Estimation of Bycatch with Bony Fish, Sharks, and Rays in the 2022 Hawaii Permitted Shallow-set Longline Fishery

Brett Cooper¹ and Marti McCracken²

¹ Cooperative Institute for Marine and Atmospheric Research, University of Hawaii

² Pacific Islands Fisheries Science Center, National Marine Fisheries Service

The attached Excel Workbook (pir.hi.sll.fish.2022.xlsx) includes annual observed bycatch for 2022. The workbook includes a worksheet labeled “key” that provides definitions of the column headings and the items being estimated. The observed numbers were derived using the Longline Observer Data System (Pacific Islands Regional Office, 2023). In 2022, 100% of shallow-set trips had an observer deployed on them and the recorded observed bycatch numbers are the estimated bycatch for the fishery. On very rare occasions, the entire haul back was not observed; consequently, there may be a small amount of measurement error in some of the estimates.
