

Agriculture: Backbone of Louisiana's Economy

This publication tabulates the value of Louisiana agriculture in 2016. Agents and specialists of the Louisiana Cooperative Extension Service, as well as other agencies – both private and public – compiled the data. Their analysis focuses on the animal, forestry, fisheries, plant and wildlife commodities that comprise our vital agricultural industry. Agricultural and natural resource industries contribute significantly to our state's economy with the potential for increased economic benefits and job creation through value-added processing in urban and rural communities throughout Louisiana.

The production and marketing environments experienced in 2016 will likely make this one of the most challenging ever faced by producers. For many, the 2016 production year was just a continuation of the difficulties experienced in 2015 which saw excessive rains early in the year followed by drought conditions. Difficult production conditions began almost immediately in 2016 with the northern part of the state experiencing historic rainfall and flooding in March. Rainfall in excess of 30 inches fell in many areas of the state causing a multitude of issues for livestock and crop producers. Rains, while fewer and of lower magnitude, continued to persist from much of April and into May. This led to additional backwater flooding throughout much of North Louisiana. At the same time, excessive rains and flooding also impacted the Southeastern part of the state. While the severity and extent of the impact was significantly lower than experienced in the northern part of the state, it still created significant difficulties for many producers.

While June and July brought a return to more normal production conditions, it was short-lived as another round of historic rainfall and flooding hit the state in August. The southern part of the state felt the brunt of this weather event with many areas once again receiving in excess of 30 inches of rain. And while not as severely impacted, the persistent rains that followed for much of September and into October created additional hardships for producers in the central and northern parts of the state as harvest delays impacted both the quantity and quality of agricultural commodities. The LSU AgCenter estimated that the total economic impact of the difficulties caused by the March and August floods and the persistent rains that followed was over \$365 million to the Louisiana agricultural industry. Thankfully, weather conditions improved into October and helped create very favorable harvest conditions for many of the late harvested commodities. While the dryer harvest conditions for much of the remainder of 2016 helped harvest efficiency for some commodities, the negative impact of the excessive rains and flooding in August and September far exceeded any positives generated by the dry fall for most commodities.

By all accounts, the 2016 production year was extremely challenging for most agricultural industries. However, the exact nature and extent of the damage was highly influenced by the commodity's stage of production at the time of the adverse weather conditions. In some cases, the impact was not necessarily related to production losses but more related to quality losses and increased production costs. As such, there was a high degree of variability in average production levels experienced by different commodities in 2016. For some commodities like cotton, soybeans, wheat, grain sorghum, and sugarcane, yields were anywhere from 5 to 31 percent higher in 2016 as compared to the previous year. For some, like sugarcane, very favorable harvest conditions helped to generate near record sugar recovery and push total sugar produced per acre to high levels despite sugarcane tonnage being down. For others, the increase in yields in 2016 versus 2015 likely had more to do with the extremely low yields experienced in 2015 due to drought conditions than it did with strong productivity in 2016. In fact, for these commodities, while yields moved closer to average or typical yields, they were still at discounted levels to those experienced in 2014.

For other commodities, the impact of the adverse weather conditions definitely was reflected in estimated yields for 2016. Yields for corn, rice, sweet potatoes, and many fruits and vegetables were down considerably from 2015. Corn yields were down by nearly 5 percent as heavy rains delayed harvest and had both yield and quality impacts. Similarly, heavy rains and flooding delayed harvest, reduced harvest efficiency, and limited second crop opportunities for rice production. Total rice yields were down roughly 4 percent in 2016. Sweet potatoes were probably the most significantly impacted commodity as persistent rains delayed harvest and helped to reduce total yields by nearly 20 percent versus 2015. Excessive rains and flooding also created significant yield reductions for several fruit and vegetable crops with reductions for some commodities reaching as high as 30 percent.

Adding to the production difficulties were the stagnant or lower commodity prices experienced in 2016. Starting in the last half of 2014, commodity prices for many of the state's large agronomic commodities began to experience significant downward momentum. This downward trend in prices continued in 2016 for many commodities. For others, while prices remain relatively unchanged from 2015, they continue to remain at severely discounted levels from those experienced just 3 or 4 years ago. For the plant commodities, rice, corn, grain sorghum, and wheat all saw significant reductions in prices in 2016. While cotton and soybean prices in 2016 were slightly higher than the previous year, they still remain at significant reductions from the period of strong prices in the late 2000's and early 2010's. Sugar prices is one of the few commodities in which prices have been able to and continue to sustain at historically strong levels.

For animal enterprises, the largest reduction in prices were experienced by the beef cattle industry. After several years of record levels, prices for all classes of cattle experienced in 2016 were roughly half of the levels seen in 2015. While this sharp downturn in prices creates more challenges for the industry, cattle prices still remain at historically favorable levels. Milk prices continued to come under pressure and currently hover at or below breakeven levels. The inability of milk prices to make a sustained move to more profitable levels continues to be a major factor to the trend of lower numbers of dairy operations in the state. Broiler production was one of the animal enterprises that did see marginally higher prices in 2016. However, prices for other sectors of the poultry industry, like egg production, saw slightly lower prices in 2016.

Finally, for the fisheries and wildlife enterprises, prices were generally mixed. Crawfish prices were up roughly 2 percent in 2016 as the industry continues to experience expansion in both production and demand. Minor increases in prices were also experienced in the freshwater fisheries as well as for the oyster and farm raised catfish industries. However, prices for all of the marine fisheries industries were down in 2016 with shrimp experiencing the largest reduction at nearly 40 percent from 2015.

While the difficulties faced by individual commodities and producers can and did vary considerably in 2016, the general impact of adverse weather conditions and lower commodity prices was to reduce the total economic activity associated with the Louisiana agriculture, forestry, and fishery industries. The total gross farm value (the amount of revenue estimated to be generated by producers from the sale of their commodities) for the Louisiana agriculture, forestry and fishery industries was down nearly 9 percent from the previous year. Leading the way for the reduction were the animal enterprises which saw their collective gross farm value fall by over 23 percent from the previous year. The main culprit in this reduction was the sharply lower cattle prices experienced in 2016. Both the fisheries and wildlife enterprises and the plant enterprises saw their collective gross farm values fall by roughly 1 percent. For fisheries and wildlife enterprises, the reduction in the gross farm value of marine fisheries more than offset gains experienced in aquaculture production and hunting leases. Large reductions in gross farm value of rice, sweet potatoes and wheat led the way for the reductions experienced in the collective gross farm value for plant enterprises.

When the commodities produced by agricultural producers are cleaned, processed, and packaged at the next stages of the marketing channel, these value-added activities create additional economic activity over and above that defined by the gross farm value. In 2016, these value-added activities were estimated to have an additional economic impact of over \$5 billion. Taken together, the gross farm value and value-added activities were estimated to have a total economic impact of nearly \$11 billion. Though the struggles of 2016 resulted in this number being a 8 percent reduction from 2015 and a 11 percent reduction from 2014, it is still undeniable that the state's agriculture, forestry, and fishery industries are major contributors to the overall state's economy. Cutting-edge research programs and extension education and outreach efforts of the LSU AgCenter remain critical to sustaining these economic benefits.

Many Louisiana communities depend on agriculture, forestry, fisheries and wildlife for local jobs and their economic well-being. However, for those who work in it day in and day out, agriculture, forestry and fisheries are far more than a business, a major job contributor and an economic engine. It truly is a way of life. Families have lived on many of these farms, forest lands or fishing villages for generations following a preferred way of life even though it means hard work, many hours, high risks and sometimes low incomes.

Each new production season has risks associated with commodity prices, trade agreements and higher input costs as well as uncertainty related to the weather. These conditions make the discovery and adoption of new agricultural technology developed by the LSU AgCenter more important than ever to our state's producers. Agriculture is a highly sophisticated segment of the national and world economy, becoming increasingly so every year. That is the reason we at the LSU AgCenter continue to support agriculture and consumers with factual information provided by a well-trained faculty of extension agents, specialists and research scientists.

Those of us in the LSU AgCenter, with its major branches of the Louisiana Cooperative Extension Service and the Louisiana Agricultural Experiment Station, are proud to be part of Louisiana's agricultural industry, and we are committed to serving that industry and the citizens across the state of Louisiana in the years ahead.

William B. Richardson, LSU Vice President for Agriculture

Louisiana Summary

Agriculture and Natural Resources

2016

The statistical information in this summary was compiled from estimates made by extension agents of the LSU AgCenter after consulting with agricultural agency representatives, agricultural and agribusiness leaders and others, and after study of various reports and resource materials. State specialists with the LSU AgCenter checked parish-level data for specific commodities to ensure accuracy and consistency of all production information. Final review of data was conducted by LSU AgCenter agricultural economist and project director Dr. Kurt Guidry, in consultation with external sources, including state and federal statistical agencies. Any inquiries about the data in this publication should be directed to Dr. Kurt Guidry in the LSU AgCenter's Department of Agricultural Economics, who oversees the process of gathering all information for the Louisiana Summary.

Although this material is reasonably accurate and can be used for planning and other general informational purposes, this is not the official document of agricultural data for the state. Official statistical data are gathered, summarized and published by the U.S. Department of Agriculture's National Agricultural Statistics Service, Delta Regional Field Office, 10800 Financial Centre Parkway, Suite 110, Little Rock, Arkansas, 72211. Reproduction or publication of information in this summary should acknowledge the Louisiana Summary as the source, but indicate the unofficial nature of the statistics.

Gross value was calculated for each commodity, which in some cases included a value from natural resources and consequently may not represent income to farmers. Gross farm values were calculated using calendar-year, market-weighted, state-level average prices, when available. When state-level price information was unavailable, price information was used from adjacent states (Texas, Arkansas or Mississippi), or the nation. Primary sources for prices were: USDA National Agricultural Statistics Service, USDA Agricultural Marketing Service, and USDA Economic Research Service. The gross value was an indicator of the commodity's contribution to economic activity in the state, but was not an indicator of farm profits. Production costs greatly affected profit (or loss) for all commodities. Even when gross income increased over previous years, corresponding increases in production costs may have decreased farm profits.

In the state summaries, the value added in cleaning, processing, packaging, marketing and transporting commodities was an estimate of the total contribution of agriculture and natural resources to the state's economy.

The state summary was not an exact summation of all parish reports because adjustments may occur due to changes in average prices received, or to accommodate information from other sources.

In each parish table, only commodities that were of commercial economic value in that parish this year were listed. In some instances, the number of producers or the number of acres in a parish were not available. An asterisk was used to avoid releasing confidential information when too few producers were present for that commodity. Within some commodity groups, such as grains, fruits and commercial vegetables, the total number of producers has been omitted because some producers grow several different crops within the group. Adding together the producers of individual crops would not give a true total for the group.

Animal Enterprises

Gross farm income for all animal enterprises was nearly \$1.67 billion for 2016, down 23 percent from \$2.19 billion in 2015. Value added was nearly \$955 million for 2016, down from \$1.03 billion in 2015. Total value of all animal enterprises in the Louisiana economy was \$2.62 billion, down 18 percent from \$3.21 billion in 2015.

Beef Cattle

As has been the trend across the United States, cattle producers in Louisiana increased cow numbers in 2016, continuing the expansion phase of the cattle cycle. Historically strong prices in 2014, and much of 2015 along with strong beef demand enticed cattle producers to make efforts to increase production through increasing cow inventory levels. With the cattle market retracting from the highs seen in 2014 and early 2015, profit margins for cattle producers have definitely been challenged. Adding to the lower markets was the difficult production environment experienced in 2016. Historic flooding in North Louisiana during March and April and in South Louisiana during August and September resulted in animal deaths, increased production costs, losses of stored hay and infrastructure damage for those impacted operations. The only saving grace for the 2016 production year was that ample rainfall for much of the year prevented any wide spread drought conditions that were common in previous years. Ample rainfall resulted in ample forage availability and production, and likely was a factor in increased cattle numbers seen in 2016.

A total of 553,945 cows were reported in 2016 on 11,603 operations throughout the state. Total cow numbers were up significantly from the 455,549 reported in 2015, while the total number of producers were down marginally from the 11,920 reported in 2015. The gross farm value of 230,325 steers sold in 2016 was \$164 million, a decrease of \$121 million from the \$285 million reported in 2015. The gross farm value of 198,403 heifers sold in 2016 was \$127 million, a decrease of \$109 million from the \$236 million reported in 2015.

In 2016, 62,118 yearling cattle (600-800 pounds each) sold for \$52 million, a decrease of roughly 9,800 head and \$44 million from 2015 levels. The number of cow-calf pairs sold in 2016 was reported at 34,766, roughly half of those sold in 2015. Lower cow-calf pair sales along with much lower prices pushed gross farm income down in 2016 to \$49 million, an \$85 million reduction from 2015. Finally, gross farm income of both cull cows and cull bulls were down in 2016 on lower sales and much lower prices. Gross farm income for cull cows was reported at \$26 million while gross farm income for cull bulls was \$7 million.

When added across all classes of beef cattle, the total gross farm income generated by the beef cattle industry in 2016 was estimated at \$427 million, nearly a 50 percent reduction from 2015. Significantly lower prices in 2016 along with higher retention rates as producers continue to build herd numbers are believed to be the main factors in the dramatic reduction in gross farm income. When value-added activities of \$53 million are added to gross farm income, the total economic impact of the beef industry in Louisiana during 2016 was estimated at \$480 million.

Dairy

Milk production was reported by 12 parishes in 2016. Three parishes in the southeastern part of the state and two parishes in the northwestern part accounted for about 92 percent of the herds and about 93 percent of the cows and milk produced. The number of dairy farms declined from 113 in 2015 to 107 in 2016.

The number of milking cows decreased from 13,335 head in 2015 to 12,171 head in 2016. Total milk production decreased from 187.4 million pounds in 2015 to 172.0 million pounds in 2016. The on-farm value of milk decreased by \$6.3 million from \$36.6 million in 2015 compared to \$30.4 million in 2016. The decrease in the on-farm value of milk in 2016 was due to a price per hundredweight of milk that was \$1.90 per cwt lower in 2016 than in 2015 and a reduction in milk production of 15.3 million pounds in 2016.

Despite combined sales of cull cows, bred heifers, mature cows, breeding age bulls and calves of 10,381 representing a slight increase in numbers over 2015. Lower prices in 2016 across all classes resulted in a gross farm value of \$5.7 million, a 3 percent reduction from 2015. When combining the value of milk and animal sales, the total gross farm income generated by the dairy cattle industry in 2016 was \$36 million, down 15 percent from 2015.

Another component to the state's dairy industry has been the production of goat's milk. While small compared to the dairy cattle industry, dairy goat production has continued to be a viable industry in the state. In 2016, dairy goats were raised by 41 producers. A total of 514 does were reported to have been milked during 2016 producing slightly over 1 million pounds of goat milk. The gross farm income of the dairy goat industry was estimated at \$0.5 million in 2016, down from the \$0.8 generated in 2015.

When combined, milk production from cattle, milk production from goats, and the sale of dairy cattle animals generated a gross farm value of \$36.5 million in 2016, down from the \$43.3 generated in 2015. Value-added activities associated with the dairy industry contributed another \$58 million in economic activity to the state in 2016. Total economic activity (gross farm value plus value-added) of the Louisiana dairy industry was estimated at \$95 million in 2016, down from \$113 million in 2015.

Horses

The horse industry continues to be a significant component of the agricultural economy in Louisiana. The horse industry has traditionally been able to be categorized into three sectors: racing, show or competition, and recreational. In terms of number of horse owners, the breakdown of the industry in 2016 into these three sectors was 9 percent racing, 18 percent show or competition, and 73 percent recreational. While the racing sector was the smallest sector in terms of number of horse owners, it presented the largest share of gross farm value generated by the horse industry. In 2016, the breakdown of the horse industry by percentage of total gross farm value generated by each sector was 46 percent racing, 32 percent show or competition, and 22 percent recreational.

The state's racehorse industry in 2016 involved 1,617 breeders who owned 10,231 mares that produced 7,223 foals that sold for \$43.3 million. Breeders also owned 1,162 stallions that were bred to 9,008 mares, generating income from stud fees of \$22.5 million. The total gross farm income generated from racehorse production was \$69.9 million. An additional 2,472 racehorse owners had 10,859 racehorses in training or on the track in Louisiana, with a gross farm value of \$108 million. The gross farm value of the entire race sector (owners' and breeders' activities) of the horse industry in 2016 was \$174.4 million, not including receipts or fees from racing events or gaming.

The show and competition horse industry (horse shows, barrel racing, cutting, roping, team penning and others) includes 1,480 breeders who own 5,387 mares that produced 3,860 foals that sold for \$15.4 million during 2014. These breeders owned 679 stallions that bred with 4,521 mares, generating \$6.8 million in income from stud fees. The total income generated from show and competition horse

production was \$22.2 million. Another 6,629 owners competed on their 19,427 horses, which had a gross farm value of \$97.1 million. The total gross farm value of the show and competition sector of the horse industry was \$119.4 million in 2016.

A large portion of the horse industry, both in terms of owners and horses, is recreational. Horses have been used for comfort, exercise and enjoyment for quite some time. Approximately 10,145 recreational horse owners in Louisiana bred 24,041 mares and sold 17,264 foals during 2016 for \$19 million. These horse enthusiasts owned 1,999 stallions that were bred to 9,798 mares, generating income from stud fees of \$4.9 million. The total income from production in the recreational horse industry was \$23.9 million during 2016. Another 23,362 recreational horse owners have 54,011 horses valued at \$59.4 million – making the total economic contribution of the recreational horse industry \$83.3 million in 2016.

There were a total of 135,971 horses in Louisiana, owned by 45,705 people, with a gross farm value of \$377.1 million in 2016. Value-added activities contributed an additional \$41.5 million in 2016, so that combining farm-gate value and the value-added, the total value of horse sector was \$418.6 million in 2016, a decrease of \$103.5 million from \$522.1 million in 2015.

In addition to the estimates of gross farm value and value-added activities, there are other potential impacts of the horse industry to the state's economy. First, the average horse owner has been reported to spend about \$4,000 to \$6,000 annually on items such as feed, tack, equipment, veterinary supplies and medicines. Second, the four racetracks in the state employ a large number of people and have been reported to generate expenditures of over \$1 billion annually. Finally, the show and competition industry conducts numerous events and activities each year and is estimated to generate \$200 million annually in expenditures. The American Horse Council suggests that the total economic impact of horse production and these related activities like horse racing and competitions is in excess of \$2 billion annually for the state of Louisiana.

Poultry

Broilers and Eggs

Poultry production continues to be the largest animal agricultural industry in Louisiana and is second only to forestry in gross farm value for all agricultural commodities. In 2016, 395 Louisiana growers (small producers and commercial operations) produced 887.9 million pounds of broiler meat with a gross farm value of \$745.9 million. Commercial broilers are produced in 11 parishes: Bienville, Claiborne, Jackson, Lincoln, Natchitoches, Ouachita, Sabine, Union, Vernon, Webster and Winn.

While broiler production is far and away the largest component of the poultry industry in the state, there are several other components that positively contribute to the state's economy. A total of 176 breeder flock producers in 2016 produced 18.9 million dozen eggs with a gross farm value of \$44.2 million. A total of 95 pullet producers produced over 1 million pullets with a gross farm value of \$13.1 million. Finally, a total of 799 egg producers (small producers and commercial operations) had a total table egg production value of 21.5 million dozens valued at nearly \$17 million.

When all of the facets of the poultry industry are combined, the total gross farm value was estimated at \$821.2 million in 2016, up nearly \$4 million from 2015. The biggest reason for the increase in gross farm value was a 2 percent increase in broiler prices experienced in 2016. Value-added activities associated with poultry production added an additional \$800.7 million in economic activity in the state, bringing the total economic impact of the poultry industry to \$1.6 billion in 2016.

Quail

Quail production in the state generally consists of smaller operations reaching niche markets. In 2016, a total of 15,700 were estimated to be produced and sold by 18 producers resulting in a gross farm value of \$43,332. Value-added activities associated with quail production provided an additional \$4,767 bringing the total economic contribution of the quail industry to \$49,099 in 2016.

Rabbits

The production of rabbits for meat and exhibition involved 432 Louisiana producers during 2016. The rabbit fryer industry produced approximately 65,621 pounds of meat in 2016. Louisiana rabbit producers generated \$164,785 in gross farm income. With value-added of \$17,302, the total value of rabbit production in Louisiana during 2016 was \$182,087.

Sheep and Goats

Sheep, lambs and wool were produced by 275 producers in 35 Louisiana parishes during 2016, a decrease from 363 producers during the previous year, but an increase to the numbers of producers reported in 2014. The total number of lambs that were marketed (slaughter, feeder and club/show lambs) was estimated to be 3,703 in 2016, with a gross farm value of \$783,579. With a gross farm value of \$44,916, the 406 head of stocker sheep sold in 2016 represented a slight increase in animals and value from the previous year. The number of cull sheep sold in 2016 was 471, down from 946 in 2015. Cull sheep sold for \$41,684 in 2016. Wool production from 3,414 sheep was 22,181 pounds, valued at \$12,421. The total gross farm value from sheep and wool sales was estimated at \$882,600 in 2016, down roughly \$80,000 from 2015. Value-added activities associated with the sheep industry added an additional \$101,499 in economic activity bringing the total economic impact to \$984,099, down nearly \$90,000 from 2015.

The Louisiana goat industry during 2016 consisted of an estimated 850 producers in 61 parishes with an inventory of 11,228 breeding aged does. Goat producers marketed a total of 5,190 slaughter goats valued at \$904,461, both down slightly from 2015. Stocker goats sold in 2016 numbered at 2,341 with a value of \$383,596. There were 1,222 cull goats marketed in 2016 at a value of \$148,534. Goats sold as club or show goats numbered 1,233 head, valued at \$400,725. Gross farm value of goats sold in Louisiana during 2016 was \$1.8 million, down from \$2.7 million in 2015. Value-added activities associated with the goat industry added an additional \$229,665 in economic activity bringing the total economic impact of the industry to \$2.1 million, down from \$3.0 million in 2015.

Swine

The Louisiana swine industry is primarily comprised of relatively small producers. In 2016, a total of 273 producers were estimated to have a total inventory of 1,789 sows, with an average sow inventory per producer of less than 7 sows. Other than servicing a local or niche market, most of the swine production in the state is targeted to the show/club pig market. In 2016, a total of 2,467 show pigs were estimated to be sold with a gross farm value of \$616,750, representing roughly 50 percent of the total gross farm value generated by the swine industry. Sales of feeder pigs, slaughter hogs, and culls represent the remaining 50 percent of the total gross farm value generated by the industry. In 2016, 5,983 feeder pigs were sold for an estimated value of \$107,694. Sales of 2,663 slaughter hogs generated a gross farm value of \$346,190, while the sale of 1,064 cull animals (sows and boars) generated a gross farm value of \$183,008.

When added together, the gross farm value of all classes of swine is estimated at \$1.3 million for 2016, down from the \$1.7 million in 2015. Value-added activities associated with the swine industry is estimated at \$156,705, bringing the total economic impact of the industry to the state economy to \$1.4 million, down roughly \$400,000 from 2015.

Exotic Animals

With less than 20 producers statewide, the exotic animal industry is a relatively small component of the total agricultural industry. An estimated 446 deer and 7 llamas were marketed in 2016 for a gross farm value of \$79,275. Total value of production for exotic animals, including value-added activities is estimated at \$87,599 for 2016.

Fisheries and Wildlife Enterprises

Total farm value of all fisheries and wildlife enterprises during 2016 was \$826.1 million, down 1.3 percent from \$837.6 million in 2015. Value added in 2016 was \$538.7 million, down from \$620.2 million the preceding year. Total value of all fisheries and wildlife enterprises to the Louisiana economy for 2016 was \$1.36 billion, down slightly from the \$1.46 billion in 2015.

Aquaculture

Louisiana has long been recognized for supporting one of the most diverse aquacultural industries in the United States. Species and products such as crawfish, catfish, alligators, oysters, tilapia, baitfish, soft-shelled crawfish and crabs, ornamental fish, baby turtles, a variety of freshwater game fish and other minor species all have been commercialized successfully.

Louisiana's producers continue to be among the leaders in the nation in crawfish, oyster, pet turtle and alligator sales. Increases in production and gross farm values were experienced in 2016 for crawfish, baitfish, alligators, oysters and soft-shelled crabs over the previous year, while decreases were experienced for catfish, minnows and turtles.

Farm-raised crawfish continued to be the state's most valuable aquaculture sector, representing nearly 60 percent of the total gross farm value generated across all aquaculture enterprises. Expansion in demand both within the state and regionally has created increasing incentive for expansion of acreage and production over the last several years. In addition, crawfish production has increasingly been added to farming operations as producers look to offset struggling rice markets. Despite concerns about drought conditions in the summer and early fall of 2015 potentially impacting the 2016 crawfish season, producers were estimated to produce 135 million pounds of crawfish in 2016 on slightly over 216,000 acres. Total crawfish production was up by nearly 2 percent over 2015 and generated a gross farm value of \$196 million. Higher production totals along with a 2 percent increase in price for 2016 resulted in a gross farm value that was more than 3 percent higher than in 2015.

Farm-raised alligators was the second largest segment of the aquaculture industry in 2016, with an estimated gross farm value of \$73.2 million. Production of farm-raised alligators was up by roughly 7 percent in 2016 to 1.37 million feet. Despite prices continuing to moderate from the highs seen in 2013, gross farm value was up nearly 3 percent.

Oyster production typically represents the third largest segment of the aquaculture industry. The oyster production information reported in this summary represents a one-year lag to avoid estimation and projection errors from using data for only part of the year (meaning figures for oysters reported this year are from 2015, not 2016). The reason for the lag is that information on oyster sales is compiled and provided by the Louisiana Department of Wildlife and Fisheries to the National Marine Fisheries Service, and the final compilation of the data is not available until the middle of the year following production. Oyster production continues to rebound from the negative impact of the Deepwater Horizon incident, and have now approached the highest levels experienced since 2005. Estimated oyster sales in 2015 of 1.79 million sacks, from a total of 1,093 producers, were \$68.1 million. These numbers represented increases in production (8 percent), and in value (17 percent) from 2014.

While the remaining segments of the aquaculture industry continue to provide positive economic impacts to the state, they are at significantly lower levels than

crawfish, alligators, and oyster production. Pet turtle production continues to be fairly stable with a gross farm value of \$2.75 million. Fish bait production continues to evolve to meet the growing demand of recreational fishers with most production held in recirculating systems or flow-through systems. In 2016, the estimated gross farm value of the fish bait industry was \$2.2 million. The catfish and minnow industries continue to see the trend of lower production and gross farm values. In 2016, the gross farm value of the catfish industry was \$153,573 while the gross farm value of the minnow industry dropped to \$61,655. Finally, soft-shell crab production continues to be a fairly minor industry with a limited number of producers. As with the oyster industry, the data for soft-shell crabs comes from the Louisiana Department of Wildlife and Fisheries, and has a one year lag period. So, the data reported in this publication is actually 2015 data. In 2015, the gross farm value of the soft-shell crab industry was estimated at \$34,887.

Examining the economic impact across all aquacultural enterprises indicates that the total gross farm value in 2016 was \$344.4 million in 2015, up nearly 6 percent from the previous year. Value-added activities associated with aquaculture production added an additional \$232.5 million bringing the aquaculture industry's total impact to \$576.9 million in 2016.

Fisheries

The harvest of freshwater and marine finfish and shellfish in Louisiana continues to contribute significantly to the state's economy. Fishery landings are recorded by two government agencies. The Louisiana Department of Wildlife and Fisheries receives monthly reports from the initial buyers (processors, dealers, etc.), who are required to record every transaction via trip tickets. Species weights and dockside sales values of the landings are reported for all commercially harvested species. The National Marine Fisheries Service also is responsible for estimating fisheries landings, using both regional National Marine Fisheries Service data collectors and Louisiana Department of Wildlife and Fisheries reports. The information reported here is from those two cooperating sources. All this data is provisional and subject to change.

The freshwater and marine fisheries data presented in the report this year (2016) reflect the calendar year 2015. The one-year lag is necessary to ensure data accuracy. Real-time reports on fisheries landings are not available until four months after the fact, and final data often runs six to seven months behind. Estimating landings for the second half of the year based on landings reports from the first half is inaccurate. This method of reporting fisheries landings data has been in place since the 2004 Louisiana Summary; data prior to that volume may not be directly comparable to the data reported since 2004 because of using the different estimation methods. To compare state-level landings for years prior to 2004, on a calendar-year basis, please consult the US-NOAA-NMFS website.

One final caveat is that parish totals for fisheries landings will not equal the state total because of legal confidentiality requirements. When there are fewer than three sources in a parish that report landings of a fisheries commodity, the number of landings cannot be publicly released by the Louisiana Department of Wildlife and Fisheries without breaking confidentiality requirements. There may also be parishes reported in this volume for which no landings or values were provided by either of those agencies, but for which there was catch. Furthermore, fisheries landings are reported for the parish in which the fish are offloaded – not the parish in which the boat and its crew may be domiciled or the parish where the catches actually were made. However, producer estimates are based on commercial licenses which are based on the fishermen's domicile.

Freshwater Fisheries

The freshwater finfish are primarily bowfin, catfish, buffalo, shad, gar and carp and typically are less valuable on a per-pound basis than marine finfish. Total freshwater finfish value increased 22 percent from \$4.2 million for 9.6 million pounds caught by 2,385 commercial fishers in 2014 to \$5.1 million for 11.5 million pounds caught by 2,335 commercial fishers in 2015. While landings in 2011-2013 where approximately 11 million pounds, the value increased per pound in 2015.

Catfish are the mainstay of the more valuable freshwater species. The commercially caught catfish are not the same as farm-raised catfish described in the aquaculture section of this summary. Sales of catfish caught commercially in Louisiana waters were \$2.8 million for 4.9 million pounds in 2015, an increase from \$2.0 million on 3.8 million pounds in 2014, and 4.3 million pounds in 2013.

Most wild crawfish are caught in the Atchafalaya Basin, where water levels fluctuate as inflows are controlled by the U.S. Army Corp of Engineers at about one-third of the combined flows of the Mississippi and Red Rivers. Although wild crawfish compete in the marketplace with farm-raised crawfish, some consumers prefer the wild product because of its frequently larger size. The volume of the wild crawfish harvest is almost completely constrained by the timing and duration of the annual winter/spring floodwater event in the Atchafalaya Basin. The 2015 crawfish season had a low year. Landings and value were down about 50 percent from the 2014 season. In 2015, 5.5 million pounds of crawfish were landed for a value of \$6.9 million. Landings in 2014 were 11.2 million pounds with sales at \$13.4 million. The 2013 crawfish season (17.1 million pounds) nearly tripled the landings from 2012 (6.5 million pounds). For comparison, freshwater crawfish landings were a record level of 50 million pounds in 1993.

Overall, landings from the freshwater fisheries sector in 2015 had a gross value of \$11.9 million. Value-added activities added an additional \$10 million bringing the total impact of the freshwater fisheries to nearly \$22 million in 2015.

Marine Fisheries

The last few years have seen a lot of flux within Marine Fisheries with the 2010 Deepwater Horizon oil spill leading to record low catches due to closures and perception for most fisheries. However, marine fisheries grounds were almost all reopened in 2011, and all marine fisheries saw an increase in landings in 2011 and 2012 compared to 2010. The final closed areas of Louisiana opened in 2015. Marine finfish landings for food are varied and complex, with about 60 different species being landed for a total of 12.1 million pounds in 2015, excluding menhaden. This was a 3 percent decrease from 2014, when 12.5 million pounds of marine finfish were landed in Louisiana. Excluding menhaden, the five most-valued species landed in 2015, by decreasing value, were red snapper, black drum, yellowfin tuna, king mackerel and sharks. Total saltwater finfish landings, excluding menhaden, were valued at \$19.2 million, a 7 percent decrease from \$20.6 million in 2014, but almost identical to \$19.2 million in 2013.

Landings of menhaden or pogy, a low-value but high-volume nonfood finfish species, were 894 million pounds in 2015, an increase of 53 percent from only 585 million pounds in 2014, but still down from 1 billion pounds in 2012. The catch was valued at \$85.3 million in 2015, an increase of 35 percent from \$63.4 million in 2014. Menhaden value decreased in 2015 to 9.5 cents per pound after several years of increasing value: 10.8 cents per pound in 2014 and 10 cents per pound in 2013. However, price per pound is still on the rise from 6.32 cents per pound in 2012. Menhaden oil and meal are sold on the world market for industrial purposes, animal feeds and omega-3 dietary supplements, among other uses, and the prices received for menhaden products is a function of the world supply of oils and

meals, particularly those produced by the fisheries for the anchovetta of the Pacific Coast of South America.

After several poor harvest years following the freshwater diversion openings in 2010 and 2011, oysters increased 28 percent in landings to 14.5 million pounds in 2015. In 2013 and 2014, 11.3 million pounds of oysters were landed. This is similar to the 14.7 million pounds of oysters harvested in 2009. The price in 2015 continued to increase from approximately \$5.44 per pound of oyster meat in 2014 to \$5.87 per pound. To calculate prices per sack, assume 6.47 pounds of shucked oyster meat per sack (\$37.98 per sack). According to US-NOAA-NMFS, the gross value of oysters harvested during 2015 was \$85.1 million— up 39 percent from \$61.4 million in 2014.

Blue crabs constitute nearly all of the Louisiana crab harvest, with stone crab claws making up less than 0.01 percent. Louisiana hard crab landings normally range from 40 to 50 million pounds. However, stock assessments show stocks fell below acceptable levels in 2012 and 2014. Blue crab landings were 41.1 million pounds with a gross value of \$57.5 million in 2015 by 2,910 license holders. This was a 5 percent increase in landings from 39.4 million pounds in 2014, but a 4 percent decrease in value after the record high \$60.6 million in 2014. While 2015 landings were back in the 40 to 50 million pound range, they were still lower than when fishers harvested 51 million pounds in 2009, or the 43.8 million pounds in 2008.

Peeler or buster crabs are blue crabs that are close to molting their shell. These crabs are sold to soft shell facilities to produce soft shell crab. In 2015, 171,130 peeler crabs were caught for the industry, and 9,520 pounds of soft shell crab were produced. In 2014, production of soft-shelled crabs (7,127 pounds) and peeler crabs for the shedding business (157,265 pounds) were similar to 2013. In 2009, production of soft-shelled crabs (35,484 pounds) and peeler crabs for the shedding business (171,656 pounds) had increased from the lowest ever recorded in 2008 due to many shore-side shedding facilities being damaged or destroyed by the 2005 and 2008 storms. Hurricane Isaac in the fall of 2012 may have affected shedding facilities, too. Overall, the soft shell crab industry has been in steady decline for at least two decades.

Louisiana shrimp landings in 2015 consisted of seven species: white shrimp, brown shrimp, sea bobs, rock shrimp, pink shrimp, royal red shrimp and roughneck shrimp. White shrimp historically have provided 50-60 percent of the harvest by weight and around 70 percent by value. In 2015, white shrimp contributed about 65 percent (59.9 million pounds) of total weight and 75 percent (\$85.4 million) of total value. In 2015, brown shrimp landings totaled 30.6 million pounds with a value of \$27.9 million dockside. The weighted-average price for shrimp was \$1.24 in 2015, down from \$2.08 in 2014, \$1.81 in 2013, and \$1.45 in 2010-2012.

Total shrimp landings in 2015 were 91.6 million pounds, a 16 percent decrease from 109 million pounds in 2014, and a decrease from 2013, when 98.4 million pounds were harvested. By comparison, 74.2 million pounds of shrimp were harvested in 2010 when most of the fishing ground were closed at least at some point in the year because of the spill and 114 million pounds in 2009. Shrimp landed in Louisiana had a gross value of \$114 million in 2015, down 50 percent from 2014. Overall, price has fallen on shrimp after a few years with higher dockside prices. The higher prices in Louisiana were a result of the decline in imported farmed shrimp due to disease issues in Asia and South America.

In 2015, marine fisheries landings in Louisiana were valued at \$361.7 million dockside, down from \$ 433.3 million in 2014.

Fur

The 2015-2016 harvest of fur animal pelts had a gross farm value of \$16,217, down significantly from previous years. This value represents fur production only,

and excludes any value associated with meat production, predominately from raccoon and nutria carcasses.

The total number of trapping licenses sold and the number of pelts harvested dropped significantly this year, which is likely in response to the slow fur market and low pelt prices. The total number of pelts harvested in the 2015-2016 season was 2,447; this was a decrease of 6,626 compared to a total pelt harvest of 9,073 in 2014-2015. The average price paid for a single pelt taken during the 2015-2016 trapping season was \$6.63, down from \$9.383 the preceding year. This varied from a low of a few cents paid for opossum and skunk pelts to a high of \$26.76 paid for bobcat pelts. Excluding nutria that were removed under the Coastwide Nutria Control Program that were not pelted or sold, the total economic impact, including value-added activities, of the 2015-2016 trapping season was estimated at \$20,271.

While only 81 nutria pelts were reported as being sold, there were approximately 349,235 nutria harvested during the 2015-2016 trapping season. The vast majority of the nutria harvested were due to the Coastwide Nutria Control Program which pays trappers \$5.00 for each nutria taken.

Hunting Lease Enterprises

The value of recreational hunting in Louisiana is estimated by the income derived from hunting lease enterprises. The number of producers who leased land in the state during the 2015-2016 hunting season was estimated at 5,852. This figure consists of 4,410 individuals who leased land for upland game hunting (predominately for deer and turkey), and 1,442 individuals who leased land for waterfowl hunting. These numbers are mostly unchanged from the previous year.

Land leased for hunting in 2015-2016 amounted to 7.93 million acres for upland game and 1.95 million acres for waterfowl, both up slightly from the previous year. Gross farm value for leases was roughly \$119 million for upland game, and over \$55 million for waterfowl. Both values are up significantly from previous years as per acre rental rates have steadily increased over the last several years. Average prices per leased acre increased to \$15.00 for upland game while prices for waterfowl leases increased to \$28.40 per leased acre.

Higher acreage and higher prices resulted in a sharply higher gross farm value for hunting lease enterprises in 2016. The total estimated gross farm value for the 2015-16 hunting season was estimated at \$174 million. When value-added activities are added, the total economic impact of hunting lease enterprises was estimated at \$189 million.

Honey

The production of honey in 2016 was 2.45 million pounds. This production was down significantly from the 4.3 million pounds produced in 2015. For three years in a row, weather played a negative role in honey production during the 2016 spring nectar flow. Two major flooding events impaired the production of honey because of lost bee yards in affected areas. Flooding along the Red River in the spring destroyed an unknown number of beehives according to social media reports. In August, south Louisiana suffered a bout of flooding, and again, beekeepers, from social media complained about lost beehives. Beekeepers will rehabilitate their hive equipment and try to repopulate their beehives.

There is a strong demand for local honey reported by beekeepers. The anti-allergenic properties of local honey is one reason many consumers state that they purchased local honey. Honey continued to be popular as a sweetener. The straining of local honey was only done to remove wax. Processes such as micro-filtration and pasteurization were avoided by local beekeepers in order to prevent honey degradation. The primary pest problems for commercial beekeepers were

Varroa mites and small hive beetles. Wax moths caused occasional problems. There were no discoveries of Africanized honey bees in 2016.

Due the impact of the adverse weather and flooding in Louisiana, along with other more typical production issues faced by beekeepers, total honey production decreased in 2016 to 2.45 million pounds. Lower production and slightly lower prices resulted in a gross farm value of \$4.1 million, roughly half of the value reported in 2015. When value-added activities associated with honey production are added, the total economic impact of the honey industry was estimated at \$5.1 million in 2016.

Plant Enterprises

The gross farm value of all plant enterprises was more than \$3.42 billion in 2016, a decrease of 1.5 percent from \$3.48 billion in 2015. Value added was \$3.55 billion for all plant commodities during 2014, down slightly from \$3.82 billion in 2015. Total value of all plant or crop enterprises to the Louisiana economy was \$6.98 billion in 2016, down 4 percent from \$7.3 billion in 2015.

Cotton

Farm land planted in cotton in 2016 was 139,902 acres which compares to 109,397 acres and 164,132 acres in 2015 and 2014, respectively. In 2016, irrigated acres represented 38 percent (52,920) and dryland acres represented 62 percent (86,982) of the total acres harvested in 2016. Irrigated acres averaged 1,159 pounds of lint per acre, and dryland acres averaged 888 pounds of lint per acre. Overall yield for all harvested cotton acres was 990 pounds of lint per acre. This past year, cotton was grown on 284 farms.

Gross farm value of cotton lint sales was \$95.6 million in 2016, with \$42.2 million from lint harvested on irrigated land, and \$53.3 million from sales of lint harvested from non-irrigated land. Sales of cotton seed contributed an additional \$26.6 million. Gross farm value of all cotton sales was \$122.3 million, with value added contributing \$30.5 million, so that total value of cotton production in 2016 was \$152.8 million.

Feed Grains

In 2016, there were 596,414 acres of feed grains harvested in the state, up from 467,029 acres of feed grains harvested in 2015. Significant increases in corn acres in 2016 led the way for higher feed grain acres, more than offsetting reductions in acres for both grain sorghum and oats. A more positive outlook for corn prices in 2016, relative to competing crops was the main reason for the higher acres.

As did most agronomic crops, feed grain production was negatively impacted by excessive rains and flooding in 2016. Increased production costs associated with having to replant acres and decreased quality and yield associated with harvest delays were common for many feed grain producers. However, despite the considerable production challenges faced in 2016, the sharp increase in acres resulted in a total gross farm value for the feed grain industry that was 22 percent higher than 2015, at \$335 million. Value added for feed grains was estimated to be \$58.6 million in 2016, so the total value, including both gross farm value and value added of feed grain production in Louisiana for the year was \$393.7 million, up significantly (18 percent) from 2015.

Corn

Corn was grown on 1,328 Louisiana farms in 2016, up from 1,140 Louisiana farms in 2015, and 1,157 farms in 2014. The statewide average yield was 164.9 bushels per acre. This compares to yields of 171.8 and 181.7 bushels per acre for 2015 and 2014, respectively. There were 544,601 acres of corn harvested in 2016, which compares to 391,044 acres in 2015, and 395,279 acres in 2014.

Gross farm value of corn production in 2016 was \$319.6 million, up significantly from the 2015 value of \$249.2 million. Despite slightly lower yields and corn prices in 2016, a significant increase in acres helped move gross farm value higher in 2016.

Grain Sorghum

Grain sorghum production continued to move lower in 2016. Several years of difficulties associated with the sugarcane aphid, along with sharply reduced prices

caused primarily by reduced export demand have seen grain sorghum acreage and production fall over the past few years. In 2016, 49,389 acres of grain sorghum were harvested throughout the state. This compares to 72,459 acres harvested in 2015, and 95,735 acres harvested in 2014. In 2015 and 2014, 72,304 and 95,735 acres were harvested. Grain sorghum yields in 2016 averaged 51.98 cwts (92.8 bushels) per acre, rebounding from the drought impacted yield of 48.2 cwts (86.1 bushels) in 2015. However, weather difficulties in 2016 prevented yields from reaching the levels experienced in 2014, when the state average yield reached 53.47 cwts (95.5 bushels) per acre.

Gross farm value of sorghum production was \$15.1 million, down substantially from \$25.4 million in 2015, due to lower acreage and significantly lower farm-gate prices.

Oats

In 2016, oats were harvested on 2,424 acres compared to 3,526 acres in 2015. This downward trend has continued since 2014. The average oat yield in 2016 was 52.1 bushels per acre, down significantly from the 78.3 bushels reported in 2015. Much of this reduction is likely tied to the excessive rainfall and flooding received in March and April of 2016. With lower production and sharply lower prices, gross farm value for oat production in 2016 fell to \$261,213, from \$701,043 reported in 2015.

Forestry

The projected Louisiana gross farm value of harvested forest products decreased by 10.96 percent during the 2016 calendar year, ending the year at \$898.1 million dollars in mill delivered revenue. The pine saw-timber harvest decreased by 14.82 percent from the prior year, and posted a total statewide harvest of approximately 798.6 million board feet during 2016. The hardwood saw-timber harvest decreased as well during 2016, a 13.94 percent decrease to 98.8 million board feet. Pine chip-and-saw harvested during 2016 totaled 841,456 cords, a decrease of approximately 6.80 percent from 2015 levels. The pulpwood harvest was 5.87 million cords, down 238,777 cords (4 percent) from the 2015 harvest. Pine pulpwood harvest increased 1.09 percent, from 5.07 million cords during 2015, to 5.12 million cords in 2016. Hardwood pulpwood harvest decreased by 28.33 percent, from 1.04 million cords in 2015, to 744,463 cords in 2016.

Stumpage prices paid for pine saw-timber during 2016 averaged \$214.5 per thousand board feet. This average represents approximately a 6.64 percent decrease from the previous year (\$229.75 per thousand board feet). Prices paid for mixed hardwood saw-timber during 2016 averaged 299.75 per thousand, which is a 2.13 percent increase from the previous year (293.5 per thousand). Pine Chip-N-Saw averaged 46.42 dollars per thousand in 2016, which was down \$1.55 from the previous year. In general, delivered prices were down across all three saw-timber class products over the period reported (ranging from 0.5 to 1.9 percent). Pulpwood stumpage prices averaged \$27.45 per cord per for pine, up 1.59 percent from the previous year, while hardwood pulpwood averaged \$34.66 per cord, down 17.13 percent from the previous year's average. As a caution, individual landowners should not look at Timber Mart South Prices as an indication of what they will get for timber sold on their land, but rather as a gauge to judge price trends and directions. Timber owners should contact a consulting forester who can help them best gauge the market for their timber as the prices received for individual tracts vary considerably depending on local conditions and specifics of their individual property.

During the year, Louisiana's private forest landowners received an estimated \$404.9 million from the sale of forest timber (stumpage),

down 12.98 percent from the \$465.33 million in the previous year. Timber harvesting contractors and their employees earned approximately \$493.14 million from harvesting the trees and moving wood to mills during 2016, a decrease of 7.16 percent from \$531.17 million in 2015.

As for predictions, more of the same from the prior several years. Since it is unlikely that Louisiana will experience the rainfall events as those that hit in 2016, slow but upward growth in harvesting across all products is expected. However, there will likely be mostly flat prices for stumpage products in 2017. Softwood lumber prices are expected to rise along with pulp prices for the year, so the expectation is that mill profitability will rise, as supply of raw material is abundant. Demand will inch upward for final goods in lumber, plywood, and OSB products but landowners and loggers are not likely to see these gains due to increased market power of the mills remaining in the state and continued slack in production capacity.

In addition to the gross farm value of the timber industry, Christmas trees, pine straw and forest seedlings also contribute to the total gross farm value of the forestry industry. In 2016, the gross farm values for these three smaller industries were estimated at a combined \$3.7 million. When added to that of the timber industry, the total gross farm value for the entire forestry industry is estimated at \$901.8 million in 2016. An additional \$2.7 billion in value-added activities brings the total economic impact of the forestry industry to \$3.61 billion in 2016.

Fruit Crops

Louisiana's commercial fruit production is diverse, ranging from berries, citrus and peaches to muscadine grapes and mayhaws, among others. In 2016, commercial fruit crops were raised by more than 1,000 producers. Gross farm value for commercial fruit production was \$44.8 million in 2016, down slightly from \$45.9 million in 2015. Value-added contributed \$15.7 million to the total value of fruit production of \$60.4 million in 2016, down from \$61.9 million in 2015.

Blackberries

Gross farm value of blackberries increased during 2016 to \$2.8 million, up from \$2.7 million during 2015. While average yields were slightly higher (5,517 pints per acre in 2016, versus 5,484 pints in 2015), lower acreage harvested (121 in 2016, versus 142 in 2015) reduced total production to 665,425 pints, versus the 778,800 pints reported in 2015.

Blueberries

Gross farm value of blueberries decreased during 2016 to \$9.6 million, down from \$10 million during 2015. A reduction in both average yields (3,569 pounds per acre in 2016 versus 4,663 pounds in 2015), and in acreage harvested (465 in 2016, versus 523 in 2015) reduced total production to 1.66 million pounds, versus the 2.44 million pounds reported in 2015.

Citrus

The Louisiana citrus industry in 2016 involved growers in 25 parishes harvesting a total of 832 acres. The citrus industry primarily consists of navels and satsumas, with satsumas representing 63 percent of all citrus acres. In 2016, the breakdown of acreage was 283 in navel production, 521 in satsuma production, and 28 in other types of citrus (lemons, grapefruits, and kumquats, among others. Total citrus acres in 2016 were down from 1,073 acres in 2015. Struggles with diseases and pests such as citrus canker, citrus greening and the Asian citrus psyllid over the last several years has been one of the main reasons for the downsizing of the citrus industry.

Total navel production was 70,136 bushels in 2016, with a total farm gate value

of \$2.5 million. Satsuma production totaled 177,131 bushels in 2016, generating a total farm gate value of \$6.1 million. Other citrus production was estimated at 6,124 bushels in 2016, with a total farm gate value of \$193,028. When combined, the total gross farm value of the citrus industry in 2016 is estimated at \$8.8 million. Despite lower acreage, slightly higher per acre yields and higher market prices helped keep total gross farm value at essentially the same level as 2015.

Mayhaws

The gross farm value for mayhaws was \$2.5 million in 2016, as compared to \$3.2 million in 2015. Orchard and native mayhaw trees produced approximately 228,024 and 887,588 pounds respectively, for a total production in 2016 of 1.1 million pounds, down from 1.6 million in 2015. Production, centered in Grant Parish, occurred on 426 acres statewide in 2016, and averaged 2,618 pounds per acre.

Muscadines

Reports concerning muscadine production were divided into fresh fruit production and commercial production. The total gross farm value of all muscadine production in 2016 was \$978,580. Muscadines were grown for fresh fruit on 82 acres by 50 growers who produced 117,350 gallons of grapes in Louisiana during 2016. The fruit usually was sold at \$4 to \$10 per gallon, with an average of \$6 per gallon. The lower prices generally were used at U-pick operations.

Production for juice and wine was considered commercial muscadine production. Muscadines grown for wine production are concentrated in East Feliciana Parish, and Louisiana produced 221 tons of commercial muscadines on 33 acres in 2016.

Peaches

Gross farm value of peaches during 2016 was \$1.4 million, down from \$1.8 million in 2015. Peaches were grown on 366 acres by 53 commercial producers and yielded 37,559 bushels during 2016.

Strawberries

In 2016, the Louisiana strawberry industry involved 73 growers who produced berries on 369 acres for a gross farm value of \$17 million. While acreage and total production were slightly down in 2016, gross farm value was up over \$1 million due to stronger prices. Tangipahoa Parish was the leading strawberry-producing parish in the state, with 290 acres and \$14.1 million in sales during 2016.

The majority of the Louisiana strawberries were sold commercial. Growers delivered berries to grocery store warehouses, individual grocery stores and fruit stands. The remaining portion of the crop was sold at farmers markets and roadside stands.

Louisiana strawberries are generally available as early as November, December and January. These early berries often bring premium prices and play a large part in the high returns for the crop in Louisiana.

Miscellaneous Fruit

A variety of other fruits are planted in Louisiana as small commercial plantings or as backyard plantings. These crops include figs and pears, among others. In 2016, the combined acreage of figs and pears was 161, and had a gross farm value of \$1.4 million.

Commercial Greenhouse Vegetables

During 2016, 15 parishes had farms commercially growing greenhouse vegetables in 137,250 square feet of greenhouse space, down from 169,700 feet in 2015. As in the past, most production (90 percent) was devoted to tomatoes during 2016, with some greenhouse space devoted to cucumbers and lettuce. All

of the greenhouse produce was sold on the fresh market, much of it direct-retail at local markets.

The estimated gross farm value of Louisiana greenhouse vegetables was \$2.3 million in 2016, up slightly from 2015 levels. Total value of greenhouse produce, including value added, was \$3.1 million for 2016, an increase of \$300,000 over 2015 levels.

Hay Sold

Hay production for commercial sales is a limited part of the total hay production in Louisiana. Nevertheless, hay produced from 244 acres of alfalfa, and 404,344 acres of grasslands was sold by 3,453 producers in 2016. Yields averaged 3.0 tons per acre from the grasslands harvested for sale, and 4.5 tons per acre from the alfalfa harvested for sale. Production included 1,220,869 tons of grass hay, and 1,100 tons of alfalfa hay. Compared to numbers reported in 2015, the acreage of grasslands used for commercial hay production decreased by less than 1 percent.

Weather conditions were not conducive for optimum hay production during 2016. Spring floods in north Louisiana and summer floods in south Louisiana negatively impacted hay production. The spring and summer months were very wet, and interfered with hay production. Conditions were not conducive for optimum hay production until late-September. The fall months were dry, and a considerable amount of the 2016 hay crop was harvested during this period. Gross farm value of all hay sales, including some minor alfalfa production, was \$117.3 million, which was \$20 million lower than the 2015 hay crop value of \$137.8 million. Total value of hay production, including value-added activities, was \$137.8 million in 2016.

Home Vegetable Gardens

The number of home gardens in any given year fluctuates greatly with people's interest and the economy. When economic conditions are weak, the number of households using home gardens tends to increase. Vegetable gardening is not only a hobby, but also extends the family budget by freeing up limited funds for other food purchases. Research conducted by the U.S. Department of Agriculture indicated approximately one in three households have some kind of garden, including backyard fruit trees, vegetable plots, berry patches, etc.

With this assumption of a garden for one in every three households, a methodology based on parish population data was developed to estimate the number of gardens in each parish of the state. Based on these calculations, the number of home gardens in Louisiana is estimated at 632,366 for 2016. The average value of the home garden was estimated at \$495 for 2016. The basis of this value was a 2008 survey conducted by the vegetable industry that indicated that the average garden produced commodities valued at roughly \$525 per garden. This value is updated each year based on the year-to-year price change experienced in a mix of vegetable and fruits that are typically produced in Louisiana. Given these assumptions, the 2016 gross farm value of home vegetable gardens is estimated to be \$313 million.

Nursery Crops

The commercial nursery industry in Louisiana consists of fruit and nut tree nursery stock production, foliage plants, woody ornamentals (trees and shrubs) and floriculture/bedding plants. Commercial nursery crop production in Louisiana had a gross farm value of \$101.4 million in 2016, compared to \$103.1 million in 2015. Wholesale nursery sales in Louisiana have improved over the past three years, and

spring sales in 2016 were average, but under-performed 2015 levels slightly. Floods, rainfall events in 15 parishes affected spring and fall retail sales and landscape plant sales, installations.

Wholesale production was \$5.4 million for the growers of fruit and nut tree nursery stock in 2016. This category, consisting of citrus, blueberries and figs, among others, had been up 10 to 20 percent annually the past three years. Bedding plant and floriculture crop production was \$39.9 million in farm-gate sales in 2016. The largest segment of the nursery industry continues to be woody ornamentals, primarily trees and shrubs. At the wholesale level, woody ornamental growers sold products worth \$53.2 million during 2016. Wholesale production of foliage plants increased somewhat from 2015, and accounted for \$2.7 million in sales in 2016. Including value-added of \$55.7 million, the total value of the Louisiana nursery industry at the wholesale level was \$157.2 million in 2016.

Peanuts

In 2016, 524 acres of peanuts were harvested compared to 804 acres in 2015. Yields averaged 4,200 pounds per acre, which is slightly higher than average yields in 2015, of 4,100 pounds per acre. These yields are reflective of a good growing season during both years. Gross farm value in 2016 was estimated at \$418,152, versus \$692,383 in 2015. When value-added activities associated with peanut production of \$62,723 are added, the total economic impact of the peanut industry is estimated at \$480,875 for 2016.

Pecans

The state's pecan crop estimates during the summer was slightly over 6 million pounds, which was slightly higher than 2015, but still remains over 50 percent below the 10 year average (2006-2015), of 12.4 million pounds. The low on-year crop was heavily influenced by tree defoliation in 2015 due to heavy scorch mite and black aphid populations statewide. The sparse foliage in the fall resulted in the trees storing limited reserves for the dormant season, which affected bloom and nut set in 2016. Insect pressure in 2016 was sporadic with no significant losses being attributable to a specific insect statewide. There was some localized crop loss early in the season due to phylloxera. There was some early scab pressure due to heavy rains in March and April, but growers were able to gain control thanks to a fairly dry mid-summer. Following heavy rainfall in late summer, especially in south Louisiana, scab disease was moderate in north Louisiana, but more abundant in the south. Flooding in south Louisiana stressed trees, resulting in part of the crop being aborted prior to kernel maturity. There were several reports of water split issues in Oconee nuts in August. Several growers also reported some defoliation due to some minor foliar fungal pathogens, especially *Neofusicoccum*.

Input from growers, county agents and accumulators estimated the final pecan crop at 6.2 million pounds, which would be 7.8 million pounds less than the last on-year crop in 2014, but 1.2 million pounds more than last year's off-year crop of 5 million pounds. The 2016 crop is forecast to consist of 3.6 million pounds of improved pecans, and 2.6 million pounds of native pecans. Wholesale prices in Louisiana were good, but variable in the early season, but steadily improved until January, when the market prices crashed. Native prices were strong, with many growers receiving over \$1.00 per pound through most of the harvest season. Large, improved varieties with good quality kernels sold for \$2.25/lb or higher, with lower quality pecans selling for \$1.25 to \$1.75 per pound. The variability on prices was due to quality, location, time of sale and quantity of pecans sold.

Native trees accounted for the majority (79%) of the production in Louisiana from 2006-2015. However, native production was not as dominant this year,

accounting for only about 41 percent of total production in 2016. The 2017 pecan crop in Louisiana should be an off-year in the alternate bearing nature of pecan production nationwide, however, following low production over the last two years, Louisiana should rebound with one of our best off-season crops in the last decade. Commercial pecan production contributes substantially to the agricultural economy of Louisiana. The majority of the improved orchards are located in the central and northern parts of the state, with native trees dominating production in southern Louisiana. Only Texas, Oklahoma and Louisiana have large areas of natives, while smaller areas are reported for five other states. Generally, over one-half of the improved variety acreage in Louisiana is managed to control diseases, insect pests and weeds.

The gross farm value of Louisiana pecans was estimated to be \$10.8 million in 2016, up considerably from the \$6.5 million for 2013. Total value of pecan production, including value added, was estimated to be \$13.8 million for 2016.

Rice

The winter preceding the 2016 season was very mild, and warmer-than-normal weather occurred in the spring. Because of this warm weather, rice planting in southwest Louisiana began in earnest the last week of February. Approximately 30 percent of the acres in southwest Louisiana was planted before March 10. Rain and overcast weather moved into southwest Louisiana around the second week in March, and seemed to hang around for much of the month, and the following April, which slowed and spread out further planting. It also submerged and stretched rice seedlings, and made many early-season, ground-applied herbicide and fertilizer applications difficult. Northeast Louisiana really got hit hard during these rains with many reporting more than 23 inches in a three-day period. Many acres in northeast Louisiana flooded during the rains, and low lying areas were inundated with backwater flooding that stayed around for weeks. While there was not much rice planted at the time, the flooding and consistent rainfall did cause a long delay in rice planting. Approximately 80 percent of the rice in northeast Louisiana was planted during the first week of May.

The South American Rice Miner (SARM) was prevalent in many rice fields in the southwest part of the state when the rice reached the early tillering and through green ring stages of development. In fact, it was hard to find a rice field that did not have the pest. This is very odd, since the SARM is really a minor pest that is seldom found in Louisiana rice. While the weather dried up in May, wetter weather moved in during June, and sheath blight pressure was observed in many rice fields. The strobilurin-resistant sheath blight fungus continued to spread in 2016. SDHI activity fungicides, like Sercadis and Elegia, are typically recommended where strobilurin resistance has previously been found. Unfortunately, it looks like some resistance to these fungicides showed up as well in 2016. Blast was not as prevalent in 2016, as it was in 2015. Cercospora was somewhat minor in the main crop; however, it was highly predominant in the ratoon crop, and late-planted rice. With a lot of heat late in the season, bacterial panicle blight was expected to be bad, but this was not the case for 2016. An increase in black kernel smut was observed in 2016.

During rice flowering, high nighttime temperatures occurred frequently, which is never good for rice yield, milling or grain quality. Early yields from southwest Louisiana tended to be about 8 percent lower than expected. Historic flooding occurred in southwest Louisiana, with many reporting more than 24 inches of rain in a 36-hour period on Aug. 12-13. The initial flash flooding was disastrous. But what was worse was the backwater flooding that crept over fields several days later and remained stagnant for a couple of weeks. Approximately 35 percent of the fields remained unharvested at the time of the flooding. Damage by the flooding varied

from field to field, with some rice being completely submerged from hours to weeks, some where the flooding never reached the heads, and some on higher ground that was not affected at all. In the end, a lot of unharvested rice became lodged, and grains on the panicle sprouted. Sprouting even occurred on standing rice that was never submerged because of the high heat and constant humidity. Quality and milling for the harvested rice was decreased dramatically in some cases, but held up in others following the flood event. Many ratoon acres were also lost where the stubble was killed. The overall ratoon crop yield was down for the year. Economic estimates indicated that the August floods accounted for more than \$68.9 million in losses to the Louisiana rice industry.

Despite all of the struggles of the 2016 growing season, rice producers were able to produce 28.2 million hundredweight of rice on 420,821 acres in 2016. This resulted in an average yield of 66.9 hundredweights per acre, down from 69.6 reported in 2015. Rice prices also struggled to find value in 2016, and were down 13 percent from the previous year. As a result, gross farm value of the rice crop fell from \$361.5 million in 2015 to \$305.5 million in 2016. When value-added activities of \$101.7 million are considered, the total economic impact of the rice industry was \$407.2 million in 2016.

Sod and Turfgrass Production

During 2016, sod was produced by 17 Louisiana sod farmers on 3,552 acres of fine turfgrasses, compared with 3,485 acres in 2015. About 60 percent of the turf sod acreage in Louisiana is centipedegrass and about one-third is St. Augustinegrass. The remaining acreage is divided among hybrid bermudagrass and zoysiagrass. Construction remained steady for the year, which influenced producers to maintain sod acreage in 2016. Shipping costs are always a major component in the eventual price of sod. Fuel costs increased slightly in 2016. However, overall profit margins continued to be strong for the industry in 2016. Out-of-state sod farms are always a major competitor for our Louisiana producers, especially in the southern Louisiana market.

Gross farm value of sod and turfgrass sales in 2016 was estimated to be \$30.2 million. Value-added for turfgrass production was \$22.6 million, so the total value of sod and turfgrass production in Louisiana during 2016 was \$52.9 million.

Soybeans

Soybeans were harvested on 1,211,478 acres by 2,362 producers in 2016. The 2016 yield for Louisiana was 45.8 bushels per acre. Soybean acres decreased by 184,781 acres, or 15 percent in 2016, while yield increased by over 4 bushels. Soybeans were harvested on 1,396,259 acres by 2,523 producers in 2015. The 2015 yield for Louisiana was 41.3 bushels per acre. While higher, soybean yields were still below the record of 58 bushels per acre set in 2014.

The 2016 growing year for soybeans started in a very similar fashion to the 2015 year. As was the case in 2015, wet conditions early in the season delayed plantings beyond optimum planting dates for many producers. According to FSA Certified Acres reports, more than 45,000 acres were reported as prevented plantings with another 2,500 acres abandoned due to flooding and excessive rains that hit the southern part of the state during the summer. While the northern part of the state was partially impacted by persistent rainfall that delayed harvest in 2016, many producers were able to still experience above average yields. This was the key difference between 2015 and 2016, as most of the state experienced drought type conditions during critical grain filling stages in 2015.

The usual weed, disease and insect problems were present during 2016. Redbanded stink bugs continue to affect soybeans production. Redbanded

stinkbug damage to soybeans seed can cause plants to remain green and not mature properly. Several thousand acres had lower yields due to damage from redbanded stinkbugs. Many other soybean acres reported quality damage from redbanded stinkbugs, as well as from delayed harvest. Asian soybean rust continues to be a threat in Louisiana, although its presence so far has not resulted in major yield losses.

Despite the struggles of 2016, the soybean industry was able to generate a gross farm value of \$554.7 million. Gross farm value of soybeans in Louisiana was \$554,416,153 in 2016, up from \$546.6 million in 2015, a 1.4 percent increase on 15 percent fewer acres. Value added from cleaning and processing soybeans in Louisiana contributed \$97.1 million, and resulted in \$651.8 million in total economic contributions to the state's economy.

Sugarcane

In 2016, sugarcane was grown on 431,342 acres in 23 Louisiana parishes. An estimated 414,089 acres were available for harvest for sugar, assuming that approximately 4 percent of the total acres were used for seed cane.

The 11 operating raw sugar factories in the state processed nearly 12.82 million tons of cane. In total, the 11 factories produced 1.578 million short tons of sugar (96 pol). The average field yield of cane was 31.8 tons/acre. The average sugar recovery set a new record at 246 pounds of sugar (96 pol) per ton of cane. The yield of commercially recoverable sugar produced per acre averaged 7,621 pounds. Although the pricing period is not completed for the 2016 crop, the average price for raw sugar set at \$0.25 per pound. Molasses price was estimated to average \$108 per short ton at 79.5° Brix.

The gross farm value of the 2016 sugarcane crop was \$496 million for sugar and molasses. The gross farm value reported above represents 60 percent of the value of the sugar, and 50 percent of the value of molasses produced. The remaining percentages are for processing and marketing, which amounted to \$338 million. Therefore, the total value of the sugarcane crop to Louisiana producers, processors and landlords at the first processing level was \$834 million.

Cane yield for the 2016 crop was lower than expected. Lower tonnage was likely the result of damage from the wet harvest of 2015, followed by a growing season that experienced high rainfall (90.54 inches at the Baton Rouge Airport). Conversely, recoverable sugar per ton of cane was excellent and partially offset the lower cane yield. The yield of sugar per acre was third best in the history of the Louisiana industry and above the 10-year average for the state. Dry weather during late September through November were ideal for harvesting. No freezes were experienced during the harvest season.

The 2016 sugarcane variety census showed a new leading variety for Louisiana producers, L 01-299, which was grown on 36 percent of the state's acreage. HoCP 96-540 continued to be widely grown in the state and occupied 30 percent of the acreage. This was followed by L 01-283 (12 percent), and HoCP 04-838 (10 percent). HoCP 09-804 was released in 2016, and seed-cane was distributed by the American Sugar Cane League.

Sweet Potatoes

Louisiana sweet potato acreage has remained constant the past couple of years. Producers planted 9,303 acres of sweet potatoes in 2016 and 9,440 acres in 2015. Acreage in 2014 was 8,494. Louisiana remained fourth in sweet potato production acreage in the United States behind North Carolina, Mississippi and California.

Producers dealt with many weather related crop issues in 2016. Wet conditions caused delays in getting seed potatoes bedded for slip production. Some beds

were flooded during rain events in the early spring. Wet conditions that persisted made beds difficult to manage. These conditions delayed timely plant cutting and grooming operations. Transplanting continued into early July due to a late wet spell that occurred the latter part of June. Rain events prior to harvest during August and September caused a significant amount of the crop to breakdown in the field. Field losses ranged from 20-100 percent in production fields depending on location. Besides extreme wet conditions in the early spring and pre-harvest period, other issues producers dealt with were weed problems with yellow and purple nutsedge and pigweed. There was a major insect issue with cucumber beetles this production season. Sweet potato producer's pest control measures are limited on the fact that there are few registered herbicides or insecticides for sweet potato.

A large percentage of the Louisiana sweet potato acreage is being marketed on the processing market for sweet potato fries or other products due to a favorable price structure currently. Some growers are marketing their entire production acreage under field contracts, while some market a percentage of acreage to processors, while maintaining some traditional fresh market acreage. As the processing demand and price remains favorable, more Louisiana acreage will move toward this market simply because of the economics. Production and packing cost for sweet potatoes in Louisiana are estimated to be in the \$4,000-\$4,500 range per acre in 2016. Cost of production for processing potatoes utilizing a bulk harvester is estimated at \$2,300 per acre before storage cost are incurred. Growers that store potatoes for processing generally have contracts with storage options added to cover this cost.

Weather conditions at harvest reduced the yield of sweet potatoes by approximately 30-35 percent state wide. In 2015, the state average was estimated at 450 bushel per acre. The 2016 yield estimate is 337 bushel per acre. There were concerns even after harvest in wet conditions how well the potatoes will hold up in storage and the quality of pack out. Estimated prices for 2016 was \$18.00 for a 40 pound box of U.S. No. 1's, \$9.00 for U.S. No. 2's and Jumbos was in the \$9.00 price range. Frozen processors paid a price of \$16-\$24/cwt. Producers received a \$5-\$8/cwt for canner grade sweet potatoes.

Louisiana currently produces three major varieties of sweet potato. They are Beauregard, Orleans, and Bayou Belle. Orleans performed consistently better than Beauregard in commercial fields and research trials during 2016. Orleans is expected to gradually replace Beauregard acreage over the next few years in both the fresh market and frozen processing sector.

Sweet potatoes are marketed year round. Producers, shippers and brokers are interested in maintaining a year round supply to meet the consumer needs. In addition to the fresh market demand, there has been an increase in demand for consumer-friendly sweet potato products such as sweet potato fries, canned sweet potatoes, sweet potato chips, cookies, pet food and juice extracts. Growth in value-added use and markets for producers is expected to increase the demand for sweet potatoes. The growth is expected to result in acreage increases in the sweet potato production areas of the southeastern United States.

Total gross farm value for sweet potatoes is estimated at \$43.5 million for 2016. Total value of sweet potato production, including value added of \$32.6 million, was \$76.1 million in 2016.

Vegetables, Commercial

Although Louisiana does not rank in the top U.S. vegetable producing states, we do produce a diverse number of crops on small acreage. Our producers grow anywhere from 1 to 30 different types of vegetables on farms ranging from 1 to 100 acres in size. Many of the farms are only 1 to 3 acres in size. The majority

of Louisiana grown vegetables are marketed through roadside stands, farmers markets, CSA's and directly sold to restaurants and grocery stores. A few producers sell on the wholesale market. Louisiana vegetable growers meet annually. In an effort to assist producers in increasing production efficiency and profitability, the LSU AgCenter partners with the Louisiana Fruit and Vegetable Growers' Association (LFVGA) in hosting a producer field day. Here producers can obtain a wealth of information to bring back to their operation. Currently, the LFVGA consists of roughly 100 farmer members.

Producers experienced fairly typical conditions for most of the spring and summer growing seasons experiencing average temperature and rainfall levels. That changed quickly, however, as south Louisiana received record flooding in August 2016 damaging many vegetable crops. The difficulties associated with the flooding in August only added to the traditional issues of tremendous insect and disease pressure.

In 2016, thirty-one vegetable crops were produced. Tangipahoa continues to be one of the top producing vegetable parishes in terms of mixed vegetable crops. Washington, Bienville and Union parishes are the top 3 watermelon growing regions in the state. The top three vegetables in terms of numbers of acres produced throughout the state included watermelon (1,375 acres), southern peas (742 acres) and sweet corn (451 acres). In terms of gross farm value, the top three vegetable crops in Louisiana for 2016 were watermelon (\$13.2 million), tomatoes (\$6.2 million), and mustard (\$3.3 million). Other vegetable crops that had significant farm gate values in 2016 were okra (\$3.1 million), bell peppers (\$2.4 million), and southern peas (\$1.9 million).

The gross farm value of all commercial vegetable sales in the state were \$45.2 million in 2016. Combined with value-added activities (\$60.9 million), the total value of Louisiana commercial vegetable production for 2016 was \$106.2 million.

Wheat

In 2016, 82 producers harvested an estimated 15,783 acres of wheat in Louisiana. This was down significantly from the 91,816 acres and 283 producers in 2015. This reduction in acres is a continuation of a downward trend in acreage and overall wheat production in the state over the past several years. Lower wheat prices, inclement weather during planting, and increased concerns over the potential of late-season Fusarium head scab all have contributed to this downward trend.

Despite having to deal with unfavorable weather conditions and head scab epidemics again in 2016, yields were able to rebound in 2016. Yields were estimated to average 52.1 bushels per acre in 2016, up from 39.6 bushels in 2015. Late-season Fusarium head scab epidemics dramatically impacted the 2016 crop. While the head scab epidemics in 2015 and 2016 were some of the most severe experienced in recent history, more favorable weather conditions in 2016, particularly at harvest, helped to prevent a total collapse in yields as was the case in 2015.

Unfortunately, in addition to the production challenges in 2016, producers also had to deal with drastically lower prices. Growing world supplies and lower demand from the export market led to prices falling by nearly 32 percent in 2016. Lower production and lower prices helped push the gross farm value of wheat production in 2016 down to \$2.9 million from \$19.2 million in 2015. When value-added activities of \$520,746 are added, the total economic impact of the 2016 wheat crop is estimated at \$3.5 million, nearly 85 percent below the 2015 value.

2016 PROGRESS REPORT

Animal Commodities

Commodity	Gross Farm Value	Value Added	Total Value
Cattle and Calves	\$427,139,387	\$53,392,423	\$480,531,810
Milk	\$36,482,582	\$58,736,957	\$95,219,539
Horses	\$377,106,000	\$41,481,660	\$418,587,660
Poultry	\$821,244,828	\$800,713,707	\$1,621,958,535
Rabbits	\$164,785	\$17,302	\$182,087
Quail/Pheasant	\$43,332	\$4,767	\$48,099
Sheep	\$882,600	\$101,499	\$984,099
Goats	\$1,837,317	\$229,665	\$2,066,982
Swine	\$1,253,642	\$156,705	\$1,410,347
Exotic Animals	\$79,275	\$8,324	\$87,599
Total	\$1,666,233,748	\$954,843,009	\$2,621,076,757

Fisheries and Wildlife Commodities

Commodity	Gross Farm Value	Value Added	Total Value
Aquaculture	\$344,449,380	\$232,503,332	\$576,952,712
Freshwater Fisheries	\$11,421,593	\$9,993,894	\$21,415,487
Marine Fisheries	\$282,092,903	\$275,040,580	\$557,133,483
Fur Animals	\$16,217	\$4,054	\$20,271
Alligators (wild)	\$9,647,758	\$5,306,267	\$14,954,025

** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.

*** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.*

*** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.*

*** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.*

** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. A another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.

** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.

** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.

** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.

** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.

** The marine, freshwater and oyster data presented here are for the year 2014 rather than 2015. Release of fisheries landings data by the collecting agencies occurs 4-5 months after the fact. Another reporting system was used in previous years, so this year's data are not directly comparable to that of previous years.

PRICES OF COMMODITY PRODUCTS

The gross farm value of the commodities reported in the parish tables was computed based upon estimated annual per-unit prices. The state average prices listed below were used for most parishes for most commodities. However, a parish price was used if the parish price was significantly different from the state price.

PLANT ENTERPRISES COMMODITIES
