

NOV 25 2013

To All Interested Government Agencies and Public Groups:

Under the National Environmental Policy Act, an environmental review has been performed on the following action.

**TITLE:** Finding of No Significant Impact and Environmental Assessment for Chenier Ronquille Barrier Island Restoration Project (Fed No. BA-76)

**LOCATION:** Barataria Basin near Empire, Louisiana in Plaquemines Parish

**SUMMARY:** The purpose of this project is to re-establish Chenier Ronquille Island by funding construction of approximately 275 acres of wetlands and 135 acres of dune/beach. This action will not result in any significant impacts on the human environment. Short-term minor to moderate adverse impacts in creation of these habitats on existing vegetation, aquatic and benthic habitats, water quality, and noise are not considered to be significant. Long-term moderate beneficial impacts are expected on a variety of resources as a result of implementing the preferred alternative.

**RESPONSIBLE OFFICIAL:** Frederick C. Sutter  
Director, Office of Habitat Conservation  
National Oceanic and Atmospheric Administration  
1315 East-West Highway  
Silver Spring, MD 20910

The environmental review process led us to conclude that this action will not have a significant effect on the human environment. Therefore, an environmental impact statement will not be prepared. A copy of the finding of no significant impact (FONSI) including the supporting environmental assessment (EA) is enclosed for your information.

Although NOAA is not soliciting comments on this EA or FONSI, we will consider any comments submitted that would assist us in preparing future NEPA documents. Please submit any written comments to the responsible official named above.

Sincerely,

Patricia A. Montanio  
NOAA NEPA Coordinator

## INTRODUCTION

The proposed project (**Chenier Ronquille Barrier Island Restoration Project, BA-76**) is authorized under the Coastal Wetlands, Planning, Protection and Restoration Act (CWPPRA) of 1990 (16 United States Code [U.S.C.] §777c, 3951-3956), which stipulates that five federal agencies and the State of Louisiana jointly develop and implement a plan to reduce the loss of coastal wetlands in Louisiana (16 U.S.C. §3952 (b) (2)). Other federal agencies that make up the CWPPRA Task Force are the U.S. Army Corps of Engineers (USACE); the U.S. Fish and Wildlife Service (USFWS), Department of the Interior; the Natural Resources Conservation Service (NRCS), Department of Agriculture; and the U.S. Environmental Protection Agency (EPA). The CWPPRA Task Force selected this project through a publicly vetted process for engineering and design ([Louisiana Coastal Wetlands Conservation and Restoration Task Force \[LCWCRTF\] 2009](#)).

As the federal sponsor for the project, the National Oceanic and Atmospheric Administration's (NOAA) National Marine Fisheries Service (NMFS) is responsible for project oversight, including National Environmental Policy Act (NEPA) compliance, as required under the CWPPRA program guidelines. Through their responsibilities under Sections 401 and 404 of the Clean Water Act, the US Army Corps of Engineers reviewed the preferred alternative prior to issuing a permit for project construction. This project received a permit for construction of the preferred alternative on November 7, 2012. NOAA, with the Louisiana Coastal Protection and Restoration Authority (CPRA), the non-federal local project sponsor and cost-share partner, is providing funding through CWPPRA to rebuild approximately 274 acres of marsh and 137 acres of dune/beach using dredged materials.

This EA complies with the NEPA of 1969 and Council on Environmental Quality (CEQ) regulations for implementation of NEPA (Title 40 *Code of Federal Regulations* [CFR] Parts 1500 through 1508 [[CEQ 1992](#)]).

For background, note that the CWPPRA Task Force and the Louisiana Coastal Wetlands Conservation and Restoration Task Force (LCWCRTF) prepared a Programmatic Environmental Impact Statement (PEIS) (LCWCRTF [1993](#)) that included information on this type of project (barrier islands). In addition, a Final Programmatic EIS prepared by the USACE as part of the Louisiana Coastal Area Ecosystem Restoration Study ([USACE 2004](#)) also includes barrier islands in their evaluation of restoration actions. This document includes background information on the goals of the CWPPRA program and coastal protection and restoration in Louisiana. While the project proposed here is consistent with the goals mentioned in these two programmatic EIS documents, the purpose and need, affected environment, and analysis of alternatives for potential impacts for the Chenier Ronquille proposed project are completely contained in this document and not tiered from these two EIS's..

This EA specifically evaluates the impacts on the human environment associated with the proposed action and alternatives. This EA provides the required analysis to determine whether the proposed action and alternatives are likely to result in substantial impacts to the human environment. Only short-term adverse impacts are anticipated related to construction and are considered minor and reversible. This conclusion is based on a review of relevant literature, site-specific data, and project-specific engineering reports related to biological, physical, and cultural resources. The natural resource benefits anticipated from implementing the preferred alternative would include creation and restoration of saline marsh, dune, and associated barrier island habitats within the proposed project area. The increase in both quality and acreage of fisheries habitat would be expected to have long-term beneficial impacts on the local economy. This EA provides information on measures that would be taken to avoid and minimize potential adverse impacts to existing resources, such as threatened and endangered species.

## **Project Location**

The proposed project is located in Plaquemines Parish, Louisiana roughly 47 miles southeast of New Orleans and 8 miles east of Grand Isle, Louisiana ([Figure 1](#)). The proposed project area encompasses approximately 400 acres of saline marsh and shallow open water (2007 survey in [Louisiana Office of Coastal Restoration and Protection 2011](#)). Four offshore borrow areas have been identified for dredging sediments.

The proposed project area lies in Barataria Basin along the shoreline of the Chenier Ronquille Mapping Unit of Region 2 of the Coast 2050 Restoration Plan ([LCWCRTF and Wetlands Conservation and Restoration Authority \[WCRA\] 1998, 1999](#)). This Mapping Unit is 51,200 acres extending from lakes Washington and Grand Ecaille to the Gulf of Mexico.

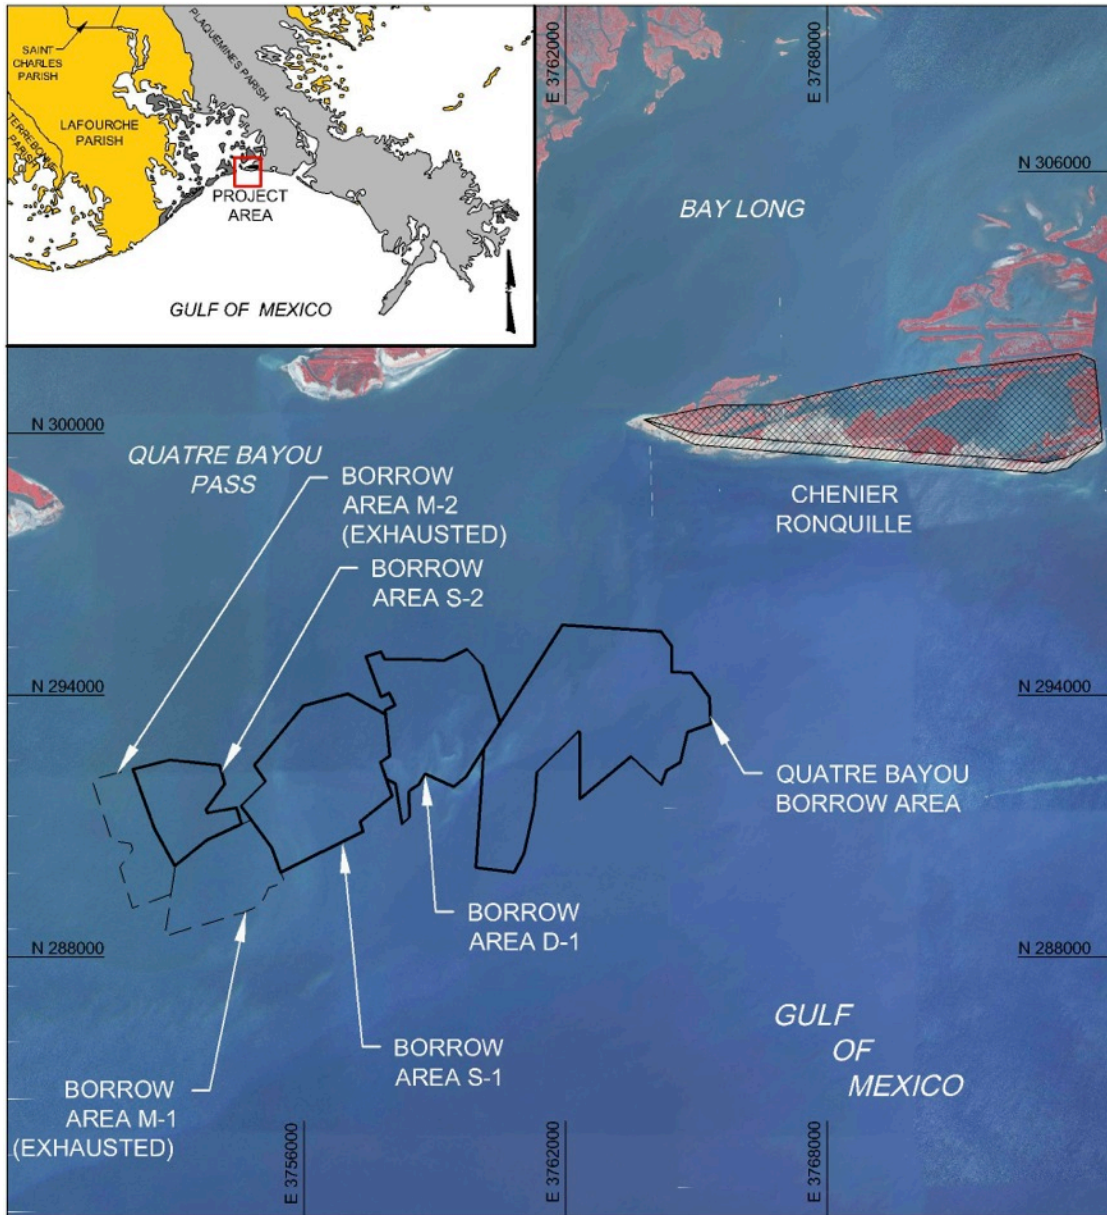

## **CWPPRA Project Selection Process**

The project was authorized for engineering and design (Phase 1) on the 19<sup>th</sup> CWPPRA annual Priority Project List. The CWPPRA project selection process takes several months to complete, involves extensive public involvement and review by federal and state agencies, and narrows the field of potential projects down to approximately four a year that are approved to enter the formal engineering and design process. As a result of this process, the field of available alternatives under consideration for a project generally includes those alternatives that would meet project goals developed during the engineering and design process and that take place within the general proposed project area.

During the engineering and design process, a CWPPRA project is subjected to layers of public, academic, and interagency review to ensure that effective projects move forward for design and ultimate construction. The project selection process begins around February of each year, when a series of Regional Planning Teams convene across the coast to solicit project nominations from the public, State, and federal agencies, as well as members of industry and academia. The meetings are publicized via public notices, and all members of the public are invited to attend. Every nominated project contains conceptual project features, approximate construction costs, and anticipated benefits to wetland resources. The nominated projects are screened and pared down to 20 nominees at a public voting meeting. Each federal agency represented in the CWPPRA program, the State, and each coastal parish participates in voting.

Interagency and academic working groups then evaluate the conceptual project features for cost and associated wetland benefits for feasibility and appropriateness to addressing the local land loss. The 20 nominee projects are then voted on by the program's federal agencies and the State to obtain a list of the 10 top-ranking projects to continue through the process. These candidate projects undergo several months of further design and interagency evaluation to determine whether the proposed project features are feasible, the anticipated benefits are likely, and the project costs fall within the funding constraints of the program. Certain project features are typically discounted during this preliminary design phase based on concerns about inferior performance, adverse impacts, technical infeasibility, or unreasonable costs. In the first months of each calendar year, the candidate projects are publicly presented and voted on by the program agencies to be funded for Phase 1 analysis, which includes the activities necessary to complete engineering and design, permitting, land rights, and environmental compliance before the project moves to construction.

2. DATE OF AERIAL PHOTOGRAPH: OCTOBER 2005.

## **Public Participation:**

Coordination with state resource agencies, federal resource agencies, and local government was conducted throughout project development. The draft Environmental Assessment (EA) was available for public review and comment at the Plaquemines Parish Public Library in Belle Chasse, Louisiana, and at the NOAA website

[http://www.habitat.noaa.gov/pdf/chenier\\_ronquille\\_ba\\_76\\_draft\\_environmental\\_assessment.pdf](http://www.habitat.noaa.gov/pdf/chenier_ronquille_ba_76_draft_environmental_assessment.pdf). Notice of the draft EA availability was published in the Advocate (State newspaper) and the Times-Picayune (local newspaper) as shown in [Appendix A](#). No public comments were received on the draft EA. Agency comments, which can be found in Appendix A have been addressed and included in this final EA.

## **Environmental Setting**

The proposed project is located on the Plaquemines shoreline that evolved from the Mississippi River Delta cycle. Naturally, river deltas develop and then degrade on a time scale in the 100s to 1000s of years. Coastal processes rework delta sediments and form barrier islands and headlands along the Gulf of Mexico, like the proposed project area. The Barataria Basin shoreline and associated barrier islands are degrading as evidenced by numerous breaches and island overwashes. Increased eustatic sea-level rise, diminished sediment supply, repeated storm events, construction of canals and navigation channels, and high rates of subsidence compromise the Barataria Basin integrity ([Boesch and others 1994](#)). The project area (near sea level) is frequently inundated with several feet (ft) of gulf water during hurricanes and tropical storms.

Barrier islands have a low topography where minor elevation changes, such as from +2.0 to 0.0 ft, result in habitat conversion. The elevation and location (bay or ocean side) largely determine habitat type. Much of the previously existing marsh, beach, and dune of the proposed project area have been converted to open water. The Chenier Ronquille Mapping Unit has been saline marsh since 1949 ([LCWCRTF and WCRA 1999](#)). High rates of subsidence (2.1 to 3.5 ft/century), wind erosion, canal dredging and altered hydrology are historic causes of land loss ([LCWCRTF and WCRA 1999](#)) that continue to convert land to open water in these units.

## **Purpose and Need**

### Purpose

The purpose of this proposed project is to support the coastal restoration objectives of CWPPRA by re-establishing the Gulf of Mexico shoreline and associated marshes in the approximately 400-acre project area using offshore sediment. The project goal is to “reestablish and maintain the functional barrier island ecosystem of Chenier Ronquille for fish and wildlife habitat by restoring and creating shoreline, dune and back-barrier marsh acreage ([Thompson and others 2011](#)).” Specific objectives are:

- Prevent island breaching over the 20-year project life.
- Provide an intertidal marsh platform with tidal exchange by the fourth year after construction.
- Maintain dune crest elevation of greater than +4 ft NAVD 20 years after construction.
- Maintain a dune elevation of greater than +5 ft NAVD following the first 10-year storm event.
- Maintain 50% of the year-after-construction subaerial acreage throughout the 20-year project life.
- Maintain the shoreline seaward of the pre-construction shoreline 20 years after construction.

### Need for Action

The need for the proposed action is directly related to the rapidly degrading environmental conditions at the proposed project site and the necessity to re-establish the structural integrity and enhance barrier island habitat value by establishing approximately 274 acres of marsh and 137 acres of dune/beach that will assist in slowing the losses in the immediate vicinity. Aerial photo series from 1998 to 2010 shows

the change from intact to overwashed shoreline of the project area ([Thompson and others 2011](#)). A healthy coastal marsh provides rearing habitat for shellfish and finfish; furnishes habitat for waterfowl, wading birds, small mammals, and numerous amphibians and reptiles; protects interior lands from storm surges; helps maintain water quality; and provides other services. Louisiana's coastal wetlands are essential to sustain renewable fisheries resources integral to the local, state, and national economies. Of the 1.3 billion pounds of fisheries landings reported for the Gulf Coast in 2007, more than 71% were caught in Louisiana ([NOAA 2009](#)). Marshes provide nursery, foraging, and spawning habitat for numerous marine and estuarine species of commercial and recreational importance. Maintaining coastal shorelines and marshes also helps protect the habitat, infrastructure, and communities inland by reducing storm surge.

#### NEPA Requirements and the Scope of the NEPA Analysis

This EA discloses information on and analyzes the direct, indirect, and cumulative impacts on the human environment likely to result from the Chenier Ronquille Barrier Island Restoration Project proposed action and the alternatives. The need for this EA is to inform the decision of whether or not to fund and authorize this project, including the proposed action and alternatives, and to determine whether the proposed restoration of Chenier Ronquille has the potential for significant impacts to the human environment.

### **PROPOSED ACTION AND ALTERNATIVES**

#### The No-Action Alternative

NEPA refers to the no-action alternative as the continuation of baseline conditions without implementation of the proposed action. Evaluation of the no-action alternative is required by CEQ regulations. Under this alternative, no steps would be taken to restore the Chenier Ronquille barrier island habitat.

#### Build Alternatives

To meet project goals and objectives, all build alternatives involve creation of a beach and dune and were designed based on results of geotechnical studies, coastal process assessments, and topographic, bathymetric, and magnetometer surveys ([Thomson and others 2011](#)). Build alternatives were simulated in SBEACH models to determine changes to potential dune construction options under historic storm events situations ([Thompson and others 2011](#)). All build alternatives include the same marsh elevation, borrow areas, access areas, plantings, and containment dike construction, as stated below. Marsh construction would be to a +2.5 ft NAVD88 for all build alternatives, because settlement analysis indicated this would provide the optimum number of years above mean high water and is similar to the marsh elevation used for similar successful projects ([Thompson and others 2011 Appendix D](#)).

Containment dikes would be necessary for all build alternatives to retain placed sediments. The amount of containment and their placement differs for build alternatives. The average containment dike profile would include a +5 ft NAVD elevation, a crest width of 10 ft, and side slopes 1V: 4H. Containment dikes are expected to degrade through natural erosion from waves. Dikes would be gapped after settlement of marsh fill materials, if necessary, to allow hydrologic connection should the expected erosion or settlement not occur.

All build alternatives include dune cross-sections designed to maintain a minimum of +5 ft NAVD88 dune height after a 10-year storm event ([Thompson and others 2011](#)). Sand fencing (fencing to capture sand that is naturally transported by wind) would be erected on the constructed dune to capture naturally windblown sand and passively build or maintain the dune feature. Sand fencing would be inspected annually and replaced as necessary over the 20-year project life on all build alternatives. The effects of

this sand fence maintenance are considered throughout this analysis. The construction of the sand fence is of limited duration using equipment that has little lasting impact on the project area.

Plantings would be similar for all build alternatives. After a period of settlement and salinity stabilization of placed materials, native intertidal and dune habitat species would be planted in phased events over the first 3 years. Plantings would help establish the plant community, and foster retention of placed sediments. Marsh plantings would likely be smooth cordgrass and black mangrove (NMFS 2009). Dune species would likely be bitter panicum. Other possible dune species include sea oats, roseau cane, marshhay cordgrass, gulf cordgrass, matrimony vine or wax myrtle. Seeding with rye grass is an option depending on timing of construction to maintain placed soils and encourage local vegetation establishment (NMFS 2009).

Additionally, pre- and post-construction monitoring would be a component of all build alternatives. Monitoring would potentially consist of: access to the island via small vessels and equipment, use of individually operated equipment (topography, bathymetry, and geotechnical equipment) that would not cause more than a temporary disturbance in marsh vegetation, and use of transects and other monitoring means to assess primary and secondary production (such as above-ground biomass harvest using quadrats and drop samples for nekton/epifauna with associated soil cores). Monitoring by qualified staff would also include site visits of the project area to determine the need for post-construction activities such as: breaching of containment dikes for access by coastal living marine resources (dike gapping), additional vegetative planting, and sand fence replacement or repair. Monitoring would be in short intervals before construction and at periodic intervals post-construction. The borrow site areas may be surveyed (back-filling, dissolved oxygen) in areas where the borrow will create a localized depression in the sea floor. Other means of monitoring, such as aerial photography, may be utilized as well.

Figures 2 through 7 show the plan views of six build alternatives, while Table 1 summarizes some key points of each alternative. Cross-sections of the build alternatives are available in Thompson and others (2011).

**TABLE 1. SUMMARY OF BUILD ALTERNATIVE DETAILS**

Alternative	Fill Volume (cubic yards)		Dune Height (ft)	Dune Width (ft)	Construction Footprint (acres above 0 NAVD)
	Beach	Marsh			
1	1,830,000	1,380,000	+8	270	437
2	1,830,000	940,000	+8	270	381
3	1,830,000	590,000	+6	270	311
4	1,840,000	940,000	+6	445	394
5	1,310,000	1,380,000	+8	150	411
6	1,310,000	1,020,000	+8	150	350

- Alternative 1 provides the largest construction footprint and volume of any alternative.
- Alternative 2 was developed to compare the cost and performance impacts of relocating the primary dike further south to avoid the Columbia Gulf pipeline but using the same access channel as in Alternative 1.
- Alternative 3 can highlight the possible range of performance and costs. The beach volume is 1,830,000 cubic yards while the marsh fill volume has decreased to 590,000 cubic yards, the lowest marsh volume in any alternative. This is the smallest footprint of the six build alternatives.

- Alternative 4 was designed to compare the +6 ft, NAVD and +8 ft, NAVD construction dune crest elevation options.
- Alternative 5 was designed to pair the smallest beach template with the largest marsh template. Alternative 5 also allows the comparison of the effect of a smaller beach on project performance. Since Alternatives 1 and 5 have the same backing marsh, the effect of the beach fill can be directly compared.
- Alternative 6 was designed to provide the lowest overall cost alternative that could still meet the project goals and objectives. Alternative 6 comprises the smallest beach template and the second smallest marsh template of the build alternatives.

### **Alternatives Considered but Eliminated**

Through the CWPPRA process, it was determined that restoration of the shoreline and back-barrier saline marsh is the appropriate approach to meet the project goals and objectives for the project area. During the CWPPRA planning process, several alternative restoration techniques were considered but eliminated from further evaluation including the use of riverine sediment diversions and construction of shoreline armoring and protection; these restoration approaches would not meet fundamental project goals of restoring and creating coastal habitats within project life timeframes and funding constraints. Comprehensive engineering and design efforts focus on project alternatives that are considered technically feasible and cost effective.

During the design phase, the six build alternatives were assessed for short and long term attainment of the project objectives. Through various engineering assessments and computer-aided modeling, it was determined that Alternatives 2, 3 and 4 did not meet one or more of the critical project objectives (Thompson and others, 2011). Alternatives 2, 3, and 4 were considered but eliminated because these alternatives did not meet the purpose and need for the action. The investment in the dune height and acreage would reduce overwash and increase dune longevity, but experience has shown that it is the back marsh that provides the platform for island roll-over and migration, and the marsh platform widths under Alternatives 2, 3, and 4 were too low. Additionally, their lower marsh acreage restored would not offset as much marsh acreage that would be adversely impacted in the near term as would Alternatives 1, 5, and 6. Consequently, Alternatives 2, 3 and 4 were eliminated from detailed evaluation.

### **Alternatives Considered in Detail**

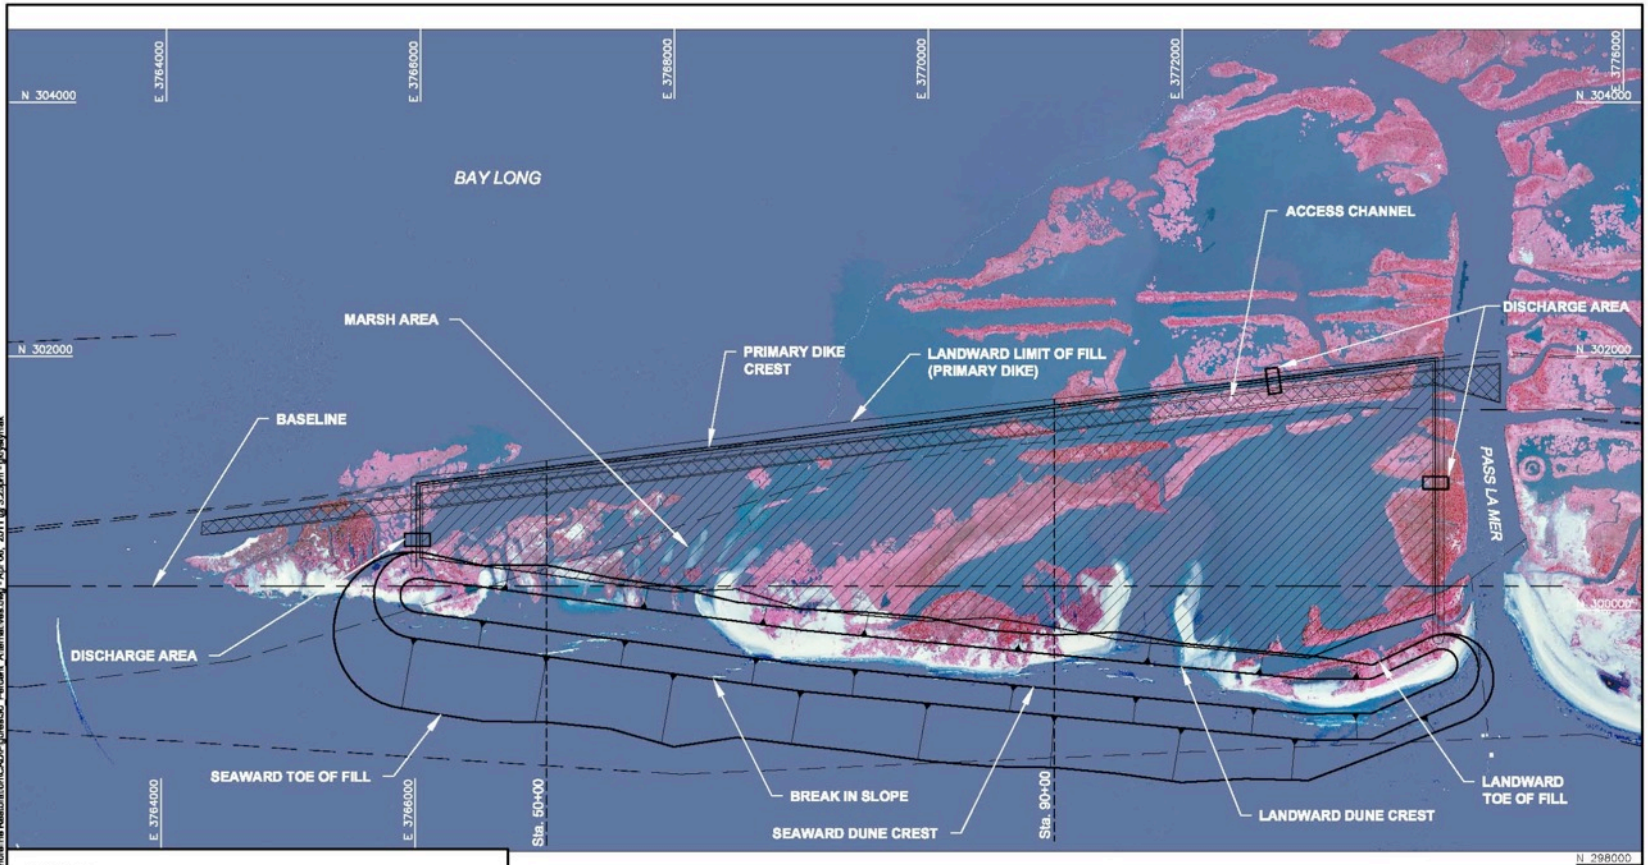

The No-Action Alternative, Alternative 1, Alternative 5, and Alternative 6 will be assessed in detail through the Environmental Consequences portion of this EA. Alternative 5 has been identified as the preferred build alternative, given the balance between dune height, marsh acreage, environmental consequences, and cost.

#### Borrow Sources

Coarse-grained sediments such as sand are critical to restoration of barrier shorelines. Sources of suitable borrow for beach and dune construction are limited due to the geological setting ([Kulp and others 2005](#)) and have been identified and characterized through previous surveys for geotechnical appropriateness for dune and marsh building ([Galliano and van Beek 1973](#); [USACE 2004](#) Appendix D, Chapter 7; [CPE 2004](#)). The Chenier Ronquille project proposes to use previously identified sediment borrow areas ([Coastal Planning and Engineering \(CPE\) 2004](#)). The borrow areas to be used for all build alternatives are located approximately 2 miles southwest of the proposed project area ([Figure 1](#)). Areas S-1, S-2, D-1, and Quatre Bayou may be used for the build alternatives. These areas contain approximately 3.9 million

cubic yards and 6.5 million cubic yards fill material suitable for beach and marsh creation, respectively ([CPE 2004, 2005, 2008, 2011 as cited in Thompson and others 2011](#)).

## AFFECTED ENVIRONMENT

### Physical Environment

#### Geology, Soils, and Topography

Chenier Ronquille is approximately 11,600 ft long along the Gulf of Mexico shoreline. The island is roughly triangularly shaped with the apex located approximately 5,000 ft north of the shoreline. The sandy beach face is narrow leaving a backing marsh to provide the island width. There are two significant breach areas along the beach face (as of February 2011). The first is located just west of the center of the island and flows into Bay Long. It does not have a clearly defined flow channel but is a combination of shallow flow paths. The second breach located just east of the island's center flows into Bay La Mer. This is a well-defined breach with sandy spit features entering the bay. The backing marsh is discontinuous with large open water areas. Several pipelines cross the project area with accompanying pipeline canals and spoil banks, which have contributed to the discontinuous nature of the backing marsh.

The western side of the project area experienced heavy oiling during the course of the Deepwater Horizon Oil Spill. Beach response activities were incorporated into the sand beach assessment, and the beaches experienced months of deep mechanical and manual treatment.

Approximately 200 acres of the project area are located at or above a +1.5' elevation. [Table 2](#) provides the percentage of acres within various elevation ranges. Gulf intertidal, bay intertidal, and subtidal habitats are all considered wetland habitats with respect to Clean Water Act Section 404 permitting.

**TABLE 2. ISLAND HABITAT AREAS AND DEFINED ELEVATION**

Elevation Range	Topography	Percentage of existing acres within various elevation range
≥ +2 ft NAVD88	Dune and Supratidal	6%
≥ 0 to < +2.0 ft NAVD88	Gulf Intertidal	9%
≥ 0 to < +2.0 ft NAVD88	Bay Intertidal	49%
≥ -1.5 to < 0.0 ft NAVD88	Subtidal	36%

A primary factor governing land loss along this portion of the Louisiana coast is relative sea level rise. Relative sea level rise consists of two components: eustatic sea level change and subsidence. Eustatic sea level change is defined as the global change in oceanic water level relative to a fixed vertical datum. Subsidence is defined as the local change in land elevation relative to a fixed vertical datum.

Along the Louisiana coast the land elevation is decreasing while the mean sea level elevation is increasing, resulting in significant land loss. Estimates of eustatic sea level rise and subsidence for the project area are  $0.0056 \pm 0.0016$  ft/year and 0.0247 ft/year, respectively.

The proposed marsh area consists of Felicity and Scatlake soils ([NMFS 2009](#)). Felicity soils are “somewhat poorly drained, mineral soils that are very rapidly permeable, saline, and firm ([USDA 2000](#)).” Scatlake soils are “very poorly drained, mineral soils that are very slowly permeable, saline, very fluid and flooded most of the time ([USDA 2000](#)).” Relative sea level rise near the project is increasing at a rate of 0.03 ft/year (calculated from 1947-2006 data) and is expected to continue over the 20-year proposed project life ([Thompson and others 2011](#)). Shoreline retreat (northward movement or loss) due to relative sea level rise was estimated to be 1.6 ft/year in alternatives analysis ([Thompson and others 2011](#)).

Borrow areas consists of sands and silts ([Table 3](#)). These were analyzed and partially used in actions similar to the proposed project (East-West Grand Terre and Barataria Complex, CPE reports as cited in [Thompson and others 2011](#)).

**TABLE 3. SUMMARY OF BORROW AREAS AND VOLUMES CURRENTLY AVAILABLE  
([THOMPSON AND OTHERS 2011](#))**

Borrow Area	Mean Grain Size (mm)	Percent Silt (%)	Beach Fill Volume (cubic yards)	Water Bottom Depth (ft)	Marsh Fill Volume (cubic yards)
S-1	0.11	15	1,651,000	-10 to -11.5	-
S-2	0.11	17	691,000	-9 to -10	-
D-1 (sand deposit)	0.11	28	1,931,000	-10 to -14 -24 to -29	-
D-1 (overburden)	-	-	-	-10 to -14	1,393,000
Quatre Bayou	-	-	-	-	5,088,000
Total			4,273,000	-	6,481,000

#### Climate and Air Quality

The subtropical climate of coastal Louisiana is characterized by long, hot summers and short mild winters with high humidity year round. Over the past 40 years, air temperature ranged from 14 to 102 °F; average winter and summer temperatures are 55.3 and 82.4 °F. In a typical year, more than 60 inches of rain falls, mostly in the spring and summer. In the fall and winter, winds tend to be from the north-northeast; in spring and summer, winds are generally from the south-southeast.

Waves generally govern sediment transport offshore and were evaluated in detail in the Borrow Area Impact analysis ([CPE 2004](#)) and alternatives modeling ([Thompson and others 2011](#)). Wave data from 1980-1999 indicate a 2.9 ft average wave height at the proposed project area ([Thompson and others 2011](#)). Largest waves occur between August and October from hurricanes, or between November and April under normal storm conditions. Wave heights can reach in excess of 36 ft ([Thompson and others 2011](#)).

Hurricanes and tropical storms typically occur over the study area between June and November. On average, since 1871, a tropical storm or hurricane is expected somewhere within the state of Louisiana every 0.7 years; hurricanes make landfall about every 2.8 years ([Roth 1998](#)). Historic data from the National Hurricane Center dataset on tropical cyclones (including tropical depressions, tropical storms, and hurricanes) along the Louisiana coast from 1899 to 2007 indicates a total of 63 storms, of which 49 were Category 3 or less.

Plaquemines Parish and offshore air quality is ranked good to moderate with ozone levels being unhealthy for sensitive groups ([Louisiana Department of Environmental Quality \(LDEQ\) 2009](#)). Offshore breezes mix and freshen the air and frequent precipitation prevents accumulation of particulates.

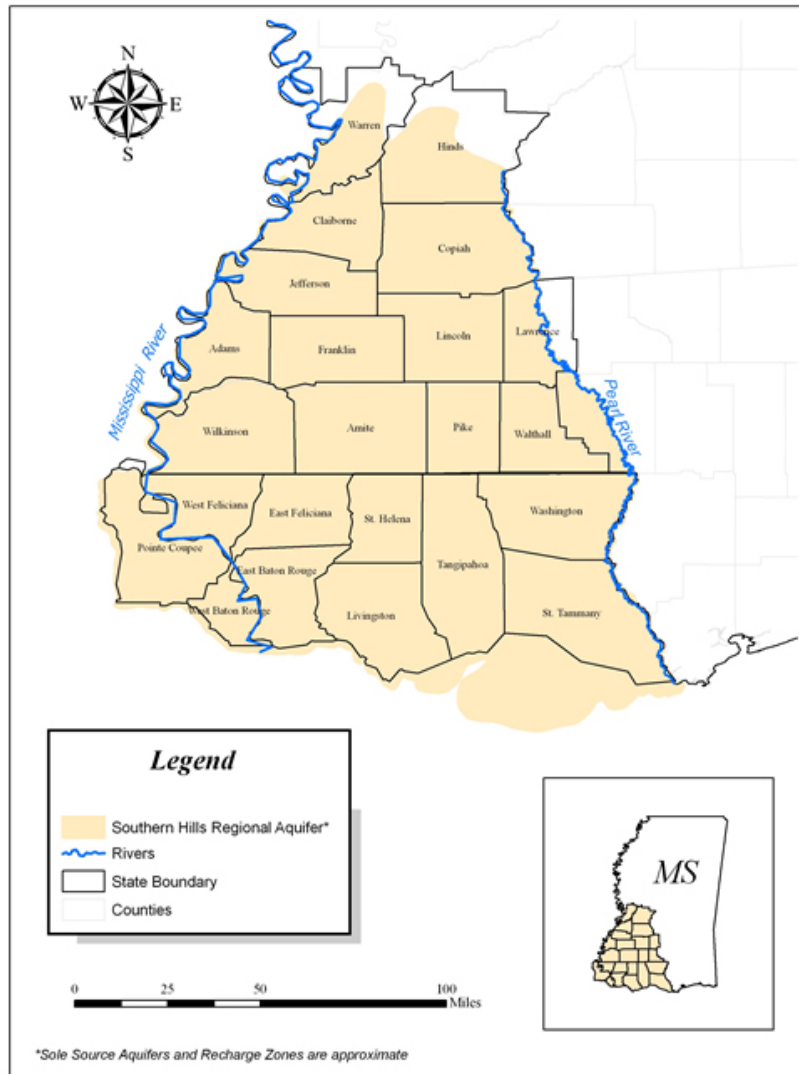

#### Water Resources

The EPA defines a sole source aquifer as an underground water source that supplies at least 50 percent of the drinking water consumed in the area overlying the aquifer. These areas have no alternative drinking water source(s) that could physically, legally, and economically supply all those who depend upon the aquifer for drinking water. The Sole Source Aquifer Program is authorized by Section 1424(e) of the Safe Drinking Water Act of 1974. Designation of an aquifer as a sole source aquifer provides EPA with the authority to review federal financially assisted projects planned for the area to determine their

potential for contaminating the aquifer. The Southern Hills Regional Aquifer System is located in eastern Louisiana and southwestern Mississippi and is shown on [Figure 8](#).

**FIGURE 8. SOUTHERN HILLS REGIONAL AQUIFER**

No fresh groundwater is found in the subsurface of Barataria Basin ([Gulf Engineers and Consultants \(GEC\) 2001](#)). Precipitation and tide are the primary factors that affect surface water in the proposed project area. The borrow areas are located in state water bottoms of the Gulf of Mexico where low dissolved oxygen waters occur periodically due to Mississippi River discharge ([Osterman and others 2008](#)).

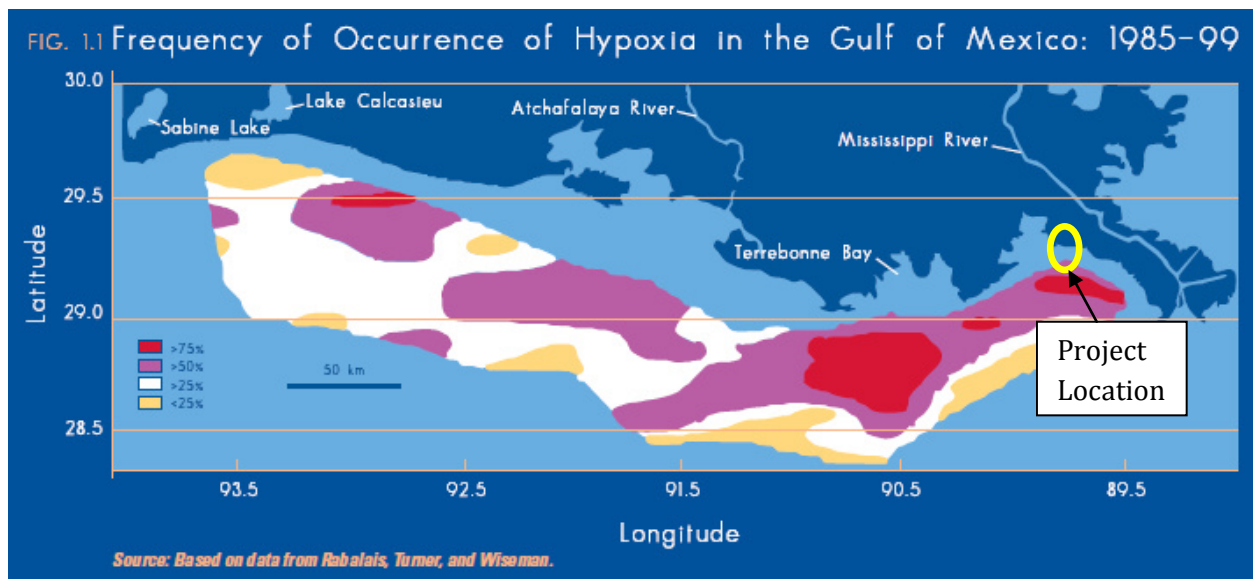

Salinity varies seasonally and decreases landward from the coast ([GEC 2001](#)). Salinity in coastal areas is highest from October through November and lowest in February and March. Designated uses of the coastal bays of the Barataria Basin and nearshore waters of the Gulf of Mexico include recreation (such as swimming, fishing, and boating), as well as support of commercially and ecologically valuable biological systems ([GEC 2001](#)).

Barataria Basin fully supports the designated uses of primary and secondary contact recreation and oyster propagation (LDEQ 2008). Fish and wildlife propagation was designated as “not fully supported” due to oxygen depletion from upstream sources and a mercury warning for fish consumption, the source of impairment is unknown (LDEQ 2008).

Chenier Ronquille lies within the Bastian Bay, Adams Bay, Scofield Bay, Coquette Bay, Tambour Bay, Spanish Pass, and Bay Jacques (Segment 0210001) identified by the LDEQ. USEPA included the segment in a list for oil, grease, and pathogen indicators, in response to a 1999 court order. The segment has not been reassessed for primary and secondary recreation contact, shellfishing, or fish and wildlife promulgation.

Scientific investigations in the Gulf of Mexico have documented a large area of the Louisiana continental shelf with seasonally depleted oxygen levels (< 2 milligrams/liter). Most aquatic species cannot survive at such low oxygen levels. The oxygen depletion, referred to as hypoxia, begins in late spring, reaches a maximum in midsummer, and disappears in the fall. The hypoxic zone forms in the middle of the most important commercial and recreational fisheries in the coterminous United States and could threaten the economy of this region of the Gulf. Hypoxic waters are distributed from shallow depths near shore (13 to 16 ft) to as deep as 197 ft but more typically appear between 16 and 98 ft. Hypoxia occurs mostly in the lower water column but encompasses as much as the lower half to two-thirds of the entire column. The area of hypoxia varies by year and can occur at the borrow sites. The proposed borrow site locations are located near or within the area of >50% annual occurrence of hypoxia in Figure 9 and range between 13 to 23 ft deep.

**FIGURE 9. HYPOXIA IN THE GULF OF MEXICO 1985-1999**

### Biological Environment

Coastal Louisiana contains an estimated 40 percent of the vegetated estuarine wetlands in the contiguous United States (USACE 2004). Approximately 735 species of birds, finfish, shellfish, reptiles, amphibians, and mammals spend all or part of their life cycle in the estuaries (USACE 2004).

### Vegetation Resources

Vegetated habitats in the proposed project area are the dune and marsh (supratidal and intertidal areas). The project area contains saline marsh vegetation that is primarily smooth cordgrass and wiregrass with some black mangrove and saltgrass ([NMFS 2009](#)). The average marsh elevation as surveyed by John Chance Land Surveys in fall of 2010 was +1.0 ft NAVD88. There are approximately 97 acres of marsh habitat in the proposed project area ([NMFS 2011b](#)). There are approximately 11 acres of vegetated dune and supratidal habitats, primarily vegetated by marshhay cordgrass and roseau cane ([NMFS 2009](#), [NMFS2011b](#)). No vegetation is present in the borrow area.

### Aquatic and Benthic Habitats

Aquatic and benthic habitats in the proposed project area include some intertidal and all subtidal areas ([Table 2](#)). The borrow area is benthic habitat under open marine water column. Shallow waters and benthic habitats support a variety of organisms that are important in supporting organisms at higher levels in the food chain, such as small fish and shrimp ([Conner and Day 1987](#); [Day and others 1989](#)). Oysters are the primary benthic organisms of interest, as they are of commercial value, are sensitive to habitat changes, important for water filtration and when established create their own (reef) habitat.

### Essential Fish Habitat (EFH)

The proposed project area contains EFH as designated by the Gulf of Mexico Fisheries Management Council (GMFMC) for species that are federally managed under the Magnuson-Stevens Fishery Conservation and Management Act, P.L. 104-297; 16 U.S.C. 1801 et seq. (Magnuson-Stevens Act). Categories of EFH in the proposed project area include estuarine emergent wetlands, mud substrates, submerged aquatic vegetation (SAV), estuarine water column, and marine water column ([GMFMC 2005](#)). [Table 4](#) lists the EFH, federally managed species, and their life stages expected to occur in the proposed project and borrow areas.

Red drum, brown shrimp and white shrimp are estuarine-dependent species. In the Barataria Basin, the estuarine-dependent assemblage, including white and brown shrimp and red drum, has shown decreasing trends over the last 10 to 20 years ([LCWCRTF and WCRA 1999](#)). These species migrate through tidal passes during their post-larval life stage and depend on the estuarine environment for survival and reproduction. Shrimp are prey species for other federally managed fish and crustaceans ([GMFMC 1998](#)).

**TABLE 4. ESSENTIAL FISH HABITAT OF PROJECT AND BORROW AREAS**

Common Name	Life Stage System (M=marine, E=estuarine)	EFH (1 meter (m)= approximately 3.3 ft)
Brown shrimp (Estuarine-dependent)	eggs M	<18-110 m, sand/shell/soft bottom
	larvae/postlarvae M/E	<82 m, planktonic, sand/shell/soft bottom, submerged aquatic vegetation (SAV), marsh oyster reef
	juvenile E	<18 m, sand/shell/soft bottom, SAV, marsh, oyster reef
	adults M	14-110 m, sand/shell/soft bottom
White shrimp (Estuarine-dependent)	eggs M	<9-34 m, sand/shell/soft bottom
	larvae /postlarvae M/E	<82 m, planktonic, soft bottom, marsh
	juvenile E	<30 m, soft bottom, marsh
	adults M	9-34 m, soft bottom
Red drum (Estuarine-dependent)	larvae/postlarvae E	planktonic, SAV, sand/shell/soft bottom, marsh
	juvenile M/E	<5 m, SAV, sand/shell/soft/hard bottom, marsh
	adults M/E	1-46 m SAV, pelagic, sand/shell/soft/hard bottom, marsh
Red snapper	adults M	7-146 m, reefs, hard/sand/shell bottom
Bonnethead shark	juvenile and adult M	inlets, estuaries, coastal waters > 25 m in depth
Lane snapper	larvae E/M	4-132 m, reefs, SAV
	juvenile E/M	<20 m, SAV, mangrove, reefs, sand/shell/soft bottom
Dog snapper	juvenile E/M	SAV, mangrove, emergent marsh

Source: [GMFMC 2005](#)

#### Fishery Resources

A wide variety of estuarine-dependent fishery species found in the Barataria Basin ([LCWCRTF and WCRA 1999](#)) are of national economic importance in accordance with Section 906(e)(1) of PL 99-602, the Water Resources Development Act of 1986. Most species vary in abundance from season to season due to their migratory life cycle, habitat preferences according to life stage, and the variation in salinity ([Herke 1978](#), [Rogers and others 1993](#), [LCWCRTF and WCRA 1999](#)). Most spawn offshore in the open Gulf of Mexico and enter the marsh area as postlarvae or young juveniles to use the marshes as a nursery, and return to the open gulf as subadults or adults.

Fishery guilds common to coastal Louisiana within each salinity-preference assemblage are below along with current population trends established for the Chenier Ronquille Project Area ([LCWCRTF and WCRA 1998](#)):

- Spanish mackerel guild (marine) – Increasing population trend for species within project area
- red drum, black drum, spotted seatrout, Gulf menhaden, southern flounder, white shrimp, brown shrimp, and blue crab guilds (estuarine dependent) – Generally decreasing population trend with the exception of Gulf menhaden and southern flounder for species within project area
- American oyster guild (estuarine resident) - Decreasing population trend for species within project area
- largemouth bass and channel catfish guilds (freshwater) – Not applicable to project location

### Marine Mammal Resources

Marine mammals that occur in Louisiana waters include the Blue, Sei, Sperm and Fin whale; and the dolphin and manatee. Whales were found to be “unlikely to occur near the project area ([NMFS 2010](#))”, so are not further discussed. West Indian manatees are rare in coastal Louisiana waters and dolphins are common along the shore. Manatee would occur in Louisiana to seek shelter and aquatic plants or algae in shallow waters. Dolphin follow schooling fishes, such as menhaden that are prey, along the coast, and seek food and refuge in interior bay waters.

### Migratory Bird Resources

Waterbirds were specifically considered pursuant to the Migratory Bird Treaty Act. No colonies of colonial nesting waterbirds have been observed in the proposed project area, but could occur ([USFWS 2011](#)). This resource includes herons, egrets, night-herons, ibis, roseate spoonbills, anhingas, and/or cormorants.

### Wildlife Resources

Louisiana’s coastal zone supports 19 percent of the United States’ winter population for 14 species of ducks and geese. The North American Waterfowl Management Plan identified coastal Louisiana as one of the most important regions for the maintenance of continental waterfowl populations in North America ([USACE 2004](#)).

The Barataria Basin has 411 species of birds; 60 species of reptiles and amphibians; 8 species of bats; and 11 species of small mammals, armadillo and marine mammals ([Connor and Day 1987](#)). The proposed project area is unlikely to support many of these species due to the non-wooded and non-freshwater vegetation ([Connor and Day 1987](#)). The basin is located at the bottom of the Mississippi Flyway, and birds from central and northern North America start to converge in the fall. Waterfowl populations in the Barataria basins have declined as marsh converts to open water ([LCWCRTF and WCRA 1999](#)).

[Table 5](#) lists the wildlife species and/or species groups prominent ([LCWCRTF and WCRA 1998](#)) within coastal Louisiana along with the habitat function, status, trend, and projection within the project area.

**TABLE 5. LOUISIANA AND PROJECT AREA WILDLIFE AND/OR SPECIES GROUPS**

Type	Species	Category	1988 Habitat		Type	Species	Category	1988 Habitat			
			Open Water	Saline Marsh				Open Water	Saline Marsh

**Functions of Particular Interest:** Ne = Nesting; St = Stopover Habitat; W = Wintering Area; Mu = Multiple Functions

**Status:** NH = Not Historically Present; NL = No Longer Present; Lo = Low Numbers; Mo = Moderate Numbers; Hi = High Numbers

**Trends (Since 1985) / Projections (through 2050):** Sy = Steady; D = Decrease; I = Increase; U = Unknown

### Threatened and Endangered Species

The threatened piping plover feeds on the intertidal beaches, mudflats, sandflats and unvegetated areas, such as those of the proposed project area. Plover may occupy these areas in winter, however, the proposed project area is not located in an area designated by USFWS as critical habitat of the plover ([USFWS 2011](#)).

Loggerhead, Kemp's ridley, hawksbill, leatherback, and green sea turtles occur in Louisiana. Green sea turtles may be in the borrow area while migrating between their nesting and foraging sites in Florida and Texas. Major threats are from exploitation for food, foraging habitat loss. They feed on phytoplankton, zooplankton, SAV, and small fish. Kemp's ridley nest in Mexico and immature individuals are believed to stay in shallow, warm, nearshore waters in the northern Gulf of Mexico. They forage for crabs, mollusks, shrimp, and small fish. Loggerhead sea turtles occur in coastal and marine areas along the margins of the Atlantic, Pacific, and Indian Oceans. Their major threats are direct take, incidental capture in fisheries, and loss of habitat. The loggerhead is the most abundant species of U.S. sea turtles, and has a complex life history that is highly migratory. No sea turtle nesting is known to occur in the vicinity of the project.

Gulf sturgeon and smalltooth sawfish are threatened or endangered fishes that may occur in the vicinity of the project area or borrow areas. Threatened or endangered marine mammals are not known to occur in the vicinity of the project, but those that occur in Louisiana are the Blue, Sei, Sperm and Fin whale. Also, the West Indian manatee could occur near the proposed project area in summer months, though it is unlikely ([USFWS 2011](#)).

### **Cultural Resources**

#### Historic, Prehistoric, and Native American Resources

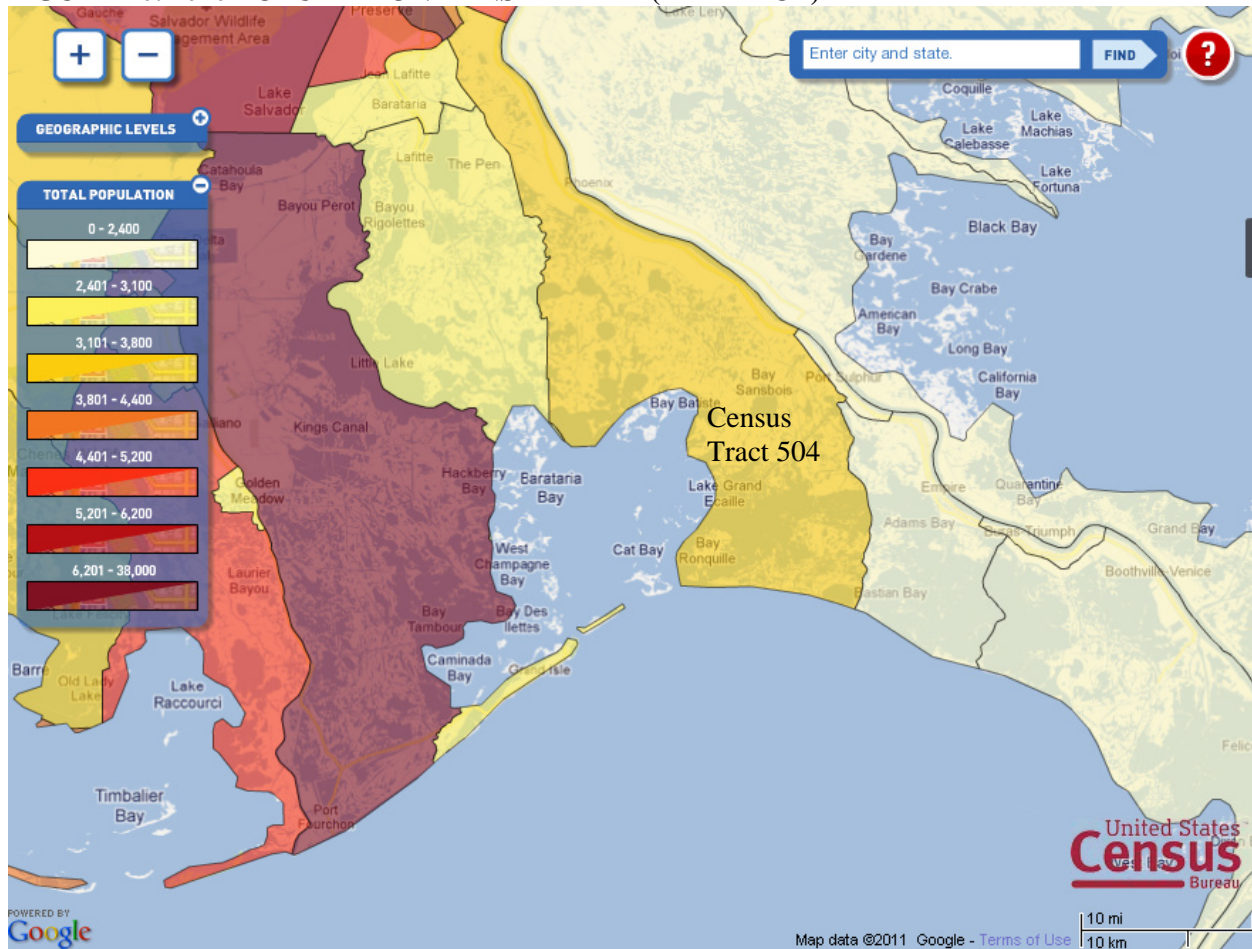

No historic properties would be affected by any element of the proposed project. While two historic sites were previously reported near the project area ([NMFS 2011](#)), those sites are now located offshore of the proposed project area due to the areas high erosion, or oil and gas developments buried them. The State Historic Preservation Office (SHPO) concurred with this determination ([SHPO 2011](#)).

#### Socioeconomics (Income and Environmental Justice)

The population of Plaquemines Parish is 23,042 ([U.S. Census 2010](#)). This is 20% less than prior to Hurricanes Katrina and Rita in 2005 that adversely impacted the area ([Plaquemines Parish Government 2011](#)). The nearest towns and roads are 13 miles northeast of the proposed project area at Port Sulphur and Empire. The project site is contained within Census Tract 504 in Plaquemines Parish that extends north to the western side of the Mississippi River excluding Port Sulphur, Empire, and Belle Chasse. [Figure 10](#) provides the general population distribution for the area. [Table 6](#) provides population/poverty data for Census Tract 504, Plaquemines Parish, and Louisiana.

**FIGURE 10. 2010 POPULATION DENSITY MAP (BY TRACT)**

**TABLE 6. POPULATIONS OF LOUISIANA, PLAQUEMINES PARISH AND CENSUS TRACT 504**

Topic	Louisiana		Plaquemines Parish		Census Tract 504	
2010 Total Population	4,533,372		23,042		3,708	
White alone	2,836,192	62.6%	16,246	70.5%	2,311	62.3%
Black or African American alone	1,452,396	32.0%	4,715	20.5%	1,127	30.4%
American Indian and Alaska Native alone	30,579	0.7%	371	1.6%	129	3.5%
Asian alone	70,132	1.5%	731	3.2%	39	1.1%
Native Hawaiian and Other Pacific Islander alone	1,963	0.0%	31	0.1%	1	0.0%
Some Other Race alone	69,227	1.5%	323	1.4%	32	0.9%
Two or More Races:	72,883	1.6%	625	2.7%	69	1.9%
2000 Total Population (provided income information)	4,334,094		25,969		3,423	
Below poverty level	851,113	19.6%	4,682	18.0%	835	24.4%

### Land Use and Infrastructure

Oil/natural gas, and maritime transport activity is prominent throughout coastal Louisiana. Oil and gas pipelines lay throughout the proposed project vicinity as active or remnant conveyance of this industry ([Figure 11](#)). Waterbottoms are leased by the state for oyster harvest. Figure 12 shows the six oyster leases (with respective lease numbers) located within the project area.

The marshes and bayous of Barataria Basin are used for recreation, such as hunting, fishing, and birding. Industries of the area are primarily agriculture, fishing and hunting; education, health, and social services; and retail ([U.S. Census 2000](#)).

The Plaquemines Parish Master Plan (<http://www.plaqueminesmasterplan.com>) identifies the current land use of the project area as undeveloped or water ([Appendix A](#)).

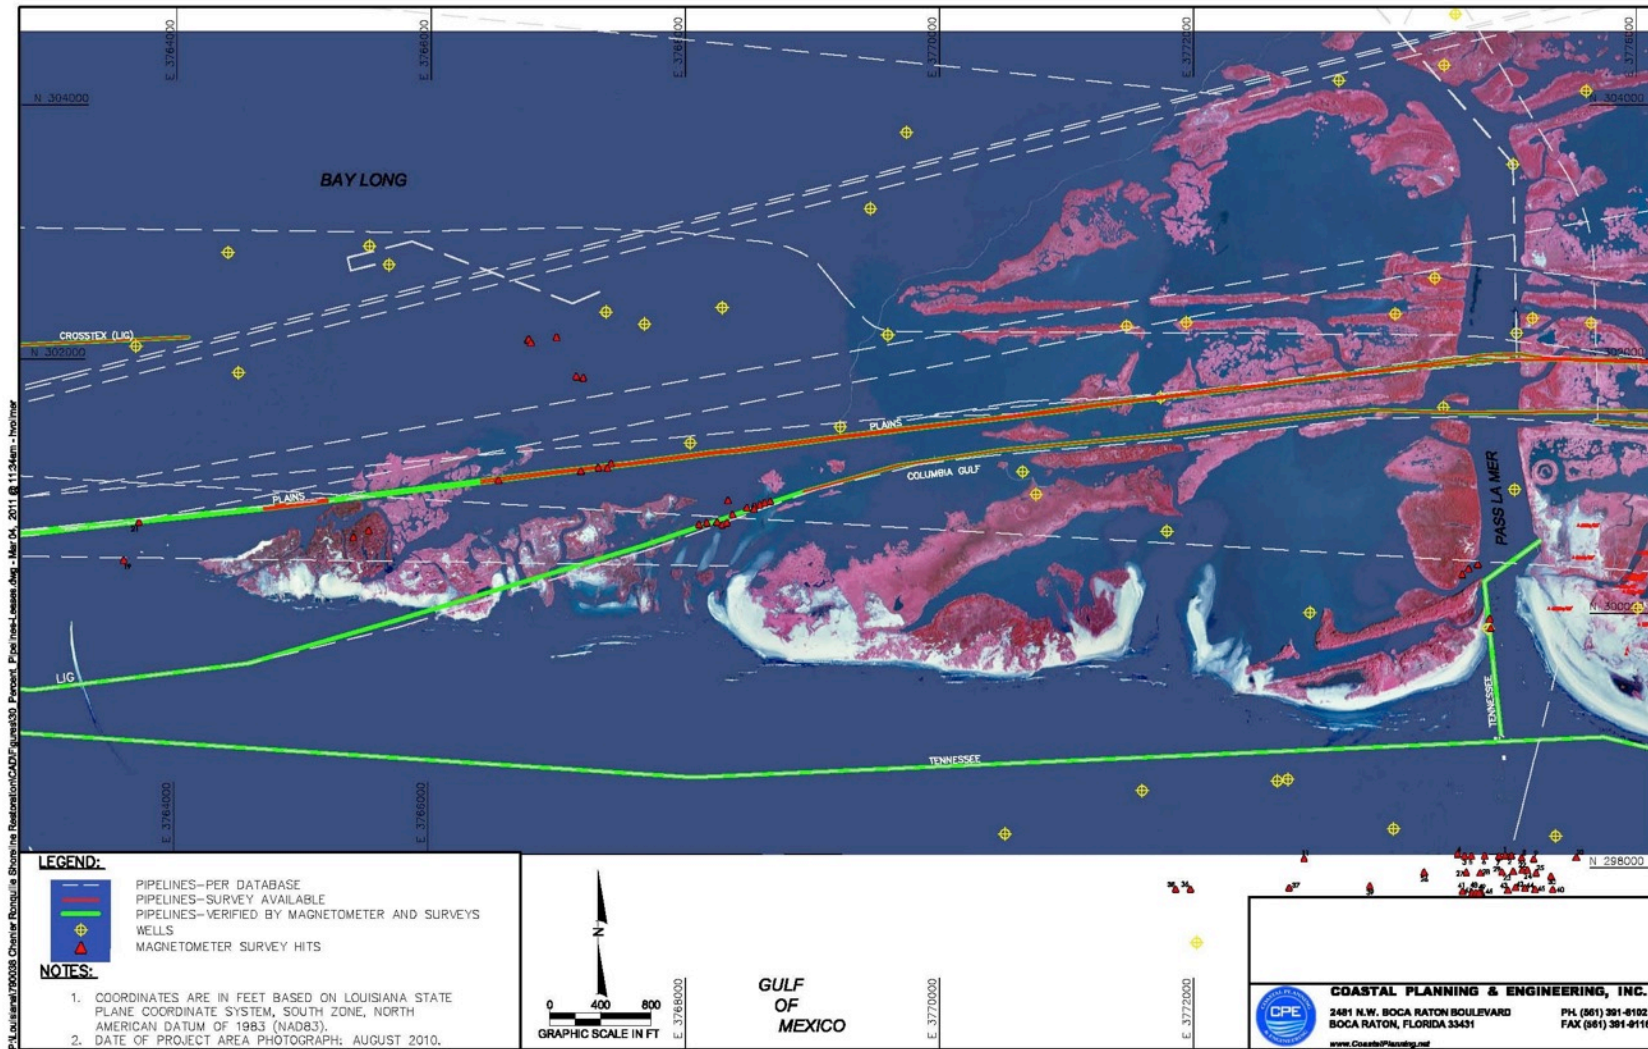

### Hazardous, Toxic, and Radioactive Wastes

Hazardous, toxic, and radioactive waste (HTRW) status of the proposed project area was investigated and is recorded in October 2011 HTRW Analysis for Chenier Ronquille, which is incorporated here by reference. NMFS personnel conducted a site investigation of the project area. There were no signs of HTRW problems, such as dead or discolored vegetation, stained soil, chemical sheens or odors, or dead or dying fish, amphibians, reptiles, or mammals, or discarded drums, tanks, or chemical containers. Based on a review of applicable federal and state regulatory agency records, historical records, interviews with persons knowledgeable about the subject property, and a physical site investigation, NMFS, through this analysis, has discovered no evidence of HTRW issues.

### Noise

The proposed marsh creation area is remote with no industry other than oil production and fisheries. Ambient noise in the area results from oil and gas production, boats, and wildlife. The borrow area is in the Gulf of Mexico with noise associated with navigation and oil and gas extraction.

**FIGURE 11. PIPELINES/ WELLS AT PROPOSED PROJECT AREA.**

**FIGURE 12. OYSTER LEASES IN THE PROPOSED PROJECT AREA.**

## ENVIRONMENTAL CONSEQUENCES

This review is consistent with CEQ regulations and NOAA Administrative Order 216-6. Specific sources of analysis used to consider environmental impacts throughout proposed project development are the Wetland Value Assessment (WVA, [NMFS 2009, 2011b](#)) and engineering design analyses ([Thompson and others 2011](#)). Other factors considered during the selection process included, but were not limited to: wetland benefit — creation, enhancement, or protection; cost effectiveness; longevity and sustainability; risk and uncertainty; consistency with Coast 2050 Plan ([LCWCRTF and WCRA 1998](#)); public support; and synergy with other restoration efforts ([LCWCRTF 2009](#)).

Wetland benefits are assessed through the CWPPRA WVA process, a quantitative, habitat-based assessment model developed to estimate anticipated fish and wildlife habitat benefits. The WVA compares conditions over a 20-year period to determine the net difference in “future without project” and “future with project” scenarios. Initial and future conditions are set based on historical land loss, aerial imagery, and on-site visits to the proposed project area. Expected benefits are based on a combination of experience with previous projects, construction plans, models, and biological and engineering experience of the assessment team.

In addition to the temporal component of each impact, the magnitude or severity of the impact is described in qualitative terms. Alternatives were designated as having *no impact*, *no significant impact* (*minor* or *moderate*), or *significant impact*. *Minor impacts* are those that may be measurable but not result in adverse effects to humans or their resources; these are short-term and reversible. *Moderate* impacts may have longer-term effects that have a measurable change to the identified environment, and thus warrant consideration of revision of the project component causing the adverse impact. *Significant* impacts to humans or their environment and long-lasting that warrant preparation of a full EIS. The qualitative assessment is based on reference material and professional judgment. A quantitative assessment is included when sufficient data are available to do so.

[Table 1](#) provides a quick reference for differences in the elements of the build alternatives, which includes not only dredge and fill activities, but also sand fencing, planting, and monitoring, both pre-, during, and post-construction. [Table 7](#) presents a comparison of environmental impacts associated with the no-action, and build alternatives. [Table 8](#) presents the minimization and avoidance measures of the preferred alternative.

**TABLE 7. COMPARISON OF ENVIRONMENTAL IMPACTS OF ALTERNATIVES**

<b>Resource</b>	<b>No Action</b>	<b>Preferred Alternative – Alternative 5</b>	<b>Alternative 1</b>	<b>Alternative 6</b>
Geology, Soils, Topography	Land loss and erosion continues.  Borrow area material likely used for other restoration projects.	Long-term, direct, beneficial impacts by extending shoreline and island longevity, recreating organic sediment source (marsh).  Short-term, direct, moderate, adverse effects would occur in borrow areas from suspended sediments.	Slightly greater long-term benefits than preferred alternative.  Slightly greater short-term, direct, moderate borrow area adverse impacts than the preferred alternative.	Less long-term beneficial impacts than other build alternatives, but more than no action.  Borrow area impacts are less than other build alternatives.
Climate and Air Quality	No impacts	Short-term, localized, minor adverse impacts from emissions and construction-generated dust.	Same as preferred alternative.	Same as preferred alternative.
Water Resources	No direct impact.  Indirectly, loss of land and shoreline retreat could increase vulnerability to storm surge of surrounding areas.	Short-term, minor, adverse impacts at the dredge and placement sites.  Long-term, moderate, beneficial impacts would result from filtering action of marsh and wave cessation of created land mass.	Same as preferred alternative.	Same as preferred alternative.
Vegetation Resources	Reduction in saline marsh and shallow water habitat, as shoreline erodes and land subsides.	Short-term, direct, minor, adverse, impact to existing saline marsh and long-term, direct, moderate benefits to saline marsh and dune vegetation.	Adverse impacts similar to preferred alternative.  Beneficial impacts would be greater than all alternatives because the larger dune area is expected to most increase island longevity.	Adverse impacts similar to preferred alternative.  Beneficial impacts not as long lasting as with the other build alternatives.
Aquatic and Benthic Habitats	Continued increase in open water, and reduction in less common sandy and marsh habitat.	Short-term, direct, minor adverse impacts by coverage of shallow water habitat and disturbance of borrow area.  Moderate benefits through increased marsh edge, and sandy benthos.	Adverse and beneficial impacts would be greater than the preferred alternative.	Adverse impacts would be greater overall and beneficial impacts not as long lasting as the other build alternatives.

<b>Resource</b>	<b>No Action</b>	<b>Preferred Alternative – Alternative 5</b>	<b>Alternative 1</b>	<b>Alternative 6</b>
Essential Fish Habitat and Fisheries	Variety and quality of estuarine, sandy bottom and marsh edge EFH would decline.	Short-term, minor unavoidable, adverse impacts from construction would be offset by long-term, moderate, benefits to EFH and nursery resources through creation of marsh and beach, and sandy intertidal habitats.	Adverse and beneficial impacts would be greater than other build alternatives.	Adverse and beneficial impacts would be less than other build alternatives.
Marine Mammals	Continued loss of forage species habitat.	Short-term displacement from feeding areas during construction resulting in temporary minor adverse impacts. Long-term moderate benefit from increasing prey species nursery habitat.	Similar to the preferred alternative.	Similar to the preferred alternative.
Migratory Birds	Continued loss of foraging species habitat.	Short-term displacement from feeding areas during construction resulting in temporary minor adverse impacts. Long-term moderate benefits through increasing quality and longevity of foraging grounds.	Similar to the preferred alternative.	Similar to the preferred alternative.
Wildlife	Continued decreases due to habitat losses.	Direct, adverse, short-term, minor impacts by construction disturbance.  Long-term beneficial, direct, minor impacts through habitat creation and increased island longevity.	Adverse impacts would be similar to other build alternatives and beneficial impacts greater than other alternatives.	Adverse impacts would be similar to, but benefits less than the other build alternatives.
Threatened and Endangered Species	Indirect adverse impacts through loss of habitat.	Temporary minor adverse impacts of displacement, with long-term benefits from increased habitat are expected.	Similar to preferred alternative.	Similar to preferred alternative.
Historic, Prehistoric, and Native American	No impact.	No impact.	No impact.	No impact.
Socioeconomics	Long-term, moderate, indirect, adverse impacts related to fisheries decline would result.	Beneficial, and no adverse economic impacts are expected, as oyster leasers would be mitigated as described below, and improved fisheries nursery habitat are expected.	Similar to preferred alternative.	Similar to preferred alternative.
Land Use and Infrastructure	Infrastructure would become more vulnerable to storm damage and erosion.	Short-term, reversible, minor adverse impacts to fishing are possible.  Long-term, beneficial impacts would be expected for infrastructure.	Similar to preferred alternative.	Less benefit than other build alternatives but more than with no action.

<b>Resource</b>	<b>No Action</b>	<b>Preferred Alternative – Alternative 5</b>	<b>Alternative 1</b>	<b>Alternative 6</b>
Hazardous, Toxic, and Radioactive Waste	No anticipated impact.	No impact.	No impact.	No impact.
Noise	No impact.	Temporary, adverse, minor impacts during construction.	Similar to preferred alternative.	Similar to preferred alternative.

**TABLE 8. SUMMARY OF AVOIDANCE AND MINIMIZATION MEASURES OF THE PREFERRED ALTERNATIVE**

Resource	Potential Avoidance and Minimization Measures
Geology, Soils, and Topography	<ul style="list-style-type: none"> <li>• Construction of the marsh area would replace borrow sediments used for access and dikes.</li> <li>• Vegetative plantings of disturbed areas would stabilize soil, and reduce resuspension of recently deposited sediment. Sand fencing would entrap naturally windblown deposits.</li> </ul>
Climate and Air Quality	<ul style="list-style-type: none"> <li>• Best management practices would minimize exhaust fumes and fugitive dust. Primary production through marsh and dune plantings would benefit air quality in long-term.</li> </ul>
Water Resources	<ul style="list-style-type: none"> <li>• Best management practices and containment dikes would prevent or minimize turbidity.</li> <li>• Compliance with the Clean Water Act and other regulations would protect water resources.</li> </ul>
Vegetation	<ul style="list-style-type: none"> <li>• Best management practices would minimize disturbance of intact wetlands.</li> <li>• Compliance with the Clean Water Act, Section 404 and Section 301, would protect wetlands from unnecessary disturbance</li> <li>• Vegetative plantings would use native species.</li> </ul>
Aquatic and Benthic Habitats	<ul style="list-style-type: none"> <li>• Best management practices would reduce scour, erosion, and sedimentation.</li> <li>• Limiting access routes would reduce adverse impacts.</li> <li>• Back filling much of the access route would offset adverse impacts.</li> </ul>
Essential Fish Habitat and Fisheries	<ul style="list-style-type: none"> <li>• Areas adjacent to borrow areas would provide source organisms for recolonization.</li> <li>• Project-specific evaluations and coordination with appropriate federal, state, and local agencies would focus on protecting sensitive species.</li> <li>• Containment dikes would be gapped after construction to provide tidal connection.</li> </ul>
Marine Mammals	<ul style="list-style-type: none"> <li>• Project-specific evaluations and coordination with USFWS and NMFS would focus on protecting this resource.</li> </ul>
Migratory Birds	<ul style="list-style-type: none"> <li>• Same as above.</li> </ul>
Wildlife	<ul style="list-style-type: none"> <li>• Project-specific evaluations and coordination with appropriate federal, state, and local agencies would focus on protecting sensitive wildlife species.</li> </ul>
Threatened, and Endangered Species	<ul style="list-style-type: none"> <li>• Education of the Federal and State teams and construction contractors on the species interactions to avoid would be part of the ongoing Federal oversight.</li> <li>• Nesting colonial waterbirds, piping plover, and manatee would be avoided given provisions provided by USFWS and NMFS Protected Resources.</li> </ul>
Historic, Prehistoric, and Native American	<ul style="list-style-type: none"> <li>• Magnetic and acoustic anomalies identified sensitive submerged cultural resources in the borrow areas that would be avoided.</li> <li>• Appropriate Section 106 Consultation with the Louisiana State Historic Preservation Office has been completed.</li> </ul>
Socioeconomics	<ul style="list-style-type: none"> <li>• Coordination with appropriate federal, state, and local agencies would focus on maintaining the quality of public recreation.</li> <li>• All staging areas used for construction materials or debris would be restored to pre-construction conditions (or better).</li> <li>• Compensation of oyster leasers at current market value.</li> </ul>
Land Use / Infrastructure	<ul style="list-style-type: none"> <li>• The alternatives have been designed to avoid pipelines, which have already been identified by magnetometer surveys of the proposed project areas.</li> </ul>
Hazardous, Toxic and Radioactive Waste	<ul style="list-style-type: none"> <li>• Care would be taken to avoid impacts to the existing oil and gas infrastructure.</li> </ul>
Noise	<ul style="list-style-type: none"> <li>• Coordination with appropriate federal, state, and local agencies would ensure that public concerns are addressed.</li> </ul>

## **Physical Resources**

### Impacts on Geology, Soils, and Topography

**No Action** The island has severely eroded, such that sections historically in the proposed project area are now shallow open water. With no action, borrow area material is likely to be used for other restoration projects in the area as sediment sources are a limited resource ([Galliano and van Beek 1973](#)). Adjacent to the project area marshes exist in a degrading state from erosion and subsidence. Geomorphology in the project area is characteristic of a highly eroding, sediment-deficient barrier island converting to open gulf water. With no action, continued erosion and conversion of land to water would occur.

**Alternative 5 - Preferred Alternative** Short-term, direct, moderate, adverse effects would result in the suspension of sediments and disturbance to natural sediment sorting and layering within the borrow area. Water depth would increase in the area as sediments were removed. Over the long term, dredged materials removed from the borrow area would be expected to rearrange by natural processes.

Long-term, direct, moderate, benefits would result from extending the beach, dune, and marsh, and recreating organic sediment through marsh creation. Re-creation of a marsh on the bayside would add longevity to the island and diversity of habitat. Elevation in the proposed project area would increase buffering from storm surges.

Construction would cover some existing marsh and shallow open water habitat. Marsh would be constructed at a higher elevation to account for material desiccation, consolidation, and compaction. After sediment is consolidated, gaps may be placed in strategic places along the dike to return tidal influence to the marsh if natural settlement and erosion of the dikes does not occur.

The dredged material used in beach, dune and marsh construction would consist of naturally occurring material deposited in the borrow areas over time by natural processes. Vegetative plantings would be used to stabilize soil, reduce resuspension of recently deposited sediment, and encourage sedimentation. Plantings would increase plant diversity and provide a seed source of diverse species for marsh and dune growth in the project area. Sand fencing would be installed during construction and an estimated two more times over the course of the project life to trap windblown sediments and encourage dune growth. There are moderate beneficial impacts of this activity on the dune habitats and no significant adverse impacts.

**Alternative 1** The beneficial and adverse impacts are slightly greater than the preferred alternative. More borrow material would be needed for dune creation that would slightly increase short-term adverse impacts, and more dune would be created which would slightly increase the long-term benefits. Impacts of placing dredged materials onto existing marsh habitat would be the same as the preferred alternative. Sand fencing, plantings, and monitoring would similarly have no to minor, temporary adverse and moderate long term beneficial effects as the preferred alternative.

**Alternative 6** The long-term, direct, moderate benefits would be less than the preferred alternative, though initial benefits would be similar to the other build alternatives. Because access would not be back filled, the marsh is of less size and elevation, less longevity of benefits would be achieved than other build alternatives, but more than with no action. Borrow area adverse impacts would be less than other build alternatives, as less material would be dredged. Sand fencing, plantings, and monitoring would similarly have no to minor, temporary adverse and moderate long term beneficial effects as the preferred alternative.

### Impacts on Climate and Air Quality

**No Action** The no-action alternative would not result in any changes to existing air quality in the area.

**Build Alternatives (including preferred alternative)** Short-term, direct, minor, adverse impacts to air quality from construction would be associated with emissions from diesel engines that would power the dredging machinery, and material placement operations. Emissions would occur over a period of a few months, with most emissions occurring at the dredge and ridge creation sites. The emissions would consist predominantly of nitrogen oxides, with smaller amounts of carbon monoxide, sulfur dioxide, particulate matter, and volatile organic compounds.

Prevailing winds would dissipate airborne pollutants and limit them to the proposed project's construction phase. In addition, newly placed, unconsolidated dredged material is subject to drying and blowing during high wind events, adding particulates to the air. Vegetation would hold sediments in place after a time. The impact to human health would be negligible because the proposed project area is remote from any residential area. In the long term, air quality in the area is expected to be unchanged. While Alternative 1 would potentially add 35 days to the dune creation dredging and Alternative 6 would subtract 11 days from the marsh creation dredging as compared to the preferred alternative, this number of days is insignificant in comparison of effects on climate and air quality. Sand fencing, planting, and monitoring would require some level of vehicular access to the project site and equipment operations; however, the duration would be very limited in duration and extent.

#### Impacts on Water Resources

**No Action** The no-action alternative would not directly affect local water quality. Long-term, indirect, moderate, adverse impacts would result from land conversion to open water that would increase in vulnerability of surrounding areas to storm surge.

**Build Alternatives (including preferred alternative)** The build alternatives would not impact any drinking water resources. Long-term, minor, indirect benefits to water quality would result from the ability of created marsh to remove nitrates and phosphate and reduce turbidity in the water ([EPA 2008](#)). Short-term, direct, minor, adverse impacts associated with dredging required for both access and borrow material of this alternative would include: (1) increased turbidity in the water column at the dredge site (dredge plume) and at the construction location; (2) potential decreased dissolved oxygen in the water column at the access route due to increased water depth; (3) possible exhumation of buried trash and debris; and (4) discharges from the dredge vessel.

To minimize adverse impacts to water quality, retention dikes and building the sand beach first would be used to retain materials and minimize sediment losses. Beach and marsh fill areas would be constructed using hydraulic dredge equipment. Interior training dikes may be used to aid material consolidation of these materials. The containment dike system would be constructed using mechanical dredge equipment. Mechanical that requires less de-watering of materials that would reduce adverse impacts to water. The greater overall amount of cubic yards dredged and fill placed for Alternative 1, and the lesser amount under Alternative 6, as compared with the preferred alternative could be expected to incrementally negative and positive effects in regards to water quality. However, the percent difference and days added or subtracted is insufficiently different to warrant categorizing these effects differently among alternatives.

The levels of dissolved oxygen within borrow sites after construction of coastal restoration projects are generally not well known. NOAA plans to perform dissolved oxygen surveys in order to better categorize potential impacts in the future. To date, no issues related to decreased dissolved oxygen have emerged from previous coastal restoration projects of this type.

Sand fencing, planting, and monitoring would be expected to have no effect to minor beneficial effects on water quality for the project area.

## **Biological Environment**

### Impacts on Vegetative Communities

**No Action** With no action, continued erosion and subsidence are expected to occur, resulting in loss of saline marsh.

**Alternative 5 - Preferred Alternative** The preferred alternative would exert long-term, direct, moderate beneficial impacts on vegetative communities of the area by adding marsh, beach, and dune elevation; increasing vegetative diversity; and decreasing land conversion to open water. Building up the barrier island dune and marsh habitats would also have long-term, indirect moderate beneficial impacts on vegetative communities and associated biological resources through protection of adjacent marsh habitats inland through wave protection.

Short-term, direct, minor, unavoidable, adverse impacts to marsh, shallow open water, and their associated plant communities would occur. Access and construction areas would be dredged or buried by slurry sediments initially. Long-term, direct, moderate beneficial impacts would result the anticipated increased quality, quantity, and diversity of vegetative habitat.

Sand fencing and plantings would have minor, temporary adverse effects and moderate long term beneficial effects, while monitoring would have likely have no discernible effect.

**Alternative 1** This alternative would have the greatest long-term benefit to the area vegetation of all alternatives. The overall quantity and quality of vegetated habitat would be the highest, whereas adverse impacts would be the same as the preferred alternative. Sand fencing, plantings, and monitoring would similarly have no to minor, temporary adverse and moderate long term beneficial effects as the preferred alternative.

**Alternative 6** Adverse impacts to vegetation would be the same as with the preferred alternative. Long-term benefits would be less than other build alternatives but greater than the no-action alternative, due to back of back filling the access canal; less marsh created; and lower elevation. This alternative would have less ability to withstand storm surges, erosion, and subsidence, because it has the narrowest marsh platform and an overall lower volume of placed material of the alternatives analyzed in depth. Sand fencing, plantings, and monitoring would similarly have no to minor, temporary adverse and moderate long term beneficial effects as the preferred alternative.

### Impacts on Aquatic and Benthic Habitats

**No Action** The quality of aquatic and benthic habitat is expected to decrease as the marsh habitats are converted to open water through erosion and subsidence. Abundant open water habitat is available in coastal Louisiana. An increase in open water habitat comes at the expense of emergent habitats, which are less common and more vulnerable to disturbance. The function of the remaining marsh as producer of organic material in the food chain would continue to degrade.

**Alternative 5 - Preferred Alternative** Under the preferred alternative, minor, short-term, direct, local, adverse impacts to aquatic and benthic resources would occur during the construction phase of the proposed project. The immediate effect of dredging is the removal of sediment along with the organisms living in the sediment. In addition to direct removal of organisms, impacts could include entrainment and entrapment of slow-moving organisms and polychaetes, during dredging in the borrow areas; and smothering of benthic organisms and more sessile aquatic species in the deposition sites. Mobile aquatic animals would be expected to move away from the proposed project area during construction and return after construction is complete. Invertebrates and fish that do not move out of the area would likely be injured as suspended particulates clog gills. Short-term, moderate adverse effects on fish eggs and larvae

in the immediate area may occur. Dredging would change substrate topography, causing a temporary redistribution of organisms in the immediate vicinity.

Benthic organisms would likely recolonize borrow areas. Early-stage recruitment of defaunated sediments occurs rapidly in coastal systems (Grassle and Grassle 1974, McCall, 1977, Simon and Dauer 1977, Ruth and others 1994, all as cited in [EPA 2003](#)). Dredged sites would be rapidly colonized by opportunistic infauna ([EPA 2003](#)). Later stages of colonization would be more gradual and would depend on environmental conditions after cessation of dredging. Local fish and invertebrate populations would be expected to recover as turbidity returns to pre-construction levels. There is expected to be a low potential for creation of persistent low dissolved oxygen conditions that would impact fisheries and aquatic biota in the borrow and placement areas ([Thompson and other 2011, response to comments](#)). The diversity and quality of fish habitat would be greater than with no action over the 20-year life of the preferred alternative.

Sand fencing, plantings, and monitoring would have no discernible effects on aquatic and benthic habitats, as there would be no additional disturbance of these habitats.

**Alternative 1** The increased area of construction in this alternative directly corresponds with increased adverse and beneficial impacts compared to the preferred alternative. Longevity and diversity of habitats would be similar to the preferred alternative. Sand fencing, plantings, and monitoring would have no discernible effects on aquatic and benthic habitats, as with the preferred alternative.

**Alternative 6** Shallow water benthos adverse impacts would be similar to other build alternatives. Benefits to aquatic and benthic habitats may be less lasting in the area north of the project area, since lower elevation beaches would not provide wind and wave protection for as long as with other build alternatives. Sand fencing, plantings, and monitoring would have no discernible effects on aquatic and benthic habitats, as with the preferred alternative.

#### Impacts on Essential Fish Habitat

**No Action** The variety and quality of some types of EFH associated with estuarine areas (emergent marsh and estuarine sand bottoms) are expected to continue to decrease as the marsh converts to open-water habitat. Only open-water EFH would increase.

**Alternative 5 - Preferred Alternative** Long-term, moderate benefits would result from reestablishing marsh and estuarine sand waterbottoms and protecting marsh habitat from erosion that would improve estuarine-related EFH. Marsh and marsh edge habitat would increase with vegetative and hydrological features that develop post-construction. Those features may be initiated from dike gapping and plantings. Increased amounts of detrital material, formed by the breakdown of emergent vegetation, would contribute to the aquatic food web of the surrounding ecosystem. Decreases in tidal and storm erosion would protect estuarine mud bottoms and marsh ponds. Thus, the preferred alternative would restore more productive habitats supportive of brown shrimp, white shrimp, and red drum.

No substantial adverse effects on EFH are expected, because hundreds of acres of similar open water and substrate are available to organisms outside of the proposed areas to be constructed and dredged. Short-term, unavoidable, direct, minor adverse impacts to habitats supportive of various life stages of brown shrimp, white shrimp, and red drum would occur during the construction phase of the proposed project as marsh is filled and created. However, there would be post-construction increases in the quality and quantity of the marsh habitats. Turbidity would return to ambient conditions post-construction. Potential short-term, adverse impacts to EFH include movement of prey species away from the construction and borrow areas, and temporary interruption of feeding or spawning.

Sand fencing and plantings, and monitoring would have no discernible effects on EFH, as there would be no additional disturbance of these habitats.

**Alternative 1** The impacts to EFH would not differ substantially from those associated with the preferred alternative, as a greater quality of EFH would be constructed but temporary adverse impacts associated with dredging would occur. Sand fencing, plantings, and monitoring would have no discernible effects on EFH, as with the preferred alternative.

**Alternative 6** Temporary, adverse impacts to EFH in the borrow area would be slightly less than for the other build alternatives because less dredging and disturbance of estuarine habitat would occur. However, the long-term benefits would also be less because less increase in quality EFH habitat would be created and maintained. Other impacts to EFH would not differ substantially from those associated with the preferred alternative. Sand fencing, plantings, and monitoring would have no discernible effects on EFH, as with the preferred alternative.

#### Impacts on Fishery Resources

**No Action** The quality of fish habitat is expected to decrease as the marsh habitats are converted to open water through erosion and subsidence and the remaining barrier island erodes. The function of the marsh as nursery habitat for estuarine-dependent species would be degraded. Open water habitat is abundantly available in coastal Louisiana; its increase replaces less common habitats that are more vulnerable to disturbance.

**Alternative 5 - Preferred Alternative** Under the preferred alternative, short-term, minor, direct, local, adverse impacts to fisheries resources would occur during the construction phase of the proposed project. Prey species may be removed in dredging and slow moving fish species or eggs smothered in the deposition sites. Mobile aquatic animals would be expected to move away from the proposed project area during construction and return after construction is complete. Adverse impacts would be localized to the dredge and placement areas.

As benthic organisms would likely re-colonize borrow areas so would their predators, such as fish and larger invertebrates. Early-stage recruitment of defaunated sediments occurs rapidly in coastal systems (Grassle and Grassle 1974, McCall, 1977, Simon and Dauer 1977, Ruth and others 1994, all as cited in [EPA 2003](#)). Dredged sites would be rapidly colonized by opportunistic infauna ([EPA 2003](#)). Later stages of colonization would be more gradual and would depend on environmental conditions after cessation of dredging. Fish and invertebrates are expected to recover as turbidity returns to pre-construction levels.

Long-term, moderate, direct and indirect beneficial impacts would result from created marsh habitat providing nursery for estuarine-dependent fisheries that does not currently exist and would not exist with the no-action alternative. Access to the marsh habitat would be maintained after construction through dike gapping, if post-construction monitoring indicates it is required, and protected waters in the bay north of the project area would be quality habitat resulting from the created landmass that reduces wind and wave perturbations.

Sand fencing and plantings, and monitoring would have no discernible effects on fishery resources, as there would be no additional disturbance of their habitats.

**Alternative 1** An increased longevity of the benefits is expected compared to the preferred alternative though temporary, minor adverse impacts would be greater to fishery resources and aquatic organisms as

well. Fishery resources dependent on estuarine habitats would have greater benefit in the long-term than with the preferred alternative because greater dune width would increase the longevity of the landmass that would provide the quality quiescent bay waters. Sand fencing, plantings, and monitoring would have no discernible effects on fishery resources, as with the preferred alternative.

**Alternative 6** The adverse and beneficial impacts on fishery and aquatic resources would be more than with no action, but less than other build alternatives. Less quality fisheries habitat would be created and the smaller marsh would provide less benefit and less longevity of benefits. Adverse impacts to fisheries would be similar to other build alternatives. Sand fencing, plantings, and monitoring would have no discernible effects on fishery resources, as with the preferred alternative.

#### Impacts on Marine Mammal Resources

**No Action** With no action, the marsh used by marine mammal forage species, such as small fish, would decline.

**Build Alternatives** Whales are unlikely to occur in the project area ([NMFS 2010](#)). Manatees are rare for this area, so are unlikely to occur, but dolphins are common along the coast of the project area. Dolphins are likely to avoid project areas during construction. They would be temporarily displaced, as would their fish food source. The dolphins would follow the fish populations for feeding and both prey and predator would return shortly after construction. Therefore, the build alternatives have short-term, indirect, minor, adverse impacts. In the long-term, moderate, direct and indirect benefits would result from increasing the quantity and longevity of prey nursery grounds, and refuges. Contractors would be instructed to watch for marine mammals. Should any manatee or dolphin be seen, any workboats in the area would be instructed to cease work until the manatee or dolphin is over 500 ft away, per construction contract clauses that are standard. Additionally, through the Section 404 permitting process, NMFS Protected Resources has included a list of measures for reducing entrapment risk to protected species (Appendix A) that will be followed in the construction process. Sand fencing and plantings, and monitoring would have no discernible effects on marine mammals.

#### Impacts on Migratory Bird Resources

**No Action** With no action, the marsh used by migratory birds and their forage species would decline.

**Build Alternatives** The project area is located in an area where colonial and solitary seabird/shoreline nesting may occur although there are no known and documented historic nesting sites in the project area. Coordination with USFWS was performed through both the Clean Water Act Section 404 permitting process and through USFWS's review of the EA in order to comply with the Migratory Bird Treaty Act (correspondence can be found in Appendix A). USFWS has advised that colonies may be present that are not currently listed in the database maintained by the Louisiana Department of Wildlife and Fisheries (LDWF).

Due to the extended duration of proposed construction activities (and post-construction sand fencing and monitoring activities), it is not possible to conduct all work outside of nesting seasons. Consequently, a qualified biologist will inspect the project area for the presence of undocumented nesting birds and if needed, an abatement plan will be developed in coordination with USFWS and implemented for the duration of project construction. Additionally, the following measures will be implemented to the maximum extent practicable to further minimize potential disturbance to nesting birds:

- For colonies containing nesting brown pelicans, all activity occurring within 2,000 feet of a rookery should be restricted to the non-nesting period (i.e., September 15 through March 31). Nesting periods vary considerably among Louisiana's brown pelican colonies, so it is possible that this

activity window could be altered based upon the dynamics of the individual colony. The LDWF Fur and Refuge Division should be contacted to obtain the most current information about the nesting chronology of individual brown pelican colonies. Brown pelicans are known to nest on barrier islands and other coastal islands in St. Bernard, Plaquemines, Jefferson, Lafourche, and Terrebonne Parishes, and on Rabbit Island in lower Calcasieu Lake, in Cameron Parish.

- For colonies containing nesting wading birds (i.e., herons, egrets, night-herons, ibis, and roseate spoonbills), anhingas, and/or cormorants, all activity occurring within 1,000 feet of a rookery should be restricted to the non-nesting period (i.e., September 1 through February 15, exact dates may vary within this window depending on species present).
- For areas containing isolated or colonial nesting gulls, terns, plovers, and/or black skimmers, all activity occurring within 650 feet of a nest area should be restricted to the non-nesting period (i.e., September 16 through April 1, exact dates may vary within this window depending on species present).

In addition, USFWS recommends that on-site contract personnel be informed of the need to identify colonial nesting birds and their nests, and should avoid affecting them during the breeding seasons specified above.

#### Impacts on Wildlife Resources

**No Action** Ducks, furbearer, game mammals, wading birds, and seabirds would continue to decrease in the proposed project area ([LCWCRTF and WCRA 1999](#)). No habitat for migratory birds or lesser scaup would be created.

**Alternative 5 - Preferred Alternative** Direct, minor short-term adverse impacts to marsh and shallow water habitat would result from this alternative. Long-term, minor, direct benefits would result from increased habitat available for wildlife through creation of marsh, dune and beach. During construction, wildlife would avoid the proposed project area due to the noise of equipment. The increased diversity and quantity of habitats would encourage return and recruitment of wildlife from other areas. Sand fencing and plantings would have minor long term beneficial impacts wildlife resources, as there would be some increase in the structural complexity and composition of habitats from these features, and monitoring is expected to temporary minor adverse effects and no discernible long term effects on wildlife resources.

**Alternative 1** The temporary disturbance of wildlife during construction would be similar to the preferred alternative. However, long-term benefits of increased diversity of habitat and greater longevity of the land mass would be of greater benefit than for the preferred alternative. Sand fencing and plantings would have minor long term beneficial impacts wildlife resources, as there would be some increase in the structural complexity and composition of habitats from these features, and monitoring is expected to temporary minor adverse effects and no discernible long term effects on wildlife resources.

**Alternative 6** Temporary, adverse impacts to wildlife during construction would be similar to the preferred alternative, but long-term benefits would be less than for the preferred alternative. The benefits would be greater than no action by extending the life of the island and associated wildlife habitats. Sand fencing and plantings would have minor long term beneficial impacts wildlife resources, as there would be some increase in the structural complexity and composition of habitats from these features, and monitoring is expected to temporary minor adverse effects and no discernible long term effects on wildlife resources.

### Impacts on Threatened and Endangered Species

**No Action** Without action, indirect, long and short-term adverse impacts would result from the continued conversion of marsh to open water. No marsh or dune habitat would develop. Less habitat would be available for nesting waterbirds as land loss continues. Losses may temporarily increase feeding locations for piping plover as remaining sand and marsh are converted to mud flat. No roosting areas would develop and temporary feeding locations would convert to open water non-feeding areas for the winter piping plover.

**Build Alternatives (including preferred alternative)** The build alternatives would increase piping plover habitat by creating foraging habitats for a long-term beneficial impact; the marsh creation area and beach face would be sparsely vegetated and would increase the size and longevity of any currently occurring plover habitat. Temporary, moderate, direct impacts to foraging habitat (i.e. unvegetated intertidal areas and wrack line) would result from smothering of the natural wrack and benthic prey from construction till recovery 6 months to 2 years post-construction. During the recovery time, the area would be less suitable for foraging but available for roosting. Minor, indirect, temporary adverse impacts to plover would result from displacement; LDWF observed 12 piping plover in the area from 2007 to 2011, which would be dispersed to the abundance of nearby habitat (e.g., East Grand Terre, Shell Island, and Pelican Island) during construction. If plovers were to roost prior to construction, the USFWS would be contacted for instruction. During construction, the noise and activity would likely prevent plovers from selecting the area. Construction would be temporary (approximately 1 year), in comparison to the increase in plover habitat (5 or more years before marsh areas are fully established).

Because manatees are unlikely, but possible, to occur during construction, contractors would be instructed to be on the lookout for them in summer months and take measures to avoid collision if manatees are encountered. If a manatee were sighted within 100 yards of the active work zone, contractors would be instructed to contact USFWS at 337-291-2100 and LDWF at 225-765-2821 for further guidance. Therefore, no impact is anticipated for manatee.

Informal ESA consultations with both USFWS and NMFS were conducted through the U.S. Army Corps of Engineers Clean Water Act Section 404 permit process for the proposed project. The NMFS concurred with the determination that endangered sea turtles and Gulf Sturgeon are not likely to be adversely affected by the proposed project. Additionally, NMFS Protected Resources has included a list of measures for reducing entrapment risk to protected species (Appendix A) that will be followed in the construction process. For the purposes of the EA, the ESA consultation process was completed with the USFWS on June 7, 2012 and with NMFS Protected Resources through the permitting process on June 6, 2012. Consultation with USFWS will have to be refreshed before commencement of construction, as per their guidance (Appendix A).

Sand fencing and plantings, and monitoring would have no discernible effects on Threatened and Endangered Species, as there would be no additional disturbance of their habitats. Measures would be taken when monitoring would occur on tidal and supratidal habitats to ensure they would not disturb threatened and endangered species.

### **Cultural Resources**

#### Impacts to Historic, Prehistoric, and Native American Resources

**No Action** No impacts to cultural resources are expected under the no action alternative. Under the no-action alternative, the shoreline would continue to erode and marshes subside. As with previously

identified cultural resources ([NMFS 2011](#)), the continued land loss process leads to resources being increasingly located offshore in deeper waters, assuming any others exist.

**Build Alternatives (including preferred alternative)** There are no anticipated impacts to cultural resources. Cultural resources in the borrow area vicinity were identified and would be avoided. Sand fencing, plantings, and monitoring would have no effects on cultural resources. The Louisiana State Historic Preservation Office has reviewed the project area and concurred that no archeological or historic resources would be adversely impacted by the proposed project or any of the build alternatives considered. Correspondence from Louisiana State Historic Preservation Office can be found in Appendix A.

#### Impacts to Socioeconomics

**No Action** Long-term, indirect, moderate adverse impacts would result from the loss of shrimp habitat and associated losses of income to fisheries in the region are expected because marsh habitats provide essential nursery function to shrimp. This and similar losses to commercial and recreation use of the area could contribute to poverty in the parish, last reported at 20.5 % at Port Sulphur ([U.S. Census Bureau 2010](#)).

**Build Alternatives (including preferred alternative)** The build alternatives would not adversely affect economic resources. Short-term and long-term, minor benefits would result. Under the build alternatives, marshes created in the proposed project area would provide the benefit of forage, nursery, and grow-out sites for a variety of commercially and recreationally important fisheries species. Improvements to marsh habitats are expected to enhance fisheries resources in the immediate area. Increased recreational and commercial fishing would, in turn, positively and indirectly support nearby businesses. Existing oil and gas infrastructure (such as pipelines) would be better protected, and economic activity in the area would continue at present levels or would increase. During construction, a small increase in employment of dredge operators, crewmembers, and other construction-related technicians would occur. Any short-term adverse impacts to oyster leases that may result from the proposed action would be compensated by the state of Louisiana at fair market value. Sand fencing, plantings, and monitoring are typically done by small local contractors, but would likely provide no discernible economic boost to the adjacent communities.

#### Impacts to Land Use and Infrastructure

**No Action** Long-term, direct, minor adverse impacts to fishery activities would result as species that rely on marsh habitat decline. This alternative would not immediately affect infrastructure in the area. Infrastructure would continue to increase in vulnerability to storm surge damages concurrent with land erosion and subsidence.

**Alternative 5 - Preferred Alternative** Long-term, direct benefits would result from the increased quality of finfish, shellfish, and waterfowl habitats; the provision of a storm buffer area; and increased recreation and commercial uses. Short-term, direct, reversible, minor, adverse impacts to land use in the vicinity would result from construction activities. Construction would avoid pipelines and commercial infrastructure.

Dredging and associated activities can affect pipelines if the dredging crosses an active pipeline. Multiple surveys to identify potential areas of pipelines, correspondence with pipeline owners and landowner searches are conducted so this can be avoided by selecting an access route with the least potential to cross pipelines. The access channel for the back dike (primary dike) ([Figure 6](#)) was carefully selected in this manner. Pipelines lie on either side and inspectors and contractors would take care to observe safety buffer zones around the located pipelines as well as any crossings.

Sand fencing, plantings, and monitoring would have no effects on land use and infrastructure.

**Alternative 1** Impacts both adverse and beneficial to land use/recreation would be similar to the preferred alternative. Sand fencing, plantings, and monitoring would have no effects on land use and infrastructure.

**Alternative 6** The benefits would not be as long lasting, because the created habitat would erode more quickly than with the preferred alternative. Sand fencing, plantings, and monitoring would have no effects on land use and infrastructure.

#### Impacts to Hazardous, Toxic, and Radioactive Waste

**No Action** There are no hazardous, toxic, or radioactive waste concerns.

**Build Alternatives (including the preferred alternative)** There are no anticipated impacts to hazardous, toxic and radioactive waste sites associated with any build alternative.

#### Impacts to Noise

**No Action** The no-action alternative would not cause any change to the existing noise conditions in the proposed project area.

**Build Alternatives (including preferred alternative)** Under the build alternatives, short-term, minor adverse impacts through the increase in noise associated with construction equipment would occur. No long-term changes in ambient noise levels would result from the build alternatives, as noise-producing equipment would vacate the area after construction. While the construction duration for Alternative 1 would likely be longer, and the duration for Alternative 6 would likely be shorter, than the preferred alternative, the relative effects given the project location are relatively functionally unquantifiable.

#### **Other Considerations**

Oil and gas pipelines are densely located in and around the proposed project area, so special attention was given to locating these and identifying or contacting the owners to coordinate safe access to the proposed project site ([Thompson and others 2011 table 4, pg 19](#)). Given the inherent risk and danger, numerous magnetometer studies are performed to locate these by the design team and by the construction contractor and to minimize interaction by choosing the designs that best avoid potential interactions. Construction BMPs are in place to best respond in the case of an active line breach and pipeline owners are notified in advance of active work adjacent to the lines. In many years of work, no active pipelines have been breached in CWPPRA projects.

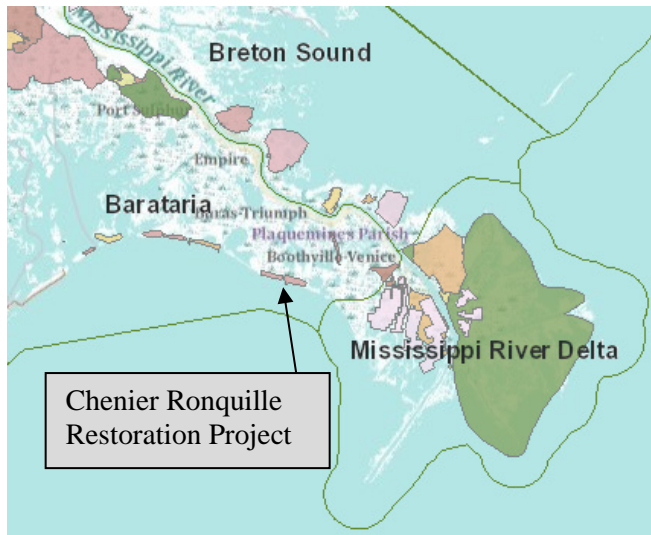

#### Cumulative Impacts

Direct and indirect impacts of past, present, and reasonably foreseeable future events were considered in the analysis of the proposed project consequences. This analysis was considered basin-wide and over the past 20 years. These impacts include historical and predicted future land loss rates for the area and other restoration projects in the vicinity. The preferred alternative would have temporary adverse impacts to some environmental resources but cumulative benefits to the environmental resources.

The coastal habitats and associated resources of Louisiana, including the project area, have been greatly impacted by natural subsidence ([Reed and Yuill 2009](#)), levees, hurricanes, and oil and gas infrastructure. Recent events, particularly hurricanes, contribute to the loss of habitat but not enough to be discernible from other impacts.

Though CWPPRA projects are nominated and implemented one at a time and must have individual merit, the cumulative value of all wetland restoration and protection projects in an area can far exceed the summed values of the individual projects. Similar wetland restoration projects in the area would operate with the preferred alternative to enhance the structural and functional integrity of the ecosystem, improve primary productivity rates, and thereby improve the overall environmental resources.

**FIGURE 13. CWPPRA PROJECTS IN THE PROJECT VICINITY**

Shaded areas of [Figure 13](#) identify individual CWPPRA projects. Since CWPPRA's inception, 151 coastal restoration or protection projects have been authorized, benefiting over 110,000 acres in Louisiana. Information on similar and nearby CWPPRA projects in the vicinity is available at [www.lacoast.gov](http://www.lacoast.gov).

Physical cumulative impacts of this and other restoration projects are to slow the land loss rate in coastal Louisiana. Currently, land loss is at an average rate of an acre every 38 minutes. If the current rate of loss is not slowed by the year 2040, an additional 800,000 acres of wetlands will convert to open water.

Physical cumulative adverse impacts are related to mining borrow sediments. Borrowing from offshore for the proposed project and for other CWPPRA projects is not expected to have any long-term adverse cumulative impacts. Cumulative impacts as a result of disposal would be minimal, temporary, and localized to the dredging and disposal sites.

The cumulative impact of the proposed action on air and water quality, when considered in addition to other CWPPRA projects, would not differ substantially from the effects of the alternatives considered individually. Air quality would be temporarily and locally affected during construction of each of the projects. Short-term, localized increases in turbidity would result from all of the projects, but these impacts are considered to be localized and short-term because projects would not co-occur in space or time. The cumulative beneficial impact to water quality would be a long-term increase in quality by increasing marsh and decreasing turbidity.

Biological cumulative impacts of all the CWPPRA and other restoration projects would be similar to the direct and indirect impacts of the alternatives described previously. All alternatives, except the no-action alternative, would work with existing projects to enhance habitat for fish, wildlife, vegetation, and EFH. Cumulatively, all build alternatives would increase benefits to the area by decreasing land loss rates. No cumulative adverse impacts are anticipated from the proposed project, other CWPPRA projects, and other habitat restoration projects.

Cumulative beneficial impacts to socio-economic resources would result from synergy of the build alternatives with nearby restoration projects. These projects would cumulatively decrease losses of habitat, thereby benefiting the local economy and providing improved storm protection when compared with no action. The build alternatives are similar to previous restoration actions in coastal Louisiana that have had no adverse cultural impacts. No adverse cumulative impacts to cultural resources would be expected to result from implementation of the proposed alternative.

### Invasive Species

Executive Order 13112 requires federal agencies to use authorities to prevent introduction and control (in cost effective and environmentally sound manners) invasive species, and to provide for restoration of native species and habitats in ecosystems that have been invaded. There is little potential to introduce novel invasive species to the project area. Given the number of barges and boats transiting the oceans waters and the Nation's waterways daily, and the frequency of use of these vessels in the area for similar purposes, the biofouling source from dredges would represent an insignificant increase in invasive species introduction potential. Additionally, only nursery using local seeds and vegetative matter sources for plantings are utilized, so as to not introduce non-native phenotypes.

### Coordination

Coordination in development of the proposed action, its alternatives and selection of the preferred alternative has been maintained with each CWPPRA Task Force agency. The proposed project was vetted publicly through the CWPPRA process, which includes opportunities for the public and CWPPRA agencies to comment on the proposed project. The proposed project was discussed in public meetings for CWPPRA where proposed project details were made available on several occasions. A draft of this EA was provided to those listed herein, as well as made available for public comment. No public comments were received. Agency comments that were received are provided in [Appendix A](#). The preferred alternative is not expected to cause adverse environmental impacts that would require compensatory mitigation through the permit review process (e.g. Section 404).

### Compliance with Laws and Regulations

This section presents a review of the potentially applicable laws and regulations that govern this proposed restoration project, and describes the measures taken to ensure compliance with all relevant laws and regulations. Many federal, state, and local laws and regulations were considered during development of the proposed restoration project, as well as several regulatory requirements that are typically evaluated during the permitting process. A brief review of potentially applicable laws and regulations that may pertain to this proposed project is presented below. The project manager would ensure that there is coordination among these programs where possible and that project implementation and monitoring are in compliance with all applicable laws and regulations.

**National Environmental Policy Act of 1969** NEPA was enacted in 1969 to establish a national policy for the protection of the environment. The CEQ was established to advise the President and to carry out certain other responsibilities relating to implementation of NEPA by federal agencies. Pursuant to Presidential Executive Order, federal agencies are obligated to comply with NEPA regulations adopted by the CEQ (40 CFR Parts 1500-1508). These regulations outline the responsibilities of federal agencies under NEPA and provide specific procedures for preparing environmental documentation to comply with NEPA.

**Clean Water Act (CWA)** The CWA is the principal law governing pollution control and water quality of the nation's waterways. It requires the establishment of guidelines and standards to control the direct or indirect discharge of pollutants to waters of the United States. Discharges of material into navigable waters, including wetlands, are regulated under Sections 401 and 404 of the CWA. The USACE has the primary responsibility for administering the Section 404 permit program. Under Section 401 of the CWA, projects that involve discharge or fill to wetlands or navigable waters must obtain certification of compliance with state water quality standards. The preferred alternative was permitted under Section 404 on November 7, 2012 under permit number MVN 2011-03148-ETT. Included in Appendix A are clearances or specific guidance as a result of the permit process, including: no objection from NMFS Habitat Conservation Division regarding permit issuance dated January 13, 2012, measures from the USFWS on avoiding impacts to ESA listed species and migratory birds from January 25, 2012, clearance

of water quality from the State of Louisiana Department of Environmental Quality from February 12, 2012, and a letter from NMFS Protected Resources Division including Sea Turtle and Smalltooth Sawfish Construction Conditions and Measures for Reducing Entrapment Risk to Protected Species dated June 6, 2012.

**Clean Air Act of 1970** Under the Clean Air Act of 1970, Congress established procedures for developing National Ambient Air Quality Standards (NAAQS) for the protection of human health and public welfare. EPA published the NAAQS in 1971, and they became effective at that time. Standards are provided for the following criteria pollutants: carbon monoxide, sulfur dioxide, nitric oxide, ozone, lead, and fine particulate matter.

**Coastal Zone Management Act** The Coastal Zone Management Act (CZMA) provides for protection of resources found in the coastal zone, proactive land management practices, and preservation of unique coastal resources. Included in the CZMA is the requirement that all federal actions within the coastal zone of Louisiana must be consistent with the federally approved State of Louisiana Coastal Resource Management Plan. The State of Louisiana has concurred that the proposed project is consistent with Louisiana's federally-approved Coastal Management Plan. Concurrence from the State of Louisiana that this project is consistent with the CZMA can be found in Appendix A.

**Executive Order 11990, Protection of Wetlands** The intent of Executive Order 11990, Protection of Wetlands, is to avoid, to the extent possible, the long- and short-term adverse impacts associated with the destruction or modification of wetlands and to avoid direct or indirect support for new construction in wetlands whenever there is a practicable alternative.

**Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations** Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs that the programs of federal agencies identify and address disproportionately high and adverse effects on human health and the environment of minority or low-income populations.

**The Endangered Species Act of 1973 (ESA)** The ESA directs all federal agencies to conserve endangered and threatened species and their habitats and encourages such agencies to utilize their authorities to further these purposes. Under the Act, NMFS and USFWS publish lists of endangered and threatened species. Section 7 of the act requires that federal agencies consult with these agencies to minimize the effects of federal actions on endangered and threatened species. NOAA has, through both the NEPA and CWA Section 404 interagency review processes, coordinated with both USFWS and NOAA regarding endangered species. Both USFWS and NMFS have concurred with the determination that the proposed action is not likely to adversely affect federally-listed species or associated critical habitat. Therefore, a formal ESA Section 7 consultation is not required. Correspondence can be found in Appendix A.

**Migratory Bird Treaty Act of 1918 (MBTA)** The MBTA requires the protection of all migratory bird species and protection of ecosystems of special importance to migratory birds against detrimental alteration, pollution, and other environmental degradation. Coordination under MBTA is generally incorporated into Section 404 of the CWA, NEPA, or other federal permit, license or review requirements. Concurrence of conclusion of both ESA and MBTA requirements with USFWS for the preferred alternative was received via letter dated June 7, 2012 and can be found in Appendix A.

**Fish and Wildlife Coordination Act** The Fish and Wildlife Coordination Act requires agencies to consult with the USFWS, NMFS, and appropriate state agencies, prior to modification of any stream or other body of water, to ensure conservation of wildlife resources. Compliance with the FWCA is

integrated into the USACE interagency review process under Section 404 of the CWA as well as through the NEPA review process.

**Archeological and Historic Preservation Act of 1974** The Archeological and Historic Preservation Act of 1974 states that, if an activity may cause irreparable loss or destruction of significant scientific, prehistoric, historic, or archeological data, the responsible agency is authorized to undertake data recovery and preservation activities, in accordance with implementing procedures promulgated by the Secretary of the Interior.

**National Historic Preservation Act of 1966** The National Historic Preservation Act of 1966, as amended in 1992, requires that responsible agencies taking action that affects any property with historic, architectural, archeological, or cultural value that is listed on or eligible for listing on the National Register of Historic Places (NRHP) comply with the procedures for consultation and comment issued by the Advisory Council on Historic Preservation. The responsible agency also must identify properties affected by the action that are potentially eligible for listing on the NRHP, usually through consultation with the state historic preservation officer. The Louisiana State Historic Preservation Office concurred on March 20, 2011 that no archeological or historic resources would be adversely impacted by the proposed project. Concurrence from Louisiana State Historic Preservation Office can be found in Appendix A.

**Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act)** In 1996, the act was reauthorized and changed by amendments to require that fisheries be managed at maximum sustainable levels and that new approaches be taken in habitat conservation. EFH was defined broadly to include “those waters and substrate necessary to fish for spawning, breeding, feeding or growth to maturity” (62 Fed. Reg. 66551, § 600.10 Definitions). The act requires consultation for all federal agency actions that may adversely affect EFH. Under Section 305(b)(4) of the act, NMFS is required to provide advisory EFH conservation and enhancement recommendations to federal and state agencies for actions that adversely affect EFH. NMFS provided a letter indicating their review of this EA on October 5, 2012 and concurrence with the assessment of no long-term adverse impacts to EFH under the proposed alternative through the permitting process on January 13, 2012. Correspondence on this can be found in Appendix A.

## CONCLUSIONS

Adverse environmental consequences of the no-action alternative are in contrast with the benefits of the preferred alternative. With no action, continued loss of marsh habitats likely would occur along with associated declines in the quality of fish and wildlife resources. The preferred alternative would provide long-term benefits to these habitats.

The natural processes of subsidence, habitat switching, and erosion of wetlands have been exacerbated by widespread human alterations of sediment delivery and other processes, resulting in marked degradation of the Louisiana coastal area. Without intervention to retard or reverse the loss of marshes and barrier islands, Louisiana’s healthy and highly productive coastal ecosystem would not be maintained.

This EA finds that the Chenier Ronquille Barrier Island Restoration Project would have long-term beneficial impacts on the coastal resources of south Louisiana and would not result in any substantial long-term adverse environmental impacts. Construction-related adverse impacts are considered minor, short-term and not substantial because they are temporary or reversible. Positive impacts would be moderate. This conclusion is based on a comprehensive review of relevant literature, site-specific data, and project-specific engineering reports related to biological, physical, and cultural resources, as well as on the cumulative experience gained through many similar coastal restoration projects in south Louisiana

over the past decade. The increase of available habitat that benefits fishery resources is expected to have long-term beneficial impacts on the local economy and culture as it relates to improved recreational and commercial fishing.

### PREPARERS

This EA was prepared by Biologists Joy Merino, Rachel Sweeney, Cecelia Linder, John Foret, Ph.D, and Phillip Parker, P.E. of NMFS in consultation with USFWS, Louisiana SHPO, and the CWPPRA Technical Committee. Correspondence is provided in [Appendix A](#).

### DISTRIBUTION LIST

This EA was distributed for comment to agencies of the CWPPRA Task Force and resource agencies as listed below. A 30-day comment period was provided. A draft EA was available for public review. This final EA will be made available to the public at [www.lacoast.gov](http://www.lacoast.gov) along with other public records for the project. This EA was distributed to:

**Thomas A. Holden** Chairman Deputy District Engineer, U.S. Army Engineer District, New Orleans  
Office of the Chief. 7400 Leake Ave. New Orleans, Louisiana 70160-0267

**Darryl Clark** Senior Field Biologist, U.S. Fish and Wildlife Service. 646 Cajundome Blvd, Suite 400  
Lafayette, Louisiana 70506

No known historic properties will be affected by this undertaking. This effect determination could change should new information come to our attention.

*Phil Boggan* 3-30-11  
Date  
Phil Boggan  
Deputy State Historic Preservation Officer

Dear Mr. Boggan,

The National Oceanic and Atmospheric Administration serves as the federal sponsor for the proposed Chenier Ronquille Barrier Shoreline Project. The project is authorized under the Coastal Wetlands Planning, Protection and Restoration Act with the Office of Coastal Protection and Restoration serving as the non-federal sponsor on behalf of the state of Louisiana. The purpose of the proposed project is to restore barrier island habitat and maintain the integrity of the Barataria-Plaquemines shoreline. As the federal sponsor of the proposed project, the National Oceanic and Atmospheric Administration is initiating coordination with the Louisiana State Historic Preservation Officer as required under the National Historic Preservation Act.

Major project components include excavating material from borrow areas located in the Gulf of Mexico, placement of sandy fill material to restore beach and dune, construction of temporary retention dikes using in-situ material on the perimeter of the marsh creation area and placement of fine-grained material to restore and create marsh. The Areas of Potential Effect include both the Gulf of Mexico borrow area and the limits of beach nourishment and marsh generally as depicted in Attachment 1 (copy enclosed); however, note that the design team is currently considering alternatives that may affect an additional area denoted on Attachment 1.

Review of records housed at the Division of Archaeology revealed two previously recorded sites within the project area. "Point Chenier Ronquille" (16PL31) was identified in 1952 as being located on the beach face. Based on an analysis of previous shoreline positions in Attachment 2 (copy enclosed) and shoreline retreat rates in this area (38 feet/year between 1998 and 2006<sup>1</sup>), we believe that any remaining portions of 16PL31 are currently located offshore of the project area in the Gulf of Mexico.

<sup>1</sup> Thompson, G., and Wycklndt, A. 2009. "Chenier Ronquille Shoreline Restoration Project, PPL-19, Phase 0 Report. Boca Raton, Florida: Coastal Planning and Engineering, Inc. 57p.

## United States Department of the Interior

FISH AND WILDLIFE SERVICE  
646 Cajundome Blvd.  
Suite 400  
Lafayette, Louisiana 70506

February 17, 2011

Mrs. Joy Merino  
National Marine Fisheries Service  
646 Cajundome Boulevard, Room 175  
Lafayette, LA 70506

Dear Mrs. Merino:

Please reference your January 31, 2011, letter requesting a list of endangered, threatened, and proposed species and designated and proposed critical habitats that may occur within the Chenier Ronquille Barrier Island Restoration Project (BA-76), located in Plaquemines Parish, Louisiana. The proposed project design includes the construction of approximately 127 acres of beach/dune fill and approximately 259 acres of marsh creation/nourishment. Additionally, intensive dune plantings with approved nursery stock would occur. The U.S. Fish and Wildlife Service (Service) has reviewed the information you provided, and offers the following comments in accordance with the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.), Coastal Barrier Resources Act of 1982 (96 Stat. 1653, as amended; 16 U.S.C. 3501 et seq.), and the Migratory Bird Treaty Act (MBTA) (40 Stat. 755, as amended; 16 U.S.C. 703 et seq.)

### **West Indian manatee**

According to our records, waters of the proposed project area may provide potential habitat for the West Indian manatee (*Trichechus manatus*). A federally listed endangered species; West Indian manatees occasionally enter Lakes Pontchartrain and Maurepas, and associated coastal waters and streams during the summer months (i.e., June through September). Manatee occurrences appear to be increasing, and they have been regularly reported in the Amite, Blind, Tchefuncte, and Tickfaw Rivers, and in canals within the adjacent coastal marshes of Louisiana. They have also been occasionally observed elsewhere along the Louisiana Gulf coast. The manatee has declined in numbers due to collisions with boats and barges, entrapment in flood control structures, poaching, habitat loss, and pollution. Cold weather and outbreaks of red tide may also adversely affect these animals. Should the proposed project involve activity during summer months, contract personnel associated with the project should be informed of the potential presence of manatees and the need to avoid collisions with manatees, which are protected under the Marine Mammal Protection Act of 1972 and the Endangered Species Act of 1973. All construction personnel are responsible for observing water-related activities for the presence of manatee(s). Temporary signs should be posted prior to and during all construction/dredging activities to remind personnel to be observant for manatees during active construction/dredging operations or within vessel movement zones (i.e., work area),

**TAKE PRIDE  
IN AMERICA** 

and at least one sign should be placed where it is visible to the vessel operator. Siltation barriers, if used, should be made of material in which manatees could not become entangled, and should be properly secured and monitored. If a manatee is sighted within 100 yards of the active work zone, special operating conditions should be implemented, including: no operation of moving equipment within 50 feet of a manatee; all vessels should operate at no wake/idle speeds within 100 yards of the work area; and siltation barriers, if used, should be re-secured and monitored. Once the manatee has left the 100-yard buffer zone around the work area on its own accord, special operating conditions are no longer necessary, but careful observations would be resumed. Any manatee sighting should be immediately reported to the Service's Louisiana Ecological Services Office (337/291-3100) and the Louisiana Department of Wildlife and Fisheries, Natural Heritage Program (225/765-2821).

### **Piping plover**

Federally listed as a threatened species, the piping plover (*Charadrius melodus*), as well as its designated critical habitat, occur along the Louisiana coast. Piping plovers winter in Louisiana, and may be present for 8 to 10 months annually. They arrive from the breeding grounds as early as late July and remain until late March or April. Piping plovers feed extensively on intertidal beaches, mudflats, sand flats, algal flats, and wash-over passes with no or very sparse emergent vegetation; they also require unvegetated or sparsely vegetated areas for roosting. Roosting areas may have debris, detritus, or micro-topographic relief offering refuge to plovers from high winds and cold weather. In most areas, wintering piping plovers are dependent on a mosaic of sites distributed throughout the landscape, because the suitability of a particular site for foraging or roosting is dependant on local weather and tidal conditions. Plovers move among sites as environmental conditions change, and studies have indicated that they generally remain within a 2-mile area. Major threats to this species include the loss and degradation of habitat due to development, disturbance by humans and pets, and predation.

On July 10, 2001, the Service designated critical habitat for wintering piping plovers (Federal Register Volume 66, No. 132). Their designated critical habitat identifies specific areas that are essential to the conservation of the species. The primary constituent elements for piping plover wintering habitat are those habitat components that support foraging, roosting, and sheltering and the physical features necessary for maintaining the natural processes that support those habitat components. Constituent elements are found in geologically dynamic coastal areas that contain intertidal beaches and flats (between annual low tide and annual high tide), and associated dune systems and flats above annual high tide. Important components (or primary constituent elements) of intertidal flats include sand and/or mud flats with no or very sparse emergent vegetation. Adjacent unvegetated or sparsely vegetated sand, mud, or algal flats above high tide are also important, especially for roosting plovers. The proposed project area is not located in piping plover designated critical habitat; however, designated critical habitat does occur approximately 2.5 miles to the west on East Grand Terre Island. Should the proposed project directly or indirectly affect the piping plover or its critical habitat, further consultation with this office will be necessary.

### **Sea turtles**

Endangered and threatened sea turtles forage in the nearshore waters, bays and sounds of Louisiana. The National Marine Fisheries Service (NMFS) is responsible for aquatic marine threatened or endangered species. Please contact Eric Hawk (727/824-5312) at the NMFS Regional Office in St. Petersburg, Florida, for information concerning those species in the marine environment. When sea turtles come onshore to nest, however, the Service is responsible for consultation. Sea turtles have been known to nest in Louisiana; accordingly, we recommend that you contact this office if your activities would occur on beach areas during May through October for further guidance.

### **Gulf sturgeon**

The Gulf sturgeon (*Acipenser oxyrinchus desotoi*), federally listed as a threatened species, is an anadromous fish that occurs in many rivers, streams, and estuarine waters along the northern Gulf coast between the Mississippi River and the Suwannee River, Florida. In Louisiana, Gulf sturgeon have been reported at Rigolets Pass, rivers and lakes of the Lake Pontchartrain basin, and adjacent estuarine areas. Spawning occurs in coastal rivers between late winter and early spring (i.e., March to May). Adults and sub-adults may be found in those rivers and streams until November, and in estuarine or marine waters during the remainder of the year. Sturgeon less than two years old appear to remain in riverine habitats and estuarine areas throughout the year, rather than migrate to marine waters. Habitat alterations such as those caused by water control structures that limit and prevent spawning, poor water quality, and over-fishing have negatively affected this species.

On March 19, 2003, the Service and the National Marine Fisheries Service (NMFS) published a final rule in the Federal Register (Volume 68, No. 53) designating critical habitat for the Gulf sturgeon in Louisiana, Mississippi, Alabama, and Florida. Portions of the Pearl and Bogue Chitto Rivers, Lake Pontchartrain east of the Lake Pontchartrain Causeway, all of Little Lake, The Rigolets, Lake St. Catherine, and Lake Borgne within Louisiana were included in that designation. The primary constituent elements essential for the conservation of Gulf sturgeon are those habitat components that support feeding, resting, sheltering, reproduction, migration, and physical features necessary for maintaining the natural processes that support those habitat components; those elements should be considered when determining potential project impacts. The primary constituent elements for Gulf sturgeon critical habitat include:

- abundant prey items within riverine habitats for larval and juvenile life stages, and within estuarine and marine habitats for juvenile, sub-adult, and adult life stages;
- riverine spawning sites with substrates suitable for egg deposition and development, such as limestone outcrops and cut limestone banks, bedrock, large gravel or cobble beds, marl, soapstone, or hard clay;
- riverine aggregation areas, also referred to as resting, holding and staging areas, used by adult, sub-adult, and/or juveniles, generally, but not always, located in

holes below normal river bend depths, believed necessary for minimizing energy expenditures during freshwater residency and possibly for osmoregulatory functions;

- a flow regime (i.e., the magnitude, frequency, duration, seasonality, and rate-of-change of freshwater discharge over time) necessary for normal behavior, growth, and survival of all life stages in the riverine environment, including migration, breeding site selection, courtship, egg fertilization, resting, and staging; and necessary for maintaining spawning sites in suitable condition for egg attachment, egg sheltering, resting, and larvae staging;
- water quality, including temperature, salinity, pH, hardness, turbidity, oxygen content, and other chemical characteristics, necessary for normal behavior, growth, and viability of all life stages;
- sediment quality, including texture and other chemical characteristics, necessary for normal behavior, growth, and viability of all life stages; and
- safe and unobstructed migratory pathways necessary for passage within and between riverine, estuarine, and marine habitats (e.g., a river unobstructed by a permanent structure, or a dammed river that still allows for passage).

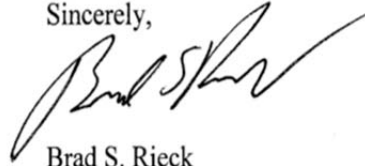

In that critical habitat designation, responsibility for consultation with specific Federal agencies was also identified for the Service and for the NMFS. For estuarine waters in Louisiana, the NMFS is responsible for consultations regarding impacts to the sturgeon and its critical habitat with all Federal agencies, except the Department of Transportation, the Environmental Protection Agency, the U.S. Coast Guard, and the Federal Emergency Management Agency, which consult with the Service. In riverine waters, the Service is responsible for all consultations regarding Gulf sturgeon and critical habitat, while in marine waters the NMFS is responsible for consultation. Therefore, please contact Dr. Stephania Bolden (727/824-5312) in St. Petersburg, Florida, for information concerning that species. The proposed project is not located within designated Gulf sturgeon critical habitat.

#### **Migratory birds**

The proposed project would be located near an area where colonial nesting waterbirds may be present. Colonies may be present that are not currently listed in the database maintained by the Louisiana Department of Wildlife and Fisheries. That database is updated primarily by monitoring the colony sites that were previously surveyed during the 1980s. Until a new, comprehensive coast-wide survey is conducted to determine the location of newly-established nesting colonies, we recommend that a qualified biologist inspect the proposed work site for the presence of undocumented nesting colonies during the nesting season. For colonies containing nesting wading birds (i.e., herons, egrets, night-herons, ibis, and roseate spoonbills), anhingas, and/or cormorants, all activity occurring within 1,000 feet of a rookery should be restricted to the non-nesting period, depending on the species present

We appreciate the opportunity to provide comments in the planning stages of this proposed project. If you need further assistance, please contact Michael Sealy (337/291-3123) of this office.

Sincerely,

A handwritten signature in black ink, appearing to read "Brad S. Rieck", written in a cursive style.

Dr. John D. Foret  
Wetland Ecologist  
National Marine Fisheries Service  
National Oceanic and Atmospheric Administration  
646 Cajundome Boulevard  
Lafayette, Louisiana 70506

Dear Dr. Foret:

Please reference your May 31, 2012, letter requesting our concurrence with the National Marine Fisheries Service's (NMFS) determination that the proposed Chenier Ronquille Barrier Island Restoration Project in Plaquemines Parish, Louisiana, is not likely to adversely affect the threatened piping plover (*Charadrius melodus*). That project has been authorized by the Coastal Wetlands Planning, Protection, and Restoration Act (CWPPRA) (104 Stat. 4779; 16 U.S.C. 3951 et seq.). The Fish and Wildlife Service (Service) has reviewed the information provided and offers the following comments in accordance with provisions of the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.).

In Louisiana, barrier island and barrier headland erosion is attributable to increasing tidal prism, insufficient volumes of sediment supplied by littoral currents, land subsidence, and sea-level rise (Boesch 1982). Although increases in the tidal prism may be primarily responsible for enlargement of tidal passes, the insufficient supply of sand available to rebuild eroded areas has also contributed to increased tidal pass widths and shoreline retreat (Louisiana Coastal Wetlands Conservation and Restoration Task Force and the Wetlands Conservation and Restoration Authority 1999). Where insufficient supplies of sand prevail, measures to maximize sand retention, such as sand fencing and vegetative planting, are needed to effectively rebuild and maintain these eroded areas.

Chenier Ronquille is the western-most portion of the Chaland barrier headland, which is a principal feature of the Barataria barrier system. The headland maintains the integrity of the Gulf shoreline and helps protect interior coastal wetlands from further deterioration. At one time, the Chaland headland consisted of narrow and low-lying sand dunes and beach berm, barrier marshes, chenier ridges interspersed with mangrove thickets, coastal dune shrub thickets, lagoons, and small bayous. The headland has historically suffered loss of habitat value and diminished function due to storm overtopping and breaching, saltwater intrusion, wind and wave induced erosion, sea level rise, subsidence, and man-made structures. The observed average shoreline erosion rate along the Chaland headland has increased from 32 feet per year (1998-

2006) to approximately 58 feet per year (2006-2010), and increased stress on fish and wildlife in the area is expected as habitats continue to be lost. Based upon the information and photographs provided in your letter, Chenier Ronquille currently consists of eroding and fragmented shoreline, low elevation saline marsh (+1 foot North American Vertical Datum 1988 (NAVD88)), and sparse supratidal mangrove habitat. The proposed project area is highly susceptible to over-wash and conversion of land to open water. Because there is little available sediment within the system, the NMFS anticipates that without the proposed project the headland would erode below sea level in 18 years. Thus, NMFS' goal is to repair and reestablish an intact and diverse headland habitat. The NMFS has previously restored two sections of the headland: the Chaland Headland Restoration Project was completed in 2006 and the Bay Joe Wise Restoration project was completed in 2009. Chenier Ronquille is the last section of the headland to be restored.

The NMFS is proposing to restore 80 acres of beach and dune habitat and 274 acres of intertidal saline marsh along Chenier Ronquille to increase the longevity of the headland system for the next 20 years. Approximately 2.7 million cubic yards of material would be mined from an offshore borrow source and hydraulically placed along 8,000 linear feet of shoreline to reconstruct the barrier headland and reduce shoreline erosion. Construction of the dune and beach portion of the project would involve surveying, disposing dredged material on the beach, grading the sand fill, installing sand fences, and planting native dune vegetation. Construction of the bay-side marsh would involve disposing dredged material onto existing marsh and into open water, as well as minor vegetative planting to start marsh growth. The NMFS anticipates that construction would require approximately 12 months. The proposed restoration efforts would not prevent over-wash during storm events or require repair of future breaches over the 20-year project life.

As you know, piping plovers winter in Louisiana, and may be present for 8 to 10 months. They arrive from the breeding grounds as early as late July and remain until late March or April. Piping plovers feed extensively on intertidal beaches, mudflats, sand flats, algal flats, and wash-over passes with no or very sparse emergent vegetation; they also require unvegetated or sparsely vegetated areas for roosting. Roosting areas may have debris, detritus, or micro-topographic relief offering refuge to plovers from high winds and cold weather. In most areas, wintering piping plovers are dependent on a mosaic of sites distributed throughout the landscape, because the suitability of a particular site for foraging or roosting is dependent on local weather and tidal conditions. Plovers move among sites as environmental conditions change, and studies have indicated that they generally remain within a 2-mile area. Major threats to this species include the loss and degradation of habitat due to development, disturbance by humans and pets, and predation. While critical habitat has been designated in areas of coastal Louisiana, none occurs within the project area; therefore, no critical habitat would be affected by the proposed project.

The project area still provides some foraging habitat for piping plovers on remnant patches of intertidal beach, over-wash fans, or sand or mud flats exposed during seasonally low tides; however, little to no roosting habitat (i.e., unvegetated or sparsely vegetated beach above high tide) exists within the project area due to the low elevations of the remaining sandy areas. Due to the current habitat conditions, it is difficult to assess the amount of foraging habitat that may be available for piping plovers during the wintering season. The Louisiana Department of

Wildlife and Fisheries' (LDWF) 2010 winter survey data indicated that six piping plovers were observed along an over-wash fan in the project area, as well as restored habitat on the eastern end of the Chaland headland. Unfortunately, due to the remoteness of the Chaland headland, we have no additional data (past or current) that indicates regular usage of the area.

The proposed activities would likely occur while piping plovers are present in the project area. Potential project effects to the piping plover would consist of temporary displacement to nearby suitable habitats and temporary loss of benthic prey species within the project footprint. There is an abundance of nearby suitable habitat into which plovers can disperse, including the remainder of the Chaland headland, the Grand Terre Islands and Grand Isle to the west, and Shell Island to the east. The benthic prey species smothered by the additional sediment in the project area would naturally re-colonize the area within 6 months to 2 years post-construction. Piping plovers would not be permanently excluded from the project area and would not be displaced beyond their normal daily movement patterns for foraging and roosting due to the abundance of suitable habitat in nearby areas. Implementation of the proposed project would ultimately benefit the piping plover by increasing, restoring, and prolonging the existence of suitable habitat for piping plovers. Because construction effects are temporary, discountable, and insignificant in nature, the Service concurs with the NMFS' determination that the proposed action is not likely to adversely affect the piping plover.

No further ESA consultation with the Service is necessary for the proposed action, unless there are significant changes in the scope or location of the project or the project has not been initiated one year from the date of this letter. If the proposed project has not been initiated within one year, follow-up consultation should be accomplished with the Service prior to making expenditures because our threatened and endangered species information is updated annually.

We appreciate the NMFS' continued excellent coordination and cooperation in the conservation of threatened species and their habitat. If you require further assistance regarding ESA coordination, or have questions regarding the content of this letter, please contact Ms. Brigitte Firmin (337/291-3108) of this office.

Sincerely,

  
for Jeffrey D. Weller

Dr. John D. Foret, Ph.D.  
NOAA Fisheries Service/SEFSC  
Estuarine Habitats and Coastal Fisheries Center  
646 Cajundome Boulevard, Room 175  
Lafayette, Louisiana 70506

Dear Dr. Foret:

NOAA's National Marine Fisheries Service (NMFS) has reviewed the draft Environmental Assessment (EA) for the Cheniere Ronquille Barrier Island Restoration (BA-76) project funded for engineering and design under the auspices of the Coastal Wetlands Planning, Protection and Restoration Act.

NMFS has reviewed the draft EA and believes that all pertinent resources have been sufficiently described and likely project impacts to those resources adequately characterized. As such, we have no comments to provide on the draft EA. In addition, because the project, as described in the EA, would help create and restore productive categories of essential fish habitat and benefit marine fishery resources, NMFS fully supports rapid implementation.

We appreciate the opportunity to review and comment on the draft EA.

Sincerely,

Virginia M. Fay  
Assistant Regional Administrator  
Habitat Conservation Division

**NATIONAL MARINE FISHERIES SERVICE NOTICE OF AVAILABILITY OF THE DRAFT ENVIRONMENTAL ASSESSMENT FOR THE CHENIER RONQUILLE BARRIER ISLAND RESTORATION PROJECT**

Notice is hereby given of the availability of the draft Environmental Assessment (EA) for the proposed Chenier Ronquille Barrier Island Restoration project. The National Oceanic and Atmospheric Administration's (NOAA) National Marine Fisheries Service (NMFS) has prepared a draft EA for the Chenier Ronquille Barrier Island Restoration project in accordance with the National Environmental Policy Act (NEPA) of 1969, as implemented by the regulations of the Council on Environmental Quality (CEQ) (Title 40 Code of Federal Regulations (CFR) Parts 1500 through 1508 (CFR 1500) and NOAA Administrative Order (NAO) 216-6, which describes NOAA's policies, requirements, and procedures for complying with NEPA and the regulations for implementation. The purpose of the proposed action is to support the restoration objectives of the Coastal Wetlands Planning, Protection and Restoration Act by restoring and creating secondary, dune, and marsh acreage on Chenier Ronquille to re-establish and maintain the functional barrier island ecosystem of for fish and wildlife habitat. As the federal sponsor for the Chenier Ronquille Barrier Island Restoration project, NMFS is responsible for project oversight in partnership with the State of Louisiana Coastal Protection and Restoration Authority. The draft EA analyzes the impacts of three design alternatives that had differences in dune width and slope, and marsh platform size, as well as the no action alternative. The preferred alternative would restore approximately 600 feet of beach and dune and about 274 acres of marsh habitat with on-shore eroded material. Native vegetation would be planted and construction to help stabilize the rebuilt marsh and dune habitat. All comments received will be considered by NMFS and will become part of the public record. If no significant issues are identified during the comment period, NMFS will finalize the draft EA, issue a Finding of No Significant Impact (FONSI), and proceed to construction. Unless substantive comments are received, NMFS will not publish another notice for this project. The draft EA is available for review online at [http://www.nmfs.gov/pdf/chenier\\_ronquille\\_bia\\_76\\_draft\\_environmental\\_assessment.pdf](http://www.nmfs.gov/pdf/chenier_ronquille_bia_76_draft_environmental_assessment.pdf) or upon request. A printed copy is available at the Picayunes Parish Public Library at 842 Highway 23, Belle Chasse, Louisiana. All questions or comments on the draft EA must be received no later than 5 p.m. EST on January 4, 2012. Comments on the draft EA may be submitted by the following methods: E-mail: Send comments to [Cecelia.Linder@noaa.gov](mailto:Cecelia.Linder@noaa.gov). Please include "Chenier Ronquille Draft EA" in the subject line of the e-mail. Mail: Send written comments to Cecelia Linder, F/HC3 1315 East-West Hwy Silver Springs, MD 20910. Fax: 301-713-5184. Please identify the fax as regarding "Chenier Ronquille Draft EA". For further information, or to request a hard copy or CD of the draft EA, please contact Cecelia Linder, (301) 427-8675 or [Cecelia.Linder@noaa.gov](mailto:Cecelia.Linder@noaa.gov).

January 13, 2012

NOAA's National Marine Fisheries Service has reviewed the Department of the Army permit application listed below. We anticipate that any adverse effects that might occur to marine and anadromous fishery resources would be minimal, and therefore, do not object to issuance of the permit for this project.

JAN 31 2012

JAN 31 2012

January 25, 2012

Colonel Edward R. Fleming  
District Commander  
U.S. Army Corps of Engineers  
Post Office Box 60267  
New Orleans, Louisiana 70160-0267

Dear Colonel Flemming:

The U.S. Fish and Wildlife Service (Service) has reviewed Joint Public Notice MVN-2011-03148-ETT, dated January 9, 2012. The National Marine Fisheries Service (NMFS) has requested a Department of the Army permit to dredge in the Gulf of Mexico and deposit that dredged material on the headland of Chenier Ronquille, in Plaquemines Parish, Louisiana. The Chenier Ronquille Barrier Island Restoration Project, which has been authorized pursuant to the Coastal Wetlands Planning, Protection, and Restoration Act (CWPPRA), would restore dune, beach, and marsh habitats along the degraded barrier headland. The Service offers the following comments in accordance with provisions of the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.), the Endangered Species Act of 1973 (ESA) (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.), and the Migratory Bird Treaty Act (MBTA) (40 Stat. 755, as amended; 16 U.S.C. 703 et seq.).

The Service has been involved in the development of the proposed project through the CWPPRA planning process and concludes that it will provide valuable ecological benefits to coastal Louisiana. While the project is beneficial overall, it has the potential to adversely affect federally listed species and migratory birds. Accordingly, the Service provides the following guidance regarding ESA consultation and measures for avoiding impacts to listed species and migratory birds.

### Threatened and Endangered Species

The endangered West Indian manatee (*Trichechus manatus*) may occur within the vicinity of the proposed project area. This species is known to regularly occur in Lakes Pontchartrain and Maurepas and their associated coastal waters and streams. It also can be found less regularly in other Louisiana coastal areas, most likely while the average water temperature is warm. Based on data maintained by the Louisiana Department of Wildlife and Fisheries' Natural Heritage Program (LNHP), over 80% of reported manatee sightings (1999-2011) in Louisiana have occurred from the months of June through December. Manatee occurrences in Louisiana appear to be increasing. Cold weather and outbreaks of red tide may adversely affect these animals. However, human activity is the primary cause for declines in species number due to collisions

**TAKE PRIDE<sup>®</sup>**  
**IN AMERICA** 

with boats and barges, entrapment in flood control structures, poaching, habitat loss, and pollution.

In the event of water-related activities, all personnel associated with the project should be instructed about the potential presence of manatees, manatee speed zones, and the need to avoid collisions with and injury to manatees. All personnel should be advised that there are civil and criminal penalties for harming, harassing, or killing manatees which are protected under the Marine Mammal Protection Act of 1972 and the ESA. Additionally, personnel should be instructed not to attempt to feed or otherwise interact with manatees, although passively taking pictures or video would be acceptable and could provide useful data in the Service's on-going manatee conservation efforts.

During in-water work in areas that potentially support manatees, all on-site personnel are responsible for observing water-related activities for the presence of manatee(s). We recommend the following to minimize potential impacts to manatee(s):

1. All work, equipment, and vessel operation should cease if a manatee is spotted within a 50-foot radius (buffer zone) of the active work area. Once the manatee has left the 50-foot buffer zone on its own accord (manatees must not be herded or harassed into leaving), or after 30 minutes have passed without additional sightings of manatee(s) in the buffer zone, in-water work can resume under careful observation for manatee(s).
2. If a manatee(s) is sighted in or near the project area, all vessels associated with the project should operate at "no wake/idle" speeds within the construction area and at all times while in waters where the draft of the vessel provides less than a four-foot clearance from the bottom. Vessels should follow routes of deep water whenever possible.
3. If used, siltation or turbidity barriers should be properly secured, made of material in which manatees cannot become entangled, and be monitored to avoid manatee entrapment or impeding their movement.
4. Temporary signs concerning manatees should be posted prior to and during all in-water project activities and removed upon completion. Each vessel involved in construction activities should display at the vessel control station or in a prominent location, visible to all employees operating the vessel, a temporary sign at least 8½ x 11 inches reading language similar to the following: "CAUTION BOATERS: MANATEE AREA/ IDLE SPEED IS REQUIRED IN CONSRUCTION AREA AND WHERE THERE IS LESS THAN FOUR FOOT BOTTOM CLEARANCE WHEN MANATEE IS PRESENT". A second temporary sign measuring 8½ x 11 inches should be posted at a location prominently visible to all personnel engaged in water-related activities and should read language similar to the following: "CAUTION: MANATEE AREA/ EQUIPMENT MUST BE SHUTDOWN IMMEDIATELY IF A MANATEE COMES WITHIN 50 FEET OF OPERATION".

Collisions with, injury to, or sightings of manatees should be immediately reported to the Service's Louisiana Ecological Services Office (337/291-3100) and the LNHP (225/765-2821).

Please provide the nature of the call (i.e., report of an incident, manatee sighting, etc.); time of incident/sighting; and the approximate location, including the latitude and longitude coordinates, if possible.

Federally listed as threatened, the piping plover (*Charadrius melodus*) is known to occur within the proposed project area. Piping plovers winter in Louisiana, and may be present for 8 to 10 months annually. They arrive from the breeding grounds as early as late July and remain until late March or April. Piping plovers feed extensively on intertidal beaches, mudflats, sand flats, algal flats, and wash-over passes with no or very sparse emergent vegetation; they also require unvegetated or sparsely vegetated areas for roosting. On July 10, 2001, the Service designated critical habitat for wintering piping plovers (Federal Register Volume 66, No. 132); however, none is located within the proposed project area.

The Service is currently coordinating ESA consultation with the NMFS regarding the manatee and piping plover because they are the lead action agency. Please note, however, that the Corps of Engineers (Corps) also has an affirmative responsibility to consult with the Service regarding the potential effects of permit issuance to federally listed threatened and endangered species prior to permit issuance. Although the Service does not object to the proposed project as described in the Joint Public Notice, we recommend that issuance of the requested permit be held in abeyance pending completion of ESA consultation (for both the Corps and NMFS) regarding the potential effects to the endangered manatee and threatened piping plover as a result of permit issuance.

There are also five species of federally listed threatened or endangered sea turtles that forage in the nearshore waters, bays, and estuaries of Louisiana. The NMFS is responsible for aquatic marine threatened or endangered species. Please contact Eric Hawk (727/824-5312) at the NMFS Regional Office in St. Petersburg, Florida, for information concerning those species in the aquatic environment.

### Migratory Birds

It should be noted, that the proposed project is located in an area where colonial and solitary seabird/shorebird nesting may occur. Nesting sites may be present that are not currently listed in the database maintained by the Louisiana Department of Wildlife and Fisheries. Because it is uncertain whether the project area supports nesting water birds, it is recommended that a qualified biologist inspect the proposed work site for the presence of undocumented nesting during the nesting season. To minimize disturbance to nesting birds, the following restrictions should be observed:

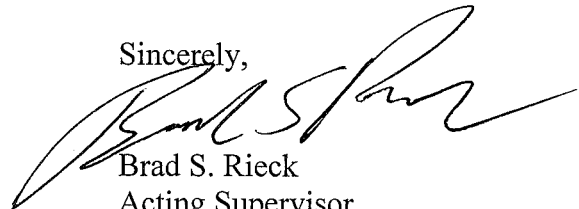

1. For colonies containing nesting brown pelicans, all activity occurring within 2,000 feet of a rookery should be restricted to the non-nesting period (i.e., September 15 through March 31). Nesting periods vary considerably among Louisiana's brown pelican colonies, so it is possible that this activity window could be altered based upon the dynamics of the individual colony.

2. For colonies containing nesting wading birds (i.e., herons, egrets, night-herons, ibis, and roseate spoonbills), anhingas, and/or cormorants, all activity occurring within 1,000 feet of a rookery should be restricted to the non-nesting period (i.e., September 1 through February 15, exact dates may vary within this window depending on species present).
3. For areas containing isolated or colonial nesting gulls, terns, plovers, and/or black skimmers, all activity occurring within 650 feet of a nest area should be restricted to the non-nesting period (i.e., September 16 through April 1, exact dates may vary within this window depending on species present).

In addition, we recommend that on-site contract personnel be informed of the need to identify nesting water bird behavior, and if such behavior is observed, the Service should be notified. If the project is long-term or time sensitive, and the time-of-year restrictions cited above are not practicable, it may be necessary to develop an abatement plan to ensure that birds do not nest at the time of project construction. That abatement plan should be developed in consultation with the Service.

The above comments constitute the report of the Department of Interior. Please contact Ms. Brigitte Firmin (337-291-3108) regarding the ongoing ESA consultation for threatened and endangered species, and Ms. Patti Holland (337/291-3121) with regard to nesting water bird issues.

Sincerely,

Brad S. Rieck

Attention: Anna Wojtanowicz, Agent for the National Marine Fisheries Service

RE: Water Quality Certification (WQC 111220-02/AI 179937/CER 20120001)  
Corps of Engineers Permit (MVN-2011-3148-ETT)  
Plaquemines Parish

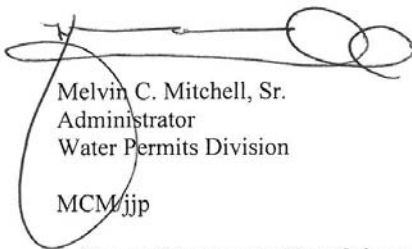

Dear Ms. Wojtanowicz:

The Louisiana Department of Environmental Quality (the Department) has reviewed your application to dredge waterbottoms & place spoil material for the restoration of a barrier island (Cheniere Ronquille), approximately 13.0 miles south-southwest of Port Sulphur, Louisiana.

Based on the information provided in the application, the Department made a determination that the requirements for a Water Quality Certification have been met and concludes that the placement of the fill material will not violate water quality standards of Louisiana as provided for in LAC 33:IX.Chapter 11. Therefore, the Department hereby issues a Water Quality Certification to the National Marine Fisheries Service.

If you have any questions, please call Jamie Phillippe at 225-219-3225.

Sincerely,

Melvin C. Mitchell, Sr.  
Administrator  
Water Permits Division

Re: Chenier Ronquille Barrier Island Restoration Project, MVN-2011-3148-ETT

Dear Mr. Serio and Mr. Hartman:

This responds to the Army Corps of Engineers (COE) New Orleans District's January 12, 2011, letter. The COE requested National Marine Fisheries Service (NMFS) concurrence with its project-effect determinations under Section 7 of the Endangered Species Act (ESA). The project is proposed and sponsored by NMFS' Habitat Conservation Division (NMFS HCD) in Baton Rouge, Louisiana, and the State of Louisiana's Coastal Protection and Restoration Authority (CRPA). The project will be authorized and funded under the federal Coastal Wetlands Planning, Protection, and Restoration Act. You determined the project may affect but is not likely to adversely affect swimming sea turtles and Gulf sturgeon. Our response is directed to both federal agencies since both agencies play a role in the funding or permitting of this project; both have Section 7 responsibilities under the ESA. Our findings on the project's potential effects are based on the project description in this response. Changes to the proposed action may negate our findings and may require reinitiating consultation.

The project site is located at 29.31879°N, 89.79077°W (North American Datum 1983) within Barataria Bay, Plaquemines Parish, Louisiana. The project purpose is to restore the integrity of the Chenier Ronquille barrier island by creating 309 acres of marsh and 189 acres of dune and beach. Approximately 11.1 million cubic yards (mcy) of material may be dredged (a minimum of 2.9 mcy will be dredged) from four borrow sites (S-1, S-2, D-1, and Quatre Bayou), consisting of 832 acres of unvegetated borrow site in the Gulf of Mexico southwest of Chenier Ronquille. The borrow sites will be dredged from the current depth of approximately -8 to -30 feet North American Vertical Datum 1988 (NAVD88) to a maximum of -37 feet. Dredged sediments will

be pumped to the marsh via a dredge pipeline. An access channel will be dredged to allow for equipment movement and pipeline placement. Sediment excavated from the access channel will be used to construct the adjacent containment dike. The containment dikes may be gapped as needed to provide hydrologic exchange and the project will continue to be monitored throughout the course of the 20-year project life. The resulting marsh will be filled to an elevation of +2.5 feet (NAVD88) and planted with approximately 20,000 units of appropriate marsh vegetation. Construction will require the use of airboats, barge-mounted bucket dredges, bulldozers, and hydraulic cutterhead dredges. The applicant will comply with NMFS' *Sea Turtle and Smalltooth Sawfish Construction Conditions* dated March 23, 2006, and NMFS' *Measures for Reducing the Entrapment Risk to Protected Species* dated May 22, 2012. Construction is anticipated to take 1 year to complete.

Four ESA-listed species of sea turtles (the endangered leatherback and Kemp's ridley; the threatened/endangered<sup>1</sup> green; and the threatened loggerhead<sup>2</sup>) can be found in or near the action area and may be affected by the project. The site is west of the Mississippi River, thus, NMFS expects no Gulf sturgeon to be present. There is no designated critical habitat in or near the project area.

NMFS has analyzed the routes of potential effects from the proposed project and determined that listed sea turtles are not likely to be adversely affected. Dredging activities have the potential to entrain and kill sea turtles. However, the use of a non-hopper-type dredge (such as cutterhead dredges and clamshell/bucket dredges) is unlikely to entrain healthy sea turtles due to the noisy, slow moving nature of these types of dredges, which would be easy for sea turtles to detect and avoid. Therefore, the likelihood of a sea turtle to be entrained would be discountable. Stranding data from Texas' shallow Laguna Madre suggests that cold-stunned turtles may be taken by cutterhead dredges while they are lethargic or dying from sudden exposure to cold; however, this possibility is rare and discountable. Although the likelihood of a sea turtle take through entrainment is discountable, NMFS recommends to further reduce the risk of sea turtle interactions with cutterhead dredges in this project, that cutterhead dredging be limited to warmer months when possible, and that cutterhead dredging be delayed and appropriate precautions taken (e.g., posting an observer) after cold snaps in shallow waters if water temperatures have fallen rapidly and if sea turtles are seen. Sea turtles could be harmed or killed by being struck by the transit and anchoring of equipment and barges at the project site, however, the likelihood of this outcome is also discountable due to these species' mobility. The implementation of NMFS' *Sea Turtle and Smalltooth Sawfish Construction Conditions* will further reduce the risk of injury to sea turtles. Sea turtles may be affected by having to avoid the area due to disturbances from in-water dredging and restoration activities where they may be foraging or sheltering. However, avoidance would be localized to a discrete area over the course of the project and will not affect foraging or sheltering opportunities for sea turtles in adjacent areas, which are suitable for these activities. Therefore, the effects of avoidance on sea turtles will be insignificant. The loss of potential foraging/sheltering habitat from the creation of the marsh is insignificant as well, because there is adequate alternative foraging/sheltering habitat in

---

<sup>1</sup>Green turtles are listed as threatened, except for breeding populations in Florida and the Pacific Coast of Mexico, which are listed as endangered.

<sup>2</sup>Northwest Atlantic Distinct Population Segment.

the nearby surrounding bayou. Last, sea turtles have the potential to become entrapped within the containment dikes. However, the likelihood of sea turtles becoming entrapped is discountable due to the deterring effects of consistent inflow of dredge material and heavy activity in and around the containment dike. Additionally, the implementation of NMFS' *Measures for Reducing the Entrapment Risk to Protected Species* will prevent or address such entrapment to sea turtles.

This concludes your consultation responsibilities under the ESA for species under NMFS' purview. Consultation must be reinitiated if a take occurs or new information reveals effects of the action not previously considered, or the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat in a manner or to an extent not previously considered, or if a new species is listed or critical habitat designated that may be affected by the identified action.

We have enclosed additional relevant information for your review. If you have any questions, please contact Ryan Hendren, ESA consultant, at (727) 551-5610, or by e-mail at [Ryan.Hendren@noaa.gov](mailto:Ryan.Hendren@noaa.gov).

Sincerely,

for Roy E. Crabtree, Ph.D.  
Southeast Regional Administrator

## **PCTS Access and Additional Considerations for ESA Section 7 Consultations (Revised 7-15-2009)**

Public Consultation Tracking System (PCTS) Guidance: PCTS is an online query system at <https://pcts.nmfs.noaa.gov/> that allows federal agencies and U.S. Army Corps of Engineers' (COE) permit applicants and their consultants to ascertain the status of NMFS' Endangered Species Act (ESA) and Essential Fish Habitat (EFH) consultations, conducted pursuant to ESA section 7, and Magnuson-Stevens Fishery Conservation and Management Act's (MSA) sections 305(b)2 and 305(b)4, respectively. Federal agencies are required to enter an agency-specific username and password to query the Federal Agency Site. The COE "Permit Site" (no password needed) allows COE permit applicants and consultants to check on the current status of Clean Water Act section 404 permit actions for which NMFS has conducted, or is in the process of conducting, an ESA or EFH consultation with the COE.

For COE-permitted projects, click on "Enter Corps Permit Site." From the "Choose Agency Subdivision (Required)" list, pick the appropriate COE district. At "Enter Agency Permit Number" type in the COE district identifier, hyphen, year, hyphen, number. The COE is in the processing of converting its permit application database to PCTS-compatible "ORM." An example permit number is: SAJ-2005-000001234-IPS-1. For the Jacksonville District, which has already converted to ORM, permit application numbers should be entered as SAJ (hyphen), followed by 4-digit year (hyphen), followed by permit application numeric identifier with no preceding zeros. For example: SAJ-2005-123; SAJ-2005-1234; SAJ-2005-12345.

For inquiries regarding applications processed by COE districts that have not yet made the conversion to ORM (e.g., Mobile District), enter the 9-digit numeric identifier, or convert the existing COE-assigned application number to 9 numeric digits by deleting all letters, hyphens, and commas; converting the year to 4-digit format (e.g., -04 to 2004); and adding additional zeros in front of the numeric identifier to make a total of 9 numeric digits. For example: AL05-982-F converts to 200500982; MS05-04401-A converts to 200504401. PCTS questions should be directed to Eric Hawk at [Eric.Hawk@noaa.gov](mailto:Eric.Hawk@noaa.gov). Requests for username and password should be directed to [PCTS.Usersupport@noaa.gov](mailto:PCTS.Usersupport@noaa.gov).

EFH Recommendations: In addition to its protected species/critical habitat consultation requirements with NMFS' Protected Resources Division pursuant to section 7 of the ESA, prior to proceeding with the proposed action the action agency must also consult with NMFS' Habitat Conservation Division (HCD) pursuant to the MSA requirements for EFH consultation (16 U.S.C. 1855 (b)(2) and 50 CFR 600.905-.930, subpart K). The action agency should also ensure that the applicant understands the ESA and EFH processes; that ESA and EFH consultations are separate, distinct, and guided by different statutes, goals, and time lines for responding to the action agency; and that the action agency will (and the applicant may) receive separate consultation correspondence on NMFS letterhead from HCD regarding their concerns and/or finalizing EFH consultation.

Marine Mammal Protection Act (MMPA) Recommendations: The ESA section 7 process does not authorize incidental takes of listed or non-listed marine mammals. If such takes may occur an incidental take authorization under MMPA section 101 (a)(5) is necessary. Please contact NMFS' Permits, Conservation, and Education Division at (301) 713-2322 for more information regarding MMPA permitting procedures.

## **SEA TURTLE AND SMALLTOOTH SAWFISH CONSTRUCTION CONDITIONS**

The permittee shall comply with the following protected species construction conditions:

- a. The permittee shall instruct all personnel associated with the project of the potential presence of these species and the need to avoid collisions with sea turtles and smalltooth sawfish. All construction personnel are responsible for observing water-related activities for the presence of these species.
- b. The permittee shall advise all construction personnel that there are civil and criminal penalties for harming, harassing, or killing sea turtles or smalltooth sawfish, which are protected under the Endangered Species Act of 1973.
- c. Siltation barriers shall be made of material in which a sea turtle or smalltooth sawfish cannot become entangled, be properly secured, and be regularly monitored to avoid protected species entrapment. Barriers may not block sea turtle or smalltooth sawfish entry to or exit from designated critical habitat without prior agreement from the National Marine Fisheries Service's Protected Resources Division, St. Petersburg, Florida.
- d. All vessels associated with the construction project shall operate at "no wake/idle" speeds at all times while in the construction area and while in water depths where the draft of the vessel provides less than a four-foot clearance from the bottom. All vessels will preferentially follow deep-water routes (e.g., marked channels) whenever possible.
- e. If a sea turtle or smalltooth sawfish is seen within 100 yards of the active daily construction/dredging operation or vessel movement, all appropriate precautions shall be implemented to ensure its protection. These precautions shall include cessation of operation of any moving equipment closer than 50 feet of a sea turtle or smalltooth sawfish. Operation of any mechanical construction equipment shall cease immediately if a sea turtle or smalltooth sawfish is seen within a 50-ft radius of the equipment. Activities may not resume until the protected species has departed the project area of its own volition.
- f. Any collision with and/or injury to a sea turtle or smalltooth sawfish shall be reported immediately to the National Marine Fisheries Service's Protected Resources Division (727-824-5312) and the local authorized sea turtle stranding/rescue organization.
- g. Any special construction conditions, required of your specific project, outside these general conditions, if applicable, will be addressed in the primary consultation.

Revised: March 23, 2006

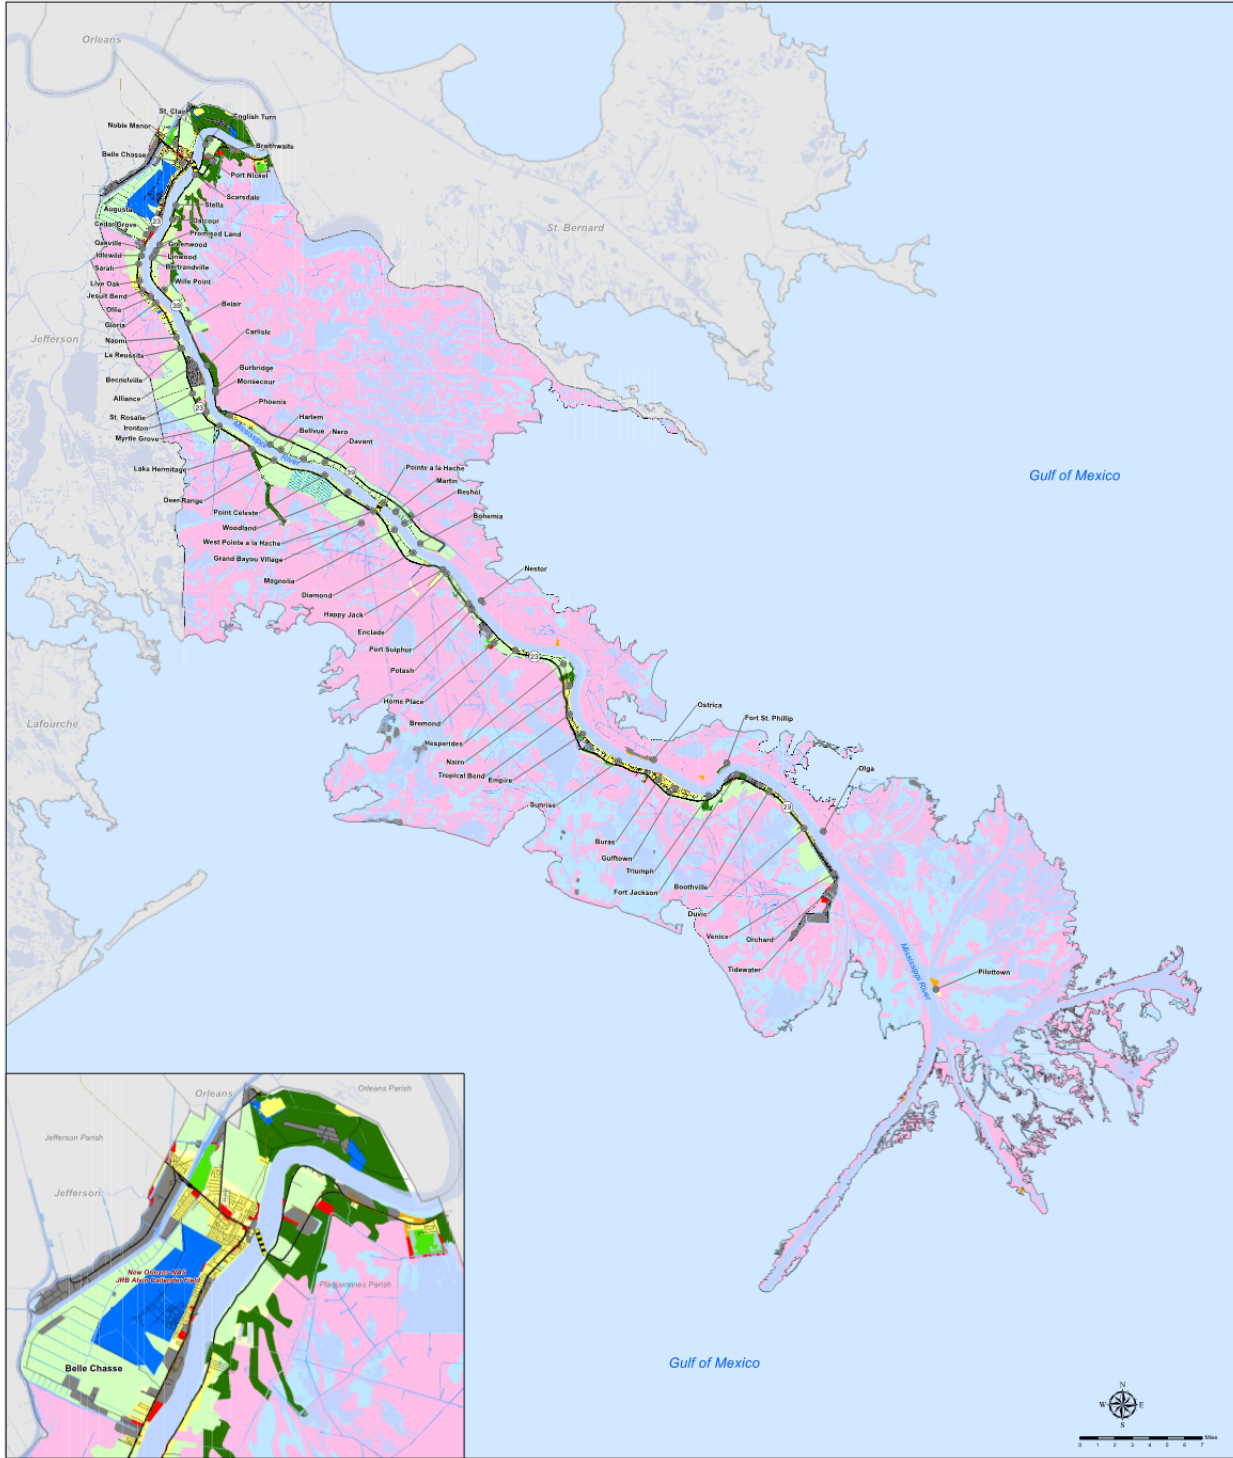

## **Measures for Reducing Entrapment Risk to Protected Species**

Bottlenose dolphins, sea turtles, and Gulf sturgeon (protected species) are known to inhabit coastal waters of the northern Gulf of Mexico. Bottlenose dolphins are protected under the Marine Mammal Protection Act (MMPA) and sea turtles and Gulf sturgeon are protected under the Endangered Species Act (ESA). Because of the potential for these protected species to become entrapped within coastal waters of construction sites along the northern Gulf coast, projects that enclose shallow open water areas for wetland creation or nourishment will use the following measures to minimize the potential for entrapment:

- 1. Pre-construction planning.** During project design, the Federal Action Agency or project proponents must incorporate at least one escape route into the proposed retention structure(s) to allow any protected species to exit the area(s) to be enclosed. Escape routes must lead directly to open water outside the construction site and must have a minimum width of 100 feet. Escape routes should also have a depth as deep as the deepest natural entrance into the enclosure site and must remain open until a thorough survey of the area, conducted immediately prior to complete enclosure, determines no Protected Species are present within the confines of the structure (see item 5 below for details).
- 2. Pre-construction compliance meeting.** Prior to construction, the Federal Action Agency, project proponents, the contracting officer representative, and construction personnel should conduct a site visit and meeting to develop a project-specific approach to implementing these preventative measures.
- 3. Responsible parties.** The Federal Action Agency will instruct all personnel associated with the project of the potential presence of protected species in the area and the need to prevent entrapment of these animals. All construction personnel will be advised that there are civil and criminal penalties for harming, harassing, or killing protected species. Construction personnel will be held responsible for any protected species harassed or killed as a result of construction activities. All costs associated with monitoring and final clearance surveys are the responsibility of project proponents and must be incorporated in the construction plan.
- 4. Monitoring during retention structure construction.** It is the responsibility of construction personnel to monitor the area for protected species during dike or levee construction. If protected species are regularly sighted over a 2 or 3 day period within the enclosure area during retention structure assembly, construction personnel must notify the Federal Action Agency. It is the responsibility of the Federal Action Agency

to then coordinate with the National Marine Fisheries Service (NMFS) Marine Mammal Health and Stranding Response team (1-877-WHALE HELP [1-877-942-5343]) or the appropriate State Coordinator for the Sea Turtle Stranding and Salvage Network (see [http://www.sefsc.noaa.gov/species/turtles/stranding\\_coordinators.htm](http://www.sefsc.noaa.gov/species/turtles/stranding_coordinators.htm)) to determine what further actions may be required. Construction personnel may not attempt to scare, herd, disturb, or harass the protected species to encourage them to leave the area.

- 5. Pre-closure final clearance.** Prior to completing any retention structure by closing the escape route, the Federal Action Agency will insure that the area to be enclosed is observed for protected species. Surveys must be conducted by experienced marine observers during daylight hours beginning the day prior to closure and continuing during closure. This is best accomplished by small vessel or aerial surveys with 2-3 experienced marine observers per vehicle (vessel/helicopter) scanning for protected species. Large areas (e.g. >300 acres) will likely require the use of more than one vessel or aerial survey to insure full coverage of the area. These surveys will occur in a Beaufort sea state (BSS) of 3 feet or less, as protected species are difficult to sight in choppy water. Escape routes may not be closed until the final clearance determines the absence of protected species within the enclosure sight.
  
- 6. Post closure sightings.** If protected species become entrapped in an enclosed area, the Federal Action Agency and NMFS must be immediately notified. If observers note entrapped animals are visually disturbed, stressed, or their health is compromised then the Action Agency may require any pumping activity to cease and the breaching of retention structures so that the animals can either leave on their own or be moved under the direction of NMFS.
  - a. In coordination with the local stranding networks and other experts, NMFS will conduct an initial assessment to determine the number of animals, their size, age (in the case of dolphins), body condition, behavior, habitat, environmental parameters, prey availability and overall risk.
  - b. If the animal(s) is/are not in imminent danger they will need to be monitored by the Stranding Network for any significant changes in the above variables.
  - c. Construction personnel may not attempt to scare, herd, disturb, or harass the protected species to encourage them to leave the area. Coordination by the Federal Action Agency with the NMFS SER Stranding Coordinator may result in authorization for these actions.
  - d. NMFS may intervene (catch and release and/or rehabilitate) if the protected species are in a situation that is life threatening and evidence suggests the animal is unlikely to survive in its immediate surroundings.
  - e. Surveys will be conducted throughout the area at least twice or more in calm surface conditions (BSS 3 feet or less), with experienced marine observers, to determine whether protected species are no longer present in the area.

## **FINDING OF NO SIGNIFICANT IMPACT for the Chenier Ronquille Barrier Island Restoration Project (BA-76) in Plaquemines Parish, Louisiana**

National Oceanic and Atmospheric Administration (NOAA) Administrative Order 216-6 (May 20, 1999) contains criteria for determining the significance of the impacts of a proposed action. In addition, the Council on Environmental Quality (CEQ) regulations at Title 40 Code of Federal Regulations (CFR) Section 1508.27 state that the significance of an action should be analyzed both in terms of “context” and “intensity.” Each criterion listed below is relevant to making a finding of no significant impact (FONSI) and has been considered individually, as well as in combination with the others. The proposed action, the preferred alternative identified in the enclosed environmental assessment (EA), is building dune and marsh along the Chenier Ronquille shoreline utilizing an identified offshore borrow area that contains appropriate construction material. The significance of this action is analyzed based on the NOAA Administrative Order (NAO) 216-6 criteria and CEQ’s context and intensity criteria and is specific to the proposed action based on the evaluation of alternatives in the supporting EA, hereby incorporated by reference. These criteria include:

(1) Can the proposed action reasonably be expected to cause substantial damage to the ocean and coastal habitats or essential fish habitat as defined under the Magnuson Stevens Act and identified in Fishery Management Plans (FMPs)?

Response: No, the proposed action will not cause substantial damage to ocean and coastal habitats or essential fish habitat (EFH) as defined under the Magnuson Stevens Act and identified in FMPs. Although some temporary adverse impacts will occur during construction, they are not substantial and will result in lasting benefits to coastal habitats and EFH. The NOAA Fisheries Habitat Conservation Division is charged with review of federal projects pursuant to the Magnuson-Stevens Act and has determined that the action presents no significant threat to EFH or managed species and NMFS has determined that the proposed action will enhance existing habitat. Some types of EFH that are abundant in the northern Gulf of Mexico (such as open water) will be converted to less common types of EFH (emergent marsh and estuarine sand waterbottoms) critical to juveniles of some estuarine-dependent managed species, including brown shrimp, white shrimp, and red drum. Short-term, unavoidable, adverse impacts to habitats supportive of various life stages of brown shrimp, white shrimp, and red drum would occur during the construction phase of the proposed project as marsh is filled and created. Approximately 365 acres of dune, marsh and shallow open water are currently present in the project area. Within this area, approximately 97 acres of degrading marsh will be affected during construction of the 240 acres of restored marsh. The proposed action will increase the longevity of these quality habitats, and offset the adverse impacts. Without action, approximately 308 less acres of coastal habitats are projected to be available in 20 years.

Short-term adverse minor impacts to EFH will result from dredging. Turbidity and disturbance of the benthic habitat will increase during dredging, affecting shallow

EFH for managed species. However, turbidity is naturally high in these shallow open water areas. Natural sedimentation rates are expected to fill the borrow areas in the northern Gulf of Mexico to pre-dredging bathymetric contours. Managed species can readily relocate to the hundreds of thousands of acres of similar substrate available nearby.

(2) Can the proposed action be expected to have a substantial impact on biodiversity or ecosystem function within the affected area (for example, benthic productivity, predator-prey relationships, and similar factors)?

Response: No, the project will not have a substantial adverse impact on ecosystem function or species biodiversity within the affected area. Positive effects are expected to be moderate. The project is designed to approximate naturally occurring marsh and stream bank conditions along the Louisiana coast, which will increase the biological productivity and diversity of the site. Native plant species will be planted to mimic naturally occurring dune and marsh, and would increase diversity. Tidal channels generally develop naturally within the marsh after consolidation and settlement; gapping of retention dikes will be conducted if natural settlement and erosion are not sufficient to provide quality fisheries (edge) habitat and enhance fisheries ingress and egress.

(3) Can the proposed action reasonably be expected to have a substantial adverse impact on public health or safety?

Response: No, the project will not have a substantial adverse impact on public health or safety. The project location is remote, accessible only by boat and used primarily for recreational fishing. During construction, some noise and exhaust fumes would create a temporary localized disturbance, but not a hazard to human health or safety.

Dredging activities have the potential to rupture or damage existing oil and gas infrastructure (pipelines, wellheads, etc.) that could result in an oil spill and potentially a natural gas explosion. Oil spills and/or natural gas explosions are the most reasonable serious impacts to public health and safety from the proposed action. Surveys to identify any unmarked pipelines will be required of the contractor prior to dredging and five potential abandoned well locations that have already been identified will be avoided during construction to further minimize the likelihood.

(4) Can the proposed action reasonably be expected to adversely affect endangered or threatened species, their critical habitat, marine mammals, or other non-target species?

Response: No, the project is not likely to adversely affect any federal or state listed species. Although temporary adverse impacts limited to the construction phase may occur to individuals, these impacts are not expected to be biologically significant or adversely affect any populations. The U.S. Fish and Wildlife Service

(FWS) and NOAA coordinated avoidance measures of the proposed action that will limit or avoid adverse effect on federally proposed or listed endangered or threatened species that could occur within the project area. NOAA has concluded informal Section 7 consultation with FWS under the Endangered Species Act, specific to the piping plover. As a result, NOAA has received FWS concurrence with NOAA's determination that the proposed action is not likely to adversely affect federally listed species, including the piping plover. Consultation with NOAA Fisheries' SERO for ESA was completed through issuance of the Clean Water Act permit for the preferred alternative. SERO determined that there was no designated critical habitat in the action area, and concurred in the Corps' determination that the project as proposed was not likely to adversely affect listed sea turtles. SERO also recommended additional construction conditions and measures that the Corps incorporated as special conditions to the permit. No other non-target species will be adversely impacted.

(5) Are significant social or economic impacts interrelated with natural or physical environmental effects?

Response: No significant adverse social or economic impacts are interrelated with natural or physical environmental effects of the proposed action. The human environment will benefit minimally from construction-related economic activity and from enhanced opportunities for recreational and commercial fishing, but these effects will not be significant.

(6) Are the effects on the quality of the human environment likely to be highly controversial?

Response: No, it has been determined that the project will have no substantial adverse effects on the quality of the human environment and thus is not likely to generate high levels of controversy. Restoring the dune and marsh will improve the human environment. The proposed action was selected to be designed by the Coastal Wetlands Planning, Protection, and Restoration Act (CWPPRA) Task Force through a publicly vetted process. Federal, state, and local government agencies have had the opportunity to review and comment on the proposed action since its inception. No substantial dispute exists as to the project's size, nature, or effect. NOAA's review of the environmental impacts of the project, including comments provided by other resource agencies, did not raise substantial questions as to whether the project would cause significant degradation of the human environment.

(7) Can the proposed action reasonably be expected to result in substantial impacts to unique areas, such as historic or cultural resources, park land, prime farmlands, wetlands, wild and scenic rivers, essential fish habitat, or ecologically critical areas?

Response: No, the project cannot be reasonably expected to have a substantial adverse impact on historic or cultural resources, park land, prime farmlands,

wetlands, wild and scenic rivers, EFH, or ecologically critical areas because no prime farmlands, parklands, or wild and scenic rivers exist on the site or in the limited area of the project's impact. The proposed action would have a beneficial effect on wetland habitat, essential fish habitat, and ecologically critical areas. The intent of the project is to restore a highly degraded shoreline. There will be localized, short-term adverse impacts to fish and wetlands habitat that will be non-significant. There will be long-term localized ecological benefits that result from restoration of habitat as a result of the proposed action.

The State Historic Preservation Office was consulted under National Historic Preservation Act Section 106 and determined that the project will have no adverse effect on cultural or historic resources. There are no submerged cultural sites identified within the construction area, potential cultural resources in the vicinity of the borrow area will be avoided, and thus no impacts are expected.

(8) Are the effects on the human environment likely to be highly uncertain or involve unique or unknown risks?

Response: No, the proposed action is similar to other completed marsh restoration projects in Louisiana during the past several years. The project involves risks that are understood and avoidable. Lessons learned on previous projects are propagated throughout the CWPPRA program through meetings of the technical committees and work groups, and the project sponsor participates in these meetings.

(9) Is the proposed action related to other actions with individually insignificant, but cumulatively significant, impacts?

Response: No, the proposed action will not contribute to any cumulatively significant impacts. The proposed action is part of a regional effort to restore and protect wetlands across coastal Louisiana. Every individual project creates temporary, localized adverse effects on existing habitat, but these are not cumulatively significant and results in the long-term beneficial addition of valuable elevation to the coast. Collectively, barrier island restoration projects contribute positively to an ecosystem by providing additional sediment into the system. These sediments then become available to help nourish and sustain the island and provide protected waters.

(10) Is the proposed action likely to adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural, or historical resources?

Response: No, all potential cultural resources, identified by a Phase One survey of the proposed borrow area, will be avoided during dredging. Upon review of the above investigations, the State Historic Preservation Officer determined that the project will have no adverse effect on cultural or historic resources.

(11) Can the proposed action reasonably be expected to result in the introduction or spread of a non-indigenous species?

Response: No, the action will not result in the introduction or spread of non-indigenous species but instead may result in their reduction. The proposed action is habitat restoration that will increase the functional value of the barrier island thereby supporting native dune and marsh species. Native plant species will be used to stabilize the soil and increase plant diversity.

(12) Is the proposed action likely to establish a precedent for future actions with significant effects or represent a decision in principle about a future consideration?

Response: No, the proposed action will not establish a precedent for future actions with significant effects or represent a decision in principle about a future consideration. This project is a stand-alone project with no identifiable funding for future action beyond the scope and funding currently allocated for the proposed action. Any additional proposed restoration action in this area would need to compete for CWPPRA, or any other, funds and the potential environmental impacts of any additional proposed restoration would be independently evaluated.

(13) Can the proposed action reasonably be expected to threaten a violation of federal, state, or local law or requirements imposed for the protection of the environment?

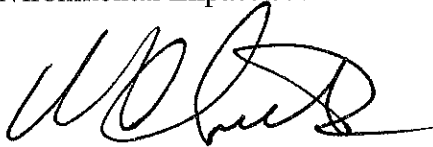

Response: No, the proposed project has been planned and coordinated to comply with all applicable environmental protection laws, and no violations are likely or expected. In addition, the project will be implemented in compliance with all permits and other authorizations required by the state and federal regulatory agencies.

(14) Can the proposed action reasonably be expected to result in cumulative adverse effects that could have a substantial effect on the target species or non-target species?

Response: No, the proposed action will not result in a substantial cumulative adverse effect on target species or non-target species. The primary goal of this restoration project is to preserve a fragmented shoreline, thereby maintaining the functional value of EFH and other habitat in the vicinity that would decrease without the proposed action. As such, the net effects are incrementally beneficial.

## DETERMINATION

In view of the information presented in this document and the analysis contained in the supporting EA prepared for the Chenier Ronquille Barrier Island Restoration Project (BA-76) in Plaquemines Parish, Louisiana, it is hereby determined that the proposed action identified for implementation will not result in direct, indirect, or cumulative significant impacts on the quality of the human environment. In addition, all beneficial and adverse impacts of the proposed action have been fully considered and evaluated to reach the Finding of No Significant Impact (FONSI). Accordingly, preparation of an Environmental Impact Statement for this action is not necessary.
