

MAY - 2 2013

To All Interested Government Agencies and Public Groups:

Under the National Environmental Policy Act, an environmental review has been performed on the following action.

TITLE: Finding of No Significant Impact and Environmental Assessment: Fishing Restrictions and Observer Requirements in Purse Seine Fisheries for 2013 and 2014; RIN 0648-BC87

LOCATION: Area of Application of the Convention on the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean

SUMMARY: The National Marine Fisheries Service (NMFS) is promulgating a rule to implement certain provisions adopted by the Commission for the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean. The specific provisions are part of the "Conservation and Management Measure for Bigeye, Yellowfin and Skipjack Tuna in the Western and Central Pacific Ocean" (CMM 2012-01) and include the following: (1) limits on fishing effort by U.S. purse seine vessels in the U.S. exclusive economic zone and on the high seas; (2) restrictions on the use of fish aggregating devices (FADs); and (3) requirements for U.S. purse seine vessels to carry observers.

NMFS prepared an Environmental Assessment (EA) that analyzed three action alternatives for implementing the purse seine provisions of CMM 2012-01, as well as the No-Action Alternative. Each of the action alternatives includes a different variation of the fishing effort limits. NMFS identified two variations for implementing the Fish Aggregating Device (FAD) restrictions, which were incorporated into the three action alternatives. NMFS identified only one manner of implementing the observer requirements, so all the action alternatives include identical observer requirements. Alternative 1 is the No-Action Alternative. Alternative 2 includes the most restrictive fishing effort limits as well as the FAD restrictions prohibiting fishing on FADs during certain periods. Alternative 3 includes the fishing effort limits based on past regulatory precedent, and FAD restrictions prohibiting fishing on FADs and setting on fish that have aggregated in association with a vessel during certain periods. Alternative 4 includes the least restrictive fishing effort alternative as well as FAD restrictions prohibiting fishing on FADs during certain periods. The rule implements Alternative 3, which includes neither the most restrictive nor the least restrictive fishing effort limits, but rather, is based on similar fishing effort limits established in past regulations. The FAD restrictions under Alternative 3 are expected to serve CMM 2012-01's objective of reducing the tuna stocks' fishing mortality rates through seasonal prohibitions on the use of FADs better than the variation for this element of the rule considered under Alternatives 2 and 4.

RESPONSIBLE

OFFICIAL: Michael D. Tosatto
Regional Administrator, Pacific Islands Region
National Marine Fisheries Service, National Oceanic and Atmospheric
Administration (NOAA)
1601 Kapiolani Boulevard, Suite 1110
Honolulu, HI 96814
(808) 944-2200; Fax (808) 973-2941

The environmental review process led us to conclude that this action will not have a significant impact on the environment. Therefore, an environmental impact statement was not prepared. A copy of the finding of no significant impact (FONSI), including the EA, is enclosed for your information.

Although NOAA is not soliciting comments on this completed EA/FONSI, we will consider any comments submitted that would assist us in preparing future NEPA documents. Please submit any written comments to the Responsible Official named above.

Sincerely,

A handwritten signature in blue ink, appearing to read 'Patricia A. Montanio', is positioned above the printed name.

Chapter 1

Chapter 1 Introduction and Purpose and Need

This Environmental Assessment (EA) has been prepared pursuant to the provisions of the National Environmental Policy Act (NEPA; 42 U.S.C. § 4321, *et seq.*) and related authorities, such as the Council on Environmental Quality's (CEQ) Regulations for Implementing the Procedural Provisions of NEPA (40 CFR Parts 1500-1508) and the National Oceanic and Atmospheric Administration's (NOAA) Environmental Review Procedures for Implementing NEPA (NAO 216-6).

At its Ninth Regular Session, in December 2012, the Commission for the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean (Commission or WCPFC) adopted Conservation and Management Measure (CMM) 2012-01, "Conservation and Management Measure for Bigeye, Yellowfin and Skipjack Tuna in the Western and Central Pacific Ocean." Among other provisions, CMM 2012-01 includes provisions for the management of purse seine fisheries operating in the western and central Pacific Ocean (WCPO). The National Marine Fisheries Service (NMFS) is promulgating a rule to implement the provisions of CMM 2012-01 for the U.S. purse seine fleet operating in the WCPO that need to be implemented via regulations at this time. These provisions include the following: (1) limits on fishing effort by U.S. purse seine vessels in the U.S. exclusive economic zone (EEZ) and on the high seas; (2) restrictions on the use of fish aggregating devices (FADs); and (3) requirements for U.S. purse seine vessels to carry observers.

1.1 Background

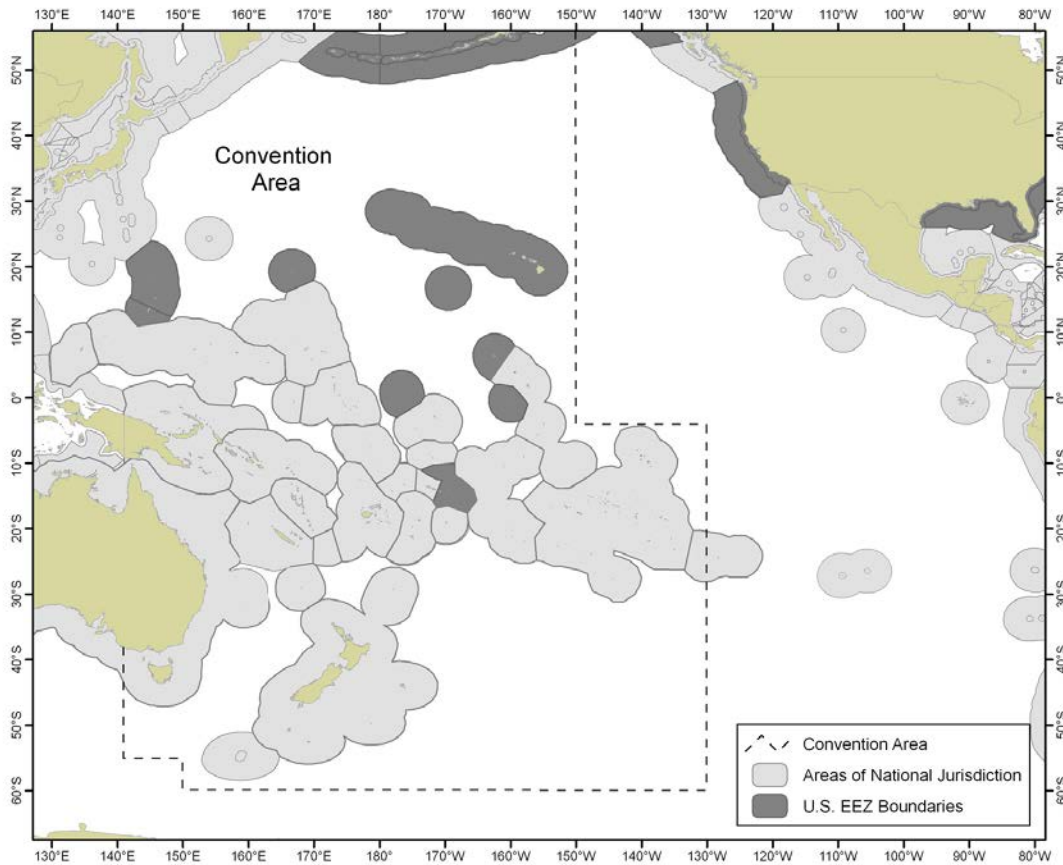

The United States ratified the Convention on the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean (Convention) in 2007.¹ The area of application of the Convention (Convention Area) is shown in Figure 1.

The Convention text indicates that the agreement is focused on highly migratory fish species (HMS) and stocks thereof within the Convention Area (see the Convention text for the specific HMS covered).² The Convention provides for the conservation and management of target stocks, non-target species, and species belonging to the same ecosystem or dependent upon or associated with the target stocks.

¹ The Convention was opened for signature in Honolulu on September 5, 2000, and entered into force in June 2004; the Convention entered into force for the United States in 2007. The full text of the Convention is available at: <http://www.wcpfc.int/key-documents/convention-text>.

² Though not stated in the Convention text, it has also been agreed that southern bluefin tuna (*Thunnus maccoyii*) that are found in the Convention Area will continue to be solely managed by the Commission for the Conservation of Southern Bluefin tuna.

Figure 1: The Convention Area - high seas (in white); U.S. EEZ (in dark gray); and foreign jurisdictions (“claimed maritime jurisdictions,” in light gray).

Source: NMFS.

The WCPFC – among other things – adopts Conservation and Management Measures (CMMs) for Commission Members, Cooperating Non-Members, and Participating Territories (collectively referred to as CCMs) of the WCPFC to implement through their respective national laws and procedures. The Western and Central Pacific Fisheries Convention Implementation Act (WCPFCIA; 16 USC 6901 *et seq.*), authorizes the Secretary of Commerce, in consultation with the Secretary of State and the Secretary of the Department in which the Coast Guard is operating, to develop such regulations as are needed to carry out the obligations of the United States under the Convention. The authority to promulgate regulations to implement the provisions of the Convention and WCPFC decisions, such as regulations to implement CMMs, has been delegated by the Secretary of Commerce to NMFS.

CMM 2012-01 contains specific provisions, identified as interim measures, for purse seine, longline, and other commercial fisheries for calendar year 2013. The rule analyzed in this EA would implement the applicable provisions for the U.S. purse seine fishery in the WCPO. NMFS is implementing the applicable provisions for U.S. longline fisheries in a separate rulemaking, consistent with the approach NMFS has used to implement

similar CMMs, which are discussed in more detail below. NMFS has determined that the provisions for other commercial fisheries do not apply to U.S. fleets.

The stated general objective of CMM 2012-01 is to ensure that compatible measures for the high seas and EEZs are implemented so that the stocks of bigeye, yellowfin and skipjack tuna in the WCPO are, at a minimum, maintained at levels capable of producing their maximum sustainable yield as qualified by relevant environmental and economic factors. The CMM includes specific objectives for each of the three stocks: for each, the fishing mortality rate is to be reduced to or maintained at levels no greater than the fishing mortality rate associated with maximum sustainable yield. CMM 2012-01 is the most recent in a series of WCPFC CMMs for the management of the principal tuna stocks in the WCPO.

Earlier WCPFC CMMs for tropical tuna management, which contained provisions for purse seine fisheries and which NMFS implemented via rulemaking, include CMM 2008-01, “Conservation and Management Measure for Bigeye and Yellowfin Tuna in the Western and Central Pacific Ocean,” and CMM 2011-01, “Conservation and Management Measure for temporary extension of CMM 2008-01.” CMM 2008-01 set forth specific provisions for purse seine fisheries for the years 2009, 2010, and 2011, which NMFS implemented in 2009 (see final rule published August 4, 2009, in 74 FR 38544; hereafter 2009 rule). Due to a change in meeting schedule, in December 2011, the WCPFC adopted an intersessional decision to extend the provisions of CMM 2008-01 until the WCPFC met in March 2012. NMFS implemented that intersessional decision for the U.S. purse seine fleet operating in the WCPO through an interim rule in 2011 (see interim rule published December 30, 2011 in 76 FR 82180; hereafter 2011 rule). Adopted in March 2012, CMM 2011-01 extended the majority of the provisions of CMM 2008-01 through the end of 2012. Given that the 2011 rule extended the applicable provisions of CMM 2011-01 for the U.S. purse seine fleet through 2012, there was no need for NMFS to take additional regulatory action to put into place the measures of CMM 2011-01 for purse seine fisheries. The provisions of CMM 2008-01 for U.S. longline fisheries were implemented in a separate rulemaking in 2009 and the provisions of CMM 2011-01 for U.S. longline fisheries were implemented in a separate rulemaking in 2012.

The specific NMFS regulations to implement the WCPFC CMMs described above for the U.S. WPCO purse seine fleet expired on December 31, 2012, and included the following:

- specific limits on the number of fishing days that may be spent by the U.S. purse seine fleet on the high seas and in areas under U.S. jurisdiction (including the U.S. EEZ);
- specific FAD restrictions;
- closure of specific areas of the high seas to U.S. purse seine fishing;
- a requirement that U.S. purse seine vessels retain on board all bigeye tuna, yellowfin tuna, and skipjack tuna up to the point of first landing or transshipment, with certain exceptions; and
- observer requirements for U.S. purse seine vessels.

CMM 2012-01 has provisions that are similar to the previous CMMs, with some modifications to those provisions. This 2013 rulemaking (hereafter 2013 U.S. purse seine rule) includes implementation of three of the five provisions listed above: (1) limits on fishing effort by U.S. purse seine vessels in the U.S. EEZ and on the high seas; (2) restrictions on the use of FADs; and (3) requirements for U.S. purse seine vessels to carry observers. The other two provisions listed above are not being implemented in the 2013 U.S. purse seine rule because CMM 2012-01 does not contain provisions for the closure of specific areas of the high seas to U.S. purse seine fishing, and because the catch retention provisions are already in effect. In a separate final rule, issued in December 2012 and effective on January 2, 2013, NMFS removed the December 31, 2012, termination date of the catch retention requirements (see final rule published December 3, 2012, in 77 FR 71501).

Prior Environmental Analysis

NMFS prepared an EA, “Environmental Assessment for the Implementation of the Decisions of the Fifth Regular Annual Session of the Commission for the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean: Fishing Restriction and Observer Requirements in Purse Seine Fisheries for 2009-2011 and Turtle Mitigation Requirements in Purse Seine Fisheries and Bigeye Tuna Catch Limits in Longline Fisheries in 2009, 2010, and 2011” (hereafter 2009 EA), which analyzed the impacts of the 2009 rule on the human environment. This EA incorporates the 2009 EA by reference.³

In the 2009 EA, NMFS analyzed four action alternatives,⁴ as well as the No-Action Alternative. NMFS concluded that all of the alternatives would have similar effects, with the main distinction between the action alternatives being the manner of application of the fishing effort limit. NMFS determined that all of the action alternatives analyzed in the 2009 EA would have minor beneficial effects or no effects on resources in the affected environment.

1.2. Purpose and Need

The purpose of the 2013 U.S. purse seine rule is to implement the provisions of CMM 2012-01 for the U.S. WCPO purse seine fleet that are necessary to implement via regulations in 2013 in a timely and practical manner, in order to contribute to the underlying objectives of CMM 2012-01 regarding WCPO bigeye tuna, yellowfin tuna and skipjack tuna, which are to reduce or maintain their respective fishing mortality rates at levels no greater than the fishing mortality rates associated with maximum sustainable

³ The 2009 EA (combined with the Finding of No Significant Impact) is available at <http://www.regulations.gov/#!docketDetail;D=NOAA-NMFS-2009-0108>.

⁴ These alternatives are described in more detail in Chapter 2 of this EA.

yield. The need for the rule is to satisfy the international obligations of the United States as a Contracting Party to the Convention, pursuant to the authority of the WCPFCIA.

1.3 Organization of This Document

The following is a brief description of the remaining chapters of this EA:

Chapter 2 provides detailed discussion of the proposed action and the development of action alternatives for detailed analysis. The chapter also discusses the No-Action Alternative and the alternatives initially considered but excluded from detailed analysis.

Chapter 3 describes the U.S. purse seine fishery in the WCPO and the physical environment and biological resources that could be affected by the implementation of the proposed action under any of the action alternatives.

Chapter 4 analyzes the direct and indirect environmental effects that could be caused by the implementation of the proposed action under any of the action alternatives analyzed in depth, as well as the direct and indirect effects of the No-Action Alternative, and compares the effects of the alternatives.

Chapter 5 analyzes the potential cumulative impacts that could result from the implementation of the proposed action under any of the action alternatives analyzed in depth, as well as the No-Action Alternative.

This EA is being issued in conjunction with the proposed 2013 U.S. Purse Seine Rule, which will be subject to a public review and comment period. Although comments are not being solicited on the EA, any comments received that pertain to matters in the EA will be considered, as appropriate.

Chapter 2 Proposed Action and Alternatives

In an environmental review document, agencies must assess the environmental impacts of a proposal and the reasonable and feasible alternatives to the proposal in comparative form. The purpose of this comparison of alternatives is to provide the decisionmaker and the public with a clear basis for choosing among the alternatives.⁵

This chapter provides a description of the proposed action analyzed in this EA and the alternative means of implementing the proposed action. The chapter also includes a description of the No-Action Alternative (i.e., the existing conditions and the conditions that would result if the proposed action were not implemented under any of the action alternatives).

2.1 *Proposed Action*

The proposed action is the promulgation of the 2013 U.S. purse seine rule to implement certain provisions of CMM 2012-01 for U.S. purse seine vessels operating in the WCPO.

The proposed action would include three elements, all applicable within the Convention Area between 20° N. and 20° S. latitude for the 2013 and 2014 calendar years: (1) limits on fishing effort, measured in terms of fishing days, on the high seas and in the U.S. EEZ for the 2013 and 2014 calendar years; (2) FAD restrictions on the high seas and in the U.S. EEZ in 2013 and 2014; and (3) a requirement to carry observers on all trips in 2013 and 2014, with certain exceptions.

Sections 2.2 to 2.4 include a description of each of these elements and alternative ways to implement each element. Section 2.5 combines the various identified alternatives for each of the elements to develop three action alternatives that are analyzed in detail, along with the No-Action Alternative, in this EA. Section 2.6 provides a discussion of the alternatives initially considered but excluded from detailed analysis.

Duration of the Rule

The “interim” measures of CMM 2012-01 are applicable for 2013. The CMM also calls for the WCPFC to adopt a new CMM for bigeye, yellowfin, and skipjack tuna during its next regular annual session, in December 2013. The new CMM would be a multi-year management program for 2014-2017 that is designed to achieve the management objectives for the three stocks that are set out in CMM 2012-01. Under section 505(a) of the WCPFC Implementation Act, NMFS is authorized to promulgate such regulations as may be necessary to carry out the United States’ international obligations under the Convention. It is foreseeable that the new CMM would include some of the same provisions for purse seine vessels as those included in CMM 2012-01. Thus, NMFS is

⁵ See the CEQ’s Regulations for Implementing the Procedural Provisions of NEPA at 40 CFR §1502.14.

proposing to implement the 2013 U.S. Purse Seine Rule for 2014 as well as 2013, as it believes this is the most effective way to ensure that the United States satisfies its international obligations under the Convention for 2014. Implementing the rule for both 2013 and 2014 would also serve to provide early public notice that the regulations would remain the same in 2014 unless the purse seine provisions of the new CMM differ from those in CMM 2012-01. Once the WCPFC adopts a new CMM, NMFS would take any steps necessary to implement the WCPFC's decision(s).

2.2 Development of Fishing Effort Limit Alternatives

In the 2009 EA, NMFS identified various methods for implementing the fishing effort limits for the U.S. WCPO purse seine fleet. First, the effort limits could be applied by: (1) allocating the effort limits among vessels (i.e., each vessel would be allocated a specific portion of the overall effort limit based on some established criteria); or (2) having no allocation of the effort limits, so all vessels would compete for the available fishing days under a single fleet-wide – competitive – limit. Second, the effort limits could be applied by: (1) having a single combined effort limit that applies to both of the applicable areas (high seas and U.S. EEZ); or (2) separate effort limits for the high seas and U.S. EEZ. Third, given that the rule was for the period 2009-2011, the effort limits also could be set in several alternative temporal terms so that days could be borrowed from the limits of past and future years, or they could be fixed so that no borrowing could take place: (1) on an annual basis, and/or (2) a multiple-year basis. In either case, but particularly the former, they could be set for the calendar year or be put on some other “limit-year” schedule – given the fleet is managed on licensing periods that run from June 15th to June 14th of the following year. NMFS analyzed four different variations of the fishing effort limits in the 2009 EA that represented a reasonable range of alternatives. These alternatives included the following:

- (1) Combined effort limits for the high seas and the U.S. EEZ, effort limits not allocated within the fleet (meaning a competitive scheme whereby fishing days are available to all vessels until the fleet-wide cap is reached), and different time scales for the limits (separate but overlapping three-year, two-year, and one-year limits) (analyzed as part of Alternative B).
- (2) Combined effort limits for the high seas and the U.S. EEZ, effort limits allocated to individual vessels in some manner, and different time scales for the limits (separate three-year, two-year, and one-year limits) (analyzed as part of Alternative C).
- (3) Separate effort limits for the high seas and for the U.S. EEZ, effort limits not allocated within the fleet, meaning on a competitive basis, and limits applied on a single-year basis (analyzed as part of Alternative D).
- (4) Combined effort limit for the high seas and the U.S. EEZ, effort limit allocated on a competitive basis, and one limit implemented for the entire three-year period, rather than having separate one-year limits or different time scales for the limits (analyzed as part of Alternative E).

The provisions of CMM 2012-01 pertaining to the purse seine fishing effort limits differ in some respects from those in CMM 2008-01. CMM 2008-01 specified that the effort limits for the high seas must be the number of days fished in 2004 or the average number of days fished in the period from 2001-2004, and that the effort limit in the U.S. EEZ should be compatible with the effort limits on the high seas. CMM 2012-01 specifies that each CCM shall take measures not to increase fishing days on the high seas and to establish effort limits or equivalent catch limits in its EEZ that reflect the geographical distributions of skipjack tuna, yellowfin tuna, and bigeye tuna, and that are consistent with the WCPFC's management objectives for those species. In addition, the purse seine effort limit provisions in CMM 2012-01 are specified only for the year 2013, and the purse seine effort limit provisions in CMM 2008-01 for a three-year period (2009-2011).

NMFS has developed three alternatives to implement the purse seine fishing effort provisions of CMM 2012-01 for detailed consideration in this EA. They are as follows:

2.2.1 Lowest Levels from Years in which Data are Available with Separate Limits for the High Seas and U.S. EEZ (Most Restrictive Alternative)

NMFS examined available logbook data on fishing effort of the U.S. WCPO purse seine fleet from 1997-2010. The 2009 EA relied on logbook data from 1997-2007 to show the recent fishing effort of the fleet. For consistency with the approach used in the 2009 EA, NMFS is using the logbook data, updated through 2010, to formulate the fishing effort limits (see Table 1 in Chapter 3 of this EA).⁶ During the 1997-2010 period, the year with the least amount of fishing effort in both the U.S. EEZ and on the high seas was 2010. In that year, the fleet of 37 vessels fished for a total of 25 days in the U.S. EEZ and 400 days on the high seas, or an average of 0.7 fishing days⁷ per vessel in the U.S. EEZ and 10.8 fishing days per vessel on the high seas. These per-vessel levels of fishing effort were extrapolated to account for the number of fishing opportunities available under the South Pacific Tuna Treaty,⁸ or 40 vessels (the same as the baseline number of vessels

⁶ These data are for the same period and from the same source as used in the 2009 EA to calculate the fishing effort limits, with numbers included for 2008, 2009, and 2010. Although data for 2011 and 2012 are available to NMFS, the source of such data is different, and thus, NMFS believes data for the years 2011 and 2012 would not be appropriate to use for the analysis in this EA at this time.

⁷ For the purposes of the 2009 rule and this 2013 U.S. purse seine rule, a fishing day is defined as any day in which a fishing vessel of the United States equipped with purse seine gear searches for fish, deploys a FAD, services a FAD, or sets a purse seine, with the exception of setting a purse seine solely for the purpose of testing or cleaning the gear and resulting in no catch.

⁸ As discussed in more detail in Chapter 3 of this EA, the U.S. purse seine fleet operating in the WCPO is, for the most part, managed by the United States under the authority of the Treaty on Fisheries between the Governments of Certain Pacific Islands States and the Government of the United States of America (South Pacific Tuna Treaty or SPTT; 16 U.S.C. 973-973r).

used to derive the proposed fishing effort limits for the United States, established in the 2009 rule, as set forth in the 2009 EA). This results in 27 fishing days in the U.S. EEZ and 433 fishing days on the high seas. Thus, this alternative would include an effort limit of 27 fishing days for the U.S. EEZ and an effort limit of 433 fishing days for the high seas for each of the calendar years 2013 and 2014.

2.2.2 Past Regulatory Precedent Alternative

This alternative would include a combined total limit of 2,588 fishing days for the high seas and U.S. EEZ for each of the calendar years 2013 and 2014. This is the same baseline effort limit for a one-year period that NMFS implemented in 2009 for the years 2009-2011 (and as extended by the 2011 rule for the year 2012), and thus, this alternative would maintain the effort limits established by NMFS for the preceding four years for one-year periods. The limits in 2009-2012 were implemented as overlapping multi-year limits, so the limit for any given year was 3,882 fishing days, for a two-year period was 6,470 fishing days, and for a three-year period was 7,764 fishing days. The one and two year limits were aimed at avoiding unduly long closed periods, while ensuring that the overall limit of 7,764 fishing days (three times the base limit of 2,588 fishing days), would not be exceeded in any three-year period.

2.2.3 Highest Levels from Years for which Data are Available with Combined Limit for the High Seas and U.S. EEZ (Least Restrictive Alternative)

As stated above, NMFS examined logbook data on fishing effort of the U.S. WCPO purse seine fleet from 1997-2010. The highest annual level of effort in the U.S. EEZ on an average per-vessel basis was 41.4 days in 1997 and the highest annual level of effort on the high seas on a per vessel basis was 57.2 days in 2005. Extrapolating for the number of fishing opportunities available under the SPTT, or 40 vessels (the same as the baseline number of vessels used to derive the proposed fishing effort limits established in the 2009 rule, as set forth in the 2009 EA), the number would be 1,655 fishing days in the U.S. EEZ and 2,288 fishing days on the high seas, or a total of 3,943 fishing days combined for the U.S. EEZ and high seas for each of the calendar years 2013 and 2014.

2.3 Development of Alternatives for FAD Restrictions

In the 2009 EA, NMFS identified one alternative for implementing the FAD restrictions, which was the same for each of the action alternatives analyzed (Alternative B, Alternative C, Alternative D, and Alternative E). This alternative was a two-month period in 2009 (from August 1 through September 30) and a three-month period in 2010 and 2011 (from July 1 through September 30), as set forth in CMM 2008-01, during which FAD restrictions were in effect.

NMFS has identified two alternatives for implementation of the FAD restrictions for the 2013 U.S. purse seine rule. One alternative would be a four-month period from July 1 through October 31 in 2013 and 2014 during which FAD restrictions would be in effect. The second alternative would be a four-month period from July 1 through October 31 in 2013 and 2014 during which FAD restrictions would be in effect, as well as restrictions during the same period on setting on fish that have aggregated in association with a vessel. This second alternative has been developed to address the fish aggregating properties of fishing vessels.

2.4 Development of Observer Coverage Provision Alternatives

In the 2009 EA, NMFS identified one alternative for implementing the observer coverage provisions, which was the same for each of the action alternatives analyzed (Alternative B, Alternative C, Alternative D, and Alternative E). That alternative required U.S. purse seine vessels to carry observers deployed as part of the WCPFC's Regional Observer Programme (ROP) on all trips in the Convention Area during the 2009 period of FAD restrictions (August 1 through September 30, 2009) and on all trips in the Convention Area in 2010 and 2011, unless the trip took place exclusively within areas under the jurisdiction of the United States or any other single nation, as set forth in CMM 2008-01.⁹ NMFS has identified one alternative for implementation of the purse seine observer coverage provisions that is similar to the alternative analyzed in 2009. The main difference is that observer coverage also would be required for trips that take place exclusively in the U.S. EEZ.

CMM 2012-01 includes a provision requiring each coastal CCM to require that all purse seine vessels – that is, purse seine vessels of any flag – fishing in the Convention Area between the latitudes of 20° N. and 20° S. latitude solely within the jurisdiction of the coastal CCM carry an observer (not necessarily a WCPFC-approved observer). Currently, no foreign purse seine fishing vessels are authorized to fish in the U.S. EEZ in the Convention Area, and no such authorizations are foreseeable during the duration of 2013 U.S. Purse Seine Rule. Therefore, NMFS does not see any need to include a requirement in the rule that foreign purse seine vessels that fish in the U.S. EEZ must carry observers. However, the rule would require U.S. purse seine vessels to carry observer when fishing exclusively in the U.S. EEZ.

Under the 2013 U.S. Purse Seine Rule, U.S. purse seine vessels would be required to carry observers deployed as part of the ROP on all trips in the Convention Area in 2013

⁹ Although the limitation of the observer requirements to the area between 20° N. and 20° S. latitude was not specifically discussed in the 2009 EA, this limitation was included in the 2009 rule, as specified in CMM 2008-01.

and 2014.¹⁰ These observer requirements would not apply to trips that take place in areas outside the area between 20° N. and 20° S. latitude.¹¹

2.5 *Alternatives for the U.S. Purse Seine Rule Considered in Detail*

The alternatives for the 2013 U.S. purse seine rule analyzed in depth in the EA are designated by number and are described in detail below. The alternatives represent a reasonable range of alternatives that combine the alternative methods of implementing the three elements of the rule (fishing effort limits, periods during which restrictions on fishing on FADs would be in effect, and observer coverage provisions), as set forth above.

2.5.1 Alternative 1: The No-Action Alternative to the 2013 U.S. Purse Seine Rule

Alternative 1, the No-Action Alternative to the U.S. Purse Seine Rule, would cause no changes to “the status quo” and would result in conditions that are treated as the baseline for the purposes of assessing the impacts of the other alternatives. The inclusion of the No-Action Alternative serves the important function of facilitating comparison of the effects of the action alternatives and is a required part of a NEPA document. Under Alternative 1, the U.S. WCPO purse seine fishery would continue to be managed under existing laws and regulations, which are described in Chapter 3, Section 2.1. In effect up to 40 vessels licensed by FFA¹² under the SPTT would continue to fish in the manner in which operations have occurred for the past 25 years, though the SPTT is currently subject to renegotiation and it is foreseeable that there will be substantive changes to the management of the U.S. WCPO purse seine fleet in 2013 or 2014. In addition, the fleet would be subject to certain NMFS regulations that implement decisions of the WCPFC,

¹⁰ Although the provisions of CMM 2012-01 do not specify that the observers carried on trips within a single EEZ must be WCPFC observers, NMFS has identified only two observer programs that would be used as sources of observers to satisfy this requirement – the Pacific Islands Forum Fisheries Agency (FFA) observer program and the NMFS observer program. Currently, both these programs are authorized by the WCPFC as part of the ROP, so observers deployed by these two programs are considered WCPFC observers.

¹¹ The 2013 U.S. Purse Seine Rule also would not require U.S. purse seine vessels to carry observers when fishing exclusively in water under the jurisdiction of a single foreign nation. However, in that situation, the foreign nation might have its own observer requirements that apply to the U.S. vessel. Furthermore, U.S. regulations at 50 CFR 300.214 require that if a U.S. fishing vessel with a WCPFC Area Endorsement or for which a WCPFC Area Endorsement is required is used for fishing for HMS in the Convention Areas in areas under the jurisdiction of a CCM other than the United States, the owner and operator of the vessel must ensure that the vessel is operated in compliance with the applicable laws of such CCM, including any laws related to carrying observers.

¹² An additional five vessel licenses are available for joint venture operations with Pacific Island Parties to the SPTT.

including permit endorsement requirements, specific reporting requirements, prohibitions on at-sea transshipments, sea turtle take mitigation requirements, catch retention requirements and observer requirements. Vessels in the U.S. WCPO purse seine fleet are also currently required to carry WCPFC observers on all trips in the WCPFC Convention Area pursuant to the general WCPFC observer requirements at 50 CFR 300.215, even though the regulations implementing CMM 2008-01 and CMM 2011-01's observer requirements for purse seine fisheries expired on December 31, 2012. The fleet is also subject to observer coverage requirements under the SPTT. The fleet would also be subject to permitting requirements under NMFS regulations implementing the High Seas Fishing Compliance Act (HSFCA; 16 U.S.C. § 5501, *et seq.*) as well as NMFS regulations implementing the Fishery Ecosystem Plan (FEP) for Pacific Pelagic Fisheries of the Western Pacific Region (Pelagics FEP), pursuant to the Magnuson-Stevens Fishery Conservation and Management Act (MSA; 16 U.S.C. § 1801 *et seq.*). All of these regulations are discussed in more detail in Section 3.2 of this EA.

2.5.2 Alternative 2: Most Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Under Alternative 2, the U.S. WCPO purse seine fleet would be subject to the following requirements, as detailed below.

Fishing Effort Limit

Under Alternative 2, in the Convention Area between 20° N. and 20° S. latitude, there would be a limit of 27 fishing days in the U.S. EEZ and a separate limit of 433 fishing days on the high seas for each of the calendar years 2013 and 2014 for the U.S. purse seine fleet.

Use of FADs

Under Alternative 2, in the Convention Area between 20° N. and 20° S. latitude, the FAD restrictions would be in effect from July 1 through October 31 (four months) in each of the years 2013 and 2014.

Observer Requirements

Under Alternative 2, U.S. purse seine vessels would be required carry WCPFC observers on all trips in the Convention Area in 2013 and 2014 in the areas between 20° N. and 20° S. latitude.

2.5.3 Alternative 3 (Preferred): Past Regulatory Precedent Fishing Limit Alternative; FAD Prohibition Period Including Prohibition on Fishing on FADs and Prohibition on Setting on Fish that Have Aggregated in Association with a Vessel

Under Alternative 3, the U.S. WCPO purse seine fleet would be subject to the following requirements, as detailed below. Alternative 3 is the agency's preferred alternative at this time, for reasons discussed in the preamble to the proposed rule.

Fishing Effort Limit

Under Alternative 3, in the Convention Area between 20° N. and 20° S. latitude, there would be a combined limit of 2,588 fishing days for the high seas and U.S. EEZ for each of the calendar years 2013 and 2014.

Use of FADs

Under Alternative 3, in the Convention Area between 20° N. and 20° S. latitude, FAD restrictions would be in effect from July 1 through October 31 (four months) in each of the years 2013 and 2014 as well as restrictions on setting on fish that have aggregated in association with a vessel.

Observer Requirements

Under Alternative 3, the observer coverage requirements would be identical to those under Alternative 2.

2.5.4 Alternative 4: Least Restrictive Fishing Effort Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Under Alternative 4, the U.S. WCPO purse seine fleet would be subject to the following requirements, as detailed below.

Fishing Effort Limit

Under Alternative 4, in the Convention Area between 20° N. and 20° S. latitude, there would be a combined limit of 3,943 fishing days for the high seas and U.S. EEZ for each of the years 2013 and 2014.

Use of FADs

Under Alternative 4, the FAD restrictions would be identical to those under Alternative 2.

Observer Requirements

Under Alternative 4, the observer coverage requirements would be identical to those under Alternative 2.

2.6 Alternatives Initially Considered But Excluded From Detailed Analysis

NMFS initially considered additional alternatives for the fishing effort limit provisions and the FAD restrictions that have been excluded from detailed analysis in this EA. These alternatives are discussed below.

2.6.1 Excluded Alternatives for Fishing Effort Limits

As stated above, CMM 2012-01 specifies that each CCM shall take measures not to increase fishing days on the high seas and to establish effort limits or equivalent catch limits in its EEZ that reflect the geographical distributions of skipjack tuna, yellowfin tuna, and bigeye tuna, and that are consistent with the WCPFC's management objectives for those species. The management regime for the tuna purse seine fisheries in the WCPO has focused on a system of fishing effort limits (vessel-fishing day limits) or input-based control, rather than catch limits or output-based control, and it is unclear how such effort limits could be converted to "equivalent catch limits" for the U.S. purse seine fleet. Thus, absent more specific guidance or requirements adopted by the WCPFC on implementation of catch limits for purse seine vessels, NMFS believes the only reasonable approach is to continue management of the U.S. purse seine fleet via effort limits at this time, and has excluded consideration of catch limits for the U.S. purse seine fleet from detailed analysis in this EA.

In the 2009 EA, NMFS considered an alternative for the allocation of the effort limits among individual purse seine vessel in some manner. As indicated in the 2009 EA, this alternative would have no real difference from other fishing effort limit alternatives that could cause impacts on resources in the affected environment, other than perhaps decreasing the likelihood of a race to fish that could be caused by competitive, fleet-wide limits. Given the complexity of setting up such an allocation scheme (which would require consideration of such things as which entities are to receive allocations, the

criteria for making allocations, and whether and how the allocations would be transferable, as well as developing a mechanism to reliably monitor the fishing effort of the individual entities), NMFS believes it is not feasible to develop such an allocation scheme for this rulemaking in 2013. Because this alternative would not be feasible to implement in 2013, NMFS is excluding detailed consideration of this alternative in this EA. Moreover, NMFS believes that it is not practical to conduct detailed analysis of this alternative at this time for 2014, given that any potential management changes to the fleet under the SPTT are not known in any detail at the current time due to the status of the ongoing renegotiation proceedings. The SPTT and the related economic assistance agreement between the United States and certain Pacific Islands is currently subject to renegotiation and it is foreseeable that there will be substantive changes to the management of the U.S. WCPO purse seine fleet in 2013 or 2014. However, the nature and details of any such changes are unknown at this time. Should NMFS decide to consider implementation of such an alternative in 2014 or beyond, NMFS would conduct any needed analysis of this alternative at the appropriate time. As set forth in Chapter 1 of this EA, the purpose of the 2013 U.S. purse seine rule is to implement the provisions of CMM 2012-01 for the U.S. WCPO purse seine fleet that are necessary to implement via regulations in 2013 in a timely and practical manner, in order to contribute to the underlying objectives of CMM 2012-01 regarding WCPO bigeye tuna, yellowfin tuna and skipjack tuna, which are to reduce or maintain their respective fishing mortality rates at levels no greater than the fishing mortality rates associated with maximum sustainable yield. The need for the rule is to satisfy the international obligations of the United States as a Contracting Party to the Convention, pursuant to the authority of the WCPFCIA. The alternative of allocating fishing effort limits among individual vessels does not meet the purpose of and need for the 2013 U.S. purse seine rule and is a complex matter that does not lend itself to a timely assessment for this regulatory effort.

2.6.2 Excluded Alternatives for FAD Restrictions

CMM 2012-01 requires CCMs to prohibit their purse seine vessels from setting on FADs in EEZs and on the high seas in the Convention area between 20° N. and 20° S. latitude from July 1 through September 30. The CMM further requires CCMs to either prohibit setting on FADs in October or limit the total number of FAD sets in the calendar year by the CCM's purse seine fleet to two-thirds of the fleet's average annual number in the 2001-2011 period, as specified in Attachment A of CMM 2012-01 (for a CCM that is a Small Island Developing State, the total annual limit on FAD sets would be eight-ninths of its fleet's 2009-2012 annual average). For the U.S. purse seine fleet, the calendar-year limit would be 1,464 FAD sets. Assuming that fishing patterns in 2013 would be similar to those in recent years, and because the limit-year would start January 1, the 2013 limit of 1,464 FAD sets would be expected to be reached as early as April 2013. It is infeasible for NMFS to complete the rulemaking process that would be necessary to establish the limit and the legal mechanism to prohibit further FAD sets once the limit is reached before April, the date the fleet would likely reach the FAD set limit. Furthermore, NMFS finds that it would not be feasible to establish by that time the mechanism needed to monitor FAD sets with respect to the limit and to reliably project when the limit is likely

to be reached so that further FAD sets can be prohibited in a timely manner. For example, a system would have to be established for rapidly processing data collected from vessel observers and/or masters and for using those data to project future levels of FAD sets in advance of actually reaching the limit. Thus, the option of limiting the annual number of FAD sets would likely result in the mandated limit for 2013 being exceeded, and the United States would have failed to satisfy its international obligations with respect to the purse seine provisions of CMM 2012-01. Because the option of limiting the number of annual FAD sets would be infeasible to implement for 2013, and the United States would consequently fail to satisfy its international obligations under the Convention, this option is not considered in detail.

NMFS believes that implementing a limit on the total annual number of FAD sets for the U.S. WCPO purse seine fleet may be a viable option in the future, should the WCPFC adopt similar provisions that would be effective after 2013. However, NMFS believes that it is not practical to conduct detailed analysis of this alternative at this time for 2014, given the potential for significant management changes to the fleet from the ongoing renegotiations of the SPTT. As stated above, the SPTT and the related economic assistance agreement between the United States and certain Pacific Islands is currently subject to renegotiation and it is foreseeable that there will be substantive changes to the management of the U.S. WCPO purse seine fleet in 2013 or 2014. However, the nature and details of any such changes are unknown at this time. It is likely that implementation of a limit on FAD sets for the U.S. fleet for 2014 and beyond would need to take into consideration any new provisions of the SPTT (e.g., limits on fishing days, license numbers, areas of fishing allowed). Thus, should the WCPFC adopt similar provisions for limiting FAD sets that would be effective in 2014 and beyond, NMFS would conduct the analysis of this alternative at the appropriate time. As set forth in Chapter 1 of this EA, the purpose of the 2013 U.S. purse seine rule is to implement the provisions of CMM 2012-01 for the U.S. WCPO purse seine fleet that are necessary to implement via regulations in 2013 in a timely and practical manner, in order to contribute to the underlying objectives of CMM 2012-01 regarding WCPO bigeye tuna, yellowfin tuna and skipjack tuna, which are to reduce or maintain their respective fishing mortality rates at levels no greater than the fishing mortality rates associated with maximum sustainable yield. The need for the rule is to satisfy the international obligations of the United States as a Contracting Party to the Convention, pursuant to the authority of the WCPFCIA. The alternative for the limit on FAD sets for 2013 does not meet the purpose of and need for the 2013 U.S. purse seine rule.

Chapter 3 Affected Environment

This chapter describes the physical and biological environment in which the U.S. purse seine fishery operates in the WCPO, focusing on the resources that could be affected by the implementation of 2013 U.S. purse seine rule. The chapter is divided as follows: (1) physical environment and climate change; (2) description of the U.S. WCPO purse seine fleet; (3) bigeye tuna, skipjack tuna, and yellowfin tuna – the principal stocks associated with the U.S. purse seine fishery in the WCPO; (4) other biological resources; and (5) protected resources.

3.1 *Physical Environment and Climate Change*

The physical reach of the Convention Area (as shown in Chapter 1), comprises all waters of the Pacific Ocean bounded to the south and to the east by the following line: from the south coast of Australia due south along the 141° meridian of east longitude to its intersection with the 55° parallel of south latitude; thence due east along the 55° parallel of south latitude to its intersection with the 150° meridian of east longitude; thence due south along the 150° meridian of east longitude to its intersection with the 60° parallel of south latitude; thence due east along the 60° parallel of south latitude to its intersection with the 130° meridian of west longitude; thence due north along the 130° meridian of west longitude to its intersection with the 4° parallel of south latitude; thence due west along the 4° parallel of south latitude to its intersection with the 150° meridian of west longitude; thence due north along the 150° meridian of west longitude.

Below is a description of the specific physical environment in which the WCPO U.S. purse seine fishery occurs and how physical features of the pelagic environment, as well as the distribution of HMS, influence the fishery.

3.1.1 Oceanography

There are two main subtropical gyres (the North Pacific subtropical gyre in the northern hemisphere and the South Pacific subtropical gyre in the southern hemisphere) in the Pacific Ocean, as well as other major Pacific Ocean currents.

Subtropical gyres rotate clockwise in the northern hemisphere and counter clockwise in the southern hemisphere in response to trade and westerly wind forces. Due to this, the central Pacific Ocean (~20° N. -20° S. latitude) experiences weak mean currents flowing from east to west, while the northern and southern portions of the Pacific Ocean experience a weak mean current flowing from west to east. Embedded in the mean flow are numerous mesoscale eddies (turbulent or spinning flows on scales of a few hundred kilometers (Stewart 2005)) created from wind and current interactions with the ocean's bathymetry. These eddies, which can rotate either clockwise or counter clockwise, typically have important biological impacts, such as creating areas of high biological productivity.

Ocean eddies create vertical fluxes, with regions of divergence (upwelling) where the thermocline shoals and deep nutrients are pumped into surface waters enhancing phytoplankton production, and also regions of convergence (downwelling) where the thermocline deepens. The edges of eddies, where the mixing is greatest, are often targeted by fishermen as these are areas of high biological productivity.

The subtropical frontal zones, consisting of several convergent fronts, lie between latitudes 25°- 40° N and S, and are often referred to as the Transition Zones. Transition zones are areas of ocean water bounded to the north and south by large-scale surface currents originating from subarctic and subtropical locations (Polovina et al. 2001). These zones also provide important habitat for pelagic fish and thus, are targeted by fishers.

Variability within the ocean-atmosphere system results in changes in winds, rainfall, currents, water column mixing, and sea-level heights, which can have profound effects on regional climates as well as on the abundance and distribution of marine organisms. In the tropical Pacific there is a limited seasonal variation, yet there is a strong interannual variability which in turn affects the entire Pacific Ocean (Langley et al. 2004).

The scientific community has become increasingly aware of the occurrence and importance of long-term (decadal-scale) oceanographic cycles and of their relationship to cycles in the population sizes of some species of fish (Chavez et al. 2003). These naturally occurring cycles can either mitigate or accentuate the impact of fishing mortality on all species, especially those targeted in HMS fisheries. El Niño Southern Oscillation (ENSO)¹³ events, including meso-scale events, such as El Niño and La Niña, and shorter term phenomena such as cyclonic eddies near the Hawaiian Islands (Seki et al. 2002), impact the recruitment and fishing vulnerability of HMS. ENSO events can cause considerable interannual physical and biological variation. During an El Niño, the normal easterly trade winds weaken, resulting in a weakening of the westward equatorial surface current and a deepening of the thermocline in the central and eastern equatorial Pacific. In turn, the eastward-flowing countercurrent tends to dominate circulation, bringing warm, low-salinity, and low-nutrient water to the eastern margins of the Pacific Ocean. As the easterly trade winds are reduced, the normal nutrient-rich upwelling system does not occur, leaving warm surface water pooled in the eastern Pacific Ocean (EPO).

¹³ ENSO events include the full range of variation observed between El Niño and La Niña events. El Niño is characterized by a large-scale weakening of the tradewinds and warming of the surface layers in the eastern and central equatorial Pacific. El Niño events occur irregularly at intervals of 2–7 years, although the average is about once every 3–4 years. These events typically last 12–18 months, and are accompanied by swings in the Southern Oscillation, an interannual “see-saw” in tropical sea level pressure between the eastern and western hemispheres. During El Niño, unusually high atmospheric sea level pressures develop in the western tropical Pacific and Indian Ocean regions, and unusually low sea level pressures develop in the southeastern tropical Pacific. During La Niña, the opposite effects are seen (NMFS 2004).

El Niño affects the ecosystem dynamics in the equatorial and subtropical Pacific by considerable warming of the upper ocean layer, rising of the thermocline in the western Pacific and lowering in the east, strong variations in the intensity of ocean currents, low trade winds with frequent westerlies, high precipitation at the dateline, and drought in the western Pacific (Sturman and McGowan 1999). El Niño events have the ability to exercise a strong influence on the abundance and distribution of organisms within marine ecosystems. The deepening of the mixed layer depth that occurs with an El Niño may be manifested by a discernable increase in purse seine catch per unit of effort (CPUE) of yellowfin tuna in the central/western regions of the Pacific. This is normally seen after a 2-3 month delay and occurs in the eastern portion of the WCPO in the vicinity of Kiribati and the U.S. EEZ of the central Pacific (Howland, Baker, Jarvis etc.). During a strong El Niño, the purse seine fishery for skipjack tuna shifts over thousands of kilometers from the western to the central equatorial Pacific in response to physical and biological impacts (Lehodey et al. 1997).

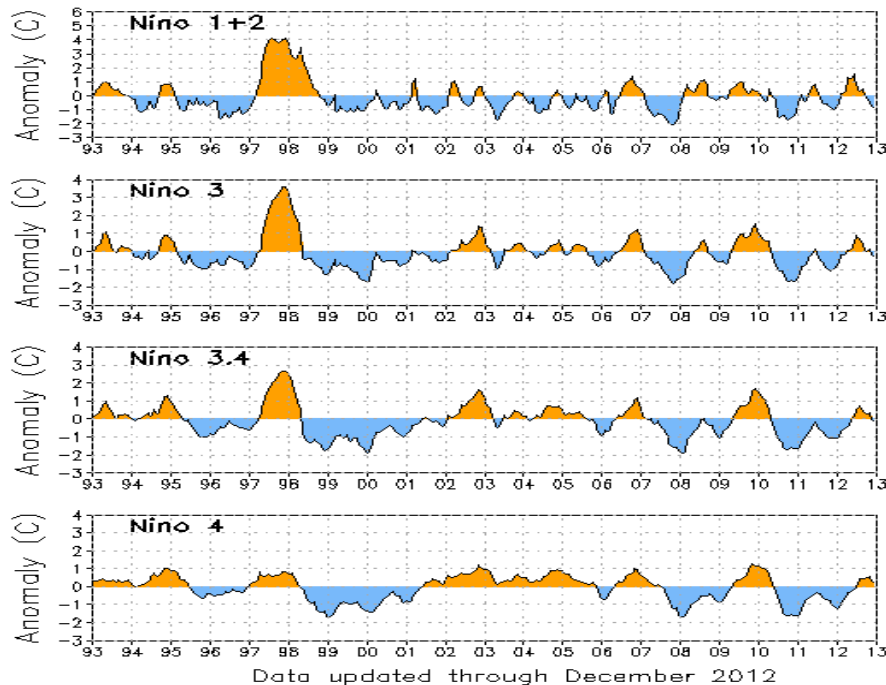

A La Niña event exhibits the opposite conditions: cooler than normal sea-surface temperatures in the central and eastern tropical Pacific Ocean. These may have larger impacts on global weather patterns. For the purse seine fishery the contraction of the warm pool tends to shift fishing to the western portion of the WCPO in the vicinity of Papua New Guinea and Federated States of Micronesia, or away from the U.S. EEZ and those areas to the north of American Samoa. The major change is a horizontal extension or contraction of the skipjack tuna habitat during El Niño and La Niña phases respectively.

Physical and biological oceanographic changes have also been observed on decadal time scales. These low frequency changes, termed regime shifts, can impact the entire ocean basin. These impacts can lead to potential impacts on the tropical Pacific fisheries for tunas such as the extension of present fisheries to higher latitudes, a decrease in productivity, mainly in the eastern Pacific, increasing variability in the catches, changes in species composition of the catch, and increasing fishing pressure, particularly on bigeye and yellowfin tuna (The World Bank 2000).

Figure 2 below shows sea surface temperature anomalies for different regions of the Pacific Ocean for the years 1993-2012. The regions are as follows: (1) Nino 1+2 is the extreme eastern equatorial Pacific between 0° to 10°S latitude and 90° to 80°W longitude; (2) Nino 3 is the eastern equatorial Pacific between 5°N to 5°S latitude and 150°W to 90°W longitude; (3) Nino 3.4 is the east-central equatorial Pacific between 5°N to 5°S latitude and 170°W to 120°W longitude; and (4) Nino 4 covers the international date line and is from 5°N to 5°S latitude and 160°E to 150°W longitude. Anomalies refer to variations from the monthly mean sea surface temperatures during the base period (1981-2010).¹⁴

Figure 2: Sea Surface Temperature Indices of ENSO Patterns from 1993 to 2012.

3.1.2 Climate Change

Climate change can affect the marine environment by impacting the established hydrologic cycle (a change in precipitation and evaporation rates) (Bala et al. 2010). This in turn may cause a shift in food web dynamics, such as a reduction in primary productivity, which affects HMS migration and distribution (Dambacher et al. 2010, Loukos et al. 2003). Climate change has been associated with other effects to the marine environment, including rising oceanic temperatures, changes in ice cover, salinity, oxygen levels, and circulation (Intergovernmental Panel on Climate Change 2007). These effects are leading to shifts in the range, abundance, and behaviors of algae, plankton, fish and other sea life (Solomon et al. 2007). Coral reefs are also being damaged through ocean acidification and sea level rise (Carpenter et al. 2008, Mayfield et al. 2012, Munday et al. 2012). There are many predictions pertaining to the rate of change and potential maximums of sea level rise but studies indicate the change is caused by rising global temperatures and ice melt (Rahmstorf 2007). Sea level changes could potentially damage the nesting, breeding, foraging, and migratory sites of coastal marine sea birds (Galbraith et al. 2002) and other vertebrate megafauna such as pinnipeds and chelonioidea (Baker et al. 2006).

Climate change is also increasing the incidence of disease in aquatic organisms (Roessig et al. 2004, Hoegh-Guldberg and Bruno 2010, Woesik et al. 2012) as well as the spread of invasive species (Hoegh-Guldberg and Bruno 2010). Studies on planktonic ecosystems demonstrate that climate change is affecting phytoplankton abundance and distribution, which in turn affects consumers ranging from zooplankton to megafauna (Hays et al. 2005). Changes in plankton affect ecosystem services such as oxygen production, carbon sequestration, and biogeochemical cycling (Edwards et al. 2010). All of these studies concluded that fish, seabirds, and marine mammals will need to adapt to shifts in spatial distribution of primary and secondary production within pelagic marine ecosystems (Hoegh-Guldberg and Bruno 2010, Dambacher et al. 2010).

Studies conducted by Perry et al. (2005) indicate that climate change is impacting marine fish distributions, which in turn may have important ecological impacts on fish as well as important impacts on commercial fisheries. How climate change can impact commercial fisheries include: (1) increases in ocean stratification leading to less primary production, which in turn leads to less overall energy for fish production; (2) decreases in spawning habitat from shifts in areas of well-mixed water zones leading to decreased stock sizes; and (3) changes in currents that may lead to changes in larval dispersals and retention, which could lead to decreases in stock sizes (Roessig et al. 2004).

Ainsworth et al. (2011) also investigate potential climate change impacts on commercially valuable species of fish, stimulating changes in (1) primary productivity; (2) species range shifts; (3) zooplankton community size structure; (4) ocean acidification; and (5) ocean deoxygenation. Climate change may also impact marine carrying capacity and relative suitable habitats for fish stocks, theoretically either positively or negatively affecting the levels of growth and survival of certain fish populations (Kaeriyama et al. 2012).

3.2 U.S. WCPO Purse Seine Fishery

U.S. purse seine vessels typically engage in targeting skipjack and to a lesser extent yellowfin tuna throughout the equatorial regions of the Convention Area. The U.S. WCPO purse seine fleet operates mostly in the EEZs of Pacific Island Countries (PIC) between 10° N and 10° S within the Convention Area (Figure 3).

Figure 3: The general operational area of the U.S. WCPO purse seine fishery (indicative only) in light blue. The red line demarks the Convention Area with the yellow line depicting the boundary of the Inter American Tropical Tuna Commission (IATTC), which generally exercises competence over HMS Fisheries in the EPO.

Source: NMFS unpublished data.

3.2.1 Fleet Characteristics

Gillett et al. (2002) provide a detailed description of the historical development and expansion of the U.S. WCPO purse seine fleet from its bases in the EPO. The U.S. fleet developed a year-round fishery along the Equator, generally within a rectangular area bounded by 10° N-10° S latitude and 135° E-170° E longitude, and encompassing the EEZs of Palau, Federated States of Micronesia, Papua New Guinea, Solomon Islands, Nauru, Marshall Islands, and the Gilbert Islands group of Kiribati. Fishing grounds continued to expand eastward throughout the 1980s, eventually encompassing the Phoenix and Line Islands (Kiribati); the U.S. possessions of Howland, Baker, and Jarvis; Tokelau; and the high seas between these EEZ areas. U.S. purse seiners typically target skipjack and yellowfin tuna found in association with drifting logs/flotsam or FADs and also unassociated free-swimming schools of tuna (“school sets”). The relative proportion of the different set types has varied considerably over time as oceanographic conditions and technology have changed.

Large modern purse seiners are one of the most complex fishing vessels in terms of both technology and machinery. Hydraulic systems on large “super seiners,” require more than 1,600 meters of piping, and are equipped with at least four auxiliary engines in addition to the main propulsion engine (or engines). The purse seine technique for catching tuna involves employing a net that is set vertically in the water, with floats attached to the upper edge and chains for weight on the lower edge. A series of rings is attached to the

lower edge of the net, and a pursing cable passes through the rings, enabling a winch on board the vessel to draw the net closed on the bottom. Purse seine nets can be up to 1,600 meters or more in length and 150 meters in depth. When the net is deployed from the purse seine vessel, a large skiff carrying the end of the net is released from the stern of the fishing vessel. The purse seine vessel encloses the school of tuna, keeping it in visual contact if on the surface, or using sonar if below the surface, and then retrieves most of the net onto the vessel. The fish are confined in the “sack” portion of the net, which consists of finer mesh webbing that prohibits their escape. The catch is removed from the sack onto the vessel with large “scoops” holding several metric tons (mt), and then is placed in brine tanks for freezing and later storage. Joseph (2002) and NMFS (2004) provide a detailed description of tuna purse seining and the fleets involved in the Pacific Ocean fisheries.

3.2.2 Management of the U.S. Purse Seine Fleet in the WCPO

The fishing activities of U.S. WCPO purse seine vessels are governed in large part by the SPTT. The SPTT manages access of U.S. purse seine vessels to the EEZs of Pacific Islands Parties to the SPTT and provides for technical assistance in the area of Pacific Island Country fisheries development. The SPTT is implemented domestically by regulations (50 CFR 300 Subpart D) issued under authority of the South Pacific Tuna Act of 1988 (SPTA; 16 U.S.C. 973-973r). As stated in Chapter 2 of this EA, the SPTT is being renegotiated, which very likely will result in changes to the current management regime. The HSFCA and implementing regulations (50 CFR 300 Subpart B), the WCPFCIA and implementing regulations (50 CFR 300 Subpart O), and regulations implementing the Pelagics FEP pursuant to MSA (50 CFR Part 665) also regulate this fishery. The main fishery management regulations established under the SPTA, HSFCA, WCPFCIA, and Pelagics FEP are:

- All U.S. vessels that fish (as defined under 50 CFR § 300.2) on the high seas are required to have a permit in accordance with the HSFCA and a WCPFC Area Endorsement, if fishing on the high seas in the Convention Area;
- A U.S. purse seine vessels operating in the WCPO must have a license issued by the FFA as Treaty Administrator on behalf of the Pacific Island Parties to the SPTT. The SPTT and implementing regulations provide for the availability of 45 licenses, five of which are only available to fishing vessels engaged in joint venture arrangements with the Pacific Islands Parties. No joint venture licenses have ever been issued.
- Within the SPTT Area there are several types of designated geographical areas, as described below:

1. The **Treaty Area** which is about 10 million square miles in size.

2. The **Licensing Area** where a license is required in order to fish.
3. **Closed Areas** are those in which U.S. purse seine vessels are not allowed to fish.
 - U.S. purse seine vessels are prohibited from transshipping fish at sea in the Convention Area and from transshipping fish caught in the Convention Area anywhere else;
 - A U.S. purse seine vessel cannot be used for directed fishing for southern bluefin tuna (*Thunnus maccoyii*) or for fishing for any kinds of fish other than tunas, except fish that may be caught incidentally;
 - Holders of vessel licenses are required to submit both written and electronic reports on their fishing activities in the Treaty Area to NMFS, the FFA or the local marine resource authority in which the vessel is operating;
 - U.S. purse seine vessels must carry observers and comply with provisions for accommodating observers;
 - U.S. purse seine vessels are required to carry and operate mobile transmitting units to provide position information and comply with Vessel Monitoring System (VMS) reporting requirements;
 - U.S. purse seine vessels are required to be identified in accordance with the 1989 United Nations Food and Agriculture Organization standard specifications for the marking and identification of fishing vessels, which requires that the vessel's international radio call sign be marked on the hull and deck;
 - U.S. purse seine vessels operating in the Convention Area must submit specific reports on transshipments, discards, and entries into and exit from a certain area of the high seas (i.e., Eastern High Seas Special Management Area; 50 CFR 300.225);
 - U.S. purse seine vessels fishing in the Convention Area must follow certain sea turtle interaction mitigation measures;
 - U.S. purse seine vessels must retain all catch of bigeye, yellowfin, and skipjack tuna, subject to certain exceptions; and
 - U.S. purse seine vessels equal to or greater than 50 feet (15.2 meters) in length overall generally cannot fish in a certain portion of the U.S. EEZ around American Samoa.

Pursuant to the terms of the SPTT, at least twenty percent of trips by the U.S. WCPO purse seine fleet must carry observers (see SPTT, Annex I, Part 7). Beginning in 2010, purse seine vessels were required to carry WCPFC observers on all trips under regulations implementing WCPFC CMM 2008-01(CFR 50 300.223), with certain exceptions. Those exceptions included: fishing trips that took place entirely within areas under U.S. jurisdiction or entirely within areas under the jurisdiction of a single nation other than the United States; fishing trips in the Convention Area not between 20°N. and 20°S. latitude; or when NMFS has determined that an observer is not available for the fishing trip and a written copy of the determination is on board the vessel.¹⁵ Although those specific observer coverage provisions implementing CMM 2008-01 expired at the end of 2012, pursuant to the regulations at 50 CFR 300.215, NMFS has directed vessels in the U.S. purse seine fleet operating in the Convention Area to carry observers on all trips.

Observers provide useful information that is independent of vessel operators and is obtained during actual fishing operations. Data typically collected by observers include catch composition by species, effort, location, environmental conditions, gear type, and information on bycatch. Observers deployed by FFA on U.S. WCPO purse seine vessels collect detailed information on bycatch and discards in the WCPO purse seine fishery and these data are routinely used to provide estimates of total bycatch and discards and the extent of interaction with species of special interest (e.g., marine mammals and turtles) (Secretariat of the Pacific Community (SPC) 2012b) and are employed for regional tuna stock assessments.

3.2.3 Participation, Effort, and Catch

As stated in Section 2.2 of this EA, the 2009 EA relied on logbook data from 1997-2007 to show the recent fishing effort of the fleet. For consistency with the approach used in the 2009 EA, NMFS is using the logbook data, updated through 2010, for the analysis in this EA.¹⁶ As shown in Table 1 below, the U.S. WCPO purse seine fleet spent, from

¹⁵ CMM 2012-01 includes provisions to require that all purse seine vessels – that is, purse seine vessels of any flag – fishing in the Convention Area between 20° N. and 20° S. latitude solely within the jurisdiction of the coastal CCM carry an observer. As explained in Chapter 2 of this EA, NMFS is implementing this provision for U.S. purse seine vessels when those vessels take trips solely within the U.S. EEZ. In addition, although the 2009 rule included an exception for fishing trips for which the NMFS Pacific Islands Regional Administrator had determined that a WCPFC observer is not available, provided that written documentation of such determination was carried on board the vessel during the entirety of the fishing trip, NMFS no longer believes that this exception is needed, and it is not included in the 2013 U.S. Purse Seine Rule. This exception was included in the 2009 rule because at that time it was not clear whether the observer providers in the region would be able to provide observers on all the required fishing trips made by U.S. purse seine vessels. The FFA observer program has now deployed observers on all fishing trips by the U.S. WCPO purse seine fleet for more than three years.

¹⁶ These data are for the same period and from the same source as used in the 2009 EA to calculate the fishing effort limits, with numbers included for 2008, 2009, and 2010. Although data for 2011 and 2012 are available to NMFS, the source of such data is different, and thus, NMFS believes data for the years 2011 and 2012 would not be appropriate to use for the analysis in this EA at this time.

1997 through 2010, about 6 percent of its effort in the U.S. EEZ, 22 percent on the high seas, and the remainder in the EEZs of Pacific Island Parties to the SPTT (unpublished NMFS data). The percentages for any given year during that period ranged from 1 percent to 21 percent for the U.S. EEZ, 5 percent to 30 percent for the high seas, and 60 percent to 94 percent for the EEZs of Pacific Island Parties to the SPTT. Figure 4 shows approximate effort data from 1997 through 2010 for the U.S. WCPO purse seine fleet (unpublished NMFS data) and Table 1 shows the effort data for the high seas, U.S. EEZ, and PIC EEZ regions for each of those years (unpublished NMFS data).

Participation in the U.S. WCPO purse seine fishery increased from the late 1980s to the mid-1990s, and gradually decreased until a low was reached in 2006. The fleet has since increased to about the levels of the mid 1990s, and has been relatively stable for the past five years. As of December 2012, the U.S. WCPO purse seine fleet included 39 vessels.

¹⁷ For the purposes of the 2009 rule and this 2013 U.S. purse seine rule, a fishing day is defined as any day in which a fishing vessel of the United States equipped with purse seine gear searches for fish, deploys a FAD, services a FAD, or sets a purse seine, with the exception of setting a purse seine solely for the purpose of testing or cleaning the gear and resulting in no catch.

¹⁸ Number of vessels indicates the total number of unique vessels contributing to the data for a given year.

The fleet is likely to operate at or near the 40 vessel level for the next two years. Figure 5 below shows the number of licensed vessels and the number of vessels that fished in the fleet from 1988 to 2012.

Figure 5: Number of U.S.-flagged purse seine vessels licensed and vessels fished under the SPTT from 1988 to 2012

Sources: Coan et al 2002; United States Coast Guard and NMFS 2013; and NMFS, unpublished data.

Skipjack tuna generally account for 70–77 percent of the purse seine catch, yellowfin tuna for about 19–22 percent, and bigeye tuna for a small proportion (<5 percent) (SPC 2012a). Table 2 shows the 2010 tuna landings of the fleet by species and port.

Historically, most of the U.S. WCPO purse seine fleet operated out of Pago, Pago, American Samoa. However, recently some of the vessels that have entered the fleet operate under a different business model, and transship most of their catch in Pacific Island ports in the region. In recent years, about 25 percent of the catch has been landed in Pago Pago.

Table 2: Tuna landings by U.S. WCPO purse seine vessels by species and port, 2010

2010	Tuna Landings (mt)			
PORT	Skipjack	Yellowfin and Bigeye	Total	%

Purse seine fishing effort in the WCPO cannot be characterized by any marked or documented seasonal patterns. As shown in Figure 6 below, over 70 percent of the U.S. purse seine fleet in the WCPO fished throughout the entire year from 1997 through 2008 and at least that in each of the years from 2009 through 2012. The percent of licensed vessels that fished in the years when the 2009 rule and 2011 rule were in effect was generally constant throughout the year.

Figure 6: Proportion of the WCPO U.S. purse seine fleet that fished, by month, 1997-2012.

Source: NMFS unpublished data.

As stated in Section 3.1 above, the spatial distribution of fishing effort is influenced by the (irregular) cycles associated with ENSO events, revealing strong temporal variation on the scale of years and decades. The distribution of catch by the WCPO purse seine fishery is also strongly influenced by ENSO events. Lehodey et al. (1997) and Lehodey et al. (1998) suggested that skipjack abundance is linked to east–west movements of warm water. El Niño conditions also produce unusual westerly winds and surface drift in the WCPO that transport drifting debris further eastward than usual. During these El Niño events, purse seine effort increases in the eastern portion of the fishery to take advantage of sets on debris, such as logs (Williams 2003).

Figure 7 depicts a good example of the U.S. purse seine effort during a transitional year between an El Niño and La Niña period (2001) and an El Niño period (2002). Effort in strong La Niña conditions normally shifts west of the vertical line indicating 160° E longitude.

Figure 7: Distribution of U.S. purse seine effort during 2001 and 2002. Lines for the Equator (0° latitude) and 160° E longitude included. The left-hand side of the figure shows effort during 2001 and the right-hand side shows effort during 2002.

Source: Williams 2003.

3.2.4 FADs

Fish aggregating devices, or FADs, are man-made devices or natural floating objects, anchored or not, capable of aggregating fish. FAD sets by purse seine fleets are generally composed of adult skipjack tuna, juvenile bigeye tuna, and juvenile yellowfin tuna (Dagorn, L. et al. 2012). Fishing on drifting FADs has also shown decreases in average size of target catch, increases in catches of bigeye, and increases in bycatch (Gillett et al. 2002) when compared to unassociated sets. FAD sets also show a more varied composition of catch.

As shown in Table 3, the WCPO purse seine fleet catches mostly skipjack and yellowfin tuna. Based on data compiled by SPC (SPC 2012a), FAD sets generally yield higher catch rates (mt/day) for skipjack tuna than unassociated sets. Data from SPC also indicates that unassociated sets generally yield a higher catch rate for yellowfin tuna than FAD sets. This may be explained from the occurrence of unassociated sets in the more eastern areas of the Convention Area containing “pure” schools of large, adult yellowfin, which account for a larger catch (by weight) than the (mostly) juvenile yellowfin encountered in FAD sets (SPC 2012a). As indicated in Table 3, almost all the WCPO purse seine catch of bigeye is from FAD sets. Table 3 shows the breakdown of catch by set type for the U.S. purse seine fleet for the years 2006-2010.

Table 3: Annual U.S. WCPO purse seine catch estimates in mt by set type (unassociated and FAD), 2006-2010 (data for 2010 are preliminary).

Year	Skipjack		Yellowfin		Bigeye		Totals
	Unass.	FAD	Unass.	FAD	Unass.	FAD	
2006	5,258	47,760	1,525	8,876	72	4,953	68,444
2007	13,041	58,829	3,733	8,540	98	4,495	88,736
2008	54,461	90,435	34,662	22,202	572	6,992	209,324
2009	87,820	137,455	17,585	27,798	1,351	9,579	281,588
2010	100,363	90,721	30,715	15,658	1,252	6,816	245,525
Total	260,943	425,200	88,220	83,074	3,345	32,835	893,617
5 year average	52,189	85,040	17,644	16,615	669	6,567	178,723

Source: SPC 2012a.

As indicated in Figure 8 below, from 1997 through 2010, FAD sets have at times accounted for more than 90 percent of all sets made by the fleet, and less than 30 percent of the sets in other years. There are likely many factors that cause this variability, all of which are not fully understood. However, some general determinates can be postulated: FADs provide a guaranteed location of fish (assuming they are marked with the appropriate electronic equipment) although the magnitude (mt) of the schools associated with FADs can vary considerably. Therefore in times of high relative fuel prices FADs provide a risk-adverse option for vessel operators. FAD sets that yield no tuna are limited while free unassociated sets have a much higher likelihood of sets with little or no catch. FADs provide a source of fish that may or may not be economic to operators – especially those that offload to canneries. Small skipjack along with juvenile yellowfin and bigeye tuna are very often associated with FADs or floating objects – however, not all fleets or operators can find markets for “small fish,” especially when ex-vessel price is low or fish demand is reduced. But in times of high fish demand when canneries are not rejecting fish based on size, FAD fishing presents an attractive scenario for many operators. On the other hand, although skipjack is the main target of the WCPO fishery, yellowfin tuna can provide an important component to vessel profitability given there is typically a premium paid for larger yellowfin, which are typically found in unassociated schools. Operators may be willing to search for these unassociated schools if fuel price is reasonable and fish can be found. However, if no school fish are available operators will fall back to the risk adverse or more assured FAD fishing. FADs provide some degree of certainty for an activity steeped in guesswork, risk, and probability.

Figure 8: FAD sets as proportion of all sets by U.S. WCPO purse seine fleet, 1997-2010.

NMFS unpublished data.

Figure 9 below shows FAD sets as a proportion of all sets by the U.S. WCPO purse seine fleet, by month, for the periods 1997-2008 and 2009-2010 – the FAD restrictions pursuant to CMM 2008-01 were in effect in 2009 and 2010.

3.3 *Bigeye Tuna, Skipjack Tuna, and Yellowfin Tuna*

Table 4 summarizes the current status of bigeye tuna, yellowfin tuna, and skipjack tuna stocks in the Pacific Ocean, as determined by NMFS. The table expresses overfishing and overfished status in terms of the status determination criteria specified in the relevant Fisheries Management Plans (FMPs) or FEPs, as required by the MSA. Stock status with respect to these two criteria is presented as reported in the NMFS quarterly stock status updates.

Table 4: Stock status summary of select highly migratory fish stocks in the Pacific Ocean for 2008¹⁹

Species	Stock	Overfishing?	Overfished?
Bigeye tuna (<i>Thunnus obesus</i>)	Pacific	Yes	No
Skipjack tuna (<i>Katsuwonus pelamis</i>)	western central Pacific	No	No
	eastern tropical Pacific	No	No
Yellowfin tuna (<i>Thunnus albacares</i>)	western central Pacific	No	No
	eastern tropical Pacific	No	No

Source: <http://www.nmfs.noaa.gov/sfa/statusoffisheries/SOSmain.htm>.

As shown in Table 4 above, using the MSA stock status determination criteria, overfishing is occurring on Pacific bigeye tuna but the bigeye tuna stock is not overfished (for the purpose of these status determinations bigeye tuna is considered a single pan-Pacific stock; however, most of the assessments upon which the determinations are based consider bigeye tuna as two stocks, one to the west of 150° W. longitude and one to the east). Neither skipjack tuna nor yellowfin tuna in the WCPO or EPO are subject to overfishing or determined to be overfished.

3.3.1 Bigeye Tuna (*Thunnus obesus*)

Several studies on the taxonomy, biology, population dynamics, and exploitation of bigeye tuna have been carried out, including comprehensive reviews by Collette and Nauen (1983), and Whitelaw and Unithan (1997). Miyabe (1994) and Miyabe and Bayliff (1998) reviewed the biology and fisheries for bigeye tuna in the Pacific Ocean. Information from these studies are presented here – but may not be specifically referenced.

The species is a mixture between a tropical and temperate water tuna, characterized by equatorial spawning, high fecundity, and rapid growth during the juvenile stage with movements between temperate and tropical waters during its life cycle.

Bigeye tuna are trans-Pacific in distribution, occupying epipelagic and mesopelagic waters of the Indian, Pacific, and Atlantic Oceans. The distribution of the species within the Pacific stretches between northern Japan and the north island of New Zealand in the western Pacific and from 40° N to 30° S in the eastern Pacific (Calkins 1980). Molecular analyses (Grewe et al. 1998) and tagging projects executed by the SPC (Langley et al. 2008) indicate that a single stock exists for Pacific bigeye tuna. Large, mature-sized bigeye tuna are sought by sub-surface fisheries, primarily longline fleets. Smaller,

¹⁹ As discussed in more detail below, the stock structure of bigeye tuna in the Pacific Ocean is not well known. The WCPFC has to date treated bigeye tuna in the WCPO as a single and entire stock, both in terms of stock assessments and management decisions. The WCPFC decisions manage bigeye tuna in the WCPO. The WCPFC decisions also manage yellowfin tuna and skipjack tuna in the WCPO and when the terms WCPO bigeye tuna, WCPO yellowfin tuna, or WCPO skipjack tuna are used in this document, they refer to the stocks of these species as defined and managed by the WCPFC.

juvenile fish are taken in many surface fisheries, either as a targeted catch or as a bycatch with other tuna species (Miyabe and Bayliff 1998). Large numbers are taken by purse seiners fishing on drifting objects in equatorial waters. Basic environmental conditions favorable for survival include clean, clear oceanic waters between 13° C and 29° C. Hanamoto (1987) estimated optimum bigeye habitat to exist in water temperatures between 10° to 15° C at salinities ranging between 34.5‰ to 35.5‰ where dissolved oxygen concentrations remain above 1 ml/l. He further suggested that bigeye range from the surface layers to depths of 600 meters. However, evidence from archival tagging studies indicates that greater depths and much lower ambient temperatures can be tolerated by the species. Juvenile bigeye occupy an ecological niche similar to juvenile yellowfin of a similar size.

There have been far fewer bigeye tuna tagged in the Pacific in comparison to skipjack and yellowfin tunas. Miyabe and Bayliff (1998) present summary information of some long distance movements of tagged bigeye tuna in the Pacific. Hampton et al. (1998) describe 8,000 bigeye tuna releases made in the western Pacific during 1990-1992. Most of the fish were recaptured close to the point of release; approximately 25 percent had moved more than 200 nautical miles, and more than 5 percent had moved more than 1,000 nautical miles. These migration patterns generally cause stock assessment in the WCPO and EPO to be conducted separately (Langley et al. 2008).

Feeding is opportunistic at all life stages, with prey items consisting primarily of crustaceans, cephalopods, and fish (Calkins 1980). There is significant evidence that bigeye feed at greater depths than yellowfin tuna, utilizing higher proportions of cephalopods and mesopelagic fishes in their diet thus reducing niche competition (Whitelaw and Unithan 1997). Spawning spans broad areas of the Pacific and occurs throughout the year in tropical waters and seasonally at higher latitudes at water temperatures above 23° or 24° C (Kume 1967). Bigeye are serial spawners, capable of repeated spawning at near daily intervals with batch fecundities of millions of ova per spawning event (Nikaïdo et al. 1991). Sex ratio is commonly accepted to be essentially 1:1 until a length greater than 150 centimeters after which the proportion of males increases. Alverson and Peterson (1963) state that juvenile bigeye less than 100 centimeters generally feed at the surface during daylight, usually near continental land masses, islands, seamounts, banks, or floating objects. Bigeye tuna are moderately fast growing, reaching maturity between the ages of two and a half and six years. A larger proportion of bigeye reach the age of eight, with some living as long as eighteen years (Langley et al. 2008).

Bigeye tuna, especially during the juvenile stages, aggregate strongly to drifting or anchored objects, large marine animals, and regions of elevated productivity, such as near seamounts and areas of upwelling (Calkins 1980; Hampton and Bailey 1993; Holland et al. 1999). Major fisheries for bigeye tuna exploit aggregation effects either by targeting biologically productive areas (deep and shallow seamount and ridge features) or by utilizing artificial fish aggregation devices to aggregate commercial concentrations of bigeye tuna. Juvenile and pre-adult bigeye of 35 centimeters to approximately 99

centimeters are regularly taken as a bycatch in the eastern and western Pacific purse-seine fisheries, usually on sets made in association with floating objects (Hampton and Bailey 1993). Juvenile bigeye tuna form mono-specific schools at or near the surface with similar-sized fish or may be mixed with skipjack and/or juvenile yellowfin tuna (Calkins 1980; Holland et al. 1999). Juvenile and adult bigeye tuna are also known to aggregate near seamounts and submarine ridge features where they are exploited by pole-and-line, handline, and purse seine fisheries (Fonteneau 1991; Holland et al. 1999).

Small bigeye are caught near the surface by purse seines, while larger fish are caught deeper using longline gear (Gillett and Langley 2007). In the western Pacific, the purse seine fishery is diverse, occurring in the waters of a number of island nations as well as the high seas and carried out by both small domestic fleets and distant water fleets from developed nations.

In 2011, the estimated total bigeye catch in the WCPO was 159,479 mt, the highest catch since 2006 (WCPFC 2012). Figure 10 below shows the catch of bigeye tuna in the Convention Area from 1980-2011 by gear type.

Figure 10: Convention Area bigeye tuna catch (mt) by gear

Source: Williams and Terawasi 2012.

3.3.1.1 Skipjack Tuna (*Katsuwonus pelamis*)

Skipjack tuna are concentrated mostly in tropical waters; though they also seasonally expand into subtropical waters in both the north and south Pacific. The main characteristics of skipjack tuna are fast growth, early maturity (ten months to one year), high fecundity, year-round spawning (Hunter et al. 1986) over broad tropical regions, a relatively short life span compared to bigeye, albacore, and bluefin tunas, high and variable recruitment and few age classes on which the fishery depends. In describing the attributes of the species, Joseph (2002) states:

These characteristics, together with their wide distribution, results in a huge biomass of fish, and very high levels of potential production. Ever since the beginning of heavy commercial exploitation in the early 1970s, the consensus among scientists had been that the populations of skipjack in all oceans of the world were lightly exploited and capable of sustaining much higher catches. This has been borne out by the fact that annual (global) catches increased from approximately 400,000 tons in 1970 to approximately 1.9 million tons in 1998. They remained near that level during 1999 and 2000.

In the western Pacific skipjack catches have continued to grow from that early 2002 quote.

CPUE trends for purse seiners dramatically rose between 2004 and 2007 before fluctuating until 2009. Post 2009 trends have been generally downward through 2011, but have not dipped much below 2005 levels (Harley et al. 2012).

In 2011, the estimated total skipjack catch in the WCPO exceeded 1.55 million mt, a slight decline from a record setting year in 2009 of 1.80 million mt, and a similarly high catch in 2010 of 1.68 million mt. The purse seine fishery was responsible for the bulk of this catch (WCPFC 2012).

Historically, bait boats (pole-and-line) were the main gear used in catching skipjack tuna but since the 1950s, purse seiners have come to dominate the fishery. Some skipjack tuna are also caught incidentally by longliners, particularly those using shallow gear (typically hooked when retrieving the gear). In the WCPO, fishing for skipjack tuna occurs in the waters of a number of island nations and is carried out by both small domestic fleets and distant water fleets from developed nations.

Genetic studies of the Pacific population of skipjack suggest that some mixing of fish occurs across the Pacific Ocean, but for management purposes, the stocks in the western Pacific have been considered by most scientists to be independent of those in the eastern Pacific. Tagging data showing limited movement of skipjack from the eastern Pacific to the western Pacific support the same conclusion (Joseph 2002). Recent research suggests that fast-growing, short-lived species like skipjack and yellowfin may have median lifetime displacements on the order of 644–805 kilometers, supporting the idea of “regional fidelity” (Sibert and Hampton 2003). Remote sensing has corroborated this data. Skipjack in the North Pacific only demonstrated north-south migrations, seeming to primarily follow sea surface temperature, with some influence from sea surface chlorophyll, and physical ocean features like currents, fronts and eddies (Mugo et al. 2010). The possibility of restricted movements of skipjack in the WCPO suggests the possibility for local depletion despite the large total biomass.

3.3.2 Yellowfin Tuna (*Thunnus albacares*)

Several studies on the taxonomy, biology, population dynamics, and exploitation of yellowfin tuna exist, including comprehensive reviews by Collette and Nauen (1983) and Suzuki (1994).

This is a tropical tuna characterized by a rapid growth rate and fast development to maturity. Estimates of length at maturity for central and western Pacific yellowfin tuna vary widely with some studies supporting an advanced maturity schedule for yellowfin tuna in coastal or archipelagic waters (Cole 1980). However, most estimates suggest that the majority of yellowfin tuna reach maturity between two and three years of age on the basis of length-age estimates for the species. Longevity for the species may not be explicitly defined, but a maximum age of six to seven years is commonly used in stock assessment. Itano (2000) notes from a large data set from the western tropical Pacific that 50% of yellowfin tuna sampled from purse seine and longline gear at 105 centimeters were histologically classified as mature and predicts a length at 50% maturity of 104.6 centimeters. Under appropriate conditions, yellowfin tuna exhibit high spawning frequency and fecundity (Cole 1980). Spawning occurs in broad areas of the Pacific. Spawning fish require surface salinity and temperature that remain above 24° C (Itano 2000). This means that spawning can occur throughout the year in tropical waters and seasonally at higher latitudes in areas such as Hawaii (Suzuki 1994).

Yellowfin tuna are trans-Pacific in distribution, occupying the surface waters of all warm oceans, and form the basis of large surface and sub-surface fisheries. The adult distribution in the Pacific lies roughly within latitudes 40° N to 40° S as indicated by catch records of the Japanese purse seine and longline fishery (Suzuki et al. 1978). Blackburn (1965) suggests the range of yellowfin tuna distribution is bounded by water temperatures between 18° C and 31° C with commercial concentrations occurring between 20° C and 30° C. Although the species preferentially occupies the surface mixed layer above the thermocline, archival tagging has revealed dives to depths in excess of 1,000 meters with water temperature of 5.8° C (Dagorn et al. 2006). Yellowfin are apex predators that rely on a wide diverse food base, but most heavily prey upon small teleost fish and crustaceans. As juveniles they prey mostly on zooplankton (Graham et al. 2007).

Although tag and recapture programs have documented that yellowfin tuna are clearly capable of large-scale movements, most recaptures occur within a short distance of release. Sibert and Hampton (2003) applied an advection-diffusion model to yellowfin tuna tagging data and determined a median lifetime displacement of 375 miles. Yellowfin tuna are known to aggregate around drifting flotsam, anchored buoys, and large marine animals (Hampton and Bailey 1993). Adult yellowfin tuna also aggregate in regions of elevated productivity, high zooplankton density (e.g., seamounts), and regions of upwelling and convergence. This association has presumably evolved to capitalize on the elevated forage available (Cole 1980; Suzuki 1994). Major fisheries for yellowfin tuna exploit aggregation effects either by utilizing artificial FADs or by targeting areas with vulnerable concentrations of tuna.

Some genetic analyses suggest that there may be several semi-independent yellowfin tuna stocks in the Pacific Ocean including possible eastern and western stocks, which may diverge around 150° W (Grewe and Hampton 1998; Itano 2000). Other analyses have failed to distinguish the presence of geographically distinct populations (Appleyard et al. 2001). Tagging studies have shown individual animals are capable of large east west movements that would suggest considerable pan-Pacific mixing of the stock.

Purse seining and longlining are the main gear employed in catching yellowfin tuna. Small yellowfin tuna may be caught on the surface by purse seine vessels, while larger fish are typically caught deeper using longline gear (Gillet et al. 2007). In the western Pacific, the fishery is diverse, occurring in the waters of a number of island nations and on the high seas and carried out by both small domestic fleets and distant water fleets from developed nations.

In 2011, the estimated total yellowfin catch in the WCPO was 479,403 mt, a decline of about 70,000 mt from the year before. The purse seine fishery was responsible for the bulk of this catch (WCPFC 2012).

3.4 Biological Environment

This section describes the other primary biological resources in the Convention Area as well as ecological interactions between the species.

3.4.1 Biodiversity and Ecosystem Function

The following description of a marine fisheries food web is taken from Begon et al. 2006, and Nybakken 1997. Primary producers such as diatoms, dinoflagellates, coccolithophores, and cyanobacteria, are organisms that utilize solar energy to convert carbon dioxide into oxygen. Primary producers are considered the first trophic (or eating) level. The next trophic level includes the zooplankton; animal planktonic forms such as copepods and larval stages of fish. These microorganisms drift through the water column grazing on phytoplankton (plant planktonic forms) and are referred to as “grazers”. Copepods are the most abundant zooplankton and make up most of the animal biomass in the ocean. The third trophic level is made up of the molluscan bivalves, amphipods, and larval forms of fish and crustaceans. Small bait fish make up the next trophic level. These include small fish such as sardines which in turn are eaten by big fish, the next trophic level. This level is made up of dominant predators, species that tend to migrate from coastal to deep ocean waters. They are also prey to the apex predators, species at the top trophic level. Species at this trophic level include tunas, billfish, and sharks. Dominant predators as well as apex predators feed opportunistically, eating anything they encounter. Digested or dead organic matter drifts towards the ocean bottom where both suspended decomposers and bottom feeders utilize the dead matter’s energy completing

the food web cycle. Both biotic and abiotic factors interact with each other to create this cycle. Figure 11 depicts a food chain from the central North Pacific Ocean.

Organisms at the top of the food web tend to be larger and less abundant. This is mainly due to the amount of energy it takes to get to the top of a food web. Marine food webs are highly connected because of the openness of marine ecosystems, general lack of specialists, potential for long life-spans, and significant size changes across the life histories of many species (Link 2002). Few fully charted examples of open water marine food webs exist. Those that do demonstrate limitations such as low species diversity, high species aggregation, limited spatiotemporal studies, and low chances of detecting important factors such as species richness, interactions or links (Link 2002).

Figure 11: Trophic levels in the central North Pacific Ocean

Source: Hinke et al. 2004.

Understanding an ecosystem depends on the identification of its food web and the exchanges between the different trophic levels in the food chain. Food webs show the dynamics of biomass production, sinks, and partitioning. Even minor changes in abiotic factors can cause far reaching changes in the spatial distribution of primary and secondary pelagic production (Richardson et al. 2004). For example, increases in sea surface temperatures may lead to increases or decreases in phytoplankton abundance

depending on the *in situ* water temperature (Richardson et al. 2004). Tuna removal by commercial fisheries or other changes in biotic balances could have lasting effects lower down the food chain. Models done by Hinke et al. (2004), and observations by Halpern et al. (2006) demonstrate that by removing top predators, mid and low trophic level species may expand due to the elimination of competition and predation, and that top down food web control may be more important to ecosystem balance than previously thought. As apex predators, bigeye, skipjack and yellowfin tuna are in the top trophic level with distinct energy pathways supporting each species (Hinke et al. 2004). They are opportunistic feeders, a quality that complicates trophic impact analysis (Cox et al. 2002).

When there is an overlap in the primary forage trophic level, as when multiple fisheries act on top predator tunas, there are indirect effects seen within their own forage groups. Hinke et al. (2004) concluded that the primary food webs for individual fisheries were relatively simple (Figure 10). Ecosystem analysis, however, is difficult because the interactions among a broad group of species are not always apparent or recognized. Each stock has a unique recruitment history so the variability in biomass over time and among stocks cannot all be attributed to fishing (Sibert et al. 2006). Cox et al. (2002) also found that declines in top predators could result in an increase in smaller tunas that serve as prey to larger tunas. Predation as a component of natural mortality is still unclear, as are the effects of fishing mortality on these predation rates and abundance (Cox et al. 2002).

Purse seining directly affects higher trophic levels but may also affect the lower trophic levels. Hinke et al., (2004) found that the aggregate effect of purse seine fishing in the central north Pacific Ocean showed a shift in the highest distributions of biomass from upper level predators to their prey. They also observed that similar changes in the overall structure of food webs can be seen in pelagic purse seine tuna fisheries in the EPO. Fishing a species at maximum sustainable yield may lead to the erosion of their trophic structure and have negative effects on recruitment (Sibert et al. 2006). Reducing population biomass too dramatically could lead to the outright collapse of the food chain (Sibert et al. 2006).

In 2010, SPC reported some of its findings on an ongoing study of the WCPO tuna ecosystem that attempts to model and understand species relationships, with an end goal of assessing future environmental and fishery impacts on tuna stock health. In the analysis of stomach contents, yellowfin, bigeye and skipjack tuna were split into three size categories (baby, small and large) to account for growth-related diet shifts as well as whether they filled a predominantly predator or prey role. All three were found to primarily eat smaller fish, followed by mollusks and crustaceans (Allain 2010).

3.4.2 Other Non-Target Fish Species²⁰

As depicted in Table 5 below, the U.S. Purse Seine fleet operating in the WCPO catches a small amount of various non-target fish species, some of which is retained.

²⁰ This terminology is used throughout the EA to differentiate between bigeye tuna, a non-target species of the U.S. WCPO purse seine fleet, and other non-target fish species.

Table 5: Observed Estimates of Catch and Rate of Discards of “Other” Fish Species in 2010 by the U.S. WCPO Purse Seine Fleet.

3.5 Protected Resources

This section provides information on protected resources in the WCPO.

3.5.1 Threatened and Endangered Species

Table 6 includes species listed under the U.S. Endangered Species Act (ESA; 16 USC 1531 *et seq.*) that could be affected by any changes to fishing patterns and practices in the Convention Area. NMFS has jurisdiction over all the species listed except for the dugong (*Dugong dugon*), Short-tailed Albatross (*Phoebastria albatrus*), Newell's Shearwater (*Puffinus auricularis newelli*), Hawaiian Dark-rumped Petrel (*Pterodroma phaeopygia sandwichensis*), Chatham Petrel (*Pterodroma axillaris*), Fiji Petrel (*Pseudobulweria macgillivrayi*), and Magenta Petrel (*Pterodroma magentae*). The U.S. Fish and Wildlife Service (USFWS) has jurisdiction over these seven species.

Table 6: Listing Status of Species in the WCPO Listed as Endangered or Threatened Under the ESA.

Scientific name	Common name	ESA Status
<i>Balaenoptera musculus</i>	Blue whale	Endangered
<i>Balaena mysticetus</i>	Bowhead whale	Endangered
<i>Balaenoptera physalus</i>	Fin whale	Endangered
<i>Megaptera novaeangliae</i>	Humpback whale	Endangered
<i>Eubalaena japonica</i>	North Pacific right whale	Endangered
<i>Balaenoptera borealis</i>	Sei whale	Endangered
<i>Physeter macrocephalus</i>	Sperm whale	Endangered
<i>Eubalaena australis</i>	Southern right whale	Endangered
<i>Monachus schauinslandi</i>	Hawaiian monk seal	Endangered
<i>Eumetopias jubatus</i>	Steller sea lion (western stock)	Endangered
<i>Dugong dugon</i>	Dugong	Endangered
<i>Phoebastria albatrus</i>	Short-tailed Albatross	Endangered
<i>Pseudorca crassidens</i>	Main Hawaiian Islands insular false killer whale ²¹	Endangered
<i>Puffinus auricularis newelli</i>	Newell's Shearwater	Threatened
<i>Pterodroma phaeopygia sandwichensis</i>	Hawaiian Dark-rumped Petrel	Endangered
<i>Pterodroma axillaris</i>	Chatham Petrel	Endangered
<i>Pseudobulweria macgillivrayi</i>	Fiji Petrel	Endangered
<i>Pterodroma magentae</i>	Magenta Petrel	Endangered
<i>Dermochelys coriacea</i>	Leatherback turtle	Endangered
<i>Caretta caretta</i>	Loggerhead turtle North Pacific and South Pacific distinct population segments ²²	Endangered ¹
<i>Chelonia mydas</i>	Green turtle	Threatened
<i>Lepidochelys olivacea</i>	Olive Ridley turtle	Threatened
<i>Eretmochelys imbricata</i>	Hawksbill turtle	Endangered

Source: <http://www.nmfs.noaa.gov/pr/>; <http://www.fws.gov/pacificislands/teslist.html>.

The Final Biological Opinion and Incidental Take Statement for the U.S. purse seine fishery for effects to ESA-listed sea turtles and marine mammals was issued on November 1, 2006, concluding formal Section 7 ESA consultation for species under the

²¹ NMFS issued a final determination to list the Main Hawaiian Islands insular false killer whale as distinct population segment as endangered (see 77 FR 70915; November 28, 2012).

²² In September 2011, NMFS and USFWS listed nine distinct population segments of loggerhead turtles. Five of the distinct population segments were listed as endangered and four were listed as threatened. The two distinct population segments in the Pacific Ocean (North Pacific and South Pacific) are listed as endangered. See 76 FR 58868.

jurisdiction of NMFS. One species under the jurisdiction of NMFS (the main Hawaiian Islands insular false killer whale) has been ESA-listed since that time. However, the range of this species does not overlap with the area in which the U.S. WCPO purse seine fleet operates.²³

By letter dated January 28, 2009, the USFWS concurred with NMFS' determination that a proposed regulation that would not alter U.S. purse fishing practices or fishing effort would not be likely to adversely affect ESA-listed species under the jurisdiction of USFWS, which at the time included the dugong, Newell's Shearwater, and Short-tailed Albatross. This determination was based on the fact that there was minimal spatial overlap between the U.S. purse seine fishery and the range of the dugong, no spatial overlap between the U.S. purse seine fishery and range of the Short-tailed albatross, and no recorded interactions between the U.S. purse seine fleet and seabirds or dugongs, based on observer data from August 1994 to January 2007. Four species under the jurisdiction of USFWS (the Hawaiian Dark-rumped Petrel, Chatham Petrel, Fiji Petrel, and Magenta Petrel) have been ESA-listed since that time. As stated in the 2009 EA, based on observer data available to NMFS, the U.S. WCPO purse seine fleet has not been reported to interact with seabirds.

²³ The range of the main Hawaiian Islands insular false killer whale includes the waters around the main Hawaiian islands from Ni'ihau to Hawai'i, and offshore as far as 140 kilometers. The U.S. WCPO purse seine fleet generally operates much further south, between 10° N and 10° S Latitude (see Section 3.2 of the EA).

3.5.2 Marine Mammals

All marine mammals receive protection under the Marine Mammal Protection Act (MMPA; 16 USC 1361, *et seq.*). The marine mammals found in the WCPO but not listed under the ESA as threatened or endangered (i.e., not included in Table 6 above) are listed in Table 7 below.

Table 7: Non-Listed Marine Mammals that Occur in the WCPO.

Species name	Common name
<i>Balaenoptera acutorostrata</i>	Minke whale
<i>Balaenoptera bonaerensis</i>	Antarctic minke whale
<i>Balaenoptera edeni</i>	Bryde's whale
<i>Berardius arnuxii</i>	Arnoux's beaked whale
<i>Callorhinus ursinus</i>	Northern Fur Seal
<i>Caperea marginata</i>	Pygmy right whale
<i>Delphinus delphis</i>	Short-beaked common dolphin
<i>Eschrichtius robustus</i>	Gray whale
<i>Feresa attenuata</i>	Pygmy killer whale
<i>Globicephala macrorhynchus</i>	Short-finned pilot whale
<i>Globicephala melas</i>	Long-finned pilot whale
<i>Grampus griseus</i>	Risso's dolphin
<i>Hyperoodon planifrons</i>	Southern bottlenose whale
<i>Indopacetus pacificus</i>	Longman's beaked whale
<i>Kogia breviceps</i>	Pygmy sperm whale
<i>Kogia sima</i>	Dwarf sperm whale
<i>Lagenodelphis hosei</i>	Fraser's dolphin
<i>Lagenorhynchus cruciger</i>	Hourglass dolphin
<i>Lagenorhynchus obliquidens</i>	Pacific white sided dolphin
<i>Lagenorhynchus obscurus</i>	Dusky dolphin
<i>Lissodelphis peronii</i>	Southern right whale dolphin
<i>Mesoplodon bowdoini</i>	Andrew's beaked whale
<i>Mesoplodon densirostris</i>	Blainville's Beaked Whale
<i>Mesoplodon ginkgodens</i>	Ginkgo-toothed whale
<i>Mesoplodon grayi</i>	Gray's beaked whale
<i>Mesoplodon hectori</i>	Hector's beaked whale
<i>Mesoplodon layardii</i>	Strap-toothed whale
<i>Mesoplodon stejnegeri</i>	Stejneger's beaked whale
<i>Mesoplodon traversii</i>	Spade-toothed whale

3.5.3 Essential Fish Habitat (EFH)

The EFH provisions (50 CFR Part 600 Subpart J) of the MSA are intended to maintain sustainable fisheries. NMFS and the Fishery Management Councils must identify and describe EFH and Habitat Areas of Particular Concern (HAPC) for each managed species using the best available scientific data and must ensure that fishing activities being conducted in such areas do not have adverse effects to the extent practicable. This process consists of identifying specific areas and the habitat features within them that provide essential functions to a particular species for each of its life stages. Both the EFH and the HAPC are documented in the FEPs established under the MSA.²⁵

EFH and HAPC have been designated in the WCPO for pelagic, bottomfish and seamount groundfish, precious corals, crustaceans, and coral reef species. Table 8 lists the EFH and HAPC for species managed under the various western Pacific FEPs.

²⁴ As stated in Table 6 above, the Main Hawaiian Islands insular false killer whale distinct population segment has been listed as endangered.

²⁵ The FEPs being the FEP for the American Samoa Archipelago, the FEP for the Mariana Archipelago; the FEP for the Pacific Remote Island Areas; the FEP for the Hawaii Archipelago; and the FEP for Pacific Pelagic Fisheries of the Western Pacific Region.

Table 8: EFH and HAPC for Management Unit Species for the Western and Pacific Region.¹

Species Group	EFH (juveniles and adults)	EFH (eggs and larvae)	HAPC
Pelagics	Water column down to 1,000 meters	Water column down to 200 meters	Water column down to 1,000 meters that lies above seamounts and banks
Bottomfish	Water column and bottom habitat down to 400 meters	Water column down to 400 meters	All escarpments and slopes between 40-280 meters, and three known areas of juvenile opakapaka habitat
Seamount Groundfish	(adults only): water column and bottom from 80 to 600 meters, bounded by 29°-35°N and 171°E-179°W	(including juveniles): epipelagic zone (0-200 meters) bounded by 29°-35°N and 171°E-179°W	Not identified
Precious Corals	Keahole, Makapuu, Kaena, Wespac, Brooks, and 180 Fathom gold/red coral beds, and Milolii, S. Kauai and Auau Channel black coral beds	Not applicable	Makapuu, Wespac, and Brooks Bank beds, and the Auau Channel
Crustaceans	Lobsters: Bottom habitat from shoreline to a depth of 100 meters	Water column down to 150 meters	All banks with summits less than 30 meters
	Deepwater shrimp: The outer reef slopes at depths between 300-700 meters	Water column and associated outer reef slopes between 550 and 700 meters	No HAPC designated for deepwater shrimp
Coral Reef Ecosystems	Water column and benthic substrate to a depth of 100 meters	Water column and benthic substrate to a depth of 100 meters	All Marine Protected Areas identified in FEP, all PRIAs, ² many specific areas of coral reef habitat

¹ All areas bounded by the shoreline and the outward boundary of the U.S. EEZ, unless otherwise indicated.

² Pacific Remote Island Areas.

3.5.4 National Wildlife Refuges (NWRs) and Monuments

Pursuant to the National Wildlife System Administration Act of 1966 (16 USC 668dd, *et seq.*), USFWS carries out the mission of NWRs, which is “to administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans.” National Monuments are designated by the President using the authority of the Antiquities Act of 1906 (16 U.S.C. 431). This act allows the President to protect areas of “historic or

scientific significance.” There are 10 NWRs and four National Monuments in the Convention Area: Guam NWR; Baker Island NWR; Howland Island NWR; Jarvis Island NWR; Johnston Island NWR; Kingman Reef NWR; Palmyra Atoll NWR; Rose Atoll NWR; Hawaiian Islands NWR; Midway Atoll NWR; Papahānaumokuākea Marine National Monument; the Marianas Trench Marine National Monument; the Pacific Remote Islands Marine National Monument; and the Rose Atoll Marine National Monument.

NMFS has issued a notice of availability of proposed amendments by the Western Pacific Fishery Management Council (WPFMC) to the FEP of the Mariana Archipelago, the FEP for the Pacific Remote Island Areas, the FEP of American Samoa, and the Pelagics FEP to implement certain provisions for the Marianas Trench Marine National Monument, the Pacific Remote Islands Marine National Monument, and the Rose Atoll Marine National Monument (see 78 FR 7385). Comments are due on these proposed amendments by April 2, 2013. The provisions in the proposed amendment include the following: identify the boundaries of the Monuments and their various management units; prohibit commercial fishing in the Pacific Remote Islands and Rose Atoll Monuments, and in the Islands Units of the Marianas Trench Monument; establish management measures for non-commercial and recreational charter fishing in the Monuments; and prohibit the conduct of commercial fishing outside the Monuments and non-commercial fishing inside the Monuments during the same trip. The 2009 Presidential Proclamation establishing these three Monuments prohibits commercial fishing within the waters of the Monuments.

Chapter 4 Environmental Consequences: Direct and Indirect Effects

This chapter provides an analysis of the direct and indirect environmental effects that could be caused by the implementation of the 2013 U.S. Purse Seine Rule under any of the action alternatives, as well as the No-Action Alternative and compares the alternatives; cumulative effects are addressed in Chapter 5.²⁶

This chapter begins with a discussion of the potential impacts²⁷ from each of the alternatives to the U.S. WCPO purse seine fleet. Then, Sections 4.2 through 4.5 analyze the potential environmental impacts these changes to the fleet could cause to the resources in the affected environment.

4.1 *The U.S. WCPO Purse Seine Fleet*

The direct and indirect effects to the U.S. WCPO purse seine fleet would fall into two categories: (1) economic; and (2) changes to fishing patterns and practices. The Regulatory Impact Review (RIR) for the 2013 U.S. Purse Seine Rule, prepared under Executive Order 12866, provides an in-depth analysis of the potential economic impacts of the rule to the fleet and to the nation and is incorporated here by reference, pursuant to 40 CFR §1502.23. The general information regarding economic impacts in the discussion below is provided to help compare the alternatives and to determine whether the economic impacts are interrelated with environmental impacts. Thus, the discussion in this section focuses on potential changes to the fishing patterns and practices of the fleet from each of the alternatives.

4.1.1 Alternative 1: No-Action Alternative

Under Alternative 1, the No-Action Alternative, the 2013 U.S. Purse Seine Rule under any of the action alternatives would not go into effect, and the fleet would continue to be managed under existing regulatory requirements, including SPTT-related requirements, and any changed or new requirements as the result of a renegotiated Treaty and its associated economic assistance agreement, as described in more detail in Section 3.2 of this document. Thus, under this alternative there would be no direct changes to the fishing patterns and practices of the fleet.

²⁶ According to the CEQ regulations implementing the Procedural Provisions of NEPA at 40 CFR §1508.7 and §1508.8, direct effects are caused by the action and occur at the same time and place; indirect effects are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable; and cumulative effects are the impacts on the environment that result from the incremental impact of the Proposed Action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.

²⁷ The terms effects and impacts are used interchangeably throughout this document. See 40 CFR 1508.8.

CMM 2012-01 includes specific objectives for the WCPO stocks of bigeye tuna, skipjack tuna, and yellowfin tuna: for each, the fishing mortality rate is to be reduced to or maintained at levels no greater than the fishing mortality rate associated with maximum sustainable yield. As stated in Section 3.3 of this EA, Pacific bigeye tuna is currently subject to overfishing but not overfished, while the stocks of yellowfin tuna and skipjack tuna in the WCPO and EPO are neither experiencing overfishing nor overfished. As shown in Table 2 and Table 3 in Chapter 3 of this EA, skipjack tuna accounts for the majority of the fleet's catch, with the proportion of catch of each of the three tropical tuna species being approximately 77 percent skipjack tuna, 19 percent yellowfin tuna, and four percent bigeye tuna for the period 2006-2010. It is conceivable that the indirect effects (or long-term effects), of this alternative on the fleet would be negative, in that the No-Action Alternative would be less likely to achieve the objectives of CMM 2012-01, which in turn would be expected to adversely affect the catch rates of the U.S. WPCO purse seine fleet to maintain catch levels and the profitability of fishing businesses. However, as discussed in Section 3.3 of this EA, many factors other than purse seine fishing, especially the contribution of the U.S. fleet, affect the stock status of bigeye tuna, yellowfin tuna, and skipjack tuna in the WCPO, and, as described further below, implementation of the U.S. Purse Seine Rule under any of the action alternatives are not expected to substantially change the fishing practices and patterns of the fleet as a whole. The primary difference between the action alternatives are the fishing effort limits. As indicated in Table 1 and Sections 3.1 and 3.2 of this EA, the spatial distribution of fishing effort by the fleet varies considerably from year to year, and is dependent mostly on oceanographic and market conditions affecting the location of the target tuna stocks and the marketability of the catch. Moreover, the majority of the fishing effort of the fleet takes place in the EEZs of Pacific Island Parties to the SPTT, and those EEZs would be unaffected by any of the action alternatives. Thus, the fishing patterns and practices of the fleet under the No-Action Alternative would be similar to the fishing patterns and practices of the fleet under any of the action alternatives analyzed in this EA. However, Alternative 4 (the least restrictive fishing effort limit alternative) would be more similar to the No-Action Alternative than Alternatives 3 or 2; Alternative 2 would be much less similar to the No-Action Alternative than either Alternatives 3 or 4, since it is much more likely that the effort limits would be reached under Alternative 2, triggering a closure of the fishery in the U.S. EEZ and/or on the high seas, as described below.

4.1.2 Alternative 2: Most Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Under Alternative 2, the U.S. purse seine fleet operating in the WCPO would be subject to the following management measures, as described in Chapter 2, all applicable to the Convention Area between 20° N. and 20° S. latitude and for the years 2013 and 2014: (1) annual limits on fishing effort, measured in terms of fishing days, on the high seas and in the U.S. EEZ; the limit for the U.S. EEZ would be 27 fishing days and the separate limit for the high seas would be 433 fishing days; (2) restrictions on FAD fishing from July 1 through October 31; and (3) a requirement to carry WCPFC observers on all fishing trips.

4.1.2.1 Fishing Effort Limit

As indicated in Table 1 in Chapter 3 of this EA, from the years 1997 through 2010, the fleet spent an average of approximately six percent of its total effort per year in the U.S. EEZ and 22 percent of its total effort per year on the high seas, and the remainder (or 73 percent)²⁸ in the EEZs of Pacific Island Parties to the SPTT. As stated above, NMFS used data from 2010 to derive the effort limits for Alternative 2. In 2010, the fleet spent approximately zero percent of its total effort in the U.S. EEZ (<0.5 percent as indicated in Table 1 of this EA) and six percent of its total effort on the high seas. Given that the proportion of days fished by the fleet in 2010 in the U.S. EEZ and on the high seas is substantially lower than the annual average of days fished by the fleet in its recent history, it is likely that the effort limits in both areas would be reached under this alternative, triggering a closure of the fishery in both the U.S. EEZ and on the high seas (likely at different times, starting when the respective limits are reached). The length of any such closures cannot be predicted with any degree of certainty, due to the large variation in the number of days fished in the U.S. EEZ and on the high seas from year to year, as shown in Table 1.

In an El Niño year, when the spatial distribution of effort is known to shift to the east, as discussed in Sections 3.1 and 3.2 of this EA, the effort limits would likely be reached much sooner in the year, and perhaps even early in the year. In a La Niña year, the effort limits would likely be reached much later in the year. If the fishing patterns and practices of the fleet are similar to those of 2010, the effort limits may not be reached at all.

If the limits are reached in 2013 or 2014, vessels in the fleet could continue to fish in the EEZs of Pacific Island Parties to the SPTT, where the fleet expends the majority of its effort. Vessels in the fleet could also increase their effort in the EPO in the area managed by the Inter-American Tropical Tuna Commission (IATTC). Vessels licensed under the SPTT can each take one fishing trip per year in the area managed by the IATTC, for a period up to 90 days in duration, so long as the total number of trips by all vessels in the fleet does not exceed 32 per calendar year. In addition, although the IATTC has adopted capacity limits for purse seine vessels operating in the EPO, the United States has a little over 31,000 cubic meters remaining of its allocated capacity. So, this capacity is available for vessels in the U.S. WCPO purse seine fleet who wish to become active on the IATTC vessel register and fish in the EPO in the area of competence of the IATTC.

Given that the fleet expends most of its fishing effort in the EEZs of Pacific Island Parties to the SPTT, which would not be included in these effort limits, it is unlikely that this alternative would substantially affect the amount of fish captured by the fleet or the revenue earned by fishing businesses in the fleet. However, as stated above, since climate and ocean conditions, such as ENSO events, affect the location of optimal fishing grounds for the fleet, 2013 or 2014 could be years in which the U.S. EEZ or high seas

²⁸ Numbers do not sum to 100 percent due to rounding of the percentages for each area.

provides more optimal fishing grounds than usual, and in that case, the fleet could be substantially restricted by the effort limits.

In addition, the effort limits could change the temporal patterns of fishing effort. Since the limit would be a competitive allocation whereby fishing days would not be allocated among individual vessels and would be available to the entire fleet until the cap is reached, some vessel operators might have an incentive to fish harder in these two areas earlier in the calendar year than they otherwise would in an attempt to obtain as many fishing days as they can (i.e., “the race to fish”) before one or both limits are reached. To the extent such a shift does occur, it would affect the seasonal timing of deliveries to canneries. A race to fish could also bring costs if it causes vessel operators to forego vessel maintenance or to fish in weather or ocean conditions that it otherwise would not. This could bring costs in terms of human safety as well as the performance of the vessel and its fishing gear and crew. This race to fish effect could also be expected in the time period between when a closure of the fishery is announced and when the fishery is closed.

4.1.2.2 FAD Restrictions

Under Alternative 2, the FAD restrictions would be in place for the U.S. purse seine fleet from July 1 through October 31 in each of the calendar years 2013 and 2014. During these four months, no fishing on or near schools associated with FADs, and no deploying or servicing FADs, would be permitted in the Convention Area in the area between 20° N. and 20° S. latitude. The specific prohibitions, which include details for enforcement purposes, would be the following:

- No setting of a purse seine around a FAD or within one nautical mile of a FAD;
- No setting of a purse seine in a manner intended to capture fish that have aggregated in association with a FAD, such as by setting the purse seine in an area from which a FAD has been moved or removed within the previous eight hours, or setting the purse seine in an area in which a FAD has been inspected or handled within the previous eight hours, or setting the purse seine in an area into which fish were drawn by a vessel from the vicinity of a FAD;
- No deployment of a FAD into the water;
- No repairing, cleaning, maintaining, or otherwise servicing a FAD, including any electronic equipment used in association with a FAD, in the water or on a vessel while at sea, except that: a FAD may be inspected and handled as needed to identify the owner of the FAD, identify and release incidentally captured animals, un-foul fishing gear, or prevent damage to property or risk to human safety; and a FAD may be removed from the water and if removed may be cleaned, provided that it is not returned to the water.
- No submerging lights under water, suspending or hanging lights over the side of the purse seine vessel or any associated skiffs, other watercraft or equipment, or directing or using lights in a manner other than as needed to illuminate the deck of the purse seine vessel or associated skiffs, watercraft or equipment, except as

needed to comply with navigational requirements, to ensure the health and safety of the crew, and in emergencies and as needed to prevent human injury or the loss of human life, the loss of the purse seine vessel, skiffs, watercraft or aircraft, or environmental damage.

As described in Chapter 3, Section 3.2, the U.S. purse seine fleet operating in the WCPO has used FADs to varying degrees for its fishing operations. As indicated by Table 3 of this EA, FAD sets tend to yield more skipjack and small bigeye tuna than yellowfin tuna. Unassociated sets tend to yield more yellowfin tuna than skipjack tuna and very little bigeye tuna. Table 3 in Chapter 3, shows that between 2006 to 2010, approximately 61 percent of the catch of the U.S. WCPO purse seine fleet was made on FAD sets. During this same period, approximately 48 percent of the U.S. WCPO purse seine fleet's catch of yellowfin tuna was made on FAD sets, while approximately 62 percent of the catch of skipjack tuna and 91 percent of the catch of bigeye tuna was made on FAD sets. As discussed in Section 3.2.4 of this EA, FAD sets tend to yield smaller fish, including smaller adult skipjack tuna, and juvenile bigeye and yellowfin tuna, while unassociated sets tend to yield larger fish – primarily adult skipjack tuna and yellowfin tuna.

The overall composition of the catch made by the fleet would likely be affected by the FAD restrictions (as intended by CMM 2012-01). It is expected that there would be a transfer of effort to fishing on unassociated sets during the prohibition period (see Figure 9 in Chapter 3) – given that represents the only viable fishing option if vessels continue to operate – so the composition of the catch during those periods would likely consist of more larger yellowfin and skipjack tuna and less bigeye tuna. As shown in Table 3 in Chapter 3, bigeye tuna accounts for only a very small percentage of the catch of the U.S. purse seine fleet operating in the WCPO. FAD sets contribute a substantial percentage of skipjack catches (as indicated in Table 3 in Chapter 3, 62 percent of the total catch of skipjack tuna during the years 2006-2010 was from FAD sets). By putting restrictions on FAD fishing for one-third of the year in 2013 and 2014, skipjack tuna catches would expect to be impacted accordingly. Depending on the availability of operators to find unassociated schools of tuna, the expected shift in composition of the catch during the periods of restriction on FAD fishing would be expected to affect gross revenues generated by the fleet, but the magnitude of the impact would depend on market conditions (i.e., the price of bigeye tuna and skipjack tuna compared to the price of yellowfin tuna and the prices of small fish versus large fish – particularly, whether the canneries are even buying small fish).

The FAD restrictions could also affect operating costs (e.g., FAD fishing generally involves less searching time and thus lower fuel costs). In aggregate it is likely that the restrictions would have some negative effect on the ex-vessel revenue generated by the fleet in the short term.²⁹ Since other factors (e.g., shifts in ocean conditions, climatological changes, shifts in market conditions, fuel prices) also influence the catch

²⁹ See the Initial Regulatory Flexibility Analysis (IRFA) and RIR for the purse seine rule for more detailed discussion of the economic impacts of the rule on the U.S. WCPO purse seine fleet.

made by a fleet and/or the revenue generated by a fleet during a specific time period, quantification of the economic impact of the FAD restrictions to the U.S. purse seine fleet operating in the WCPO cannot be made with any degree of precision. It is possible that operators of some purse seine vessels would choose not to fish during the FAD restrictions because of reduced revenues profitability during that time. For example, vessel operators might choose to schedule their routine vessel maintenance during a portion of that time. The result of this could be somewhat less effort during that time than there otherwise would be. However, as shown in Figure 6 of this EA, during the FAD restrictions in the last four years (August 1 through September 30 in 2009, and July 1 through September 30 in 2010, 2011, and 2012), there was no substantial change in the proportion of the fleet that fished during those months in each of those years when compared to the proportion that fished during those months in 1997-2008.

As stated above, the FAD restrictions are expected to affect the fishing patterns and practices of the fleet by transferring fishing effort from FAD sets to unassociated sets during that time, and possibly reducing the amount of total fishing effort during that time relative to the No-Action Alternative.

4.1.2.3 Observer Requirements

U.S. purse seine vessels fishing in the WCPO are currently required to carry a WCPFC observer on all trips in the Convention Area, pursuant to the general WCPFC observer coverage requirements under 50 CFR 300.215. The observer coverage requirements under Alternative 2 would differ from the existing requirements by requiring a WCPFC observer to be carried only on trips that include the area between 20° N. and 20° S. latitude . Given that the fleet generally fishes only between 20° N. and 20° S. latitude and each vessel generally fishes in multiple EEZs on each trip (see Figure 3 in Chapter 3 of this EA), Alternative 2 would be almost identical to the existing observer requirements and thus, to the No-Action Alternative. Thus, these requirements would not be expected to affect the fishing patterns and practices of the fleet.

4.1.2.4 Summary of Impacts

The requirements of implementing the proposed rule under Alternative 2 have the potential to impact the gross revenue and profits earned by the U.S. WCPO purse seine fleet and cause impacts to its fishing patterns and practices. Overall, NMFS believes that it is unlikely that Alternative 2 would cause substantial financial burden to the fleet or substantially affect the fleet's current fishing patterns and practices given the short duration of the rule (two years) and the other fishing opportunities available to the fleet. The primary direct effects of Alternative 2 on the fleet are the following: (1) the fishing effort limits on the high seas and in the U.S. EEZ could cause the fleet to fish more in the EEZs of Pacific Island Parties to the SPTT or in the EPO and could cause a reduction in the total fishing effort of the fleet; and (2) the FAD restrictions during July-October would likely transfer some fishing effort from FAD sets to unassociated sets, with

consequent impacts in terms of species composition of the catch and possibly shift fishing effort from that time to other periods of the year.

4.1.3 Alternative 3 (Preferred): Past Regulatory Precedent Fishing Limit Alternative; FAD Prohibition Period Including Prohibition on Fishing on FADs and Prohibition on Setting on Fish that Have Aggregated in Association with a Vessel

Under Alternative 3, the U.S. purse seine fleet operating in the WCPO would be subject to the following management measures, as described in Chapter 2, all applicable to the Convention Area between 20° N. and 20° S. latitude and for the years 2013 and 2014: (1) annual limits on fishing effort, measured in terms of fishing days, on the high seas and in the U.S. EEZ; the combined limit for the U.S. EEZ and high seas would be 2,588 fishing days; (2) FAD restrictions and restrictions for fishing on fish aggregating in association with vessels from July 1 through October 31 in each of the calendar years 2013 and 2014; and (3) a requirement to carry WCPFC observers on all fishing trips.

4.1.3.1 Fishing Effort Limit

This limit would be considerably higher than the limits under Alternative 2 and also would not include separate limits for the high seas and U.S. EEZ. Thus it is much less likely that the limit would be reached under this alternative than under Alternative 2. If the limit is reached, the fishery would be closed on the high seas and in the U.S. EEZ for the remainder of the calendar year. Although the length of any such closure cannot be predicted with any degree of certainty, due to the large variation in the number of days fished in the U.S. EEZ and on the high seas from year to year, as shown in Table 1, any closure period would likely be shorter than under Alternative 2, for the same reasons that the likelihood of reaching the limit is less than under Alternative 2, and would most likely take place toward the end of the year, if at all.

As discussed above for Alternative 2, if the limits are reached in 2013 or 2014, vessels in the fleet could continue to fish in the EEZs of Pacific Island Parties to the SPTT, where the fleet expends the majority of its effort. Vessels in the fleet could also increase their effort in the EPO in the area managed by the IATTC. Vessels licensed under the SPTT can each take one fishing trip per year in the area managed by the IATTC, for a period up to 90 days in duration, so long as the total number of trips by all vessels in the fleet does not exceed 32 per calendar year. In addition, although the IATTC has adopted capacity limits for purse seine vessels operating in the EPO, the United States has a little over 31,000 cubic meters remaining of its allocated capacity. So, this capacity is available for vessels in the U.S. WCPO purse seine fleet who wish to become active on the IATTC vessel register and fish in the EPO in the area of competence of the IATTC.

Given that the fleet expends most of its fishing effort in the EEZs of Pacific Island Parties to the SPTT, which would not be included in these effort limits, it is unlikely that this alternative would substantially affect the amount of fish captured by the fleet or the

revenue earned by fishing businesses in the fleet. However, as discussed above for Alternative 2, climate and ocean conditions, such as ENSO events, affect the location of optimal fishing grounds for the fleet, and 2013 or 2014 could be years in which the U.S. EEZ or high seas provides more optimal fishing grounds than usual.

In addition, the effort limits could change the temporal patterns of fishing effort. Since the limit would be a competitive allocation whereby fishing days would not be allocated among individual vessels and would be available to the entire fleet until the cap is reached, vessel operators might have an incentive to fish harder in these two areas zone earlier in the calendar year than they otherwise would in an attempt to obtain as many fishing days as they can (i.e., “the race to fish”) before one or both limits are reached. To the extent such a shift does occur, it would affect the seasonal timing of deliveries to canneries, the implications of which are addressed in the RIR. A race to fish could also bring costs if it causes vessel operators to forego vessel maintenance or to fish in weather or ocean conditions that it otherwise would not. This could bring costs in terms of human safety as well as the performance of the vessel and its fishing gear and crew. This race to fish effect could also be expected in the time period between when a closure of the fishery is announced and when the fishery is closed.

4.1.3.2 FAD Restrictions

Under Alternative 3, FAD restrictions would be in effect from July 1 through October 31 in each of the calendar years 2013 and 2014 as well as restrictions on setting on fish that have aggregated in association with a vessel. During these months, no fishing on or near schools associated with FADs or vessels, and no deploying or servicing FADs, would be permitted in the Convention Area in the area between 20° N. and 20° S. latitude. The specific prohibitions, which include details for enforcement purposes, would be the following:

- No setting of a purse seine around a FAD or within one nautical mile of a FAD;
- No setting of a purse seine in a manner intended to capture fish that have aggregated in association with a FAD or a vessel, such as by setting the purse seine in an area from which a FAD or a vessel has been moved or removed within the previous eight hours, or setting the purse seine in an area in which a FAD has been inspected or handled within the previous eight hours, or setting the purse seine in an area into which fish were drawn by a vessel from the vicinity of a FAD;
- No deployment of a FAD into the water;
- No repairing, cleaning, maintaining, or otherwise servicing a FAD, including any electronic equipment used in association with a FAD, in the water or on a vessel while at sea, except that: a FAD may be inspected and handled as needed to identify the owner of the FAD, identify and release incidentally captured animals, un-foul fishing gear, or prevent damage to property or risk to human safety; and a FAD may be removed from the water and if removed may be cleaned, provided that it is not returned to the water.

- No submerging lights under water, suspending or hanging lights over the side of the purse seine vessel or any associated skiffs, other watercraft or equipment, or directing or using lights in a manner other than as needed to illuminate the deck of the purse seine vessel or associated skiffs, watercraft or equipment, except as needed to comply with navigational requirements, to ensure the health and safety of the crew, and in emergencies and as needed to prevent human injury or the loss of human life, the loss of the purse seine vessel, skiffs, watercraft or aircraft, or environmental damage.

Alternative 3 would be the same as Alternative 2 except for the additional restrictions on setting on fish that have aggregated in association with a vessel.

As stated above, the FAD restrictions are expected to affect the fishing patterns and practices of the fleet by transferring fishing effort from FAD sets to unassociated sets during the prohibition periods, and possibly reducing the amount of fishing effort during the prohibition periods relative to other periods of the year. In addition, under Alternative 3, there could be a transfer of fishing effort from setting on fish that have aggregated in association with a vessel to other unassociated set types. The number of these types of sets is small. According to logbooks maintained by vessel operators, sets on fish aggregating in association with vessels averaged about four per year for the entire fleet from 1997 through 2010 (examination by NMFS of observer data from selected years indicates a somewhat higher number than the number reported by vessel operators, so vessel logbook data might underestimate the actual number, but the number is still small in comparison to FAD sets). Thus, the effects to the fleet from the FAD restrictions under Alternative 3 would likely be almost identical to the effects caused by implementation of Alternative 2.

4.1.3.3 Observer Requirements

The observer coverage provisions under Alternative 3 would be the same as under Alternative 2. Thus, the effects to the fleet would be identical and the same as described above in Section 4.1.2.3.

4.1.3.4 Summary of Impacts

The requirements of implementing the proposed rule under Alternative 3 have the potential to impact the gross revenue and profits earned by the U.S. WCPO purse seine fleet and cause impacts to its fishing patterns and practices. Overall, it is unlikely that Alternative 3 would cause substantial financial burden to the fleet or substantially affect the fleet's current fishing patterns and practices, given the short duration of the rule and the other fishing opportunities available to the fleet. The primary direct effects of Alternative 3 on the fleet are the following: (1) the fishing effort limit on the high seas and in the U.S. EEZ could cause the fleet to fish more in the EEZs of Pacific Island Parties to the SPTT or in the EPO and could cause a reduction in the total fishing effort of the fleet; and (2) the FAD restrictions during July-October would likely transfer some

fishing effort from FAD sets to unassociated and from setting on fish that have aggregated in association with a vessel to other unassociated set types, with consequent impacts in terms of species composition of the catch, and possibly shift fishing effort from that time to other periods of the year. Given that the fishing day effort limit under this alternative would be substantially larger than the limits under Alternative 2, it is much less likely that the limit would be reached and a fishery closure triggered under Alternative 3 than Alternative 2. Thus, this alternative would likely cause fewer changes to the existing fishing patterns and practices of the fleet and would be more similar to Alternative 1, the No-Action Alternative.

4.1.4 Alternative 4: Least Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Under Alternative 4, the U.S. purse seine fleet operating in the WCPO would be subject to the following management measures, as described in Chapter 2, all applicable to the Convention Area between 20° N. and 20° S. latitude and for the years 2013 and 2014: (1) annual limits on fishing effort, measured in terms of fishing days on the high seas and in the U.S. EEZ; the combined limit for the U.S. EEZ and high seas would be 3,943 fishing days; (2) restrictions on FAD fishing from July 1 through October 31; and (3) a requirement to carry WCPFC observers on all fishing trips, unless NMFS determines that an observer is not available for a fishing trip and a written copy of the determination is carried on board the vessel.

4.1.4.1 Fishing Effort Limit

This limit would be considerably higher than the limits under Alternative 2 or the limit under Alternative 3, and represents the maximum fishing effort by the fleet in the U.S. EEZ and on the high seas in recent years. This alternative also would not include separate limits for the high seas and U.S. EEZ as does Alternative 2. Thus it is highly unlikely that the limit would be reached under this alternative. If the limit is reached, the fishery would be closed on the high seas and in the U.S. EEZ for the remainder of the calendar year. While the length of any such closure cannot be predicted with any degree of certainty, due to the large variation in the number of days fished in the U.S. EEZ and on the high seas from year to year, as shown in Table 1, any closure period would be shorter than under Alternative 2 or Alternative 3, and would likely take place toward the end of the year, if at all.

However, as discussed above for Alternative 2 and Alternative 3, if the limits are reached in 2013 or 2014, vessels in the fleet could continue to fish in the EEZs of Pacific Island Parties to the SPTT, where the fleet expends the majority of its effort. Vessels in the fleet could also increase their effort in the EPO in the area managed by the IATTC. Vessels licensed under the SPTT can each take one fishing trip per year in the area managed by the IATTC, for a period up to 90 days in duration, so long as the total number of trips by all vessels in the fleet does not exceed 32 per calendar year. In addition, although the

IATTC has adopted capacity limits for purse seine vessels operating in the EPO, the United States has a little over 31,000 cubic meters remaining of its allocated capacity. So, this capacity is available for vessels in the U.S. WCPO purse seine fleet who wish to become active on the IATTC vessel register and fish in the EPO in the area of competence of the IATTC .

Given that the fleet expends most of its fishing effort in the EEZs of Pacific Island Parties to the SPTT, which would not be included in these effort limits, it is unlikely that this alternative would substantially affect the amount of fish captured by the fleet or the revenue earned by fishing businesses in the fleet. However, as stated above for Alternatives 2 and 3, climate and ocean conditions, such as ENSO events, affect the location of optimal fishing grounds for the fleet, and 2013 or 2014 could be years in which the U.S. EEZ or high seas provides more optimal fishing grounds than usual.

In addition, the effort limits could change the temporal patterns of fishing effort. Since the limit would be a competitive allocation whereby fishing days would not be allocated among individual vessels and would be available to the entire fleet until the cap is reached, vessel operators might have an incentive to fish harder in these two areas zone earlier in the calendar year than they otherwise would in an attempt to obtain as many fishing days as they can (i.e., “the race to fish”) before one or both limits are reached. To the extent such a shift does occur, it would affect the seasonal timing of deliveries to canneries, the implications of which are addressed in the RIR. A race to fish could also bring costs if it causes vessel operators to forego vessel maintenance or to fish in weather or ocean conditions that it otherwise would not. This could bring costs in terms of human safety as well as the performance of the vessel and its fishing gear and crew. This race to fish effect could also be expected in the time period between when a closure of the fishery is announced and when the fishery is closed. Given that the limits under this alternative reflect the maximum fishing effort by the fleet in recent years, it is unlikely that any race to fish effect would be pronounced under this alternative, since it is unlikely that the limits would be reached or that vessel owners and operators would need to compete for available fishing days under the limit.

4.1.4.2 Restrictions on FAD Fishing

Under Alternative 4, the FAD restrictions would be in effect from July 1 through October 31 in each of the years 2013 and 2014. During these months, no fishing on or near schools associated with FADs or vessels, and no deploying or servicing FADs, would be permitted in the Convention Area in the area between 20° N. and 20° S. latitude. The specific prohibitions, which include details for enforcement purposes, would be identical to those described above in Section 4.1.2.2 for Alternative 2. Thus, the effects to the fleet from the restrictions on FAD fishing under Alternative 4 would be the same as those under Alternative 2.

As stated above, the periods restricting fishing on FADs are expected to affect the fishing patterns and practices of the fleet by transferring fishing effort from FAD sets to

unassociated sets during the prohibition periods, and possibly reducing the amount of fishing effort during the prohibition periods relative to other periods of the year.

4.1.4.3 Observer Requirements

The observer coverage provisions under Alternative 4 would be the same as under Alternative 2 and Alternative 3. Thus, the effects to the fleet would be identical and the same as described above in Section 4.1.2.3.

4.1.4.4 Summary of Impacts

The requirements of implementing the proposed rule under Alternative 4 have the potential to impact the gross revenue and profits earned by the U.S. purse seine fleet operating in the WCPO and cause impacts to its fishing patterns and practices. Overall, it is unlikely that Alternative 4 would cause substantial financial burden to the fleet or substantially affect the fleet's current fishing patterns and practices, given the short duration of the rule and the other available fishing opportunities. The primary direct effects of Alternative 4 on the fleet are the following: (1) the fishing effort limit on the high seas and in the U.S. EEZ could cause the fleet to fish more in the EEZs of Pacific Island Parties to the SPTT or in the EPO and could cause a reduction in the total fishing effort of the fleet; and (2) the FAD restrictions during July-October would likely transfer some fishing effort from FAD sets to unassociated sets, with consequent impacts in terms of species composition of the catch, and possibly shift fishing effort from that time to other periods of the year. Given that the fishing day effort limit under this alternative would be substantially larger than the limits under Alternative 2 or the limits under Alternative 3 and represents the highest effort exerted by the fleet in recent years, it is very unlikely that the limit would be reached to trigger a closure of the fishery in the U.S. EEZ or on the high seas. Thus, Alternative 4 would likely cause fewer changes to the existing fishing patterns and practices of the fleet and would be the most similar of all the action alternatives to Alternative 1, the No-Action Alternative.

4.2 Physical Environment and Climate Change

None of the alternatives (No-Action Alternative or any of the action alternatives) would be expected to cause direct or indirect effects to the physical environment of the WCPO. In addition, none of the alternatives would be expected to contribute to climate change. Under the action alternatives, the FAD restrictions could increase search time and thus, fuel use, if vessels in the fleet shift to fishing on FAD sets during that time, and the fishing day effort limits could also increase fuel use, if vessels in the fleet steam to locations farther than they otherwise would due to any closure of the U.S. EEZ or high seas to fishing. However, the fishing effort limits could also cause an overall decrease in fuel use if there is an overall decrease in fishing effort. Moreover, given that the catch and effort of the fleet varies substantially from year to year, as shown in Table 1 in Chapter 3 of this EA, as does the use of FADs, as shown in Figure 8 in Chapter 3 of this EA, the overall fuel use of the fleet would be expected to depend more on other factors (market conditions, oceanographic changes affecting the location of the target tunas,

etc.), and the action alternatives would not be expected to lead to increased emissions of greenhouse gases affecting climate change.

4.3 *Bigeye Tuna, Skipjack Tuna, and Yellowfin Tuna*

This section presents the analysis of the potential impacts that could be caused by the No-Action Alternative and each of the action alternatives for the 2013 U.S. Purse Seine Rule to bigeye tuna, skipjack tuna, and yellowfin tuna in the WCPO – the three stocks on which CMM 2012-01 focuses.

4.3.1 Alternative 1: No-Action Alternative

Under Alternative 1, the U.S. purse seine fleet would continue to be managed through existing requirements, and the elements of the 2013 U.S. Purse Seine Rule would not be implemented. Thus, there would be no direct changes to the fishing patterns or practices of the fleet and thus, no resulting direct effects to bigeye tuna, yellowfin tuna, or skipjack tuna.

As shown in Table 4 of this EA, the stock of Pacific bigeye tuna in the Pacific is currently experiencing overfishing, but the stocks of skipjack tuna and yellowfin tuna in the WCPO and EPO are neither experiencing overfishing nor are they overfished. CMM 2012-01 includes specific objectives for the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna: for each, the fishing mortality rate is to be reduced to or maintained at levels no greater than the fishing mortality rate associated with maximum sustainable yield. Because Alternative 1 would not implement the provisions of CMM 2012-01 for the U.S. purse seine fleet, the objectives of the CMM would be less likely to be met under this alternative than under any of the action alternatives. It is conceivable that the indirect effects (or long-term effects), of this alternative on bigeye tuna, yellowfin tuna, and skipjack tuna would be increased fishing pressure on stocks, leading to a decline to sizes smaller than that which is capable of producing maximum sustainable yield.

On the other hand, as stated above, many other factors affect the status of these stocks, and implementation of 2013 U.S. Purse Seine Rule under any of the action alternatives would not substantially change the fishing practices and patterns of the fleet. Thus, the status of the stocks under the No-Action Alternative would not differ substantially from any of the action alternatives. Under this alternative, however, any minor beneficial effects that the stocks could experience from implementation of the 2013 U.S. Purse Seine Rule under any of the action alternatives would not occur. Thus, there could be some increased potential for long-term negative effects to the stocks over the action alternatives, although such effects cannot be predicted with certainty.

4.3.2 Alternative 2: Most Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Overall, Alternative 2 would likely lead to some direct beneficial impact on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna by reducing the fishing mortality on predominantly juvenile tunas and adult skipjack tuna during the FAD restrictions and by a potential overall reduction in fishing effort from the implementation of the fishing effort limits. The FAD restrictions could also have some potentially adverse effects on the WCPO stock of yellowfin tuna by an increase in the overall fishing mortality on the stock as a result of the fleet targeting large unassociated tunas during the FAD restrictions. Any adverse effects would be ameliorated by reduced catches of juvenile yellowfin tuna during the FAD restrictions, which may have a chance to move or recruit to a deeper, non-predominantly FAD associated life cycle that would provide benefits in terms of additional adult yellowfin tuna available to unassociated fishing.

The indirect effects of Alternative 2 on bigeye, skipjack, and yellowfin tuna stocks would likely be beneficial, since this alternative would be expected to result in some decreased fishing mortality on the stocks, which could lead to long-term positive effects on the stocks. However, these beneficial effects would be relatively small, because: (1) the FAD restrictions and fishing effort limits would only be in effect for two years – 2013 and 2014; and (2) this alternative would result in only a small reduction in the overall fishing mortality on these stocks.

As discussed in Chapter 3, Section 3.3, adult bigeye tuna, skipjack tuna, and yellowfin tuna are considered among the top predators of the tropical or warm pool marine ecosystem. Changes to the stocks of these species could lead to trophic interactive effects, including increased competition for prey species with other top predators. Larval and juvenile tunas are also sources of food for other marine species, such as fish, seabirds, porpoises, marine mammals, and sharks. Thus, increases in larval and juvenile tuna could increase the food available for these other species. It is unlikely that the effects of Alternative 2 to the stocks of bigeye, skipjack and yellowfin tuna, which would be short-lived, would be large enough to impact the marine ecosystem. Overall, Alternative 2 would not cause substantial effects on biodiversity and ecosystem function.

4.3.3 Alternative 3 (Preferred): Past Regulatory Precedent Fishing Limit Alternative; FAD Prohibition Period Including Prohibition on Fishing on FADs and Prohibition on Setting on Fish that Have Aggregated in Association with a Vessel

Under Alternative 3, the impacts to the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna would be similar to the impacts under Alternative 2. However, the fishing effort limits are more restrictive under Alternative 2 than under Alternative 3. Thus, it is much more likely that the fishing effort limits under Alternative 2 would be reached in a given year, necessitating a closure of the U.S. purse seine fishery in the U.S. EEZ and on the high seas. In addition, any similar fishery closure under Alternative 3 would be shorter than under Alternative 2, since the limit under Alternative 3 would be reached later in the year. Thus, any effects on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna would be less than under Alternative 2.

Alternative 3 would also include the additional prohibition during the FAD restrictions, which would prohibit U.S. purse seine vessels from fishing on fish that have aggregated in association with a vessel. It is unlikely that this additional prohibition would affect the stocks of bigeye tuna, skipjack tuna, or yellowfin tuna. The number of these types of sets is small. According to logbooks maintained by vessel operators, sets on fish aggregating in association with vessels averaged about four per year for the entire fleet from 1997 through 2010 (examination by NMFS of observer data from selected years indicates a somewhat higher number than the number reported by vessel operators, so vessel logbook data might underestimate the actual number, but the number is still small in comparison to FAD sets).

4.3.4 Alternative 4: Least Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Under Alternative 4, the impacts to the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna would be similar to the impacts under Alternative 2 and Alternative 3. However, the fishing effort limits are more restrictive under Alternative 2 and Alternative 3 than under Alternative 4. Thus, it is much more likely that the fishing effort limits under Alternative 2 or Alternative 3 would be reached in a given year, necessitating a closure of the U.S. purse seine fishery in the U.S. EEZ and on the high seas. In addition, any similar fishery closure under Alternative 4 would be shorter than under Alternative 2 or under Alternative 3, since the limit under Alternative 4 would be reached later in the year. Thus, any effects on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna would be less than under Alternative 2 or Alternative 3, and Alternative 4 would be more similar to the No-Action Alternative.

4.4 Other Non-target Fish Species³⁰

This section discusses the potential impacts from the No-Action Alternative or from implementation of any of the action alternatives for the 2013 U.S. Purse Seine Rule on non-target fish species caught by the U.S. WCPO purse seine fleet.

4.4.1 Alternative 1: No-Action Alternative

Under Alternative 1, the No-Action Alternative, there would be no direct changes to the existing fishing patterns of the U.S. WCPO purse seine fleet, and thus, no direct effects to non-target fish species. As discussed above in Section 4.3.1 of this EA, it is conceivable that the indirect, or long-term, effects of the No-Action Alternative on bigeye tuna, skipjack tuna, and yellowfin tuna would be negative, should this alternative lead to increased fishing pressure on the stocks. Any such increased fishing pressure could also lead to long-term negative effects on other non-target fish species that are caught by the U.S. WCPO purse seine fleet. However, as shown in Table 5 in Chapter 3 of this EA, the U.S. WCPO purse seine fleet does not generally catch a substantial amount of other fish species. Also, given that many other factors influence the status of non-target fish species (e.g., fisheries that target those species, oceanic conditions), it is unlikely that there would be any indirect effects to non-target species under the No-Action Alternative, stemming from lack of implementation of the 2013 U.S. Purse Seine Rule. In addition, none of the action alternatives would substantially change the fishing patterns and practices of the

³⁰ This terminology is used throughout the EA to differentiate between bigeye tuna, a non-target species of the U.S. WCPO purse seine fleet, and other non-target fish species.

fleet as a whole. The primary difference between the action alternatives are the fishing effort limits. As indicated in Table 1 and Sections 3.1 and 3.2 of this EA, the spatial distribution of fishing effort by the fleet varies considerably from year to year, and is dependent mostly on oceanographic and market conditions affecting the location of the target tuna stocks and the marketability of the catch. Moreover, the majority of the fishing effort of the fleet takes place in the EEZs of Pacific Island Parties to the SPTT, and those EEZs would be unaffected by any of the action alternatives. Thus, the fishing patterns and practices of the fleet under the No-Action Alternative would be similar to the fishing patterns and practices of the fleet under any of the action alternatives analyzed in this EA. However, Alternative 4 (the least restrictive fishing effort limit alternative) would be more similar to the No-Action Alternative than Alternatives 3 or 2; Alternative 2 would be much less similar to the No-Action Alternative than either Alternatives 3 or 4, since it is much more likely that the effort limits would be reached under Alternative 2, triggering a closure of the fishery in the U.S. EEZ and/or on the high seas, as described above. So the effects to non-target species from the No-Action Alternative would not be substantially different from the effects to non-target species under any of the action alternatives.

4.4.2 Alternative 2: Most Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Under Alternative 2, there could be some change in the amount and type of non-target fish species caught by the U.S. WCPO purse seine fleet. As discussed above, during the FAD restrictions, the fleet may fish in different areas than fished historically (i.e., make unassociated rather than FAD sets), which would affect the composition of the catch, including both target stocks and non-target species, and the fishing day effort limits could cause some shift in effort to the EEZs of Pacific Island Parties to the SPTT or to the EPO. Direct impacts to non-target fish species would include a potential increase in the catch of some species and a decrease in the catch of other species, due to the changes in fishing patterns and practices of the fleet and the potential for an overall decrease in fishing effort due to implementation of the fishing effort limits and any associated fishery closure. Indirect or long-term effects would include the greater potential for adverse effects to the stocks of non-target fish species that experience increased fishing mortality and reduced potential for adverse effects to the stocks of non-target fish species that experience decreased fishing mortality. Because the U.S. WCPO purse seine fleet fishing does not generally catch large amounts of other non-target fish species (see Table 5 in Chapter 3 of this EA), the overall direct and indirect effect on non-target fish species would be negligible.

4.4.3 Alternative 3 (Preferred): Past Regulatory Precedent Fishing Limit Alternative; FAD Prohibition Period Including Prohibition on Fishing on FADs and Prohibition on Setting on Fish that Have Aggregated in Association with a Vessel

Under Alternative 3, similar to Alternative 2 there could be some change in the amount and type of non-target fish species caught by the U.S. WCPO purse seine fleet. The nature of the potential direct and indirect impacts to other non-target fish species would be identical to those identified under Alternative 2, although the extent of effects would be less, since it is much less likely that the fishing limit would be reached under this alternative to trigger a fishery closure leading to an overall reduction in fishing effort. However, the overall effects to other non-target fish species would be negligible for the reasons discussed above for Alternative 2.

4.4.4 Alternative 4: Least Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Under Alternative 4, similar to Alternative 2 and Alternative 3, there could be some change in the amount and type of non-target fish species caught by the U.S. WCPO purse seine fleet. The nature of the potential direct and indirect impacts to other non-target fish species would be identical to those identified under Alternative 2 and Alternative 3, although the extent of effects would be less, since it is highly unlikely that the fishing limit would be reached under this alternative to trigger a fishery closure leading to an overall reduction in fishing effort. Alternative 4 would be the most similar to the No-Action Alternative out of all the action alternatives. However, the overall effects to other non-target fish species and overall the effects would be negligible for the reasons discussed for Alternative 2.

4.5 Protected Resources

This section discusses the potential impacts from each of the alternatives to protected resources in the affected environment.

4.5.1 Alternative 1: No-Action Alternative

Under Alternative 1, the No-Action Alternative to the purse seine rule, there would be no direct changes to the existing fishing patterns of the U.S. WCPO purse seine fleet, and thus, no direct effects to protected resources. As discussed above in Section 4.3.1 of this EA, it is conceivable that the indirect, or long-term, effects of the No-Action Alternative on bigeye tuna, skipjack tuna, and yellowfin tuna would be negative, should this alternative lead to increased fishing pressure on the stocks. Any such increased fishing pressure could also lead to long-term negative effects on protected resources with which the U.S. WCPO purse seine fleet interacts. However, given that many other factors influence the status of those species (e.g., other fisheries, oceanic conditions), it is

unlikely that there would be any substantive indirect effects to protected resources stemming from lack of implementation of the 2013 U.S. Purse Seine Rule under the No-Action Alternative.

4.5.2 Alternative 2: Most Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

Data indicates that the U.S. purse seine fleet has had some interaction with marine mammals and sea turtles in the WCPO, and the U.S. WCPO purse seine fleet has not been known to interact with seabirds. The direct and indirect effects to marine mammals and sea turtles from the Alternative 2 would likely be negligible. To the extent that there could be a reduction in fishing effort, any effect to ESA-listed species or critical habitat of these species would be beneficial, since there would be a reduced risk of interaction with the protected resource. To the extent that there is a shift in fishing patterns and practices, any effects in terms of interactions with protected resources would be negligible compared to typical year-to-year variations in interactions with species driven by changing oceanic and economic conditions. As indicated in Table 1 of the EA, the distribution of effort of the fleet varies considerably from year to year, and as indicated in Figure 8 of the EA, the proportion of FAD versus unassociated sets also varies from year to year, so the overall shifts in fishing patterns and practices of the fleet in a given year depend mostly on oceanographic and economic factors, which would not be affected by this alternatives. Moreover, the FAD restrictions and fishing effort limits would only be in effect for two years – 2013 and 2014. Thus, for these reasons, it is likely that there would be no net change in interactions stemming from implementation of the proposed. Alternative 2 would not cause any effects to ESA-listed species that have not been addressed in prior consultations and would not cause additional impacts to marine mammals protected under the MMPA.

The changes in fishing patterns and practices of the fleet would not affect the following areas designated as EFH or HAPC: ocean or coastal habitats; historic properties listed in or eligible for listing in the National Register of Historic Places; or NWRs or National Monuments. Such resources would not be affected because the potential changes in fishing patterns and practices of the fleet would take place in areas of the ocean far from shorelines and would not affect the seafloor or benthic habitats since purse seine fishing does not involve contact with the seafloor (see Section 3.2 of this EA for a description of purse seine fishing). Also, because any effects to fish stocks would be minor or negligible, as discussed above, any pelagic fish habitat designated as EFH, including the water column, or HAPC, would not be expected to experience any substantial effects – either beneficial or adverse – from implementation of this alternative. In addition, as discussed in Section 3.5 of this EA, commercial fishing is already prohibited in the Monuments, pursuant to the 2009 Presidential Proclamation.

4.5.3 Alternative 3 (Preferred): Past Regulatory Precedent Fishing Limit Alternative; FAD Prohibition Period Including Prohibition on Fishing on FADs and Prohibition on Setting on Fish that Have Aggregated in Association with a Vessel

The effects to protected resources under Alternative 3 would be essentially the same as under Alternative 2. However, as discussed above, under Alternative 3 it would be much less likely that there would be closure of the fishery in the U.S. EEZ or on the high seas as a result of the fishing effort limit being reached, so it is much less likely that there would be an overall decrease in fishing effort. Thus, the potential for any beneficial impacts to protected resources from a reduction in fishing effort leading to a potential for reduced risk of interactions with the protected resource would be much less under Alternative 3 than under Alternative 2.

4.5.4 Alternative 4: Least Restrictive Fishing Effort Limit Alternative; FAD Prohibition Period Limited to Prohibition on Fishing on FADs

The effects to protected resources under Alternative 4 would be essentially the same as under Alternative 2 and Alternative 3. However, as discussed above, under Alternative 4 it would be much less likely that there would be closure of the fishery in the U.S. EEZ or on the high seas as a result of the fishing effort limit being reached than under Alternative 2 or even under Alternative 3, given that the effort limit represents the maximum effort exerted by the fleet in recent years, so it is much less likely that there would be an overall decrease in fishing effort. Thus, the potential for any beneficial impacts to protected resources from a reduction in fishing effort leading to a potential for reduced risk of interactions with the protected resource would be much less under Alternative 4 than under Alternatives 2 or 3, and Alternative 4 would be more similar to the No-Action Alternative.

4.6 *Environmental Justice*

Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations," states that "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations." As discussed above, the overall environmental effects from under any of the alternatives would be minor and generally would be distributed evenly among the affected vessels in the fleet. Thus, none of the alternatives considered would result in significant and adverse effects on minority or low-income populations.

Chapter 5 Cumulative Impacts

This chapter presents the cumulative impacts analysis for the 2013 U.S. Purse Seine Rule.

A cumulative impact is defined by the CEQ's regulations at 40 CFR § 1508.7 as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions." And further: "cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." The cumulative impacts analysis examines whether the direct and indirect effects of the proposed action and alternatives on a given resource interact with the direct and indirect effects of other actions on that same resource to determine the overall, or cumulative effects, on that resource. As discussed in Chapter 4, the analysis of the direct and indirect effects of the No-Action Alternative and the three action alternatives indicates that each of the alternatives may have some minor effects on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna in the WCPO. The direct and indirect effects on other resources in the affected environment would be none or negligible. Thus, this chapter focuses on the potential cumulative effects to bigeye, skipjack, and yellowfin tuna in the WCPO.

Before beginning a cumulative impacts analysis, the geographic area of the analysis and the time frame for the analysis must be identified to determine the appropriate scope for the analysis (CEQ 1997). The geographic area of the analysis here is the Pacific Ocean area as described in Chapter 3 and in Section 5.1.1. The time frame for this analysis is from 2009 – when the United States first implemented a WCPFC decision for the management of tropical tunas through rulemakings with effects on the environment similar to the effects that would be caused by implementation of the 2013 U.S. Purse Seine Rule – to 2017, the reasonably foreseeable end date of the new multi-year CMM for tropical tunas that the WCPFC may adopt at the end of this year. Although it is likely that the WCPFC would adopt additional management measures for tropical tunas after 2017, any specific actions beyond 2017 that would affect tropical tunas in the WCPO are not definitive enough to be reasonably foreseeable at this time.

Section 5.1 provides some additional information on the affected environment, Section 5.2 describes the identified past, present, and reasonably foreseeable future actions during the 2009-2017 time period, and Section 5.3 presents the cumulative effects analysis.

5.1 Affected Environment

Chapter 3 describes the affected environment that could be affected by the proposed action under any of the alternatives studied in depth. Chapter 3 sets forth the baseline for assessing the direct and indirect impacts of the proposed action, as presented in Chapter 4. This section supplements the information in Chapter 3 in order to establish the baseline for studying the other actions that are part of the cumulative impacts analysis. The section

provides information on the fisheries that are active in the area of application of the Convention.

5.1.1 Convention Area HMS Fisheries

The dominant HMS fisheries in the Convention Area are tuna fisheries that target skipjack tuna, yellowfin tuna, bigeye tuna, and albacore tuna. Many distant-water fishing nations and coastal states participate and operations vary from small-scale, subsistence, and artisanal operations in the coastal waters of Pacific Island States, to industrial scale operations both in the EEZs of Pacific Island States and on the high seas.

HMS fisheries in the Convention Area are individually managed under a number of international agreements and associated domestic authorities. Catch and effort information is compiled by the Oceanic Fisheries Programme at the Secretariat of the Pacific Community as the scientific and data support provider to the WCPFC for most fisheries. The WCPFC Tuna Yearbook, produced by the OFP at SPC, summarizes this information and is available to the public.³¹ Table 9 through Table 12 below summarize relevant data, such as, total catch by species, catch by gear, catch by nation, and number of active vessels.

Williams and Terawasi (2012) summarized the Convention Area HMS fishery in the following terms: Annual total catches of the four main tuna species (skipjack, yellowfin, bigeye and albacore) in the [Convention Area] increased steadily during the 1980s as the purse seine fleet expanded and remained relatively stable during most of the 1990s until the sharp increase in catch during 1998. From 2004 until 2009, there had been a clear increasing trend in total tuna catch, primarily due to increases in purse-seine fishery catches. . . . The provisional total [Convention Area] tuna catch for 2011 was estimated . . . the lowest since 2005 and [about] 300,000 mt lower than the record in 2009.

³¹ See <http://www.wcpfc.int/statistical-bulletins>. The Tuna Fishery Yearbook 2011 is referenced in this document and cited as WCPFC 2012.

2011	1,488	490	3,667

Source: WCPFC 2012, Table 71.

The changes in purse seine and pole and line between years 2000-2001 are due to increasingly improved data coming from Indonesia. In recent years Indonesia has reported around 1,000 domestic purse seine vessels – most of which are small (under 400 gross tons), many of which had been previously counted as pole and line vessels; the larger vessels still contribute to the majority of the total catch.

5.2 Past, Present, and Reasonably Foreseeable Future Actions

This section describes the other actions in the period 2009-2017 that have the potential to affect bigeye tuna, skipjack tuna, and yellowfin tuna in the WCPO. The analysis of cumulative impacts is presented in the following section.

5.2.1 Past Actions

Past actions include:

- U.S. implementation of the purse seine provisions of CMM 2008-01 and CMM 2011 through the 2009 rule and the 2011 rule, as discussed in Chapter 1 of this EA;
- U.S. implementation of the longline provisions of CMM 2008-01 and CMM 2011-01, which was essentially implementation of a 3,763 mt catch limit for bigeye tuna for the U.S. longline fleets operating in the Convention Area for the

³³ An active vessel is any vessel that has actively fished at some point during the course of the year.

- years 2009-2012 (see final rule published December 7, 2009 at 74 FR 63999; and final rule published August 27, 2012 at 77 FR 51709);
- U.S. implementation of the IATTC decisions for tropical tunas in the EPO in 2009 and 2011, which include bigeye tuna catch limits for longline fisheries and closed areas and periods for purse seine fishing for the years 2009 through 2013 (see final rule published November 23, 2009 at 74 FR 61046; and final rule published November 4, 2011 at 76 FR 68332); and
 - actions by other nations to implement the WCPFC and IATTC decisions for tropical tunas, details of which are unknown.

5.2.2 Other Present Actions

Present actions include:

- U.S. implementation of the longline provisions of CMM 2012-01 through a separate rulemaking later this year, as discussed in Chapter 1 of this EA, which would put into place a catch limit for bigeye tuna;
- Amendments to the relevant FEPs to implement certain provisions for the Marine National Monuments, as described in Section 3.5 of this EA; and
- actions by other nations to implement CMM 2012-01, details of which are unknown.

5.2.3 Reasonably Foreseeable Future Actions

Reasonably foreseeable future actions include:

- Implementation of the WPFMC recommendations for an amendment to the Pelagics FEP that would set up a system for the assignment of WCPFC-imposed HMS catch limits among the United States and American Samoa, Guam, and the Commonwealth of the Northern Mariana Islands;
- actions by the United States and other nations to implement a new multi-year WCPFC CMM for tropical tunas for 2014-2017, details of which are unknown;
- actions by the United States and other nations to implement a new multi-year IATTC management measure for tropical tunas for 2014 and beyond, details of which are unknown; and
- actions by the United States to implement a renegotiated SPTT, the specific details of which are unknown at this time.

5.3 Discussion of Cumulative Impacts to Bigeye, Skipjack, and Yellowfin Tuna in the WCPO

As discussed in Chapter 4, the direct and indirect effects from any of the action alternatives to bigeye, skipjack, and yellowfin tuna stocks in the WCPO would likely be minor and beneficial. Alternative 2 would have more potential for beneficial effects on the stocks, given that the length of any closure caused by the fishing effort limits would be longer; Alternative 3 would have less potential for beneficial effects on the stocks than Alternative 2, since the fishing effort limit would be reached later in the year, if at all, but less than Alternative 4; Alternative 4 would have the least potential for beneficial effects on the stocks, since the fishing effort limit would be reached even later in the year than under Alternative 3, if at all. As for the No-Action Alternative, there would be no direct effects to bigeye, skipjack, and yellowfin tuna stocks, and the potential indirect effects would be minor and perhaps negative.

The status of the stocks of bigeye, skipjack, and yellowfin tuna has not changed since 2009, thus, it is evident that the past management actions identified above, which were intended to help to conserve the stocks, have also had, at the most, minor biological effects. The other identified present actions would also be expected to have minor effects on these stocks. Some of the other present actions would implement interim measures under CMM 2012-01, and in CMM 2012-01, the WCPFC contemplates that additional management measures for 2014-2017 will be needed to achieve its stated objectives. The proposed amendments to the relevant FEPs to implement certain provisions for the Marine National Monuments are not expected to substantially affect fish stocks (see WPFMC 2013). CMM 2012-01 includes specific objectives for each of the three stocks: for each, the fishing mortality rate is to be reduced to or maintained at levels no greater than the fishing mortality rate associated with maximum sustainable yield.

The details of the reasonably foreseeable future actions are unknown, and thus, specific assessment of each of their potential contributions to cumulative impacts on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna is not possible at this time. However, given the WCPFC's articulated objectives in CMM 2012-01 and the current status of the stocks, it is likely that the reasonably foreseeable future actions will be consistent with the objectives of CMM 2012-01 and would likely include some provisions that are similar to the provisions in CMM 2012-01.

Thus, the cumulative impacts from the identified past, present, and reasonably foreseeable future actions on the stocks of bigeye tuna, yellowfin tuna, and skipjack tuna in the WCPO would likely be beneficial. However, it is unlikely that the current status of the stocks will change as a collective result of all of these actions – though this is difficult to predict without knowing the details of the reasonably foreseeable future actions. Therefore, the cumulative impacts from implementation of the 2013 U.S. purse seine rule under any of the action alternatives or lack of implementation under the No-Action Alternative would not be expected to lead to substantial cumulative impacts on the status of the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna in the WCPO.

Consultation

NAO 216-6 requires a listing of the agencies and persons who were consulted while preparing this EA. Table 13 lists the agencies, NOAA units, and entities that were contacted for information.

Table 13: List of agencies and offices contacted

NMFS – Headquarters – Office of International Affairs
NMFS – Pacific Islands Regional Office – Observer Program
NMFS – Pacific Islands Regional Office – Sustainable Fisheries Division
NMFS – Pacific Islands Fisheries Science Center
NMFS – Southwest Regional Office – Sustainable Fisheries Division

Finding of No Significant Impact

Fishing Restrictions and Observer Requirements in Purse Seine Fisheries for 2013 and 2014 RIN 0648-BC87

This Finding of No Significant Impact (FONSI) was prepared according to the guidelines established in National Marine Fisheries Service (NMFS) Instruction 30-124-1 and the requirements set forth in the National Oceanic and Atmospheric Administration's (NOAA) Administrative Order (NAO 216-6, May 20, 1999). The FONSI is based on the Environmental Assessment (EA) prepared pursuant to the requirements of the National Environmental Policy Act (NEPA; 42 U.S.C. § 4321 *et seq.*) to analyze the potential impacts on the human environment from promulgation of the rule (RIN 0648-BC87), "Fishing Restrictions and Observer Requirements in Purse Seine Fisheries for 2013-2014."

Background

At its Ninth Regular Session, in December 2012, the Commission for the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean (Commission or WCPFC) adopted Conservation and Management Measure (CMM) 2012-01, "Conservation and Management Measure for Bigeye, Yellowfin and Skipjack Tuna in the Western and Central Pacific Ocean." Among other provisions, CMM 2012-01 includes provisions for the management of purse seine fisheries operating in the western and central Pacific Ocean (WCPO). Pursuant to the authority of the Western and Central Pacific Fisheries Convention Implementation Act (16 U.S.C. 6901 *et seq.*), the National Marine Fisheries Service (NMFS) is promulgating a rule to implement the provisions of CMM 2012-01 for the U.S. purse seine fleet operating in the WCPO that need to be implemented via regulations at this time. These provisions include the following: (1) limits on fishing effort by U.S. purse seine vessels in the U.S. exclusive economic zone (EEZ) and on the high seas; (2) restrictions on the use of fish aggregating devices (FADs); and (3) requirements for U.S. purse seine vessels to carry observers.

NMFS prepared an EA that analyzed three action alternatives for implementing the purse seine provisions of CMM 2012-01, as well as the No-Action Alternative. Each of the action alternatives includes a different variation of the fishing effort limits. NMFS identified two variations for implementing the FAD restrictions, which were incorporated into the three action alternatives. NMFS identified only one manner of implementing the observer requirements, so all the action alternatives include identical observer requirements. Alternative 1 is the No-Action Alternative. Alternative 2 includes the most restrictive fishing effort limits as well as the FAD restrictions prohibiting fishing on FADs during certain periods. Alternative 3 includes the fishing effort limits based on past regulatory precedent, and FAD restrictions prohibiting fishing on FADs and setting on fish that have aggregated in association with a vessel during certain periods. Alternative 4 includes the least restrictive fishing effort alternative as well as FAD restrictions prohibiting fishing on FADs during certain periods. The rule implements Alternative 3,

which includes neither the most restrictive nor the least restrictive fishing effort limits, but rather, is based on similar fishing effort limits established in past regulations. The FAD restrictions under Alternative 3 are expected to serve CMM 2012-01's objective of reducing the tuna stocks' fishing mortality rates through seasonal prohibitions on the use of FADs better than the variation for this element of the rule considered under Alternatives 2 and 4. For the purposes of this document, the term "proposed action" refers to Alternative 3.

The February 2013 version of the EA was made available to the public in conjunction with the publication of the proposed rule. The four comment letters submitted during the comment period on the proposed rule did not raise any issues regarding the information in the EA.

Significance Analysis

NAO 216-6 contains criteria for determining the significance of the impacts of a proposed action. In addition, the Council on Environmental Quality regulations for implementing NEPA at 40 C.F.R. 1508.27 state that the significance of an action should be analyzed both in terms of "context" and "intensity." Each criterion listed below is relevant to making this FONSI and has been considered individually, as well as in combination with the others.

The significance of this action is analyzed based on the NAO 216-6 criteria and CEQ's context and intensity criteria. These include:

1) Can the proposed action reasonably be expected to jeopardize the sustainability of any target species that may be affected by the action?

Response: No. The target species of the U.S. WCPO purse seine fishery are skipjack tuna and yellowfin tuna, with bigeye tuna being an incidentally caught species. As stated in Section 4.3 of the EA, the proposed action would likely lead to some direct beneficial impacts on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna by reducing the fishing mortality on juveniles of all three tuna stocks and adult skipjack tuna during the period of application of the FAD restrictions and by a potential overall reduction in fishing effort from the implementation of the fishing effort limits. The FAD restrictions could also have some adverse effects on the WCPO stock of yellowfin tuna by an increase in the overall fishing mortality on the stock as a result of the fleet targeting large unassociated schools of tunas during the period of application of the FAD restrictions. Any adverse effects would be ameliorated by reduced catches of juvenile yellowfin tuna during the period of application of the restrictions, which may have a chance to move or recruit to a deeper, non-predominantly FAD associated life cycle that would provide benefits in terms of additional adult yellowfin tuna available to unassociated fishing.

The indirect effects of the proposed action on bigeye, skipjack, and yellowfin tuna stocks would likely be beneficial, since this alternative would be expected to result in some decreased fishing mortality on the stocks, which could lead to long-term positive effects on the stocks. However, these beneficial effects would be relatively small, because: (1) the FAD restrictions and fishing effort limits would only be in effect for two years – 2013 and 2014; and (2) this alternative would result in only a small reduction in the overall fishing mortality on these stocks. As described in Chapter 3 and Chapter 5 of the EA, the U.S. purse seine fleet contributes only a small portion of the total fishing mortality on these stocks, and the proposed action would reduce the fishing mortality of the stocks by only a small amount.

2) Can the proposed action reasonably be expected to jeopardize the sustainability of any non-target species?

Response: No. Section 4.4 of the EA discusses the potential impacts to non-target fish species (other than bigeye tuna) from the proposed action. The proposed action could cause some change in the amount and type of non-target fish species caught by the U.S. WCPO purse seine fleet. During the period of application of the FAD restrictions, the fleet may fish in different areas than fished historically as a result of making unassociated rather than FAD sets, which would affect the composition of the catch, including both target stocks and non-target species, and the fishing effort limits could cause some shift in effort to the EEZs of Pacific Island Parties to the South Pacific Tuna Treaty (Treaty) (where the fleet expends the majority of its effort) or to the eastern Pacific Ocean (EPO). Direct impacts to non-target fish species could include a potential increase in the catch of some species and a decrease in the catch of other species, due to the changes in fishing patterns and practices of the fleet and the potential for an overall decrease in fishing effort due to implementation of the fishing effort limits and any associated fishery closure. Indirect or long-term effects would include the greater potential for adverse effects to the stocks of non-target fish species that experience increased fishing mortality and reduced potential for adverse effects to the stocks of non-target fish species that experience decreased fishing mortality. Because the U.S. WCPO purse seine fleet does not generally catch large amounts of other non-target fish species (see Table 5 in Chapter 3 of the EA), the overall direct and indirect effects on non-target fish species would be negligible.

3) Can the proposed action reasonably be expected to cause substantial damage to the ocean and coastal habitats and/or essential fish habitat (EFH) as defined under the Magnuson-Stevens Fishery Conservation and Management Act (MSA) and identified in FMPs?

Response: No. As stated in Chapter 4, Section 4.5 of the EA, the proposed action would not cause any adverse impacts to areas designated as EFH or Habitat Areas of Potential Concern under MSA provisions, or to ocean and coastal habitats. Such resources would not be affected because the potential changes in fishing patterns and practices of the fleet would take place in areas of the ocean far from shorelines and would not affect the seafloor or benthic habitats since purse seine fishing does not involve contact with the seafloor (see Section 3.2 of the EA for a description of purse seine fishing). Also, because any effects to fish stocks would be minor or negligible, as discussed above, any pelagic fish habitat designated as EFH, including the water column, or HAPC, would not be expected to experience any substantial effects – either beneficial or adverse – from implementation of the proposed action.

4) Can the proposed action reasonably be expected to have a substantial adverse impact on public health or safety?

Response: No. As indicated in the EA in Section 4.1.3.1, the only identified potential impact to public health and safety from the proposed action would be from the “race to fish” that could be caused by the implementation of the fishing effort limit provision. The rule implements the effort limit provision in a competitive manner (i.e., not allocated among individual vessels). Thus, vessel operators could have an incentive to fish harder in this zone earlier in the applicable limit period than they otherwise would in an attempt to fish as many fishing days as they can before the limit is reached. This “race to fish” effect could cause vessel operators to forego vessel maintenance or to fish in weather or ocean conditions than they otherwise would not. This could bring costs in terms of human safety as well as the performance of the vessel and its fishing gear and crew. The “race to fish” effect could also be expected in the time period between when a closure of the fishery due to a fishing limit being reached is announced and when the fishery is closed. However, given that the fleet expends most of its fishing effort in the EEZs of Pacific Island Parties to the Treaty, which would not be included in the effort limit, it is unlikely that any “race to fish” effect as a result of the effort limit on the high seas and in the U.S. EEZ would be pronounced. Thus, substantial adverse impacts on public health or safety are not anticipated to result from promulgation of the rule.

5) Can the proposed action reasonably be expected to adversely affect endangered or threatened species, marine mammals, or critical habitat of these species?

Response: No. As stated in Section 4.5 of the EA, the proposed action would not be expected to adversely affect species listed as endangered or threatened under the Endangered Species Act (ESA), their critical habitat or marine mammals. Data indicate that the U.S. purse seine fleet has had some interaction with marine mammals and sea turtles in the WCPO, and the U.S. WCPO purse seine fleet has not been known to interact with seabirds. The direct and indirect effects to marine mammals and sea turtles from the proposed action would likely be negligible. To the extent that there could be a reduction in fishing effort, any effect to ESA-listed species or critical habitat of these species would be beneficial, since there would be a reduced risk of interaction with the protected resource. To the extent that there is any change in fishing patterns and practices, any effects in terms of interactions with protected resources would be negligible compared to typical year-to-year variations in interactions with species driven by changing oceanic and economic conditions. As indicated in Table 1 of the EA, the spatial distribution of effort of the fleet varies considerably from year to year, and as indicated in Figure 8 of the EA, the proportion of FAD versus unassociated sets also varies from year to year, so the overall shifts in fishing patterns and practices of the fleet in a given year depend mostly on oceanographic and economic factors, which would not be affected by the proposed action. Moreover, the FAD restrictions and fishing effort limits would only be in effect for two years – 2013 and 2014. Thus, for these reasons, it is likely that there would be no net change in interactions stemming from implementation of the proposed action. The proposed action would not cause any effects to ESA-listed species that have not been addressed in prior consultations and would not cause additional impacts to marine mammals protected under the Marine Mammal Protection Act.

6) Can the proposed action be expected to have a substantial impact on biodiversity and/or ecosystem function within the affected area (e.g., benthic productivity, predator-prey relationships, etc.)?

Response: No. The purpose of the proposed action is to implement provisions of CMM 2012-01 for the U.S. WCPO purse seine fleet, in order to contribute to the underlying objectives of CMM 2012-01 regarding WCPO bigeye tuna, yellowfin tuna and skipjack tuna, which are to reduce or maintain their respective fishing mortality rates at levels no greater than the fishing mortality rates associated with maximum sustainable yield. As discussed in Section 3.4.1 and Section 4.3 of the EA, adult bigeye tuna, skipjack tuna, and adult yellowfin tuna are considered among the top predators of the tropical or warm pool marine ecosystem. Changes to WCPO stocks of these species could lead to trophic interactive effects, including increased competition for prey species with other top predators. Larval and juvenile tunas are also sources of food for other marine species, such as fish, seabirds, porpoises, marine mammals, and sharks. Thus, increases in larval and juvenile tuna could increase the food available for these other species. However, it is unlikely that the effects of the proposed action to the WCPO stocks of bigeye, skipjack, and yellowfin tuna, which would be short-lived given the limited duration of the rule, would be large enough to impact the marine ecosystem. Overall, the rule would not cause substantial effects on biodiversity and ecosystem function.

7) Are significant social or economic impacts interrelated with natural or physical environmental effects?

Response: No. As stated in the Regulatory Impact Review (RIR), some of the provisions of the rule could lead to substantial costs and/or revenue losses in the U.S. purse seine fleet. For example, the fact that the fleet has typically made a large portion of its sets on FADs suggests that prohibiting the use of FADs for four months each year may bring substantial costs and/or revenue losses to affected businesses. However, although these economic effects are somewhat speculative and unquantifiable, it is unlikely that these economic effects would substantially affect the fleet's current fishing patterns and practices. As stated in Section 4.1.3 of the EA, the primary direct effects of the rule in the U.S. WCPO purse seine

fishery are the following: (1) the fishing effort limit on the high seas and in the U.S. EEZ could cause the fleet to fish more in the EEZs of Pacific Island Parties to the Treaty or in the EPO and could cause a reduction in the total fishing effort of the fleet; and (2) the period of application of the FAD restrictions during July-October would likely transfer some fishing effort from FAD sets to unassociated and from setting on fish that have aggregated in association with a vessel to other unassociated set types, with consequent impacts in terms of species composition of the catch, and possibly shift fishing effort from that time to other periods of the year. As discussed throughout the EA, these direct effect on the fishery would not lead to substantial effects on the human environment – at the most, there could be some beneficial impacts on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna, with the effects on other resources in the affected environment being none or negligible.

8) Are the effects on the quality of the human environment likely to be highly controversial?

Response: No. As stated throughout the EA, the primary effects of the rule on the U.S. WCPO purse seine fishery are the following: (1) the fishing effort limit on the high seas and in the U.S. EEZ could cause the fleet to fish more in the EEZs of Pacific Island Parties to the Treaty or in the EPO and could cause a reduction in the total fishing effort of the fleet; and (2) the FAD restrictions during July-October would likely transfer some fishing effort from FAD sets to unassociated and from setting on fish that have aggregated in association with a vessel to other unassociated set types, with consequent impacts in terms of species composition of the catch, and possibly shift fishing effort from that time to other periods of the year. Overall, these effects could lead to some minor beneficial impacts on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna, and it is unlikely that there would be any controversy regarding the size, nature, or effects of the action (i.e., the effects of the action on the quality of the human environment). Moreover, the EA was made available during the public comment period for the proposed rule and the four comment letters submitted did not raise any issues regarding the information in the EA.

9) Can the proposed action reasonably be expected to result in substantial impacts to unique areas, such as historic or cultural resources, park land, prime farmlands, wetlands, wild and scenic rivers or ecologically critical areas?

Response: No. As described in Section 3.5.4 of the EA, there are several National Wildlife Refuges and National Monuments in the affected environment. However, these resources would not be affected because the potential changes in fishing patterns and practices of the fleet would take place in areas of the ocean far from shorelines and would not affect the seafloor or benthic habitats since purse seine fishing does not involve contact with the seafloor. In addition, as discussed in Section 3.5 of the EA, commercial fishing is already prohibited in the National Monuments, pursuant to the 2009 Presidential Proclamation.

10) Are the effects on the human environment likely to be highly uncertain or involve unique or unknown risks?

Response: No. As described throughout the EA, although the magnitude of the effects on the human environment cannot be quantified with certainty, the types of effects and the direction of those effects can be predicted. The purpose of the proposed action is to implement the provisions of CMM 2012-01 for the U.S. WCPO purse seine fleet that are necessary to implement via regulations in 2013 in a timely and practical manner, in order to contribute to the underlying objectives of CMM 2012-01 regarding WCPO bigeye tuna, yellowfin tuna and skipjack tuna, which are to reduce or maintain their respective fishing mortality rates at levels no greater than the fishing mortality rates associated with maximum sustainable yield. The primary effects of the rule on the U.S. WCPO purse seine fishery are the following: (1) the fishing effort limit on the high seas and in the U.S. EEZ could cause the fleet to fish more in the EEZs of Pacific Island Parties to the Treaty or in the EPO and could cause a reduction in the total fishing effort of the fleet; and (2) the FAD restrictions during July-October would likely transfer some fishing effort from

FAD sets to unassociated sets and from setting on fish that have aggregated in association with a vessel to other unassociated set types, with consequent impacts in terms of species composition of the catch, and possibly shift fishing effort from that time to other periods of the year. Overall, these effects could lead to some minor beneficial impacts on the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna. Thus, the effects on the human environment from the proposed action would not be highly uncertain or involve unique or unknown risks.

11) Is the proposed action related to other actions with individually insignificant, but cumulatively significant impacts?

Response: No. As discussed in Chapter 5 of the EA, the cumulative impacts on the resources in the affected environment that could be impacted by the proposed action (i.e., the WCPO stocks of bigeye tuna, skipjack tuna, and yellowfin tuna), from the proposed action, other present actions, and all reasonably foreseeable future actions, would likely be beneficial. However, it is unlikely that the current status of the stocks, using the NMFS status determination criteria, will change as a collective result of all of these actions – though this is difficult to predict without knowing the details of the reasonably foreseeable future actions. Therefore, the cumulative impacts from implementation of the proposed action would not be expected to lead to substantial cumulative impacts on the status of the stocks of bigeye tuna, skipjack tuna, and yellowfin tuna in the WCPO, and no significant cumulative impacts on the human environment are anticipated from implementation of the proposed action.

12) Is the proposed action likely to adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural or historical resources?

Response: No. As stated in Section 4.5 of the EA, such resources would not be affected because the potential changes in fishing patterns and practices of the fleet would take place in areas of the ocean far from shorelines and would not affect the seafloor or benthic habitats since purse seine fishing does not involve contact with the seafloor. Thus, there would be no effects to districts, sites, highways, structures or objects listed in or eligible for listing in the National Register of Historic Places or potential loss or destruction of significant scientific, cultural, or historical resources.

13) Can the proposed action reasonably be expected to result in the introduction or spread of a nonindigenous species?

Response: No. As stated above, the primary effects of the rule on the U.S. WCPO purse seine fishery are the following: (1) the fishing effort limit on the high seas and in the U.S. EEZ could cause the fleet to fish more in the EEZs of Pacific Island Parties to the Treaty or in the EPO and could cause a reduction in the total fishing effort of the fleet; and (2) the FAD restrictions during July-October would likely transfer some fishing effort from FAD sets to unassociated and from setting on fish that have aggregated in association with a vessel to other unassociated set types, with consequent impacts in terms of species composition of the catch, and possibly shift fishing effort from that time to other periods of the year. Although some transfer of effort is anticipated, none of these effects would be expected to result in the introduction or spread of a nonindigenous species since the vessels in the fleet would not be entering any new geographic areas of operation.

14) Is the proposed action likely to establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration?

Response: No. The purpose of the proposed action is to implement the provisions of CMM 2012-01 for the U.S. WCPO purse seine fleet that are necessary to implement via regulations in 2013 in a timely and

practical manner, in order to contribute to the underlying objectives of CMM 2012-01 regarding WCPO bigeye tuna, yellowfin tuna and skipjack tuna, which are to reduce or maintain their respective fishing mortality rates at levels no greater than the fishing mortality rates associated with maximum sustainable yield. The need for the rule is to satisfy the international obligations of the United States as a Contracting Party to the Convention on the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean, pursuant to the authority of the Western and Central Pacific Fisheries Commission Implementation Act. Thus, the rule is limited to an immediate and focused objective and it does not establish a precedent for future actions with significant effects or represent a decision in principle about a future consideration.

15) Can the proposed action reasonably be expected to threaten a violation of Federal, State, or local law or requirements imposed for the protection of the environment?

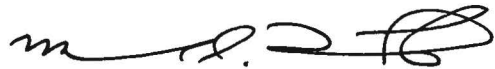

Response: No. As stated in the response to #14, the purpose of the rule is to implement specific conservation and management measures and the need for the rule is to satisfy the international obligations of the United States as a member of the WCPFC. As such, the rule would not be expected to violate any laws or requirements imposed for the protection of the environment.

16) Can the proposed action reasonably be expected to result in cumulative adverse effects that could have a substantial effect on the target species or non-target species?

Response: No. See the response to #11 above for a discussion of cumulative effects. The overall cumulative impacts to the WCPO stocks of bigeye tuna, skipjack tuna, and yellowfin tuna are expected to be beneficial, though not substantial.

DETERMINATION

In view of the information presented in this document and the analysis contained in the supporting EA and RIR prepared for the rule "Fishing Restrictions and Observer Requirements in Purse Seine Fisheries for 2013 and 2014," it is hereby determined that the proposed action will not significantly impact the quality of the human environment as described above and in the supporting EA. In addition, all beneficial and adverse impacts of the proposed action have been addressed to reach the conclusion of no significant impacts. Accordingly, preparation of an Environmental Impact Statement for this action is not necessary.
