INTRODUCTION

This report presents hydrographic data for ARIES Expedition Legs I, II and VI, and ANTIPODE Expedition Legs IV, XII and XIII. Data from ARIES Legs III and IX will appear in a subsequent report. Data from ARIES Leg IV is too sparse to warrant publication. Both expeditions have had data previously published. ARIES Leg VIII appears as Cruise 12 in NORTH PACIFIC STUDY PHYSICAL DATA REPORT, SIO Reference Series 73-26 and ANTIPODE XV and XVII in SIO Reference Series 72-77 issued by the GEOSECS Operations Group. No hydrographic data was collected on other Legs of ANTIPODE Expedition.

Preceding the tabulated data for each cruise are: 1) a description of the principal objective and the hydrographic work carried out on the cruise, 2) sponsoring agency, 3) a description of all "non-standard" procedures, 4) a list of scientific personnel participating in the collection of data and 5) a list of publications utilizing the cruise data.

STANDARD PROCEDURES

Hydrographic Casts

Temperature was measured using paired deep-sea reversing thermometers and is reported to hundredths of a degree Celsius. In some instances specially scaled thermometers were used which were read and the results reported to thousandths of a degree. Unprotected thermometers were included on most Nansen bottles lowered more than 100 meters.

Water samples for chemical and nutrient analyses were obtained from the Nansen bottles.

Salinity was determined with a Hytech (now Plessey Environmental Systems) inductive salinometer (ARIES I) and a University of Washington (1960) conductive salinometer (ARIES II and VI, ANTIPODE IV, XII and XIII). Salinity is reported to three decimal places provided it meets accepted standards. The values are reported to two decimal places when only one determination per sample was obtained, or when the accuracy of a particular sample, or of all samples on a station may be in doubt.

Dissolved oxygen was determined by the Winkler method as modified by Carpenter (1965). Determinations were made of phosphate, silicate, nitrite and nitrate with a DU spectrophotometer according to methods suggested by Strickland and Parsons (1968).

The observed data has been evaluated using the method described by Klein (1973). This involves consideration of their variation as functions of density or depth and their relations to each other, and comparison with adjacent observations.

TABULATED DATA

Almost all data in this report was tabulated from Nansen bottle casts.* The observed values are listed on the left of each page with interpolated and calculated values at standard depths on the right. The values at standard depths are calculated according to a modified Rattray (1962) interpolation technique.

The only data reported from STD lowerings is for stations 64, 67, 68 and 69, ARIES Expedition Leg II. Temperature, salinity and calculated values at standard depths are listed on the right of the page with any data from Nansen bottles used for calibrating the STD lowering listed on the left.

The time reported for bottle casts is the time of messenger release. When a station consists of more than one cast, the messenger times for the first and last casts are given. Multiple casts are indicated by a letter following all observed depths except the cast with the shallowest depth. For STD lowerings the time given is the "start down" time.

The bottom depth, listed in meters, was determined by applying corrections from Matthews (1939) tables to echo soundings.

The weather and dominant waves were coded using the National Oceanographic Data Center (NODC) recommended conversions.

The Column headings from the computer are explained as follows:

Z	Depth	Meters
T	Temperature	°C
S	Salinity	‰
O2	Dissolved oxygen	ml/L
P04	"Reactive" inorganic phosphate-phosphorous	µg at/L
SiO3	"Reactive" inorganic silicate-silicon	µg at/L
N02	"Reactive" nitrite-nitrogen	µg at/L
N03	"Reactive" nitrate-nitrogen	µg at/L
DT	δ_T Thermosteric anomaly	cl/ton
SIGT	$\sigma_t = (\rho_{s,t,0} - 1) \cdot 10$ where $\rho_{s,t,0}$ is the density the parcel would have if moved isothermally to the sea surface.	g/L
DD	Geopotential anomaly, referred to the sea surface.	dyn. meters

*Original STD data for ARIES Legs I, II, III, IV and IX is on file in SIO data archives. ARIES Legs V and VII were geological cruises without STD lowerings. Original STD data for ARIES Leg VI is in the possession of Dr. Bruce Taft, University of Washington. No STD data was collected on ANTIPODE Expedition.

FOOTNOTES

ANNE E. COOK, JR.

Data which appears to be in error without obvious reason is reported, flagged uncertain with a U. Such data was not used in the determination of values at standard depths. Footnotes are used to indicate data which has required special processing.

Specimens measured at 100 fathoms, below the depth with the rest of the data, were collected at the central station (N-10). All the types and samples from and around the station were compared with samples from the same depth taken from the DEEPEND Expeditions. The net (100 ft. by 10 ft. by 10 ft. long), a single trawl net composed of 10 meshes and treated for hydrodynamically stable currents.

Specimens measured by the methods of longer trawls.

Personal participation in the expeditions:

Peter A. Bergelson

Robert W. Johnson

William R. Johnson

John C. Ladd

Johnson, R. W., 1972. Contributions to the bathymetric
biogeography of the Gulf of Mexico. Ph.D. Dissertation, University
of Texas at Austin, TX.

Johnson, R. W., 1973. The "Central" Mesoobtuse, deep-water, and
coastal congeneric forms of *Argyropelecus*. Ph.D. Dissertation, University
of Texas at Austin, TX.

ARIES EXPEDITION LEG I

The program on ARIES I consisted principally of biological sampling in zones immediately south of the equator in mid-ocean. Crossings of this region were made near 110°W and 120°W, and partial crossings were made as far west as 145°W. The Longhurst-Hardy plankton recorder (LHPR) or serial opening-closing nets (Bongo nets) were used for plankton sampling. Nutrients and hydrographic parameters were measured at 38 stations. Focus of study was the zone of transition between the equatorial and the central waters at 10-20°S. ARIES I provided December data and samples across this zone, to be compared with March-April (1969) data obtained earlier (PIQUERO Expedition, SIO Ref. 74-27). On each of the stations, a single Nansen bottle cast of 18 bottles was lowered to approximately 1000 meters.

ARIES I was sponsored by the National Science Foundation.

Personnel participating in the expedition were:

Ship's Captain:

Bonham, John W.

Scientific personnel:

Brinton, Dr. E. (Chief scientist)
Anderson, G. C.
Antezana, T. J.
Elston, M. B.
Ferreira, S. M.
Hamilton, B.
Hemingway, G. T.
Hester, A. W.
Kellogg, D.
Matsui, T.
Mead, R. V.
Owen, G. P.
Pearson, G.
Scruggs, F.
Stewart, C. S.
Venrick, Dr. E.
Withington, P.
Youngbluth, M.

Publications utilizing ARIES I data are:

Anderson, G. C., 1972. Double oxygen minimum in the south-eastern Pacific Ocean. *J. Mar. Res.*, 30: 275-280.

Youngbluth, M., 1973. The vertical distribution, diel migration, and community structure of euphausiids. Ph.D. dissertation, Stanford University. 296 pp.

ARIES EXPEDITION LEG II

The objective of Leg II of the ARIES Expedition was to measure the deep flow, water characteristics and topography in the area between New Zealand and Antarctica. Most of the work was carried out between 60°S and 70°S. Some preliminary results have been published by Reid and Mantyla (1971) and references in other publications listed below. The data from 12 current meter lowerings is available from NODC. On 60 stations single or multiple casts were lowered as near the bottom as possible.

ARIES II was sponsored by the National Science Foundation and the Office of Naval Research.

Personnel participating in the expedition were:

Ship's Captain:

Bonham, John W.

Scientific personnel:

Reid, J. L. (Chief scientist)
Anderson, G. C.
Bates, A. T.
Ferreira, S. M.
Graham, J. B.
Hester, A. W.
Kellogg, D.
Linick, T.
Mantyla, A. W.
Mead, R. V.
Morris, G. S. Jr.
Scruggs, F.
Steffin, O.
Withington, P.
Worthington, L. V.

Papers resulting from ARIES II are:

Reid, Joseph L., and Arnold W. Mantyla, 1971. Antarctic work of the ARIES Expedition. *Antarctic J., U. S.*, 6: 111-113.

Reid, Joseph L., 1973. The shallow salinity minima of the Pacific Ocean. *Deep-Sea Res.*, 20: 51-68.

Reid, Joseph L., 1974. Deep Pacific circulation inferred from the density field and water characteristics. *Trans. Amer. Geophys. Un.*, 56: 1134. (Abstract only).

Mantyla, Arnold W., 1975. On the potential temperature in the abyssal Pacific Ocean. *J. Mar. Res.*, 33: 341-354.

A) THE DATA FROM THE STD HAS BEEN TABULATED FOR THIS STATION. THE DATA FROM THE TWO NANSEN BOTTLES PLACED A FEW METERS ABOVE THE STD FOR CALIBRATION ARE ALSO LISTED.
 B) CAST II.

ARIES EXPEDITION LEG VI

The Kuroshio flows south of Japan as an intense western boundary current. On this expedition temperature measurements were made to provide data on the spacial scales of the meanders of the near-surface Kuroshio between Kyushu and eastern Honshu. Four surface drogues were tracked for a five-day period while XBTs were taken to estimate the near-surface velocity distribution and relate it to the 200m temperature distribution. Meander spacial scales were obtained by analysis of maps of the 15°C isotherm at 200m which were based on XBT drops at five-mile intervals.

In order to define the deep circulation under the Kuroshio and to determine whether or not the deep motions appear to be coherent with the surface flow, an array of current meters was deployed. Nine current meters were placed 100m off the bottom beneath the Kuroshio surface current; eight were recovered with good velocity records which ranged from 29 to 103 days. Four deep hydrographic sections were made over the current meters, which included measurements of dissolved oxygen, inorganic phosphate and silicate concentrations. The geostrophic current distribution determined on the sections has been referenced to the current meter measurements for computation of transport.

On each of 51 stations single or multiple Nansen bottle casts were lowered as near the bottom as possible.

ARIES VI was sponsored by the Office of Naval Research and the National Science Foundation.

Personnel participating in the expedition were:

Ship's Captain:

Ferris, Noel L.

Scientific personnel:

Taft, Dr. B. A. (Chief scientist)
Armstrong, H. C.
Buland, R.
Connors, R. A.
Cunningham, L. M. Jr.
Flick, R. E.
Flierl, G.
Graham, J. B.
Hasunuma, K.
Mantyla, A. W.
Matsuyama, M.
Morris, G. S., Jr.
Robinson, Prof. A. R.

Scharff, J. M., III
Shuto, K.
Solomon, H.
Stock, G. G.
Thomas, J. E.
Wells, J. A.

Publications utilizing ARIES VI data are:

- Solomon, H., 1974. Observations of thermal microstructure in the Kuroshio off of southern Honshu and Shikoku. *Jour. Oceanogr. Sc. Japan*, 30: 108-120.
- Taft, B. A., A. R. Robinson and W. J. Schmitz, Jr., 1973. Current path and bottom velocity of the Kuroshio. *Jour. Phys. Ocean.* 3: 347-350.

A) THE NANSEN BOTTLE AT THIS LEVEL ON CAST I PRETRIPPED. THE DEPTH MAY BE SLIGHTLY IN ERROR.

B) CAST II.

C) ALTERNATE VALUE 23.39 DEGREES.

D) TEMPERATURE INFERRED FROM PRESSURE THERMOMETER AND WIRE LENGTH.

E) ALTERNATE VALUE 2.67 DEGREES.

A) CAST II.

ANTIPODE EXPEDITION LEG IV

The objective of Leg IV of ANTIPODE Expedition was to investigate the influence of productivity, as reflected in zooplankton standing crop, on the distribution of deep-sea fishes in the western Pacific Ocean. On each of the hydrographic stations single Nansen bottle casts, each with 13 bottles, were lowered to approximately 1600 meters.

ANTIPODE IV was sponsored by the National Science Foundation.

The Nansen bottles were more widely spaced than usual. An expendable bathythermogram (XBT) was used on most stations to aid in determining the temperature at standard levels above 450 meters. Only observed values of salinity and oxygen are reported.

Personnel participating in the expedition were:

Ship's Captain:

Ferris, Noel L.

Scientific personnel:

Rosenblatt, Dr. R. H. (Chief scientist)
Butler, C. M.
Copp, J. F.
Dockins, D. M.
Greenbaum, M. H.
Hartwick, R. F.
Hester, A. W.
Johnson, R. K.
Karig, Dr. D. K.
Liebertz, P. J.
Nolan, R. S.
O'Neill, P. V.
Saban, D. D.

Publications resulting from ANTIPODE IV are:

ANTIPODE EXPEDITION LEG XII

The objective of ANTIPODE XII was to determine the seismic anisotropy of compressional velocity of the upper mantle. The hydrographic work comprised one station made up of two casts with the deeper cast lowered to near the bottom.

ANTIPODE XII was sponsored by the Office of Naval Research and the National Science Foundation.

The single hydrographic station was made to study principally the deep and near-bottom region, therefore the observations in the shallower portion of the cast are more widely spaced than usual. Temperature interpolations have been made with the aid of an expendable bathythermogram (XBT) record to 500m depth. Salinity and oxygen interpolations should be used with caution because of the wider-than-usual spacing of the observations.

Personnel participating in the expedition were:

Ship's Captain:

Phinney, Alan W.

Scientific personnel:

Sclater, Dr. J. G. (Co-chief scientist)
Raitt, Dr. R. W. (Co-chief scientist)
Baba, K.
Butler, C. M.
Forsman, K. G.
Foster, T. D.
Henry, A.
Hester, A. W.
Hohnhaus, G. W.
Hubenka, F.
Kirk, H. K.
McGowan, D. D.
Newhouse, D. A.
O'Neill, P. V.
Walsh, T. J.

A paper utilizing data from ANTIPODE XII is:

Raitt, R. W., G. G. Shor, Jr., H. K. Kirk and M. Henry, 1972.

Anisotropy of the oceanic upper mantle. Geological Society of America, Abstracts with Programs, 4: 222. (Abstract only)

A) CAST II.

ANTIPODE EXPEDITION LEG XIII

The objective of ANTIPODE XIII was to determine the age and the mean heat flow of the western Philippine Basin. The two hydrographic stations were made up of multiple casts with the deepest cast lowered to the bottom.

ANTIPODE XIII was sponsored by the National Science Foundation.

These hydrographic stations were made to study principally the deep and near-bottom region, therefore, the observations in the shallower portion of the casts are more widely spaced than usual. Temperature interpolations have been made with the aid of the expendable bathythermogram (XBT) to 500m depth. Salinity and oxygen interpolations should be used with caution because of the wider-than-usual spacing of the observations.

Personnel participating in the expedition were:

Ship's Captain:

Bonham, John W.

Scientific personnel:

Sclater, Dr. J. G. (Chief scientist)

Baba, K.

Dixon, F. S.

Henry, A. J.

Hester, A. W.

Hilde, T. W.

Hubenka, F.

Isezaki, N.

Karig, D. E.

McKinney, D.

Rogers, J. E.

Trier, R. M.

Walsh, T. J.

Yasui, M.

Papers utilizing data from ANTIPODE XIII are:

Sclater, J. G., D. Karig, L. A. Lawver and K. Louden, 1976. Heat flow, depth and coastal thickness of the west Philippine Basin. *J. Geophys. Res.*, 81: 309-318.
