Technical Report No. 52

ACKNOWLEDGMENT

Many people are responsible for reporting and recording the statistical data on the Great Lakes fisheries. The development of the system for collecting data on the Great Lakes fisheries was begun by Dr. John Van Oosten in 1926 with the cooperation of the State of Michigan Department of Natural Resources. Ralph Hile further developed the system and Howard Buettner is presently responsible for maintenance of the system. The quality and completeness of the data arise from the honesty and cooperativeness of Michigan commercial fishermen. These data could not be obtained without the cooperation and assistance of the State of Michigan Department of Natural Resources.

INTRODUCTION

Extensive yield and effort data have been collected for the State of Michigan Great Lakes commercial fisheries. All fishermen fishing in the Michigan waters of the Great Lakes are required to submit each month a form which lists the yield by species and the fishing effort. These data have been collected since 1929 for 20 different statistical districts of the upper Great Lakes. Similar data are collected by other states and the province of Ontario.

In this report yield and effort data for the four most important commercial fisheries in Michigan are summarized. These fisheries are the lake whitefish (Coregonus clupeaformis) fishery, the lake trout (Salvelinus namaycush) fishery, the lake herring (Coregonus artedii) fishery, and the chub (Coregonus spp.) fishery. In the original records yield and effort are reported by month. In this summary annual yield in pounds is listed. Yield is reported for each major gear type. For a description of the gear types see Hile (1962). The "other catch" column is yield for gears other than the main types of gear or yield for which gear type was not reported.

STATISTICAL DISTRICTS

Fishing conditions in the Great Lakes are diverse, so the Great Lakes were separated into several statistical districts. The boundaries of the 20 statistical districts of the State of Michigan waters in the upper Great Lakes are shown in Figure 1. The boundaries of the statistical districts are precisely defined by Smith et al. (1961).

Hile (1962) listed the criteria for establishing these districts as: 1) a district must be large enough so that yield-effort data can be based on a substantial yield, 2) a district should be as homogeneous as possible, and 3) boundaries should be such that they are easily identified so fish caught in one district are not reported in a different district.

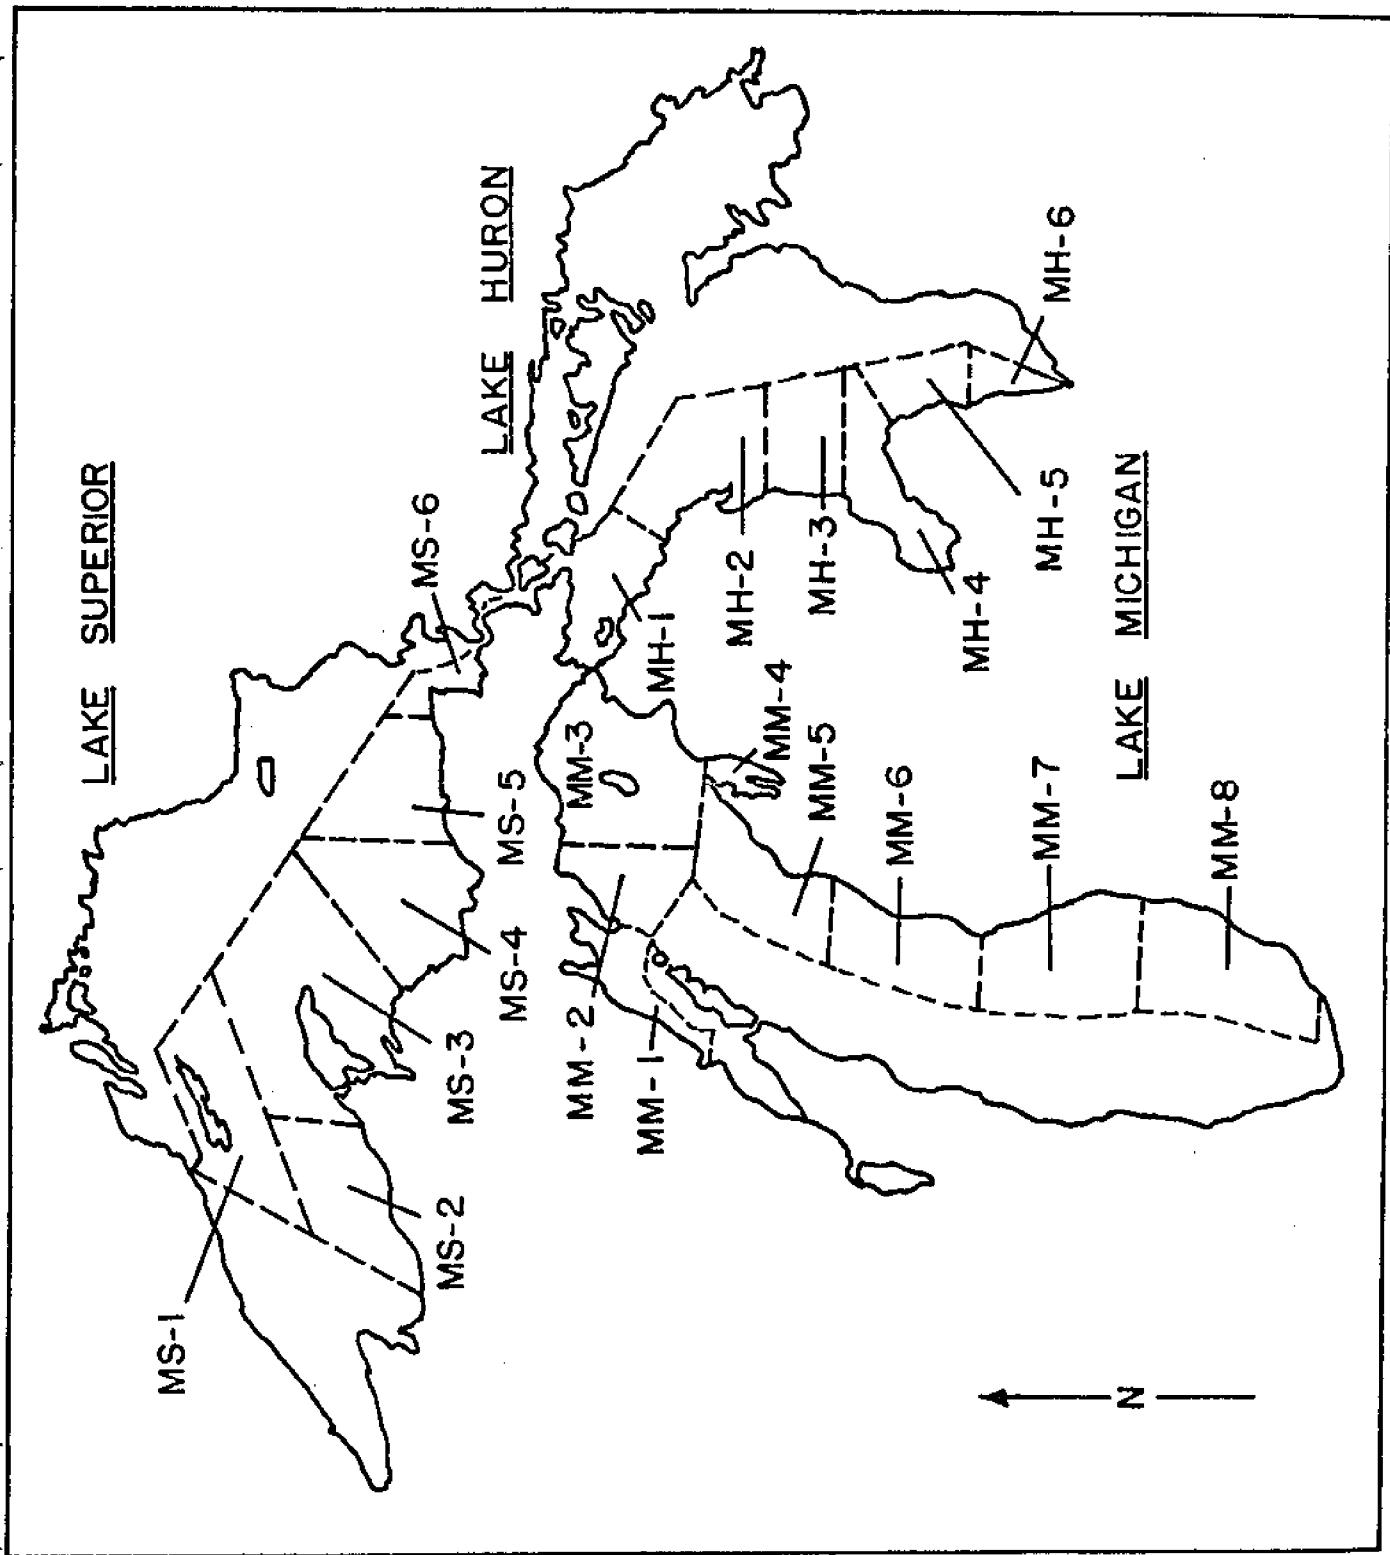

Figure 1. Statistical districts of the Michigan waters of the upper Great Lakes.

FISHING EFFORT

A unit of fishing effort has been established for each gear type (Hile, 1962):

Gill Nets: One unit of effort is the lift of 1000 linear feet of gill netting.

Impounding nets (pound nets, deep trap nets, and shallow trap nets):

One unit of effort is the lift of one net.

Hooks: One unit of effort is the lift of 1000 hooks.

All gear lifted by a fisherman on a particular day is charged to each species taken.

Technically, fishing effort is fishing power times the duration of fishing. The "effort" data recorded for the Great Lakes fisheries are really a measure of fishing power. The effect of the duration of power was studied by Hile (1962). He concluded that yield increased with increased fishing time. However, the increase in yield was far less than proportional and because of the limited variation in fishing time its effect was insignificant.

In some cases the fishing effort for a particular gear was not reported; for simplicity the fishing effort is printed out as zero. A true zero fishing effort occurs only if no yield is also reported.
