoe Bay oilfields and the Trans-Alaska Pipeline brought rapid growth to Anchorage. Population, office space, and housing tripled within a 10-year period. On September 15, 1975, the city and borough governments were unified, along with the cities of Girdwood and Glen Alps.

Natural Resources and Environment

The average temperatures in January range from 8 to 21 °F (-13 to -6 °C). In July, average temperatures range from 51 to 65 °F (11 to 18 °C). Average annual precipitation is 15.9 inches, and average annual snowfall is 69 inches.³⁰

Anchorage and its surrounding communities are located in close proximity to the Chugach National Park, Chugach National Forest, and Anchorage Coastal Wildlife Refuge. Terrestrial wildlife in the area includes wolves, otters, marmots, lynx, Dall sheep, bears, moose, muskrat, weasels, mink, hares, voles, shrews, and ground squirrels. Aquatic mammals include beluga, orca, gray, and humpback whale, porpoise, sea otters, Steller sea lions, and seals. Fish and shellfish include all five species of Pacific salmon, cod, sablefish, Dungeness, king, and Tanner crab, clams, trout, arctic grayling, char, sculpins, stickleback, halibut, and northern pike.³¹

Much of the Anchorage area is built on heavily glaciated sediments and alluvium. Subsurface geology consists of sedimentary rock typically found in lowland areas west of the Chugach Mountains. Upland areas consist of harder metamorphic and igneous rock. Surface materials consist of moraines, estuarine deposits, and bog deposits. Soils are made up primarily of silty loams.³²

The diverse landscape surrounding Anchorage is characterized by lowland marsh and tidal mudflats, subalpine and upland tundra, alpine meadows, taiga, mesic forest, barren rock, and icefields.³³ Anchorage is located in a transitional zone creating a mix of coastal and boreal vegetation communities. Coniferous stands dominated by Sitka spruce and mountain hemlock populate the coastal zones, while dwarf spruce birch, aspen, alder, and willow populate the boreal areas. Disturbed, lowland, or drainage areas typically consist of conifers mixed with cottonwood, willow, and birch. Upland muskegs and bogs consist of dwarf vegetation, shrubs, and sedges.^{34,35}

Mineral resources in the area include Wishbone Hill coal deposit 40 mi northeast of Anchorage, and Willow Creek mineral area 40 mi north. Usibelli Coal Mine Inc. has been conducting exploration and feasibility studies determining the viability of developing Wishbone Hill.³⁶ The Willow Creek mineral area, which has a history of producing several gold prospects, is also currently being assessed for further development.³⁷ There are several thousand acres of municipal greenbelts and parkland that link settled areas with surrounding natural open space. Numerous small lakes, streams, wetlands, and wooded areas provide a range of ecological services and recreation resources.³⁸

According to the U.S. Environmental Protection Agency (EPA) there are several Superfund sites in Anchorage currently under remediation. These include white phosphorus, volatile organic compound, heavy metals, and polychlorinated biphenyl contaminants affecting soils, groundwater, and surface water within Fort Richardson Army Base; and petroleum and heavy metals threatening community aquifers within Elmendorf Air Force Base.³⁹

According to the Municipality of Anchorage Hazard Mitigation Plan, natural hazards that have the potential to impact Anchorage include earthquakes, coastal erosion, avalanches, ground failure, volcanic ash fallout, coastal and river flooding, wildfire, extreme rain and cold events, and windstorms. Unconsolidated bluffs and shorelines around the Knik Arm are susceptible to coastal erosion.⁴⁰

Current Economy^{41,42}

Anchorage went through a period of rapid growth in the 1980s. During that time, the city saw \$2.8 billion in new construction, including more than 21,000 new homes, over 2 million sq ft of new office space, and nearly four million sq ft of new retail space. Between 1982 and 1985, 19,000 jobs and 44,000 residents were added to the municipality. Top employers in 2010⁴³ included Anchorage School District 9011, State of Alaska, Providence Hospital, Municipality of Anchorage, University of Alaska, Safeway Inc., Alaska Native Tribal Health Consortium, Fred Meyer Stores, Inc., Wal-Mart Associates Inc., and the Southcentral Foundation.

When oil prices dropped in 1986, state revenues and expenditures shrank, and Anchorage's economy stalled. Many unemployed residents walked away from mortgages and rental vacancies jumped from 3% in 1982 to 25%. In that year, residential and commercial property values declined by almost half. However, in 1989 the economy rebounded, thanks in

part to the *Exxon Valdez* oil spill. Anchorage's economy continued to grow throughout the 1990s.

Today, Anchorage is a commerce center with a diversified economy. Oil and gas industries, finance and real estate, transportation, communications, and government agencies are headquartered in Anchorage. Numerous visitor and tourist facilities and services are available. Over 13,000 military personnel are stationed at Fort Richardson and Elmendorf Air Force Base.⁴⁴ Economic assets include efficient air and marine transportation services, strategic location, modern communication infrastructure, low cost utilities, low taxes, and good quality of life.

Construction is a large economic contributor. In the 1980s, about \$3.9 billion in construction value was added to the municipality and another \$3.2 billion in the 1990s. Anchorage's development as Alaska's center of commerce continues to contribute to its sizable construction sector. Revenues from the petroleum industry make up a very sizable portion of the Alaska state budget. The industry is also an important employer and purchaser of local goods and services. As prices for oil and gas products rise globally, it is expected that the petroleum industry will continue to be large economic force within Anchorage.

Anchorage is also closely tied to national and global economies. Alaska exports many of its resources, and much of Alaska's export economy is based in Anchorage. In addition, Alaska imports a larger share of consumables than any other state. Anchorage's prosperity is tied to national and international oil, gas, minerals, timber, and seafood markets. Likewise, the flow of tourists and cargo, which are the backbone of Anchorage's transportation economy, are also dependant on national and international economies. Ted Stevens International Airport is boasted as one of the busiest air cargo ports in the United States. In the late 1980s, 1.7 million travelers passed through the airport and jet service is provided throughout the United States, Europe, and Asia. In 2010, the number of passengers served rose to over five million.⁴⁵

In 2009, an estimated 1.58 million tourists visited Alaska; directly or indirectly contributing \$1.75 billion to southcentral Alaska, and creating 17,600 jobs in the area.⁴⁶ In addition to southcentral Alaska, Anchorage acts as a starting off point for many tourists seeking other destinations throughout the state. The Alaska Railroad provides transportation to cruise ship embark/debark points in Seward and Whittier, and visitors can link to interior destinations through Fairbanks. Bus tours provide excursions to Denali, interior Alaska, and Prudhoe Bay.

In 2010,⁴⁷ the estimated per capita income was \$34,678 and the estimated median household income was \$73,004, compared to \$25,287 and \$55,546 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,⁴⁸ the real per capita income (\$33,252) and real median household income (\$73,042) indicate that both individual and

⁴⁸ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

household incomes stayed relatively stagnant between 2000 and 2010. In that year, Anchorage ranked 31st of 305 communities from which per capita income was estimated, and 38th of 299 communities from which median household income was estimated.

According to 2006-2010 ACS estimates, 70.7% of residents aged 16 and over were part of the civilian labor force in 2010. In that year, unemployment was estimated at 5.2%, compared to an estimated 5.9% statewide; and an estimated 7.9% of residents lived below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed, an estimated 71.6% worked in the private sector, an estimated 21.7% worked in the public sector, an estimated 6.4% was self-employed, and an estimated 0.2% was unpaid family workers.

By industry sector, most (21.4%) employed residents were estimated to work in education service, health care, and social assistance sectors in 2010; followed by retail trade (10.9%) and professional, scientific, management, administrative, and waste management (10.9%) sectors. Agriculture, forestry, fishing, hunting, and mining sectors made up 3.4% of sector employment that year, compared to 3.1% in 2000 (Figure 3). By occupation type, most (39.0%) employed residents were estimated to hold management or professional positions in 2010; followed by sales or office positions (25.5%); service positions (17.4%); natural resources, construction, or maintenance positions (9.1%); and production, transportation, or material moving positions (9.0%) (Figure 4). There was very little proportional change in sector employment or occupation types between 2000 and 2010, which was reflective of the large, stable economy.

Figure 3. Local Employment by Industry in 2000-2010, Anchorage (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Anchorage (U.S. Census).

According to 2010 ALARI estimates,⁴⁹ most (22.3%) employed residents were estimated to work in trade, transportation, and utilities sectors; followed by education and health service sectors (14.5%); professional and business service sectors (11.5%); and leisure and hospitality sectors (11.3%). In addition, 4.1% of employed residents were estimated to work in natural resources and mining sectors.

Governance

Anchorage is a home rule municipality located within its own borough. Anchorage was not included in the Alaska Native Claims Settlement Act (ANCSA), and does not have its own federally recognized Tribal government or corporation. However, the City of Anchorage houses headquarters for offices of many regional institutions related to rural development, Native Alaska issues, commerce, communication, environment, infrastructure, fishing, education, and housing.⁵⁰ The Alaska Department of Fish and Game (ADF&G), National Marine Fisheries Service (NMFS), and U.S. Bureau of Citizenship and Immigration Services all have offices in Anchorage.

As of 2010, the city administered a 12% accommodations tax, 8% car rental tax, tobacco tax, and property tax (median rate: 15.72 mills).⁵¹ Total revenue in 2010 was \$421.4 million, compared to \$259.2 million in 2000; an increase of 25.7% after adjusting for inflation.⁵² State allocated Community Revenue Sharing accounted for 3.6% of total municipal revenues in 2010, compared to 1.4% in 2000 from State Revenue Sharing. State and federal fisheries-related grants awarded to Anchorage between 2000 and 2010 included: \$110.0 million for port expansion projects, \$198,000 for Lower Yukon salmon marketing, \$144,939 for 10th & M Seafoods processing and packaging equipment, \$25,000 for salmon marketing, \$6.3 million for harbor

dredging, \$93,000 for seafood quality control, and \$6.0 million for dock improvements. Information regarding municipal finances can be found in Table 2.

Infrastructure

Connectivity and Transportation

Controlled airports include the state-owned Ted Stevens Anchorage International Airport and Lake Hood Float Plane Base, the municipality's Merrill Field, and U.S. Army and Air Force facilities. The Port of Anchorage handles 85% of the general cargo for the Alaska Railbelt area. There are five terminal berths, with 3,488 linear ft available. Several barge and trucking companies are available. The Alaska Railroad connects Anchorage to Seward, Whittier, and Fairbanks.⁵³ Highway networks connect Anchorage with the statewide highway system as well as the rest of the United States and Canada. Roundtrip airfare between Anchorage and Seattle in June 2012 was estimated at \$460.⁵⁴

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Anchorage from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$259,231,060	n/a	\$3,746,210	n/a
2001	\$258,381,150	n/a	\$3,176,186	\$1,000,000

⁵⁴ Airfare was estimated from travel websites, including <http://www.travelocity.com> (retrieved November, 2011)

Facilities

Water is diverted from three primary sources. Lake Eklutna supplies 35 million gal per day; Ship Creek Reservoir supplies 24 million gal per day; and deep wells supply another 20 million gal per day. Water is treated and piped throughout the municipality -- the Anchorage Water & Wastewater Utility maintains 670 mi of transmission and distribution mains. Most homes are served by the piped wastewater system. The John M. Asplund Wastewater Treatment Facility, built in 1972, provides primary treatment of 35 million gal of wastewater each day. Effluent is discharged into Cook Inlet. Approximately 15,000 homes use individual wells and septic systems. Eagle River and Girdwood are served by tertiary treatment facilities. Piped natural gas is available from ENSTAR Natural Gas Company and is the most prevalent and cost-effective home heating method. Electricity is provided to the core area by Anchorage Municipal Light & Power and the privately-owned Chugach Electric Association. Matanuska Electric Association serves the Eagle River and Chugiak area of Anchorage, as well as the Matanuska-Susitna Valley. In October 1997, these three utilities purchased the Eklutna Hydroelectric Facility. Anchorage Municipal Light & Power also owns 8 electrical generating facilities. Chugach Electric owns power generating facilities from the Kenai Peninsula to the Eklutna River. The municipality and privately-owned companies collect refuse for deposit into the Anchorage Regional Landfill on Hiland Road. The municipality collects hazardous wastes and waste oil. The privately-owned Anchorage Recycling Center collects cans, metal, paper, and newspaper.⁵⁵ Communications services include telephone and cable television infrastructure. Long distance fiber optic capacity for voice, video, and data transmission is available, as are transmission and receiving facilities for wireless communications. Civic facilities include the Anchorage Museum of History and Art, the Municipal Library System, Alaska Center for the Performing Arts, William A. Egan Civic and Convention Center, George M. Sullivan Arena, municipal offices, community recreation centers, public parking, Anchorage Senior Center, indoor ice rinks, and a number of parks and green spaces. Public safety services include a police headquarters, 11 substations, and a regional training center. Fire and rescue services include 10 fire stations.⁵⁶

Anchorage possesses a substantial amount of fisheries-related infrastructure, businesses, and services. The Port of Anchorage occupies 122 acres of tidelands. Facilities include three general cargo terminals providing 2,109 ft of dock face; two petroleum product terminals providing 600 ft of dock space each; loose cement offloading capability and storage; and intermodal deep-water connections via rail, road, and air.⁵⁷ In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there are ongoing fisheries-related infrastructure improvements including improvements to barge landing areas, dock space and structure, dockside utilities, transportation and connectivity, pilings, and harbor dredging. Harbor facilities are capable for handling regulated vessels, including rescue vessels, cruise ships, fuel barges, container ships, dry bulk carriers, and military vessels. Over the

last 3 years, the city has seen an increase in the frequency and number of cruise ships and petroleum tankers; a trend they believe will continue. The Port of Anchorage does not have any public dock space for moorage of permanent or transient vessels, although numerous privately run moorage facilities are available.

*Medical Services*⁵⁸

Medical services include Alaska Regional Hospital, Providence Alaska Medical Center, Alaska Native Medical Center, Elmendorf AFB 3rd Medical Group, U.S. Army Medical Clinic/Fort Richardson, Air National Guard Medical Squadron/Kulis, and numerous others. Many facilities are acute, long term care facilities. In addition, a wide range of specialized care facilities are available locally.

*Educational Opportunities*⁵⁹

As of 2011, the Anchorage school district had 96 schools, 49,206 students enrolled, and 3,071 teachers employed. In addition, Anchorage is home to the University of Alaska's Anchorage campus and Alaska Pacific University. Numerous private schools and universities are also located in Anchorage.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Originally, the Kachemak tradition and Dena'ina Athabascans occupied the Cook Inlet region. Kachemak people were the first to arrive approximately 3,000 years ago followed by Dena'ina Athabascans. These groups utilized both marine and riverine ecosystems, relying on marine mammals and fish using drift nets, weirs, and dip nets, and basket traps. In general all five species of Pacific salmon and Dolly Varden char were utilized throughout the Cook Inlet.⁶⁰

The first commercial fish packing operation in the southcentral Alaska region started in 1878 by the Alaska Commercial Company at its Kenai River trading station. Large commercial salmon fisheries in the Cook Inlet did not begin until the 1880s, when a cannery was established at Kasilof. Once the fur trade collapsed in the 1890s, fur traders switched to salmon to make a living. Fish traps operated by canneries were established in the mouths of the Kenai and Kasilof rivers.⁶¹

An influx of Euro-Americans during the late 1880s gold rush brought increased competition for resources, and many Dena'ina were forced to take jobs in canneries. Instead of

relying on traditional subsistence cycles, many Dena'ina took up a pattern of commercial fishing in the inlet and at the mouth of the Kenai River during spring and summer, and going up-river in the fall to harvest coho, hunt moose, fish for freshwater species, and trap.⁶²

During the early twentieth century, many Dena'ina and Alutiiq began using salmon resources for commercial sale. In 1904, transportation infrastructure was proliferating setting the stage for the first sport fishery on the Kenai Peninsula. Cooper Creek and Kenai Lake became destination rainbow trout fishing grounds. At that time, commercial traps at the mouth of the Kenai River, and nets upriver were beginning to severely impact salmon runs. By 1923, salmon runs on the Kenai River were severely depleted, with one dip netter recalling that only 160 fish were taken during that season when usually there would be thousands.⁶³

Homesteaders arrived on the Kenai Peninsula in the 1930s and 1940s, and commercial and subsistence fishing became important aspects of economic life. Back then, fill nets and seines were used in the Kenai, Skilak, and Tustumena Lakes to harvest northern pike, lake trout, grayling, whitefish, and char. Commercial catches were sold in Anchorage, Kenai, and Kasilof.⁶⁴

Commercial fishing for Chinook salmon in the Cook Inlet began to increase substantially during the 1940s. Before 1940, commercial fishermen harvested approximately 60,000 Chinook annually, however, over the next decade harvests would more than double. Average harvests of Chinook were about 13,000 fish during the 1960s, 12,000 fish during the 1970s, 25,000 fish during the 1980s, and 17,000 fish during the 1990s. Sockeye salmon harvests did not exceed 3 million fish in any year until 1982. Prior to that, the peak decadal average occurred in the 1940s at 1.6 million fish. Commercial harvests of sockeye averaged 4.5 million fish in the 1980s and 4.1 million fish in the 1990s. Coho salmon harvests averaged less than 400,000 annually until the 1980s when the annual commercial harvest averaged about 540,000 fish. During the 1990s average annual harvest dropped to 360,000 fish. The largest commercial harvest of pink salmon in the Cook Inlet occurred in 1952 when almost 5 million were caught. Commercial harvests of chum salmon peaked in the 1980s at an average annual catch of around 906,000 fish.⁶⁵

A commercial herring fishery began in the Lower Cook Inlet in 1914. A total of eight salteries were operating during the fisheries peak and over 7,900 tons were averaged between 1924 and 1926. In 1939, a fishery was started in and around Resurrection Bay and Day Harbor within the Eastern District. Again, peak years occurred from 1944 to 1946 where the average harvest was 16,250 tons. The fishery died out during the late 1950s due to overharvesting. A Lower Cook Inlet herring sac roe fishery began in 1969; however, it went into decline after 1973 until limits were established in 1974. However, quotas were never followed and Outer and Eastern districts were eventually closed until 1984 for stock recovery.⁶⁶

Today, the Cook Inlet is managed according to two distinct management areas: Upper and Lower Cook Inlet. The city of Anchorage plays a complex role in the Alaskan fishing industry. Historically, Anchorage was built around mining, and later petroleum. Fishing was never a central component of the city's economy in its early years. However, as fisheries

developed in the Cook Inlet and around the Kenai Peninsula, Anchorage found itself playing an increasingly important role in the support of those fisheries.

Anchorage is located in Federal Reporting Area 630, International Pacific Halibut Commission (IPHC) regulatory area 3A, and the Central Gulf of Alaska sablefish regulatory district. The community is not eligible for participation in the Community Quota Entity (CQE) program for sablefish and halibut quota.

Processing Plants

Originally founded in 1943 as a freezing facility for mink hunters, the two facilities of 10th and M Seafoods (also known as Alaska Sea Pack Inc.) in Anchorage process fresh and frozen crab, shrimp, halibut and salmon. In addition to buying fish and shellfish from various commercial fishermen from around the state, 10th and M Seafoods custom processes seafood for sport fishermen.⁶⁷

Alaska Wild Kenai Salmon owns and operates a processing facility and online seafood store in Anchorage. The facility processes fresh and frozen halibut and salmon. The salmon comes to the facility via their buying station in Ninilchik and their halibut is caught in Prince William Sound.⁶⁸

AquaTech is a family owned and operated seafood exporter with a processing facility in Anchorage. Aquatech specializes in live, fresh, and frozen King Crab. They also process and sell halibut and salmon. The Norton Sound red King Crab fishery is the only small boat, summer King Crab fishery in Alaska, taking place in July and August. Meanwhile the Bristol Bay Red King crab fishery takes place from October to December. The halibut season lasts from February through November, and collectively all five species of salmon are caught from May through the winter months.⁶⁹

Copper River Fine Seafoods is one of the three original fish companies that came together in 1996 to form Copper River Seafoods. Copper River Seafoods has a processing facility in Anchorage as well as a larger seafood processing plant in Cordova. Both its Anchorage and Cordova facilities, Copper River Seafoods collectively employs 150 fish processors (including foreign students with J-1 visas) and processes salmon (king, sockeye, coho), halibut, Pacific cod, rockfish, rock sole, red king crab and spot prawns. The processing season at its Anchorage facility begins in March and lasts until October.⁷⁰ The plant relies on public water services, power/electricity, gas, and waste management services. The plant receives fish that are already headed and gutted, and reports that it will be undergoing changes in 2012 that will change the overall character and processing capacity of the plant.⁷¹

Favco, Inc. has operated a seafood processing facility in Anchorage since 1974, processing black cod, clam, crab (Dungeness, king, snow), halibut, mussels, oysters, rockfish-

⁷¹ This information is based on the results of a survey of processing plant managers conducted by the Alaska Fisheries Science Center in 2011.

snapper, salmon (Chinook, chum, coho, sockeye), scallop, shrimp and prawns.⁷² The plant operates year-round and has maximum of 35 employees, and relies on public water services, power/electricity, gas, and waste management services.

Established in 1977, Great Pacific Seafoods operates a seafood processing facility in Anchorage from January through March and from May through September, specializing in salmon and Pacific cod. During these periods Great Pacific employs as many as 100 people.⁷³

According to ADF&G's 2010 Intent to Operate list, there are two shore-based processors that go by the local name of Homer Fish Processing. Processor Code F8488 is owned by Wild Kenai Salmon and Naknek Family Fisheries, although its official port location code is Anchorage. According to the company website, this plant also goes by the name of "A Fisherman's Resort." Homer Fish Processing/A Fishermen's Resort has been family owned and operated for 5 years, and processes and smokes sockeye salmon and processes king crab.⁷⁴

Mat Valley Meats is a "full service, old-fashioned meat market" that custom processes sport game and fish and also smokes sport fish. It is actually located outside of Anchorage on the East Wasilla-Palmer Highway between Wasilla and Palmer.⁷⁵

For over 30 years Sagaya Corporation has operated a seafood retail and wholesale facility in Anchorage.⁷⁶ Sagaya's products include black cod, clam, Pacific cod, crab (Dungeness, king), halibut, lingcod, mussels, oysters, rockfish-snapper, and salmon (Chinook, chum, coho, sockeye).⁷⁷

The company Triple Threat Bait Company operates a seafood processing facility in Anchorage called Triple Threat Salmon Eggs. The facility specializes in processing salmon roe (coho and king) for bait, and prides itself in processing roe that is blood-free, fresh and hand-cured.⁷⁸

Togiak Seafoods LLC is also known to operate a seafood processing plant in Anchorage; however, little is known about its operations.

Fisheries-Related Revenue

Overall in 2010, Anchorage received \$185,120 in fisheries-revenues compared to \$80,281 in 2000. These revenues were collected from a Shared Fisheries Business tax and Fisheries Resource Landing tax. Between 2000 and 2010, fisheries-related revenue collected by the City of Anchorage was relatively insignificant, indicating that Anchorage's diverse economy isn't directly dependent on fisheries. However, the indirect importance of the fishing industry can be seen in the number of businesses and services in Anchorage which are tied to the local and statewide fishing industry. These entities, combined with the peripheral assets created by the businesses serving them, attest to Anchorage's complex relationship with Alaska's fishing communities. Information regarding fisheries-related revenue trends can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In 2010, 1,009 residents, or less than 1% of the population, held a total of 1,181 permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 1,073 residents held 1,416 CFEC permits. Of the CFEC permits held in 2010, 74% were for salmon, compared to 62% in 2000; 9% were for herring, compared to 11% in 2000; 6% were for halibut, compared to 10% in 2000; 5% were for “other” shellfish, compared to 1% in 2000; 2% were for groundfish, compared to 10% in 2000; 2% were for crab, compared to 3% in 2000; 2% were for sablefish, compared to 3% in 2000; and less than one-percent were for “other” finfish, compared to less than 1% in 2000. In addition, 36 residents held 41 Federal Fisheries Permits (FFP), 72 residents held 95 License Limitation Program (LLP) groundfish permits, and 24 residents held 35 LLP crab permits. Finally, residents held 11.28 million shares of halibut quota on 124 accounts in 2010, compared to 9.86 million shares on 211 accounts in 2000; 7.66 million shares of halibut quota was held on 20 accounts, compared to 2.25 million shares on 31 accounts in 2000; and 213.05 million shares of crab quota was held on 16 accounts, compared to 49.49 million shares held on 18 accounts in 2005.

Residents held 1,318 commercial crew licenses in 2010, compared to 1,378 in 2000. In addition, residents held majority ownership of 438 vessels that year, compared to 1,181 in 2000. Of the CFEC permits held in 2010, 54% were actively fished, compared to 61% in 2000. This varied by fishery from 87% of halibut permits, to 83% of sablefish, 50% of crab, 38% of groundfish, 27% of “other” shellfish, 9% of herring, and 0% of “other” finfish. In addition, 44% of FFPs, 31% of LLP crab, and 31% of LLP groundfish permits were actively fished. Fisheries prosecuted in 2010 by Anchorage residents included: Bering Sea pot king and Tanner crab; Bristol Bay pot king crab; Alaska Peninsula pot Tanner crab; statewide longline halibut; Southeast Alaska purse seine herring roe; Kodiak purse seine herring roe; Bristol Bay purse seine herring roe; Norton Sound gillnet herring roe and food/bait; statewide longline miscellaneous saltwater finfish; Gulf of Alaska pot, longline, and otter trawl miscellaneous saltwater finfish; statewide pot, otter trawl, and mechanical jig miscellaneous saltwater finfish; Prince William Sound pot shrimp; Southeast Alaska pot shrimp; statewide longline and mechanical jig sablefish; Prince William Sound fixed gear sablefish; Northern Southeast Alaska longline sablefish; Prince William Sound purse seine, set and drift gillnet salmon; Kodiak purse seine and set gillnet salmon; Chignik purse seine salmon; Alaska Peninsula purse seine, set and drift gillnet salmon; Southeast Alaska drift gillnet salmon; Cook Inlet drift and set gillnet salmon; Bristol Bay drift and set gillnet salmon; Yakutat set gillnet salmon; Kuskokwim gillnet salmon; Kotzebue gillnet salmon; Lower Yukon gillnet salmon; and statewide hand and power troll salmon.⁷⁹

In 2010, Anchorage ranked 31st of 67 communities reporting landings for that year and 31st of 67 communities in terms of ex-vessel revenue acquired from landings. In that year, 2.81 million lbs of fish were landed in Anchorage valued at \$4.13 million ex-vessel, compared to

⁷⁹ Alaska Commercial Fisheries Entry Commission. 2011. Alaska commercial fishing permits, permit holders, and vessel licenses, 2000 – 2010. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. [URL not publicly available as some information is confidential.]

283,910 lbs valued at \$105,797 ex-vessel in 2001. Landings and ex-vessel revenues in 2010 were significantly higher than any other year going back to 2000. By fishery, salmon was the only species landed in Anchorage between 2001 and 2010. In 2010, 2.39 million lbs of salmon valued at \$3.69 million ex-vessel was landed, compared to 283,910 lbs valued at \$105,797 ex-vessel; an increase of \$1.01 per pound landed after adjusting for inflation,⁸⁰ and without considering the species composition of landings. In terms of landings made by Anchorage residents, salmon was most lucrative in 2010, followed by crab and Pacific cod. In that year, residents landed 37.35 million lbs of salmon valued at \$22.49 ex-vessel, compared to 25.30 million lbs valued at \$11.16 million ex-vessel in 2000; a decrease of \$0.01 per pound landed after adjusting for inflation,⁸¹ and without considering the species composition of landings. Revenues from salmon landings peaked in 2010. Crab landings that year totaled 8.55 million lbs valued at \$21.88 million ex-vessel, compared to 1.14 million lbs valued at \$3.03 million in 2000; a decrease of \$1.10 per pound landed after adjusting for inflation,⁸² and without considering the species composition of landings. Revenues from crab landings peaked in 2008 at \$30.71 million. Pacific cod landings totaled 9.59 million lbs valued at \$3.84 million ex-vessel, compared to 2.68 million lbs valued at \$932,672 in 2000; a decrease of \$0.08 per pound landed after adjusting for inflation.⁸³ Revenues from Pacific cod landings peaked in 2010. Halibut landings totaled 703,909 lbs valued at \$3.19 million ex-vessel, compared to 739,055 lbs valued at \$1.86 million in 2000; an increase of \$1.07 per pound landed after adjusting for inflation.⁸⁴ Revenues from crab landings peaked in 2008 at \$3.47 million. Sablefish landings totaled 462,738 lbs valued at \$1.58 million ex-vessel, compared to 176,365 lbs valued at \$567,867 in 2000; a decrease of \$1.01 after adjusting for inflation.⁸⁵ Revenues from sablefish landings peaked in 2010. Pollock landings totaled 4.05 million lbs valued at \$531,107 ex-vessel, compared to 5.73 million valued at \$652,283; a decrease of \$0.03 per lb landed after adjusting for inflation.⁸⁶ Revenues from pollock landings peaked in 2005 at \$1.30 million. Herring landings totaled 3.26 million lbs valued at \$264,233 ex-vessel, compared to 3.0 million lbs valued at \$346,404 in 2000; a decrease of \$0.08 per pound landed after adjusting for inflation. Revenues from herring landings peaked in 2002 at \$387,819. “Other” shellfish landings totaled 33,816 lbs valued at \$102,320, compared to 23,383 valued at \$76,729 in 2000. Revenues from “other” shellfish landings peaked in 2010. Finally, “other” groundfish landings totaled 392,172 lbs valued at \$40,854 in 2000. Revenues from “other” groundfish landings peaked in 2000. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Anchorage's position as a point of entry for many of Alaska's visitors has encouraged many regional tourism related businesses to locate themselves within the city. However, the Anchorage area itself is not as popular a destination for sportfishing when compared to the Kenai Peninsula, Lower Cook Inlet, Prince William Sound, and Gulf of Alaska. For local anglers, popular streams and rivers include the Eklutna and Eagle rivers; and Thunderbird, Ship, and Bird creeks. However, there are many other drainages and lakes within the municipality which offer sportfishing opportunities.⁸⁷ Many local outfitters serve the greater southcentral Alaska area, and are not limited to Knik and Turnagain arms.

In 2010, there were a total of 48 sportfish guide businesses active in Anchorage, compared to 99 in 2000. The number of active sportfish guide businesses declined steadily between 2000 and 2010, from its peak in 2000 and 2001, to its lowest in 2000. Also in 2010, residents held 299 sportfish guide licenses, compared to 651 in 2000. The number of sportfish guide licenses held in Anchorage peaked in 2004 before declining significantly. Also in that year, there were a total of 101,073 sportfishing licenses sold locally, compared to 75,997 in 2000. The number of locally sold sportfish licenses peaked in 2005 at 114,509. Finally, residents were sold 79,066 sportfishing licenses in 2010, compared to 77,142 in 2000. Sportfishing licenses sold to residents peaked in 2004 at 80,571.

Anchorage is located within the Anchorage ADF&G Harvest Survey Area which includes all waters bounded by the Eklutna River to the north; Knik Arm to the west; Turnagain Arm, to Ingram Creek in the South; and the Chugach Mountains to the east. In 2010, there were a total of 1,675 saltwater and 60,029 freshwater angler days fished, compared to 2,197 and 165,302 in 2000, respectively. In that year, non-Alaska residents accounted for 5% of freshwater angler days fished, compared to 6% in 2000. In addition, non-Alaska residents accounted for 11% of freshwater angler days fished that year, compared to 9% in 2000. According to ADF&G Harvest Survey data,⁸⁸ local private anglers target all five species of Pacific salmon, landlocked salmon, rainbow trout, Dolly Varden char, cutthroat trout, whitefish, Arctic grayling, northern pike, sheefish, Pacific halibut, lingcod, Pacific cod, shark, smelt, steelhead trout, sablefish, Dungeness crab, Tanner crab, razor clams, hardshell clams, shrimp, and other finfish and shellfish. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Subsistence activities do not hold the same importance in Anchorage as they do in more rural locations; however, residents still take advantage of subsistence and personal use fisheries. A significant number of Anchorage residents travel to the Kenai Peninsula to take advantage of personal-use fisheries in the area.

Of the species listed by ADF&G in Table 13, sockeye salmon were harvested most, followed by Chinook, coho, pink, and chum salmon. In 2008, residents reported harvesting 39,595 salmon, compared to 58,064 in 2000. Sockeye accounted for 92% of salmon harvests in both years. In addition, harvests reported by Anchorage residents accounted for 3.8% of total subsistence salmon harvests reported statewide for 2010. Reported salmon harvests peaked in 2001 at 74,529 fish. In 2010, residents held 232 Subsistence Halibut Registration Certificates (SHARC), compared to 176 in 2003. In that year, 15,344 lbs was harvested on 52 SHARC cards, compared to 11,584 lbs harvested on 38 SHARC in 2003. Between 2010 and 2000, an estimated 573 sea otters were harvested. Estimated sea otter harvests peaked in 2006 at 105. Between 2000 and 2007, an estimated seven walrus were harvested. Estimated walrus harvests peaked in 2002 at three. Between 2000 and 2008, an estimated 1 Steller sea lion and 337 harbor seals were harvested. Estimated harbor seal harvests peaked in 2003 at 55. Finally, an estimated 6 polar bears were harvested between 2003 and 2005. Information regarding subsistence trends can be found in Tables 12 through 15.

Palmer (PALL-mur)

People and Place

Location

Palmer is located in the center of the lush farmlands of the Matanuska Valley, between the Talkeetna and Chugach mountains. The City is situated on the west bank of the Matanuska River, just north of its junction with the Knik River. Palmer is 42 miles northeast of Anchorage on the Glenn Highway. It is located in the Palmer Recording District and the Matanuska-Susitna (Mat-Su) Borough Census Area. The City encompasses 3.8 square miles of land and 0 square miles of water.^{89,90}

*Demographic Profile*⁹¹

In 2010, there were 5,937 residents in Palmer, ranking it as the 18th largest of 352 communities in Alaska with recorded populations that year. Overall between 1990 and 2010, the population of Palmer more than doubled. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 22%. The average annual growth rate during this period was 0.67%, reflecting a consistent upward trend with small declines in some years. According to a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders indicated that seasonal workers or transients are present in Palmer between May and September, and the population of the community typically peaks between June and August. They also reported that population fluctuations are only slightly driven by employment in fisheries sectors.

In 2010, the majority of the population of Palmer identified themselves as White (79.1%), along with 9.2% who identified as American Indian or Alaska Native, 1.8% as Black or African American, 1.1% as Asian, 0.4% as Native Hawaiian and Other Pacific Islander, 0.8% as 'some other race', and 7.6% who identified with two or more races. In addition, 4.6% of Palmer's population identified themselves as Hispanic in 2010. The percentage of the population made up of White residents decreased from 88.6% in 1990 to 80.9% in 2000, and 79.1% by 2010. At the same time the percentage of the population made up by American Indians and Alaska Natives increased from 7.7% in 1990 to 8.2% in 2000, and 9.2% by 2010. The change in population from 1990 to 2010 is provided in Table 1, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Figure 1. Racial and Ethnic Composition, Palmer: 2000-2010 (U.S. Census).

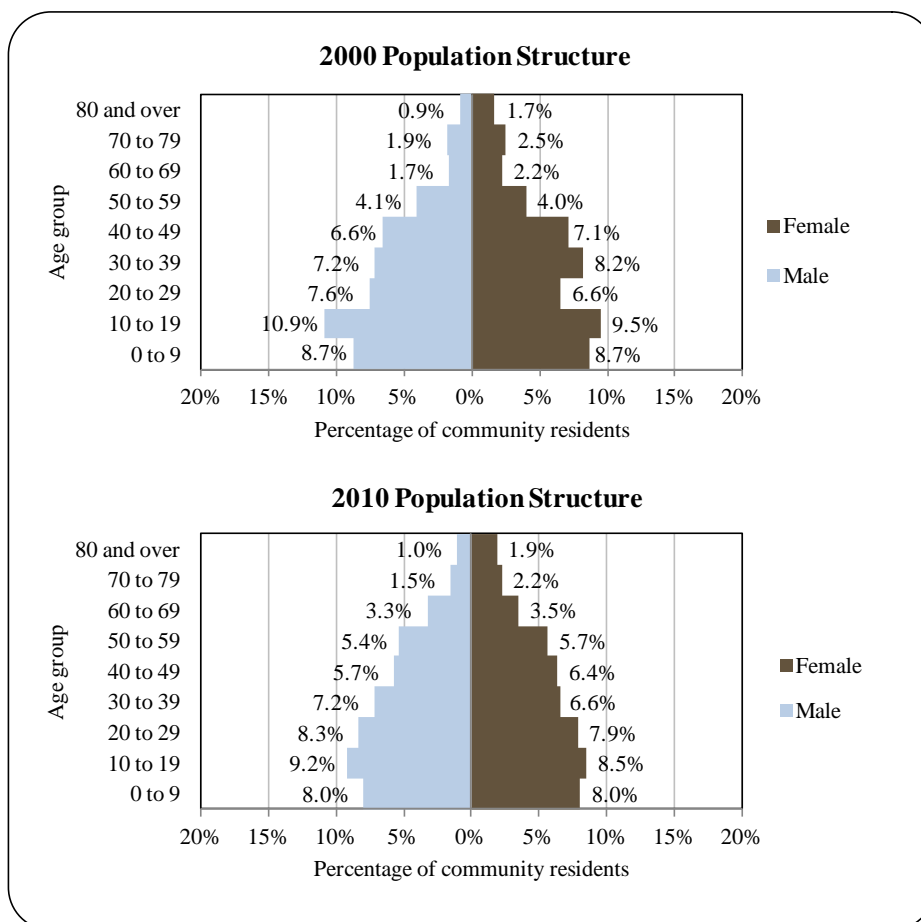

Based on the U.S. Census, the average household size in Palmer remained relatively stable between 1990 and 2010, increasing from 2.7 to 2.81 between 1990 and 2000, and decreasing again to 2.7 in 2010. The number of households in Palmer increased over time, from 998 households in 1990 and 1,472 in 2000, to 2,113 in 2010. Of the 2,281 housing units surveyed for the 2010 U.S. Census, 54.5% were owner-occupied, 38.1% were rented, and 7.4% were vacant or used only seasonally. In 2010, 423 Palmer residents were living in group quarters.

In 2010, there were more women than men in Palmer (population 49.5% male and 50.5% female). In comparison, the state population had more men than women overall (52% male, 48% female). The median age of Palmer residents was 38.8 years, lower than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, there was a relatively even

distribution of males and females across age groups. That year, 13.4% of Palmer’s population was 60 or older. The population structure of Palmer in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁹² 89.4% of Palmer residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 3.8% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaska residents overall; 6.8% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 30.6% were estimated to have some college but no degree, compared to 28.3% of Alaska residents overall; 7.7% were estimated to have an Associate’s degree, compared to 8% of Alaska residents overall; 13.8% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 6.4% were estimated to have a graduate or professional degree, compared to 9.6% of Alaska residents overall.

Figure 2. Population Age Structure in Palmer Based on the 2000 and 2010 U.S. Decennial Census.

⁹² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Starting around 1000 A.D., the Matanuska Valley was the home of two groups of Athabascan Indians, the Ahtna and Dena'ina.⁹³ The Athabascan people migrated seasonally, traveling in small groups to fish, hunt, and trap. They traditionally lived in small groups of 20 to 40 people that moved systematically through their resource territories. Annual summer fish camps for the entire family and winter villages served as base camps.⁹⁴ Historical accounts and oral traditions suggest that at least two villages were located at the head of Knik Arm, near the mouth of the Knik and Matanuska Rivers, and another village was once located near Palmer.⁹⁵

During the time of Russian fur trading, the Ahtna traveled along the Matanuska River, transporting furs from the Dena'ina to Copper Fort near Chitina.⁹⁶ George Palmer is said to have arrived in 1875. He was a trader in Knik and established a trading post on the Matanuska River around 1890. A railway siding was constructed in Palmer in 1916. In 1935, Palmer became the site of one of the most unusual experiments in American history: the Matanuska Valley Colony. The Federal Emergency Relief Administration, one of the many New Deal relief agencies created by President Roosevelt, planned an agricultural colony in Alaska. Two hundred and three families, mostly from Michigan, Wisconsin, and Minnesota, were invited to join the colony. They arrived in Palmer in the early summer of 1935. Although the failure rate was high, many of their descendants still live in the Valley today. The City of Palmer was formed in 1951. Construction of the statewide road system and the rapid development of Anchorage have fueled growth in the area. Today, the Valley is renowned for the annual Alaska State Fair.⁹⁷

Natural Resources and Environment

Palmer is influenced by both continental and maritime climate patterns. Temperatures in January range from -36 to 51 °F and from 37 to 85 °F in July. Annual precipitation averages 16.5 inches, with 50 inches of snowfall.⁹⁸ The landscape around Palmer is primarily bottomland spruce-poplar forest, typical of floodplains and low river terraces.⁹⁹ As of 2008, the State of Alaska owned approximately 1.8 million acres of timber lands in the Matanuska and Susitna Valleys. Timber harvest for use as lumber has decreased in recent decades.¹⁰⁰ Relatively level, deep and easily tilled soils in the area allowed the development of a thriving agricultural industry in the Matanuska Valley historically.¹⁰¹ The Matanuska Valley continues to produce vegetables

and potatoes, and as of 2008 had four operating dairy farms. However, the role of agriculture has declined as a percentage of the modern economy, and increased housing development has placed pressure on the best agricultural lands.¹⁰²

Popular recreation sites near Palmer include Hatcher Pass Public Use Area, Crevasse-Moraine Trails, Kepler Lake, Bonnie Lake, Finger Lake, and Long Lake.¹⁰³ Hatcher Pass Public Use Area is located 15 miles north of Palmer on the Little Susitna River. This area provides for a variety of recreational activities, including recreational gold panning. It has also been identified as important habitat for spawning, rearing, and migration of anadromous fish. Permits are required to ensure that recreational mining activities do not conflict with habitat considerations.¹⁰⁴ The 130,000-acre Matanuska Valley Moose Range is also located north of Palmer. Created in 1984, the Range is managed for wildlife habitat, coal, and timber production, and public recreation, with grazing as a secondary land use.¹⁰⁵ Northeast of Palmer, the Nelchina Public Use Area (NPUA) encompasses approximately 2.5 million acres of the Talkeetna Mountains. The NPUA was established in 1985 for the protection of fish and wildlife habitat, including caribou calving areas, trumpeter swan nesting areas, and habitat for moose, Dall sheep, and brown bear, as well as to perpetuate and enhance public uses including wildlife hunting and viewing, and recreation. Recreational mining activities are also allowed within area boundaries, with restrictions during caribou calving season.¹⁰⁶

In 2010, the most important commercial mineral export from the Matanuska Valley was sand and gravel.¹⁰⁷ Additional mining activity in Southcentral Alaska included continued exploration by Full Metal Minerals Ltd. and Harmony Gold Corp. at the Lucky Shot gold property, located just northwest of Palmer. To the northeast of the City, Usibelli Coal Mine Inc. continued to develop coal deposits at the Wishbone Hill coal property near Sutton. The Mat-Su Borough granted Usibelli a 25-year lease to 60 acres of land. Usibelli estimated that approximately one-half million tons of bituminous coal is buried near the surface in the western portion of the coal lease area.¹⁰⁸ Some oil and natural gas exploration and production activity is also taking place within the Borough. Several coal bed methane leases have been granted, including a pilot project on 840 acres of farmland near Palmer that is being developed by Fowler Oil and Gas Corporation.¹⁰⁹

Natural hazards that have been identified in Palmer include earthquakes, and flood and erosion hazards.¹¹⁰ Three types of earthquakes have the potential to occur in the Mat-Su Borough, including those caused by subduction of the Pacific Plate under the North American Plate, transform earthquakes caused by plates sliding past each other, and intraplate earthquakes that occur within a tectonic plate, sometimes at great distance from the edge of a plate.

¹¹⁰ See footnote 93.

Approximately 11% of the world's earthquakes take place in Alaska, at a rate of about one earthquake per year.¹¹¹ Although 99% of the City of Palmer is located outside of the range of flooding from the Matanuska River, river erosion threatens homes located close to its banks, as well portions of an old railroad line that runs north out of Palmer.¹¹² Additional high risk natural hazards in the Mat-Su Borough include wildfire and severe weather.¹¹³

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Palmer as of July 2012.¹¹⁴

Current Economy¹¹⁵

According to a survey conducted by the AFSC in 2011, community leaders reported that natural resource-based industries are not a primary component of the local economy. The surrounding Matanuska Valley has a history of agricultural production, although population growth in the region has led to conversion of much of this land to subdivisions, and Palmer has evolved from rural, to bedroom community, to an independent commercial and employment center.¹¹⁶ In the 2011 AFSC survey, community leaders indicated that although Palmer is not a port city, fishing vessels are owned by residents. In 2010, 39 Palmer residents were the primary owner of a fishing vessel, and 92 residents held commercial fishing permits (see *Commercial Fishing* section of this profile).

In 2010, top employers in Palmer included the State of Alaska, the Mat Su Borough School District, retail and other services, the City and the Borough.¹¹⁷ Many Palmer residents also commute to Anchorage for employment. Some light manufacturing occurs locally. In addition, Palmer is also home to 200 musk oxen whose underwool (qiviut) is knitted into garments by Alaska Native women from several rural villages. Between 2,500 and 3,500 garments are created each year by these women and sold by an Anchorage cooperative. The 75-acre musk ox farm is a tourist attraction. The university has an Agricultural and Forestry Experiment Station Office and a district Cooperative Extension Service office in Palmer. The University's Matanuska Research Farm is also located in Palmer.¹¹⁸

Based on household surveys conducted for the 2006-2010 ACS,¹¹⁹ in 2010, the per capita income in Palmer was estimated to be \$22,709 and the median household income was estimated

¹¹⁹ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF)

to be \$54,706. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$17,203 and \$45,571, respectively). However, if inflation is taken into account by converting the 2000 values to 2010 dollars,¹²⁰ the per capita income is shown to have remained stable (real per capita income was \$22,622 in 2000), and median household income is shown to have decreased (real median household income was \$59,925 in 2000). In 2010, Palmer ranked 129th of 305 Alaskan communities with per capita income data that year, and 103rd in median household income, out of 299 Alaskan communities with household income data.

However, Palmer's small population size may have prevented the ACS from accurately portraying economic conditions.¹²¹ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Palmer in 2010 is \$13,301.¹²² This estimate is lower than the 2000 per capita income reported in by the U.S. Census, suggesting that caution is warranted when citing an increase in per capita income in Palmer between 2000 and 2010. Palmer was not recognized as "distressed" by the Denali Commission in 2010.¹²³ It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a lower percentage of Palmer residents were estimated to be in the civilian labor force (54.2%) than were estimated to be in the civilian labor force statewide (68.8%). In the same year, 18.1% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaska residents overall, and the unemployment rate was estimated to be 7.7%, compared to a statewide unemployment rate of 5.9%. In contrast, an unemployment estimate based on the ALARI database indicates that the unemployment rate in 2010 was 13.2%, slightly higher than the statewide unemployment rate estimate of 11.5% derived from that source.¹²⁴

Also based on the 2006-2010 ACS, a majority of Palmer's workforce was estimated to be employed in the private sector (69.5%), along with 25.1% in the public sector, and 5.4% estimated to be self-employed. Of the 2,308 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in educational services, health care, and social assistance (25.2%), arts, entertainment, recreation, and accommodation and food services (11.8%), and retail trade (10.9%). That year, 4.2% of the employed civilian labor force in Palmer was estimated to work in agriculture, forestry, fishing and hunting, and mining. However, the number of individuals employed in

Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹²⁰ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹²¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹²⁴ See footnote 117.

farming, fishing, and forestry industries is likely underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Palmer (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Palmer (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 2,423 employed residents in Palmer in 2010, of which 21% were employed in trade, transportation, and utilities, 15.4% in education and health services, 12.8% in leisure and hospitality, 10.2% in local government, 9% in construction, 8.8%

in professional and business services, 6.9% in state government, 4.5% in natural resources and mining, 3.5% in information, 3.3% in financial activities, 0.9% in manufacturing, 0.2% in unknown industries, and 3.5% in other industries.¹²⁵ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Palmer is a Home Rule City in the Mat-Su Borough. The City was incorporated in 1951 and has a Strong Mayor form of government, with a seven-person city council including the Mayor, a seven-person advisory school board, a seven-person planning and zoning commission, and a number of municipal employees. The City administers a 3% sales tax, and the Borough administers a 5% Bed Tax and 5.74% Tobacco and Cigarette Tax. Together, the City and Borough require a 12.961 mills property tax.¹²⁶ In addition to local tax revenues, other locally-generated income sources in Palmer between 2000 and 2010 included license and permit fees and charges for services including fire protection and police dispatch, equipment and building rentals, community center and library fees, planning and zoning, and public safety. Outside revenue sources included state maintenance contracts, state and federal grants, and various sources of shared revenue. The City received State Revenue Sharing contributions of between \$110,000 and \$134,000 each year from 2000 to 2003, and Community Revenue Sharing contributions of approximately \$375,000 per year in 2009 and 2010. Other sources of shared revenue included state electric and telephone co-op tax refund and state fish tax refunds in some years (see the *Fisheries-Related Revenue* section). No information was reported regarding fisheries-related grants received by Palmer between 2000 and 2010. Information about selected aspects of Palmer's municipal revenue is presented in Table 2.

Palmer was not included under the Alaska Native Claims Settlement Act (ANCSA), and is not federally recognized as a Native village.¹²⁷ Offices of the Alaska Department of Fish and Game (ADF&G) and the Alaska Department of Natural Resources are located in Palmer. The nearest offices of the National Marine Fisheries Service (NMFS), Alaska Department of Commerce, Community, and Economic Development and the U.S. Bureau of Citizenship and Immigration Services are located in Anchorage.

Infrastructure

Connectivity and Transportation

Palmer lies 42 miles northeast Anchorage on the Glenn Highway. Commercial airlines serve the Ted Stevens Anchorage International Airport in Anchorage, but the Palmer Municipal Airport supports private and chartered services with two paved airstrips, one at 6,009 ft long by 100 ft wide and the other at 3,617 ft long by 75 ft wide.¹²⁸ The Alaska State Division of Forestry bases its wildland firefighting operations out of the Palmer Municipal Airport.¹²⁹ There are also several privately-owned airstrips in the vicinity. Float planes may land at nearby Finger Lake and Wolf Lake. The Alaska Railroad connects Palmer to Whittier, Seward, and Anchorage for ocean freight delivery.¹³⁰

¹³⁰ See footnote 126.

Facilities

Water in Palmer is derived from three deep wells, treated, and stored in a million-gallon reservoir. Individual wells are also in use. All homes are completely plumbed, and the City operates a piped water and sewer system. Sewage is collected and treated in a sewage lagoon. Some individual septic tanks are also in use. The Borough operates a landfill outside the City, and a sludge disposal site is also available.¹³¹ Solid waste collection services are provided by the City.¹³² The Matanuska Electric Association Inc. (MEA) provides electric utility service to the entire City of Palmer, generating 85% by gas turbine and 15% hydroelectric. MEA purchases virtually all of the electricity it distributes from Chugach Electric Association Inc., pursuant to a contract expiring January 1, 2015. Piped natural gas, provided by Enstar, is used to heat homes.¹³³

Public safety services are provided by the City of Palmer Police Department and a state troopers post in Palmer. Palmer is also the seat of the State Superior Court District Court Magistrate. Palmer has a city jail, a correctional center, and a pre-trial facility. The Borough Public Safety Building is also located in Palmer. Rescue and fire fighting services are provided by the Victory and Wolverine volunteer fire departments, and the Palmer and Borough ambulance services.¹³⁴

Additional community facilities include the Palmer Community Center, a senior citizen's center, a Pioneer's Home, the Borough swimming pool, an Elks Lodge, Moose Lodge, two museums, and a variety of libraries. Telephone, internet, cable services are available in Palmer.¹³⁵ According to a survey conducted by the AFSC in 2011, community leaders reported that Palmer also has a food bank, publicly subsidized housing, and job placement services, and that plans are under way to build a new community center within the next 10 years. Community leaders also indicated that no fisheries-related facilities are present in Palmer, given it is not a port city, and that local residents typically travel to Anchorage, Seward or Homer to access fisheries-related businesses and services not available in Palmer.

Medical Services

Medical services are provided at the Mat-Su Regional Medical Center in Palmer, located between Wasilla and Palmer, approximately 7 miles from downtown Palmer. The hospital is a privately owned qualified Acute Care facility. Long term care is provided in Palmer at the Veterans' Home and Palmer Pioneers' Home. Emergency services have highway, air, floatplane, and helicopter access. Emergency service is provided by 911 Telephone Service and volunteers.¹³⁶

Educational Opportunities

Six active school facilities are present in Palmer, including one primary school, one intermediate school, one middle school, two high schools, and one K-12 school. Swanson Elementary School serves grades preschool through 2, and as of 2011 had 465 students and 28 teachers; Sherrod Elementary School serves grades 3 through 5, and as of 2011 had 460 students and 26 teachers; Palmer Middle School serves grades 6 through 8, and as of 2011 had 575 students and 37 teachers; Palmer High School serves grades 9 through 12, and as of 2011 had 774 students and 45 teachers; Valley Pathways serves grades 9 through 12, and as of 2011 had 199 students and 11 teachers; and Academy Charter School serves grades Kindergarten through 12, and as of 2011 had 231 students and 19 teachers.¹³⁷

In addition to these six active schools, Mat-Su Secondary School is located in Palmer. It is a secure detention unit school, which offers students a way to continue earning high school credits while they transition back into the Palmer School District or into/out of treatment programs.¹³⁸ However, as of 2011, Mat-Su Secondary School was reported to not have any enrolled students or current teaching staff.¹³⁹

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Historically, Athabascan Indians moved seasonally through the Palmer region to pursue subsistence fishing, hunting, and trapping activities.¹⁴⁰ Today, Palmer residents are most engaged in fisheries for salmon and halibut. In addition to local Cook Inlet fisheries, Palmer fishermen participate in fisheries around the state. For example, in 2010, 25% of Palmer salmon permits were held in Cook Inlet gillnet fisheries, while 41% were held in Bristol Bay gillnet fisheries, and the remaining permits were held in other salmon fisheries ranging from Southeast Alaska to Norton Sound. In addition to salmon and halibut, Palmer residents were most highly engaged in fisheries for herring and groundfish during the 2000-2010 period (see *Commercial Fishing* section).

Commercial salmon and herring fisheries began to develop shortly after the purchase of Alaska by the U.S. in 1867. The earliest herring harvest was for human consumption, while harvest of herring for bait began around 1900, and herring sac roe fisheries developed in the late 1970s.^{141,142} Commercial exploitation of halibut and groundfish first extended into the Gulf of

Alaska (GOA) in the 1920s after development of diesel engines, which allowed fishing vessels to undertake longer trips.¹⁴³

Cook Inlet is the closest marine area to Palmer. ADF&G manages the Cook Inlet salmon and herring fisheries.¹⁴⁴ The marine waters bordering Cook Inlet are encompassed by Federal Reporting Area 630, Pacific Halibut Fishery Regulatory Area 3A, and the Central Gulf of Alaska Sablefish Regulatory Area. Pacific halibut fisheries are managed under the International Pacific Halibut Commission. Groundfish fisheries that occur within 3 nautical miles (nmi) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nm in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction.

Palmer is not eligible to participate in either the Community Development Quota (CDQ) program or the Community Quota Entity (CQE) program. According to a survey conducted by the AFSC in 2011, community leaders reported that Palmer does not participate in fisheries management processes in Alaska.

Processing Plants

ADF&G's 2010 Intent to Operate list does not list a registered processing plant in Palmer. However, numerous processing facilities are located in nearby Anchorage.

Fisheries-Related Revenue

Between 2000 and 2010, revenue was reported in Palmer in two different years from the Shared Fisheries Business Tax. In 2003, \$15 of revenue was reported, and in 2010, \$3,128 of revenue was reported. No other information was reported regarding fisheries-related revenue in Palmer between 2000 and 2010 (Table 3).¹⁴⁵

Commercial Fishing

Although Palmer is not a port city, local residents are involved in the commercial fishing industry as crew license holders, quota share account and permit holders, and vessel owners. In 2010, 88 Palmer residents held commercial fishing crew permits and 39 fishing vessels were primarily owned by residents. These numbers represent decreases since the year 2000, when 107 Palmer residents held crew licenses, and 74 fishing vessels were primarily owned by residents. The number of vessels reported as homeported in Palmer has also decreased over the period, from 26 in 2000 to 7 as of 2010 (Table 5).

In 2010, 92 Palmer residents held a total of 117 state-issued Commercial Fisheries Entry Commission (CFEC) permits. Of these, 75 were held in salmon fisheries, 15 in halibut fisheries,

¹⁴² Woodby, Doug, Dave Carlile, Shareef Siddeek, Fritz Funk, John H. Clark, and Lee Hulbert. 2005. *Commercial Fisheries of Alaska*. Alaska Dept. of Fish and Game, Special Publication No. 05-09. Retrieved December 29, 2011 from <http://www.adfg.alaska.gov/FedAidPDFs/sp05-09.pdf>.

¹⁴⁴ Alaska Dept. of Fish and Game. 2012. *Commercial Fisheries Overview*. Retrieved June 27, 2012 from <http://www.adfg.alaska.gov/index.cfm?ADFG=fishingcommercialbyarea.main>.

¹⁴⁵ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

9 in crab fisheries, and the rest in fisheries for ‘other shellfish’ (4), herring (3), sablefish (5), and groundfish (6). In the same year, the greatest number of salmon CFEC permits were held in the Bristol Bay drift gillnet fishery (20 permits), Cook Inlet set gillnet fishery (15), Bristol Bay set gillnet fishery (11), Prince William Sound drift gillnet fishery (5), Cook Inlet drift gillnet fishery (4), and Kodiak purse seine fishery (3). One or two CFEC permits were also held in 12 additional salmon fisheries around the State, in areas including Chignik, Peninsula-Aleutians, Yakutat, Lower Yukon, Upper Yukon, Kuskokwim, Kotzebue, and Norton Sound, using fishing gear including set and drift gillnet, purse seine, hand troll, and fishwheel. Salmon permit numbers remained relatively stable between 2000 and 2010, although the percentage of permits that were actively fished decreased from 82% in 2000 to 67% in 2010.

Of the 15 halibut CFEC permits held by Palmer residents, 12 were held in the statewide longline fishery using vessels under 60 ft, 2 were held in the statewide longline fishery using vessels over 60 ft, and 1 was held in the statewide mechanical jig fishery. Of these, 10 were actively fished that year, including 9 in the statewide longline fishery using vessels under 60 ft and 1 using vessels over 60 ft. The number of halibut permits held stayed relatively stable between 2000 and 2010, although the percentage of active permits decreased from 92% in 2000 to 67% in 2010.

Crab CFEC permits held in Palmer in 2010 were for Dungeness crab (one of three permits actively fished in the Cook Inlet pot gear fishery, one of one permit active in the Southeast 150 pots fishery), king crab (one of one permit actively fished in the Bering Sea pot gear, vessels 60 ft or over fishery, and zero of one permit active in the Bristol Bay pot gear, vessels 60 ft or over fishery in 2010), and Tanner crab (one of one permit active in the Peninsula-Aleutians pot gear, vessel under 60 ft fishery, one of one permit active in the Bering Sea pot gear, vessels 60 ft or over fishery, and zero of one permit active in the Kodiak pot gear, vessel under 60 ft fishery).

The number of groundfish and herring CFEC permits held by Palmer residents decreased markedly between 2000 and 2010. In the case of groundfish, 18 permits were held in 2000, decreasing to 6 by 2010. The percentage of groundfish permits actively fished also decreased over the period, from 50% in 2000 to 17% by 2010. In 2010, groundfish permits were held in statewide groundfish fisheries targeted miscellaneous saltwater finfish, using longline, pot gear, or mechanical jig, along with one Gulf of Alaska permit for pot gear. In the case of herring, 3 of 13 CFEC permits were actively fished in 2000 (23%), decreasing to 0 of 3 total herring permits actively fished in 2010 (0%). In 2010, herring permits were held in roe herring gillnet fisheries in Prince William Sound and Goodnews Bay. Earlier, in 2000, herring permits had also been held in roe herring gillnet fisheries in Bristol Bay and Security Cove, the herring gillnet fishery in Norton Sound, and the Prince William Sound herring spawn on kelp fishery. CFEC permit information is presented in Table 4.

In addition to CFEC permits, three Palmer residents held License Limitation Program permits (LLP) in federal groundfish fisheries, of which one was actively fished in 2010. One Palmer resident held an inactive LLP in a federal crab fishery in 2010, and three Palmer residents held Federal Fisheries Permits (FFP) in 2010, of which one was actively fished that year. Between 2000 and 2010, the number of quota share account holders in the federal halibut catch share fishery in Palmer decreased from 17 to 15. The number of halibut quota shares held initially decreased from 911,606 to 578,308, and then increased to over 1 million shares between 2008 and 2010. Also between 2000 and 2010, the number of Palmer residents holding quota share accounts in the federal sablefish catch share fishery varied between 2 and 4, and the

amount of quota shares held increased from 473,306 in 2000 to 665,340 in 2010. With respect to both halibut and sablefish catch share fisheries, annual individual fishing quota (IFQ) allotments remained relatively stable between 2000 and 2010. No quota shares were held in federal crab catch share fisheries by Palmer residents during the 2000-2010 period. Information about LLP and FFP permits is presented in Table 4, while information about federal catch share participation is presented in Tables 6 through 8.

Given that no fish buyers or shore-side processors were present in Palmer between 2000 and 2010 (Table 5), no landings or ex-vessel revenue were generated in the community (Table 9). Rather, Palmer vessel owners delivered landings in other locations. Information was available for all years between 2000 and 2010 regarding salmon harvest by Palmer vessel owners, and for some years during the period for harvest of halibut, Pacific cod, sablefish, and ‘other groundfish.’ Information about harvest in other years and for other species is considered confidential due to the small number of participants. On average between 2000 and 2010, 3,056,909 net lbs of salmon were harvested by Palmer vessel owners, valued at an average of \$1,537,949 in ex-vessel revenue. For those years in which information can be reported regarding halibut, landings averaged 65,262 net lbs valued at an average of \$175,418 in ex-vessel revenue. For those years in which information can be reported regarding Pacific cod harvest, landings averaged 421,454 net lbs valued at an average of \$116,702. Finally, for those years in which ‘other groundfish’ information can be reported, Palmer vessel owners harvested an average of 18,922 net lbs valued at an average of \$10,650. Sablefish landings and revenue information can be reported for one year between 2000 and 2010. That year (2004), Palmer vessel owners landed a total of 56,692 net lbs of sablefish, valued at \$154,028 in ex-vessel revenue. Landings and ex-vessel revenue earned by Palmer vessel owners are presented in Table 10.

Recreational Fishing

According to ADF&G, the number of active sport fish guides registered in Palmer remained relatively stable over the 2000-2010 period, varying between four and eight active businesses per year. In contrast, the number of licensed sport fish guides present in the community declined substantially over the decade, from 63 in 2000 to 29 in 2010. Despite this decline, these numbers represent a significant sport fishing infrastructure in Palmer. The presence of this infrastructure suggests that sport fishing is a tourism draw to the area. However, according to a survey conducted by the AFSC in 2011, community leaders indicated that a majority of sport fishing activity in the Palmer area is done by local residents using their private boats.

Between 2000 and 2010, the number of Palmer residents that purchased sport fishing licenses (irrespective of point of sale) varied between 6,825 and 8,724, generally increasing over the period. The number of fishing licenses sold in Palmer was slightly smaller, varying between 4,831 and 6,340 between 2000 and 2010. These numbers suggest that local residents may travel to nearby communities such as Anchorage or Wasilla to purchase licenses and fishing gear. Information about sport fishing activity in Palmer is presented in Table 11.

According to the 2011 AFSC survey, community leaders indicated that salmon and halibut are the most commonly targeted sport species in Palmer. The Alaska Statewide Harvest Survey,¹⁴⁶ conducted by ADF&G between 2000 and 2010, noted additional species known to be targeted by private anglers in Palmer. In freshwater, additional species included landlocked salmon, rainbow trout, Dolly Varden, whitefish, burbot, Arctic grayling, northern pike, and smelt. In saltwater, additional species targeted by sport fishing included Dolly Varden, rockfish, lingcod, Pacific cod, sablefish, shark, and smelt. The survey also noted sport harvest of razor clams, hardshell clams, shrimp, and ‘other shellfish’ by anglers in Palmer.¹⁴⁷ No kept/release log book data were reported for fishing charters out of Palmer between 2000 and 2010.¹⁴⁸

Palmer is located within Alaska Sport Fishing Survey Area K – Knik Arm. Between 2000 and 2010, freshwater sport fishing activity was more important than saltwater sport fishing at this regional level, and Alaska residents consistently fished a greater number of angler days than non-Alaska residents. In 2010, Alaska residents logged 95,285 freshwater and 124 saltwater angler days, while non-Alaska resident logged 10,872 freshwater days and no saltwater angler days. This information about regional sport fishing activity in Palmer is presented in Table 11.

¹⁴⁶ Alaska Department of Fish and Game. 2011. *Alaska Sport Fishing Survey results, 2000 – 2010*. ADF&G/ADF&G Division of Sport Fish, Alaska Statewide Harvest Survey project. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sf/sportfishingsurvey/> (Accessed September 2011).

¹⁴⁷ The Alaska Statewide Harvest Survey includes separate categories for Dungeness crab, Tanner crab, razor clams, hardshell clams and shrimp. Remaining species fall into the ‘other shellfish’ category.

Subsistence Fishing

Palmer is located in the traditional territory of two groups of Athabascan Indians, the Ahtna and Dena'ina people.¹⁴⁹ Historically, Athabascans migrated seasonally, traveling in small groups to pursue subsistence fishing, hunting, and trapping activities.¹⁵⁰ Today, the economy of Palmer is based primarily on government services, retail, and manufacturing,¹⁵¹ but some local residents continue to participate in subsistence activities. According to a survey conducted by the AFSC in 2011, community leaders reported that the most important subsistence resources for Palmer residents include herring and littleneck clams harvested in Cook Inlet, and salmon harvested in the Matanuska River and its tributary streams.

No information was reported by ADF&G regarding per capita subsistence harvest or the percentage of households in Palmer utilizing various marine resources for subsistence purposes between 2000 and 2010 (Table 12). However, information is available during the 2000-2010 period regarding total subsistence harvest of salmon and halibut. Between 2000 and 2008, the number of subsistence salmon permits issued to Palmer households varied between 371 and 608. Sockeye salmon were the most heavily harvested species during this period, averaging 10,796 sockeye harvested for subsistence per year. Several hundred Chinook and coho salmon were also harvested on average each year between 2000 and 2008, along with a small number of chum salmon each year and pink salmon in some years during the period. This information about subsistence salmon harvest is presented in Table 13. Between 2003 and 2010, the number of Subsistence Halibut Registration Certificates (SHARC) issued to Palmer residents increased from 3 to 12 in 2009. In 2010, 10 cards were issued, 1 was returned, and a total of 24 lbs of halibut were reported harvested for subsistence purposes by Palmer residents. This information about subsistence harvest of halibut is presented in Table 14.

No information was reported by management agencies regarding subsistence harvest of marine invertebrates, non-salmon fish (not including halibut), or marine mammals between 2000 and 2010 (Tables 13 and 15).

Additional Information

The Matanuska Valley is famous statewide and nationally for the extremely large vegetables produced by local farmers. These vegetables frequently win prizes as the Alaska State Fair, which is held in Palmer every fall. More than 250,000 people attend the 12-day event, which generates more than \$2 million for the local economy.¹⁵²

Petersville

People and Place

*Location*¹⁵³

Petersville is located on Petersville Road, at mile 114.9 of the George Parks Highway, west of Trapper Creek. Petersville Road is 17 miles north of the junction to Talkeetna Spur Road. Peters Creek and the Deshka River flow through the community. Petersville is located in the Talkeetna Recording District and the Matanuska-Susitna Borough Census Area.

*Demographic Profile*¹⁵⁴

According to the 2010 Decennial Census, there were four inhabitants in Petersville, making it the 348th largest of 352 total Alaskan communities with populations recorded that year. However, the Alaska Department of Labor and Workforce Development (DOLWD) recorded 12 residents age 16 and over living in the community in 2010.¹⁵⁵ Petersville first appeared in U.S. Census records in 2000, with 27 individuals (Table 1). Although no population was recorded in Petersville by the U.S. Census in 1990, an estimate was provided regarding a sparsely populated U.S. Census block including Petersville. In this area, which included some areas of little or no population beyond the community council boundaries of Petersville, the 1990 population estimate was 84, with 37 households.¹⁵⁶ Between 2000 and 2009, Alaska Department of Labor estimates indicate that the population of permanent residents in Petersville decreased by 77.8%, with an average annual growth rate of -5.72%.

In 2010, a majority of Petersville residents identified themselves as White (75%), while 25% identified with two or more races (Figure 1). That year, no Petersville residents identified themselves as Hispanic. Several racial and ethnic groups appeared to have been present in the year 2000 but were not represented in 2010, such as American Indians and Alaska Natives and Native Hawaiian and Other Pacific Islanders. Some of these individuals may have moved away, and some may be represented among those who identified with two or more races in 2010.

Figure 1. Racial and Ethnic Composition, Petersburg: 2000-2010 (U.S. Census).

In 2010, there were four occupied housing units in Petersburg, with an average of one person living in each of these households. This represents a decrease from the year 2000, when there were 17 total households in Petersburg, with an average of 1.59 persons per household. Of the 179 total housing units surveyed for the 2010 U.S. Decennial Census, three (1.7%) were owner-occupied, one (0.6%) was rented, and the remaining 175 housing units were vacant. A

majority of these (174) were vacant at the time of the survey due to their seasonal use. From 2000 to 2010, no residents of Petersville were recorded as living in group quarters.

In 2010, the gender makeup of Petersville’s population (25% male and 75% female) was much more weighted toward females than the population of the state as a whole, which had more men than women overall (52% male and 48% female). In 2010, the median age of Petersville residents was 46.5 years, older than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, one Petersville resident (25% of the population) was over the age of 60. It is important to keep in mind that these numbers reflect a population of only four individuals. With such a small population, the difference of several individuals can affect percentages, averages, and median scores greatly. The overall population structure of Petersville in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Petersville Based on the 2000 and 2010 U.S. Decennial Census.

It is also useful to examine the population structure of Petersville in 2000, when the population was somewhat higher. In 2000, the gender ratio in the Petersville (52.8% male and 47.2% female) was slightly more weighted toward males than the state population as a whole, which was 51.7% male and 48.3% female. The age groups particularly skewed toward males included 10-19 and 70-79 years, while there were more females than males in the age groups 20-29 and 40 to 69 years. The median age in 2000, 14 years, was much younger than the 2000 national average of 36.5 years and the 2000 Alaska median age of 32.4 years. In 2000, 61.6% of the population was under the age of 20, and 5.4% of the population was age 60 or older. The population structure of Petersville in 2000 and 2010 is shown in Figure 2.

The 2006-2010 American Community Survey (ACS) did not provide any information regarding educational attainment in Petersville in 2010. Although the U.S. Decennial Census recorded four individuals as permanent residents in Petersville in 2010, the ACS estimated a population of zero.^{157,158} Given the small population of Petersville in 2010, it is useful to look back at education statistics in the year 2000 as well, when the population was slightly higher (27 residents). That year, 12 Petersville residents were aged 25 or older, all of whom held high school diplomas, as well as Bachelor's degrees (100%), compared to 27.9% of the population that held high school diplomas and 16.1% that held Bachelor's degrees in 2000. No Petersville residents held graduate or professional degrees in 2000, compared to 8.6% of Alaskans overall.¹⁵⁹

History, Traditional Knowledge, and Culture

Dena'ina Athabascans historically inhabited the Petersville area, and used the region for subsistence hunting and fishing.¹⁶⁰ In 1905, gold was discovered on Cache Creek and upper Peters Creek. In 1917, a freighting trail was built by the Alaska Road Commission from Talkeetna. The crossing of the Susitna River was by ferry during summer and over ice in the winter. Petersville became home to a district post office as a result of the road construction. By 1921, there were 24 mining operations in the Yentna Mining District, most with large-scale hydraulic plants. World War II caused a shutdown of nearly all mining operations. Federal homesteading began here in 1948 and continued through the 1960s. In the late 1970s, many of the previously idle mining sites were brought back into production.¹⁶¹ There is no community

¹⁵⁷ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹⁵⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

center in Petersville. Residents are dispersed throughout the area.¹⁶² Today, most residences in Petersville are seasonal homes.¹⁶³ Year-round residents are typically involved in caretaking the historic Petersville mining camp.¹⁶⁴

Natural Resources and Environment

Petersville is located in a transitional climatic zone, influenced both by marine and continental climate patterns. January temperatures range from -30 to 33 °F, and temperatures in July can vary from 42 to 83 °F. Annual rainfall ranges from 16 to 27 inches, along with 48 to 150 inches of snowfall.¹⁶⁵

There is currently relatively little mining activity in the Petersville area, although large gold reserves exist within the upper base of the Peters Creek area.¹⁶⁶ Several mining claims are located in the area immediately south and west of Petersville. Each year, three or four small mines are under operation, with approximately half a dozen miners actively working between mid-May and mid-October.¹⁶⁷ In addition, in 2010, Diamond Gold Corporation reported development activity in the Yentna (Petersville) mining district, including construction of five miles of pioneer road for its Sable–Kahiltna Mine.¹⁶⁸ This area is being developed as “a new world-class gem field,” with known gemstones including opal, sapphire, ruby, garnet, and diamond, and stones including emerald, agate, jade, red and green jasper, and opalized wood.¹⁶⁹

Land in the Petersville area is owned by the Matanuska-Susitna Borough, the State of Alaska, the University of Alaska, as well as some private ownership.¹⁷⁰ Two public use areas have been designated in the vicinity of Petersville, including one for recreational mining and one for general public recreation. The Petersville Recreational Mining Area allows for gold panning, mineral prospecting, or mining using portable, non-electric field equipment. No new mining claims may be granted within the area.¹⁷¹ The Trapper Creek – Petersville Winter Trails system offers 12.5 miles of trail for snowmobiling, dog mushing, cross-country skiing and skijoring.¹⁷²

Natural hazards that have been identified as highly likely to occur in the Matanuska-Susitna Borough include floods, wildfire, earthquake and volcanic activity. Avalanche and

severe weather were rated a moderately likely to occur, and drought was rated at a low probability of occurrence.¹⁷³

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Petersville as of July 2012.¹⁷⁴

Current Economy¹⁷⁵

Subsistence and sporting activities are an integral part of the lifestyle of local residents, many of whom are retired and reside in Petersville on a seasonal basis. Those who are employed work in industries including education, transportation, and construction.¹⁷⁶ Small scale farming and logging are still economically important in the area.¹⁷⁷ Tourism is also increasing in importance in Petersville. The area draws visitors to engage in recreational activities, such as hunting, dog mushing, snowmobiling, and cross-country skiing. This activity has led to development of some retail and service businesses in the region.¹⁷⁸ A lodge and several bed and breakfast businesses are located in the area.¹⁷⁹ Historically, mining was an important local industry. Today, although some small operations are under development, mining is no longer a significant employer in the Petersville area.¹⁸⁰ No additional information was available from the Alaska Department of Labor and Workforce Development regarding top employers in Petersville.¹⁸¹

Although the U.S. Decennial Census reported four residents age 16 or over in Petersville in 2010, household surveys conducted for the 2006-2010 ACS did not collect data from local residents.¹⁸² Given this, the civilian labor force was thus estimated to be zero and no earnings were reported in Petersville through the 2006-2010 ACS. In 2000, the per capita income in Petersville was \$43,200 and the median household income was \$43,750. Taking inflation into account by converting the 2000 values to 2010 dollars,¹⁸³ the real per capita income in 2000 is shown to have been \$56,807, and the real median household income in 2000 was \$57,531. In the

Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹⁸³ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

year 2000, Petersville ranked 6th of 344 Alaskan communities with per capita income data that year, and 121st in median household income, out of 341 Alaskan communities with household income data. In 2000, no Petersville residents were below the poverty level, compared to 9.4% of Alaskan residents overall.

An alternative estimate of 2010 per capita income can be generated using economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the DOLWD. The ALARI database estimated that there were 12 residents age 16 and over in the civilian labor force in 2010. Of these, six residents were estimated to be employed that year.¹⁸⁴ If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Petersville in 2010 is \$43,745.¹⁸⁵ This estimate is lower than the real per capita income reported in the year 2000, providing evidence that per capita income may have decreased in Petersville between 2000 and 2010. However, given the different data sources used to generate the 2000 and 2010 statistics, caution should be used when considering this information.

The possible decrease in per capita income is reflected in the fact that Petersville met the Denali Commission's criteria as a "distressed community" in 2010,¹⁸⁶ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both U.S. Census and DOLWD data are based on wage earnings, and these income figures do not take into account the value of subsistence within the local economy.

Given Petersville's small population size, the 2006-2010 ACS did not estimate employment statistics for 2010.¹⁸⁷ Income and employment information was reported in the 2000 decennial census, when 27 individuals resided in the community. Of 12 Petersville residents aged 16 or older in 2000, all (100%) were in the civilian labor force that year, compared to 67.6% that were in the civilian labor force statewide. Of these 12, 6 were employed and 6 were unemployed, for an unemployment rate of 50%, compared to a statewide unemployment rate of 6.1% in 2000. That year, all six employed individuals in Petersville worked in the public sector, in management/professional occupations in educational, health, and social services industries. This information from the 2000 Census about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were six employed residents in 2010, of which two were employed in leisure and hospitality, one in manufacturing, one in trade, transportation, and utilities, one in professional and business services, and one in local government.¹⁸⁸ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

¹⁸⁴ See footnote 181.

¹⁸⁵ See footnotes 181 and 182.

¹⁸⁶ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

¹⁸⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁸⁸ See footnote 181.

Governance

Petersville is an unincorporated community located in the Matanuska-Susitna Borough.¹⁸⁹ No sales tax is administered in Petersburg, although the Borough does collect a 10.35 mills property tax, a 5% Bed Tax, and a 5.29% Tobacco Excise Tax.¹⁹⁰ The community is represented by the Petersburg Community Council, an advisory body established by the Borough,¹⁹¹ which provides citizens with the opportunity for maximum community

involvement.¹⁹² No municipal revenue was reported between 2000 and 2010. In addition, no information was reported regarding State and Community Revenue Sharing contributions or fisheries-related grants received by the Petersville between 2000 and 2010 (Table 2).

Petersville was not included under the Alaska Native Claims Settlement Act (ANCSA), and is not federally recognized as a Native village.¹⁹³ The nearest office of the Alaska Department of Fish and Game (ADF&G) is located in Palmer, and the nearest office of the Alaska Department of Natural Resources is located in Wasilla. Offices of these agencies are also located in Anchorage, along with the closest offices of the Alaska Department of Commerce, Community, and Economic Development, the National Marine Fisheries Service (NMFS), and the U.S. Bureau of Citizenship and Immigration Services.

Infrastructure

Connectivity and Transportation

Petersville is located approximately 30 miles out the state-maintained Petersville Road, which leaves the George Parks Highway at Trapper Creek. A four-wheel drive or high-clearance

¹⁹² *Petersville Road Corridor Management Plan*. 1998. Retrieved May 23, 2012 from <http://www.southdenali.alaska.gov/includes/pvcorridormp.pdf>.

¹⁹³ See footnote 189.

vehicle is recommended for travel on this road, as the second half of the trip is primitive roadway.^{194,195} The closest non-commercial airstrip is located in Talkeetna,¹⁹⁶ while a variety of transportation means are available in Wasilla and Palmer.¹⁹⁷

Facilities

The majority of year-round residents have individual wells, septic tanks, and complete plumbing. Residents of seasonal homes haul water and use outhouses. There is no central electric system in Petersville, and residents use private generators. A borough refuse transfer facility is available in Trapper Creek. Police services are provided by state troopers stationed approximately 50 miles away in Talkeetna. The nearest fire and rescue services are available from Fire Station 112, approximately 100 miles away in Wasilla. Local and long-distance telephone service is available, but no internet or cable providers offer service locally.¹⁹⁸ Except for ambulance and rescue service, no other public services are provided locally.¹⁹⁹

Medical Services

The nearest medical services are provided at the Sunshine Community Health Center in Talkeetna (approximately 50 road miles away) or the Valley Hospital in Palmer (approximately 115 road miles). Anchorage-area hospitals are also accessible to Petersville residents by road. Alternate health care is provided by Trapper Creek Ambulance Service.²⁰⁰

Educational Opportunities

No schools are located in Petersville, although the community is part of the Mat-Su Borough School District.²⁰¹ The nearest elementary school is located in Trapper Creek (30 miles away by road), while the closest combined middle/high school is the Su-Valley High School located near Talkeetna along the George Parks Highway (60 miles away). Some students may also be homeschooled through correspondence programs such as Mat-Su Central School, or other state, federal, or church correspondence programs.²⁰²

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Historically, Dena'ina Athabascan people had permanent village sites near Petersville, in the Susitna River drainage. In the spring, the Dena'ina established fish camps near their village sites, and during summer months they harvested and processed large quantities of Chinook, sockeye, and coho salmon. The salmon was dried and stored at permanent village sites.²⁰³

Today, residents of Petersville and the surrounding region continue to utilize salmon resources, as well as additional freshwater species, for subsistence and recreational fishing purposes. No commercial fisheries take place in the immediate vicinity of Petersville. Cook Inlet provides the nearest access to the ocean. A commercial salmon fishery takes place in Cook Inlet.²⁰⁴ Gulf of Alaska (GOA) waters beyond Cook Inlet are encompassed by Federal Statistical and Reporting Area 630, Pacific Halibut Fishery Regulatory Area 3A, and the Central GOA Sablefish Regulatory Area.

Processing Plants

The 2010 ADF&G Intent to Operate list did not list any registered processing plants in Petersville. The list did indicate that over 10 facilities were in operation in Anchorage that year, along with two in Wasilla.

Fisheries-Related Revenue

No information was reported between 2000 and 2010 regarding fisheries-related revenue earned in the community of Petersville (Table 3).

Commercial Fishing

Between 2000 and 2010, no Petersville residents were involved in commercial fisheries in Alaska. No permits were held in federal or state fisheries (Table 4), and no residents held quota share accounts or quota shares in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 through 8). No residents held commercial crew licenses or were the primary owner of a fishing vessel during the 2000-2010 period. Further, no vessels were homeported in Petersville (Table 5). Given the lack of fish-buyers or processing facilities in the community between 2000 and 2010 (Table 5), no landings and ex-vessel revenue were generated in Petersville (Table 9). In addition, the lack of vessel owners in Petersville (Table 5) led to a lack of landings and ex-vessel revenue generated by local residents (Table 10).

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses or licensed sport fish guides were registered in the community of Petersville. Further, no residents purchased sportfishing licenses during this period, and no sportfishing licenses were sold in the community. However, these numbers do not reflect the activity of the large number of individuals who reside in Petersville on a seasonal basis, and for whom sport hunting and fishing are an important part of the local lifestyle.²⁰⁵

It is important to note that recreational fishing is a popular activity in the region generally. Petersville is located within Alaska Sport Fishing Survey Area M – Susitna River drainage. Information is available about freshwater sport fishing only at this regional level. Between 2000 and 2010, non-Alaska resident anglers fished an average of 57,330 days per year, while Alaska resident anglers fished an average of 118,222 days per year. This information about sport fishing trends in Petersville and the Susitna River drainage is presented in Table 11.

Table 11. Sportfishing trends, Petersville: 2000-2010.

²⁰⁵ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

The Alaska Statewide Harvest Survey,²⁰⁶ conducted by ADF&G between 2000 and 2010, did not report on species targeted by private anglers in Petersville. However, the survey noted the following species targeted by sport fisheries downstream in the community of Willow during the 2000-2010 period. In freshwater, anglers caught all five species of salmon, rainbow trout, Dolly Varden, Arctic grayling, northern pike, burbot, and smelt. Anglers from Willow also traveled to saltwater to fish for Pacific halibut, rockfish, lingcod, and Pacific cod. The survey also noted sport harvest of razor clams, hardshell clams, and shrimp by Willow sport fishers.

Given the lack of sportfish businesses, no kept/release log book data were reported for fishing charters out of Petersville between 2000 and 2010.²⁰⁷

Subsistence Fishing

Subsistence activities are an important part of the local lifestyle in Petersville.²⁰⁸ Very little information was reported by ADF&G regarding subsistence harvest activities in Petersville between 2000 and 2010. The low population of permanent residents in the community may affect statistics reported here, as the subsistence harvest activities of seasonal residents may be reported for the community in which they make their primary residence.

In 2008, one subsistence salmon permit was issued to a Petersville household. The permit was returned that year, and the household reported harvesting 14 sockeye salmon. This information is presented in Table 13. No information was reported by management agencies regarding per capita subsistence harvest, the percentage of Petersville households participating in subsistence activities between 2000 and 2010 (Table 12), subsistence harvest of halibut (Table 14) or marine mammals (Table 15) during the 2000-2010 period.

Skwentna (SKWENT-nuh)

People and Place

*Location*²⁰⁹

Skwentna lies in the Yentna River Valley, on the south bank of the Skwentna River at its junction with Eight Mile Creek. The community is located 70 air miles northwest of Anchorage in the Matanuska-Susitna (Mat-Su) Borough. Skwentna is in the Anchorage Recording District and the Matanuska-Susitna Census Area.

*Demographic Profile*²¹⁰

In 2010, there were 37 inhabitants in Skwentna, making it the 310th largest of 352 total Alaskan communities with recorded populations that year. Overall the population has decreased since 1990, though the population rose in 2000 and then declined again according to the U.S. Decennial Census. The U.S. Decennial Census shows a much steeper rate of decline than Alaska Department of Labor estimate of permanent residents. The change in population from 1990 to 2010 is shown in Table 1. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that approximately 200 individuals come to Skwentna each year as seasonal workers or transients in addition to the population of permanent residents, and the population reaches its annual peak during the summer months.

In the 2010 U.S. Decennial Census, 100% of Skwentna residents identified themselves as White. The percentage of residents identifying themselves as White increased by 7.2% between 2000 and 2010, with corresponding decreases in the percentage of the population identifying themselves as American Indian and Alaska Native and two or more races. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Skwentna was 1.85, a decrease from 2.7 persons per household in 1990 and 2.22 in 2000. The total number of households decreased overall, from 31 in 1990 to 50 in 2000 to 20 in 2010. Of the 353 total housing units surveyed for the 2010 U.S. Decennial Census, 18 were owner-occupied, two were renter occupied, and 333 were vacant, though 325 of the units reported as vacant are used seasonally. Throughout this period, no residents of Skwentna were reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Skwentna: 2000-2010 (U.S. Census).

The gender makeup in Skwentna in 2010 was 59.5% male and 40.5% female, more skewed than the state as a whole (52% male, 48% female). The median age was estimated to be 52.8 years, higher than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010 the largest percentage of residents fell within the age category 50 to 59 years old, while the next largest percentage fell within the age category 40 to 49 years old. There were no Skwentna residents under age nine or over age 80 in 2010. By comparison, in

2000 a greater percentage of the population was made up of residents under the age of 20 (24.3% in 2000 compared to 11.7% in 2010), and a lower percentage of the population was made up of individuals aged 60 or older (5% in 2000 compared to 24.3% in 2010). This shift could be related to the closure of the Skwentna school in 2000 (see the *Educational Opportunities* section). The overall population structure of Skwentna in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Skwentna Based on the 2000 and 2010 U.S. Decennial Census.

The 2006-2010 American Community Survey (ACS) did not provide any information regarding educational attainment in Skwentna in 2010. Although the U.S. Decennial Census recorded 37 individuals as permanent residents in Skwentna in 2010, the ACS estimated a population of zero.^{211,212} Given the small population of Skwentna in 2010, it is useful to look

²¹¹ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

back at education statistics in the year 2000 as well, when the population was slightly higher (111 residents). Based on the 2000 U.S. Census,²¹³ 95% of Skwentna residents aged 25 and older held a high school diploma or higher degree, compared to 88.3% of Alaskan residents overall that year. Also based on the 2000 Census, 5% of Skwentna residents aged 25 and older had less than a ninth grade education, compared to 4.1% of Alaskan residents overall; 28.8% had a high school diploma or equivalent, compared to 27.9% of Alaskan residents overall; 7.5% had some college but no degree, compared to 28.6% of Alaskan residents overall; 22.5% had an Associate's degree, compared to 7.2% of Alaskan residents overall; and 36.3% of Skwentna residents had a Bachelor's degree, compared to 16.1% of Alaskan residents overall. No Skwentna residents held graduate or professional degrees in 2000, compared to 8.6% of Alaskans overall.

History, Traditional Knowledge, and Culture

Dena'ina Athabascans have fished and hunted along the Skwentna and Yentna Rivers for centuries. Dena'ina villages were occupied in the Yentna River Valley until the 1800s, and continued to be used as seasonal fishing and hunting camps by the Susitna Station and Kroto Creek Dena'ina until around 1930.²¹⁴ The gold rush of the late 1800s brought hundreds of prospectors to the Susitna River basin.²¹⁵ An extensive network of trails and wagon roads was established by early explorers, mining companies, and the Alaska Road Commission. Old Skwentna is located along the route of the Iditarod Trail.²¹⁶ Many roadhouses were constructed along the trail to the Innoko Mining District, including the Old Skwentna Roadhouse. Prospectors, trappers, and Natives often used sled dogs to transport goods over the trail. Max and Belle Shellabarger homesteaded and started a guide service in 1923 and later a flying service and weather station. A post office was opened in 1937. After World War II, Morrison-Knudson built an airstrip, and in 1950 the U.S. Army established a radar station at Skwentna and a recreation camp at Shell Lake, 15 air miles from Skwentna. In the 1960s, state land disposals increased settlement. Skwentna residents are scattered over a large area of land. The community has a number of seasonal-use homes. There is a small local store, and area residents use snowmobiles or aircraft to travel to the post office.²¹⁷

²¹² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Natural Resources and Environment

January temperatures in Skwentna range from -30 to 33 °F (-34.4 to 0.6 °C), and July temperatures can vary from 42 to 83 °F (5.6 to 28.3 °C). Annual precipitation averages 28 inches, with 70 inches of snowfall.²¹⁸ In a survey conducted by the AFSC in 2011, community leaders reported that Skwentna's economy is reliant upon the following natural resource-based industries: mining, logging, fishing, ecotourism, and sport hunting/fishing.

Skwentna is located near Denali National Park and Preserve. The following information about Denali National Park and Preserve (National Park) is from the U.S. National Park Service. Denali, the “High One,” is the name Athabascan native people gave the massive peak that crowns the 600-mile-long Alaska Range. Denali is also the name of an immense national park and preserve created from the former Mount McKinley National Park. In 1917, Mount McKinley National Park was established as a game refuge. The park, including North America's highest peak, were named for former senator - later President - William McKinley. In 1980, the Alaska National Interest Lands Conservation Act (ANILCA) enlarged the boundary of the park by 4 million acres and redesignated it as Denali National Park and Preserve. The National Park exemplifies interior Alaska's character as one of the world's last great frontiers; its wilderness is largely unspoiled.²¹⁹

More than 650 species of flowering plants as well as many species of mosses, lichens, fungi, algae, and others grace the slopes and valleys of the National Park. Only plants adapted to long, cold winters and short growing seasons can survive in this subarctic wilderness. Permafrost ground underlies many areas of the park, where only a thin layer of topsoil is available to support life. After the continental glaciers retreated from most of the park 10,000 to 14,000 years ago, hundreds of years were required to begin building new soils and revegetation. The dynamic glaciated landscape provides large rivers, countless lakes and ponds, and unique landforms which form the foundation of the ecosystems that thrive in the National Park.²²⁰

The National Park is well-known for its diversity of wildlife. There are 39 species of mammals, 169 species of birds, 14 species of fish, and one species of amphibian known to occur in the area. There are no reptiles recorded in the National Park. Animal life and activity is dictated by the seasons. Winter is the longest season and the animals that are year-round residents are well-adapted to life in the subarctic. The brief spring season brings the return of 80% of the National Park's bird life, the waking of hibernating bears, and an increase in activity levels of wildlife. Summer is a time for raising young and preparing for migration, hibernation, or survival during the winter. Summer also brings hordes of insects, including mosquitoes. In late summer, king and chum salmon run in the multitude of streams and rivers. In autumn, migrating birds fill the skies and bull moose gather their harems of cows for the mating season.²²¹

²²¹ Ibid.

Natural hazards that have been identified as highly likely to occur in the Mat-Su Borough include floods, wildfire, earthquake and volcanic activity. Avalanche and severe weather were rated a moderately likely to occur, and drought was rated at a low probability of occurrence.²²²

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in the Skwentna area as of December 2012.²²³

Current Economy²²⁴

Historically, commercial trapping and personal use harvest of fish and wildlife have played important roles in the economy of western Susitna basin communities like Skwentna, and employment patterns have been seasonal.^{225,226} Today, wage employment in Skwentna is also provided by local lodges, the post office, and the airstrip.²²⁷

Although the 2010 Decennial Census reported 37 residents age 16 or over in Skwentna in 2010, household surveys conducted for the 2006-2010 ACS did not provide similar coverage of local residents.^{228,229} Given this, the civilian labor force figure provided by the 2006-2010 ACS was estimated to be zero, and no earnings were reported in Skwentna. Due to the lack of 2010 data, only 2000 income estimates are discussed here.

Based on the 2000 Decennial Census, in 2000, the per capita income in Skwentna was \$23,994 and the median household income was \$16,250. Taking inflation into account by converting the 2000 values to 2010 dollars,²³⁰ the real per capita income in 2000 is shown to have been \$31,552, and the real median household income in 2000 was \$21,369. In the year 2000, Skwentna ranked 42nd of 344 Alaskan communities with per capita income data that year, and 322nd in median household income, out of 341 Alaskan communities with household income data. That year, 5.8% of Skwentna residents were below the poverty level, compared to 9.4% of Alaskan residents overall.

An estimate of 2010 per capita income can be generated using economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska

²²⁷ See footnote 225.

²²⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²²⁹ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²³⁰ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Department of Labor and Workforce Development (DOLWD). The ALARI database estimated that there were 65 residents age 16 and over in the civilian labor force in 2010. Of these, 16 residents were estimated to be employed that year.²³¹ If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Skwentna in 2010 is \$11,756.²³² In addition, an estimate based on the ALARI database indicates that the unemployment rate in 2010 was 7.7%, lower than the ALARI statewide unemployment rate estimate of 11.5%.²³³

The per capita estimate based on the ALARI database is lower than the real per capita income reported by the 2000 Census, providing evidence that per capita income may have decreased in Skwentna between 2000 and 2010. The possible decrease in per capita income is reflected in the fact that Skwentna met the Denali Commission's criteria as a "distressed community" in 2010,²³⁴ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. However, given the different data sources used to generate the 2000 and 2010 statistics, caution should be used when considering this information. It should also be noted that both U.S. Census and DOLWD data are based on wage earnings, and these income figures do not take into account the value of subsistence within the local economy.

Also due to Skwentna's small population size, the 2006-2010 ACS did not estimate employment statistics for 2010.²³⁵ Due to the lack of information for 2010, Figure 3 presents employment by industry in the year 2000, and employment is broken down by occupation for the year 2000 in Figure 4. Of 80 Skwentna residents aged 16 or older in 2000, 59 (73.8%) were reported to be the civilian labor force that year, compared to 67.6% that were in the civilian labor force statewide. No Skwentna residents were reported to be unemployed, compared to a statewide unemployment rate of 6.1% in 2000. That year, all 59 employed individuals in Skwentna worked in the private sector. The majority of residents (67.8%) in 2000 worked in tourism related industries (e.g., food services, recreation, etc.) and service occupations (45.8%). An estimated 10.2% of residents worked in natural resource based industries, which includes fishing. However, the number of individuals employed in farming, fishing, and forestry industries may be underestimated in census statistics as fishermen may hold another job and may characterize their employment accordingly.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 16 employed residents in 2010, of which 5 were employed in leisure and hospitality industries, 4 in trade, transportation, and utilities, 3 in professional and business services, 2 in construction, 1 in natural resources and mining, and 1 in information.²³⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Skwentna is an unincorporated community located in the Mat-Su Borough.²³⁷ The community is represented by the Skwentna Community Council, but this body has been inactive in recent years. Since it is unincorporated, Skwentna does not maintain a municipal budget with community revenue and expenditures. Between 2000 and 2010, Skwentna did not receive State or Community Revenue Sharing contributions or any state or federal fisheries-related grants (Table 2). A federally-recognized tribe is not present in Skwentna.

²³⁷ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

The nearest offices of the Alaska Department of Fish and Game (ADF&G) and Department of Natural Resources are located in Palmer. The nearest offices of the National Marine Fisheries Service (NMFS), Alaska Department of Commerce, Community, and Economic Development, Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement are located in Anchorage.

Infrastructure

Connectivity and Transportation

There is no road access between Skwentna and the nearest state highway system, the George Parks Highway corridor, located approximately 40 miles east of the community. Residents are dependent upon air travel and snowmobiles.²³⁸ In a survey conducted by the AFSC in 2011, community leaders also indicated that water taxi service is available in the area. A state-owned 3,400 ft long by 75 ft wide gravel airstrip is available. There is also a private airstrip and float plane access, located at Alexander Lake, 15 miles to the southeast. Regularly scheduled commercial air service is not available to the Skwentna airport. Residents must reach Anchorage via private or charter aircraft.²³⁹

²³⁸ Ibid.

²³⁹ Ibid.

Facilities

A number of homes in Skwentna have individual water wells and septic systems, but very few homes are fully plumbed. Outhouses are the primary means of sewage disposal. There is no central electric system, and residents provide power via individual generator sets. A community refuse incinerator is available at an unpermitted dump site near the airport, operated by the borough. The site is currently being used by several families, but most residents burn and bury their own refuse. Law enforcement services are provided by state troopers in Talkeetna and fire and rescue services are provided by the Lake Creek/Skwentna First Responders.²⁴⁰

In a survey conducted by the AFSC in 2011, community leaders reported that, in the last ten years, Skwentna has completed a new landfill/solid waste site and a new post office. With regard to fisheries-related infrastructure, community leaders indicated that, although no dock space is available for permanent or transient vessels to moor, there is shore moorage available in the river for vessels up to 100 ft long, and Skwentna is equipped to handle fuel barges, landing craft, and water taxis. They noted that vessels basing in Skwentna are typically under 60 ft in length, and local boat traffic is primarily comprised of charter boats, private pleasure boats, barges, and landing craft. Fisheries-related services available in Skwentna include sale of boat fuel and fishing gear and tackle, boat repair (electrical, welding, and mechanical services), dry dock storage, and fishing lodges. For fisheries-related businesses and services not available in Skwentna, community leaders indicated that residents travel to Willow, Wasilla, or Anchorage.

*Medical Services*²⁴¹

Medical care is available at the Valley Hospital located in Palmer (approximately 80 miles from Skwentna). Alternate health care is provided by the Lake Creek/Skwentna First Responders. Emergency services have highway and river access and are provided by the 911 telephone service and volunteers.

Educational Opportunities

Through the 1999-2000 school year, the Mat-Su Borough administered a small school in Skwentna that offered grades kindergarten through high school, but since the school has been closed since the fall of 2000 due to lack of sufficient enrollment.^{242,243} As of 2012, the nearest elementary schools are Trapper Creek Elementary and Talkeetna Elementary, and the nearest Junior/Senior high school is Su-Valley High School, located near Talkeetna along the George Parks Highway. Some students may also be homeschooled through correspondence programs such as Mat-Su Central School, or other state, federal, or church correspondence programs.²⁴⁴

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Historically, residents of Skwentna have mainly participated in recreational and subsistence fishing and have had limited participation in commercial fishing.^{245,246} The area drained by the Skwentna and Yentna rivers has many lakes and small streams that support all five species of salmon in Alaska. A number of fly-in fishing lodges are present in the area to taking advantage of the fine fishing opportunities. Most are located on the Talachulitna River, Lake Creek, and Fish Creek. Guests target Chinook salmon from June to mid-July, pink and sockeye salmon in July and early August, and coho salmon from August to early September. Rainbow trout, grayling, Dolly Varden, and northern pike are also important sport species.²⁴⁷ Local residents also participate in a state-managed subsistence fish wheel fishery for salmon, which has taken place in main stem of the Yentna River since 1998. Season limits of 25 salmon per head of household plus 10 salmon for each dependent are in place for the fishery, as well as a 2,500 total season limit. All Chinook salmon and rainbow/steelhead trout must be returned alive to the water.^{248,249} For more information about the fish wheel fishery, see the *Subsistence Fishing* section below.

No commercial fisheries take place in the immediate vicinity of Skwentna. The community is located approximately 50 miles inland, north of Cook Inlet, the nearest marine area. A number of state-managed commercial fisheries take place in Cook Inlet, including fisheries for salmon, Pacific halibut, and scallops, as well as commercial harvest of razor clams along the shoreline.^{250,251} Gulf of Alaska (GOA) waters beyond Cook Inlet are encompassed by Federal Statistical and Reporting Area 630, Pacific Halibut Fishery Regulatory Area 3A, and the Central GOA Sablefish Regulatory Area.

In a survey conducted by the AFSC in 2011, community leaders indicated that Skwentna actively participates in fisheries management processes in Alaska. The community participates through sending a representative to the North Pacific Fisheries Management Council committees or advisory groups and Board of Fisheries meetings, a representative that sits on regional fisheries advisory and/or working groups run by the ADF&G, and through a representative that participates in the Federal Subsistence Board or Federal Subsistence Regional Advisory Council

process. Skwentna is also the meeting location of the Mt. Yenlo Fish and Game Advisory Committee. Advisory committees are formed by local community members as forums to discuss fish and wildlife issues and provide recommendations to the Alaska Board of Fisheries and Board of Game.²⁵²

When asked to describe challenges facing Swentna's fishing economy, community leaders reported in the 2011 AFSC survey that declines in Chinook and sockeye salmon populations in the Swentna and Yentna Rivers are a serious concern, and have led to restrictions in both sport and subsistence salmon harvests in the area. They expressed the opinion that restoration of sockeye, chum, coho, and Chinook salmon runs in the Skwentna area will require reduced interception of salmon by commercial net fisheries in Cook Inlet. They also expressed the belief that salmon by-catch in the offshore pollock fishery is detrimental to Chinook salmon runs bound for the Skwentna River. Community leaders also observed positive results from management efforts to control northern pike populations, which they felt allowed salmon stocks to rebound.

Processing Plants

According to the ADF&G's 2010 Intent to Operate list, Skwentna does not have a registered shore-based processing plant. The nearest processing plant is located in Anchorage.

Fisheries-Related Revenue

According to the 2011 AFSC survey, community leaders reported that no revenues were received from fisheries-related taxes or fees in Skwentna in 2010. Likewise, Alaska state agencies reported no fisheries-related revenue in Skwentna between 2000 and 2010 (Table 3).

Commercial Fishing

Between 2000 and 2010, no Skwentna residents held Federal Fisheries Permits, federal License Limitation Program permits, or state-issued Commercial Fisheries Entry Commission (CFEC) permits (Table 4). In addition, there were no crew license holders, fish buyers, shore-side processing facilities, or vessels landing catch in Skwentna between 2000 and 2010. From 2000 to 2004, the number of vessels primarily owned by Skwentna residents varied between 28 and 32, and the number of vessels registered as homeported in the community ranged from 43 to 51. However, between 2005 and 2010, zero vessels were primarily owned by Skwentna residents or homeported there. Information about the characteristics of the commercial fishing sector in Skwentna is presented in Table 5. There were no Skwentna residents holding halibut (Table 6) or sablefish (Table 7) quota share accounts or quota shares in federal catch share fisheries between 2000 and 2010. There were also no Skwentna residents holding crab share accounts or quota shares between 2005 and 2010 (Table 8). There were no landings or associated ex-vessel revenue reported in Skwentna between 2000 and 2010 (Table 9), nor were there any landings or associated ex-vessel revenue reported by Skwentna residents during this period (Table 10).

Recreational Fishing

Although between 4 and 13 active sport fish guide businesses were registered in Skwentna between 2000 and 2010, none were active during this period. The number of licensed sport fish guide present varied between 7 and 26 per year. In 2010, 52 sportfishing licenses were sold to Skwentna residents (irrespective of the point of sale), a decline from 71 licenses sold to community residents in 2010. The number of sportfishing licenses sold in Skwentna also declined over the period, from 315 in 2000 to 70 in 2010. The fact that a greater number of licenses were sold locally than the number of residents that purchased licenses suggests that sportfishing activities attract visitors to the Skwentna area.

Recreational fishing is a popular activity in the region generally. Skwentna is located within Alaska Sport Fishing Survey Area M – Susitna River drainage. Information is available about freshwater sportfishing only at this regional level. Between 2000 and 2010, non-Alaska resident anglers fished an average of 57,330 days per year, while Alaska resident anglers fished an average of 118,222 days per year. This information about sportfishing trends in Skwentna and the Susitna River drainage is presented in Table 11.

Table 11. Sport Fishing Trends, Skwentna: 2000-2010.

Year	Active Sport Fish Guide Businesses ¹	Sport Fish Guide Licenses ¹	Sport Fishing Licenses Sold to Residents ²	Sport Fishing Licenses Sold in Skwentna ²	Freshwater Angler Days Fished – Non-Residents ³	Freshwater Angler Days Fished – Alaska Residents ³

³ Alaska Department of Fish and Game. 2011. Alaska Sport Fishing Survey results, 2000 – 2010. ADF&G Division of Sport Fish, Alaska Statewide Harvest Survey project. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sf/sportfishingsurvey/> (Accessed September 2011).

The Alaska Statewide Harvest Survey, conducted by ADF&G between 2000 and 2010, noted the following species targeted by private anglers in Skwentna: Chinook salmon, coho salmon, sockeye salmon, rainbow trout, burbot, and northern pike.²⁵³ No kept/release log book data were reported for fishing charters out of Skwentna between 2000 and 2010.²⁵⁴

In a survey conducted by the AFSC in 2011, community leaders noted that recreational fishing in Skwentna takes place from charter boats or party boats, private boats owned by local residents, private boats owned by non-residents, shore-based or dock fishing by local residents, and shore-based or dock fishing by non-residents. Community leaders also reported that the following species are targeted by recreational fishermen that use boats based in Skwentna: all five species of salmon, Dolly Varden char, and smelt.

Subsistence Fishing

Subsistence harvest activities play an important role for Skwentna-area residents. According to research by ADF&G in past decades, subsistence harvests are generally higher in remote areas of the Mat-Su Borough such as Skwentna compared to communities located along road networks.²⁵⁵ In the 2011 AFSC survey, community leaders indicated that subsistence fishing resources utilized most heavily by Skwentna residents include salmon, northern pike, whitefish, trout, and burbot. They also noted the importance of beaver and mink as local subsistence resources.

Between 2000 and 2010, no information was reported by management agencies regarding per capita subsistence harvest in Skwentna or the percentage of households utilizing various marine resources for subsistence purposes (Table 12). Likewise, no information was reported during this period regarding halibut (Table 14) or marine mammal harvests (Table 15). However, some information was reported between 2000 and 2008 regarding subsistence salmon permits issued to Skwentna households.

A personal use fish wheel fishery began in 1996 in the Upper Yentna and Skwentna Rivers. In 1998, the fishery transitioned to a subsistence designation, following a lawsuit that required the Alaska Board of Fisheries to revisit Skwentna residents' subsistence fishery proposal, and to consider new evidence of customary and traditional use of subsistence resources by residents of the Skwentna area.²⁵⁶ In 2008, the most recent year for which data were available, seven subsistence salmon permits were issued to Skwentna households, an overall decline from 12 subsistence salmon permits issued in 2000. All seven of the permits issued in 2008 were reported to have been fished. While the amount of each species of salmon harvested under subsistence permits was variable from year to year during the 2000-2008 period, sockeye salmon were consistently harvested in greater numbers than other species. Data were not available regarding harvest of marine invertebrates and non-salmon fish between 2000 and 2010. This information regarding salmon, marine invertebrates, and non-salmon fish is presented in Table 13.

Talkeetna (towl-KEET-nuh)

People and Place

*Location*²⁵⁷

Located at the junction of the Talkeetna and Susitna Rivers, Talkeetna lies 115 mi north of Anchorage at mi 226.7 of the Alaska Railroad. The paved Talkeetna Spur Road runs 14 mi east from the George Parks Highway at milepost 98.7. Talkeetna is located in the Talkeetna Recording District, the Matanuska-Susitna (Mat-Su) Census Area, and the Mat-Su Borough.

*Demographic Profile*²⁵⁸

In 2010, there were 876 inhabitants in Talkeetna, making it the 74th largest of 352 total Alaskan communities with recorded populations that year. Overall since 1990, the population of Talkeetna has increased substantially. The change in population from 1990 to 2010 is provided in Table 1. According to a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that an estimated 300 people come to Talkeetna each year as seasonal workers or transients between May and September.

A majority of Talkeetna residents identified themselves as White in 2010 (91.4%). Other ethnic groups present in Talkeetna that year included American Indian and Alaska Native (3.7%), two or more races (3.4%), some other race (0.2%), Native Hawaiian and Other Pacific Islander (0.5%), Asian (0.5%), Black or African American (0.3%), and Hispanic or Latino (1.8%). The percentage of residents identifying themselves as White, Hispanic or Latino, Asian, Native Hawaiian and Other Pacific Islander, and Black or African American increased between 2000 and 2010, with corresponding decreases in the percentage of the population identifying themselves as two or more races, some other race, and American Indian and Alaska Native. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

The average household size in Talkeetna in 2010 was 1.95, a decrease from 2.1 persons per household in 1990 and 2.16 in 2000. The total number of households in Talkeetna increased from 114 in 1990 to 358 in 2000 to 449 in 2010. Of the 744 total housing units surveyed for the 2010 Decennial Census, 318 were owner-occupied, 131 were renter-occupied, and 295 were vacant or used only seasonally. Throughout this period no residents of Talkeetna were reported to be living in group quarters.

In 2010, the gender distribution in Talkeetna was 51.7% male and 48.3% female, very similar to the state as a whole (52% male, 48% female). The median age was estimated to be 45.4 years, higher than both the U.S. national average of 36.8 years and the median age for

Figure 2. Population Age Structure in Talkeetna Based on the 2000 and 2010 U.S. Decennial Census.

According to the 2006-10 American Community Survey (ACS),²⁵⁹ in terms of educational attainment, 91.3% of Talkeetna residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, there were no residents of Talkeetna aged 25 and older that were estimated to have less than a ninth grade education, compared to 3.5% of Alaska residents overall; 8.8% were estimated to have a ninth to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 33.3% were estimated to hold a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; 31.8% were estimated to have some college but no degree,

²⁵⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

compared to 28.3% of Alaska residents overall; 3% were estimated to hold an Associate's degree, compared to 8% of Alaska residents overall; and 23.3% were estimated to hold a Bachelor's degree, compared to 17.4% of Alaska residents overall. No Talkeetna residents aged 25 and over were estimated to hold a graduate or professional degree in 2010, compared to 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*²⁶⁰

The Talkeetna and Chulitna Rivers join the Susitna River at Talkeetna, a Dena'ina (Tanaina) word meaning "river of plenty." Talkeetna was settled as a mining town and Alaska Commercial Company trading post in 1896. A gold rush to the Susitna River brought prospectors to the area, and by 1910 Talkeetna was a riverboat steamer station, supplying miners and trappers in the Cache Creek, Iron Creek, and Broad Creek districts. In 1915, Talkeetna was chosen as the headquarters for the Alaska Engineering Commission, who built the Alaska Railroad, and the community population peaked near 1,000. World War I and completion of the railroad in 1919 dramatically decreased the population. Talkeetna has since developed as an aviation and supply base for expeditions to Mt. McKinley and Denali National Park. Several of its old log buildings are now historical landmarks, and Talkeetna was placed on the National Register of Historic Places in April 1993. State land disposals and homestead programs helped the community grow. Talkeetna is popular for its recreational fishing, hunting, boating, flightseeing, skiing, and dog mushing. Local businesses provide services to climbers visiting the National Park.

Natural Resources and Environment

January temperatures range from -33 to 33 °F (-36.1 to 0.6 °C); July can range from 42 to 83 °F (5.6 to 28.3 °C). Annual precipitation averages 28 inches, with 70 inches of snowfall.²⁶¹

Talkeetna is the gateway to Denali National Park for people who wish to climb Mt. McKinley. The following information about Denali National Park and Preserve (National Park) is from the U.S. National Park Service.²⁶²

Denali, the "High One," is the name Athabascan native people gave the massive peak that crowns the 600-mi-long Alaska Range. Denali is also the name of an immense national park and preserve created from the former Mount McKinley National Park. In 1917, Mount McKinley National Park was established as a game refuge. The park, including North America's highest peak, were named for former senator - later President - William McKinley. In 1980, the Alaska National Interest Lands Conservation Act (ANILCA) enlarged the boundary of the park by 4 million acres and redesignated it as Denali National Park and Preserve. The National Park exemplifies interior Alaska's character as one of the world's last great frontiers; its wilderness is largely unspoiled.

²⁶⁰ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

²⁶¹ Ibid.

²⁶² U.S. National Park Service. 2012. *Denali National Park and Preserve: Nature and Science*. Retrieved from <http://www.nps.gov/dena/naturescience/index.htm> on March 29, 2012.

More than 650 species of flowering plants as well as many species of mosses, lichens, fungi, algae, and others grace the slopes and valleys of the National Park. Only plants adapted to long, cold winters and short growing seasons can survive in this subarctic wilderness. Permafrost ground underlies many areas of the park, where only a thin layer of topsoil is available to support life. After the continental glaciers retreated from most of the park 10,000 to 14,000 years ago, hundreds of years were required to begin building new soils and revegetation. The dynamic glaciated landscape provides large rivers, countless lakes and ponds, and unique landforms which form the foundation of the ecosystems that thrive in the National Park.

The National Park is well-known for its diversity of wildlife. There are 39 species of mammals, 169 species of birds, 14 species of fish, and 1 species of amphibian known to occur in the area. There are no reptiles recorded in the National Park. Animal life and activity is dictated by the seasons. Winter is the longest season and the animals that are year-round residents are well-adapted to life in the subarctic. The brief spring season brings the return of 80% of the National Park's bird life, the waking of hibernating bears, and an increase in activity levels of wildlife. Summer is a time for raising young and preparing for migration, hibernation, or survival during the winter. Summer also brings hordes of insects, including mosquitoes. In late summer, king and chum salmon run in the multitude of streams and rivers. In autumn, migrating birds fill the skies and bull moose gather their harems of cows for the mating season.

In a survey conducted by the AFSC in 2011, community leaders reported that Talkeetna's economy relies upon the following natural resource-based industries: logging, fishing, ecotourism, and sport hunting.

Current Economy²⁶³

As the take-off point for fishing and flightseeing trips and a staging area for Denali climbing expeditions, Talkeetna provides air taxis, helicopters, outfitters, and related services. Numerous air taxis provide transport to Kahiltna Glacier Base Camp. All climbers must register for Mount McKinley and Mount Foraker. In 2010, nine area residents held commercial fishing permits.²⁶⁴ Top employers in 2010²⁶⁵ included Mat-Su Borough Schools, Ciri Alaska Tourism Corp., Sunshine Community Health CTR, Latitude 62 LLC, Alaska Railroad Corp., Talkeetna Air Taxi Inc., Nagley Store, K2 Aviation, Old Talkeetna Roadhouse LLC, and State of Alaska.

According to the 2006-10 ACS, in 2010, the per capita income in Talkeetna was estimated to be \$19,187 and the median household income was estimated to be \$31,087, compared to \$23,695 and \$38,289 in 2000, respectively. Taking inflation into account by converting the 2000 values to 2010 dollars,²⁶⁶ the real per capita income in 2000 is shown to have been \$31,159 and the real 2000 median household income was \$50,350. This shows that both per capita income and household income decreased between 2000 and 2010. In 2010, Talkeetna ranked 160th of 305 Alaskan communities with per capita income that year, and 240th

²⁶³ Unless otherwise noted, all monetary data are reported in nominal values.

²⁶⁵ Alaska Department of Labor and Workforce Development (n.d.). Alaska Local and Regional Information Database. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

²⁶⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

out of 299 Alaskan communities with household income data. However, Talkeetna's small population size may have prevented the ACS from accurately portraying economic conditions.²⁶⁷ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database, the per capita income in Talkeetna in 2010 was \$15,362, which indicates an even further decrease compared to the real per capita income values reported by the U.S. Census in 2000.²⁶⁸

Based on the 2006-2010 ACS, 64.9% of the population age 16 and older was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 14.4%, compared to the statewide unemployment rate of 5.9%. Approximately 16.1% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; figures reported for Talkeetna are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Talkeetna. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 19.7%.

Based on household surveys conducted for the 2006-2010 ACS, the greatest number of workers was employed in the private sector (64.2%), while 30.6% were self-employed and 5.2% were employed in the public sector. Out of 268 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest percentage worked in retail trade (39.2%), construction (16.9%), and professional, scientific, management, administration, and waste management (11.8%). Smaller percentages of the population were estimated to be employed in other services, except public administration (2.5%), arts, entertainment, recreation, accommodation, and food services (4.9%), educational services, health care, and social assistance (7.4%), finance, insurance, and real estate (4.7%), information (2.5%), transportation, warehousing, and utilities (2.5%), and agriculture, forestry, fishing, hunting, and mining (7.8%). However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in farming, fishing, and forestry industries may be underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

²⁶⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Governance

Talkeetna is an unincorporated town located in the Mat-Su Borough. Because of Talkeetna’s unincorporated status, no municipal taxes were administered between 2000 and 2010. Talkeetna did not receive any Community Revenue Sharing contributions or fisheries-related grants between 2000 and 2010. Information about selected aspects of Talkeetna’s community revenue is presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Talkeetna from 2000 to 2010.

Talkeetna was not included in the Alaska Native Claims Settlement Act (ANCSA) and is not federally recognized as a Native village. Talkeetna is a member of Cook Inlet Region, Incorporated (CIRI), a regional Native corporation. CIRI is one of 12 Alaska-based regional corporations established ANCSA to benefit Alaska Natives who had ties to the Cook Inlet region. The Company is owned by more than 7,300 Alaska Native shareholders of Athabascan and Southeast Indian, Inupiat, Yupik, Alutiiq (Sugpiaq) and Aleut (Unangax) descent. It is based in Anchorage and has interests across Alaska, the lower 49 and abroad. CIRI's well-diversified portfolio of business operations and investments includes: traditional and alternative energy and resource development, oilfield and construction services, environmental services, real estate investment and management, tourism and hospitality, telecommunications, aerospace defense, private equity and venture capital investments. CIRI also created a family of nonprofit service organizations that provide needed health care, housing, employment, education and other social and cultural enrichment services for Alaska Natives and others.²⁶⁹

The nearest offices of the Alaska Department of Fish and Game (ADF&G) is located in Palmer. The nearest offices of the Alaska Department of Natural Resources (DNR), Department of Commerce, Community, and Economic Development (DCCED), National Marine Fisheries Service, Bureau of Citizenship and Immigration Services (BCIS), and U.S. Immigration and Customs Enforcement (US ICE) are all located in Anchorage.

Infrastructure

*Connectivity and Transportation*²⁷⁰

Talkeetna is accessible by road, air, and train. The Talkeetna Spur Road connects to the George Parks Highway, which connects to Fairbanks and Anchorage. There are two state-owned runways. One is a paved asphalt runway and is 3,500 ft long by 75 ft wide; the other is a 480 ft long by 85 ft wide gravel strip. There are several additional airstrips in the vicinity, including one owned by the U.S. Bureau of Land Management. There is an Alaska Railroad depot located in Talkeetna. While Talkeetna is accessible to charter and private aircraft, there is no regularly scheduled service between Talkeetna and Anchorage, which can be reached by road.

*Facilities*²⁷¹

The majority of residents have individual wells, septic tanks, and complete plumbing. A piped water and sewer system is maintained by the Mat-Su Borough. The high school operates its own water system. A borough-operated refuse transfer station is located at mi 11.5 on the Talkeetna Spur Road. A sludge disposal site is available locally. Law enforcement services are provided by a state troopers post that is located at mi 97.8 on the George Parks Highway. Fire and rescue services are provided by the Borough, with the station located at mi 14 on the Talkeetna Spur Road, and by Talkeetna Ambulance Service. The following visitor attractions are located in Talkeetna: Denali/Talkeetna Visitor Center, Talkeetna Ranger Station, Talkeetna Historical Society Museum, Museum of Northern Adventure, riverboat services guides, McKinley flight tours, and fishing charters. Talkeetna has a number of accommodations for visitors, as well as two school libraries and one public library.

*Medical Services*²⁷²

Medical services are provided by the Sunshine Community Health Center and the Mat-Su Regional Hospital which is located between Palmer and Wasilla on the George Parks Highway. The community health center is privately owned and operated. Alternate health care is provided by the Talkeetna Ambulance Service and by Valley Hospital in Palmer. The community health center is a qualified Emergency Care Center. Emergency services have highway, air, and helicopter access and are provided by a 911 telephone service and volunteers.

²⁷² Ibid.

*Educational Opportunities*²⁷³

Talkeetna Elementary School provides instruction to students from pre-school through sixth grade. In 2011, the school had 96 students and 9 teachers. Middle and high school students are bused to Sustina North, at milepost 98, in the Susitna Valley.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Talkeetna's participation in North Pacific fisheries is rooted in its recent development as a tourist destination. Susitna River drainages produce large coho runs in the late summer which attract many Alaskan and non-Alaska resident anglers to the area.²⁷⁴ Clear Creek is a popular spot for landing Chinook salmon starting in July.²⁷⁵ Recreational fisheries in the area are managed by ADF&G Division of Sportfish in Palmer.

Talkeetna is located at the intersection of the Talkeetna and Susitna Rivers. Due to its inland location, Talkeetna is not located within a Federal Statistical and Reporting Area, a Pacific Halibut Fishery Regulatory Area, or a Sablefish Regulatory Area. However, the nearest Federal Statistical and Reporting Area is Area 630, the nearest Pacific Halibut Fishery Regulatory Area is Area 3A, and the nearest Sablefish Regulatory Area is the Central Gulf of Alaska.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Talkeetna does not have a registered processing plant. The nearest processing plant is located in Anchorage.

Fisheries-Related Revenue

No fisheries-related revenue was reported for Talkeetna between 2000 and 2010 (Table 3).

Commercial Fishing

In 2010, there were 10 Talkeetna residents holding a total of 10 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC) for herring, sablefish, and salmon. While the number of herring and sablefish CFEC permits and permit holders remained relatively stable during this period, none of those permits were reported as fished (with the exception of sablefish permits in 2000 and 2001). The sablefish CFEC permit issued in 2010

²⁷⁵ Alaska Department of Fish and Game. (n.d.). *Matanuska-Susitna Valley & West Cook Inlet King Salmon*. Retrieved July 10, 2012 from: <http://www.adfg.alaska.gov/static-sf/Region2/pdfpubs/MatSuKingSalmon.pdf>.

was for the fixed gear fishery using vessels under 35 ft in Prince William Sound, while the herring CFEC permits were issued for the gill net fishery in Norton Sound. The number of salmon CFEC permits and permit holders increased before decreasing again between 2000 and 2010, while the number of those permits reported as fished decreased before increasing again during the same period. The majority of the salmon CFEC permits issued in 2010 were for the set gill net fishery in Cook Inlet, with the remainder issued for the drift gill net fishery in Bristol Bay, the gill net fishery in Kotzebue, and the statewide hand troll fishery. Information on permits and permit holders by species between 2000 and 2010 is presented in Table 4.

Between 2000 and 2010, the number of commercial crew license holders in Talkeetna varied considerably, from 13 in 2000 to one in 2006. In 2010, there were eight crew license holders in Talkeetna. Between 2000 and 2010, there were no fish buyers or shore-side processing facilities located in Talkeetna. The number of vessels owned primarily by Talkeetna residents and the number of vessels homeported in Talkeetna both decreased substantially between 2000 and 2010. There were no commercial vessels landing catch in the community between 2000 and 2010. Information about the characteristics of the commercial fishing sector in Talkeetna is provided in Table 5.

There were no individuals in Talkeetna holding quota share accounts or quota shares for federal halibut (Table 6), sablefish (Table 7), or crab (Table 8) fisheries between 2000 and 2010. As previously stated, there were no vessels landing catch in Talkeetna between 2000 and 2010, and therefore there are no landings or associated ex-vessel revenue to report between 2000 and 2010 (Table 9). Landings of all species by Talkeetna residents between 2000 and 2010 are considered confidential due to the small number of participants (Table 10).

Recreational Fishing

Between 2000 and 2010, the number of sport fish guide business varied, from 10 in 2000, to 9 in 2010. However, no registered sport fish guide businesses were active during those years. During the same period, the number of sport fish guide licenses in Talkeetna decreased substantially from 35 in 2000, to 19 in 2010. The number of sportfishing licenses sold to Talkeetna residents (irrespective of the location of the point of sale) varied only slightly between 2000 (596) and 2010 (678). The number of sportfishing licenses sold in Talkeetna, in contrast, varied widely and was higher than the number of licenses sold in the community in each year during this period. This indicates the potential that visitors to Talkeetna were pursuing recreational fishing during this period. Overall, the number of freshwater days fished in the Susitna River Drainage region has declined by roughly half, from a total of 241,457 in 2000 to 122,235 in 2010. During this period, the proportion of angler days fished by non-Alaska residents in the region increased only slightly, from 26.6% in 2000 to 33.1% in 2010. Information on sportfishing trends in Talkeetna between 2000 and 2010 is presented in Table 11.

The Alaska Statewide Harvest Survey,²⁷⁶ conducted by ADF&G between 2000 and 2010, noted the following species targeted by private anglers in Talkeetna: all five species of Pacific salmon, landlocked salmon, rainbow trout, Dolly Varden, whitefish, burbot, Arctic grayling, northern pike, Pacific halibut, rockfish, Pacific cod, razor clam, hardshell clam, and shrimp. No kept/released log book data were reported for fishing charters out of Talkeetna between 2000 and 2010.²⁷⁷

In a survey conducted by the AFSC in 2011, community leaders reported that recreational fishing in Talkeetna takes place from charter boats or party boats, private boats owned by local residents, and private boats owned by non-residents. In the same survey, community leaders noted that all five Pacific salmon species are targeted by recreational fishermen that use boats based in Talkeetna.

Subsistence Fishing

Data were not reported between 2000 and 2010 for subsistence participation by household and species (Table 12), subsistence halibut fishing participation (Table 14), and subsistence harvest of various marine mammal resources (Table 15). In years for which data were reported between 2000 and 2010, an average of 19 subsistence salmon fishing permits were issued to Talkeetna residents, with an average of 18.5 of those permits reported as fished during the same period. Although limited harvest of salmon occurred overall, sockeye salmon were the primary species harvested under subsistence permits, along with smaller numbers of Chinook salmon, chum salmon, coho salmon, and pink salmon. Information about subsistence harvest of salmon, marine invertebrates, and non-salmon fish (not including halibut) is presented in Table 13.

The ADF&G Division of Subsistence reported that the following species of marine invertebrates were used for subsistence in Talkeetna during this period: abalone, Dungeness crab, king crab, mussels, razor clams, shrimp, Tanner crab, and unknown clams. Marine mammals reported as harvested for subsistence use included bowhead and harbor seal. Non-salmon fish reported as harvested for subsistence use included: burbot, cod, cutthroat trout, Dolly Varden, eulachon (hooligan candlefish), flounder, grayling, herring, lake trout, pike, rainbow trout, red rockfish, sheefish, unknown char, and whitefish.²⁷⁸

Wasilla (WAH-sill-ah)

People and Place

*Location*²⁸⁰

Wasilla is located midway between the Matanuska and Susitna Valleys, on the George Parks Highway. It lies between Wasilla and Lucille Lakes, 43 miles north of Anchorage. The area encompasses 13 sq mi of land and 0.7 sq mi of water. Residents of the community enjoy a rural lifestyle while in close proximity to the urban amenities of Anchorage. Wasilla was incorporated in 1974 as a Second-class city, and became a First-class city in 1984.

*Demographic Profile*²⁸¹

Wasilla first appeared in the 1930 Census with a population of 51 and grew steadily in size over the next 40 years, reaching 300 residents in 1970. Over the next several decades, the community experienced rapid growth as a commuter suburb of Anchorage, with its population reaching 5,469 in 2000. From 2000 to 2010, the population grew by 43.19%, and the City's average annual growth rate from 2000 to 2009 was 1.46%. In 2010, Wasilla's population was 7,831, making the city the 12th largest community in Alaska out of 352 total communities. Information regarding trends in Wasilla's population size can be found in Table 1.

The racial and ethnic composition of Wasilla remained relatively unchanged between 2000 and 2010, as shown in Figure 1. In 2010, 83.4% of residents identified themselves as White, compared to 85.5% in 2000. Also in that year, 5.2% identified themselves as American Indian or Alaska Native, compared to 5.2% in 2000; 2.1% identified themselves as Asian, compared to 1.3% in 2000; 1.4% identified themselves as Black or African American, compared to 0.6% in 2000; 0.2% identified themselves as Native Hawaiian or Other Pacific Islander, compared to 0.1% in 2000; 6.5% identified themselves as two or more races, compared to 5.9% in 2000; and 1.2% identified themselves as some "other" race, compared to 1.3% in 2000.

In 2010, the average household size in Wasilla was 2.61, representing a notable decrease from the 3.27 in 2000 and 2.80 in 1990. In that year, there were a total of 3,277 housing units, compared to 2,119 in 2000 and 1,723 in 1990. Of the households surveyed in 2010, 48% were owner-occupied, compared to 52% in 2000; 43% were renter-occupied, compared to 41% in 2000; 8% were vacant, compared to 5% in 2000; and 1% were occupied seasonally, compared to 2% in 2000. In addition, 95 residents were living in group quarters, compared to 5 in 2000.

Figure 1. Racial and Ethnic Composition, Wasilla: 2000-2010 (U.S. Census).

Wasilla experienced population aging between 2000 and 2010 as the percentage of residents aged 50 and over increased from 17.8% to 27.1% of the population. The median age of Wasilla residents during this same period increased from 29.7 to 32.2 years, though the community’s 2010 median age was still lower than both the U.S. national median age of 36.5 years and Alaska’s state median age of 33.8 years. Wasilla’s gender composition in 2000 and 2010 was roughly equal, with females slightly outnumbering males in both years (50.1% to

49.9%). In 2010, gender distribution within the 20-29, 30-39, and 40-49 age groups were roughly equal, while the population aged 50 and over was skewed toward females and the population aged 19 and under, toward males. Females aged 50 and over made up 14.9% of Wasilla’s population, compared to the 12.2% represented by males in this age category. Males aged 19 and younger made up 17.3% of Wasilla’s population, compared to the 15.0% represented by females in this age category. Figure 2 shows the population and gender structure of Wasilla in 2000 and 2010.

Figure 2. Population Age Structure in Wasilla in 2000 and 2010.

In terms of educational attainment, the 2006-2010 American Community Survey (ACS)²⁸² estimated that 91.8% of Wasilla residents aged 25 had earned a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 2.6% had less than a 9th grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 5.6% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 30.5% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 7.6% held an Associate's degree, compared to an estimated 8.0% of Alaska residents overall; an estimated 16.0% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 5.9% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

History, Traditional Knowledge, and Culture^{283,284,285}

Wasilla is named after Chief Wasilla, a respected local Dena'ina Indian. In the Athabascan Indian dialect, "Wasilla" is said to mean "breath of air." However, other sources claim that, given the Russian trading post influences in the Lower Cook Inlet during the 18th and 19th centuries, Chief Wasilla may have actually derived his name from the Russian name "Vassily."

Prior to the founding of the Wasilla township, the Dena'ina Athabascan Indians who inhabited the area called it "Benteh," meaning "among the lakes." Ample fishing was available in nearby freshwater lakes and streams, and the area became a popular wintering ground for semi-permanent Native villages. These villages were connected by various trails to hunting grounds in the Susitna Valley and Talkeetna Mountains and to the Ahtna Indians residing east of the Matanuska Valley.

The founding and initial development of Wasilla owes much to the early twentieth Alaskan gold rush and mining boom. The town site was established in 1917 at the intersection of the Carle Wagon Road, now Wasilla-Fishhook Road, which linked the coastal community of Knik with the Willow Creek mining district, and the newly-constructed Alaska Railroad. Given its advantageous location, Wasilla quickly replaced the older settlement of Knik as the most important distribution point for mining activities in the Valley. Until the latter part of World War II, which brought the gold mining boom to a halt, Wasilla prospered as the self-proclaimed "Gateway to the Willow Creek Mining District."

Agriculture also helped to shape Wasilla's role in the region. The founding of the Matanuska Colony in 1935 under President Roosevelt's New Deal created the nearby town of Palmer and brought over 200 families from the Midwest to the region as colony homesteaders.

²⁸² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²⁸⁵ City of Wasilla. (2011). *Wasilla History*. Retrieved November 28, 2011 from <http://www.cityofwasilla.com>.

Though several farms were located near Wasilla, Palmer emerged as the regional commercial center and remained so until the 1960s.

Construction of the George Parks Highway through Wasilla in the early 1970s shifted population growth and development from the Palmer area to Wasilla and its surrounding area. The Parks Highway enabled workers to reside in Wasilla and commute to Anchorage for employment, thus bringing the first wave of the community's "suburbanite" settlement. The Alaska oil boom and pipeline construction in the 1970s and 80s brought an influx of oil workers and additional growth of the community. Since the mid-1980s, Wasilla has served as the retail and commercial hub of the central Matanuska-Susitna ("Mat-Su") Valley, the fastest growing region in Alaska. Wasilla was incorporated in 1974 as a second class city and became a first class city in 1984.

Natural Resources and Environment

Located at a latitude of 61.58 °N, Wasilla has a climate that is transitional between the extreme weather of Interior Alaska and the wet maritime conditions of the coastal areas. The city is sheltered from extreme conditions by the Alaska Range and the Chugach and Talkeenta Mountains, although high winds in excess of 60 mph are a frequent occurrence in the region during the fall and winter months. The average annual precipitation is 17 inches, with 50 inches of snowfall, with temperatures ranging from -33 °F to 33 °F in January and from 42 °F to 83 °F in July. On average, Wasilla is frost-free in spring and summer for 115 days, with first frost usually arriving by September 1st.²⁸⁶

Wasilla's topography consists of undulating ridges of glacial till and flat benches of sand gravel, features left by glacial advances and retreats during the last ice age. Elevation varies from 300 ft to 500 ft above sea level within the city boundaries. Prominent water features in the community are Wasilla Lake and Lake Lucille; Cottonwood Creek, Lucille Creek, and several small streams traverse the city.²⁸⁷ Most vegetation communities are consistent with interior taiga. Lowland vegetation consists of mixed stands of willow, birch, cottonwood, and aspen.²⁸⁸

Terrestrial wildlife in the area include moose, small rodents, fox, rabbit, brown bear, black bear, coyote, mink, weasel, muskrat, and beaver. Wasilla's numerous water bodies provide habitat for all five species of Pacific salmon, as well as steelhead, Dolly Varden, and cutthroat trout.²⁸⁹

Gold mining in the Willow Creek mining district contributed to the growth of Wasilla from its founding in 1917 through the latter part of World War II. Independence Mine was actively mined from 1938 to 1943 and in its peak year employed over 200 workers and had gold production worth over \$17 million in 2010 dollars. Though the mine closed permanently in 1951 when gold mining became unprofitable, a state historical park was established at the site in the

²⁸⁸ See footnote 284.

²⁸⁹ Ibid.

1970s.²⁹⁰ As of 2010, mining activities in the region included sand and gravel mining and exploratory drilling at the historic Lucky Shot gold mine property.²⁹¹

Natural hazards which have the potential to threaten Wasilla include earthquakes, high winds, severe weather, wildfire, volcanism, erosion, and flooding. Major fault zones in close proximity include the Castle Mountain fault to the north, the Bruin Bay fault to the northwest, and the Border Ranges fault along the south. Most fault structures in the area are of sufficient size to produce earthquakes of magnitude 6.0 and above. Wind events can produce localized gusts up to 100 mph. These events are associated with severe weather events, and are often associated with extreme cold (-40 to -60 °F). Winter storms can cause freezing fog and icing which carries the potential to damage property and public infrastructure. As with many areas influenced by interior Alaska's continental weather, frostbite and hypothermia pose public health risks. Wasilla is located within an area designated as *Critical Protection Level*, which carries a high level of suppression action in terms of wildland fires. Large wildland fire complexes occurred within the vicinity of Wasilla in 1979, 1980, and 1996. The most likely source of hazards related to volcanism come from Hays, Redoubt, and Mount Spurr. Heavy ashfall can produce thick layers of acidic silt which pose threat to property, infrastructure, and transportation systems. Impacts to local wildlife and vegetation can also be devastating. Active volcanoes are at a sufficient distance that impacts from debris flows and lateral blasts are unlikely. Most erosion in Wasilla is wind-driven, as exposed topsoils are removed by high winds. In addition, fugitive dust particles can reduce visibility and impact residents with sensitive respiratory systems. No major river systems lie within City boundaries, so potential flooding events are limited to rainfall runoff, rapid snowmelt, and groundwater saturation.²⁹²

According to the Alaska Department of Environmental Conservation, no significant environmental remediation projects were active within Wasilla as of 2010.²⁹³

Current Economy²⁹⁴

Wasilla serves as the retail and commercial hub of the central Matanuska-Susitna Valley. In addition to a growing service and retail sector, the community's economy also supports such industrial activities as steel fabrication, agriculture, and manufacture of concrete and wood products. A significant percentage of Wasilla's labor force works outside the community: approximately 30% of the workforce of the Matanuska-Susitna Borough commutes to Anchorage; and in 2008, 8% of the Borough's residents worked on the North Slope and another 5% held jobs in other distant locations around the state.²⁹⁵ Mean travel time to work in 2009 for Wasilla's labor force was estimated at almost 30 minutes.²⁹⁶

²⁹⁴ Unless otherwise noted, all monetary data are reported in nominal values.

²⁹⁵ See footnote 284.

²⁹⁶ Ibid.

In 2010,²⁹⁷ the estimated per capita income was \$28,449 and the estimated median household income was \$52,014; compared to \$21,127 and \$48,226 in 2000, respectively. After adjusting for inflation by converting 2000 values to 2010 dollars,²⁹⁸ the real per capita income (\$27,782) and real median household income (\$63,417) indicate that while individual earnings changed little, household earnings dropped somewhat. In 2010, Wasilla ranked 74th of 305 communities from which per capita income was estimated, and 117th of 299 communities from which median household income was estimated.

It should be noted that Wasilla's small population size may have prevented the ACS from accurately portraying economic conditions.²⁹⁹ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database,³⁰⁰ total wages based on state and private employers in 2010 was \$129 million.³⁰¹ When compared with the 2010 Census population, the per capita income equals \$16,483, indicating an extreme decrease compared to the real per capita income values reported by the U.S. Census in 2000.³⁰² However, Wasilla was not determined to be "distressed" by the Denali Commission.³⁰³

Based on 2006-2010 ACS estimates, 8.0% of the civilian labor force was unemployed, which represents a decrease from the 2000 unemployment rate of 11.2%. Additionally, an estimated 13.9% of individuals were below the poverty line, compared to an estimate 9.6% statewide. In 2010, an estimated 67.5% of residents aged 16 years and older were part of the civilian labor force. Of those employed in the civilian labor force, an estimated 71.8% were employed in the private sector, an estimated 20.8% were employed in the public sector, an estimated 7.0% were self-employed, and the remaining 0.4% were estimated to be unpaid family workers. Major industries in terms of employment were educational services, healthcare, and social assistance (an estimated 22.0% of workers); construction (an estimated 14.5%); retail trade (an estimated 14.1%); and public administration (an estimated 10.6%). The 2010 ALARI estimates provide similar estimates for educational and health services (16.8%) and construction (11.5%), but also indicate a high percentage of people employed in trade, transportation and utilities industries (22%).

²⁹⁷ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²⁹⁸ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²⁹⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³⁰³ Denali Commission. 2011. Distressed Community Criteria 2011 Update. Retrieved April 16, 2012 from: www.denali.gov.

Top employers in 2010 were the Mat-Su Borough Schools; the State of Alaska; Wal-Mart; and Arctic Slope Regional Corporation Energy Services, an oil and gas service company headquartered in Anchorage. Occupations in farming and natural resource extraction (fishing and hunting, forestry, and mining) accounted for 5.2% of employment in Wasilla.³⁰⁴ However, the number of individuals employed in the fishing industry is probably underestimated in Census statistics given the seasonality of commercial fishing activities; individuals often combine other employment with fishing. Figures 3 and 4 below show additional statistics on employment by industry and by occupation.

Figure 3. Local Employment by Industry in 2000-2010, Wasilla (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Wasilla (U.S. Census).

³⁰⁴ See footnote 302.

NOAA-TM-AFSC-259 – Volume 2
Community Profiles for North Pacific Fisheries – Alaska: Wasilla

Governance

Wasilla is a First-class city located in the Matanuska-Susitna Borough. The City was not included in the Alaska Native Claims Settlement Act (ANCSA) of 1971, and is not represented by a Native Traditional Council or ANCSA chartered village corporation. The nearest Alaska Department of Fish and Game (ADF&G) offices are located in Anchorage and Palmer, while the regional NOAA Fisheries (NMFS), Bureau of Citizenship and Immigration Services (BCIS), and Department of Natural Resources (DNR) offices are located in Anchorage. Wasilla residents can access some institutions that have offices in neighboring Palmer, including headquarters for the Matanuska-Susitna (Mat-Su) Borough and a USDA Rural Development office.

The City of Wasilla Police Department was established in 1993 and currently employs 24 commissioned officers.³⁰⁵ The local detachment of Alaska State Troopers is headquartered in Anchorage.

As of 2010, the city administered a 2.5% sales tax, while the Borough administered a 5.5% tobacco excise tax and a 5% bed tax. Property taxes included a 1.42 mill (0.14%) fire service area tax administered by the City of Wasilla and a 9.65 mill (0.96%) tax administered by the Borough.³⁰⁶ Municipal revenue figures were taken from financial audits.³⁰⁷ Total revenues increased at a steady rate between 2000 and 2010. When adjusted for inflation,³⁰⁸ total municipal revenues increased by 45.4% from \$9.19 million in 2000, to \$17.28 million in 2010. In 2010, most (74.9%) general fund revenues were collected from local taxes; followed by intergovernmental revenues (11.9%) and service charges (9.6%). In total, general fund revenues accounted for 87.3% of total municipal revenues for Wasilla. Other sources included capital project funds (2.9%) and non-major funds (9.9%). In that year, sales taxes accounted for 5.8% of total municipal revenues, compared to 5.8% in 2000. In addition, state allocated Community Revenue Sharing and State Revenue Sharing accounted for less than one-percent of total revenues in both 2010 and 2000, respectively. Information regarding municipal finances can be found in Table 2.

Fisheries-related grants received by Wasilla between 2000 and 2010 are also shown in Table 2. In 2003, Wasilla was awarded \$50,000 to restore juvenile fish passage and habitat in Swiftwater Creek.³⁰⁹ In 2010, the Wasilla Soil & Conservation District was awarded approximately \$26,000 for urban salmon habitat restoration projects undertaken as part of the Mat-Su Basin Salmon Habitat Partnership.³¹⁰

Infrastructure

Connectivity and Transportation

As with most of the communities located at the end of the Knik Arm, Wasilla is well connected by road to surrounding communities. The George Parks Highway and Glenn Highway connect Wasilla to Anchorage, Fairbanks, Denali National Park, and Palmer, as well as a number of smaller communities. The Alaska Railroad serves Wasilla on the Anchorage to Fairbanks route, while Mat-Su Valley Public Transportation provides bus service between Wasilla, Palmer, and Anchorage.

Commercial air service is available at Anchorage International Airport, located 45 miles away. Wasilla's municipal airport, which has a paved 3,700 ft long by 75 ft wide runway, provides scheduled commuter and air taxi services. Numerous additional private airstrips also operate in the vicinity. Float planes land at Wasilla Lake, Jacobsen Lake, and Lake Lucille.

Facilities

The majority of homes in Wasilla use individual water wells and septic systems, although the city operates a piped water and sewer system. Water is provided by a well at Spruce Avenue and two wells at Iditarod School; there is a 2.3 million gal storage capacity. Refuse collection is provided by a private company for disposal in the borough landfill. Residents also drop refuse at

the borough landfill in Palmer. Matanuska Electric Association is part owner of the Alaska Electric Generation & Transmission Cooperative, Inc., which purchases electricity from Chugach Electric and the Bradley Lake Hydroelectric Project. Piped natural gas, provided by Enstar, is used to heat homes. Wasilla provides an array of visitor accommodations and visitor attractions. Local public safety services are provided by the Wasilla Police Department. Fire and rescue services are provided by borough fire department, Wasilla Lake Fire and Emergency Medical Services, and Wasilla Ambulance Service. Additional public facilities include local youth center, community hall, senior services, swimming pool, local arena, movie theater, three museums, and 15 libraries. Communication services include local and long distance telephone, broadband internet, local and cable television, and local radio.³¹¹

Medical Services

A variety of medical care services are available at the Mat-Su Regional Medical Center (MSRMC), a privately-owned, qualified Acute Care facility located between Palmer and Wasilla. Opened in 2006 to replace the aging Valley Hospital, MSRMC contains 50 medical/surgical beds and eight each of intensive, care, progressive, and obstetric beds. Urgent care services are also available at a MSRMC outpatient clinic in Wasilla.

Educational Opportunities

Wasilla is served by the Mat-Su borough School District. As of 2011, there are 21 schools located within the community, including 8 elementary schools, 4 high schools, and 3 each of K-12, middle, and mixed-grade schools. There are a total of 10,106 students and 550 teachers in Wasilla schools.

Matanuska-Susitna College, located between Palmer and Wasilla, is part of the University of Alaska Anchorage system and offers two-year associate degree programs. Total enrollment is approximately 1,650 students. Wasilla also hosts a campus of Charter College, an independently-accredited private college offering both associate and bachelor degree programs.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Extensive populations of freshwater fish, as well as of all five salmon species, are supported in the waters of the Mat-Su basin, which include the Matanuska, Knik, and Little Susitna Rivers, as well as the Nancy Lake Recreational Area and numerous river drainages and smaller lakes. Historically, the abundance of fish locally made the area a popular wintering ground for Dena'ina Athabascan Indians. Today, the area around Wasilla provides diverse opportunities for recreational freshwater fishing. The Susitna River, a popular salmon sportfishing location, supports the fourth largest run of Chinook salmon in the state.³¹²

³¹¹ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

³¹² Mat-Su Basin Salmon Habitat Partnership. (2008). *Conserving Salmon Habitat in the Mat-Su Basin*. Retrieved November 28, 2011 from <http://conserveonline.org/workspaces/MatSuSalmon>.

Additionally, the Alaska Department of Fish and Game (ADF&G) oversees an aggressive lake stocking program in the Northern Cook Inlet Sport Fishing Management Area, with over 90 area lakes stocked with rainbow trout, Arctic grayling, arctic char, landlocked coho, and Chinook salmon.³¹³

Rapid growth and development in the last two decades have stressed the region's fish habitats, especially those in urban waters. In 2010, Lake Lucille and Cottonwood Creek in Wasilla were classified as "impaired" by the Alaska Department of Environmental Conservation.³¹⁴ The Wasilla Soil & Water Conservation District represents the community within the Matanuska-Susitna Basin Salmon Habitat Partnership, which formed in 2005 to address increasing impacts of salmon from human use and development in the Mat-Su basin. With respect to federal fisheries regulatory areas, Wasilla is located nearest to Federal Reporting Area 630 (Central Gulf of Alaska), Pacific Halibut Fishery Regulatory Area 3A, and the Central Gulf of Alaska Sablefish Regulatory Area. With respect to State of Alaska fisheries management, the community is located nearest to the ADF&G Upper Cook Inlet commercial fisheries management area and within the Northern Cook Inlet sport and subsistence fisheries management area. Wasilla is not eligible to participate in either the Community Development Quota or the Community Quota Entity Program.

Processing Plants

As of 2011, at least two businesses in Wasilla were involved in fish processing activities. Smoked Alaska Seafoods, a family-owned business that has been in operation over 30 years, produces smoked sockeye, coho, and Chinook salmon products.^{315, 316} Mat Valley Meats is located on the East Palmer-Wasilla highway and began operations in 2008, specializing in custom processing for game hunters and sport fishermen.³¹⁷

Fisheries-Related Revenue

Wasilla earned little to no revenue from fisheries-related sources between 2000 and 2010. As shown in Table 3, a negligible amount of the community's revenue was derived from the Shared Fisheries Business Tax from 2006 to 2009.

Commercial Fishing

As Wasilla is an inland community, its involvement in North Pacific commercial fisheries stems primarily from the numerous residents who own, operate, and crew on vessels in the North Pacific fishery fleet, in addition to those holding quota in federal individual fishing quota (IFQ) fisheries.

³¹³ Alaska Department of Fish & Game. (2011). *Northern Cook Inlet Management Area*. Retrieved December 2, 2011 from <http://www.adfg.alaska.gov/index.cfm?ADFG=ByAreaSouthcentralNorthCookInlet.main>.

³¹⁷ AFSC Processing Plant Survey 2011.

From 2000 to 2010, the number of crew license holders indicating Wasilla as their community of residence increased from 199 to 265. During the same time period, there was a decrease in the number of vessels owned primarily by Wasilla residents and the number of vessels homeported in the community, with a sharp decline between 2004 and 2005. Table 5 presents 2000 to 2010 data on crew and fleet statistics.

In 2010, 219 residents of Wasilla held a total of 279 permits issued by the Commercial Fisheries Entry Commission (CFEC). This represents an increase from the 141 residents holding 185 permits in 2000. Salmon permits made up the majority of CFEC permits issued to Wasilla residents from 2000 to 2010—from 65% in 2000 to 71% in 2007 and 2009. Most salmon permits held by Wasilla residents are for Bristol Bay-area fisheries; permits for Prince William Sound and Cook Inlet salmon fisheries are held in smaller amounts.³¹⁸ A small number of residents also participate in federal groundfish and crab limited license permit (LLP) program fisheries. Table 4 shows CFEC and federal fishing permits issued to Wasilla residents from 2000 to 2010. Holdings by Wasilla residents in the three catch share fisheries (sablefish, halibut, and crab) have increased significantly from 2000 to 2010. In 2010, 24 Wasilla residents held halibut quota shares amounting to an allocation of 235,998 lbs. Sablefish and crab quota share holdings by Wasilla residents in the same year amounted to approximately 40,000 and 30,000 lbs, respectively. Tables 6 to 8 present quota holdings by Wasilla residents in the three catch share programs over the 2000 to 2010 period.

In spite of a decline from 2000 to 2010 in the number of commercial vessels owned primarily by Wasilla residents, the volume and real ex-vessel value of landings by residents' vessels has more than doubled during this period. In 2010, commercial fishery landings by Wasilla vessels totaled 12.5 million lbs and had an ex-vessel value of \$11.0 million; in 2000 dollars, ex-vessel value in 2000 was \$3.6 million.³¹⁹ Salmon accounts for the largest volume of landings out of all species landed by Wasilla vessels. This species group is also the most lucrative for Wasilla vessels, accounting for 68% of total ex-vessel value from 2000 to 2010. Other species landed by Wasilla's fleet between 2000 and 2010 were sablefish, pollock, Pacific cod, crab, herring, halibut, and other shellfish. Table 10 presents 2000-2010 commercial fishery landing statistics for vessels owned by community residents.

³¹⁸ Alaska Commercial Fishery Entry Commission. (2011). Fishery Statistics – Participation & Earnings. Permit & Fishing Activity by Year, State, Census Area or Alaskan City. Retrieved January 24, 2012 from http://www.cfec.state.ak.us/fishery_statistics/earnings.htm.

³¹⁹ Inflation was adjusted using the Bureau of Labor Statistics Producer Price Index for processed unprocessed and packaged fish, retrieved December 1, 2011 from <http://www.bls.gov/ppi/#data>.

Recreational Fishing

Wasilla residents actively participate in Alaska recreational fisheries as anglers and guides. As shown in Table 11, there were a total of 6 registered sport fish guide businesses active in 2010, compared to 8 in 2000. Overall, the number of active sport fish guide businesses remained steady between 2000 and 2010, peaking in 2001 at 9, and bottoming out in 2006 at 4. The number of sport fish guide licensees held within the community declined between 2000 and 2010, from 106 to 66. The number of sport fish guide licenses held peaked in 2003 at 126 and was at its lowest in 2005 at 56. Though the numbers of sport fish guide businesses and licenses in the community have generally declined since 2000, the number of Wasilla residents purchasing licenses (irrespective of location of purchase) steadily increased from 12,417 in 2000 to 18,789 in 2010. Sportfishing licenses sold in Wasilla also increased significantly from 13,216 in 2000 to 28,511 in 2010.

With respect to recreational fishing in the surrounding Knik Arm region, survey data on private anglers indicate that fished species include Chinook, coho, pink, and sockeye salmon, as well as smelt and Dolly Varden.³²⁰ As shown in Table 11, in 2009 an estimated 33,865 private anglers fished in the region for a total of 122,299 estimated fishing days; freshwater recreational fishing accounted for nearly all of the activity reported (122,140 estimated days).³²¹ Resident anglers in 2009 accounted for 76% of estimated saltwater fishing days and 91% of estimated freshwater fishing days. No kept/released log book data was reported for fishing charters out of Wasilla between 2000 and 2010³²², although a number of guides in the community offer charter fishing opportunities in the surrounding Mat-Su Valley region.

Subsistence Fishing

Wasilla is legally designated a non-subsistence area for the purpose of state and federal subsistence fisheries management. Residents, however, may participate in state subsistence fisheries located outside the community; and residents who are members of certain Alaska Native Tribes are eligible to harvest halibut for subsistence purposes.

Of the marine species documented by the ADF&G Division of Subsistence, sockeye salmon is estimated to account for a significant majority of subsistence harvest by Wasilla’s residents; Chinook and coho salmon are estimated to be harvested in smaller amounts. In 2008, the most recent year for which data is available, Wasilla residents harvested an estimated 16,180 sockeye salmon, down from the estimated high of 22,799 fish in 2005 as well as from the 2000-2007 estimated average of 18,000 fish. Average estimated harvests of Chinook and coho salmon from 2000 to 2008 were 650 and 325 fish, respectively.

For the small number of Wasilla residents who hold a Subsistence Halibut Registration Certificate (SHARC), estimated harvest of subsistence halibut from 2003 to 2009 averaged 2,093 lbs annually. However, reported halibut harvests declined significantly in 2010 to 80 pounds on two SHARC; a relatively small number of active permits compared to total SHARC held. Residents of Wasilla have not been documented as harvesting any marine mammal species for subsistence purposes. Tables 12 through 15 show additional statistics on participation by Wasilla residents in subsistence fishing activities.

Additional Information

Wasilla is home to the annual 1,000-mile Iditarod Trail Sled Dog Race from Anchorage to Nome. The community served as the official starting location of the race until 2008, when urban growth and lack of snow forced officials to permanently move the start location north to Willow.³²³

³²³ White, Rindi. 2008. Iditarod home more than just restart point. *Alaska Daily News*. Retrieved December 2, 2011 from <http://www.adn.com/2008/01/28/296206/itarod-home-more-than-just-restart.html>.

Willow (WILL-oh)

People and Place

*Location*³²⁴

Willow is located in the Mat-Su Borough, between mile 60.0 and 80.7 of the George Parks Highway, 37 mi north of Anchorage. Its western boundary is the Susitna River. The area encompasses 684.8 sq mi of land and 8.0 sq mi of water. Willow is not incorporated into a municipality and is under the jurisdiction of Matanuska-Susitna (Mat-Su) Borough.

*Demographic Profile*³²⁵

In 2010, there were 2,102 residents living in Willow, ranking it 45th of 352 communities in terms of population size. Between 1990 and 2010, the population grew by 637.5%. Between 2000 and 2009, the population grew by 33.8% with an average annual growth rate of 2.1%, which was much higher than the statewide average of 0.75% and indicative of steady growth. Information regarding population trends can be found in Table 1.

In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there are seasonal workers living in Willow year-round for lodging, fishing, and dog mushing. The population typically reaches its annual peak in June, and is thought to be driven mostly by employment in fisheries sectors.

The racial and ethnic composition of Willow is predominately White. In 2010, 90.8% of residents identified themselves as White, compared to 92.4% in 2000; 5.2% identified themselves as American Indian or Alaska Native, compared to 3.1% in 2000; and 2.9% identified themselves as two or more races, compared to 3.9% in 2000. In addition, 1.3% of residents identified themselves as Hispanic or Latino in both 2000 and 2010. All other races each represented less than 1% of the population in both 2000 and 2010 (Figure 1).

In 2010, the average household size was 2.34, compared to 2.90 in 1990 and 2.54 in 2000. In that year, there were 1,912 total housing units, compared to 244 in 1990 and 1,530 in 2000. Of the households surveyed in 2010, 40% were owner-occupied, compared to 37% in 2000; 7% were renter-occupied, compared to 5% in 2000; 5% were vacant, compared to 4% in 2000; and 48% were occupied seasonally, compared to 53% in 2000. There were 11 residents living in group quarters in 2010, compared to 0 in both 1990 and 2000.

The gender distribution in 2010 was somewhat skewed at 53.4% male and 46.6% female. This was slightly less even than the statewide distribution (52% male, 48% female), and similar to the distribution in 2000 (53.3% male, 46.7% female). The median age in 2010 was 46.4 years,

Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

which was significantly higher than the statewide median of 33.8 years and moderately higher than the 2000 median of 40.1 years.

When compared with 2000, the population structure in 2010 was less expansive. In addition, age cohorts above 39 showed characteristics consistent with a stable population, meaning that cohorts aged while still mostly retaining their structural character. However, age cohorts 30 and under did not retain their structure, possibly indicating low youth retention. In 2010, 23.4% of residents were under the age of 20, compared to 29.8% in 2000; 22.5% were over the age of 59, compared to 13.7% in 2000; 46.4% were between the ages of 30 and 59, compared to 50.1% in 2000; and 7.7% were between the ages of 20 and 29, compared to 6.5% in 2000.

Figure 1. Racial and Ethnic Composition, Willow: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Willow Based on the 2000 and 2010 U.S. Decennial Census.

Gender distribution by age cohort was slightly more even in 2010 than in 2000 with slight male biases along most age ranges. In that year, the greatest absolute gender difference occurred in the 60 to 69 range (8.2% male, 6.3% female), followed by the 50 to 59 (11.1% male, 9.6% female) and 70 to 79 (3.4% male, 2.1%) ranges. Of those three, the greatest relative difference occurred in the 70 to 79 range. Information regarding Willow’s population structure can be found in Figure 2.

In terms of education attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS)³²⁶ estimated that 89.3% of residents aged 25 years and older held a high school

³²⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 2.7% of residents had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 8% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 33.9% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 9.9% held an Associate's degree, compared to an estimated 8% of Alaska residents overall; an estimated 18% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; an estimated 5.4% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*³²⁷

Historically, Dena'ina Athabascan Indians occupied the area; living in semi-permanent villages. The community got its start when gold was discovered on Willow Creek in 1897. Supplies and equipment were brought in by boat to Knik. From there, a 26 mi summer trail went northwest, up Cottonwood Creek, and across Bald Mountain to Willow Creek. The winter sled trail went north, crossing the present line of the Alaska Railroad at Houston, Alaska, and up the west end of Bald Mountain for 30 mi. This trail, dubbed the "Double Ender Sled Trail," is still being used by skiers, hunters, backpackers, and snowmobile enthusiasts. The sleds then followed a trail, now Hatcher Pass Road, along Willow Creek in an easterly direction. The Talkeetna Trail also passed through Willow and was used by dog teams and pack horses. Cabins to accommodate freighters and mail carriers were located at Nancy Lake, Willow, and other points north. This route was the forerunner of the Parks Highway. During construction of the Alaska Railroad, surveyors, construction crews, homesteaders, and other settlers came to Willow. A railroad station house was constructed in 1920. During World War II, a radar warning station and airfield were built. The Trail's End Lodge was built in 1947; it subsequently became a post office in 1948. By 1954, Willow Creek was Alaska's largest gold mining district, with total production approaching \$18 million. Land disposals, homestead subdivisions, and completion of the George Parks Highway in 1972 fueled growth in the area. In 1976, Alaskans selected Willow for their new state capital site. However, funding to enable the capital move was defeated in the November 1982 election.

Natural Resources and Environment

January temperatures range from -33 to 33 °F (-36 to 56 °C); July can range from 42 to 83 °F (6 to 28 °C). Annual rainfall varies from 16 to 27 inches, with 48 to 150 inches of snowfall.³²⁸

The topography surrounding Willow was shaped by glaciers which retreated in a north and northeastern direction approximately 9,000 years ago. As they retreated, a series of low hills and ridges were left behind. Numerous lakes occupy areas between the ridges. Underlying geology in the area consists of coal-bearing bedrock. As the glaciers retreated, thick deposits of sandy and gravelly moraine remained, which were later covered by silt loess. Topsoil is generally well-drained, with the exception of pockets of poorly drained peat. Vegetation is consistent with most of southcentral Alaska. Woody vegetation consists of mixed paper birch and white spruce stands. Black spruce is common on north facing slopes, poorly drained soils, and areas where permafrost may exist below the surface. Low-lying alluvial plains support cottonwood and quaking aspen populate some well-drained areas. Understory vegetation consists generally of low shrubs, devils club and high grasses. Poorly drained areas consist of alder and willow thickets. Muskeg areas are covered with sphagnum mosses. Other plants include Labrador-tea, cotton grass, bog birch, dwarf willow, bog blueberry, cloudberry, and low and high bush cranberry. Aquatic wildlife in the area includes coho, sockeye, and Chinook salmon, rainbow trout, Dolly Varden, whitefish, northern pike, burbot, long nose suckers, and three-spined stickleback. The nearby Nancy Lake State Recreation Area (NLSRA) has stocked rainbow trout and landlocked coho salmon. Terrestrial mammals include moose, black bear, beaver, otter, mink, muskrat, lynx, wolverine, martin, rabbits, and fox. Birds include ravens, loons, magpies, ducks, owls, eagles, and spruce hens.³²⁹

Coal, timber, and gravel make up the majority of exploitable natural resources in the Willow area. Coal deposits studied in the Houston area are sub-bituminous and characterized as low to medium grade.³³⁰ Chuitna Coal Project, located to the southwest of Willow, produces 12 million tons of coal annually and is expected to have a productive lifespan of 25 years.³³¹ The NLSRA and Susitna Flats State Game Refuge provide scenic and recreational resources, as well as environmental services which support wildlife and quality of life. Oil and gas sources are known to exist in the area.³³² There are several shallow gas leases within the Willow area and additional exploration licenses have been issued within the Susitna Valley.³³³ Other coal gasification developments are focused primarily within the Beluga River area to the southwest. Gas storage was approved for the Ivan River area outside of Beluga.³³⁴ Geothermal energy

sources are also thought exist in the area.³³⁵ The State of Alaska owns most of the 1.8 million acres of identified timber lands in the Mat-Su Valley.³³⁶

Borough-wide natural hazards include flooding, earthquakes, avalanches, wildfire, severe weather, and extreme cold. Wildfires throughout the Mat-Su Borough typically present little risk to people and property because they often occur in sparsely populated areas. However, fire risk has been increasing in recent years due to urban development and spruce bark beetle infestations. The Mat-Su Borough is subject to seismic hazards which can trigger earthquakes, landslides, avalanches, ground uplift or subsidence, infrastructure failures, and soil liquefaction. Severe weather hazards can bring extreme cold, heavy snow, high winds, ice, flooding, landslides, and erosion. Overall, the Susitna Valley is most susceptible to wildfire, river flooding, erosion, and earthquakes.³³⁷

According to the Alaska Department of Environmental Conservation, there were no notable environmental remediation sites active in Willow as of 2010.³³⁸

Current Economy³³⁹

Many Willow residents are self-employed in a variety of businesses, including lodging, guiding and charter services, and retail stores. There are two saw mills and one prefabricated wood-building manufacturer. Some residents are employed in Palmer, Wasilla, or Anchorage. Capitol Speedway attracts stockcar racing enthusiasts from the entire state.³⁴⁰ In a survey conducted by the AFSC in 2011, community leaders reported that Willow's economy is reliant on mining, fishing, sportfishing, hunting, and dog mushing. Top employers³⁴¹ in 2010 included: Mat-Su Borough Schools, State of Alaska, Mat-Su Borough, ASRC Energy Services O&M Inc., Newman's Hilltop Service, Palmer-Wasilla Health System LLC, Job Ready Inc., Fishhook/Halfrack/Townsite, BP Exploration Alaska Inc.; and VECO Alaska Inc.

In 2010,³⁴² the estimated per capita income was \$27,981 and the estimated median household income was \$58,438, compared to \$22,323 and \$38,906 in 2000, respectively. However, after accounting for inflation by converting 2000 values into 2010 dollars,³⁴³ the real per capita income (\$29,354) and real median household income (\$51,161) indicate a decline in both individual and household earnings. In that year, Willow ranked 79th of 305 communities from which per capita income was estimated and 83rd of 299 communities from which median household income was estimated.

Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

³⁴³ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

It should be noted that ACS survey methods sample a relatively small percentage of the population, and as such, may not capture accurate economic conditions within communities with small populations. Data compiled in the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (ADOLWD) reported \$29.49 million in total wages earned by private sector and state employees, indicating a per capita income of \$14,030 when compared to 2010 U.S. Census population figures.³⁴⁴ In addition, the Denali Commission identified Willow as a “distressed” community in 2011, meaning that over 70% of residents were estimated to have incomes of less than \$16,120 in 2010. Overall, ALARI estimates indicate significantly lower incomes than what was reported by the Census Bureau in both 2000 and 2010.

According to 2006-2010 ACS estimates,³⁴⁵ 53.5% of residents aged 16 and over were part of the civilian labor force and an estimated 0.8% were part of the armed forces in 2010. In that year, unemployment was estimated at 1.2%, compared to an estimated 5.9% statewide; and an estimated 6.1% of residents were living below the poverty line, compared to an estimated 9.5% of Alaska residents overall. It should be noted that these estimates seem to conflict with Willow’s designation as a “distressed community.” ALARI estimates in 2010 estimated that unemployment was approximately 12.9% based on unemployment insurance claimants. Of those employed in 2010, an estimated 64.2% worked in the private sector, an estimated 16.2% worked in the public sector, an estimated 17.9% were self-employed, and an estimated 1.7% were unpaid family workers.

By industry, most employed residents were estimated to work in construction sectors (28.3%) in 2010;³⁴⁶ followed by education, health care, and social assistance (15.2%) and retail trade (13.8%) sectors. Employment by industry was relatively diverse in both 2000 and 2010; however, it should be noted that many Willow residents commute to Wasilla, Palmer, and Anchorage for work. Because of this, employment figures may not necessarily be reflective of Willow’s local economy. Residents estimated to be employed in agriculture, forestry, fishing, hunting, and mining sectors declined from 6.1% in 2000 to 3.2% in 2010. Since agriculture, forestry, and mining are dominant industries in the Mat-Su Valley, it is difficult to determine the level at which fisheries sectors contributed to these figures. It should also be noted that much of Willow’s fisheries employment is related to recreational fishing sectors, which may not be captured in agriculture, forestry, fishing, hunting, and mining sector estimates. According to 2010 ALARI estimates,³⁴⁷ most (23.0%) employed residents worked trade, transportation, and utilities sectors; followed by education and health (13.2%); local government (12.2%); and construction (11.7%) sectors.

By occupation type, most employed residents were estimated to hold management or professional positions in 2010 (38.3%);³⁴⁸ followed by natural resources, construction, or maintenance positions (19.5%); production, transportation, or material moving positions

³⁴⁴ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

³⁴⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³⁴⁶ See footnote 342.

³⁴⁷ See footnote 344.

³⁴⁸ Ibid.

(18.0%); sales or office positions (17.1%); and service positions (7.1%). Overall, there were significant changes in both employment by industry, and employment by occupation type between 2000 and 2010. Most notably, there was a significant increase in construction sector employment. Other notable increases occurred in education services, health care, social assistance, professional, scientific, management, administrative, and waste management sectors. In terms of occupation type, there were notable increases in the amount of management and professional positions, while there were notable declines in sales and office positions.

Overall, while variation in employment between 2000 and 2010 may be attributed to economic changes, although it is also possible that ACS survey methods were unable to capture accurate employment conditions due to a relatively small sample size. Information regarding employment trends can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Willow (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Willow (U.S. Census).

Governance

Willow is considered a Census Designated Place and is not incorporated into a municipality. Instead it is under the jurisdiction of the Mat-Su Borough, which is seated in Palmer. The community was not included in the Alaska Native Claims Settlement Act (ANCSA) of 1971 and is not represented by a Native Traditional Council. The closest Alaska Department of Fish and Game (ADF&G) office is located in Palmer, 34 mi southeast. The closest National Marine Fisheries Service (NMFS) and U.S. Bureau of Citizenship and Immigration Services offices are located in Anchorage, 37 mi south.

Since Willow is not an incorporated municipality, it is unable to collect revenue through municipal taxes or fees (Table 2). All finances are handled on a borough level. The Borough administers a 9.956 mill base property tax, 5% accommodations tax, and 5.5% tobacco excise tax.

Infrastructure

*Connectivity and Transportation*³⁴⁹

From the George Parks Highway, the area has access to the statewide highway system and the transportation facilities of Wasilla, Palmer, and Anchorage. There are two public airstrips: one is a state-owned 4,400 ft long by 75 ft wide gravel airstrip at mile 69.7 Parks Highway and the other is at Deshka Landing and owned by the Alaska Department of Natural Resources. There are five additional private strips and a seaplane base at Kashwitna Lake.

*Facilities*³⁵⁰

Nearly all of the occupied homes in Willow are fully plumbed and use individual water wells and septic tanks. The school operates its own water system. Seasonal-use homes haul water and use outhouses. A borough-operated refuse transfer site is available on Willow-Fishhook Road, about 2 mi off the Parks Highway. Electricity is provided by hydroelectric generator. Visitor accommodations include Willow Trading Post Lodge, Ruth Lake Pioneer Lodge, Willow Island Resort, Sheep Creek Lodge, Chandalar RV Park, Cline's Lake Bed & Breakfast, Camp Caswell, Susitna Landing & Campground, Alaska Host Bed & Breakfast, Giggewood Inn, Nancy Lake Bed & Breakfast, and Willow Park Bed & Breakfast. Public safety services are provided by state troopers based in Talkeetna. Fire and rescue services are provided by Mat-Su Borough and Willow Ambulance Service. Additional public facilities include a community center and library. Communications services include local and long distance telephone, local television, and local radio.

In a survey conducted by the AFSC in 2011, community leaders reported that local public infrastructure includes a fish cleaning station, a barge landing area/marina at Deshka Landing on the Susitna River. There are no permanent public mooring facilities located in Willow. Vessels which can use facilities in Willow include jet boats, small vessels, fuel barges, and vessels containing hazardous materials. Fisheries-related businesses and services available in Willow include fishing gear sales, boat repair (electrical, mechanical, machining), tackle sales, bait sales, commercial cold storage, fish lodges, fishing related bookkeeping, boat fuel sales, fishing gear repair, fishing gear storage, ice sales, water taxi, seaplane services, and air taxi. Additional public services include a food bank and publically subsidized housing. Residents typically travel to Anchorage, Palmer, or Wasilla for businesses and services not available in Willow.

*Medical Services*³⁵¹

There are no medical services located in Willow. Sunshine Community Health Center in Talkeetna provides basic health care. Valley Hospital in Palmer provides acute, specialized, and long-term care. Willow Ambulance Service provides alternative care.

³⁵¹ Ibid.

*Educational Opportunities*³⁵²

Beryozova School offers Kindergarten through 12th grade instruction. In 2011, there were 22 students enrolled and one teacher employed. Willow Elementary School offers preschool through 6th grade instruction. In 2011, there were 130 students enrolled and 12 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Soon after glaciers receded some 9,000 years ago, Tanaina Athabascans, and possibly Yup'ik Eskimos move into the Susitna River Valley. Two archaeological sites found within the NLSRA have been confirmed, and evidence shows that inhabitants of those sites relied on subsistence fishing, hunting, and trapping. The Alaska Railroad brought homesteaders into the Willow area around 1917, who built a life around mining, logging, and farming.³⁵³ Since then, Willow's participation in North Pacific fisheries has been tied primarily to recreational fishing. The lower Susitna River, Little Susitna River, and various lakes in the region are popular among local anglers, as well as anglers from throughout the state. Willow has become a popular area with residents from the greater Mat-Su region and Anchorage, and the community has grown as a bedroom community centered on sportfishing and hunting. Although commercial fishing is not a central component of Willow's fisheries participation, several residents have commercial fishing permits.

In a survey conducted by the AFSC in 2011, community leaders reported that Willow participates in the fisheries management process in Alaska through a representative who sits on regional fisheries advisory and/or working groups run by ADF&G. Willow is not eligible for participation in either the Community Development Quota (CDQ) or Community Quota Entity (CQE) programs.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Willow did not have a registered processing plant operating in 2010. The closest seafood processor is located in Wasilla.

Fisheries-Related Revenue

Willow did not receive any fisheries-related revenue from taxes or fees between 2000 and 2010 (Table 3).

Commercial Fishing

In 2010, 18 residents, or less than one-percent of the population, held 30 permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 19 residents held 44 CFEC permits. Of the CFEC permits held in 2010, 50% were for salmon, compared to 36% in 2000; 20% were for groundfish, compared to 32% in 2000; 7% were for sablefish, compared to 11% in 2000; 3% were for herring, compared to 7% in 2000; and 20% were for halibut, compared to 14% in 2000. Of the CFEC permits held in 2010, 73% were actively fished, compared to 73% in 2000. This varied by fishery from 100% of halibut permits, to 80% of salmon, 67% of groundfish, and 0% of herring and sablefish permits. Fisheries prosecuted by Willow residents in 2010 included: statewide longline halibut, statewide longline and mechanical jig miscellaneous saltwater finfish, Prince William Sound drift gillnet salmon, Cook Inlet drift and set gillnet salmon, Alaska Peninsula drift gillnet salmon, and Bristol Bay drift and set gillnet salmon.³⁵⁴

In addition, 7 residents held 8 License Limitation Program (LLP) groundfish permits, one resident held one LLP crab permit, and 3 residents held 3 Federal Fisheries Permits (FFP) that year. Approximately 50% of groundfish LLP, 0% of crab LLP, and 100% of FFP were actively fished in 2010. Finally, 470,466 shares of halibut quota were held through 7 accounts in 2010, compared to 155,692 shares held through 3 accounts in 2000. No residents held sablefish quota in 2010, although 143,794 shares were held on one account in 2006. No residents held crab quota between 2010 and when the program began.

Residents held 23 commercial crew licenses in 2010, compared to 16 in 2000. In that year, residents held majority ownership of 11 vessels, compared to 32 in 2000. Given that no shore-based processing plants are located in Willow, no commercial landings were reported in Willow between 2000 and 2010. However, residents of Willow did participate in the state's commercial fisheries by making landings in other communities. However, landings reported by Willow residents at other locations are considered confidential in 2010 with the exception of salmon. In that year, 695,046 lbs of salmon valued at \$668,183 were landed, compared to 387,574 lbs valued at \$296,558 in 2000; a decrease of \$0.09 per lb after adjusting for inflation³⁵⁵ and without considering the species composition of landings. Halibut landings in 2008 totaled 58,355 lbs valued at \$260,112, compared to 51,523 lbs valued at \$104,800 in 2001; an increase of \$1.73 after adjusting for inflation.³⁵⁶ Other groundfish landings totaled 32,413 lbs valued at \$12,478 in 2007, compared to 184,426 lbs valued at \$70,268 in 2001. Pacific cod landings totaled 1.07 million lbs valued at \$320,352, compared to 901,249 lbs valued at \$356,323 in 2000; a decrease of \$0.08 per lb after adjusting for inflation.³⁵⁷ Pollock landings in 2002 totaled 3,659 lbs valued at \$231. Sablefish landings in 2001 totaled 49,605 lbs valued at \$157,306. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Recreational fishing is an important part of Willow’s fisheries-related economy. Many throughout the state maintain residences in Willow, which they use part-time.³⁵⁸ According to the 2010 U.S. Census, 47% of total households were occupied full-time. Many streams and lakes in the area are stocked with rainbow trout, arctic grayling, char, and landlocked coho salmon.³⁵⁹ In a survey conducted by the AFSC in 2011, community leaders reported that sportfishing takes place on charter or party boats, private boats owned by local residents, private boats owned by non-local residents, and from shore or docks. In addition, “fly-in” (remote destination) sportfishing is a popular local activity. Species targeted by local private anglers include all five species of Pacific salmon and hooligan.

In 2010, there were no registered sport fish guide businesses active in Willow, compared to one in 2000. The number of sport fish guide licenses held in the community declined steadily between 2000 and 2010, from 40 to 15. The number of sport fish guide licenses held in the community peaked at 46 in 2004. Also in 2010, 1,109 sportfishing licenses were sold to Willow residents, compared to 896 in 2000; and 817 sportfishing licenses were sold within the community, compared to 421 in 2000. Sportfishing license sales within the community peaked in 2005 at 1,321 licenses.

Willow is located within the Susitna River Drainage ADF&G Harvest Survey area which includes all drainages of the Susitna River. In 2010, there was a total of 122,235 freshwater angler days fished, compared to 241,457 in 2000. In that year, non-Alaska residents accounted for 33% of angler days fished, compared to 27% in 2000. Between 2000 and 2010, there were declines in both Alaska resident and non-Alaska resident angler days fished although the decline in Alaska resident angler days fished was relatively more significant. Information regarding recreational fishing trends can be found in Table 11. According to ADF&G Harvest Survey records,³⁶⁰ private anglers in Willow target all five species of Pacific salmon, landlocked coho, rainbow trout, Dolly Varden char, whitefish, burbot, Arctic grayling, northern pike, Pacific halibut, rockfish, lingcod, Pacific cod, smelt, razor clams, hardshell clams, shrimp and other shellfish, and other finfish. Kept/released charter information is not available in Willow.

Subsistence Fishing

Willow is not considered a subsistence-dependent community, and traditional subsistence activities are generally not practiced by local residents. In a survey conducted by the AFSC in 2011, community leaders reported that subsistence harvesting is not done by residents of Willow. However, residents do harvest salmon as a personal use fishery, through sportfishing. Subsistence data compiled by ADF&G is limited; and information on subsistence participation by household and on subsistence halibut, marine invertebrate, other non-salmon fish and marine

mammal harvests is unavailable. Minimal harvests of salmon for subsistence have been reported by residents. Sockeye salmon are harvested most by residents, followed by coho and Chinook salmon. In 2008, residents reported harvesting 564 salmon, compared to 960 in 2000. Reported subsistence salmon harvests peaked in 2007 at 1,225 fish. Between 2003 and 2008, one resident held a Subsistence Halibut Registration Certificate (SHARC) although no halibut harvests were reported in that time. Two residents held SHARC in 2009 and 2010; again, there were no reported harvests. Information regarding subsistence trends can be found in Tables 12 to 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders were asked their opinions on impacts that fisheries-related management and policies have had on their communities. Community leaders were concerned over poor salmon returns to Willow Creek, Little Willow Creek, Lake Creek, and Deshka River, and their impacts on recreational fishing. When asked about current challenges for the portion of Willow’s economy that is based on fishing, community leaders expressed concern over overharvesting and poaching of salmon. Specifically, there were concerns regarding Cook Inlet netting and its affect on Susitna River salmon runs. When asked about the effects fisheries policies or management actions have had on Willow, community leaders expressed concerns over emergency openings for Kenai sockeye impacting northbound salmon stocks. In addition, coho and Chinook salmon bycatch in the Cook Inlet is of chief concern. Overall, there is concern over poor salmon returns and equitable management on a region-wide level.

Regional Introduction: Prince William Sound

Communities

Chenega
Cordova
Gakona
Glennallen

Tatitlek
Valdez
Whittier

People and Place

Location

The communities profiled in this section are located along the shores of Prince William Sound (PWS) and inland in the Copper River basin. All are located in the Valdez-Cordova Census Area. PWS is situated between the Kenai Peninsula to the west and Southeast Alaska to the east. PWS consists of a labyrinth of fjords at roughly 61° N. latitude. The Copper River valley stretches northeast from PWS, bordered by the Alaska Range and Talkeetna, Chugach, and Wrangell mountains.¹ The Copper River has its outlet just southeast of the City of Cordova, at the southeastern corner of PWS.

The climate of PWS is influenced by its coastal location. Temperatures are mild with average highs in the summer around 60° F and average winter lows around 20° F. Precipitation in the sound is quite heavy, averaging around 60 inches of rain annually. Valdez, located at the north edge of PWS, receives an incredible 325 inches (roughly 27 feet) of snow each year.²

Demographic Profile

In 2010, the total population of the Valdez-Cordova Census Area was 9,636. Of the seven PWS communities profiled in this document, two (Valdez and Cordova) had populations of greater than 2,000 in 2010, while the remaining five communities had between 76 and 485 residents. The population of Valdez accounted for 41.3% of the total regional population that year, while 23.3% resided in Cordova.³

In 2010, a majority of the residents of the Valdez-Cordova Census Area identified themselves as White (74%), along with 13.6% who identified as American Indian or Alaska Native, 3.7% who identified as Asian, 0.6% as Native Hawaiian or Other Pacific Islander, 0.5% as Black or African American, 0.5% as 'Some Other Race', and 7.2% that identified as two or more races. In addition, 3.6% of PWS residents identified themselves as Hispanic or Latino. Because of Cordova's robust seafood processing sector, the community has a more highly diversified population in terms of race or ethnicity than other PWS communities. In 2010, 64% of residents identified themselves as White, 19% as Asian, 18% as Filipino, and 13% as Alaska Native or American Indian. It is also important to note that a majority of residents in both Tatitlek and Chenega identified themselves as Alaska Native or American Indian in 2010.⁴

⁴ Ibid.

In 2010, the overall regional per capita income of the Valdez-Cordova Census Area was estimated at \$30,703, while the estimated median household income was \$76,625, compared to statewide estimates of \$30,726 and \$77,886, respectively.⁵

History

PWS has been the home of Alutiiq (Sugpiaq) people for approximately 5,000 years. Athabascan and Tlingit groups, who migrated into the sound from other areas, have also been present since prehistory. Since the late 1700s, the region has been a crossroads for explorers, miners, fishermen, and the Native inhabitants of the region. In particular, the presence of a protected, deep-water port at Valdez has been a key ingredient in the development of the region, culminating in the construction of the Trans-Alaska oil pipeline terminus in the 1970s.^{6,7}

Today, most residents live within the larger communities of Valdez and Cordova; the other residents are scattered throughout a few dozen small communities. The demographics of the region have changed quite dramatically through time. The construction of the Trans-Alaska oil pipeline, the build-up and withdrawal of U.S. military personnel, particularly in Whittier, and the 1989 *Exxon Valdez* oil spill—all these factors have influenced the dramatic flux in the composition of PWS.⁸ Today, some 13% of residents are all or part Alaska Native.⁹

Natural Resources and Environment

Five of the communities profiled in this section lie on the shores of PWS, from Chenega Bay in the coastal islands to the southwestern, Whittier in the west, Valdez and Tatitlek on the northeastern shores, and Cordova in the southeastern portion of the Sound. This section also includes Gakona and Glennallen, inland communities in the heart of the Copper River Valley, northeast of PWS. The five communities directly bordering the Sound are located within the boundaries of the Chugach National Forest (except Valdez, which is just outside the border), while the communities in the Copper River Valley are located on the western border of Wrangell St. Elias National Park and Preserve.

The coastal communities profiled here are located within a maritime climate zone, characterized by cool summers and mild winters, while the climate of the inland communities is continental, with long, cold winters and relatively warm summers.¹⁰ The PWS region is characterized by complex coastlines, peninsulas and small islands, and glacial carved valleys and fjords. Uplands host coniferous forest and muskeg.¹¹ The Copper River Valley is surrounded by

the mountains of the Alaska Range and Talkeetna, Chugach, and Wrangell Mountains. Forests of aspen, spruce, and balsam poplar cover much of the valley. Permafrost is found throughout the valley at varying depths.¹²

PWS and the Copper River Valley are located in a highly active tectonic zone, with high risk of earthquake and tsunami activity. The Denali Fault runs through the Copper River Valley, and more than 12 volcanoes are recognized in the Wrangell Mountains. Mt. Wrangell is considered to be an active volcano, with steam still venting from near its summit. There are 11 major active fault systems within 150 miles that are capable of producing earthquakes that can be felt in PWS.¹³ The Good Friday earthquake of 1964, or “Great Alaska Earthquake”, was the largest recorded earthquake in the country, with a magnitude of 9.2 on the Richter scale. It struck PWS on Good Friday, March 28th, 1964. The maximum wave height recorded was 67 m at Valdez Inlet.¹⁴ Shoup Bay near Valdez became infamous for the 150-foot tidal wave that surged in and out of the bay three times during the earthquake.¹⁵ In Cordova, tectonic uplifts were recorded from 6.5 to 7.5 feet.¹⁶ The tsunami generated by the earthquake destroyed the village of Chenega and killed 23 people.¹⁷ Other regional hazards include coastal erosion, avalanches, landslides, sea level rise, land subsidence, volcanoes, coastal flooding, and storm surges.¹⁸

Oil development plays a large role in the PWS region. Valdez hosts the terminus of the Trans-Alaska Pipeline, which carries crude oil south from oil fields on Alaska’s North Slope. As of 2006, Alyeska Pipeline Service Company employed approximately 300 people in Valdez. Oil industry jobs are concentrated in Valdez, while oil spill response has become an important economic driver throughout PWS. Following the 1989 *Exxon Valdez* Oil Spill, a Ship Escort/Response Vessel System was created. This System is the largest oil spill organization in the Western Hemisphere, and as of 2006, employed approximately 300 people, including staff, response specialists, vessel crews, material handlers, and mechanics. In 2006, approximately 325 private fishing vessels were also on contract by Alyeska Pipeline Service Company to provide response assistance in the event of an oil spill.¹⁹

In addition to oil, industries that provide employment in this region include fishing, tourism, and timber harvesting. Sporadic mining activity has also taken place in the region over the past century.²⁰ Valdez played a role in the history of mining in Alaska both as a launching point for gold prospectors bound for the Klondike or Copper River Basin in the late 1800s and early years of the 1900s, and later miners prospected for gold, copper and silver locally on the

²⁰ Ibid.

islands and shores of PWS. The most profitable mines in the vicinity of Valdez were the Cliff Gold Mine and the Midas Mine. The Cliff Mine extracted about 51,740 ounces of gold and 8,153 ounces of silver. The Midas Mine, in nearby Solomon Gulch on the south shore of the Port, was the fourth largest producer of copper in the PWS area. Ellamar Mine, located near Tatitlek, was a large copper producer, and almost as much gold was produced as a byproduct of copper mining, as was produced at the Cliff Mine.²¹ Today, the Midas and Ellamar Mines still work some of the most significant copper deposits in Alaska, along with extracting some gold, zinc, lead, and silver.²² Copper and gold deposits were also found in the Copper River basin at the end of the 19th Century, and a copper mine was active there between 1910 and 1938.²³ Today, communities located inland in the Copper River valley, further from commercial fishing activity, depend largely on tourism, including visitors passing by on the Glenn Highway.²⁴

Governance

Communities in PWS belong to the Valdez-Cordova Census Area but are not under the jurisdiction of an organized borough. As a result, the communities themselves are responsible for basic services and tax administration. Of the seven communities profiled for the PWS region, three have incorporated city governments (Cordova, Valdez, and Whittier), and three are governed by federally-recognized tribal councils, including the Native Village of Tatitlek, Native Village of Chenega (Chenega Bay), and the Mount Sanford Tribal Consortium in Gakona. This Consortium is made up of the Tribal Councils of Chistochina and Mentasta Lake. Glennallen is unincorporated, and does not have a Tribal Council.²⁵ However, despite a lack of municipal governance in Glennallen, the community serves as a regional hub of state and federal administration offices.²⁶

The communities profiled in this section are divided between two regional Native corporations. The offices of the Ahtna, Inc., the regional Native corporation for the Copper River region, are headquartered in Glennallen.²⁷ The Copper River Native Association, with offices 16 miles south in Copper Center, provides health and tribal community services in the Copper Valley basin.²⁸ Tribal communities located on the shores of PWS and in Lower Cook Inlet are represented by the Chugach Alaska Corporation,²⁹ and are members of Chugachmiut, a tribal 501(c)(3) non-profit organization with the goal of advancing the overall economic, social, and cultural development of the people of the Chugach Region.³⁰

Involvement in North Pacific Fisheries

Fisheries resources provide a strong foundation for the regional economy in PWS, although variability in both the health of fish stocks and global markets has led to concerns about the stability of this industry.³¹ Vessel owners and permit holders residing in PWS communities have the highest rates of involvement in fisheries for salmon, halibut, shrimp, sablefish and other groundfish species, including lingcod, Pacific cod, and pollock.^{32,33} Cordova is a regional fisheries hub, with a fleet of 645 vessels and 7 shore-side processing facilities in 2010.³⁴ That year, almost half of Cordova households had at least one person working in commercial harvesting or processing.³⁵ Valdez serves as a smaller fisheries hub in northern PWS, with 80 vessels homeported and 3 shore-side processing facilities in 2010. Whittier also offers several processing facilities and hosts a small fishing fleet, and residents of each of the communities profiled in this document have participated to some degree in local PWS fisheries as well as fisheries around the State.^{36,37}

Salmon is the most important regional fishery resource in terms of participation, landings volume, and ex-vessel revenue.³⁸ The success of Copper River Chinook and sockeye salmon in international markets has provided for relatively high prices in this local fishery.^{39,40} In 2010, approximately 400 residents of the seven communities profiled in this document held state-issued Commercial Fisheries Entry Commission (CFEC) permits in PWS salmon fisheries. A majority of these (just over 350) were held by Cordova residents, while just under 40 were held in Valdez, and several were held by residents of Whittier and Tatitlek.⁴¹

Relatively high numbers of state permits are also held by residents of the profiled communities in PWS fisheries for herring and shrimp; however, in 2010, no PWS herring permits were actively fished. Although PWS historically had a productive herring fishery, in 1993, 4 years after the *Exxon Valdez* oil spill, the stock collapsed in conjunction with an outbreak of hemorrhagic septicemia virus. Since 1998, the PWS herring fishery has been closed. The

⁴¹ See footnote 34.

relationship between the oil spill, the virus, and the stock collapse remain unclear, and the population has shown little sign of recovery.^{42,43} In contrast, spot shrimp (*Pandalus platyceros*) pot fisheries reopened in PWS in 2010 after two decades of closure due to low abundance.⁴⁴

Sport fishing is also an important component of regional fishery involvement. Sport license sales for the communities profiled in this section totaled more than the population of the communities combined. More than half of the sport fish licenses were sold to sport fishermen from outside the region. Major sport species include all five species of Pacific salmon, halibut, rockfish, and lingcod.^{45,46} Between 2000 and 2010, the greatest number of sport fish guide businesses and licensed sport fish guides were located in Valdez. A large number of guide businesses were also located in Cordova, Glennallen, and Gakona in 2000, but steep declines were evident in all three communities through the decade.⁴⁷ In Glennallen and Gakona, participation by local residents in sport fishing was relatively more important than participation in commercial fisheries compared to communities located on the coastline. The number of sport fishing licenses sold to local residents in these inland communities was equivalent to a higher percentage of the total local population compared to Cordova and Valdez between 2000 and 2010, while a much smaller percentage held commercial crew licenses, owned a fishing vessel, or held a state-issued commercial fishing permit.^{48,49}

Subsistence harvest of marine resources is important in communities throughout PWS and the Copper River basin, and particularly in communities located farther from major transportation networks, including Tatitlek and Chenega. In 2003, subsistence harvest surveys conducted by ADF&G found that 96% of Tatitlek households participated in halibut subsistence and 89% participated in salmon subsistence, with a per capita harvest of marine and terrestrial subsistence resources of 290 pounds. In Chenega, 94% of Chenega households were estimated to participate in halibut subsistence and 86% in salmon subsistence, with a per capita harvest of 406 pounds of marine and terrestrial resources in 2003. In addition to halibut and salmon, common marine invertebrate species utilized for subsistence purposes in PWS communities include Pacific littleneck, horse, razor, butter, and pinkneck clams, cockles, mussels, shrimp, chitons, limpets, Dungeness, Tanner, and king crab, snails, and octopus. Common species of non-salmon

fish (not including halibut) harvested for subsistence purposes include herring, eulachon (hooligan candlefish), red and black rockfish, smelt, Dolly Varden, lingcod, sablefish, Pacific cod, rainbow, cutthroat, and lake trout, Pacific tomcod, skates, flounder, sea bass, greenling, shark, walleye pollock, grayling, whitefish, and burbot. Herring roe is also an important subsistence resource. Marine mammals harvested for subsistence purposes include harbor seal and Steller sea lion, as well as porpoise harvested by residents of Tatitlek.⁵⁰ Harvest of sea otters was also reported in Cordova, Valdez, Chenega, and Tatitlek between 2000 and 2010.⁵¹

Regional Challenges

This region faces several challenges, largely resulting from the March 1989 *Exxon Valdez* oil spill, which leaked some 11 million gallons of oil into PWS. Living marine resources were negatively impacted and continue to show effects of the spill. The spill affected the food chain that supports the PWS commercial fishery, and impacted shore birds, waterfowl, sea otters, harbor porpoises, harbor seals, Steller sea lions, and several species of whale, among other species.⁵² Harvest of shellfish declined dramatically due to petrochemical contamination. Sea otter mortality was as high as 40% immediately following the spill. The 50% decline in the PWS orca population in the decades following the spill has been attributed to direct oil exposure and consumption of oiled marine mammals. Many other fish, marine mammal, and bird populations declined following the spill, including marbled murrelets and black oyster catchers. Impacts on habitat and forage fishes created continued difficulties for recovery of many species.⁵³ In particular, the 1993 collapse of the PWS herring fishery has made recovery for many species difficult, as it is a primary food source for harbor seal, Steller sea lion, and marbled murrelet, among others. The relationship between the herring collapse and the oil spill remains unclear.^{54,55}

Tourism revenues were also impacted by the *Exxon Valdez* oil spill. Ecological damages and economic losses due to declines in fishing and tourism revenues were significant. Today, a major funding source for tourism development projects is the Exxon Valdez Oil Spill Trustee Council, which has contributed to the construction of museums and cultural centers in PWS.⁵⁶

Variability in fish stocks and market value of fisheries resources is another challenge faced by communities in PWS and throughout Alaska. With the importance of the salmon fishery

in PWS, a downward trend in salmon prices in the 1990s and early 2000s caused economic hardship,⁵⁷ although salmon ex-vessel prices and value have rebounded since 2002.⁵⁸ A number of salmon hatcheries are in operation in PWS to supplement wild runs. Declines in the statewide pollock fishery are of concern to PWS fishermen.⁵⁹

In addition to commercial fisheries, concerns about localized overharvest of Pacific halibut have led to limitations on the halibut charter industry.⁶⁰ In 2007, the North Pacific Fishery Management Council (NPFMC) approved implementation of a limited entry program for halibut charter fleets in Areas 2C and 3A (Southeast and Southcentral Alaska) and a daily halibut bag limit for each charter vessel angler of two halibut of any size per day per person. The limited entry program was implemented in 2010.^{61,62} Declining halibut availability and harvest limitations are reflected in steep declines in the number of sport fish guide businesses and licensed sport fish guides residing in PWS communities between 2000 and 2010.⁶³

Chenega Bay (chuh-NEE-guh)

People and Place

Location ⁶⁴

Chenega Bay is located on Evans Island at Crab Bay, 42 mi southeast of Whittier in Prince William Sound (PWS). It is 104 mi southeast of Anchorage and 50 mi east of Seward. The community occupies 28.8 sq mi of land and 0.3 sq mi of water. Chenega Bay is unincorporated, located in the Valdez-Cordova Census Area, and is not under the jurisdiction of a borough.

Demographic Profile ⁶⁵

In 2010, there were 76 residents ranking Chenega Bay 273rd of 352 Alaskan communities in terms of population size. Overall since 1990, the population has declined by 19.1%. Between 2000 and 2009, the population declined by 17.44% with an average annual growth rate of -0.23%; lower than the statewide average of 0.75% and indicative of a downward trend despite the large variation in annual Alaska Department of Labor (DOL) estimates.

In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that there were 60 permanent and 10 to 15 seasonal or transient residents living in Chenega Bay according to a 2010 head count. On average, the number of seasonal workers living in the community peaks between April and September; however, the peak is only slightly driven by employment in the fishing sectors. Information regarding population trends can be found in Table 1.

Chenega Bay is predominately an Alutiiq community; however, in 2010 only 52.6% of the population identified themselves as American Indian or Alaska Native, compared to 73.3% in 2000. Also in 2010, 39.5% of the population identified themselves as White, compared to 22.1% in 2000; and 7.9% identified themselves as two or more races, compared to 4.7% in 2000. In addition, 2.6% of residents identified themselves as Hispanic or Latino, compared to 0.0% in 2000. The marked change in racial composition between 2000 and 2011 could coincide with the highly variable population, and might not reflect a long term trend. Information regarding trends in Chenega Bay's racial and ethnic composition can be found in Figure 1.

Figure 1. Racial and Ethnic Composition, Chenega Bay: 2000-2010 (U.S. Census).

In 2010, the average household size was 2.45, compared to 3.0 in 1990 and 3.55 in 2000. In that year there were 51 total housing units, compared to 30 in 1990 and 27 in 2000. Of the households surveyed in 2010, 23.5% were owner-occupied, compared to 55.6% in 2000; 37.3% were renter-occupied, compared to 26% in 2000; 11.8% were vacant, compared to 11.1% in 2000; and 27.5% were occupied seasonally, compared to 7.4% in 2000. In 2010, there were no residents reported to be living in group quarters, compared to eight in 2000.

The gender distribution in 2010 was relatively even at 51.3% male and 48.7% female. This was similar to the statewide distribution (52.0% male, 48.0% female) and more even than the distribution in 2000 (57.0% male, 43.0% female). The median age was 35.0 years, which similar to the statewide median of 33.8 years, and older than the 2000 median of 30.6 years.

Because of the small and variable population, the population structure was irregular in both 2000 and 2010 making it difficult to discern a trend. In 2010, 32.9% of residents were under the age of 20, compared to 26.0% in 2000; 15.8% were over the age of 59, compared to 8.2% in 2000; 37.0% were between the ages of 30 and 59, compared to 43.1% in 2000; and 14.5% were between the ages of 20 and 29, compared to 12.8% in 2000.

Gender distribution by age cohort was significantly less even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred in the 60 to 69 range (11.9% male, 2.6% female), followed by the 0 to 9 (13.1% female, 7.9% male) and 50 to 59 (7.9% female, 5.0% male) ranges. Of those three, the greatest relative gender difference occurred in the 60 to 69 range. Information regarding Chenega Bay’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Chenega Bay Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the 2006-10 American Community Survey (ACS)⁶⁶ estimated that 100% of Chenega Bay residents aged 25 years and older held a high school diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, and estimated 33.3% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 59.3% had a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall, and an estimated 7.4% had a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*⁶⁷

Founded before Russian contact in the late eighteenth century, Chenega was the longest occupied community in PWS, before the original community was destroyed by a tsunami resulting from the 1964 “Good Friday” Earthquake. In that event, all of the buildings in the community were destroyed with the exception of a single house and the community school. Over a third of the residents lost their lives, and survivors were evacuated initially to Cordova and later resettled in the community of Tatitlek by the U.S. Bureau of Indian Affairs (BIA).

With the passage of the Alaska Native Claims Settlement Act (ANCSA), former residents of Chenega formed the Chenega Corporation, which selected 76,093 acres around the original Chenega township as part of the ANCSA lands settlement. This land was acquired in order to one day re-establish the community of Chenega. Shareholders selected their new community site at Crab Bay on Evans Island in March of 1977. The Chenega Corporation and the Chenega Indian Reorganization Act (IRA) Council worked to find funds for roads, water and sewer systems, electric generators, a boat and floatplane dock, and a school. The new Chenega “Chenega Bay” was finally occupied in 1984 after the construction of 21 Housing and Urban Development homes.

On March 24, 1989 Chenega Bay was impacted by another disaster. The *Exxon Valdez* Oil Spill released approximately 11 million gallons of crude oil into the waters of PWS and Chenega Bay became a major center for cleanup operations. The Chenega Corporation participated in cleanup of the oil spill, and in 1997, sold a large portion of its land holdings to the U.S. Forest Service and State of Alaska for \$34 million in hopes of using the funds to diversify its business plan following the spill.

Today, the community of Chenega Bay still relies on some subsistence and/or commercial fishing resources, but a cash economy has become more important in the wake of the oil spill and many jobs in the community are dependent on cleanup.

Natural Resources and Environment

Chenega Bay is located in dense coastal rain forests which extend from southeastern Alaska to Kodiak Island. The climate is marine influenced, with cool cloudy summers and relatively mild winters. Annual precipitation averages 66 in of rain and 80 in of snowfall.

⁶⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁶⁷ GDM Inc. (2008). *Chenega Bay Masterplan*. Retrieved January 17, 2012 from: <http://www.commerce.state.ak.us/dca/plans/ChenegaBay-MP-2008.pdf>.

Summer temperatures range from 49 to 63 °F (9 to 17 °C) and winter temperatures range from 17 to 28 °F (-8 to -2 °C).⁶⁸

Chenega Bay is located in the Chugach National Forest, which covers 5.4 million acres of south-central Alaska. The surface soils and geology surrounding the community are characterized by exposed and peat-covered bedrock. Tree stands are typically found in areas where peat is relatively shallow; while areas of deeper poorly drained peat tends to form bogs or muskegs.⁶⁹ Coastal forest vegetation includes mixed stands of Sitka spruce and western hemlock. Woodland lodge pole pine communities can be found in muskegs. Tidal areas and deltas are dominated by sedges and grass wet meadows.⁷⁰ The PWS area provides habitat for a wide range of aquatic and terrestrial wildlife. Coastal areas host seals, sea lions, sea otters, whales, and an abundance of waterfowl. Fisheries include all five species of Pacific salmon, halibut, rockfish, lingcod, sablefish, cutthroat trout, and Dolly Varden char. The Chugach National Forest and Kenai Fjords National Park host Dall sheep, moose, mountain goats, deer, wolves, brown and black bears, and a small caribou herd. Other resources in the area include an inactive copper/silver mine on Latouche Island to the east, as well as several salmon hatcheries in PWS.⁷¹

No offshore oil and gas lease sales were scheduled in the Gulf of Alaska (GOA) for the 2012-2017 leasing program.⁷² A 2000 assessment of conventionally recoverable oil and gas estimated the presence of between 360 million to 3.27 billion barrels of oil and gas in the GOA region. This was slightly higher than estimates in Cook Inlet. The Pacific Margin Subregion (including Cook Inlet, GOA and Shumagin-Kodiak) was estimated to hold only 6.3% of all conventionally recoverable oil and gas in Alaska's offshore regions, while the Arctic Subregion was estimated to hold 84.6% and the Bering Shelf subregion was estimated to hold 9.1%.⁷³

The community of Chenega Bay does not have a hazard mitigation plan; however, earthquakes and tsunamis have been hazards in the past and continue to impact the region as a whole. Other regional hazards include coastal erosion, avalanches, landslides, sea level rise, land subsidence, volcanoes, coastal flooding, and storm surges. Susceptibility and vulnerability to any one of these hazards on a community-specific level is not known.⁷⁴

Living marine resources in the Valdez area were negatively impacted and continue to show affects of the March 1989 *Exxon Valdez* Oil Spill, when 11 million gallons of crude oil spilled into PWS. The spill affected the food chain that supports the PWS commercial fishery, and impacted shorebirds, waterfowl, sea otters, harbor porpoises, harbor seals, Steller sea lions and several species of whale, among other species.⁷⁵ Harvest of shellfish declined dramatically

due to petrochemical contamination. Sea otter mortality was as high as 40% immediately following the spill. The 50% decline in the PWS orca population in the decades following the spill has been attributed to direct oil exposure and consumption of oiled marine mammals. Many other fish, marine mammals and bird populations declined following the spill, including harbor seals, Steller sea lions, marbled murrelets and black oyster catchers. Impacts on habitat and forage fishes created continued difficulties for recovery of many species.⁷⁶ In particular, the 1993 collapse of the PWS herring fishery has made recovery for many species difficult, as it is a primary food source for harbor seal, Steller sea lion, and marbled murrelet, among other species. The relationship between the herring collapse and the oil spill remains unclear.^{77,78}

Current Economy⁷⁹

Most residents of Chenega Bay still rely on some subsistence and commercial fishing resources; however, in the wake of the *Exxon Valdez* Oil Spill, fishing has declined and employment has shifted towards opportunities created by the spill.⁸⁰ In a survey conducted by the AFSC in 2011, community leaders reported that the local economy was dependant on sport hunting and fishing. Top employers in 2010⁸¹ included Chenega IRA Council, Chugachmiut, PWS Aquaculture Corp., Native Village of Chenega Bay Public Health, Chugach School District, and Chenega Corp.

In 2010,⁸² the estimated per capita income in Chenega Bay was \$26,092 and the estimated median household income was \$46,458, compared to \$13,382 and \$53,750 in 2000, respectively. After accounting for inflation by converting 2000 values into 2010 dollars,⁸³ the real per capita income (\$17,597) and real median household income (\$70,681) indicate that individual earnings increased while household earnings decreased. In 2010, Chenega Bay ranked 95th of 305 communities reporting per capita income, and 155th of 299 communities reporting median household income. It should be noted that ACS estimates are based on wage income and do not account for the value subsistence resources have within the community.

Chenega Bay's small population size may have prevented the ACS from accurately portraying economic conditions.⁸⁴ Another way of understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development.

⁷⁶ Chugachmiut. 2009. *Chugach Region Comprehensive Economic Development Strategy*. Retrieved April 30, 2012 from <http://www.chugachmiut.org/services/enterprise/Chugach%20Region%20CEDS%20draft%20v5.pdf>.

⁷⁹ Unless otherwise noted, all monetary data are reported in nominal values.

⁸⁰ See footnote 71.

⁸¹ Alaska Department of Labor and Workforce Development (n.d.). Alaska Local and Regional Information Database. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

⁸² U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁸³ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁸⁴ See footnote 66.

According to the ALARI database, residents earned \$740,349 in total ages in 2010.⁸⁵ When matched with the population in 2010, the per capita income equals \$9,741, suggesting that caution should be used when comparing 2010 ACS estimates with the 2000 Census.⁸⁶ However, it should be noted that Chenega Bay was not recognized as “distressed” by the Denali Commission indicating that less than 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁸⁷

Based on 2006-10 ACS estimates,⁸⁸ 62.3% of residents aged 16 years and over were in the civilian labor force in 2010. In the same year, unemployment was estimated at 0.0%, compared to an estimated 5.9% statewide; and no residents were estimated to be living below the poverty line, compared to 9.5% statewide. There is a possibility that these figures are inaccurate, as they conflict with ALARI wage estimates; however, DOLWD did estimate a low unemployment rate of 6.7% for that year.

Of those employed in 2010, an estimated 39.5% worked in the private sector, an estimated 36.8% worked in the public sector; and an estimated 23.7% were self-employed; which possibly explains the significant variation between ACS and ALARI estimates as DOLWD does not include self-employed workers in their estimates. By industry, most (26.3%) employed residents were estimated to work in education services, health care, and social assistance sectors in 2010; followed by other services sectors, other than public administration (26.3%); public administration sectors (23.7%); and agriculture, forestry, fishing, hunting, and mining sectors (10.5%). By occupation type, most (78.9%) employed residents were estimated to hold management or professional positions; followed by sales or office positions (13.2%); and service positions (7.9%). Overall, there was significant variation in employment by industry sector and occupation type between 2000 and 2010. Most notably, there was a significant decline in the public administration sector, and significant increase in management and professional positions. These variations may be attributed to either the significantly volatile population or sampling errors within the ACS. Information regarding employment trends can be found in Figures 3 and 4.

⁸⁵ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

⁸⁶ See footnote 81.

⁸⁷ Denali Commission. 2011. Distressed Community Criteria 2011 Update. Retrieved April 16, 2012 from: www.denali.gov.

⁸⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Figure 3. Local Employment by Industry in 2000-2010, Chenega Bay (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Chenega Bay (U.S. Census).

Governance

Chenega Bay is unincorporated and not under the jurisdiction of a municipal or borough government. There is however, a BIA recognized Tribal government (Native Village of Chenega), as well as an ANCSA chartered Native village corporation (Chenega Corporation). The regional ANCSA corporation representing Chenega Bay is the Chugach Alaska Corporation. The closest Alaska Department of Fish and Game (ADF&G) and National Marine Fisheries Service (NMFS) offices are located in Seward, 46 mi west. The closest U.S. Bureau of Citizenship and Immigration Services office is located in Anchorage, 104 mi northwest.

Since the community is unincorporated, the community is unable to collect revenue through taxes. However, there were several state and federal fisheries-related grants awarded to the community between 2000 and 2010 including \$109,402 for harbor upgrades in 2005 and \$1.1 million for a small boat harbor rehabilitation project in 2009. Information regarding community revenue streams can be found in Table 2.

Infrastructure

*Connectivity and Transportation*⁸⁹

Chenega Bay has a state-owned 3,000-ft gravel airstrip and floatplane landing area in the harbor. Charter flights are available from Anchorage, Cordova, Seward, and Valdez. The community has a small boat harbor and dock and freight is brought in by air or barge. The Alaska Maine Highway System maintains a dock facility in the community. Ferry service departing from Seward arrives in Chenega Bay monthly during the winter and three times a month in the summer. Ferry service from Valdez arrives in Chenega Bay once a month. Skiffs, cars, trucks, ATVs, and snow machines are used for local transportation. Alaska Air Transit operates scheduled flights between Anchorage and Chenega Bay for \$225 one-way.⁹⁰

*Facilities*⁹¹

Chenega Bay Utilities operates three diesel generators which distribute power via underground powerlines at a maximum capacity of 217 kW. As of 2008, the residential rate was 19 cents per kW hour and the commercial rate was 40 cents per kW hour. Piped water service is provided via a surface water collection system with dam, treatment, and 50,000 gal storage capacity. Sewage is piped to a 20,000 gal community septic tank, and some homes maintain private septic systems. In 2001, a new landfill was completed and refuse is collected twice a week. Fuel is typically purchased twice annually from Valdez and distributed to households directly as well as the local tank farm. Internet is only provided at the school. Visitor accommodations include the Chenega Bay Hotel. Public safety services are provided by state troopers based in Seward. Fire and rescue services are provided by Chenega Bay Emergency Medical Services. Additional public facilities include a youth center, community center, school gym, and school library. Communications services include state and long distance telephone, internet (at the school only), local television, and local radio.

In a survey conducted by the AFSC in 2011, community leaders reported that infrastructure projects completed between 2000 and 2010 included new dock space, existing dock improvements, dockside water and power service, port road access, pilings, airport improvements, water treatment improvements, and landfill improvements. Projects which were under development in 2010 included broadband internet infrastructure and road improvements. There is 20 ft of public dock space available for permanent moorage. Regulated vessels which Chenega Bay is capable of handling include ferries and fuel barges. During the fishing season, vessels using the community as a base of operations are typically less than 60 ft in length. The community has seen a lot less vessels over 60 ft in length since 2005, while seeing more private vessels, commercial fishing vessels, and vessels less than 60 ft in length. Fisheries-related businesses and services include a machine shop, and commercial and recreational fishing moorage.

Medical Services

Arch Priest Nicholas Kompkoff Clinic is a Primary Health Care facility and Community Health Aid Program (CHAP) site. Acute, long-term, and specialized care is provided in Seward and Anchorage.

Educational Opportunities

Chenega Bay School provides preschool through 12th grade instruction. As of 2011, there were 24 students enrolled and three teachers employed.⁹²

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Chenega Bay's character as a fishing-based community dates back thousands of years; however, both the 1964 Good Friday Earthquake and 1989 *Exxon Valdez* Oil Spill have dramatically reshaped the community and its participation in North Pacific Fisheries. Although local participation in commercial fishing has been in decline in recent years, participation in subsistence and sport fisheries is still an important part of Chenega Bay's identity. In a survey conducted by the AFSC in 2011, community leaders reported that Chenega Bay is not involved nor does it advocate for itself in the fishery management process in Alaska.

However, the community is eligible to participate in the Community Quota Entity (CQE) program, and its interests are represented by the non-profit Chenega Heritage Incorporated. The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead to decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf. As of Fall 2013, Chenega Heritage Incorporated had not yet purchased any commercial halibut Individual Fishing Quota (IFQ) or non-trawl groundfish License Limitation Program permits. However, the non-profit had acquired seven halibut charter permits for lease to community members.⁹³

ADF&G manages the PWS salmon fishery. The PWS salmon management area is divided into 11 commercial fishing districts, covering the coastal area from Cape Suckling (northwest of Yakutat) to Cape Fairfield (east of Seward), and the inland waters of PWS. Valdez is located in the Eastern district. Purse seine gear is the most common gear type, and is allowed in eight of the nine inland fishing districts. Drift gillnet gear is allowed in three districts, and set gillnet gear is only allowed in the Eshamy District. It is important to note that a salmon hatchery program was initiated in PWS in the early 1970s, and hatchery returns have consistently contributed to harvests since the 1980s.⁹⁴

Groundfish and crab fisheries that occur within 3 nmi of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nmi in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction. Pacific halibut fisheries are managed under the International Pacific Halibut Commission. PWS is located in Federal Statistical and Reporting Area 649 and Pacific Halibut Fishery Regulatory Area 3A. The outlet of PWS is at the boundary between the Central GOA and Eastern GOA federal Sablefish Regulatory Areas.

In addition to federal groundfish fisheries that take place in the Central and Eastern GOA, state groundfish fisheries take place in the inland waters of PWS for rockfish, lingcod, pollock, sablefish, and Pacific cod. The PWS Pacific cod fishery is managed as a parallel fishery, which takes place at the same time as the federal cod fishery. The Total Allowable Catch (TAC) set by NMFS applies to both fisheries. Beginning in 1997, an additional ‘state-waters fishery’ for Pacific cod was initiated in PWS. A pelagic trawl fishery for pollock began in PWS in 1995, and is managed under a guideline harvest limit (GHL) determined by ADF&G, and is not conducted as a parallel fishery. Typically, state-waters fisheries are opened once federal and parallel fisheries close. The PWS limited entry sablefish fishery is also managed separately under a GHL.⁹⁵

A majority of lingcod are found in nearshore rocky reef habitat from 10-100 m in depth. ADF&G manages all lingcod fisheries in state and EEZ waters off Alaska. Lingcod in PWS are primarily harvested as incidental catch in longline fisheries, although lingcod fisheries have increased in importance in recent decades. The state manages rockfish harvest in PWS, and since 1998 also has jurisdiction of blue and black shelf rockfish in the western GOA, and all rockfish in the eastern GOA.⁹⁶

PWS historically had a productive herring fishery. However, in 1993, 4 years after the Exxon Valdez, the stock collapsed in conjunction with an outbreak of hemorrhagic septicemia virus. Since 1998, the PWS herring fishery has been closed. The relationships between the oil spill, the virus and the stock collapse remain unclear, and the population has shown little sign of recovery.^{97,98} PWS was also a historical center for Dungeness crab fisheries, but this stock has also collapsed. Possible causes for the Dungeness collapse include overfishing, sea otter

predation, and adverse climatic changes. Red king crab and Tanner crab fisheries in PWS are also closed due to low stock abundance.⁹⁹ In contrast to the closures of herring and crab fisheries, spot shrimp (*Pandalus platyceros*) pot fisheries reopened in PWS in 2010 after almost two decades of closure due to low abundance.¹⁰⁰

Chenega Bay is located in Federal Reporting Area 649, International Pacific Halibut Commission (IPHC) regulatory area 3A, and the Central GOA Sablefish Regulatory District.

Processing Plants

According to the 2010 Alaska Department of Fish and Game's Intent to Operate list, Chenega Bay does not have a registered processing plant. The closest seafood processor is located in Whittier.

Fisheries-Related Revenue

Between 2000 and 2010, there was no reported fisheries-related revenue collected in Chenega Bay.

Commercial Fishing

In 2010, no residents held crew licenses or owned majority share of any vessels. In addition, no vessels made landings in Chenega Bay that year. Participation in commercial fisheries has declined in recent years with no residents holding any fisheries permits between 2007 and 2010. In 2006, 1 resident held 1 salmon permit issued by the Commercial Fisheries Entry Commission (CFEC); however, that permit was not fished. Permit activity peaked in 2000 when 3 residents held 3 CFEC salmon permits, all of which were fished that year. Between 2000 and 2010, no residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits. Between 2000 and 2010, 1 account held 628 halibut quota shares. No residents held sablefish or crab quota between 2010 and when the programs began. In a survey conducted by the AFSC in 2011, community leaders reported that commercial vessels that use Chenega Bay as a base of operations typically use pots, longline, gill net, purse seine, and troll gear types.

Between 2000 and 2010, no landings were made in the community. Landings were made by residents between 2000 and 2005; however, reports for these landings are considered confidential. No landings were made by residents between 2006 and 2010. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Chenega Bay is located in North Gulf Coast/PWS ADF&G Harvest Survey Area which includes all drainages from east of Cape Suckling, through PWS to Gore Point. In 2010, there was 41 sport fishing licenses sold in the community and 30 sold to residents, compared to 0 and 5 in 2000, respectively. The number of sport fishing licenses sold to both the community and residents increased steadily between 2000 and 2010, with each peaking in 2010. There was never more than one active sport fish guide businesses registered in Chenega Bay at any given year between 2000 and 2010. During 2000 and 2009 there were no active sport fish guide businesses registered. In addition, there was never more than one sport fish guide license held in the community during those years, with the exception of 2007 when there were two.

In 2010, there were a total of 212,793 saltwater angler days fished, compared to 122,459 in 2000; representing a 74% increase. Non-Alaska residents accounted for 30.4% of total saltwater angler days fished in 2010, compared to 32.3% in 2000. Saltwater angler days fished peaked at 300,205 in 2007. There was a total of 22,979 freshwater angler days fished in 2010, compared to 12,108 in 2000; an increase of 90%. Non-Alaska residents accounted for 57% of freshwater angler days fished in 2010, compared to 26% in 2000. Total freshwater angler days fished peaked in 2010.

According to ADF&G Harvest Survey data, species targeted by private anglers in Chenega Bay include coho, sockeye, and pink salmon, rainbow trout, Dolly Varden char, Pacific halibut, rockfish, lingcod, hardshell clams, and shrimp. In a survey conducted by the AFSC in 2011, community leaders reported that local private anglers target all five species of Pacific salmon, halibut, rockfish, crab, sablefish, shrimp, clams, and octopus.

Chenega Bay hopes to boost its sport fishing and tourism economy through the development of lodging facilities, cultural activities, and improvements to recreational fishing infrastructure, businesses, and services.¹⁰¹ Information regarding sport fishing trends can be found in Table 11.

Subsistence Fishing

Subsistence hunting, fishing, and gathering are essential components to Chenega Bay’s economy and culture. The community’s participation in subsistence fisheries was severely impacted following the 1989 *Exxon Valdez* Oil Spill, and residents continue to be concerned over the long- term impacts on subsistence resources. In a survey conducted by the AFSC in 2011, community leaders expressed concern over the impacts commercial fishing has on local access to subsistence resources. Community leaders also reported that residents depend mostly on deer, salmon, crab, and shrimp for subsistence purposes. According to the ADF&G *Community Subsistence Information System*,¹⁰² species which residents of Chenega Bay harvest or use include chitons, butter clams, Dungeness crab, horse clams, king crab, limpets, octopus, littleneck clams, razor clams, shrimp, snails, Tanner crab, harbor seal, Steller sea lion, rockfish, Dolly Varden, eel, eulachon, grayling, herring, lake trout, lingcod, Pacific cod, tom cod, rainbow trout, sablefish, sea bass, skates, flounder, greenling, Irish lord, shark, whitefish, and walleye pollock.

Information on subsistence participation is limited; however, in a 2003 ADF&G household survey, 86% of households participated in subsistence salmon activities, 94%

¹⁰² Alaska Department of Fish and Game. 2011. Community Subsistence Information System (CSIS). ADF&G Division of Subsistence. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sb/CSIS/> (Accessed February 2011).

participated in subsistence halibut activities, 44% participated in subsistence marine mammal activities, 60% participated in subsistence marine invertebrate activities, and 39% participated in subsistence non-salmon fish activities; totaling approximately 406 lbs harvested per capita.

In 2008, ADF&G¹⁰³ reported 277 salmon harvested by residents, a significant decrease from 722 in 2004. Of the species documented, sockeye salmon was harvested most often, although the number of fish harvested dropped significantly between 2004 and 2008. In 2010, an estimated 3,440 lbs of halibut was harvested using 6 Subsistence Halibut Registration Certificates (SHARC), compared to an estimated 5,644 lbs harvested using 13 SHARC in 2003. Subsistence halibut harvests peaked in 2006 at an estimated 8,260 lbs harvested on 11 SHARC. Between 2000 and 2010, an estimated 23 sea otters were harvested. Sea otter harvests peaked in 2000 at an estimated 11 otters. Finally, an estimated 180 harbor seals and 4 Steller sea lions were harvested between 2000 and 2008. Estimated harbor seal harvests peaked in 2003 at 45 seals. Estimated Steller sea lion harvests peaked in 2007 at 3 sea lions. Information regarding subsistence trends can be found in Tables 12 through 15.

Cordova (*core-DOH-vuh*)

People and Place

*Location*¹⁰⁴

Cordova is located at the southeastern end of Prince William Sound (PWS) in the Gulf of Alaska. The community was built on Orca Inlet at the base of Eyak Mountain. It lies 52 mi southeast of Valdez and 150 mi southeast of Anchorage. The area encompasses 61.4 sq mi of land and 14.3 sq mi of water. Cordova is a Home Rule city and was first incorporated in 1909. It is located in the Valdez-Cordova Census Area and is not under the jurisdiction of a borough.

*Demographic Profile*¹⁰⁵

In 2010, there were 2,239 residents, ranking Cordova 42nd of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population increased by 6.1%. Between 2000 and 2009, the population fell by 13.4% with an average annual growth rate of -1.03%, which was less than the statewide average of 0.75% and indicative of a steady rate of decline in those years. In a survey conducted by the Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that 1,800 seasonal or transient workers lived in Cordova in 2010. On average, seasonal workers live in the city from April to September, and annual peaks in seasonal population is typically seen from May through August. Peaks in population are thought to be mostly driven by employment in fishing and construction sectors. Information regarding population trends can be found in Table 1.

Cordova is a racially diverse community. In 2010, 70.3% of residents identified themselves as White, 10.9% as Asian, 8.8% as American Indian or Alaska Native, 0.4% as Black or African American, and 0.5% as some other race. In addition, 9% identified themselves as two or more races. Residents identifying themselves as Hispanic or Latino made up 4.2% of the population that year. Between 2000 and 2010, there was very little change in the racial and ethnic composition of Cordova. The most significant change was in those identifying themselves as two or more races (2.3 percentage points). Information regarding trends in race and ethnicity can be found in Figure 1.

Figure 1. Racial and Ethnic Composition, Cordova: 2000-2010 (U.S. Census).

In 2010, the average household size was 2.41, compared to 2.6 in 1990 and 2.48 in 2000. In that year, there were a total of 1,100 housing units, compared to 883 in 1990 and 1,099 in 2000. Of the households surveyed in 2010, 52% were owner-occupied, compared to 52% in 2000; 32% were renter-occupied, compared to 35% in 2000; 10% were vacant, compared to 7% in 2000; and 7% were occupied seasonally, compared to 6% in 2000. There were a total of 18 residents living in group quarters in 2010, compared to 77 in 2000.

The gender distribution in 2010 was slightly skewed at 53.6% male and 46.4% female. This was similar to both the statewide distribution (52% male, 48% female) and 2000 distribution (54.4% male, 45.6% female). The median age that year was 42.2 years, which was somewhat older than both the statewide median of 33.8 years and 2000 median of 36.9 years.

Compared with 2000, the 2010 population structure showed age transitions consistent with a stable population, meaning that cohorts aged while still mostly retaining their structural character. In 2010, 26% of residents were under the age of 20, compared to 30.3% in 2000; 16% were over the age of 59, compared to 10.5% in 2000; 47.1% were between the ages of 30 and 59, compared to 50% in 2000; and 10.9% were between the ages of 20 and 29, compared to 9.1% in 2000. In 2010, the population aged 50 to 59 represented the largest (21.2%) proportion of the population; while those aged 30 to 39 represented the smallest proportion (10%).

Overall gender distribution by age cohort was similar in both 2000 and 2010. In 2010, the greatest absolute gender difference occurred within the 20 to 29 range (6.5% male, 4.4% female), followed by the 50 to 59 (11.6% male, 9.6% female) and 10 to 19 (8.0% male, 6.4% female) ranges. Of those three, the greatest relative gender difference occurred within the 20 to 29 range. Information regarding trends in Cordova’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Cordova Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census 2006-2010 American Community Survey (ACS)¹⁰⁶ estimated that 87.9% of residents aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 6.2% had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 5.9% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 33.7% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 8.8% held an Associate's degree, compared to an estimated 8% of Alaska residents overall; an estimated 16.4% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 7% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*¹⁰⁷

Historically, the area around Cordova was populated by Alutiiq and migrating Athabascan and Tlingit Natives who called themselves Eyaks. The most prominent Native group in the area was the Chugachigmuit, who occupied most of PWS to the west of Cordova. The Eyaks, while never numerous in recorded times, occupied the nearby village sites of Alakganik and Eyak, as well as a site on what is now Old Town in Cordova. Both Alakganik and the historic village of Eyak were abandoned by the end of the nineteenth century, and many moved to what would later become Cordova.

Kayak Island, southeast of the Copper River Delta, was the first point of Alaska sighted by Vitus Bering in 1741. Bering was followed in 1778 by Captain James Cook, who anchored in Snug Corner Cove northwest of Cordova. No major settlements were established by the Russians in the PWS area, although a fur gathering post was established west of Cordova, on Hinchinbrook Island in 1793. After the purchase of Alaska by the U.S. Government, oil was discovered in the Katalla area in 1902, which became Alaska's first producing well. By 1905, a port and facilities were needed to serve 5,000 oil workers, as well as developers of the nearby Bering River coal fields. An attempt to build a deep-water port at Katalla was unsuccessful, and the site of present day Cordova was chosen instead. At the same time, the Kennecott Copper Company was organized to develop new copper claims in the Chitina River valley. Before development could begin, a transportation link to the coast was needed and Cordova was selected as the coastal terminus of the Copper River and Northwestern railroads.

By 1908, the city of Cordova was incorporated and by the time of the 1910 Census, the city had a population of 1,152 people. At that time, Cordova was the fifth largest community in Alaska, exceeded in population only by Nome, Fairbanks, Juneau, and Ketchikan. In the years between 1910 and 1938, Cordova primarily served as a transportation and service center for the Kennecott copper mines. However, as the city grew, its economy diversified. Although there had been canneries in the PWS area since 1889, it was after its establishment as a company town that fishing and fish processing gained in economic importance in Cordova. The 1907 establishment

¹⁰⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁰⁷ City of Cordova. (1995). *Cordova Comprehensive Development Plan*. Retrieved February 23, 2012 from: <http://www.commerce.state.ak.us/dca/plans/Cordova-CP-1994.pdf>.

of the Chugach National Forest also encouraged a local timber industry. The local Kennecott mines, arguably the largest economic contributor of its time, had produced approximately \$175 million worth of copper by 1925. However, by 1927 production began to decline and by 1938 the mines closed. The Katalla oil fields also closed in the 1930s after their refinery burned in 1933. By 1940, Cordova's economy switched to fishing and fish processing to replace lost mining jobs. With the exception of a brief spike in construction during World War II, including the construction of the city's airport, fishing has remained a main economic driving force in Cordova to this day. The population of Cordova has steadily grown since 1940 as the commercial fishing industry has become more community-based. The Cordova post office and courthouse are listed on the National Register of Historic Places (NRHP) as significant properties.¹⁰⁸

Natural Resources and Environment

Cordova has a maritime climate which is characterized by cool summers and mild winters. Winter temperatures average from 17 to 28 °F (-8 to -2 °C). Summer temperatures average from 49 to 63 °F (9 to 17 °C). Average annual precipitation is 167 inches, and average annual snowfall is 80 inches.¹⁰⁹

Cordova is located in the Chugach National Forest and is backed by the Chugach Mountains, characterized by rugged peaks from 7,000 to 13,000 ft high and expansive icefields which feed valley and piedmont glaciers. Inundated glacial valleys create steep coastlines, and much of the level surfaces comprise of glacial outwash and alluvial plains. The 1964 "Good Friday" earthquake dramatically altered the physical landscape with tectonic uplifts ranging from 6.5 to 7.5 ft in areas around Cordova. Mudflats, beaches, and reefs that were formally only exposed during low tides became permanently exposed. Several canneries were forced to extend their docks and extensive dredging and harbor repairs were needed to make port facilities usable again. Essentially, Cordova lost its deep-water port capabilities following the earthquake.¹¹⁰

Vegetation surrounding Cordova is dominated by mixed Sitka spruce and western hemlock stands, with limited amounts of mountain hemlock, yellow cedar, and black cottonwood. Pure Sitka spruce stands occur along river banks and on glacier flats. The Copper River Delta flats consist of brackish marsh vegetation populated by a mix of grasses, willow, alder, and scattered Sitka spruce and cottonwood.¹¹¹

The 700,000 acre Copper River Delta Game Management Area serves as important habitat for a wide range of wildlife. Local large terrestrial animals include black and brown bear, mountain goat, deer, and moose. Furbearers present in the area include wolf, wolverine, lynx, beaver, mink, muskrat, marten, land otter, and coyote. The waters of PWS support all five species of Pacific salmon, Pacific halibut, rockfish, herring, lamprey, lingcod, Atka mackerel, walleye pollock, and sablefish.¹¹² Marine mammals present in the area include harbor seal, Steller sea lion, porpoise, and whales.¹¹³

¹¹² Alaska Department of Fish and Game. (n.d.). *Species: Animals*. Retrieved February 23, 2012 from: <http://www.adfg.alaska.gov/index.cfm?ADFG=animals.main>.

¹¹³ Ibid.

Economically important fish resources in the Cordova Coastal District include all five species of Pacific salmon, Dolly Varden char, rainbow trout, Pacific herring, halibut, Pacific cod, rockfish, sablefish, Tanner crab, Dungeness crab, king crab, shrimp, mussels, razor clams, and hardshell clams. While timber and mineral resources were of importance in Cordova's past, currently there are no large-scale developments for either. The Eyak Corporation holds timber interests in the area and may begin harvests once timber becomes profitable. In addition, Chugach Alaska Corporation and Eyak Corporation both hold mineral rights on lands they own in the area, and both have indicated an intention to continue exploration activities. Finally, coastal habitats provide a range of ecosystem services to Cordova and the region as a whole. Estuaries, barrier islands, wetlands, tidal flats, and coastlines throughout the Copper River Delta area provide important habitat for a wide range of aquatic and terrestrial wildlife. The Copper River is one of the most productive salmon habitats in Alaska, producing salmon which have become a globally recognized brand. Deeper offshore areas provide important halibut rearing habitat while coastal estuaries, wetlands, and sea cliffs are important to seabird nesting.¹¹⁴

According to the City of Cordova's Hazard Mitigation Plan¹¹⁵, potential natural hazards include severe weather, flooding, earthquake, tsunami, erosion, avalanches, and wildfires. Flood hazards can occur from storm surges, heavy rainfall, heavy snowmelt, and glacial outbursts. Flood events can in turn, contribute to local sediment deposition and erosion. Eyak Lake and River present the greatest flood risk to Cordova, as the River does not have the capacity to handle seasonal flows. In addition, outburst floods occasionally occur on the Scott Glacier, although these are not thought to contribute significantly to flooding. Major coastal flooding events in the Cordova Coastal District occur every 60 to 100 years. Severe weather comes in the form of heavy snowfall and high winds. Cordova gets an average of 80 inches of snow per year, and heavy and potentially damaging snowfall events are common. Cordova has a moderate probability of wildfire occurrence; however, the city is located in a critical protection area and wildfires can potentially threaten high-value properties, as well as natural and cultural resource sites. Cordova has a moderate vulnerability to tsunami damage, with the most serious threat coming from earthquakes occurring in the Gulf of Alaska. All coastal areas are less than 100 ft in elevation and should a tsunami occur, port and harbor facilities, public works facilities, transportation facilities, and public equipment would be affected. Finally, the area surrounding Cordova has a high probability of avalanche or landslide occurrence due to high relief topography, coupled with high levels of precipitation.

According to the Alaska Department of Environmental Conservation (DEC), there were no significant environmental remediation sites active in 2010.¹¹⁶

Current Economy¹¹⁷

In a survey conducted by the AFSC in 2011, community leaders reported that Cordova's economy is dependent on commercial and recreational fishing, eco-tourism, and mineral exploration. Since the decline of the oil and mineral industries in the mid-twentieth Century, Cordova has strived to develop a diverse economy, supporting year-round employment. This has centered on commercial fishing, recreational fishing, tourism, and entrepreneurship. While the *Exxon Valdez* oil spill in 1989 contributed to a decline in PWS commercial fisheries, the salmon drift and gill net fisheries recovered quite well, and Copper River salmon are now in high demand. Robust growth has led to strong construction, transportation, and materials service industries as well as growth in professional and retail services. Tourism has been growing at a heightened pace since focus was turned to developing tourism services and infrastructure in the late 1990s. These services included sportfishing charter operations, sightseeing businesses, visitor accommodations, and other visitor related industries. Finally, state and federal agencies are strong employers given Cordova's involvement in resource extraction, relatively high population size, and proximity to publically managed lands.¹¹⁸ Top employers in 2010 included:¹¹⁹ Trident Seafoods Corp., Cordova School District, City of Cordova, Native Village of Eyak, State of Alaska, Cordova Community Medical Center, AK Commercial Co., Reluctant Fisherman LLC., Ocean Beauty Seafoods LLC., and Cordova Electric Coop Inc.

In 2010,¹²⁰ the estimated per capita income was \$30,630 and the estimated median household income was \$72,125, compared to \$25,256 and \$50,114 in 2000, respectively. After accounting for inflation by converting 2000 values to 2010 dollars,¹²¹ the real per capita income (\$33,211) and real median income (\$65,899) indicate a slight decrease in individual earnings and moderate increase in household earnings. In 2010, Cordova ranked 58th of 305 communities from which per capita income was estimated, and 41st of 299 communities from which median household income was estimated.

Cordova's small population size may have prevented the ACS from accurately portraying economic conditions.¹²² Another way of understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$31.96 million in total wages in 2010.¹²³ When matched with the population in 2010, the per capita income equals \$14,275, which is

¹¹⁷ Unless otherwise noted, all monetary data are reported in nominal values.

¹²⁰ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

¹²¹ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

¹²² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹²³ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

significantly less than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Census figures.¹²⁴

According to the 2006-10 ACS estimates,¹²⁵ 67.9% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 9.9%, compared to 5.9% estimated statewide; and an estimated 1.8% of residents were living below the poverty line, compared to an estimated 9.5% of Alaska residents overall. Of those employed in 2010, an estimated 49.7% worked in the private sector, an estimated 35.6% worked in the public sector, an estimated 13.0% were self-employed, and an estimated 1.6% were unpaid family workers. If accurate, the high proportion of self-employed residents estimated by the 2010 ACS may have impacted the accuracy of ALARI estimates, which do not account for self-employed workers.

By industry, sector employment was relatively diverse in 2010. In that year, most (24.4%) employed residents were estimated to be working in education services, health care, and social assistance sectors; followed by agriculture, forestry, fishing, hunting, and mining sectors (14.2%); and arts, entertainment, recreation, accommodation, and food service sectors (10.8%). Compared with 2000, significant increases occurred in education services, health care, and social assistance sectors while significant decreases occurred in public administration and non-public administrative service sectors. By occupation type, most (29.7%) residents held management or professional positions in 2010; followed by natural resources, construction, or maintenance positions (25.5%); service positions (18.3%); sales or office positions (15.9%); and production, transportation, or material moving positions (10.7%). Compared with 2000, production, transportation, material moving, sales, and office positions declined, while all other occupation types increased in 2010. According to 2010 ALARI estimates, most (27.2%) employed residents worked in local government sectors; followed by trade, transportation, and utilities sectors (18.7%); and manufacturing sectors (15.1%).¹²⁶ Information regarding employment trends can be found in Figures 3 and 4.

Governance

Cordova is a Home Rule city with a mayoral form of government. The city has a seven-member city council, five-member school board, seven member planning and zoning commission, and six municipal employees. Cordova was not included in the Alaska Native Claims Settlement Act (ANCSA) and does not a U.S. Bureau of Indian Affairs recognized Tribal government. The Alaska Department of Fish and Game (ADF&G) has a field office located in Cordova. The closest National Marine Fisheries Service (NMFS) and U.S. Bureau of Citizenship and Immigration Services offices are located in Anchorage, 150 mi northwest.

In 2010, Cordova administered a 6% sales tax, 13.9 mills property tax, 6% accommodations tax, and 6% car rental tax. Total municipal revenues for 2010 were \$10.31 million, compared to \$5.75 million in 2000; a 38.7% increase after accounting for inflation.¹²⁷ Total sales tax revenue that year accounted for 27.9% of total municipal revenues; compared to 37.5% in 2000. State allocated Community Revenue Sharing accounted for 2.0% of total municipal revenues in 2010, compared to 2.2% in 2000 from State Revenue Sharing. Sales and use taxes accounted for most locally generated tax revenue, followed by property taxes and payments in lieu of taxes (federal). Outside revenues came primarily from forest service receipts and raw fish taxes. State and federal fisheries-related grants awarded to Cordova include \$1.2 million for a breakwater expansion project, \$9.75 million for harbor repair and renovation, \$16 million for improvements to the old Coast Guard dock, \$924,000 for a boat haulout facility, and \$1 million for marine pollution abatement for the haul-out facility. Information regarding municipal finances can be found in Table 2.

Table 2. Selected Municipal, State, and Federal Revenue Streams for the Community of Cordova from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$5,747,827	\$2,157,441	\$129,078	\$9,176,000
2001	\$5,683,228	\$2,348,268	\$109,686	\$9,176,000
2002	\$5,660,755	\$2,320,200	\$110,767	\$4,300,000
2003	\$5,035,346	\$2,124,800	\$106,714	\$4,335,000
2004	\$5,746,680	\$2,033,859	-	n/a
2005	\$6,437,229	\$2,325,235	-	n/a
2006	\$6,456,225	\$2,469,977	-	n/a
2007	\$6,666,635	\$2,605,167	-	n/a
2008	\$7,363,347	\$2,745,924	-	n/a
2009	\$9,508,883	\$2,669,455	\$206,242	\$1,889,000
2010	\$10,307,738	\$2,875,479	\$202,622	n/a

Infrastructure

*Connectivity and Transportation*¹²⁸

Cordova is accessible by plane and boat. It is linked directly to the North Pacific Ocean shipping lanes through the Gulf of Alaska. It receives year-round barge services and state ferry service. The Merle K. "Mudhole" Smith Airport is state-owned and -operated, with a 7,500-ft long by 150-ft wide asphalt runway and 1,899-ft long by 30-ft wide gravel crosswind runway. The state-owned and city-operated Cordova Municipal Airport has a 1,800 ft-long by 60-ft wide gravel runway. Daily scheduled jet flights and air taxis are available. Float planes land at the Lake Eyak seaplane base or the boat harbor. Harbor facilities include a breakwater, dock, small boat harbor with 850 berths, boat launch, boat haulout, ferry terminal, and marine repair services. A 48-mi gravel road provides access to the Copper River Delta to the east. The price of roundtrip airfare between Anchorage and Cordova in June 2012 was \$208.¹²⁹

Facilities

Cordova utilizes water from Murcheson Falls, Heney Creek Dam, Meals Reservoir, Orca Reservoir, and Eyak Lake. The water is treated, but only the Eyak Lake water is filtered. Water storage capacity is 2.1 million gal. The city operates a piped water and sewer system. Sewage is treated before discharge. Over 90% of homes are fully plumbed. Some homes use individual wells and septic systems. A class 2 landfill and sludge disposal is available. The community participates in recycling and a household hazardous waste program. Cordova Electric Cooperative operates the Humpback Creek Hydro Facility and two diesel-powered plants at Eyak and Orca.

Public safety is provided by the local police department, state troopers, and state fish and wildlife protection. Fire and rescue services are provided by the local volunteer fire department, Emergency Medical Services (EMS), and local search and rescue services. Broadband internet, cable, local television, and long distance telephone services are all available. Additional public infrastructure includes a youth center, local gym and pool, museum and cultural center, moose lodge, jail, several libraries, and numerous visitor accommodations and attractions.¹³⁰

Cordova's existing port facilities include three docks for large vessels, two boat ramps, a three-tier dock, a small boat harbor, and a few piers associated with local canneries. All three docks are city-owned, as are the small boat harbor facilities. The Municipal Dock (Ocean Dock) is Cordova's main commercial port facility. The outside face of the dock is 408 ft long and the inside face is 325 ft long. The dock is equipped with water, gasoline, and diesel services. The dock is primarily used for cargo, freight, and ferry passengers. Next to the Ocean Dock is a staging and container storage area, as well as a 150-ton haulout and maintenance facility. The City Dock is used for the transfer of fishing gear and light cargo. The outside face is 280 ft long and is equipped with electricity and water utilities. The North Containment Dock is used primarily for Coast Guard moorage. The outside face is 213 ft long. The Cordova Small Boat Harbor has 727

¹²⁹ Airfare was calculated using lowest fare available from www.travelocity.com. Retrieved November 22, 2011.

¹³⁰ See footnote 128.

slips available and covers approximately 30 acres. Electricity, telephone, and water are provided to all floats.¹³¹

In a survey conducted by the AFSC in 2011, community leaders reported that infrastructure projects completed or in progress as of 2010 included a fish cleaning station, new dock space, dock improvements, dockside electrical and water utilities, sewage and water treatment facilities, a new landfill, a new community center, school improvements, and telephone improvements. As of 2010 there were plans to construct additional dock space, expand dockside utilities, construct new pilings and a breakwater, build more dry dock space, expand haulout facilities, and improve police and fire services by 2020. According to community leaders, there is 900 ft of dock space available for transient vessel moorage, and vessels up to 90 ft long can use moorage in Cordova. Coast Guard regulated vessels which Cordova is capable of handling include rescue vessels, cruise ships, ferries, fuel barges, and hazardous materials (HAZMAT). Fisheries support businesses and services located in Cordova include fish processing plants, fishing gear sales, boat repair (electrical, welding, mechanical services, machine shop, hydraulics), small vessel haulout (<60 tn), large vessel haulout (>60 tn), tidal grid for small vessels (<60 tn), tidal grid for large vessels (>60 tn), commercial fishing vessel moorage, recreational fishing vessel moorage, tackle sales, bait sales, commercial cold storage facilities, dry dock storage, marine refrigeration, fish lodges, fishing business attorneys, fishing related bookkeeping, boat fuel sales, fishing gear repair, fishing gear storage, ice sales, water taxi, seaplane service, and air taxi. Public services available include medical services, food bank, publicly subsidized housing, public library, and mental health services.

Medical Services

Cordova Community Medical Center provides acute care, emergency care, laboratory and radiology services, physical therapy, mental health services, crisis support, long-term care, and a wide range of specialized services.¹³² Ilanka Community Health Center provides elder care, alcohol and substance abuse, youth, and wellness programs.¹³³

*Educational Opportunities*¹³⁴

Mount Eccles Elementary provides preschool through 6th grade instruction. As of 2011, there were 173 students enrolled and 13 teachers employed. Cordova Junior and Senior High School provides 7th through 12th grade instruction. As of 2011 there were 173 students enrolled and 15 teachers employed. An extension of PWS Community College is located in Cordova, offering opportunities for Associate's and Bachelor's degrees.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Commercial fishing started at the mouth of the Copper River in 1887 when the region's first cannery was built by the Pacific Packing Company near the village of Eyak. Early fishing at the mouth of the Copper River was done by essentially barricading the mouth, which although very efficient, did not allow enough salmon through to spawn. Soon after Alaska became a territory in 1912, measures were taken to regulate gear types in the Cooper River area due to a proliferation of many different catch methods, and subsequent concerns of local Native groups regarding decreased subsistence harvests. Between 1914 and 1923, 14 new canneries were established in the PWS area. In the 1930s, the Alaska Fish Cannery Workers Union was formed, representing cannery workers, clam diggers, and fishermen in Cordova. That organization eventually evolved into present day Cordova District Fishermen United. Herring, which had been fished in the PWS since 1914, peaked in 1936 at over 56,000 tn landed.

By the 1940s, over 40 fish traps were built in the PWS area which operated 6 days a week for 24 hours a day during seasons. Canneries processed not only salmon, but also crab, clams, and shrimp. Fish stocks began to crash in the late 1940s and early 1950s because of the overuse of fishtraps. Upon gaining statehood, Alaska was given the authority to manage its fisheries, including gear types used in prosecuting them, which lead to the abolishment of commercial traps in the Copper River Delta.

The 1964 “Good Friday” earthquake radically changed the landscape of Cordova, causing coastal uplift of 6.5 to 7.5 ft in some areas. This event, coupled with over-exploitation and an expanding sea otter population, essentially ended the commercial clamming industry in Cordova which had previously been renowned for its razor clams. The 1989 *Exxon Valdez* Spill had lasting impacts on PWS, particularly on the herring fishery. The perception of tainted fish by consumers along with a flood of cheap farm raised fish resulted in steep declines in local incomes, boat values, and permit values. Since then, salmon, halibut, and sablefish have lead in the recovery of the local commercial fishing economy.¹³⁵

In a survey conducted by the AFSC in 2011, community leaders reported that Cordova currently participates in the fisheries management process in Alaska through representatives that participate in North Pacific Fisheries Management Council (NPFMC) committees or advisory groups, ADF&G regional fisheries advisory groups or working groups, and Federal Subsistence Board or Federal Subsistence Regional Advisory Council processes. In addition, Cordova relies on regional organizations including the Cordova District Fishermen United and other industry related organizations. Current challenges for the portion of Cordova's economy based on fishing include current state management of fisheries, resource allocation, other user groups on the Copper River, fish farming, and international competition.

Cordova is located in Federal Reporting Area 649, International Pacific Halibut Commission (IPHC) Regulatory Area 3A, and the Central Gulf of Alaska (GOA) Sablefish Regulatory District.

¹³⁵ Cordova District Fishermen United. (n.d). *A Historical Narrative of Fishing in the PWS/Copper River Area*. Retrieved February 24, 2012 from: <http://www.cdfu.org>.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, a number of processing plants are operating in Cordova.

Copper River Seafoods was formed in 1996 by three Alaska fishermen with three formerly competing companies. Beginning in May, the facility in Cordova processes Copper River king and sockeye salmon. The plant shuts down for the year after the Copper River coho salmon season comes to an end in late September. Copper River Seafood has 10 year-round employees who work at their two offices in Cordova and Anchorage and the Cordova plant employs a maximum of 120 seasonal workers (including foreign students with J-1 visas) during the salmon season.¹³⁶ The plant relies on public docks, water services, power/electricity, and waste management services.¹³⁷

Ocean Beauty's Cordova production facility is located on the waterfront in Orca Inlet, and began operations in 1978. The plant operates from February to September and is one of the largest producers and shippers of Copper River king and sockeye salmon. In addition to Copper River king and sockeye salmon, the facility also processes pink, chum and coho salmon, as well as halibut, black cod, Pacific cod and herring. Ocean Beauty's Cordova facility provides free laundry machines and work-related clothing to its fish processing workers, as well as room and board at a nominal fee if workers fulfill their contractual obligations.¹³⁸

The Prime Select Seafoods facility in Cordova opened in 2011 and is a small family company that processes various fish species from the Copper River, PWS and the Gulf of Alaska. Beginning in early May, Prime Select Seafoods begins processing Copper River king salmon. Throughout the summer and into early fall the facility processes Copper River king, sockeye and coho as well as pink and chum salmon caught in PWS. During this time halibut is also processed at the facility. During the winter the plant receives deliveries of lingcod, rockfish, Pacific cod, and Pollock from boats fishing in PWS and the Gulf of Alaska.¹³⁹ The plant mostly smokes fish and purchases from fisherman that have IFQs. The plant relies on public docks, water services, power/electricity, and waste management services. There are between 3 and 15 employees each year.¹⁴⁰

Trident Seafoods Corporation has two processing facilities in Cordova. Trident was founded in 1973, and by the year 2000 was employing 4,000 people annually throughout Alaska and the Pacific Northwest. The Cordova plants combined employ a maximum of 560 workers during the summer months.¹⁴¹ According to its website, throughout Alaska Trident processes cod, pollock and crab in the winter and herring and salmon in the summer. Both Cordova facilities provides room and board at a nominal cost, as well as air transportation to Cordova from Seattle and back, to its seafood processors.¹⁴² Both plants also rely on public water

services, power/electricity, gas (only the Cordova North facility), and waste management services.¹⁴³

Wild by Nature is a seafood processing plant in Cordova which is owned and operated by two husband and wife teams. Between mid-May and October they catch and process fresh, frozen and smoked Copper River salmon (Chinook, sockeye and coho) that they sell on the Internet.¹⁴⁴

Fisheries-Related Revenue

Between 2000 and 2010, Cordova raised fisheries-related revenue through raw fish taxes, Shared Fisheries Business Taxes, Fisheries Resource Landing Taxes, harbor usage fees, and port/dock usage fees. In 2010, \$1.81 million was collected in fisheries-related revenue, compared to \$1.59 million in 2000, representing an approximate 12% decline in revenues after accounting for inflation.¹⁴⁵ Fisheries-related income peaked in 2009 at \$4.68 million. In a survey conducted by the AFSC in 2011, community leaders reported that there are not any fishing-related fee programs charged to the fishing industry that specifically support public services or infrastructure. Information regarding fisheries-related income trends can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that on average, Pacific cod season starts in February, salmon season runs from May through September, and halibut and sablefish seasons run from March through November. Gear types used by locals in Cordova include purse seines, pots, long lines, and gill nets.

In 2010, 392 residents, or 15.5% of the population, held 654 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC); which represented 3.1% of statewide CFEC permit holders and 3.7% of total CFEC permits issued that year. In 2000, 406 residents held 692 CFEC permits, which represented 3% of statewide CFEC permit holders and 3.3% of CFEC permits issued that year. Of the CFEC permits issued in 2010, 60% were for salmon, compared to 62% in 2000; 13% were for herring, compared to 18% in 2000; 9% were for “other” shellfish, compared to less than 1% in 2000; 8% were for halibut, compared to 9% in 2000; 4% were for groundfish, compared to 8% in 2000; 3% were for sablefish, compared to 2% in 2000; and 1% were for crab, compared to less than 1% in 2000. Also in 2010, 34 residents held 37 License Limitation Program (LLP) groundfish permits, of which 35% were actively fished; and 4 residents held 4 LLP crab permits, of which none were actively fished. In addition, 25 residents held 27 Federal Fisheries Permits (FFP), of which 70% were actively fished. In 2000, 34 residents held 35 LLP groundfish permits, of which 37% were actively fished; 6 residents held 6 LLP crab permits, of which 16% were actively fished; and 23 residents held 24 FFP, of which none were active. In 2010, 63 halibut quota share accounts held 7.88 million

¹⁴⁵ Inflation calculated using the 2010 Anchorage CPI from the Alaska Department of Labor: <http://labor.alaska.gov/research/cpi/cpi.htm>.

shares or 3.8% of total halibut quota statewide. Also in that year, 10 sablefish quota share accounts held 3.39 million shares or 2.6% of total sablefish quota statewide, and one crab quota share account held 382,422 shares or 1% of state crab quota statewide.

There were 320 residents who held commercial crew licenses in 2010, compared to 409 in 2000. In addition, residents held majority ownership of 448 vessels that year, compared to 520 in 2000. Of the CFEC permits issued in 2010, 72% were actively fished, compared to 67% in 2000. This varied by fishery ranging from 100% of sablefish permits to 3% of herring permits. Fisheries prosecuted by residents of Cordova in 2010 include Bristol Bay pot king crab, Bering Sea pot Tanner crab, Kodiak pot Tanner crab, statewide longline halibut, Kodiak purse seine herring roe, statewide longline ling cod, statewide and GOA longline miscellaneous finfish, GOA pot miscellaneous finfish, southeast Alaska dive geoduck, PWS pot shrimp, southeast Alaska dive sea cucumber, statewide longline sablefish, PWS fixed gear sablefish, statewide pot sablefish, southeast Alaska purse seine salmon, PWS purse seine salmon, Kodiak purse seine salmon, southeast Alaska drift gillnet salmon, Bristol Bay drift gillnet salmon, PWS set gillnet salmon, Cook Inlet set gillnet salmon, and Bristol Bay set gillnet salmon.¹⁴⁶

In 2010, a total of 162.1 million pounds of fish were landed in Cordova with an ex-vessel value of \$92 million, compared to 160.1 million pounds landed in 2000, which was valued at \$46.8 million ex-vessel. This represented a 43% increase in total ex-vessel revenues between 2000 and 2010, after accounting for inflation.¹⁴⁷ In that year, Cordova ranked 4th of 67 communities in terms of total pounds landed, and 3rd of 67 communities in terms of ex-vessel revenue derived from landings. By fishery, salmon was the most profitable species landed in Cordova in 2010, with 157.7 million pounds landed valued at \$82.8 million ex-vessel, compared to 151.3 million pounds valued at \$39.8 million in 2000. After accounting for inflation,¹⁴⁸ this represented an increase of approximately \$0.16 per overall pound landed.¹⁴⁹ Halibut landings in Cordova totaled slightly over 1.0 million pounds in 2010, and were valued at \$4.7 million, compared to 1.1 million pounds valued at \$2.8 million in 2000; which represented an approximate increase of \$1.01 per pound landed after accounting for inflation.¹⁵⁰ Sablefish landings totaled 862,622 lb valued at \$3.6 million ex-vessel, compared to 739,402 lb valued at \$2.8 million in 2000; representing a decrease of \$1.07 per pound landed after accounting for inflation.¹⁵¹ Finally, 1.9 million pounds of Pacific cod was landed in 2010, valued at \$684,639, compared to 640,455 lb valued at \$242,481 in 2000; which represented a decrease of \$0.17 per pound landed after accounting for inflation.¹⁵² Other groundfish landings in 2010 totaled 549,991 and were valued at \$211,545 total, compared to 71,547 lb valued at \$47,441 in 2000. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Although not connected to a highway system, Cordova’s developed tourism infrastructure and location make it very appealing to recreational fishermen. Recreational fishing based from Cordova fish by charter boats, private boats owned by local residents, private boats owned by non-residents, and by shore and dock. In 2010, there were a total of 3 active sportfishing businesses registered in Cordova, and 13 residents had sport fish guide licenses; a decrease from 9 and 32 in 2000, respectively. Also in that year, 2,966 sportfishing licenses were sold in the community, compared to 2,275 in 2000; and 1,010 sportfishing licenses were issued to residents, compared to 1,199 in 2000.

Cordova is located in North Gulf Coast/PWS Statewide Harvest Survey Area which includes all drainages from east of Cape Suckling, through PWS to Gore Point. In 2010, there were a total of 212,793 saltwater angler days fished in the region, compared to 122,459 in 2000, representing a 74% increase. Non-residents made up 30.4% of total saltwater angler days fished in 2010 in the region, compared to 32.3% in 2000. Regional saltwater angler days fished peaked at 300,205 in 2007. Total freshwater angler days fished was 22,979 in 2010, compared to 12,108 in 2000; an increase of 90%. Non-residents made up 57% of freshwater angler days fished in 2010 in the region, compared to 26% in 2000. Total freshwater angler days fished in the region peaked in 2010. Information regarding these sportfishing trends can be found in Table 11.

According to harvest survey data,¹⁵³ local private anglers target all five species of Pacific salmon, rainbow trout, Dolly Varden char, cutthroat trout, Pacific halibut, rockfish, lingcod, Pacific cod, shark, smelt, Dungeness crab, Tabber crab, razor clams, hardshell clams, and other finfish. According to 2010 harvest survey records, charter boats kept 3 king salmon, 66 coho salmon, 304 halibut, 47 lingcod, and 410 rockfish. In a survey conducted by the AFSC in 2011, community leaders reported that recreational fishermen based in Cordova target all five species of Pacific salmon, halibut, rockfish, shrimp, and clams.

Subsistence Fishing

Although Cordova’s economy and culture are not dependent on subsistence activities like many other rural communities, subsistence harvesting is still widely practiced by residents. In a survey conducted by the AFSC in 2011, community leaders reported that the three most important marine subsistence resources to residents in Cordova are sockeye, coho, and king salmon. In a 2003 survey by ADF&G measuring household subsistence participation, 74% of households surveyed were found to be harvesting salmon, 74% were harvesting halibut, 9% were harvesting marine mammals, 17% were harvesting marine invertebrates, and 17% were harvesting non-salmon fish. In that year, surveyed residents were harvesting 112.89 lbs of those resources per capita. Of the species listed by ADF&G, sockeye salmon was harvested the most often between 2000 and 2008, followed by king and coho salmon (Table 12). According to ADF&G’s *Community Subsistence Information System*,¹⁵⁴ species which Cordova residents harvest or use include: chitons, butter clams, Dungeness crab, limpets, octopus, littleneck clams,

¹⁵⁴ Alaska Department of Fish and Game. 2011. Community Subsistence Information System (CSIS). ADF&G Division of Subsistence. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sb/CSIS/> (Accessed February 2011).

pinkneck clams, razor clams, shrimp, cockles, king crab, mussels, Tanner crab, harbor seal, Steller sea lion, black rockfish, cutthroat trout, Dolly Varden, eulachon, grayling, herring, lake trout, lingcod, Pacific cod, Pacific tom cod, rainbow trout, red rockfish, sablefish, sea bass, skates, starry flounder, steelhead, greenling, Irish lord, smelt, sole, sturgeon, and wolf fish.

In 2003, residents reported that 35,047 lbs of non-salmon fish were harvested, which exceeded harvests for all salmon species combined between 2000 and 2008. However, information is only available for that year and it is unknown whether other years result in similar harvest sizes. In 2008, residents reported harvesting 3,799 salmon total, a significant increase from 94 in 2000. Reported salmon harvests peaked in 2007 at 5,959 fish. In 2010, 557 residents were issued Subsistence Halibut Registration Certificates (SHARC) by NMFS, compared to 358 residents in 2003. In that year, and estimated 28,339 lbs of halibut was harvested on 167 SHARC, compared to 15,498 lbs on 102 SHARC in 2003. Halibut subsistence harvests peaked in 2005 at 45,751 lbs harvested on 281 SHARC.

In 2010, 134 sea otters were reported harvested, compared to 213 in 2000. In that decade, an estimated total of 1,747 sea otters were harvested. Reported sea otter harvests peaked in 2004 at 298. Finally, an estimated 602 harbor seals and 15 Steller sea lions were harvested between 2000 and 2008. Estimated harbor seal harvests peaked in 2001 and 2002 at 103 seals each year. Estimated Steller sea lion harvests peaked in 2001 and 2002 at four sea lions each year (Table 15).

Gakona (guh-KOH-nuh)

People and Place

*Location*¹⁵⁵

Gakona is at the confluence of the Copper and Gakona Rivers, 15 miles northeast of Glennallen. It lies at mile 2 on the Tok cutoff to the Glenn Highway, just east of the Richardson Highway. Gakona is located in the Valdez-Cordova Census Area and the Chitina Recording District.

*Demographic Profile*¹⁵⁶

In 2010, there were 218 residents in Gakona, ranking it the 189th largest community in Alaska. Overall, between 1990 and 2010, the population has increased by 772%, yet since 2000 the population has changed very little (Table 1). The majority (79.4%) of Gakona residents identified themselves as White, compared to 74.3% in 2000. Also in that year, 0.9% identified themselves as Hispanic or Latino, compared to 1.4% in 2000. The biggest changes over this decade included an increase in the population of Native Alaskans and a decrease in the population with two or more races (Figure 1; 19.7% as American Indian or Alaskan Native, compared to 12.1% in 2000; and 0.9% identified themselves as two or more races, compared to 10.7% in 2000).

The overall population structure of Gakona in 2000 and 2010 is shown in Figure 2. In 2010, there was a relatively even spread of males and females across each age category, though the 70 to 79, 20 to 29, and 0 to 9 age groups show the greatest difference in the spread of males and females. For example, in 2010, the 70 to 79 age group was 5.1% males and 0.9% females, and the 20 to 29 age group was 4.6% males and 2.3% females. In 2000, there were relatively few residents in the 50 to 59 age range (13%), whereas in 2010, 22.9% of residents were in this age category. Further changes in population and in racial and ethnic composition from 2000 to 2010 can be found in Table 1 and Figures 1 and 2.

In 2010, the gender makeup was 52.2% male and 47.7% female, and somewhat similar to the gender makeup of the state as a whole (52% male, 48% female; see Figure 2). The median age was 40.7 years, which is slightly higher than the U.S. national average of 36.8 years and significantly higher than the median age for Alaska, 33.8 years.

Figure 1. Racial and Ethnic Composition, Gakona: 2000-2010 (U.S. Census).

In 2010, the average household size was 2.5, a significant decline from 3.5 in 1990 and about the same when compared to 2000 (2.6). There has been an increase in occupied households, from seven in 1990 to 84 in 2000 to 86 in 2010. Of those occupied households surveyed in 2010, 75.6% were owner-occupied and of the 86 housing units reported in Gakona, 52.3% were considered vacant, compared to 71.4% in 2000. Of those households surveyed in 2010, 24.4% were renter-occupied. There are no records of residents living in group quarters in 2000 and 2010.

Figure 2. Population Age Structure in Gakona Based on the 2000 and 2010 U.S. Decennial Census.

According to the 2006-2010 American Community Survey (ACS),¹⁵⁷ in terms of educational attainment, 92.1% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to 91% of Alaskan residents overall. Also in 2010, 3.9% of residents aged 25 and older were estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 3.9% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 13.8% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 1.3% were estimated to have an Associate’s degree, compared to 8% of Alaskan residents overall; 36.8% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaskan residents overall; and 20.4% were

¹⁵⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Ahtna Athabascans have lived in the Copper River basin for thousands of years. “Ahtna” is the Athabaskan name for the Copper River. Most settlements along the river were either fish camps, winter villages, or hunting and trapping camps. Gakona served as a wood and fish camp and later became a permanent village.¹⁵⁸ In 1904, Doyle’s Roadhouse was constructed at the junction of the Valdez-Eagle and Valdez-Fairbanks Trails and became an essential stopping point for travelers. There was also a post office, stagecoach station, and blacksmith shop here. Some buildings are still standing, like the Gakona Lodge which was built in 1929 and is on the National Register of Historical Places. The lodge contains many old relics of the gold rush era in the late 1890s.¹⁵⁹

Natural Resources and Environment

Gakona is located in the center of Copper Valley, surrounded by mountains and the famous Copper River. Gakona is located adjacent the Copper, Gakona and Gulkana Rivers allowing access to world class Chinook salmon, sockeye salmon and rainbow trout fishing. Gakona is located in the continental climate zone, with long, cold winters and relatively warm summers. Temperature extremes have been recorded from -62 to 91 °F. Annual snowfall averages 61 inches, with total precipitation of 13 inches.¹⁶⁰

Between 1910 and 1938, the Kennecott Copper Company operated in Gakona. The company also built the railroad between Cordova and Kennecott/McCarthy, and today the mine site is a National Historic Landmark managed by the National Park Service. During the gold rushes in 1898 and 1899, the Copper River Basin was a staging area for thousands of prospectors traveling to Alaska’s interior, including Gakona.¹⁶¹

The Copper River or Ahtna River is a 300 mile river in south-central Alaska. It drains a large region of the Wrangell Mountains and Chugach Mountains into the Gulf of Alaska. It is known for its extensive delta ecosystem, as well as for its prolific runs of wild salmon, which are among the most highly prized stocks in the world. It is the tenth largest river in the United States, as ranked by average discharge volume at its mouth. The Copper River Delta, which extends for roughly 700,000 acres is the considered the largest contiguous wetlands along the Pacific coast of North America. It is used annually by 16 million shorebirds, including the world's entire population of western sandpipers. It is also home to the world's largest population of nesting trumpeter swans and is the only known nesting site for the dusky Canada goose. Over 20,000

¹⁵⁸ Simeone, William E. and James Kari. (2002). *Traditional Knowledge and Fishing Practices of the Ahtna of the Copper River, Alaska*. Technical Paper No. 270. Alaska Department of Fish and Game. Division of Subsistence. Juneau, Alaska. July.

¹⁶⁰ See footnote 159.

¹⁶¹ Ibid.

years ago, the area now drained by the great Copper River was a massive lake, covering nearly 2,000 square miles.

The name of the river comes for the abundant copper deposits along the upper river that were used by Alaska Native population and then later by settlers from the Russian Empire and the United States. Extraction of the copper resources was rendered difficult by navigation difficulties at the river's mouth. Finalized in 1911, the construction of the Copper River and Northwestern Railway from Cordova through the upper river valley allowed widespread extraction of the mineral resources, in particular from the Kennecott Mine, as mentioned above, which was discovered in 1898. The mine was abandoned in 1938 and is now a ghost town tourist attraction. A road runs from Cordova to the lower Copper River near Child's Glacier, following the old railroad route and ending at the reconstructed "Million Dollar Bridge" across the river. The Tok Cut-Off follows the Copper River Valley on the north side of the Chugach Mountains. To the west of Gakona, is Lake Louise, where there are vast deposits of coal.¹⁶²

In August 2011, the Native Village of Gakona and the Mt. Sanford Tribal Consortium partnered to reduce solid waste in Gakona, removing 90 tons or about 180,000 pounds. This was achieved by the removal of about 110 abandoned cars and trucks from Native land in the Gakona area, many of which were removed from one large dumping ground in the community. The Native Village of Gakona began working with the Indian General Assistance Program with the Environmental Protection Agency in 2004 on a number of environmental projects.¹⁶³ However, according to the Alaska Department of Environmental Conservation (DEC), there were no notable environmental remediation sites active in 2010.¹⁶⁴

Current Economy¹⁶⁵

The 2006-2010 ACS estimated 107 residents as employed in that time period and 77.6% of residents aged 16 years and over were part of the civilian labor force in 2010. In that year, unemployment was estimated at 11.6%, almost twice the statewide rate of 5.9%. However, an estimated 5.7% of residents were living below the poverty line, compared to an estimated 9.5% of Alaskan residents overall. Of those employed in 2010, an estimated 28.8% worked in the private sector and an estimated 71.2% worked in the public sector.

In 2010,¹⁶⁶ the estimated per capita income was \$32,829 and the estimated median household income was \$104,375, compared to \$18,143 and \$33,750 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,¹⁶⁷ the real per capita income (\$23,858) and real median household income (\$44,381) indicate that both individual earnings and household earnings increased significantly during this time period. In 2010, Gakona ranked

¹⁶⁷ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

46th of 305 communities from which per capita income was estimated, and 7th of 299 communities for which median household income was estimated.

However, Gakona's small population size may have prevented the ACS from accurately portraying economic conditions.¹⁶⁸ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development.¹⁶⁹ According to the ALARI database, residents earned \$2,845,759 million in total wages in 2010.¹⁷⁰ When paired with the 2010 Decennial Census population, the per capita income is \$13,053, which was significantly less than the 2010 ACS estimate and suggests that caution should be used when using ACS data.

In 2010, the greatest number of workers was employed in the public sector (67.3%), while 16.8% were employed in the private sector, while no residents reported themselves as self-employed. As seen in Figure 3, by industry, slightly over half (52.3%) of the employed residents were estimated to work in education services, health care, and social assistance sectors; followed by public administration sectors (14.0%) and arts, entertainment, recreation, accommodation, and food service sectors (14.0%). Compared with 2000, significant proportional increases occurred in education services, health care, and social assistance sectors, as well as information and public administration sectors. However, there was a significant drop in the percentage of those estimated to be employed in retail trade sectors from 12.7% in 2000 to an estimated 8.4% in 2010. A significant drop was seen in the percentage of those estimated to be employed in scientific/professional/management sectors from 9.5% in 2000 to an estimated 2.8% in 2010.

By occupation type, most (69.2%) employed residents were estimated to hold management or professional positions in 2010; followed by service positions (16.8%); sales or office positions (11.2%); and natural resources, construction, or maintenance positions (2.8%). Compared to 2000, significant proportional decreases occurred in natural resources, construction, or maintenance positions sales and office occupations, and significant proportional increases occurred in service and management and professional occupations. As an additional source of occupational information, according to ALARI estimates, in 2010, accommodation and food service, and construction workers made up the majority of occupations.¹⁷¹ Further trends for employment by industry and occupation can be found in Figures 3 and 4.

¹⁶⁸ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

¹⁶⁹ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

Figure 4. Local Employment by Occupation in 2000-2010, Gakona (U.S. Census).

Governance

Gakona is an unincorporated city and is not located in an organized borough, so there are no city or borough officials in the community. Given this, there is no local authority to set a municipal budget or collect taxes or revenue (Table 2). However, the Native Village of Gakona is a U.S. Bureau of Indian Affairs (BIA) recognized tribe and serves as the governing body for the village.¹⁷²

The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Gakona is Ahtna, Incorporated, and the local ANCSA chartered non-profit is the Cooper River Native Association. The ANCSA chartered village corporation is Ahtna, Inc.

Gakona is home to the Mount Sanford Tribal Consortium (Kelt'aeni), a tribal consortium made up of two federally recognized Tribal Councils of Chistochina and Mentasta Lake.¹⁷³

The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish and Game (ADF&G), and Bureau of Citizenship and Immigration Services offices are all located in Cordova.

Infrastructure¹⁷⁴

Connectivity and Transportation

The Glenn/Tok cutoff and Richardson Highway provides road access to the Anchorage, Fairbanks, and the Lower 48. The Richardson Highway connects Valdez to Gakona. There is a 5,000' paved runway in nearby Gulkana. The nearest airport to Gakona is approximately 130 miles away in Valdez, where, as of June 2012, roundtrip airfare from Anchorage to Valdez costs \$314.¹⁷⁵

Facilities

Electricity in Gakona is provided by Copper Valley Electric Association, Inc and operated by REA Co-op. The local communication service infrastructure is provided by Copper Valley Telephone Cooperative, AT&T Alascom GCI, and local radio stations include KCAM-AM and KUAC-FM. All residences have individual wells and septic systems and complete plumbing. The school uses its own well-water system. Refuse collection services are available from Copper Basin Sanitation, which hauls waste to the Glennallen landfill.

Medical Services

The Gakona Clinic, which is a designated Community Health Aid Program site, is operated by the Mt. Sanford Tribal Consortium and owned by the Village Council. Emergency Services have highway and air access and are within 30 minutes of a higher-level satellite health care facility. Emergency service is provided by 911 Telephone Service and volunteers. The nearest hospital to Gakona is the Mat-Su Regional Medical Center in Palmer, Alaska, about 132 miles away.

Educational Opportunities

Gakona is located in the Copper River School District. In 2011, there was one school, the Gakona Elementary School, which had no students or teachers.¹⁷⁶

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The Copper River and Bering River districts are located on the Gulf of Alaska east of Prince William Sound. Covering over 1,100 square miles, the Copper River District is the largest district in Prince William Sound. By contrast, Bering River District is approximately one-sixth the size with an open area greater than 200 square miles. The Copper River drains over 27,000

square miles of interior Alaska while the Bering River has a drainage area of only a few hundred square miles. Together, these systems provide spawning and rearing habitat for all five species of Pacific salmon. Sockeye, coho and Chinook salmon runs are harvested by approximately 500 drift gillnet commercial permit holders and managed by the local Alaska Department of Fish and Game office in Cordova.

The sockeye and Chinook salmon runs that have been commercially fished since the late 1800s are among the earliest and most prized in the state.¹⁷⁷ Ahtna Athabascans have long fished along the Copper River¹⁷⁸ and Gakona itself continues to be a popular salmon and trout fishing destination. Early research on the Copper River salmon is related to the development of the commercial fishery at the mouth of the river. Between 1889 and 1905, a commercial fishery targeting Copper River stocks of salmon was developed on the Copper River delta. In 1915, the fishery expanded into the lower Copper River up to Baird Canyon and in 1924 Congress passed the White Act, which prohibits commercial fishing in the main stem of the Copper River. After the passage of the White Act, the federal government conducted periodic harvest surveys on the upper river and monitored escapement into the river. Following statehood in 1959, the State of Alaska took over management of the Copper River salmon fishery.¹⁷⁹

Ahtna oral tradition indicates that every 30 or 40 years the salmon runs on the Copper River failed¹⁸⁰ and there Ahtna stories of starvation and hard times when people had to rely upon resources other than salmon support this claim. Today, there are indications that certain wild stocks of sockeye and Chinook salmon may have declined from historical levels. The Ahtna have identified 14 different species of fish and 21 different salmon runs or stocks in the Copper River Basin, and sockeye salmon are the most culturally valued fish of the Ahtna.¹⁸¹ The cultural significance of sockeye salmon is shaped by the fact that this species of salmon has been critical to the Ahtna's economic and cultural survival for at least 1,000 years.¹⁸²

Given that Gakona is more than 50 miles from the coast, no federal fisheries regulatory areas are located within the immediate vicinity. Gakona is not eligible for the Community Quota Entity (CQE) program. The community is also not eligible to participate in the Community Development Quota (CDQ) program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Gakona does not have a registered shoreside processing plant. The nearest shoreside processing plant is located in Cordova.

Fisheries-Related Revenue

Given the lack of an incorporated governance structure, there was no reported fisheries-related municipal revenue for Gakona between 2000 and 2010.

Commercial Fishing

Commercial fishing plays a small role in the economy of Gakona. In 2010, five permits were held by four permit holders and of these, 100% were actively fished. Since 2000, when there were three permits issued and three permit holders, there has only been a slight increase in the number of permits issued. Between 2000 and 2010, residents held permits issued by the Commercial Fisheries Entry Commission (CFEC). In that time period, the number of salmon CFEC permit holders ranged from two to four, there was one herring CFEC permit holder between 2005 and 2007, and one halibut CFEC permit holder between 2000 and 2008. Residents holding CFEC permits participated in Bristol Bay salmon drift and set gillnet fisheries.

No residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits between 2000 and 2010. Finally, no residents participated in the sablefish or crab catch share programs between 2000 and 2010. In this same time period, limited participation was seen in the halibut catch share program where participation was non-existent until 2006 when 32,154 were held by one resident. In 2007, no halibut quota shares were held and then from 2008 to 2010 only 489 shares were held each year, again by one account holder (see Table 6).

Although no landings were made in Gakona, local residents did make commercial landings elsewhere. For example, ex-vessel revenue earned by Gakona residents landing catch outside of Gakona totaled \$721,322 in 2010, a significant increase compared to the \$497,668 earned from landings in 2009, and all of which was based on salmon landings. All data on ex-vessel revenue earned by Gakona residents between 2000 and 2008 is confidential, so reporting trends for this time period is not possible. Since 2004, there has been an 84.2% decrease (from 19 to 3) in the number of vessels homeported and a 66.7% decrease (from 15 to 5) in the number of vessels primarily owned by Gakona residents. Between 2000 and 2010 the number of crew license holders has ranged from one to three. As of 2010, there are no fish buyers or shoreside processors in Gakona. Further trends for commercial fishing in Gakona between 2000 and 2010 can be found in Tables 4 through 10.

Recreational Fishing

The Copper River is a major sportfishing destination in Alaska and many Gakona residents participate in recreational fishing. The Upper Copper/Upper Sustina Sport Fish Management Area (UCUSMA), offers a unique blend of freshwater fishing opportunities to sport anglers and subsistence participants. Three species of North Pacific salmon (Chinook, coho, and sockeye) are available to anglers fishing upper Copper River drainage waters. A resident-only, personal use dip net fishery and a subsistence fishery takes place in the mainstem Copper River. The upper Sustina River drainage has no anadromous salmon. A velocity barrier in Devil's Canyon prevents upstream migration in the Sustina River. Anglers can also target coho salmon stocked in several landlocked lakes of the region. Popular fisheries also occur on the area's resident stocks of Arctic grayling, Burbot, Dolly Varden, rainbow and steelhead trout, and lake trout. Smaller fisheries occur on the area's resident stocks of whitefish. Currently 29 lakes in the UCUSMA are stocked with Arctic grayling, rainbow trout, coho salmon and Arctic char. The

stocked fish are reared at state-owned hatcheries on Fort Richardson and Elmendorf Air Force Base in Anchorage.¹⁸³

In 2010, 324 sportfishing licenses were sold in the community, of which 190 were sold to Gakona residents, representing 87% of the population. Since 2000, the number of sport fish guide licenses has steadily declined, with 20 licenses issued in 2000 and 5 in 2010. Between 2004 and 2010, the number of sport fish guide licenses issued decline by 70.6%. The number of locally registered sport fish guide business averaged around seven between 2000 and 2005, while declining to an average of five between 2006 and 2010. However, only one locally registered sport fish guide business was in operation in any given year, and none operated between 2005 and 2007. The number sport fish guide licenses hit a 10-year high in 2000 at 21, and declined steadily in years following. In 2010, eight sport fish guide licenses were held in the community. According to the ADF&G harvest survey data, local charters are fishing in both freshwater and saltwater, and catch primarily coho, burbot, grayling, rockfish, Pacific cod, and razor clams.

Gakona is located within Alaska Sport Fishing Survey Area I – Upper Copper River Drainage. Information is available about freshwater sportfishing activity only at this regional scale. In general, freshwater fishing in the region surrounding Gakona was significant. Between 2000 and 2010, freshwater angler days fished varied considerably for both Alaska residents and non-Alaska residents. Alaska residents fished consistently more angler days in freshwater in this region between 2000 and 2010, averaging 31,555 angler days fished per year compared to an average of 14,109 angler days fished by non-Alaska residents. Further information about the sportfishing sector in and near Gakona is presented in Table 11.

Subsistence Fishing

Ahtna have historically engaged in subsistence fishing along the Copper River, with a particular focus on salmon.¹⁸⁴ Between 2000 and 2010, subsistence fishing by residents of Gakona targeted almost exclusively salmon (Table 13). Sockeye salmon made up the bulk of subsistence harvests between 2000 and 2008, followed by Chinook, coho, and chum. Salmon are harvested using either a dip net or a fish wheel, but only one type of gear can be used for each permit. Subsistence fishing opens in the Glennallen district of the Copper River opens June 1 and closes September 30. In 2008, the most recent year in which data are available, 33 subsistence salmon permits were issued, representing 15% of the population. In that same year, 2,300 sockeye salmon were reported as harvested, in addition to 153 Chinook salmon and 21 coho salmon. The largest harvest of Sockeye salmon occurred in 2001, when 7,188 were harvested, and the lowest harvest occurred in 2003, when 1,377 were harvested. Between 2000 and 2008, Chinook harvests were at their lowest in 2003, when 52 Chinook were harvested, and were at their highest in 2000, when 309 were harvested (Table 13).

¹⁸⁴ Simeone, William E. and James Kari (2002). *Traditional Knowledge and Fishing Practices of the Ahtna of the Copper River, Alaska*. Technical Paper No. 270. Alaska Department of Fish and Game. Division of Subsistence. Juneau, Alaska. July.

In 2010, one halibut Subsistence Halibut Registration Certificate (SHARC) was issued, but there was no reported harvest (Table 14). Based on household surveys conducted by ADF&G, there appears to be no reliance on marine mammals for subsistence by local residents (Table 15). While the ADF&G's Community Subsistence Information System (CSIS) reports no data on the percentage of households using subsistence resources in Gakona in particular, non-salmon fish species are harvested by subsistence users on the Copper River, including: rainbow and lake trout, burbot, grayling, whitefish, steelhead, and Dolly Varden.

Glennallen (gleh-NAL-len)

People and Place

*Location*¹⁸⁵

The community of Glennallen lies along the Glenn Highway at its junction with the Richardson Highway, 189 road miles east of Anchorage. Glennallen is located in the Valdez-Cordova Census Area and the Chitina Recording District. The community is located just west of Wrangell-St. Elias National Park.

*Demographic Profile*¹⁸⁶

In 2010, there were 483 residents in Glennallen, ranking it the 120th largest community in Alaska terms of population size. Overall, between 1990 and 2010, the population increased by 7.09%. Between 2000 and 2010, the population decreased by 12.8% and the average annual growth rate during that time was -2.3%, representing a greater decline than the statewide average of 0.75% (Table 1).

In 2010, the majority of Glennallen residents identified themselves as White (77.4%), compared to 85.2% in 2000. Additionally, 7.7% identified themselves as American Indian and Alaska Native in 2010, compared to 5.1% in 2000; 11.4% identified themselves as of two or more races in 2010, compared to 7.9% in 2000; 2.1% identified themselves as Native Hawaiian and Other Pacific Islander in 2010, compared to 1.4% in 2000; 1.4% identified themselves as Hispanic or Latino in 2010, compared to 0.5% in 2000; 0.4% identified themselves as Black or African American in 2010, compared to 0.2% in 2000; 0.6% identified themselves as Asian in 2010, compared to 0.2% in 2000; and 0.4% identified themselves as of some other race, compared to 0.0% in 2000. The largest changes were seen in the White population, which decreased over the time period, and the Alaska Native population, which increased a corresponding amount over the time period (Figure 1).

In 2010, the average household size in Glennallen was 2.29, compared to 3.31 in 2000 and 2.7 in 1990. Also in 2010, there were a total of 203 occupied housing units, compared to 204 in 2000. Of those households surveyed in 2010, 30.9% were owner-occupied and 29.5% were renter-occupied. In that same year, 39.6% were vacant, compared to 24.2% in 2000. There were 17 residents living in group quarters in 2000 and 18 in 2010.

Figure 1. Racial and Ethnic Composition, Glennallen: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Glennallen was 50.7% male and 49.3% female, very similar to the state as a whole (52% male, 48% female). The median age was estimated to be 35.8 years, lower than the U.S. national average of 36.8 years and higher than the median age for Alaska, 33.8 years. In 2010, females outnumbered males in most age groups but 60-69 years, 50-59 years, and 30-39 years. The age groups that experienced the greatest change between 2000 and 2010 were the 50-59 and 10-19 age groups, when in 2010 the male population increased by 2.9% and decreased by 3.5% when compared to 2000. In 2010, 13.1% of the Glennallen

population was age 60 or older, compared to 9.8% in 2000. The overall population structure of Glennallen in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)¹⁸⁷ an estimated 97% of Glennallen residents aged 25 and over held a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also in 2010, 0% of residents aged 25 and older were estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 3% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 30.6% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 11% were estimated to have an Associate's degree, compared to 8% of Alaskan residents overall; 11.3% were estimated to have a Bachelor's degree, compared to 17.4% of Alaskan residents overall; and 15.1% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.¹⁸⁸

Figure 2. Population Age Structure in Glennallen Based on the 2000 and 2010 U.S. Decennial Census.

¹⁸⁷ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

The area has historically been occupied by the Ahtna Athabaskan people, although Glennallen is currently predominantly a White community.¹⁸⁹ Most historical settlements along the Copper River were either fish camps, winter villages, or hunting and trapping camps in the uplands. The Native Alaskan residents were divided into clans and the various groups had their own hunting, fishing and berry picking areas.¹⁹⁰ While historical records show Russian contact in this area as early as the 18th century, it was not until the late 1800s that the Ahtna had their first true involvement with outside explorers. Several years after the U.S. purchase of Alaska from Russia in 1867, Lt. Henry Allen traveled the Copper River as far north as the Tanana River. With his exploration came the word of the large concentrations of copper found in this volcanic valley.¹⁹¹ The community received its modern name from Henry Allen and another early American explorer named Major Edwin Glenn.¹⁹² The settlement of Glennallen grew in the 1940s with the construction of the Glenn Highway.¹⁹³ It is one of the few communities in the Copper River region that was not built on the site of a Native village.¹⁹⁴

Natural Resources and Environment

Just outside the western boundary of Wrangell-St. Elias National Park, Glennallen is located in the continental climate zone, with long, cold winters, and relatively warm summers. The mean temperature in January is -10°F and 56°F in July. Temperature extremes can reach -50°F in winter and 80°F in summer. Snowfall averages 39 inches, with total precipitation of 9 inches per year.¹⁹⁵ The Copper River Valley is surrounded by the mountains of the Alaska Range and Talkeetna, Chugach, and Wrangell Mountains. The Denali Fault runs through the region, and more than 12 volcanoes are recognized in the Wrangell Mountains. Mt. Wrangell is considered to be an active volcano, with steam still venting from near its summit.¹⁹⁶

Forests of aspen, spruce, and balsam poplar cover much of the Valley. Permafrost is found throughout the Valley at varying depths. Common wildlife in the Valley includes moose, bison, Dall sheep, mountain goats, black bear, grizzly bear, porcupines, and many furbearers such as coyote, red fox, martin, mink, lynx, muskrat, and beaver. In addition, about 135 species of birds are present during summer months in interior Alaska, along with an approximately 3 dozen migratory species that pass through the area in spring and fall. Resident species include trumpeter swans, bald eagle, and spruce, sharptail, and ruffed grouse.¹⁹⁷

The Wrangell–St. Elias National Park and Preserve is a U.S. National Park and National Preserve jointly managed by the National Park Service in southeastern Alaska established in 1980 by the Alaska National Interest Lands Conservation Act. This protected area is included in an International Biosphere Reserve and is part of a UNESCO World Heritage Site. This Park and Preserve is the largest protected area managed by the National Park Service, with a total of 13,175,799 acres. Nearly 66% of the Park and Preserve is designated as wilderness, also ranking as the largest designated wilderness in the country.¹⁹⁸

As a community within the greater Copper River Basin, Glennallen has a rich natural resource harvesting history. In 1898, the U.S. Geological Survey published reports on the geology of the Copper River basin region, and several copper and gold deposits were found. For example, in 1900 the great copper deposit was staked on a ridge just north of what is now the community of McCarthy. The Kennecott Copper Company developed the mine and built the railroad between Cordova and Kennecott/McCarthy, which was active from 1910 until it shut down in 1938. Discovery of gold in 1898 and 1899 in the Klondike resulted in the creation of the Valdez-Eagle trail as an alternate route for gold miners. This resulted in Copper Basin becoming a major staging area for thousands of prospectors who were traveling to the interior regions of Alaska from the coast at Valdez. It later became an important stage coach and mail route for those people who, under the Homestead Act, had settled through the Copper Valley region.¹⁹⁹

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation sites active in Glennallen as of October 2012.²⁰⁰

Current Economy²⁰¹

Glennallen is a hub of the Copper River region, acting as a center of commerce, medical services, administration, and education and community services.²⁰² The economy of Glennallen and other communities along the Glenn Highway also depends on tourism, including visitation resulting from passing traffic.²⁰³ Various state, federal, and local government offices located in Glennallen provide additional employment opportunities, including an administrative office of the Alaska Department of Fish and Game (ADF&G), a U.S. Bureau of Land Management (BLM) field office, an Alaska Department of Labor and Workforce Development (DOLWD) job center, offices of the Copper River School District, and an Alaska State Troopers post.²⁰⁴ The offices of the Ahtna, Inc., the regional Native corporation for the Copper River region, is also headquartered in Glennallen.²⁰⁵ In addition, there are several small farms in the area that provide

employment, and a number of residents hold commercial fishing permits (see *Commercial Fishing* section).²⁰⁶

Based on household surveys conducted for the 2006-2010 ACS,²⁰⁷ in 2010, the per capita income in Glennallen was estimated to be \$26,858 and the median household income was estimated to be \$49,000. These numbers represent increases from the per capita reported in 2000 (\$17,084) and a slight increase from the median household income reported in 2000 (\$38,846). If inflation is taken into account by converting the 2000 values to 2010 dollars,²⁰⁸ per capita is shown to have increased slightly, from a real per capita income figure of \$22,465 in 2000, and median household incomes appear to have decreased slightly over the decade, from a real per capita income in 2000 of \$51,082. In 2010, Glennallen ranked 88th of 305 Alaskan communities with per capita income data, and 137th in median household income, out of 299 Alaskan communities with household income data that year.

However, Glennallen's small population size may have prevented the ACS from accurately portraying economic conditions.²⁰⁹ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the DOLWD. If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Glennallen in 2010 is \$13,199.^{210,211} This estimate is lower than per capita income reported in 2000, suggesting that caution is warranted when citing an increase in per capita income in Glennallen based on 2006-2010 ACS estimates. This lower ALARI income estimate is reflected in the fact that the community was recognized as "distressed" by the Denali Commission, indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.²¹² It is important to note that both ACS and DOLWD data are based on wage earnings, and do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a slightly higher percentage of Glennallen residents was estimated to be in the civilian labor force (71.6%) compared to the civilian labor force statewide (68.8%). In the same year, 0% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate was also estimated to be 0%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment, based on the ALARI database, indicates that the unemployment rate in Glennallen was much higher in 2010 (12.6%), slightly higher than the

Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²⁰⁸ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²⁰⁹ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

statewide unemployment rate estimate of 11.5%.²¹³ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Also based on the 2006-2010 ACS, a majority of the Glennallen workforce was estimated to be employed in the private sector (61.8%), along with 24.7% in the public sector, and 13.4% estimated to be self-employed. Of the 283 people aged 16 and over that were estimated to be employed in the civilian labor force, almost half were estimated to be working in retail trade (48.8%), while 12.7% were estimated to be working in public administration and 11.7% in educational services, health care and social assistance industries. Smaller numbers were estimated to be working in transportation, warehousing, and utilities (6.4%), information (5.3%), arts, entertainment, recreation, accommodation, and food services (5.3%), construction (4.9%), and finance, insurance, real estate, rental and leasing (4.9%) industries. Between 2000 and 2010, employment in retail trade appears to have increased by almost 5 times, while employment in education, health care, and social assistance industries declined by over 70% (Figure 3). These shifts in employment by industry are reflected in changes in employment by occupation. Compared to 2000, approximately 42% more of the workforce was employed in sales and office occupations in 2010, while 18.7% less of the workforce was employed in management and professional occupations (Figure 4). It is also important to note that no Glennallen residents were estimated to be employed in agriculture, forestry, fishing, hunting, and mining industries in 2010, compared to 2% of the civilian labor force in 2000 (Figure 3). The number of individuals employed in fishing industry is probably underestimated in census statistics; fishermen may hold another job and characterize their employment accordingly.

Data reported in the ALARI database conflicts somewhat with 2006-2010 ACS employment estimates, with the highest percentage of workers estimated to be employed in trade, transportation, and utilities industries (25.5%), and a higher percentage estimated to be employed in public administration (16.8% in local government and 10.9% in state government). In addition, the ALARI database suggests that 15% were employed in education and health services, 10.5% in leisure and hospitality, 5% in construction, 2.7% in natural resources and mining, 2.7% in financial activities, 2.7% in professional and business services, and 7.3% in other industries.²¹⁴

Governance

Glennallen is an unincorporated city located in an unorganized borough. Therefore, no information about municipal, state, or federal revenue is reported for this community (Table 2). Glennallen was not included under the Alaska Native Claims Settlement Act (ANCSA), and is not federally recognized as a Native village.²¹⁵

²¹⁵ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved August 4, 2012 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

Although there is no Tribal Council or Native village corporation in Glennallen, many Natives living in the area are shareholders in Ahtna, Incorporated, the regional Native corporation for the Copper River region. Ahtna, Inc. is headquartered in Glennallen.²¹⁶ In addition, the Copper River Native Association (CRNA), with offices 16 miles south in Copper Center, provides health and tribal community services in the region.²¹⁷ The CRNA is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.²¹⁸

An office of the ADF&G is located in Glennallen. The closest office of the Alaska Department of Natural Resources is located in Palmer, and the nearest offices of the National Marine Fisheries Service (NMFS), Alaska Department of Commerce, Community, and Economic Development, and the U.S. Bureau of Citizenship and Immigration Services are located in Anchorage.

Infrastructure

Connectivity and Transportation

Glennallen is accessible by highway year-round. The Glen/Tok cutoff connects Glennallen to Palmer and Anchorage to the west and to Tok to the east. The Richardson Highway provides access south to Valdez and north to Delta Junction and further to Fairbanks.²¹⁹ Glennallen is also accessible via air. Brenwick's Airport provides public air access, and scheduled services are available. The 2,070 foot turf airstrip is owned and operated by Copper Basin District, Inc.²²⁰ The nearest commercial airport is the Gulkana airport, located approximately 6 miles northeast of Glennallen. As of 2012, roundtrip airfare from Anchorage to the Gulkana airport was \$390.²²¹

Facilities

A majority of homes in Glennallen source water from private wells, and several community wells are also available. Well water is not treated.²²² Water in the area is highly mineralized and sometimes iron-rich, and wells drilled in the Glennallen area sometimes produce somewhat saline water.²²³ All year-round homes are fully plumbed. For those homes not connected to the piped water system or a well, a local business offers water-delivery to fill home water tanks. Many homes also use private septic tanks, and a community septic tank and sewage lagoon are also in use. A non-profit organization called the Glennallen Improvement Corporation operates the local sewer system, which serves 52 homes and businesses. A majority of the downtown area is connected to a piped sewage system, while other homes use private septic tanks. Copper Basin Sanitation operates a landfill, and also provides refuse collection services. Electricity in Glennallen is provided by the Copper Valley Electric Association, Inc., which purchases power from the state-owned Solomon Gulch Hydro Facility. The utility company also owns diesel plants in Glennallen and Valdez.²²⁴

Glennallen is an administration hub for the Copper River region, and a number of state, federal, local, and tribal offices are present in the community. These include a local state trooper post, state highway maintenance, Copper River School District administrative offices, an office of the ADF&G, a BLM field office,²²⁵ and the headquarters of Ahtna, Incorporated.²²⁶

Additional facilities are located in nearby Copper Center, 16 miles to the south, such as the National Park Service’s Wrangell-St. Elias Visitor Center²²⁷ and officers of the CRNA.²²⁸

Police services are provided by the state trooper post, as well as a Village Public Safety Officer stationed in Glennallen. Fire and rescue services are provided by Copper River Emergency Medical Services and GlennRich Fire/Rescue. Additional community facilities in Glennallen include several public libraries (one public, three at schools, and one special library), the Greater Copper River Valley Visitor Information Center, the Frontier Museum, Wrangell-St. Elias National Park Repertory Theater, and a number of hotels, bed and breakfasts, lodges, and campgrounds. Telephone and internet service is available in Glennallen, but no cable provider offers local service.²²⁹

Medical Services

Medical services are available in Glennallen at the Cross Road Medical Center, which is a qualified Emergency Care Center. The facility provides Critical Care Air Ambulance Services. Emergency Services have highway and helicopter access. Emergency service is provided by 911 Telephone Service and volunteers.²³⁰ In addition, the Glennallen Health Center is operated by the Alaska Department of Public Health. The Center offers preventative health services, family planning, well-child screening, immunizations and TB tests, STD and HIV screenings and counseling, and offers some educational programs related to health and parenting.²³¹ The nearest hospitals are located in Valdez (120 road miles away) and Palmer (140 road miles away).

Educational Opportunities

There are three schools in Glennallen. Glennallen Elementary offers preschool through 6th grade), Glennallen Jr./Sr. High School instructs 7th through 12th grade, and the Upstream Learning correspondence program offers Kindergarten through 12th grade via a correspondence program. As of 2011, the elementary school had 118 students and 9 teachers, and the high school had 135 students and 11 teachers. Also that year, the Upstream Learning program (formerly known as Copper River Correspondence Studies) had 54 students and 1 teacher.²³² The Upstream Learning program serves home-educated students. In its early years the service was offered to residents of the Copper River Valley only, but in the 1990s services were expanded to enroll correspondence students throughout Alaska. Program officers are located in Glennallen.²³³

It is important to note that the main office of the Copper River School District is located in Glennallen. In addition to K-12 education, campuses of the Alaska Bible College and Prince William Sound Community College are both located in Glennallen.²³⁴

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The Ahtna Athabascan people have engaged in subsistence fishing in the Copper Valley Basin for at least the past 1,000 years. Salmon have long been one of the species critical to survival of indigenous peoples of the region, and major settlements have long been located along the Copper River in order to make use of this resource. Sockeye salmon were particularly important in the area, and Chinook and coho salmon also spawn and rear in the Copper River. Historically, dip nets were the most common salmon harvest method used by the Athna, along with additional harvest methods including use of weirs, basket traps, gaffs, spears, and snares. Whitefish and Arctic grayling were also important subsistence species.²³⁵ Ahtna oral tradition indicates that every 30 or 40 years the salmon runs on the Copper River have failed²³⁶ and other stories of starvation and hard times when people had to rely upon resources other than salmon support this claim.²³⁷ Subsistence fishing remains important along the Copper River today. Copper River subsistence and personal use fisheries are managed by the ADF&G. The River is divided into two management subdistricts. The Glennallen subdistrict is classified as a subsistence fishery, in which both fishwheels and dipnets can be used for harvest. Further downriver, the Chitina subdistrict is managed as a personal use fishery, and only dipnets are allowed.²³⁸ The Copper River and its tributaries also attract a large number of sport fishers each year.²³⁹

Commercial fishing for salmon takes place in marine waters near the mouth of the Copper River. The Copper River commercial salmon fishery began in 1887 when Prince Williams Sound's (PWS) first cannery was built by the Pacific Packing Company near the village of Eyak. Early fishing at the mouth of the Copper River was done by essentially barricading the mouth, which although very efficient, did not allow enough salmon through to spawn. Soon after Alaska became a territory in 1912, measures were taken to regulate gear types in the Copper River area due to a proliferation of many different catch methods, and subsequent concerns of local Native groups regarding decreased subsistence harvests. Between 1914 and 1923, 14 new canneries were established in the PWS area. By the 1940s, over 40 fish traps were built in the PWS area which operated six days a week for 24 hours a day during seasons. Canneries processed not only salmon, but also crab, clams, and shrimp. Fish stocks began to crash in the late 1940s and early 1950s because of the overuse of fish traps. Upon gaining statehood, Alaska was given the authority to manage its fisheries, including gear types used in

²³⁵ Simeone, William E. and Kari, James. 2002. *Traditional Knowledge and Fishing Practices of the Ahtna of the Copper River, Alaska*. U.S. Fish and Wildlife Service, Technical Paper No. 270. ²³⁹ Copper River Chamber of Commerce. 2011. *Welcome to the Greater Copper Valley*. Retrieved October 23, 2012 from <http://www.coppervalleychamber.com/>.

prosecuting them, which lead to the abolishment of commercial traps in the Copper River Delta.²⁴⁰

Today, the Copper River salmon fishery is managed by the ADF&G. The PWS salmon management area is divided into 11 commercial fishing districts, covering the coastal area from Cape Suckling (northwest of Yakutat) to Cape Fairfield (east of Seward), and the inland waters of PWS. The Copper River empties into marine waters just east of the entrance to PWS. Drift gillnet is the only fishing gear utilized in this salmon district, as well as the adjacent Bering River district east of the Copper River. It is important to note that a sockeye hatchery program augments Copper River returns.²⁴¹

Along with salmon, herring harvest developed into one of the earliest commercial fisheries in Alaska, during the period when the product was salted for storing and shipment. PWS historically had a productive herring fishery. However, in 1993, four years after the Exxon Valdez oil spill, the stock collapsed in conjunction with an outbreak of hemorrhagic septicemia virus. Since 1998, the PWS herring fishery has been closed. The relationships between the oil spill, the virus, and the stock collapse remain unclear, and the population has shown little sign of recovery.^{242,243}

The commercial fishery for Pacific halibut expanded north to the Gulf of Alaska (GOA) by the 1920s, after diesel engines expanded the range of fishing trips.²⁴⁴ Today, Pacific halibut fisheries are managed under the International Pacific Halibut Commission (IPHC). In 1995, management of the Pacific halibut fishery shifted from limited entry to a catch share program.²⁴⁵

In addition to salmon, herring, and halibut, one Glennallen resident was involved in a fishery for ‘freshwater fish’ during the 2000-2010 period (see the *Commercial Fishing* section below). Commercial freshwater fish fisheries may target species such as Arctic char, northern pike, rainbow trout, Dolly Varden char, and sheefish.²⁴⁶

Given that Glennallen is more than 50 miles from the coast, no federal fisheries regulatory areas are located within the immediate vicinity. Glennallen is not eligible for the Community Quota Entity program or to participate in the Community Development Quota program. The Copper River empties into marine waters encompassed by Federal Reporting Area 649, IPHC Regulatory Area 3A, and the Central GOA Sablefish Regulatory District.

Processing Plants

According to the ADF&G's 2010 Intent to Operate list, Glennallen does not have a registered processing plant. The closest processing facilities are located in Anchorage.

Fisheries-Related Revenue

Between 2000 and 2010, no known fisheries-related revenue was recorded in Glennallen (Table 3).

Commercial Fishing

Between 2000 and 2010, Glennallen residents participated in commercial fisheries as state permit holders, crew license holders, and vessel owners. The number of state-issued Commercial Fisheries Entry Commission (CFEC) permits held by residents varied between four and nine per year over the period (Table 4), while the number of crew licenses holders varied between three and six. The number of Glennallen residents who were the primary owners of a fishing vessel showed a declining trend over the period, from 14 in 2001 and 2002 to 0 by 2010, and the number of vessels homeported in the community declined from 10 to 0. No fish buyers or shore-side processors were present in Glennallen during the 2000-2010 period, and no landings or ex-vessel revenue were generated locally (Table 5).

Glennallen residents held CFEC permits in fisheries for salmon, herring, halibut, and freshwater fish between 2000 and 2010. Several salmon and herring permits were held in all years during the period, while an 'other finfish' permit was held from 2000 to 2006, and one halibut permit was held in 2002 only. In 2010, salmon permits were held in the Bristol Bay drift gillnet fishery (1 permit held, 1 actively fished), the Lower Yukon gillnet fishery (1 permit held, 0 actively fished), and the statewide hand troll fishery (1 permit held, 0 actively fished). Earlier in the decade, a small number of salmon permits were also held by Glennallen residents in the Prince William Sound, Bristol Bay, and Cook Inlet set gillnet fisheries, and in the Prince William Sound purse seine fishery. The 'other finfish' permit was held in the statewide freshwater fish permit, and was not actively fished in any year during the period. One herring permit was held each year in the Prince William Sound spawn on kelp fishery, and was not actively fished in any year between 2000 and 2010. Two additional herring permits were held in 2005 in the Security Cove and Bristol Bay roe herring gillnet fisheries, and both of these permits were actively fished that year. Finally, the halibut permit held in 2002 was held in the statewide longline fishery, and was actively fished that year. Information about CFEC permits is presented in Table 4.

Additionally, no residents held federal fishery permits (Table 4) or participated in federal catch share programs for halibut, sablefish, or crab between 2000 and 2010 (Tables 6-8). Given the lack of fish buyers and shore-side processors in Glennallen (Table 5), no landings were reported in the community during this time period (Table 9). In addition, information about landings and ex-vessel revenue generated by Glennallen vessel owners, including all delivery locations, is considered confidential due to the small number of participants engaged in commercial fishing between 2000 and 2008 (Table 10).

Recreational Fishing

The Copper River is a major sportfishing destination in Alaska and many Glennallen residents participate in recreational fishing. Two tributaries of the Copper River – the Gulkana and Klutina Rivers – are particularly well known for their Chinook and sockeye sport fisheries.²⁴⁷ Excellent sportfishing opportunities are also available in the main stem of the Copper River. Three species of salmon (Chinook, coho, and sockeye) are present in the Upper Copper/Upper Susitna Sport Fish Management Area. Anglers can also target coho salmon stocked in several landlocked lakes of the region. Twenty-nine lakes in the area are also stocked with Arctic grayling, rainbow trout, and Arctic char, providing for popular sport fisheries for these species. Other freshwater sport fish species in the local Sport Fish Management Area include burbot, Dolly Varden, steelhead, lake trout, and whitefish.²⁴⁸

Although there was an active sport fish guide business in one year of the 2000-2010 period only, the number of licensed sport fish guides present in Glennallen was more significant. The number of licensed sport fish guides declined over the period, from a high of 31 guides in 2003 to a low of 3 guides in 2009. Over the same period, the number of sportfishing licenses sold locally in Glennallen increased substantially over the decade, from 0 in 2000 to 1,113 sold in 2010. However, the number of licenses sold to Glennallen residents remained relatively stable over the period (averaging 570 per year), suggesting that Glennallen residents have access to additional license sale locations.

Glennallen is located within Alaska Sport Fishing Survey Area I – Upper Copper River Drainage. Information is available about freshwater sportfishing activity only at this regional scale. Between 2000 and 2010, Alaska residents fished consistently more angler days in freshwater than non-Alaska residents, averaging 31,555 angler days fished per year compared to an average of 14,109 angler days fished by non-Alaska residents. No saltwater fishing was recorded in this region given its inland location. Further information about the sportfishing sector in and near Glennallen is presented in Table 11.

Subsistence Fishing

The Ahtna people have historically engaged in subsistence fishing along the Copper River, with a particular focus on salmon.²⁴⁹ Today, salmon harvests continue to be a primary subsistence resource in the Glennallen area. The Copper River is divided into two management subdistricts. The Glennallen subdistrict is classified as a subsistence fishery, in which both fishwheels and dipnets can be used for harvest. Further downriver, the Chitina subdistrict is managed as a personal use fishery, and only dipnets are allowed.²⁵⁰ Between 2000 and 2010, the number of Glennallen households that were issued subsistence salmon permits varied between 116 and 239 per year. Sockeye salmon were by far the most heavily harvested salmon species, with an average of 6,908 sockeye harvested per year. Several hundred Chinook and coho salmon were also reported as harvested using subsistence salmon permits between 2000 and 2010 (Table 13).

During this period, no data were reported by ADF&G regarding harvest of marine invertebrates or non-salmon fish (not including halibut) (Table 13). However, an earlier subsistence harvest survey by ADF&G provides some information about harvest of marine invertebrates and non-salmon fish by Glennallen households in 1987. That year, the species of non-salmon fish harvested by the greatest number of Glennallen households were Arctic grayling (27% of households reported participation in harvest activity), rainbow trout (16% of households), Dolly Varden (14%), whitefish (6%), lake trout (5%), pike (2%), steelhead (2%), and red rockfish (2%). In addition, 1% of Glennallen households were estimated to harvest clams in 1987.²⁵¹

According to data reported by ADF&G, four Subsistence Halibut Registration Certificates (SHARC) were issued to Glennallen residents in 2004 and again in 2005, while one was issued in 2010. No data were reported regarding the number of SHARC cards returned or pounds of halibut harvested between 2003 and 2010 (Table 14). In addition, no data were reported by management agencies regarding harvest of marine mammals by Glennallen residents between 2000 and 2010 (Table 15).

Tatitlek (*tuh-TIT-leck*)

People and Place

*Location*²⁵²

Tatitlek is located on the northeast shore of Tatitlek Narrows, on the Alaska Mainland in Prince William Sound (PWS). It lies near Bligh Island, southwest of Valdez by sea and 30 air miles northwest of Cordova. Tatitlek is located in the Valdez Recording District and the Valdez-Cordova Census Area and is not located within an organized Borough.

*Demographic Profile*²⁵³

In 2010, there were 88 inhabitants in Tatitlek, making it the 257th largest of 352 total Alaskan communities with recorded populations that year. Between 2000 and 2009, the population of Tatitlek decreased by 22.43%, with an average annual growth rate of -3.01%. The change in population from 1990 to 2010 is provided in Table 1.

In 2010, a majority of Tatitlek residents identified themselves as American Indian and Alaska Native (60.2%). Other ethnic groups present in Tatitlek that year included White (30.7%), two or more races (5.7%), Hispanic or Latino (3.4%), some other race (1.1%), Native Hawaiian or Other Pacific Islander (1.1%), and Asian (1.1%). Between 2000 and 2010, the percentage of the population identifying themselves as American Indian and Alaska Native decreased by 23.9%, with corresponding increases in the percentage of the population identifying themselves as White, two or more races, some other race, Native Hawaiian and Other Pacific Islander, and Hispanic or Latino. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Tatitlek was 2.44, a decrease from 3.6 persons per household in 1990 and 2.82 in 2000. The total number of households increased from 33 in 1990 to 38 in 2000, then decreased slightly to 36 occupied housing units in 2010. Of the 75 total housing units surveyed for the 2010 Decennial Census, 22 were owner-occupied, 14 were renter occupied, and 39 were vacant or used only seasonally. Throughout this period no residents of Tatitlek were reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Tatitlek: 2000-2010 (U.S. Census).

The gender makeup in Tatitlek in 2010 was 45.5% male and 54.5% female, more heavily skewed towards females than the state as a whole (52% male, 48% female). The median age was estimated to be 29.5 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the largest percentage of the population fell within the age group zero to 9 years old, with the next largest percentage falling within the age group 10 to 19 years old. There were no residents of Tatitlek that were age 70 or over in 2010. The overall population structure of Tatitlek in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Tatitlek Based on the 2000 and 2010 U.S. Decennial Census.

According to the 2006-10 American Community Survey (ACS),²⁵⁴ in terms of educational attainment, 87.8% of Tatitlek residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also in 2010, 4.1% of residents aged 25 and older were estimated to have less than a ninth grade education, compared to 3.5% of Alaskan residents overall; 8.2% were estimated to have a ninth to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 42.9% were estimated to have a high school diploma or equivalent, compared to 27.4% of Alaskan residents overall; 26.5% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; and 18.4% were estimated to have a Bachelor’s degree, compared

²⁵⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

to 17.4% of Alaskan residents overall. In 2010, there were no residents of Tatitlek that were estimated to have an Associate’s degree or a graduate or professional degree.

*History, Traditional Knowledge, and Culture*²⁵⁵

Tatitlek is an Alutiiq village first reported in the 1880 U.S. Census as “Tatikhlek,” with a population of 73. The present spelling was published in 1910 by the U.S. Geological Survey, which wrote that the village originally stood at the head of Gladhaugh Bay but was moved to its present site in the shadow of Copper Mountain around 1900. A post office was established in 1946. Many residents of Chenega moved to Tatitlek following its destruction by tsunami after the 1964 Good Friday Earthquake. The dominant feature in the village is the blue-domed Russian Orthodox church.

Today, Tatitlek is a coastal Alutiiq village with a fishing- and subsistence-based culture. The sale and importation of alcohol is banned in the village.

Natural Resources and Environment

Winter temperatures range from 17 to 28 °F (-8.3 to -2.2 °C); summers average 49 to 63 °F (9.4 to 17.2 °C). Annual precipitation averages 28 inches of rain and 150 inches of snowfall.²⁵⁶

Tatitlek is located within the Chugach National Forest, an area that is administered by the U.S. Department of Agriculture (USDA) Forest Service.²⁵⁷ The Chugach National Forest is America’s most northerly National Forest. This stunning landscape stretches across south-central Alaska, from the salty waters and snowy peaks of PWS to the fabulous salmon and trout streams of the Kenai Peninsula, covering an area the size of New Hampshire. It is one of the few places left in the world where glaciers still grind valleys into the hard rock of the earth. Its geographic diversity is unique among national forests. The three distinct landscapes of the Copper River Delta, the Eastern Kenai Peninsula, and PWS are destinations for adventurers and nature enthusiasts the world over. The forest is home to wild lands, wildlife, wild fish, and wild ice. Visitors in kayaks, cruise ships, small boats, ferries, and float planes explore the Sound’s 3,500 miles of coastline and 3 million acres of ocean and land.

Historically, the Chugach region was one of the foremost mining regions in Alaska. The Beatson mine on Latouche Island and the Ellamar mine near Tatitlek yielded over 200 million pounds of copper, 52,000 ounces of gold and 1.7 million ounces of silver before closing down in the 1930’s.²⁵⁸

²⁵⁵ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

Current Economy²⁵⁹

Fish processing and oyster farming provide some employment in Tatitlek. In 2010, one resident held a commercial fishing permits. Subsistence activities provide the majority of food items. A coho salmon hatchery, supporting subsistence activities, is located at Boulder Bay. The community has a store.²⁶⁰ Top employers in 2010 included Tatitlek Village IRA Council, Chugach School District, The Tatitlek Corp., Chugachmiut, Native Village of Chenega Bay Public Health, and North Pacific Rim Housing Authority.

In 2010, the per capita income in Tatitlek was estimated to be \$17,068 and the median household income was estimated to be \$38,750, compared to \$13,015 and \$36,875 in 2000, respectively. Taking inflation into account by converting the 2000 values to 2010 dollars,²⁶¹ the real per capita income in 2000 is shown to have been \$17,115 and the real 2000 median household income was \$48,490. This shows that per capita income stayed stable over the period, while there was a real decrease in median household income. In 2010, Tatitlek ranked 176th of 305 Alaskan communities with per capita income that year, and 197th of 299 Alaskan communities with household income data. However, Tatitlek's small population size may have prevented the American Community Survey from accurately portraying economic conditions.²⁶² In addition, the Alaska Department of Labor and Workforce Development (DOLWD) reported \$7,692 in per capita income, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.^{263,264} This data is supported by the fact that the community was recognized as “distressed” by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. However, it should be noted that American Community Survey and DOLWD data is based on wage earnings and does not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in the same year, 59.3% of the population age 16 and older was estimated to be in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 8.6%, compared to the statewide rate of 5.9%. Approximately 5.4% of local residents were living below the poverty line, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; figures reported for Tatitlek are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Tatitlek. A more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 3.4%.

Also based on household surveys conducted for the 2006-2010 ACS, the greatest number of workers was employed in the private sector (53.1%), while 37.5% were employed in the

²⁵⁹ Unless otherwise noted, all monetary data are reported in nominal values.

²⁶⁰ See footnote 255.

²⁶¹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²⁶² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²⁶³ Calculated as the total wages earned by those employed in the community divided by the total population. The wages earned do not include income collected by residents that are self employed.

²⁶⁴ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

public sector and 9.4% were self-employed. Out of 32 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest percentage worked in educational services, health care, and social assistance (57.6%), public administration (12.1%), transportation, warehousing, and utilities (12.1%), and construction (12.1%). Only 6.1% of the workforce was employed in retail trade. No individuals characterized themselves as working in natural resource based occupations or industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Tatitlek (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Tatitlek (U.S. Census).

Governance

Tatitlek is an unincorporated town located in the Valdez-Cordova Borough. Because of Tatitlek’s unincorporated status, no municipal taxes were administered between 2000 and 2010, nor is there any total municipal revenue to report. Likewise, no information was available regarding revenue sharing contributions from the State Revenue Sharing and Community Revenue Sharing programs during the 2000-2010 period. However, community entities in Tatitlek did receive a number of fisheries-related grants for projects including small boat harbor and breakwater design and construction, small boat harbor construction, construction of the Tatitlek Community Dock, and an Alaska King Crab Research and Rehabilitation Contract. This information about selected revenue streams in Tatitlek is presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Tatitlek from 2000 to 2010.

Tatitlek was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is The Tatitlek Corporation. The regional Native corporation to which Tatitlek belongs is the Chugach Alaska Corporation (Chugach). Chugach is one of the thirteen regional Alaska Native corporations created by ANCSA as amended by the Alaska National Interest Land Conservation Act (ANILCA). The Chugach Region comprises some 10 million acres in South-central Alaska. Chugach is entitled to 928,000 acres, of which approximately 378,000 acres are full fee entitlement and 550,000 acres of subsurface estate. At

this time, Chugach has received 94% of its total entitlement. Chugach has selected lands that have potential for economic development including commercial timber land, mineral estates as well as lands that have potential for tourism, and lands of cultural and historical importance to the Chugach people.²⁶⁵

The closest office of the Alaska Department of Fish and Game (ADF&G) is located in Cordova. The closest offices of the Alaska Department of Natural Resources (DNR), Department of Commerce, Community, and Economic Development, the National Marine Fisheries Service (NMFS), the Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement are located in Anchorage.

Infrastructure

Connectivity and Transportation

Tatitlek has a state-owned 3,701 foot long by 75 foot wide lighted gravel airstrip and a seaplane landing area; air charters are available from Valdez and Cordova. Boats are the primary means of local transportation. In 1996, the Alaska Marine Highway began "whistle stop" service.²⁶⁶ After a short charter flight, direct commercial service is available to Anchorage from Valdez and Cordova. In June 2012, round-trip airfare between Valdez and Anchorage was \$298, and round-trip airfare between Cordova and Anchorage was \$208.²⁶⁷

*Facilities*²⁶⁸

A dam provides water, which is treated and stored in a 170,000-gallon tank. A piped water and sewer system serves all 34 homes. The piped community septic tank system discharges via an ocean outfall. There is an operating oil and hazardous waste recycling center. Law enforcement services are provided by state troopers in Valdez, and fire/rescue services are provided by the Tatitlek Emergency Medical Service. Tatitlek also has a teen center and a community center.

*Medical Services*²⁶⁹

Medical care is provided by the Tatitlek Clinic, which is owned by the Village Council and operated by Chugachmiut. The clinic is a Community Health Aid Program site. Alternate health care is provided by the Tatitlek Emergency Medical Service. Emergency services have coastal air, floatplane, and helicopter access and are provided by a health aide.

The Tatitlek Community School provides instruction to students from pre-school through 12th grade. In 2011 the school had 18 students and two teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Groundfish and crab fisheries that occur within 3 nautical miles (nm) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nm in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction. Pacific halibut fisheries are managed under the International Pacific Halibut Commission. PWS is located in Federal Statistical and Reporting Area 649 and Pacific Halibut Fishery Regulatory Area 3A. The outlet of PWS is at the boundary between the Central Gulf of Alaska (GOA) and Eastern GOA federal Sablefish Regulatory Areas.

In addition to federal groundfish fisheries that take place in the Central and Eastern GOA, state groundfish fisheries take place in the inland waters of PWS for rockfish, lingcod, pollock, sablefish, and Pacific cod. The PWS Pacific cod fishery is managed as a parallel fishery, which takes place at the same time as the federal cod fishery. The Total Allowable Catch (TAC) set by NMFS applies to both fisheries. Beginning in 1997, an additional ‘state-waters fishery’ for Pacific cod was initiated in PWS. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, a pelagic trawl fishery for pollock began in PWS in 1995. It is managed under a guideline harvest limit (GHL) determined by ADF&G, and is not conducted as a parallel fishery. The PWS limited entry sablefish fishery is also managed separately under a GHL.²⁷¹

A majority of lingcod are found in nearshore rocky reef habitat from 10-100 meters in depth. ADF&G manages all lingcod fisheries in state and EEZ waters off Alaska. Lingcod in PWS are primarily harvested as incidental catch in longline fisheries, although lingcod fisheries have increased in importance in recent decades. The state manages rockfish harvest in PWS, and since 1998 also has jurisdiction of blue and black shelf rockfish in the western GOA, and all rockfish in the eastern GOA.²⁷²

PWS historically had a productive herring fishery. However, in 1993, four years after the Exxon Valdez oil spill, the stock collapsed in conjunction with an outbreak of hemorrhagic septicemia virus. Since 1998, the PWS herring fishery has been closed. The relationships between the oil spill, the virus, and the stock collapse remain unclear, and the population has shown little sign of recovery.^{273,274} PWS was also a historical center for Dungeness crab fisheries, but this stock has also collapsed. Possible causes for the Dungeness collapse include

overfishing, sea otter predation, and adverse climatic changes. Red king crab and Tanner crab fisheries in PWS are also closed due to low stock abundance.²⁷⁵ In contrast to the closures of herring and crab fisheries, spot shrimp (*Pandalus platyceros*) pot fisheries reopened in PWS in 2010 after almost two decades of closure due to low abundance.²⁷⁶

Tatitlek is located on the northeast shore of Tatitlek Narrows, on the Alaska Mainland in PWS.²⁷⁷ The area is included in Federal Statistical and Reporting Area 640, Pacific Halibut Fishery Regulatory Area 3A, and Sablefish Regulatory Area Eastern Gulf of Alaska/ West Yakutat. The community is eligible for the Community Quota Entity (CQE) program; however, it has not yet formed a non-profit entity that can purchase quota share.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Tatitlek does not have a registered processing plant. The nearest processing plants are located in Cordova and Valdez.

Fisheries-Related Revenue

Tatitlek did not receive any fisheries-related revenue between 2000 and 2010 (Table 3).

Commercial Fishing

In 2010, there was one permit holder that held one commercial salmon fishing permit issued by the Commercial Fisheries Entry Commission (CFEC) for the drift gill net fishery in PWS. Overall between 2000 and 2010, the number of CFEC salmon permits and permit holders, as well as the number of permits fished, as declined. In previous years, Tatitlek residents have also held groundfish and sablefish CFEC permits, though the permits were not reported as fished in all years between 2000 and 2010. During this period, there was one groundfish License Limitation Program (LLP) permit issued to a Tatitlek resident, though that permit was not reported as fished between 2000 and 2010. Information on commercial fishing permits and permit holders by species is provided in Table 4.

There were six crew license holders in Tatitlek in 2010, a number which varied considerably between 2000 and 2010. During this period, there were no fish buyers or shore-side processing facilities located in Tatitlek. Also in 2010, there was one commercial fishing vessel primarily owned by a Tatitlek resident, a number which declined from a high of seven vessels owned primarily by Tatitlek residents in 2000. There were three commercial fishing vessels homeported in Tatitlek in 2010, a number which varied between one and three vessels between 2000 and 2010. During this period, there were no vessels landing catch in the community, and as such there are no landings or associated ex-vessel revenue to report. Information on characteristics of the commercial fishing sector in Tatitlek between 2000 and 2010 is provided in Table 5.

²⁷⁷ Ibid.

Between 2000 and 2010, there were no quota share account holders in Tatitlek for federal halibut (Table 6), sablefish (Table 7), or crab fisheries (Table 8). As previously stated, there were no landings recorded in Tatitlek between 2000 and 2010, and no associated ex-vessel revenue reported during this period (Table 9). Landings by Tatitlek residents, as well as associated ex-vessel revenue between 2000 and 2010, are considered confidential due to a small number of participants (Table 10).

¹ Net pounds refers to the landed weight recorded in fish tickets.

² Totals only represent non-confidential data.

Recreational Fishing

There were no sport fish guide businesses or community residents holding sport fish guide licenses in Tatitlek between 2000 and 2010. In 2010, there were 16 sportfishing licenses sold to community residents (irrespective of the location of the point of sale), a number which varied between 2000 and 2010. In contrast, no sportfishing licenses were sold within the community in 2010, indicating the potential that Tatitlek residents pursue recreational fishing in other communities.

Tatitlek is located in the North Gulf Coast/PWS Alaska Sport Fishing Survey Area. Between 2000 and 2010, sportfishing activity in this region varied considerably. For saltwater sportfishing, non-Alaska resident angler days fished varied between 39,551 and 90,002 during this period, while Alaska resident angler days fished varied between 82,908 and 210,203 days. Alaska resident anglers fished consistently more angler days than non-Alaska residents during

this period. Information about the sportfishing sector in and near Tatitlek is displayed in Table 11.

The Alaska Statewide Harvest Survey,²⁷⁸ conducted by ADF&G between 2000 and 2010, noted that coho salmon and sockeye salmon are targeted by private anglers in Tatitlek.

Subsistence Fishing

Subsistence activities provide the majority of food items for Tatitlek residents. A coho salmon hatchery, supporting subsistence activities, is located at Boulder Bay, which is less than a mile from the center of the community.²⁷⁹ In 2003, the only year that a subsistence survey was conducted by ADF&G in Tatitlek between 2000 and 2010, 89% of households were recorded as using salmon for subsistence, 96% of households used halibut, 46% of households used marine mammal, 58% of households used marine invertebrates, and 57% of households used non-salmon fish (other than halibut). Per capita, the residents of Tatitlek harvested 262.32 pounds of

²⁷⁸ Alaska Department of Fish and Game. 2011. *Alaska Sport Fishing Survey results, 2000-2010*. ADF&G Division of Sport Fish, Alaska Statewide Harvest Survey project. marine subsistence resources. Information about per capita subsistence harvest and household participation in subsistence activities is presented in Table 12.

In years for which data were reported between 2000 and 2010, an average of nine subsistence salmon permits were issued to Tatitlek residents, with an average of six of those permits being reported as fished in any given year. Coho salmon were the primary species harvested under subsistence permits (an average of 217 coho per year), along with Chinook salmon, chum salmon, pink salmon, and sockeye salmon in much smaller quantities. In 2003, total harvest of marine invertebrates was 61 pounds, and total harvest of non-salmon fish was 4,270 pounds. According to the ADF&G Division of Subsistence, marine invertebrate species harvested for subsistence in Tatitlek included black (small) chitons, butter clams, octopus, Pacific littleneck clams (steamers), and unknown cockles. The ADF&G Division of Subsistence also reported that non-salmon fish species harvested for subsistence included: black rockfish, eel, eulachon (hooligan candlefish), herring, herring roe/unspecified, lake trout, lingcod, Pacific cod (gray), red rockfish, sablefish (black cod), sea bass, starry flounder, unknown sole, and wolf fish. Information about subsistence harvest of salmon, marine invertebrates, and non-salmon fish (not including halibut) is presented in Table 13.

Between 2003 and 2010, an average of 24 Subsistence Halibut Registration Certificates (SHARC) were issued to Tatitlek residents each year, representing 28.4% of the total households. In 2010, 15 SHARC were issued, 6 were reported as fished, and 1,525 pounds of subsistence halibut were reported as harvested. This represents a substantial decline from 2007, in which 28 SHARC cards were issued, 26 were returned, and 12,782 pounds of subsistence halibut were reported as harvested. Information about subsistence halibut harvest is presented in Table 14.

Information about subsistence harvest of marine mammals was reported between 2000 and 2008, with the exception of 2005 and 2007. Sea otters were among the marine mammals harvested by Tatitlek residents during this period. No information was reported regarding harvest of beluga whales or walrus. Information about the subsistence harvest of marine mammals is presented in Table 15. Between 2000 and 2008, Steller sea lions and harbor seals were also reported harvested for subsistence in Tatitlek. The number of Steller sea lions harvested for subsistence varied from year to year, from two in 2000 to 41 in 2007, and the number of harbor seals harvested for subsistence also varied from 13 in 2002 to 219 in 2006. No information was reported regarding harvest of spotted seals during this period. Information regarding the subsistence harvest of seals and sea lions is presented in Table 16.

The ADF&G Division of Subsistence reported that the following species of marine invertebrates were used for subsistence in Tatitlek during this period: black (small) chitons, butter clams, octopus, Pacific littleneck clams (steamers), and unknown cockles. Marine mammals reported as harvested for subsistence use included harbor seal, harbor seal (saltwater), porpoise, and Steller sea lion. Non-salmon fish reported as harvested for subsistence use included: black rockfish, eel, eulachon (hooligan candlefish), herring, herring roe/unspecified, lake trout, lingcod, Pacific cod (gray), red rockfish, sablefish (black cod), sea bass, starry flounder, unknown sole, and wolf fish.²⁸⁰

Valdez (val-DEEZ)

People and Place

Location

Valdez is located on the north shore of Port Valdez, a deep water fjord in Prince William Sound. By water, Valdez is 1,239 miles northwest of Seattle, 170 miles northeast of Seward, 80 miles northeast of Whittier, and some 45 miles northwest of Cordova. Anchorage is 120 air miles northwest of Valdez, and 305 road miles. Valdez is the southern terminus of the Trans-Alaska oil pipeline. It is located in the Valdez Recording District and the Valdez-Cordova Census Area. The City encompasses 222 square miles of land and 55.1 square miles of water.^{281,282}

*Demographic Profile*²⁸³

In 2010, there were 3,976 residents in Valdez, making it the 29th largest of 352 Alaskan communities with populations recorded that year. From 1990 to 2010, the population decreased by 2.3%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population fell by 13.9% with an average annual growth rate of -1.65%, indicative of a steady rate of decline in those years.

In 2010, a majority of Valdez residents identified themselves as White (81.5%), 8.2% identified as American Indian or Alaska Native, 1.9% as Asian, 0.8% as Native Hawaiian or Other Pacific Islander, 0.6% as Black or African America, 0.7% as ‘some other race’, and 6.3% identified with two or more races. In addition, 4.7% of Valdez residents also identified themselves as Hispanic in 2010. The percentage of the population made up of each of these racial and ethnic groups remained relatively stable between 2000 and 2010. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

The average household size in Valdez decreased over time, from 2.9 persons per household in 1990 to 2.66 per household in 2000, and 2.43 in 2010. During the same period, the number of households increased, from 1,277 occupied households in 1990 and 1,494 in 2000, to 1,573 occupied housing units in 2010. Of the 1,763 total housing units surveyed for the 2010 Decennial Census, 61.3% were owner-occupied, 28% were rented, and 10.8% were vacant or used only seasonally. In 1990, 281 Valdez residents lived in group quarters. This number decreased to 56 in 2000, then rose again to 149 by 2010.

Figure 1. Racial and Ethnic Composition, Valdez: 2000-2010 (U.S. Census).

The gender distribution in 2010 (53.3% male and 46.7% female) was slightly more skewed toward males than the statewide distribution (52% male, 48% female). The median age of Valdez residents that year was 36.7 years, close to the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 10.9% of Valdez’s population was age 60 or older. The overall population structure of Valdez in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),²⁸⁴ 96.1% of Valdez residents over the age of 16 were estimated to hold a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 0% had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 3.9% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 40.6% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; an estimated 13.2% held an Associate’s degree, compared to an estimated 8% of Alaskan residents overall; an estimated 15.1% held a Bachelor’s degree, compared to an estimated 17.4% of Alaskan residents overall; and an estimated 5.9% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

Figure 2. Population Age Structure in Valdez Based on the 2000 and 2010 U.S. Decennial Census.

²⁸⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Archaeological evidence suggests that Chugach Eskimos (Chugachmiut) were present in the Valdez region starting in the early Holocene period. Port Valdez was likely used for foraging and hunting activities, but probably did not contain permanent settlements, as the Chugachmiut preferred to reside along protected shorelines with unobstructed views of all approaches, and avoided closed bays. Of eight sub-groups of Chugachmiut, the Tatitlek group was the nearest to Valdez.²⁸⁵

The Port of Valdez was named in 1790 by Don Salvador Fidalgo for the celebrated Spanish naval officer Antonio Valdes y Basan. Due to its excellent ice-free port, a town developed in 1898 as a debarkation point for men seeking a route to the Eagle Mining District and the Klondike gold fields. Valdez soon became the supply center of its own gold-mining region and incorporated as a City in 1901. Fort Liscum was established in 1900, and a sled and wagon road was constructed to Fort Egbert in Eagle by the U.S. Army. The Alaska Road Commission further developed the road for automobile travel to Fairbanks.²⁸⁶ By 1920, the Richardson Highway was completed, and was Alaska's first road connecting Fairbanks in the interior with the coast. Today, the Highway (Alaska Route 4) is a paved, two-lane highway open year-round to traffic.²⁸⁷

Valdez prospered for a time as a commercial center, especially after gold and copper were discovered nearby.²⁸⁸ However, the community's population declined by half between 1910 and 1920 as mining activity decreased and Fort Liscum was closed. In addition, completion of the Alaska Railroad from Seward to Fairbanks in 1923 led to a decline in the importance of Valdez as a transportation center.²⁸⁹ As mining declined in importance to the local economy, commercial fishing began to grow in importance in the region. The first salmon cannery was built in Valdez in 1917. Between 1917 and 1955, several additional canneries opened and closed. Fur farming was briefly an important industry in the 1920s, and mining retained a small presence in the local economy through the early 1940s.²⁹⁰

The Great Alaska Earthquake of 1964 caused significant damage in Valdez. Shock waves from the 9.2 magnitude quake ripped streets apart, damaged homes and destroyed buildings in town. An underwater landslide followed the earthquake that caused a tsunami, further destroying the waterfront and much of the community. Two docks in town were completely destroyed. Several residents were killed. In total, \$15 million dollars in damage was reported. Following this disaster, community leaders moved the City four miles west to a safer location.²⁹¹ The economy of Valdez rebounded after the City was selected as the terminus of the Trans-Alaska Pipeline, and construction of a terminal and other cargo transportation facilities brought rapid growth.²⁹² The Exxon Valdez oil spill disaster of March, 1989 also led to a population boom, as

thousands of workers came to Valdez to work in clean-up efforts.²⁹³ The oil spread outward and did not reach the shores of the community, but commercial, recreational, and subsistence fisheries in Valdez continue to be affected by the impacts of the spill.²⁹⁴

Natural Resources and Environment

Valdez has a maritime climate which is characterized by cool summers and mild winters. January temperatures range from 21 to 30 °F, and July temperatures are from 46 to 61 °F. Annual precipitation averages 62 inches. The average snowfall is 325 inches (27 feet) annually.²⁹⁵ The Prince William Sound area is characterized by complex coastlines, peninsulas and small islands, and glacial carved valleys and fjords.²⁹⁶ Valdez is surrounded by the Chugach mountains, with close peaks as high as 4,000 feet, and Mt. Marcus Baker, located 55 miles northwest, rising to 13,250 feet. High mountain ridges to the north of the community provide a barrier to the flow of cold air from the interior, but the mountains also channel local winds, bringing cold air down from snowfields and the Valdez glacier. The City of Valdez is built on an alluvial fan of Mineral Creek.²⁹⁷ Uplands host coniferous forest and muskegs.²⁹⁸

The City of Valdez is located just north and east of the boundary of the Chugach National Forest, the western and northern-most National Forest in the U.S., comprising 5.5 million acres. The area of the National Forest adjacent to Prince William Sound makes up 48% of its total acreage. Within this region of the National Forest there are 3,500 miles of shoreline, and 20 active tidewater glaciers.²⁹⁹ Marine protected areas near Valdez include Shoup Bay, Jack Bay, and Sawmill Bay State Marine Parks (SMPs) and the Copper River Delta Critical Habitat Area.³⁰⁰ SMPs are intended to protect natural habitat, and do not restrict fishing activity.³⁰¹ All three of these SMPs are important recreational areas for residents of Valdez. Additional recreational areas include Mineral Creek Flats and Canyon, the Valdez Glacier, Valdez Lake and Stream, Robe Lake, Keystone Canyon and associated trail system, Solomon Gulch, the Old Valdez townsite, and Valdez Duck Flats.³⁰²

Valdez hosts the terminus of the Alaska Pipeline, which carries crude oil south from oil fields in Alaska's North Slope. Living marine resources in the Valdez area were negatively impacted and continue to show affects of the March 1989 Exxon Valdez Oil Spill, when 11 million gallons of crude oil spilled into Prince William Sound. The spill affected the food chain

that supports the Prince William Sound commercial fishery, and impacted shore birds, waterfowl, sea otters, harbor porpoises, harbor seals, Steller sea lions, and several species of whale, among other species.³⁰³ Harvest of shellfish declined dramatically due to petrochemical contamination. Sea otter mortality was as high as 40% immediately following the spill. The 50% decline in the Prince William Sound orca population in the decades following the spill has been attributed to direct oil exposure and consumption of oiled marine mammals. Many other fish, marine mammal, and bird populations declined following the spill, including harbor seals, Steller sea lions, marbled murrelets, and black oyster catchers. Impacts on habitat and forage fishes created continued difficulties for recovery of many species.³⁰⁴ In particular, the 1993 collapse of the Prince William Sound herring fishery has made recovery for many species difficult, as it is a primary food source for harbor seal, Steller sea lion, and marbled murrelet, among other species. The relationship between the herring collapse and the oil spill remains unclear.^{305,306}

No offshore oil and gas lease sales were scheduled in the Gulf of Alaska for the 2012-2017 leasing program.³⁰⁷ A 2000 assessment of conventionally recoverable oil and gas estimated the presence of between 360 million to 3.27 billion barrels of oil and gas in the Gulf of Alaska region. This was slightly higher than estimates in Cook Inlet. The Pacific Margin Subregion (including Cook Inlet, Gulf of Alaska and Shumagin-Kodiak) was estimated to hold only 6.3% of all conventionally recoverable oil and gas in Alaska's offshore regions, while the Arctic Subregion was estimated to hold 84.6% and the Bering Shelf subregion was estimated to hold 9.1%.³⁰⁸ On state lands, acreage is available in the Valdez area for oil and gas exploration, but no current leases were active as of 2011, and no exploration licenses were proposed in the area for the 2012-2017 lease period.³⁰⁹

Valdez played a role in the history of mining in Alaska both as a launching point for gold prospectors bound for the Klondike or Copper River Basin in the late 1800s and early years of the 1900s, and later miners prospected for gold, copper and silver locally on the islands and shores of Prince William Sound. The most profitable mines in the vicinity of Valdez were the Cliff Gold Mine and the Midas Mine. The Cliff Mine resulted in about 51,740 ounces of gold and 8,153 ounces of silver. The Midas Mine, in nearby Solomon Gulch on the south shore of the Port, was the fourth largest producer of copper in the Prince William Sound area. Ellamar Mine, located near Tatitlek, was a large copper producer, and almost as much gold was produced as a by-product of copper mining as was produced at the Cliff Mine.³¹⁰ Today, the Midas and

Ellamar Mines are still considered to be some of the most significant copper deposits in Alaska, along with some gold, zinc, lead, and silver.³¹¹

Natural hazards identified in Valdez include high risk of flooding, avalanche, landslides, erosion, and severe weather, and medium risk of earthquake, tsunami and seiche, and wildfire. The risk of volcanic activity and drought was unknown.³¹² Avalanche areas in Valdez include steep slopes north of the Valdez airport and along Mineral Creek. Flood hazards are posed by tsunamis, storm surges, heavy rainfall, snow and glacial melt, and potential for release of glacier-dammed lakes.³¹³ Earthquake hazards are high in this region of Alaska. There are 11 major active fault systems within 150 miles that are capable of producing earthquakes that can be felt in the Valdez.³¹⁴ According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Valdez as of July 2012.³¹⁵

Current Economy³¹⁶

In a survey conducted by the AFSC in 2011, community leaders reported that Valdez's economy is dependent on commercial and recreational fishing, sport hunting, and oil and natural gas exploration and drilling. Valdez is the southern terminus and off-loading point of oil extracted from Prudhoe Bay on Alaska's North Slope, and as a result has one of the highest municipal tax bases in the state. Valdez is a major seaport, with a \$48 million cargo and container facility. City, state, and federal agencies provide significant employment. In addition, in 2010, 62 residents held state commercial fishing permits. Several fish processing plants operate in Valdez. The Valdez Fisheries Development Association operates the Valdez Fish Hatchery as well as a seasonal processing plant during harvest season. Several cruise ships dock in Valdez each year. Valdez is a foreign free trade zone. In addition, 98 uniformed U.S. Coast Guard personnel were stationed in Valdez in 2011.³¹⁷ As of 2010, top local employers included pipeline services (design, construction, maintenance, and operation), schools, the City of Valdez, health services, oil spill cleanup and prevention services, the State of Alaska, University of Alaska, and police/security services.³¹⁸

Based on household surveys conducted for the 2006-2010 ACS,³¹⁹ in 2010, the per capita income in Valdez was estimated to be \$34,822 and the median household income was estimated

to be \$69,536. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$27,341 and \$66,532, respectively). However, if inflation is taken into account by converting the 2000 values to 2010 dollars,³²⁰ per capita income is shown to have decreased very slightly, from a real per capita income of \$35,953 in 2000, while household income is shown to have decreased more substantially, from a real median household income of \$87,489 in 2000. In 2010, Valdez ranked 30th of 305 Alaskan communities with per capita income data, and 48th in median household income, out of 299 Alaskan communities with household income data that year.

Although Valdez's small population size may have prevented the ACS from accurately portraying economic conditions,³²¹ additional evidence for a decrease in per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Valdez in 2010 is \$24,105.³²² This is lower than the 2006-2010 ACS estimate, thus providing additional evidence that per capita may have declined between 2000 and 2010. Despite this, Valdez did not meet the Denali Commission's 2011 criteria as a "distressed" community.³²³ It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the potential value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a slightly higher percentage of Valdez residents were estimated to be in the civilian labor force (74%) than in the civilian labor force statewide (68.8%). In the same year, 4.7% of local residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate was estimated to be 3.6%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 9.7%, compared to a statewide unemployment rate estimate of 11.5%.³²⁴

Also based on the 2006-2010 ACS, a majority of the Valdez workforce (71.6%) was estimated to be employed in the public sector, along with 22.1% in the public sector, and 6.3% estimated to be self-employed. Of the 547 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number was estimated to be working in educational services, health care, and social assistance (25.1%) and transportation, warehousing, and utilities (12.5%). Between 2006 and 2010, only 5.9% of the Valdez civilian labor force was estimated to be employed in agriculture, forestry, fishing, hunting, and mining (Figures 3 and 4). However, given the known information on Valdez residents' contribution to state fisheries, the number of individuals employed in farming, fishing, and forestry occupations and industries may be underestimated in census statistics as fishermen may hold another job and characterize their employment accordingly.

³²⁰ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

³²¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³²² See footnotes 318 and 319.

³²³ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

³²⁴ See footnote 318.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 1,960 employed residents in Valdez in 2010, of which 26.3% were employed in trade, transportation, and utilities, 15.9% in local government, 12.8% in leisure and hospitality, 11.8% in education and health services, 8% in professional and business services, 6% in state government, 5.5% in natural resources and mining, 4.1% in manufacturing, 3.5% in construction, 2.7% in information, 1.5% in financial activities, 0.1% in unknown industries, and 1.9% in other industries.³²⁵ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Figure 3. Local Employment by Industry in 2000-2010, Valdez (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Valdez (U.S. Census).

Governance

Valdez is a Home Rule City, and is not located in an organized borough. The City was incorporated in 1901 and has a Strong Mayor form of government, including a seven-person city council including the Mayor, a seven-person advisory school board, a seven-person planning and zoning commission, and a number of municipal employees. The City administers a 20.0 mills property tax and a 6% Bed Tax. No sales tax is administered in the City of Valdez.³²⁶ Municipal revenue in Valdez more than doubled between 2000 and 2010, from just over \$20,000,000 in 2000 to over \$50,000,000 in 2009 and 2010. This increase can be attributed in part to an increase in tax revenues over the period.

Shared revenues from state and federal sources provided another important revenue source for the City during this period. Valdez received contributions from the State Revenue Sharing program from 2000 to 2003 (approximately \$100,000 per year), from the Community Revenue Sharing program in 2009 and 2010 (just over \$320,000 per year), as well as shared funds from state fish tax refunds (see the *Fisheries-Related Revenue* section for more information).

Grants also accounted for a sizeable portion of municipal revenues, including multiple fisheries-related grants. Federal funding came from the U.S. Economic Development Administration, including \$3,000,000 toward harbor improvements or the cruise ship dock in 2004, and \$558,000 for a smoker and cold storage in 2006. In addition, Valdez received federal disaster assistance totaling \$2,825,267 between 2000 and 2006, and a federal ‘marine first responder’ grant of \$7,756 in 2008. State funding included \$12,174,427 from the Alaska Department of Commerce, Community, and Economic Development’s (DCCED) Division of Community and Regional Affairs (DCRA) between 2000 and 2010. DCRA-funded projects included design of a dried fish processing plant, City Dock repair, revitalization, and fendering, improvements to the small boat harbor including installation of a ramp, development of a new harbor, cruise ship dock renovation, and uplands repair, other dock and harbor improvements and maintenance, and funding for chum salmon fisheries development granted to the Prince William Sound Aquaculture Corporation. Alaska DEC – Municipal Grants and Loans contributed \$56,700 toward the small boat harbor in 2002. The Alaska Department of Transportation and Public Facilities provided \$762,998 in 2001 for replacement of the ferry terminal building, and \$424,623 in 2002 for staging of the Valdez Ferry Terminal. In addition, the State of Alaska provided \$310,473 between 2000 and 2004 for repairs the old City Dock including addition of fenders, and \$140,117 from 2000 to 2003 for construction of a new cruise ship dock. Information about selected aspects of Valdez’s municipal revenue is presented in Table 2.

Valdez was not included under the Alaska Native Claims Settlement Act (ANCSA), and is not federally recognized as a Native village.³²⁷ The Native population of Valdez is represented by the Valdez Native Tribe, a non-profit organization that formed in 1974. The Tribe’s mission is to “promote the unity, self-determination, and empowerment of the Alaska Native and American Indian beneficiaries residing in the Valdez area, by providing services that will strengthen, increase opportunities, and enhance the mental, physical and spiritual well being of

³²⁶ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

³²⁷ Ibid.

our people, in harmony with our land and traditional values.”³²⁸ The organization provides health, social, educational, and cultural services.³²⁹

The closest office of the Alaska Department of Fish and Game (ADF&G) is located in Cordova, though ADF&G’s Anchorage office may be more accessible to residents of Valdez because Cordova is not connected to the road system. Anchorage also hosts the nearest offices of the Alaska Department of Natural Resources, the National Marine Fisheries Service (NMFS), the DCCED, and the U.S. Bureau of Citizenship and Immigration Services.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Valdez from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$21,679,852	n/a	\$114,675	\$868,727
2001	\$23,193,808	n/a	\$102,453	\$1,877,490
2002	\$23,759,150	n/a	\$92,373	\$3,109,197

Infrastructure

Connectivity and Transportation

The Richardson Highway connects Valdez to Alaska’s road system. Valdez is 305 road miles southeast of Anchorage. The Port of Valdez is ice-free throughout the year, and is navigated by hundreds of ocean-going oil cargo vessels each year. Valdez has the largest floating concrete dock in the world, with a 1,200-foot front and water depth exceeding 80 feet. Numerous cargo and container facilities are present in Valdez, as well as boat harbors. Both barges and

³²⁹ Chugachmiut. 2012. *Valdez Native Tribe*. Retrieved April 27, 2012 from <http://www.chugachmiut.org/tribes/valdez.html>.

trucking services deliver cargo to the City.³³⁰ The Alaska Marine Highway Ferry System provides transport to Cordova, Tatitlek, Whittier, and Chenega Bay in Prince William Sound, to Kodiak, Ouzinke, Port Lions, and Old Harbor on Kodiak Island, and to Seward, Seldovia, and Homer on the Kenai Peninsula.³³¹ The Valdez airport is operated by the State, with a 6,500 feet long by 150 feet wide paved runway.³³² As of early June 2012, roundtrip airfare between Valdez and Anchorage was \$298.³³³ In addition, a seaplane base is located at Robe Lake, approximately 8 road miles southeast of town.³³⁴

Facilities

Water in Valdez is derived from four primary wells and is stored in five 750,000-gallon reservoirs. The City operates a piped water distribution system, and also operates the sewage system. The sewage treatment plant is capable of processing 1.25 million gallons a day. Sewage is deposited in a secondary treatment lagoon. Over 95% of homes are fully plumbed, and many homes use individual wells and septic tanks. The City operates a landfill and provides refuse collection services in Valdez. An oil and hazardous waste recycling center is also available. Electricity is provided by the Copper Valley Electric Association which purchases hydroelectric power from the Four Dam Pool Power Agency and diesel electricity from the Petro Star Refinery. The electric utility also owns a backup diesel plant. Police services are provided by the City Police Department and a local state troopers post. Fire and rescue services are provided by the City Fire Department and Emergency Medical Service (EMS), as well as the Robe River Fire Hall, Alyeska Marine Terminal Fire Response, and Civil Air Patrol. A State District Court and State Jail are both located in Valdez.³³⁵

Additional community facilities and services include Valdez Senior Citizens housing, a convention and civic center which houses a movie theater, a teen center, two museums and a historical archive, one academic/public library and three school libraries, a high school pool and gymnasium, and bingo offered by the Valdez Native Tribe.³³⁶ According to a survey conducted by the AFSC in 2011, Valdez also has a food bank. Internet, cable, and telephone service are all available in Valdez.³³⁷

With regard to fisheries-related facilities, a small harbor is present in Valdez that accommodates 546 commercial fishing boats and recreational vessels. Boat launches and haul-out services are available.³³⁸ According to the 2011 AFSC, community leaders indicated that dry dock storage is also available, along with sales of ice, boat fuel, bait, and tackle. They also noted that fish processing plants are present in Valdez (see *Processing Plants* section).

Medical Services

Local health care is provided by the Valdez Community Hospital and the Valdez Native Tribe Clinic. The hospital is owned by the City, and the clinic is owned and operated by the Valdez Native Tribe. The hospital is a qualified Acute Care facility. Emergency Services have helicopter, marine, and airport access. Emergency service is provided by 911 Telephone Service and paid EMS. Alternative health care is provided by the Valdez Fire Department. Long-term care is also available in Valdez at Sourdough Place.³³⁹

Educational Opportunities

Three schools are present in Valdez, including Hermon Hutchens Elementary School (preschool through 6th grade), George H. Gilson Junior High School (7th and 8th grade), and Valdez High School (9th through 12th grade). As of 2011, 354 students were enrolled at the elementary school, 112 at the junior high school, and 222 at the high school. That year, there were 26 elementary school teachers, 13 junior high school teachers, and 19 high school teachers. A correspondence school is also in operation in Valdez – the Chugach Extension Correspondence School – which offered preschool through 12th grade. As of 2011, 203 students were enrolled in the correspondence program, and there were 6 teachers.³⁴⁰

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The original inhabitants of the Valdez area, the Chugachmiut, were marine hunters and fishers. In summer, they moved from permanent winter settlements to temporary fish camps. Salmon were a dietary staple, and large quantities were dried for winter use. The Chugachmiut also caught other fish, gathered intertidal resources, and hunted sea mammals, such as whales, seals, sea lions, and sea otters. Hunting was done with harpoons and clubs, and fish were speared, gaffed, harpooned, or hooked. Salmon were often caught in weirs built across rivers.³⁴¹

The community of Valdez was originally founded as a debarkation point for miners in the late 1800s. Commercial fishing began to gain importance as mining activity declined in the early 1900s. The first salmon cannery was built in Valdez in 1917.³⁴² Prior to construction of the Valdez cannery, one salmon cannery was in operation in the Prince William Sound (PWS) region, and fishing took place primarily along the Copper River delta. Salmon fishing continued to expand to other regions of PWS as additional canneries were constructed.³⁴³ Salmon and herring were two of the earliest commercial fisheries in Alaska, during the period when the

product was salted for storing and shipment.³⁴⁴ By the 1920s, commercial fisheries for Pacific halibut and groundfish expanded north to the Gulf of Alaska (GOA) and west as far as Unimak Pass.³⁴⁵

Today, ADF&G manages the PWS salmon fishery. The PWS salmon management area is divided into 11 commercial fishing districts, covering the coastal area from Cape Suckling (northwest of Yakutat) to Cape Fairfield (east of Seward), and the inland waters of PWS. Valdez is located in the Eastern district. Purse seine gear is the most common gear type, and is allowed in eight of the nine inland fishing districts. Drift gillnet gear is allowed in three districts, and set gillnet gear is only allowed in the Eshamy District. It is important to note that a salmon hatchery program was initiated in Prince William Sound in the early 1970s, and hatchery returns have consistently contributed to harvests since the 1980s.³⁴⁶

Groundfish and crab fisheries that occur within 3 nautical miles (nmi) of the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nmi in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction. Pacific halibut fisheries are managed under the International Pacific Halibut Commission. PWS is located in Federal Statistical and Reporting Area 649 and Pacific Halibut Fishery Regulatory Area 3A. The outlet of PWS is at the boundary between the Central GOA and Eastern GOA federal Sablefish Regulatory Areas.

In addition to federal groundfish fisheries that take place in the Central and Eastern GOA, state groundfish fisheries take place in the inland waters of PWS for rockfish, lingcod, pollock, sablefish, and Pacific cod. The PWS Pacific cod fishery is managed as a parallel fishery, which takes place at the same time as the federal cod fishery. The Total Allowable Catch (TAC) set by NMFS applies to both fisheries. Beginning in 1997, an additional ‘state-waters fishery’ for Pacific cod began in PWS. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, a pelagic trawl fishery for pollock began in PWS in 1995, managed under a guideline harvest limit (GHL) determined by ADF&G, and is not conducted as a parallel fishery. The PWS limited entry sablefish fishery is also managed separately under a GHL.³⁴⁷

A majority of lingcod are found in nearshore rocky reef habitat from 10-100 meters in depth. ADF&G manages all lingcod fisheries in state and EEZ waters off Alaska. Lingcod in PWS are primarily harvested as incidental catch in longline fisheries, although lingcod fisheries have increased in importance in recent decades. The state manages rockfish harvest in PWS, and since 1998 also has jurisdiction of blue and black shelf rockfish in the western GOA, and all rockfish in the eastern GOA.³⁴⁸

PWS historically had a productive herring fishery. However, in 1993, four years after the Exxon Valdez oil spill, the stock collapsed in conjunction with an outbreak of hemorrhagic septicemia virus. Since 1998, the PWS herring fishery has been closed. The relationships between the oil spill, the virus, and the stock collapse remain unclear, and the population has shown little sign of recovery.^{349,350} PWS was also a historical center for Dungeness crab

³⁴⁴ Woodby, D., D. Carlile, S. Siddeek, F. Funk, J.H. Clark, and L. Hulbert. 2005. *Commercial Fisheries of Alaska*. Alaska Dept. of Fish and Game, Special Publication No. 05-09. Retrieved December 29, 2011 from <http://www.adfg.alaska.gov/FedAidPDFs/sp05-09.pdf>.

³⁴⁹ Ibid.

fisheries, but this stock has also collapsed. Possible causes for the Dungeness collapse include overfishing, sea otter predation, and adverse climatic changes. Red king crab and Tanner crab fisheries in PWS are also closed due to low stock abundance.³⁵¹ In contrast to the closures of herring and crab fisheries, spot shrimp (*Pandalus platyceros*) pot fisheries reopened in PWS in 2010 after almost two decades of closure due to low abundance.³⁵²

Valdez is not eligible to participate in the Community Quota Entity program or the Community Development Quota program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, three shore-side processing plants are in operation in Valdez. Information about and history of these facilities is presented below.

Peter Pan Seafoods owns and operates the only fresh/frozen/cannery facility in Valdez. The facility operates between April and September, processing salmon – including Copper River salmon – as well as sablefish and halibut.³⁵³ According to a survey of plant managers conducted by the AFSC in 2011, the Valdez plant began operations in 1988, and in 2010 employed up to 352 workers in the months of July and August.

Silver Bay Seafoods LLC processes salmon at its “Northern Reach Seafoods” facility in Valdez, which it acquired in early 2010. During the first winter, the company made large-scale investments in the old plant, including expanding freezer capacities by four times and purchasing new equipment for cutting salmon and preserving salmon roe. The daily processing capacity of the facility was increased from 250,000 round pounds of salmon to one million round pounds. The plant was operational during the 2010 summer season. In 2011, the Valdez facility employed 197 workers during the summer season.³⁵⁴

The Solomon Falls Seafoods facility in Valdez processes pink and coho salmon. Solomon Falls Seafoods is a subsidiary of the Valdez Fisheries Development Association, which was started in 1978 and is one of the biggest producers of pink salmon in Alaska.³⁵⁵ According to the 2011 survey of plant managers conducted by the AFSC, in 2010, the Solomon Falls plant employed up to 20 workers from June through September.

Fisheries-Related Revenue

In 2010, the City of Valdez received \$1,868,658 from fisheries-related taxes and fees. These revenue sources include the Shared Fisheries Business Tax and fees for harbor and port/dock usage. Table 3 presents details of selected aspects of community finances between 2000 and 2010.³⁵⁶

³⁵⁶ A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

Between 2000 and 2010, Valdez residents were active in commercial fisheries as permit and quota share account holders, crew license holders, and vessel owners. They were most involved in fisheries for salmon, halibut, and sablefish. Inactive permits were held in a number of other fisheries throughout the period, and a number of shrimp permits were acquired in 2010 (Table 4). In addition to fisheries participation, the community of Valdez is one of the leading processing communities in Alaska, ranking 9th in landings and 14th in ex-vessel revenue, out of 67 Alaskan ports that received landings in 2010. That year, 20 fish buyers were present locally, and 3 shore-side processing facilities were in operation. In total, 72,812,837 net pounds were landed in Valdez in 2010, generating a total of \$31,530,772 in ex-vessel revenue (Table 5).

Between 2000 and 2010, the number of Valdez residents holding commercial crew licenses varied between a low of 56 in 2009 and a high of 93 in 2003. In 2010, 78 crew licenses were held. During the same period, the number of residents that were the primary owner of a fishing vessel varied between a low of 46 in 2006 and a high of 88 in 2000 and 2004, with 69 fishing vessels primarily owned by Valdez residents in 2010. Also in 2010, 80 vessels were listed as homeported in Valdez, and 275 vessels delivered landings locally. Further information about the commercial fishing sector in Valdez is presented in Table 5.

In 2010, 62 Valdez residents held a total of 97 state Commercial Fisheries Entry Commission (CFEC) permits. Of these, 44 were held for salmon fisheries, 25 were held for ‘other shellfish’ (shrimp), 13 were held for halibut, 6 were held for herring, 5 for sablefish, and 4 for groundfish. Additional information about CFEC permits is presented in Table 4, and further details regarding these permits are included below.

Of 44 salmon CFEC permits, 28 were held in the PWS purse seine fishery, 10 in the Prince William Sound drift gillnet fishery, 2 for Upper Yukon River fishwheel, 1 in the Cook Inlet drift gillnet fishery, 1 for Bristol Bay drift gillnet, and 1 was a statewide hand troll permit. In addition, one PWS ‘special harvest area’ (hatchery) permit was held in 2010. Overall, 57% of salmon permits held in Valdez were actively fished in 2010. Of the purse seine permits, 61% were actively fished that year, and 80% of PWS drift gillnet permits were actively fished. No statewide troll or Upper Yukon River fishwheel permits were actively fished by Valdez residents during the 2000-2010 period. The number of salmon permit holders and the total salmon permits held increased slightly between 2000 and 2010, and the percentage of permits actively fished also increased slightly over the period.

In 2010, 25 ‘other shellfish’ permits were held in Valdez. All 25 of these permits were held for shrimp fisheries using pot gear, and 11 of the permits were actively fished that year (44%). This represents a sudden increase in the number of ‘other shellfish’ permits held in Valdez, from one inactive permit held in 2000 and 2001 and no permits held between 2002 and 2009. The sudden increase reflects the reopening of the spot shrimp fishery in PWS in 2010. The fishery had previously been closed since the early 1990s due to low stock abundance.³⁵⁷

All 13 halibut CFEC permits held in 2010 were for the statewide longline fishery on vessels under 60 feet in length. That year, 11 (85%) of halibut permits were actively fished. Between 2000 and 2010, the number of halibut permit holders and the total number of permits held decreased slightly, while the percentage of permits actively fished increased.

³⁵⁷ Alaska Dept. of Fish and Game. 2012. *Spot Shrimp Species Profile: Status, Trends and Threats*. Retrieved April 30, 2012 from <http://www.adfg.alaska.gov/index.cfm?ADFG=spotshrimp.main>.

Sablefish CFEC permits were actively fished at the highest rate of any fishery in Valdez between 2000 and 2010, with 100% of permits fished in 8 years during the period. The number of sablefish permits held by Valdez residents rose from a low of two held in 2001 to a peak of eight held in 2004. From 2007 to 2010, five Valdez residents held five sablefish CFEC permits.

The number of groundfish CFEC permits held by Valdez residents also peaked in 2004, with 12 permits held by 9 permit holders. That year was also the only year during the 2000-2010 period in which a groundfish permit was actively fished. Between 2004 and 2010, the number of permit holders declined to three, and the number of permits held declined to four.

Although the PWS herring fishery has been closed since 1998, several Valdez residents held inactive herring permits in PWS herring fisheries between 2000 and 2010. The number of permit holders and permits held during this period varied from four to six per year. In 2010, six residents held a total of six herring permits. Three of these were held in the PWS herring purse seine fishery, one was held in the PWS roe herring gillnet fishery, and two were held in the PWS closed-pound herring spawn on kelp fishery. A “closed-pound” is a single, floating, rectangular frame structure with suspended webbing that is used to enclose herring long enough for them to spawn on kelp included in the enclosure.³⁵⁸

Local PWS fisheries for Dungeness, red king, and Tanner crab are currently closed due to low stock abundance of these species.³⁵⁹ However, from 2001 to 2004, one permit was held by one Valdez resident in the Southeast Alaska Tanner crab pot gear fishery. The only years during the 2000-2010 that the permit was actively fished were 2002 and 2003.

In addition to CFEC permits, Valdez residents also held Federal Fisheries Permits (FFP) and federal License Limitation Program (LLP) permits between 2000 and 2010. The number of FFPs held increased from five to nine from 2000 to 2006, and then declined to seven by 2010. The first year that an FFP was actively fished during the 2000-2010 period was 2003, and the number of active permits varied from two to four between 2003 and 2010. The number of Valdez residents holding groundfish LLPs declined from nine in 2000 to seven in 2010, and the number actively fished varied from zero to two during this period. No LLP permits were held for federal crab fisheries between 2000 and 2010. Federal permit information is presented in Table 4.

Between 2000 and 2010, Valdez residents held quota share accounts and quota shares in federal catch share fisheries for halibut, sablefish, and crab, with the highest level of participation in the halibut fishery. The number of halibut quota share account holders in Valdez was 26 in the year 2000, declining to 16 by 2010. It is interesting to note that the number of quota shares held did not decrease at the same rate as the number of quota share accounts. On average, the number of quota shares held in each quota share account increased from 24,464 in 2000 to 44,320 in 2008, then declined slightly to 37,107 by 2010. The annual halibut individual fishing quota (IFQ) allotment increased to 41% higher than 2000 levels by 2007, before decreasing to 8% above 2000 levels in by 2010. Information about federal halibut catch share participation is presented in Table 6.

The number of sablefish quota share account holders varied from two to four between 2000 and 2010. The maximum amount of quota shares were held in 2005 (711,077), declining to

³⁵⁸ Alaska Dept. of Fish and Game. 2011. *2011 Southeast Alaska Herring Spawn-On-Kelp Pound Fishery Management Plan*. Regional Information Report No. 1J11-01. Retrieved April 2, 2012 from <http://www.sf.ADFG.state.ak.us/FedAidpdfs/RIR.1J.2011.01.PDF>.

³⁵⁹ Woodby, D., D. Carlile, S. Siddeek, F. Funk, J.H. Clark, and L. Hulbert. 2005. *Commercial Fisheries of Alaska*. Alaska Dept. of Fish and Game, Special Publication No. 05-09. Retrieved December 29, 2011 from <http://www.adfg.alaska.gov/FedAidPDFs/sp05-09.pdf>.

389,073 in 2010. Annual sablefish IFQ allotment followed a similar pattern as the halibut IFQs described above. The value increased to 28% above 2000 levels in 2005, before decreasing to approximately 22% below 2000 levels in 2010. Information about federal sablefish catch share participation is presented in Table 7.

Between 2005 and 2010, one crab quota share account was held each year by a Valdez resident. The number of quota shares held decreased from 65,056 in 2005 to a stable 8,951 from 2006 to 2010. From 2006 to 2008, no IFQ allotment was associated with these quota shares. From 2009 to 2010, the annual crab IFQ allotment increased by 37%. This information is about crab catch share participation is presented in Table 8.

Of the landings reported between 2000 and 2010, the species landed in the greatest volume in Valdez were salmon and halibut. On average between 2000 and 2010, 38,318,995 net pounds of salmon were landed in Valdez, valued on average at \$11,070,777 in ex-vessel revenue. Salmon landings can be reported for all years except 2006 and 2008, for which the information is considered confidential due to the small number of participants. For the 4 years in which halibut landings and revenue were reported, landings averaged 119,942 net pounds, valued at \$281,186 in ex-vessel revenue on average. Landings and revenue information for halibut is considered confidential in years other than 2000-2003 due to low participant numbers. In addition, ‘other groundfish’ landings were reported from 2000 to 2002, averaging 4,096 net pounds landed per year, and an average ex-vessel revenue of \$1,021, while ‘other groundfish’ landings are considered confidential from 2003 to 2010. In the 2000-2010 period, landings and revenue were reported in 2010 only for ‘other shellfish’. All of the 4,668 net pounds were landings from the PWS shrimp pot gear fishery, valued at \$29,132. Landings and revenue in ‘other shellfish’ fisheries are considered confidential in 2000 and 2001, and no permits were held from 2002 to 2009. Information about landings and ex-vessel revenue in Valdez is presented in Table 9.

In addition to the landings delivered in Valdez by fishermen from many communities, landings and ex-vessel revenue earned by Valdez vessel owners, irrespective of port of landing, is of note. Valdez vessel owners made deliveries in many locations around Alaska between 2000 and 2010. Information can be reported in all years during this period for salmon and halibut, and for all years except 2006 for ‘other groundfish’ landings, when the information is considered confidential due to the small number of participants. On average between 2000 and 2010, Valdez vessel owners landed 10,144,922 net pounds of salmon, valued at \$2,323,243 in ex-vessel revenue on average over the period. The next greatest volume of deliveries was in the halibut fishery, with an average of 50,243 net pounds landed per year, and average ex-vessel revenue of \$158,722. For those years in which data can be reported, Valdez residents landed an average of 3,609 net pounds of ‘other groundfish’ during the 2000-2010 period, with an average ex-vessel revenue of \$1,472. In addition, ‘other shellfish’ landings in 2010 totaled 2,531 net pounds for a total ex-vessel revenue of \$14,471 that year. Data for other fisheries, with the exception of crab, are considered confidential between 2000 and 2010 due to low participant numbers. Information about landings by Valdez vessel owners is presented in Table 10.

Of the species landed between 2000 and 2010, shrimp (‘other shellfish’) landings were the most valuable per pound, and halibut were the second most valuable species per pound.

Recreational Fishing

In 2010, there were 19 active sport fish guide businesses and 31 licensed sport fish guides located in Valdez (Table 11). These numbers remained relatively stable over the 2000-2010 period, although there was a peak of 45 licensed guides present in 2003 and 2004. During this period, the number of sportfishing licenses sold to Valdez residents (irrespective of point of sale) varied from 1,470 to 1,813 per year, and the number of licenses sold in Valdez varied from 2,207 to 7,509 per year (Table 11). The greater number of licenses sold locally than sold to residents reflects the fact that sportfishing draws tourism to the Valdez area.

Valdez is located in North Gulf Coast/PWS Statewide Harvest Survey Area which includes all drainages from east of Cape Suckling, through PWS to Gore Point. In 2010, there were a total of 212,793 saltwater angler days fished in the region, compared to 122,459 in 2000, representing a 74% increase. Non-Alaska residents made up 30.4% of total saltwater angler days fished in 2010 in the region, compared to 32.3% in 2000. Regional saltwater angler days fished peaked at 300,205 in 2007. Total freshwater angler days fished increased 90% from 22,979 in 2010 to 12,108 in 2000. Non-Alaska residents made up 57% of freshwater angler days fished in 2010 in the region, compared to 26% in 2000. Total freshwater angler days fished in the region peaked in 2010. Information regarding these regional trends can also be found in Table 11.

³ Alaska Department of Fish and Game. 2011. Alaska Sport Fishing Survey results, 2000 – 2010. ADF&G Division of Sport Fish, Alaska Statewide Harvest Survey project. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sf/sportfishingsurvey/> (Accessed September 2011).

According to a survey conducted by the AFSC in 2011, community leaders indicated that private anglers in Valdez target all five species of salmon, halibut, rockfish, sablefish, crab, and shrimp. They also noted that sportfishing activity takes place using private boats and charter boats, and through shore-based fishing. The Alaska Statewide Harvest Survey,³⁶⁰ conducted by ADF&G between 2000 and 2010, also noted species harvested by Valdez sport fishermen. In freshwater, the survey indicated that Valdez recreational anglers harvest chinook, coho, and sockeye salmon, rainbow trout, cutthroat trout, Dolly Varden, burbot, whitefish, and Arctic grayling. In saltwater, the survey noted sport harvest of all five Pacific salmon species, Dolly Varden char, Pacific halibut, rockfish, lingcod, Pacific cod, and smelt. In addition, the survey noted sport harvest of Dungeness crab, hardshell and razor clams, and shrimp.

Kept/released statistics from charter logbook data reported by ADF&G³⁶¹ show that coho salmon, Pacific halibut, rockfish, and lingcod were the most important species caught by volume

³⁶⁰ Alaska Dept. of Fish and Game. 2011. *Alaska Sport Fishing Survey results, 2000 – 2010*. ADF&G Division of Sport Fish, Alaska Statewide Harvest Survey project. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sf/sportfishingsurvey/> (Accessed September 2011).

³⁶¹ Alaska Department of Fish and Game. 2011. *Alaska sport fish charter logbook database, 2000 – 2010*. ADF&G Division of Administrative Services. Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. [URL not publicly available as some information is confidential.]

during fishing charter trips out of Valdez, with an average of 11,682 coho, 8,873 halibut, 4,632 rockfish (yelloweye, pelagic, and ‘other’ rockfish), and 1,692 lingcod kept between 2000 and 2010. In addition, 978 pink, 79 sockeye, 53 chinook and 45 chum salmon, 70 sharks, and 20 sablefish were kept per year, on average. It is important to note that the species with the highest numbers of releases were Pacific halibut (6,600 released per year on average), lingcod (1,190 per year), rockfish (480 released per year, including yelloweye, pelagic, and ‘other’ rockfish), coho salmon (343 per year), sharks (156 per year), and Chinook salmon (83 released per year, on average).

Subsistence Fishing

Residents of Valdez, including members of the Valdez Native Tribe, continue to practice a subsistence lifestyle.³⁶² In 1992, an ADF&G household survey of subsistence activity found that 97% of Valdez households used subsistence resources that year.³⁶³ Health concerns after the 1989 Exxon Valdez oil spill led to a decline in subsistence activity in PWS communities. In the nearby village of Tatitlek, oil contamination led to an 89% reduction in subsistence harvest in the years following the spill.³⁶⁴ According to the Exxon Valdez Oil Spill Trustee Council, subsistence resources are recovering, although harvest levels in most PWS communities are still below pre-spill levels.³⁶⁵

According to Chugachmiut, a Tribal consortium serving Native communities in the Chugach region, chum salmon have historically been important to subsistence users who dry fish for winter use; halibut are important in subsistence diets; clams remain an important component of subsistence harvests in the region, although commercial harvest of clams has been restricted following the Exxon Valdez oil spill; use of mussels has declined significantly due to high concentrations of petrochemicals still present in mussel beds following the oil spill; and Native Alaskans harvest some sea otters, harbor seals, and Steller sea lions. Populations of harbor seals and Steller sea lions are both depressed in PWS. The collapse of the PWS herring population in the 1990s, one of the primary food sources for both species, is thought to have contributed to population declines.³⁶⁶

Between 2000 and 2010, no information was reported by ADF&G regarding the percentage of households participating in subsistence harvest of various marine resources, or per capita harvest of subsistence resources by Valdez residents (Table 12). In addition, no information is available about the use of marine invertebrates or non-salmon fish (not including halibut) between 2000 and 2010 (Table 13). However, earlier information is available from an ADF&G study of 1992 subsistence harvest. The survey identified species of marine invertebrates and non-salmon fish harvested by Valdez households that year. The species of marine invertebrates harvested by the greatest percentage of Valdez households in 1992 included shrimp (17% of households reported harvest), razor clams (6%), butter clams (5%), Tanner crab (3%),

³⁶⁶ See footnote 362.

mussels (2%), Dungeness crab (1%), and octopus (1%). Additional marine invertebrate species harvested in 1992 included black chitons, red chitons, cockles, horse clams, pinkneck clams, Pacific littleneck clams, scallops, sea cucumber, sea urchin, Dungeness crab, and king crab. The species of non-salmon fish harvested by the greatest percentage of Valdez households included Dolly Varden (20% of households reported harvest), grayling (14%), rainbow trout (13%), lingcod (11%), black rockfish (9%), and herring (9%). Valdez residents also harvested lake trout, Pacific cod, sablefish, flounder, eulachon (hooligan candlefish), cutthroat trout, pike, sea bass, sole, steelhead, sturgeon, Irish lord, red rockfish, burbot, salmon shark, skates, greenling, whitefish, pollock, and wolf fish. In addition, Valdez residents harvested herring sac roe and spawn on kelp roe.³⁶⁷ It is important to note than in many cases, the number of households reporting use of these subsistence resources was greater than the number involved in harvest, indicating the presence of sharing networks in Valdez.

Data are available for the 2000-2010 period regarding annual subsistence salmon and halibut harvest. The number of Valdez households that were issued subsistence salmon permits varied from 181 to 306 between 2000 and 2008. In 2008, the last year for which data were reported, 227 permits were issued and 197 were returned. Sockeye was the most heavily utilized salmon species during this period, averaging 5,919 harvested per year. An average of 193 Chinook were also harvested each year, as well as a small number of pink, coho, and chum salmon. This information about subsistence harvest of salmon is presented in Table 13.

Between 2003 and 2010, the number of Valdez residents that participated in the Subsistence Halibut Registration Certificate (SHARC) program increased from 22 to 38. The greatest subsistence harvest of halibut was reported in 2009, when 4,778 pounds of halibut were harvested on 33 SHARC cards. In 2010, only 6 SHARC cards were reported to have been active. This information about the subsistence halibut fishery is presented in Table 14.

In addition, information was reported by the various management agencies regarding marine mammal harvest by residents of Valdez between 2000 and 2010. According to data reported by the U.S. Fish and Wildlife Service, the number of sea otters harvested varied between 40 and 101 per year, while ADF&G reported harvest of harbor seal varying between 18 and 63 animals per year (for those years in which information was available). No information was reported regarding harvest of beluga whale, walrus, Steller sea lion, or spotted seal between 2000 and 2010. Information about subsistence harvest of marine mammals by Valdez residents is presented in Table 15.

Additional Information

The Good Friday earthquake of 1964, or “Great Alaska Earthquake,” was the largest recorded earthquake in the U.S., with a magnitude of 9.2 on the Richter scale. It struck Prince William Sound on Good Friday, March 28th, 1964. A tsunami with a maximum wave height recorded was 67 meters at Valdez Inlet.³⁶⁸ Shoup Bay near Valdez became famous for the 150-foot tidal wave that supposedly surged in and out of the bay three times during the earthquake.³⁶⁹

Whittier (WIT-ee-er)

People and Place

*Location*³⁷⁰

Whittier is on the northeast shore of the Kenai Peninsula, at the head of Passage Canal. It is on the west side of Prince William Sound, 60 miles southeast of Anchorage. The area encompasses 12.5 square miles of land and 7.2 square miles of water. Whittier was incorporated in 1969 and is now a Second-class city. It is located in the Valdez-Cordova Census Area, and is not under the jurisdiction of a borough.

*Demographic Profile*³⁷¹

In 2010 there were 220 residents ranking Whittier 185th of 352 communities in terms of population size. Between 1990 and 2010, the population declined by 9.5%. Between 2000 and 2009, the population declined by 12.6% with an average annual growth rate of -1.37%, which was much lower than the statewide average of 0.75% and indicative of steady decline. Information regarding population trends can be found in Table 1.

The racial composition of Whittier is predominately White, although there is some diversity. In 2010, 69.5% of residents identified themselves as White, compared to 79.1% in 2000; 13.2% identified themselves as two or more races, compared to 8.2% in 2000; 7.7% identified themselves as Asian, compared to 7.1% in 2000; 5.5% identified themselves as American Indian or Alaska Native, compared to 5.5% in 2000; 3.2% identified themselves as Native Hawaiian or Pacific Islander, compared to 0% in 2000; 0.5% identified themselves as Black or African American, compared to 0% in 2000; and 0.5% identified themselves as some other race, compared to 0% in 2000. In addition, 5.0% of residents identified themselves as Hispanic or Latino, compared to 1.1% in 2000 (Figure 1).

In 2010, the average household size was 1.93, which was a decrease from 2.10 in 1990 and 2.12 in 2000. In that year, there were a total of 280 housing units, compared to 265 in 1990 and 213 in 2000. Of the households surveyed in 2010, 15% were owner-occupied, compared to 16% in 2000; 25% were renter-occupied, compared to 24% in 2000; 22% were vacant, compared to 23%; and 37% were occupied seasonally, compared to 37% in 2000.

The gender distribution in 2010 was somewhat skewed at 56.8% male and 43.2% female, which was more uneven than the statewide distribution (52.0% male, 48.0% female) and distribution in 2000 (52.7% male, 47.3% female). The median age that year was 48.0 years, which was significantly older than the statewide median of 33.8 years and 2000 median of 39.3 years.

Figure 1. Racial and Ethnic Composition, Whittier: 2000-2010 (U.S. Census).

When compared to 2000, the population structure was somewhat less expansive in 2010 (Figure 2). In that year, 15.4% of residents were under the age of 20, compared to 22.5% in 2000; 18.7% were over the age of 59, compared to 9.8% in 2000; 55.0% were between the ages of 30 and 59, compared to 59.7% in 2000; and 11.0% were between the ages of 20 and 29, compared to 7.6% in 2000.

Gender distribution by age cohort was less even in 2010 and in 2000, with relatively equal numbers of male and female biases along age ranges. The greatest absolute gender

difference that year occurred in the 40 to 49 range (11.4% male, 5.9% female), followed by the 30 to 39 (9.1% male, 4.1% female) and 50 to 59 (14.5% male, 10% female) ranges. Of those three, the greatest proportional gender difference occurred in the 30 to 39 range. Information regarding Whittier’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Whittier Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)³⁷² estimated that 95.7% of residents aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 1.4% had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 2.9% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 30.6% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; an estimated 7.7% held an Associate's degree, compared to an estimated 8.0% of Alaskan residents overall; an estimated 25.4% of residents held a Bachelor's degree, compared to an estimated 17.4% of Alaskan residents overall; and an estimated 3.3% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

*History, Traditional Knowledge, and Culture*³⁷³

The Whittier townsite was platted by the U.S. Department of the Interior in 1942 as a terminal for the Alaska Railroad. The U.S. Army selected Whittier as a focal point for several of its operations in Alaska and built a port and rail-tunnel in 1942 and 1943. These facilities were built for the purpose of transporting service-members and materials to Fort Richardson in Anchorage, and Fort Wainwright in Fairbanks.

In 1949, the Army constructed an extensive complex to provide long term support facilities for petroleum-rail operations as well as other military interests throughout Alaska. At the height of military activity in the late 1950s, there were approximately 1,000 people stationed in Whittier. At the time, the military complex there boasted the largest building in Alaska. The now vacant Buckner Building consisted of 1,000 apartments, a hospital, bowling alley, theater, library, two firing ranges, and a host of shops. The building was damaged and abandoned after the 1964 Good Friday earthquake and has since fallen into considerable disrepair. Other structures, most notably the Begich Towers, currently serve as housing and commercial space.

In 1960, the Army declared that Whittier was no longer necessary to its operations in Alaska. Most buildings were abandoned, although many were maintained until 1968.

The 1964 Good Friday earthquake caused considerable damage to Whittier. The ground shook for three to four minutes and land subsidence measured over eight feet. Three massive tsunamis, the largest being over 40 feet in height, struck the town. After it ended, 13 people had died and many port facilities were destroyed.

In 1969, the City was incorporated with a population of approximately 140. Shortly after incorporation, a small boat harbor was built and the newly formed city sought to acquire additional land for development. In 1973, the Shotgun Cove area was annexed to the city. In 1980, the small boat harbor was expanded, and in 1984, freight services in Whittier were improved.

³⁷² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

³⁷³ City of Whittier (1986). *City of Whittier Community Comprehensive Plan*. Retrieved April 19, 2012 from: <http://www.commerce.state.ak.us/dca/plans/Whittier-CP-1986.pdf>.

Natural Resources and Environment

Winter temperatures range from 17 to 28 °F (-8 to -4 °C) and summer temperatures average 49 to 63 °F (9 to 17 °C). Average annual precipitation includes 197 inches of rain and 241 inches of snowfall. High winds are common.³⁷⁴

Whittier is located in the Chugach National Forest, which occupies 5.5 million acres of Southcentral Alaska. Subsurface geology consists mostly of slate and greywacke. Bedrock is overlain by unconsolidated glacial materials and stream gravel. Topography is characterized by steep relief slopes rising abruptly from sea level at 30-60% grades. Mountain altitudes range from 3,500 to 4,500 feet. The Bay Delta and Shotgun Cove areas provide the only shallow relief suitable for development. The Passage Canal connects Whittier to Prince William Sound (PWS). The deep-water port is ice free all year, although subject to strong winds, fog, and precipitation. Seas can reach six feet around the port during poor weather. Ground cover consists of a thick layer of topsoil. Vegetation is mostly comprised of mixed Sitka Spruce and Western Hemlock stands. Undergrowth consists of lichens, grasses, wildflowers, and high-bush blueberries. Disturbed land is covered in scrub alder, blueberry, and salmonberry bushes.³⁷⁵

PWS and surrounding areas are home to a variety of terrestrial and aquatic wildlife. Common fish include rockfish, flounder, all five species of Pacific salmon, lingcod, and Pacific halibut. Salmon sharks, crab, shrimp, and clams are also in the area. Marine mammals include whales, porpoises, seals, sea otters, and sea lions. Terrestrial mammals include black bears, wolves, coyotes, mountain goats, moose, snowshoe hares, porcupines, beavers, river otters, mink, marmots, squirrels, and weasels. Migratory birds such as geese, ducks and cranes frequent the Portage Pass.³⁷⁶

Fishery and recreational resources make up the majority of natural resources utilized locally. Timber is a potential resource; however, commercial timber leases in the PWS area have been halted in order to aid environmental recovery following the 1989 *Exxon Valdez* oil spill.³⁷⁷ As of 2011, there were no active mineral projects in the area; however, the Mineral King and Granite gold/arsenic mines occupy the east and west banks of College Fjord, north of Whittier.³⁷⁸

Environmental hazards present in the community include coastal flooding, wildfire, earthquake, snow avalanche, tsunami, severe weather, landslides, and erosion. Flooding and erosion are primarily caused by storm surges, although rainfall, snowmelt, and glacier outwash flooding contributes as well. In addition, there is the possibility of levee failure as the Whittier Creek Levee is over 50 years old and levee protection has eroded. The last major flooding event occurred in 2006. Severe weather can bring high winds, extreme cold and heavy snow. These hazards can potentially impact local infrastructure, particularly the local small boat harbor. Wildfire potential in the Whittier area has been determined as moderate, although there has been no history of catastrophic wildfires affecting the community. Whittier is located in a potentially damaging seismic area, as evidenced by the 1964 Good Friday earthquake. The area itself is

prone to tsunami inundation, land subsidence, liquefaction, and landslides. Finally, high relief slopes combined with high levels of precipitation in forms of both rain and snow create hazardous conditions for landslides and avalanches on steep slopes behind the West Delta and partway out Shotgun Cove.³⁷⁹

According to the Alaska Department of Environmental Conservation (DEC), there are no notable active environmental cleanup sites located in or around Whittier.³⁸⁰

Current Economy³⁸¹

Whittier's origins as a military outpost led to an emphasis on commercial-industrial port and railroad land uses and dense residential style housing. Although relatively diverse, the community's economy is focused on commercial and recreational fishing and boating in PWS. Tourism is another important industry and the community is connected to other regions of Alaska via the Anton Memorial Tunnel. Cruise ships and the Alaska Railroad bring visitors to the city each summer. Cruise ships dock in Whittier several times per week during summer months and visitors have a range of accommodations and attractions to choose from during their stay.³⁸² Top employers³⁸³ in 2010 included: City of Whittier, Chugach School District, Anchor Inn, Southeast Stevedoring Corporation, Great Pacific Seafoods Inc., VMS Inc., State of Alaska, Begich Towers Condo Association Inc., Shoreside Petroleum Inc., and VECO Alaska Inc.

in 2010,³⁸⁴ the estimated per capita income was \$37,135 and the estimated median household income was \$47,969, compared to \$25,700 and \$47,500 in 2000, respectively. However, after accounting for inflation by converting 2000 values into 2010 dollars,³⁸⁵ the real per capita income (\$33,795) and real median household income (\$62,462) indicate that individual earnings grew while household earnings declined. In 2010, Whittier ranked 21st of 305 communities from which per capita income was estimated, and 142nd of 299 communities from which median household income was estimated.

Whittier's small population size may have prevented the ACS from accurately portraying economic conditions.³⁸⁶ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$3.09 million in total wages in 2010,³⁸⁷ resulting in a per capita income of \$14,024 when matched with the population in 2010. Overall, comparative differences between the ACS and ALARI estimates indicate significantly a lower per capita income than what was reported in both 2000 and 2010.

³⁸⁵ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

³⁸⁶ See footnote 372.

³⁸⁷ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

According to 2006-2010 ACS estimates, 75.9% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 13.2%, compared to an estimated 5.9% statewide; and an estimated 13.7% of residents were living below the poverty line, compared to an estimated 9.5% of Alaskan residents overall. Of those employed, an estimated 37.8% worked in the private sector, an estimated 46.9% worked in the public sector, and an estimated 15.4% were self-employed.

By industry, most employed residents were estimated to work in public administration sectors (23.8%) in 2010; followed by arts, entertainment, recreation, accommodation, and food service sectors (21.7%); and other services, except public administration (11.2%). By occupation type, most employed residents were estimated to hold management or professional positions (35%) that year; followed by service positions (26.6%); sales or office positions (18.2%); natural resources, construction, or maintenance positions (14.7%); and production, transportation, or material moving positions (5.6%). Overall, there was significant growth in public administration and other service, except public administration sectors. Most other sectors saw declines during those years. In addition, there was moderate growth in the number of employed residents estimated to hold service positions, while there was a decline in the number of employed residents estimated to hold production, transportation, and material moving positions. No residents were estimated to work in agriculture, forestry, fishing, hunting, or mining sectors in 2010. However, it should be noted that many resource based sectors, including commercial fishing, are seasonal or transient in nature. This makes tracking them by conventional ACS survey methods difficult in some instances. Information regarding employment trends can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Whittier (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Whittier (U.S. Census).

Governance

Whittier is a Second-class city with a mayoral form of government. There is a seven-member city council, five-member school board, five-member planning commission, and six municipal employees. The community was not included in the Alaska Native Claims Settlement Act (ANCSA) and does not possess a U.S. Bureau of Indian Affairs (BIA) recognized Tribal council. The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish and Game (ADF&G), and U.S. Bureau of Citizenship and Immigration Services (BCIS) offices are located in Anchorage, 60 miles northwest.

In 2010, the city administered a 5% sales tax between April and September, a 5 mill property tax, and a \$2.50 Passenger Transportation Tax. Municipal revenue figures were taken from financial audits, and report total governmental funds.³⁸⁸ When adjusted for inflation,³⁸⁹ total municipal revenues increased by 36.4% between 2000 and 2010 from \$2.62 million, to \$4.63 million. In 2010, general funds accounted for 37.3% of total municipal revenues. In that year, most (62.7%) general funds were collected from local taxes, followed by rental and lease revenues (15.0%), state revenue sharing (8.0%), and federal revenues (5.9%). Cruise ship tax revenues accounted for 22.6% of total municipal revenues, while several capital projects accounted for 38.8%.

Sales taxes accounted for 12.1% of total municipal revenues in 2010, compared to 6.6% in 2000. In addition, state allocated Community Revenue Sharing accounted for 2.9% of revenues, compared to 2.5% from State Revenue Sharing in 2000. Between 2000 and 2010, Whittier was awarded over \$7.94 million in federal and state fisheries-related grants. These grants went to harbor and dock expansion and maintenance and a new breakwater. Information regarding community finances can be found in Table 2.

Infrastructure

*Connectivity and Transportation*³⁹⁰

Whittier has an ice-free port and two city docks (70-foot cargo dock and 60-foot floating passenger dock). A small boat harbor has slips for 360 fishing, recreation, and charter vessels. It is served by road, rail, the state ferry, boat, and aircraft. Since 2000, a tunnel has provided a road connection to Anchorage and the rest of the Alaska highway system. The Anton Anderson Memorial Tunnel was reconstructed to accommodate both rail and road vehicles. The railway carries passengers, vehicles, and cargo 12 miles from the Portage Station east of Girdwood. The state-owned 1,480-foot long by 58-foot wide gravel airstrip accommodates charter aircraft, and a city-owned seaplane dock is available for passenger transfer.

Facilities

Water is derived from wells and a reservoir. Water storage capacity is 1.2 million gallons. The entire community is served by a piped water and sewer system, and over 95% of homes are fully plumbed. Refuse is hauled out by a private contractor to Anchorage - the local landfill has been closed. An oil and hazardous waste recycling center is available. Electricity is provided by

³⁹⁰ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

hydroelectric and natural gas generators. Visitor accommodations include June’s Whittier Bed & Breakfast, The Anchor Inn, The Inn at Whittier, and Sportsman’s Inn. Public safety is provided by city police and state troopers based in Girdwood. Fire and rescue services are provided by city volunteer fire department, Anton Anderson Memorial Tunnel Fire Department, and local Emergency Medical Services. Additional public facilities include a community hall, school gym, museum, and library. Communications services include local and long distance telephone, internet, and local and cable television.³⁹¹

Most residents rent or own condominiums in the Begich Towers or Whittier Manor. The six-unit Anchor Annex and several single family homes contribute addition housing. Although most units in the Begich Towers are reserved for living space, several floors are zoned for commercial uses.

Whittier acts as a freight exchange hub for barge service between Alaska and the rest of the contiguous United States and Canada. Several barge services and transport agencies move freight through Whittier including Lynden Transport, Alaska Railroad Corporation, Alaska Railroad Marine Services, and Canadian National. As of 2010, berth capacity of public mooring facilities was insufficient, and unmet demand was estimated at between 1,500 and 2,000 berths for recreational vessels. A private marina was completed in 2004. Fisheries-related businesses and services include marine fuel, marine repair and welding, dry-dock storage, haulout facilities, self-storage facilities, and charter services. Cruise ship facilities include a dock and 20,000 square-foot terminal capable of accommodating one cruise ship visit per day. Whittier acts as a “turnaround” point for cruise ships rather than a port of call. Visitors embarking or disembarking rely on the Alaska Railroad for transportation to and from Anchorage. The airport is non-towered and not maintained in the winter. High winds and poor weather common to Whittier often make landing difficult and there is no scheduled air service.³⁹²

*Medical Services*³⁹³

The Whittier Medical Clinic is located in the Begich Towers. The facility provides basic health care and has a nurse practitioner and community health practitioner on staff. Emergency medical staff tends to a range of local and regional medical-related issues and are often tasked with addressing issues aboard cruise ships

*Educational Opportunities*³⁹⁴

Whittier Community School offers preschool through 12th grade instruction. In 2011, 19 students were enrolled and there were 4 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Whittier's history as a military and transportation hub predates its involvement in North Pacific fisheries and much of PWS's extensive fisheries history is tied to Cordova and the Copper River. However, after military operations ceased the community became increasingly dependent on commercial and recreational fishing. Today, Whittier is one of the most popular sportfishing communities in the state as evidenced by the overcrowding of small vessel berths and constant summer influx of tourists.

Fish targeted in Whittier include all five species of Pacific salmon, cod, halibut, herring, rockfish, eel, trout, char, king crab, tanner crab, and Dungeness crab. Great Pacific Seafoods constructed a commercial seafood processor and in 2003, 11 million pounds of seafood was processed at the facility. Fish are pumped from tenders at the Alaska Railroad Corporation dock. Minimally processed fish is primarily transported to Anchorage for secondary processing. All five species of Pacific salmon from the Copper River and PWS make up the majority of landings. The remainder includes halibut and black cod. Most of Whittier's commercial fishing fleet consists of gillnetters, followed by purse-seiners and long-liners.

Built in 1985, the Wally Noerenberg Hatchery is the closest hatchery to Whittier; located 20 miles east in Lake Bay. The hatchery is the largest pink salmon production facility in North America. In 2001, 7.2 million pink and 2.4 million chum salmon returned to the facility. Additional PWS hatcheries are located in Valdez, Main Bay, Sawmill Bay, and Cannery Creek.

Whittier is located in Federal Reporting Area 649, International Pacific Halibut Commission (IHPC) Regulatory Area 3A, and the Central Gulf of Alaska (GOA) Sablefish Regulatory District. As of 2010, Whittier was ineligible for participation in the Community Quota Entity (CQE) program for GOA communities.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, there are two active shore-based processing plants in Whittier. Fee's Custom Seafoods provides custom processing for sport fishermen in Whittier. The plant began operations in 2003.³⁹⁵ The facility, located "on the Triangle" in Whittier, is open during the summer in conjunction with the Prince William Sound salmon (sockeye, coho, chum) runs. Fee's Custom Seafoods also processes halibut, spot prawns and side stripe shrimp.³⁹⁶ Employees are on an "on call" basis and the plant processes mostly for charter businesses.³⁹⁷

Great Pacific Seafoods was founded in 1977 and has a small seafood processing facility in Whittier that began operations in 1993.³⁹⁸ Its salmon season is from May to September, during which it employs up to 130 workers.³⁹⁹

³⁹⁵ This information is based on the results of a processing plant survey conducted by the Alaska Fisheries Science Center in 2011.

³⁹⁹ Ibid.

Fisheries-Related Revenue

Whittier receives fisheries-related revenue from both Shared Fisheries Business Taxes and harbor usage fees. In 2010, \$1.17 million was collected in fisheries-related revenue, compared to \$776,566 in 2001. Fisheries-related revenue totals are incomplete for 2000 and 2005 because of missing harbor fees data. Fisheries-related revenue peaked in 2009 at \$1.25 million. Information regarding fisheries-related revenue trends can be found in Table 3. It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In 2010, 12 residents, or 5.5% of the population, held 18 permits issued by the Commercial Fisheries Entry Commission (CFEC). In 2000, 9 residents held 18 CFEC permits. Of the CFEC permits held in 2010, 17% were for salmon, compared to 11% in 2000; 17% were for groundfish, compared to 61% in 2000; 6% were for sablefish, compared to 6% in 2000; 6% were for halibut, compared to 6% in 2000; and 56% were for other shellfish, compared to 17% in 2000. Of the CFEC permits held in 2010, 61% were actively fished, compared to 11% in 2000. This varied by fishery from 100% of salmon, sablefish, and halibut permits; to 50% of other shellfish and 33% of groundfish permits. Fifty-percent of FFP were actively fished and 0% of LLP were fished in 2010. Fisheries prosecuted by Whittier residents in 2010 included: statewide longline halibut, statewide hand troll ling cod, PWS pot shrimp, PWS fixed gear sablefish, PWS drift gillnet salmon, and Cook Inlet drift gillnet salmon.⁴⁰⁰

In addition, two residents held two Federal Fisheries Permits (FFP) and three residents held three License Limitation Program (LLP) groundfish permits that year. Residents held 8,474 shares of halibut quota on two accounts in 2010, compared to 77,054 shares held on four accounts in 2000. No residents held sablefish or crab quota between 2010 and when the programs began.

Residents held 27 commercial crew licenses in 2010, compared to 17 in 2000. In addition residents held majority ownership of 13 vessels, compared to 13 in 2000. In 2010, 330 vessels landed 15.94 million pounds of fish valued at \$10.10 million in Whittier, compared to 5.30 million pounds valued at \$3.67 million landed by 326 vessels in 2000. Salmon landings totaled 15.65 million pounds valued at \$9.34 million in 2010, compared to 4.85 million pounds valued at \$2.65 in 2000; a decrease of approximately \$0.15 per pound landed after adjusting for inflation⁴⁰¹ and without considering the species composition of landings. Halibut landings totaled 78,990 pounds valued at \$320,445 in 2010, compared to 303,961 pounds valued at \$787,381 in 2000; an increase of approximately \$0.50 per pound after adjusting for inflation.⁴⁰² Shrimp landings totaled 68,855 pounds valued at \$321,664 in 2010. Sablefish landings totaled 11,662 pounds valued at \$59,059 in 2010, compared to 29,957 pounds valued at \$70,183 in 2003; an

increase of \$1.79 per pound after adjusting for inflation.⁴⁰³ Other groundfish landings totaled 36,573 pounds valued at \$20,375, compared to 29,526 pounds valued at \$19,555 in 2000. All other 2010 landings in Whittier are considered confidential. In addition, landings by Whittier residents between 2000 and 2010 are considered confidential for most years. However, in 2010 residents landed 3,006 pounds of Pacific cod valued at \$23,973 and 180,990 pounds of salmon valued at \$148,038. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Whittier's position as an embark/disembark port for cruise ships contributes substantially to its recreational fishing industry, as does the City's access to Alaska's highway system. As of 2005, fishing and hunting guide businesses outnumbered all other local tourism related businesses at 15 providers. Sightseeing came second at 10 providers.⁴⁰⁴ The Whittier Chamber of Commerce listed 15 local charter, guide service, and cruise service companies as of 2012.⁴⁰⁵ In 2010, there were five registered sport fish guide businesses active, compared to two in 2000. In addition, five sport fish guide licenses were held that year, compared to three in 2000. Charter log records kept by ADF&G report that in 2010, charter operators in Whittier kept 1,428 coho salmon, 4,497 halibut, 571 lingcod, 1,271 rockfish, one shark, 16 sablefish, and 276 unidentified salmon.⁴⁰⁶

In 2010, 76 sportfishing licenses were sold to Whittier residents and 1,072 were sold in the community, compared to 78 and 812 in 2000, respectively. Sportfishing license sales in the community peaked in 2002 at 1,360. Whittier is located in North Gulf Coast/PWS Statewide Harvest Survey Area which includes all drainages from east of Cape Suckling, through PWS to Gore Point. In 2010, there were a total of 212,793 saltwater angler days fished in the region, compared to 122,459 in 2000, representing a 74% increase. Non-Alaskan residents made up 30.4% of total saltwater angler days fished in 2010 in the region, compared to 32.3% in 2000. Regional saltwater angler days fished peaked at 300,205 in 2007. Total freshwater angler days fished was 22,979 in 2010, compared to 12,108 in 2000; an increase of 90%. Non-Alaskan residents made up 57% of freshwater angler days fished in 2010 in the region, compared to 26% in 2000. Total freshwater angler days fished in the region peaked in 2010. Information regarding these sportfishing trends can be found in Table 11. According to ADF&G Harvest Survey data,⁴⁰⁷ local private anglers target all five species of Pacific salmon, Pacific halibut, rockfish, lingcod, Pacific cod, shark, and shrimp.

Subsistence Fishing

Subsistence harvesting is not widely practiced by residents of Whittier. Although ADF&G subsistence harvest data is limited, reports show limited involvement. Information on subsistence participation by household and sea mammal subsistence harvesting is unavailable. Of the species listed by ADF&G in Table 13, sockeye salmon was the only species residents reported harvesting between 2003 and 2008. During those years, residents reported harvesting 85 total salmon. In 2010, two residents held Subsistence Halibut Registration Certificates (SHARC), compared to one in 2003. However, between 2003 and 2010 no halibut harvests were reported. Information regarding subsistence trends can be found in Tables 12 through 15.

People and Place

Location

Covering a total of 135,525 square miles, the Northern Alaska region is occupied by both the Northwest Arctic Borough and North Slope Borough. Selawik (66.60° N by -160.00° W) occupies the southernmost point of the region, while Barrow (71.29° N by -156.79° W) occupies the northernmost point. The region is bordered by the Chuckchi Sea to the west, Beaufort Sea to the north, and Yukon Territory, Canada, to the east. The region's largest city, Barrow, is located 725 miles from Anchorage.

Demographic Profile

A total of 11 communities met profiling criteria within the Northern Alaska region; six of which had populations over 500, including three that had populations over 2,000. The total regional population in 2010 was 16,953, 24.8% of which lived in Barrow. Almost 13% of area residents reside in Prudhoe Bay, although most of those residents are non-permanent oil workers. At 3,201 residents (19.3% of the region's population), Kotzebue is the regional center for the Kobuk River and Kotzebue Sound sub-region. It is also the center for commercial fishing within the Northern Alaska region.¹

In 2010, 71.1% of residents in the region identified themselves as at least part American Indian or Alaska Native, 23.7% identified themselves as White, 3.5% identified themselves as at least part Asian, 1.4% identified themselves as at least part Black or African American, and 1.1% identified themselves as at least part Native Hawaiian or Other Pacific Islander. In addition, 1.8% of residents identified themselves as Hispanic or Latino.² It should be noted that almost half of the residents who identified themselves as White in 2010 resided in Prudhoe Bay, whose 2010 Decennial Census population is grossly misrepresentative of the community's permanent population due to the seasonal presence of oil exploration company employees. According to Alaska Department of Labor (DOL) population estimates, Prudhoe Bay had a permanent population of three in 2009.³ DOL population estimates are based on addresses listed on Alaska Permanent Fund Dividend applications, and are likely more reliable sources of permanent residents in some instances.

The region's economy is mixed. Prudhoe Bay is entirely dependent on oil extraction and exploration, while most other communities in the area are dependent on a subsistence economy. Commercial fishing is limited for communities within the North Slope Borough. Under the current Arctic Fishery Management Plan (FMP), commercial fishing is prohibited in federal waters.⁴ Limited commercial fishing does occur in state waters however. While communities within the Kotzebue Sound region are also governed by the current Arctic FMP, commercial

fishing in that area is more intensive due to a state regulated salmon fishery. Kotzebue is a service and transportation center for many villages in the Northwest Arctic Borough. Due to its location at the confluence of three river drainages, Kotzebue is the transfer point between ocean and inland water shipping and also the air transport center for the region. Activities related to oil and mineral exploration and development have contributed to the economy. Barrow is the economic center of the North Slope Borough, the city's primary employer, and numerous businesses provide support services to oil field operations. State and federal agencies also provide employment. The midnight sun has attracted tourism, and arts and crafts provide some cash income. Smaller villages within the region largely depend on local government and education services for wage employment.

In 2010,⁵ the estimated per capita income for the Northern Alaska region was \$21,694 and the estimated median household income was \$61,867. Broken down by community, estimated per capita and median household incomes were similar across the region. Of those aged 16 and older, an estimated 64.9% were considered part of the civilian labor force. Of those employed, most (30.5%) worked in education services, health care, and social assistance sectors; followed by public administration (18.0%) and transportation, warehousing, and utilities sectors (10.3%). Finally, an estimated 25.3% of residents were unemployed in 2010.

It should be noted that U.S. Census statistics do not represent the value of subsistence to the regional economy, and many residents who hold seasonal wage positions, including those in commercial fisheries, may have been misrepresented during Census sampling. Subsistence resources are not only consumed by individual household units, but are traded throughout the community (and the region) for other goods and services, supplying an “informal” economy that is difficult to measure using traditional survey methods. However, the informal subsistence economy is essential in communities where standard wage employment is scarce, and living expenses are high.⁶

History

Approximately 10 to 25 thousand years ago, during the Pleistocene Ice Age, the level of the ocean was up to 300 feet lower than present levels. At that time, the Seward Peninsula was connected to the Asian continent via the Bering land bridge, which formed a flat, grassy, treeless plain.⁷ The land bridge is thought to have been a primary route by which humans migrated to the North American continent from Asia. Archaeologists have identified evidence of human inhabitation in the Bering Land Bridge National Preserve dating to 12,000 years before the present.⁸ Archaeological findings in northwest Alaska indicate that people have continuously occupied the Kotzebue Sound area for the past 4,000 years. Two cultures can be linked with

continuous occupation of the Kotzebue Sound area: the Arctic Small Tool tradition (4,200 to 1,000 years ago) and Northern Maritime tradition (1,400 years ago to present).

Most settlements were semi-permanent as most people of the area followed migratory caribou herds. But the coastal resources of the area allowed for permanent settlement, and *Kikitaruk* (present day Kotzebue) established itself as a regional trading hub. Centuries before European contact, *Kikitaruk* was a busy center of trading activities and a stopping point for trade routes throughout the Arctic linking Siberian Chukchi and northern MacKenzie Eskimos and Canadian Athabascans. Interior peoples traded furs, jade, salmon skin clothing, and birch bark baskets for muktuk, seal oil, ivory, and walrus hides from coastal peoples. Tobacco, metal implements, and firearms reached the Kotzebue and Norton Sound region before trade routes from Russians were established.⁹

Around 1,000 years ago, the Thule culture expanded into the North Slope region, characterized by winter ice-hunting, kayak and umiaq¹⁰ open sea hunting, use of dogs and dog sleds, and settlement in large coastal villages.¹¹ Although major settlements have always occurred on the North Slope, traditionally people lived in small groups and travelled throughout the region to hunting and fishing areas. Today, most people live in permanent villages, “yet the animals still roam widely, and seasonal locations for fishing and trapping are scattered over a vast territory.”¹² The use of snowmachines and motor boats allows residents to extend the range of their subsistence use while still living in a permanent community.¹³

Exploration of the Naval Petroleum Reserve Number 4 (now National Petroleum Reserve in Alaska, NPR-A) began in 1946. The Prudhoe Bay oilfields have been heavily developed since the 1970s, following the completion of a oil pipeline connecting the North Slope with Valdez. The pipeline has 12 pump stations and a maximum capacity of 2 million barrels of crude oil per day.¹⁴

Natural Resources and Environment

The weather in the North Slope Borough is arctic with temperatures ranging from -56 to 78 °F. Precipitation is about 5 inches per year; however, snowfall averages approximately 20 inches. The coastal region of the Baldwin Peninsula, where Kotzebue is located, is in the transitional climate zone, which is characterized by long, cold winters and cool summers. The average low temperature during January is -12 °F; the average high during July is 58 °F. Temperature extremes have been measured from -52 to 85 °F. Annual snowfall averages 40

inches, with total precipitation of 9 inches per year. Kotzebue Sound is ice-free from early July until early October.¹⁵

The Baldwin Peninsula is composed primarily of unconsolidated Quaternary sediments. These sediments are mostly eolian, glacial, and marine in origin. Illinoian glaciers deposited till and outwash over marine sediments. Loess was deposited over the glacier sediments during glacial retreat. Sea level rose, and in some areas, marine sediments were deposited over the eolian silts. Late Wisconsin and Holocene sediments are primarily silts, clays, and fine sands; with the oldest sediments exposed on coastal bluffs. An exploratory petroleum well drill 10 miles east of Cape Blossom hit bedrock at a depth of 900 feet. The nearest bedrock outcrops at sea level are on the Choris Peninsula to the southeast, at Ekichuk Lake on Hotham Inlet to the northeast, and at Cape Krusenstern Lagoon northwest of the project site. The Baldwin Peninsula is located within a zone of continuous permafrost. The depth of the bottom of permafrost is probably between 200 and 300 feet. During the summer, the active permafrost layer extends two to four inches beneath the surface.¹⁶ The prominent vegetation type on the Baldwin Peninsula is moist coastal tundra. Continuous, uniformly developed cotton grass tussocks with sparse groups of other sedges and dwarf shrubs dominate. Few trees grow in the area, particularly near Kotzebue. However, some stands can be found in the Noatak and Kobuk River drainages, and driftwood is scattered along the coast. Kotzebue residents collected various edible plants including greens, berries (cranberries, salmon berries, blue berries, and black berries), and roots. Cotton grass, wild rhubarb, and wild onion, wild peas, willow leaves, and sprouts are also traditionally gathered.¹⁷

The primary mineral development project on the Baldwin Peninsula is the Red Dog Mine, which is the world's largest zinc and lead mine. Mineral deposits are located in the DeLong Mountains, which are part of the Brooks Range. The Kobuk River Valley contains many placer gold deposits. On Jade Creek, gold and jade deposits can be found. The Ambler Mining District, east of Kotzebue, has vast deposits of jade, copper, and other minerals. The Noatak District, north of Kotzebue, contains gold deposits at Lucky Six Creek. The Selawik District, southeast of Kotzebue, has one reported gold operation on Shovel Creek, which was mined until shortly after World War II. Finally, the Shungnak District, east of Kotzebue, contains many placer gold deposits throughout several drainages.¹⁸

The coastal landscape of the North Slope is characterized by bays and inlets, lagoons with barrier islands, gravel and sandy shores, basins, shallow lakes, and deltas. Coastal plains are characterized by low terraces, floodplains, shallow lakes, and streams. Peat bluffs run about 40 miles southwest of Barrow's coastline. Soils are generally poorly drained sandy loams, peats, and marine sediments. The permafrost layer generally ranges from 650 to 1,300 feet deep. Coastal plains ecoregions are characterized broadly as nearshore wet tundra and river floodplains. Vegetation is extremely limited within these coastal areas, where grasses prevail.

Natural resources in the area include the expansive North Slope oil and gas fields, as well as several offshore oil and gas fields in the Beaufort and Chukchi seas. Production in the North Slope area began in the 1970s and reached a production rate of 2.2 million barrels per day by

¹⁵ Ibid.

¹⁷ Ibid.

¹⁸ Stoops, L. (2004). *Northwest Arctic Borough Comprehensive Economic Development Strategy*. Retrieved August 20, 2012 from: <http://www.commerce.state.ak.us/dca/plans/NorthwestArcticBorough-EDP-2004.pdf>.

1988. However, by 2007 production had declined to 720,000 barrels per day representing approximately 14% of U.S. domestic production at that time. By the end of 2007, the North Slope oil fields had produced 15.7 billion barrels of oil, with about 6.1 billion barrels of economically recoverable oil remaining. As of 2009, gas reserves of the North Slope were estimated at approximately 35 trillion cubic feet. However, long-term (2005 to 2050) optimistic assumptions estimate the total amount of economically recoverable oil to total 35 to 36 billion barrels and economically recoverable gas to total 137 trillion cubic feet. However, these projections are contingent on the opening of Area 1002 of the Arctic National Wildlife Refuge (ANWR) to extraction.¹⁹

Governance

The Northern Alaska region is governed by two boroughs: the Northwest Arctic Borough (Kotzebue Sound sub-region), and the North Slope Borough (North Slope sub-region). With the exception of Prudhoe Bay, all profiled communities within the region are incorporated into municipalities and have federally recognized Tribal governments and Alaska Native Claims Settlement Act (ANCSA) chartered Native village corporations. The regional ANCSA chartered Native corporation representing Northern Alaska include NANA Regional Corporation (Kotzebue Sound sub-region) and Arctic Slope Regional Corporation (North Slope sub-region). The regional ANCSA chartered non-profit corporations include Arctic Slope Native Association (North Slope sub-region), and Maniilaq Association (Kotzebue Sound sub-region).

In 2010, the North Slope Borough administered an 18.5 mills property tax. The Northwest Arctic Borough did not administer any taxes that year. No communities are eligible to participate in the federal Community Development Quota program.

Involvement in North Pacific Fisheries

As previously mentioned, the current Arctic FMP prohibits commercial fishing in federal waters. Most commercial fishing effort is concentrated on the Kotzebue Sound area in state waters, where a summer chum salmon season runs from July through August in the Noatak and Kobuk river systems. Small harvests of sockeye, Chinook, coho, and pink salmon also occur, but at a negligible level. Dolly Varden are, at times, incidentally harvested during the final weeks of the salmon season.²⁰ Commercial catches vary from year to year due to changes in migration patterns of chum salmon. Fishing usually begins in mid-July when fishermen in small outboard skiffs fish set gillnets. Kotzebue chum salmon are of high quality and are in high demand. Fish are typically dressed with heads on, iced, and transported to offshore Japanese freezer ships or shipped to Anchorage or Seattle markets. Commercial fisheries for Arctic char and inconnu (whitefish) also occur. Arctic char run later than salmon and are fished following the salmon season.

Funding for the State-owned Sikusuliaq Springs Fish Hatchery on the Noatak River was discontinued in 1983. The State had invested close to \$20 million in capital improvement and operating costs of the hatchery.²¹ The hatchery closed in 1996, however runs continued until 2000.²²

A commercial fishery for sheefish has operated in the Kotzebue Sound since the 1960s, but is historically small and does not contribute significantly to the local economy. In most years, sheefish quota was not met, and the fishery remained open throughout the winter. Fishermen use gill setnets under ice, and most commercial catch is sold to local residents or kept for personal use.²³ No sheefish have been fished commercially since 2005. The Alaska Department of Fish and Game (ADF&G) permits commercial harvests of freshwater species including whitefish, sheefish, char, northern pike, blackfish, and Arctic lamprey in the Northern Region, north of Point Hope. Arctic least cisco are commercially harvested within the Colville River delta (60 miles west of Prudhoe Bay) from October through November.²⁴

As of 2010, there were no shoreside processors registered with ADF&G within the region, although several fish brokers were located in Kotzebue.²⁵ While landings were reported in Kotzebue that year, totals are considered confidential. In addition, despite commercial fishing permits being actively fished in Barrow, Kivalina, Kotzebue, and Noatak, landings were only reported by residents of Barrow. Again, landings made by residents are considered confidential.²⁶

In 2010, residents held a total of 179 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC), 82.7% of which were held by residents of Kotzebue. Of those permits, only 39.1% were actively fished. Salmon accounted for 96.6% of total CFEC permits held in 2010, while freshwater finfish, crab, “other” shellfish, and herring making up the few remaining.²⁷ No residents held quota share for halibut, sablefish, or crab fisheries.²⁸

Tourism is a rapidly growing industry in Kotzebue, driven in large part to sport hunting and fishing. To complement this growth, tourism infrastructure has been expanding. NANA Regional Corp. opened a new 78 room hotel in Kotzebue in 2011.²⁹ Golden Eagle Outfitters provides guided sportfishing excursions, targeting Dolly Varden northern pike, sheefish, Arctic grayling, and chum salmon.³⁰ Sheefish are a popular target for private anglers on the Kobuk River, as the river supports one of the largest sheefish populations in the world. Typically, private anglers based in Kotzebue will fly to remote locations on the Upper Kobuk River to target this species. The communities of Ambler and Kobuk are seasonally inundated with recreational fishermen, many of whom originate in Kotzebue or Bettles. Dolly Varden, northern pike, Arctic grayling, burbot, lake trout, and Arctic char are also popular targets within the Kobuk River watershed.³¹ Outside the Kotzebue region, recreational fishing is less popular. For example, the communities of Point Lay, Wainwright, Nuiqsut, Prudhoe Bay, and Kaktovik did not have registered sport fish guide businesses between 2000 and 2010, and Barrow has not had one since 2005.

In 2010, there were three registered sport fish guide business in the Northern Alaska region: one in Kiana and two in Kotzebue. In that year, 730 sport fish guide licenses were sold in the region, 60.0% of which were sold in Kotzebue. In addition, 941 sportfishing licenses were held by residents; 44.7% of which were held in Kotzebue, and 33.4% of which were held in Barrow.³²

Subsistence activities are extremely important to Northern Alaska residents. In the Kotzebue Sound region, The subsistence season begins each year at spring ice breakup, usually in May. During breakup, travel becomes increasingly difficult, and many residents move to seasonal subsistence camps on the coast northwest of Kotzebue before travelling on ice becomes unsafe. When the water becomes open enough to permit boat travel, local hunters go out in search of marine mammals, particularly bearded seal, but also ringed seal and walrus. Migrating waterfowl are also hunted, and their eggs are gathered when available. Near Kotzebue, residents continue to jig for sheefish on the last remnants of shoreside ice. As the ice clears, residents fish for herring, whitefish, and Dolly Varden. Beluga whale hunting also begins at this time. From a subsistence perspective, May through July is the busiest time of year for harvesting. With cool, dry weather, oil and “black meat” (half-dried bearded seal) is produced from harvested seal.³³

Summer arrives in late June or July. At this time many residents turn their efforts towards salmon fishing for both subsistence and commercial purposes. Berry picking begins around this time, and many residents gather salmonberries, blueberries, blackberries, and cranberries. Incidental Dolly Varden harvesting begins in early August. Salmon fishing concludes around the end of August, while berry picking continues through September. Migrating caribou herds make their way through the area around the beginning of fall in late August. Both caribou and moose

³³ See footnote 23.

are hunted during this time. As sea ice begins to form in October, Kotzebue hunters pursue young bearded seals and spotted seals. Saffron cod (tomcod) are jigged on ice forming near shorelines. During the winter, caribou, moose, ptarmigan, and hare are hunted. Wolf, wolverine, and fox are also hunted or trapped for furs. In early winter, nets are set under the ice in the Hotham Inlet to fish for sheefish. In late winter, sheep hunting takes place in the Baird Mountains, and moose, caribou, seal, and fur bearer hunting continues.³⁴ Coastal communities on the North Slope rely on bowhead whale, seal, walrus, beluga whale, salmon, whitefish, and arctic grayling. Rod and reel, gill net, and jigging are techniques used to harvest fish in the summer, while gill nets and jigs are used in the winter.³⁵ Whale hunts are a central part of Barrow's identity, and a focal point of cohesion and reciprocity within the community.³⁶

In 2008, residents reported harvesting 843 salmon, 88.0% of which were reported by residents of Barrow. Sockeye accounted for 80.2% of salmon harvests reported for that year, while Chinook accounted for 18.6%.³⁷ It is important to note that reported harvests may not have occurred locally. Also in 2008, an estimated 27 walrus and 15 polar bear were harvested in the region, most by residents of Barrow.³⁸

Regional Challenges

Challenges impacting Northern Alaska residents are largely tied to climate change and oil extraction. Expansion of oil development in the ANWR, particularly within the currently closed Area 1002, has become a source of conflict between proponents of development and those concerned with potential impacts to the local ecosystem and migratory caribou herds.³⁹ In addition, drilling operations within the Beaufort Sea can potentially pose risks to aquatic subsistence resources heavily relied upon by local communities.

Climate change, particularly sea ice retreat, is already impacting the availability of subsistence resources. Marine mammals dependent on sea ice (e.g., ice seals and walrus) retreat further offshore in search of suitable haul-out locations, making them more costly for subsistence hunters to harvest. As conditions continue to change, food chain disruptions may impact the abundance of subsistence resources across trophic scales. Communities' ability to predict and adapt to impacts from climate change is both crucial and challenging. Moreover, the risks to current Traditional Ecological Knowledge systems due to rapidly changing environmental conditions pose additional challenges to local adaptation.⁴⁰

Some species may experience an increase in abundance as pack ice retreats. These include marine mammals such as beluga and bowhead whales, harbor and harp seals, and walrus. This may in turn have a beneficial impact on the subsistence economy. Sub-arctic fish populations, including whitefish, Northern pike, and lake trout, may experience changes to their range and availability. Depending on local conditions, these changes could come in the form of increases or declines in abundance.⁴¹

Finally, sea ice melt may alter climatic conditions in ways that could threaten community infrastructure. Changes in the seasonality of sea ice pack not only increases the frequency and intensity of fall and early winter storms, but leaves shorelines more exposed to erosion as well; as is occurring already in Kivalina.⁴² If the rate of sea ice retreat continues to the point that seasonal shipping routes become viable, a unique set of challenges and opportunities may be imposed on communities in Northern Alaska. Already limited shipping is being undertaken along Russia's Northern Sea Route.⁴³

Barrow (BARE-row)

People and Place

*Location*⁴⁴

Barrow, the northernmost community in the United States, is located on the Chukchi Sea coast, 10 mi south of Point Barrow, from which it takes its name; and 725 mi northwest of Anchorage. The area encompasses 18.4 sq mi of land and 2.9 sq mi of water. Barrow was incorporated as a Fourth-class city in 1958. Today, the community is a First-class city and North Slope Borough seat.

Demographic Profile^{45,46}

In 2010, there were 4,212 residents, ranking Barrow 27th of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population grew by 21.4%. Between 2000 and 2009, the population fell by 10.1% with an average annual growth rate of -0.97%; which was somewhat lower than the statewide average of 0.75% and indicative of recovering growth following a steady decline between 2000 and 2007. According to a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that the permanent population was estimated at 4,380 based on a household survey. In addition the estimated number of seasonal or transient workers living in Barrow was 30 to 50. Seasonal employment is primarily driven by construction projects in the area, and the seasonal population depends on when projects are available. Population peaks are not at all driven by employment in the fishing sectors, but rather by construction and tourism. Information regarding population trends can be found in Table 1.

Barrow's racial composition is relatively diverse, with a majority Inupiat Eskimo population. In 2010, 61.2% of residents identified themselves as American Indian and Alaska Native, compared to 57.2% in 2000. Also in that year, 16.9% the population identified themselves as White, compared to 21.8% in 2000; 9.1% identified themselves as Asian, compared to 9.4% in 2000; 8.7% identified themselves as two or more races, compared to 8.5% in 2000; 2.4% identified themselves as Native Hawaiian and Other Pacific Islander, compared to 1.4% in 2000; 1.0% identified themselves as Black or African American, compared to 1.0% in 2000; and 0.8% of the identified themselves as some other race, compared to 0.7% in 2000. In addition, 3.1% of residents identified themselves as Hispanic or Latino, compared to 3.3% in 2000. Information regarding racial and ethnic composition can be found in Figure 1.

Figure 1. Racial and Ethnic Composition, Barrow: 2000-2010 (U.S. Census).

In 2010, the average household size was 3.26, compared to 3.2 in 1990 and 3.91 in 2000. In that same year there were 1,554 total housing units, compared to 1,184 in 1990 and 1,620 in 2000. Of the households surveyed in 2010, 33.8% were owner-occupied, compared to 34.5% in 2000; 48.5% were renter-occupied, compared to 50.1% in 2000; 12.3% were vacant, compared to 12.9% in 2000; and 5.3% were occupied seasonally, compared to 2.5% in 2000. In 2010, there were 34 people living in group quarters, compared to 13 in 1990 and 95 in 2000.

Gender distribution in 2010 was relatively even at 51.4% male, and 48.6% female. This was similar to both the distribution statewide (52.0% male, 48.0% female) and distribution in 2000 (51.7% male, 48.3% female). The median age that year was 28.0 years, which was somewhat younger than the statewide median of 33.8 years and similar to the 2000 median of 28.8 years.

Overall, the population structure in both 2010 and 2000 was expansive. In addition, cohorts maintained their overall structure as they aged, indicating a stable population. In 2010, 36.6% of residents were under the age of 20, compared to 39.9% in 2000; 8.7% were over the age of 59, compared to 5.5% in 2000; 38.7% were between the ages of 30 and 59, compared to 42.8% in 2000; and 15.9% were between the ages of 20 and 29, compared to 12.0% in 2000.

Figure 2. Population Age Structure in Barrow Based on the 2000 and 2010 U.S. Decennial Census.

Gender distribution by age cohort was more even in 2010 than in 2000. In that year, the greatest absolute gender difference occurred in the 40 to 49 range (7.3% male, 6.1% female), followed by the 50 to 59 (7.3% male, 6.6% female) and 60 to 69 (3.4% male, 2.8% female) ranges. Of those three, the greatest relative difference occurred in the 60 to 69 range. Information regarding trends in Barrow's population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)⁴⁷ estimated that 80.2% of residents aged 25 and older held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 7.1% had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 12.7% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 25.1% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 3.2% held an Associate's degree, compared to an estimated 8.0% of Alaska residents overall; an estimated 7.2% held a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall; and an estimated 10.9% held a graduate or professional degree, compared to an estimated 9.6% of Alaska residents overall.

*History, Traditional Knowledge, and Culture*⁴⁸

While human habitation in the arctic can be traced to as early as 8,000 years ago, archaeological sites indicate habitation in the Barrow area from around 1,600 to 1,000 years ago. Inupiat traditionally depended on subsistence marine mammal hunting, supplemented by inland hunting and fishing. Archaeological remains of 16 dwelling mounds from the Birnirk culture exist today. Barrow was named for Sir John Barrow, the second Secretary of the British Admiralty. The city's Eskimo name is Ukpeagvik ("place where owls are hunted"). In 1881, the U.S. Army established a meteorological and magnetic research station near Barrow. The Cape Smyth Whaling and Trading Station was constructed there in 1893. A Presbyterian church was established in 1899, and a post office was opened in 1901. Exploration of the Naval Petroleum Reserve Number 4 (now National Petroleum Reserve in Alaska, NPR-A) began in 1946. The Naval Arctic Research Laboratory, 3 mi north of Barrow, soon followed. The city was incorporated in 1958. Formation of the North Slope Borough in 1972 and the Arctic Slope Regional Corporation, as well as construction of the Prudhoe Bay oilfields and Trans-Alaska Pipeline, have each contributed to the development of Barrow. Today, tax revenues from the North Slope oil fields fund borough-wide services. The sale of alcohol is prohibited.

Barrow has one property listed on the National Register of Historic Places (NRHP). The Cape Smyth Whaling and Tradition Station is a nineteenth-century American-built frame structure located around Point Barrow. In its day, it played a significant role in early commerce in the region as a whaling and fur-trading post.⁴⁹

⁴⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁴⁸ Alaska Department of Community and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

Archaeological sites along the coast from Kotzebue to Barrow include Walakpa, Point Hope, and Cape Krusenstern. Birnirk houses and artifacts are nearly identical to those of the historic Inupiat people. Tool assemblages include ivory harpoon heads, flakes and blades, ulus, tool handles, and composite tool parts. Dwellings include semi-subterranean winter houses.⁵⁰

Natural Resources and Environment

The climate of Barrow is arctic. Annual precipitation is light, averaging 5 inches, and annual snowfall is 20 inches. Temperatures range from -56 to 78 °F (-49 to 26 °C), with an average temperature of 40 °F (4 °C) during summer. The sun does not set between May 10th and August 2nd each summer and does not rise between Nov. 18th and January 24th each winter. The daily low temperature is below freezing for 324 days of the year. Prevailing winds are easterly and average 12 mph. The Chukchi Sea is typically ice-free from mid-June through October.⁵¹

The coastal landscape surrounding Barrow is characterized by bays and inlets, lagoons with barrier islands, gravel and sandy shores, basins, shallow lakes, and deltas.⁵² Coastal plains are characterized by low terraces, floodplains, shallow lakes, and streams. Peat bluffs run about 40 mi southwest of Barrow's coastline. Soils are generally poorly drained sandy loams, peats, and marine sediments. The permafrost layer generally ranges from 650 to 1,300 ft deep. Coastal plains ecoregions are characterized broadly as nearshore wet tundra and river floodplains. Vegetation is extremely limited within these coastal areas, where grasses prevail. Upland areas closer to the Brooks Range to the south consist of dwarf shrubs and sedges.⁵³ Wildlife present in the North Slope region include many species of freshwater and marine fish, migratory birds, and terrestrial and marine mammals. Marine and freshwater fish species include arctic cisco, burbot, broad whitefish, arctic grayling, humpback whitefish, least cisco, pink, Chinook, and chum salmon, Dolly Varden char, round whitefish, four-horned sculpin, rainbow smelt, northern pike, arctic cod, capelin, arctic char, and lake trout.⁵⁴ Terrestrial mammals on the North Slope include caribou, polar bear, arctic fox, red fox, snowshoe hare, moose, black bear, grizzly bear, beaver, muskrat, lynx, mink, marten, land otter, weasel, wolverine, coyote, wolf, and Alaska tiny shrew.^{55,56} Aquatic mammals include bowhead whales, gray whales, minke whales, humpback whales, beluga whales, narwhal, bearded seal, ringed seal, spotted seal, ribbon seal, and Pacific walrus.⁵⁷

Natural resources in the area include the expansive North Slope oil and gas fields, as well as several offshore oil and gas fields in the Beaufort and Chukchi seas. Production in the North Slope area began in the 1970s and reached a production rate of 2.2 million barrels per day by

1988. However, by 2007 production had declined to 720,000 barrels per day representing approximately 14% of U.S. domestic production at that time. By the end of 2007, the North Slope oil fields had produced 15.7 billion barrels of oil, with about 6.1 billion barrels of economically recoverable oil remaining. As of 2009, gas reserves of the North Slope were estimated at approximately 35 trillion cu ft. However, long-term (2005 to 2050) optimistic assumptions estimate the total amount of economically recoverable oil to total 35 to 36 billion barrels and economically recoverable gas to total 137 trillion cu ft. However, these projections are contingent on the opening of Area 1002 of the Arctic National Wildlife Refuge (ANWR) to extraction.⁵⁸

Natural hazards in the area include extensive coastal erosion due climate change and human impacts. Large amounts of gravel were removed from Barrow's shoreline during the 1960s in order to support local construction. This removal resulted in the destabilization of shorelines and subsequent erosion. In addition, shorter periods of ice-cover in the Beaufort and Chukchi seas have resulted in greater and prolonged impacts of storm surges and general tidal forces on coastlines.⁵⁹ Peat bluffs often experience the most rapid rate of erosion.⁶⁰

Current Economy⁶¹

Barrow is the economic center of the North Slope Borough (the city's primary employer) and numerous businesses provide support services to oil field operations. State and federal agencies also provide employment. The midnight sun has attracted tourism, and arts and crafts provide some cash income. Many residents rely upon subsistence food sources; whale, seal, polar bear, walrus, duck, caribou, grayling, and whitefish are harvested from the coast or nearby rivers and lakes.⁶² In a survey conducted by the AFSC in 2011, community leaders reported that Barrow's economy is reliant on oil and gas exploration and extraction. Top employers in 2010⁶³ were North Slope Borough, North Slope Borough School, Arctic Slope Native Assoc., Native Village of Barrow, Ilisagvik College, Ukpeagvik Inupiat Corp., City of Barrow, Barrow Utilities, Harpoon Construction Group, and AK Commercial Co.

In 2010,⁶⁴ the estimates per capita income was \$25,528 and the estimates median household income was \$78,250, compared to \$22,902 and \$67,097 in 2000, respectively. However, after adjusting for inflation by converting 2000 values to 2010 dollars,⁶⁵ the real per capita income (\$30,116) and real median household income (\$88,232) indicate a decline in both individual and household incomes. However, it should be noted that data are based on wage earnings and does not take into account the value of subsistence within the local economy. In

Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁶⁵ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

2010, Barrow ranked 100th of 305 Alaskan communities from which per capita income was estimated, and 27th of 299 Alaskan communities from which median household income was estimated.

According to 2006-2010 ACS estimates, 66.8% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 14.3%, compared to 5.9% statewide; and an estimated 14.5% of residents were living below the poverty level, compared to an estimated 9.5% of Alaska residents overall. Of those employed in 2010, an estimated 37.9% worked in the private sector, an estimated 60.4% worked in the public sector, and an estimated 1.7% were self-employed.

Barrow supported a diverse economy in 2010. By industry, most (27.1%) employed residents were estimated to work in public administration sectors; followed by education services, health care, and social assistance sectors (26.4%) and transportation, warehousing, and utilities sectors (9.0%). By occupation type, most (41.6%) employed residents were estimated to hold management or professional positions; followed by sales or offices positions (24.8%); service positions (20.9%); production, transportation, or material moving positions (7.1%); and natural resources, construction, or maintenance positions (5.6%). An estimated 4.1% of employed residents worked in agriculture, forestry, fishing, hunting, and mining sectors; although the proportion of employment derived from fisheries sectors cannot be determined. Between 2000 and 2010, there was a significant proportional decline in education services, health care, and social assistance sectors; while there were increases in public administration, professional, scientific, management, administrative, waste management, arts, entertainment, recreation, accommodations, and food service sectors. Information regarding employment trends can be found in Figures 3 and 4.

Figure 3. Local Employment by Industry in 2000-2010, Barrow (U.S. Census).

NOAA-TM-AFSC-259 – Volume 4
 Community Profiles for North Pacific Fisheries – Alaska: Barrow

Figure 4. Local Employment by Occupation in 2000-2010, Barrow (U.S. Census).

According to the Alaska Local and Regional Information (ALARI) network compiled by the Alaska Department of Labor and Workforce Development (DOLWD),⁶⁶ most (54.1%) employed residents were estimated to work in local government sectors; followed by trade, transportation, and utilities sectors (9.0%); and professional and business service sectors (8.5%).

Governance

Barrow is a First-class city with a mayoral form of government. In addition, there is a U.S. Bureau of Indian Affairs (BIA) recognized Tribal government (Native Village of Barrow), and Alaska Native Claims Settlement Act (ANCSA) chartered Native village corporation (Ukpeagvik Inupiat Corporation). The regional ANCSA Native corporation representing Barrow is the Arctic Slope Regional Corporation. Other organizations located in the community include the Alaska Eskimo Whaling Commission, the Inupiat Community of Arctic Slope, and the North Slope Borough seat. The Alaska Department of Fish and Game (ADF&G) maintains an office in Barrow. The closest U.S. Bureau of Citizenship and Immigration Services (BCIS) office is located in Fairbanks, 500 mi southeast. The closest National Marine Fisheries Service (NMFS) office is located in Anchorage 725 mi southwest.

In 2010, the borough administered an 18.5 mills property tax, and the city administered a 5% accommodations tax, \$1 tobacco tax, and 3% alcohol tax. Total municipal revenues increase by 76.3% between 2000 and 2010 (after adjusting for inflation⁶⁷), thanks in large part to increases in the city's general fund and outside grants awarded. In 2010, most locally generated revenue came from tobacco taxes, property taxes, sales taxes, property leases, Barrow sales tax distribution center, and gaming revenues. Outside revenue came chiefly from Community Revenue Sharing, grants, and payments in lieu of taxes. In that same year, the community was allocated \$301,812 in state allocated Community Revenue Sharing accounting for 8.0% of the municipal budget, compared to 1.7% from State Revenue Sharing in 2000. Between 2000 and 2010, Barrow received several state and federal fisheries-related grants including \$4.0 million for several boat ramp projects, \$1.25 million for several fish inventory, harvest, and health

⁶⁶ See footnote 63.

⁶⁷ Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

monitoring projects, and \$109,000 for harbor upgrades. Information regarding community finances can be found in Table 2.

Infrastructure

Connectivity and Transportation

Regularly-scheduled jet services provide Barrow's only year-round access. The state-owned Wiley Post-Will Rogers Memorial Airport serves as the regional transportation center for the borough. The airport has a 6,500-ft long by 150-ft wide asphalt runway. Marine and land transportation provide seasonal access.⁶⁸ Roundtrip airfare between Barrow and Anchorage in June 2012 was \$566.⁶⁹

⁶⁹ Airfare was calculated using lowest fare. Source: <http://www.travelocity.com> (retrieved November 22, 2011).

Facilities

Water is derived from a dam on Isatkoak Lagoon and is stored in a tank. Most residents have piped water. Funds have been requested to serve remaining houses and to construct a second water reservoir. The member-owned Barrow Utilities & Electric Cooperative operates the water and sewage treatment plants, generates and distributes electric power, and distributes piped natural gas for home heating. The North Slope Borough provides all other utilities. Refuse collection services are provided by the North Slope Borough. The Barrow Power Plant is fueled by natural gas. Businesses and services include several hotels, consulting and contracting services, internet services, community services, a church, and a restaurant.⁷⁰ Public safety services are provided by Borough policy and local state troopers. Fire and rescue services are provided by Borough volunteer fire department. Judicial services are provided by a local state magistrate. Additional public facilities include a youth center, community center, senior center, school gym, movie theater, museum, and one public and four school libraries.

In a survey conducted by the AFSC in 2011, community leaders reported that local infrastructure completed in the past 10 years includes sewage treatment facilities, and a new landfill. Infrastructure currently in progress or planned includes, harbor access roads, harbor dredging, broadband internet expansion, new dock space, community center/library expansion, and recreation center expansion. Currently there is no dock space available for permanent or temporary public moorage. Facilities are capable of handling regulated vessels including offshore rescue vessels, fuel barges, and container vessels. While there are no fisheries-related businesses or services in the community, a seafood processor is in the planning stages. Additional public services provided by the community include medical services, food bank, job placement services, public library, and a recreation center.

*Medical Services*⁷¹

There are both a hospital and a clinic in the community providing primary health care, acute care, and emergency care, and are Community Health Aid Program sites. Specialized care includes a substance abuse treatment center, and mental health services.

*Educational Opportunities*⁷²

There are four schools operated through the borough school district. Barrow High School offers 9th through 12th grade instruction, and had 218 students enrolled and 19 teachers as of 2011. Eben Hopson Middle School offers 6th through 8th grade instruction, and had 202 students enrolled and 16 teachers as of 2011. Fred Ipalook Elementary offers preschool through 5th grade instruction, and had 638 students enrolled and 34 teachers as of 2011. Kiita Learning Community offers 6th through 12th grade instruction, and had 53 students enrolled and 5 teachers as of 2011. Iisagvik College offers associate degrees and certificates in a range of vocational, health services, art, and business fields.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

History of fisheries participation in the Barrow area dates back to almost 2,000 years ago, with the early Birnirk and Thule traditions. By 1867, commercial whaling was taking place along the Barrow coast, until markets declined in 1915. The introduction of outside whaling fleets radically changed traditional subsistence practices with the introduction of repeater rifles, and subsistence harvests rapidly increased.⁷³ Today, participation is limited mostly to subsistence and recreational fisheries. Commercial fishing is extremely limited in both the Beaufort and Chukchi Seas as the current Arctic Fishery Management Plan (FMP) allows only several small fisheries occurring in state waters.⁷⁴ Barrow is located in the Arctic Management Area for federal management. In a survey conducted by the AFSC in 2011, community leaders reported while there is no commercial fishing within the community, subsistence fishing is practiced from June through September. In addition, the community participates in fisheries management through the support of research organizations including the Barrow Arctic Science Consortium (BASC) and the National Science Foundation (NSF). Other local advocacy organizations include the Barrow Whaling Captains Association and Alaska Eskimo Whaling Commission.

Processing Plants

According to the 2010 Alaska Department of Fish and Game's Intent to Operate list, Barrow does not have a registered processing plant. The closest seafood processing facility is located in Nome.

Fisheries-Related Revenue

Between 2000 and 2010, there were no reports of fisheries-related revenue being collected in either Barrow or the North Slope Borough (Table 3).

Commercial Fishing

Commercial fishing is prohibited in federally regulated waters within the Arctic Management Area. Only in state regulated waters are their limited commercial fisheries, none of which were prosecuted in 2010 by residents of Barrow.⁷⁵ In 2010, 5 residents held a total of 7 permits issued by the Commercial Fisheries Entry Commission (CFEC), compared to 7 residents holding 8 CFEC permits in 2000 (Table 4). Salmon permits made up 71% while "other" shellfish permits made up the remaining CFEC permits issued that year. In 2000, 100% of CFEC were for salmon. Of the CFEC permits issued in 2010, a total of 71% were actively fished, compared to 63% in 2000. This varied by species from 100% of shellfish permits to 60% of salmon permits

being fished that year. In 2010, salmon CFEC permits were fished in the Yakutat, Cook Inlet, and Bristol Bay set-gillnet fisheries. “Other” shellfish CFEC permits were fished in the southeast sea cucumber fishery. Between 2000 and 2010, no residents held Federal Fisheries Permits (FFPs) or License Limitation Program (LLP) permits (Table 4). In addition, no residents held quota share for halibut, sablefish, or crab between 2010 and when the programs began. In 2010, four residents held commercial crew licenses, compared to six in 2000. In addition, residents held majority ownership of three vessels that year, compared to two in 2000. No landings were reported in Barrow between 2000 and 2010 and landings made by residents of Barrow are considered confidential (Tables 5 through 10).

Recreational Fishing

One sport fish guide business was active in Barrow in 2000 and 2004-2005, although it is not clear whether it was the same business in each of those years. Sport fish guide licenses were held between 2000 and 2005, although numbers were low. In 2010, 108 sportfishing licenses were sold in the community and a total of 314 residents held sportfishing licenses, compared to 74 and 238 in 2000, respectively. The number of sportfishing licenses sold to residents peaked in 2010, and was at its lowest in 2008 (228).

The community is located in the North Slope-Brooks Range ADF&G Harvest Survey Area which includes all Alaskan waters, including drainages flowing into the Beaufort and Chukchi seas, north of the Brooks Range and east of Point Hope. Reports on total saltwater angler days fished between 2000 and 2010 are limited and trends are difficult to determine. In 2010, there were a total of 4,384 freshwater angler days fished, compared to 3,996 in 2000. In that year, non-Alaska residents accounted for 30.1% of freshwater angler days fished, compared to 13.1% in 2000. There is no kept/released charter information available for Barrow.

According to ADF&G Harvest Survey data, species targeted by private anglers in the area include all five species of Pacific salmon, rainbow trout, Dolly Varden char, whitefish, burbot, arctic grayling, Pacific halibut, rockfish, and razor clams. In a survey conducted by the AFSC in 2011, community leaders reported that recreational fishing within the community mainly targets Dolly Varden char, and pink and chum salmon. Sportfishing by residents is typically done by private vessel. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Subsistence fishing is an important part of Barrow's identity, culture, and economy. In a survey conducted by the AFSC in 2011, community leaders reported that species harvested include bowhead whale, seal, walrus, beluga whale, salmon, whitefish, and arctic grayling. Rod and reel, gill net, and jigging are techniques used to harvest fish in the summer, while gill nets and jigs are used in the winter.⁷⁶ Whale hunts are a central part of Barrow's identity, and a focal point of cohesion and reciprocity within the community.⁷⁷ According to the ADF&G *Community Subsistence Information System*,⁷⁸ species which Barrow residents harvest or use include bearded seal, bowhead whale, ringed seal, spotted seal, Arctic char, Arctic cod, Bering cisco, broad whitefish, burbot, capelin, flounder, grayling, humpback whitefish, lake trout, least cisco, northern pike, rainbow smelt, round whitefish, saffron cod, and sculpin. Information on subsistence participation is limited, and data regarding the percentage of households participating in subsistence activities are unavailable.

Of the species listed by ADF&G in Table 13, sockeye salmon were harvested the most, followed by Chinook, coho, and chum salmon. In 2008, residents reported harvesting 742 salmon, compared to 231 in 2000. Salmon harvests peaked in 2005 when residents reported harvesting 780 fish. One Subsistence Halibut Registration Certificate (SHARC) between 2006 and 2010 although harvests were only reported in 2010. In that year, an estimated 800 lbs of halibut was harvested on 1 SHARC. Between 2000 and 2010, an estimated 43 beluga whales, 265 walrus, and 161 polar bears were harvested. Beluga whale harvests peaked in 2007 at an estimated 15 whales. Walrus harvests peaked in 2003 at an estimated 52 walrus. Polar bear harvests peaked in 2002 at an estimated 27 bears. Data on Steller sea lion, harbor seal, and spotted seal harvests are unavailable. Information regarding subsistence trend can be found in Tables 12 through 15.

Kaktovik (kack-TOH-vick)

People and Place

Location

Kaktovik, also known as Qaaktugvik, lies on the north shore of Barter Island, between the Okpilak and Jago Rivers on the Beaufort Sea coast.⁷⁹ The community is 360 miles east of Barrow, 72 miles west of the U.S.-Canadian border, and 640 miles north of Anchorage. It lies on the coast of the Arctic National Wildlife Refuge (ANWR). Kaktovik is located in the North Slope Borough and the Barrow Recording District. The area encompasses 0.8 square miles of land and 0.2 square miles of water.⁸⁰

*Demographic Profile*⁸¹

In 2010, there were 239 residents in Kaktovik, ranking it as the 181st largest of 352 communities in Alaska with recorded populations that year. Overall between 1990 and 2010, the population increased by 6.7%. According to Alaska Department of Labor estimates, between 2000 and 2009, the average annual growth rate -0.81%, reflecting small increases and decreases and an overall stable population during the decade. In 2010, the majority of Kaktovik residents identified themselves as American Indian and Alaska Native (54.1%), while 33% identified themselves as White, and 12.8% as two or more races. In addition, 3.7% of residents identified themselves as Hispanic or Latino in 2010. The change in population from 1990 to 2010 is provided in Table 1 below, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

From 1990 to 2010, the average household size in Kaktovik stayed quite stable, decreasing very slightly from 3.30 in 1990 to 3.29 in 2000 and 2010. In 2010, there were a total of 72 occupied housing units in Kaktovik, compared to 89 in 2000 and 67 in 1990. Of a total of 87 housing units surveyed for the 2010 U.S. Decennial Census, 47% were owner-occupied, 35.6% were renter-occupied, and 17.2% were vacant or used only seasonally. No residents were reported to live in group quarters in 1990 or 2000, while two were recorded to be living in group quarters in 2010.

Figure 1. Racial and Ethnic Composition, Kaktovik: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Kaktovik was 52.3% male and 47.7% female, very similar to the makeup of the state population as a whole (52% male, 48% female). The median age was estimated to be 30.5 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 10.5% of the Kaktovik population was age 60 or older. The overall population structure of Kaktovik in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Kaktovik Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)⁸² estimated that 58.4% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, 28.3% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 13.4% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 13.7% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; 1% of residents held a Bachelor's degree, compared to an estimated 17.4% of Alaskan residents overall.

⁸² While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Until the late nineteenth century, the island on which Kaktovik is located – Barter Island – was a major trade center for the Inupiat. It was especially important as a bartering place for Inupiat from Alaska to trade with Inuit from Canada.⁸³ During the 1890s and early 1900s, Kaktovik was an important stop for commercial whalers, and remained a key trading point for residents of the region who came to rely on trade goods provided by the whalers such as food, utensils, firearms, and alcohol. By the 1900s, foodstuffs such as flour and molasses had become necessities for the local Inupiat people.⁸⁴

Whaling had been the first commercial industry to enter the Arctic, and when bowhead whaling came to an end around 1910, the Inupiat experienced the first in a series of boom and bust cycles. The next industry to enter the region was fur trapping, which brought a new source of income beginning in the 1920s. A permanent settlement was first established at Kaktovik in 1923, when Tom Gordon established a fur trading post at the site for the H.B. Liebes Company of San Francisco. However, the price of fox fur dropped in the late 1930s and the industry declined in importance. Another industry that was attempted during this time period involved reindeer herding within what is now the ANWR. Semi-domesticated reindeer⁸⁵ had been brought into western Alaska from Siberia in an effort to provide a stable economy for the local people and prevent food shortages. However, most of the herd starved during the severe winters of 1936 and 1937. Others were killed during that time to provide food and clothing for local residents who were also close to starvation during those years, according to a Bureau of Indian Affairs (BIA) survey conducted in the spring of 1936. In late 1937, 3,000 additional reindeer were transferred from Barrow to Barter Island in one more attempt to establish the herd, but the herd diverted course and returned back to Barrow, taking the remnants of the Barter Herd with it. Kaktovik residents were discouraged and killed the few remaining animals, bringing the era of reindeer herding in ANWR to a close.⁸⁶

Trading posts throughout the Arctic region began to shut down after the decline of the fur trade, and the last of the trading posts had closed by 1943. In the case of Barter Island, the trading post closed in 1938 following Tom Gordon's death. Without a local source of supplies, Kaktovik residents were forced to travel to Canada for trade, and some moved to Canada permanently. Some wage employment came to the region when the U.S. Coast and Geodetic Survey began mapping the Beaufort Sea coastline in 1945. Villagers were forced to relocate in the 1940s due to installation of a Distant Early Warning system and contribution of a U.S. Air force runway and hangar. They were forced to relocate again in 1951, when the area surrounding Kaktovik was made a military reserve. With another relocation in 1964, villagers finally received title to the village site, and government services began to create some stable jobs in the area.⁸⁷ The City of Kaktovik was incorporated in 1971. Today, the village maintains its Inupiat Eskimo traditions, in part due to its isolation. The possession of alcohol is banned in the village.⁸⁸

Natural Resources and Environment

The climate of Kaktovik is arctic. Temperatures range from -56 to 78 °F. Precipitation is light, averaging 5 inches, with snowfall averaging 20 inches.⁸⁹ Kaktovik is located at the northern boundary of the ANWR, a wilderness area that covers 19,286,722 acres and contains calving grounds for both the Central Arctic and Porcupine Caribou Herds.⁹⁰ The coastal marine region of ANWR is characterized by salt marshes, lagoons, barrier islands, beaches and river deltas that are important to polar bears, fish, and migratory birds.⁹¹ ANWR contains a diversity of ecosystems and animals and plant life, including polar, grizzly, and black bears, wolves, lynx, wolverine, red fox, moose, muskox, Dall sheep, beaver, and other small mammals.⁹² Residents of Kaktovik use areas in ANWR and adjacent waters for subsistence harvest. In particular, bowhead whale, caribou, Dall sheep, muskoxen, and various fish species are essential food sources for the Kaktovikmiut (people of Kaktovik).⁹³

ANWR is currently closed to oil and gas drilling activities under Section 1003 of the Alaska National Interest Lands Conservation Act (ANILCA).⁹⁴ Estimates of recoverable oil in ANWR range between 4.2 and 11.8 billion barrels.⁹⁵ In village meetings conducted to inform the North Slope Borough's 2004 Comprehensive Plan, Borough residents expressed concerns about current and cumulative effects of oil and gas development on subsistence resources and harvest activities. More specifically, their concerns centered on habitat fragmentation, disruption of migration routes and pathways for fish and wildlife, disturbance and deflection of wildlife from traditional harvest areas, restrictions or exclusions of Borough residents from areas traditionally used for harvest, cumulative contamination, and potential catastrophic events such as oil spills.⁹⁶

Offshore, initial oil and gas exploration in the outer continental shelf (OCS) of the Beaufort Sea began in 1981, and a total of 20 wells were drilled by 1989. The Bureau of Ocean Energy Management (formerly Minerals Management Service) held six sales in the Beaufort OCS between 1991 and 2007, resulting in the leasing of 1,742,987 acres. After reevaluation of their Beaufort Sea exploration plan due to a 2007 lawsuit, and numerous appeals by Native communities and environmental groups during the permitting process,⁹⁷ Shell began drilling exploratory wells in non-petroleum zones on October 3rd, 2012. Before Shell could receive final authorization to drill in petroleum zones, its spill response barge was required to be in place. The

barge was damaged in September, but was expected to be in place in time for the 2013 drilling season.⁹⁸ The proposed 2012-2017 OCS oil and gas leasing program also schedules one additional lease sale in the Beaufort Sea planning area.⁹⁹

The impact of oil and gas development activities on marine subsistence resources has been the focus of considerable research. There is evidence that off-shore activities are disrupting migratory patterns of bowhead whales, causing difficulty for whalers from Kaktovik and other villages in the area that depend on harvest of these animals.¹⁰⁰ A 3-year study confirmed the reports of local elder and whaling captains that migrating bowhead whales deflect around seismic noise at a minimum distance of 20 kilometers (12 miles).¹⁰¹

Natural hazards that present a high risk to the community of Kaktovik coastal and river erosion, coastal storm surges, snow and avalanche, tsunami, and severe weather events. The community is also at low risk of wildland fire, earthquakes, and flooding.¹⁰² Storm surges cause almost annual flooding to the runway in Kaktovik. Storm surges, or coastal floods, occur when the sea is driven inland above the high-tide level onto land that is normally dry. Often, heavy surf conditions driven by high winds accompany a storm surge adding to the destructive force of the flooding waters. The conditions that cause coastal floods also can cause significant shoreline erosion as the floodwaters undercut roads and other structures. Storm surges have flooded the Barter Island Runway on multiple occasions, in some cases causing the airport to close for several days, blocking all transport of persons and supplies in and out of the community.¹⁰³ The community is also very vulnerable to power breakdowns associated with extreme weather events or other problems such as fuel supply. Outages during winter storms can result in significant damage and present a threat to public health and safety.¹⁰⁴

As of August, 2012, no contaminated sites were reported near Kaktovik by the Alaska Department of Environmental Conservation's Spill Prevention and Response program.¹⁰⁵ However, local communities are concerned about pollution from military and oil and gas exploration and production activities. Kaktovik and five other communities in the North Slope Borough have restoration advisory boards to work with the local community during cleanup of contaminated sites.¹⁰⁶

Current Economy¹⁰⁷

Because of Kaktovik's isolation from the rest of Alaska, economic opportunities are limited and there is high local unemployment. A majority of jobs are provided by the school district, the North Slope Borough, and the City of Kaktovik. In addition, part-time seasonal jobs provide some wage income, such as construction projects. The community relies heavily on subsistence harvest, with particular focus on caribou.¹⁰⁸ The economy of Kaktovik may drastically change in the years to come, as the community is at the epicenter of the oil drilling debate unfolding in ANWR.

Based on household surveys conducted for the 2006-2010 ACS,¹⁰⁹ in 2010, the per capita income in Kaktovik was estimated to be \$17,799 and the median household income was estimated to be \$46,458. This represents a decrease from the per capita and median household incomes reported in the year 2000 (\$22,031 and \$55,625, respectively). If inflation is taken into account by converting the 2000 values to 2010 dollars,¹¹⁰ the income decrease is revealed to be even larger, falling from a real per capita income of \$28,970 and a real median household income of \$73,146 in 2000. In 2010, Kaktovik ranked 171st of 305 Alaskan communities with per capita income data that year, and 156th in median household income, out of 299 Alaskan communities with household income data.

However, Kaktovik's small population size may have prevented the ACS from accurately portraying economic conditions.¹¹¹ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Kaktovik in 2010 is \$17,192.^{112,113} This estimate is very close to the 2006-2010 ACS estimate, providing additional evidence for a decrease in per capita income between 2000 and 2010. Kaktovik was not recognized as a "distressed" community by the Denali Commission in 2011.¹¹⁴ It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

¹⁰⁷ Unless otherwise noted, all monetary data are reported in nominal values.

¹¹³ See footnote 109.

¹¹⁴ Denali Commission. 2011. *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

Based on the 2006-2010 ACS, in 2010, a much smaller percentage of Kaktovik’s population (47.6%) was estimated to be in the civilian labor force in 2010 compared to the percentage of the statewide population in the civilian labor force (68.8%). That same year, 13.3% of Kaktovik residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate in Kaktovik was estimated to be 15.5%, more than twice the state unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 9.7%, compared to a statewide unemployment rate estimate of 11.5%.¹¹⁵

Also based on the 2006-2010 ACS, a majority of Kaktovik’s workforce was estimated to be employed in the public sector (72.6%), along with 27.4% in the private sector. Of the 224 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in educational services, health care, and social assistance (29%), public administration (24.7%), and retail trade (21%). The largest differences between 2000 and the latter part of the decade manifested as elimination of employment in the finance/insurance/real estate and professional/scientific/management industries. In addition, a comparable decrease was seen in the educational/health care/social assistance sector when compared to the increase in employment in the retail trade industry. This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Kaktovik (U.S. Census).

¹¹⁵ See footnote 112.

Figure 4. Local Employment by Occupation in 2000-2010, Kaktovik (U.S. Census).

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 142 employed residents in Kaktovik in 2010, of which 67.6% were employed in local government, 15.5% in financial activities, 9.2% in professional and business services, 2.8% in trade, transportation, and utilities, 2.8% in leisure and hospitality, 0.7% in construction, 0.7% in natural resources and mining, and 0.7% in education and health services.¹¹⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Governance

Kaktovik was incorporated in 1971 as a 2nd Class City and is located in the North Slope Borough. The City has a “Strong Mayor” form of government, with a seven-person city council including the Mayor, a seven-person school board, and several municipal employees. The City does not administer any taxes, although an 18.5 mills property tax is collected by the Borough.¹¹⁷ Annual municipal revenue reported for Kaktovik stayed relatively stable from 2000 to 2010, varying from a low of \$802,154 in 2008 to a high of \$1,073,460 in 2010.

According to a 2006 Economic Review, up to 2005, the two largest sources of local revenue had been bingo operations and other local revenues including revenue from interest earnings, sale of assets, capital equipment and donations.¹¹⁸ No sales tax revenues were reported during the period, given that Kaktovik does not collect a sales tax. Locally-generated revenue sources in Kaktovik during the 2000-2010 period included building rentals, land leases, concessions and recreation sale items, gaming revenues including bingo and pull tab receipts, and revenues from local enterprises such as cable TV connection. Outside revenue sources included state grants and shared funds. from The community receive between \$31,000 and \$40,000 per year in State Revenue Sharing contributions from 2000 to 2003, as well as approximately \$110,000 per year in Community Revenue Sharing contributions in 2009 and

¹¹⁶ Ibid.

2010. In addition, Kaktovik received several fisheries-related grants between 2000 and 2010. The U.S. Army Corps of Engineers awarded the community \$250,000 in 2000 for harbor and breakwater construction, and the State of Alaska provided \$10,000 to \$20,000 per year from 2000 to 2008 for work on the Kaktovik boat dock. For more information on selected municipal, state, and federal revenue streams see Table 2.

Kaktovik was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the BIA, is Kaktovik Village. The Native village corporation is the Kaktovik Iñupiat Corporation, which manages 92,160 acres of land. All of the Village corporation’s land is within the boundaries of ANWR. The regional Native corporation to which Kaktovik belongs is the Artic Slope Regional Corporation.¹¹⁹

⁶ This number is drawn from the year’s budget rather than the certified financial statement.

Kaktovik is also a member of the Arctic Slope Native Association (ASNA), a tribal 501(c)(3) non-profit organization headquartered in Barrow. The ASNA is one of the 12 regional Alaska Native nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their

¹¹⁹ See footnote 117.

regions.¹²⁰ The ASNA works alongside the federal Indian Health Service to provide health and community services to Native communities in the region. In 1986, ASNA took over operation of the regional hospital in Barrow. In 2009, ASNA announced plans for a new hospital in Barrow with an expanded space and range of services, to be completed by 2013.^{121,122}

The closest office of the Alaska Department of Fish and Game (ADF&G) is located in Barrow. The closest office of the Alaska Department of Commerce, Community, and Economic Development is located in Kotzebue, and the closest office of the Alaska Department of Natural Resources and U.S. Bureau of Citizenship and Immigration Services are located in Fairbanks, although the Anchorage offices of these agencies may be equally accessible by air to people of this region. The closest office of the National Marine Fisheries Service (NMFS) is located in Anchorage.

Infrastructure

Connectivity and Transportation

Air travel provides the only year-round access to Kaktovik. In addition to serving as a crucial link for passengers and cargo, aviation is also the primary means by which Kaktovik residents receive mail. The Barter Island Airport is owned by the Air Force and operated by the North Slope Borough.¹²³ The price of a roundtrip ticket by plane from Barter Island to Anchorage in early June of 2012 was \$706.¹²⁴ The existing airport is affected by severe erosion problems. According to the 2005 Barter Island Airport Master Plan, plans were under consideration to relocate the airport to a higher site near the community landfill.¹²⁵

Kaktovik is currently isolated from regional road networks. As of 2005, 9.9 miles of gravel roadways were recorded in and around Kaktovik. At that time, the community Kaktovik requested several small road extensions and improvement projects, as well as a bridge that could provide year-round access to the mainland and provide a future possible link to the regional road network. Although there had been some discussion regarding the possibility of a road connection from Kaktovik to Prudhoe Bay or the Dalton Highway (approximately 110 miles), support for

the road was mixed and the cost of construction was considered to be well beyond the North Slope Borough's ability to finance.¹²⁶

In addition to air and overland transportation, marine transportation provides seasonal access to Kaktovik. Barges deliver cargo to the community during the summer. Barges are beached in front of the community, and materials are unloaded there to be hauled to the village. As of 2005, no boat ramp was present in the community, and boats were stored on the beach of Kaktovik Lagoon. The community would like a boat ramp to allow safer ocean launching of boats, and also report that the current launching area is too shallow and should be relocated.¹²⁷

Facilities

The North Slope Borough provides all utilities in Kaktovik.^{128,129} Water in Kaktovik is derived from a surface source and is treated and stored in a 680,000-gallon water tank. Water is delivered by truck to holding tanks, and all homes have running water in the kitchen. A central watering point is available, and a washeteria is operated by the Borough. For the most part, homes still use water and sewage haul services. Some homes have septic tanks. Sewage is treated in the borough-managed sewage lagoon. Electricity is provided to Kaktovik by a diesel powerhouse operated by the Borough.¹³⁰ The nearest state trooper post is located in Barrow.¹³¹ The Borough provides refuse collection services and operates a landfill. Police services are provided by the Borough Department of Public Safety, and fire and rescue services are offered by the Kaktovik Volunteer Fire Department. Additional community facilities include a community hall, school gymnasium, and a library. The City of Kaktovik provides cable services, and telephone and internet service is also available locally.¹³²

Medical Services

The Kaktovik Clinic provides residents with basic medical services. The Clinic is a Community Health Aid Program site. Emergency Services have coastal and air access. Emergency service is provided by 911 Telephone Service volunteers and a health aide.¹³³ In addition to local health services, a regional hospital with a wider range of services is available in Barrow. A hospital renovation is expected to be completed by 2013, expanding space and services for people of the North Slope region.¹³⁴

Educational Opportunities

There is one school in Kaktovik that offers preschool through 12th grade education. As of 2011, the Harold Kaveolook School had 59 students and 9 teachers.¹³⁵

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence hunting and fishing have defined the economy and culture of Inupiaq people for thousands of years, and it remains essential today.¹³⁶ Kaktovik lies on Barter Island, situated between the Okpilak and Jago Rivers along the coast of the Beaufort Sea. The Beaufort Sea is encompassed by the Arctic Management Area. Commercial fishing for all species is currently prohibited in federally regulated waters of the Arctic Management Area, “until sufficient information is available to support the sustainable management of a commercial fishery.”¹³⁷ From August to October, state waters near Kaktovik (from Anderson Point in Camden Bay to Humphrey Point, and north to the coastal zone boundary) are designated for subsistence use of bowhead whales.¹³⁸

Whaling has had a particularly strong presence and history in the North Slope region. Whales were historically and are currently a primary subsistence resource for the Inupiaq people. The commercial whaling industry entered area waters in the 1850s, and continued through the early decades of the 1900s, when the combination of overharvest and declining markets for baleen and whale oil brought the industry to an end.¹³⁹ In 1977, a NMFS study found that stocks of bowhead whale were in decline, and the International Whaling Commission (IWC) issued a ban on the Native subsistence whale hunt. However, Native whaling captains and elders reported that their estimates of population size were several times higher than the NMFS estimates. Follow-up study confirmed that the bowhead whale population was healthy and growing.¹⁴⁰

A system of co-management was established with the creation of the Alaska Eskimo Whaling Commission (AEWC) in 1977. The AEWC represents whalers from Kaktovik, Nuiqsut, Barrow, Wainwright, Point Hope, Kivalina, Little Diomedea, Wales, Savoonga, and Gambell. Other examples of co-management efforts in the North Slope region are the Eskimo Walrus Commission (formed in 1978), the Beluga Whale Committee (formed in 1988), and the Nanuuq Commission (formed in 1994 for polar bear management). In 1994, Section 119 of the reauthorization for the Marine Mammal Protection Act provided a legislative basis for these cooperative agreements with Alaska Native organizations.¹⁴¹

¹⁴¹ See footnote 136.

Kaktovik is located in the Arctic Management Area and thus is not located with a Federal Statistical and Reporting Area, a Pacific Halibut Fishery Regulatory Area, or a Sablefish Regulatory Area. Kaktovik is not eligible to participate in the Community Development Quota program or the Community Quota Entity program.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Kaktovik does not have a registered processing plant. The closest seafood processing facility is located in Nome.

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue in Kaktovik (Table 3).

Commercial Fishing

Between 2000 and 2010, almost no Kaktovik residents were involved in commercial fishing activity. During two years of this period (2005 and 2010), one resident per year held a commercial crew license, but no Kaktovik residents were the primary owner of a fishing vessel, no fish buyers or shore-side processors were present, and no vessels were homeported in the community (Table 5). In addition, no residents of Kaktovik held permits in state or federal commercial fisheries (Table 4) or held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 through 8), and no landings or ex-vessel revenue were generated in the community or by Kaktovik vessel owners (Tables 9 and 10).

¹ Net pounds refers to the landed weight recorded in fish tickets.

² Totals only represent non-confidential data.

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses were located in Kaktovik, and no licensed sport fish guides resided there. Also during this period, no sportfishing licenses were sold in the community. However, a number of Kaktovik residents participated in sportfishing activities, although the number of Kaktovik residents that purchased sportfishing licenses (irrespective of point of sale) has been declining from a high of 36 in 2000 to a 14 by 2010. For more information on sportfishing trends for the community of Kaktovik between 2000 and 2010, see Table 11.

The Alaska Statewide Harvest Survey,¹⁴² conducted by ADF&G between 2000 and 2010, noted sport harvest of coho salmon and Dolly Varden by private anglers in Kaktovik. The survey also noted sport harvest of sockeye salmon in Prudhoe Bay to the west. Given the lack of charter activity in Kaktovik, no kept/release log book data were reported for fishing charters out of Kaktovik between 2000 and 2010.¹⁴³

Kaktovik is located within Alaska Sport Fishing Survey Area Z – North Slope-Brooks Range, which includes all Alaskan waters, including drainages flowing into the Beaufort and Chukchi seas, north of the Brooks Range and east of Point Hope. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, Alaska resident anglers consistently fished a greater number of days than non-Alaska resident anglers in both freshwater and saltwater, and freshwater sportfishing activity was significantly higher than in saltwater. On average between 2000 and 2010, Alaska resident anglers fished 3,065 fresh water days and 228 saltwater days, while non-Alaska resident anglers fished on average 1,001 freshwater and 17 saltwater days. This information about the sportfishing sector in and near Kaktovik is also displayed in Table 11.

Subsistence Fishing

Subsistence harvest activities were historically the basis of life in the Kaktovik area, and continue to be fundamental to the economy and way of life today. It is important to emphasize that subsistence is much more than just a ‘way of life’:

“To many people on the North Slope, subsistence *is* their life. Subsistence defines the essence of who they are, and it provides a connection between their history, culture and spirit. An essential component of Iñupiaq values is the sharing of subsistence resources among, families, friends, elders, and those in need.”¹⁴⁴

Today, Kaktovik’s primary subsistence resources are caribou, Dall sheep, bowhead whale, fish and waterfowl, bearded and ringed seal, polar bear, walrus and furbearers. Trading relationships exist between communities, and Kaktovik is recognized for its contribution of Dall sheep.¹⁴⁵

The community of Kaktovik is located within the boundaries of ANWR. Residents use lands within ANWR, as well as the adjacent waters of the Beaufort Sea, for subsistence and other

¹⁴⁴ Glenn Gray and Associates. June 2007. *North Slope Borough Coastal Management Plan*. Retrieved February 29, 2012 from http://www.co.north-slope.ak.us/programs/coastal_management/NSB_Coastal_Management_Plan.pdf.

¹⁴⁵ Ibid.

traditional uses.¹⁴⁶ Residents of Kaktovik have traditionally used an area covering a minimum of 11,406 square miles, from the U.S.-Canadian border in the east to within 20 miles of the Colville River to the west, and from 25 miles out into the Beaufort Sea to about 85 miles inland to the continental divide of the Brooks Range.¹⁴⁷ Kaktovik residents hunt bowhead whales near the village each fall mainly during September and October. The Hula Hula River is a major spawning and over-wintering area for Arctic char, and a smaller over-wintering area is located about 19 miles inland from the river mouth. This smaller drainage is heavily used by residents of Kaktovik. Findings from a 1994 to 1995 subsistence survey, reported by the North Slope Borough in 2000, found that the majority of edible pounds harvested by Kaktovik residents were marine mammals (61%), followed by terrestrial mammals (26%), fish (11%), and birds (2%). A 2003 survey by the North Slope Borough found that almost three quarters of Iñupiat families in Kaktovik received more than 50% of their food from subsistence resources, and a majority of households shared subsistence resources.¹⁴⁸

Between 2000 and 2010, ADF&G did not report any information about the percentage of Kaktovik households participating in marine resource subsistence or regarding per capita subsistence harvest (Table 12). An earlier ADF&G subsistence survey provides species-level household participation information regarding marine mammals and non-salmon fish in 1992. That year, 28% of Kaktovik households reported harvesting bearded seal, 26% reported harvesting ringed seal, 6% reported harvest of bowhead whale, and 4% reported harvest of spotted seal. Species of non-salmon fish harvested by the greatest percentage of Kaktovik households in 1992 included Arctic char (79% of households reported involvement in harvesting), Bering cisco (62%), cod (32%), lake trout (17%), Arctic grayling (15%), and least cisco (9%). Many of these resources were shared with households that did not participate in harvest activities. A particularly important example of subsistence resource sharing is the bowhead whale. While only 6% of households in Kaktovik reported involvement in the harvest of bowhead whale in 1993, 87% of households reported using the resource that year.¹⁴⁹

Some information was reported during the 2000-2010 period regarding subsistence salmon permits. From 2000 to 2008, for those years in which data are available, the number of subsistence salmon permits issued to Kaktovik households varied between one and three per year. A majority of the permits issued were reported as returned. Sockeye salmon made up most of the catch reported, along with several Chinook salmon in some years. This information is presented in Table 13. No information was reported regarding subsistence harvest of marine invertebrates or non-salmon fish (Table 13), and no information was reported regarding subsistence halibut harvest by Kaktovik residents between 2003 and 2010 (Table 14).

Between 2000 and 2010, some information was reported regarding marine mammal harvest in Kaktovik. According to data reported by the U.S. Fish and Wildlife Service (FWS), polar bears were harvested in seven years during the 2000-2010 period, with a maximum of five harvested per year in 2002, 2003, and 2004. Harvest of one walrus was also reported by the FWS in 2001. In addition, NMFS reported a small number of beluga whales harvested in Kaktovik in 5

years during the period. No information was reported by management agencies regarding sea otters,¹⁵⁰ harbor seal, spotted seal, or Steller sea lion. This information is presented in Table 15.

Additional Information¹⁵¹

According to Jenness (1914), Barter Island received its name from non-Native whaling captains who landed there to trade with the local Inupiat, although the site was never a rendezvous for the local population. The Native name for Kaktovik (Qaqtovik) means “the place where the sein (qaqto) is used”. This name relates to a story told about a boy belonging to one of the two families who lived on the island. The boy turned up missing, and after searching in vain for his son, the boy’s father discovered the arm of his son in his fish net as he pulled it from a crack in the ice to check it. He knew that his son had been killed and his body thrown into the sea through a hole in the ice.

Kiana (*kai-ANN-uh*)

People and Place

Location

Kiana is located on a high bluff overlooking the confluence of the Kobuk and Squirrel Rivers. The community is 57 air miles east of Kotzebue, and 500 miles northwest of Anchorage. Kiana is located in the Northwest Arctic Borough and the Kotzebue Recording District. The area encompasses 0.2 square miles of land and zero square miles of water.^{152,153}

*Demographic Profile*¹⁵⁴

In 2010, there were 361 residents in Kiana, making it the 146th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population of Kiana remained relatively stable, falling from 385 to 361 (a decrease of 6.2%). According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased to just over 400 in the early part of the decade, before falling to just under the 1990 population level starting in 1998 (Table 1).

In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported that Kiana's population has a yearly peak during the spring, and that population fluctuations are not at all driven by employment in fishing sectors. Community leaders estimated the seasonal workforce and transient population to be roughly 30 people.

In 2010, the majority of Kiana residents identified themselves as American Indian and Alaska Native (90.3%), along with 6.6% that identified as White and 2.8% identifying with two or more races (Figure 1). Less than 1% of the population identified as Black or African American or as Hispanic or Latino. None of Kiana's residents identified as Native Hawaiian and Other Pacific Islander, Asian, or as some other race in 2010. Between 2000 and 2010, the percentage of the population identifying as American Indian and Alaska Native decreased slightly, and the percentage of the population identifying with two or more races increased by a similar margin.

Figure 1. Racial and Ethnic Composition, Kiana: 2000-2010 (U.S. Census).

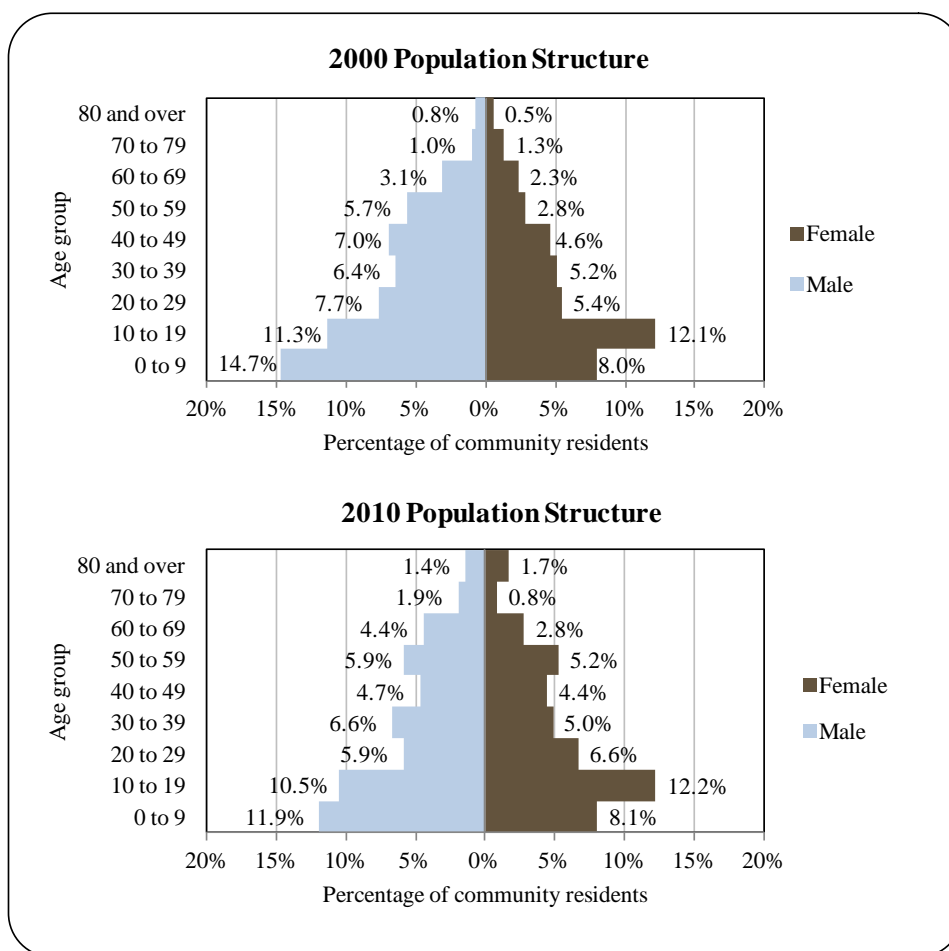

The average household size in Kiana decreased over time, from 4.2 persons per household in 1990 to 4 in 2000, and 3.57 persons per household in 2010. The decreasing number of individuals per household may be linked to an increase in the total number of occupied households over the same period, rising from 91 occupied housing units in 1990 to 97 in 2000, and 101 by 2010. The 2006 Kiana Community Comprehensive Development Plan reported that significant population increases in Kiana since the 1970s resulted in inadequate housing. The Northwest Inupiaq Housing Authority is the primary organization that has worked to construct

additional housing.¹⁵⁵ Of the 142 housing units surveyed for the 2010 Decennial Census, 39.2% were owner-occupied, 31.5% were renter-occupied, and 29.4% were vacant. Between 1990 and 2010, no Kiana residents were reported to be living in group quarters.

In 2010, the gender makeup of Kiana's population was 53.2% male and 46.8% female, slightly more weighted toward males than the gender distribution statewide (52% male, 48% female). That year, the median age in Kiana was estimated to be 26.9 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska of 33.8 years. Compared with 2000, the population structure in 2010 was slightly more evenly dispersed among age groups. For example, in 2000, 46.1% of residents were under the age of 20, compared to 42.7% in 2010, and 9% were over the age of 59 in 2000, compared to 13% in 2010. Age distribution by gender cohort was also slightly more even in 2010 than in 2000. In 2010, the greatest absolute gender difference occurred within the 0 to 9 age range (11.9% male, 8.1% female), followed by the 10 to 19 (10.5% male, 12.2% female) and 30 to 39 (6.6% male, 5.0% female) ranges. The overall population structure of Kiana in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Kiana Based on the 2000 and 2010 U.S. Decennial Census.

¹⁵⁵ Northwest Arctic Borough Planning Department. 2006. *Kiana Community Comprehensive Development Plan 2006-2016*. Retrieved September 13, 2012 from <http://www.nwabor.org/forms/kianaplan.pdf>.

In terms of educational attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS)¹⁵⁶ estimated that 79.4% of Kiana residents aged 25 and over held a high school diploma or higher degree in 2010, significantly less than the estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 12.4% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 8.2% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 19.4% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; 1.8% of resident held a Bachelor’s degree, compared to an estimated 17.4% of Alaskan residents overall; and 4.1% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

¹⁵⁶ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Kiana is a traditional Inupiat Eskimo village practicing a subsistence lifestyle. The name Kiana means “a place where three rivers meet.”¹⁵⁷ The Kobuk River was one of the last areas of Alaska explored by Westerners, with the earliest expeditions in the 1880s. In the 1800s, the traditional Inupiat society in the Kiana area was the Akunigmiut, meaning “the people in between two other things”. The ‘other things’ were the nearby Inupiat societies of Kuunmiut of the Kobuk delta and the Kuuvaum Kanjaniigmiut of the upper Kobuk River. Traditional Akugigmiut winter villages were all located upstream of the modern village of Kiana near productive subsistence areas by the Salmon and Hunt Rivers. Archaeological evidence from the eastern boundary of Akugigmiut territory suggests that the area has been inhabited for 8,500 years, with continuous Eskimo inhabitation for the past 4,000 years.¹⁵⁸ The people of the Kobuk River are also known as Kowagmiut, or ‘big river people’. Since the late 1800s, Kiana has been a central village of the Kowagmiut people.^{159,160}

With the Nome gold rush of 1898, hundreds of prospectors entered the Kobuk River. No gold was found during this first rush, and most of the prospectors left the following year. However, a small number of miners stayed and a gold deposit was later discovered in 1909 near Kiana at Klery Creek. A boom in development took place in Kiana following this discovery, including construction of a post office, hotel, saloon, jail, and restaurant. During this period, Inupiat from surrounding villages began to abandon old winter settlements and consolidate in Kiana.¹⁶¹ At its height, the Klery Creek gold mine supported as many as 200 miners, and by 1931, more than \$600,000 in gold had been removed from Klery Creek and five other creeks in the area.¹⁶² A post office was established in 1915, and the City was incorporated in 1964. Prior to the formation of the Northwest Arctic Borough in 1976, a Bureau of Indian Affairs (BIA) high school provided education for students from surrounding villages, including Noatak, Shungnak, and Ambler, who traveled to Kiana and boarded with local residents.¹⁶³

Today, the way of life in Kiana continues to revolve around subsistence. Sale of alcohol in Kiana is limited the city-owned store.¹⁶⁴

Natural Resources and Environment

Kiana is located in a transitional climate zone, influenced by both maritime and Arctic climates. Temperatures average -10 to 15 °F during winter and 40 to 60 °F during summer, and temperature extremes have been recorded from -54 to 87 °F. Snowfall averages 60 inches per year, along with 16 inches of total precipitation. The Kobuk River is ice-free from the end of

May to early October.¹⁶⁵ The Kobuk River is located at the northern boundary of the boreal forest, and much of the landscape is characterized by open woodlands and thick tundra.¹⁶⁶

In 1980, much of the traditional area of the Iñupiaq was protected as national parks, preserves, monuments, and wildlife areas under the Alaska National Interest Lands Conservation Act (ANILCA).¹⁶⁷ One of the goals of the legislation was to protect the viability of subsistence resources.¹⁶⁸ Kiana is located in close proximity to several of these areas, including Kobuk Valley National Park and Wilderness, Noatak National Preserve, and the Selawik National Wildlife Refuge (NWR).

Kobuk Valley National Park is 1.7 million acres stretching from the Baird Mountains in the north to the Kobuk Sand Dunes of the Kobuk River in the south.¹⁶⁹ The Noatak National Preserve is made up of 6.5 million acres. The National Preserve is surrounded by the Baird and DeLong Mountains of the Brooks Range.¹⁷⁰ The 2.15 million acre Selawik NWR, managed by the U.S. Fish and Wildlife Service, is situated east of Kotzebue Sound. Refuge lands include 240,000 acres of designated Wilderness Area. The approximately 21,000 lakes on NWR lowlands create a very large Arctic tundra lake complex that is comparable in scale and ecological significance to any found on Alaska's other NWR lands, providing important habitat for migratory waterfowl.¹⁷¹

Also under ANILCA, 330 miles of the Noatak River, 70 miles of the Salmon River, and 160 miles of the Selawik River were designated as a National Wild and Scenic Rivers.^{172,173} Historically, these rivers served as important travel corridors for local residents to access subsistence harvest areas, and they remain important travel routes for both humans wildlife today.¹⁷⁴ The Western Arctic Caribou herd – the largest caribou herd in Alaska at about 490,000 individuals – migrates between the coastal plain and the tundra of these protected areas on its way to and from calving grounds. A large variety of animals and plants are found in the region. Mammals include brown bear, black bear, wolves, lynx, Dall's sheep, moose, red fox, wolverine, and numerous other furbearers.¹⁷⁵

Gold mining began in the Kiana area in the early 1900s, and limited gold development interest is still present in the region.¹⁷⁶ Today, mining in Northwest Alaska is dominated by Red Dog Mine, the largest producer of zinc in Alaska. In 2010, the mine accounted for almost half of Alaska's mineral production value, making up 49% of the total value of mining operations in

Alaska that year. The mine is 100% owned by Teck Resources Ltd., a Canadian mining company, under a 1982 agreement signed with the regional Native corporation, Northwest Alaska Native Association (NANA) Regional Corporation, Inc., which owns the land.¹⁷⁷ The agreement specifies that the mine must 1) protect subsistence and the Inupiaq way of life, 2) create lasting jobs for NANA shareholders, 3) provide opportunities for NANA's youth, and 4) act as a catalyst for regional economic benefits.¹⁷⁸ In addition, jade is mined at the Jade Mountain Mine in the Kiana mining district.^{179,180}

With regard to natural hazards, Kiana is particularly susceptible to risks of erosion, flooding, wildfire, and severe weather, including cold temperatures and high winds.¹⁸¹ Warming temperatures due to climate change have exacerbated some of these risks, leading to increased erosion rates of riverbanks and thawing permafrost along rivers, under lakes, and across the tundra. Climate changes have also led to shifts in species distributions, affecting harvest of some traditional subsistence resources such as caribou.¹⁸²

According to the Alaska Department of Environmental Conservation, no active environmental cleanup sites were located near Kiana as of August 2012.¹⁸³

Current Economy¹⁸⁴

In the 2011 AFSC survey, community leaders indicated that the Kiana economy depends heavily on subsistence fishing and sport hunting and fishing. Some of the most important subsistence resources include chum salmon, freshwater fish, moose, caribou, waterfowl, and berries. In addition to subsistence harvest activities, local residents supplement their income with cash employment. Some of the top year-round employers in Kiana include the school, City, the three local general stores, and the regional Native association, the Maniilaq Association. Seasonal employment is also available on river barges, firefighting for the Bureau of Land Management.¹⁸⁵ Some mining also provides employment in the area, including jade produced from Jade Mountain Mine in the Kiana mining district,¹⁸⁶ and zinc produced at Red Dog Mine.¹⁸⁷ Between 2000 and 2010, a small number of Kiana residents were also involved in the Kotzebue salmon gillnet fishery, although no permits were actively fished during this period (see *Commercial Fishing* section). In addition, there is local interest in development of a freshwater

fish processing facility, and the City is interested in developing an ecotourism industry focused on guided river trips to the Great Kobuk Sand Dunes.¹⁸⁸

Based on household surveys conducted for the 2006-2010 ACS,¹⁸⁹ in 2010, the per capita income in Kiana was estimated to be \$15,682 and the median household income was estimated to be \$43,438. This represents an increase from the per capita and median household incomes reported in the year 2000 (\$11,534 and \$39,688, respectively). However, if inflation is taken into account by converting the 2000 values to 2010 dollars,¹⁹⁰ per capita income appears to have remained relatively stable, increasing only slightly from a real per capita income of \$15,167, and real median household income appears to have declined, from a \$52,189 in 2000. In 2010, Kiana ranked 197th of 305 Alaskan communities with per capita income data that year, and 171st in median household income, out of 299 Alaskan communities with household income data.

Kiana's small population size may have prevented the ACS from accurately portraying economic conditions.¹⁹¹ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Noatak in 2010 is \$9,391,^{192,193} slightly lower than the per capita income reported for the year 2000. This suggests that caution is warranted when citing per capita income stability in Kiana between 2000 and 2010. Low per capita income levels are supported by the fact that the community was recognized as “distressed” by the Denali Commission in 2011,¹⁹⁴ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a smaller percentage of Kiana's population (60.7%) was estimated to be in the civilian labor force in 2010 compared to the percentage of the statewide population in the civilian labor force (68.8%). That same year, 30.2% of Kiana residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate in Kiana was estimated to be 16.4%, more than twice the statewide unemployment rate of 5.9%. An additional estimate of unemployment is

based on the ALARI database, which indicates that the unemployment rate in 2010 was 21.6%, almost double the statewide unemployment rate estimate of 11.5%.¹⁹⁵

Also based on the 2006-2010 ACS, approximately half of Kiana's workforce was estimated to be employed in the public sector (51.6%), and the other half in the private sector (48.4%). Of the 95 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in the following industries: educational services, health care, and social assistance industries (22.1%), public administration (18.9%), services other than public administration (15.8%), retail trade (12.6%), and transportation, warehousing, and utilities (11.6%). Occupations in which the greatest percentages of the civilian labor force were estimated to be employed included management, business, science and arts (44.2%), production, transportation, and material moving occupations (29.5%), and service occupations (15.8%). Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 182 employed residents in Kiana in 2010, of which 64.8% were employed in local government occupations, 9.9% in educational and health services, 9.3% in natural resources and mining, 4.9% in professional and business services, 1.6% in information, 1.6% in leisure and hospitality, 1.1% in financial activities, 1.1% in state government, 0.5% in construction, and 1.1% in other industries.¹⁹⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

¹⁹⁵ See footnote 192.

Governance

Kiana is a 2nd Class City located in the Northwest Arctic Borough. It was incorporated in 1964, and has a “Strong Mayor” form of government, with a 6-person city council including the Mayor, an 11-person school board, 7-person planning commission, and a number of municipal employees. The City administers a 3% sales tax.¹⁹⁷ In addition to sales tax revenue, other locally-generated revenue sources in Kiana between 2000 and 2010 included leases and rentals of buildings, enterprise revenues including fees for water and sewer, cable TV, and fuel sales, property sale, and equipment rentals. Outside revenue sources included shared funds from a variety of programs and grants in some years. Shared funds came from the State of Alaska through the State Revenue Sharing program from 2000-2003 (approximately \$30,000 per year) and the Community Revenue Sharing program in 2009 and 2010 (approximately \$115,000 each year). Kiana also received state shared funds through a telephone / electric co-op tax refund and the SAFE Communities program (public safety, utilities, infrastructure, etc.). State grants provided funds toward building renovations, water and sewer line improvements, landfill cleanup, and purchase of bulk fuel. This information about selected municipal revenue streams in Kiana is presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Kiana from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵

Kiana was included under the Alaska Native Claims Settlement Act (ANCSA) and is federally recognized as a Native village. The authorized traditional entity, recognized by the BIA, is the Native Village of Kiana. The regional Native corporation to which Kiana belongs is the NANA Regional Corporation. In 1972, most village corporations in the region merged with NANA Regional Corporation, with the exception of the village corporation for Kotzebue, known as Kikiktagruk Inupiat Corporation. NANA Regional Corporation now has title to 2,082,052 surface acres, including 115,200 that were originally titled to Kiana's Native village corporation.^{198,199}

Kiana is a member village of the Maniilaq Association, a tribal non-profit corporation that provides health and social services to residents of Northwest Alaska. The Maniilaq Association is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Originally called NANA, it was renamed Maniilaq when the NANA Regional Corporation was formed to avoid confusion between the names.²⁰⁰ Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.²⁰¹ The Maniilaq Association coordinates tribal and traditional assistance programs, and environmental and subsistence protection services in the region.²⁰²

The closest offices of the Alaska Department of Fish and Game (ADF&G) and the Alaska Department of Commerce, Community, and Economic Development are located in Kotzebue. The closest offices of the Alaska Department of Natural Resources and U.S. Bureau of Citizenship and Immigration Services are located in Fairbanks, although the Anchorage offices of these agencies may be more accessible by air to people of this region. The closest office of the National Marine Fisheries Service (NMFS) is located in Anchorage.

Infrastructure

Connectivity and Transportation

Kiana is primarily accessible by air, as well as small boat and snowmobile. The state-owned Bob Baker Memorial Airport has a 3,400 feet long by 100 feet wide lighted gravel runway. Daily scheduled flights and charter flights are provided by Bering Air, ERA Alaska, and Ryan Air Service.²⁰³ An air taxi service operates in Kiana. As of June 2012, roundtrip airfare from Anchorage to Kiana was \$700.²⁰⁴

Crowley Marine Services barges fuel and supplies to Kiana each summer and local store owners have large boats to bring supplies upriver. Local transportation takes place using boats, ATVs, snowmachines, and some trucks owned locally. A road connects Kiana to Kobuk camp,

²⁰⁴ Airfare was calculated using lowest fare. <http://www.travelocity.com> (retrieved November 22, 2011).

and a network of old trading trails is still in use.²⁰⁵ Community leaders reported in the 2011 AFSC survey that there are plans to expand the road system within the next 10 years.

Facilities

In 2004, provision of city services shifted from the City of Kiana to the Village Council.²⁰⁶ The Village Council operates a piped water and sewer system which serves the clinic, school, community hall, and 73 homes. Water is sourced from two wells near the Kobuk River. A 200,000 is intermittently filled, and water is chlorinated prior to distribution. Sewage is collected via a 6-inch buried gravity sewer system, which is piped to a sewage lagoon northeast of the village for treatment. Nineteen households that are not connected to the pipe system haul water and use honeybuckets or septic tanks. Some outhouses are also in use in Kiana.²⁰⁷ In the 2011 AFSC survey, community leaders indicated that improvements to water and sewer pipelines are expected within the next 10 years. The Village Council does not provide refuse collection services, and individuals are responsible delivering their own refuse to a landfill operated by UIC Construction, Inc. The landfill is located west of the sewage disposal lagoon.²⁰⁸ Community leaders reported in the 2011 AFSC survey the relocation of the landfill should be completed within the next 10 years.

Electricity in Kiana is provided by a diesel plant operated by the Alaska Village Electric Cooperative. Safety services are provided by state troopers posted in Kotzebue as well as a Village Police Officer stationed in Kiana. The City has a public safety building that includes holding cells. Fire and rescue services are provided by the City Fire Hall, the City Volunteer Fire Department, and Project Code Red. The City also maintains its own volunteer fire department with equipment provided by Project Code Red. Additional community facilities include the City Office, the Council Building, a bingo hall, a Boys and Girls Club, a school gymnasium, a school library, and post office. Visitor accommodations are provided by Kiana Lodge. Local telephone services are provided by OTZ Telephone Co-op Inc, and long distance service is provided by four different private companies.²⁰⁹ In the 2011 AFSC survey, community leaders reported that Kiana plans to install broadband internet access within the next ten years. Community leaders also indicated that improvements are currently underway on the local fire department and emergency response system, as well as the local library. In addition, community leaders reported the presence of job placement services, publicly subsidized housing, and a food distribution program in Kiana.

Additional development priorities identified in the 2006 Kiana Community Comprehensive Plan included access to a gravel source, construction of a multi-purpose building to be used by the Village Council and post office, a bigger office complex with improved facilities, a Native Store, home construction, weatherization, renovation, and additions for tribal members, development of a new valley subdivision, and a community park for outdoor recreation.²¹⁰

With regard to fisheries-related infrastructure, community leaders reported in the 2011 AFSC survey that the community is planning to build a new barge landing area in 2013, and that the construction of new dock space and improvement of existing docks is currently in progress. Currently they reported there is not public dock space for permanent and transient vessels moorage. Community leaders indicated that mechanical boat repair services are available in Kiana. In addition, they noted the presence of sport fish lodges in the community.

Medical Services

The Kiana Health Clinic, operated by the Maniilaq Association, provides residents with basic medical services. The Clinic is a Community Health Aide Program site. Emergency Services have river and air access. Emergency service is provided by volunteers and the health aide.²¹¹ The nearest hospital is located in Kotzebue.

Educational Opportunities

There is one school in Kiana. As of 2011, the school had 112 students and 13 teachers. Kiana is located in the Northwest Arctic Borough School District.²¹²

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence harvest historically formed the basis of life for Native people living along the Kobuk River. According to one elder interviewed for an oral history project, “Before Kiana was established, there were Inupiat living along the river and fishing and hunting all through the area. For their settlements, people selected sites which were ideal for fishing and hunting.”²¹³ Historically, in summer Akunigmiut women historically operated fish camps along the main river and focused on harvest and preservation of whitefish and salmon. Akunigmiut men walked north to hunt for caribou and sheep in the Baird Mountains during the summer season. In winter, families returned to winter villages and continued subsistence harvest using fish traps, snared caribou and small game, and made preparations for the summer harvest season.²¹⁴

Subsistence remains fundamental to the economy and way of life in Kiana today.²¹⁵ According to a survey of subsistence harvest conducted by ADF&G in 2007, the most important aquatic subsistence species in Kiana, in terms of harvest volume, are chum salmon, whitefish, and sheefish. Burbot, northern pike, coho salmon, bearded seal, and other resources are also harvested in Kiana.²¹⁶ In the 2011 AFSC survey, community leaders reported that subsistence

²¹⁶ See footnote 214.

harvest is the primary fishing activity in Kiana, and indicated that there are no local commercial fisheries. However, it is important to note that several Kiana residents did participate in commercial fisheries between 2000 and 2010 as permit holders, crew license holders, or vessel owners (see *Commercial Fishing* section), and some sportfishing activity was also reported in Kiana and the Northwest Arctic region (see *Recreational Fishing* section).

Kiana is located in the Arctic Management Area. A Fishery Management Plan (FMP) for the Arctic Management Area was approved by the Secretary of Commerce in August 2009. Initially, the FMP prohibits commercial fishing in the federal waters of the Beaufort and Chukchi seas until more information is available to support sustainable fisheries management.²¹⁷ In state regulated waters of the Arctic Management Area, several small fisheries occur, including a small fishery for chum salmon in the Kotzebue Sound region.²¹⁸ The Kotzebue Sound salmon fishery is the northernmost commercial salmon fishery in Alaska. Over 99% of the salmon harvested in this fishery are chum salmon returning to the Kobuk and Noatak Rivers. Commercial harvest of salmon first occurred in the Kotzebue area in 1909 when Native fishermen sold salmon to gold miners. Starting in 1914, salmon were canned and sold to miners in the upper Kobuk drainage. This small industry ceased after 1918. The modern commercial fishery began in 1962, and catch peaked in 1981 with 680,000 chum commercially harvested. Since 1995, poor market conditions and variable processing capacity and interest have caused harvests to fall short of their potential. Due to limited opportunities to sell their catch, the number of active permits in the Kotzebue salmon fishery had declined over the last 30 years. Very few of the 173 total set gillnet permits have been used in recent years.²¹⁹ Fish caught in the Kotzebue salmon fishery are primarily sold to local markets, although some are shipped to markets outside the Arctic region.²²⁰

In the 2011 AFSC survey, community leaders reported that Kiana actively participates in fisheries management processes in Alaska. This participation includes sending a representative to sit on regional fishery advisory and/or working groups run by ADF&G and a representative to participate in the Federal Subsistence Board or Federal Regional Advisory Council process. Kiana is not eligible to participate in the Community Development Quota or Community Quota Entity programs.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Kiana does not have a registered processing plant. However, between one and five fish buyers were active in the nearby City of Kotzebue between 2000 and 2010, as well as one shore-side processor in 2004 and 2005 (see the Community Profile for Kotzebue). In addition, there is local interest in Kiana to develop a freshwater fish processing facility.²²¹

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue was received by the community of Kiana (Table 3).²²² Although no information was available regarding these revenue sources, community leaders reported in the 2011 AFSC survey that a number of public services in Kiana are at least partially supported or funded by fisheries-related revenue. These services include the Kiana Health Clinic, road maintenance, the water and sewer system, police enforcement, fire protection, educational scholarships, and other social services.

Commercial Fishing

Between 2000 and 2010, Kiana residents held a small number of Commercial Fisheries Entry Commission (CFEC) permits in all years, and in some years during the period were also engaged in fisheries as crew license holders and vessel owners. The number of Kiana residents holding state CFEC permits fluctuated between two and three per year. All of these permits were held in the Kotzebue salmon gillnet fishery, and none were actively fished in any year during the 2000-2010 period. No other permits were held by Kiana residents in state or federal fisheries between 2000 and 2010, and no residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab. Permit information is presented in Table 4, and federal catch share information is presented in Tables 6 through 8.

From 2000 to 2002, two fishing vessels were primarily owned by Kiana residents, and two vessels were homeported in the community, while no vessels were owned or homeported locally from 2003 to 2010 (Table 5). Given the lack of fish buyers or processing facilities in Kiana, no vessels were recorded as delivering landings locally, and no ex-vessel revenue was generated in the community. This information about the commercial fishing sector in Kiana is presented in Table 5, and Kiana landings and revenue information is also presented in Table 9. Information about landings and ex-vessel revenue generated by Kiana vessel owners, including all delivery locations, is considered confidential from 2000 to 2002 due to the small number of participants, and given the lack of vessel owners from 2003 to 2010, no landings by Kiana vessel owners are reported in those years (Table 10).

²²² A direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Recreational Fishing

Sportfishing activity was minimal in Kiana between 2000 and 2010. In some years during the period, one licensed sport fish guide was present in the community, while no active sport fish guide businesses were present in any year. The number of sportfishing licenses purchased each year by residents of Kiana (irrespective of point of sale) varied between 18 and 42 per year. From 2002 to 2010, the number of sportfishing licenses sold in the community fluctuated between 14 and 50 per year. In most years, the number of sportfishing licenses sold in Kiana was slightly greater than the number sold to Kiana residents, indicating that sportfishing activities may attract a small number of visitors to the community.

According to the 2011 AFSC survey, community leaders reported that most sportfishing in Kiana takes place from private boats owned by local residents. They also indicated that chum and coho salmon are the primary species targeted by sport fishermen near Kiana. The Alaska Statewide Harvest Survey,²²³ conducted by ADF&G between 2000 and 2010, noted sportfishing activity in freshwater only, and noted the following species as targeted by private anglers in Kiana: chum salmon, Arctic grayling, northern pike, and sheefish. No kept/release log book data were reported for sportfishing charters out of Kiana between 2000 and 2010.²²⁴

Kiana is located within Alaska Sport Fishing Survey Area X – Northwest Alaska. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, Alaska resident anglers consistently fished a greater number of days than non-Alaska resident anglers in both freshwater and saltwater, and freshwater sportfishing activity was significantly higher than in saltwater. On average between 2000 and 2010, Alaska resident anglers fished 3,251 fresh water days and 582 saltwater days, while non-Alaska resident anglers fished on average 1,690 freshwater and 64 saltwater days. This information about the sportfishing sector in and near Kiana is also displayed in Table 11.

Subsistence Fishing

In the 2011 AFSC survey, community leaders reported that subsistence harvest is the primary fishing activity in Kiana, and that close to 60% of local residents participate in subsistence fishing activities. Further, an ADF&G survey of 2006 subsistence harvest activity in Kiana found only one household that did not use some type of subsistence foods.²²⁵ According to ADF&G's Community Subsistence Information System (CSIS), in 2006, 63% of households participated in salmon subsistence, 14% in marine mammals subsistence, 4% in marine invertebrate subsistence, and 51% in non-salmon fish subsistence (other than halibut). No information was reported regarding the percentage of households participating in halibut subsistence. CSIS data suggest that Kiana residents harvested 348 pounds of marine and land-based resources per capita that year. This information about household participation and per capita subsistence harvest is presented in Table 12.

Results of the 2006 ADF&G subsistence survey included species-level information about household harvest and use of marine invertebrates, non-salmon fish, and marine mammals. Kiana households reported harvesting two species of marine invertebrates: king crab and clams. Non-salmon fish species harvested by Kiana households included sheefish, whitefish, burbot, Dolly Varden char, northern pike, smelt, herring, least cisco, and saffron cod.²²⁶ According to data reported in the CSIS, a total of 1,346 lbs of marine invertebrates and 38,274 lbs of non-salmon fish were harvested by Kiana residents in 2006 (Table 13). In addition, Kiana households reported using a variety of marine mammal resources. A small percentage of Kiana households (5%) were reported to be involved in the harvest of one marine mammal species – bearded seal, while a higher percentage (14%) was reported to use bearded seal for subsistence. A number of other marine mammal species were also reported used by Kiana households, although no households were reported to participate in their harvest. These species included ringed seal, spotted seal, and bowhead whale. The fact that a significant percentage of households had access to marine mammal resources without participating directly in harvest can be explained by strong subsistence support ties between households in Kiana and the coastal communities of Kotzebue and Barrow.²²⁷

Information about subsistence salmon permits was available from ADF&G for four years of the 2000-2010 period. During these four years, Kiana households were issued an average of 90 subsistence salmon permits, and an average of 71 permits was returned. Chum were the most targeted salmon species, with an average of 3,791 chum harvested per year. A smaller number of coho, pink, sockeye, and Chinook salmon were also harvested by Kiana residents in each of the four years. Information about subsistence salmon harvest is presented in Table 13.

Between 2000 and 2010, no additional data were reported by management agencies regarding subsistence harvest of Pacific halibut (Table 14) or marine mammals (Table 15).

Kivalina (kiv-uh-LEE-nuh)

People and Place

*Location*²²⁸

Kivalina is at the tip of an 8-mile barrier reef located between the Chukchi Sea and Kivalina River. It lies 80 miles northwest of Kotzebue, and 620 miles northwest of Anchorage. The area encompasses 1.9 square miles of land and 2.0 square miles of water. Kivalina was incorporated as a Second-class city in 1969 and is under the jurisdiction of the Northwest Arctic Borough.

*Demographic Profile*²²⁹

In 2010, there were 374 residents in Kivalina, ranking it 144th largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population increased by 18.0%. Between 2000 and 2009, the population increased by 8.8% with an average annual growth rate of 0.77%, which was very similar to the statewide average of 0.75% and indicative of slow growth. Information regarding population trends can be found in Table 1.

Kivalina is a traditional Inupiat Eskimo village. In 2010, 96.3% of residents identified themselves as American Indian or Alaska Native, compared to 96.6% in 2000; 2.1% identified themselves as White, compared to 3.4% in 2000; and 1.6% identified themselves as two or more races, compared to 0.0% in 2000. Information regarding racial and ethnic trends can be found in Figure 1.

The average household size in 2010 was 4.40 individuals, compared to 4.70 in 1990 and 4.83 in 2000. In that year, there were 99 housing units, compared to 71 in 1990 and 80 in 2000. Of the households surveyed in 2010, 65% were owner-occupied, compared to 78% in 2000; 21% were renter-occupied, compared to 20% in 2000; 10% were vacant, compared to 3% in 2000; and 4% were occupied seasonally, compared to 0% in 2000. No residents lived in group quarters between 1990 and 2010.

The gender distribution in 2010 was somewhat biased towards females with 52.4% females and 47.6% male. This was in contrast to both the statewide distribution that year (52.0% male, 48.0% female), and distribution in 2000 (51.5% male, 48.5% female). The median age in 2010 was 21.3 years, which was significantly younger than the statewide median of 33.8 years, and similar to the 2000 median of 20.8 years.

The population structure was expansive in both 2000 and 2010. In 2010, 46.6% of residents were under the age of 20, compared to 48.0% in 2000; 8.8% were over the age of 59,

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

compared to 8.5% in 2000; 27.2% were between the ages of 30 and 59, compared to 28.4% in 2000; and 17.4% were between the ages of 20 and 29, compared to 15.1% in 2000.

Gender distribution by age cohort was more equal in 2010 than in 2000. In that year, the greatest absolute gender difference occurred within the 50 to 59 range (5.1% female, 2.4% male), followed by the 10 to 19 (10.7% female, 9.1% male) and 30 to 39 (5.1% female, 3.7% male) ranges. Of those three, the greatest relative gender difference occurred within the 50 to 59 range. Information regarding trends in Kivalina’s population structure can be found in Figure 2.

Figure 2. Population Age Structure in Kivalina Based on the 2000 and 2010 U.S. Decennial Census.

In terms of educational attainment, the U.S. Census’ 2006-2010 American Community Survey (ACS)²³⁰ estimated that 64.1% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 14.9% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 21% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 15.5% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; 2.8% of resident held a Bachelor’s degree, compared to an estimated 17.4% of Alaskan residents

²³⁰ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

overall; and an estimated 1.1% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Human occupation of the barrier island where Kivalina is located extends back 1,500 years, when the area was first populated as a stopping-off place for people travelling between Arctic coastal areas and the Kotzebue Sound region. According to oral history, the original permanent settlement known as Kivalina was located on the coast of the mainland, somewhat north of the Kivallik Channel. Originally, the people of Kivalina utilized the barrier island only as a seasonal hunting ground, making camp during summer months. Kivalina's existence was recorded in 1847 by a Russian Naval officer who mistook a seasonal subsistence camp north of the present day village as a permanent settlement. This settlement was logged as "Kivualinagmut."²³¹ A severe famine hit the area in the early 1880s, which killed or drove out most inhabitants of the Kivalina area.

From 1896 to 1902, reindeer were transported to the Kivalina area by the federal government, and locals were actively trained as herders. In 1905, Kivalina was relocated to its current location when the U.S. Bureau of Indian Affairs (BIA) repeated the error of the Russian naval officer by mistaking a seasonal camp on the barrier reef for a permanent village. Soon, the BIA established a school on the southern tip of the island and threatened any residents who did not enroll their children with imprisonment. This led to the vacating of the original Kivalina as well as surrounding communities.²³²

A post office was established in 1940, and an airstrip in 1960. During the 1970s, a new school, power system, and new houses were built. The sale and importation of alcohol is prohibited within the community.²³³

Natural Resources and Environment

Kivalina lies in the transitional climate zone, which is characterized by long, cold winters and cool summers. The average low temperature during January is -15 °F; the average high during July is 57 °F. Temperature extremes have been measured from -54 to 85 °F. Annual snowfall averages 57 inches, with 8.6 inches of precipitation per year. The Chukchi Sea is ice-free and open to boat traffic from mid-June to the first of November.

The village lies on a 5-mile long, 700-foot wide barrier reef island. Local soils are characterized by sand and gravel, which are largely unconsolidated and subject to erosion. The mainland to the east of Kivalina consists of a large coastal plain dotted with lakes, meandering streams, sloughs, and gently rolling limestone hills. In most areas, continuous permafrost underlies a tundra-covered bed of glacier till and alluvium. Lowland topography is characterized by thermokarst features which include thaw lakes, ice wedge polygons, frost mounds, and solifluction lobes. Moist and wet tundra are primary vegetation communities in lowland areas. The landscape is dominated by sedge-grasses and dwarf shrubs. Tall shrubs are present around

many drainages. Freshwater species found in drainages include four species of whitefish, northern pike, Arctic char, Dolly Varden, and Arctic grayling. Terrestrial mammals include brown bear, snowshoe hare, moose, muskoxen, fox, wolves, weasels, and wolverine. There is also habitat for a wide range of seabirds.²³⁴ Marine species within the Chukchi and East Bering seas include urchins, sea cucumbers, Snow crab, Arctic cod, sculpins, Saffron cod, shrimp, flounder, eelpouts, herring, walleye pollock, smelt, Pacific cod, king crab, sole, capelin, turbot, greenling, and a range of bivalves. All five species of Pacific salmon are found in the Kotzebue Sound region.²³⁵ Marine mammals found within the Chukchi Sea include spotted seal, bearded seal, ringed seal, ribbon seal, beluga whale, killer whale, harbor porpoise, gray whale, minke whale, bowhead whale, polar bear, and Pacific walrus.²³⁶

Mineral resources in the region include a major zinc-leader development operated by NANA Corporation and Tech Alaska Incorporated. The Red Dog mine has been in operation since 1989 and one of the world's largest producers of zinc concentrate.²³⁷

Environmental hazards manifest almost exclusively in the form of flood and erosion events caused by storm surges. Storm flooding historically occurred in early fall, before the formation of sea ice along the shore. However, Kivalina can experience storm events at any time of the year. Southwesterly storms bring 70 knot winds in the summer and early fall, while winter storms typically come from the northeast. Local observations have found that shorefast ice has formed later in recent years, increasing the effects of fall storm flooding. For two decades, steady erosion of the Kivalina shoreline has led to increased sea encroachment, and the City has decided that relocation to an inland site is necessary. Relocation inland would alleviate shoreline flooding concerns; however, the U.S. Army Corps of Engineers (USACE) estimates relocation to be 15 to 20 years away, putting the community in a difficult situation if current erosion trends continue. In addition to sediment removal, bank failure, and habitat destruction; flood and erosion hazards can damage infrastructure, leading to the potential release of toxic contaminants into the local environment. Outhouses, the school sewer, septic bunkers, and dog yards are all potential sources of contaminants which could impact community health. A significant concern of flood victims would be the lack of a reliable, clean water source. Mitigation measures in place include a large rock revetment, proposed evacuation route, public awareness programs, and structure elevation and relocation plans.²³⁸

In 2003, the Government Accountability Office reported that Kivalina faced an imminent threat from flooding and erosion, and the USACE was utilized in assessing threats and possible mitigative actions, including relocation. Storms in 2004 and 2005 caused significant damage to Kivalina's shore, and it was estimated that 70 to 80 feet of coastline was lost. The city was subsequently declared a federal disaster area by the Federal Emergency Management

Administration (FEMA), qualifying it for relief funding. A seawall was soon constructed; however, it failed a day before its inauguration. A storm in 2007 forced an evacuation of the community, and a large rock revetment project was planned soon after. Kivalina had selected the relocation site of *Kiniktuuraq*, which was located a mile southeast on a portion of the Chukchi Sea coast that had been used by residents as a subsistence camp. However, the site was determined as vulnerable to erosion by federal contractors, and would require riprap and armor rock to stabilize the shoreline. This determination frustrated Kivalina residents, as it conflicted with local and traditional ecological knowledge of area characteristics. However, the USACE requires that floodplain delineation and long-term shoreline stabilization plans are submitted before relocation efforts can be funded by FEMA and to qualify for federal disaster insurance. These requirements raised the cost of relocation significantly.²³⁹

In 2008, costs associated with relocation prompted the City of Kivalina and the Native Village of Kivalina to file a public nuisance suit against Exxon-Mobil Corporation and 23 other fossil fuel companies for contributing to the effects of global warming through excessive emissions of greenhouse gases. The claim stated that harm to the community was caused by anthropogenic climate changes, which was caused in part by carbon dioxide emitted by the defendants. However, a California District Court dismissed the case on grounds that the plaintiffs' claim lacked standing. It was the court's opinion that under the political question doctrine, it was inappropriate for the court system to weigh in on an issue that had not been given clear legislative or political definitions. In addition, the plaintiffs' claim that harm was linked to the defendants' emissions lacked sufficient evidence. The case was later filed in appellate court in 2010, and oral argument was held in November 2011.²⁴⁰ Ultimately, the original ruling was upheld.

According to the Alaska Department of Environmental Conservation, there are no significant environmental remediation sites active within Kivalina as of 2010. However, the nearby Red Dog Mine site consistently monitored for potential impacts to populated and subsistence use areas from fugitive dust and lead sulfide and zinc sulfide contaminants. Potential risks include respiratory problems associated with dust, and impacts to subsistence food sources from dissolved or bioaccumulated contaminants. Dust deposition from the mine site poses risks to the local environment surrounding open pits. A study conducted in 2001 found that it was safe to continue eating subsistence foods, and mitigation techniques have been put in place to control fugitive dust particles.²⁴¹

Current Economy²⁴²

Kivalina's economy is heavily dependent upon subsistence hunting and fishing. Wage employment opportunities are limited, and many jobs are either part-time or seasonal. Major employers include the City, Village Council, school, Maniilaq Association, NANA Regional

²⁴² Unless otherwise noted, all monetary data are reported in nominal values.

Corp., local stores, and the Red Dog Mine. Commercial fishing is another source of seasonal employment. The Native art industry is also expanding, and locals specialize in ivory carving.²⁴³

In 2010,²⁴⁴ the estimated per capita income was \$13,425 and the estimated median household income was \$59,375, compared to \$8,360 and \$30,833 in 2000, respectively. After adjusting for inflation by converting 2000 values into 2010 dollars,²⁴⁵ the real per capita income (\$10,993) and real median household income (\$40,545) indicate that both individual and household earnings declined. In 2010, Kivalina ranked 220th of 305 communities from which per capita income was estimated, and 79th of 299 communities from which median household income was estimated.

However, Kivalina's small population size may have prevented the ACS from accurately portraying economic conditions.²⁴⁶ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$2.96 million in total wages in 2010.²⁴⁷ When matched with the 2010 Decennial Census population, the per capita income equals \$7,919, which is significantly less than the 2010 ACS estimate and suggests that cautions should be used when comparing 2010 ACS and 2000 Census figures.²⁴⁸ This is supported by the fact that Kivalina was recognized as "distressed" by the Denali Commission, indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.²⁴⁹ It should be noted that ACS and DOLWD data are based on wage earnings and do not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates,²⁵⁰ 66.8% of residents aged 16 and older were part of the civilian labor force in 2010. In that year, unemployment was estimated at 17.1%, compared to an estimated 5.9% statewide; and an estimated 22.0% of residents lived below the poverty line, compared to an estimated 9.5% of Alaskan residents overall. Again, it should be noted that the ACS may not have accurately captured economic conditions in Kivalina due to its small population size. According to 2010 ALARI estimates, the unemployment rate was 25.8% based on unemployment insurance claimants.²⁵¹ Of those employed in 2010, the ACS estimated that 40.3% worked in the private sector and 59.7% worked in the public sector.

²⁴⁴ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²⁴⁵ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012) from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>.

²⁴⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²⁴⁷ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

By industry, most (39.6%) employed residents were estimated to work in education services, health care, and social assistance sectors; followed by public administration (25.2%); retail trade (15.1%); and agriculture, forestry, fishing, hunting, and mining (6.5%) sectors.²⁵² According to 2010 ALARI estimates, most (66.5%) employed residents worked in local government sectors; followed by educational and health service (11.2%) and natural resources and mining (7.1%) sectors.²⁵³ Between 2000 and 2010, there was significant variation in employment by industry sector. Significant proportional increases occurred in public administration sectors; education services, health care, and social assistance sectors; and retail trade sectors. Conversely, significant proportional declines occurred in other service sectors; construction sectors; and agriculture, forestry, fishing, hunting, and mining sectors (Figure 3).

²⁵³ Ibid.

Figure 4. Local Employment by Occupation in 2000-2010, Kivalina (U.S. Census).

By occupation type, most (37.4%) employed residents were estimated to hold management or professional positions; followed by service (23.0%); production, transportation, or material moving (18.7%); sales or office (15.8%); and natural resources, construction, or maintenance (5.0%) positions (Figure 4).²⁵⁴ According to 2010 ALARI estimates, most employed residents held construction laborer occupations; followed by stock clerks or other fillers; office or administrative support workers; and gaming service workers. ALARI listed 11 occupational categories in 2010.²⁵⁵ Between 2000 and 2010, there were significant variations in employment by occupation type. Significant proportional increases occurred in management or professional occupations. Conversely, significant proportional declines occurred in natural resources, construction, and maintenance positions.

Governance

Kivalina is a Second-class city with a mayoral form of government. There is a six-member city council, eleven-member school board, and five municipal employees. In addition, there is a U.S. Bureau of Indian recognized tribal government.

The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Kivalina is the NANA Regional Corporation, which also serves as the ANCSA-chartered village corporation. The local ANCSA chartered non-profit is the Maniilaq Association.

The closest National Marine Fisheries Service (NMFS) office is located in Anchorage, 620 miles southeast. The closest Alaska Department of Fish and Game (ADF&G) office is located in Kotzebue, 80 miles southeast. The closest U.S. Bureau of Citizenship and Immigration Services office is located in Nome, 490 miles south.

Municipal revenues were taken from Certified Financial Statements. When adjusted for inflation,²⁵⁶ total municipal revenues declined by 2.4% between 2000 and 2010 from \$836,087, to \$1.06 million. Total municipal revenues peaked in 2009 at \$1.68 million, and were at their lowest in 2005 at \$241,479. In 2010, most (79.5%) municipal revenues were collected locally. In

²⁵⁴ Ibid.

²⁵⁵ Ibid.

²⁵⁶ Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

that year most locally generated revenues were collected from gaming revenues, followed by donations, utility rents, and debt interests. Outside revenues were collected from state allocated Community Revenue Sharing and other outside grants. Sales tax revenues accounted for 2.5% of total municipal revenues in 2010, compared to less than one-percent in 2000. In addition, Community Revenue Sharing accounted for 11.1% of total municipal revenues that year, compared to 3.8% in 2000 from State Revenue Sharing. Information regarding municipal revenue can be found in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Kivalina from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵
2000	\$836,087	\$6,017	\$31,947	n/a
2001	\$1,257,173	\$29,411	\$32,017	n/a

Infrastructure

Connectivity and Transportation^{257,258}

Kivalina is not connected to any road systems, and basic modes of transportation to and from Kivalina are plane, small boat, and snowmobile. The state owns a 3,000-foot long by 60-foot wide gravel airstrip. There is daily service from Kotzebue and twice weekly service from Point Hope provided by Bering Air and Era Aviation. In total, roundtrip airfare between Anchorage and Kivalina in June 2012 was \$718.²⁵⁹ Air freight services between Kivalina and Kotzebue are provided by Ryan Air, Bering Air, and Era Aviation. Two main hunting trails follow the Kivalina and Wulik Rivers. Northland Services barges fuel, automobiles, groceries, household goods, and general supplies to Kivalina in July and August. Cargo is shipped in from either Anchorage or Seattle.

Facilities^{260,261}

Water is sourced from the Wulik River and pumped via a 3-mile surface line to a pair of storage tanks holding 1.17 million gallons. Water is chlorinated and fluoridated as it is pumped. Kivalina operates on a “fill-and-draw” system meaning that water is pumped and stored during July and August for use during the winter. During warm-weather months, residents haul and treat their own water individually, while during the winter water is hauled from the central tanks. A few residents have plumbing, and the school and health clinic are fully plumbed with individual water and sewer lines. Residential sewage is hauled in honeybuckets to four disposal bunkers located throughout the community. A washeteria is operated by the city within the community and offers three showers. When the water tank is down to 12 feet, the washeteria is closed to the public.

The Alaska Village Electric Co-op provides electricity via diesel generators with a peak capacity of 1,040 kilowatts. Telephone service is provided by Kotzebue-based OTZ Telephone Cooperative. Landline and cellular phone service capabilities are available. OTZ also provides DSL high speed internet services. Cable television service is provided by the City.

A community hall and Boys & Girls Club are available in the community. There is no Village Public Safety Office, and services are provided by state troopers based in Kotzebue. The City also maintains its own volunteer fire department and search and rescue group. Visitor accommodations are not available in Kivalina. Other public facilities include the City Office, Tribal Office, Kivalina Native Store, two churches, bingo hall, and three small privately owned dry goods shops.

²⁵⁹ Airfare was calculated using lowest fare from www.travelocity.com (Retrieved November 22, 2011).

²⁶⁰ See footnote 258.

²⁶¹ See footnote 257.

*Medical Services*²⁶²

The Kivalina Clinic operated by the Maniilaq Association provides residents with basic medical services. Two health aides provide services 6 days per week and are on call 24 hours. The small clinic has a waiting room, two exam rooms, an office, a communications room, and a bathroom. Acute, long-term, specialized, and emergency medical services are provided in Kotzebue.

Educational Opportunities

McQueen School provides preschool through 12th grade instruction. As of 2011, there were 139 students enrolled and 13 teachers employed.²⁶³ Opportunities for post-secondary education are available through online classes provided by Chukchi Campus, a rural division of the University of Alaska.²⁶⁴ Bachelor's degrees are offered in child development and family studies, rural development, social work, and education. Master's degrees are offered in education and rural development.²⁶⁵

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Historically, the area's inhabitants used Kivalina as a seasonal subsistence camp. Important subsistence fish include Arctic char, chum salmon, sheefish, whitefish, tomcod, and smelt. Important subsistence marine mammals include bearded seals, ringed seals, spotted seals, beluga whale, and bowhead whale, and walrus. Subsistence harvests are conducted throughout the year, depending on species. Bowhead and beluga whale hunting is primarily conducted in the spring, from April through June. Walrus hunting peaks during May and June. Seal hunting peaks from April through June, and again from late January through the end of February. Fishing is done throughout the year, along coastal areas and within the Kivalina and Wulik River drainages. Arctic char and chum salmon are especially important species.²⁶⁶

With the exception of Pacific halibut, commercial fishing within the federally managed Arctic Management Area (AMA) is prohibited under the current Arctic Fishery Management Plan (FMP). Pacific salmon fisheries are managed by the State of Alaska and directed fishing is allowed in State waters within the Kotzebue Sound region. Halibut is management under the International Pacific Halibut Commission (IPHC). Halibut harvests may occur within federal waters under the management of the IPHC; however, no commercial harvests have been attempted. Experimental fishing for halibut has occurred within the AMA in the past. Directed

fishing for crab in the Chukchi Sea is limited to small subsistence or personal use fisheries. The commercial harvest of crab within the AMA is prohibited under the current Arctic FMP.²⁶⁷

In terms of state water fisheries, a small crab fishery occurs in the Norton Sound area; adjacent to the AMA. While authorized under the federal crab FMP, management is largely deferred to the State. Some crab subsistence and personal use occurs within the southeastern Chukchi Sea. A commercial salmon fishery is managed by the state within the Kotzebue Sound region. Again, commercial salmon harvests are prohibited within the AMA. While prohibited within the AMA, herring harvests occur in some adjacent State waters. Dolly Varden are at times caught incidentally during salmon harvests within the Kotzebue Sound region.²⁶⁸

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Kivalina does not have a registered processing plant. The closest seafood processor is located in Kotzebue.

Fisheries-Related Revenue

Between 2000 and 2010, there was no known fisheries-related revenue reported by the community of Kivalina (Table 3).

Commercial Fishing

Overall, commercial fishing in Kivalina is somewhat limited. In both 2000 and 2010, five residents, or 1.3% of the population, held five commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). Between those years, no more than five residents held CFEC permits. Salmon was the only species harvested by residents of Kivalina between 2000 and 2010. No residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits in those years, nor did any residents hold halibut, sablefish, or crab quota share. In 2010, 20% of permits held were actively fished, compared to 40% in 2000; which was also the year that local permit activity peaked.

Residents held three commercial crew licenses in 2010, compared to two in 2000. In addition, residents held majority ownership of only one commercial fishing vessel that year, compared to none in 2000. Kotzebue gillnet salmon was the only fishery prosecuted by residents of Kivalina in 2010.

No landings were reported in Kivalina between 2000 and 2010. Landings reported by residents of Kivalina during that time are considered confidential. Information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Sportfishing in remote areas of Northwest Alaska is extremely limited due to travel costs and a lack of visitor infrastructure. There are few recreational fisheries in the AMA and no catch and release fishery management programs. Personal use fisheries exist, although they are more closely related to subsistence fisheries. Most recreational fishing occurs near Kotzebue and within state waters.²⁶⁹

Between 2000 and 2010, there were no sport fish guide businesses registered within the community, no sport fish guide licenses issued to residents, and no sportfishing licenses sold within the community. In 2010, residents held 25 sportfishing licenses, compared to 5 in 2000. No information on species targeted by resident private anglers is available (Table 11).

Kivalina is located within the Northwest Alaska ADF&G Harvest Survey Area which includes the Selawik, Kobuk, Noatak, Wulik, and Kivalina river drainages; and all saltwater in the northern half of Kotzebue Sound. There are no saltwater angler days fished data available for 2010. In 2009, there was a total of 251 angler days fished, compared to 215 in 2000. In that year, non-Alaskan residents accounted for 100% of total angler days fished, compared to 6.5% in 2000. In 2010, there was a total of 1,088 freshwater angler days fished, compared to 1,404 in 2000. In that year, non-Alaskan residents accounted for 32.7% of total angler days fished, compared to 31.2% in 2000. Further information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Subsistence is essential to Kivalina’s residents, sustaining them economically, nutritionally, and culturally. Popular subsistence fishing areas include the Kivalina River and Wulik River watersheds, as well as coastal areas of the Chukchi Sea. According to ADF&G household surveys conducted in 2008, 34% of households reported participating in salmon subsistence activities in 2007, 67% reported participating in marine mammal subsistence activities, 7% reported participating in marine invertebrate subsistence activities, and 79% reported participating in non-salmon fish subsistence activities (Table 12). In terms of subsistence resource use, 98% of households reported using fish and 93% reported using marine mammals in 2007.²⁷⁰

Broken down by species, most (45%) households surveyed in 2008 reported using chum salmon in 2007, followed by pink (19%), coho (10%), and Chinook (7%) salmon. Also in that year, an estimated 2,406 pounds of chum salmon were harvested, followed by an estimated 502 pounds of Chinook, 251 pounds of pink, and 33 pounds of coho salmon. Data regarding

²⁷⁰ Magdanz, J.S., N. S. Braem,, B. C. Robbins,, and D. S. Koster. 2010. Subsistence Harvests in Northwest Alaska, Kivalina and Noatak, 2007. Alaska Dept. of Fish and Game Technical Paper No. 354. Retrieved September 25, 2012 from: <http://www.subsistence.adfg.state.ak.us/techpap/TP354.pdf>.

subsistence salmon permits issued by ADF&G are largely unavailable, with only limited data reported in 2008. In terms of non-salmon fish, 93% of households surveyed in 2008 reported using Dolly Varden in 2007, followed by saffron cod (81%), whitefish (40%), sheefish (36%), Arctic grayling (33%), Arctic cod (31%), northern pike (17%), and burbot (14%). Overall, an estimated 75,332 to 78,780 lbs of non-salmon fish were harvested in 2007.^{271,272} Between 2003 and 2010, no residents were issued Subsistence Halibut Registration Certificates (SHARC) by NMFS (Table 14).

Marine mammals accounted for the largest part of Kivalina's subsistence harvest in 2007. In that year, 126,002 lbs of marine mammals were harvested, accounting for 49% of the total community subsistence harvest reported for that year. In that year, most (88%) households reported using beluga whale, followed by bearded seal (83%), bowhead whale (64%), ringed seal (48%), walrus (45%), spotted seal (5%), and ribbon seal (2%).²⁷³ For species listed in Table 15, an estimated total of 78 beluga whales, 6 walrus, and 2 polar bears were harvested between 2000 and 2010. Most beluga whale harvests occurred in 2000 (44) and 2007 (22).

Overall, 10 species accounted for 95% of the edible weight harvested by subsistence resources (most of which were aquatic species). This included an estimated 229 bearded seals, 20,527 Dolly Varden, 268 caribou, 22 beluga whale, 25,824 saffron cod, 71 ringed seals, 490 gallons of cloudberry (salmonberry), 401 chum salmon, 357 gallons of crowberry, and 4 moose.²⁷⁴

In terms of availability of aquatic resources, 26% of households reported not "getting enough" marine mammals, specifically bearded seals, walrus, bowhead whales, and beluga whales. According to ADF&G subsistence harvest records (Tables 15), an estimated 50 beluga whales and 6 walrus were harvested between 2000 and 2010; however, these estimates were not consistent with the 2008 ADF&G household survey.

Kotzebue (KAWT-zuh-byoo)

People and Place

*Location*²⁷⁵

Kotzebue is on the Baldwin Peninsula in Kotzebue Sound, on a 3-mile long spit, which ranges in width from 1,100 to 3,600 ft. It is located near the discharges of the Kobuk, Noatak, and Selawik Rivers, 549 air miles northwest of Anchorage and 26 miles above the Arctic Circle. Kotzebue is located in the Kotzebue Recording District. The area encompasses 27.0 square miles of land and 1.7 square miles of water. Kotzebue was incorporated in 1958 and is under the jurisdiction of the Northwest Arctic Borough.

*Demographic Profile*²⁷⁶

In 2010, there were 3,201 residents in Kotzebue, ranking it 34th largest of 352 total Alaskan communities with recorded populations that year (Table 1). Overall between 1990 and 2010, the population increased by 16.4%. Between 2000 and 2009, there was an average annual growth rate of 0.21%, which was slightly under the statewide average of 0.75% and indicative of slight growth over those years. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that the permanent population of Kotzebue in 2010 was 3,270. In that year, the estimated seasonal or transient population was 400. Community leaders reported that one average, seasonal residents live in Kotzebue between April and October, with the population peaking June through September. However, seasonal population peaks do not appear to be driven by employment in fisheries sectors.

Kotzebue is traditionally an Inupiat Eskimo community. In 2010, 73.6% of residents identified themselves as American Indian or Alaska Native, compared to 71.2% in 2000; 16.0% identified themselves as White, compared to 19.5% in 2000; 1.2% identified themselves as Asian, compared to 1.8% in 2000; 0.9% identified themselves as Black or African American, compared to 0.3% in 2000; 0.3% identified themselves as Native Hawaiian or Other Pacific Islander, compared to 0.1% in 2000; 7.6% identified themselves as two or more races, compared to 6.4% in 2000; and 0.4% identified themselves as some other races, compared to 0.8% in 2000. In addition, 1.3% of residents identified themselves as Hispanic or Latino in 2010, compared to 1.2% in 2000. Further information regarding racial and ethnic trends can be found in Figure 1.

Figure 1. Racial and Ethnic Composition, Kotzebue: 2000-2010 (U.S. Census).

In 2010, the average household size in Kotzebue was 3.31, compared to 3.50 in 1990 and 3.40 in 2000. In that year, there were a total of 1,160 housing units, compared to 911 in 1990 and 1,007 in 2000. Of the households surveyed in 2010, 38% were owner-occupied, compared to 39% in 2000; 47% were renter-occupied, compared to 50% in 2000; 9% were vacant, compared to 7% in 2000; and 8% were occupied seasonally, compared to 5% in 2000. In addition, 47 residents were living in group quarters in 2010, compared to 62 in 2000.

In 2010, the gender distribution of Kotzebue was 51.0% male and 49.0% female. This was similar to both the gender distribution statewide (52.0% male, 48.0% female) and distribution in 2000 (50.5% male, 49.5% female). The median age that year was 27.2 years, which was lower than the statewide median of 33.8 years, but higher than the 2000 median of 25.9 years.

Compared with 2000, the population structure in 2010 was somewhat more constricted. In that year, 36.5% of residents were under the age of 20, compared to 42.9% in 2000; 10.3% were over the age of 59, compared to 6.2% in 2000; 35.5% were between the ages of 30 and 59, compared to 38.3% in 2000; and 17.7% were between the ages of 20 and 29, compared to 12.7% in 2000. The increase in older age brackets with a subsequent decrease in younger age brackets reflects an aging population.

Figure 2. Population Age Structure in Kotzebue Based on the 2000 and 2010 U.S. Decennial Census.

Gender distribution by age cohort continued to be relatively even between 2000 and 2010. In that year, the greatest absolute gender difference occurred within the 40 to 49 age range (7.3% male, 5.6% female), followed by the 30 to 39 (6.3% male, 5.4% female) and 80 and over (0.3% male, 1.0% female) age ranges. Of those three, the greatest relative gender difference occurred within the 80 and older range.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)²⁷⁷ estimated that 83.2% of residents aged 25 and over held a high school diploma or higher degree in 2010, compared to an estimated 90.7% of Alaskan residents overall. Also in that year, an estimated 6.7% of residents had less than a 9th grade education, compared to an estimated 3.5% of Alaskan residents overall; an estimated 10.1% had a 9th to 12th grade education but no diploma, compared to an estimated 5.8% of Alaskan residents overall; an estimated 24.2% had some college but no degree, compared to an estimated 28.3% of Alaskan residents overall; 9% of resident held a Bachelor's degree, compared to an estimated 17.4% of Alaskan residents overall; and an estimated 8.6% held a graduate or professional degree, compared to an estimated 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Archaeological findings in northwest Alaska indicate that people have continuously occupied the Kotzebue Sound area for the past 4,000 years. Evidence from the oldest sites show that humans were in the area 6,000 years ago, and perhaps as early as 8,000 to 10,000 years ago. Two cultures can be linked with continuous occupation of the Kotzebue Sound area: the Arctic Small Tool tradition (4,200 to 1,000 years ago) and Northern Maritime tradition (1,400 years ago to present). The area near present day Kotzebue has been occupied as a village for the past 600 years. The oldest excavated Kotzebue site is dated at 1400 C.E.²⁷⁸

The permanent settlement of *Kikitaruk* was unusual for its time, in that most settlements were semi-permanent as most people of the area followed migratory caribou herds. But the coastal resources of the area allowed for permanent settlement, and *Kikitaruk* established itself as a regional trading hub. Centuries before European contact, *Kikitaruk* was a busy center of trading activities and a stopping point for trade routes throughout the Arctic linking Siberian Chukchi and northern MacKenzie Eskimos and Canadian Athabascans.²⁷⁹

In the first half of the 19th century, the Kotzebue territory of *Qikiqtagrumiut* was a group of regional winter settlements, focused around a larger settlement located south of present-day Kotzebue. The estimated population of the *Qikiqtagrumiut* was 375 as of 1840. *Sisualik*, located on a spit 10 miles northwest of Kotzebue, was the site of the largest Eskimo fair in the World; attracting 2,000 or more people from throughout northwest Alaska and the Asiatic mainland. The fair, peaking in July, included feasts, dancing, games, and trade. Interior peoples traded furs, jade, salmon skin clothing, and birchbark baskets for muktuk, seal oil, ivory, and walrus hides

²⁷⁷ While ACS estimates can provide a good snap shot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²⁷⁸ Georgette, S., and H. Loon. 1993. Subsistence Use of Fish and Wildlife in Kotzebue, a Northwest Alaska Regional Center. Technical Paper No. 167. Alaska Dept. of Fish and Game. Retrieved August 22, 2012 from: <http://www.subsistence.adfg.state.ak.us/TechPap/tp167.pdf>.

²⁷⁹ Alaska State Housing Authority. (1971). *Kotzebue, Alaska Comprehensive Development Plan*. Retrieved August 17, 2012 from: <http://www.commerce.state.ak.us/dca/plans/Kotzebue-CP-1971.pdf>.

from coastal peoples. Tobacco, metal implements, and firearms reached Sisualik through trade routes from Russian before Europeans arrived in the region. The Great Famine of 1882-84 decimated the Qikiqtagrmiut. Other factors, including introduced diseases, loss of autonomy, and Euro-American influences also contributed towards deteriorating traditional societies.²⁸⁰

The first explorer to the Kotzebue Sound was Otto von Kotzebue in 1816. Europeans continued to periodically visit the Kotzebue Sound area during the first half of the 19th century, although there was little interaction with the Qikiqtagrmiut. After 1850, foreign traffic increased in the area as commercial interests in whales, ivory, and fur intensified. The period between 1880 and 1900 was a time of significant change in the region, as famine and disease severely eroded traditional life. In 1897, the Religious Society of Friends missionaries arrived, establishing living quarters, schools, and churches in what would be present-day Kotzebue. In 1898, the discovery of hold along the Kobuk River brought thousands of prospectors to Kotzebue. Inupiaq residents earned cash from miners by building boats and dog sleds, provided meat and dried fish, hauled mail and freight, and manufactured clothing. By 1900, most of the miners had left, most without realizing their sought after fortune.²⁸¹

In 1909, the resident population of Kotzebue was 193. The community's population has grown since 1900, with rapid growth occurring immediately after World War II during the construction of the Air Base White Alice and Distant Early Warning system sites. The population went from 372 in 1939, to 623 in 1950, and 1,290 in 1960.²⁸²

The passage of the Alaska Native Claims Settlement Act (ANCSA) in 1971 greatly transformed Kotzebue. The Kikiktagruk Inupiat Corporation received title to much of the Baldwin Peninsula, as did the NANA Regional Corporation. In the late 1980s, Kotzebue continued to grow as a regional transportation and commercial hub. Nearly all goods and services in the region are supplied from the community.²⁸³

Within the core of Kotzebue, a historic district is mentioned. Official designation on the National Register of Historic Places (NRHP) has not been submitted.²⁸⁴ The Cape Krusenstern Archeological District National Monument, located in the vicinity of Kotzebue, is listed on the NRHP.²⁸⁵

Natural Resources and Environment

Kotzebue is located in the transitional climate zone, which is characterized by long, cold winters and cool summers. The average low temperature during January is -12 °F (-24 °C); the average high during July is 58 °F (14 °C). Temperature extremes have been measured from -52 to 85 °F (-47 to 29 °C). Annual snowfall averages 40 inches, with total precipitation of 9 inches per year. Kotzebue Sound is ice-free from early July until early October.

Kotzebue is surrounded by Cape Krusenstern National Monument, Noatak National Preserve, Kobuk Valley National Park, and Selawik National Wildlife Refuge. Kotzebue is

located on the northern end of the Baldwin Peninsula. The Baldwin Peninsula is composed primarily of unconsolidated Quaternary sediments. These sediments are mostly eolian, glacial, and marine in origin. Illinoian glaciers deposited till and outwash over marine sediments. Loess was deposited over the glacier sediments during glacial retreat. Sea level rose, and in some areas, marine sediments were deposited over the eolian silts. Late Wisconsin and Holocene sediments are primarily silts, clays, and fine sands; with the oldest sediments exposed on coastal bluffs. An exploratory petroleum well drill 10 miles east of Cape Blossom hit bedrock at a depth of 900 feet. The nearest bedrock outcrops at sea level are on the Choris Peninsula to the southeast, at Ekichuk Lake on Hotham Inlet to the northeast, and at Cape Krusenstern Lagoon northwest of the project site. The Baldwin Peninsula is located within a zone of continuous permafrost. The depth of the bottom of permafrost is probably between 200 and 300 feet. During the summer, the active permafrost layer extends 2 to 4 inches beneath the surface.²⁸⁶

The prominent vegetation type on the Baldwin Peninsula is moist coastal tundra. Continuous, uniformly developed cotton grass tussocks with sparse groups of other sedges and dwarf shrubs dominate. Few trees grow in the area, particularly near Kotzebue. However, some stands can be found in the Noatak and Kobuk River drainages, and driftwood is scattered along the coast. Kotzebue residents collected various edible plants including greens, berries (cranberries, salmon berries, blue berries, and black berries), and roots. Cotton grass, wild rhubarb, and wild onion, wild peas, willow leaves, and sprouts are also traditionally gathered.²⁸⁷

Terrestrial mammals in the area include moose, caribou, bear, wolves, fox, lynx, mink, marten, wolverine, land otter, beaver, and muskrat. Marine mammals include bearded seal, ringed seal, walrus, beluga whale, and other whales. There is a historic area for taking seal located near the entrance to Hotham Inlet from Kotzebue. Polar bears rarely venture as far south as Kotzebue, but they have been spotted in the area. The region is home to more than 50 species of fish, including Arctic char, whitefish, Dolly Varden, sheefish, Northern pike, grayling, herring, cod, and all five species of Pacific salmon. Birds are present in the area between May and September. Most birds are migratory because of Kotzebue's proximity to Asian and North American flyways.²⁸⁸

The primary mineral development project on the Baldwin Peninsula is the Red Dog Mine, which is the world's largest zinc and lead mine. Mineral deposits are located in the DeLong Mountains, which are part of the Brooks Range. The Kobuk River Valley contains many placer gold deposits. On Jade Creek, gold and jade deposits can be found. The Ambler Mining District, east of Kotzebue, has vast deposits of jade, copper, and other minerals. The Noatak District, north of Kotzebue, contains gold deposits at Lucky Six Creek. The Selawik District, southeast of Kotzebue, has one reported gold operation on Shovel Creek, which was mined until shortly after World War II. Finally, the Shungnak District, east of Kotzebue, contains many placer gold deposits throughout several drainages.²⁸⁹

Environmental hazards present in the community include flooding, erosion, severe weather, and earthquakes. In general, most hazards are area wide. Primary flooding and erosion hazards come from storm surge flooding, wave and slough erosion, sea ice, and permafrost melt. Kotzebue is located on the coast, and is therefore susceptible to significant storm surge flooding.

²⁸⁶ See footnote 282.

²⁸⁷ Ibid.

²⁸⁸ Ibid.

²⁸⁹ Stoops, L. (2004). *Northwest Arctic Borough Comprehensive Economic Development Strategy*. Retrieved August 20, 2012 from: <http://www.commerce.state.ak.us/dca/plans/NorthwestArcticBorough-EDP-2004.pdf>.

Permafrost and erosion place strains on transportation and utility infrastructure, as well as constraints on community expansion. Potential effects of climate change include increased flood events, sea level rise, offshore ice retreat, and more severe coastal erosion. Sea-ice poses unique hazards to submerged infrastructure. Phenomenon such as strudel scour and ice gouging can potentially damage underwater utilities. In addition, offshore drilling platforms and shoreside facilities can become susceptible to ice overrides and pressure ridging.

Climate change is expected to alter seal levels, change wind and deep-ocean circulation patterns, marine resource productivity, species distribution, and outbreaks of disease and harmful algal blooms. Permafrost melt is expected to result in land subsidence, which may impact local infrastructure; especially in poorly drained areas. Storm systems produce high winds that generate large waves and currents. Storm surges can temporarily raise water levels by as much as 23 feet, increasing the vulnerability of shorelines and floodplains to sediment and nutrient migrations. The retreat of sea ice facilities storm damage to the shorelines of the Baldwin Peninsula to the extent that communities may be forced to relocate. Deposition, resulting from storm surges, can alter drainage hydrography and reduce channel capacity; increasing flooding and bank erosion. Floodwaters pose environmental health hazards through the dispersal of harmful materials or the contamination of water sources. In addition to storms, extreme weather can also include extreme cold temperatures and heavy snow accumulations. Winter storms can produce temperatures of -40 to -60 °F. Heavy snow and ice storms impact transportation and supply networks. While the risk is present, the Kotzebue area has a relatively low risk of earthquakes. There is no historical precedence of earthquakes impacting the community. In addition, the probability of secondary impacts from earthquakes is also low.²⁹⁰

According to the Alaska Department of Environmental Conservation, there were no significant environmental remediation sites active in Kotzebue as of 2010. However, Kotzebue is a regional center, transportation hub, and former military site. As such, there are many smaller, ongoing cleanup projects active in the community.²⁹¹

Current Economy²⁹²

Kotzebue is a service and transportation center for many villages in the Northwest Arctic Borough. Due to its location at the confluence of three river drainages, Kotzebue is the transfer point between ocean and inland water shipping and also the air transport center for the region. Activities related to oil and mineral exploration and development have contributed to the economy. The majority of income is directly or indirectly related to government employment, including the School District, Maniilaq Association, NANA Corporation, and City and Borough governments. In a survey conducted by the AFSC in 2011, community leaders reported that Kotzebue's resource-based economy is reliant on mining, fishing, and sport hunting/fishing.

In 2010,²⁹³ the estimated per capita income was \$23,067 and the estimated median household income was \$66,908, compared to \$18,289 and \$57,163 in 2000, respectively.

²⁹⁰ City of Kotzebue; WHPacific, Inc.; and Bechtol Planning and Development. (2008). *City of Kotzebue, Alaska Local Hazards Mitigation Plan*. Retrieved August 21, 2012 from: http://www.commerce.state.ak.us/dca/planning/nfip/Hazard_Mitigation_Plans/Kotzebue_LHMP.pdf.

²⁹¹ Alaska Dept. of Environmental Conservation. (n.d.). *Contaminated Sites Program*. Retrieved August 21, 2012 from: <http://dec.alaska.gov/spar/csp/list.htm>.

²⁹² Unless otherwise noted, all monetary data are reported in nominal values.

However, after adjusting for inflation by converting 2000 values into 2010 dollars,²⁹⁴ the real per capita income (\$24,050), and real median household income (\$75,169) indicate that while individual earnings remained unchanged, household earnings declined. In 2010, Kotzebue ranked 124th of 305 communities from which per capita income was estimated, and 55th of 299 communities from which median household income was estimated.

However, Kotzebue's small population size may have prevented the ACS from accurately portraying economic conditions.²⁹⁵ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned \$58.4 million in total wages in 2010.^{296, 297} When matched with the 2010 decennial population, the per capita income equals \$18,245, which is slightly less than the 2010 ACS estimate.

According to 2006-2010 ACS estimates, 70.8% of residents aged 16 and over were part of the civilian labor force in 2010. In that year, unemployment was estimated at 14.7%, compared to an estimated 5.9% statewide; and an estimated 15.3% of residents lived below the poverty line, compared to an estimated 9.5% of Alaskan residents overall. In addition, an estimated 59.3% worked in the private sector, an estimated 36.5% worked in the public sector, an estimated 3.8% were self-employed, and an estimated 0.4% were unpaid family workers. Based on unemployment insurance claimants, the DOLWD estimated that the local unemployment rate was 11.3% in 2010.

By industry, the 2006-2010 ACS estimated that most (40.7%) employed residents worked in education services, health care, and social assistance sectors in 2010; followed by retail trade sectors (11.2%); transportation, warehousing, and utilities sectors (11.2%); and public administration sectors (11.1%). Also in that year, an estimated 4.6% of employed residents worked in sectors which included fisheries. Between 2000 and 2010, significant proportion gains were seen in public administration, education services, health care and social assistance sectors. Conversely, significant proportional declines were seen in professional, scientific, management, administrative, and waste management sectors (Figure 3).

²⁹³ U.S. Census Bureau (n.d.). Profile of selected social, economic and housing characteristics of all places within Alaska. Datasets utilized include the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

²⁹⁴ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

²⁹⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

²⁹⁶ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

²⁹⁷ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

Figure 3. Local Employment by Industry in 2000-2010, Kotzebue (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Kotzebue (U.S. Census).

By occupation type, the 2006-2010 ACS estimated that most (37.1%) employed residents held management or professional positions; followed by sales or office positions (23.7%); service positions (16.1%); natural resources, construction, or maintenance positions (14.8%); and production, transportation, or material moving positions (8.2%). For the most part, no significant proportional changes occurred between 2000 and 2010, although there was a modest proportional increase in the number of natural resources, construction, and maintenance positions. However, the proportion attributed to fisheries positions cannot be determined. Another source of occupation data is the ALARI database. According 2010 ALARI estimates,

most (26.9%) residents worked in educational and health service sectors; followed by local government sectors (23.0%); and trade, transportation, and utilities sectors (16.8%) (Figure 4).²⁹⁸

Governance

Kotzebue is a second-class city located in the Northwest Arctic Borough. Incorporated in 1958, the city has a manager, or “Strong Mayor” form of government. There is a 7-member city council, 11-member school board, 7-member planning commission, and 6 municipal employees. There is also a U.S. Bureau of Indian Affairs recognized tribal government. The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Kotzebue is the NANA Regional Corporation, and the local ANCSA-chartered non-profit is the Maniilaq Association. The ANCSA-chartered village corporation is the Kikiktagruk Inupiat Corporation.

There is an Alaska Department of Fish and Game (ADF&G) office located in Kotzebue. The closest National Marine Fisheries Service (NMFS) office is located in Anchorage 549 miles southeast. The closest U.S. Bureau of Citizenship and Immigration Services is located in Nome, 181 miles southwest.

The City collects a 6% sales tax, 6% accommodations tax, 6% alcohol tax, and 6% gaming tax. In 2010, the total municipal budget was \$10.77 million, compared to \$7.63 million in 2000; an increase of 9.2% after adjusting for inflation.²⁹⁹ Municipal budgets steadily increased between 2000 and 2010, peaking in 2010. Also in that year, sales tax revenues accounted for 29.9% of the municipal budget, compared to 32.3% in 2000. In addition, state allocated Community Revenue Sharing accounted for 2.4% of the municipal budget in 2010, compared to 1.3% from State Revenue Sharing in 2000. State and federal fisheries-related grants awarded to Kotzebue between 2000 and 2010 included \$56,099 for Swan Lake Harbor improvements, \$462,000 for Kotzebue Sound chum salmon enhancement projects, \$45.2 million for DeLong Mountain Harbor construction, and \$27,000 for a fish processor business plan. Information regarding municipal finances can be found in Table 2.

Infrastructure

*Connectivity and Transportation*³⁰⁰

Air is the primary, year-round means of transportation for residents of Kotzebue. The state-owned Ralph Wien Memorial Airport supports daily jet service to Anchorage and several air taxis to the region’s villages provided by Alaska Airlines, Bering Air, ERA Alaska, and Ryan Air Service. The airport has a 5,900-ft-long by 150-ft-wide main paved runway and 3,876-ft-long by 90-ft-wide crosswind gravel runway. A seaplane base is also operated by the state in Kotzebue. As of June 2012, roundtrip airfare from Anchorage to Kotzebue costs \$462.³⁰¹

The shipping season lasts 100 days, from early July to early October, when the sound is ice-free. Due to river sediments deposited by the Noatak River 4 miles above Kotzebue, its harbor is shallow. Deep draft vessels must anchor 15 miles out, and cargo is lightered to shore and warehoused. Crowley Marine Services operates shallow draft barges to deliver cargo to area communities. Water taxi services are not available. There are 26 miles of local gravel road used by cars, trucks, and motorcycles during the summer. Snowmobiles are preferred in winter for local transportation.

*Facilities*³⁰²

Electricity in Kotzebue is provided by a diesel plant owned by the Kotzebue Electric Association. Kotzebue also uses ten 50-kilowatt wind turbines for supplemental electrical generation. The City operates water and sewage systems. Water is supplied by the 150-million-gallon Vortac Reservoir, located one and a half miles from the city. Water is then treated and stored in a 1.5-million-gallon tank. Before circulation in the water mains, the water is heated with a waste heat recovery system at the electric plant. A washeteria is privately operated within the community. Piped sewage is treated in a 32-acre zero discharge facultative lagoon west of the airport. Around 80% of homes are fully plumbed, and 521 homes are served by the City's water

³⁰² See footnote 300.

system. A transfer station and Class 2 permitted landfill with balefill is available. Recycling and hazardous waste disposal are also provided.

A public library, recreational and entertainment center, food bank, and Boys & Girls Club are also available in the community. Safety services are provided by the city police department and the state trooper post in Kotzebue itself. The City also maintains its own volunteer fire department with additional fire and rescue services provided by the Maniilaq Air Ambulance and NANA Search and Rescue. Visitor accommodations are provided by Bibber's Bed and Breakfast, Bison's Bed and Breakfast, and the Nullagvik Hotel. The community is also home to the NANA Museum.

With regard to fisheries-related infrastructure, Alaska's Department of Community and Rural Affairs (DCRA) community profile of Kotzebue states that the harbor is shallow and cargo from deep raft vessels must be lightered to shore. DCRA also reports that no public dock space exists for permanent and transient vessels to moor at. However, in the 2011 AFSC survey, community leaders reported that a barge landing area exists in the community and there are plans to construct new dock space for permanent, transient or public moorage in the next 10 years. The current dock infrastructure is serviced by electricity and water although no fuel tanks exist at the dock. Within the next 10 years, Kotzebue hopes to make improvements to its existing dock structure and construct both dry dock space and haul out facilities, although haul out facilities for small boats (less than 60 tons) already exist in the community. Community leaders indicate that limited boat repair and fisheries-related businesses are available in Kotzebue, and that residents typically travel to nearby cities of Nome, Anchorage, and Fairbanks to access fisheries-related businesses and services.

*Medical Services*³⁰³

The Maniilaq Medical Health Center provides residents with basic medical services. The hospital is a qualified Acute Care facility. Long-term care is provided at the Kotzebue Senior Center, and specialized care is provided at the Maniilaq Alcohol Program's Maniilaq Camp and the Lake Street House, both operated by the Maniilaq Association. Emergency Services have limited highway coastal and airport access, and are provided by 911 Telephone Service and volunteers.

*Educational Opportunities*³⁰⁴

As of 2011, there were two schools in Kotzebue. The June Nelson Elementary School had 388 students enrolled and 23 teachers. The Kotzebue Middle/High School had 298 students enrolled and 24 teachers.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Kotzebue residents have been fishing in the regions for at least 600 years. Marine mammals such as seal and beluga are of primary importance, and their capture is always a cause for celebration. Salmon, whitefish, sheefish, and Arctic char are major fish species sought for subsistence. They are all used commercially by the Kotzebue Sound Area Fisheries Cooperative.³⁰⁵ The Cooperative owns and operates a local processing plant and acts as a catalyst for organizing local fishermen to work together in commercial fishing. In a survey conducted by the AFSC in 2011, community leaders reported that the commercial gillnet salmon season typically runs from July 12 to August 15. In addition, community leaders reported an increase in the number of vessels shorter than 35 ft, compared to 2005.

The summer chum season runs from July through August, and is focused on Noatak and Kobuk River chum. Small numbers of sockeye, Chinook, coho, and pink salmon also occur, but their contribution to commercial harvests is negligible. Dolly Varden are at times, incidentally caught in the last weeks of the commercial salmon season.³⁰⁶

From 1914 to 1918, the Midnight Sun Packing Company operated a small cannery in the Kotzebue district and processed slightly over 100,000 fish. However, between 1918 and 1961, no commercial fishing took place. The present commercial fishery began in 1962, primarily for chum salmon. Most fishing takes place along and within a 10-mile-side channel between the Baldwin Peninsula and Sheshalik Spit. Fishing is closely regulated during the early season when most of the fish are passing through the district, bound for the Kobuk River. The commercial season is set later to harvest the large run of chum salmon to the Noatak River.³⁰⁷

Commercial catches vary from year to year due to changes in migration patterns of chum salmon. Fishing usually begins in mid-July when fishermen in small outboard skiffs fish set gillnets. Kotzebue chum salmon are of high quality and are in high demand. Fish are dressed with heads on, iced, and transported to offshore Japanese freezer ships or shipped to Anchorage or Seattle markets. Commercial fisheries for Arctic char and inconnu (whitefish) also occur. Arctic char run later than salmon, and are fished following the salmon season. Funding for the State-owned Sikusuliaq Springs Fish Hatchery on the Noatak River was discontinued in 1983. The State had invested close to \$20 million in capital improvement and operating costs of the hatchery.³⁰⁸ The hatchery closed in 1996; however, runs continued until 2000.³⁰⁹

A commercial fishery for sheefish has operated in the Kotzebue Sound since the 1960s, but it is historically small and does not contribute significantly to the local economy. In most years, sheefish quota was not met, and the fishery remained open throughout the winter.

Fishermen use gill setnets under ice, and most commercial catch is sold to local residents or kept for personal use.³¹⁰ No sheefish have been fished commercially since 2005.

Kotzebue is located in the Arctic Management Area and thus is not located within a Federal Statistical and Reporting Area, a Pacific Halibut Fishery Regulatory Area, or a Sablefish Regulatory Area. Kotzebue is not eligible to participate in either the Community Development Quota program or the Community Quota Entity program.

Processing Plants

According to the ADF&G's 2010 Intent to Operate list, Kotzebue does not have a registered processing plant. The closest seafood processor is located in Nome.

Attracting commercial seafood processors to Kotzebue has been difficult because of the small size and unpredictability of local fisheries, as well as depressed market conditions. Chum harvests historically have been dictated largely by market conditions; which have fluctuated greatly, resulting in low harvests numbers in many years. Commercial chum salmon harvests between 1982 and 2001 ranged from 55,907 to 521,406 with a 20 year average of 220,720 fish. Between 1997 and 2001; however, chum salmon harvests decreased significantly. While many residents held commercial salmon permits, most permits remained inactive during recent years. Permit activity was likely market-driven and in 2002, the last significant local fish buyer decided to not purchase fish in Kotzebue. In 2002 and 2003, one salmon permit holder became a licensed agent for a buyer outside of Kotzebue, and worked with other permit holders to provide product for the market. In 2004, one buyer provided a limited local market for permit holders.³¹¹ In that year, there was a fish processor operated under a combined effort by the Bering Sea Fishermen's Association and NANA Regional Corp.³¹²

Fisheries-Related Revenue

Between 2000 and 2010, there was no known fisheries-related revenue received by the community of Kotzebue, with the exception of \$475 in Shared Fisheries Business Taxes in 2006 (Table 3).

Commercial Fishing

Commercial fishing effort in Kotzebue is predominately focused on Noatak River chum salmon.³¹³ Local fish are caught in Sub-district 1 of the Kotzebue Sound District. Historical chum harvests between 1962 and 2004 averaged 201,250 fish.³¹⁴ In 2000, 144 residents held 147 commercial fishing permits issued by the Commercial Fisheries Entry Commission (CFEC). The number of CFEC permits held by residents peaked in 2005 at 157. In 2010, 155 residents, or 4.8% of the population, held 148 CFEC permits. Of the CFEC permits held in 2010, 97% were for salmon, compared to 96% in 2000; 1% were for crab, compared to 1% in 2000; 1% were for

³¹⁰ See footnote 306.

³¹⁴ See footnote 309.

herring, compared to 0% in 2000; and 1% were for “other” finfish, compared to 3% in 2000. Between 2000 and 2010, no residents held Federal Fisheries Permits (FFP) or License Limitation Program (LLP) permits. In addition, no residents participated in federal catch share fisheries for halibut, crab, or sablefish between 2000 and 2010. Fisheries prosecuted by Kotzebue residents in 2010 included: Kotzebue gillnet salmon, Norton Sound gillnet salmon, and statewide power troll salmon.³¹⁵

Residents held 98 commercial crew licenses in 2010, compared to 87 in 2000; marking a decadal peak for number of crew licenses held in the community. In addition, residents held majority ownership of four vessels that year, compared to six in 2000. Fisheries participation varied significantly between 2000 and 2010. In 2010, 40% of CFEC permits held were actively fished, compared to 38% in 2000. Permit activity was at its lowest 2001 and 2002 at 2% of permits fished. Permit activity varied by fishery in 2010, from 41% of salmon permits fished, to 0% of crab, herring, and “other” finfish permits. “Other” finfish permits were activity fished between 2001 and 2005, while crab permits were only actively fished in 2005. No herring permits were actively fished between 2000 and 2010.

No landings were reported in Kotzebue between 2000 and 2010, although there were between one and four fish buyers registered there. Landings were reported in the community in 2001, 2004, 2005, 2006, and 2007. Total landings for those years are considered confidential, with the exception of 2005. In that year, 626,418 pounds of seafood were landed, valued at \$129,304 ex-vessel. Landings by species in Kotzebue are considered confidential. Landings reported by residents between 2000 and 2010 are also considered confidential. Further information regarding commercial fishing trends can be found in Tables 4 through 10.

Recreational Fishing

Tourism is a rapidly growing industry in Kotzebue, driven in large part to sport hunting and fishing. Tourism infrastructure has been expanding. NANA Regional Corp. opened a new 78 room hotel in Kotzebue in 2011.³¹⁶ Golden Eagle Outfitters provides guided sportfishing excursions, targeting Dolly Varden, northern pike, sheefish, Arctic grayling, and chum salmon.³¹⁷ Sheefish are a popular target for private anglers on the Kobuk River, as the river supports one of the largest sheefish populations in the world. Typically, private anglers based in Kotzebue will fly to remote locations on the Upper Kobuk to target this species. The communities of Ambler

³¹⁶ Associated Press. (2011, August 31). NANA development opens new Kotzebue hotel. *Anchorage Daily News*. Retrieved August 22, 2012 from: <http://www.adn.com/2011/08/31/2041468/nana-development-opens-new-kotzebue.html>.

³¹⁷ Golden Eagle Outfitters. (n.d.). *Kotzebue*. Retrieved August 22, 2012 from: <http://www.alaskawildernessexpeditions.com/kotzebue.html>.

and Kobuk are seasonally inundated with recreational fishermen, many of whom originate in Kotzebue or Bettles. Float excursions are a popular activity, and many large parties will spend days floating the Kobuk as far downriver as Kiana. Most sheefish sportfishing is conducted in August and September. By mid-September, most recreational fishermen on the Kobuk River fish for sheefish only as a secondary attraction, with most their efforts focused on hunting moose and caribou.³¹⁸ Dolly Varden, northern pike, Arctic grayling, burbot, lake trout, and Arctic char are also popular targets within the Kobuk River watershed.³¹⁹

No sport fish guide businesses actively operated in Kotzebue between 2000 and 2010 despite several being registered between those years. However, one sport fish guide license was issued in 2010. Also in that year, 438 sportfishing licenses were sold in the community, compared to 101 in 2000. The number of sportfishing licenses sold in the community peaked in 2010. In addition, Kotzebue residents held 389 sportfishing licenses in 2010, compared to 329 in 2000. The number of sportfishing licenses held by residents peaked in 2007 at 514. According to ADF&G Harvest Survey records, private anglers from Kotzebue have targeted all five species of Pacific salmon, rainbow trout, Dolly Varden, whitefish, burbot, Arctic grayling, northern pike, sheefish, Pacific halibut, smelt, and razor clams. In a survey conducted by the AFSC in 2011, community leaders reported that local anglers generally target pink and chum salmon, crab, shrimp, and clams. Species-specific harvest information from charter logbook records is not available for Kotzebue.

Kotzebue is located within Alaska Sport Fishing Survey Area X – Northwest Alaska, which include the drainages of Selawik, Kobuk, Noatak, Wulik, and Kivalina rivers and all saltwater in the northern half of Kotzebue Sound to and including Point Hope. Information on saltwater angler days fished for 2010 is unavailable. Otherwise, angler days fished on marine waters was insignificant between 2000 and 2009. Total saltwater angler days fished peaked in 2008 at 420 with non-Alaskan residents accounting for the majority of recreational fishing effort. In 2010, freshwater angler days fished totaled 1,088, compared to 1,401 in 2000. Total freshwater angler days fished peaked in 2003 at 1,873. Non-Alaskan residents accounted for 35.3% of freshwater angler days fished in 2010, compared to 31.3% in 2000. Overall, Alaskan residents comprise a larger portion of freshwater angler days fished than non-Alaskan residents. Information regarding recreational fishing trends can be found in Table 11.

Subsistence Fishing

Subsistence activities are extremely important to Kotzebue residents, and for many residents, participation in subsistence activities supplement or replace wage employment. In many cases, unemployment statistics are often misleading since many residents are working, although not in “occupations” captured by traditional labor statistics.

The subsistence season begins each year at spring ice breakup, usually in May. During breakup, travel becomes increasingly difficult, and many residents move to seasonal subsistence camps on the coast northwest of Kotzebue before travelling on ice becomes unsafe. When the water becomes open enough to permit boat travel, local hunters go out in search of marine mammals, particularly bearded seal, but also ringed seal and walrus. Migrating waterfowl are also hunted, and their eggs are gathered when available. Near Kotzebue, residents continue to jig for sheefish on the last remnants of shoreside ice. As the ice clears, residents fish for herring, whitefish, and Dolly Varden. Beluga whale hunting also begins at this time. From a subsistence perspective, May through July is the busiest time of year for harvesting. With cool, dry weather, oil and “black meat” (half-dried bearded seal) is produced from harvested seal.³²⁰

Summer arrives in late June or July. At this time many residents turn their efforts towards salmon fishing for both subsistence and commercial purposes. Berry picking begins around this time, and many residents gather salmonberries, blueberries, blackberries, and cranberries. Incidental Dolly Varden harvesting begins in early August. Salmon fishing concludes around the end of August, while berry picking continues through September. Migrating caribou herds make their way through the area around the beginning of fall in late August. Both caribou and moose are hunted during this time. As sea ice begins to form in October, Kotzebue hunters pursue young bearded seals and spotted seals. Saffron cod (tomcod) are jigged on ice forming near shorelines. During the winter, caribou, moose, ptarmigan, and hare are hunted. Wolf, wolverine, and fox are also hunted or trapped for furs. In early winter, nets are set under the ice in the Hotham Inlet to fish for sheefish. In late winter, sheep hunting takes place in the Baird Mountains, and moose, caribou, seal, and fur bearer hunting continues.³²¹

Seasonal subsistence patterns are particularly susceptible to variations in weather, temperature, travel conditions, and species availability. Long term changes also can occur as a result of diminishing wildlife populations, climate change, and habitat regime shifts.³²²

In a 1993 survey of Kotzebue households, an estimated 23.1% harvested marine mammals (principally bearded seals), an estimated 51.3% harvested salmon, an estimated 44.8% harvested sheefish, and an estimated 38.3% harvested Dolly Varden. Overall, an estimated 75.1% of households harvested fish that year.³²³

ADF&G subsistence data are limited for 2000 through 2010. Information regarding subsistence participation by household is unavailable. Significant data on salmon harvests are only available for 2000 and 2001. In 2001, residents reported harvesting 17,713 chum salmon, compared to 36,896 in 2000. The significant decline in salmon harvests could possibly be attributed to cyclical variations in annual chum runs. Between 2000 and 2008, Chinook, pink, coho, and pink salmon were also harvested, but to a lesser degree. Subsistence Halibut Registration Certificates were held by residents in 2007 through 2009, however there were no

³²⁰ See footnote 318.

³²¹ Ibid.

³²² Ibid.

³²³ Ibid.

reports of halibut harvests. Between 2000 and 2010, an estimated 89 beluga whales, 10 sea otters, 8 walrus, and 6 polar bears were harvested. Beluga whale harvests significantly peaked in 2007 at 69 animals. No information is available regarding Steller sea lion, spotted seal, and harbor seal harvests.

According to ADF&G *Community Subsistence Information System* records, “other” species Kotzebue residents use or harvest include king crab, mussels, pinkneck calms, razor clams, shrimp, Tanner crab, bearded seal, bowhead whale, gray whale, minke whale, ribbon seal, ringed seal, spotted seal, Bering cisco, blackfish, broad whitefish, burbot, Dolly Varden, Arctic grayling, herring, humpback whitefish, least cisco, northern pike, saffron cod, sheefish, and sucker. Information regarding subsistence trends can be found in Tables 12 through 15.

Additional Information

In a survey conducted by the AFSC in 2011, community leaders expressed concern over a lack of funds available to develop local fisheries. Leaders expressed that the community was being adversely affected by not being able to participate in the CFQ program. They also contend that outside CDQ groups are attempting to expand their effort into Kotzebue area fisheries, and local fishermen lacks the funds to compete. Finally, the Magnuson Stevens Act prevents Kotzebue from directly negotiating with Japan and requires the community to sell product through intermediaries.

Noatak (NO-uh-tack)

People and Place

*Location*³²⁴

Noatak is located on the west bank of the Noatak River, 55 miles north of Kotzebue and 70 miles north of the Arctic Circle, just west of the 66-million acre Noatak National Preserve. This community is the only settlement on the 396 mile-long Noatak River. Noatak is in the Kotzebue Recording District and the Northwest Arctic Borough Census Area.

*Demographic Profile*³²⁵

In 2010, there were 514 residents in Noatak, ranking it as the 115th largest of 352 communities in Alaska with recorded populations that year. Overall between 1990 and 2010, the population of Noatak increased by 54.4%. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents increased by 21.3%. The average annual growth rate during this period was 0.68%, reflecting an overall positive population trend with small decreases in population in some years.

In 2010, the majority of the population of Noatak identified themselves as American Indian or Alaska Native (94.7%), while 2.5% identified as White, 1.1% as Asian, 0.4% as Black or African American, and 2.3% identified with two or more races. No residents of Noatak identified themselves as Hispanic in 2010. The percentage of the population identifying as White decreased over time, from 3.3% in 1990 and 3.7% in 2000, to 2.5% in 2010. The percentage of the population identifying as American Indians and Alaska Natives decreased between 1990 and 2000, from 96.7% to 93.7%, then increased again to 94.7% in 2010. The change in population from 1990 to 2010 is provided in Table 1, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Based on household surveys conducted for the U.S. Census, the average household size in Noatak was fairly consistent between 1990 and 2010, with 4.5 persons per household in 1990, 4.23 in 2000, and 4.51 in 2010. The number of households in Noatak increased over time, from 74 households in 1990 to 100 in 2000, and 114 in 2010. All 114 of the total available housing units in Noatak were occupied in 2010. Of these, 69.3% were owner-occupied and 30.7% were rented. Between 1990 and 2010, no residents of Noatak were reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Noatak: 2000-2010 (U.S. Census).

In 2010, the gender makeup of Noatak’s population (52.1% male and 47.9% female) was very close to the balance of the state population as a whole, which was 52% male and 48% female. The median age of Noatak residents was 21.3 years in 2010, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 9.8% of Noatak’s population was 60 or older. The overall population structure of Noatak in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),³²⁶ 78.5% of Noatak residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also in 2010, 13% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 8.5% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 4.9% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 3.1% were estimated to have an Associate’s degree, compared to 8% of Alaskan residents overall; 3.1% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaskan residents overall; and 0.9% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

Figure 2. Population Age Structure in Noatak Based on the 2000 and 2010 U.S. Decennial Census.

³²⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Archaeological surveys conducted by the National Park Service have identified evidence of human habitation in the Noatak area dating back at least 11,000 years.³²⁷ Noatak is located in the traditional territory of the Napaaqtugmiut, meaning “tree people,” who inhabited the lower Noatak River area. The name Noatak means “inland river people,”³²⁸ and is derived from the name of the traditional inhabitants of the upper Noatak River, the Nuataagmiut.³²⁹ The present Village of Noatak is home to descendants of both of these Iñupiaq societies, along with the Nunamuit, or “treeless land people.”³³⁰

In the early 1800s, there were an estimated 10 Napaaqtugmiut villages and 22 Nuataagmiut villages scattered along the Noatak River. The Napaaqtugmiut suffered from famine in the early 1800s, and many fled north or to the Kobuk River area. Many Nuataagmiut also relocated to the north in the 1880s due to the decline of the Western Arctic Caribou herd.³³¹ In the 1890s, missionaries asked families living in sod houses in different settlements along the river to select a permanent village site where they would construct a school and place of worship. Elders selected Noatak, previously a fishing and hunting camp, for the site of the settlement, due to the plentiful resources of the area and strategic location for access to other camp sites.³³² Construction of a mission and school was completed by 1908.³³³

The Native Village of Noatak was established in 1939 under the Indian Reorganization Act (IRA). A post office was established in 1940. In 1994, a 50-year flood event created a large shoal on the Noatak River downstream from the Village of Noatak, preventing barge access to the Village. Since then, all fuel, groceries, and other supplies must be flown in to the community.³³⁴ Today, subsistence activities remain the central focus of the culture in Noatak. Families travel to coastal seasonal subsistence camps of Nuvguruk and Sisualik, as well as inland camps.³³⁵ Noatak is a dry village; the sale and importation of alcohol is banned.³³⁶

Natural Resources and Environment

Noatak is located in the transitional climate zone. Winter temperatures average between -21 and 15 °F, and average summer temperatures vary between 40 and 60 °F. Temperature extremes have been recorded from -59 to 75 °F. Annual snowfall averages 48 inches, with 10 to 13 inches

of total precipitation. The Noatak River is navigable by shallow-draft boats from early June to early October.³³⁷

In 1980, much of the traditional area of the Iñupiaq was protected as national parks, preserves, monuments, and wildlife areas under the Alaska National Interest Lands Conservation Act (ANILCA).³³⁸ One of the goals of the legislation was to protect subsistence uses of both Native and non-Native rural residents.³³⁹ Noatak is located in close proximity to several of these protected areas. The closest are Cape Krusenstern National Monument, less than 10 miles west, and Noatak National Preserve, approximately 5 miles east of the Village. Also under ANILCA, 330 miles of the Noatak River were designated as a National Wild and Scenic River, from the River's source in Gates of the Arctic National Park to the Kelly River in Noatak National Preserve.^{340,341}

The Noatak National Preserve is made up of 6.5 million acres. The National Preserve is surrounded by the Baird and DeLong Mountains of the Brooks Range. Within the area of the National Preserve, the boreal forest transitions into treeless tundra.³⁴² Cape Krusenstern National Monument stretches for 70 miles along the coast of the Chukchi Sea. The area is a coastal plain, characterized by sizeable lagoons along the coast and rolling tundra moving inland. Migratory birds use the system of wetlands. Many important archaeological sites are found within the National Monument, including a series of beach ridges that provide evidence of an estimated 9,000 years of human settlement. The outer beaches of the National Monument are an important location for subsistence hunting of marine mammals by local rural residents.³⁴³

The Western Arctic Caribou, numbering almost 500,000, migrates between the coastal plain of Cape Krusenstern National Monument and the tundra of Noatak National Preserve on its way to and from calving grounds. Many other animals, including hare, moose, fox, wolves, brown bear, and various birds and fish species are found in the Noatak area.^{344,345} Bearded seals, an important subsistence resource, are present along the coast for a short period in June.³⁴⁶ In addition, muskoxen were reintroduced to the area in 1970 as part of an Alaska-wide recovery effort. In 1934, 34 muskoxen were captured in East Greenland and transported to Nunivak Island. By 1968, the Nunivak Island herd numbered 750, and was used as a seed population to reintroduce muskoxen to areas around northern Alaska. By 2000, there were at least 450 muskoxen in northwestern Alaska.^{347,348}

Many Arctic communities, including Noatak, are experiencing significant changes and increased risk as a result of climate change. Key among these changes are subsidence due to

thawing permafrost, erosion of river banks, changing water level in the river, increasing frequency and intensity of storm events, and warming temperatures. Infrastructure in Noatak, including building foundations and the water distribution system, is damaged or threatened by subsidence and erosion. Low water levels in the river reduce access to the community and increase the cost of living. Coastal subsistence camps are at increased risk of flooding due to increased storm activity along a shoreline made increasingly vulnerable due to reduced ice cover during fall storms. Higher temperatures bring increasing wildfires and impacted air quality, as well as instances of heat-related illness. Food security is also an increasing concern, as climate change affects both distribution of wildlife and access to resources. Changing water level in the Noatak River, as well as increased sediment discharge into Kotzebue Sound, has led to increasing boat groundings on the way to and from subsistence camps. Poor sea ice conditions have increased the risk of injury for subsistence hunters.³⁴⁹

Mining in Northwest Alaska is dominated by Red Dog Mine, the largest producer of zinc in Alaska. In 2010, the mine accounted for almost half of Alaska's mineral production value, making up 49% of the total value of mining operations in Alaska that year. The mine is 100% owned by Teck Resources Ltd., a Canadian mining company, under a 1982 agreement signed with the regional Native corporation, NANA³⁵⁰ Regional Corporation, Inc., which owns the land.³⁵¹ The agreement specifies that the mine must 1) protect subsistence and the Inupiaq way of life, 2) create lasting jobs for NANA shareholders, 3) provide opportunities for NANA's youth, and 4) act as a catalyst for regional economic benefits.³⁵²

Compared to the Beaufort Sea, very little oil and gas exploration has taken place in the Chukchi Sea Outer Continental Shelf (OSC) area to date. Some exploration took place in the late 1980s, and several lease sales in the early 1990s allowed for follow-up exploration. In 2008, 488 tracts totaling 2,758,408 acres were leased during Lease Sale 193, primarily by Shell and ConocoPhillips, as well as international companies including StatoilHydro USA, Repsol, and Ente Nazionale Idrocarburi (ENI).³⁵³ Following the Deepwater Horizon event in the Gulf of Mexico, Lease Sale 193 was remanded to the Department of the Interior for further National Environmental Protection Act (NEPA) analysis regarding the potential for a very large oil spill (VLOS) and its potential consequences for the Chukchi Sea ecosystem, local economy, and subsistence harvest patterns. In late 2011, Secretary of the Interior Ken Salazar affirmed the original Lease Sale 193.^{354,355} This sale is expected to initiate a large-scale exploration effort in

the Chukchi Sea.³⁵⁶ Given the controversy surrounding Lease Sale 193, Secretary Salazar removed Chukchi Sea Sales 212 and 221 from the 2007-2012 program.³⁵⁷ The Proposed 2012-2017 program schedules one sale in the Chukchi Sea, deliberately set late in the program (2016) to allow time for further study and infrastructure development.³⁵⁸

According to the Alaska Department of Environmental Conservation (DEC), no active environmental cleanup sites were located near Noatak as of August 2012.³⁵⁹

Current Economy³⁶⁰

The economy of Noatak is heavily tied to subsistence activities, with a focus on chum salmon, whitefish, caribou, moose, and waterfowl.³⁶¹ Cash employment is also available with the school district, local government, local and regional Native corporations and non-profit organizations, the health clinic, mining and oil industries, Noatak Search and Rescue, the local Lion's Club, and retail stores.^{362,363} Some residents work as commercial fishermen. Many travel to fish camps at Sheshalik during the summer, and some find seasonal work in Kotzebue or working as firefighters.³⁶⁴

Based on household surveys conducted for the 2006-2010 ACS,³⁶⁵ in 2010, the per capita income in Noatak was estimated to be \$15,803 and the median household income was estimated to be \$68,000. This represents a large increase from the per capita and median household incomes reported in the year 2000 (\$9,659 and \$30,833, respectively). If inflation is taken into account by converting the 2000 values to 2010 dollars,³⁶⁶ this income increase remains large, from a real median household income of \$40,545 and real per capita income of \$12,701 in 2000. In 2010, Noatak ranked 191st of 305 Alaskan communities with per capita income data that year, and 51st in median household income, out of 299 Alaskan communities with household income data.

³⁶⁶ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

Noatak's small population size may have prevented the ACS from accurately portraying economic conditions.³⁶⁷ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Noatak in 2010 is \$9,796,³⁶⁸ similar to the per capita income reported for the year 2000. This suggests that caution is warranted when citing an increase in per capita income in Noatak between 2000 and 2010, but provides additional evidence for income stability in the community during this period. Despite stable per capita income levels, the community was recognized as "distressed" by the Denali Commission in 2011,³⁶⁹ indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010. It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a slightly smaller percentage of Noatak's population (65.3%) was estimated to be in the civilian labor force in 2010 compared to the percentage of the statewide population in the civilian labor force (68.8%). That same year, 3.7% of Noatak residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate in Noatak was estimated to be 25.7%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 23.3%, compared to a statewide unemployment rate estimate of 11.5%.³⁷⁰

Also based on the 2006-2010 ACS, the majority of Noatak's workforce was estimated to be employed in the private sector (67.2%), along with 28.1% in the public sector and 4.7% estimated to be self-employed. Of the 36 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in the following industries: agriculture, forestry, fishing and hunting, and mining (26.6%), educational services, health care, and social assistance (14.8%), and public administration (13.3%). Occupations in which the greatest percentages of the workforce were employed were natural resources/construction/maintenance (28.1%) and sales and office occupations (27.3%). It is important to note that, although the percentages of the workforce involved in natural resource-related industries and occupations are relatively high in Noatak, they do not reflect employment in the fishing industry. A breakdown of the natural resource/construction/maintenance occupation category reveals that 0% of the workforce is employed in farming, fishing, and forestry occupations. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 51 employed residents in Noatak in 2010, of which 36.6% were employed in local government, 15.2% in leisure and hospitality, 11.1% in natural resources and mining, 9.5% in professional and business services, 9.5% in education and

³⁶⁷ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

health services, 4.9% in trade, transportation, and utilities, 3.3% in construction, 1.2% in financial activities, 0.8% in information, and 7.8% in other industries.³⁷¹ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents' activity in the subsistence economy.

Governance

Noatak is an unincorporated community in the Northwest Arctic Borough. Neither the community nor the Borough administers any local taxes.³⁷² Given that Noatak is not incorporated, there was no municipal revenue or municipal sales tax revenue between 2000 and 2010. No information was reported regarding State or Community Revenue Sharing contributions received by the community between 2000 and 2010. However, one fisheries-related grant was received by Noatak in 2002. The \$750,000 grant was awarded for design and construction of a harbor in Noatak, along with an initial feasibility study.³⁷³ This information about selected aspects of revenue sources in Noatak are presented in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Noatak from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵

Noatak was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs (BIA), is the Native Village of Noatak. The regional Native corporation to which Noatak belongs is the NANA Regional Corporation. In 1972, most village corporations in the region merged with NANA Regional Corporation, with the exception of the village

corporation for Kotzebue, known as Kikiktagruk Inupiat Corporation (KIC). NANA Regional Corporation now has title to 2,082,052 surface acres, including 115,200 that were originally titled to the Noatak Village Corporation.^{374,375}

Noatak is a member village of the Maniilaq Association, a tribal non-profit corporation that provides health and social services to residents of Northwest Alaska. The Maniilaq Association is one of the 12 regional Alaska Native 501(c)(3) nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. It was originally called the Northwest Alaska Native Association (NANA), but was renamed Maniilaq when the NANA Regional Corporation was formed to avoid confusion between the names.³⁷⁶ Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.³⁷⁷ The Maniilaq Association coordinates tribal and traditional assistance programs, and environmental and subsistence protection services in the region.³⁷⁸

The closest offices of the Alaska Department of Fish and Game (ADF&G) and the Alaska Department of Commerce, Community, and Economic Development (DCCED) are located in Kotzebue. The closest offices of the Alaska Department of Natural Resources (DNR) and U.S. Bureau of Citizenship and Immigration Services are located in Fairbanks, although the Anchorage offices of these agencies may be more accessible by air to people of this region. The closest office of the National Marine Fisheries Service (NMFS) is located in Anchorage.

Infrastructure

Connectivity and Transportation

Noatak's primary means of connection to the outside world is by air. A state-owned, lighted, 4,000 ft by 60 ft, gravel runway is located in the Village. Commercially scheduled passenger flights serve Noatak, and the air strip is also used for delivery of cargo and mail. Currently, no barge service is able to access Noatak. Local residents use small boats, ATVs, and snowmachines for travel locally and to nearby villages. Historic trails are still used for inter-village travel and subsistence activities.³⁷⁹

Facilities

Water in Noatak is derived from three shallow wells in the Noatak River, two of which provide drinking water. At the village water treatment plant, water is filtered to remove solids, and chlorine is used for disinfection. Treated water is stored in a 97,000-gallon tank which provides approximately three days of water supply for Noatak. The water level in the river has

³⁷⁹ See footnote 375.

been decreasing in recent year, and the primary community well occasionally runs dry. All three wells are threatened by erosion.³⁸⁰ The Village Council operates a piped water and sewer system that serves 77 of 100 homes, the school, and businesses in Noatak. The remaining residences use honeybuckets, and the Village Council offers honeybucket haul service. Sewage is treated in Noatak using a sewage lagoon. The Village Council also operates a landfill, but refuse collection is left to individual residents. A diesel powerhouse, operated by the Alaska Village Energy Cooperative (AVEC), provides electricity in Noatak.³⁸¹

Other community facilities in Noatak include a fire hall that houses the Volunteer Fire Department, a school gymnasium, and school library.³⁸² Safety services are provided by Village Public Safety Officer stationed in Noatak.³⁸³ The nearest state trooper post is located in Kotzebue.³⁸⁴ Telephone, internet, and cable are available in the Village.³⁸⁵

With regard to fishing-related facilities, no docking facilities are available in Noatak. Small boats are used for river travel to subsistence camps, and pull-up areas are located along the riverbank by the Village.³⁸⁶

Medical Services

Medical services in Noatak are provided at the Esther Berger Memorial Health Clinic, owned by the Village Council and operated by the Maniilaq Association. Noatak is a Community Health Aid Program site. Emergency services have river and air access, and are provided by volunteers and a health aide.³⁸⁷ The nearest hospital is located in Kotzebue.

Educational Opportunities

One school is present in Noatak. The Napaaqtugmiut School serves preschool through 12th grade. As of 2011, the school had 159 students and 12 teachers.³⁸⁸

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The Noatak area has been used by the Inupiat people for at least 1,000 years. Today, subsistence harvest of marine resources remains a primary economic activity for Noatak residents, continuing historic resource use patterns. Noatak residents travel to seasonal

subsistence camps along the coast each summer.³⁸⁹ Today, some Noatak residents are also involved in the commercial salmon harvest, and a number of residents purchase sport fish licenses each year (see *Commercial Fishing* and *Recreational Fishing* sections below).

The Kotzebue Sound salmon fishery is the northernmost commercial salmon fishery in Alaska. Over 99% of the salmon harvested in this fishery are chum salmon returning to the Kobuk and Noatak Rivers. Commercial harvest of salmon first occurred in the Kotzebue area in 1909 when Native fishermen sold salmon to gold miners. Starting in 1914, salmon were canned and sold to miners in the upper Kobuk drainage. This small industry ceased after 1918. The modern commercial salmon fishery began in 1962, and catch peaked in 1981 with 680,000 chum commercially harvested. Since 1995, poor market conditions and variable processing capacity and interest have caused harvests to fall short of their potential. Due to limited opportunities to sell their catch, the number of active permits in the Kotzebue salmon fishery has declined over the last 30 years. Very few of the 173 total set gillnet permits have been actively fished in recent years.³⁹⁰

A chum salmon hatchery was built in 1981 at Sikasuilaq Springs, a tributary of the Noatak River. The hatchery operated until 1995. The peak of hatchery production was approximately 90,000 chum salmon per year.³⁹¹

Noatak is located in the Arctic Management Area. A Fishery Management Plan (FMP) for the Arctic Management Area was approved by the Secretary of Commerce in August 2009. Initially, the FMP prohibits commercial fishing in the Beaufort and Chukchi seas until more information is available to support sustainable fisheries management.³⁹² Noatak is not eligible to participate in either the Community Quota Entity (CQE) or the Community Development Quota (CDQ) programs.

Processing Plants

ADF&G's 2010 Intent to Operate list did not list a registered processing plant in Noatak. However, between one and five fish buyers were active in the nearby City of Kotzebue between 2000 and 2010, as well as one shore-side processor in 2004 and 2005 (see the Community Profile for Kotzebue).

Fisheries-Related Revenue

Between 2000 and 2010, no data were reported about fisheries-related revenue received by Noatak (Table 3).

Commercial Fishing

In 2010, 14 Noatak residents held a total of 13 Commercial Fisheries Entry Commission (CFEC) permits, of which 5 were actively fished that year. All of these permits were held in the Kotzebue set gillnet salmon fishery. According to data reported by ADF&G, the percentage of permits actively fished that year (38%) was the highest of any year between 2000 and 2010.³⁹³ The number of salmon permits actively fished in the Kotzebue commercial salmon fishery has declined steadily over the past 30 years, and in some years between 2000 and 2010 only 3 or 4 permits out of a total of 173 Kotzebue gillnet permits were active.³⁹⁴ Also in 2010, no residents of Noatak held Federal Fisheries Permits (FFP) or federal License Limitation Program permits (LLP). In addition, no residents held quota share accounts or quota shares in federal catch share fisheries for halibut, sablefish, or crab. Information about permits held by Noatak residents is presented in Table 4, and information about federal catch share participation is presented in Tables 6 through 8.

Between 2000 and 2010, no fishing vessels were primarily owned by Noatak residents, and no fishing vessels were homeported in the Village. During this period, the number of Noatak residents holding commercial crew licenses varied between zero and five. No fish buyers or shore-side processors were reported to be present in Noatak between 2000 and 2010. Given that no fish buyers were present in Noatak, and no residents of Noatak were the primary owner of a fishing vessel, no landings or ex-vessel revenue were generated in the community or by Noatak vessel owners. Information about the commercial fishing sector in Noatak is presented in Table 5, and information about landings and ex-vessel revenue is presented in Tables 9 and 10.

Recreational Fishing

Between 2000 and 2010, no active sport fish guide businesses or licensed sport fish guides were reported to be present in Noatak. However, the number of sportfishing licenses purchased each year by residents of Noatak (irrespective of point of sale) varied between 35 and 92 during this period. Prior to 2008, no sportfishing licenses were sold in the Village of Noatak. Between 2008 and 2010, a small number of licenses were purchased in the community, but a majority of residents continued to purchase their licenses elsewhere, indicating that Noatak residents travel to other communities for sportfishing.

The Alaska Statewide Harvest Survey,³⁹⁵ conducted by ADF&G between 2000 and 2010, noted sportfishing activity in freshwater only. The following species were listed as targeted by private anglers in Noatak: Chinook, coho, sockeye, pink, and chum salmon, Dolly Varden, whitefish, and northern pike. No kept/release log book data were reported for fishing charters out of Noatak between 2000 and 2010.³⁹⁶

Noatak is located within Alaska Sport Fishing Survey Area X – Northwest Alaska. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, Alaska resident anglers consistently fished a greater number of days than non-Alaska resident anglers in both freshwater and saltwater, and freshwater sportfishing activity was significantly higher than in saltwater. On average between 2000 and 2010, Alaska resident anglers fished 3,251 fresh water days and 582 saltwater days, while non-Alaska resident anglers fished on average 1,690 freshwater and 64 saltwater days. This information about the sportfishing sector in and near Noatak is also displayed in Table 11.

Subsistence Fishing

Subsistence fishing and hunting are the primary economic activities in Noatak, in combination with employment in other local industries.³⁹⁷ Subsistence activities take place up-river at Noatak, and residents also travel to seasonal subsistence camps on the coast, the most important being Nuvguruk and Sisualik.³⁹⁸ According to a subsistence survey conducted in Noatak by ADF&G Division of Subsistence, the most important aquatic subsistence species for residents of Noatak in 2007, by harvest weight, included Dolly Varden, chum salmon, bearded seal, and whitefish. That year, two times as much non-salmon fish was harvested in Noatak as salmon.³⁹⁹

³⁹⁷ Alaska Dept. of Comm. and Rural Affairs (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

³⁹⁸ Alaska Native Tribal Health Consortium (ANTHC) (2011). *Climate Change in Noatak, Alaska: Strategies for Community Health* (2011). Retrieved February 2, 2012 from http://www.anthc.org/chs/ces/climate/upload/Climate_Change_in_Noatak_Strategies_for_Community_Health.pdf.

³⁹⁹ Magdanz, J.S., N.S. Braem, B.C. Robbins, and D.S. Koster (2007). *Subsistence Harvests in Northwest Alaska, Kivalina and Noatak, 2007*. Alaska Department of Fish and Game, Technical Paper No. 354. Retrieved February 3, 2012 from <http://www.subsistence.adfg.state.ak.us/techpap/TP354.pdf>.

According to ADF&G's Community Subsistence Information System (CSIS), in 2007, 86% of households participated in salmon subsistence, 69% in marine mammals subsistence, and 74% in non-salmon fish subsistence (other than halibut). No information was reported regarding the percentage of households participating in halibut or marine invertebrate subsistence, or per capita harvest of marine and land-based resources that year. Information about household participation and per capita subsistence harvest is presented in Table 12.

The ADF&G survey of 2007 subsistence harvest includes species-level information about household use of non-salmon fish and marine mammals. Noatak households reported harvesting sheefish, Arctic grayling, northern pike, lake trout, Arctic char, burbot, tomcod, herring, smelt, Dolly Varden, and whitefish. In addition, Noatak households reported harvesting bearded seal, ringed seal, spotted seal, walrus, and beluga whale. In the case of most of the species listed above, a greater percentage of households reported using the species than reported harvesting them, suggesting the presence of sharing networks in Noatak. In addition, although bowhead whale was not harvested by any Noatak households in 2007, 1% of households reported using this resource, suggesting that trading also takes place between communities. It is also important to note that, although no harvest of marine invertebrates was reported by Noatak households in 2007, 1% of households did report using king crab.⁴⁰⁰

Information was also reported by ADF&G regarding subsistence salmon permits during the 2000-2010 period. Between 2000 and 2004, an average of 102 subsistence salmon permits were issued to Noatak households. In 2005, the reported number of permits issued fell to one, no information was reported for 2006, and in 2007 one permit was again issued. For those years in which data were reported, chum salmon were the most heavily harvested salmon species, with an average of 3,746 chum harvested per year. On average, several hundred coho and pink salmon were also harvested, along with a small number of sockeye per year. This information about subsistence harvest of salmon in Noatak is presented in Table 13. Also reported in Table 13, 51,476 total pounds of non-salmon fish (not including halibut; see species listed in previous paragraph) were harvested by Noatak residents in 2007.

No information was reported by management agencies regarding halibut or marine mammal subsistence harvest by Noatak residents during the 2000-2010 period (Tables 14 and 15). However, as noted earlier in this section, some Noatak households reported harvesting and using bearded seal, ringed seal, spotted seal, walrus, and beluga whale.

⁴⁰⁰ Ibid.

Nuiqsut (*new-WICK-sit; var. Nooiksut*)

People and Place

*Location*⁴⁰¹

Nuiqsut is located on the west bank of the Nechelik Channel of the Colville River Delta, about 35 miles from the Beaufort Sea coast. Nuiqsut is located in the Barrow Recording District and the North Slope Borough Census Area. The City encompasses 9.2 square miles of land and 0 square miles of water.

*Demographic Profile*⁴⁰²

In 2010, there were 402 residents in Nuiqsut, ranking it as the 138th largest of 352 communities in Alaska with recorded populations that year. Overall between 1990 and 2010, the population of Nuiqsut increased by 13.6%. Most of this growth occurred between 1990 and the year 2000, when 433 residents were recorded as residing in Nuiqsut. According to Alaska Department of Labor estimates, between 2000 and 2009, the population of permanent residents decreased by 7.2%, with an average annual growth rate of -0.48%.

In 2010, a majority of the Nuiqsut residents identified themselves as American Indian or Alaska Native (87.1%), while 10% identified themselves as White, 0.2% as Black or African American, and 2.7% identified with two or more races. No Nuiqsut residents identified themselves as Hispanic in 2010. It is important to note that both Asians and Hispanics appear to have been present in 2000, and are no longer represented in 2010 Decennial Census statistics. The percentage of the population identifying as White increased over time, from 7.3% in 1990, to approximately 10% in 2000 and 2010. The change in population from 1990 to 2010 is provided in Table 1, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Based on household surveys conducted for the U.S. Decennial Census, the average household size in Nuiqsut was fairly consistent between 1990 and 2010, with 3.8 persons per household in 1990, 3.93 in 2000, and decreased slightly in 2010 to 3.47. The number of households in Nuiqsut has increased over time, from 91 households in 1990 and 110 in 2000, to 114 in 2010. Of the 136 total housing units surveyed for the 2010 U.S. Decennial Census, 44.9% were owner-occupied, 39% were rented, and 16.2% were vacant or used only seasonally. In 2010, six Nuiqsut residents were reported to be living in group quarters.

In 2000, the gender makeup of Nuiqsut's population (59.6% male and 40.4% female) was much more skewed toward males than the population of Alaska as a whole, which was made up of 51.7% males and 48.3% females. The gender imbalance evened out considerably by 2010,

⁴⁰¹ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

⁴⁰² U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

when 51.7% of Nuiqsut’s population was male and 48.3% was female, very close to the balance of the State population as a whole that year (52% male and 48% female). In 2010, the median age of Nuiqsut residents was 25.2 years, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. It is of note that very few Nuiqsut residents were between the ages of 30 and 39 in 2010. That year, 9.1% of Nuiqsut’s population was 60 or older. The overall population structure of Nuiqsut in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁴⁰³ 76.4% of Nuiqsut residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also in 2010, 9.8% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 13.8% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 10.5% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 1.1% were estimated to have an Associate’s degree, compared to 8% of Alaskan residents overall; 3.6% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaskan residents overall; and 14.2% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

⁴⁰³ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

The Nuiqsut area has been inhabited for at least 4,000 years, according to archaeological evidence. A cultural tradition known as the Arctic Small Tool tradition was the first to appear. Around 1,000 years ago, the Thule culture expanded into the North Slope region, characterized by winter ice-hunting, kayak and umiaq⁴⁰⁴ open sea hunting, use of dogs and dog sleds, and settlement in large coastal villages.⁴⁰⁵ Although major settlements have always occurred on the North Slope, traditionally people lived in small groups and travelled throughout the region to hunting and fishing areas. Today, most people live in permanent villages, “yet the animals still roam widely, and seasonal locations for fishing and trapping are scattered over a vast territory.”⁴⁰⁶ The use of snowmachines and motor boats allows residents to extend the range of their subsistence use while still living in a permanent community.⁴⁰⁷

Downstream from Nuiqsut, the Colville Delta has traditionally been a gathering and trading place for the Inupiat and has always offered good hunting and fishing. The Colville River was the traditional homeland of the Kukpikmut, the “people of the lower Colville River.” The old village of Nuiqsut (Itqilippaa) was abandoned in the late 1940s, when the Bureau of Indian Affairs (BIA) required families to relocate so that children could attend school in Barrow. Because some families had continued to use the lower Colville area for hunting, fishing, trapping, and trading after the 1940s, Nuiqsut qualified as a village under the Alaska Native Claims Settlement Act (ANCSA) of 1971.⁴⁰⁸ In 1973, the Village was resettled by 27 families from Barrow.⁴⁰⁹ Federal agencies, along with the Arctic Slope Regional Corporation, the regional Native corporation created under ANCSA, offered to help with the construction of a school, homes, and facilities in the summers of 1973 and 1974.^{410,411} Goods were hauled from Barrow by tractor and snowmachines. The City of Nuiqsut was incorporated in 1975.⁴¹²

Today, a majority of the Nuiqsut population is Inupiat Eskimo, and most residents practice a traditional subsistence lifestyle.⁴¹³ Cultural practices revolve around traditional whaling and other subsistence hunting, fishing, trapping, and gathering activities.⁴¹⁴ A subsistence exchange network exists between Nuiqsut and other villages in the region. Nuiqsut is known for its whitefish and pelts, and often receives bowhead and beluga whale, sheep, and smelt

⁴⁰⁴ An umiaq is a large open Inuit or Eskimo boat made of skins stretched on a wooden frame, usually propelled by paddles. (Source: <http://www.thefreedictionary.com>. Retrieved June 21, 2012.)

from other villages.⁴¹⁵ The sale, importation, and possession of alcohol are banned in the village.⁴¹⁶

Natural Resources and Environment

The climate of Nuiqsut is arctic, with temperatures ranging from -56 to 78 °F. On average, the daily minimum temperature is below freezing 297 days each year. Annual precipitation is light, averaging 5 inches, along with 20 inches of snowfall per year.⁴¹⁷ Nuiqsut is located on the arctic coastal plain, a rolling landscape with small hills and many ponds and lakes trapped on the surface by an underlying permafrost layer. The Colville River has three major channels, of which Nuiqsut is situated on the westernmost, and the Colville Delta is crossed by a maze of waterways. The Brooks Range rises up in the distance to the south.^{418,419}

Nuiqsut is located within the National Petroleum Reserve – Alaska (NPRA). The Prudhoe Bay oil field was discovered in 1968, and all oil exploration and production to date has taken place in the Colville-Canning area. The zone immediately west of Nuiqsut has one of the highest concentrations of leases. Future development is planned to expand west and south within the NPRA, south in the Colville-Canning region, and into offshore state and federal waters. The NPRA area contains an estimated 10.6 billion barrels of oil in a total area of 24.2 million acres (440 barrels per acre).⁴²⁰

Offshore, initial oil and gas exploration in the outer continental shelf (OCS) of the Beaufort Sea began in 1981, and a total of 20 wells were drilled by 1989. The Bureau of Ocean Energy Management (formerly Minerals Management Service) held six sales in the Beaufort OCS between 1991 and 2007, resulting in the leasing of 1,742,987 acres. After reevaluation of their Beaufort Sea exploration plan due to a 2007 lawsuit, and numerous appeals by Native communities and environmental groups during the permitting process,⁴²¹ Shell began drilling exploratory wells in non-petroleum zones on October 3rd, 2012. Before Shell could receive final authorization to drill in petroleum zones, its spill response barge was required to be in place. The barge was damaged in September, but was expected to be in place in time for the 2013 drilling season.⁴²² The proposed 2012-2017 OCS oil and gas leasing program also schedules one additional lease sale in the Beaufort Sea planning area.⁴²³

The impact of oil and gas development activities on local subsistence resources has been the focus of considerable research. There is evidence that off-shore activities are disrupting migratory patterns of bowhead whales, causing difficulty for whalers from Nuiqsut and other villages in the area that depend on harvest of these animals.⁴²⁴ A 3-year study confirmed the reports of local elder and whaling captains that migrating bowhead whales deflect around seismic noise at a minimum distance of 20 kilometers (12 miles).⁴²⁵

Local communities are also concerned about pollution from military and oil and gas exploration and production activities. Several contaminated sites are present in the North Slope Borough as a result of old military installations, including Camp Lonely Landfill and the Point Lonely short range radar station. The U.S. Air Force operated the Camp Lonely Landfill between 1976 and 1989. As of 2005, human health and environmental concerns at the site included exposed sharp materials such as drums, glass, and scrap metal, as well as oil seeps leaching into the soil near the coastal lagoon, which could be toxic to aquatic organisms. Batteries and petroleum products had been disposed of at the site. Beginning in 2006, responsible parties were expected to start cleaning up the site. At the Point Lonely radar station, the U.S. Air Force is managing cleanup of an old dump site that received waste between 1955 and 1976. Cleanup efforts include removal of soil contaminated with petroleum products and polychlorinated biphenyls (PCBs), a probable human carcinogen. PCBs are not prone to leaching from the soil, and the primary routes of exposure are through ingestion or skin contact (eating or touching). During the cleanup process, steps are being taken to keep the contaminated soil capped to prevent these exposure routes to humans and wildlife.⁴²⁶ Nuiqsut has a restoration advisory board to work with the local community during cleanup of contaminated sites.⁴²⁷

In addition, local are concerned about air quality. In the winter and spring, visibility can be reduced from more than 50 miles to less than 5 miles, a phenomenon known as “arctic haze”. Scientists believe that the haze is a result of long-range transport of pollution from industrialized Europe. Nuiqsut resident have testified that they see a yellow haze that originates directly from local oil fields. A local health worker believes that rates of respiratory illness in Nuiqsut have increased dramatically since she began working in the community in 1985.⁴²⁸

Nuiqsut is located near several protected and special management areas. The Teshekpuk Lake Surface Protection Area is located just west of Nuiqsut, also within the area of the NPRA. The lake is in an area of high potential for economically recoverable oil and gas resources, and is also recognized for its unique environmental value.⁴²⁹ Teshekpuk Lake is one of the most important wetland complexes in the circumpolar Arctic, providing habitat for millions of migratory birds from around the world, as well as calving grounds for the Teshekpuk Lake caribou herd, and important herd for subsistence for hunters from Nuiqsut and surrounding

villages. Oil development within this area is directed to minimize impact on these surface environmental values.⁴³⁰

The northern boundary of the Gates of the Arctic National Park and Preserve is located approximately 140 miles south of Nuiqsut, in the Central Brooks Range. The Central Arctic Caribou Herd migrates each year between the boreal forest of the Park and Preserve and calving areas on the coastal plain.⁴³¹ The western boundary of the Arctic National Wildlife Refuge (NWR) is located approximately 250 miles to the east of Nuiqsut, which contains calving grounds of both the Central Arctic and Porcupine Caribou Herds.⁴³² These areas host a diversity of ecosystems and animals and plant life. Polar bears are found in the Arctic NWR, and grizzly and black bears are found in both protected areas, along with wolves, lynx, wolverine, red fox, moose, muskoxen, Dall sheep, beaver, and other small mammals. The boreal forest hosts a diversity of migratory birds.⁴³³ The Arctic NWR is currently closed to oil and gas drilling activities under Section 1003 of the Alaska National Interest Lands Conservation Act (ANILCA).⁴³⁴ Estimates of recoverable oil in the NWR range between 4.2 and 11.8 billion barrels.⁴³⁵

Natural hazards in and near Nuiqsut include river erosion, river flooding (mainly due to ice jams, as precipitation is low), and permafrost melting. Coastal areas near Nuiqsut are also subject to erosion and ice hazards, such as ice ridging, shear zones, ice break-off, strudel scour, ice gouging, ice override, and ice pileup. Earthquakes and volcanoes are not identified as a concern in the North Slope Borough. Climate change appears to be leading to increased risk from coastal storms, flooding, erosion, and permafrost melting.^{436,437}

According to the Alaska Department of Environmental Conservation, one active environmental cleanup site is located in Nuiqsut as of August 2013. The U.S. Air Force operated a landfill near Nuiqsut from the mid 1970s through the late 1980s. The “Camp Lonely Landfill” was used to dispose of sharp objects including glass, and scrap metal, as well as oil drums and other toxics including batteries. On-going soil erosion in the area leads to exposure of sharp materials and exacerbates the rate at which oil contamination enters nearby water bodies. As of summer 2006, the responsible parties were expected to begin cleaning up the landfill⁴³⁸

Current Economy⁴³⁹

Unemployment is high in Nuiqsut. In 2010, top employers of local residents included the Borough, City, and Village offices, the local village Native Corporation, the school, the local store, and several private construction and energy companies.⁴⁴⁰ Trapping and craft-making also provide some income, and subsistence harvest is a foundational aspect of the local economy. Caribou, bowhead and beluga whale, seal, moose, and fish are staples of the diet. Polar bears are also hunted.⁴⁴¹

Based on household surveys conducted for the 2006-2010 ACS,⁴⁴² in 2010, the per capita income in Nuiqsut was estimated to be \$22,981 and the median household income was estimated to be \$86,458. This represents a sizeable increase in the per capita and median household incomes reported in the year 2000 (\$14,876 and \$48,036, respectively). If inflation is taken into account by converting the 2000 values to 2010 dollars,⁴⁴³ the income increase remains large, from a real per capita income of \$19,562 and a real median household income of \$63,167 in 2000. In 2010, Nuiqsut ranked 126th of 305 Alaskan communities with per capita income data that year, and 21st in median household income, out of 299 Alaskan communities with household income data.

However, Nuiqsut's small population size may have prevented the ACS from accurately portraying economic conditions.⁴⁴⁴ An alternative estimate of per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Nuiqsut in 2010 is \$14,214.⁴⁴⁵ This estimate is lower than the 2000 per capita income reported in by the U.S. Census, suggesting that caution is warranted when citing an increase in per capita income in Nuiqsut between 2000 and 2010. Nuiqsut was not recognized as a "distressed" community by the Denali Commission in 2011.⁴⁴⁶ It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

⁴³⁹ Unless otherwise noted, all monetary data are reported in nominal values.

Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁴⁴³ Inflation was calculated using the Anchorage Consumer Price Index for 2000 and 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁴⁴⁴ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁴⁴⁵ See footnotes 440 and 442.

⁴⁴⁶ Denali Commission (2011). *Distressed Community Criteria 2011 Update*. Retrieved April 16, 2012 from www.denali.gov.

Based on the 2006-2010 ACS, in 2010, a smaller percentage of Nuiqsut’s population (61.7%) was estimated to be in the civilian labor force in 2010 compared to the percentage of the statewide population in the civilian labor force (68.8%). That same year, 0.6% of Nuiqsut residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate in Nuiqsut was estimated to be 20.1%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 16.1%, compared to a statewide unemployment rate estimate of 11.5%.⁴⁴⁷

Also based on the 2006-2010 ACS, a majority of Nuiqsut’s workforce was estimated to be employed in the public sector (60.3%), along with 39.7% in the private sector. Of the 224 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers were estimated to be employed in public administration (28.1%), educational services, health care, and social assistance (22.3%), and retail trade (15.2%). This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 218 employed residents in Nuiqsut in 2010, of which 55.5% were employed in local government, 16.5% in financial activities, 9.6% in construction, 5.5% in natural resources and mining, 5% in trade, transportation, and utilities, 4.1% in professional and business services, 1.8% in education and health services, 0.9% in leisure and hospitality, and 0.9% in other industries.⁴⁴⁸ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Figure 4. Local Employment by Occupation in 2000-2010, Nuiqsut (U.S. Census).

Governance

Nuiqsut is a 2nd Class City in the North Slope Borough. The City has a Strong Mayor form of government, with a seven-person city council that includes the Mayor, a seven-person advisory school board, and several municipal employees. The Borough administers an 18.5 mills property tax, and the City does not administer any additional taxes.⁴⁴⁹ The North Slope Borough also receives significant tax revenue from oil and gas development activities which supports services provided in Nuiqsut.⁴⁵⁰

Total municipal revenue varied substantially each year between 2000 and 2010, with a low of \$205,741 in 2004 and a high of \$1,181,332 in 2009. Nuiqsut received State Revenue Sharing contributions each year between 2000 and 2004, and Community Revenue Sharing contributions between 2008 and 2010 of over \$100,000 per year. No information was reported regarding state and federal fisheries-related grants received by Nuiqsut between 2000 and 2010. However, a donation of \$23,000 was reported in 2008 to help carry out a survey of subsistence harvest activities in Nuiqsut. Information about selected aspects of Nuiqsut’s municipal revenue is presented in Table 2.

Nuiqsut was included under ANCSA, and is federally recognized as a Native village. The authorized traditional entity, recognized by the BIA, is the Native Village of Nuiqsut. The Native village corporation is the Kuukpik Corporation, which manages 137,881 acres of land. The regional Native corporation to which Nuiqsut belongs is the Arctic Slope Regional Corporation.⁴⁵¹

Nuiqsut is also a member of the Arctic Slope Native Association (ASNA), a tribal 501(c)(3) non-profit organization headquartered in Barrow. The ASNA is one of the 12 regional Alaska Native nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their

regions.⁴⁵² The ASNA works alongside the federal Indian Health Service to provide health and community services to Native communities in the region. In 1986, ASNA took over operation of the regional hospital in Barrow. In 2009, ASNA announced plans for construction of a new hospital in Barrow with an expanded space and range of services. The project is expected to be completed by 2013.^{453,454}

The closest office of the Alaska Department of Fish and Game (ADF&G) is located in Barrow. The closest office of the Alaska Department of Commerce, Community, and Economic Development (DCCED) is located in Kotzebue, and the closest office of the Alaska Department of Natural Resources (DNR) and U.S. Bureau of Citizenship and Immigration Services are located in Fairbanks, although the Anchorage offices of these agencies may be equally accessible by air to people of this region. The closest office of the National Marine Fisheries Service (NMFS) is located in Anchorage.

Infrastructure

Connectivity and Transportation

Air travel provides the only year-round access. The 4,343-ft-long by 90-ft-wide gravel airstrip is owned and operated by the North Slope Borough.⁴⁵⁵ Barrow is a primary air hub for surrounding villages. Mail is shipped to Nuiqsut along the Dalton Highway and then flown from Deadhorse.⁴⁵⁶ The price of a roundtrip ticket by plane from Nuiqsut to Anchorage in early June of 2012 was \$977.⁴⁵⁷ Coastal access for barged fuel and supply deliveries is possible during the ice-free season, which takes place for only a few weeks during the middle of summer. A 60-mile ice road reaches Nuiqsut approximately 5 to 7 months per year from Deadhorse and Prudhoe Bay, which are connected to the Alaska road system via the Dalton Highway. Additional trails connect Nuiqsut to Anaktuvak Pass (140 miles) and Atqasuk (150 miles). Snowmobiles and ATVs are commonly used for local transportation.⁴⁵⁸ Proposed development of the Colville River Road would provide year-round access to eastern portions of the National Petroleum Reserve Area, and would include a spur road to Nuiqsut.⁴⁵⁹

Facilities

Water in Nuiqsut is derived from a lake, and is chlorinated and filtered before entering the Borough-operated piped water system. A majority of homes have running water in the kitchen. A central hauling point is available, and some homes have individual water tanks with water delivery services. The Borough also operates a piped sewer system, and a sewage lagoon is used for sewage treatment.⁴⁶⁰ The community and individuals also use septic tanks, and some use honeybucket pits. A landfill is located in the area, and the Borough offers refuse collection services. A diesel powerhouse provides electricity in Nuiqsut, and is owned and operated by the North Slope Borough.⁴⁶¹ According to a 2005 Borough Comprehensive Plan, Nuiqsut was in the process of converting from diesel to a natural gas system.⁴⁶² Police services in Nuiqsut are provided by the North Slope Borough Police Department.⁴⁶³ The nearest state trooper post is located in Barrow.⁴⁶⁴ Fire and rescue services are provided by the Nuiqsut Volunteer Fire Department. Additional community facilities include City Hall, the Kisik Community Center, a school/community library, and a school gymnasium.⁴⁶⁵ Nuiqsut has a digital telephone system, local dialup internet, a community teleconference center, cable television, public radio broadcast,

an interactive video distance education system, wide area data network, and several two-way radio technologies.⁴⁶⁶

Medical Services

Local health services are available at the Nuiqsut Clinic, which is owned by the City and operated by the North Slope Borough. The Clinic is a Community Health Aide Program site. Emergency Services have river and air access. Emergency service is provided by 911 Telephone Service volunteers and a health aide. Alternate health care is provided by the Nuiqsut Volunteer Fire Department.⁴⁶⁷ In addition to local health services, a regional hospital with a wider range of services is available in Barrow. A hospital renovation is expected to be completed by 2013, expanding space and services for people of the North Slope region.⁴⁶⁸

Educational Opportunities

One school is present in Nuiqsut. The Nuiqsut Trapper School serves preschool through 12th grade. As of 2011, the school had 91 students and 12 teachers.⁴⁶⁹

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence hunting and fishing have defined the economy and culture of Inupiaq people for thousands of years, and remains essential today.⁴⁷⁰ Nuiqsut is located on the Colville River, which empties into the Beaufort Sea, an area encompassed by the Arctic Management Area. Commercial fishing for all species is currently prohibited in federally regulated waters of the Arctic Management Area, “until sufficient information is available to support the sustainable management of a commercial fishery.” In state-regulated waters near Nuiqsut, a small commercial fishery takes place for whitefish (Arctic and least cisco) in the Colville River Delta. Catch from this fishery is primarily sold to local markets, although some fish are shipped to markets outside the Arctic region.⁴⁷¹ However, the waters near Nuiqsut are primarily managed for subsistence. Currently, the marine areas north and east of the Colville River are designated for subsistence use of bowhead whales between August and October each year.⁴⁷²

Whaling has had a particularly strong presence and history in the North Slope region. Whales were historically and are currently a primary subsistence resource for the Inupiaq people. The commercial whaling industry entered area waters in the 1850s, and continued through the early decades of the 1900s, when the combination of overharvest and declining markets for

⁴⁷² See footnote 458.

baleen and whale oil brought the industry to an end.⁴⁷³ In 1977, a NMFS study found that stocks of bowhead whale were in decline, and the International Whaling Commission (IWC) issued a ban on the Native subsistence whale hunt. However, Native whaling captains and elders reported that their estimates of population size were several times higher than the NMFS estimates. Follow-up study confirmed that the bowhead whale population was healthy and growing.⁴⁷⁴

A system of co-management was established with the creation of the Alaska Eskimo Whaling Commission (AEWC) in 1977. The AEWC represents whalers from Kaktovik, Nuiqsut, Barrow, Wainwright, Point Hope, Kivalina, Little Diomedes, Wales, Savoonga, and Gambell. Other examples of co-management efforts in the North Slope region are the Eskimo Walrus Commission (formed in 1978), the Beluga Whale Committee (formed in 1988), and the Nanuuq Commission (formed in 1994 for polar bear management). In 1994, Section 119 of the reauthorization for the Marine Mammal Protection Act provided a legislative basis for these cooperative agreements with Alaska Native organizations.⁴⁷⁵

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Nuiqsut does not have a registered processing plant. The closest seafood processing facility is located in Nome.

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue in Nuiqsut (Table 3).

Commercial Fishing

A combined subsistence-commercial fishery for Arctic cisco (*Coregonus autumnalis*) operates out of Nuiqsut on the Colville River delta during the fall. The commercial fishery is small and run by a prominent local family, the Helmericks. Fishery participants use gillnets strung under the ice. In total, the subsistence and commercial harvest can reach 80,000 fish each year.⁴⁷⁶ Arctic cisco feed on invertebrates and other fish and are distributed between Arctic Canada and Siberia. Arctic cisco from the Colville River can live up to 10 years, reaching a maximum of 14 inches in length and 1.5 pounds in weight. They are similar in appearance to Bering cisco (found in Bering Sea drainages), but are more easily distinguished from least cisco (found in Bristol Bay drainages), which is more slender and often confused with herring. Arctic cisco may sometimes be sold under the name "white trout".⁴⁷⁷ Fish caught in the Colville River fishery are primarily sold locally, although some are exported to markets in Barrow and

Fairbanks. No other commercial fisheries are currently permitted in state or federal waters in the Nuiqsut area.⁴⁷⁸

Between 2000 and 2010, no residents of Nuiqsut held permits in state or federal commercial fisheries (Table 4). In addition, no Nuiqsut residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 through 8). There were also no commercial crew license holders in Nuiqsut during the 2000 to 2010 period, no Nuiqsut residents were the primary owner of a fishing vessel, and no commercial fishing vessels were homeported in the community. In addition, no fish buyers or shore-side processing facilities were located in Nuiqsut. These characteristics of the commercial fishing sector are presented in Table 5. Given the lack of commercial fishing activity and fish buyers in Nuiqsut, no landings or ex-vessel revenue were generated in the community or by Nuiqsut vessel owners (Tables 9 and 10).

⁴⁷⁸ See footnote 471.

Recreational Fishing

Between 2000 and 2010, no sport fish guide businesses or licensed sport fish guides were reported to be present in Nuiqsut. The number of sportfishing licenses purchased each year by residents of Nuiqsut (irrespective of point of sale) varied between 18 and 52 during this period. The number of licenses purchased in the City of Nuiqsut was much smaller, varying between 0 and 19 per year between 2008 and 2010, indicating that a Nuiqsut residents travel to other communities to prepare for sportfishing activity.

The Alaska Statewide Harvest Survey,⁴⁷⁹ conducted by ADF&G between 2000 and 2010, noted sport harvest of Pacific halibut by private anglers in Nuiqsut. The survey also noted sport harvest of sockeye salmon in nearby Prudhoe Bay, and a wider range of species targeted in Barrow, including all five species of Pacific salmon, rainbow trout, Dolly Varden, whitefish, burbot, arctic grayling, Pacific halibut, rockfish, and razor clams. No kept/release log book data were reported for sportfishing charters out of Nuiqsut between 2000 and 2010.⁴⁸⁰

Nuiqsut is located within Alaska Sport Fishing Survey Area Z – North Slope-Brooks Range, which includes all Alaskan waters, including drainages flowing into the Beaufort and Chukchi seas, north of the Brooks Range and east of Point Hope. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, Alaska resident anglers consistently fished a greater number of days than non-Alaska resident anglers in both freshwater and saltwater, and freshwater sportfishing activity was significantly higher than in saltwater. On average between 2000 and 2010, Alaska resident anglers fished 3,065 fresh water days and 228 saltwater days, while non-Alaska resident anglers fished on average 1,001 freshwater and 17 saltwater days. This information about the sportfishing sector in and near Nuiqsut is also displayed in Table 11.

Subsistence Fishing

Subsistence is an essential aspect of the culture and economy of Nuiqsut. The Inupiaq people depend on subsistence harvest of marine mammals and fish, as well as land-based resources. Historically, residents of the North Slope lived in small groups and traveled throughout the region following seasonal availability of fish and wildlife. Today, most live in permanent villages, and use snowmachines and motor boats to extend the range of subsistence harvest opportunities. Nuiqsut hunters travel as far east as Sagavanirktok, as far south as middle Colville, west to Teshekpuk Lake, and along the coast as far west as Pitt Point and east beyond Prudhoe Bay to the mouth of the Canning River.⁴⁸¹

Land-based resources are a primary focus of Nuiqsut subsistence harvesting, including caribou, moose, wolf, wolverine, fox, and freshwater fishes. Marine resources, including marine mammals, waterfowl, and polar bears are also important. Commonly utilized fish species include Arctic cisco, whitefish, least cisco, grayling, humpback whitefish, burbot, northern pike, pink salmon, and Arctic char.⁴⁸² Hunters from Nuiqsut harvest species of marine mammals including bowhead whale, bearded seal, ringed seal, Pacific walrus, and polar bear.⁴⁸³ Some trading of resources takes place between villages in the region. Nuiqsut is known for its whitefish and pelts, and often receives bowhead and beluga whale, sheep, and smelt from other villages.⁴⁸⁴

A survey conducted by the North Slope Borough in 2003 found that 85% of Nuiqsut households use subsistence foods, and approximately 74% of households receive over half of their food from subsistence activities.⁴⁸⁵ Between 2000 and 2010, ADF&G did not report any information about the percentage of Nuiqsut households participating in marine resource subsistence or regarding per capita subsistence harvest (Table 12).

A 1993 subsistence survey conducted by ADF&G provides species-level household participation information regarding marine mammals and non-salmon fish. That year, 31% of Nuiqsut households reported harvesting ringed seal, 7% reported harvesting bearded seal, 5% reported harvest of bowhead whale, and 2% reported harvest of spotted seal. Species of non-salmon fish harvested by the greatest percentage of Nuiqsut households in 1993 included Arctic cisco (68% of households reported involvement in harvesting), broad whitefish (66%), grayling (65%), burbot (57%), least cisco (47%), Arctic char (31%), and humpback whitefish (24%). Many of these resources were shared with households that did not participate in harvest activities. A particularly important example of subsistence resource sharing is the bowhead whale. While only 5% of households in Nuiqsut reported involvement in the harvest of bowhead whale in 1993, 97% of households reported using the resource that year.⁴⁸⁶

Some information was reported during the 2000-2010 period regarding subsistence salmon permits. In 2003 and 2004, one subsistence salmon permit was issued per year to a Nuiqsut household, and two were issued in 2008. No information was reported regarding the number of permits fished in these years or the number or species of salmon harvested. Likewise,

no information was reported regarding subsistence harvest of marine invertebrates or non-salmon fish. This information is presented in Table 13. In addition, no information was reported regarding subsistence halibut harvest by Nuiqsut residents between 2003 and 2010 (Table 14).

Between 2000 and 2010, some information was reported regarding marine mammal subsistence harvest in Nuiqsut. According to data reported by the U.S. Fish and Wildlife Service, polar bears were harvested in several years during the period, including four harvested in 2000, two per year harvested in 2002 and 2004, and one harvested in 2009. No information was reported by management agencies regarding harvest of beluga whale, sea otters,⁴⁸⁷ walrus, harbor seal, spotted seal, or Steller sea lion. This information is presented in Table 15.

Point Lay (A.K.A. Kali)

People and Place

Location

Point Lay is located on the Chukchi Sea coast, south of the Kokolik River mouth. The community is protected from the open ocean by the Kasugaluk Lagoon. The Eskimo name for the site is Kali, which means ‘mound’, referring to the elevated ground on which the Village is located. Point Lay is located about 180 miles southwest of Barrow, and 700 miles northwest of Anchorage. Point Lay is located in the Barrow Recording District and the North Slope Borough Census Area.^{488,489}

*Demographic Profile*⁴⁹⁰

In 2010, there were 189 residents in Point Lay, ranking it as the 203rd largest of 352 communities in Alaska with populations recorded that year. Point Lay was first included in U.S. Decennial Census statistics in 1880, when 30 individual were recorded as permanent residents. No permanent residents were recorded during many decades of the 20th century, but a consistent population has been recorded since 1980, after some residents of Barrow and Wainwright relocated there. The population of Point Lay rose substantially between 1990 and 2000, increasing by approximately 78%. By 2010, the population declined again to 189 individuals, but was still 36% higher than the population in 1990. According to Alaska Department of Labor estimates, between 2000 and 2009 the population of permanent residents decreased by 5.3%, with an average annual growth rate of -0.76%.

According to a survey conducted by the AFSC in 2011, community leaders estimated that an additional 10 individuals are present in Point Lay as seasonal workers or transients each year, and are primarily Borough employees. They indicated that the community’s population peaks during June and August each year. They also noted that population fluctuations are not at all driven by employment in fishing sectors.

In 2010, a majority of the population of Point Lay identified themselves as American Indian or Alaska Native (88.4%), while 10.6% identified as White, 0.5% identified as Native Hawaiian or Other Pacific Islander, and 0.5% identified with two or more races. In addition, 0.5% of Point Lay residents identified themselves as Hispanic in 2010. It is important to note that Asians appear to have been present in 2000, and are no longer represented in 2010 Decennial Census statistics. The percentage of the population identifying as American Indian or Alaska Natives increased over time, from 81.3% in 1990 and 82.6% in 2000, to 88.4% by 2010. The

percentage of the population identifying as all other racial and ethnic groups declined over the same period. The change in population from 1990 to 2010 is provided in Table 1, and changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Based on household surveys conducted for the U.S. Decennial Census, the average household size in Point Lay increased from 2.9 persons per household in 1990 to 3.93 in 2000, and then declined to 3.15 by 2010. The number of households in Point Lay increased from 44 occupied housing units in 1990 to 61 in 2000 and 60 in 2010. Of the 70 total housing units surveyed for the 2010 U.S. Decennial Census, 32.9% were owner-occupied, 52.9% were rented, and 14.3% were vacant or used only seasonally. Nine Point Lay residents were reported to be living in group quarters in 1990, and six in 2000. In 2010, no Point Lay residents were reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Point Lay: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Point Lay Based on the 2000 and 2010 U.S. Decennial Census.

In 2010, the gender makeup of Point Lay’s population (56.1% male and 43.9% female) was more heavily weighted toward males than the population of the Alaska as a whole, which had 52% males and 48% females. The median age of Point Lay residents was 25.1 years, much younger than the national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, 6.4% of Point Lay’s population was 60 or older. The overall population structure of Point Lay in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁴⁹¹ 65.9% of Point Lay residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaskan residents overall. Also in 2010, 6.9% of the population was estimated to have less than a 9th grade education, compared to 3.5% of Alaskan residents overall; 27.2% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 16.2% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 0% were estimated to have an Associate’s degree, compared to 8% of Alaskan residents overall; 0% were estimated to have a Bachelor’s degree, compared to 17.4% of Alaskan residents overall; and 2.9% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Point Lay is probably the last remaining village of the Kuukpaagruk people. The deeply indented shoreline prevented effective bowhead whaling, and the Village never fully participated in the whaling culture common in villages further north. The Village’s traditional hunt of the beluga whales is similar to the bowhead whaling culture in other North Slope villages.⁴⁹² Today, subsistence remains essential to the economy and culture of Point Lay, and the Village is particularly active in beluga whaling.⁴⁹³ In addition, the first bowhead whale since 1937 was landed in Point Lay in 2009.⁴⁹⁴

The Village of Point Lay was historically occupied year-round by a small group of one or two families. They were joined in 1929-30 by several more families from Point Hope. In 1974, the Village moved from the old site on a gravel barrier island just offshore. The old village site is now used as a summer hunting camp. Some residents of Barrow and Wainwright relocated to the Village in the mid-1970s during the Alaska Native Claims Settlement Act (ANCSA) process. In the late 1970s, due to seasonal flooding from the Kokolik River, the Village relocated again to a site near the Air Force Distance Early Warning station to the south. Homes were relocated to the new townsite. Point Lay bans the sale, possession, and importation of alcoholic beverages.⁴⁹⁵

⁴⁹¹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

Natural Resources and Environment

The climate in Point Lay is arctic. Temperatures range from -55 to 78 °F during the course of the year. Precipitation is light, averaging 7 inches annually, with 21 inches of snow. The Chukchi Sea is ice-free from late June until September.⁴⁹⁶ The Village is located on the mainland shore of the Kasegaluk Lagoon, a coastal lagoon protected from the Chukchi Sea by a series of thin barrier islands. Five rivers or inlets empty into the lagoon, including the Koklik, which enters the lagoon just north of Point Lay. The tundra along the mainland coast near Point Lay is dotted by ponds, lakes, streams, marshes and river/river delta.⁴⁹⁷ The Point Lay area is underlain by a continuous permafrost layer.⁴⁹⁸

In 1980, much of the traditional area of the Iñupiaq people was protected as national parks, preserves, monuments, and wildlife areas under the Alaska National Interest Lands Conservation Act (ANILCA).⁴⁹⁹ One of the goals of the legislation was to protect subsistence uses of both Native and non-Native rural residents. Point Lay is located close to the Chukchi Sea unit of the Alaska Maritime National Wildlife Refuge (NWR). The NWR extends along the Aleutian Island chain and incorporates the Pribilof Islands, a unit in Bristol Bay, a unit in Kodiak, areas of the Southeast Alaska panhandle, and some in the Arctic. The Chukchi Sea unit includes coastal lagoons and headlands between Icy Cape and Cape Thompson.⁵⁰⁰

The Kasegaluk Lagoon is included in the Alaska Maritime NWR. The lagoon provides important habitat for marine mammals and seabirds. It is the largest coastal lagoon system in Arctic Alaska. It is particularly important for summer concentrations of beluga whale, spotted seal, and black brant.⁵⁰¹ In recent years, large concentrations of walrus (8,000-20,000) have also hauled out on the barrier island near Point Lay in late summer. Villagers from Point Lay have been actively involved in protection of the colony. Point Lay was awarded an “Outstanding Partner” award by the U.S. Fish and Wildlife Service in 2010 in recognition of these local efforts.⁵⁰² The Point Lay area also provides important habitat for the spectacled eider and Steller’s eider, both of which are listed as threatened under the U.S. Endangered Species Act.⁵⁰³

Point Lay is located approximately 30 miles from the western boundary of the National Petroleum Reserve – Alaska (NPR). To date, a majority of oil development has taken place in the Colville-Canning area, further east near Prudhoe Bay and Nuiqsut. Future development is

⁵⁰³ URS Corporation. October 2005. *North Slope Borough Comprehensive Plan*. Retrieved February 29, 2012 from <http://www.commerce.state.ak.us/dca/plans/NorthSlopeBorough-CP-2005.pdf>.

planned to expand west and south within the NPRA, south in the Colville-Canning region, as well as into offshore state and federal waters in the Beaufort Sea. The NPRA area contains an estimated 10.6 billion barrels of oil in a total area of 24.2 million acres (440 barrels per acre).⁵⁰⁴

Compared to the Beaufort Sea, very little oil and gas exploration has taken place in the Chukchi Sea Outer Continental Shelf area to date. Some exploration took place in the late 1980s, and several lease sales in the early 1990s allowed for follow-up exploration. In 2008, 488 tracts totaling 2,758,408 acres were leased during Lease Sale 193, primarily by Shell and ConocoPhillips, as well as international companies including StatoilHydro USA, Repsol, and ENI.⁵⁰⁵ Following the Deepwater Horizon event in the Gulf of Mexico, Lease Sale 193 was remanded to the Department of the Interior for further National Environmental Protection Act analysis regarding the potential for a very large oil spill and its potential consequences for the Chukchi Sea ecosystem, local economy, and subsistence harvest patterns. In late 2011, Secretary of the Interior Ken Salazar affirmed the original Lease Sale 193.^{506,507} This sale is expected to initiate a large-scale exploration effort in the Chukchi Sea.⁵⁰⁸ Given the controversy surrounding Lease Sale 193, Secretary Salazar removed Chukchi Sea Sales 212 and 221 from the 2007-2012 program.⁵⁰⁹ The Proposed 2012-2017 program schedules one sale in the Chukchi Sea, deliberately set late in the program (2016) to allow time for further study and infrastructure development.⁵¹⁰

Point Lay is at risk of severe weather events. Ice override events on barrier islands in the Point Lay area have been documented as moving 98 to 846 feet onshore and were up to 6.6 feet high.⁵¹¹ In addition, communities in the North Slope Borough were rated at risk of flooding, wildfire, earthquake, and volcanic activity, tsunami/seiche, landslides, erosion, and drought.⁵¹² Arctic communities are also experiencing significant changes and increased risk as a result of climate change. In interviews in the late 1990s, Point Lay residents reported late arrival of snow and decreased ocean ice formation.⁵¹³ Land settlement resulting from permafrost melting has negatively impacted sewer lines, leading to frequent need for repairs. Land settlement must be

considered during both design and location of utilities, facilities, and housing in Point Lay and other North Slope communities.⁵¹⁴

According to the Alaska Department of Environmental Conservation, there are no notable active environmental cleanup sites located in Point Lay as of July 2012.⁵¹⁵

Current Economy

The Point Lay economy is primarily based on subsistence hunting, fishing and whaling. Seal, walrus, beluga, caribou and fish are staples of the diet.^{516,517} According to a survey conducted by the AFSC in 2011, that the community primarily depends on subsistence harvesting, and there were no local commercial fisheries. Between 2000 and 2010, no Point Lay residents owned commercial fishing vessels, held commercial fishing permits or crew licenses (see *Commercial Fishing* section of this profile). Most year-round employment opportunities in Point Lay are with the North Slope Borough and school district, local Village government and the village Native corporation, local retailers, and private construction and engineering companies.^{518,519}

Based on household surveys conducted for the 2006-2010 ACS,⁵²⁰ in 2010, the per capita income in Point Lay was estimated to be \$15,802 and the median household income was estimated to be \$47,500. This represents a decrease from the year 2000, when per capita income in Point Lay was \$18,003 and median household income was \$68,750. If inflation is taken into account by converting the 2000 values to 2010 dollars,⁵²¹ the decrease in income is shown to be even larger; real per capita income in 2000, in 2010 dollars, was \$23,674, and real median household income was \$90,405. In 2010, Point Lay ranked 192nd of 305 Alaskan communities with per capita income data that year, and 145th in median household income, out of 299 Alaskan communities with household income data.

Although Point Lay's small population size may have prevented the ACS from accurately portraying economic conditions,⁵²² additional evidence for a decrease in per capita income is provided by economic data compiled by the Alaska Local and Regional Information (ALARI)

⁵¹⁴ URS Corporation. October 2005. *North Slope Borough Comprehensive Plan*. Retrieved February 29, 2012 from <http://www.commerce.state.ak.us/dca/plans/NorthSlopeBorough-CP-2005.pdf>.

⁵²⁰ U.S. Census Bureau (n.d.). *Profile of selected social, economic and housing characteristics of all places within Alaska*. Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

⁵²¹ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved January 5, 2012 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁵²² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Point Lay in 2010 is \$13,898.⁵²³ Despite evidence for a decline in per capita income in Point Lay, the community did not meet the Denali Commission’s criteria as a “distressed” community in 2011.⁵²⁴ It should be noted that both ACS and DOLWD data are based on wage earnings, and these income statistics do not take into account the value of subsistence within the local economy.

Based on the 2006-2010 ACS, in 2010, a smaller percentage of Point Lay’s population (57.8%) was estimated to be in the civilian labor force in 2010 compared to the percentage of the statewide population in the civilian labor force (68.8%). That same year, 15.1% of Point Lay residents were estimated to be living below the poverty line, compared to 9.5% of Alaskan residents overall, and the unemployment rate in Point Lay was estimated to be 9.4%, compared to a statewide unemployment rate of 5.9%. An additional estimate of unemployment is based on the ALARI database, which indicates that the unemployment rate in 2010 was 16%, compared to a statewide unemployment rate estimate of 11.5%.⁵²⁵

Also based on the 2006-2010 ACS, a majority of Point Lay’s workforce was estimated to be employed in the public sector (65.3%), along with 29.8% in the private sector, and 4.8% estimated to be self-employed. Of the 124 people aged 16 and over that were estimated to be employed in the civilian labor force, the greatest number of workers was estimated to be employed in educational services, health care, and social assistance sector (35.5%), arts, entertainment, recreation, accommodation, and food services (19.4%), construction (16.9%), and transportation and warehousing (16.1%). This information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

An alternative estimate of employment is provided by economic data compiled in the ALARI database, which indicate that there were 108 employed residents in 2010, of which 82.4% were employed in local government, 6.5% in construction, 5.6% in trade, transportation, and utilities, 2.8% in professional and businesses services, 0.9% in natural resources and mining, 0.9% in financial activities, and 0.9% in education and health services.⁵²⁶ As with income statistics, it should also be noted that ACS and DOLWD employment statistics do not reflect residents’ activity in the subsistence economy.

Governance

Point Lay is an unincorporated community located in the North Slope Borough. The Borough administers an 18.5 mills property tax.⁵²⁷ The North Slope Borough also receives significant tax revenue from oil and gas development activities which supports services provided in Point Lay.⁵²⁸ No taxes are collected in Point Lay, and no municipal revenue was reported between 2000 and 2010. Point Lay did not receive State or Community Revenue Sharing contributions or fisheries-related grants between 2000 and 2010. This information about selected revenue sources in Point Lay is presented in Table 2.

⁵²⁹ See footnote 527.

Point Lay is also a member of the Arctic Slope Native Association (ASNA), a tribal 501(c)(3) non-profit organization headquartered in Barrow. The ASNA is one of the 12 regional Alaska Native nonprofit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. Today, these regional Native Associations receive federal funding to administer a broad range of services to villages in their regions.⁵³⁰

The closest offices of the Alaska Department of Fish and Game (ADF&G) are located in Barrow and Kotzebue, the closest office of the Alaska Department of Commerce, Community, and Economic Development is located in Kotzebue, and the closest office of the Alaska Department of Natural Resources is located in Fairbanks. These agencies also have offices located in Anchorage. The closest offices of the National Marine Fisheries Service (NMFS) and U.S. Bureau of Citizenship and Immigration Services are also located in Anchorage.

Infrastructure

Connectivity and Transportation

Point Lay is accessible year-round by air. Coastal and overland access are seasonal. The U.S. Air Force owns the public 4,500 ft long by 100 ft wide gravel airstrip in Point Lay.⁵³¹ ERA Alaska provides direct flights between Point Lay and Barrow five days per week, and between Point Lay and Point Hope two days per week.⁵³² The price of a roundtrip ticket by plane from Point Lay to Anchorage in early June of 2012 was \$1,132.⁵³³ Freight is delivered by air throughout the year and seasonally by barge.⁵³⁴ Barges typically leave the Seattle area by July 1 and arrive in Barrow by August 1, delivering goods to North Slope Borough communities along the way. Landing craft with a 5-foot draft are used to unload goods on beaches near the communities. In the case of Point Lay, the landing craft unloads goods onto the outer spit of Kasegaluk Lagoon. They are transferred across the spit to a 50-ft watercraft that transports the goods across the Lagoon to Point Lay.⁵³⁵

Approximately eight miles of gravel roads are present in Point Lay. During the winter, an extensive network of trails is available for travel between communities and to subsistence sites. The trails are impassible in summer due to the presence of wetlands and many small lakes. Point Lay is connected to Point Hope, Wainwright, and Barrow via a coastal trail. The trail network also connects Wainwright to Deadhorse, Nuiqsut, and Atqasuk, and Nuiqsut south to Anaktuvuk Pass. Snowmobiles are used for winter travel between communities and to subsistence camps.⁵³⁶

Facilities

Water in Point Lay is obtained from a lake near the community and is filtered and stored in a tank. A community well source and individual wells are also in use. There is no piped water system. Water trucks deliver water to homes, providing running water for kitchens. A central watering point is also available. No piped sewer system is present, either. The Borough operates a sewage lagoon for sewage treatment.⁵³⁷ Problems associated with melting permafrost have caused problems for existing sewer lines, and system repairs have been frequent in recent years.⁵³⁸ The Borough also operates a landfill and provides refuse collection services in Point Lay. Electricity is provided by a diesel powerhouse operated by the Borough.⁵³⁹ According to a survey conducted by the AFSC in 2011, community leaders indicated that a new diesel powerhouse is expected to be completed by 2013. Wind power generation was briefly tried in Point Lay in the past, but was discontinued. The Borough is interested in revisiting the possibility of wind power in Point Lay.⁵⁴⁰ Police services are provided by the North Slope Borough Police Department.⁵⁴¹ The nearest state trooper posts are located in Barrow and Kotzebue.⁵⁴² Fire and rescue services are provided by the Point Lay Volunteer Fire Department.⁵⁴³ The fire station is equipped with a fire engine and an ambulance.⁵⁴⁴

Additional community facilities and services include a local store, operated by the Native Village of Point Lay, which sells groceries and clothing. Propane, diesel, and regular gasoline are sold in town.⁵⁴⁵ A community center is also present.⁵⁴⁶ According to the 2011 AFSC survey, a food bank and public library are present, and job placement services are offered. Telephone, internet, and cable services are available in Point Lay.⁵⁴⁷

In the 2011 AFSC survey, community leaders indicated that no fisheries-related infrastructure is present in Point Lay. They reported that no dock space is available in the community and no fishing support businesses are present. They also indicated that the only vessels present in Point Lay are small boats, ranging from 16 to 20 feet in length. Skiffs are a primary mode of transportation for Point Lay residents traveling to subsistence sites during summer months.⁵⁴⁸

Medical Services

Local health services are available at the Point Lay Clinic, which is owned and operated by the North Slope Borough. The Clinic is a Community Health Aide Program site. Emergency

Services have coastal and air access. Emergency service is provided by 911 Telephone Service volunteers and a health aide. Alternate health care is provided by the Point Lay Volunteer Fire Department.⁵⁴⁹ The fire station is equipped with an ambulance.⁵⁵⁰ The nearest hospitals are located in Barrow and Kotzebue.

Educational Opportunities

One school is present in Point Lay. The Kali School provides preschool through 12th grade education. As of 2011, the school had 87 students and 11 teachers.⁵⁵¹ The school also provides adult basic education.⁵⁵²

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Subsistence hunting and fishing have defined the economy and culture of Inupiaq people for thousands of years, and remain essential today. Point Lay is located just south of the mouth of the Kokolik River, on the inland shore of Kasegaluk Lagoon. Beyond the Lagoon lies the Chukchi Sea, an area encompassed by the Arctic Management Area. Commercial fishing for all species is currently prohibited in federally regulated waters of the Arctic Management Area, “until sufficient information is available to support the sustainable management of a commercial fishery.” The focus of harvest in communities within the Arctic Management Area remains subsistence.⁵⁵³ In addition, no state regulated commercial fisheries currently take place in the vicinity of Point Lay.

Subsistence harvest in the North Slope region is managed by both federal government agencies and local Native communities through various co-management efforts that facilitate communication between these entities. Examples of co-management institutions include the Alaska Eskimo Whaling Commission (AEWC - established in 1977), the Eskimo Walrus Commission (formed in 1978), the Beluga Whale Committee (formed in 1988), and the Nanuq Commission (formed in 1994 for polar bear management). The Marine Mammal Protection Act (MMPA) includes specific text providing a legislative basis for these cooperative agreements. Specifically, in 1994, Section 119 of the reauthorization for the MMPA provided a legislative basis for cooperative agreements with Alaska Native organizations.⁵⁵⁴

In recent decades, the community of Point Lay has been particularly engaged in subsistence harvest of beluga whales. Point Lay hunters typically harvest between 30 and 50

⁵⁵⁴ Ibid.

belugas per year.⁵⁵⁵ Recently, Point Lay has renewed historical bowhead whale harvest, as well. Since its formation in 1977, the AEWG has represented the whaling communities of Kaktovik, Nuiqsut, Barrow, Wainwright, Point Hope, Kivalina, Little Diomedea, Wales, Savoonga, and Gambell.⁵⁵⁶ No bowhead whales had been harvested in Point Lay since whaling ended there in 1937, and Point Lay was not initially included as a member community in the AEWG. In recent years, the community of Point Lay has sought to reactivate their bowhead whaling traditions, customs, and practices. A ‘needs study’ was conducted by the North Slope Borough, and in 2008, Point Lay received quota from the AEWG to harvest one whale. The first bowhead whale since 1937 was landed in Point Lay in 2009, and a second was landed in 2011.^{557,558} Point Lay is also a member community of the Eskimo Walrus Commission and Nanuuq Commission.

Processing Plants

According to ADF&G’s 2010 Intent to Operate list, Point Lay does not have a registered processing plant. The closest seafood processing facility is located in Nome.

Fisheries-Related Revenue

Between 2000 and 2010, no information was reported regarding fisheries-related revenue in Point Lay (Table 3).

Commercial Fishing

From 2001 and 2007, one state Commercial Fisheries Entry Commission (CFEC) permit was held by a Point Lay resident in the Kotzebue salmon gillnet fishery. The permit was not actively fished in any of these years, and no other state or federal commercial fishing permits were held by Point Lay residents between 2000 and 2010 (Table 4). In addition, no residents held quota share accounts in federal catch share fisheries for halibut, sablefish, or crab (Tables 6 through 8). There were also no commercial crew license holders in Point Lay during the 2000-2010 period, no Point Lay residents were the primary owner of a fishing vessel, and no commercial fishing vessels were homeported in the community. In addition, no fish buyers or shore-side processing facilities were located in Point Lay. These characteristics of the commercial fishing sector are presented in Table 5. Given the lack of commercial fishing activity and fish buyers in Point Lay, no landings or ex-vessel revenue were generated in the community or by Point Lay residents (Tables 9 and 10).

Recreational Fishing

According to a survey conducted by the AFSC in 2011, community leaders reported that no recreational fishing activity takes place in Point Lay. This is reflected in the fact that, between 2000 and 2010, no active sport fish guide businesses or licensed sport fish guides were reported to be present in Point Lay, and no sportfishing licenses were sold in the community. Several Point Lay residents were reported as having purchased sportfishing licenses (irrespective of point of sale), ranging from a total of 3 to 14 per year. The Alaska Statewide Harvest Survey,⁵⁵⁹ conducted by ADF&G between 2000 and 2010, did not report information regarding species targeted by recreational fishers in Point Lay, and given the lack of local sport fish businesses, no kept/release log book data were reported for sportfishing charters out of Point Lay between 2000 and 2010.⁵⁶⁰

Point Lay is located within Alaska Sport Fishing Survey Area Z – North Slope-Brooks Range, which includes all Alaskan waters, including drainages flowing into the Beaufort and Chukchi seas, north of the Brooks Range and east of Point Hope. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, Alaska resident anglers consistently fished a greater number of days than non-Alaska resident anglers in both freshwater and saltwater, and freshwater sportfishing activity was significantly higher than in saltwater. On average between 2000 and 2010, Alaska resident anglers fished 3,065 fresh water days and 228 saltwater days, while non-Alaska resident anglers fished on average 1,001 freshwater and 17 saltwater days. This information about the sportfishing sector in and near Point Lay is also displayed in Table 11.

Subsistence Fishing

In a survey conducted by the AFSC in 2011, Point Lay community leaders indicated that subsistence is the primary economic activity in the community. They reported that some of the most important marine subsistence resources are beluga whale, bowhead whale, ugruk (bearded seal), walrus, salmon, and spotted seal. They also indicated that the most important fishing seasons include harvest of grayling during the month of October, smelt harvest from mid-December to mid-February, and salmon harvest from June through August.

According to the North Slope Borough Coastal Management Plan, caribou, fish, and beluga whale comprise the most significant portion of the subsistence harvest in Point Lay, while the use of seals and walrus have declined due to reduced use of dog teams and the present adequate supply of caribou meat. In addition, polar bears are not as actively hunted as in former years.⁵⁶¹ Until recently, bowhead whales were not harvested in Point Lay, although residents traveled to other communities to participate in bowhead whale hunts. However, in 2008, Point

⁵⁶¹ Glenn Gray and Associates. June 2007. *North Slope Borough Coastal Management Plan*. Retrieved February 29, 2012 from http://www.co.north-slope.ak.us/programs/coastal_management/NSB_Coastal_Management_Plan.pdf.

Lay received quota from the AEWC. In 2009, the community harvested its first bowhead whale since 1937, and a second bowhead was landed in 2011.^{562, 563}

Residents of Point Lay utilize a large area of the North Slope for subsistence harvest, from Icy Cape to Cape Beaufort, and inland along the Kukpowruk River into the De Long Mountains. Many residents of Point Lay have lived in Wainwright, and subsistence use areas between the two communities overlap. Icy Cape is a site for harvest of waterfowl and eggs, the annual walrus hunt, and communal beluga hunts. Kasegaluk Lagoon is the site of gillnet fisheries for salmon, whitefish, flounder, smelt, herring, bullhead, and occasionally char. Hunting and trapping activities take place inland, in the Amatusuk Hills, Kiklupiklak Hills, and western Brooks range. Caribou is also hunted near Icy Cape during summer months, when the Western Caribou Herd migrates to the coast near Point Lay. Subsistence foods are exchanged between villages. Point Lay is a major supplier of beluga whale, and most often receives bowhead whale from Point Hope and Barrow.⁵⁶⁴

A survey conducted by the North Slope Borough in 2003 found that 77.4% of Point Lay households use subsistence foods, and approximately 13.6% of households receive over half of their food from subsistence activities.⁵⁶⁵ Between 2000 and 2010, ADF&G did not report any information about the percentage of Point Lay households utilizing various marine resources for subsistence purposes (Table 12). However, a 1987 subsistence survey conducted by ADF&G provides household participation information regarding marine mammals and non-salmon fish (not including halibut). That year, 29% of Point Lay households reported harvesting spotted seal, 27% reported harvesting bearded seal, 27% reported harvest of ringed seal, and 21% reported harvest of bowhead whale. Species of non-salmon fish harvested by the greatest percentage of Point Lay households in 1987 included grayling (37% of households reported harvesting), Arctic char (23%), and flounder (10%). Many of these resources were shared with households that did not participate in harvest activities.

Some information was reported for the 2000-2010 period regarding annual subsistence harvest of salmon. In 2001 and 2002, ADF&G issued one subsistence salmon permit per year to a Point Lay household. In 2001, 30 sockeye salmon were reported as harvested, and in 2002, harvest of 1 Chinook and 9 sockeye was reported (Table 13).

No information was reported regarding total subsistence harvest of marine invertebrates or non-salmon fish (not including halibut) between 2000 and 2010 (Table 13). Likewise, no information was reported regarding annual subsistence harvest of halibut (Table 14). The Chukchi Sea is noted as the northern extent of the range of Pacific halibut.⁵⁶⁶

Between 2000 and 2010, information was reported by the U.S. Fish and Wildlife Service and the AFSC regarding subsistence harvest of beluga whales, walrus, and polar bears by residents of Point Lay. For years in which data were reported, an average of 40 beluga whales, 3 walrus, and 2 polar bears were harvested per year. It is important to note that no information was

Prudhoe Bay (PROO-doh Bay)

People and Place

*Location*⁵⁶⁸

Prudhoe Bay is adjacent to the Beaufort Sea, east of Nuiqsut. Prudhoe Bay is located in the Barrow Recording District and the North Slope Census Area and is part of the North Slope Borough. Prudhoe Bay is unincorporated and figures for Prudhoe Bay include nearby Deadhorse.

*Demographic Profile*⁵⁶⁹

In 2010, there were 2,174 residents in Prudhoe Bay, making it the 43rd largest of 352 total Alaskan communities with recorded populations that year. Overall between 1990 and 2010, the population increased by 460%. Between 2001 and 2009, the Alaska Department of Labor (DOL) estimates show that the population fell by 40%, though the U.S. Census shows that the population increased substantially between 2000 and 2010. This is likely due to differences in how each source calculates population estimates, as DOL only counts the number of permanent residents that are eligible to collect the Permanent Fund Dividend and the U.S. Census counts all people living in a community, irrespective of whether they are temporary or permanent residents. In the case of Prudhoe Bay, the majority of those counted in the U.S. Census could be classified as temporary workers in the oil and gas industry and thus not eligible to collect the Permanent Fund Dividend. The Prudhoe Bay average annual growth rate between 2000 and 2009 was -1.71%, indicating a slow rate of population decline of permanent residents. The change in population from 1990 to 2010 is provided in Table 1.

The majority of residents in 2010 identified themselves as White (85.2%), with the remaining racial composition as follows: American Indian or Alaska Native (7.8%), Hispanic (4.0%), two or more races (1.9%), Black or African American (1.9%), Asian (1.6%), other (1.4%), and Native Hawaiian and Other Pacific Islander (0.1%). The percentage of the population composed of residents identifying themselves as White increased by 65.2% between 2000 and 2010, with corresponding decreases in the percentage of residents identifying themselves as two or more races and as Native American or Alaska Native. The changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

Estimates of household size, number of households, and number of housing units in 2010 were not available for Prudhoe Bay, potentially due to the nature of this community as a work camp for employees involved with the oil industry. These individuals live in employer-provided housing when in residence in Prudhoe Bay.

Figure 1. Racial and Ethnic Composition, Prudhoe Bay: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Prudhoe Bay Based on the 2000 and 2010 U.S. Decennial Census.

In 2010, the gender makeup was heavily skewed, at 90% male and 10% female, quite different from the state as a whole (52% male, 48% female). The median age in Prudhoe Bay was estimated to be 49.1 years, higher than the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the greatest percentage of residents fell within the age category 50-59 years old, with the next largest percentages falling within the age categories 40-49 years old and 30-39 years old. Relatively few people were 19 years old or younger and 60 years old or older. No data were reported by the 2000-2010 American Community Survey (ACS) regarding the educational attainment of Prudhoe Bay residents.⁵⁷⁰

⁵⁷⁰ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

*History, Traditional Knowledge, and Culture*⁵⁷¹

The bay itself was named in 1828. The site was extensively developed for oil drilling operations in the 1970s. An 800-mile pipeline was constructed to transport crude oil from Prudhoe Bay to Valdez, where it is shipped in marine tankers to terminals throughout the country. The pipeline has 12 pump stations and a maximum capacity of 2 million barrels of crude oil per day. Prudhoe Bay is a large work camp for the oil industry. All residents are employees of oil-drilling or oil-production and support companies and work long consecutive shifts. Living quarters and food are provided to the workforce, and there are a number of recreational facilities.

Natural Resources and Environment⁵⁷²

Prudhoe Bay is located on the North Slope of Alaska, which experiences an arctic climate. Temperatures range from -56 to 78 °F (-48.9 to 25.6 °C). Precipitation is light, averaging 5 inches per year, with 20 inches of snow per year.

The presence of oil drives the economy and population of Prudhoe Bay, which is entirely composed of employees of oil-drilling or oil-production and support companies.

In October 2010, a former U.S. Navy facility at the Deadhorse Airport in Prudhoe Bay was added to the list of facilities needing a Preliminary Assessment (PA) to determine whether the site should be listed under the Superfund program.⁵⁷³ The PA had not yet been completed as of November 2011.

The Prudhoe Bay oil fields provide some 2-3% of the nation's domestic oil supply and employ over 5,000 individuals in drilling, pipeline operations, cargo transportation, and a variety of support positions. Most oil field workers travel home to Anchorage or the lower 48 when off duty. Pre-arranged tours are available through various tour companies.⁵⁷⁴

Prudhoe Bay is located near the Gates of the Arctic National Park and Preserve (Park), an area that is managed by the National Park Service.⁵⁷⁵ This vast landscape does not contain any roads or trails. Visitors discover intact ecosystems where people have lived with the land for thousands of years. The Park remains virtually unchanged except by the forces of climate, weather, geology, plant life, and animal activities. Situated above the Arctic Circle in the Central Brooks Range, summers here are short, but continuous daylight during the summer means very high productivity during this period. Animals present in the Park include insects, migratory birds such as arctic terns, non-migratory birds such as ptarmigan, and mammals such as beavers, caribou, moose, grizzly and black bears, arctic ground squirrels, lemmings, and voles. Fish species in the park include whitefish, northern pike, and grayling.

Current Economy⁵⁷⁶

The oil companies involved in doing work in Prudhoe Bay are British Petroleum (BP), ConocoPhillips, ExxonMobil, and Chevron.⁵⁷⁷ Because the majority of employees working in Prudhoe Bay return to homes elsewhere in Alaska or in the lower 48 U.S. States when not working, employment and other information for these individuals is reflected in the information for their home communities.

Information regarding estimates for per capita and household income for Prudhoe Bay in 2010 was not available from the 2006-2010 ACS; however, in 2000 the U.S. Census reported that the mean per capita income for Prudhoe Bay was \$19,880 and the median household income was \$90,957. After accounting for inflation by converting the 2000 values to 2010 dollars,⁵⁷⁸ the per capita income for Prudhoe Bay was \$26,142 and the median household income was \$119,607. Prudhoe Bay's nature as a community of temporary residents and the overall small population size may have prevented the ACS from accurately portraying economic conditions.⁵⁷⁹ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database, the per capita income in Prudhoe Bay in 2010 was \$315, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.⁵⁸⁰

While employment data for Prudhoe Bay were not reported in the 2006-2010 ACS, an estimate based on the ALARI database indicates the unemployment rate in 2010 was 21.4%. Data from the 2000 U.S. Census show that 50% of Prudhoe Bay residents were employed in the professional, scientific, management, administration, and waste management industries, while the other 50% were employed in construction in 2000. This information is shown in Figures 3 and 4, which break down local employment by industry and occupation.

⁵⁷⁶ Unless otherwise noted, all monetary data are reported in nominal values.

Figure 4. Local Employment by Occupation in 2000-2010, Prudhoe Bay (U.S. Census).

Governance

Prudhoe Bay is unincorporated and is located within the North Slope Borough. The nearest Alaska Department of Fish and Game (ADF&G) office is located in Barrow. The nearest offices of the Alaska Department of Natural Resources and the Alaska Department of Commerce, Community, and Economic Development are located in Fairbanks. The nearest offices of the National Marine Fisheries Service (NMFS), the U.S. Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement are located in Anchorage.

Since it is unincorporated, Prudhoe Bay does not maintain a municipal budget with community revenue and expenditures, nor does Prudhoe Bay administer its own sales tax. Data are not available for community revenues from 2000 to 2010 (Table 2).

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Prudhoe Bay Municipal Government from 2000 to 2010.

Infrastructure

*Connectivity and Transportation*⁵⁸¹

The airport at nearby Deadhorse is the primary means of public transportation to the North Slope. The state-owned asphalt and gravel airstrip at Deadhorse is 6,500 feet long by 150 feet wide. A 5,000-foot by 100-foot wide private gravel airstrip is owned and maintained by Conoco Phillips Alaska, Inc. A state-owned heliport is located at Prudhoe Bay. The Dalton Highway is used year-round by trucks to haul cargo to the North Slope from Fairbanks. There are no services beyond this point, and the highway is hazardous during winter months. Roundtrip airfare to Anchorage was \$792.⁵⁸²

Facilities

Electricity is provided to the community by a diesel powerhouse operated by the local utility, TDX North Slope. Modern sanitation facilities are available at the group quarters facilities. The North Slope Borough offers refuse collection services and operates a Class 1

⁵⁸¹ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

landfill 6 miles northwest of Deadhorse, on Oxbow Road. The Borough also operates the local waters and sewer systems. There are also numerous other oilfield facilities. Fire and rescue services are provided by the Greater Prudhoe Bay Fire Department.⁵⁸³ The nearest state trooper post is located in Barrow.⁵⁸⁴

*Medical Services*⁵⁸⁵

Medical care is provided by private, oil company medical staff. Alternate health care is provided by the Greater Prudhoe Bay Fire Department. Emergency Services have limited highway, coastal, and airport access. Emergency service is provided by a paid EMS Service. Alternative health care is provided by oil company medical staff as well as the Greater Prudhoe Bay Fire Department. The nearest hospital is located in Barrow.

*Educational Opportunities*⁵⁸⁶

As of 2011, there were no schools located in Prudhoe Bay.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prudhoe Bay is located on the coast of the Arctic Management Area, and residents have had limited participation in North Pacific fisheries. Commercial fishing for all species is currently prohibited in federally regulated waters of the Arctic Management Area, “until sufficient information is available to support the sustainable management of a commercial fishery.”⁵⁸⁷ Between 2000 and 2010, one permit was held per year from 2000 to 2007 in a statewide freshwater fish set gillnet fishery (‘other finfish’). Commercial freshwater fish fisheries may target species such as Arctic char, pike, rainbow trout, Dolly Varden, and sheefish.⁵⁸⁸ No other commercial fisheries permits were held by Prudhoe Bay residents between 2000 and 2010. Prudhoe Bay is not eligible to participate in the Community Development Quota Program or the Community Quota Entity Program.

Processing Plants

According to ADF&G’s 2010 Intent to Operate list, Prudhoe Bay does not have a registered processing plant.

Fisheries-Related Revenue

Given that Prudhoe Bay has no taxing authority and does not manage a community budget, no data were available regarding revenue received by Prudhoe Bay from fisheries-related taxes and fees between 2000 and 2010 (Table 3).

Commercial Fishing

Between 2000 and 2010, there were no vessels reported as being owned by Prudhoe Bay residents, no vessels were homeported in Prudhoe Bay, and no vessels landed catch in Prudhoe Bay (Table 5). From 2000-2007, one resident held an Alaska Commercial Fisheries Entry Commission (CFEC) permit to harvest ‘other finfish,’ though the permit was not fished in 2007. This ‘other finfish’ permit was held in the statewide freshwater fish set gillnet fishery. No federal commercial fishing permits were held by Prudhoe Bay residents between 2000 and 2010. Information about state and federal commercial fishing permits is presented in Table 4. No residents of Prudhoe Bay are documented to have held quota share accounts in any of Alaska’s catch share programs during the 2000-2010 period (Table 6, Table 7, Table 8). Because no fish buyers or shore-side processing facilities were present in Prudhoe Bay, and because no residents were the primarily owners of fishing vessels (Table 5), no landings were recorded locally (Table 9) or by Prudhoe Bay vessel owners (Table 10) between 2000 and 2010.

Recreational Fishing

According to the ADF&G Statewide Harvest Survey, sockeye salmon are the only species caught by private anglers in Prudhoe Bay.⁵⁸⁹ In 2010, a total of 13 sportfishing licenses were sold to residents of Prudhoe Bay (irrespective of the location of the point of sale). In comparison, a total of 66 sportfishing licenses were sold in Prudhoe Bay, indicating the potential that visitors and temporary residents are participating in recreational fishing activities.

Between 2000 and 2006, the ratio of non-charter anglers that were non-Alaska residents in the North Slope-Brooks Range region of Alaska varied from year to year. In 2007, all the saltwater angler days fished in this region were fished by non-Alaska residents. Between 2009 and 2010, there were no reported saltwater angler days fished in this region. For freshwater sportfishing, the number of angler days fished by non-Alaska residents increased between 2000 and 2010, while the number of angler days fished by Alaska residents remained relatively stable (Table 11).

Subsistence Fishing

For 2000-2010, the ADF&G Division of Subsistence does not provide estimates for the percent of households utilizing various marine resources for subsistence purposes or the per capita subsistence harvest (in pounds) in Prudhoe Bay (Table 12). Some limited information was reported regarding annual salmon harvest during the period: from 2005-2007, one subsistence salmon permit was issued to a Prudhoe Bay household. Using this permit, 13-14 sockeye salmon were harvested per year in those years. Data were not available for other salmon species or other years during the 2000-2010 period. Likewise, no information was available regarding total harvest of marine invertebrates or non-salmon fish (not including halibut) during these years (Table 13). In addition, data were not available from management agencies regarding subsistence harvest of halibut (Table 14) or marine mammals (Table 15) between 2000 and 2010.

Selawik (SELL-uh-wick)

People and Place

*Location*⁵⁹⁰

Selawik is located at the mouth of the Selawik River, where it empties into Selawik Lake, about 90 miles east of Kotzebue. It lies 670 miles northwest of Anchorage. The City is near the Selawik National Wildlife Refuge, a key breeding and resting spot for migratory waterfowl. Selawik is located in the Kotzebue Recording District, the Northwest Arctic Census Area, and the Northwest Arctic Borough. The city boundaries encompass 2.5 square miles of land and 0.9 square miles of water. Selawik was incorporated as a 1st Class City in 1974, but changed to a 2nd Class City government in 1977.

*Demographic Profile*⁵⁹¹

In 2010, there were 829 residents in Selawik, making it the 76th largest of 352 total Alaskan communities with recorded populations that year. While the U.S. Census shows a dramatic increase in population between 1990 and 2010, the Alaska Department of Labor estimates of permanent residents shows a less substantial increase between 2001 and 2009. The change in population from 1990 to 2010 is presented in Table 1.

In 2010, a majority of Selawik residents identified themselves as American Indian and Alaskan Native (85.4%), with 10.5% of the population identifying themselves as two or more races, 4.0% of the population identifying themselves as White, and 0.1% of the population identifying themselves as Black or African American. Between 2000 and 2010, the percentage of the population identifying themselves as American Indian and Alaskan Native decreased by 9.4%, with corresponding increases in the percentage of the population identifying as two or more races and the percentage identifying as White. Changes in racial and ethnic composition from 2000 to 2010 are shown in Figure 1.

In 2010, the average household size in Selawik was 4.46, a decrease from 4.6 persons per household in 1990 and 4.49 in 2000. The total number of households in Selawik increased during the same period, from 129 in 1990 to 172 in 2000 to 186 in 2010. Of the 201 housing units surveyed for the 2010 Decennial Census, 97 were owner-occupied, 89 were renter-occupied, and 15 were vacant. In 2010, there were no residents of Selawik reported to be living in group quarters.

Figure 1. Racial and Ethnic Composition, Selawik: 2000-2010 (U.S. Census).

In 2010, the gender makeup in Selawik was 52% male and 48% female, the same as the gender makeup for the state as a whole. The median age was estimated to be 21.4 years, lower than both the U.S. national average of 36.8 years and the median age for Alaska, 33.8 years. In 2010, the greatest percentage of the population was in the age group 0 to 19 years, with the next largest percentage for the age group 20 to 39 years old. Relatively few people were age 70 or older. The overall population structure in Selawik in 2000 and 2010 is shown in Figure 2.

In terms of educational attainment, according to the 2006-2010 American Community Survey (ACS),⁵⁹² 62.9% of Selawik residents aged 25 and over were estimated to hold a high school diploma or higher degree in 2010, compared to 90.7% of Alaska residents overall. Also in 2010, 9.9% of residents aged 25 and older were estimated to have less than a ninth grade education, compared to 3.5% of Alaska residents overall; 27.2% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaska residents overall; 45.5% were estimated to hold a high school diploma or equivalent, compared to 27.4% of Alaska residents overall; 10.5% were estimated to have some college, but no degree, compared to 28.3% of Alaska residents overall; 4.2% were estimated to hold a Bachelor’s degree, compared to 17.4% of Alaska residents overall; and 2.7% were estimated to hold a graduate or professional degree, compared to 9.6% of Alaska residents overall.

Figure 2. Population Age Structure in Selawik Based on the 2000 and 2010 U.S. Decennial Census.

⁵⁹² While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

History, Traditional Knowledge, and Culture

Selawik is an Inupiat Eskimo community active in traditional subsistence fishing and hunting. Lieutenant L.A. Zagoskin of the Imperial Russian Navy first reported the existence of the village in the 1840s as “Chilivik.” Ivan Petroff counted 100 “Selawigamute” people in his 1880 census. Around 1908, the community site had a small wooden schoolhouse and church. The village has continued to grow and has expanded across the Selawik River onto three banks, linked by bridges. Selawik was incorporated as a 1st Class City in 1974, changed to a 2nd Class City government in 1977.⁵⁹³ The Selawik River takes its name from the Inupiat Eskimo word “siilivik,” which means, “place where sheefish (sii) spawn (li-vik).”⁵⁹⁴ The sale and importation of alcohol is banned in the village.⁵⁹⁵

Natural Resources and Environment

Selawik is located in the transitional climate zone. Temperatures average -10 to 15 °F (-23.3 to -9.4 °C) during winter and 40 to 65 °F (4.4 to 18.3 °C) during summer. Temperature extremes have been recorded from -50 to 83 °F (-45.6 to 28.3 °C). Annual snowfall averages 35 to 40 inches, with 10 inches of precipitation. The Selawik River is navigable from early June to mid-October.⁵⁹⁶

Selawik is located near the Selawik National Wildlife Refuge (NWR), an area that is managed by the U.S. Fish and Wildlife Service. The 2.15-million-acre NWR is situated on the Arctic Circle to the east of Kotzebue Sound, and occupies a unique variety of landforms in northwest Alaska. Refuge lands, including the 240,000 acres of designated Wilderness Area, are some of the most remote “wildlands” in the state. Landscapes found on the refuge include alpine tundra, arctic tundra, taiga (northern forest), lake and wetland complexes, large river deltas, open grass and sedge meadows, and previously glaciated mountains and river valleys. This area is a transition zone where the northernmost boreal forests give way to open arctic tundra. The approximately 21,000 lakes on NWR lowlands create a very large arctic tundra lake complex that is comparable in scale and ecological significance to any found on Alaska’s other NWR lands.⁵⁹⁷

Historically, the Kobuk and Selawik rivers served as important travel corridors from the coast to the more mountainous areas to the east. This is still true today. Local residents access NWR lands via these waterways by boat in the summer and by snowmobile or dog team in the winter. In most roadless areas across northwest Alaska, river corridors remain important travel routes for humans and wildlife.⁵⁹⁸

One of the purposes for which the Selawik NWR was established is the conservation and management of the Western Arctic Caribou Herd. With 377,000 animals, as of 2007 the herd was the largest in Alaska, migrating twice annually through the NWR on its way between

⁵⁹⁸ Ibid.

northern calving grounds and southern wintering grounds. The other wildlife found within the NWR include moose, musk oxen, black bears, grizzly bears, wolves, arctic and red fox, lynx, wolverine, beaver, marten, snowshoe hares, and small mammals such as redback voles, tundra voles, and arctic shrews. The NWR also provides important habitat for migratory waterfowl, such as white-fronted geese, tundra swans, sandhill cranes, Northern pintails, greater scaup, black scoters, Pacific loons, and Pacific golden plovers. Songbirds such as the yellow wagtail, yellow warbler, white-crowned sparrow, and Lapland longspur utilize habitats within the NWR, as do palmated and western sandpipers, red-necked phalaropes, and whimbrels. The NWR also contains large populations of resident and anadromous fish. Sheefish and other whitefish are the primary species harvested for subsistence purposes. Sheefish can be very large (approaching 60 lb). Other fish species found within the NWR include northern pike, burbot, and Arctic grayling.⁵⁹⁹

Most public use in the NWR is in the form of subsistence activities by local residents. Caribou hunting, subsistence fishing, furbearer trapping, and berry picking go on as they have for many hundreds of years. The residents of this area still depend on the wildlife and natural resources of the NWR for much of their food and for the perpetuation of their traditional way of life. In addition to subsistence activities, the other primary public use of the NWR occurs during fall hunting seasons. Caribou, moose, and bear hunters from other parts of Alaska and the continental United States come to the NWR to pursue hunting opportunities and to enjoy the scenery and wilderness character of the area.⁶⁰⁰

According to the Alaska Department of Environmental Conservation, no active environmental cleanup sites were located near Selawik as of August 2012.⁶⁰¹

Current Economy⁶⁰²

Subsistence harvest is fundamental to the local economy in Selawik. Important subsistence food sources include whitefish, sheefish, caribou, moose, ducks, ptarmigan, and berries. Occasionally, bartered seal and beluga whale supplement the diet. The primary employers in the community include the school, the city, the Tribal Council, Maniilaq, and three grocery stores. Handicrafts are made and sold locally and at gift shops in larger cities. Seasonal work is also found outside of Selawik with the Red Dog Mine, Bureau of Land Management firefighting, or lighterage operations.⁶⁰³

According to the 2006-2010 ACS,⁶⁰⁴ in 2010, the per capita income in Selawik was estimated to be \$9,681, and the median household income was estimated to be \$32,875, compared to \$8,170 and \$25,625 in 2000, respectively. However, after accounting for inflation by converting the 2000 values to 2010 dollars,⁶⁰⁵ the real per capita income in 2000 was \$10,743

⁶⁰⁵ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

and the real median household income in 2000 was \$33,697, indicating that both per capita and household incomes in Selawik declined between 2000 and 2010. However, Selawik's small population size may have prevented the ACS from accurately portraying economic conditions.⁶⁰⁶ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD).). If total wages reported in the ALARI database for 2010 are divided by the 2010 population reported by the U.S. Census, the resulting per capita income estimate for Selawik in 2010 is \$7,255.^{607,608} According to the ALARI database, the per capita income in Selawik in 2010 was \$7,255, which indicates an overall decrease compared to the real per capita income values reported by the U.S. Census in 2000.⁶⁰⁹ This is supported by the fact that the community was recognized as "distressed" by the Denali Commission, indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁶¹⁰ However, it should be noted that ACS and DOLWD data are based on wage earnings and do not take into account the value of subsistence within the local economy.

In 2010, Selawik ranked 280th of 305 Alaskan communities with per capita income that year, and 229th of 299 Alaskan communities with household income data. Based on the ACS, in the same year, 47.1% of the population age 16 and older was in the civilian labor force, compared to the statewide rate of 68.8%. The local unemployment rate was 44.6%, compared to the statewide unemployment rate of 5.9%. Approximately 36.9% of local residents were living below the poverty line in 2010, compared to 9.6% of Alaskans overall. It should be noted that income and poverty statistics are based on wage income and other money sources; the relatively low income figures and high poverty rates reported for Selawik are not reflective of the value of subsistence to the local economy. In addition, these unemployment and poverty statistics are likely inaccurate given the small population of Selawik.⁶¹¹ A potentially more accurate estimate is based on the ALARI database, which indicates that the unemployment rate in 2010 was 24.1%.⁶¹²

Based on household surveys conducted for the 2006-2010 ACS, the greatest percentage of workers was employed in the public sector (59.3%), along with 40.7% employed in the private sector. Out of 123 people aged 16 and over that were estimated to be employed in the civilian labor force in 2010, the greatest numbers were estimated to work in education services, health care, and social assistance (39.8%), agriculture, forestry, fishing, hunting, and mining (15.4%), and public administration (13.8%). Compared to 2000, greater percentages of the workforce were estimated to work in education, health care and social assistance as well as agriculture, forestry, fishing, hunting and mining industries in 2010, while there was a decline in the

⁶⁰⁶ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

percentage estimated to work in transportation, warehousing and utilities. When viewing employment in terms of occupation, a majority of the workforce in 2010 was estimated to be employed in service (30.9%) and management/professional occupations (30.1%). Compared to 2000, there were declines in the percentage of the workforce employed in sales/office and production/transportation/material moving occupations, and an increase in the percentage employed in service occupations. Information about employment by industry is presented in Figure 3, and employment is broken down by occupation in Figure 4.

Figure 3. Local Employment by Industry in 2000-2010, Selawik (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Selawik (U.S. Census).

Governance

Selawik is a 2nd Class City located in the Northwest Arctic Borough. The City has a Strong Mayor form of government, with a 7-person city council including the mayor, an 11-person school board, a 7-person planning commission, and various city employees. The City administers a 5% sales tax.⁶¹³ In addition to sales tax revenues, other locally-generated income sources in Selawik between 2000 and 2010 included enterprise revenues from water/sewer, washeteria, and cable TV fees, electric utility maintenance contract, building leases and rentals, equipment rentals, land sales, and bingo receipts. The total municipal revenue reported by the City of Selawik generally increased between 2000 and 2010, driven in part by an increase in sales tax revenues over the period. Selawik received Community Revenue Sharing contributions of just under \$140,000 per year in 2009 and 2010, and also reported receiving approximately \$36,000 in State Revenue Sharing contributions in 2001. No state or federal fisheries-related grants were reportedly received by Selawik between 2000 and 2010. Selected municipal, state, or federal revenue streams for Selawik are shown in Table 2.

Table 2. Selected Municipal, State, or Federal Revenue Streams for the Community of Selawik from 2000 to 2010.

Year	Total Municipal Revenue ¹	Sales Tax Revenue ²	State/Community Revenue Sharing ^{3,4}	Fisheries-Related Grants (State and Federal) ⁵

Selawik was included under the Alaska Native Claims Settlement Act (ANCSA), and is federally recognized as a Native village. The authorized traditional entity, recognized by the Bureau of Indian Affairs, is the Native Village of Selawik. The regional Native corporation to which Selawik belongs is the NANA Regional Corporation. In 1972, most village corporations in the region merged with NANA Regional Corporation, with the exception of the village corporation for Kotzebue, known as Kikiktagruk Inupiat Corporation. NANA Regional Corporation now has title to 2,082,052 surface acres, including 138,240 that were originally titled to Selawik's Native village corporation.^{614,615}

Selawik is a member village of the Maniilaq Association, a tribal non-profit corporation that provides health and social services to residents of Northwest Alaska. The Maniilaq Association is one of the 12 regional Alaska Native 501(c)(3) non-profit organizations that were identified under ANCSA and charged with naming incorporators to create regional for-profit corporations. It was originally called NANA (the Northwest Alaska Native Association), but was renamed Maniilaq when the NANA Regional Corporation was formed to avoid confusion between the names.⁶¹⁶ Today, these regional Native associations receive federal funding to administer a broad range of services to villages in their regions.⁶¹⁷ The Maniilaq Association coordinates tribal and traditional assistance programs, and environmental and subsistence protection services in the region.⁶¹⁸

The nearest offices of the Alaska Department of Fish and Game (ADF&G) and Alaska Department of Commerce, Community, and Economic Development are located in Kotzebue. The nearest office of the Alaska Department of Natural Resources is located in Fairbanks. The nearest offices of the National Marine Fisheries Service (NMFS), Bureau of Citizenship and Immigration Services, and U.S. Immigration and Customs Enforcement are located in Anchorage.

Infrastructure

Connectivity and Transportation

Selawik is accessible by plane and barge only. The Roland Norton Memorial Airport provides a 3,000-ft-long by 70-ft-wide gravel runway owned by the city. The state also owns a 3,000-ft-long by 60-ft-wide gravel airstrip, with a 2,659-ft-long by 60-ft-wide crosswind strip. Scheduled flights are available to Kotzebue and Nome and other area villages. Docking facilities and a barge landing area exist. Freight is shipped upriver from Kotzebue each summer by Crowley Marine Services. Boardwalks have been constructed within the village. Boats, ATVs,

and snowmachines are prevalent forms of local travel.⁶¹⁹ The price of a round-trip ticket from Selawik to Anchorage (connecting in either Kotzebue or Nome) in June 2012 was \$725.⁶²⁰

*Facilities*⁶²¹

A circulating water and vacuum sewer system provides services to about 100 homes. A central treatment facility pumps water from the Selawik River, providing up to 8,000 gallons a day. Groundwater wells have been unsuccessful.

Law enforcement services are provided by VPSOs (Village Public Safety Officers), the city VPO (Village Police Officer), and state troopers stationed in Kotzebue. Fire and rescue services are provided by the Selawik Area Volunteer Emergency Rescue and the City Public Safety Office. The City is home to a Boys and Girls Club and has a community building that houses city offices and a multi-purpose facility. The school has a gym and a school/community library.

*Medical Services*⁶²²

Medical services are provided by the Selawik Health Clinic, which is owned by the Village Council and operated by the Maniilaq Association. The clinic is a Community Health Aid Program site. Alternate health care is provided by the Selawik Area Volunteer Emergency Rescue. Emergency services have lake and air access and are provided by volunteers and a health aide. The nearest hospital is located in Kotzebue.

Educational Opportunities

The Davis-Ramoth School in Selawik provides instruction for students from pre-school through 12th grade. In 2011, the school had 266 students and 18 teachers.⁶²³ Selawik is also a Head Start site.⁶²⁴

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

The lands surrounding the community of Selawik have been the hunting and fishing grounds of the Iñupiaq Eskimo people for thousands of years. Historically, the Iñupiat were distributed in small, widely dispersed settlements often located on high river banks that provided good access to fishing sites. Historically, sheefish, whitefish, salmon, northern pike, caribou, hares, migratory birds, and marine mammals were major subsistence resources used by residents

of the Selawik and lower Kobuk rivers. These subsistence traditions continue today, although methods of harvest and travel have changed over time.⁶²⁵ Commercial fisheries are currently less important to the Selawik economy, although several residents held state commercial fishing permits in the Kotzebue salmon gill net fishery between 2000 and 2010 (see Commercial Fishing section).

Selawik is located in the Arctic Management Area. A Fishery Management Plan for the Arctic Management Area was approved by the Secretary of Commerce in August 2009. Initially, the plan prohibits commercial fishing in the federal waters of the Beaufort and Chukchi seas until more information is available to support sustainable fisheries management.⁶²⁶ In state regulated waters of the Arctic Management Area, several small fisheries occur, including a small fishery for chum salmon in the Kotzebue Sound region.⁶²⁷ The Kotzebue Sound salmon fishery is the northernmost commercial salmon fishery in Alaska. Over 99% of the salmon harvested in this fishery are chum salmon returning to the Kobuk and Noatak Rivers. Commercial harvest of salmon first occurred in the Kotzebue area in 1909 when Native fishermen sold salmon to gold miners. Starting in 1914, salmon were canned and sold to miners in the upper Kobuk drainage. This small industry ceased after 1918. The modern commercial fishery began in 1962, and catch peaked in 1981 with 680,000 chum commercially harvested. Since 1995, poor market conditions and variable processing capacity and interest have caused harvests to fall short of their potential. Due to limited opportunities to sell their catch, the number of active permits in the Kotzebue salmon fishery had declined over the last 30 years. Very few of the 173 total set gill net permits have been used in recent years.⁶²⁸ Fish caught in the Kotzebue salmon fishery are primarily sold to local markets, although some are shipped to markets outside the Arctic region.⁶²⁹

Selawik is not eligible to participate in the CDQ (Community Development Quota) or CQE (Community Quota Entity) programs.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Selawik does not have a registered processing plant. The nearest processing plant is located in Kotzebue.

Fisheries-Related Revenue

Selawik did not receive any known fisheries-related revenue between 2000 and 2010 (Table 3).

⁶²⁹ See footnote 471.

Commercial Fishing

In 2010, four Selawik residents held Commercial Fisheries Entry Commission (CFEC) permits for the Kotzebue salmon gill net fishery, and this number remained stable between 2001 and 2010. Between 2000 and 2010, the number of salmon permits that were actively fished varied between zero to two. In 2010, none of the four permits were reported as actively fished (Table 4). In 2010, there were no crew license holders, fish buyers, shore-side processing facilities, vessels owned primarily by community residents, vessels homeported in the community, or vessels landing catch in the community of Selawik. In previous years there were crew license holders residing in Selawik, ranging from one to six between 2000 and 2009 (Table 5). Also, there were no community residents holding quota share accounts in federal catch share fisheries for halibut (Table 6) or sablefish (Table 7) between 2000 and 2010, and no residents holding quota share accounts for crab (Table 8) between 2005 and 2010. As there were no vessels landing catch in Selawik between 2000 and 2010, there was no ex-vessel value to report during the same period (Table 9). Additionally, there were no vessels owned primarily by Selawik residents landing catch between 2000 and 2010 (Table 10).

Recreational Fishing

Between 2000 and 2010, there were no active sport fish guide businesses or licensed sport fish guides in Selawik. In 2010, 47 sportfishing licenses were sold to Selawik residents (irrespective of the point of sale). In the same year, 62 sportfishing licenses were sold in Selawik, indicating the potential that some visitors came to Selawik to pursue recreational fishing activities (Table 11).

Data compiled by Alaska Fisheries Information Network for Alaska Fisheries Science Center, Seattle. <http://www.adfg.alaska.gov/sf/sportfishingsurvey/> (Accessed September 2011).

Selawik is located within Alaska Sport Fishing Survey Area X – Northwest Alaska. Information is available about both saltwater and freshwater sportfishing activity at this regional scale. Between 2000 and 2010, Alaska resident anglers consistently fished a greater number of days than non-Alaska resident anglers in both freshwater and saltwater, and freshwater sportfishing activity was significantly higher than in saltwater. On average between 2000 and 2010, Alaska resident anglers fished 3,251 freshwater days and 582 saltwater days, while non-Alaska resident anglers fished on average 1,690 freshwater and 64 saltwater days (Table 11).

Subsistence Fishing

Inhabitants of Selawik subsist mainly on whitefish, sheefish, caribou, moose, ducks, ptarmigan, and berries. Occasionally, bartered seal and beluga whale supplement the diet.⁶³⁰ Eschscholtz Bay is an important subsistence area for Selawik residents. Spring and summer uses include beluga whaling, seal hunting, egg gathering, smelt harvest, and berry picking. Beluga whaling involves the combined effort of residents of various area villages who set up hunting camps at Elephant Point. In addition, Kobuk and Selawik Lakes are an important subsistence use area for residents of Selawik and other nearby villages. Seal are harvested in both lakes during the spring and summer, and sheefish are harvested year-round. Selawik Lake is also an important site for waterfowl hunting in the spring and fall, and eggs are gathered during summer. Whitefish are the second most important fish resource in the area, along with some Dolly Varden char and northern pike.⁶³¹

Limited data were available subsistence salmon permits in 2000, 2002, 2003, and 2006. In each of these years, one subsistence salmon permit was issued to a Selawik household, though the permit was only actively fished in 2000 and 2006. In these two years, Chinook salmon and sockeye salmon were the species reported as harvested for subsistence use under the permit. In addition, in 2006, 115,481 lb of non-salmon fish (not including halibut) were reported as harvested for subsistence in Selawik (Table 13). Species of non-salmon harvested in Selawik that year included northern pike, sheefish, and whitefish.⁶³²

Data were not available for Selawik during the 2000-2010 period regarding subsistence participation by household and species or per capita subsistence harvest (Table 12), or for subsistence halibut fishing participation (Table 14), or subsistence harvest of marine mammal resources (Table 15).

Wainwright (WANE-rite, A.K.A. Ulguniq)

People and Place

*Location*⁶³³

Wainwright is located on the Chukchi Sea coast, about 300 miles north of the Arctic Circle and 100 miles southwest of Point Barrow, the most northerly point in the United States. The community is situated on the base of a small peninsula separating the Kuuk Lagoon from the ocean. Barrow, the economic and transportation hub for the region, is located approximately 90 miles to the northeast; and Anchorage is located 711 miles to the southeast. The community's area encompasses 17.6 square miles of land and 24.9 square miles of water. The community is located in the North Slope Borough and the Barrow Recording District. It is located on the perimeter of the 23.5 million acre National Petroleum Reserve - Alaska (NPR).

*Demographic Profile*⁶³⁴

In 2010, there were 556 residents in Wainwright, making it the 110th largest community out of 352 Alaska communities with a recorded population. Since the 1990 Census, which recorded 492 residents, the population of Wainwright has increased by 13%. Between 2000 and 2010, the recorded population fluctuated from a high of 562 in 2001 to a low of 517 in 2006, but overall increased by only ten individuals. Wainwright's annual growth rate between 2000 and 2009 was 0.28%, though population figures in Table 1 suggest that this rate is more reflective of year-to-year variation than a general upward trend. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders estimated that 50 people in the community reside there seasonally or are transients. Community leaders reported that while seasonal workers are present year-round, there is a heavier presence in the summer, with the population typically reaching its annual peak in July.

In 2010, 90.1% of the population identified themselves as American Indian and Alaska Native, a slight increase from the 2000 figure of 90.3%. White residents made up a slightly larger share of the population in 2010 (8.1%) than in 2000 (6.8%), while the percentage of the population identifying with two or more races decreased slightly from 2.7% in 2000 to 1.8% in 2010. In 2010, 0.4% of residents identified themselves as Hispanic or Latino. No residents in 2010 identified themselves as Native Hawaiian or Pacific Islander, Asian, or Black or African American. Figure 1 shows changes in the city's racial and ethnic makeup between 2000 and 2010.

Figure 1. Racial and Ethnic Composition, Wainwright: 2000-2010.

In 2010, the average household size in Wainwright was 3.65, a slight decrease from the 2000 average household size of 3.69. Also in 2010, 20 individuals (3.6% of the population) resided in non-institutionalized group quarters, compared to 0 in 2000. The community had 179 housing units in 2010, the same number recorded in the 2000 Decennial Census. From 2000 to 2010, there was only a slight change in the ratio of occupied and unoccupied housing units: 147 units in 2010 were occupied, compared to 148 in 2000. Of the 147 households in 2010, 99 (67.3%) were owner occupied, and 48 (32.7%) were renter occupied; 115 (78.2%) were family households, and 32 (21.8%) were nonfamily households. In 2010, 99 individuals (17.8% of the population) were counted as living in a household and being either a non-relative of the head of

the household (including unmarried partners) or a non-spouse or non-child relative of the head of the household.

In 2010, the gender makeup of Wainwright’s population was 53.8% male and 46.2% female, less balanced than the state as a whole (52% male and 48% female). Between 2000 and 2010, the median age of Wainwright’s residents was 27.6 (28.8 for males and 26.5 for females), notably lower than the statewide median of 33.8 years. In 2010, 39.4% of the population was younger than 20 years, 51.8% was between the ages of 20 and 59, and 8.7% of the population was 60 or older. The overall population structure of Wainwright in 2000 and 2010 is shown in Figure 2.

Figure 2. Population Age Structure in Wainwright in 2000 and 2010.

According to the 2006-10 American Community Survey,⁶³⁵ in terms of educational attainment, an estimated 61.8% of the 490 Wainwright residents aged 25 and older in 2010 held a high school diploma or higher degree, compared to 90.7% of Alaskan residents overall; and an estimated 2.9% held a bachelor's degree or higher, compared to 27.0% of Alaska residents overall. Also in 2010, 7.1% of the community's 25-and-over population was estimated to have less than a 9th grade education, compared to 3.5% of residents statewide overall; 31% were estimated to have a 9th to 12th grade education but no diploma, compared to 5.8% of Alaskan residents overall; 19.4% were estimated to have some college but no degree, compared to 28.3% of Alaskan residents overall; 1.4% were estimated to have an Associate's degree, compared to 8% of Alaskan residents overall; 0% were estimated to have a Bachelor's degree, compared to 17.4% of Alaskan residents overall; and 2.9% were estimated to have a graduate or professional degree, compared to 9.6% of Alaskan residents overall.

History, Traditional Knowledge, and Culture

Inupiat Eskimos been present on the North Slope of Alaska for hundreds of years; archaeological sites around Wainwright indicate their presence in the vicinity from as early as 1000 CE.⁶³⁶ The area around Kuuk Lagoon was well-populated by the time the community site was formally established at the turn of the twentieth century: an 1853 map documented the village of "Olrona,"⁶³⁷ and in 1881, at least five Inupiat settlements were located within a 25 mile radius.⁶³⁸ Inhabitants of these settlements migrated seasonally between the interior and the coast.

During the 1880s, small-scale coal mines were opened nearby to provide coal for steam whaling ships, which had been active in the Arctic since the mid-century. Natives were located to the area to mine coal. They also engaged in trade with whalers and were employed as wage laborers assisting in whaling operations.⁶³⁹

The community of Wainwright was formally established in 1904, when it became the site of an Alaska Native Service schoolhouse. The site was reportedly chosen by the ship captain delivering construction materials for the school, due to favorable sea-ice conditions. The community took its name from Wainwright (Kuuk) Lagoon, named in 1826 by Captain F.W. Beechey for one of his officers.⁶⁴⁰

A reindeer station was also established in 1904, and Kuugmiut (from the Kuuk River area and the coasts around Wainwright) and Utuggagmiut (from areas to the east and south of Wainwright) were enlisted to manage the herd. The 1918 influenza epidemic brought additional immigrants to Wainwright from nearby smaller communities, as did the expansion of the school in the early 1920s. Booms and busts in whaling, coal mining, reindeer herding, and fur trapping

⁶³⁵ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁶⁴⁰ See Footnote 637.

also contributed to fluctuations in the population from the 1880s to the 1970s. During the late 1940s and 1950s, Wainwright's population fell by a third as residents moved to Barrow to pursue new opportunities there provided by federal military projects. The passage of the Alaska Native Claims Settlement Act (ANCSA) in 1971, the formation of the North Slope Borough and Arctic Slope Regional Corporation, and the development of North Slope oil resources resulted in investments in Wainwright's public infrastructure and helped drive population growth over the next two decades.⁶⁴¹ The city was incorporated as a second-class city in 1962.

The majority of current Wainwright residents are of Kuugmiut or Ituggagmiut Inuit descent. The community is also known by its Inupiaq name, "Ulguniq".

Natural Resources and Environment

Wainwright has an arctic climate. Temperatures range from a low extreme of -56°F to 80°F. Precipitation is light, averaging 5 inches annually, with 12 inches of snow. The Chukchi Sea is ice-free from mid-July through September. The North Slope Borough has about 83 days annually of "midnight sun", when the sun stays above the horizon, and about 65 days annually when the sun stays below the horizon.⁶⁴²

The landscape of the North Slope is treeless from the coast to the foothills of the Brooks Range, located 100 miles inland from Wainwright. Permafrost is continuous across the region due to low temperatures. The tundra supports lichens, mosses, and low bushes. Tundra plants include salmonberry, wild rhubarb, cranberry, and blueberry; sedges and grasses grow around sloughs, marshes, and poorly drained lakes. Kuuk Lagoon, located behind the peninsula on which Wainwright is sited, extends for 50 miles inland before narrowing into the 80-mile long Kuuk River. Major tributaries of the Kuuk fan out over a 110 mile radius. The Kuuk river system allows travel to the interior year round—by snow machine when the river is frozen in winter and by motorboat during the remainder of the year.⁶⁴³ During the winter months, the sea ice cover extends for several miles out to sea. Wainwright is vulnerable to coastal flooding and erosion.⁶⁴⁴

The North Slope provides habitat for many species of terrestrial and marine mammals, freshwater and marine fish, and birds. Terrestrial mammals in the region include caribou, reindeer, moose, muskox, wolverine, wolf, arctic and red foxes, grizzly bear, and small furbearers such as marmot, ermine, and Arctic ground squirrels. Marine mammals include bowhead, gray, and beluga whale; bearded, ringed, and spotted seal; and Pacific walrus. Wainwright residents fish locally for grayling, whitefish, lingcod (or burbot), salmon, cisco, sculpin, rainbow smelt, Arctic grayling, capelin, crab, and shrimp. Birds of importance to community subsistence practices include eider duck, Pacific brant, white-fronted goose, snow goose, oldsquaw and pintail duck, and ptarmigan.⁶⁴⁵

Extensive oil and gas resources exist on the North Slope and on the continental shelves of the Beaufort and Chukchi Seas. North Slope oil production began in 1977, and as of 2008, 15.7 billion barrels of oil had been produced, with 6.1 billion barrels of technically recoverable oil

⁶⁴¹ See Footnote 638.

remaining from then-developed fields.⁶⁴⁶ Though production to date has been limited to the Central Arctic, between the Colville and Canning rivers, and adjacent near-shore areas in the Beaufort Sea,⁶⁴⁷ exploratory well drilling in leased areas of the Chukchi Sea Continental Shelf (OCS) could begin as early as summer of 2012.⁶⁴⁸ The Chukchi Sea OCS is estimated to contain 15.38 billion barrels of technically recoverable oil and 76.77 trillion cubic feet of natural gas.⁶⁴⁹ In a 2011 survey conducted by the AFSC, community leaders cited “opening up of off-shore drilling” as the fisheries-related policy or management action of most concern to Wainwright.

The Northern Alaska Coal Province contains an estimated four trillion tons of bituminous coal deposits, or one ninth of the world’s known coal reserves. These deposits have remained undeveloped due to distance from markets; though the Arctic Slope Regional Corporation (ASRC) is engaged in an aggressive program to determine the economic feasibility of their development.⁶⁵⁰

Climate change effects observed in the region include reductions in sea ice cover and permafrost. The extent of Arctic sea-ice has generally declined over the last half century, and total loss of summer sea ice is projected over the next century.⁶⁵¹ The delayed formation of sea ice may increase Wainwright’s exposure to coastal flooding and erosion. Shifts in population densities and distribution may occur for species associated with ice habitats, including seals, walrus, and polar bears.⁶⁵² Additionally, warmer summers and milder winters may result in thawing of permafrost and ground subsidence.⁶⁵³

Current Economy⁶⁵⁴

Wainwright residents participate in a mixed economy involving both wage labor and subsistence practices. Economic opportunities in the community are influenced by its proximity to Barrow, the economic center of the North Slope Borough. The village and regional corporations, along with the North Slope Borough and the North Slope Borough School District, are the major employers in the community, and sales of arts and crafts supplement income from wage employment. Important subsistence resources include bowhead whale, bearded seal, caribou, and arctic grayling.⁶⁵⁵ The North Slope oil and gas industry is the primary source of

revenue for Borough government services. Top employers in 2010⁶⁵⁶ included: North Slope Borough, Olgoonik Crop., North Slope Borough School, City of Wainwright, Wainwright Cooperative Association, Olgoonik Environmental Services, Olgoonik Oilfield Services LLC, SKW/Eskimos Inc., Arctic Slope Regional Corp., and Arctic Slope Native Association Ltd.⁶⁵⁷

In 2010, the median household income in Wainwright was estimated to be \$65,156, compared to \$66,521 statewide; and per capita household income was estimated at \$19,395, compared to \$30,726 statewide. Wainwright ranked 61st out of 299 Alaska communities with data on median income and 156th out of 305 Alaska communities with data on per capita income. Median and per capita income in Wainwright in 2010 represented decreases from 1999 estimated levels, which were \$71,959 and \$21,972, respectively, in 2010 dollars.⁶⁵⁸ From 2000 to 2010, the percentage of residents below the poverty line decreased slightly from 12.5% to 11.4%. The 2010 poverty rate in Wainwright was higher than the statewide rate of 9.5%. It should be noted that income and poverty statistics are based on wage income and other cash sources; these statistics are not reflective of the value of subsistence to the local economy.

Wainwright's small population size may have prevented the American Community Survey from accurately portraying economic conditions.⁶⁵⁹ A potentially more accurate understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development. According to the ALARI database, residents earned \$7.19 million in total wages in 2010.⁶⁶⁰ When matched with the population in 2010, the per capita income equals \$12,935, which is significantly less than the 2010 ACS estimate and suggests that caution should be used when comparing 2010 ACS and 2000 Decennial Census figures.⁶⁶¹

Based on 2006-2010 American Community Survey estimates, 69.1% of Wainwright residents aged 16 years and older were in the civilian labor force. Of the civilian labor force in 2010, 33% were unemployed. This is notably higher than the statewide rate of 5.9% and represents a notable increase from 2000 unemployment rate of 21.8%. Of the employed civilian labor force in 2010, 41.4% were in the private sector, 55.2% were in the public sector, and the remaining 3.4% were self-employed. The largest industries in terms of employment were educational services, healthcare, and social assistance (22.1% of the employed civilian labor force) and transportation, warehousing, and utilities (15.6% of the employed civilian labor force). The percentage employed in agriculture or natural resource extraction (fishing and hunting, forestry, and mining) was 6.7%. As with income and poverty statistics, it should be noted that employment statistics do not reflect residents' activity in the subsistence economy. Additional statistics on employment by industry and by occupation are shown in Figures 3 and 4.

⁶⁵⁶ Alaska Department of Labor and Workforce Development (n.d.). *Alaska Local and Regional Information Database*. Retrieved April 23, 2012 from <http://live.laborstats.alaska.gov/alari/>.

⁶⁵⁷ See Footnote 651.

⁶⁵⁸ Inflation was calculated using the Anchorage Consumer Price Index for 2010 (retrieved October 18, 2011 from the Alaska Department of Labor, <http://labor.alaska.gov/research/cpi/inflationcalc.htm>).

⁶⁵⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

⁶⁶⁰ ALARI estimates based on wages reported for unemployment insurance purposes. Estimates do not include self-employed or federally employed residents.

⁶⁶¹ See footnote 656.

Figure 4. Local Employment by Occupation in 2000-2010, Wainwright (U.S. Census).

Governance

Wainwright is a Second-class city with a strong-mayor form of government. The mayor holds the seventh seat on the City Council. The Native Village of Wainwright is a Bureau of Indian Affairs (BIA) recognized Native village council and is a member of the Inupiat Community of the Arctic Slope (ICAS), the regional Alaska Native tribal government organized under the Indian Organization Act. Among other activities, ICAS provides vocational rehabilitation services to members and advocates for environmental and natural resource protection in the North Slope. Olgoonik Corporation and the Arctic Slope Regional Corporation

(ASRC) are the village and regional Alaska Native corporations under the Alaska Native Claims Settlement Act (ANSCA). Olgoonik Corporation holds title to over 170,000 acres of land.⁶⁶²

North Slope Borough offices, as well as the closest regional office of the Alaska Department of Fish and Game (ADF&G), are located in Barrow. The closest office of the Alaska Department of Commerce, Community and Economic Development (DCCED) is located in Kotzebue. The closest Alaska Department of National Resources (DNR) office is located in Fairbanks. Anchorage is the site of the closest National Marine Fisheries Service (NMFS) office and the closest Bureau of Citizenship and Immigration Services (BCIS) office.

In 2010, the North Slope Borough administered an 18.5 mills property tax. Municipal finance figures were taken from *Certified Financial Statements*⁶⁶³ (with the exception of 2008, which was taken from financial audits). When adjusted for inflation,⁶⁶⁴ total municipal revenues increased by 133.3% between 2000 and 2010 from \$434,265 to \$1.52 million. Beginning in 2006, state and federal grants began accounting for a significant portion of municipal revenues. This followed 2004, when municipal revenues were at their lowest. In that year, Borough payments in lieu of taxes accounted for half of revenues collected, while rentals, gaming receipts, and state grants accounted for the remainder. In 2010, general fund revenues accounted for 15.7% of total municipal revenues, while various grants made up the remainder. Most grant revenues were awarded by the National Petroleum Reserve of Alaska, and targeted community development, services, and youth programs. Most (34.5%) locally generated revenues were collected from rents and leases, followed by donations (31.7%) and leases for the senior center (14.2%). Outside revenues were collected from state allocated Community Revenue Sharing and North Slope Borough payments in lieu of taxes. Overall, Community Revenue Sharing accounted for 8.1% of total municipal revenues in 2010, compared to 6.2% from State Revenue Sharing in 2000.

From 2000 to 2010, Wainwright received grants totaling \$2,358,212 (\$2,512,394 in 2010-adjusted dollars) for improvements to existing dock structures. Information on community finances from 2000 to 2010 can be found in Table 2.

Infrastructure

Connectivity and Transportation

Air travel provides Wainwright’s only method of year-round access. The North Slope Borough owns and operates a 4,494-ft long gravel airstrip; an additional 3,000 ft long gravel airstrip exists at the Wainwright Air Station. Roundtrip airfare between Wainwright and Anchorage in early June of 2012 was \$982, which included connecting travel through the regional hub of Barrow.⁶⁶⁵ Skiffs, all terrain vehicles, and snowmachines are used for local transportation. Freight arrives by cargo plane and barge.

Communications in Wainwright include local and long distance phone service, radio, Internet, and television. Wainwright is one of 235 Alaskan communities that receive television service from the state-owned Alaska Rural Communication Service.⁶⁶⁶ In a 2011 survey conducted by the AFSC, community leaders reported that improvements to broadband internet infrastructure were made within the last 10 years.

⁶⁶⁵ This price was calculated on November 21, 2011 using kayak.com.

⁶⁶⁶ See Footnote 662.

Facilities

All utilities in Wainwright, including water distribution, sewage collection, landfill, and electricity, are provided by North Slope Borough. Water is obtained from Merekrak Lake, located 3 miles northeast of the community, and then treated and stored in tanks. Water is then hauled or delivered to household tanks by truck; hauling services are provided by the borough. The majority of homes have running water for the kitchen. Diesel fuel is the primary energy source used.⁶⁶⁷ In a 2010 survey conducted by the AFSC, community leaders reported water and sewer pipelines among community infrastructure projects completed within the last 10 years.

Community facilities in Wainwright include a USPS post office, as well a hotel, restaurant, and community store operated by the Olgoonik Corporation. The gymnasium and library at the school are available for public use.⁶⁶⁸

With respect to fisheries-related facilities and services, community leaders reported in a 2011 survey conducted by the AFSC that improvements to dock infrastructure were among the community projects completed within the last 10 years. Vessels up to 24 feet long can use moorage in Wainwright; however, no dock space is currently available for permanent or temporary public moorage. Fishing support services available in Wainwright include fishing gear sales, haulout facilities for small boats, and boat fuel sales.

Medical Services

The North Slope Borough owns and operates the Wainwright Health Clinic. Emergency services have coastal and air access to the community. Auxiliary medical care is provided by the Wainwright Volunteer Fire Department.⁶⁶⁹ The nearest hospital is located in Barrow.

Educational Opportunities

The community has one school, Alak School, which is operated by North Slope Borough Schools. As of 2011, the school has 16 teachers and serves 149 students from preschool through twelfth grade.⁶⁷⁰ IIsagvik College, a public community located in Barrow, is the nearest postsecondary institution and offers associate degrees and certificates in a range of vocational, health services, art, and business fields.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Participation in subsistence fisheries on the Arctic coast dates back almost 2,000 years to the Birnirk and Thule traditions. Commercial whalers began operating in the Arctic during the mid-19th century, and the industry factored heavily in the growth and development of the community of Wainwright. Today, fisheries participation is limited to subsistence and

recreational fisheries. As of February 2012, no commercial fishing in federal waters of the Chukchi and Beaufort Seas is authorized under the Arctic Fishery Management Plan (FMP).⁶⁷¹ Since 1964, a small commercial finfish fishery has taken place in state waters in the Colville River delta to the east of Wainwright.⁶⁷²

Current engagement by Wainwright residents is limited to subsistence and recreational fishing. In a survey conducted by the AFSC in 2011, community leaders reported that residents fish for coho salmon during the month of August. Additionally, whale and other fish were cited in the survey as the most important subsistence marine or aquatic resources to residents.

Wainwright is located adjacent to the Arctic Management Area for federal fisheries management. The community is located in the Northern Area of the Arctic-Yukon-Kuskokwim Region for ADF&G commercial fisheries management; in the North Slope Management Area for ADF&G recreational fisheries management; and in the Northern Area for ADF&G subsistence fisheries management. Wainwright has a representative on North Slope Subsistence Regional Advisory Council of the Federal Subsistence Management Board. The community is one of ten Alaska whaling Alaska communities that participates in the Alaska Eskimo Whaling Commission, which manages bowhead whale hunting. Additionally, Wainwright is a member community of the Eskimo Walrus Commission.

Processing Plants

According to ADF&G's 2010 Intent to Operate list, Wainwright does not have any registered processing plants. The closest seafood processor is located in Nome.

Fisheries-Related Revenue

Between 2000 and 2003, Wainwright received a small amount of revenue from raw fish taxes and the Shared Fisheries Business Tax. No known fisheries-related revenue was received by the community after 2003. Information on fisheries-related revenue trends are shown in Table 3.

Commercial Fishing

Residents of Wainwright do not currently participate in commercial fisheries either as permit holders, holders of IFQ quota share, or fishing vessel owners. Between 2000 and 2010, no Commercial Fisheries Entry Commission (CFEC) permits, Federal Fisheries Permits (FFP), or License Limitation Program (LLP) permits were issued to residents. No residents have held halibut, sablefish, or crab quota share since these IFQ programs began. Between 2000 and 2010, no commercial fishery landings were made by vessels owned by Wainwright residents, irrespective of location of landing. With the exception of one commercial fishing crew license holder in 2000, no residents participated as crew members in Alaska commercial fisheries. Information on commercial fishing trends can be found Table 4 through 10.

Recreational Fishing

The sport fish population on the North Slope is slow growing and supports minimal harvest. As shown in Table 11, no sport fish guide businesses were registered in the community between 2000 and 2010, and no residents held sport fish guide licenses during this period. Additionally, there were no reports of charter operations in the community between 2000 and 2010.

Between 2000 and 2010, the number of sportfishing licenses sold to residents, irrespective of location of sale, fluctuated between a low of 7 in 2007 to a high of 16 in 2008. No sportfishing licenses were sold in the community during this period.

Wainwright is located in the North Slope-Brooks Range (Area Z) of the Alaska Department of Fish & Game Sport Division Statewide Harvest Survey (SWHS). The area includes all Alaskan waters and drainages north of the Brooks Range and flowing into the Beaufort and Chukchi seas to the north and east of Point Hope. Major drainages in the area, which include the Colville, Sagavanirktok, Canning, and Kuparuk rivers, provide habitat for diadromous Beaufort Sea Dolly Varden. The area also includes Teshekpuk Lake, the state’s third largest lake, as well as hundreds of smaller lakes, many of which contain lake trout, Arctic char, Arctic grayling, and burbot. As presented in Table 11, freshwater fishing accounts for the vast majority of recreational fishing in the area (94% of all angler days fished between 2000 and 2010), with Alaska residents doing most of the fishing (76% of angler days fished between 2000 and 2010). According to the SWHS, species caught and harvested by private anglers in the North Slope-Brooks range area include Dolly Varden char; Chinook, pink, and chum salmon; arctic grayling; burbot; lake trout; and northern pike. Community leaders also reported in a 2011 AFSC survey that Wainwright residents target silver salmon as a recreational species. Sportfishing by residents is typically done using locally-owned private vessels.

Subsistence Fishing

Subsistence resources comprise an important part of Wainwright's mixed economy. According to a 2003 survey, almost 92% of Wainwright households depended on subsistence to some extent, with 31% of households dependent on subsistence for at least 50% of their food source.⁶⁷³ Wainwright residents engage in subsistence fishing throughout the year, but most fishing activity takes place during the summer and fall. In midsummer, nets are set up in front of the village for salmon, trout, and whitefish, with fishing moving to streams and rivers along with the migration of fish. Fall fishing typically takes place at camps along the Kuk, Ivisaruk, Avalik, and Utukok Rivers. Smelt fishing is conducted January through March in the Kuk Lagoon.⁶⁷⁴ Other important subsistence fish species include whitefish, Arctic grayling, rainbow smelt, burbot, lingcod, Bering cisco, and pink and chum salmon.⁶⁷⁵

Data between 2000 and 2010 on subsistence harvests in Wainwright is limited, as shown in Tables 12-15. Available survey data collected by ADF&G show estimated harvests of Chinook salmon, sockeye salmon, walrus, and beluga whale in selected years. Marine mammals constitute an important subsistence resource for Wainwright residents. The bowhead whale hunt, typically occurring anytime from mid April to early June, is a central part of Wainwright community life: customs associated with the bowhead whale, including the celebrations that follow a successful hunt, help reinforce social relations and the values of sharing and interdependence. Other marine mammals used as subsistence resources in Wainwright include bearded seals, polar bears, beluga whale, and Pacific walrus.⁶⁷⁶

Of the species listed by ADF&G in Table 12, sockeye salmon were harvested exclusively (based on reported harvests). In any given year between 2000 and 2005, between one and two subsistence salmon permits were held by Wainwright residents. In those years, 132 sockeye salmon were reported harvested. Between 2000 and 2010, an estimated 213 beluga whales were harvested. Harvest reporting was somewhat variable, with few harvests occurring in 2004 through 2006, and in 2010. An estimated 276 walrus were harvested between 2000 and 2010, 70.3% of which were reported harvested between 2000 and 2004. Finally, an estimated 31 polar bears were harvested between 2000 and 2005. Information regarding marine mammal subsistence harvests can be found in Table 15.

People and Place

Location

The communities profiled in this section are located in the Kodiak Island archipelago, a group of islands located in the Western Gulf of Alaska. The largest island is Kodiak Island, the second largest island in the country, encompassing approximately 3,500 square miles and spanning 100 miles in length. Others are Afognak Island, Sitkalidak Island, the Trinity Islands, Raspberry Island, Shuyak Island, and Marmot Island and many additional small islands.¹ The archipelago is approximately 25 miles across the Shelikof Strait from the Katmai Coast of the Alaska Peninsula, and 90 miles southwest of the Kenai Peninsula.² In total, the area of the Kodiak Island Borough includes 6,559.8 square miles of land and 5,463.8 square miles of water. The islands are located at approximately 57.8° N. latitude and -152.4° W longitude. The most populous city, Kodiak, is located on the eastern shore of Kodiak Island, and is about 252 air miles south of Anchorage.

The influence of surrounding ocean waters protects the islands from extreme temperatures. Average monthly temperatures in this area vary from 32° to 62° F. There is frequent cloud cover on Kodiak Island as well as fog, with moderate rain, and rare if any freezing weather. Harsh storms during the months of December through February are common with winds sometimes reaching 90 miles-per-hour. On the windward side of the island the yearly precipitation is 60 inches and 40 inches on the leeward side. These intense winds and rain often result in airport closures or delays.³

Demographic Profile

In 2010, the total population of the Kodiak Island Borough was 13,592. That year, just under half of Borough residents resided in the City of Kodiak (45.1%), with a population of 6,130. The other six communities profiled in this section had populations of between 37 and 218 in 2010.⁴

In 2010, just over half of Kodiak Island Borough residents identified themselves as White (55%), along with 19.6% who identified as Asian, 13.2% as American Indian or Alaska Native, 0.7% as Black or African American, 0.6% as Native Hawaiian or Other Pacific Islander, 0.5, 2.9% as 'Some Other Race', and 7.6% that identified as two or more races. In addition, 7.3% of Kodiak Island Borough residents identified themselves as Hispanic or Latino in 2010. It is important to note that, other than in the City of Kodiak, a majority of the population of all other communities profiled in this section identified themselves as American Indian or Alaska Native, from 51% identifying as Native in Ouzinkie to 100% in Karluk. In comparison, 9.9% of the population of the City of Kodiak identified themselves as Native in 2010, along with 13.8% that

indicated they were American Indian or Alaska Native in combination with some other race. Most individuals identifying with other races or ethnicities reside in the City of Kodiak.⁵

In 2010, the overall regional per capita income of the Kodiak Island Borough was estimated at \$26,413, while the estimated median household income was \$65,605, compared to statewide estimates of \$30,726 and \$77,886, respectively.⁶

History

Kodiak Island is within the traditional territory of the Alutiiq peoples, and the area is estimated to have been inhabited for at least 7,500 years.⁷ At the time of Russian settlement, the Alutiiq peoples were referred to as ‘Aleuts’. The name ‘Alutiiq’ has been used since the 1980s to refer to the linguistic and cultural group of Alaska Natives from the southern coast of the Alaska Peninsula to Prince William Sound, as distinguished from the Aleuts living in the Aleutian Islands. Alutiiq people living on Kodiak Island and the south coast of the Alaska Peninsula are called Koniag (Koniagmiut), and those living on Kodiak Island specifically are called Qikertarmiut (people of Kodiak Island). The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources, and marine mammals, including whales, sea lions, seals, and sea otters. They were skilled mariners, using skin kayaks and larger wooden boats for both war raids and trade.^{8,9}

After the Russian fur trade caused sea otter populations to decline in the Aleutian Islands, fur traders entered the territory of the Koniags. The Russians were initially repelled by the Alutiiqs, but in 1784 Gregorii Shelikof approached Kodiak Island armed with muskets and cannons to take the area by force. Several thousand Natives retreated to Refuge Rock near Sitkalidak Island. Once the Russians discovered a hidden access to the rock, the Alutiiqs knew they were overwhelmed. Rather than be captured, hundreds of Alutiiqs were killed jumping off a cliff to escape from Shelikof’s party. That same year, Shelikof’s men founded a settlement near the present location of Old Harbor. Three Saint’s Bay was the first Russian colony in Alaska, but in 1788 the settlement was destroyed by a tsunami. The community experienced two more earthquakes and relocated to the northeast coast of the island in 1793, to “Saint Paul’s”, which today is the City of Kodiak. Kodiak was the capital of Russian America until 1808, when the capital was moved to Sitka to provide better access to Russia’s holdings in California. Russian Orthodox clergymen arrived around 1794 to missionize the population of the region. There were more than 6,500 Koniags in the Kodiak area at that time, but by the end of Russian control of the

island in 1867 the Native population had decreased to around 2,000 because of “hardship, accidents, and starvation, along with diseases introduced by the Russians.”¹⁰

After the U.S. purchase of Alaska in 1867, American entrepreneurs arrived to continue hunting sea otter and to develop other industries, including salmon fishing.¹¹ The first salmon cannery on the Karluk River was established in 1882. Additional canneries were built in the Karluk area in the late 1800s and early 1900s.^{12,13} Few Alaska Natives initially worked in the local canneries. A majority of cannery employees were brought in from outside the region, primarily from the lower U.S. and China, and later a wave of Scandinavian immigrants arrived to work in local fisheries. However, Alaska Natives became increasingly involved in commercial salmon fishing in the early 1900s, and coordinated their commercial fishing activity with subsistence hunting and fishing activities.¹⁴ Canneries placed at the mouth of rivers funned returning salmon into their processing lines, and by the late 1930s overfishing forced all of the Karluk canneries to close.¹⁵

Through the early decades of the 1900s, the salmon fishery remained the primary focus of local commercial fishing activity, and the most common fishing gear was the beach seine. With the rise of diesel engines in the 1920s, the range of fishing vessels expanded, and commercial exploitation of halibut and groundfish extended into the Gulf of Alaska. The rise of fuel-powered vessels also led to a shift towards the use of purse seines in the salmon fishery. Herring fishermen also began stopping in Kodiak by the 1920s, and a herring reduction plant also operated in Kodiak until the early 1960s.^{16,17,18}

Military involvement during World War II contributed to development on Kodiak Island; the Navy and the Army both built bases as part of the “Aleutian Campaign”. Fort Abercrombie, built in 1939, became the first secret radar site in Alaska.¹⁹

The Good Friday earthquake of 1964 caused widespread destruction of communities on Kodiak Island and throughout the Gulf of Alaska. All three salmon canneries on the Karluk River were destroyed, as was the City of Old Harbor and nearby Native villages. The fishing fleet and downtown area of the City of Kodiak were also destroyed. The canneries at Karluk were never rebuilt, and after the tsunami, processing activity became increasingly concentrated in Kodiak. The king crab fishery emerged as a new focus for the Kodiak fishing fleet in the years following the tsunami. Most Alutiiq fishermen continued to focus on salmon fishing into the late 1900s, but some also diversified into herring, Pacific cod, and crab fisheries. Today, all of these

commercial fisheries continue to be important to Kodiak Island fishermen, along with continued subsistence fishing and hunting.²⁰

Natural Resources and Environment

The Kodiak Island archipelago is a group of islands located approximately 25 miles from the Alaska Peninsula. The largest island in the group, Kodiak Island, comprises 3,588 square miles of diverse landscapes, and is part of a larger archipelago encompassing roughly 5,000 square miles. The Island consists primarily of mountainous terrain, with mountain ridges running northeast-southeast. Most peaks range between 3,000 and 4,000 feet, although several peaks are greater than 4,000 feet. Approximately 40 small cirque glaciers are located along the main divide of the glaciers, feeding into hanging valleys. Many swift-water streams drain upland areas. The Barren Islands to the north of Shuyak Island consist primarily of barren, rocky environments. Tugidak Island is relatively flat and supports expansive areas of moist and wet tundra. Sitka spruce stands dominate much of the landscape from the shore to the treeline on Shuyak Island to northeastern Kodiak Island. Stands extend south to a general northwest-southeast divider running from Kupreanof Peninsula to Cape Chiniak. Southeast Kodiak Island is relatively flat and covered by wet and moist tundra. Exposed bedrock and shallow soils cover the 2,500 miles coastline.²¹

Protected areas in the Kodiak Island Borough include several National Wildlife Refuges, state parks and recreation sites, and a Critical Habitat Area (CHA). The Kodiak National Wildlife Refuge (NWR) encompasses 1.9 million acres of the southwestern two-thirds of Kodiak Island, Uganik Island, Ban Island, and the Red Peaks area on the northwest side of Afognak Island.²² The waters surrounding the northeastern portion of the archipelago are included as a unit of the Alaska Maritime NWR.²³ A number of state parks, state historical parks, and state recreation sites located on the northeast corner of Kodiak Island.²⁴ The Tugidak Island CHA is located on the southwest corner of Kodiak Island. It was established in 1988 to protect habitat and populations of marine mammals, birds, fish and shellfish and other wildlife.²⁵

Kodiak Island is located in a highly active volcanic and tectonic zone along the Pacific “Ring of Fire.” The original settlement at the site of Old Harbor was destroyed by a tsunami in 1788, and Old Harbor was again destroyed by the tsunami resulting from the Good Friday earthquake of 1964.²⁶ The 1912 eruption of the volcano Novarupta, located 100 miles northwest of Kodiak Island on the Alaska Peninsula, covered the island in ash and gasses and disrupted the

local salmon fishery, especially between 1915 to 1919, when many adult fish starved and failed to spawn in ash-choked streams.²⁷

In addition to high risk of earthquake, tsunami, and volcanic activity, natural hazards with the potential to impact communities in the Kodiak Island Borough include landslides (moderate to high risk), fire, severe weather, flood, drought, and coastal erosion (all moderate risk), and avalanche (low risk).²⁸

Kodiak Island was directly impacted by the *Exxon Valdez* Oil Spill in March of 1989, in which 11 million gallons of crude oil spilled into Prince William Sound and spread to surrounding areas.²⁹ Oil was carried by currents throughout the area of the Alutiiq people, and hit the beaches of Kodiak Island in mid-April.³⁰ The *Exxon Valdez* Oil Spill Trustee Council was formed following the spill, and has overseen large-scale habitat restoration, protection, and acquisition. On Kodiak Island, the Trustee Council has protected over 260,000 acres, much of it now included within the Kodiak NWR.³¹

Governance

The Kodiak Island Borough was incorporated in 1963 and includes Kodiak Island and the surrounding islands, as well as a portion of the southern coast of the Alaska Peninsula.³² Services provided by the Borough include solid waste management, fire protection, and road maintenance within road service areas.³³ The Borough also administers the school system. As of 2011, there were 15 schools in the school district, with a total of 2,565 students and 207 teachers.³⁴ Communities located in the Borough include Akhiok, Chiniak, Karluk, Kodiak, Kodiak Station, Larsen Bay, Old Harbor, Ouzinkie, Port Lions, Uganik, and Womens Bay.³⁵ City governments are incorporated for six communities (Akhiok, Kodiak, Larsen Bay, Old Harbor, Ouzinkie, and Port Lions),³⁶ and there are Tribal Councils in six communities (Akhiok, Karluk, Larsen Bay, Old Harbor, Ouzinkie, and Port Lions).³⁷ The Borough administers a 10.75 mills property tax (excluding service areas), a 1.075% severance tax, and a 5% Bed Tax.³⁸ Sales tax is collected by

some City governments within the Borough, including a 6% sales tax in the City of Kodiak, and 3% sales tax in Larsen Bay, Old Harbor, and Ouzinkie.³⁹

The regional Native corporation for the Kodiak area is Koniag, Inc. The corporation holds approximately 56,860 acres of surface lands near Karluk and Larsen Bay, as well as subsurface land rights to these lands and Native village corporation lands elsewhere in the Kodiak archipelago and the coast of the Alaska Peninsula.⁴⁰ The Koniag Education Foundation, which is part of Koniag, Inc., provides scholarships and other educational programs to Koniag shareholders and their descendants for college, graduate school, vocational training, or career development courses.⁴¹ Native villages in the region are also members of the Kodiak Area Native Association (KANA), a tribal non-profit organization headquartered in Kodiak that serves communities in the Kodiak Archipelago. KANA provides health and development services, as well as career development and other community services, with the goal of promoting economic self sufficiency and promote healthy families.⁴²

Offices of the National Marine Fisheries Service (NMFS), Alaska Department of Fish and Game (ADF&G), Alaska Department of Natural Resources, and U.S. Bureau of Citizenship and Immigration Services are all located within the City of Kodiak, on the eastern tip of Kodiak Island. The nearest office of the Alaska Department of Commerce, Community, and Economic Development is in Anchorage.

Involvement in North Pacific Fisheries

Communities in the Kodiak Island Borough are highly dependent on fisheries resources overall. The City of Kodiak is one of the top commercial fishing ports in Alaska, ranking 2nd in 2010 in terms of overall volume and value of landings. While commercial fishing activity is concentrated around the City of Kodiak, a relatively high percentage of the local populations of Larsen Bay, Old Harbor, and Ouzinkie are also engaged in commercial fishing activities as vessel owners, crew license holders, and permit holders.^{43,44} The higher rate of commercial fishing participation in these communities relative to others profiled in this section is likely due to their proximity to processing facilities. According to ADF&G's Intent to Operate list, there were 11 shore-side processing plants in the City of Kodiak in 2010, as well as 1 in Larsen Bay and 1 in Old Harbor.⁴⁵ Although no processing facilities were located in Ouzinkie, Kodiak processing facilities are relatively close by. In contrast, some Kodiak Island communities are minimally engaged in commercial fishing. For example, in a survey conducted by NOAA's

³⁹ Alaska Dept. of Comm. and Rural Affairs. (n.d.). *Community Database Online*. Retrieved October 17, 2011 from http://www.commerce.state.ak.us/dca/commdb/CF_BLOCK.htm.

Alaska Fisheries Science Center (AFSC) in 2011, Akhiok community leaders indicated that the community has no dependence on commercial fishing. In Karluk, no fishing permits were held by residents between 2000 and 2010, and very few community members held crew licenses or owned fishing vessels.

The sport fishing industry is also an important component of the regional economy of Kodiak Island. Sport fisheries target all five species of Pacific salmon, halibut, rockfish, lingcod, Dolly Varden, steelhead, and rainbow trout. As in the case of commercial fishing, infrastructure in the visitor industry is centered in and around the City of Kodiak, and the extensive road network provides easy access to 10 salmon streams and over 20 stocked lakes.⁴⁶ In 2010, 65 sport guide businesses operated out of the City of Kodiak.⁴⁷ The sport hunting and fishing industry is also a primary economic driver in the community of Karluk. According to the Kodiak Area Native Association, as of 2011, there were six lodges in Karluk that provide local employment opportunities,⁴⁸ although ADF&G statistics suggest that the number of guides and guide businesses declined to zero in Karluk over the 2000-2010 period. ADF&G statistics suggest that sportfishing activity was also relatively high in Old Harbor, Larsen Bay, and Ouzinkie. One registered sport fish guide was also located in Akhiok in 2010.⁴⁹

Finally, subsistence fishing is very important to residents of the Kodiak Island area. Of those communities surveyed in a 2003 subsistence harvest study by ADF&G, per capita subsistence harvest varied between a low of 157 lbs in Akhiok to a high of 357 lbs in Old Harbor. In all communities surveyed that year (Akhiok, Larsen Bay, Old Harbor, Ouzinkie, and Port Lions), 100% of households were estimated to participate in halibut subsistence, and between 80% and 88% of households were estimated to participate in salmon subsistence. The highest levels of marine invertebrate subsistence participation were recorded in Akhiok and Ouzinkie, and the highest levels of marine mammal and non-salmon fish participation in Old Harbor and Ouzinkie.⁵⁰

Regional Challenges

The Kodiak Island region faces several challenges with regard to fishery stock status. The Kodiak red king crab fishery, historically the leading fishery in Kodiak from the 1950s to early 1970s, has been closed in recent years due to low abundance.⁵¹ A Kodiak food/bait herring fishery has historically taken place in Shelikof Strait, but has been closed in recent years because the Kamishak Bay spawning biomass (Cook Inlet) has been below threshold since 1998. The

Alaska Board of Fish closes food/bait fisheries if any of the individual spawning populations is below threshold.⁵²

In the 2011 AFSC survey, some community leaders also noted a lack of sufficient infrastructure to effectively engage in commercial fishing activities. In Ouzinkie, community leaders indicated in the survey that Individual Fishing Quota accounts have migrated out of the community over the past decade, creating a challenge for continued participation in that fishery. The community was actively looking for ways to bring quota back into the community, and as of the 2011 survey, the Ouzinkie Community Holding Corporation had purchased its first block of community quota through the Community Quota Entity program.

The challenge of declining fisheries participation is present in many Kodiak-area coastal communities. Data on fisheries participation presented in these community profiles show dramatic changes in fisheries participation in the Kodiak Archipelago in recent years. This topic has been thoroughly studied by Courtney Carothers at the University of Alaska. Please refer to the books and articles referenced here a more detailed discussion of the impact of declining fishing participation on Kodiak-area villages.^{53,54,55,56}

Akhiok (AH-key-ock)

Includes Alitak Bay

People and Place

*Location*⁵⁷

Akhiok is located at the southern end of Kodiak Island in Alitak Bay. It lies 80 mi southwest of the City of Kodiak and 340 mi southwest of Anchorage. The area encompasses 7.9 sq mi of land and 2.5 sq mi of water. Akhiok was incorporated as a Second-class city in 1972 and is under the jurisdiction of the Kodiak Borough.

*Demographic Profile*⁵⁸

In 2010, there were 71 residents, ranking Akhiok 278th of 352 Alaskan communities in terms of population size. Between 1990 and 2010, the population declined by 7.8%. Between 2000 and 2009, the population fell by 10.5% with an average annual growth rate of -1.9%, which was much lower than the statewide average of 0.75% and indicative of a rapid decline in those years. There is a notable difference between the 2009 Alaska Department of Labor and Workforce Development (DOLWD) and 2010 Census figures indicating a possible discrepancy between the two. In a survey conducted by NOAA's Alaska Fisheries Science Center (AFSC) in 2011, community leaders reported 80 permanent and no seasonal or transient residents living in Akhiok in 2010 (83 as of 2012). Because of housing shortages, the community is unable to accommodate temporary residents. Information regarding population trends can be found in Table 1.

Akhiok's population was mostly Alutiiq in 2010. In that year, 50.7% of residents identified themselves as American Indian or Alaska Native, compared to 86.2% in 2000. In addition, 38.0% of residents identified themselves as two or more races that year, compared to 7.5% in 2000; 8.5% identified themselves as White, compared to 2.5% in 2000; 1.4% identified themselves as Black or African American, compared to 0.0% in 2000; and 1.4% identified themselves as Asian, compared to 3.8% in 2000. In addition, 11.3% of residents identified themselves as Hispanic or Latino in 2010, compared to 1.3% in 2000. Information regarding race and ethnicity can be found in Figure 1.

In 2010, the average household size was 3.74, compared to 3.91 in 2000 and 4.0 in 1990. The total number of housing units that year was 27, compared to 77 in 1990 and 34 in 2000. Of the households surveyed in 2010, 41% were owner-occupied, compared to 68% in 2000; 30% were renter-occupied, compared to 6% in 2000; 22% were vacant, compared to 21% in 2000; and 7% were occupied seasonally, compared to 6% in 2000. In a survey conducted by NOAA's

Datasets utilized include the 2000 (SF1 100% and SF3 sample data) and 2010 (Demographic Profile SF) Decennial Census and the 2010 American Community Survey 5-year estimates. Retrieved November 1, 2011 from <http://factfinder2.census.gov/faces/nav/jsf/pages/index.xhtml>.

AFSC in 2011, community leaders reported that there was no annual influx of seasonal workers in Akhiok due to housing shortages.

The gender distribution in 2010 was almost even, at 49.3% male and 50.7% female. This was slightly more even than both the statewide distribution (52.0% male, 48.0% female) and 2000 distribution (55.0% male, 45.0% female). The median age that year was 22.2 years, much younger than the statewide median of 32.7 and slightly younger than the 2000 median of 24.0 years.

Figure 1. Racial and Ethnic Composition, Akhiok: 2000-2010 (U.S. Census).

Figure 2. Population Age Structure in Akhiok Based on the 2000 and 2010 U.S. Decennial Census.

Compared to 2000, the population structure in 2010 was slightly more expansive. In that year, 44.9% of residents under the age of 20, compared to 33.8% in 2000; 8.4% were over the age of 59, compared to 4.4% in 2000; 23.9% were between the ages of 30 and 59, compared to 23.1% in 2000; and 22.5% were between the ages of 20 and 29, compared to 15.4% in 2000.

Gender distribution by age cohort was less even in 2010 than in 2000 with almost equal biases in both females and males among age ranges. In that year, the greatest absolute gender difference occurred in the 0 to 9 age (16.9% female, 7.0% male), followed by the 20 to 29 (14.0% male, 8.5% female) and 60 to 69 (4.2% male, 0% female) ranges. Of those three, the greatest relative gender difference occurred in the 60 to 69 range. Information regarding population structure can be found in Figure 2.

In terms of educational attainment, the U.S. Census' 2006-2010 American Community Survey (ACS)⁵⁹ estimated that in 2010, 75.5% of residents aged 25 and older held a high school

⁵⁹ While American Community Survey (ACS) estimates can provide a good snapshot estimate for larger populations, smaller populations can be misrepresented by ACS estimates if demographic information is not collected from a representative sample of the population. This is especially problematic for Alaskan communities with small populations that have a low probability of being adequately sampled.

diploma or higher degree, compared to an estimated 90.7% of Alaska residents overall. Also in that year, an estimated 10.3% had less than a ninth grade education, compared to an estimated 3.5% of Alaska residents overall; an estimated 13.8% had a ninth to twelfth grade education but no diploma, compared to an estimated 5.8% of Alaska residents overall; an estimated 25.9% had some college but no degree, compared to an estimated 28.3% of Alaska residents overall; an estimated 6.9% had an Associate's degree, compared to an estimated 8% of Alaska residents overall; and an estimated 22.4% had a Bachelor's degree, compared to an estimated 17.4% of Alaska residents overall. No residents were estimated to have a graduate or professional degree in 2010.

*History, Traditional Knowledge, and Culture*⁶⁰

The original village of Akhiok was located near Humpy Cove, and served as a sea otter hunting settlement. The village, called Kashukugniut, was occupied by Russians during the early nineteenth century. The name "Akhiok" was reported in the 1880 census. In 1881, residents from the old village relocated to the present site at the south end of Kodiak Island at Alitak Bay. A post office was established in 1933 and remained open until 1945. The village was renamed Alitak during World War I by the post office to avoid confusion with a village near Bethel named Akiak. The name was later changed back to Akhiok. With the decline of the sea otter industry, the village became oriented toward fishing. Following the 1964 earthquake and tsunami, families from the village of Kaguyak were relocated in Akhiok.

The majority of Akhiok's residents are descendants from the Alutiiq people who originally occupied the Kodiak archipelago. Residents are proud of their heritage and traditions of respect towards their land and marine resources. Subsistence is an important part of the community's culture. Children are taught from an early age how to hunt, fish, dig for clams, pick berries, and gather wild edibles and medicinal plants.

Akhiok's community life revolves around its "Protection of the Theotokos" Orthodox Church. This strong faith has sustained the community through loss and hardship, demonstrated during Great Lent when the entire community gathers to celebrate the Easter season. The community's cemetery contains several historic landmarks. The community values the need to find ways to continue its Native language and culture so that young people grow up with a strong sense of identity. To this end, Akhiok initiated "Alutiiq Week" in 1991. Alutiiq Week is a week of workshops, celebration and community gatherings in the Akhiok School that focus on the continuance of Alutiiq culture. Alutiiq Week is now celebrated every year by other Kodiak Archipelago villages, and has become a cornerstone of teaching skills such as carving to young people.

The community hosts one property currently on the National Register of Historic Places (NRHP). Protection of the Theotokos Chapel, a Russian Orthodox church, was founded in 1926.⁶¹ Alutiiq petroglyphs are also found in the area.

Natural Resources and Environment

The climate of the Kodiak Islands is dominated by a strong marine influence. There is little or no freezing weather, moderate precipitation, and frequent cloud cover and fog. Severe storms are common from December through February. Annual precipitation is 35 inches. Temperatures remain within a narrow range, from 25 to 54 °F (-3 to 12 °C).⁶²

Akhiok's landscape is characterized by narrow rocky beaches, moist tundra lowlands, and steep relief uplands. Dominant vegetation types include tall grasses, fireweed, horse-tail, yarrow, sedges, mosses, fern, lichens, dwarf birch, and alder stands.⁶³

The Kodiak archipelago and waters that surround it are home to many species of terrestrial and aquatic life. The Kodiak National Wildlife Refuge occupies two-thirds of Kodiak Island and is home to terrestrial species such as brown bears, bats, tundra vole, short-tailed weasel, red fox, river otter, Sitka black-tail deer, beavers, red squirrels, snowshoe hare, arctic ground squirrel, Roosevelt elk, muskrat, and mountain goat. Marine mammals documented in the area include whales, harbor seals, fur seals, sea otters, and Steller sea lions.⁶⁴ The adjacent waters provide some of the richest commercial fishing grounds in the world, home to stocks of Pacific salmon, halibut, flounder, cod, trout, grayling, crab, and shrimp.⁶⁵

There are several mineral projects in the area as of 2011 including a tin claim around Halibut Bay to the north and a gold/silver claim around the city of Kodiak.⁶⁶ In addition, there is a placer gold deposit located in the vicinity of Alitak and Tanner Head Island to the south.⁶⁷

Natural hazards in the area include coastal flooding, coastal erosion, earthquakes, tsunamis, volcanism, landslides, and sea-level rise. Coastal flooding and erosion is mainly attributed to storm surges. There are several faults that run through Kodiak Island, and earthquakes that are magnitude six or above are relatively frequent. Threats from Aleutian volcanoes include the possibility of acidic rain, ash clouds, landslides, tsunamis, and earthquakes.⁶⁸ According to the Alaska Department of Environmental Conservation, there were no local significant environmental remediation projects active in 2010.⁶⁹

Current Economy⁷⁰

Akhiok's economy is largely based around subsistence. Public sector employment and seasonal work provide cash flow in the community. Almost all of Akhiok's residents depend heavily on subsistence fishing and hunting. Salmon, crab, shrimp, clams, ducks, seal, deer, rabbit, and bear are utilized. In January 2003, each Akhiok shareholder received \$200,000 from

⁷⁰ Unless otherwise noted, all monetary data are reported in nominal values.

the sale of a \$36 million trust fund provided in the *Exxon Valdez* oil spill settlement.⁷¹ Top employers in 2010⁷² included the Kodiak Area Native Association, Kodiak Island Housing Authority, the City of Akhiok, Kodiak Island Borough School District, Ocean Beauty Seafoods, and Kishan Group.

According to the 2006-2010 ACS,⁷³ the per capita income in Akhiok was estimated at \$12,614 and the median household income was estimated at \$23,182, compared to \$8,473 and \$33,438 in 2000, respectively.⁷⁴ After accounting for inflation by converting 2000 values into 2010 dollars,⁷⁵ the real per capita income (\$11,142) and real median household income (\$43,971) indicate that while individual earnings increased slightly, household earnings decreased somewhat dramatically. In 2010, Akhiok ranked 229th of 305 Alaskan communities from which per capita income was estimated, and 267th of 299 Alaskan communities from which median household income was estimated, indicating that it is one of the poorer communities in Alaska.

Akhiok's small population size may have prevented the ACS from accurately portraying economic conditions.⁷⁶ Another understanding of per capita income is obtained through economic data compiled by the Alaska Local and Regional Information (ALARI) database maintained by the Alaska Department of Labor and Workforce Development (DOLWD). According to the ALARI database, residents earned a total of \$335,453 in wages in 2010.⁷⁷ When divided by the 2010 population, the per capita income of \$4,725 indicates a significant decline in individual earnings compared to the real per capita income values reported by the U.S. Census in 2000.⁷⁸ In addition, the community was recognized as "distressed" by the Denali Commission indicating that over 70% of residents aged 16 and older earned less than \$16,120 in 2010.⁷⁹ However, it should be noted that American Community Survey and DOLWD data are based on wage earnings and does not take into account the value of subsistence within the local economy.

According to 2006-2010 ACS estimates,⁸⁰ 62.9% of residents aged 16 and over were considered part of the civilian labor force. Between 2006 and 2010, the estimated unemployment rate was 4.8%, compared to an estimated 5.9% statewide; and an estimated 7.1% of the population was living below the poverty level, compared to an estimated 9.5% of residents

⁷¹ See footnote 62.

statewide. Of those employed, an estimated 91.7% worked in the public sector while an estimated 8.3% worked in the private sector.

By industry, most (77.8%) employed residents were estimated to work in education services, health care, or social assistance sectors; followed by public administration sectors (8.3%); finance, insurance, and real estate sectors (8.3%); and transportation, warehousing, and utilities sectors (5.6%) (Figure 3). By occupation type, most (75.0%) employed residents were estimated to hold management or professional positions; followed by services positions (11.1%); natural resources, construction, or maintenance positions (8.3%); and sales or office positions (5.6%) (Figure 4).

Figure 3. Local Employment by Industry in 2000-2010, Akhiok (U.S. Census).

Figure 4. Local Employment by Occupation in 2000-2010, Akhiok (U.S. Census).

It should be noted that sampling techniques may not have captured the true scope of industry and occupational representation. This may account for the dramatic variation in industry sector employment and occupation type between 2000 and 2010. It should also be noted that income and poverty statistics are based on wage income and other money sources and are not reflective of the value of subsistence to the local economy. According to 2010 ALARI estimates, most (30.0%) employed residents were estimated to work in local government sectors; followed by education and health service sectors (26.7%) and financial service sectors (20.0%). No individuals characterized themselves as working in natural resource based industries that include fishing. However, given the data reported in the *Commercial Fishing* section below, the number of individuals employed in the farming, fishing, and forestry industries may be underestimated by census statistics as fishermen may hold another job and characterize their employment accordingly.

Governance

Akhiok is a Second-class city located within the Kodiak Island Borough. In addition, there is a U.S. Bureau of Indian Affairs (BIA) recognized Tribal government located in Akhiok. The Alaska Native Claims Settlement Act (ANCSA) chartered regional corporation representing Akhiok is Koniag Inc., and the local ANCSA chartered non-profit is the Kodiak Area Native Association. The ANCSA chartered village corporation is Akhiok-Kaguyak, Inc. The closest National Marine Fisheries Service (NMFS), Alaska Department of Fish and Game (ADF&G), and Bureau of Citizenship and Immigration Services are all located within the city of Kodiak, 80 mi northeast.

The City does not administer any taxes; however, the borough administers an annually adjusted property tax, resource severance tax, and 5% accommodations tax. The total municipal revenue for 2010 was \$215,913, compared to \$101,285 in 2000, representing a 64.8% increase in revenues after adjusting for inflation.⁸¹ Akhiok collected revenue from both the Community Revenue Sharing and State Revenue Sharing programs between 2000 and 2010. Akhiok collected an average of \$21,316 annually between 2000 and 2004 from State Revenue Sharing and \$99,230 annually between 2009 and 2010 from Community Revenue Sharing. Additional revenue included \$19,000 collected in 2007 from fuel deliveries, and a \$14 million grant in 2008 for the construction of a sewer system and landfill (Table 2).

⁸¹ Inflation calculated using Anchorage CPI from Alaska DOL: <http://labor.alaska.gov/research/cpi/cpi.htm>.

Infrastructure

Connectivity and Transportation

Akhiok is accessible by water or air only. The State of Alaska maintains a 3,120-ft runway south of town. No crosswind runway or tower services exist and flights are often limited due to severe weather. There is also a floatplane harbor available.⁸²

Akhiok does not have a deep water dock or boat harbor and no regular barge service is available. One company transports cargo via landing craft as needed. Alitak cannery possesses full docking facilities and residents are able to obtain supplies at the cannery store when the facility is operating. Otherwise, freight is most often moved by small personal craft from off-shore freight vessels or by air.⁸³

According to survey conducted by the AFSC in 2011, community leaders reported that most travel throughout the area is done by private skiff. As of November 2011, the price for

airfare in June 2012 was \$360 for roundtrip from Anchorage to the city of Kodiak.⁸⁴ Island Air provides charter flights from Kodiak to Akhiok. As of 2011, the rate was \$140 each way.⁸⁵

*Facilities*⁸⁶

Akhiok's water is derived from a small dam and reservoir. Water is treated, stored, and distributed through a city-owned piped gravity water and sewer system that serves each home in the community. Additional water capacity is needed, as current systems often do not provide adequate water during July and August, which forces residents to haul water from other sources. Improvements to filtration systems are needed as well. Wastewater is piped from buildings to several city-owned septic tanks. The city and Tribal council provide electricity service from a central diesel power plant, and fuel is stored in a new bulk storage facility located outside the community.

*Medical Services*⁸⁷

Basic healthcare is provided by the Akhiok Health Clinic or Akhiok Village Response Team. The clinic is a Primary Health Care Facility. Acute, long-term, and specialized care can be found in the city of Kodiak.

*Educational Opportunities*⁸⁸

Akhiok has one school providing Kindergarten through 12th grade instruction. As of 2011, Akhiok School had 12 students enrolled and 2 teachers employed.

Involvement in North Pacific Fisheries

History and Evolution of Fisheries

Prior to the arrival of Europeans, subsistence hunting and fishing was the basis of the economy for people living on Kodiak Island and surrounding areas. The Koniags historically migrated between permanent winter villages and temporary summer fish camps. Salmon was an important staple, and they also harvested other fish, intertidal resources and marine mammals, including whales, sea lions, seals, and sea otters. With the arrival of Russian colonists to Kodiak Island in the late 1700s, the Alutiiq people were forced to hunt for sea otters to fuel the trade of their valuable pelts.⁸⁹

The ADF&G manages the Kodiak salmon and herring fisheries in waters surrounding the Kodiak archipelago.⁹⁰ The salmon fishery is divided into seven fishing districts (Afognak District, Northeast Kodiak District, Eastside Kodiak District, Alitak Bay District, Southwest Kodiak District, Northwest Kodiak District, and Mainland Districts). Gear types in use currently include purse seine, set gillnets and beach seine.⁹¹ Kodiak herring fisheries include a roe fishery (using both purse seine and gillnet gear) and a food/bait fishery. Herring sac roe fisheries take place in the spring when individual spawning biomasses are aggregated. In contrast, food/bait fisheries take place in the summer, fall, and winter when herring from several stocks may be mixed together. A Kodiak food/bait herring fishery has historically taken place in Shelikof Strait, but has been closed in recent years because the Kamishak Bay spawning biomass (Cook Inlet) has been below threshold since 1998. The Alaska Board of Fish (BOF) closes food/bait fisheries if any of the individual spawning populations is below threshold.⁹²

Groundfish and crab fisheries that occur within 3 nmi off the coast or in inland waters are under the jurisdiction of the State of Alaska, and fisheries that take place beyond 3 nmi in the U.S. Exclusive Economic Zone (EEZ) are under federal jurisdiction. In the Gulf of Alaska (GOA), federally-managed groundfish fisheries target Pacific cod, walleye pollock, pelagic shelf rockfish, sablefish, and flatfish. Parallel fisheries for Pacific cod and walleye pollock also take place in state waters surrounding Kodiak Island. Parallel fisheries occur at the same time as the federal fisheries. The Total Allowable Catch (TAC) set by NMFS in each fishery applies to both federal and parallel harvest. In addition to federally-managed groundfish fisheries, beginning in 1997, a ‘state-waters fishery’ for Pacific cod was initiated in the Kodiak area. Management plans for state-waters fisheries are approved by the BOF, and guideline harvest limits (GHL) are set by the ADF&G. Typically, state-waters fisheries are opened once federal and parallel fisheries close. In addition, the ADF&G manages lingcod fisheries in both state and EEZ waters off Alaska, and beginning in 1998, management of black rockfish and blue rockfish in the GOA was transferred from NMFS to ADF&G.⁹³

Kodiak Island is one historical center of the red king crab fishery, and Tanner crab are also distributed through the GOA. ADF&G manages red king and Tanner crab stocks in the GOA. Snow crab are distributed throughout the eastern and northern Bering Sea, and are not found in the immediate Kodiak area.^{94,95} The Kodiak red king crab fishery has been closed in recent years due to low abundance. Parts of the Kodiak district have been open for Tanner crab harvest in recent years. Kodiak area Tanner crab harvest is managed using eight separate

management areas, each with its own GHL.⁹⁶ Pacific halibut fisheries are managed under the International Pacific Halibut Commission.

Although Akhiok was originally founded as a sea-otter hunting community, the decline of the industry prompted its economy to migrate towards subsistence and commercial fishing. Today, salmon is the mainstay of commercial fishing in the community while subsistence activities involve range of marine mammals, fish, and aquatic invertebrates.

In a survey conducted by the AFSC in 2011, community leaders reported that the community is not tied to commercial fisheries economically, nor does it advocate for itself in the management process. However, Akhiok is eligible for participation in the Community Quota Entity (CQE) program and is represented by the Akhiok Halibut & Sablefish Commission. The impetus for the CQE program followed the implementation of the halibut and sablefish Individual Fishing Quota (IFQ) program in 1995. The IFQ program restructured fixed gear halibut and sablefish fisheries into a catch share program which issued transferable quota shares that allocated and apportionment of the annual Total Allowable Catch to eligible vessels and processors. Although the IFQ program resulted in many benefits to fishermen, processors, and support businesses, and unintended consequence was that many quota holders in smaller Alaskan communities either transferred quota outside the community or moved out themselves. In addition, as quota became increasingly valuable, entry into halibut or sablefish fisheries became difficult. In many cases, it was more profitable for small-scale operators to sell or lease their quota rather than fish it due to low profit margins and high quota value. These factors lead decreased participation in communities traditionally dependent on the halibut or sablefish fisheries. To address this issue, the North Pacific Fishery Management Council implemented the CQE program in 2005. Under the program, eligible communities could form a non-profit corporation to purchase and manage quota share on their behalf.

The community is located in Federal Reporting Area 620, International Pacific Halibut Commission Regulatory Area 3B, and the Central Gulf of Alaska (GOA) Sablefish Regulatory District.

Processing Plants

In a survey conducted by the AFSC in 2011, community leaders reported that Akhiok's economy is not dependant on the commercial fishing industry nor are there any fisheries support businesses in town. According to the 2010 Alaska Department of Fish and Game's Intent to Operate list, Akhiok does not have a registered processing plant. However, there is a seafood processor located in nearby Alitak.

The Alitak processing facility, owned and operated by Ocean Beauty Seafoods, was built in 1917. Due to its remote location on the south end of Kodiak Island the facility is only accessible by boat or float plane. The facility opens in early April to process herring roe. During this time the plant also processes deliveries of black cod, halibut, Pacific cod and idiot fish (rockfish) from long line boats. Starting in early June the plant begins the salmon season. Between June and mid-September the Alitak facility processes sockeye, chum, pink and coho salmon. The Alitak facility is completely self-sufficient, providing its own electricity and water system. It supplies work-related clothing such as gloves, aprons, rubber boots and rain gear to its fish processing employees.⁹⁷

⁹⁶ See footnote 93.

⁹⁷ Ocean Beauty Seafoods. (n.d.). Retrieved from: <http://www.oceanbeauty.com/about/alitak.htm>

Fisheries-Related Revenue

Overall, in 2010, the city of Akhiok received a reported \$332,699 in fisheries-related taxes and fees, most of which came from Fisheries Resource Landings taxes. Since 2000, reported fisheries-related revenues steadily increased by an inflation adjusted⁹⁸ \$314,807, although these figures are likely tied to Alitak Bay which is not recognized as a Census Designated Place (CDP). In addition, in several cases reported fisheries-related revenue exceeded reported municipal revenue which further complicates Alitak Bay's distinction as a separate community. Information regarding fisheries-related revenue trends can be found in Table 3.

It should be noted that a direct comparison between fisheries-related revenue and total municipal revenue cannot reliably be made as not all fisheries-related revenue sources are included in the municipal budget.

Commercial Fishing

In a survey conducted by the AFSC in 2011, community leaders reported that Akhiok does not possess harbor infrastructure or commercial fishery support services. In addition, they reported that the community itself is not dependent on fisheries. However, commercial vessels between 35 and 60 feet do use the community as a base of operation during the fishing season. It is likely that when reporting, community leaders made a distinction between Akhiok and neighboring Alitak Bay, where a processor is located and landings are made. However, for the purpose of this profile Alitak Bay is considered part of Akhiok.
