Surfrider Foundation (Sardez) (Written)	The weakest part of the document is the 'justification" for the NOAA Marine Fisheries "take" permit to harm and kill endangered marine mammals. There is simply no science whatsoever to justify the numbers. Killing endangered species, arguably, is one of the worst things the Navy does besides burning fuel and polluting the ocean and yet there is no justification, nor science for NOAA to make any educated decision. Years ago, the Navy would not hire consultants and did whatever they want. Now they hire consultants and continue the same destructive behavior without mitigations.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

Table E.3-3: Responses to Comments from Organizations (continued)

Commenter	Comment	Navy Response
		been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4 contains comments from private individuals received during the public comment period and the Navy's response. Responses to these comments were prepared and reviewed for scientific and technical accuracy and completeness. Comments appear as they were submitted and have not been altered with the exception that expletives, addresses, and phone numbers have been removed, as necessary.

Table E.3-4: Responses to Comments from Private Individuals

Commenter	Comment	Navy Response
Anonymous (Hilo-Written)	Remove outline around the monument as the way it is currently represented it appears that the Navy does not conduct training activities within that area which is not true.	Thank you for your comment. The Navy agrees that this outline has created confusion. The figures depicting the Study Area have been revised in the Final EIS/OEIS to remove this outline. One exception is Figure 6.1-2, in which the point of the figure is to identify the monument.
Anonymous (Hilo-Written)	There have been consistent and significant long-term studies which show conclusive evidence that acoustic disturbances result in brain hemmrage, internal injury, breaking of resonance chambers, rapid ascent from dives, etc. in many critically endangered cetaceans. From speaking with officials tonight, my only impression of the EIS is its impossible to quantify the real impact in these pelagic species despite the fact the Navy "isn't seeing many problems." Although these trainings serve a benefit to National Defense their location, timing, and true impact must be more closely examined.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from acoustic sources were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Abrahams (Electronic)	Dear Dept. Of the Navy, I am writing to ask you to please not use high frequency sonar in our oceans. The damage it does to marine animals is horribly inhumane. While I do understand the need to test, continuing with the high frequency soar testing makes our nation to bad to the rest of the world. We need to find a more humane way to do testing. Thank you, Leslie Abrahams	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

		Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Actipis (Electronic)	I'm extremely concerned about the impact this might have on sea creatures. I think we can protect national security AND endangered marine animals. Please consider the steps recommended by the Humane Society of the US and other groups: * avoiding the most harmful activities in areas used as calving grounds or migratory corridors * avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; * using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. Through consultation and permitting with NMFS and USFWS, the Navy refined the mitigation measures, which are now presented in Chapter 5 of this Final EIS/OEIS.
Adams (Electronic)	Please protect all of the marine mammals from explosives and sonar along the East Coast» and California/Hawaii».	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Agnello (Electronic)	I am completely against this useless display of disregard to wildlife. I think you can see how many people are against it, so please go back to square one and think of another way to do this without harming innocent creatures. Please,please, please don't do this – these creatures can't speak for themselves!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Ahern (Electronic)	Please reconsider your plans for training exercises that will harm, maim or kill dolphins, whales and other marine life off the coasts of California and Hawaii.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Akaka (Oral-Hilo)	That's fine. 'Ano 'ai ke aloha. My name is Moanikeala Akaka. I'm with the Aloha Aina Education Center. I really didn't have any prepared statement. However, over 20 years	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	ago, the first suit that was done related to the sonar and the whales came from Hilo, came from this island, and so this has been going on for a number of years, maybe 15, 20 years. And, you know, I see that we keep going 'round and 'round about this whole issue related to, you know, the sonar. You know, it's not just the fact that it's not known the kind of damage that the sonar can do to our mammals and our sea life and the whales, the turtles, the dolphins. You have beachings that have happened, that have happened in areas where there has been sonar trials going on, and there is a great deal of concern. You know, these creatures have inhabited these oceans for millions of years, and yet we end up intruding on their territory, and with the sonar you end up hurting them. There's a situation where whales, when they're in the vicinity, they end up going up fast and end up getting the bends. There's a great deal of concern, but the U.S. Navy doesn't seem to be concerned about these creatures that there aren't very many of them left. There are only, you know, two countries in the world that -- you know, and that is shameful -- that even hunt whales. You know, there's a great deal of concern about the more and more military industrial complex that's evolving in our islands. You know, bad enough that we have areas left over from the Second World War, say in Waikoloa, where they say it will take -- at $10 million a year, it will take 60 years to remove the munitions that they have left over at Waikoloa. It will take 60 years at $10 million a year to remove these munitions. We have over in Oahu, even off this coastline, munitions that have been dumped since the Second World War. You know, the U.S. Military seems to have no regard for the trash, the lethal, toxic trash. Even on our shores we have munitions that float up on one of our only white sand beaches, Hapuna Beach, and, you know, there seems to be no concern. Over in Waianae, you have debris, military debris that's still there, leaking probably, leaking into the ocean, getting into the fish life, and then we eat the fish. You know, it's -- you know, we're sick and tired of being the dumping ground for America's military industrial complex. They don't want you in Japan. They don't want you in Guam. In Okinawa they say the Osprey helicopters are too dangerous. You know, the U.S. Military -- whether it be the Navy, the Army, or the Marines, keep dumping on these islands. And we're sick and tired of this kind of abuse. Mahalo.	Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Alalem (Oral-Kauai)	Aloha, my name is James Alalem. Under the International Laws of Occupation, more particularly Article 43 of the 1907 Hague Convention, The occupying government must establish a system of direct administration of the laws of the country that it's occupying. In other words, the United States government is an illegally occupying government in the Hawaiian Islands since its unprovoked intrusions by the troops on August 13, 1898, was mandated to administer the Hawaiian Kingdom Law over the territory and not its own until they withdraw. This is not a mere descriptive assumption by the occupying government, but rather it's the law of occupation. Under the International Laws of Occupation a title of sovereignty of occupied territory does not pass to the occupying powers. And if that occupying territory to be a neutral, the occupying powers is limited by	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	the laws of war. In other words, we are military occupied from 1893. It was never solved. So with that I leave it to you guys to know that we want back our country that you guys stole from us. Thank you.	
Alalem (Written-Kauai)	U.S. violates international law. You should be ashamed of yourself. Ignoring the Kingdom of Hawaii. The people and culture you help destroy! What more do you want? You don't need to put on a show, do you think we are that dumb and stupid? Hawaiian Kingdom is military occupation. You going to do what you want anyway.	Thank you for participating in the NEPA process.
Albertini (Oral-Hilo)	This is a fraud. The greatest invasive species that I know of in Hawaii is the United States military. MS. AKAKA: Hear, hear. MR. ALBERTINI: And the history of Hawaii was the U.S. Navy was directly involved in the overthrow of Hawaii in 1893 on behalf of corporate interest, which was sugar then. And today the U.S. Navy and its Navy SEALs and special operations teams are involved on behalf of corporate interest today, overthrowing governments all around the world on behalf of oil interests and others. So the whole idea of the U.S. Navy protecting the environment is a fraud just like the whole sense of defending democracy, freedom and democracy. It's a fraud. And it's time we really take you to account on this kind of thing. You're the greatest polluter on the face of the Earth, the U.S. Military, and in Hawaii that's the case. Pearl Harbor alone, what is it? Seven hundred and some odd sites are polluted sites in Pearl Harbor. It used to be the fish-breeding capital of the world. Today it's a polluted cesspool from the U.S. Military, including nuclear waste from the submarines at Pearl Harbor. The Navy Sea Systems Command used to put out the data, and I remember doing the research. There were five million gallons discharged as of 1973, and when we started publicizing that, they started withholding the data. The U.S. Navy continues to bomb at Pohakuloa along with all the other military branches, and it's a contaminated area with depleted uranium and other things up there. So stop the fraud on us. Stop dividing the community by this type of thing, and I would say I agree with the Grim Reaper. It's time for the Navy to go. AUDIENCE MEMBER: Time for the Navy to go. AUDIENCE MEMBER: Thank you, Jim Albertini.	Thank you for participating in the NEPA process.
Allen-01 (Electronic)	I just want to comment, without bias, but a clear and present sense of urgency, that the sounding tests that will be carried out to better map the seafloor and subterranean channels, will most likely and at a high degree of probability, be in the same locations, where many of the high order mammals will be hunting and eating, spawning, etcetera. My hope is that the US Naval operations, especially the pacific and southern California fleet will form a partnership with independent, unbiased sources, regarding the survival, of an already heavily impacted irradiated undersea environment, logic should prevail, the link to the story below cites the effects of new high pulse sounding gear and the dolphin deaths speak for themselves.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

		testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Allen-02	Timing is everything, let us not ignore the extreme stress that the entire ocean food chain is under right now, the events at fukushima have yet to be measured in such a wide scale, but I think further stressing an already battered food chain, is going to be the nail in the coffin, so to speak, for the majority of sensitive mammals. If not killing them, it will destroy their sense of direction, I urge the highest caution in this matter, if we start to see dolphins washing ashore in California right after the sounding tests, we will know who to point the finger at, just like in Peru. I only hope for the highest transparency and for the Navy to bring in the consultation of unbiased marine protection agencies to assess ways in which the Navy can have the least environmental impact. Thank you, sincerely Nathan Allen http://inhabitat.com/615-dead-dolphins-discovered-on-peruvian-coast-oil-exploration-thought-to-be-responsible/615-dead-dolphins-found-along-peruvian-coast-ocra-peru-2/	The Navy used the best available science and a comprehensive review of past, present and reasonably foreseeable actions to develop a robust Cumulative Impacts analysis. See Chapter 4 of the EIS/OEIS.
Almy (Electronic)	Dear Sir or Madam: I write out of concern about the effects of SONAR on marine mammals. Please avoid causing death or interfering with these animals' biologically important behaviors by changing the timing and/or location of these activities. By avoiding areas of high use and high importance to these animals, and by employing technologies such as acoustic monitoring to detect marine mammals' presence, the Navy could proceed with its operations without causing undue harm to these species. Sincerely yours, Jessica Almy	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Alward (Electronic)	It saddens me beyond belief to think of how horrific a death the sea mammals must endure under the sonar and explosive noise. Please minimize the collateral damage to these vulnerable creatures. No sea creatures, no seas, and without seas, we will no longer survive. This is the first generation of people who can legitimately worry if their children's children will have a future on this planet.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ames-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available

		at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ames-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. Through consultation and permitting with NMFS and USFWS, the Navy refined the mitigation measures, which are now presented in Chapter 5 of this Final EIS/OEIS.
Amornkul-01 (Electronic)	Dear US Navy, As a former Hawaii resident, I have seen what happens with well-intentioned military testing off pristine coastal shores in Kauai and Kahoolawe. I grew up in Maryland, and I now live in California. As a Buddhist physician who has worked and lived all over the world doing International HIV prevention in Africa and polio eradication in Nepal/India, I plead that this proposal be reconsidered. All beings on this earth are inter-related, and if we damage/harm another, we hurt ourselves. Humans, with our highly evolved brains, have the responsibility of foresite and thinking through the global consequences (not just financial or political) and repercussions of our actions and decisions.	Thank you for participating in the NEPA process.
Amornkul-02	Please reconsider the initiative. Please consider E-138dditional steps to reduce the harmful impact to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please re-think the plans and incorporate additional protective measures to preserve the marine biodiversity – particularly in Hawaii where 80% of the US’s endemic biodiversity is found. Thank you for your consideration. P.N. Amornkul, MD, MPH	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. 		Mitigation, and Monitoring) of the EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. Through consultation and permitting with NMFS and USFWS, the Navy refined the mitigation measures, which are now presented in Chapter 5 of this Final EIS/OEIS.
D. Anderson (Oral-Oahu)	My name is Diane Anderson. Do you want my address? I live on the North Shore of Oahu, and I arrived here today with my mind pretty much already set up with really, really concerns about where our species, our human species is going to draw the line to impact the marine world, mammals in particular. And I just find that it just seems in our world escalating and escalating and escalating, and I believe our human species can do better, much better. So I do not support active -- when I read the numbers of the impact that the Navy is predicting, I am horrified, just horrified. That's not very much to say, except for that I'm here in person to say it. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
R. Anderson (Written)	I think the public would welcome a situation in which truly independent observers could be placed upon the Navy ships during the most critical times. They would not be government employees or scientists on the Navy payroll. They would be highly qualified experts from independent university marine programs and from credible environmental organizations. The arguments I have heard against this are need for security clearances and lack of bunk space or various inconveniences. However I think this is doable if the Navy would agree to it.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Please see Section 5.3.4.1.15 (Conducting Visual Observations Using Third-Party Observers) for a complete discussion of the viability of independent observers.
Anderson-Pomeroy (Electronic)	I live in the San Juan islands off the coast of Washington state. The lives of Orcas, Minkes, Gray and Humpback whales are intertwined with the lives of the islanders economically, educationally, and spiritually. As a proud daughter of a retired Navy Chief, I understand and respect the Navy's need to conduct various exercices to protect our country. But I also have the utmost confidence in the Navy's ability to develop technologies that protect the marine life that our citizens depend on. Those that serve show everyday their excellent capabilities to take the long view, to do what's right especially if it is difficult. The exercises currently conducted by the Navy cause horrible pain and suffering in intelligent species. The death of L112, the female Orca, was definitely caused by those exercises. I know the Navy does not want to harm these creatures intentionally. Please show those whom you serve and protect that you intend	Thank you for participating in the NEPA process.

Commenter	Comment	Navy Response
	endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Please consider the voice of the public..we wish to support all that you do. We appreciate your dedication to our safety. Most sincerely, Lynne Argentieri	Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Arias (Electronic)	Please consider that there is no rewind button on your testing equipment -- once the damage is done, there is no going back. If you seriously want to develop these weapons in order to protect the people of this country and its allies, then you might want to think about what it means for our children and their children to live in a world damaged beyond repair by people with all the right intentions but none of the real courage to protect all of its creatures. Please do the right thing -- even though it won't make billions of dollars for some companies who invest their money but none of their own lives...	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Arita (Electronic)	The U.S. Navy is completely inconsiderate and asinine. They should know that we have already had several important sea animals die from the oil spill and more etc. Now they wanna do super explosions with what little life is even [expletive deleted] left in the ocean? I hate our army. I hate the people who don't give a damn about any other living creatures we SHARE this planet with. If I was in charge, i'd make my own prison to put idiots like that, away for life. This is another reason why i hate the american army. Got damn rednecks controlling everything, little rich kids don't know [expletive deleted].	The Navy used the best available science and a comprehensive review of past, present and reasonably foreseeable actions to develop a robust Cumulative Impacts analysis. See Chapter 4 of the EIS/OEIS. Thank you for participating in the NEPA process.
Arkin (Electronic)	Please consider protecting. ALL living creatures, not just the human race. Please do not conduct these tests as the cost to sealife is too high. We are all God's creatures.	Thank you for participating in the NEPA process.
Armao (Electronic)	if navy sonar is harming dolphins whales and other marine mammals then someone is not doing their job. it is not good enough to develop sonar that detects enemies if you are then killing life in the oceans. this is a nightmare and sonar should not be tested and used if that is the end result. theses animals live in the seas it's not like they can go	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the

Arms (Electronic)	How can we call ourselves a civilized nation when we are killing animals- not for the needs of our people? This is completely irresponsible behavior of the government. Keeping the planet ALIVE should be the main goal.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Asam (Written)	Opposed	Thank you for participating in the NEPA process.
Ashkenazy (Oral-Kauai)	First, I'd like to thank you for being here. I'm really glad that you're visiting all the Hawaiian Islands to get public input, and I'm very happy to you know that you go to San Diego as well. But I don't think this is enough. I think that the entire Pacific Coast needs to be covered because people in California, Oregon, and Washington, they all need to give their input into this very urgent situation. And I'd also like to say that really an EIS wouldn't be necessary if it were not for this endless push of weapons testing, weapons production for endless wars. This is pure insanity. In fact, this is not for the defense of the country. This is for the benefit of the war contractors; Raytheon, General Electric, Lockheed Martin to name a few. This is so wrong. These people are making huge profits with war. Now, I remember, Commander, I saw you in the newspaper where Raikaohi (ph) was blessing you and telling everyone that a balance had to be struck between culture and the military. Well, let me tell you about the balance. I have a relative at Jeju Island in South Korea, and she is seeing the results of the testing of the Aegis missile that has gone on here. And I'm going to read you some of the things that she wrote me. She said, Well, the testing of the Aegis missile is resulting in an Aegis missile base forcibly shoved down the throats of the brave people of Jeju as if the U.S. Military doesn't already have enough bases in Korea. Remember, we have a thousands bases worldwide. Why do we need another base on this beautiful island? I mean, I find it amazing that the military always picks the most beautiful places to set up housekeeping.	Because of the footprint of the proposed activities, the Navy feels the public meeting locations are appropriate for this project. In addition to the meeting venues, the public can download and review the document, and make comments to it, on the website, which is available throughout the world.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	But anyway, as I said, it's about money and the rape of people to get it. Shame on anyone supporting PMRF which cannot possibly justify the jobs that it provides for the people of Kauai. The money which supports PMRF could provide so many more jobs, many more jobs for a peaceful economy such as education, health, environmental progress, alternative energy, housing, public welfare, and the list goes on. Shame, shame, shame.	
Atack-01 (Electronic)	How can you sleep at night knowing you're contributing to the death of our oceans? You do realize that no matter where on the planet you live, when the ocean dies, we all die.	Thank you for participating in the NEPA process.
Atack-02	In the year 2012 how can you think this is ok? How can you put at risk so many creatures of the ocean? Not only cetaceans will be affected by this, but you are going to disrupt the entire balance of the ocean! Our planet cannot exist on any level without our ocean. I beg you to stop this!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Atkins-01 (Electronic)	It is known that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. I ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please re-think plans and incorporate additional protective measures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Atkins	It is known that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please re-think plans and incorporate additional protective measures.	Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Attwell (Electronic)	If you must do this kind of testing, please implement additional protective measures to minimize harm to our precious sea creatures. No amount of national defense is worth the harm, suffering, and destruction it causes to these creatures. Our own future depends on the health of our oceans. Protect our ocean life, and you protect us. This too must be part of the mission of the U.S. Navy.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. Through consultation and permitting with NMFS and USFWS, the Navy refined the mitigation measures, which are now presented in Chapter 5 of this Final EIS/OEIS.
Atwood (Electronic)	Navy: " Sonar, Blasts Way Harmful Than We Thought" "1.6K WHALES, DOLPHINS COULD FACE INJURY, HEARING LOSS IN YEAR (NEWSER) – The Navy's use of sonar and explosives could deal damage to some 1,600 marine mammals near California and Hawaii every year—a figure far higher than once believed. The whales and dolphins are at risk of hearing loss and other injuries, the AP reports. What's more, the explosives could accidentally kill up to 200 animals. An earlier study assessing the risk between 2009 and 2013 predicted that just 100 creatures could be hurt or killed. The new research is part of an environmental impact statement that considers the Navy's plans between 2014 and 2019." You know it's not only harmful, but deadly. This quote was from the US Navy, posted 5/11/12. So, why would you continue to do this? Are you here to protect lives or destroy them? I am a constituent, and a tax paying US citizen, and I do NOT want my hard earned tax $ going to the destruction of such precious species. Thank you for your consideration to protect, rather than harm and destroy. Sincerely, Shelly Atwood, MD	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Commenter	Comment	Navy Response
Avery (Electronic)	Please stop killing off whales. This world is rough enough and we need them, the oceans need them. Find a better way!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
M. Avila (Electronic)	As a resident of Hawaii, I can think of no greater responsibility than to be stewards of our great life giving ocean. I must plead with the Government and Naval forces: PLEASE! For the sake of ALL sea creatures, reconsider and change the plans you have for testing in our oceans; in Hawaiian and Californian Pacific waters and Atlantic waters as well.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
P. Avila	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. 	so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours, Paula	[Use whatever AFTT settles on for their comment #217. Find the other 20+ comments in HSTT using the phrase "There is also the issue of sound channels in the ocean…" and apply this response to those as well. I think we are keeping the response sentence that says we're not hurting anything, but add that that applies to stocks and populations.]
Ayers-bell (Electronic)	This is in regard to the Navy plans to do practice in the oceans near California and Hawaii using live explosives and high intensity sonar, that will cause extensive and potentially harmful and possibly deadly effects on marine life in those areas. I understand the need for practice, but there must be some way to eliminate or reduce the amount of damage to the unsuspecting wildlife, to make dry runs or some other option. Please reconsider the damage to the already compromised creatures of the oceans. Thank you!	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. The Navy used the best available science and a comprehensive review of past, present and reasonably foreseeable actions to develop a robust Cumulative Impacts analysis. See Chapter 4 of the EIS/OEIS.
Backinoff (Written)	I am very concerned about the impact of sound and weapon testing on marine mammals and other sea life as well as humans. In the research I have done, I have seen documentation that some of the experts that claim that whales and dolphins are safe in relation to sonar testing are working under government grants in so they are biased by their funding sources. I am strongly for decreasing military expenditures and reallocating those funds to programs that will improve conditions for peaceful communication. Most people just want a safe home with food to eat and that is much less expensive then high tech weaponry and protective equipment.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding bias in the Navy's analysis, in conducting the analysis of impacts to marine mammals, the Navy uses hundreds of peer-reviewed scientific research studies.
Baker (Electronic)	This project, that will adversely affect the hearing of whales and dolphins, is unconscionable. Please think of another way to accomplish what you want to do to map the seas. There is no need to sacrifice precious marine life. Your present plans are not acceptable. Please reconsider the consequences of your actions now before it's too late. Thank you!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Balagan	Opposed	Thank you for participating in the NEPA process.

	consideration.	significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Barker (Electronic)	Dear sirs, Thank you for providing this method to comment on the underwater sonar program. I support the United States military and the United States Navy as the daughter of a former Air Force enlistee, a friend to several enlisted men and officers in various branches of the service, and a resident of a Coast Guard town. I have volunteered for various causes that support our military and their families. I support having a ready military that is well trained. All this said, I oppose the sonar program as there are still scientists and environmentalists who argue that sonar can disrupt whale feeding patterns, and in extreme cases can kill whales by causing them to beach themselves. I understands that scientists don't fully understand how sonar affects whales, but implore you to consider delaying this program while more scientific study is conducted. While you will encounter many individuals and comments that are inflammatory, reason and unbiased scientific study are the only true methods to discerning the correct path. Respectfully yours, Katie Barker	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
D. Barlow (Electronic)	Whales are some of the oldest, most intelligent creatures alive on earth. Only about a century ago, they were hunted nearly to extinction, and many populations are just now making a comeback while other populations struggle to do so. However, just as these whale populations are beginning to recover from the previous harm caused by humans, the Navy threatens to harm or kill thousands more through their sound testing. Whales us sound for navigation, communication, feeding, and for the selection of a mate. The frequency and intensity of the sound deployed by the Navy deafens the whales. Without the use of sound, whales are unable to survive, and a deaf whale is a dead whale. Whales are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. I have personally seen the pain and suffering that whales are capable of experiencing through encounters I have had with humpback whales entangled in nets. The Navy is fully aware of the harm and damage that they will be causing. They have calculated the estimated number of deaths, and I know the amount of suffering that the whales will endure. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Sincerely, Dawn Barlow	
S. Barlow (Electronic)	To the Navy officials: I am writing to express my strong opposition to the Navy's acoustic/sonor testing in Hawaii and California along the migration routes of dolphins and whales. I understand that these tests are killing or gravely injuring these whales and dolphins. I recognize that testing is necessary for our national security and I'm glad you are doing that. But surely you can find places to do the testing in areas that do not damage these creatures. I would appreciate a response. regards, Sean Barlow, Brooklyn, New York	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Barnard (Electronic)	Dear Navy Officials: I definitely think we should protect our country and I thank you very much for that. Every American is proud of our Navy and we all appreciate the fact that you keep us safe. I also know you are smart enough to find a way to protect our country without killing and/or endangering our whales and other marine life off the coast of California. Marine life is one of this country's greatest natural resources. Please be considerate and protect these animals while you're protecting Americans. Sincerely, Sue Ellen Barnard, DVM Franklin, Tennessee	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Barnum (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I strongly disapprove of Navy sound testing.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Barry (Electronic)	You live in a beautiful place - why practice war there? The sea creatures have been there far longer than we have and deserve our respect. Please stop killing them!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Barton (Electronic)	I am deeply concerned over the sonar testing proposed off the east coast. The cost to marine mammals resulting from such testing is unthinkable, especially since there are other alternatives which would avoid this catastrophic massacre and permanent impairment to such a large number fellow inhabitants - all feeling, thinking creatures. This is unbearable. Don't let this happen, please!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Bator (Written)	Aloha! The U.S. Navy is just going through the 'process' of the National Environmental Policy Act of 1969. I understand that my comments in this final Environmental Impact Statement/Overseas Environmental Impact Statement will not have any affect on the purpose of the U.S. Navy to implement the Hawaii-Southern California Training and Testing EIS/OEIS Project. However, I will make an effort to endeavor: The environmental effects associated with the HSTT EIS/OEIS Project will be insurmountable. The use of active sonar and explosives under the Pacific Ocean will have extremely harmful effects on the wildlife. It is 2012, simulated military training is possible, to accomplish the U.S. navy's mission to maintain, train, and equip combat-ready U.S. naval forces capable of deterring aggression and maintain freedom of the seas without destroying the sea life.	Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, “Today’s simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments.”
Baugh (Electronic)	Why do some humans think the human race is separate from nature and therefore superior to it? We will thrive and survive when we learn to live together without harm to any life. Please reconsider the plans to do the testing that surely will affect the sea life. Thank you for attention.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Baxter (Electronic)	I think it is sad that you will be testing in the waters off of California and Hawaii and potentially killing and causing hearing loss to so many marine animals. I am truly opposed and hope that this testing will be stopped.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Beard (Electronic)	Please stop the naval testing that will hurt marine life, specifically marine mammals such as whales and dolphins. The ocean noise is very harmful to the ecosystem, especially for marine mammals who use sonics to hunt, comunicate, and mate. Thank you. Sincerely, Sky	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the

Commenter	Comment	Navy Response
		maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Benjamin (Electronic)	I am conservative American and support our Arned Forces and those that galantly serve in each of our armed forces, especially the Navy. Protecting our nation and our troops is essential and vigilance is mandatory. However, I believe it is our responsibility to do all we can to avoid unncessary and avoidable damage to wildlife and our surroundings in the natural order of life, we need to do everything we can to protect animals and our fellow humans while not sacrificing the above. In upcoming military naval excersises in our oceans, especially those involving sonar and explosives, we MUST take prudent steps to avoid damaging and/or killing marine mammals like whales and porpoises. Using technology at our fingertips we need to avoid populated marine areas in testing and di everything we can to protect these helpless animals who become unnecessary collateral damage. Sonar must be used with consideration for the best outcomes for the planet and for our future. Please take immediate steps to avoid the deafening of thousands of whales and other collateral damage that can be avoided. It is our charge and responsibility as Americans. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Benke (Electronic)	Please protect marine mammals from explosives and sonar along the East Coast and California/Hawaii. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Please consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Regarding the 2003 Washington State stranding event referred to in the comment, although mid-frequency active sonar was used by the Navy, the distribution of harbor porpoise strandings by location and with respect to time surrounding the event do not support the suggestion that mid-frequency active sonar was a cause of harbor

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. I am calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures. Thank you.	porpoise strandings. Rather, a lack of evidence of any acoustic trauma within the harbor porpoises, and the identification of probable causes of stranding or death in several animals, supports the conclusion that harbor porpoise strandings were unrelated to Navy sonar activities. Regarding the 2005 North Carolina stranding event, NMFS was unable to determine any causative role that sonar may have played in the stranding event. All of the species involved in this stranding event are known to occasionally strand in this region. Although the cause of the stranding could not be determined, several whales had preexisting conditions that could have contributed to the stranding. Cause of death for many of the whales was likely due to the physiological stresses associated with being stranded. A consistent suite of injuries across species, which was consistent with prior strandings where sonar exposure is expected to be a causative mechanism, was not observed. For a complete analysis of these and other stranding events, please see the Marine Mammal Stranding Report, found on the HSTTEIS.com website at: http://hstteis.com/Portals/0/hstteis/SupportingTechnicalDocs/ Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Bennett (Electronic)	Stop. Think. Killing marine life to test weapons? The Navy's job is to protect America, not kill it's animals. Many if not most Americans love, enjoy and would want to protect our animals as well as out citizens. If we are murdering animals to test weapons we are ignorant useless dwellers on this planet. Destruction is not protecting. This world belongs to every animal and human on it. America belongs to every citizen in it. I would hate to read that the US Navy disgraced our country by murdering marine mammals just to test some weapon. We are better than that.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Benzel (Electronic)	I am very much against the use of explosives and high intensity sonar when it harms whales, dolphins and other sea creatures, killing many of them. I'm all for security but "training exercises" can certainly be done without creating a war on wildlife. I am also ashamed that my tax dollars are funding this sort of thing, which we know has done terrible harm and death to sea creatures over the years. The price is too high in my opinion.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Berberich (Electronic)	I spoke with many people at the meeting and after doing so I just don't feel explosive testing is necessary. Computer simulation can be just as realistic and is unharmful. Don't brush it off and say it's not as realistic. Technology is fantastic and can absolutly make it as realisitic as the real thing. Also that way the rest of the human population won't hate the Navy and be constantly fighting them.	Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the EIS/OEIS, today's simulation technology does not permit effective training and testing.
S. Berg (Electronic)	Please DO NOT carry on with the proposed Naval Training and Testing EIS/OEIS that will inevitably kill and maim marine wildlife!!! It is incredibly baffling that all of our military training exercises have to include torturing and killing mammals on land and in the sea and I find it repugnant, unnecessary and evil. Our nation has become one that does not respect the sanctity of life -- whether animal or human -- and I am always thoroughly DUSGUSTED to hear about activities that promote this violence. STOP, STOP, STOP these sick and twisted projected procedures! Thank you.	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
M. Berg (Electronic)	I understand the need for the Navy. However , we, as the human race have a responsibility to protect and keep our planets marine mammals safe from harm, and we should most certainly not should not bring them death. I believe as human beings we are intelligent enough to conduct tests without harming these amazing animals. I also believe that those in charge of this project will be humane enough to find another way. Swim with these amazing creatures. They will share a feeling of peace with you that render you unable to even consider harming them or their environment.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Betourne-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements.	As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis.
Betourne-02 (Electronic)	The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	The increase in harassment levels is due to several contributing factors that make it inappropriate to compare takes from the 2008 SOCAL EIS/OEIS: • An increase in training and testing activities and the inclusion of more activities and sources, such as pierside sonar testing, to meet emerging requirements • The 2008 EIS/OEIS included very little of the existing testing that is now included in this EIS/OEIS, much of which was covered under other environmental analyses. • This EIS/OEIS now includes a number of previously unanalyzed sound sources • Combined geographical areas (inclusion of both SOCAL and Silver Strand Training Complexes, and areas not previously analyzed such as San Diego Bay) • Included activities conducted along a transit corridor between

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		SOCAL and Hawaii that account for additional potential harassments • Updated marine mammal density information that reflects current species abundance • New acoustic effects model that provides a more accurate prediction of animal movement and therefore, potential exposures • New acoustic threshold criteria based on the best available science that is more protective of marine mammals, extends the ranges to effects of sound sources, and results in higher numbers of predicted level A takes.
Betourne-03 (Electronic)	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries.	As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. Through consultation and permitting with NMFS and USFWS, the Navy refined the mitigation measures, which are now presented in Chapter 5 of this Final EIS/OEIS.
Betourne-04 (Electronic)	I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. Through consultation and permitting with NMFS and USFWS, the Navy refined the mitigation measures, which are now presented in Chapter 5 of this Final EIS/OEIS.
Bettwy (Electronic)	Dear Sir/Madame representing the U.S. Navy: Please consider steps to reduce the harmful impacts to marine mammals in your testing methods. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please re-think the current plans for testing and incorporate additional protective measures. Surely the Navy can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. Thank you, Dana Bettwy Irvine, California	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as

		presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Bhatt (Electronic)	This is making me sick to my stomach. Dolphins and whales are such intelligent and gentle creatures known for saving human beings on multiple occasions. Please please please please please do not put them through this torture. There is no explanation that can make this okay. We (The United States of America) are better than this. Thank you for your time.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Bianco Johnston (Electronic)	DO NOT HARM MARINE LIFE	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Bickel (Electronic)	I am emailing you as a very concerned citizen of the united States. I would like to please ask you to refrain from planned sonar and explosive testing that the Navy is planning to proceed with. This is such a huge danger to the oceans mammals and survivial of multiple types of endangered species. We must protect our oceans and these animals, to sustain our earth for the future of our own children and our planets survival. Please reconsider executing your plans. Sincerely Jenni Bickel	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at

		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Bielby (Electronic)	I am deeply concerned for our ocean sea life with the Navy's proposal with their testing which will deafen 1600 cetaceans and kill 200 marine mammals. If we continue to destroy our oceans in the name of protecting us who are we actually protecting ? THINK PEACE	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Blackorby (Electronic)	This is unthinkable and unforgivable. There must be a better way. PLEASE don't do this to our precious ocean friends.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Bleiweiss-01 (Electronic)	Please, please, for the mercy of the living creatures who reside in the ocean STOP THE UNDERWATER SONAR/SOUND TESTING. The US military is without question, the strongest, most advanced military on our great blue planet. It is now time for our great military to make its future technical advances in humane ways. As a future resident of Hawaii, I speak out for the whales and dolphins who cannot be heard but who CAN HEAR YOU. They are suffering greatly from the effects of underwater sonar. Dolphins and whales use sonar not only to navigate, but to communicate with each other. Our sonar testing, much louder than their own voices, drowns out their own calls, destroys their hearing, and can lead to loss of life. Please, please be conscious of how sonar testing affects them and cease this practice.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Bleiweiss-02	We can use our technical prowess to create lab environments to test our equipment. Thank you sincerely for your consideration.	Sonar is the best means of locating small objects in the water at present. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Bleiweiss-03	Can you imagine the incredible headache sonar testing must cause to whales and dolphins? It is on the magnitude of TORTURE to these magnificent creatures. PLEASE	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Booker (Electronic)	Find another way. The cost is too high. The oceans and its abundant life are essential to the health of the whole planet.	Thank you for participating in the NEPA process.
Boros (Electronic)	I am writing to protest your sonar testing which will kill and injure countless marine animals. While I believe in taking steps to maintain our national security I know there must be alternative methods that don't harm the animals and sea life that live in the ocean. We must learn to share the planet with other living beings, not take everything for ourselves. Please consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Bowen (Electronic)	I question the value of ANY underwater explosives testing. I don't believe that the navy or the country is facing any submarine or surface vessel threats which would effectively be countered by in-water explosions. Certainly any need for such devices could be adequately served by existing WW 2 era technology and simulation training. I applaud, however, that the US Navy is submitting to this public scrutiny, which has been lacking in the case of high-impact echo-sounding by oil exploration firms. I would advocate an international assessment of ALL sonic pollution in the oceans.	Thank you for participating in the NEPA process.

Commenter	Comment	Navy Response
	other nonhuman persons, yes persons, like whales and dolphins (among others) who will be adversely affected by Naval testing stretching from Hawaii to California. The proposed testing is incredibly selfish and short sighted, actually unthinkable. How dare we?	development of alternatives.
Bradley (Electronic)	please consider the damage to the cetaceans, dolphins and whales, with the sound experiments. This would be terrible to kill or damage these animals. Very bad planning. It is time to heal the planet not to add to the destruction. Thank you, Jean Bradley	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Bradshaw (Electronic)	please don't allow this.	Thank you for participating in the NEPA process.
Brandeis (Written)	My question to the Navy: Since the Navy conducts public outreach on all Hawaiian Islands and San Diego, then the Navy should conduct similar outreach on the entire Pacific Coast, from CA through Washington, to enable Americans affected by weapons development in the Pacific to give their input.	The decision on where to host public meetings is based on a variety of factors, including range of the Study Area and public interest in the project. Based on these factors, the Navy determined that meetings in Southern California and Hawaii were the most efficient and effective at providing and receiving relevant information from the public. Studies currently being conducted for activities in the Pacific Northwest do include public meetings in Washington, Oregon, and Northern California.
Braniff (Electronic)	We cannot further endanger the whale population for any reason. The level of intelligence of these giant mammals is unknown to us, but their future existence depends on the intelligence and compassion of human beings. Please do not create any situation that will harm their future. They need our help to survive. Thank you for listening, Martha E. Braniff	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Brenkman (Electronic)	My late stepfather, Paul Stevens, was a Naval Oceanographer, and he taught at the Naval Academy in Monterey, CA. He was extremely concerned about the impact of projects such as this, as he understood the balance of nature and the possible damage to creatures who would be affected by such research. I respectfully plead that you suspend all plans to implement these studies. It is my belief that this would be cruel and torturous treatment. I thank you for your consideration, on behalf of myself and my late stepfather.	Thank you for participating in the NEPA process.
Brewster (Electronic)	I think this is wrong and should not happen!	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Brickell Vaughn (Electronic)	I am very concerned that a branch of the military of my country is seriously considering this kind of destructive, large scale testing. That so many intelligent, sensitive marine mammals would suffer incalculable suffering and loss strikes me as prohibitive. How can we be a proud people while conducting such reprehensible behavior? I fully understand that testing of various technologies needs to be done. Yet I see no reason this kind of data collection has to be done with such breathtaking disregard for our fellow living, breathing, feeling fellow creatures. As a nation, we have evolved in many ways. When we go to war, we now actually go to some great lengths to avoid "colateral damage". Civilian deaths are no longer seen as an acceptable & necessary by products of war. So too should we graduate to clearer thinking when it comes to creatures we share this planet with. Dolphins & Whales are not "just fish", they are our kindred. Not so very different from us, they think, they plan, they feel, they love, they live in family groups that support and care for one another. Are we so base a creature that this does not move us to seek out their protection? How can we think of ourselves as beings of conscience, yet allow ourselves to participate in a program that will blindly rip into our fellow creatures. Are we so blood thirstily self-centered? We certainly can devise testing protocols that insure the continued safety and well being of these animals, while allowing us to collect the information we need. Would our currently proposed testing have to be scaled back? Perhaps. Would our current plans need to be modified & revised? Certainly. Would it cost more money than we had anticipated? You bet. Would it be simple & easy? Not likely. But COULD it be done? Of that, there is no doubt! I want to look at myself in the mirror every morning and be able to stand tall. I want my Son to be proud of the things I have stood for. I imagine you do too. But I won't achieve these things if I stand by and say nothing while plans are made which would inflict grevious harm on innocent animals for no good reason. And to my way of thinking, being inconvienenced, having to go back to the drawing board to create a more humane plan, and being forced to become creative and come up with a new budgetary structure are not good enough reasons to allow ourselves to sidestep doing what is right and what is justifiable. Our current plans treat our companion creatures as if they were "things" with no feeling-that warrant no thought on our part. "Things" we can just discount. Nothing could be further from the truth. And if we don't start acknowledging this, we stain ourselves with filth. The filth that comes with the manically egocentric attitude that we can do whatever we want without regard to how it affects the planet's other "citizens". Personally, I would much rather try to grow & become "more" in my lifetime. The broader view, the bigger picture, the more inclusive approach is what leads us to become better human beings. And whatever that may cost-it is what we are called to do. Thank you for your time. Please think deeply about this. Sincerely Yours, Denise Brickell Vaughan	Currently, sonar is the best technology available that can help keep Sailors safe from mines and hostile submarines. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Bridges (Electronic)	The price is too high. Please do not make this lethal mistake. I understand the need to protect our country but feel that innocent lives should not be taken to achieve this end. Please make me proud to support the Navy, as I always have been. PUT A STOP TO	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	THESE PLANS!	
Briglio (Electronic)	I want to say that the Navy (and everyone) MUST consider how it's actions affect the biological systems of other living creatures. The fact is that when one system is affected, it affects ALL systems, including humans. You cannot harm these intelligent mammals. You should be protecting them. There is always a way to compromise so that BOTH sides get what they need. Please don't hurt these amazing animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Brooks-01 (Electronic	I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. J. Brown (Electronic)	The U.S. Navy is proposing to conduct training exercises in the rich marine environment off the coast of California and Hawaii. I am calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures for marine wildlife. These exercises would involve the use of live explosives and high-intensity sonar. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Please protect marine mammals from explosives and sonar in California and Hawaii by considering steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
K. Brown-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
K. Brown-02	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.

Kelly Brown-01 (Electronic)	Please don't destroy anymore marine wildlife using sonar testing. Too many animals have already perished.	Thank you for participating in the NEPA process.
R. Brown (Electronic)	All animals deserve to live on this planet and be safe from destruction of another species. Please do the right thing and make the necessary changes to protect whales and other sea animals. Thank you,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Bruckner-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Buckley (Electronic)	Please consider steps to reduce the harmful impacts of sonar on marine mammals such as avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Burley (Oral-Kauai)	Hi, my name is Stu Burley, and I live in Lawai Valley, and I am a resident of Kauai for 55 years now. When I came over I helped to open up the Pacific Missile Range Facility, and from there I started working as a civilian for PMRF, and finally after 46 years of being involved with every operation that took place, no matter what it was, I had a fantastic career. Now I'd like to speak a little bit about sonar. I remember when the underwater range first operated in 1968. The oldest ship in the United States Navy was the first ship on the range, U.S.S. Fletcher. And it came on the range, and it put one little torpedo in the water, and underwater warfare started at that time. This EIS/OEIS, is a long time coming. It's great. It's something that should have happened some time ago. Now, when people ask about sonar, one thing, and I'd like to just identify the missile range here. First of all, there's a lot of submarines that do the work on the range. You will not hear a submarine sonar. They do not transmit mainly because in time of war if they transmitted they would be found immediately. And it takes surface ships, when they come on range, and they transmit, they are told at the pre-sail briefs that they should go into half power instead of full power because if they went full power, their sonar would ricochet off the island of Kauai or the island of Niihau. Therefore, the sonar signals that are in the water here are less than what you would hear in the open ocean. Now, for range safety, let me make a comment about range safety. PMRF is very environmentally, the word I want is conscious. I've seen it sometimes that if there's a helicopter in the area and it happens to spot a pod of whales, that is reported. The exercise stops and then moves to another location where that pod of whales no longer exists. They take care of the ocean. They take care of what's here around the island. They also give a lot of employment. Before I retired I took a poll of how many companies on Kauai actually get paid for doing	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	something at PMRF, and the number came up with 270 companies. Thank you.	
Burley (Written)	Real-time training is very essential to all sailors in order to maintain their efficiency as a war fighter, a defender of our great nation, and the reason we have a free republic. Training in simulators is good but does not fill the warfighter experience at sea contingencies. The Navy has always been very environmentally conscious of endangered species. Range safety is always involved when training operations are scheduled.	Thank you for participating in the NEPA process.
Burns (Electronic)	As a shareholder I believe that the negative impact that the training and testing in the ocean around Hawaii and California during the next five years on animals defeats the purpose of having an EIS. According to your document the exercises could cause 1,600 marine mammals to suffer from hearing loss or other injury from its use of sonar and explosives each year for the next five years. The report also projects that 200 marine mammals will die each year. This is such a devastating and harmful impact to the marine life and an alternate on land testing facility should be utilized. There were millions of frogs used for biology dissection at one time but because of technology we now have better alternatives. Consider the IMPACTS in your EIS. You may not see the direct impact and the animals can not complain to you directly but is their pain, suffering and possibly death worth it?	See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy historically has recorded few to no mortalities caused from sonar or explosives. The estimated number of marine mammals sonar testing could affect is based on a scientific model, and it is only an estimate. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts.
Butler (Electronic)	With all the research DARPA does, I sincerely believe that the Navy needs to work on a better solution than using sonar that damages more of our mammal marine life. It has taken 40 years for the humpback whale to make a comeback from near extinction to ONLY reach the designation of "endangered" species. There is research on the damage to dolphins and whales hearing and the disorientation leading to death and serious injury of mammal marine life due to the SONAR used by the Navy - in the U.S. and the U.K. Stranding, beachings, confusion and fear cause whales to stop feeding and subsequently die. The UK military has research from 2007 that clearly indicates there are issues with sonar in causing death to whales and that in 2011 additional research conducted by a team of international scientists has confirmed the earlier research. We have some of the best scientists in the world working on these issues and still, this issue continues to plague us in finding a better solution. The NAVY should re-evaluate it's plans, establish a timeline and a plan for alternatives, expedite research on better tools than SONAR, and start to more fully balance the military need in the context of damage to the ocean environment. It is unconscionable that the U.S. Navy would expand the damage to the marine environment by simplistically justifying it's actions by creating fear in the public. It requires leadership to take a more thorough and thoughtful approach. I respectfully submit, having been a public servant, that there are always alternatives that can be examined, and in this case, should be considered to mitigate the loss of marine mammal life.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Butner-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Butner-02	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly,

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of

		monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Butz (Electronic)	Dear Sir/Madam, I am writing in support of your careful consideration about proposed testing that may adversely impact migrating whales in the coastal waters. I am a concerned citizen, and simply want to register my request that you weigh the various needs for research and defense related activities along with a keen sense of stewardship in managing the larger environment and ecosystem that your activities may impact. Thank you for your consideration, Tom Butz, phD	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Byers (Electronic)	Please take all reasonable measures to ensure your impact on marine wildlife is minimized by exploring less dense areas and employing some of the recommendations provided by those concerned about the threats to whales and dolphins.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Caffrey (Electronic)	I am deeply concerned about the harm that most likely will be caused to marine mammals during the Navy's sonar training and testing. Please apply your environmental report findings, and avoid your sonar testing in areas where whales, porpoises and dolphins are especially vulnerable: in calving grounds, migratory corridors and seasonal-use feeding areas. Your military testing can go forth, and with a small amount of awareness and planning, thousands of marine mammals can continue to live in their natural habitat. Thank you for protecting part of our country's rich natural resources. We stand to learn much more about sonar from these amazing creatures when they are protected, and can share the coastline with us.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

		with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cagley-01 (Electronic)	Dear Officials, I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cagley-02	What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to bring this to your attention. Sincerely, Jonah Cagley	not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Callan (Electronic)	Please reconsider your use of warfare on mother nature. There are permanent catastrophic consequences to your actions and while you may feel it is necessary, consider that you may be wrong. Your actions will murder and permanently disable innocent members of this planet and while it is clear that that is of little importance to you, it is to many other people. I hope your conscious gets a hold of your decisions and you make the right one.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Callis (Electronic)	Please adjust your training exercises to protect marine mammals from explosives and sonar.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Calton (Electronic)	I do not consent to have my tax money used for this. When SERVICE members say they SERVE...what does that mean? It means they SERVE US. I am a veteran and I approve this message.	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Camino (Electronic)	The estimates of the number of marine mammals that could be deafened and/or killed is unacceptable. Despite it being a worst-case estimate, the numbers are far higher than in the past, and I question the longterm benefit. We continue to destroy habitat and animal life and justify it as necessary for national defense, but at some point, the cost is too high. What will be left for those we've protected? I believe we've reached that point and ask that this testing be scaled back to reduce the negative impact on marine life as much as possible.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Capozzelli (Written)	I have read that the Navy is moving full speed ahead with plans for sonar and explosives training that threaten to deafen, injure, and even kill countless whales, dolphins and other marine mammals. Starting in 2014, the Navy will harass, injure, or kill marine mammals more than 33 million times in both the Atlantic and Pacific Oceans during five years of testing and training with sonar and explosives. Those alarming numbers come from the Navy itself. I am writing to ask your help because I am deeply concerned at the Navy's estimates of the far-reaching harm that will be inflicted on marine mammals during proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard, and the Gulf States from 2014 to 2019, as stated in your Draft Environmental Impact Statements. The sheer scope of the Navy's proposed training and testing activities is staggering, potentially assaulting entire populations of marine wildlife off the East Coast, Southern California, Hawaii and the Gulf states. Navy ships will flood millions of square miles of ocean with high-intensity sonar, which is known to cause disorientation, hearing loss, stranding and death in whales. In addition, the Navy will be detonating high-powered explosives with the potential to fatally injure	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	the lungs and other organs of marine mammals. The projected damage to whales and dolphins is staggering, with 33 million instances of "take" over five years, a vast increase over existing estimates of harm for the same regions. I am shocked by the level of carnage reflected in these numbers: over 5 million instances of temporary hearing loss; 16,000 instances of permanent hearing loss; almost 9,000 lung injuries; and over 1,800 deaths. The analysis fails to present and analyze reasonable alternatives that would significantly reduce the unprecedented level of harm to marine life. The mitigation scheme that the Navy principally relies upon, centered on the ability of lookouts to detect whales and dolphins, will not result in an appreciable decrease in marine mammal injuries. Federal courts have found this same scheme inadequate and ineffective for good reason: it is largely useless in conditions (common at sea) that impair visual surveillance, it is unsuitable for detecting cryptic and deep-diving species that spend little time at the surface and, even if it were fully effective at detecting whales and dolphins, would only protect species from the most serious injuries. The waters around Hawaii and Southern California, including critical habitat for endangered blue and humpback whales, would be among the hardest hit. The Navy predicts that more than 1,000 marine mammals would be killed in this area alone. And the threat to even one North Atlantic right whale may be one too many, as fewer than 400 of these survivors now hover on the brink of extinction. I urgently and respectfully call on the Navy to identify and set aside areas of high marine mammal density acknowledged to be the most effective means of reducing marine mammal injury. The Navy should and must take common sense precautions -- like keeping training out of key whale habitat -- before launching this sonic assault. Such precautions will not compromise the nation's military readiness. I urgently and respectfully ask the Navy to enact tough safeguards for marine mammals before it conducts the next five years of training exercises. If the Navy wishes to be seen as an effective steward of the ocean environment, it must take steps to significantly reduce the level of harm that training and testing activities will inflict on marine life. Thank you for the opportunity to comment and for your help on behalf of marine life.	Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

A. Cardenas-01 (Electronic)	PLEASE. If it is possible to attain your goals without the negative impact on live creatures - Why wouldn't you do it? We all have to share this earth. Animals are our gifts and our responsibility. We must behave humanely if we are ever going to evolve as human beings. Please, Deborah Cardenas	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
A. Cardenas-02	we see..and we base our life in the sense of sight. they hear..and base their life on the sense of hearing. Imagine if there was no light to see because someone decided to test the velocity of light through air..only to gain more knowledge and be more prepared to win a war..Please stop this, as you will harm every single living being that depends on hearing to survive, which are most of the animals in the ocean.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
M. Cardenas (Electronic)	I am appalled over the decision to use both sonar and explosives inside our precious oceans. The ocean is sacred and home to a life as vibrant and necessary as the dry land we live on. I am sickened over the idea of pollution and death being forced upon these innocent creatures and precious waters. The ocean is not our playground; it is not our property to abuse or mistreat. It is a home and a cooling center for the earth. These exercises are extremely selfish. I am demanding you find another way to train. For hundreds of years people walked on this earth thinking only of themselves. As a result poisons were pumped into the air, land and yes oceans. In our present life we cannot afford to be so ignorant and unenlightened. We have to put the concerns and welfare of ALL elements - people, animals, natural resources - to the forefront in any decision.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	American is not ignorant. We know better. Do not show a lack of compassion or disregard for this beautiful planet and the gifts our oceans bring to us every single day. Do NOT.	Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Carey (Electronic)	I ask for use of explosives in the ocean to be stopped in order to protect dolphins, whales and other creatures from being injured or killed.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
R. Carley (Oral-Hilo)	Aloha. My name is Ru, and I live in Honaunau, West Hawaii. I come here as a voice for those who cannot be here tonight, and that includes thousands of people who live in and near Kailua-Kona, Captain Cook, Kealakekua, Honaunau, and Hawaii. I come as a voice for the creatures in the ocean who cannot defend themselves against this plan. I tried to read the Draft EIS, but how does one go through 838 pages in two days? My understanding of the draft means that the Navy wishes to step up testing on land and in the sea around our islands and off the coast of Southern California. I am not alone when I say no to this plan. What the Navy proposes is basically a death sentence to countless beings in and around Hawaiian waters. According to one of the Navy's Draft Environmental Impact Statements, the sonar sound field around this transmitting ship will be 180 decibels up to one mile away and 150 to 160 decibels up to 100 miles. This means that many marine mammals will be exposed to low-frequency sonar levels capable of causing stranding and lung hemorrhaging over large areas of the ocean. I am not alone when I say no to this plan. Hawaii's tourism depends on the sea. Many boats bring hundreds of people a day from	The Navy shares your desire to preserve marine life. The Navy believes that the proposed training will not pose a risk to marine mammals, fish, and other wildlife given that these same activities have been conducted for many years in this Study Area and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Navy training or testing on land is not included in this EIS/OEIS. The Navy is not aware of any documented cases of sonar harming people.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Honokohau Harbor out to spend times with dolphins and catch glimpses of humpback whales, pilot whales, false killer whales, turtles, manta rays, sharks and more. The lure of the dolphin stretches all around the globe, and groups spend vast sums of money here in the islands because of their desire to be around dolphins. It should be noted that back in the '90s when sonar testing was present off Kona, people went into the water and developed nerve damage shortly thereafter. Marine mammals are no different if not more sensitive. Everybody knows, including the Navy, that sonar is deadly. I am not alone when I say no to this plan. The National Marine Fisheries Act granted the endangered Hawaiian monk seals and humpback whales protection. By granting the Navy permission to play war games and low-frequency sound testing in Hawaiian waters or anywhere puts marine life in danger. The Navy's plan has the potential to harm and even kill the already low numbers of monk seals. I am not alone when I say no to this plan. I understand --Equally important, low-frequency sonar levels also affect fish, and business and family fishermen could be affected. This in turn translates to reduced state and federal taxes. I understand that the Navy wants to test new equipment, new weapons, new ways of killing for the defense of this nation, but don't we already have enough fire power to destroy the world many times over? I am not alone when I say no to this plan. Thank you. Aloha kakou.	
R. Carley (Electronic)	The Navy's proposal of increased activity in the eastern Pacific (i.e., Hawaii and California) will be disastrous for marine life, especially for the dolphins and whales. Cetaeceans are dying from sonar blasting, and it seems the Navy couldn't care less. What about Hawaii tourism which relies on healthy oceans? Can you imagine what will happen to tourism when whales and dolphins start washing up on our shores? Thousands of people come to the islands to visit with these creatures. You will be destroying, not helping anything. You need to stop this idea dead in its tracks! Try applying your immense resources and energy to something healthy and productive for the beings on the planet from now on.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Carlson (Electronic)	I am strongly against the use of the sound testing that endangers dolphins , whales and other sea life. I am writing to ask you to remember the Navy has projected that it will make deaf 1600 whales and dolphins and kill 200 EACH YEAR IN A 7-YEAR PROGRAM in training exercises.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Carpenter (Electronic)	I am writing to ask the Navy to consider steps to reduce the harmful impacts to marine mammals during planned exercises that involve the use of live explosives and high-intensity sonar. I learned these planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. This is horrible!! Whales have stranded and died after major military sonar exercises. If the Navy could avoid the most harmful activities in areas used as calving grounds or migratory corridors; avoid seasonal high-use feeding areas; create a larger "safety zone" around the exercises; and use aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed, it could save their lives. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please do the right thing. Save all lives!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. 		significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Carr-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Carr-02	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures,

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However,

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Carroll (Electronic)	I live in San Diego. I'm a supporter of the Navy. I also understand the need to test systems. But when it comes to this testing, I think we need to look long and hard about the benefits versus the disaster it spells for marine life. Our science has shown us, (and is showing us more everyday) that these are intelligent, curious and at times loving animals. Whales have been shown to display affection to humans who've helped them out of bad situations, like being caught up in fishing line. Should we use our heads when making decisions like this? Of course. But I would contend this decision also needs some input from the heart and when that comes into play the conclusion is obvious. DO NOT CONDUCT THIS TERRIBLY HARMFUL TESTING! Thank You.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Carter (Electronic)	I am writing to ask you to protect marine mammals during your sonar exercises on the East Coast and in Hawaii, and anywhere else such exercises are conducted. I am asking you to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. 	penny is being spent on war should now go to the needs of the people; jobs, housing and education like the schools over here. Now, let's get straight. Okay. The people are suffering. Enough money on war and war preparations. In fact, there's a global worldwide movement against war and militarism and corporate greed. The only people that are really benefacting out of this whole thing is the contractors and people that make missiles and bombs like General Electric. We've got to stop killing people that did nothing to us. We've got to give the land back to the Hawaiians, and we've got to start taking care of the needs of the working class.	
Cavanagh-01 (Electronic)	Raymond C. Cavanagh Vienna VA 22181 July 10, 2012 Comments and Questions about Navy's HSST DEIS/OEIS of May 2012 -- Emphasis is on MMPA and ESA acoustic impact of sonars/projectors and explosives on marine mammals. 1. General Comments 1.1 The sections applying to acoustic impacts are very much like those of previous EISs (viz., USWTR, HRC, SOCAL, etc.). 1.1.1 This is disappointing - given the years that have passed in which the accuracy and readability could have been improved. Errors and misinformation and redundancy abound. More below. 1.1.2 The number of pages devoted to the subject is staggering. [I count about 200 for Vol I alone. This is not to mention the repeated attention to individual species (how many bio-histories do we need?) Why not relegate all of this to appendices or reference papers?] 1.1.3 A modest amount of editing by experts on sonars and explosives and acoustics would to it. The cost would be minimal.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cavanagh-02	1.1.3.1 A technical editor could help - to reduce the page count to 1/4 of what it is now. But the technical editor's edited text would have to be edited once more by the authors. 1.2 Precision vs accuracy is not explained. This is a perennial problem, as noted by MMC and many others. NMFS' abundance estimates for a single species and a small area to 6 significant figures? What about TL estimates like 67.23 dB? SPLs like the now infamous 169.3 dB? Such reporting misleads the reader - Is accuracy suggested by these inexplicable levels of detail? Better to either fix the number of significant figures or repeat a caveat often in the text about how precision almost never implies accuracy. 1.3 If the goal of the subject sections was to induce sleep in the reader, confuse the reader, gloss over the important points, and hide the main messages, then the goal was more than met. 1.3.1 As a good example, consult the Executive Summary. None of the important issues is given any attention (e.g., what are the take counts, by species and source and action?). 1.4 Even for a veteran of acoustic risk assessments, terminology can be a mystery. 1.4.1 What is a 'Stressor?' A cause of stress? But what is 'stress?' No definition is given for this very often-used term in the text. Why confuse the issue with	The Navy has used the best available science in the development of this EIS/OEIS. The text has been reviewed and revised throughout the document's development by professional technical editors and scientists for accuracy. Levels of precision are used as provided by source documents, which are largely peer-reviewed scientific studies. The level of detail in the document is a result of refining the document to satisfy the needs of both the public and scientists, as well as meet legal sufficiency standards of NEPA. As noted in Section 3.0.5 (Overall Approach to Analysis), "the term stressor is broadly used in this document to refer to an agent, condition, or other stimulus that causes stress to an organism or alters physical, socioeconomic, or cultural resources." The term 'exposure' is used in a number of different contexts within the document. When used in the context of a sound or energy exposure that exceeds the PTS or TTS criteria, then the predicted effect (or exposure) is similar to the MMPA term 'take.' In terms of Endangered Species Act (ESA) listed animals, NMFS also

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	jargon that is not defined? Are full moons or teenagers partying in the surf or very low wind-speeds stressors? (We searched for 'stressor' in the pdf document, but found no defintion) 1.4.2 What is an 'exposure?' Please define. It looks like an exposure is the same as a take. After all, won't the take permit (LOA) be based on the number of exposures listed in the text? (Again, we searched the pdf document but found no definition of exposure.) 1.4.2.1 In a previous NMFS' document, an 'exposure' was defined in two different sections as (a) a sound level above 120 dB or (b) as any sound that the animal could hear!	used the term exposure to mean exposure to any level of sound, energy, or stressor, which pursuant to ESA constitutes a "may affect". Due to the ambiguity, in the term "exposure", Navy has attempted to be clearer in the FEIS by referring to the numbers of animals estimated to be exposed to the various criteria as predicted effects.
Cavanagh-03	Likewise, NMFS has claimed that as regulator it can make the judgment (even years and years before the action) of whether an exposure is to be counted as a take (for a permit) or not. We have never seen such a determination in a formal take permit request. 1.4.3 Where is 'restart time?' This has been a critical NMFS' pronouncement in many risk assessments. No mention is made here. The importance is that NMFS counts takes of an animal at most once over a restart time. NMFS prescribed restart times have been documented as '24 hours' or 'duration of the exercise' – whichever is smaller. 1.4.3.1 A review of the SURTASS-LFA FEIS will show that the restart time was of order 10 days -- so that no animal could be taken more than once in that period. The consequences are huge! 1.4.3.2 Restart time gets its name from the logic that the whole take assessment is restarted after that time has elapsed. There is no memory of any previous conditions or 'exposures.' Usually, the take counts for 3 restart times equal 3 times the take counts for 1 restart time. 1.5 Basic and important acoustic quantities are almost never defined correctly, or explained, or defined at all. Some examples follow. 1.5.1 Source Level (SL) for a sonar or projector is complicated and not understood by many. 1.5.1.1 A good example is for SURTASS-LFA in which NMFS and Navy supported a 215 dB (re 1 μPa re 1 m) SL. For compliance and sonar applications, this is 10s of dBs too low for the actual, standard and traditional source level. This misunderstanding by NMFS and Navy is astounding. 1.5.2 There seems to be no understanding of the definitions of SPL, Intensity Level, EFDL, SEL, peak pressure, max SPL, and many more. 1.5.2.1 SEL is not an energy metric; it is new to underwater sound, having its derivation from in-air acoustics. It does not allow for near-field effects, and is independent of medium (same in air as in water). Likewise for SPL as power metric. In air, from whence it came, the units are 1 μPa and assumes a 1 second normalization for pulse length. In current use, by bio-acousticians, the metric for SEL is like that for EFDL (1 μPa2-s). This is very confusing. Why not use EFDL? 1.5.2.2 For a transient signal, SPL has to have many parameters specified to give it any meaning. Many good examples of errors resulting from such lack of definition and confusion about the metric can be provided upon request. The NMFS-Navy Dose Function for sonars provides a great example of confusion about SPL. 1.6 We stop here- but many many more examples can be given as requested.	As described in Chapter 5 of the EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. Through consultation and permitting with NMFS and USFWS, the Navy refined the mitigation measures, which are now presented in Chapter 5 of this Final EIS/OEIS.

Commenter	Comment	Navy Response
Cavanagh-04	Raymond C. Cavanagh Vienna VA 22181 July 10, 2012 Comments and Questions about Navy's HSST DEIS/OEIS of May 2012 (Part Two) -- Emphasis is on MMPA and ESA acoustic impact of sonars/projectors and explosives on marine mammals. 2 More Specific Comments and Questions --Sonar Level B (behavioral)Take Counts for an LOA 2.1 Ten's of thousands of 'exposures' (Level B behavioral 'takes') for Sonars?. How can this be? We argue that this is orders of magnitude greater than it should be. 2.1.1 Application of the NMFS' prescribed dose-response functions (DRF) is the problem here. The input RL metric to the DRF must have been miscalculated during the risk assessment. It is supposed to be the 'mean of the mean SPLs 'and not the 'mean of the peak SPLs. ' This is per the SHOUP analysis which led to the infamous 169.3 dB estimate of the 0.5 probability of harassment, as input to the DRF. If the 'mean of the mean SPLs' was used as the RL for the DRF for the HTTS actions, the take counts would be dramatically reduced. We roughly estimate 100 Level B behavioral takes over the year, all of which could be mitigated. Sonar operating modes could reduce this even more. In fact, behavioral takes should almost always be fewer than TTS takes. 2.1.2 The NMFS' DRF form is attributed to Feller Vol 1. (It is a GREAT book and I keep it under my pillow for inspiration). No one has yet found the form in Feller since its use in 1999 for a SURTASS-LFA EIS. NMFS could not find it either - so they said the 'Feller-adapted function.' This has zero basis, and another obfuscation. Can anyone find the citation? (I have an answer, but Feller is not the sole source.) By the way, the formula given in the text 2.1.2 1 The use of the Nowacek et al playback results in construction of the NMFS' DRF is hard to defend. The animal was a mysticete and the alarm signal that caused a reaction was an FM slide from 500 Hz to 4500 Hz over a minute. That signal is not at all similar to s sonar signal - as claimed by Nowacek and NMFS (in writing). NMFS has massaged the result by saying it projected signals within the frequency band of a tactical sonar, or misquoted the bandwidth of the signal ('above 1 kHz). In addition, the signal lasted much longer than any sonar signal. These data distorted greatly the DRF shape and parameters. 2.1.3 For a typical HTTS hull-mounted sonar action, the expected number of takes (as usual, over time and space) does not at all depend on grouping of the animals. Nor does it depend on spatial distribution of the animals, given a non-specific sonar track (also as usual). To say that a take estimate applies to a 'population' of animals and not to a single specific animal (as per NMFS) is contrary to the statistical bases for take counts. 2.2 Level A takes by sonars This is not possible. Collision is more likely. Theories about embolisms, bends, brain trauma etc. as impacts or causes of strandings have never been treated seriously . Any response? 3	There are several contributing factors that make it inappropriate to compare takes from previous studies: • An increase in training and testing activities and the inclusion of more activities and sources to meet emerging requirements. • Combined geographical areas (areas not previously analyzed) • Updated marine mammal density information • New acoustic effects model • New acoustic threshold criteria extended the ranges to effects of sound sources and result in higher numbers of predicted level A takes. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded few to no mortalities from sonar or explosives. Any model used to predict marine mammal mortality and takes is only an estimate. The Navy has used the best available science in the development of this EIS/OEIS.
Cavanagh-05	More Specific Comments and Questions --Explosive Take Counts for an LOA 3.1 Precedent is not respected here. The SEAWOLF and CHURCHIL EISs use a different threshold for harassment - specifically the peak 1/3 octave band RL vs the average of the 1/3 octave band RLs.. To say that this is more 'conservative' is not a valid reason for using it. It was approved in the EISs mentioned, and reviewed by many scientists. 3.2	The Navy has used the best available science in the development of this EIS/OEIS.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	We doubt that the impact estimates involving the Goertner modified positive impulse could be accurate. Very few persons in the world know how this works. Impulse is not the same as positive impulse!! Impulse must be zero. The depth dependence rule is incorrect. 3.3 As we have argued with NMFS, peak pressure is not a reasonable metric for impact on animals. It does not reflect the physics of what happens when an animal (or human) approaches the surface of the water. See the AIR FORCE's JASSM and EGTTR EISs for more on this. NMFS spent a lot of time on it. 3.4 'Peak pressure' requires a careful definition for explosives. SPL is not applicable. Peak pressure cannot be measured and most be modeled. 3.5 To infer impact to animals in air from impact in water is controversial - for peak pressure or SEL. Some adhere to the concept that peak pressure itself (independent of the water or air medium) is the metric to use to estimate injury, etc. (See Ketten, Chapman, Craig, and others). Others argue that power or energy (which depend on impedance) are the appropriate metrics. What is the view from the EIS - do we need to apply dual thresholds including peak pressure (independent of impedance). These dual thresholds are key to this EIS.	
Cerio (Electronic)	Please rethink planned training exercises that use live explosives and high-intensity sonar. The impact on wildlife would be significantly damaging. I would rather these exercises stop altogether but another option is to take steps including avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Chalmers (Electronic)	Please don't do any underwater testing in the oceans. Everything that lives there should have a peaceful life. You will be destroying marine mammals that can not escape the repercussions from testing bombs and other experiments.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Chambers-01 (Electronic)	The plans that you currently have and the horrific impact it will have on marine wildlife is simply unacceptable. Considerations should be made and taken very seriously to alter these plans as to avoid the devastating impact your actions will have.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Chambers-02	By disrupting marine life you ultimately disrupt tourism and therefore the economy in the area. Sick/injured/dead marine life and marine mammals = bad tourism and economy for the area. There are much larger implications here. I plead with you to reconsider.	Section 3.11 (Socioeconomic Resources) has addressed impacts to fishing and tourism activities. Socioeconomic Resources screened for impacts on other resources that might create secondary impacts. The biological resources sections (3.4-3.9) determined there would be no long-term impacts to populations, therefore not reaching the level of "harm" as to impact tourism activities.
Chan (Electronic)	Please do not harm marine life. Don't you see the kind effects it'll do, particularly in the long term? Aren't there other ways? Even if the other methods are not cost efficient or convenient, the harm it'll do to your pockets will benefit in the long term, for everyone, including your association, we're all living in the same place, same earth. Affecting marine life apart from being morally wrong and causing extinction, it in turn, would cause fishermen, and anyone in the field which depends on the ocean and the life in it, to fall. You all are trying to make a living, and so are they. Sooner or later it's going to come back to you anyway. Wake up, and don't go along with this, think of the effects. Hear all	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to

	the comments flooding the mail system, and listen to them.	whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Chandler (Electronic)	Please do not harm our dolphins and whales.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Chaney (Electronic)	Dear Navy Sonar Testing Participants, I want you to stop sonar testing within the Pacific Region. From reading the NOAA stranding report, there is ample evidence that continuing or expanding this pracitce has the potential to harm an unknown number of marine mammals. Let's not have a repeat performance of the whaling era, albeit through this remote means of death to cetaceans. In reality, the number of stranded animals noted in the report are likely a small percentage of the number of animals killed through the use of oceanic sonar. Please discontinue the use of sonar practice, and keep our cetaceans preserved for future generations. Sincerely, Nancy L. Chaney	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Commenter	Comment	Navy Response
	the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above.	at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cheshelski (Electronic)	The Sonar testing you are doing in the ocean is killing whales,dolphins,and God knows what else. This has been proven, the Navy has been aware of it for sometime now, yet you continue. My daughter of 12 years old was watching Animal Planet, unaware of what she was about to see, I also had become interested in the program at this point. This program was filmed in the Ocean where they were recording sounds of the Orcas and other whales, unaware of your testing the crew that was recording was completely caught off guard by the events to follow. The beautiful sounds of the whales communicating were shattered by a horrible sound, followed by complete panic coming from every direction. The sounds/shreaks coming from these precious animals were indescribable, terror and screams of being tortured alive is about as close as I can get to describe. Alot like the screams coming from 100's of dolphins being speared with metal rods to die a slow painful death in Taiji Japan. I watched the cove by mistake and I will tell you that is a sound I have never forgotten. Please stop this Sonar testing, there are so many inhumane acts of violence, tortures, killings of animals/ people around the world, please don't be the reason for the deaths of these beautiful animals. I must add one thing. The people recording these Orcas, the looks on their faces, the tears welling up in their eyes, the sadness and hopeless look along with complete shock, knowing there was nothing they could do to help these poor animals was about all I could handle. My eyes also started to burn and I shut the T.V. off with disbelief of what I was seeing. Please, please step down on this testing, it is not worth it. I know you will do what it is that you have decided already, and I can only hope that our Navy Defense has already decided to abort Sonar Testing. We are the United States of America, and we just have to stand for something good in today's world. Honor, Respect, some sort of kindness. Thank you for giving us "we the people" an opportunity to comment on your Sonar Testing, I pray that you will make the right decision for humanity reasons. Sincerely, Cali Cheshelski Calimesa, California	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Cole (Electronic)	Why can't this testing be done out in deeper waters, instead of along the coasts?	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Comito (Electronic)	Please do not test and cause harm to the area dolphins and whales. They have no way to speak for themselves so I am speaking for them.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
H. Concoff (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing.	Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
R. Concoff (Electronic)	Please stop this kind of testing. It is detrimental to whales and other marine mammals which it is our duty to protect. Thank you.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Coniglio (Electronic)	This is beyond cruel and MUST STOP !!!	Thank you for participating in the NEPA process.
Conrad (Electronic)	re: the use of high frequency underwater sound for testing in Hawaii, the California and Atlantic Coasts, and the Gulf of Mexico. Stop this testing NOW - it will deafen many whales and dolphins and kill more of them. Just horrid and cruel!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Corey	I have just finished reading much of the EIS/OEIS report. I am especially concerned on the impacts of the Navy's explosive and sonar testing in the Pacific areas addressed in	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
(Electronic)	the report. I want to firmly protest the negative impacts this proposed testing will have on the whales, dolphin and other mammals in this area. The thought that any amount of these species being harmed, in such as way as to drive them from their habitat of the coastal areas there, that are their feeding and mating grounds is unacceptable. Even worse to see it is quantified and acceptable to cause deafness, tissue damage and general suffering, or whatever pain and discomfort these tests cause is beyond just unacceptable into the highly objectionable range. How can the military of the United States depend on, design and plan to implement a project to save human life by increasing our security when it is dependent on the loss of other life that are not our enemies and cohabitate peacefully beside us? This is a flawed argument with a bias against other species even to their death and displacement. I believe that the mammals and all creatures of this earth have the unquestionable right to live freely without harassment, suffering or pain inflicted on them by any of our human activities. We do not possess this right to do so and any action that harms another and so grievously with forethought is immoral, ignorant and totally without merit. I therefore state my objection to this testing, to the premise this testing rests on and any future execution of this plan. I firmly resolve to do what i can, within the power i have as a citizen of this land to stop, object, publicize, promote dissent, inform, and disperse this information and its disastrous consequences to all parties within my circle of influence with the intention of collectively working to thwart, stop and beseech the United States of America Navy, its generals, our congress and our President to remove any authorization to proceed with such a plan. In short, please reassess- its egregious and i would be ashamed for any agency of my country to be engaging in these horrendous practices under the banner of protection of our rights, liberty and lives. We are not the only ones living here. Sincerely, C. Corey	Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Costa (Electronic)	please do not conduct these tests. thousands of animals will be tortured, deafened, and other thousands will die.	The Navy shares your concern for marine life. Commenter	Comment	Navy Response
		at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Courbis-01 (Written)	As a member of the public and an expert in marine mammal science, I respectfully submit the following comments on the Navy's Hawaii-Southern California Training and Testing Activities Draft Environmental Impact Statement/Overseas Environmental Impact Statement for your consideration. To begin with, I have concerns that the draft EIS/OEIS does not fully consider the scientific documentation of strandings of marine mammals that may be associated with the types of activities proposed by the Navy. For example, the work of Wang and & Yang (2006) indicating pygmy killer whales stranded in Taiwan as a result of active sonar & seismic operations is dismissed as "not supported by the data available" on page 3.4-45. In addition, there is no mention of the concurrent unusual melon-headed whale activity in Hanalei Bay, Kaua'i and Sasanhaya Bay, Rota, Northern Mariana Islands in 2004. These "strandings" are both included in the report "Marine Mammal Strandings Associated with U.S. Navy Sonar Activities" (April 2012) associated with the Atlantic Fleet Training and Testing EIS (http://aftteis.com/Portals/4/aftteis/Supporting%20Technical%20Documents/Marine%20Mammal_Stranding_Report_v02.pdf). The Atlantic Navy report describes five stranding events associated with U.S. Navy sonar activities and five stranding events speculated to be linked to U.S. Navy sonar activities. I suggest that the Hawaii-Southern California EIS/OEIS include details of the Hanalei Bay incident and that it acknowledge the heightened risk for certain species documented to strand during Naval activities. In addition to melon-headed whales, beaked whales are considered to be especially vulnerable to injury and death associated with Navy sonar (five beaked whale stranding events with potential links to Navy sonar activity are described in the Atlantic EIS cited above). Although such strandings of beaked whales associated with Naval exercises have not been seen in Hawai'i, the science indicates that animals affected by Navy sonar in Hawai'i may not be easily detectable (Faerber and Baird 2010). Overall, my recommendation is that the Navy expand its description of potential impacts to include a more thorough treatment of historical stranding information as done in the Atlantic EIS and acknowledge that species such as melon-headed whales and beaked whales have higher risks for injury and death. Potentially, a variable regarding higher risk should be incorporated into the model for calculating take of these species. Although not described in detail, five stranding events identified as including U.S. Navy exercises as a contributing cause are listed on page 3.4-113. This and other stranding events illustrate the need for mitigation plans for live and dead strandings. Although I am aware that the Navy has participated in carcass removal and necropsy in past strandings in Hawai'i, I encourage the Navy to develop a more formal mitigation plan as part of the EIS/OEIS. I understand that a regional stranding implementation plan is being developed collaboratively between the Navy and NOAA. I encourage the Navy (and NOAA) to seek input from the State of Hawai'i and the Pacific territories and to incorporate cultural considerations into protocols.	The Navy shares your desire to preserve marine life. The Navy believes that the proposed training and testing will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at NMFS Office of Protected Resources website. For a complete analysis of stranding events, please see the Marine Mammal Stranding Report, found on the HSTTEIS.com website at: http://hstteis.com/Portals/0/hstteis/SupportingTechnicalDocs/ An integrated monitoring plan for the activities in the HSTT Study Area is also planned as presented in Section 5.5.1.1 (Integrated Comprehensive Monitoring Program) of the Final EIS/OEIS. The Navy will continue to implement the monitoring and research programs where training and testing has been occurring to determine if there are determinable impacts as a result of those activities and will do so in the HSTT Study Area associated with future training and testing occurring there. The Navy will continue to be a leader in funding of research to better understand the potential impacts of Navy training and testing activities and to operate with the least possible impacts while meeting training and testing requirements.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	This does not require the Navy to take formal responsibility for causing any marine mammal stranding, but it would make the Navy a formal partner in the activities necessary to deal with stranded animals. This should include monetary support for removal of animals and appropriate necropsy and sampling. It is to the Navy's benefit to have full necropsy and sampling done on stranded animals to reduce speculation that the Navy is responsible for deaths that have not been properly investigated. Funding for such necropsy work has gone down significantly in recent years.	
Courbis-02	The EIS appears to dismiss some of the science associated with mid-frequency sonar effects on marine mammals. On page 3.4-95 it states "As a result, no marine mammals addressed in this analysis are given differential treatment due to the possibility for acoustically mediated bubble growth." Regardless of the mechanism, it is clear that certain species, like the beaked and melon-headed whales, can be affected by mid-frequency sonar. Bemaldo de Quiros et al. (2012b) found that deep diving marine mammals have a higher risk of decompression; that risk should be considered in determining levels of take. Further, the protocols designed by Bernaldo de Quiros et al. (2012a, 2012b) should be included in official necropsy protocols.	The Navy used the best available science to develop its analysis and appropriate mitigation measures. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures must be estimated scientifically using complex modeling, but it is only an estimate, not a prediction. This estimate needs to encompass the capacity of what could occur to ensure Navy's permits are not exceeded. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The U.S. Navy has conducted active sonar training and testing activities for decades in the sea space depicted in the Study Area with no documented proof of injuries to marine mammals. Though the intensity of training and testing will increase, the events are of relatively short duration and therefore the Navy does not anticipate long-term population level impacts.
Courbis-03	The Navy acknowledges on page 3.4-92 that long-beaked dolphins have been directly killed by Navy activity in an incident involving explosives. This illustrates the importance of mitigation zones. Some odontocetes are more cryptic and surface less often than long-beaked dolphins. As such, I recommend that the Navy not reduce any of the mitigation zones used in the previous EIS/OEIS. Smaller mitigation zones, as proposed in the draft EIS/OEIS, will only increase risk to marine mammals. Even if animals are not at risk for direct injury by the sound, it is clear that behavioral responses of marine mammals can be contributing factors to injury and death, suggesting that mitigation zones should be conservatively large to account for behavior-induced injury.	The mitigation measures listed in the Chapter 5 of the DEIS/OEIS are the result of the consultation with NMFS and USFWS. Mitigation under MMPA will be coordinated through the Letters of Authorization from NMFS. Mitigation under ESA will be coordinated through the ESA consultation between the Navy and NMFS and USFWS.
Courbis-04	Page 3.4-97 states that "Hearing loss resulting from auditory fatigue could effectively reduce the distance over which animals can communicate, detect biologically relevant sounds such as predators, and echolocate (for odontocetes). The costs to marine mammals with temporary threshold shift, or even some degree of permanent threshold shift have not been studied." There are some studies of threshold shift in cetaceans (e.g. Mooney et al. 2009, Nachtigall et al. 2004). These studies examine things like TTS frequencies and behavioral effects of sonar. Studies also describe odontocete immune response to sonar pings and seismic water guns (Romano et al. 2004). I did not do an exhaustive search of the literature, but further information about TTS and PTS should be	. The discussion in the EIS relies on years of rulemaking, previous Navy NEPA documents analyzing the same actions, and extensive research cited throughout 3.4.3.1. Specific to the latest development of the criteria including TTS and PTS, please see Finneran and Jenkins (2012), which is cited throughout Section 3.4.3 and is available for review at the HSTT EIS/OEIS website.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	reported in the EIS as a quick search indicates some is available.	
Courbis-05	The EIS/OEIS states on page 3.4-93 "The potential for auditory trauma in marine mammals exposed to impulsive sources (e.g., explosions) is inferred from tests of submerged terrestrial mammals exposed to underwater explosions (Richmond et al. 1973; Yelverton et al. 1973; Ketten et al. 1993)." Terrestrial mammals do not have the same hearing physiology and mechanisms as marine mammals, though some ear structures are conserved among the mammals. I am not clear on how terrestrial data can be translated to marine mammal potential for auditory trauma. A clearer explanation of this link would be helpful to assess whether this comparison is appropriate. Darlene Ketten has published a number of articles on cetacean hearing physiology, and Cranford et al. (2008) reported on sound transmission and reception in Cuvier' s beaked whales using CT scan information, which could be cited in this section.	. The development of conservative criteria and thresholds for marine mammal impact analysis has a long history of considering research from terrestrial animals including humans. There is no additive useful information provided by Cranford et al (2008) that is required by the analysis or otherwise assists in understanding of impacts to marine mammals or beaked whales in particular. Section 3.4.3.1 of the EIS provides a synopsis of the information required and provides citations for those interested in looking into the history of the development of environmental impact analyses as related to marine mammals hearing. It is suggested that the commenter start with the cited Southall et al (2007) reference as a baseline overview for understanding the history and use of terrestrial mammal hearing to assist in developing marine mammal hearing impact thresholds.
Courbis-06	Because the Navy's model of biologically significant population consequences of Navy activities included abundance estimates, the Navy EIS/OEIS choses to combine what are now considered separate populations of marine mammals among the Hawaiian Islands for the analysis. This is biologically inappropriate and does not account for the lack of dispersal among island regions. Because populations of many odontocete species are now scientifically documented to be local and island-associated, an analysis of impact by population is necessary to assess affects to these populations. If this assessment cannot be conducted now because of the need to use abundance estimates in the model, I have suggestions. One, the fact that these populations are separate should be acknowledged and described, with a full literature review, in the EIS/OEIS. Two, the letter of authorization and EIS/OEIS should include language that reflects a commitment to do new calculations as abundance estimates become available. With the new Guidelines for Marine Mammal Stock Assessments becoming finalized soon and the new research that is becoming available regularly, abundance estimates for many of these stocks should likely be available before the next reauthorization, so I encourage quick turn around on updating impact estimates as these data become available.	The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures must be estimated scientifically using complex modeling, but it is only an estimate, not a prediction. This estimate needs to encompass the capacity of what could occur to ensure Navy's permits are not exceeded. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States. Active sonar is currently the most effective way to locate submerged enemy submarines before they are close enough to sink U.S. ships. To successfully defend against submarines and other underwater threats, such as mines, Sailors must train realistically with the latest

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		technology, including both passive and active sonar.
Courbis-07	Another aspect of local populations is that displacement of these populations could be permanent or long-term. Other members of the species may not be able to repopulate an area where animals are displaced. Alternatively, movement of local populations out of the area may not be possible if marine mammals have behaviorally adapted to the area. Some high-risk species like melonheaded whales and Blainsville's and Cuvier's beaked whales show evidence of local populations near the Island of Hawai'i (Aschettino et al. 2011, Baird et al. 2011, McSweeney et al. 2007). The increased risks associated with local, island-associated populations should be described in the EIS/OEIS and potentially taken into account in the modeling.	The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures must be estimated scientifically using complex modeling, but it is only an estimate, not a prediction. This estimate needs to encompass the capacity of what could occur to ensure Navy's permits are not exceeded. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States. Active sonar is currently the most effective way to locate submerged enemy submarines before they are close enough to sink U.S. ships. To successfully defend against submarines and other underwater threats, such as mines, Sailors must train realistically with the latest technology, including both passive and active sonar.
Courbis-08	The Navy should identify known "hot spots" for species and preferentially avoid hot spots for Endangered, Threatened, and Candidate marine mammals unless there is a National Security issue. There is already some mitigation of that nature in place for humpback whales. There is extensive research on monk seal and false killer whale movements (e.g. Baird et al. 2012) that should be considered in the EIS/OEIS as areas to avoid Navy activity if possible.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The Navy has used the best available science in the development of this EIS/OEIS.
Courbis-09	On page 3.4-107, the EIS states "Humpback whales showed a trend from negative to positive reactions with vessels during the study period. The author concluded that the whales had habituated to the human activities over time." I urge the Navy to not use terms like "negative" and "positive" because they suggest that there is a "positive" way to harass marine mammals. Even marine mammals engaged in approach are not necessarily experiencing a "positive" interaction. For example, calves of dolphins fed by humans in Shark Bay Australia have up to twice as much calf mortality than unprovisioned dolphins in the area (Mann et al. 2000). Although one could argue the dolphins "choose" to interact with humans and to take handouts, it is not actually in their best interest biologically because it distracts them from protecting and rearing their calves. This is a "positive" interaction with negative consequences. It is also important to remember the difference between habituation and tolerance. Some animals may not have anywhere else to go and therefore, tolerate disturbance. The draft EIS/OEIS states on page 5-24 "The Navy will cease transmissions when a marine mammal is sighted within 200 yd. (183 m). The exercise will re-commence if one of the following conditions are met: the animal is thought to have exited the mitigation zone and the mitigation zone has been clear from any additional sightings for a pre-established amount of time; the vessel has transited more than a pre-established distance beyond the location of the last sighting; or if the ship concludes that dolphins are deliberately closing in on the ship to ride the vessel's bow wave." Although the EIS/OEIS indicates that bow-riding animals would be out of the main transmission axis of active sonar, bow-riding behavior can cease at any time and approaching animals could be in danger of sonar affects. Again, it is important to remember that because an animal "chooses" to approach the vessel does not mean the animal is unaffected by sonar-animals do not always make the best choices for their own health and safety.	Bow riding dolphins may quickly move out of the sound path if they break from bow riding because of the speed of the ship. If dolphins move into the sound path and remain in the mitigation zone, then mitigation procedures would apply and sonar would be powered or shut down as appropriate.
Courbis-10	I support the continued implementation of Marine Species Awareness Training and use of lookouts. I suggest that mitigation measures could also include passive acoustic monitoring to help detect cryptic and long-diving marine mammals. The EIS/OEIS mentions that marine mammals are sometimes detected this way, but does not include passive acoustic detection in protocols for mitigation, with the exception of increased vigilance by lookouts. Passive acoustic detection and localization of marine mammals has come a long way in the last few years. The Journal of the Acoustical Society of	Passive acoustic monitoring is already and will continue to be implemented with several activities. Information on mitigation measures can be found in Chapter 5 of the DEIS and FEIS.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	America will be publishing a special issue on methods for marine mammal passive acoustics later this year. We encourage the Navy to continue to get the latest information to inform mitigation that includes passive acoustic monitoring and detection. Acoustic monitoring has also been done for several years off Hawai'i's coasts through the University of Hawai'i. We encourage the Navy to continue to support these efforts and use this information to learn more about "hot spots" of cetacean activity near the Hawaiian Islands and incorporate this information into updates of the letter of authorization and to develop better means of detecting and localizing cetaceans near testing and training exercises.	
Courbis-11	The Navy's main mitigation measures include visual detection within a radius of the activity and cessation of the activity until the marine mammal has not been seen for 30 min. This may not cover the beaked whales and sperm whales well, as these species can be under the water for more than an hour at a time without appearing at the surface. I suggest movement to a new area or at least an hour without seeing these species before restarting activities. I also encourage as much wait time as possible for cryptic species that are difficult to see, such as pygmy and dwarf sperm whales.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Courbis-12	On page 3.4-57, the draft EIS/OEIS states "There are no significant species-specific threats to spinner dolphins in the Study area." The species-specific threats associated with swimming with spinner dolphins in Hawaiian bays are well documented (e.g. Courbis 2007, Courbis and Timmel 2009, Danil et al. 2005, Timmel et al. 2008), and NOAA published a Federal Register notice of intent to propose rulemaking to protect spinner dolphins from human interactions in Hawai'i (National Marine Fisheries Service 2005). With the number of publications and the intent of NOAA to engage in rulemaking on the issue, swimming with spinner dolphins should be considered a significant species-specific threat.	Thank you for participating in the NEPA process.
Courbis-13	The Navy cites the Hawaiian Islands Humpback Whale National Marine Sanctuary as reporting as many as 12,000 humpback whales in 2010; however, the citation is not included in the bibliography of the EIS/OEIS. We suggest that abundance of humpback	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	whales be determined based on the primary literature, such as Calambokidis et al. (2008) (Hawai'i) and Barlow et al. (2011) (North Pacific). I encourage the Navy to use abundance estimates from directed scientific studies in primary literature for modeling of population level effects of Navy activities.	
Courbis-14	The EIS/OEIS states on page 3.4-115 'The best assessment of long-term consequences from training and testing activities will be to monitor the populations over time within the Study Area. A recent U.S. workshop on Marine Mammals and Sound (Fitch 2011) indicated a critical need for baseline biological data on marine mammal abundance, distribution, habitat, and behavior over sufficient time and space to evaluate impacts from human-generated activities on long-term population survival." I am aware that the Navy helps to support a variety of research on marine mammal populations in the Hawaiian Islands. I encourage the Navy to continue to support research as an indirect mitigation strategy.	The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States. Active sonar is currently the most effective way to locate submerged enemy submarines before they are close enough to sink U.S. ships. To successfully defend against submarines and other underwater threats, such as mines, Sailors must train realistically with the latest technology, including both passive and active sonar.
Courbis-15	On page 3.4-239, Figure 3.4-15 appears to be incorrect. The text states that there were nine humpback whale vessel strikes in 2009 and four in 2010, but no strikes appear in the figure.	The text and the figure indicate **multiple species** and multiple vessel sources in the years 2009 and 2010. There were **no** Navy whale strikes in Hawaii during 2009 or 2010 which is correctly indicated in the figure.
Courbis-16	On page 3.4-243, the EIS/OEIS states "Based on the probabilities of whale strikes suggested by the data the Navy is requesting takes by morality or injury of 15 large marine mammals over the course of the 5 years of the HSTT regulations from either training activities of no more than 15 large whales from either training activities over the course of the 5 years of the HSTT regulations. This would consist of no more than four large whales in any given year." This is a confusing sentence. It sounds like the proposal is to get a letter of authorization for take of 15 large whales by vessel strike, but it is not clear what a "large marine mammal" vs. a "large whale" is. This request is broad, asking for takes across species and across populations (stocks) of species. In the past, the maximum number of whale strikes by the Navy across the entire SOCAL and Hawai'i ranges in a five-year period was ten. If the Navy were striking 15 large whales in five years, that would be a large red flag with respect to its activities in comparison with the past 20 years. This also must be considered in the context of several endangered large whale species (sperm whales, humpback whales, blue whales, fin whales, and sei whales), urging caution. I suggest requesting permission for striking 10 large whales rather than 15 over a five year period. Alternatively, I suggest that if more than ten whales are struck in five years, it should trigger an investigation into what has caused an increase in whale strikes and how that cause can be mitigated.	The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures must be estimated scientifically using complex modeling, but it is only an estimate, not a prediction. This estimate needs to encompass the capacity of what could occur to ensure Navy's permits are not exceeded. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Courbis-17	I have some concerns about the request for a five-year letter of authorization, as previous letters have been less than five years, though I understand the administrative	The Council on Environmental Quality guidance encourages federal agencies to develop internal processes for post-decision monitoring to

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	burdens and costs associated with constant permit renewals. Although I recognize that the law allowing for a five year permit requires re-authorization with the publication of significant new information, I encourage the Navy to include language in the EIS/OEIS that makes it clear that new science will be used to adjust model outputs and change mitigation strategies as it becomes available and will not wait for the termination of the permit period.	ensure the implementation and effectiveness of the mitigation. It also states that federal agencies may use adaptive management as part of an agency's action. Adaptive management, when included in the NEPA analysis, allows for the agency to take alternate mitigation actions if mitigation commitments originally made in the planning and decision documents fail to achieve projected environmental outcomes. Consistent with the cooperating agency agreement with NMFS, mitigation and monitoring measures presented in this Final EIS/OEIS focus on the requirements for protection and management of marine resources. A well-designed monitoring program can provide important feedback for validating assumptions made in analyses and allow for adaptive management of marine resources. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States. Active sonar is currently the most effective way to locate submerged enemy submarines before they are close enough to sink U.S. ships. To successfully defend against submarines and other underwater threats, such as mines, Sailors must train realistically with the latest technology, including both passive and active sonar.
Courbis-18	I am aware that the Navy has considered and discarded a list of mitigation measures described on pages 5-52 and 5-53. I encourage the Navy to reconsider sharing marine mammal sighting data to augment scientific information, minimizing as much as is possible testing and training activity that takes place during sea states or light levels at which marine mammals are unlikely to be seen by lookouts (or alternatively increasing radii of mitigation, passive acoustic monitoring for marine mammals, or wait time when marine mammals are spotted), and avoiding '"hot spots" of marine mammal activity, particularly for those animals that are listed or candidate species under the Endangered Species Act. I appreciate the value of military readiness but also believe strongly in protection of the resources and culture that make a Hawai'i unique and special place. I encourage collaboration and dialog among stakeholders and the Navy to provide the best protection to both people and the environment.	The Navy shares your desire to preserve marine life. The Navy believes that the proposed training and testing will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at NMFS Office of Protected Resources website. For a complete analysis of stranding events, please see the Marine Mammal Stranding Report, found on the HSTTEIS.com website at: http://hstteis.com/Portals/0/hstteis/SupportingTechnicalDocs/ An integrated monitoring plan for the activities in the HSTT Study Area is also planned as presented in Section 5.5.1.1 (Integrated Comprehensive Monitoring Program) of the EIS/OEIS. The Navy will continue to implement the monitoring and research programs where training and testing has been occurring to determine if there are

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		determinable impacts as a result of those activities and will do so in the HSTT Study Area associated with future training and testing occurring there. The Navy will continue to be a leader in funding of research to better understand the potential impacts of Navy training and testing activities and to operate with the least possible impacts while meeting training and testing requirements.
Cox (Electronic)	Please protect marine mammals from the effects of sonar testing as recommended by the HSUS. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Coyle (Electronic)	We can all appreciate the many jobs the U.S. Navy performs, national security and education in particular. Proposed exercises are known to cause great harm to marine life. While we are protecting the U.S.A., it seems we would want to protect the health of our oceans. My hope is the Navy will take all steps possible to minimize damage. The health of our oceans aids in keeping our country strong. Please take every marine life safety step you can. Thank You for your consistent hard work, Kate	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. Thank you for your comment.
Craddock (Electronic)	I truly do support our armed forces. I know that we need to conduct training exercises in order to further our technology, however, I do not approve of doing so in such a way that endangers wildlife. Please find an alternate solution. I know that you can find other means to ensure both our safety, and the safety of innocent lives. Thank you, A concerned and supportive citizen.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Cramer (Electronic)	I am concerned for the well-being of the marine mammals that may be impacted by sonar and other naval testing. This Environmental Impact Statement (EIS) estimates more than 1,600 marine mammals each year will suffer from hearing loss or other injury from its use of sonar and explosives over the next five years. The EIS also predicts 200 sea mammals could die each year in its Hawaiian and Southern California training and testing areas. I know protective measures are put in place but marine mammals are very important to people and hold a lot of value. Please consider the least harmful alternative.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cranden (Electronic)	I find the news of the Navy testing explosives and sonar to be both distressing and altogether horrifying. I cannot believe that our country would sacrifice and put in harm's way so many living things. These are not simply after-thoughts; they are living, breathing, feeling, thinking animals. They do not deserve this kind of careless and thoughtless mistreatment. Please reconsider for the sake of our oceans and these incredible animals we have fought so hard to protect over the years.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Crawford (Electronic)	I love my cozy life in the U.S. as a native born citizen, and I want it to continue. I value our Navy, and its role in protecting our country. But..... injuring, terrifying and/or killing the ocean animals for testing explosives and sonar is not acceptable. Please accept this message from a U.S. citizen who abhors the Navy's testing procedures in the world's oceans, and will always stand up against it. Sincerely, Valerie Crawford McMinnville, OR	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

Commenter	Comment	Navy Response
		testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cresko (Electronic)	It is AWFUL that Marine life,such as Dolphins and Whales are severely affected by the Sonar Operations. The Navy should work with NRDC to find ways to eliminate the impact on these species. I am sure the majority of the American people would agree!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. The Navy is working with NMFS, the Navy's cooperating agency and the regulator under the MMPA, to finalize mitigation measures through the permitting and consultation processes for MMPA, ESA, and other laws as required. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cullen (Electronic)	I fully support the Navy's training and testing activities to the extent necessary, regardless of any so-called environmental effects.	Thank you for participating in the NEPA process.
Cunningham-Welsh-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Cunningham-Welsh-02	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Curington	To the US Navy: Please do not carry through on your proposal to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

(Written)		
Daly-01 (Electronic)	I am saddened to hear that the U.S. Navy is proposing to conduct training exercises in the rich marine environment off the coast of California and Hawaii. These exercises would involve the use of live explosives and high-intensity sonar. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. I urge you to please do just that.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis.
S. Davis-01 (Electronic)	I have concerns about the increased use of active sonar as well as explosives and the effects both may have on marine mammals in the area.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
S. Davis-02	In addition I don't think the EIS takes into account the social and cultural impacts caused by this increase in the militarization of seas around Hawaii. By making military use the first and highest priority for the seas around Hawaii it sets a dangerous precedent and could effect other uses of the ocean space that may be more economically, culturally and scientifically valuable for the people of Hawaii. I ask that the training activities of the Navy be curtailed, not expanded.	As described in Section 3.10 (Cultural Resources), Section 3.11 (Socioeconomics), and Section 3.12 (Public Health and Safety) of the Draft EIS/OEIS, the Navy's proposed activities are fully compatible with other uses of the ocean space around Hawaii. The Draft and Final EIS/OEIS fully considers the potential social and cultural impacts associated with the proposed activities. As explained in Section 2.5 (Alternatives Development) of the Draft EIS/OEIS, the range of alternatives considered by the Navy must be reasonable alternatives. To be reasonable, an alternative must meet the stated purpose of and need for the Proposed Action. A curtailment or reduction in the number of training and testing activities would not meet the stated purpose of and need for the proposed action, and would therefore be unreasonable. The Navy is not expanding the area where training and testing occurs, but is simply expanding the area that is to be analyzed in the EIS/OEIS as part of a phased compliance approach.
De Meurisse (Electronic)	This potential disaster must not be allowed to happen. As Americans we are proud of the U.S. Navy and the work being done to protect our protectour country, but to put marine mammals at such cruel and inhumane dangerwould lead to embarassment and protests from all other concerned countries. We should protect, preserve and respect these mammals to the highest degree possible. I urge the Navy to take the appropriate action put forth in the letter. Respectfully Sheila de Meurisse	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis.
De Tavira (Electronic)	Please protect marine mammals from explosives and sonar, Thanks in advance	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis.
DeCaro (Electronic)	Please.. there are other ways to test sonic water frequency range missiles. I know there is a war on, and I know that the NAVY is terrified of the potentiality of long range missiles, but there has to be another way ... a pool or some form of testing that would not do undue damage to which the likes of which a military based operation does not seem to care about. The biological aspects should intertwine with the safety of human kind, because we are animals, with animals and although we have the potentiality to do what we think we can, this will result in hardships of which will cause a cataclysmic undue hardship and end to life to which the ecology of it tying it to our own selves will be unable to right once it is wronged. Please don't be the bad guys, I know you want to be the good	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Currently sonar is the best means of locating small objects in the water. Evaluation of these technologies continues to be a Navy focus as is research into all

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	ones and save people but this effects people too.	technologies that will protect and defend the United States.
DeFalco Lippert (Electronic)	I heard, that you are planning Sonar experiments in and around Hawaii. Please do not do so! Sonar tortures and kills whales and dolphins (as they are loosing their orientation) - and there are so many whales and dolphins living around Hawaii! Please remain sensitive to nature and it´s animals. Hawaii is such a paradise... Thank you very much! How many more whales and dolphins have to die before you admit that Navy testing is causing it???? Cetaceans face enough threats, from toxic pollution to habitat destruction to death from impacts by ships, to outright killing by humans. Stop contributing to their deaths and cease all sonar and other testing that is harming them!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Dente (Electronic)	This can't be a fair process unless communities up and down the entire Pacific coast have hearings in them. I am completely against any military expansion, any sonar at all, and war games anywhere in the world. The military is bankrupting the nation, and creating terrorists by their oppressive presence and their brutal tactics. Bring the troops home. Stop the endless war for the profit of a few. End America's reign of terror, now!	Thank you for participating in the NEPA process.
Dente (Written)	STOP ALL SONAR TESTING!! TOTAL WASTE OF TIME AND OUR TAX DOLLARS PLUS IT IS KILLING UP TO 1600 WHALES AND DOLPHINS AND MAKING DEAF 11,200 MORE. GET OVER THIS WAR MACHINE ATTITUDE!! This nation will not be "done in" by nuclear missiles from the sea, but rather cyber space attacks. Any nation will think twice before disabling by nuclear missiles because they will have to deal with millions of dead bodies. But, knocking out all our satellites is a sure way to gain control of us. Meantime go clean up the radioactive waste ready to land on our beaches any day now. Do something constructive, not destructive.	Thank you for participating in the NEPA process.
Devine (Electronic)	I would like to make the observation that the supposed benefit of the scale of sonar testing/training does not justify the potential harm to marine wildlife. History teaches us that the majority of national security decisions relating to naval matters do not largely rest on technical or technological matters. The fact that the US Navy over-obsesses about technical matters has been noted by many authors. Indeed the decisive moments of US naval history have not been decided by technology but rather by poor decision-making and a lack of understanding of opponents motives. Pearl Harbor, USS Cole, USS Maine, USS Vincennes (CG-49), USS Pueblo, Gulf of Tonkin....etc. These are not	Please refer to Section 5.3.4.1.3 (Reducing Sonar Source Levels and Total Number of Hours) for a discussion on how the Navy uses active sonar at the lowest practicable source level and number of hours consistent with mission requirements. Strike groups are constantly evaluated and exercises are modified to ensure each strike group receives the training necessary to achieve required readiness levels.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	moments when history was changed by Sonar technology but by flawed decision-making. Better to save the marine life and concentrate on wargaming and proper decision-making. Sonar is only a tool but is becoming a fixation for the US Navy. The US Navy should also push for rules limiting the use of Sonar by foreign navies as well – to be enforced by international monitoring and sanctions if rules are violated.	
R. Devine (Electronic)	Errors may sometimes represent approximations to successes or correct paths; other times errors may reveal a total lack of connection to successful paths. Errors of misemphasis or overemphasis can be very serious, as in the U.S. Navy's testing of sonar devices, seriously affecting marine life yet not responsive to a clear and present danger. While sonar is a useful, and necessary device, the over-testing of finely calibrated sonar draws attention away from more serious military matters. Over testing can lead to a false sense of preventing dangers and divert attention from the most serious problems.	Please refer to Section 5.3.4.1.3 (Reducing Sonar Source Levels and Total Number of Hours) for a discussion on how the Navy uses active sonar at the lowest practicable source level and number of hours consistent with mission requirements. Strike groups are constantly evaluated and exercises are modified to ensure each strike group receives the training necessary to achieve required readiness levels. The Navy employs new technology where feasible to reduce impacts. One example is the use of passive sonar to listen for the presence of marine mammals prior to starting a sonar activity.
Diamond (Electronic)	Please do NOT test in ocean around Hawaii and California. Do NOT see any good that can come from such knowing torture our ocean life will go through. This type of testing and training is unnecessary. Please think of other ways that will not impact our oceans and environment to do testing/training exercises. Thank You for your time. If the Navy follows through with this kind of cruel activity, I will re-consider my support and thoughts towards the U.S. Navy. I will be sharing this issue with everyone I know on all types of media available. Thank You and hope you do not follow through with testing/training in Hawaiian/California waters.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Diaz (Electronic)	To whomever it may concern: im very concern that our marine wild life will be harmed by the navy testing of sonar in our oceans please think about our marine life whichis already been harmed by the E-230xtinctionE-230 as well excessive testing in the ocean waters. Stop the testing and save our marine life from E-230xtinction. Let our marine life live in peace and not in misery. The marine life is here for us to enjoy and not to destroy.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at

		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Dietrich (Electronic)	I am outraged at the navy's action towards our marine life and oceans. Using DISORIEBTING Sonar should not be used at all anywhere in the world. This is directly directed at all sea life, especially our marine mammals and other human species. I cannot believe that our own Navy is involved in the permanent destruction of our Whales, Dolphins and other Marine Life, destrying family after family with Sonar and also Target Practice. Who knows what else is being done to those highly intelligent creatures. I urge the end of this plan for a five year expansion to destroy our Pacific/Atlantic Coast. This inhumane practice needs to end. No more Sonar Killings of our earths mammals. Please Respect our Oceans.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. It is important to note that the Navy uses sonar not only for testing, but for training. In fact, the majority of the sonar use is related to training, training that is essential to the preparedness of deploying forces.
Disch (Electronic)	Please refrain from the planned bombing and detonation of explosives in the ocean. It will cause irreparable harm to marine species. It is cruel and unnecessary. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Doak (Electronic)	We must stop pretending that the effects of our human actions are unimportant and that the value human life is greater than other life, it is not. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to

		whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Dobson (Electronic)	Please stop the undersea high frequency, or at least redesign it in a way the does not harm whales and dolphins. Your own estimates of killing 1800 whales and dolphins, and deafening as many as 15,900??? How are we any better than whaling nations like Norway and Japan? We aren't. The United States is being covert and hypocritical in allowing this. Naval practices are much more lethal to endangered sea life than any other "whaling" nation. This is WRONG.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically Navy records have had few to no mortalities from sonar or explosives. Any model predicting takes is only an estimate. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Dooley (Electronic)	Please do not begin testing in the waters surrounding Hawaii puting any of these precious and amazing animals at risk of injury inCluding hearing loss or worse yet - death. The animals of this area are unbelievable and should NOT be put at risk for any reason. This is such a God given specacular environment and it should be preserved.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

B. Doyle (Electronic)	I have recently read about the Navy's plan to use sonar testing which will damage hearing on whales and dolphins which will result in a slow lingering death to whales and dolphins whose existence now is hanging by a thread, a thread which connects all of us. We humans have done so much damage to this beautiful planet. The creatures on this	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	planet are to be revered and respected and yet we continue on with species disappearing on a daily basis. What is going to be left for future generations? Why do you need to test battle equipment when we are not at war, except a war in which the creatures and the environment on this planet struggle to survive in spite of damage caused by man to the environment. Every time a military "test" is conducted, every time a gun is made, every time a warship is launched, every time a rocket is fired steals from real things needed on this planet, including the whales and the dolphins you seek to destroy. Furthermore you are not spending and wasting just money and destroying endangered species, you are spending the work of people who should otherwise be helping this planet, you are taking the genius of its scientists who should be finding ways to save the environment and you are taking away the hopes of its children who should be able to see beautiful things in the world. Further as a taxpayer, and as someone who pays your salary and benefits and healthcare and pension and retirement and who also pays for the equipment you use and as someone who works 2 jobs to do so and as someone who cares about the environment, I am requesting a written response from you as to why this testing is being done and as to why these animals mean so little.	decade.
E. Doyle (Electronic)	I fail to see the long-term term benefit of endangering a species that are already under a great deal of pressure. I urge you to reconsider.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Dozier (Electronic)	I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree by taking certain steps. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. (Electronic)		
Dressin (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours, Aaron Dressin	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Duggan-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Duggan-02	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Duncan (Electronic)	I am very concerned about the impact your testing will have on our precious marine mammals. There is so much destruction and toxicity already in our oceans. Please reconsider and make the best choice for all of life.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Dux (Written)	I find it an insult that the Navy should use the word "Green" or insinuate that it is such to boost its tarnished image. We are all aware of the damage this branch of the military has	Thank you for participating in the NEPA process.

Commenter	Comment	Navy Response
(Electronic)	the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours, sophie ebert	the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Ebrahimian-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Ebrahimian-02	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from

Table E.3-4: Responses to Comments from Private Individuals (continued)

Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
D. Evans-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

Table E.3-4: Responses to Comments from Private Individuals (continued)

	communicate and survive.	with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
D. Evans-02	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
E. Evans-01 (Electronic)	The U.S. Navy is proposing to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. These exercises would involve the use of live explosives and high-intensity sonar. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. THIS IS NOT EXCEPTABLE! The careless project would not just kill a few already ENDANGERED marine mammals but thousands! What will there be left?? The environmental impact would be devastating!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as

		presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded few to no mortalities from sonar or explosives. Any model that is meant to predict future takes on marine mammals is only an estimate.
E. Evans-02	This not only affects all ocean animals but humans as well! Not only do oil spills and Asian countries such as China and Japan hunt hundreds of whales and dolphins and other marine mammals. But THE UNITED STATES OF AMERICA is posing a threat worse??? The navy is a brave organization and does many things for our country but this new proposed plan and the effects it will create is just wrong!! I thought we were smarter and more civilized them that! America wants to help the earth not destroy it! That's what makes out country great! We take into consideration things other countries don't! Well this proposed act is NOT doing anything to help the country but destroy part of the planet EVERYONE shares!!! God made this planet all the animals, the enviorment the fish in the sea Everything! It's not meant to be risked or be destroyed. We are smarter then that! I pray this act gets overturned! People who swim in the water will be exposed to the harmful effects as well! The fish that humans eat from the ocean will be contaminated with radiation as well leading humans to be internally affected!!This new project is not a far cry from the numerous atom bomb tests in the 50's. Except it will permantly damage much more! PLEASE PLEASE consider differant options for this project! All of us share the planet animals and humans! Please help it to be better for the future!!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy used the best available science and a comprehensive review of past, present and reasonably foreseeable actions to develop a robust Cumulative Impacts analysis. See Chapter 4 of the EIS/OEIS.
K. Evans (Electronic)	THIS IS SO DISRESPECTFUL TO THE BASIC RIGHTS OF THE OCEAN, AND THE INHABITANTS OF THE OCEAN, AND THEREFORE ALL LIVING THINGS BECAUSE WE ARE ALL CONNECTED AS ONE LIVING EARTH. FOR GOD'S SAKE, PLEASE STOP THIS INHUMANE BEHAVIOR/PROCEDURE!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Fain (Electronic)	I can appreciate how live testing is a better form of training, but the detrimental consequences to marine and mammal life are so great I am against this training and testing program. Sincerely, Marla Fain	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Fallon-01 (Electronic)	I find it appalling and deeply disturbing that this level of damage to marine creatures is being contemplated. There must be some way, or hopefully many ways, to reduce these terrible consequences.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Fanizza-01 (Electronic)	Unbelievable,that our own Navy would cause such pain and death for our marine mammals. You must stop!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Farhadi-01 (Electronic)	When I heard about the U.S. Navy's Environmental Impact for training and testing in the ocean around Hawaii and California during the next five years I was shocked. I wish to be added to the petition to stop such activity. Thank you!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Fergerstrom (Oral-Hilo)	Please excuse me. I am grossly unprepared for this. I did not even know of this meeting or that the process had gone this far until yesterday afternoon. One of my major concerns is, is that I've been involved with the military buildup here in the islands. Aloha.	The Navy shares your desire to preserve marine life. The Navy believes that the proposed training will not pose a risk to marine mammals, fish, and other wildlife given that these same activities have

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	My name is Hanalei Fergerstrom. I am a spokesman for Na Kupuna Moku O Keawe, which encompasses all six major districts of the island of Hawaii. So for those of you who do not know, this is the council of the elders. I'm also a haumana of the Heiau O Lono. This is a religious organization (inaudible). Anyway, I have been involved with the military buildup here for over 12 years. I was involved with the low sonar frequency testing that was done here, I believe, about 12 years ago. I actually filed suit against the Navy. During that time, my suit was denied because it was basically moot. You were just pulling out of Hawaii. But I am on your mailing list, so I am very shocked that this has gone this far and I have not been provided with information. As you know, information is critical for a proper response. I have been working with different branches. I've spent the last two years working with the Army on the Pohakuloa buildup, which is actually coupled with this in some fashion or form. Again I'm a little bit outraged because I do not have this information. I am grossly unprepared, but I have to try to do something. I have been successful in getting myself on the mailing list. People are aware of me. I've been promised a hard copy because I need the hard copy to make a proper response by your July 10th deadline. Of course when I looked at your timeline, this has been going on for quite some time, and if I had had this information from the start, perhaps I would not feel so intimidated and overwhelmed. One of the things that is extremely important to add into this fray of things is that the environment includes me. I am a part of this environment. The Hawaiian people, the Hawaiian Islands are part of this environment. It is not just the ocean. Secondly, because a lot of this testing that is going to be done or this project that is going to be deployed is going to be done in large part in international waters, and when you talk about in the EIS, it affects many countries -- and I refer to subjects such as RIMPAC -- that other countries also need to be informed of where you are and participate in the EIS process because it affects all the Pacific region. Sorry. You threw me off with that one-minute thing. Please don't hold me to that. As long as we make sure, I'd like to utilize the time. Again I am grossly unprepared. I did not find out about this meeting until last evening. And interestingly enough I went to the Pacific Command to try to get some information, and Google cited it as an unsafe link. That's something that you should be aware of. As I said 12 years ago, the kohola and the nai'a that are the most impacted that have been most frequently (inaudible) are not just large fish. They are my family, my blood, my blood, which can be established through the Kumulipo, the Hawaiian creation chant. I am also a Hiapo Na Koa O Pu'ukohola, or the Warriors from the Mound of the Whale. So we are very familiar with this. We are very, very concerned that a whole lot of things are not being considered. You refer to the larger species of mammals like the porpoises and the whales, but we are island people, and so the effect on smaller fish and the crustaceans and how it affects -- Okay. So you see the problem we have here, not being able to talk about this because how can you possibly do this if you're constantly cut off after three minutes? Thank you, and I want to register my objection. Thank you.	been conducted for many years in this Study Area and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. The Navy is not aware of any documented cases of sonar harming people.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Ferry (Electronic)	I am in the UK - I volunteer for a charity which rescues stranded marine mammals. Have you ever seen a whale up close, & tried to help him survive? No, I think not. All animals are precious, as humans we are responsible for caring for them & protecting them, not continually destroying them & their habitats. You should be ashamed this activity is even being considered. You need to rethink your plans, with immediate effect.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Firestone (Electronic)	Please do not do this! These beautiful animals have a right to live in their ocean without being killed or deafened by YOUR TESTING. This is their home, not yours.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Fischer (Electronic)	Please do not allow any marine life to be damaged in any way by any training, testing, or drills of any kind. I am very pleased to see that the Navy does have a program in place to protect marine life. My sincere hope is that this program is implemented and carried out with the highest standards of integrity,and that integrity will be unfaltering. Marine mammals are threatened in so many ways at this time. We must all protect these species from any further abuse. I thank the Navy for stepping up to the plate, and responding with a program to protect these precious creatures. Most Sincerely,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Antoinette Fischer Wife of a Wartime Navy Veteran	Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
K. Fisher (Electronic)	Please cease and desist and do not further plan to test explosives and utilize sonar and other devices which will disrupt and harm Marine life, particularly cetaceans.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
S. Fisher (Electronic)	Please DO NOT conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. There is no need for the use of live explosives and high-intensity sonar that kills our ocean life. They have just as much right to live freely without threat as all the humans of the earth.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Fitting-Gifford (Oral-Kauai)	I haven't had the opportunity to read your draft environmental impact statement in completeness, but I did notice one particular little item. And I hope that the rest of the report was not done with as much brevity and lack of concern as this one. It's on page 13, and it's about social economics. And it reads, Impacts from the proposed action on social economic resources would be short term and temporary and, therefore, negligible. If we look back over the economic impact of having the military here in Hawaii since 1940, later, during my lifetime at any rate; I think that we find that the social economic impact is tremendous. The report talks about the practice in bringing people out here to serve and giving them practice in different techniques on the way out. But they don't say	The Hawaii-Southern California Training and Testing EIS/OEIS Proposed Action does not include any actions that result in individuals being based permanently in the Study Area; therefore, no analysis of the economic impact of real estate is warranted. Other socioeconomic issues are described in Section 3.11 (Socioeconomics) of the EIS/OEIS.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	anything about taking them back. And our habit has been here that when someone comes to Hawaii and loves our country as much I do, that they don't want to go home. And one of the impacts, the long-range impacts, is certainly the governor's and the state deciding that we should take a thousand acres of our farmland on Oahu and turn it into houses for people to live in. Clearly the military has contributed significantly to the demand for homes on Oahu, if not here on Kauai as well. Hence, I would like to see in particular this item expanded and some of the ramifications of our social economic policies as far as the military goes in terms of permanence be considered more fully. Thank you.	
Flagg (Electronic)	I support the following statement by Dr.Gans: There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Most sincerely, Patricia B Gans MD	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Folman (Electronic)	Please stop the abuse of marine mammals through the U.S. Navy !!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

Denise Foster (Electronic)	I am here to raise my voice for those who can not speak for themselves to STOP the US Navy's War Technology and War Game Expansion that is directed to destroy all Sea Life & Marine Mammals!! There is NO need to "test" ANYTHING with sonar! YOU ARE KILLING MINDS OF THE OCEANS!! I'm sure you wouldn't like it! WHY DO IT TO THEM?!! PLEASE STOP ALREADY! ENOUGH IS ENOUGH!!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
David Foster (Electronic)	I understand national security, but is the risk that great that our Navy has to bang its sonar so loud that it disorients and damages the creatures in the sea? I work with a former sailor and he thinks not. Yes, he's just one and I am just one, but collectively we are all. What is done must be done for the good of all. I am not convinced that these "war games" and sonar tests are necessary due to such a great threat. Do we really have an enemy what will attack us from the sea? The enemy can get to us without that and proved it on 9/11/01. Do we really have intentions of attacking another country? There is no winner in war. If we destroy the sea life, we destroy ourselves. Man must evolve and stop leading us all to extinction. We don't inhabit this planet. We are an integral part of the Earth life system. I would hope that the one that claims to be the most intelligent species on the planet would not responsible for destroying it. Sincerely, David J. Foster	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of

		significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Currently, sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Peter Foster (Written)	Opposed.	Thank you for participating in the NEPA process.
Fox (Electronic)	Please mitigate and reduce the impact of sonar and explosives testing on dolphins and whales. These are intelligent creatures whom we, as the superior species on the planet, are charged to protect over the long haul. We must protect them! I recognize the need for military testing but the protection of the environment and sea life must be a priority too. We are all on this planet together. Do you want dolphins and whales to be here 500 or 1,000 years from now for example for our descendants to enjoy and interact with? I certainly do. So we must shepherd them carefully now.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Franco (Electronic)	I live on the ocean, my work involves photographing and documenting any cetaceans I come in contact with off the Western Coast of Oahu. The idea that we are injuring the animals we learned Sonar from simply befuddles me. I've read the reports and done my research and am still opposed to this proposal.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Free (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours,	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. Freehill (Electronic)	This comment is about the Navy Sonar Warfare Testing program in the Pacific. There is ever increasing evidence and clear indication that simply turning off sonar tests when marine mammals are visually spotted is not sufficient to protect them from serious injury and death resulting from these tests. This testing is devastating to vast numbers of marine mammals. Knowing this, I can only implore those reviewing this practice to immediately STOP these tests. They are injuring and killing precious and defenseless marine mammals. I refer you to NRDC article documenting this "staggering" and severe harm here: http://www.nrdc.org/wildlife/marine/sonar.asp and here: http://switchboard.nrdc.org/blogs/zsmith/harm_of_staggering_proportions.html The WASHINGTON POST stated that: (Associated Press) May 11, 2012 – "New Navy study says use of sonar, explosives may hurt more marine mammals than once thought "…HONOLULU-The U.S. Navy may hurt more dolphins and whales by using sonar and explosives in Hawaii and California under a more thorough analysis that reflects new research and covers naval activities in a wider area than previous studies…" "The Navy estimates its use of explosives and sonar may unintentionally cause more than 1,600 instances of hearing loss or other injury to marine mammals each year, according to a draft environmental impact statement that covers training and testing planned from 2014 to 2019. The Navy calculates the explosives could potentially kill more than 200 marine	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	mammals a year" Please tell us how, with this brutally painful injury imminent and clearly KNOWN, the Navy can continue this destructive warfare testing? “Mass dolphin deaths in Peru caused by acoustic trauma” were announced by “…Dr. Carlos Yaipen Llanos of ORCA in Peru informed Hardy Jones of Blue Voice that acoustical trauma is the cause of the Mass Mortality Event (MME) that killed an estimated one thousand dolphins along the coast of northern Peru in March 2012…”. Digital Journal News Report – “Mass Dolphin Deaths in Peru Caused by Acoustic Trauma” May 17, 2012 - Read more: http://www.digitaljournal.com/print/article/325075#ixzz1vnKmJkGL http://www.digitaljournal.com/print/article/325075 This is another reason to begin to limit sonar, laser, radar, and electromagnetic weapons testing in the Atlantic, Pacific, and the Gulf of Mexico. Some more documentation here about the connection between tests and MARINE MAMMAL STRANDINGS ASSOCIATED WITH U.S. NAVY SONAR ACTIVITIES April 2012: http://hstteis.com/Portals/0/hstteis/SupportingTechnicalDocs/Marine%20Mammal_Stranding_Report_v02.pdf Thank you for your attention and serious consideration of this comment & grave matter. May true honest intelligence & moral compassion guide your decisions in this matter.	whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, “(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching.” When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60’. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in “calm sea conditions” is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier’s and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the “one or two personnel” described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy’s reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.

Freeland (Electronic)	Thank you for taking the time to read this letter and authentically consider its message. And thank you for the in depth assessment the Navy has produced in its EIS report regarding the impact of sonar weapons testing on marine mammals and seabirds in the Pacific region. My father served in the Navy in the Korean war and I am grateful to those who serve in the Navy for any contributions they have made to make the world a better place. However, when it comes to the issue of underwater sonar testing which include underwater detonations, explosions and high frequency sonar blasts, I have to voice my opposition. Who will defend the defenseless sea creatures and eco systems of the ocean from these violent disruptions? As stated in the Navy assessment, many deaths of dolphins, whales, and other marine mammals will result from escalated sonar testing, as well as lung and gi tract damage and traumatic stress. This level of stress will affect mating and the robust propagation of these species. In your assessment, however, you did not calculate the toll of human suffering. When large numbers of deaths and declining populations of of these majestic marine mammals occur, consider the psychological suffering it will incur on people who love God's creatures. There is a highly evolved level of communication and empathy between humans and the dolphins and whales. If the tax dollars of millions of Americans continue to be used to fund weapons systems that aggressively and violently disrupt the eco system of the ocean, it could result in a domino effect of population decline and down the road, possible extinction, of these vulnerable populations of marine mammals and other sea creatures. If this occurs, all humanity will suffer a profound loss. To ponder the loss of these majestic marine mammals tears at the very fabric of how humans make sense of the meaning of life. If being alive as a human being on this planet means that we helplessly participate in the perpetuation of endless conflicts, ceaselessly manufacturing weapons of destruction to blow up underwater, overwater, in the air and everywhere we can manage to explode something, with the end result of polluting and destroying the very air, water, food and shelter that we depend on for life ...then why even be here at all? Is this how God intended for human beings to "steward" His precious creation? Just reading the Navy report on projected mortality rates, damage to the lungs and gi tracts and traumatic stress to dolphins, whales and monk seals, actually makes me physically ill. We live in	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

	Hawaii where the economy is driven almost exclusively by tourism. Can you imagine dying dolphins washing ashore on Waikiki beach witnessed by hundreds of shocked visitors? Can you imagine hundreds of live videos being beamed instantly around the world showing people the world over this tragedy? Can you imagine what may happen if people realize they have been paying the government 60% of their tax dollars over a lifetime of dutiful IRS contributions - to fund this insanity? It's not humane, it's not necessary, it's not right, it's not pono. It's a nightmare. The dolphins, whales, monk seals, turtles - they are a part of my family. You are using my money to kill my own family. That is an outrage. The US spends more money on "defense" than 60 major countries combined. We see that our government is building up a military presence in the Pacific. We see that the Navy is planning on escalating the sonar testing three fold. I am a Hawaii resident. I don't want the Navy to continue to detonate explosives in the ocean waters surrounding the Hawaiian islands. I don't need that to happen in order to feel safe, secure or protected. As a matter of fact, underwater military explosions and sonic blasts create the opposite feeling - that the ocean is no longer a safe place to fish and to swim, that the very balance of the oceanic realm is being violently disturbed and that makes me feel personally violated. I want the killing to stop, I want the destruction of the ocean to stop. I want this madness to end. No more detonations, explosions, drilling, mountaintop removal, poisoning and polluting. It must stop. If we have any interest at all in leaving behind a world worth living in for our children's children and beyond. We must shift our global attitude from "Every man for himself" to "We're all in this together". Again, in regard to the continuation and escalation of Navy sonar weapons testing in the Pacific ocean, I am appalled at how my tax dollars are being used. It implicates me and every other tax paying American in the destruction of the planet and the killing of defenseless marine mammals. Respectfully, Candace Freeland Kapaa, Kauai, HI 96746	
Freeman (Electronic)	As a concerned voting citizen, I strongly wish to register my wishes that no, repeat NO, whales, dolphins or fish be injured, impacted or killed by any actions of the US Navy or other military groups. Thank you!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Freitas (Electronic)	To whom it may concern, Almost everybody agrees that we need a robust and strong Navy to protect national security. And almost all of us agree that whales, dolphins, and porpoises deserve to live and to have a healthy ocean environment. We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Pleaser consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please re-think your plans and incorporate additional protective measures. Thank you. Sincerely, Tatiana Freitas	The Navy shares your concern for marine life. Gawboy (Electronic)	Hello U.S. Navy, I will comment on your plans to expand on the 5 - year Warfare range in the oceans surrounding the United States of America. I have read a tremendous amount of information on the subject, and I have attended a meeting with representatives from the Navy talking to the public at the Wharfinger building in Eureka, California. I met someone who saw the whale that traveled up the Klamath river that later died there. We know that the sonar testing is hurting the cetaceans in large numbers and this is unacceptable to me and many others. We know that a lot of the bombs that are tested and even ship cleaning procedures pour toxins into the ocean. Maybe some people think the ocean is big enough and can take it. But we know that there are now huge dead zones forming in the ocean. We eat fish from the ocean and they are becoming more toxic due to many things including pollution from the Navy. I know that even the oceans have a finite ability to take our abuse and keep the wildlife thriving. There are other ways to protect this nation besides more bomb and sonar testing. One is to actively developing peaceful, fair, and just relations with other nations. We need to be spending more money on communicating, and rearranging our priorities so we do not have such fearful "enemies". We are smart enough as a people to do this. We are aware that there are some corporations that make a lot of money selling weapons and when they are used by testing, more have to be made and sold. I am saying that the motive for polluting our oceans, damaging our wildlife, and threatening the health of our people may not be based on our protection, it may be based on greed. I do not fear these other nations, more than I fear the system that allows you to pollute and harm us so severely. So I am asking you to create a new policy, that will instead protect our oceans and in turn the health of the people of our nation. Like I said before, we need to make a concerted effort to make peace, that is the best defense. I understand that some people are not ready for peace and we still need a military that is well trained. I have faith that we can protect ourselves without escalating our use of weapons. The other point is that if we keep testing at this rate, there will be no nation left to protect. So you just need to come up with healthy alternatives to protecting this land, sea and nation. Give us a chance to restore the health of our surroundings. That would be the best defense. Thank you, Stephanie Gawboy P.O. Box 871 Redway, CA 95560	The Navy is not proposing to expand the areas in which it conducts training and testing. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, “Today’s simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments.”
Geddes (Oral-Kauai)	My comment was somewhat the same because I go halfway to the bank. So it's a 13-hour run and 13 hours back. And so the ops, I get a hold of some of my buddies on the base, yeah. And they let me know. But if there was an easier way because sometimes it's hard to get ahold, and then the schedule gets changed, and we get kicked out. We got to go 80 miles south, and then we get ahold of da kine Honolulu Coast Guard then maybe day, day and a half, and so a couple days where we no can fish 'cause, you know, so it's a mile and a half deep. And halfway bank, you know, it's all about the up, you know, the up, the shallows. And so yeah, just give us a better, some way to know your scheduling of your practices. One other comment. Please don't get mad. A lot of	Navy training and testing activities have the potential to temporarily limit access to areas of the ocean for a variety of human activities associated with commercial transportation and shipping, commercial recreation and fishing, subsistence use, and tourism in the Study Area. As discussed in Section 3.12.2.1.1 (Sea Space) of the Draft EIS/OEIS, when training or testing activities are scheduled that require specific areas to be free of nonparticipating vessels due to public safety concerns, the Navy requests that the U.S. Coast Guard issue Notices to Mariners to warn the public of upcoming Navy activities. Training

Georgi (Electronic)	(1) Noticed one typo on page 365 of volume 2. The name of the port on Kauai is Nawiliwili, not Hawiliwili. (2) Other than that, the EIS is reasonably thorough, and alternative 2 represents a good balance of protecting our national security interests versus endangered species, etc. (3) In the past, I worked at PMRF for 16 years and saw major exercises delayed (once for 2 days!) because marine mammals (whales) were in the operations area. (4) The Navy tries to stay 1,000 yards away from marine mammals. If a skipper gets too close, it can end his/her career. On the other hand, whale watching vessels are allowed to approach to 100 yards of whales...and if they get closer, the crew may get bigger tips! The encouragement of whale watching is far more dangerous to the whales than the proposed Navy actions under the EIS!	Thank you for your comment. The error you pointed out has been corrected.
Germano (Written)	Opposed. Stop what you are doing. You have no respect for the ocean. Hawaii is a natural country. You military forces yourself on our country. We do not need you to destroy the life of our air and ocean. The only one that want war is you. This ocean belong to those whom love Mother Nature.	Thank you for participating in the NEPA process.
Gherini (Electronic)	Please don't do this. These creatures are part of California and America's population, and I cannot proudly say im an American and let this happen.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in

Gibson (Oral-Hilo)	I'm Inga Gibson. I'm the Hawaii State Director with the Humane Society, United States. We will be submitting formal written comments, but I wanted to make a few comments for the record, if I may. We are very concerned, obviously, with the potential impacts on marine mammals and other animals in the Pacific and Hawaii. We're especially concerned about the potential permanent and temporary hearing loss, lung injuries, gastrointestinal injuries, and death. We understand that there's no presentation or analysis of alternatives at this time that would in any way significantly reduce the unprecedented impacts and level of harm to these marine animals, many of which are protected under both the MMPA and the SMR, or in some cases are critically endangered, such as the Hawaiian monk seal. We are concerned with the Navy's mitigation scheme, centered on the ability of lookouts for whales and dolphins, and do not believe that it will result in an appreciative decrease in marine mammal take. Furthermore, we are concerned that the Navy appears to dismiss what is acknowledged to be the most effective means to reduce marine mammal take and avoiding areas associated with high marine mammal density. That, again, is what we would like to see, is an avoidance and a better scheme in avoiding altogether some of the areas where there is strong marine mammal presence. We also encourage the Navy in their continued efforts to be seen as an effective steward of the ocean environment to take steps to significantly reduce the level of harm in training and testing activities. Again, we'll be submitting formal more detailed written comments. There is also concern about the significant increase in the proposed takes under the new DEIS from the prior EIS and the numbers of animals potentially impacted. Also a concern with the verification of take, and the methods used to verify take, if that is even verified. Again, thank you for this opportunity.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Gitzel (Electronic)	Please, please, for the mercy of the living creatures who reside in the ocean STOP THE UNDERWATER SONAR/SOUND TESTING. The US military is without question, the strongest, most advanced military on our great blue planet. It is now time for our great military to make its future technical advances in humane ways. As a future resident of Hawaii, I speak out for the whales and dolphins who cannot be heard but who CAN HEAR YOU. They are suffering greatly from the effects of underwater sonar. Dolphins and whales use sonar not only to navigate, but to communicate with each other. Our sonar testing, much louder than their own voices, drowns out their own calls, destroys their hearing, and can lead to loss of life. Please, please be conscious of how sonar testing affects them and cease this practice. We can use our technical prowess to create lab environments to test our equipment. Thank you sincerely for your consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Gobioff (Electronic)	It is outrageous any action would be taken that would put whales and dolphins in harms way	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to

Goodwin-01 (Electronic)	Of course, the marine ecosystem would be best served if the Navy cancelled this exercise. That decision makers conclude that there are overriding consideration is a	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	topic for another venue: Is it possible to simultaneously prepare for war and prevent war? The Navy and NMFS by admission don't understand the current level of health of the eastern Pacific basin ecosystem and are guessing at the impacts of this exercise. For a scientifically correct and ethical study there must be research and data collection to establish a baseline against which future studies can be measured.	Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy has used the best available science in the development of this EIS/OEIS.
Goodwin-02	The Navy needs to be more aggressive in publicizing the scoping sessions to promote community awareness and participation. An item on the back pages of one newspaper is insufficient when there are many media, government and civic organizations that can get the word out. The Nay plans only one scoping session on the west coast, in San Diego. They should occur in communities north through California and Oregon where impacts from the exercise may be felt.	NEPA requires federal agencies to provide opportunities for meaningful public involvement. For this EIS/OEIS several opportunities have been afforded the public to become involved beginning with the 60-day scoping period that commenced with the publication of a Notice of Intent to prepare an EIS in the Federal Register on July 15, 2010. Advertisements were also published in local newspapers. During the scoping period, six public meetings were held where Navy staff members were available to answer questions and take comments from the public. In addition to holding scoping meetings, the Navy made significant efforts to notify the public to ensure maximum public participation during the scoping process, including the distribution of stakeholder notification letters, postcard mailers, press releases, and newspaper display advertisements. The release of the Draft EIS/OEIS initiated a 60-day public review period. The Navy announced five public meetings in the Federal Register and local newspapers. These public meetings provided members of the public opportunities to learn about the proposed action and its potential environmental impacts and comment on the Draft EIS/OEIS. The public was also offered the opportunity to comment on the Draft EIS/OEIS via an internet web site and via the U.S. Mail. Comments received during the scoping period were considered in the development of the Draft EIS/OEIS. Comments received on the Draft EIS/OEIS have been considered in the development of this Final EIS/OEIS.
Goodwin-03	Because the proposed exercise is more intense in its use of sonar and explosives than anything before attempted, the Navy should instead maximize computer simulation practices to mitigate harm. The Navy should conduct minimal as possible exercises as far from marine habitat, especially habitat of endangered species, as is possible.	As described in Section 2.5.1.3 (Simulated Training and Testing), the Navy currently uses computer simulation for training and testing whenever possible. Computer simulation can provide familiarity and complement live training; however, it cannot provide the fidelity and level of training necessary to prepare naval forces for deployment. The Navy is required by law to operationally test major platforms, systems, and components of these platforms and systems in realistic combat conditions before full-scale production can occur. Substituting simulation for live training and testing fails to meet the purpose of and need for the Proposed Action and therefore was eliminated from

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		consideration as a mitigation measure.
Goodwin (Written)	I'm appalled to hear about the proposed testing because of the impact it will evidently have on the hearing and very lives of so many precious whales and dolphins. It's hard to believe that the extensive damage to these mammals is worth the benefits gained from the testing. PLEASE... do not proceed with this testing. Thank you very much. Lori Goldwyn	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Grant (Electronic)	How will destabilizing an ocean ecosystem by deafening or killing marine mammals contribute to our security? If we cause the collapse of our fisheries with the resultant loss of jobs and food sources, how are we safer? It's already well established that the fisheries off our coasts are strained and nearing depletion. This exercise will only hasten this demise. It's time to step back and really analyze how we defend ourselves and our coasts without harming the ocean ecosystem.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

Table E.3-4: Responses to Comments from Private Individuals (continued)

		with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy has conducted training in these operating areas regularly for approximately 60 years. Though the intensity of live training will increase, the events are of relatively short duration and therefore the Navy does not anticipate that fish will be affected as a result of the training exercises and testing activities. Fish may respond behaviorally to sound sources in their hearing range (most Navy sound sources are not in the hearing range for most fish species), but this reaction is only expected to be brief and not biologically significant. Most commercially important fish species are not believed to hear mid- and high-frequency sound sources which make up the majority of sound producing activities.
Gray (Electronic)	I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historic records from the Navy show few to no mortalities from sonar or explosives. Any model used to predict numbers of animals affected is only an estimate.

Greenwood (Electronic)	As a concerned citizen, educator, ocean & environmental health instructor, I feel compelled to address your ongoing assault on our ocean's health and the well being of all sea life. I feel equally perplexed at your decision to double warfare training exercises for a 5 year period and your aggression toward our oceans. Just who or what are we at war with? Whales? Seals? Fish? Dumping countless tons of toxic chemicals into her waters, and killing whatever life might get in your way just does not humanly make any sense. Enough is enough. When will the military ever figure that out? I deploy you to double down your trainings, take the exercises BACK to pre-2008 levels and protect our oceans, NOT blow the hell out of them. Our oceans, which support ALL life on our fragile planet, are under severe and relentless attack from over-fishing, to pollution, to carbon sequestration which turns our waters more acidic. Our inter-tidal zones are dying, our coral reefs disappearing, our large fisheries, already GONE. So does this vast emptiness just look like a playground to the Navy? An empty stadium for the global gladiators to flex their muscles, scream their insults and destroy life and peace in nature? We DO NOT need more toxins pumped into our air or waters by the Navy's desire to flex and dominate. At these times of severe budget cuts throughout education, health care and assistance for the elderly, I find your wanton doubling of exercises and its expense insulting and abhorring. Our economy is still attempting a recovery and at the time of your decision to double exercises, was at a state of collapse. Yet, you pushed on at the expense of life, of education and health and the well being of all. This hellbent attitude of destruction and vast waste of much needed financial resources must end. Why do we need this constant drive to KILL, to CONQUEST, to DEFEND? What enemy are you truthfully fighting? The whale, the dolphin, the salmon, the seal? OUR CHILDREN'S FUTURE? Your actions on these matters leave me speechless and angry. Why can't we truly BE a country which leads by example, a country which values life, which values our oceans, our forests, our environment? "Taking" life from the ocean to study the effects of blowing them up is insane. Stop stop stop this madness! For the future of our children and their children and their children, leave the oceans alone, to heal, to replenish, to continue to bring health and well being to all life on Earth. I ask you to cut back your training exercises to pre-2008 levels, and to immediately stop polluting our waters with your toxic chemicals and your doubled fossil fuel emissions. Stop! If a private citizen were to act in the manner you act, that citizen would be locked up for years. Look in the mirror, truly ask yourself what good will be accomplished in having a strong Navy, a trained Navy if there are no oceans to sail, no planet to protect. There you go, how about defending and protecting the health of the planet and NOT the corporations which make their money off of WAR! Enough is enough. As you look in that mirror, ask yourself why you treat our Mother Earth and Mother Ocean with such contempt and uncontrollable harm and destruction. It makes NO SENSE. Leave HER alone, to heal or I fear, we shall ALL perish from your actions. For the Earth, Education & Peace Len Greenwood	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Griffith	I am horrified at your disregard for lifeforms other than our own. Most, if not all, of the	The Navy is committed to protecting the marine environment during

(Electronic)	animals you will be affecting are on the endangered species list, and those lives are just as valuable (if not more so) than a human's. With such superior intelligence that we humans have been blessed with, one would think that the US Navy would be able to come up with a better plan--one which doesn't wipe out or handicap tens of thousands. The species that you would kill and endanger are crucial to the underwater ecosystems they live in, and without them, our world would be in chaos; it already is in chaos from the damage we've done. Please don't cause such harm for your own means. I have a deep and profound respect for the Navy that supports and protects my country. I also have an equally deep and profound respect for our planet--one that friends and enemies alike must share--and I truly hope that the US Navy keeps that in mind. The consequences of what you are planning to do are not worth the means that you would achieve. Find another way; one that doesn't harm the innocent.	the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Groeber (Electronic)	It is known that the use of sonar and explosives in naval maneuvers threatened the lives of marine mammals and fish. Since many species of marine mammals are threatened with extinction, I can not understand that use of sonar and explosives are required for these exercises. Don't inflict such damage to the habitat ocean for only a maneuver!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Hale (Electronic)	Please consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Thank you for your time and consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Hammonds (Electronic)	The US Navy has released its initial Draft Environmental Impact Statements for the next 5-year round of permits it will seek from the National Marine Fisheries Service for its at-sea training activities. I would ask the NMFS to place an extremely high priority on the protection of marine mammals as it reviews the permit applications. I note with alarm that the numbers of marine animals expected to be affected have skyrocketed. The Navy's estimate of the number of animals whose behavior could be affected has jumped from 770,000 to 14 million, including 2 million cases of temporary hearing impairment, in addition to 2,000 animals experiencing permanent hearing loss. And, the Navy estimates that explosives training and testing could kill 1,000 animals. This is simply not an acceptable level of take. Marine mammals are extremely valuable creatures and we don't know enough about them to risk causing them this level of harm. This action, without substantial mitigation, is outside ethical boundaries. There is a solution that would balance national security needs with the need for environmental protection. So far, the Navy is refusing to set aside areas of high marine mammal density where sonar should not be used. NMFS should take every possible step to require the Navy to change its position on this. Sensitive breeding and foraging habitats and biologically unique areas within the training area must be protected from use for sonar and underwater explosives training. Safeguarding specific areas of sensitive habitat is the best way to lessen harm to whales and dolphins from sonar and other activities. I understand the need to balance national defense with protection for the environment.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. The Navy is proposing to implement several mitigation measures within pre-defined habitat areas in the Study Area. For the purposes of this document, the Navy will refer to these areas as "mitigation areas." As described throughout this section, these recommended mitigation areas may be based off endangered species critical habitats, endangered species reproductive areas, or bottom features. The size and location of certain habitat areas, such as the critical habitats, is subject to change over time; however, the Navy's effectiveness and operational assessments and resulting mitigation recommendations are entirely dependent on the mitigation area defined in this document. Therefore, it is important to note that the Navy is recommending implementing mitigation measures only within each area as described in this document. Applying these mitigations to additional or expanded areas could potentially result in an unacceptable impact on readiness. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	The best way to do this is not to use the technology in the same areas where whale and dolphin numbers are high or during breeding seasons. The Navy must do more to identify and set aside the most environmentally sensitive portions of its training areas and not conduct training and testing in such areas.	implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Han (Written)	Opposed.	Thank you for participating in the NEPA process.
Hansen (Electronic)	Visual detection can miss anywhere from 25–95 percent of the marine mammals in an area. It's particularly unreliable in rough seas or in bad weather. We learn more every day about where whales and other mammals are most likely to be found. We need a healthy ecosystem in the ocean. Would the Navy be allowed to drop bombs on animal sanctuaries on land? Enough destruction of the Ocean and it's inhabitants. Protect marine life.	The Navy's mitigation plan involves more than just visual monitoring. Aerial monitoring and passive acoustic monitoring are used as well. The EIS/OEIS, Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring), presented the U.S. Navy's mitigation measures, outlining steps that would be implemented to protect marine mammals and Federally listed species during training and testing events. In addition, the probability of trackline detection is for visual observers during a survey. In general, there will be more ships, more observers present on Navy ships, and additional aerial assets all engaged in exercise events having the potential to detect marine mammals, than is present on a single, generally smaller (having a lower height of eye), survey ship. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Harden-01 (Electronic)	Please evaluate this incident: State cites Navy for hazardous waste violations Tuesday, July 3, 2012 6:33 PM ESTUpdated: Jul 03, 2012 5:08 PM <em class="wnDate">Tuesday, July 3, 2012 11:08 PM EST The Hawaii State Department of Health (DOH) has issued a notice of violation with a penalty fine totaling	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	$80,000 against the U.S. Navy Public Works Center Makalapa Compound for alleged violations of the state's hazardous waste and used oil rules. Makalapa Compound operates as a base yard for maintenance activities for Pearl Harbor Navy Region Hawai'i. Makalapa faces four counts of failure to make a hazardous waste determination and two counts of storage of hazardous waste without a permit. During a routine inspection on August 31, 2011, DOH found Makalapa failed to make a hazardous waste determination for corrosive wastes generated during coil cleaning of refrigerant equipment and for wastes generated from the use of solvents containing methyl ethyl ketone and perchloroethylene. These wastes were disposed of in the trash instead of handling them as hazardous wastes. Makalapa also stored hazardous waste paints and fuels in open containers, thereby violating the requirements for a permit for storage of hazardous waste. The Navy has 20 days to contest its notice of violation and request a hearing. Navy responds to State Dept. of Health The Navy received a Notice of Violation from the State Department of Health (SDOH) in June 2012 for non compliance activities discovered during an inspection at Naval Facilities Engineering Command, Hawaii in August 2011. The Navy took immediate corrective action, provided refresher training, and increased internal reviews to ensure compliance. An unannounced follow-up visit by SDOH in February 2012 revealed no negative comments or report. The Navy is committed to protecting and preserving the environment. The Navy has formally requested a hearing to contest the Notice of Violation and Order and penalty. During an unannounced inspection in August 2011, one (1) open hazardous waste drum in a hazardous waste accumulation site and three (3) open paint-related cans were identified as being improperly managed under the Resource Conservation and Recovery Act. The Navy addressed the concerns immediately and implemented procedures to ensure these actions are not repeated. Internal periodic reviews by subject matter experts indicate that the facility remains in compliance. "The Navy in Hawaii takes its environmental stewardship very seriously and is constantly working towards being in compliance with all hazardous waste laws," said Aaron Poentis, Navy Region Hawaii Environmental Program Director. "In this case, SDOH inspectors found concerns at one of our local commands in August 2011 which we immediately corrected. A follow up SDOH visit occurred in February 2012 which did not generate any comment or report. I am confident that after our requested hearing for the Notice of Violation and Order much of the allegations will be resolved to the satisfaction of the SDOH." The Navy plans to discuss SDOH's allegation and assessment. The Navy received the inspection report in November 2011, and a summary of our efforts and corrective actions was immediately forwarded to DOH in a January 2012 correspondence. As always the Navy is committed to operating in a manner protective of the environment. The Navy has a long history of demonstrated environmental compliance. National defense and environmental protection are, and must be, compatible goals. [http://www.hawaiinewsnow.com/story/18946134/state-cites-navy-for-hazardous-waste-violations]

Harden-03 (Electronic)	Please evaluate this information: Navy to resume sinking old ships in US waters Published: 7/02 11:26 pm Updated: 7/02 11:30 pm PEARL HARBOR, Hawaii (AP) -- The U.S. Navy is resuming its practice of using old warships for target practice and sinking them in U.S. coastal waters after a nearly two-year moratorium spurred by environmental and cost concerns. Later this month, three inactive vessels - Kilauea, Niagara Falls and Concord - will be sent to a watery grave off Hawaii by torpedoes, bombs and other ordnance during the Rim of the Pacific naval exercises, or RIMPAC. The military quietly	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	lifted the moratorium on Sinkex, short for sinking exercise, last year after a review of the requirements, costs, benefits and environmental impacts of the program, the Navy said in a statement to The Associated Press. It will be the first time since 2010 the Navy has used target practice to dispose of an old ship. Previous targets have ranged from small vessels to aircraft carriers such as the USS America, which was more than three football fields long. Conservation groups argue that the ghost ships should instead be recycled at a ship-breaking facility. Concerns about the long-lasting effects of toxic pollutants onboard the ships spurred a lawsuit by those groups to force the Environmental Protection Agency to better catalog and regulate Sinkex. The case, filed in U.S. District Court in San Francisco, is ongoing. The groups said they did not plan to seek an injunction to stop the Navy from restarting the exercises. "We are appealing to the Navy to continue their moratorium at least until our case is heard," said Colby Self of the environmental group Basel Action Network, which joined the Sierra Club in suing the EPA. "After the vessels hit the sea-bottom, it will be a little too late to redress damages to our precious marine resources." The Navy says Sinkex offers valuable live-fire training for times of war and provides clean vessels for at-sea, live-fire exercises. The ships can be targeted from the air, ocean's surface or underwater, with the results aiding the acquisition, planning and design of future vessel classes and systems, the Navy said. For decades, the Navy destroyed the vessels with little or no oversight. Then in 1999, the EPA ordered the Navy to better document toxic waste left on the doomed ships while removing as much of the material as possible. In return, the EPA exempted the military from federal pollution laws that prohibit any such dumping in the ocean. The Navy is still in charge of estimating the amount of pollutants onboard after the ships are prepared for sinking. In addition, the Navy must file an annual report with EPA estimating the amount of PCBs, or polychlorinated biphenyls, carried by the vessels. High levels of the chemical are believed to increase the risk of certain cancers in humans. It was banned by the U.S. in 1979 in part because it is long-lasting and accumulates throughout the food chain. Vice Admiral Gerald Beaman, commander of the combined task force running the exercises, said Monday that each ship will be stripped of PCBs and other contaminants such as asbestos, as required by the Navy's agreement with EPA. "There are severe restrictions that are placed on any hulk of that nature," Beaman said during a news conference at Pearl Harbor, flanked by commanders from participating countries. The Navy must also conduct the exercises at least 50 nautical miles from shore and in water at least 6,000 feet deep. Beaman said decisions about sinking the ships versus recycling them are made outside the scope of the exercises. A previous AP review of records from the past 12 years found the Navy got rid of most of its old ships over that time through target practice. Records show the Navy sunk 109 peeling, rusty U.S. warships off the coasts of California, Hawaii, Florida and other states during that period. Navy documents show some of the ships it sunk contained an estimated 500 pounds of PCBs. During the same time, 64 ships were recycled at one of six approved domestic ship-breaking facilities. RIMPAC, which lasts for five weeks, features training exercises for thousands

	of military personnel from 22 nations. [KHON news]	
Harden (Written)	"What if someone took an air horn and blasted it directly into your ear? Now turn the volume up twice as high." That's what Earthjustice says about how sonar could sound to endangered marine animals off the Northwest U.S. Coast. Earthjustice is suing to move Navy actions to less sensitive areas. [Email to Cory Harden from Earthjustice, 5-29-12][Navy admits greater harm to sea mammals, Earthjustice press release 5-17-12] For actions proposed in this Hawaii/California EIS, the Navy seems unconcerned about sonar. They say "International council for the Exploration of the Sea… noted, taken in context of marine mammal populations in general, sonar is not a major threat, or significant portion of the overall ocean noise budget." [DEIS p. 3.4-114] But the Navy doesn't report that the Council also says: "The full effects of sonar on cetaceans are not well known… behavioral alteration is more important than the direct effect of the sound on hearing mechanisms. It is unknown how many animals that are affected further out to sea can survive and not strand. Little is known of the sub-lethal effects of sonar on beaked whales or on other cetacean species." http://ec.europa.eu/environment/nature/conservation/species/whales_dolphins/docs/sonar_impact_cetations.pdf] some say marine animals trying to avoid sonar may get the bends. The Woods Hole Oceanographic Institute says "blood and tissues of some deceased beaked whales stranded near naval sonar exercises are riddled with bubbles… human divers can suffer from bubbles-induced decompression sickness, also known as the bends." [Stranded dolphins exhibit bubbles, and ability to recover, WHOI press release, 10-19-11] The Navy again seems unconcerned. They say "Recent modeling suggests that even unrealistically rapid rates of ascent from normal dive behaviors are unlikely to result in super saturation to the extent that bubble formation would be expected in beaked whales…" [DEIS 3.4-93 to 95] But the Navy doesn't report that the scientists they cited also say "… modeling indicates that repetitive shallow dives, perhaps as a consequence of an extended avoidance reaction to sonar sound, can indeed pose a risk for DCS…" [Decompression sickness] [Repetitive Shallow Dives Pose Decompression Risk in Deep-Diving Beaked Whales, Zimmer and Tyack, Marine Mammal Science, 10-07] The current EIS finds that 16 times as many marine mammals might be harmed by Navy actions, compared to an estimate from an EIS just a few years ago. The earlier EIS did not consider in-port sonar testing or actions in waters between Hawaii and California. And behavioral research and computer modeling was less accurate. How much more harm will be discovered in the next few years? [Sonar, explosive pose high risk for marine mammals, Associated Press, 5-12-12] And when will old Navy and other military sites ever be cleaned up? A GAO (General Accounting Office) report found that military "policies do not specify when to conduct public health assessments… beyond the initial assessment of certain priority sites… officials… did not know what actions, if any, installations had taken on about 80 percent of… recommendations." [DOD (Department of Defense) Can improve its Response to	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The potential risk from sonar and other sound sources affecting the behavior of marine mammals, including the potential for acoustically mediated bubble growth, was taken into account in the Draft EIS/OEIS analysis. The discussion of this phenomenon is presented in the EIS/OEIS in Section 3.4.3.1.2.2 (Nitrogen Decompression). As noted in that section, recent modeling by Kvadsheim, Miller, et al. (2012) determined that while behavioral and physiological responses to sonar have the potential to result in bubble formation, the actually observed behavioral responses of cetaceans to sonar did not imply any significantly increased risk of over what may otherwise occur normally in individual marine mammals. The reports cited in the comment (Bernal de Quiros et al. 2012a, 2012b) were reviewed, but do not add any substantive new information to the analysis of proposed actions covered in this EIS/OEIS.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Environmental Exposures on Military Installations, GAO-12-412, 5-1-12] The Navy May not be concerned about all this, but many citizens are. Include information from this report in the analysis of cumulative impacts—DOD [Department of Defense] Can Improve its Response to Environmental Exposures on Military Installations [by U.S. General Accounting Office] GAO-12-412, May 1, 2012 DOD relies on four types of policies to identify and respond to many but not all aspects of environmental exposures: (1) environmental restoration policies address hazardous releases at military installations; (2) occupational and environmental health policies address workplace exposures; (3) deployment health policies address the collection of occupational and environmental health data for deployed individuals; and (4) public health emergency management policies. Nonetheless, there are some limitations in the policies' coverage. For example, DOD's environmental restoration policies do not specify when to conduct public health assessments at its sites beyond the initial assessment of certain priority sites required by the Superfund law. In addition, DOD has not fully documented its responses to recommendations that result from the assessments. DOD officials responsible for oversight reported that they did not know what actions, if any, installations had taken on about 80 percent of the recommendations. Without a comprehensive tracking system, DOD has no assurance that it is addressing recommendations appropriately and could be missing opportunities to identify and resolve concerns about some health threats. Further, DOD has no policy guiding services and their installations on appropriate actions to address health risks from past exposures, which DOD attributes to the Super fund law not specifically requiring responsible parties to address such risks. http://gao.gov/products/GAO-12-412 The aggregate impacts of past, present, and other reasonably foreseeable future actions are expected to result in significant impacts on marine mammal and sea turtle species, although the contribution to those impacts from the Navy's proposed activities is low… The No Action Alternative, Alternative 1, or Alternative 2 would contribute to cumulative impacts, but the relative contribution would be low compared to other actions. Compared to potential mortality, stranding, or injury resulting from Navy Training and testing activities, marine mammal and sea turtle mortality and injury from bycatch, commercial vessel ship strikes, entanglement, ocean pollution, and other human causes are estimated to be orders of magnitude greater (hundreds of thousands of animals versus tens of animals). [p. ES-16] But the Navy requires citizen consent and is using taxpayer money. Bubble Formation A suggested indirect cause of injury to marine mammals is rectified diffusion (Crum and Mao 1996), the process of increasing the size of a bubble by exposing it to a sound field… There is considerable disagreement among scientists as to the likelihood of this phenomenon (Piantodosi and Thalmann 2004) Evans and Miller, 2003). Although it has been argued that traumas from recent beaked whale stranding are consistent with gas	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	emboli and bubble-induced tissue separations (Fernandez et a. 2005, Jepson et al. 2003), nitrogen bubble formation as the cause of the traumas has not been verified… The hypothesis speculates that if exposure to a startling sound elicits a rapid ascent to the surface, tissue gas saturation sufficient for the evolution of nitrogen bubbles might result (Jepson 2003, Fernandez 2005)… Recent modeling suggest that even unrealistically rapid rates of ascent from normal dive behaviors are unlikely to result in super saturation to the extent that bubble formation would be expected in beaked whales (Zimmer and Tyack 2007)… no marine mammals addressed in this analysis are given differential treatment due to the possibility for acoustically mediated bubble growth. [3.4-93 to 95] The DEIS contradicts the Zimmer and Tyack article I found—"ABSTRACT The impact of naval sonar on beaked whales is of increasing concern. In recent years the presence of gas and fat embolism consistent with decompression sickness (DCS) has been reported through postmortem analyses on beaked whales that stranded in connection with naval sonar exercises. In the present study, we use basic principles of diving physiology to model nitrogen tension and bubble growth in several tissue compartments during normal diving behavior and for several hypothetical dive profiles to assess the risk of DCS. Assuming that normal diving does not cause nitrogen tensions in excess of those shown to be safe for odontocetes, the modeling indicates that repetitive shallow dives, perhaps as a consequence of an extended avoidance reaction to sonar sound, can indeed pose a risk for DCS and that this risk should increase with the duration of the response. If the model is correct, then limiting the duration of sonar exposure to minimize the duration of sonar exposure to minimize the duration of any avoidance reaction therefore has the potential to reduce the risk of DCS. [bold added, REPETITIVE SHALLOW DIVES POSE DECOMPRESSION RISK IN DEEP DIVING BEAKED WHALES, Walter M. X. Zimmer, Peter L. Tyack, Article first published online: 10 SEP 2007, http://onlinelibrary.wiley.com/doi/10.1111/j.1748-7692.2007.00152.x/abstract;jessionid=6EA38DCE37C4ADC452C707C5736538F3.d04t02?denied AccessCustomisedMessage=&userIsAuthenticated=false] I don't see Piantadosi and Thalmann 2004 in the bibliography or in Google Scholar. As international Council for the Exploration of the Sea (2005b) noted, taken in context of marine mammal populations in general, sonar is not a major threat, or significant portion of the overall ocean noise budget [p. 4.3-113]. This EIS section does not mention the ICES report also says: "The full effects of sonar on cetaceans are not well known, mostly due to the difficulty of studying the interaction…high-intensity (>215dB) mid-frequency (1-10 kHz) sonar… has led to the deaths of a number of cetaceans in some places. All incidents have been investigated have occurred in the North Atlantic, or Mediterranean and have related to the use of military sonar… the most consistent deduction form the evidence is that behavioral alteration is more important than the direct effect of the sound on hearing mechanisms. It is unknown how many animals that are affected further out to sea can survive and not strand. Little is known of the sub-lethal effects of sonar on beaked whales or on other cetacean species."	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	[http://ec.europa.eu/environment/nature/conservation/species/whales_dolphins/docs/sonar_impact_cetaceans.pdf] The increase in proposed testing activities under Alternative 2 over the No Action alternative would in turn lead to an approximately 389 percent increase in predicted impacts (behavioral reactions, TTS, and PTS) to marine mammals [p. 4.3-173]. This seems to contradict the news: " The Navy estimates its use of explosives and sonar may unintentionally cause more than 1,600 instances of haring loss or other injury to marine mammals in one year… the old analysis… estimated the service might unintentionally injure or kill about 100 marine mammals." [Navy says their sonar and explosion tests could harm more marine life than previously thought, CBS News Los Angeles, 5-10-12]	
Harden (Oral-Hilo)	Thanks for taking comments. So the way Earthjustice describes the sound of sonar is they describe it as an air horn blasted directly in your ear and then turning the volume up twice as loud, and that's what they're saying how sonar could sound to endangered marine animals off the northwest U.S. coast. And as you know, Earthjustice is suing to move the Navy actions there to less sensitive areas. But for actions that are proposed in this EIS, the Navy is not as concerned about sonar as citizens are. The Navy says, "International Council for Exploration of the Sea noted, taken in the context of marine mammal populations in general, sonar is not a major threat or significant portion of the overall ocean noise." But the Navy doesn't report that the Council also says, "The full effects of sonar on cetaceans are not well known. Behavioral alteration is more important than the direct effect of the sound on hearing mechanisms. It is unknown how many animals that are affected further out to sea can survive and not strand. Little is known of the sublethal effects of sonar on beaked whales or other cetacean species." Some people say marine animals who are trying to avoid sonar may get the bends. The Woods Hole Oceanographic Institute says blood and tissues of some deceased beaked whales stranded near naval sonar exercises are riddled with bubbles, and human divers, when they get bubbles-induced decompression sickness, that's also known as the bends. The Navy doesn't seem concerned. They say recent modeling suggests that even unrealistically rapid rates of ascent from a normal dive are unlikely to result in supersaturation that would form bubbles in beaked whales. But the Navy didn't report that the scientists they cited also said modeling indicates repetitive shallow dives, maybe as a consequence of trying to avoid sonar, can indeed pose a risk for the decompression sickness. The current EIS finds 16 times as many marine mammals might be harmed by Navy actions compared to an estimate from the EIS just a few years ago. The earlier EIS didn't consider in-port sonar testing or actions in waters between Hawaii and California, and research and computer modeling was less accurate. So I wonder how much harm we'll discover in the next few years. And when will old Navy sites and other military sites ever be cleaned up? A General Accounting Office report found that military policies don't specify when to conduct public health assessments beyond the initial assessment, and officials did not know what actions, if any, installations have taken on about 80 percent of	Earthjustice is incorrect in making the comparison of sound in the air and sound underwater for a number of reasons and there are no circumstances where sonar underwater would be like an air horn "blasted" directly in a human's ear. Sound in air and sound in water are two different scales somewhat like comparing Fahrenheit and centigrade temperature scales. Unlike these temperature scales there is no completely accurate means to convert in air sound levels to sound levels underwater although a rough approximation is that there is a 62 dB difference (80 dB in air could be equivalent to 142 dB underwater). In addition, the weighted dB scale in air is meant to reflect human perception and the frequencies best heard by humans. The point being that the frequency component of the sound is of critical importance in how a sound is perceived. Also compounding the understanding of dB scales in air and underwater is that often the dB scale in air is not always (although should be) referenced to a distance from which the source level is measured. Underwater the standard is to measure source level at one meter (approximately 1 yard) from the source. Therefore what a marine mammal hears as a received sound level at any distance from sonar beyond one meter is the sound level reduced by various factors as explained in the HSTT EIS/OEIS Section 3.4.3. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

	recommendations. So the Navy may not be concerned about a lot of things, but citizens are.	
Harmon (Electronic)	Someone who works at PMRF on Kauai island told me recently that it's all about money. Jobs and money to the military industrial complex. These exercises are not making us safer. We already far surpass our enemies in military expertise. We win over our enemies by being a good shepard of the planet. We rejuvenate the ocean so it can give life providing nourishment to our present and future generations. As it is the ocean is dying from being over fished and used as a dumping grounds for toxins which includes those created by the military shooting off missiles and creating ear drum deafening sonar. one of the largest dump sites for plastic is between here and San Diego, larger than the state of Texas. Such sites, called gyres are found in oceans around the globe. The toxins from broken down plastics are found in fish and humans that eat those fish. It is no wonder the oceans are dying. What we need is to stop the killing of marine life so it can recuperate from the present harm we inflict daily. 1. strict fishing quota enforcement because the ocean is over fished. 2. we need an aggressive full on assault of plastic dumps in the ocean. 3. stop military exercises that harm the life of the ocean.	Thank you for participating in the NEPA process.
L. Harris (Electronic)	It's time to stop testing. Please do so.	Thank you for participating in the NEPA process.
M. Harris (Electronic)	Please, please, for the mercy of the living creatures who reside in the ocean STOP THE UNDERWATER SONAR/SOUND TESTING. The US military is without question, the strongest, most advanced military on our great blue planet. It is now time for our great military to make its future technical advances in humane ways. Please stop!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Harrison-Hinds (Electronic)	We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. The HSUS is joining other environmental and animal welfare groups to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We are calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures. This is not a dress rehearsal, ladies and gentlemen. We only have one chance to get this right so let's do so. Let's do the right thing and think of all the beautiful and wonderful creatures and do no harm, especially in the name of humanity.	Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Regarding the 2003 Washington State stranding event referred to in the comment, although mid-frequency active sonar was used by the Navy, the distribution of harbor porpoise strandings by location and with respect to time surrounding the event do not support the suggestion that mid-frequency active sonar was a cause of harbor porpoise strandings. Rather, a lack of evidence of any acoustic trauma within the harbor porpoises, and the identification of probable causes of stranding or death in several animals, supports the conclusion that harbor porpoise strandings were unrelated to Navy sonar activities. Regarding the 2005 North Carolina stranding event, NMFS was unable to determine any causative role that sonar may have played in the stranding event. All of the species involved in this stranding event are known to occasionally strand in this region. Although the cause of the stranding could not be determined, several whales had preexisting conditions that could have contributed to the stranding. Cause of death for many of the whales was likely due to the physiological stresses associated with being stranded. A consistent suite of injuries across species, which was consistent with prior strandings where sonar exposure is expected to be a causative mechanism, was not observed. For a complete analysis of these and other stranding events, please see the Marine Mammal Stranding Report, found on the HSTTEIS.com website at: http://hstteis.com/Portals/0/hstteis/SupportingTechnicalDocs/ Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Harrold (Electronic)	DO NOT DO THIS! you have no right to inflict pain and injury upon innocent, unsuspecting animals. Be a compassionate navy, PLEASE!!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in

		Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Hawthorne-01 (Electronic)	I recently learned that the Navy has projected that they will deafen 1600 cetaceans and kill 200 marine mammals EACH YEAR IN A 7-YEAR PROGRAM in the name of training for our defense. I am writing to add my voice of outrage against the horror of this plan. With all the creativity humans possess, and the resources of our military, I urge you to find other ways to plan for our defense. This plan is unconscionable. Thank you.	The Navy does not anticipate any mortality from its activities. Though the model estimates the potential for mortality based on very conservative criteria, with the implementation of proven mitigation and decades of historical information from conducting training and testing in the study area, the likelihood of mortality is near zero and would not impact populations. Additionally, there is no evidence that the type of injuries that could potentially occur (fully recoverable or limited permanent threshold shift) have or will result in follow on mortality. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures must be estimated scientifically using complex modeling, but it is only an estimate, not a prediction. This estimate needs to encompass the capacity of what could occur to ensure Navy's permits are not exceeded. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a

Hazard (Electronic)	Please suspend this operation now!	Thank you for participating in the NEPA process.
Hazarika (Electronic)	This should not be done...there are a lot of intelligent people from the govt. and armed forces.that are involved in these operations ..i belive they should opt. for some other alternative..and no living being should be harmed from these operations or experiments..	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Heard (Electronic)	National security takes many forms. If we ruin our oceans at the rate we're going, we'll all be dead anyway. Please widen the definition of "security" This is my respectful request, Cassandra Heard	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Heizer (Electronic)	There MUST be a way that the Navy can do tests WITHOUT killing all this marine life!! In THIS DAY AND AGE we should be peaceful instead of trying to kill everything around us!! PLEASE PLEASE consider this!!!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Hennessy (Electronic)	As a citizen of the United States of America, I do not understand how the world's most powerful navy justifies harming other species in order to improve military techniques. Marine mammals, birds, fish, turtles, and habitat could be harmed with sounds, explosions, detritus, and electromagnetic impulses that are being implemented to supposedly train our navy personnel for future combat. This is complete nonsense. No other military in the world is as advanced or as well-funded as ours, and the ones that we would possibly need to prepare for war against do not have navies of any substantial power. We could easily beat them with conventional weapons, that we already know how they work and have an ample supply of. Radiation levels in some places in the southwest are still elevated due to atomic tests in the 1940's and 1950's; the long-standing effects of these tests are rarely, if ever, accurately estimated beforehand. Do we really need to cause irreparable harm to creatures that have no part in human warfare? Including those that are already suffering from dwindling populations? When is enough enough? Let's see this for what it truly is; a job-advancement ladder for weapons engineers, using "training" as a scrim, and meted on the backs of taxpayers and wildlife. How many whales would be deafened, disoriented, and killed by this operation? And for what purpose do we ask them to make that sacrifice? The costs outweigh the benefits, if only we would take all costs into consideration.	Thank you for participating in the NEPA process.

Hepworth (Electronic)	No live explosives and sonar exercises, please! They kill thousands of precious animals that have right to live.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Hernandez (Electronic)	it's not right that the navy would do something like this KNOWING what harm it could do to the environment. Your disrupting the balance which in the end the results will be tragic and that will be on you who are trying to go through with this. Do the research and think how this can harm not just you, but everyone. Please reconsider. Sincerely, Cristina Hernandez	The Navy shares your concern for the environment. All of the reasonably foreseeable effects from the proposed activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Herrera (Electronic)	I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Herron (Electronic)	Please don't do it. Find a laboratory way to test your sonar weapons. Leave the oceans and their inhabitants to peace. They, like civilians, should have rights.	Thank you for participating in the NEPA process.
Hess (Electronic)	The injury or morality of any marine mammals due to the actions of the Navy are completely unacceptable. There is no legitimate reason that national defense should ever cause harm to any wildlife. The Navy should be implementing the protection and recovery of the wildlife they have harmed over the past two centuries, not further endangering these creatures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the

Hidaka (Electronic)	I understand the need for protecting our country, but please find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. I know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. I support the HSUS and other environmental and animal welfare groups in asking the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Regarding the 2003 Washington State stranding event referred to in the comment, although mid-frequency active sonar was used by the Navy, the distribution of harbor porpoise strandings by location and with respect to time surrounding the event do not support the suggestion that mid-frequency active sonar was a cause of harbor porpoise strandings. Rather, a lack of evidence of any acoustic trauma within the harbor porpoises, and the identification of probable causes of stranding or death in several animals, supports the conclusion that harbor porpoise strandings were unrelated to Navy sonar activities. Regarding the 2005 North Carolina stranding event, NMFS was unable to determine any causative role that sonar may have played in the stranding event. All of the species involved in this stranding event are known to occasionally strand in this region. Although the cause of the stranding could not be determined, several whales had preexisting conditions that could have contributed to the stranding. Cause of death for many of the whales was likely due to the physiological stresses associated with being stranded. A consistent suite of injuries across species, which was consistent with prior strandings where sonar exposure is expected to be a causative mechanism, was not observed. For a complete analysis of these and other stranding events, please

Hill (Electronic)	The Navy's mid-frequency sonar has been implicated in mass strandings of marine mammals in, among other places, the Bahamas, Greece, the Canary Islands, and Spain. In 2004, during war games near Hawai'i, the Navy's sonar was implicated in a mass beaching of up to 200 melon-headed whales in Hanalei Bay. In 2003, the USS Shoup,operating in Washington's Haro Strait, exposed a group of endangered Southern Resident killer whales to mid-frequency sonar, causing the animals to stop feeding and attempt to flee the sound. "In 2003, NMFS learned firsthand the harmful impacts of Navy sonar in Washington waters when active sonar blasts distressed members of J pod, one of our resident pods of endangered orcas," said Kyle Loring, Staff Attorney for Friends of the San Juans. "Given this history, it is particularly distressing that NMFS approved the Navy's use of deafening noises in areas where whales and dolphins use their acute hearing to feed, navigate, and raise their young, even in designated sanctuaries and marine reserves." In 1996 twelve Cuvier's beaked whales beached themselves alive along the coast of Greece while NATO (North Atlantic Treaty Organisation) was testing an active sonar with combined low and mid-range frequency transducers, according to a paper published in the journal Nature in 1998. The author established for the first time the link between atypical mass strandings of whales and the use of military sonar by concluding that although pure coincidence cannot be excluded there was better than a 99.3% likelihood that sonar testing caused that stranding.[16][17] He noted that the whales were spread along 38.2 kilometres of coast and were separated by a mean distance of 3.5 km (sd=2.8, n=11). This spread in time and location was atypical, as usually whales mass strand at the same place and at the same time. The Navy's mitigation plan for sonar use relies primarily on visual detection of whales or other marine mammals by so-called " watch-standers" with binoculars on the decks of ships. If mammals are seen in the vicinity of an exercise, the Navy is to cease sonar use. "Visual detection can miss anywhere from 25–95% of the marine mammals in an area," said Heather Trim, Director of Policy for People For Puget Sound. "It's particularly unreliable in rough seas or in bad weather. We learn more every day about where whales and	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Regarding the 2003 Washington State stranding event referred to in the comment, although mid-frequency active sonar was used by the Navy, the distribution of harbor porpoise strandings by location and with respect to time surrounding the event do not support the suggestion that mid-frequency active sonar was a cause of harbor porpoise strandings. Rather, a lack of evidence of any acoustic trauma within the harbor porpoises, and the identification of probable causes of stranding or death in several animals, supports the conclusion that harbor porpoise strandings were unrelated to Navy sonar activities. Regarding the 2005 North Carolina stranding event, NMFS was unable to determine any causative role that sonar may have played in the stranding event. All of the species involved in this stranding event are known to occasionally strand in this region. Although the cause of the stranding could not be determined, several whales had preexisting conditions that could have contributed to the stranding. Cause of death for many of the whales was likely due to the physiological stresses associated with being stranded. A consistent suite of injuries across species, which was consistent with prior strandings where sonar exposure is expected to be a causative mechanism, was not observed.

Commenter	Comment	Navy Response
	other mammals are most likely to be found—we want NMFS to put that knowledge to use to ensure that the Navy's training avoids those areas when marine mammals are most likely there." Some of the mid-frequency sonar systems the Navy employs are capable of generating sounds in excess of 235 decibels. A normal human conversation takes place at 60-70 decibels; a loud rock concert is about 115 decibels; permanent hearing damage for people can occur from short-term exposure to 140 decibels. The decibel scale is a logarithmic scale, and each ten-decibel rise along the scale corresponds to a ten-fold increase in power: a sound measuring 130 decibels is ten times more intense than a 120 decibel sound, a sound of 140 decibels is 100 times more intense, and a sound of 150 decibels is 1,000 times more intense. Judge David A. Ezra found that the Navy was violating federal law, after Earthjustice sued the Navy last May for violating the National Environmental Policy Act (NEPA) and the Coastal Zone Management Act (CZMA. Judge Ezra said, "there is little disagreement that MFA [mid-frequency active] sonar can cause injury, death, and behavioral alteration to these animals." The judge noted that the Navy's harm threshold -- 173 decibels (dB) -- contradicts the best available science and "cast into serious doubt the Navy's assertion that, despite over 60,000 potential exposures to MFA sonar, marine mammals will not be jeopardized." Further, he ruled that the Navy's reliance on a noise level of 173 decibels, below which it claims harm to animals from its sonar will not occur,was "arbitrary and capricious," an acknowledgment that even sonar noise at much lower intensity levels can harm and kill marine mammals."Whales have stranded and died at predicted noise levels of around 150 decibels – 100 times less intense than the threshold set by the Navy," said AWI President Cathy Liss. "Such a level is without scientific justification." The court determined that the Navy had failed to explore reasonable alternatives to conducting its exercises, failed to notify and involve the public as required by law. The Navy must, take greater precautions to protect marine life and use the latest scientific information to identify these biological "hot spots" and establish protection for marine mammals and other species." Examples of mitigation measures include not operating: at nighttime,at specific areas of the ocean that are considered sensitive,when dolphins are bow-ridings,low ramp-up of intensity of signal to give whales a warning, air cover to search for mammals,using fish-finders to look for whales in the area	For a complete analysis of these and other stranding events, please see the Marine Mammal Stranding Report, found on the HSTTEIS.com website at: http://hstteis.com/Portals/0/hstteis/SupportingTechnicalDocs/ Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. J. Ho (Oral-Hilo)	Hi. My name is Jennifer Ho, and I live here in Hilo, Hawaii. I thank you for coming and making an opportunity for us to give you public testimony. I'm very concerned. My brothers both served in the -- two of my brothers served in the Navy, and I'm concerned about today's Navy. I know that in your mission to take care of America, you do a lot of submarine sonar, and that is something that I know has harmed sea life. It's harmed whales, other cetaceans, dolphins, and I understand turtles also are at risk. And it's of great concern for me about the increased militarization of Hawaii and of our oceans because I know on Jeju Island, we've had increased military presence and that as we're closing bases abroad, more of the military are moving to new places. So here we are wanting to make room for you and wanting to see you as heroes, and you wanting to see yourself as heroes, and yet I see what you are being asked to do is not heroic. You are in ships that use sonar to detect an enemy, an enemy that might not even be there. I think if we changed our American policies not to be so militaristic, if we work with other nations to help them have a better quality of life, who would attack the person that's helping them have a better quality of life? And your need to be so wary is -- if you're only looking for enemies, that's what you'll see. And I don't think whales or dolphins are	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from electromagnetic sources, active sonar, and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	enemies, and I know water amplifies sound. And I really wish that those of you who want to see yourselves doing the right thing would ask that your policies, the Navy's policies, and the increased militarization would change. And I thank you for taking this time to let me speak.	
N. Ho (Oral-Hilo)	Yeah. Aloha. Can everybody hear me? My name is Nelson Ho. I live here in Hilo, am a lifetime resident of Hawaii. I'd like to thank the military for presenting this opportunity, and I hope it's recorded and heard by more than you folks here in the room. First of all, I'd like to speak out for the whales having their three minutes. In fact, I'd like to reverse it. I'd like for the Navy to have three minutes and then silence for the whales, for the turtles, for all the mammals and all the marine organisms that you folks are impacting. That's one of the concerns that I have. The second one is for the overall militarization of Hawaii, an independent Hawaiian kingdom that was overthrown at the point of a bayonet by -- I think it was the Marines. Is that right, Moani? Thank you. This was an independent nation, and it's still under occupation. And it was the military that enabled a civilian government to be overthrown. I'd like to bring that to your attention. The third thing, openly I'd like to create cognitive dissonance within the military because I think the military's mission has been distorted. And this whole desire for protection has led us into, I think, an overwhelming political force, military force, that is really bullying the rest of the world. And I, as a citizen who pays my taxes, wish that with stop. And I want you to see a person here who is willing to stand up and say that as a tax-paying American citizen, who believes in the Constitution even though I feel it's being dismantled by the corporations and the powers that be. I want to stand in opposition to that. So while I believe that the military may, in fact, be the largest researcher for marine studies, that's insufficient given the nature of your business and given the impacts, the adverse impacts that you are creating to our environment and our human society because while all this money and research goes to speak in favor of your military activities, our society is decaying. We can't pay for teachers. And in summary our society is becoming a third-world society, and we are creating way too many enemies that we don't need. So I thank you for listening to me and recording this testimony.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Hofacre (Electronic)	As a visitor to Kauai for many years, I am opposed to any testing that harms the dolphins and whales. Please find another way and spare these beautiful creatures.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Hoffmann (Electronic)	I heard, that you are planning Sonar experiments in and around Hawaii. Please do not do so! Sonar tortures and kills whales and dolphins (as they are loosing their orientation) - and there are so many whales and dolphins living around Hawaii! Please remain sensitive to nature and it´s animals. Hawaii is such a paradise... Thank you very much!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the

Holt (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, Thanks, Justin Holt	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Holzman (Oral-Kauai)	Hi, my name is Greg Holzman, and I'm a resident of the west side of Kauai for 30 plus years and fishing out there 25 years off Niihau, Kailua, and Kauai. You know, my biggest concern that I want to get on record right away is that we would like to see as fisherman who go out to kolua rock and the middle banks, which is right up against the marine sanctuary at Northwestern Hawaiian Islands, and we would like to see a better warning of scheduling so that if we go up all the way up, you know, it takes us 17, 18 hours to get up there that we're not having a helicopter telling us we have to move, you know, eight hours out of our fishing grounds or going out to Kaula Rock and then being told in the middle of the night to move. If we can schedule our fishing trips around, you know, better scheduling, then we would really appreciate that. How you guys do that, I'm not sure whether it's a website or we can call a number. I know that you have that already in effect for the parts around Kauai on a lot of the missile work that goes on. But not as much for the bombing that comes out of Honolulu at Kailua or, you know, the things that go on up at the Northwest Hawaiian Islands. So that's just one thing I wanted to point out. The other thing is is that access to the area around Nahili Point should be open at least at some time. I was part of the West Side Access Committee. We really appreciated the fact that the Navy went out and made that contact to allow us back in to surf and fish and has continued to work with the surfers and fisherman to increase those areas. We would like to see some time, one, two days a month that at least, you know, the Hawaiian people really, it's one of the few areas that has a clear, clean reef water that they can fish off of for nenue, palani, kala on the west side. And so that's really important to the Hawaiians for their benefit and for any of our people that need to fish for their diet. So I appreciate that. Thank you.	Navy training and testing activities have the potential to temporarily limit access to areas of the ocean for a variety of human activities associated with commercial transportation and shipping, commercial recreation and fishing, subsistence use, and tourism in the Study Area. As discussed in Section 3.12.2.1.1 (Sea Space) of the Draft EIS/OEIS, when training or testing activities are scheduled that require specific areas to be free of nonparticipating vessels due to public safety concerns, the Navy requests that the U.S. Coast Guard issue Notices to Mariners to warn the public of upcoming Navy activities. Training and testing activities occur in established restricted or danger areas as published on navigation charts.
Horzely (Electronic)	Is there not a better solution? Have you calculated the potential disturbances based on the mammals not being able to hear!!!! These are sonar-based animals? Please don't.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Houser (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing Jennifer Houser	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Howell (Electronic)	This is ridiculous! Test in the dead sea, a deep lake or anywhere else but our oceans!!!!	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Huart (Electronic)	Please spend your money on Something worthwhile like cleaning up the oceans and preservation of endangered spcies and preventing illegal fishing	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

Hubbard (Electronic)	This is something that the people should be able to vote on. My vote is no for this testing. Why is it that too much power is granted to those who want to kill or who are responsible for so many deaths in the animal kingdom and sea world? There is already too much "not caring" anymore about natural life in exchange for easy solutions that involve death and murder. WE NEED TO CARE MORE TO PROTECT LIFE; ALL LIFE HERE ON THIS PLANET, and it is very serious. PLEASE RECONSIDER THESE HORRIBLE TESTS THAT ARE NOT ABSOLUTELY NECESSARY AS THEY CLAIM THEM TO BE. Seek other solutions and options, and let the American people vote on it too.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Hunt (Electronic)	We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Please no sonar exercises, killing innocent marine mammals!! sincerely, Traci Hunt	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Huntemer (Electronic)	Very briefly, I would like to state my total opposition to the Navy's proposed actions off the coasts of California and Hawaii. These waters are home to numerous species of cetaceans. Cetaceans are by nature very sensitive to sonic and other vibrations. Manoeuvers involving noise and other vibrations could injure or kill them. This is a well known fact. Not only might these prosposed actions be detrimental to cetaceans but theier disruptive effects on other types of marine life have not been adequetely studied. Indeed comprehensive studies on the cetacean populations have not even been carried	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

	out yet. however, all evidence pionts to thier sensitivity. PLEASE do not go ahead with these manoeuvers! Thank you for your time and attention. Angela Huntemer.	testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Hurd (Electronic)	I'm dismayed to read: The Washington Post (Associated Press) May 11, 2012 – Revealed today that a "New Navy study says use of sonar, explosives may hurt more marine mammals than once thought"[25]. "…HONOLULU-The U.S. Navy may hurt more dolphins and whales by using sonar and explosives in Hawaii and California under a more thorough analysis that reflects new research and covers naval activities in a wider area than previous studies…" and... On May 17, 2012, news reports that "Mass dolphin deaths in Peru caused by acoustic trauma" were announced by "…Dr. Carlos Yaipen Llanos of ORCA in Peru informed Hardy Jones of Blue Voice that acoustical trauma is the cause of the Mass Mortality Event (MME) that killed an estimated one thousand dolphins along the coast of northern Peru in March 2012…" [28]. This is another reason to begin to limit sonar, laser, radar, and electromagnetic weapons testing in the Atlantic, Pacific, and the Gulf of Mexico. You guys are destroying that which you are charged to defend. There will be a burn-out cinder before you're through with no life forms still extant except Dick Cheney breathing through a filtration system in a bunder in Wyoming. STOP THE SONAR!! Oh, and while you're at it please put IN WRITING that you will no longer use DU munitions in practice or ever!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. In 2008, Commander Pacific Fleet directed that all Pacific Fleet ships offload all depleted uranium rounds at the earliest opportunity. The use of depleted uranium is not included in the Navy's Proposed Action. The Navy was not conducting sonar or explosives training activities within 500 miles of the Peruvian coast in the 3 months prior to or during the 2012 stranding event in Peru. The Peru stranding event did not result from acoustic trauma based on (1) the condition of the animals' ears, which clearly were not impacted by an acoustic event; (2) the timing of the strandings, which is not typical for strandings from acoustic trauma; and (3) the types of animals affected, which suggest the Peru strandings more likely occurred due to weather or biological

		factors such as toxic algae or disease. The Navy will continue to assist the National Marine Fisheries Service and stranding networks as needed, and remains committed to protecting marine life while performing its national security mission.
Hurley-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Hurley-02 (Electronic)	What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in

		publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Hurt (Electronic)	My comment concerns the proposed Navy training exercises off the coast of California and Hawaii - some of the most incredible and rich marine environments in the world. I am a live-aboard, world cruiser. I just returned by sailboat from Hawaii where I visited the whales breeding grounds. The Humpback whales are an endangered species. In the past, the global humpback whale population size was about 750,000 to 2 million animals while the current global population is only about 30 to 40 thousand. With about 66% of the North Pacific population wintering in Hawaii each year, up to 10,000 humpback whales are expected to come to Hawaii this winter. I understand the need for protecting our country, but I strongly oppose destroying our marine environment to do it. We must find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures as would occur under the Navy's training exercises planned for the California coast and Hawaii. Consider steps to reduce the harmful impacts to marine mammals: including avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. This kind of devastation to the marine environment will have great costs beyond just the loss of marine mammals. There will be a significant loss of revenue from tourism and fishing as well as a great ecological cost. It just takes planning and modifying your training plans to avoid this. These marine animals are already struggling for their existence. Don't add this assault to their plight.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Huvard (Electronic)	Please develop and use training methods that do not harm or kill marine life. Thanks.	The Navy shares your concern for marine life. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Hyson (Oral-Hilo)	Okay. Well, thank you for letting me speak here. I hope my input can have some value. Star Newland and I, through the Sirius Institute and Planet Puna, have been studying mostly the effects of birth and general birth and water birth on the constitution of humans. And one of the major experts in underwater birth and birth in general is a French medical doctor named Dr. Michel Odent. And he points out that nearly all cultures have messed around with the birth imprint or the birthing process. For example, some cultures will express the mother's colostrum and throw it away to make sure that the baby never has it in spite of the fact it's the most helpful thing it could get right at birth. Other cultures would put sand, salt, bread, sugar, rice, anything other than milk as the first taste for an infant. So we have planet-wide messed up the process of birth. Recently -- well, not recently but over the last decades, they've been using more and more synthetic Oxytocin, Pitocin, and it's causing great fetal distress, but it also messes up the bonding and the suckling between the mother and infant. So we are rapidly losing	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	the ability to give birth properly. The punchline of this is when you do this to an infant, since the type of life they have is dependent on their birth imprint, you end up -- if you interfere with birth in a major way like we've been doing, you end up with people that have missed connecting with their mothers, with the Earth, and they are great warriors, and they are traumatized. They're enraged, and they're ready to kill at some point because we have messed up their birth imprint. So we have fallen into this, and that might be one of the major reasons why we have such a warlike planet. So fortunately the Navy has agreed to partner with Star Newland and the Sirius Institute for domestic harmony, and so we're here to talk to them about that. And we hope that the Navy can start this process that one could imagine, for example, Navy wives giving birth in the water with the service dolphins that the Navy already has. One can imagine the service dolphins helping the returning veterans with their traumas and post-traumatic stress disorders and so on. And this could lead to a much more harmonious planet, which is consonant with the Navy goals right now, that they will pursue humanitarian efforts to avoid or reduce conflict before they will choose to attack and to do other things like that. So we're very proud that the Navy wants to do that, and we're hoping they'll continue, and we're here to help in any way to reverse this trend on the planet. Thanks.	
Igel-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. 	mammals are respected, I cannot condone Navy sound testing. I see these animals swimming in the ocean every day as I drive sown my hilland their rights need to be respected, Most sincerely, Barbara Ingram	
Islas (Electronic)	I do not agree or support this effort. It is not protecting and maintaining our oceans mammals. This testing is causing harm, and I do not see any use or good coming from it.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Ivascyn (Electronic)	Please rethink the US Navy plans to conduct training exercises all along the US East Coast and in the rich marine environment off the California and Hawaii coasts. If these training sites are used, please ensure that the Navy protects marine mammals from explosives and sonar. especially in calving grounds and migratory corridors, The Navy should create large "safety zones" around the exercises so that marine mammals are not harmed. This would allow training to go forward and minimize the liklehood that whatles, dolphins and porpoises would be harmed or killed. thank you for your help with this matter.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Jackman (Electronic)	I respectively ask you, the United States Navy, to rethink your training exercises. There MUST be a way that you can safeguard our Nation and safeguard those animals that have the right to live in these waters. We depend on them for a balanced world and ecosystem. I grieve to think of the pain and suffering these beautiful, amazing, intelligent creatures will endure due to your training exercises. PLEASE revise your plans, and take into greater consideration the importance and worth of these creatures, and the responsibility we have as humans to make sure our actions don't cause undue, unnecessary, and uncaring harm to those we share the earth with. I have faith in your capabilities to make a different, more compassionate, and more sensible plan. Thank you.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
James (Electronic)	This training program is both devastating and unnecessary. The projected mortality rates are staggering. The number of animals left deafened will slowly starve. The impacts of this kind of testing are well documented in numerous studies. These impacts are far	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	ranging and are damaging and lethal to ocean life -- from fisheries to marine mammals to all kinds of flora and fauna in the ocean. The only responsible action is to not use this lethal technology.	Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy has conducted training in these operating areas regularly for approximately 60 years. Though the intensity of live training will increase, the events are of relatively short duration and therefore the Navy does not anticipate that fish will be affected as a result of the training exercises and testing activities. Fish may respond behaviorally to sound sources in their hearing range (most Navy sound sources are not in the hearing range for most fish species), but this reaction is only expected to be brief and not biologically significant. Most commercially important fish species are not believed to hear midand high-frequency sound sources which make up the majority of sound producing activities.
Janton (Electronic)	ALOHA...I am a long distance swimmer on the Na Pali Coast of Kauai. The date of June 11,2012 I was swimming from Miloli'i to Polihale when I heard thunder under water....what was that....my kayak escort man heard the thunder too , he thought it was real thunder over by the island of Ni'ihau. I was concerned. Later that same day, back at Miloli'i beach a group of us heard the "thunder" again and again. Then we saw he big grey ship over in the water west of Polihali. The sound of just that kind of booming was very disturbing . I was wondering why the ocean here in a marine life sanctuary would be subject to this kind of "drills". I am concerned that the tests with sonar will effect all of us who are in the sea, swimmers, divers, all the marine life . When the tests were done by the Navy off the Kona Coast several years ago I was in the ocean swimming. One of my fellow swimmers was damaged by the sounds in the sea coming from the Navy vessel. To this day she has nerve damage as a result of being in the water too close to where the sonar tests were being done.I wish to swim with confidence that I will not be damaged by sounds that are being tested in the sea. I am also concerned for all marine life especially in designated Marine life sanctuary areas.Mahalo.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. The EIS/OEIS analysis indicates that no impact on public health and safety would result from training activities using sonar, based on the Navy's implementation of strict operating procedures that protect public health and safety. The Navy is not aware of any documented cases of sonar harming people. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to

The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
T. Jones (Electronic)	Please consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
K. Jones (Electronic)	Why is it ok for this gov'ment to do whatever they want, when they want. This is not money well spend.	Thank you for participating in the NEPA process.
Jose (Electronic)	I know Navy sonar testing is necessary to protect Americans, but please limit testing around known cetacean migratory paths (geographically and seasonally). Whale watching boats, fishermen (both recreational and commercial) and scientists are a good resource for that information. Please use passive sonar to check for any cetaceans in the immediate area before testing and the animals will thank you for saving their lives! Thank you for your time, Cherilyn Jose	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Joseph (Electronic)	I'm writing to ask that you please stop the sonar that is killing mammals in your test areas. We went from 155,000 incidences to the potential for millions of times per year? Unacceptable. I live on the West coast and want future generations to be able to love the oceans, whales, and dolphins, that I have been able to enjoy.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Of the millions of annual exposures resulting from the Navy's proposed training and testing activities, nearly all are expected to result in "Level B harassment," defined as harassment that, "disturbs or is likely to disturb a marine mammal or marine mammal stock in the

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering to a point where such behavioral patterns are abandoned or significantly altered." Only Level A harassment would have the potential to injure a marine mammal. As described in the Draft EIS/OEIS, marine mammals would potentially be exposed fewer than 1,000 times annually, throughout the entire Study Area, to sound levels that could result in Level A harassment. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities, designed to reduce marine mammal injury. As a result of these mitigation measures, impacts to marine mammals are not expected to decrease the overall fitness of any given population.
Jubran (Electronic)	Please do not deafen and kill marine life with your military practices. Why is it something you are not concerned with? Find a way to practice without hurting anything. We know you can do it with computer simulation - so why hurt our marine life? WHY?????????	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the EIS/OEIS, today's simulation technology does not permit effective training and testing.
Ken K. (Electronic)	Don't do these activities if they harm living animals. You've got enough ways to kill and maim people, these tests are not important enough to kill innocent animals over. How about we do tests on you and your family? Would that be ok?	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Kaempfer (Electronic)		Blank
Kahele (Written)	Enough is enough – no more military. This is not America, so go home. For the record I'm against all Navy and Military here in Hawaii, it's take, take, take. No end to it. You say you're here to protect us but who is going to protect us from you? Stop already. This is Military occupation. Stolen Land!	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Kaiu (Written)	Opposed.	Thank you for participating in the NEPA process.
Kaiwi (Oral-Kauai)	Aloha, my name is Ed Kaiwi. I was formally in the United States Marine Corps, Echo Company, Second Battalion. So I talked to this lady here, and she told me all about the Navy. Why are we trying to chase the Navy out of here? I just want the Navy to remove the sonar from all military ships within 300 miles within our sights. So I want to give this to the captain. This is a handbook. It says, Consultant with Native Hawaiian Organizations in Section 106, review process handling. So the Navy has to go through procedures with the Native Hawaiian Historical Preservation Officer, which I am. And then Sheryl Lovell is the other historical preservation officer for the Office of Hawaiian Affairs. So I represent the Office of Hawaiian Affairs and the Department of the Interior. So these policies and procedures things that I'm going to have Scott read after me identifying the historical properties. So the Navy hasn't identified what area, like the lady said, that they're going to test this thing. And now the whole northern islands is a sanctuary. So no military ships supposed to be in the sanctuary. So right now the Navy is violating many rules by bringing any military ship within the sanctuary area, which is the Pacific Missile Range. So the other one is adverse effect on it, and then there's how to resolve the adverse effect. What is the implementation of the MOA? The memorandum of agreement is what we need to sit down with the Navy and the historical preservation officer and the state preservation officer before anyone can proceed in whatever you're doing today. And the last part is charter Native Hawaiians and the public, so the public informant is the key ingredients in sufficient Sections 106 consulting, and the views of the public should be listed and considered throughout the whole entire process. So I'm a Native Hawaiian, and these are the public. And so the public and us are complaining about the sonar that you guys destroy it. You have called the mermaids aquatic eighth. So anyway, my time is up. And he can read the rest of this to you and follow the policies and procedures of the federal government before you even start to bring EIS in our waters. They're not allowed here and please follow the instructions. Let that be known the procedures and policies of the military. So do I.	As described in Section 3.10.1.2 (Identification, Evaluation, and Treatment of Cultural Resources) of the Draft EIS/OEIS, "Section 106 of the National Historic Preservation Act requires federal agencies to consider the effects of their actions on cultural resources listed in or eligible for inclusion in the National Register. The regulations implementing Section 106 (36 C.F.R. Part 800) specify a consultation process to assist in satisfying this requirement. Consultation with the appropriate State Historic Preservation Offices, the Advisory Council, Native American tribes and Native Hawaiian organizations, the public, and state and federal agencies is required by Section 106 of the National Historic Preservation Act. Scoping letters for this EIS/OEIS were sent to appropriate State Historic Preservation Offices and federally-recognized Native American tribes." The Navy will continue to comply with the National Historic Preservation Act.
Kaleiwahea (Oral-Hilo)	I hope that you guys understand in the three minutes that I have because one reason I'll be (inaudible). I want to ask you a question to you, you people. Do you know what Hawaii is here in the contribution to the world? Do you know what Hawaii is? Because you guys have to have an understanding that what we're here as a contributor to the world. We represent the heart in the (inaudible) system of humanity. This is why we have a culture Kanaloa. And for what you guys are doing, it's, you know, a beautiful culture that we have. You know, you guys are destroying it on the land, the water. You know, you guys not thinking. Why we're here, the way our (inaudible) put us here in this master plan because we have a culture. You guys don't. You guys are manmade culture. Ours organic. And this is why you guys got to know what we represent in this world by the	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

	system of humanity. We represent the heart, brah. This is why we (inaudible). And because you no can understand that (inaudible), you know, how we going to pull this world together? You got to understand. You see that mountain up there? That's the (inaudible), the gods. Okay? (Inaudible) has three sides that connect the four pillars of the world. You understand me? Four pillars of the world: north, south, east, west. Okay? You people come to the west, go in there. You represent (inaudible). Go into the east (inaudible). We come from Kanaloa, the living spirit over the land and the water, and we come from a culture Kanaloa. You guys have to make that connection so we can pull the world together. I'm not (inaudible). America, Japan, China (inaudible). Okay? Why? Because this reason: They're supposed to come here and understand. (Inaudible.) It's a power play, one with the (inaudible) and one with military gain. That's not the way, man. We got to pull the world together. The world is the heart, and that's what we're here for. Okay?	
Kanaka'ole (Electronic)	Dear Sirs/Madams, I am strongly in opposition to any/all proposed use of the Hawaiian Archipelago as a training/test site for the US Navy et al as it is evidently detrimental to the critical habitat of these Hawaiian Islands & its' people. I am a lineal heir descendant/3rd party beneficiary of the Cleveland-Liliuokalani Assignment/Agreement who has never willingly/knowingly conveyed and/or ever been compensated for my assets (inherent vested undivided interest to what was under the lawful management of the Crown/Hawaiian Kingdom Government prior to January 17, 1893) as a matter of fact or pursuant to the law of Nations (Geneva IV & V). The Apology Resolution (Public Law 130-150) & Act 359 of the Hawaii State Legislature acknowledges the historical injustices committed upon the Crown). The Hawaiian Kingdom Government & its' People never conveyed nor have we been justly compensated for what was under the lawful management of Liliuokalani (Queen of these Hawaiian Islands). It has been reported today that the US Navy has knowingly dumped hazardous waste into Pearl Harbor (Oahu) & are being fined $80,000.00. The ridiculous fine shall not compensate or financially cover restoration/reparation of the critical habitat affected by the US Navy's illegal dumping of hazardous materials into Pearl Harbor!!! Furthermore, no consultation has ever been made with me & my ohana directly possessing an undivided interest to the entire Hawaiian Archipelago as pursuant to Section 106 of the National Historic Preservation Act of which compliance is mandatory!!! Whereas, I demand that all directly/indirectly concerned cease & desist immediately. Your failure to cease & desist would give cause of action for me & my ohana to file grievances with the international court of justice for cultural genocide & civil rights violations pursuant to applicable sections of Title 18; 28; & 42 of the United States Code etc!!! Please govern yourselves accordingly with due diligence!!! Aloha nui & Mahalo!!! Simbralynn Leiolani Kanaka'ole	Thank you for participating in the NEPA process.
Kane (Electronic)	Please do not continue with your sound testing in the Pacific	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Kastel (Electronic)	Almost everybody agrees that we need a robust and strong Navy to protect national security. And almost all of us agree that whales, dolphins, and porpoises deserve to live and to have a healthy ocean environment. But a recent proposal from the federal government tries to make Americans pick between these options, and it's a false choice. The U.S. Navy is proposing to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. These exercises would involve the use of live explosives and high-intensity sonar. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, porpoises, and many other marine creatures. We are asking the Navy today to protect marine mammals from explosives and sonar along the East Coast, and California and Hawaii. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. The HSUS is joining other environmental and animal welfare groups to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

	marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We are calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures. PLEASE CARE ABOUT THE MARINE LIFE! HAVE MERCY! BE RESPONSIBLE!	
D. Katir (Electronic)	I respect the thought and care you are using in your efforts to make our country safe and also for your efforts to reduce any adverse effects to wildlife. However, I ask that you please find a method, a time, or a location that will result in few to zero fatalities or injuries while you strive to achieve your goals. All marine life is in need of our protection, but especially sea turtles, whales and beaked dolphins. Please do not seek to use methods that have adverse effects on marine life.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
U. Katir (Electronic)	First, I praise you for inviting comments. Please help us to understand why using potentially lethal testing methods is necessary. I hereby state my objection to any sonar testing that would damage whales, dolphins or any other sea creature sensitive to such testing. Please DO NOT DO THIS!!! Is there another way? Is there another location? Please help the public to understand what you are doing! Again, thank you very much for allowing the public to comment. I just wish I had known sooner. You have my phone number, please call if you have any information that will help me to understand. I appreciate you and pray that everyone's needs can be met. Very best regards, Usha Katir	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Kaur (Electronic)	To whom it may concern, Sometimes as an individual one feels very impotent to stop an exercise of this magnitude. All I want to remind the people behind this is that we are NOT alone on Earth. The continuance of life on Earth requires balance and respect to all those we share this planet with. In the name of progress we ignore the collateral damage we cause but we don't realize that the Earth has a pulse too and it has reminded us, through Tsunamis and Earthquakes and disasters of horrible magnitudes, that payback is tough. So lets respect non-humans on Earth and not inflict such damage on them. Best, Simran	Thank you for participating in the NEPA process.
Keanu (Written)	Opposed.	Thank you for participating in the NEPA process.
Keeble (Electronic)	I'd appreciate it if you didn't test your sonar and explosives in proximity to defenseless marine life. C'mon, with all the pollution and overfishing those guys have a hard enough time getting by as it is don't you think? Do we have to be the planets biggest a-hole neighbor every time?	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. The Navy has conducted training in these operating areas regularly for approximately 60 years. Though the intensity of live training will increase, the events are of relatively short duration and therefore the Navy does not anticipate that fish will be affected as a result of the training exercises and testing activities. Fish may respond behaviorally to sound sources in their hearing range (most Navy sound sources are not in the hearing range for most fish species), but this reaction is only expected to be brief and not biologically significant. Most commercially important fish species are not believed to hear midand high-frequency sound sources which make up the majority of sound producing activities.
Keefauver (Electronic)	Please put the safety of the whales & dolphins first and keep your testing off the shores of Hawaii & California.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Keller (Electronic)	This is too high a price to pay. You know how the animals will be damaged. The damages will be in effect for many years in some cases. Spend the money to go somewhere less harmful if this "testing" must be done. Frankly, you people are not dumb. Why can't you figure out a way to test your merchandise without the harm? This is too high a price to pay.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
A. Kelly (Written)	Opposed. I'm opposed to the use of High frequency Sonar. I further believe that this EIS is incomplete as it does NOT mention the effects on Humans Due to the impact on the sea reafs and animals. There is no mention of Cultural or food impacts as a result of High frequency Sonar.	This EIS/OEIS fully analyzed all impacts to the human environment. The reasonably foreseeable effects to coral reefs and other marine species were analyzed in Chapter 3. Impacts to cultural resources were analyzed in Section 3.10 (Cultural Resources) of the EIS/OEIS.
G. Kelly (Oral-Hilo)	I'd just like it to go on record that I'd like the meetings to go back the way they were, where we were able to reach the whole public and not just the choir so that we can reach out to our community, and I feel like this is a suppressive tactic even if it wasn't intentional. On the first introductory panel that declares your mission, one of them is to	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	"maintain, train and equip combat-ready military forces capable of winning wars." I just said to myself, wow, imagine if you went up to the pearly gates and they said, "Well, what was your mission in life?" and you said, you know, "I'm capable of winning wars." I wonder how that would go over with the Creator. And I looked at that word, military forces. Two syllables in forces. What's the first syllable? That's got to tell us something. Force. In regards to the environmental studies, most of these studies have kind of failed the people. You know, we may be thrown a crumb once in a while where they'll save a bird or a patch of habitat, but for the most part our wishes are overridden while military toxins continue, everything from heavy metals to depleted uranium and to unexploded ordnances. So even though we're here for an environmental study, I can't detach that from the bigger mission, which I see as empire-expanding. And by empire, you know, okay, U.S., NATO, Israel kind of joining forces to dominate the rest of the world one country at a time, Iraq, Afghanistan, Egypt, Libya, Pakistan, Syria, with the intention of circling of course some nations that still show some independence like Russia and China, all moving towards the ideal of globalization, which steals every country's sovereignty. And we will be then led by leaders in the U.N. half a world away, whom we have not elected, and have less of a voice and less local authority to decide how our lives are led. And now going into Mother Africa, and we know that it's about resource grab, about owning the oil and owning the water and owning the ports and the poppies, the heroin poppies and the opium poppies and every other resource out there. And so when I talked to everyone here, everybody was passing the buck including you, sir. You said, "We do not make the decisions," but you do serve those who make the decisions. And I guess the last part of what I want to say is outreach to those of you who are holding up the military killing machine because I see it as such. You choose to settle conflicts by taking lives, and that's a very primitive way to advance civilization. Please think about our words tonight. We're reaching out to you. We'll be here for you if you decide on a different course in life. It's not too late.	
Kemp (Electronic)	Please do not do this!! Stop the testing...NOW!	Thank you for participating in the NEPA process.
Kendrick (Electronic)	Please do not endanger the hearing or lives of whales and dolphins. Isn't there another way?	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

		been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Kenzie (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Kenzie	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in

		publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Kershner (Electronic)	as vast as the oceans may seem to us landdwellers, for many creatures, it is their only home. please consider the following steps to reduce the harmful impacts to marine mammals: avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ketcherside (Electronic)	Almost everybody agrees that we need a robust and strong Navy to protect national security. And almost all of us agree that whales, dolphins, and porpoises deserve to live and to have a healthy ocean environment. But a recent proposal from the federal government tries to make Americans pick between these options, and it’s a false choice. The U.S. Navy is proposing to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. These exercises would involve the use of live explosives and high-intensity sonar. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Khomyakov (Electronic)	I am saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. I look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact me.	analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Commenter	Comment	Navy Response
	reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	
Kingsley (Electronic)	I'm concerned about the harm potentially caused to marine mammals by your project. Surely it would be unthinkable for someone to come to your home and deafen your family members. Why then is it acceptable to do it to another species? Because they don't talk? Because they don't vote or have any influence? Are any species other than humans at risk from other "projects"? We are not being good custodians if we think we are so far above everything else that lives here that we can't be compassionate and use restraint when we exert our "supremacy" over other life forms. These creatures were here long before humans but we think nothing of harming them to advance ourselves. They need their hearing to eat, mate, communicate...all the things we do without a second thought. What if those things were taken from us through no fault of our own but by a, supposedly, more advanced society? We have no more right to harm another than they have to harm us. I know I sound like a bleeding heart hippie or something. I may be but I'm trying to give a voice to those we can't understand. Shouldn't we side with compassion and respect instead of arrogance? Thank you for your time. Sincerely, Michele Kingsley	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Kirch (Electronic)	Don't kill & or deafen innocent animals for testing, please find a better way.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Commenter	Comment	Navy Response
Kislak (Electronic)	As a taxpayer and supporter of the U.S. military, I implore you to please NOT destroy or injure in any way any marine animals with naval (or other) exercises. It is an abomination in the eyes of God. You MUST figure out a way to exercise military hardware and forces WITHOUT significantly damaging ANY of God's creatures. I am generally in favor of national defense exercises, and I understand collateral damage during war, but killing and injuring simply for exercises is a sin of the highest magnitude.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Kitch (Electronic)	Please do not threaten the lives of whales and dolphins on East Coast, California, Hawaii by conducting experiments using explosives and sonar. This is unacceptable and unnecessary. Please take into consideration and develop another plan.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5

		(Alternatives Development) for more detailed information on the development of alternatives.
Kivlen (Electronic)	Whales and dolphins depend on sound to navigate and live. Please stop the useless killing of 1,800 whales and dolphins and the deafening of 15,900 more by ceasing the operation of the Navy's underwater sound system in the Hawaiian Islands, the California and Atlantic Coasts, and the Gulf of Mexico. The use of high-frequency underwater sound testing should be better managed by working with Environmental groups. The Navy should plan to test during a safer time period, or if necessary stop the testing completely if it can't be done without harming thousands of whales & dolphins.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Klick (Electronic)	The proposed plan is indefensible from the point of view of putting at risk many thousands of marine mammals, who are considered by leading scientists to be sentient and self-aware. A similar proposal that involved the planned death of 2000 primates, many of endangeded species, along with irreversible damage to tens of thousands of others would never even be considered. If indeed these exercises are important to our future security, it is imperative that measures be taken to minimize the impact on marine manmmals. These measures could include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Knable-Crook (Electronic)	I realize your work/testing is critical. But so is the survival of these wondrous creatures... please, please pursue alternative solutions to actions that will inflict such pain and devastation. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Koopmans (Electronic)	plz do not do this its to cruel we need Animals on this world	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Korhonen (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Krinsky (Electronic)	Marine mammals live in the ocean. They do not have a choice on their location of residence. They rely on their sense of hearing to survive in their native environment. Sonar interferes with their ability to live. Every technology invented by humans has an impact on the world. Some of these impacts turn out to be severely negative consequences that were unintended but very real. When that occurs, it is incumbent on mankind to change its implementation of those technologies to mitigate the harm done to other beings or the environment. We now understand the destructive impact of sonar use in areas of high marine mammal activity, particularly in the areas off of Southern California and Hawaii. We should develop and use alternative technology in these areas at the very least, but also in other sensitive areas to ensure that other species have the right to live their lives in a safe, peaceful and positive manner without the kind of unnatural interference provided by our deployment of the sonar technology in their homes and feeding and breeding grounds.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy employs new technology where feasible to reduce impacts. One example is the use of passive sonar to listen for the presence of marine mammals prior to starting a sonar activity.
Kronsnoble (Electronic)	I am outraged that the Navy is planning an operation which will harm dolphins and whales not to mention other creatures in the ocean. Please do not do this!!! It is just wrong.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

Commenter	Comment	Navy Response
		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Landsberg (Electronic)	I am writing to ask the Navy to please implement all protective measures while using sonar and explosives in areas where marine mammals live. We know the harmful effects sonar and explosives have on marine mammals and we need to make sure we protect them in the process. Thank you, Marisa Landsberg	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
A. Lane-01 (Electronic)	Please do not conduct training exercise along the US East Coast or off the coasts of California and Hawaii. Your own environmental studies indicate that a large number of marine mammals including some endangered species will be impacted negatively, even killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded few to no mortalities from sonar or explosives.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		Any prediction of mortality made by a model is only an estimate.
A. Lane-02	With the technology that our nation possesses, we can certainly find more humane and ethically/environmentally responsible ways to test live explosives and high-intensity sonar. I urge the U.S. Navy to listen to the majority of the public and use and observe protective measures in your testing excercises-all creatures on this earth have a right to a peaceful existence. April Lane Whitefish,MT	Currently sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
K. Lane (Electronic)	STOP UNDERWATER SOUND TESTING!!!	Thank you for participating in the NEPA process.
Lang (Electronic)	I urge and request the US Navy to adopt safeguards during sonar training. The upcoming testing, please protect Whales and Dolphins. I know there must be ways to keep our country safe WITHOUT torturing non human life. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Lauer (Electronic)	I am urging you to consider steps to reduce the harmful impacts to marine mammals when conducting training exercises. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Many animal welfare organizations, including The Humane Society of the United States, are happy to work together to come to the best, most humane solution for all. Please explore all options before sacrificing the precious species that call our oceans home. Thank you in advance for your compassion.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of

		significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Leach-01 (Electronic)	Don't do it! Lives are at stake, not human, just as meaningful.	Thank you for participating in the NEPA process.
Leach-02	Please don't do it! We have done enough to destroy, then try and save sea life!	Thank you for participating in the NEPA process.
Leder (Written)	Opposed.	Thank you for participating in the NEPA process.
A. Lee (Electronic)	For me, part of being an American is knowing that our actions are what make this country great. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Thank you, Andrew Lee	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
C. Lee (Electronic)	Please protect animals during training exercises.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. 		at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
M. Lee-01 (Electronic)	Humpback Whale Breaching Photo: Thomas R. Kieckhefer I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
M. Lee-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4)

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
R. Lee (Electronic)	To Whom It May Concern, We just returned from a vacation to Texel, a small island in north Holland in the North Sea. Walking along the beach one evening we found a dead, beached harbor porpoise. The entire time we stayed on the island, we observed construction in the water near the beach. There is no way to know if this had anything to do with the porpoise's death, but it was clear that it significantly affected the environment these beautiful animals live in. It is disturbing to know that in our home state of	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	California, our own government is considering activities that will risk the health and lives of marine mammals, such as whales and porpoises. Our son's second grade teacher took her class to Point Reyes, CA in the spring to show them the migrating whales. The class counted a number of whales together and returned home with beautiful images and stories in their minds. These are the very whales that would be affected by the Navy's tests. I urge you to please consider alternatives to the planned testing, that would allow these animals to continue living in our waters unharmed. With much appreciation, Dr. Ria Lee	
Legere (Electronic)	To the Navy, Please stop murdering the sentient beings of the oceans. Stating you are doing it for our defense makes no sense and only proves how insane or rather unsane your department is. Murdering divine beings protects no one, it only endangers the planet even further. Stop this horrid practice now! Have you ever heard of karma (cause and effect)? Saying you are just following orders is not an excuse and does not protect you from your cause and effect.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Leland (Electronic)	Considering the state of the world's oceans this exercise is irresponsible if not completely moronic. And why can't these exercises be conducted in simulators or with as little negative impact as possible? Monstrous.	Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the EIS/OEIS, today's simulation technology does not permit effective training and testing.
Leo (Electronic)	This is truly outrageous! Please, I am asking the Navy to consider steps to reduce the harmful impacts to marine mammals. We must value and preserve our oceans and the marine mammals that inhabit the ocean, in addition to protecting our national security. There must be a balance. Please avoid the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; create a larger "safety zone" around the exercises; and use aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Thank you for the consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Leonard (Electronic)	I urge finding in favor of the No Action alternative. Multiple past studies and environmental assessments have found that current levels of Navy training and testing activities do have detrimental effects on marine resources' including on protected and endangered species. These include some with permissible takes of zero. Any increase in training and testing levels' or increase in use of active sonar would result in greater	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the

Lett (Electronic)	I am truly saddened to learn that the US Navy is planning to use live explosives and high intensity sonar that will affect the lives of 2000 marine animals. I have seen programs about marine mammals affected by navy exercises involving the use of explosives and that footage is highly disturbing as it highlights the effect such equipment has on marine life. In addition, the US Navy is carrying out these exercises without any regard for the marine life that is being affected in other countries by the use of it's sonar equipment. It is well documented that sound channels in the sea allow sound to travel over vast distances. Other countries deserve to be made aware and consulted about the US Navy's exercises. Please consider this matter seriously the Navy's actions impact upon lives of so many marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of

		significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
M. Levine (Electronic)	Please do not do this. Our marine mammals are so precious and are such an important part of the greater ecosystem. We've already done so much damage to our oceans and the life there -- we should be doing everything we can to return the ecosystems to their previous state, not destroy them further.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
R. Levine (Electronic)	I urge the Navy to limit the number of sonar exercises which negatively effect marine mammals. Evaluating necessary vs unecessary testing is a fair compromise between the navy & environmental groups. These magnificent animals play a vitally important role on earth. Disrupting their enviornment , in such profound ways, is inhumane. We are the stewards of this planet and are responsible for protecting all of the earth's creatures. I hope that the navy makes sound decisions based on good science, and with the assistance of marine experts, so less stress is placed on the oceans ecosystems, which are so important to life on earth. Thank you.	The Navy's requirements for training and testing have been developed through many years of iteration to ensure Sailors and Marines are prepared to properly respond to the many contingencies that may occur during an actual mission. These training requirements are designed to provide the experience and proficiency needed to ensure Sailors are properly prepared for operational success. Current testing levels are necessary to provide safe, reliable, effective systems to Sailors. There is no "extra" training or testing built into the Navy training and testing program. Any reduction of training or testing would impede the Navy's ability to achieve the levels of certification, proficiency and readiness required to accomplish assigned missions.
Levitt-01 (Electronic)	This comes up year after year. Please understand something. We, the concerned, care for the safety and preparation of the US Navy. AND, we accept that we (humans), MUST act responsibly regarding our actions here in relation to ALL who may be effected by it. You need to train. You also need to find a way to do so without bringing harm to the creatures with whom we share our waters. We aren't better or more important than them and we haven't the right to disregard their lives in pursuit of our own aims.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Levitt-02	We need to find a solution that works, and if that involves taking a radically new approach, applying innovative, out-of-the-box thinking to this problem, then it's about time. This principle is universal. No culture or industry ever survives, let alone thrives, without seeking to improve itself. And these improvements must benefit themselves as well as all others effected byit their endeavors. If it doesn't, it is doomed to failure and will, inevitably, cause a de-evolution of all those associated and effected by it. So. DO you think you're able to access the genius required to come up with such a solution? I think you are. To do so, you'll have to fore-go your traditional approach to problem solving. Please, please, show us what you're really made of. Show us you're more than grunts with guns. Help us to remember that you are in fact intelligent, motivated, inspired protectors of things good in this world. Show us that you've found an elegant, brilliant, remarkably effective solution to this and we won't just get out of your way, we'll help you along. Can you imagine that? When you can, you're on the right track. in gratitude, Jason	Currently sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
J. Lewis (Electronic)	Please protect the future of our wildlife.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
O. Lewis (Electronic)	We are saddened to hear that they Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not	The Navy shares your concern for marine life. 	only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours, Olivia Lewis	whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
S. Lewis (Electronic)	I strongly oppose any further sonar testing in our ocean waters. This testing is repetitive and unnecessary. The resulting stranding and deaths of marine mammals in these kinds of numbers is totally unacceptable. Whales and dolphins are aready struggling to survive the existing global human impact, and there is no justification for the amount of anticipated deaths. The military should not be given any special permissions to kill federally protected marine mammals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Li (Electronic)	I have heard through the Humane Society that the Navy is proposing to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. The Navy proposes the use of live explosives and high-intensity sonar. Your own Environmental Impact Statements estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. How is this justifiable? This is unacceptable and horrific. These intelligent, sensitive creatures do not deserve to have their habitat recklessly destroyed and their lives impacted by unnecessary training exercises in their area. There must be a better way. Please consider steps to reduce the harmful impacts	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. 		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Lincoln (Oral-Oahu)	My name is Lancelot Haili Lincoln. I am a direct descendent of Kamehameha I. If you look at the crescent of our royalty, the two twin brothers you see there, this is my family. My question to the Navy is when are they going to clean up Kahoolawe, which they have been bombing for many years? Another question I have, when are they going to clean up that oil spill over there at Pearl Harbor at the war memorial? Please, you make a mess in our islands, you must clean it up. You destroy the islands by bombing our islands, Kahoolawe, please, now you must clean it and make it the way it was when you first started. Pearl Harbor, that ship is still leaking oil. Anywhere in the world a ship dumps oil, everybody comes in to clean it up, environmentalists are all over these people, like BP. Please, clean the oil spill up over there at Pearl Harbor so we can -- again one day hopefully my grandchildren can eat the oysters that come from Pearl Harbor, Ewa Beach, Waipahu, like I did when I was a child. Now, my keiki, my children, and my grandchildren, my opio, they are not able to eat these urchins from these areas because of the destruction and oil spill from these ships. Please, you created this disaster, please clean it up for us. That's all I ask, Captain Nicholas. Thank you very much.	Thank you for participating in the NEPA process.
Lindsay (Electronic)	Crimes against the earth are crimes against humanity. What you do to the earth, you do to the people. We are all ONE. This is a human rights issue because EIS/OEIS is destroying life on earth. Protecting life, means protecting each other. Do no harm.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Linzer (Electronic)	I am upset that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. There must be reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Whales and other ocean animals are already at risk from the changing acidity in the ocean. Please help keep them safe for the years they still have left in the ocean. Thank you. Mary Linzer	analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy historically has recorded few to no mortalities caused from sonar or explosives. The estimated number of marine mammals sonar testing could affect is based on a scientific model, and it is only an estimate.
Livesey-Fassel (Electronic)	With great respect for all the Navy in particular and the military do to protect USA citizens may I please beg and plead that you consider the harm that is done to dolphins and whales in some of the excercises that harm their guidance systems! We MUST consider the great benefit of these creatures to our World and not destroy them in the process. Thank you!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Locascio (Electronic)	Has an analysis indicated the level of sonar testing that will have a minimal effect on marine mammals? With all of the scientific brainpower and experience concerning sonar testing they should arrive at an environmentally friendly solution. Has consideration been	The Navy shares your concern for marine life. The analysis and the science show that there is not a significant impact on marine species. All of the potential effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	given to conducting sonar tests in waters avoiding marine mammals?	analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy implements the most practical mitigation measures with the aim of achieving the least practicable adverse impacts to marine mammal species or stocks, to the maximum extent practicable, during its training and testing activities. The Navy has conducted active sonar training and testing activities for decades in the seaspace depicted in the Study Area with no documented proof of injuries to marine mammals.
Lochlaer (Electronic)	Cetaceans are facing many threats: hunting, pollution, loss of food sources (due to overfishing by humans). We should not be adding to their problems. The relationship between sonar and stranding events is already documented. I know that the Navy's intentions are noble and honorable. But the cost in cetacean lives will be too high. Please abandon your plans to conduct these exercises.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Lockhart (Electronic)	I am concerned about the impact the upcoming training exercises will have on marine life off the coasts of California and Hawaii. Please consider using protective measures when conducting activities that will harm or kill the marine mammals that many Americans appreciate and respect. Thank you for considering my comments.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at

		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Loe (Electronic)	Please do the right thing and respect our oceans. The living organisms are more allowed to exist than us even. They do nothing but mind their own business and we do nothing but hurt them and their environments. Please again, do the right thing and leave the oceans alone. Spend less on war and more on friendships. It is possible.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Loew (Electronic)	I urge you to protect Pacific marine mammals from injury & death by NAVY Sonar Weapons testing. Underwater sound systems damage and destroy organs that whales and porpoises need to survive. The under-ocean noise literally blasts apart the delicate fluid sacs (similar to our human ears) and makes the whale and other sea mammals unable to hunt which is essentially a death sentence. Projections indicate that 11.7 Million mammals would be affected. Please rule on the basis of reason and human conscience, not in response to an unconscionable escalation of military might. We have no looming threats being made by sea that require such magnitude of testing, and this particular plan's ramification is unacceptable.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Logan (Written)	Opposed.	Thank you for participating in the NEPA process.

Lopatka (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Commenter	Comment	Navy Response
	issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours, Trina Lopatka	actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
H. Lopez-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
H. Lopez-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly,

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	I hope to hear this testing is stopped since the damage to our oceans would be horrific.	however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of

		monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
J. Lopez (Electronic)	We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. We MUST protect marine mammals from explosives and sonar along the East Coast» and California/Hawai. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Please to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We are calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Lord (Electronic)	I am opposed to any testing or other process by the US Navy that puts our valuable sea creatures at unnecessary risk. Whatever the purpose for this "testing", it should not interfere with the health and safety of ocean creatures. I'm sick of hearing how my own government kills, wounds, and maims creatures for 'science' or 'necessary drills'. You do not have to right to kill indiscriminately in the name of progress. You will not use my tax payments for any more deadly ventures. How about making sure you are not in an inhabited area, or find some way not to harm dolphins and whales with your deadly devices.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Lotts (Electronic)	Please stop this madness. There are other ways of testing, please don't kill marine mamals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Lucas (Electronic)	How absolutely absurd that we would allow such a heinous act to even make it this far. What evil men propose such cruel displays of 'muscle'? There will be no hope for mankind as long as our military and leaders are allowed to act as such, with such disregard for our Oceans and the beautiful, feeling beings which live there. I believe you may have no souls, I will never stand behind our government until you start acting appropriately and decently. Shame on you! The government keeps waving their 'one nation under God' flag around but more and more are starting to realize who the real enemy is. You harm Gods creatures and destroy this beautiful planet with every act, the consequences will be dire. "Thou shalt not kill." No exceptions!!!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Lucky (Electronic)	I am concerned about the impact of this sonor on our sea life. I hope that more testing can be done to determine the effect upon sea mammals and the use of any device be postponed until some less harmful device is invented. I believe in the USA and its protection but hopefully we can also avoid killing the wonderful creatures of our planet except during unavoidable wartime. This sounds excessive.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to

Commenter	Comment	Navy Response
		whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Currently sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Ludwig (Electronic)	We don't need to hurt marine mammals in order to stay ready to defend our country. The thinking that says we do, is thoroughly mistaken.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Lunardi (Electronic)	Please do not let our precious marine animals die from your experiments. Please have a conscious.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
L. Lynch (Electronic)	I am writing to The Navy requesting that you include my comments on your Environmental Impact Statement (EIS) re: the use of high frequency underwater sound	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	for testing in Hawaii, the California and Atlantic Coasts, and the Gulf of Mexico. According to your estimates it will deafen more than 15,900 whales and dolphins and kill 1,800 more over the next 5 years. Whales and dolphins depend on sound to navigate and live. I am requesting that you please reconsider your Naval program, and save the lives of these ocean creatures.	analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. As noted in the Final EIS/OEIS, the design of the modeling and input factors has insured that the quantification of effects to marine mammals is a purposefully conservative overestimate of impacts. The impact analysis in the Final EIS/OEIS has been refined in coordination with NMFS. The number of marine mammal harassment exposures is only an estimate, not a prediction. The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
S. Lynch (Electronic)	Please do all that you can to minimize the effects of sonar testing on marine wildlife. The reports that have been aired on reputable programs like the Today show indicate that temporary or permanent hearing loss among marine creatures that depend on their own sonar for navigation is likely, by your own estimates, in an enormous number of animals. The numbers are unacceptably high, and by working with other agencies (governmental and private environmental), you can significantly reduce the negative impact and still conduct the necessary research to protect our service men and women. Thank you! Susan Lynch	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Commenter	Comment	Navy Response
Lynne (Electronic)	I wish to state that the use of sonar testing in the pacific waters and the damage that will be done to marine life because of it is not okay at any level with this tax payer. I believe that if it were to be put to a vote at a national level that this would not be something that the citizens of this country would support. We do not want the endless wars either on our fellow human beings and we do not want it waged on our fellow creatures of the sea. Jefferson stated that taxation without representation is tyranny. Stop the tyranny of the military industrial complex and listen to your citizens!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Lyter (Electronic)	U.S. Navy needs to re-think its plans and to incorporate additional protective measures. It is inhumane to harm the whales and other sea creatures. do what is right, please.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Maat (Electronic)	I have learned that the Navy is proposing to conduct training exercises that would involve the use of live explosives and high-intensity sonar and would kill up to 2,000 marine mammals. Please reconsider and do not do these exercises. For what? So many creatures are risk to be killed, maimed and/or otherwise disabled. Do don't this please. Leave nature alone. Thanks, Doris Maat	See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy historically has recorded few to no mortalities caused from sonar or explosives. The estimated number of marine mammals sonar testing could affect is based on a scientific model, and it is only an estimate.

Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Macey (Electronic)	This meeting was a disservice to the public. Nowhere was the true reason spelled out for the public as to what is being done or why. This meeting was called I assume because it is required for public notification but there was no notification here. Several pretty displays that do not say anything or educate the public as to what is really going on here. How about you redo this meeting and actually inform the public and allow the public to respond with questions. This format is very deceptive for the public by seeming to provide information but not doing so. I would like for someone in charge of this project or a decision maker to actually give an informative brief to the public and allow the public to respond to them. What does this project entail? How does it really affect the public and environment? That's nice that the Navy recycles their oil and is trying to be a good steward for the environment but what does that have to do with this project. I have more questions now then when I came about the true nature of what this project is.	The specifics of the Navy's Proposed Action were described in Chapter 2 and Appendix A (Navy Activities Descriptions) of the Draft EIS/OEIS. Due to the large number and variety of activities proposed, the EIS/OEIS is the best source for the detailed information. The intent of the public meetings was to provide an overview (through the posters and handouts), and also to allow an exchange of information with the subject matter experts on hand.
MacInnis-01 (Electronic)	Dolphins and whale mothers use sound and echo location to communicate with their babies. The Navy will literally be ripping apart family units if it tests in sensitive areas. The whole process smacks of a disregard for life on this planet, not protection. It's shameful.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

Mandell (Electronic)	Hello: I am writing because I strongly oppose sonic testing. Animals exist in their own right as individuals pursuing their way of being, which is no more or less sacred and holy then yours or mine. My most recent concern is Decompression Related Embolism in Stranded Whales and Dolphins, which occurs exclusively due to the US Navy. I am a citizen. I do not support cruel and grievous conduct to human or non-human creatures. Moreover, means do not justify ends - even when those ends may seem justifiable to those employing unjust means. I do not support hurting or violence towards others, human or otherwise. I appreciate a strong defense but not one that disrupts, upsets or destroys others, human, non-human, plant, mineral, rock, water or soil. I look forward to your response. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Mangan (Electronic)	Stop the killing of and or potentia1 killing of 1,600 whales and dolphins and the deafening of 11,200 more by ceasing the operation of the Navy's underwater sound system in the Hawaiian Islands and California coastline. Or anywhere else for that matter. It's 2012 - catch up with technology and adapt. I can't even believe I have to state the obvious.	See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded few to no mortalities from sonar or explosives. Any prediction of marine mammal takes is made by a model and is only an estimate.
Mann (Electronic)	I am very concerned about what the naval testing will do to sea life, especially whales and dolphins. Please do not let the sound testing happen.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

Table E.3-4: Responses to Comments from Private Individuals (continued)

Scott Manning (Oral-Kauai)	All you talking back there, can you mellow out for a minute. Thank you. Everyone came to listen. I'm just going to follow up with Uncle Ed here with Section 106 regulation summary so everyone understands what that is. Who's interested in that? Anyone interested in that? All right, cool. For the record, Section 106 of the National Historical Preservation Act of 1966. NHPA requires federal agencies to take into account the effects of their undertakings on historic properties and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment. The historic preservation review process mandated by Section 106 is outlined in regulations issued by ACHP revised regulations, protection of historic properties, 36 CFR Part 800, became effective January 11, 2001, and are summarized below. Initiate Section 106 process: The responsible federal agency first determines whether it has an undertaking that is a type of activity that could affect historic properties. Historic properties are properties that are included in the National Register of Historic Places or that meet the criteria for the National Register. If so, it must identify the appropriate state historic preservation officer, tribal historic preservation officer, SHPO, THPO, to consult with during the process. It should also plan to involve the public and identify other potential consulting parties. If it determines it has no undertaking or that its undertaking is a type of activity that has no	As described in Section 3.10.1.2 (Identification, Evaluation, and Treatment of Cultural Resources) of the Draft EIS/OEIS, "Section 106 of the National Historic Preservation Act requires federal agencies to consider the effects of their actions on cultural resources listed in or eligible for inclusion in the National Register. The regulations implementing Section 106 (36 C.F.R. Part 800) specify a consultation process to assist in satisfying this requirement. Consultation with the appropriate State Historic Preservation Offices, the Advisory Council, Native American tribes and Native Hawaiian organizations, the public, and state and federal agencies is required by Section 106 of the National Historic Preservation Act. Scoping letters for this EIS/OEIS were sent to appropriate State Historic Preservation Offices and federally-recognized Native American tribes." The Navy will continue to comply with the National Historic Preservation Act.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	potential to affect historic properties, the agency has no further Section 106 obligations. Identify the historic properties: If the agency's undertaking could affect historic properties, the agency determines the scope of appropriate identification efforts and then proceeds to identify historic properties and the area of potential effects. The agency reviews background information, consults with the SHPO/THPO and others, seeks information from knowledgeable parties and conducts additional studies as necessary. Districts, sites, buildings, structures and objects listed in the national register are considered. Unlisted properties are evaluated against a National Park Service's published criteria and consultation with the SHPO/THPO and any Indian tribe or Native Hawaiian organization that may attach religious or cultural importance to them. So I know I just have a few seconds here. But public involvement is a key ingredient in successful Section 106 consultation, and the views of the public should be solicited and considered throughout the process. The regulations also place major emphasis on consultation with Indian tribes and Native Hawaiian organizations in keeping with the 1992 amendments.	
Marckx (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Sincerely, Risty Marckx	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. 		Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
V. Martin (Electronic)	Our oceans are under threat already, please dont let this happen	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Marvin (Electronic)	PLEASE don't do this. Our ocean is full of things that we don't even understand. The living beings in the ocean need as much protection as the living beings on land. I understand that the navy, government, and who ever has power, money, and voice to make these things stop and go doesn't really care about the citizens opinion, however please consider the beauty in the ocean, the importance it plays in all our lives, and please put those of us who cant come on land and speak their voice, some kinds of respect and rights! I appreciate the Navy and I thank all those who give us freedom, but the same freedom we savor, is the same freedom the ocean needs. We don't belong there. PLEASE hear the voice. Do what's right.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Matejcek-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Matejcek-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Matejcek-03	I support a robust Navy to protect US national security. But I believe it is imperative that this be achieved without sacrificing marine life essential to a healthy marine ecosystem on which all terrestrial life depends. According to its own Environmental Impact Statements, the US Navy estimates that the planned training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii would involve the use of live explosives and high-intensity sonar. The casualties would be up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage, an additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. Marine mammals navigate, communicate and hunt by sound, which makes them extremely negatively affected by the high-intensity sonar and explosive detonations that currently are part of naval training exercises. Whales, dolphins, and porpoises have essential roles in maintaining marine biodiversity yet already face threats from global warming, ocean acidification, entanglement in fishing nets, loss of food to unregulated fishing, illegal killing. Losing thousands of them as the result of naval training exercises is unacceptable In the past, whales have stranded and	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar, including incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species dying in North Carolina in 2005. I urge you to implement the full range of steps to reduce the harmful impacts of these exercises to marine mammals that are recommended by the HSUS and other environmental and animal welfare groups . These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded few to no mortalities from sonar or explosives. Any prediction of marine mammal takes is made by a model and is only an estimate.
Mattera (Electronic)	The USA Navy is proposing to conduct training exercises that would involve the use of live explosives and high-intensity sonar and would kill up to 2,000 marine mammals Please protect marine mammals from explosives and sonar We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. The HSUS is joining other environmental and animal welfare groups to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We are calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded few to no mortalities from sonar or explosives. Any prediction of marine mammal takes is made by a model and is only an estimate.
Mauthe (Electronic)	The war is over! We do not need this horrible playing "Army" in our oceans. Do you realize how many animals you are killing? How rewarding is it to you when you see and smell a dead Whale, Seal, etc on the beach after one of these test? Stop the killing and go play your Army Games somewhere else, we all own a part of Big Blue and I don't like	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Mayorga-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Commenter	Comment	Navy Response
	been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Mc Keating-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. McCartney (Electronic)	I watched the Navy video on this page and I am happy to note the huge efforts being made toward responsible behavior such as recycling, using alternative energy, improving the logger-head shrike population, etc. Accomplishing Navy goals while respecting the lives of other Earth creatures is incredibly complicated I'm sure. Since we see ourselves as the beings with the most intelligence and with the most valid agendas we have an even larger responsibility of stewardship for our fellow creatures while pursuing our goals. Although the Navy says it's doing the best it can to respect the marine creatures I don't believe the proposed testing methods do respect those creatures. I understand the testing is expected to deafen thousands of cetaceans in the course of standard operations. Others will die outright. While it seems bad enough that we would ruin their sense of hearing we need to remember that hearing is their way of living, finding food, communicating with their family/pod. Our desire to test weaponry and defensive methods should NOT turn us (and our children) into the terrorists of these creatures. The lifeforms on our planet are intertwined and all are hugely important. We humans are not intrinsically more important or better than any of the others and we shouldn't subject them to our damage. They have no way to take a stand in this; they are just busy trying to live. I say we let them do that to the very best of our ingenious ability. Please, do not approve testing/training procedures that impose such a price tag on these peaceful creatures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded few to no mortalities from sonar or explosives. Any prediction of marine mammal takes is made by a model and is only an estimate.
McDaniel (Electronic)	I do not feel safe in a country that chooses to annihilate innocent marine life. With thousands of marine animals that will lose their life in explosions with high intensity sonar, please reconsider. I worry for the thousands more that are not killed instantly, but become deaf and die slow, terrifying deaths as ear tissue is destroyed and sonar communication becomes impossible... effectively intelligent marine life like dolphins and whales die alone and afraid. I believe national security is important, but I also believe in the 21st century with the great amount of intelligence and creativity the finest in the US Navy offer, we can find a better way. Please include protective measures. I know the US Navy is designed to protect US citizens such as myself, but I do not feel protected if the wildlife I love is destroyed. These actions hurt the reputation of the military and country I respect and admire. It becomes more difficult to defend that the US Navy is a force for	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Mcgovern (Electronic)	i am sorry i missed your public meeting and comment opportunity in may. i just recently became aware of the navy's plan to kill and deafen thousands of crustaceans and other marine life. i wonder how often these programs are evaluated for the impact on the environment and defenseless animals that are at the mercy of our gov't programs that are deemed necessary and fair but only further destroy and cause the decay of our planet. i hope there were other in the communities who care about the marine life of our planet who voiced similar concerns. thank you for the opportunity to express my concern. joan mcgovern	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
McGraw (Electronic)	The Navy's own estimates of sonar and bombs testing causing harm and mortality to so many marine mammals is evidence that the Navy needs to make significant changes to minimize this harm and deaths. I support the recent lawsuits against the Navy that call for scaling back your programs. I urge you to take all steps requested by marine biologists to minimize harm.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
McIndoo-01 (Electronic)	Hello Navy. As a military brat I understand the need for a secure world and I believe in the men and women who work to uphold it. But I have been watching the "progress" of your sonar technology since the early days of LFAS and, really, thank God for our environmental protection procedures and laws. You are messing with this technology simply for technology's sake. Unfortunately too many individuals in the military system are in deep denial about Sept. 11th. All the best technology in the world is not going to cover up the fact that this simple and brilliant plan was used so devastatingly against us by using our own everyday things. Box cutters. Planes. They didn't come at us in submarines and LFAS didn't protect us then. "They" won't now either. Because the game of war has changed. An underwater Maginot Line doesn't answer for our inability to think like the enemy! These military mistakes have happened over and over in human history. What makes you think you are any different? Your myopic belief in your newest strategy--this technology-- will finally make us invulnerable? It won't. Because you aren't thinking like them! A trained killer with a box cutter, if he goes swimming, will go around your sonar wall of death and get us from behind. And they will succeed. Again. Learn from history and stop repeating it. What you are doing is an abomination. It is an abomination to create, test and implement this weapon-- because that is exactly what your sonar acts like-- against another species in their home environment. An environment that we know very little about, and which they are dependant upon for their very survival. They cannot live on land. We cannot live in the ocean. It's not like they have somewhere else to go!	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	And your motives are not heroic. They are very dark indeed. Otherwise why do this in an environment in which we cannot see what you are doing and likewise see the actual true consequences?! It's not just the dolphins and whales, it's the very bottom of the ocean global food chain too! No doubt your weapon can blast apart the simple life forms upon which ALL OF US depend. You are engaging in an unprovoked act of aggression against innocents. There is no way you can rationalize this. HUMAN warfare against HUMAN INNOCENTS is unfortunately part of our human condition. But not the cetaceans and the millions of lives in the sea. And they have no means to defend themselves against us. What you are doing is fundamentally and profoundly wrong. Personally, I have been reeling through the shocks of the economic problems that are part of the history since LFAS, just as Sept 11th is part of that history. I find it so hard to believe that so many good and decent people are having such trouble paying their basic bills, and yet YOU have no issues with spending money on this weapon, this ultimately useless underwater Maginot line, the consultants salaries to convince us otherwise, the maps and diagrams, the list goes on and on. I have to budget a trip to the copy shop. One of your maps and diagrams would stretch that budget, so it wouldnt get done instead. And yet there you are, well fed and housed, on your military career tracks, self assured in your faith in your system. Good for you. Again, I've been there. But because I am reeling along with so many other good people does not mean that I am weak, or powerless, or that I cannot hold you to account. What you are doing is sick. Dangerous. Perverse. And you know it! This is not noble or heroic. It is not upholding any shining military virtues. It will not protect us. When the killer with the box cutter chooses to swim around you, it will prove once again that you failed to protect us. You failed in your duty. And in addition, you will have done so while desecrating whole communities of cetaceans and sea life. And you will be rewarded by adding their pain and suffering to the ghosts and demons that already haunt you. -*- Don't do this. Sincerely, Hilary McIndoo	
McIndoo-02	I just sent you my document but I couldn't get the cut and paste to work. Also my iPad does not have a printer port. So I want you to acknowledge that my comment was recieved and to please email me the entire copy of my comment. This is required of a document that is public record, such as being submitted to this EIS. Hilary	Your comment was received.
McIntyre (Electronic)	Please reconsider the explosive and sonar exercises. The military forces of the United States should be know to protect their people, but also protect their environment and animals within this environment. How can the people responsible sleep at night, knowing what they destroyed. This earth and many of the animal species have been here way before us and we should not take the liberty to destroy them!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. 		the conduct of its training and testing activities. As described in Chapter 5 of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
McKenna (Electronic)	To whom it may concern: It has come to my attention that the Navy plans to conduct training exercises along the California coast that could negatively affect marine wildlife. I am asking the Navy to instead consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Thank you for your consideration. Joan McKenna California resident	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
K. McNeil (Written)	Opposed. The Kingdom of Hawai'I remains sovereign although under prolonged belligerent illegal occupation by the U.S.A. and its military. Because no treaty of annexation could be ratified and because of the "executive agreement" between Queen Lili'uokalani and President Cleveland, which is still in effect to this day. Free Hawai'i!	Thank you for participating in the NEPA process.
T. McNeil (Written)	Opposed.	Thank you for participating in the NEPA process.
McNulty (Electronic)	I can barely express how horrified I felt when I saw the amount of devastation to be wrought by your projected training exercises. This is an abomination and must not take place. Damaging our planet and Her seas for any reason makes no sense. It seems more fitting that you should be protecting Her, in all aspects. The planet is our home, the only one we've got! Respectfully, Marnie McNulty	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
McNutt (Oral-Kauai)	I'm more organized than NOAA, which stands for No Organization At All. Sorry. My name is Lyn and my last name is McNutt, which has to be the best haole last name on the island, especially considering my daughter is the Kauai nut roaster. I just wanted to remind you guys, and this one thing that always comes back to me, you're working on tax dollars. Okay. These are my tax dollars. And this process needs much more	Your scoping comments were received, and along with all of the other scoping comments, were reviewed by the Navy to ensure the appropriate project issues were properly scoped in the Draft EIS/OEIS. The Navy appreciates your comments on this project and appreciates your desire to stay informed. In this particular case, the mailing

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	community input. I read the Federal Register, and that's how I found out about this meeting. I was at the last meeting. I received nothing back about my comments, not a thing, not any acknowledgement. I didn't get on any mailing list. I know I gave you all the information. I handed in seven pages of comments. I have a really strong background in writing EISs and marine policy. They were cogent comments, they were worth looking at and paying attention to. I felt really put out because I wasn't. And I also do the community calendar at Kauai Community Radio. We didn't get anything. Not a thing. People here don't all read the newspaper, and they certainly don't read the Federal Register. And by the way, at the end of this if anybody would like to be on my mailing list for the Federal Register, give me your email because I pull out all the things related to the ocean and land in Kauai and I send them out. As I look at your document right here, who do we call? Where is it written anywhere in here the timeline? Who do we contact? How do we get ahold of you guys? Because I know it's in the EIS, but it's buried in the EIS. And I'd like to come back to that comment the person made about data. I think it was Ken.	address provided was an old address, which is where meeting information and project updates were sent. This address has now been updated.
McRory (Electronic)	The HSUS is joining other environmental and animal welfare groups to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We are calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures. Thank you, Kathy McRory	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Megan (Electronic)	Navy, NO, this is absolutely not acceptable. Sacrificing lives for tests is not an intelligent or sensitive decision. My entire American family does not support the decision to "sound" test! Absolutely not!! Sincerely, Megan , Gabriel & Frances	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Megles	As a senior citizen I have been aware of other times also when our scientists tested sonar and explosives where the whales, fish, etc. of our oceans were threatened and	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
(Electronic)	even harmed. Truly I am ashamed of how little respect we have for these creatures. Will we ever learn to respect them and find other ways to conduct these tests? Are they even all that necessary? Of course, people have always found ways to justify their cruelty to animals. 60 Minutes years ago profiled Dr. Michael Carey who shot 600 cats in the head for a wound study. Imagine this was approved. Either I am terribly abtuse or many people are.	analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Meima-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Meima-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Meister	As a US tax paying citizen, I find it totally unacceptable that the Navy would even consider doing any kind of testing that would do harm to whales and dolphins, not to mention other marine life. We are stewards of this planet, not destroyers. These animals are not only highly intelligent and beautiful creatures, they are also part of the web that we all belong to. I urge you to reconsider your position on this issue. I would venture to guess that if this were taken up for a vote, most every person in this country would vote in favor of the marine life. Thank you , Ann Meister	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Commenter	Comment	Navy Response
Merritt (Electronic)	I feel that the Navy is being very irresponsible for testing around 2 of the most beautiful states in the entire U.S. I have homes along the coast of California and on Kauai. The dolphins, whales, and other marine life are already affected by pollution. Now you are going to confuse them more with sonar. I think it speaks so poorly for those in planning and think some other sites should be considered. How about off of Mexico. I sometimes wonder how smart organizations headed by even smarter people can make such stupid choices. This to me is more important than who runs for president or Congress. Before retirement I worked for a government contractor and God help us if you have solicited contractors to perform your dirty work. I'm not sure I'm a proud American when decisions like this are made.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Mezzanatto (Electronic)	I find it reprehensible that as a country we would even consider doing this. Knowing how it affects the oceans beautiful mammals. We are SO much better than this! Have we not become less of a barbaric nation? Are we not supposed to be the example for others? Does anything go now, in the climate of lies and dishonesty, no integrity and whats in it for me..... the Navy has no intention of protecting the mammals in the ocean. They are intelligent beautiful creatures. Would you do this to your family and children? I sure hope not. Then act as if you have a heart and do what is right. Stop implementing something that you KNOW to be harmful. Please.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. L. Miranda (Electronic)	Dear U.S. Navy, Please re-think your plans and incorporate the additional protective measures below to reduce the harmful impacts to marine mammals. - Avoid the most harmful activities in areas used as calving grounds or migratory corriders. - Avoid seasonal high-use feeding areas. - Create a larger "safety zone" around the exercises - Use aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We need a strong Navy to protect our country and we need to protect and ensure a healthy ocean environment for whales, dolphins, and porpoises to live in as it is their given birth right. Respect and protection of marine environments makes us a great nation. We need to ensure that we do not harm many whales, dolphins and other marine creatures. The tradgedies of the past can be avoided significantly. Please remove the facade of having to choose between a strong Navy and national security or a healthy marine environment for ocean mammals by implementing the protective measures above. Sincerely and Respectfully,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
S. Sincerely and Respectfully,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Misseldine (Electronic)	I am deeply concerned that you are proposing to conduct training exercises that will involve the use of live explosives and high - intensity sonar. Your own estimates show that you will kill u to 2,000 marine and thousands more will suffer permanent damange such as deafness. Please do everything you can to reduce the harmful impacts to marine animals such as avoiding activities in calving grounds or along migratory corridors; avoiding high-use feeding areas and monitoring to determine if marine mammals are nearby. If you take these actions, your training can still go forward, but you'll minimize damage to these beautiful creatures. Thank you for your consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Carol Misseldine	actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy historically has recorded few to no mortalities caused from sonar or explosives. The estimated number of marine mammals sonar testing could affect is based on a scientific model, and it is only an estimate.
D. Mitchell (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Most sincerely, Deborah Mitchell	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
M. Mitchell (Electronic)	I strongly urge not proceeding with this testing as planned. I understand that it is not disuputed that this is harmful to marine animals, including very intelligent animals such as whales and dolphins, and perhaps gravely so. Of course this is measured against the importance of this testing to national security to a degree that perhaps the public cannot	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Table E.3-4: Responses to Comments from Private Individuals (continued)

	fully know. I do not contest that we value human life over animal life, but of course that relative value cannot be an absolute argument allowing any harm to animals that might potentially be of any small benefit to our species. And in particular, with certain species, we see an almost universal desire to value their well being almost as much as we value our own. There have been many suggestions for modifications in the way the testing is done that would mitigate the suffering of these animals, and I cannot see not doing such things as we might, albeit at some expense. Thank you.	Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Moak (Electronic)	I am alarmed and appalled that the US Navy is planning to conduct underwater testing involving explosives and high intensity sonar in areas where dolphins and whales will be injured and killed. Surely there are other ways to conduct this sort of testing that will not endanger these beautiful animals. This type of testing in indefensible and wrong. We do not own this world; the United States needs to occupy the "high ground" in regard to its treatment of animals. There are many things that we need to do to accomplish this. Abandoning this current testing plan is one step that will move this process forward. Thank you for your consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. 		with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
D. Monasevitch (Written)	This is a letter opposing the Navy's use of deadly sonar in its war games practices. I challenge the validity of the current DEIS. The military and the government have lost most of its legitimacy in conducting science. Those of us that have been following this have been aware that environmental science has suffered since the 1980 Regan administration and especially since the "W" Bush era policy of firing scientists that do not agree with their politics. Unfortunately the Obama administration had done little or nothing to remedy this situation. The bulk of the science presented in the EIS is clearly the work of Ph.D.'s for hire. A Big slew of military hacks, regurgitating each other's papers and dancing around targeted science that substantiates the realities of the wanton murder and destruction of species and the environment. I support the need for a strong Defense. I pay my taxes. I question the bogus science condoning the militarization of the oceans and the planet at the expense of biodiversity. I view the present DEIS an example of pure greed and an utter lack of creativity and wisdom.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States. Active sonar is currently the most effective way to locate submerged enemy submarines before they are close enough to sink U.S. ships. To successfully defend against submarines and other underwater threats, such as mines, Sailors must train realistically with the latest technology, including both passive and active sonar
D. Monasevitch (Written)	I would like 5 Whale wheels. They will be shared in the schools on Kauai as I make my rounds as a substitute teacher. Free advertisement for the U.S. Navy!	The whale wheels were available for distribution at the public meetings.

Commenter	Comment	Navy Response
N. Monasevitch (Oral-Kauai)	Aloha. Thank you for the opportunity to be here. I appreciate your presence. My name is Nina Monasevitch. I'll give you my card. I'm the co-founder and chair of Kohola Leo, Kohola meaning whales, and Leo meaning voice. We started the group to be a voice for the whales. There's been a lot of discussion here about impacts to marine mammals, and I just want to say unequivocally sonar kills marine mammals. It tortures, it causes excruciable pain to all cetaceans and other marine life. I've done a lot of research. I've read all the scientific papers. The fact that the Navy is even continuing to consider decimating marine animals, particularly cetaceans with sonar is unconscionable. Especially within the Hawaiian Islands Humpback Whale National sanctuary where we're the only meeting and birthing grounds in the United States for these endangered whales. I have briefed some of the EIS. But, of course, it's very long. I haven't read it all. And I've given documentation throughout the years on several scientific papers that I'd like you to include, but I haven't checked whether or not you've included all of those. But the evidence is clear, scientifically sonar kills whales and other marine life.	The Navy shares your desire to preserve marine life. The Navy believes that the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years in this Study Area and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations.
N. Monasevitch (Written)	There are many serious problems and omissions to this DEIS. Here are a few of the problems: In my testimony dated September 12, 2010 I asked for the following to be included in the DEIS: In relation Sonar impact on cetaceans I pointed out that the likely cause of mass strandings arc panic, bubble formation and/or decompression sickness (based on real scientific published papers): 1) Sonar caused panic reactions leading to strandings followed by death 2) Sonar caused decompression sickness (the bends) followed by death 3) The bends caused by sonar even in the absence of panic These three points were either not included or not addressed in a scientifically relevant matter.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Monin (Electronic)	I am writing in protest of navy testing in southern California waters in defense of whales.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Monroe (Electronic)	I am big fan of whales, but I am not against your testing. I believe that you will be aware of possible damage and work to minimize it as much as possible. Some things are more	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	important that protecting wildlife and I hope that your training and testing will be beneficial.	
Montalbano (Electronic)	I do NOT support the use of US tax dollars to fund sonar testing of the type contemplated by the US Navy in the proposed program. There is no question that sonar tests of this nature cause damage to whale and dolphin species of every type, including endangered species. Some of these species have only just come back from the brink of extinction. Our Navy is one of the largest and most advanced in the world. While I understand that continuing to advance our naval technology is one of the ways in which we achieved and can maintain that status, I do not suport doing so at the expense of the lives of these creatures. We must approach these issues from the perspective that the worst case scenario will occur, because it often does, and in light of the Navy's own increased estimates of sonar contacts, this number is simply too high. Use the resources we have to develop even better technologies that will maintain our position in the world as a military leader, without harming these creatures. If we can send a man to the moon, I have no doubt you can accomplish this as well.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Moore (Electronic)	save the whales, don't kill them in the name of training exercises!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Moorehead (Electronic)	Please consider the mission of the Navy, to protect us. You are not protecting our overall health and safety if you are simultaneously damaging our oceans. They are not empty space; they are active living ecosystems that need certain conditions to survive. The oceans are already under attack from overfishing, pollution, and ocean acidification. Wouldn't it be great to see our USA Navy become the true defenders of our oceans and put their efforts towards guarding against illegal poaching and complete destruction of all the worlds fish stocks. I'd love to send my tax dollars in for that. Be real heroes. Protect us from the real threat to Americans and everyone else. First do no harm. Protect our	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

Commenter	Comment	Navy Response
	oceans, USA. You can do it!! Go USA!!	
Moreland (Electronic)	While I believe that we need a strong Navy for protect national security reasons, I also strongly believe that we need to be respectful and protect marine mammals and the oceans. I do not think we have to choose between these two options; we can have both. Because we can have both, I am writing today to ask the Navy to use training methods that do not kill or damage marine mammals such as whales, dolphins and other marine creatures. I understand that from your own Environmental Impact statements you estimate the current planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. Damaging or killing these creatures is unacceptable and beneath us as a great country. A great country does not squander life of any kind when there are other ways to achieve what we need. We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. I urge the Navy to protect marine mammals from explosives and sonar along the coasts of California and Hawaii. I urge the Navy to take steps to reduce the harmful impacts to marine mammals. Such steps to protect these magnificent creatures include: a) avoiding the most harmful activities in areas used as calving grounds or migratory corridors; b) avoiding seasonal high-use feeding areas; c) creating a larger “safety zone” around the exercises; and d) use aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Implementing these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please do not go forward with activities that will maim or kill marine creatures without these mitigating steps to protect them. Thank you, Sandra Moreland	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy historically has recorded few to no mortalities caused from sonar or explosives. The estimated number of marine mammals sonar testing could affect is based on a scientific model, and it is only an estimate.
Mork (Electronic)	Please discontinue plans for the use of explosives that will, according to the Navy's own research, cause hearing loss in more than 1,600 marine mammals and potentially kill 200 more. The benefits of this project cannot possibly outweigh the negative effects of this program.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
E. Morris (Electronic)	Please do not move forward with the sound testing under consideration. There is much we don’t know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing.	Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
J. Morris-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
J. Morris-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
K. Morris-01 (Electronic)	The Navy's DEIS is fatally flawed and fails to comply with the basic requirements of NEPA. The Navy's assessment of impacts is consistently undermined by its failure to meet these fundamental responsibilities of scientific integrity, methodology, investigation, and disclosure. The Navy must revise its acoustic impacts analysis, including its thresholds and risk function, to comply with NEPA.	The Navy complies with all applicable environmental laws, including NEPA, and has used the best available science in the development of this EIS/OEIS.
K. Morris-02	The Navy fails to properly analyze impacts on marine mammals. For example Sonar impacts on cetaceans that are the likely cause of mass strandings are panic, bubble formation and/or decompression sickness. The following must be included in the DEIS: 1) Sonar caused panic reactions leading to strandings followed by death 2) Sonar caused decompression sickness (the bends) followed by death 3) The bends caused by sonar even in the absence of panic The following scientific papers need to be included in the EIS: J. R. POTTER;, 'A Possible Mechanism for Acoustic Triggering of Decompression Sickness Symptoms in Deep-Diving Marine Mammals' Paper presented at the IEEE International Symposium on Underwater Technology 2004, Taipei Taiwan, April 2004. PARSONS, E. C. M.; SARAH J. DOLMAN; ANDREW J. WRIGHT; NAOMI A. ROSE and W. C. G. BURNS. MARINE POLLUTION BULLETIN 56(7):1248-1257. 2008. Navy sonar and cetaceans: Just how much does the gun need to smoke before we act? TYACK, PETER L. JOURNAL OF MAMMALOGY 89(32):549-558. 2008. Implications for marine mammals of large-scale changes in the marine acoustic environment. WRIGHT, A. J.; N. AGUILAR SOTO; A. BALDWIN; M. BATESON; C. BEALE; C. CLARK; T. DEAK; E. EDWARDS; A. FERNANDEZ; A. GODINHO; L. HATCH; A. KAKUSCHKE; D. LUSSEAU; D. MARTINEAU; L. ROMERO; L. WEILGART; B. WINTLE; G. NOTARBARTOLO DI SCIARA and V. MARTIN. INTERNATIONAL JOURNAL OF COMPARATIVE PSYCHOLOGY 20(2-3):274- 316. 2007. Do marine mammals experience stress related to anthropogenic noise? FAERBER, M .M., R. W. BAIRD. 2010. Does a lack of observed beaked whale strandings in military exercise areas mean no impacts have occurred? A comparison of stranding and detection probabilities in the Canary and main Hawaiian Islands. Marine Mammal Science DOI: 10.1111/j.1748-7692.2010.00370.x The DEIS fails to address the following: other impacts on marine mammals such as stress, indirect effects, cumulative impacts, effects of toxic chemicals, hazardous materials and waste oil spills. The Navy must adequately evaluate impacts and propose mitigation for each category of harm for all species marine life. Each individual potentially federal activity that is to have a significant environmental impact	Discussion of the general topics ("panic, bubble formation and/or decompression sickness") noted in the comment were thoroughly discussed in the Draft EIS/OEIS. In particular see Section 3.0.5.7.1.3 (Physiological Responses) for the presentation of the conceptual framework for analysis and Section 3.4.3.1.2.1 (Direct Injury). For a specific discussion of strandings, see Section 3.4.3.1.2.7 (Stranding) and note that a more detailed presentation was offered in a companion Cetacean Stranding Technical Report ("Marine Mammal Strandings Associated with U.S. Navy Sonar Activities") that is referenced in the DEIS/OEIS and available on the HSTT EIS/OEIS website (HSTTEIS.com). The three points raised ["1) Sonar caused panic reactions leading to strandings followed by death 2) Sonar caused decompression sickness (the bends) followed by death 3) The bends caused by sonar even in the absence of panic"], are covered within the material as described above. With regard to the references noted, while these particular five references were not cited, all were reviewed during preparation of the Draft EIS/OEIS except Potter (2004), which discusses a hypothesis covered in the Draft EIS/OEIS using the following more recent science and data from seven references: Dennison et al. (2011); Fahlman et al. (2006); Hooker et al. (2009); Moore et al. (2009); Southall et al (2007); Tyack et al. (2006); Zimmer and Tyack (2007). Finally, the EIS/OEIS has been created with National Marine Fisheries Service acting as a cooperating agency with input to both the Draft and Final versions. The team also includes a number of non-governmental scientists and subject matter experts.

	should have its own environmental analysis. For example, RIMPAC and DARPA each need separate EIS's. The Navy failed to analyze the impacts on fish and fisheries.	
L. Morris (Electronic)	Please STOP! If man continues to destroy the natural environment and it's creatures, our lives will not be safe or secure, no matter how many underwater warning systems are in place!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Morrison (Electronic)	We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. Please consider alternate means which will help protect these amazing animals. Thanks you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Moses (Electronic)	I strenuously object to this testing on the grounds that it is harmful for our marine mammal species. We Americans who live on the Pacific Rim -- California and Hawaii -- value our marine environments and we also support the Navy as well. But we are asking the Navy to take protective measures and find a way to train that does not harm and kill	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Commenter	Comment	Navy Response
	our marine wildlife. We have enough robust science by now to show that these training exercises are devastating for whales and dolphins. Please take steps to find training that eliminates the harm to our marine mammals.	Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Mueller (Electronic)	Please reconsider and do not conduct training exercises where there are so many sea animals to injure. There are ways to avoid harm by avoiding migratory routes, calving areas, using safety zones, and monitoring sea life activity in the area. We do not want to hear that whales, porpoises, or other animals are dying.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Mulholland (Electronic)	Please do everything in your power to ensure that whales and dolphins are not harmed in you testing of sonar! These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors;and avoid seasonal high-use feeding areas; and to create a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. I implore you to take these precautions into consideration!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Munoz (Electronic)	Hello. I'm writing to you today because I recently read that the Navy estimates up to 2,000 marine mammals, including a large number of animals from endangered species, could be killed due to exercises performed by the navy using live explosives and sonar.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. I understand the need to protect our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. I'm asking that you please protect marine mammals from explosives and sonar along the East Coast» and California/Hawaii! Thank you so much for your time. Samantha Munoz	Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Munzon-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Munzon-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	I hope to hear this testing is stopped since the damage to our oceans would be horrific.	detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation

		has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Muzik (Written)	As an expert in Hawaiian Octocorallia, I ask that before your Training and Testing Activities, research be conducted by marine biologists on the effects of your proposed sonar and munitions testing, especially in the Papahanaumokuakea Marine National Monument, and also in the proposed zone from California to Hawaii. Certainly, these sessile invertebrates cannot move away from the proposed Navy Activities, yet, although they have been living there for hundreds or even. thousands of years, it is also quite likely they will not survive the impacts your testing will impose. I predict that their nervous and reproductive systems will be impaired, not to mention their feeding and growth, by your tests. Therefore, please cease your activities until you can prove they are not harmful to these important corals. There are over 100 new species, yet to be named, in deep waters of Oahu, and perhaps many more, over 200, in the Monument! (I know, I dived in the submarine Star II, off Makapuu, in the seventies, and observed them, even naming a new species! I was a Research Fellow at the Smithsonian Institution, and so received permission to dive, observe and collect them. My collection of Hawaiian Octocorallia is catalogued at the Natural History Museum, Smithsonian, Washington, DC.) These important animals form "Octocoral Forests" in the very deep sea, where not only the endangered monk seals graze for fish, but also these "octocorals" provide habit for myriads of other marine life, including both vertebrates (fish) and invertebrates (snails, bivalves, hydroids, sponges, worms, etc.), all creatures which are extremely important to maintain the balance of life there. I ask you to curtail your activities until you can prove you will not harm life in the sea. Without a living sea, we humans cannot survive either. Katherine Muzik, PhD	Refer to Section 3.8.3 (Environmental Consequences) where potential impacts to invertebrates are fully analyzed.
Nakamura (Electronic)	1) please, please, please publicize this site as an alternative to http://signon.org/sign/navy-under-water-sound?source=s.em.mt&r_by=2886317 2) A hard commitment to accelerated development of more capable (highly realistic and flexible) sonar training simulators that can be used in fleet training activities would be a good compromise - this could be a cooperative effort between academia, industry, and the military across RIMPAC nations. By hard commitment, I mean for example reducing the amount of live sonar time by 50% by the next exercise or next EIS period 3) Since there appears to be research showing that mammals will leave the area and return, a training/testing schedule that included a warning/chase activity using lower amplitude signals followed by the actual exercise focused to minimize duration, followed by a minimum waiting period before the next sequence, might be a relatively simple way to	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

Commenter	Comment	Navy Response
	minimize the effects at reasonable overall cost. 4) item 3) could be combined with item 2) so an extended exercise like RIMPAC could be conducted with a combination of simulated and live exercises with the additional benefit of using live data to calibrate/validate the simulations.	with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the EIS/OEIS, today's simulation technology does not permit effective training and testing. Sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Naples (Written)	I am writing as the US Navy is moving full speed ahead with plans for sonar and explosives training that threaten to deafen, injure -- and even kill -- countless whales, dolphins and other marine mammals. Starting in 2014, I have be made aware that the Navy will harass, injure, or kill marine mammals more than 33 million times in both the Atlantic and Pacific Oceans during five years of testing and training with sonar and explosives. Those alarming numbers come from the Navy itself! These potential injuries include more than five million instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and more than 1,800 deaths. This letter is written to tell the US Navy that inflicting such far-reaching harm on marine mammals is simply unacceptable. The sheer scope of the Navy's proposed training and testing activities is staggering, potentially assaulting entire populations of marine wildlife off the East Coast, Southern California, Hawaii and the Gulf states. I understand that Navy ships will flood millions of square miles of ocean with high-intensity sonar, which is known to cause disorientation, hearing loss, stranding and death in whales. In addition, the Navy will be detonating high-powered explosives with the potential to fatally injure the lungs and other organs of marine mammals. The waters around Hawaii and Southern California -- including critical habitat for endangered blue and humpback whales -- would be among the hardest hit. The Navy predicts that more than 1,000 marine mammals would be killed in this area alone. The most significant threat to marine animals from the Navy sonar testing is potential injury or death to the North Atlantic right whale. Please be aware that fewer than 400 of these survivors now hover on the brink of extinction.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	I am urging the US Navy to reexamine and reevaluate their potential ocean sonar and explosive testing as this potential harm and destruction of our endangered marine wildlife will threaten their ability to survive and must be reevaluated. These actions are inhumane and unacceptable.	
Nekomoto (Oral-Kauai)	Hi, my name is Dave Nekomoto, and thank you for having me today and allowing me to speak. I'm speaking for PMRF. I represent myself, although I have been an over 20-year employee of the Niihau Ranch. I've been in touch with the Niihau Ranch people very closely all through those years, and I still am. You're name is Louis, right? And Vida. You were both here when the Niihau people gave testimony that they supported the early EISs that had to do with missile defense. When a lot of people were claiming, No, you can't, you know, screw the Hawaiians that way. Well, they came out and they said, Hey, listen, we can make our own decision, and they decided to support the PMRF. And I can say unequivocally that they still support you and the Robinsons, Keith and Bruce, who I work for, they both support you also and so do I. Wars today are won by technology. And one of the big reasons for improving our technology is to reduce the amount of casualties on our side. And I can say that they've been very successful at doing that. There's nobody here that's speaking for hundreds of thousands of people that Saddam killed or the hundreds of thousands of people that got killed in Korea for just objecting to the government. That's the kind of thing that causes the U.S. to get involved in these wars. Nobody wants to go to war. I spent my time in Vietnam, 426 combat missions in Vietnam on an attack helicopter and on ships. My ears ring today constantly because of the loud noises that I was subjected to. But that's something I just live with. The dues I have to pay. So I do support you. I do respect all of your opinions. And we do have those opinions because the guys were out there to fight for this nation. Thank you very much.	Thank you for participating in the NEPA process.
Nekomoto (Written)	Thank you for receiving my oral statement at the Public Meeting held last evening in Lihue. In three minutes of testimony a person can basically relay his/her support for the project or opposition to it, and not much more than a general reason for taking that position. For this reason, I am also submitting this written statement to be able to discuss in more detail important aspects of public sentiment and to share my experience in these important matters. I have participated in every major EIS which PMRF has been involved in over the course of the past twenty five years, and what I saw last evening was similar to public information meetings of the past. You have a pattern which includes those who support the whales, dolphins and turtles and don't want to do anything to hurt them; the ones who are against war no matter what; the native Hawaiians who are fighting for the rights to "their" land, and the few who support a strong national defense posture. There is a great silent majority of Kauaians that will support PMRF. They are those who see PMRF as a good neighbor, and friend in the community. They are also the ones who value the economic impact of PMRF's operations on our fragile island economy. There is a large population of those who are related to PMRF employees, who depend on	Thank you for participating in the NEPA process.

Commenter	Comment	Navy Response
	paychecks from the base; the local merchants that live off of the spending of that income; the visitor industry businesses, hotels, rental cars, airlines, restaurants and gift shops, all who witness significant spikes in their business when PMRF hosts large operations. All these folks and more will show up for public hearings when the chips are down, and more so if they feel a threat to their livelihood. They all know PMRF's worth to the community.	
Nelson (Electronic)	PLEASE take steps to reduce the harmful impacts of testing to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises, and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. PLEASE re-think training exercise and testing plans and incorporate additional protective measures. THANK YOU. Jill Nelson - Kansas City, KS	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Nesladek (Electronic)	Please stop any testing and let the ocean be free from this kind of cruelty to the enviorment.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Ness (Electronic)	Please do not move forward with your plans for training and testing in the waters around California and Hawaii. These marine mammals have enough threats and issues due to human choices and behaviors. They are entitled to live just as we are. They're safety and well-being is equally important to ours. Sincerely, Rebecca R. Ness	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

Nevans (Electronic)	Please do not conduct military tests which harm marine wildlife.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Newhouse (Electronic)	Ladies and Gentlemen, We live in a busy world which is why jobs are created. These jobs are designed to allow citizens of the world time to do the job they are focusing on for the betterment of famly and global community with the comfort that the jobs they are paying for via taxes are representative and an extension of their own personal intergrity to life. With this system design we wish to be confident in our employees ie Navy, etc, as they expeditite protection for sustainable life not dominance over life. I support protection of life, thus support military personel. However, I do not condone morally wrong behavior toward what I consider an attack on conscious life through a murderous approach. It is obvious that cateceans have mind, body, emotions and social community. It is obvious that we have not enough knowledge to jeopardize the balance of this water planet by using EIS/OEIS pollution in the water upon a blue-water planet we are currently and bilogically calling home. I can feel the electromagnetic pollutions we have created on land and I caution additional stress we are implementing to the earth and her creatures for the sake of war, destruction, contol and science. We are ignoring and have imprisoned the basic wisdom of the indigenous keepers of the earth thus putting at risk Humanity's basic roots and human's basic desire to be kind. I do believe research and history has noted that we are in danger of extinction, thus I support protection for all life until which time war and death proves a more successful way to create peace and life. We have technology which is supportive; and less aggressive and primitive; by using a more compassionate approach that allows the evolution of Humanity to show dignity and sophistication toward the balance and harmony the Universe mathematically and scientifically has exhibited in the creation of the solar system, planetary interaction, to the tiniest living organism, which we are contantly putting at risk through our desire to manipulate and control that, which in the long run, we will ultimately discover were designed to dominiate life and remove the joy of living. Whomsoever participates in projects such as these will find accountability and shame following their heirs and heritage for years to come. To protect the future generations we must put a stop to	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

	historic behavior of destruction, ignorance and unconsiousness. Education does not make a person smart, but wisdom does. Reflect on the logic and wisdom of EIS/OEIS and you, too, will find a lack of evolution in this process, unkindness, irrevocable ramifications and a danger to our future possibly leading to the extinction of humankind. Know the land and you shall know thyself. Treat the earth with respect and you shall reap respect on a level, I believe, has yet to be considered. Respectfully, Gayle Newhouse	
Newland (Oral-Hilo)	I have a pretty simple message, the one that I've brought here every time we've come to meet our partners in domestic harmony, the Navy, which is that there's so much energy all across the world every day about fighting, war, killing, hating, what are we going to do? And please don't make faces at me because I would listen to you with respect. But I've come, you know, again as always in the spirit of domestic harmony and in the spirit of aloha because there are lots of things that we have to give our attention to, like how we're getting along with each other. The people that we've met over the years here through Barking Sands and through Pearl Harbor have only been bright, kind-hearted to us, open-hearted, and willing to hear what we have to say and very thankful that someone showed up who is willing to hear and see what they had to say and meet them simply with an open heart. So we're all here because we love our life. We love our world. We love the sea life. We want to see the best done for it all. But maybe we can take a look at inside of ourselves to see what we can do to help generate a more harmonious world so that the day will come when the Navy is out there promoting harmony for all of us and working with navies of other nations because we know we have changes coming to this world. When I read the material that's up on their website or the newspapers or on the Internet and everything, what I'm seeing is partly what the navies are doing is they're establishing platforms where they are able to work together in harmony and knowing that when they call someone on that boat over there, someone knows how to answer, and all those systems are set up. The Navy's purpose is also a humanitarian purpose. They send their ships. They send their supplies. They send their resources to places where there has been devastation, and they have helped in many, many ways. Many people are thankful for the navies of the world. I'm asking that we could take a different kind of look at the situation and see how we can help change the world dynamic, help them do their work better so that we do have a world in harmony and that they're only there to help us when something really bad happens because rest assured things are going to be changing. We're going to be very thankful that they're able to go and address these issues all across the world whether it's tsunamis generated by meteors, whether there are earthquakes or any other catastrophic changes. I for one am very thankful that the Navy are my friends and my partners in domestic harmony, that they're willing to hear what we have to say. And everything I've ever seen and heard like from Tom Clements and all of them is about how they super-mitigate, how they're really careful, that they care. We have to understand these people care. They're just like us, working in the Navy	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

	and for the Navy, but they care, and I know we'll have a better outcome when we just reach back with our caring. Thank you.	
Newland (Written)	We are the 100%... knowing Unity Consciousness. Every journey begins with a first step. Every writer begins with a first word. I've started my chapter for rose, dear rose. Rose asked me to relate how my relationship with Cetacea, whales and dolphins, has influenced my life and the lives around me. My podlet, including my island community on Hawaii Island, the Big Island. When the request for a chapter came out the country was occupied by Occupy groups. The focus was on the 99% or the 1%. You were one of 'us' or one of 'them'. From the beginning that troubled me. After all, unity consciousness is about we are all here together, we have more in common than anything, we are all earth humans, regardless of origin. How could the world come to balance so long as had a polarized people, us vs. them thinking? As I looked around for things to inspire and remind me, I came across this section in an interview about dolphins and birth a few years ago. Star Newland on Dolphin-consciousness. Ashley: So, tell me about this dolphin-consciousness and how it came to be so important in your life. Star Newland: Wow, that's a long story! Ashley: Okay, first tell me when you say dolphin-consciousness, what do you specifically mean, define that more for us. Star Newland: I would say the essence of the dolphin-consciousness is unity consciousness. Knowing that we are all part of everything, that we are connected to all of it, whether we are aware of that connection to consciousness, the reality is, we are still connected anyway. One of the things that happened in my own birth that took me quite a while to work out was what I call the myth of separation, which is what I thought my mom and I underwent. I was on the outside, we were separate and apart. And that was the consensus consciousness too. At that time there were very few people who really understood how long, extensive and deep the inner bonding is between mother and infant. And when I realized that, whether my mom thought we were separate or what, the reality was we were still connected. And when I put that together for myself, I was able to put that together within me, in my life. I was able to be part of it, and when I met the dolphins, physically, directly, for the first time in Florida, they came and showed me that we have much more in common than I had imagined, that we were much more alike than I knew. See 'Telepathy's Gift' on www.planetpuna.com. And it was the beginning of an exploration for me to find out who we are to each other and what is our common bond? What are our common bonds? And even prior to that when I met dolphins at another place in Florida I went and saw them after the show and I had a really strong telepathic experience with them. It took me a while to figure out what had happened. In hindsight I realized they reached into me, into that part where all of life is connected and said basically, we know who you are, we remember and recognize you. And this is a connection. I refer to it like the inside part connecting to the other inside part. The indwelling being, whether it's a dolphin or a human or tree or an ant or a grasshopper it hardly matters, everything that is alive especially has that indwelling component of life and we're all part of that life.	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Ashely: That does change the way you live doesn't it, when you realize that, or when you open out to that. Star Newland: Completely, so that to me is the dolphin consciousness. And that life was meant to be more playful and more fun and more light-hearted and above all connected to ourselves and to our children. And up to this moment I've had remarkable telepathic rapport with my first son. Even last night I was about to text him something and got sidetracked on the text and he calls. And of course he'd call right when I'm in the midst of texting! It always works that way and we have so many examples of that. But when we allow ourselves to be close and remain close to our children, that's a large part of what makes a difference. Even though our life was pretty different than what I had anticipated, by this time I had learned to be centered with everything, and whatever we were experiencing my son took his cues from me, the primary figure in his life and in his world. To the extent that I was able to flow with it and make the most of all these challenges, he was able to do it and get it that way as well. INSPIRATION I was a close friend of Toni and John Lilly. Their life's work though the Human/Dolphin Foundation inspired me before we ever met. Reading Communications between Man and Dolphin' opened my mind to a new kind of life on Earth, a shared planet with our Cetacea kin. We say this as there is a fair amount of evidence showing specific marine mammal characteristics in humans. How do we come to have them? Hmm? How did they come about? What does it mean? Do we have companionship on our journey through life? A loving, intelligent, really fun relationship is possible when we let ourselves connect with dolphins or whales. As soon as I heard the words 'dolphins and birth' at the same time in 1982, from my new friend Josef, my world shifted. Suddenly I could see how that kind of birth would be so exciting! So amazing to birth in water and have dolphins around us. While it seemed so natural to me at the same time it blew my mind. While this kind of birth was then practiced in Russia and being introduced to the West, it had been a traditional birthing practice for many native cultures across the world over millennia. Fortunately, Hawaii is one of those places. Ultimately it was that which brought me to Hawaii. When I first saw newborns swimming I was touched to my core. OMG. That's what we were meant/designed to experience. Instead we were born hard into gravity, our world view limited to what we could see lying on our backs in a crib or in a carriage, occasionally in arms. Our mobility came about only when someone picked us up and moved us. After a while we could move our arms, legs, head and so on. In water though, we could move them all from the beginning of life. This same feeling showed up much later as I witnessed twin calves born in Arkansas. I am amazed to see them walk right away, have mobility from the beginning of life. Birth into water and the subsequent mobility buoyancy affords wires our brains very differently than when we are born onto land and the world of gravity. Our bodies wire differently from birth because all parts of it have mobility and buoyancy at once. Subtle structures of the brain gently protected in the womb have a chance now to mature in this aquatic environment. We have a center of buoyancy instead of a center of gravity. We have 360 degree perspective and have mobility under our own volition. We have the perspective of unity,	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	we are part of the water, yet we feel it cross our skin. Like dolphins we move freely and easily carried by currents as well as our own efforts. Since we dwell upon the land we can retain this center of buoyancy by living joyfully. Why am I interested in these things? I wonder what human kind would be like were we to be able to express the kind of life and mindset that babies born like this would naturally have as a function of their birth and early water contact. I think about what we know of our human brain for example, coming from people who nearly all have lost various parts of their brain's natural capacity simply by virtue of how they were born. Nearly all of us are to some extent 'damaged' from the beginning due to the loss of the subtle structures of the brain that are lost when we birth into gravity. How would they live in a way between two worlds? This is part of our future that I have been exploring for these last 30 years plus and we at the Sirius Institute are creating step by step by step. Tiger was raised so very differently in many ways. His 'education' consisted of life and play first. He experienced life to be grounded in, to know many things based on direct experience and contact. He was allowed to be his own person, free to think for himself, to make choices through his mature decision making processes. He was free to play as much as he wanted for play is for children. Play is essential in their development in many areas, especially socialization and brain/body coordination. He chose his own hours, his food, eating schedule. I was known as the mom who said yes! Instead of the terrible twos, we had the terrific twos. We had so much fun living like this. We bypassed all the fighting about rules and schedules and homework, other peoples' ideas about what was right, or how it should be. We created what we call "the transmission of our culture'. A baby elephant is with its mom, side by side for 14 years, 24/7 to learn the ropes of how to be an elephant. If it takes that long to pass on elephant culture, how much do our children need to be good humans? How can we think that leaving our children on their own in many different ways would prepare them for life? Where and how are we transmitting our culture to them? WHAT DOES IT TAKE TO BE A HUMAN BEING OF A CERTAIN LEVEL OF FUNCTIONING AND SUCCESS? Rather than focus on readin', writin' and 'rithmatic, we focused on life and play first. Part of his cultural transmission consisted of having Mike, our research director as his personal tutor, play buddy and teacher of things biological along with the many pod people we met along the way, all with their books of wisdom, things they know and could pass on. Mike is a Ph.D neurobiologist and rocket scientist and child at heart. We played and stayed up all night as he wanted to, tumbling into bed as the dawn broke and the birds started their songs of the day. I missed that that the sights and sounds of the dark. I was always in bed at bedtime though still wakeful and keen to have more time awake and to play or learn. Perhaps this is why I'm a night owl. When we experience this kind of flow it helps us move through life more readily. Life is a flow – Zero a box of minutes and hours cut off from each other, scheduled to the max. Most parents, when I ask them why their child is in school reply, "so they can be with their friends". Hardly anyone said so that they could get a better education or get into college. It was so their children could play with other children. Then why I wondered did	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	they go through so much school trauma when they just wanted a way for their child to be with other children. It is much easier than we know to educate our children. I keep reading about 'No Child Left Behind' and teaching to tests that are so secretive of their contents that it's a violation if the teacher even looks at the questions. What the heck? Who's behind all this? How does it happen that our lives and our children's lives are co-opted by school decisions that have almost zero to do with 'educating' our precious children. My son matured into a compassionate, competent, intelligent thoughtful productive member of the human race. He is the dolphin conscious child I'd worked so hard for, waited so long to hold in arms. By the time he was born I knew quite a lot about how to do better for him. I was mature enough to stand my ground in the face of much resistance on how to raise this new type of dolphin conscious child. He learned from me to follow his own path, to create his life around his interests and passions. He accompanied me as I went around creating community concerts and events then found his passion for creating shows for his cohorts, giving them a voice for their kind of music. He saw me speak out and work in areas that mean a lot to me and now is a leader in his own right on various issues. He motivates and inspires others, young and old alike. He introduced 'Zero' to an Occupy flyer. That made me laugh. With homes to share he made them available to his cohorts so they had safe place, sanctuary just like we did, when more than a few nights there were 12 to 17 adolescents with us who just wanted to be somewhere they felt warmth and security. And many nights we had them toasting marshmallows on candles in the living room, young people away from home for various reasons sharing the simple comforts of good mammalian contact. This is how closeness creates comfort, our theme for 2012's Domestic Harmony Awareness Action Initiative. One thing about this kind of relationship with our children is to remind us why we had them in the first place… to support them in being who they are and what they came to be. Each child is unique!!! Think about it- if every snowflake is unique and there are gazillions to the nth. Degree, how can we possibly think any two human living beings to be the 'same'? How can we 'educate' them to their potential since how would they have a chance to express themselves fully if they have to conform to a certain way of thinking, seeing, answering questions and so on? And we have them to raise them as best we can, to cherish and love and enjoy, to have fun together, to share our world and more. Due to so many pressures we often shunt them away, let the state and others take them over. I let go a more secure life by living simply and making 'mom' my work. I was a single mom who created a pod around us wherever we were. Remember where two or more are gathered, our have a pod (let). Out of this came the Pod Project. I should have seen it coming as I saw many aspects of how I thought our life was going o be turning out very differently, seemingly with a mind of its own. In my article, 'how to raise a dolphin conscious child', there were already signs of the traveling life we would live. We stayed in places beyond count across the country and in our home towns, brining 'pod people' to our friends, old and new. I saw how this type of experience and exposure to life enhances the development of feelings of connectivity, how living close and being	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	with one another, and meeting other pod people gave us the feeling and experience that there are good people everywhere, and mom and child have changes to see others in diverse environments, stimulating pattern recognition and stimulating neural development through input. The image of the robot in the movie 'short circuit' came to mind often as our life led us to rich, stimulating, fun and challenging situations. We were creating his mind to be full of connections and as he got this my own wiring was being redone. Assuredly, this lifestyle is only appropriate for some. We chose to explore this kind of life through the circumstances we met. We have lots of ways we can raise and interact with our children. I talk story about us as we did things very uniquely. Above all, listen to the child… our inner child and our own child (ren). If a child is going to lead the way, we have to be willing to follow. The Pod Project brings us together in pod homes, islands of stability across the neighborhood across the state and already the world. Pod homes bring us together in places where there are good people, people we feel comfortable with even if they are really different. Good hearts abound we found everywhere, caring, connected, belonging, part of life and having a role to play in the life of the pod. WATCH PEOPLE IN HARMON Y TO SEE WHAT THEY DO… for many hours over the last few years I've been at 2 Step Beach with the Hawaiian uncles, like Herbert and Eddie, Norman, Rocky, Alika, Colburn, Louie, Albert who gather throughout the day and evening to talk story, play music. He Boats come and go too, and so I've been learning about fishing and hearing stories about how people used to live – close to the land for real. Few cars, zero electricity, roads or any stores close by and they had to walk a long ways to get to school. Everything was fresh from nearby. Enough was kept a hand of most things cause there was little if any ice or refrigeration. Foods had to be prepared a certain way and above all, people mostly took just what they needed. My friends knew how to do everything and would again should the boats stop coming. We are in the middle of the ocean farthest from landfall. Most of what is here is shipped. I'm there this night while my new pod daughter CJay plucks songs at the ukulele under the direction of Uncle Norm, and learns an integral part of Hawaiian Culture. She's a natural and they are delighted I brought her by. A big smile crosses my face as I watch my friend fit in so well. Music has a way to do that as the universal language. Melodic strains of Hawaiian songs fill the night air in the company of waves flapping at the shore just feet away. One by one over the years I've let them know that some of the most precious moments of my life have been here with them. I think about things like that… whatever I experience goes into eternity with me, it is part and parcel of my Earth time. Does it really matter if or how we have continuity of consciousness when we 'pop' out? For do we really 'die' so much as 'pop' out when we are done with our Earth time. Perhaps to 'pop' back in somehow, when we find the reentry code. I am mindful of what I'm experiencing, what I subject myself to. This started in earnest when I was carrying my son. I realized that everything I was now experiencing, witnessing, feeling, thinking was going into him. When scary things showed up like snakes or poisonous spiders in Arkansas I breathed deeply and sent calming thoughts out and trust in my wellbeing so	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	we both knew snakes and spiders could be just snakes and spider something else in the world. This led to being more mindful of what I attract to myself, what I think, how are my interactions with 'others'. Harmonious? How am I feeling with what I watch or read, what actions I take, what I'm projecting 'out there'. For sure enough, all of this matters. Over our lifetime, moment by moment we are creating the pictures inside ourselves that we then put 'out there'. This is self-reflection, knowing ourselves and being true. Recently this was shared more with a group of parents and Keikis (children) here for my friend Connie's dolphin retreat. The words tumbled out as inspiration flowed …every action, every thought, feeling matters. The more conscious we are in any moment the more we set that energy into what is happening. When I'm being more mindful of what I eat, where it's from , is it clean and pristine, is it bee friendly, gmo and round up free and so on the more this adds to our collective consciousness that is functioning now from a place of knowing we all matter. These are aspects of life that are important on an island in the middle of the ocean, farthest away from landfall, where easily 40% local corps are bee pollinated. And we import 70% or better of our food. It matters that we start asking these questions and when we make better choices, more 'pono' choices everything will start reflecting our awakening. We have to be aware of many things now, of the interconnectedness of life and the global nature of 'we are here together on this world'. We are humans first. We have that common bond. We are connected. Everyone doing one small mindful thing any moment during the day, for example, adds up to a huge amount of new higher energy into the new matrix, the matrix of our choosing. You being the one person who tips a street musician enough to buy dinner that one time could be the one who helps s/he go on in their music career after being inspired/kept alive even by your kindness. You being the name on a petition to mandate clean water or land or dolphin free tuna, could be the one who tips the scale and yet One of many. Here in rural Hawaii water is especially precious, as it is becoming increasingly so across the globe, and much of it comes directly from rain into catchment tanks. Zero rain, water runs out. Yet by watching how water is used, conserving it even when there is lots, helps through taking good care o f the resources at hand. We can have more and/or we can do our utmost with what we have. This applies in big ways across the islands of Hawaii. Realizing that babies are mostly born well and sound we actively have to do things to create their various ailments. It is easier to keep children well than to get them better once they become ill. It is easier to keep them well by strengthening their immune systems by suckling as long as baby wants when possible, by keeping them in arms a great deal, close to us, for we are mammals who are designed to thrive when we are provided with the mammalian basics. Skin to skin contact helps develop protective immune factors to keep them well when they get a scratch outside. Are children born well and raised to be strong naturally going to succumb to the autism epidemic or any of the myriad of diseases afflicting our keikis? Ask around. How many autistics are there in this population? Nearly zero. By living life that considers what is best for this child now and answering that as they mature we will bring about a sea change for our kind. Much	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	like being good to the land (aina) –keep it clean, build it up, put good food to it, tend with care. By bringing these factors and more into play in pod homes, we are strengthening our 'local field effect' (Book of Blonde Physics). We are creating a living energy field within and around us that spread from pod home/person to pod home/person anywhere in the world. As we move around we bring it with us for it is who we are, now living more in harmony within ourselves and generating it as we go through our lives. This is how one person makes a difference every moment as well as triggers others. Larger gatherings, what we call superpods' happen with us as well. One very special place in my heart is Kalapana, close to where I first landed in Puna, Hawaii, home to Madame Pele, volcano Goddes, birther of new land. Here, at Uncle Robert's Kava club, there are many gatherings throughout the year, week after week. The focus is to unite the guests who come from near and far to experience Aloha. True Aloha.	
Nickerson (Electronic)	Dear Navy People, PLEASE stop the testing of sonar weaponry in the waters of the Pacific, which are already contaminated with radioactivity from the Japanese meltdown. We still have so much to learn from the dolphins and whales, their methods of communication and language. These creatures are incredibly intelligent and an important part of the Hawaiian culture. People come here to swim with them and learn from them, and you want to knowingly attack them with your "testing" and "training" for war. How is it ok to wage war against other intelligent life forms and not be charged with murder? Where are the boundaries for the rules of war on this one? What kind of morality conversation was had in which it was decided that THOUSANDS of animals would be seriously injured and killed EVERY TIME you "test" your equipment. It's not too late. You can stop this. Let's stop killing ourselves, each other, our home planet. I really like the beaches here in Hawaii, let's not cover them with the carcasses of dead animals. Thank you for remembering your humanity.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Niklasson (Electronic)	I appreciate your willingness to hearing the public opinion on this important matter. Seeing the research that has been done on this and the dramatic effect previous test have had on marine life I am frankly chocked that you are even considering going ahead	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Table E.3-4: Responses to Comments from Private Individuals (continued)

	with this. Please do not pursue this project I fear that it will have a very negative impact on marine life! It seems to me that there already is much research to support my stand point.	Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Normandin (Electronic)	Don't commit murder.	Thank you for participating in the NEPA process.
Novak (Electronic)	To whom it may concern, Please protect marine mammals from explosives and sonar along the coasts of California and Hawaii. I urge you to re-think the proposed plans for the use of sonar and explosives, and to incorporate additional protective measures. Thank you for your consideration, Samantha Novak	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Novello (Electronic)	Please do not continue with this testing program/exercise. There are numerous studies that show this is damaging to marine mammal life. We here in Hawaii and on the west coast depend on these animals and the tourist revenue they bring to us. By hurting them, you are hurting the welfare of thousands of Americans. Furthermore, you damage the global life web. The oceans account for 3/4 of the planet's surface. There is no way that you can cause damage to it without a ripple of effects spreading outward from it.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Nuccio (Electronic)	I opposed the use of sonar training and testing a few years ago at the Whidbey Island site here in Washington State. I am opposed to the use of this technology in the waters near Hawaii and California as well. These are the same whale populations! The Navy certainly has this information about the annual migration of these mammals for feeding and birthing all along the Pacific Coast of the U.S. I am also opposed to the use of sonar in the Gulf of Mexico, for similar reasons. In addition to the whale populations other mammals, such as dolphins, will be affected. Thank you for your time and attention.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Nunez (Electronic)	Please discontinue the exercises planned. They are harmful to our marine wildlife.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
O'Brien (Electronic)	The U.S. Navy is proposing to conduct training exercises that invole explosives and high intensity sonar all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. The planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. Please consider steps to reduce the harmful impacts to marine mammals. Please avoid the most harmful activities in areas used as calving grounds or migratory corridors. Avoid seasonal high-use feeding areas. Create a larger "safety zone" around the exercises. Use aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. These steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Whales, dolphins, and porpoises deserve to live and to have a healthy ocean environment. You can make this happen. Please take these steps to reduce the harmful impacts to marine mammals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. O'Dowd (Electronic)	I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. Please protect marine mammals from explosives and sonar.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ognjanovic (Electronic)	The Navy's use of sonar in the fragile Whale and dolphin habitats is an antagonist. It is driving the mammals away from their habitats, disrupting their families, and it is causing changes in all their habits, not least many of them are being driven to distraction and beaching themselves on purpose or accidentally. The sonar must respectfully stop in these fragile habitats, our natural resources are equally vital to our country's legacy and these mammals are sentient beings.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

OKeeffe' (Electronic)	Do NOT do this. Do NOT do this. Do NOT do this.	Thank you for participating in the NEPA process.
Olson (Electronic)	I urge the Navy to not test your sonar or conduct war games in Hawaii or California territories because of the harm this will cause marine life. Our marine species are already under stress from all forms of pollution in the ocean. It's time to conduct ourselves in a way that supports a healthy marine environment rather than degradade it. Dominion means to take care of not dominate... so far most humans have done a very good job of dominating and causing harm to other species including ourselves. Now it is time to be caretakers of all our marvelous life forms. Humans need to stop thinking only about themselves. I have been interacting with Cetaceans for 23 years and know they are an intelligent aware social species that deserves to live in peace. They have much more to share with us than their blubber on a dinner table or to be in the way of target	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

	practice for sonar guns. I have written a book, Messages From The Dolphins. It includes my insights on five subjects and what I would say to humans if I was a dolphin. Chapter four is about war. Please take the time to read it. Hopefully you will realize that for the sake of all our species not just humans we humans need to begin living peacefully with each other. It is available as an ebook at my website www.dolphinsmile.org Thank you for taking the time to read this comment. In Peace, Scott	been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Olson-tuma (Electronic)	Please protect our marine wildlife and do not conduct this testing, US Navy.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
O'Neil-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
O'Neil-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	I hope to hear this testing is stopped since the damage to our oceans would be horrific.	detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation

		has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Oordenaar (Electronic)	I am very concerned about the effects of sonar on marine life, and especially Cetaceans (dolphins, whales). Here's why: Cetaceans' brain as a matter of fact contain spindle cells, the type of cell in humans responible for giving us complex speech, strong emotions and empathy. In whales and dolphins the concentration of these was even found to be 3x as high as humans. Above that, their brains are a lot bigger. (source: http://www.newscientist.com/article/dn10661-whales-boast-the-brain-cells-that-make-us-human.html) There is more than just anatomic evidence. Dolphins are also self aware; cetaceans are the only species apart from humans that can think about thinking, and possesing self-awareness. (source: http://news.discovery.com/animals/dolphins-smarter-brain-function.html) Luckily, people now try to decipher their languages, hoping to verbally communicate with them. (source: http://news.discovery.com/animals/dolphin-talk-communication-humans-110906.html) Other recent researches state cetaceans have cultures, their own names, accents, dialects, can teach each other, and deserve rights as non-human persons. All reasearch aimed at investigating the effects of sonar on marine mammals show the same conclusions: Significant damage to internal organs Severe hearing damage Known cause of cetacean mass strandings Please reconsider your navy testing policies and plans, now with scientific knowledge in mind. Thank you. J.T. Oordenaar	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Orr (Electronic)	Hello, I know we need defense, but it must not be at the expense of important marine life. The pain the creatures feel from these tests must be excruciating and a slow painful death. I believe we must evolve past this type of testing, can we not? Thank you, Michele Orr	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Ott (Electronic)	With all the research DARPA does, I sincerely believe that the Navy needs to work on a better solution than using sonar that damages more of our mammal marine life. It has taken 40 years for the humpback whale to make a comeback from near extinction to ONLY reach the designation of "endangered" species. There is research on the damage to dolphins and whales hearing and the disorientation leading to death and serious injury of mammal marine life due to the SONAR used by the Navy - in the U.S. and the U.K. Stranding, beachings, confusion and fear cause whales to stop feeding and subsequently die. The UK military has research from 2007 that clearly indicates there are issues with sonar in causing death to whales and that in 2011 additional research	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

Commenter	Comment	Navy Response
	conducted by a team of international scientists has confirmed the earlier research. We have some of the best scientists in the world working on these issues and still, this issue continues to plague us in finding a better solution. The NAVY should re-evaluate it's plans, establish a timeline and a plan for alternatives, expedite research on better tools than SONAR, and start to more fully balance the military need in the context of damage to the ocean environment. It is unconscionable that the U.S. Navy would expand the damage to the marine environment by simplistically justifying it's actions by creating fear in the public. It requires leadership to take a more thorough and thoughtful approach. I respectfully submit, having been a public servant, that there are always alternatives that can be examined, and in this case, should be considered to mitigate the loss of marine mammal life.	been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Currently, sonar is the best technology available that can help keep Sailors safe from mines and hostile submarines.
Overman (Electronic)	Dear Sirs: I have read through much of the EIS and will continue until I finish it, but I don't see any strong effort made to consider alternative testing and training methods that would not entail the assured death or deafness of marine mammals. I hope the choice you are making - the one that DOES assure death or deafness - is unquestionably the ONLY way to properly test and train, and not that it is simply the most expedient. Please consider providing an extension to your comment period as well. The size and technical aspects of the EIS require a great deal of time to read and review, especially for folks with more than one job and with other responsibilities who also have a strong interest in marine ecology. Thank you for your consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Currently, sonar is the best technology available that can help keep Sailors safe from mines and hostile submarines.
Owen (Electronic)	What is this world coming to? Why do you have to destroy marine life, for someone's thought to "better" our security? It's sick.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Pap (Written)	I could like to see the Navy adhering to the HI state federal Consistency process (through the Coastal Zone Management Act). During the last permit approval process, the state objected to the decibel levels being used during the training exercises due to impacts on marine mammals and other coastal resources. They were overruled by the Secretary due to pressure from the Navy. This go around the Navy should take a hard look at its training exercises and whether they can be changed to meet the requirements of Hawaii's coastal zone management program.	In compliance with the Coastal Zone Management Act, the Navy has completed a Consistency Determination with both Hawaii and California. See Section 6.1.1 (Coastal Zone Management Act Compliance) in the Final EIS/OEIS for the complete discussion of Navy activities and compliance with the Coastal Zone Management Act.
Parr (Electronic)	I understand that the U.S. Navy is proposing to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. These exercises would involve the use of live explosives and high-intensity sonar. According to your own Environmental Impact Statements, the estimates show the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. I completely understand the need for protecting our country, but there is a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. There is evidence that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	very significant degree. Please consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please re-think your plans and incorporate additional protective measures. Thank you.	
L. Parraga (Oral-Kauai)	Okay, my name is Lou Parraga, Jr. I'm 84 years old. I live in Kekaha. And during the Second World War I used to go into the base and pick up the garbage. My father raised a lot of hogs, maybe about 50 or more. So I seen planes coming and going, and some all shot up from the Midway battle. In fact, the worst one I seen was a gossier, I think, had the pilot and the copilot in the back, two cockpits. And I was going there, and I saw this plane coming and sputtering and backfiring and all the smoke coming out from the exhaust. And I took off, I wanted to see where he would land. When he landed, I was right there by the airport, and he landed the plane. And I saw the guy in the back was just hanging over like this, hanging over. He was dead. And the pilot just landed the plane and the plane hit the runway, and he veered off right into the sand. And the fire engine guys came, and when they got to the plane, the pilot himself was dead. So that's a terrible thing to see. I was a young boy at that time. But that's what military is all about and wars. So, okay, I'm a Korean War veteran, 1950, that's when I got the call to go into the Army for the Korean War. And of all things I got the notice on my birthday, and my birthday is trick-or-treat. So to be inducted November 5th. Maybe I should turn like this. So I got trick-or-treat from the government to be inducted November 5th. I spent three years in the Army, and I seen things that if you're not in the service you will never see or understand. A lot of people that protest about this, lot of people don't understand that have never been in the service what the service is all about and what the base do and good for us. How would most of you people feel if you have a guard in the front door instead of a criminal? And that's what the base is. They're like a guard for us. I hear a lot of things that somethings that cannot be proved. So I think without the base we'll be in big trouble. Thank you very much.	Thank you for participating in the NEPA process.
M. Parraga (Oral-Kauai)	I was born here on Kauai. I'm 85 years old. I've been very ill for a long time. I was known as the volunteer. I didn't never gave up on my country. They took good care of us. I seen war because we heard the bombs, we heard the airplanes going over to bomb Pearl Harbor. Our country didn't let us alone. Right away they came. All young men, very good soldiers. Why can't you people understand we need our father in heaven? We also need our country who gives us so much. We got to be thankful for that, not go against the country. Some do wrong in your country, right. But most do not. Our Navy do not. They helping us. Don't go against them, please. Please take care of our men. Why do they do that? Now you get good care. I see them with nice cars with money to feed their children.	Thank you for participating in the NEPA process.

	I do not have anything like that, but I love my country so much. I wish I wasn't sick so I could help more. Thank you. Change your minds, be for your country. The country loves you and they love me. Thank you. I love to sing the Star Spangled Banner.	
Parrish (Electronic)	I am against your impending sonar research which may, by your own admission, deafen and kill potentially thousands of dolphins and whales off the coasts of California and Hawaii. I ask that you put an end to this inhumane and unconscionable Naval program and look for alternative, more humane ways of testing your sonar equipment.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Patterson (Electronic)	PLEASE PLEASE protect marine life from explosives and sonar in Navy and all exercises. This is unnecessary.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Pendarvis (Electronic)	As a citizen, I am very concerned about Navy activities which might impact marine life, particularly dolphins and whales. HSUS is joining other environmental and animal welfare groups to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Commenter	Comment	Navy Response
	minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Thanks, Richard Pendarvis, Ph.D. (Chemistry)	actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Pennington (Electronic)	to whom is going to read this, I do NOT see the true reason to do these excersises. To thoughtlessly KILL and Injure ALL those animals for practice... REALLY? i would one day like to have my daughter and her kids know what marine life is... doing such training excersises that will hurt and kill animals on the endanger spieces list will further hinder our oceans and our future generations from enjoying the rich life they support. the whalers around the world atleast kill to eat the poor animals... not just for the heck of it... i understand the Navy HAS TO do somethings but the wildlife in the oceans around the US are still trying to come back from the BP oil spill that was now 2 yrs ago. i doubt we need dead animals washing up on our shores AGAIN! This is NOT ok and i dont support these actions the US millitary are willing to take in order to just have drills... there are so many species in the ocean and if we as people are wreckless we will never even get to see and explore them. we only know 2% of what there is to know about our oceans. this is just wrong and as a millitary i will always support our troops BUT I DONT HAVE TO SUPPORT THE ACTIONS THE US GOVERNMENT MAKES THE TROOPS DO! I hope this reaches someone who can help stop this from happening. my daughter is 4. she started to cry as i read to her what the US NAVY wants to do. EVEN A 4 YR OLD KNOWS ITS WRONG! i am writting this as a plea from my heart and the heart of my daughter, PLEASE DONT DO IT! PLEASE HELP TO PROTECT THESE ANIMALS AND NOT DO THINGS SUCH AS TRAINING EXCERSISES THAT WILL ONLY FURTHER HURT THEM. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
G. Perez	I, Gale K. Perez, on this 9 day of July 2012, am in opposition for any Naval or Military training and testing in our Archipelago of Hawai'i, by land or ocean. My hand written comment: I am against all training and testing in our aina (land) and ocean. It is our Kuleaua (responsibility) to protect our ecosystem an dcreatures like the whales and dolphins and turtles who are our family. Stop!!	Thank you for participating in the NEPA process.
Mariana Perez (Electronic)	PLEASE protect marine mammals from explosives and sonar.. Protect our oceans and all living things. I have witnessed in person what the effects of submarine sonar testing has done to marine life and it's a horrible things to see and horrible that it is happening! PLEASE STOP and PROTECT OUR OCEANS AND MARINE LIFE. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Michelle Perez (Electronic)	I would like to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Perkins (Electronic)	To preserve our freedom is to preserve our planet and all the life it contains. This test is meaningless, murderous, and unnecessary. The idea that my military and my government would allow such a disastrous test makes me ashamed to be an American. There is no benefit that could possibly outweigh the cost – not only to the environment, but to the reputation of this country.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the

Commenter	Comment	Navy Response
		maximum extent possible, mitigation measures during its training and testing activities.
Perry (Electronic)	Whales, dolphins, and porpoises deserve to live and to have a healthy ocean environment. The U.S. Navy is proposing to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. These exercises would involve the use of live explosives and high-intensity sonar. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. In the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Re-think plans and incorporate additional protective measures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Peter-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

Commenter	Comment	Navy Response
	communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Peter-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
A. Peterson-01 (Electronic)	July 10, 2012 RE: U.S. Navy Hawaii-Southern CA Proposed Range Complex - Public Comment Perchlorate is a rocket fuel component and by-product of rocket and missile testing; it also can accumulate in leafy food crops and fruit irrigated by perchlorate-contaminated water and can find its way into food crops from air pollution sources. Perchlorate accumulates in the thyroid gland and can block iodide transfer into the thyroid, resulting in iodine deficiency. Adequate iodide is crucial for neurological development. A recent study found that all types of powdered baby formula (e.g., milk, soy) are contaminated with perchlorate. If perchlorate also is in tap water used to mix the formula, babies may be doubly dosed with the chemical. Long-term exposure to perchlorate has been shown to induce thyroid cancer in rats and mice. The U.S. Navy and the U.S. Air Force uses perchlorate as a fuel in rocket and missile testing in the proposed NWTT Range Complex. What impact will perchlorate from this type of testing have on human health, air pollution, sailors exposed to these chemicals, marine mammals, and the air quality on shoreline communities? Rocket and missile fuel emissions also contain aluminum oxide and particles of soot. What impact do these emissions have on the ocean environment, marine mammals, and general air pollution over these areas and on shoreline communities? When you combine Jet fuel emissions, rocket and missile emissions, warship emissions, laser test emissions all together how will all of them impact human health, ocean air quality, and shoreline community air	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

	quality?	
A. Peterson-02	July 10, 2012 RE: U.S. Navy Hawaii-Southern California Range Public Comments: 1) If any hazardous materials wash ashore during the next 5 years the Navy should be responsible for cleanup and disposal of all materials at Navy expense. How much money has the U.S. Navy allocated for this type of clean up and disposal? 2) If disruptions in fishing, availability of fish, impact local fisherman the Navy should be required to reimburse the fishing fleet in the NWTRC, the Hawaii Range Complex, the Mariana Range Complex, the Southern CA Range Complex for their economic losses. (This would include the ocean tourism industry.) How much money has the U.S. Navy allocated for any economic losses from their 5-Year Warfare testing in these areas and the proposed NWTT and Hawaii-Southern CA Range complex expansions? 3) The Navy should be required to cleanup and restore ocean and shoreline areas where natural resources have been negatively impacted and also where regional wildlife have been affected by all NWTRC, NWTT, Mariana Islands, and the Southern CA warfare exercises. How much money has the U.S. Navy allocated for this purpose? How much additional funding will be needed for the Hawaii-Southern CA Range Expansion? 4) Military operations in the NWTRC 5-Year Warfare Testing Exercises include deployment of sonar which may impact marine mammals, fish, and other marine life. Effective mitigation measures (with 90% success in studies), should be used to locate marine mammal populations before deployment of sonar, toxic chemicals, bomb blasts, missile exercises, and new weapons testing. What mitigation measures are planned for the Hawaii-Southern CA Range Complex? 5) All maritime military training range complexes in the Pacific Ocean, especially the NWTRC, the Southern California Range Complex, and the Hawaii and Mariana Islands Range Complexes should have as a primary goal maintaining healthy oceans, marine, shoreline and beach environments that are economic fishing and tourism drivers. How much money is the U.S. Navy allocating for this purpose? Please advise on how many ranges have had this type of restoration work performed when military activities and toxic chemicals have damaged ocean or shoreline areas in the Pacific Ocean Range Complex Areas? What is the monetary allocation for yearly restoration work in the NWTT and the Hawaii-Southern CA Range Expansion areas?	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
A. Peterson-03	July 10, 2012 U.S. Navy NEPA Public Comment – for Hawaii-Southern CA Range Complex New U.S. Navy New Sonar Systems have been deployed and we don't know the marine mammal effects from those experiments. http://www.navy.mil/search/display.asp?story_id=48201 WASHINGTON (NNS) -- The U.S. Navy took delivery of the next generation of the AN/AQS-20A Minehunting Sonar and the AN/AQS-235 Airborne Mine Neutralization System (AMNS) from Raytheon Company at the company's facility in Tewksbury, Mass. Sept. 2, 2009. September 4, 2009: "...Scientists at the Naval Research Laboratory are developing a new technology for use in underwater acoustics. The new technology uses flashes of laser light to	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	remotely create underwater sound. The new acoustic source has the potential to expand and improve both Naval and commercial underwater acoustic applications, including undersea communications, navigation, and acoustic imaging. Dr. Ted Jones, a physicist in the Plasma Physics Division, is leading a team of researchers from the Plasma Physics, Acoustics, and Marine Geosciences Divisions in developing this acoustic source..." http://www.nrl.navy.mil/pao/pressRelease.php?Y=2009&R=63-09r We can expect that these new techniques will be or have been deployed and could have negative consequences on our marine mammals. There are inadequate or non-existent studies by NOAA (NMFS), service about the impacts of these new technologies and their impacts on fish and marine mammals. Thus, the deployment of these technologies in the NWRTC and other ranges should be prohibited. http://djcoregon.com/news/2010/05/13/wave-energy-device-would-steer-whales-away/ WAVE Energy Acoustic devices are also being deployed in the oceans which may have a similar impact on the health of our whales. According to this May 13, 2010, Oregon News article: "...Gray whales tend to stick close to shore to avoid predation by killer whales, which travel in deeper waters. So, gray whales will be traveling through prime real estate for the wave energy-generating buoys...Mate in December will place an acoustic device on a mooring near Newport. The device emits a low, one-second "whoop" sound three times a minute during a six-hour stretch each day. The hope is that the sound, which is about as noisy as a fisherman's fish radar device, would act as a whale deterrent. A $600,000 grant from the U.S. Department of Energy is funding the study..." May 13, 2010 They will be deployed in Oregon by the end of 2010. The problem is that this could disrupt the feeding and migration of our gray whales and also add to the acoustic problems in our oceans. And this device could be deployed along the California Coastline as well. Combined with the U.S. Navy planned expansion and use of sonar this could be a disaster for our gray whales and other marine mammals. The U.S. Navy should take into consideration in their proposed Hawaii-Southern CA Range Expansion other sources of sonar when used in conjunction with Navy Sonar in the NWTRC, the Gulf of Alaska, and the Mariana Range complexes, along with the proposed NWTT range. Acoustic Impacts on Marine Life Marsha L Green, PhD For references and citations contact info@oceanmammalinst.org "…In the past decade a dismaying sequence of marine mammal strandings has occurred in Greece (1996), the Bahamas (2000), Madeira (2000), Vieques (1998, 2002), the Canary Islands (2002, 2004), the northwest coast of the U.S. (2003) and Hawaii (2004). Each stranding has been correlated with the use of high intensity military sonar. These sonars – both low - frequency (LFAS) and mid - frequency can have a source level of 240 db, which is one trillion times louder than the sounds whales have been shown to avoid. One scientist analyzing underwater acoustic data reported that a single low frequency sonar signal deployed off the coast of California could be heard over the entire North Pacific Ocean. Necropsies performed on whales stranded in the Bahamas (2000) and the Canary Islands (2002) revealed hemorrhaging around the brain and in other organs most likely	whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	due to acoustic trauma from the use of high intensity sonar. It appears that the sonar exercise in the Bahamas in 2000 may have decimated the entire population of beaked whales in the area. In December 2004, 169 whales and dolphins died on beaches in Australia and New Zealand after reported military exercises and air gun use in the area. In January, 2005, 37 whales stranded on the U.S. coast of North Carolina after high intensity sonar was used in a naval exercise. In March, 2005 almost 80 dolphins stranded on the U.S. coast in Florida after the acknowledged use of naval sonar. Though still too recent to link definitively to sonar, these last three strandings have triggered official inquiries into the possible role played by sonar in these mortalities. Intense noise generated by commercial air guns used for oil and gas exploration and oceanographic experiments; underwater explosives; and shipping traffic also poses a threat to marine life. Air gun use was correlated with whale strandings in the Gulf of California and Brazil in 2002. The global magnitude of the problem has not even been determined, as many fatally injured animals are likely to sink in the deep ocean and not all injured whales strand. Thus, a growing body of evidence confirms that intense sound produced by human-generated noise in the marine environment can induce a range of adverse effects on marine mammals. These effects include death and serious injury caused by hemorrhages or other tissue trauma, strandings, temporary and permanent hearing loss or impairment, displacement from preferred habitat and disruption of feeding, breeding, nursing, communication, sensing and other behaviors vital to survival. High intensity sonars and air guns impact not only marine mammals but also have been shown to affect fish, giant squid and snow crabs. In a study by the British Defense Research Agency, exposure to sonar signals caused auditory damage, internal injuries, eye hemorrhaging and mortality in commercially caught fish. Air guns caused extensive damage to the inner ears of fish and lowered trawl catch rates 45 to 70% over a 2,000 square mile area of ocean (Norwegian Institute of Marine Research). Catch rates did not recover in the five days surveyed after air gun use stopped. This presents the possibility that increasing production of intense underwater noise can significantly and adversely impact food supply, employment and the economies of maritime countries. Recent studies show that ocean background noise levels have doubled every decade for the past six decades. As a result of the masking effects of human-produced ocean noise pollution, the possible communication range of blue whales has decreased from greater than 1,000 km to only 100 km in the noisy Northern Hemisphere. We don't know how this affects their ability to find food and mates. Thus, there are numerous indications that intense noise from sonars, air guns, shipping and other sources poses serious threats to cetaceans and the already depleted fish stocks in the world's oceans…" Marsha L Green, PhD For references and citations contact info@oceanmammalinst.org The above information should be taken into consideration by the U.S. Navy and NOAA should provide all additional recent studies on all weapons systems in your Final EIS/OEIS for the Hawaii-Southern CA Range Complex.

A. Peterson-04	July 10, 2012 U.S. Navy Public Comment Hawaii-Southern CA Range Complex Proposed Expansion U.S. GAO 2002 Report: "…Unexploded ordnance are munitions that have been primed, fused, armed, or otherwise prepared for action, and have been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or material and remain unexploded either by malfunction, design or any other cause…" Munitions constituents consist of such things as propellants, explosives, pyrotechnics, chemical agents, metal parts, and other inert components that can pollute our oceans or cause harm to marine mammals, breeding habitats, migrating fish, whales, and other marine mammals. What precautions is the U.S. Navy taking to make sure that these unexploded ordnance are removed so that they don't pose a hazard to ocean and marine life and are not washed ashore onto beaches? If this type of unexploded ordnance is found in the Pacific Ocean or along any coastal beaches will the Navy pay for its safe removal? How much money has the U.S. Navy budgeted for this type of removal and clean up?	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
A. Peterson-05	U.S. NAVY PUBLIC COMMENTS & REQUESTS FOR INFORMATION July 10, 2012 It is almost totally impossible to be able to address a proposed Hawaii-Southern CA EIS/OEIS, without being able to consider a wide variety of classified documentation on the results of studies conducted by the U.S. Navy, NOAA, NMFS, independent studies, and other information on past, current, and proposed future weapons systems testing. The information which has been made public is limited and not readily available for public comment at this time under the proposed Hawaii-Southern CA EIS/OEIS. The U.S. Navy in their scoping Open House Sessions (in violation of NEPA), have refused to give any formal presentations, to take oral public comments (maybe a recorder available but hidden at most meetings), or provide information on new studies undertaken by the Navy or NOAA (also university studies). Therefore, we are requesting the following information in order to be able to make informed public comments on the proposed Hawaii-Southern CA Range Expansion. The U.S. Navy has been operating in 12+/- Five Year Warfare Testing Ranges since 2008-2012, including the NWTRC (part of the new NWTT Range). They have refused to provide the public with any information about their new weapons system testing in not only the NWTRC but in other range testing areas or studies on impacts to marine mammals, fish, biologically sensitive areas, migrating fish and whales, strandings, etc. Thus, this is a formal request for additional information about the U.S. Navy activities in the Pacific, Atlantic, and the Gulf of Mexico, where many of these new weapons systems, lasers, sonar, radar and other experimental tests have been or are currently being tested and their impact on all marine life and ecosystems. The Following is a List of Documents and studies requested so that the public and our elected officials can make informed public comments about the proposed NWTT: 1) September 10, 2010: U.S. Navy Final NWTRC EIS Volume II Page G113 Answer to public comment question: "…No, the Navy does not plan on suspending sonar operations during the gray whale migration seasons…" What is the justification for	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments." NEPA provides a forum for public involvement in federal decision

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	the Navy not suspending sonar operations during gray whale, turtle, and salmon migrations or protecting national marine sanctuaries, marine reserves, biologically sensitive areas, and breeding habitats? 2) The U.S. Navy has ongoing 5-Year Warfare Testing Programs in their Southern California and Hawaii Range Complexes. Does the Navy suspend sonar or bombing exercises during gray whale and other marine mammal or fish migrations which use the proposed NWTT and NWTRC corridor at various times of the year for these migrations as they move through breeding, feeding, and other biologically sensitive areas while nurturing their young? Will they suspend these activities in the proposed Hawaii-Southern CA Range? 6) The Navy states in their Final EIS and ROD (Record of Decision) that they will be testing new weapons systems in the NWTRC. What precautions will be taken by the Navy to protect marine mammals from the unknown impacts of these weapons systems? Will the Navy be testing these new systems and weapons in the proposed NWTT and the Hawaii-Southern CA Ranges? 7) What impacts will the new testing of electromagnetic weapons systems have on marine mammals and fish? We are formally requesting an online listing of studies undertaking since 2008, on weapons system testing on marine mammals and fish in the Pacific, Atlantic, and the Gulf of Mexico. In order to evaluate these U.S. Navy, NOAA, NMFS, and other university or independent testing…the Navy needs to provide this information to the public. Once the public can evaluate these study results public comments will be of value in determining future allowable Navy testing in the NWTT and the NWTRC and the proposed Hawaii-Southern CA Range. 8) Since NOAA has issued the Navy a permit and Letter of Authorization to allow the Navy to "take" marine mammals paving the way for full-scale warfare testing, which areas, in the proposed NWTT and the Hawaii-Southern CA Range, will the Navy avoid to protect the endangered salmon and whales populations when they are in migration patterns? 9) U.S. Congressman Thompson has noted that NOAA & U.S. Navy mitigation measures to protect marine mammals are effective only 9% of the time...will the U.S. Navy be using mitigation measures now that are proven effective more than 9% of the time? If so, what studies were conducted by NOAA or the U.S. Navy that were proven effective more than 9% of the time and will the Navy institute using these alternatives? 10) The proposed Hawaii-Southern CA, NWTT and the NWTRC ranges are in an area where the fishing and tourism industries make millions of dollars. Will the U.S. Navy be warning those who are operating such businesses of their activities in advance in order to protect our fishermen and tourists from the impacts of these bombing exercises or toxic chemical exposures (from aluminum coated fiberglass particulates which can stay airborne up to 20 hours or airborne toxics like red phosphorus, smoke, flakes, obscurants or other airborne toxic chemicals), in the future? 11) The U.S. Navy NWTRC Final Environmental Impact Statement lists many hazardous materials that are being used in the NWTRC and their dangers. The Navy lists the following habitats that may be impacted by hazardous materials: Open Ocean Habitat Surface & Subsurface Areas Bottom Dwelling Communities, Near Shore Habitat which includes bottom dwelling algaes, kelp forests,	making. Several opportunities have been provided including scoping meetings, public meetings, and opportunities to comment on the Draft EIS/OEIS. The Navy has engaged the regional fishery management councils. Comments received during the scoping period were considered in the development of the Draft EIS/OEIS. Information on the development of mitigation measures can be found in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the DEIS and FEIS. The mitigation measures listed in the Final EIS/OEIS and Record of Decision are the result of the consultation with NMFS and USFWS.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	and seagrass beds. Why doesn't the Navy restrict its testing to limit the impact on biological sensitive habitats in the proposed Hawaii-Southern CA and NWTT Ranges and the NWTRC? 12) In several U.S. Navy final environmental Impact statements the Navy notes that many hazardous materials will be Containerized for Shore Disposal. Where will these contaminants be stored onshore and at what Navy facility will proper disposal be conducted? 13) In the Final NWTRC Environmental Impact Statement there are many hazardous materials which will be discharged overboard. Please designate, on the proposed Hawaii-Southern CA, NWTT and the NWTRC, U.S. Navy Range map which areas in the Pacific are considered "safe" for these discharges? And list any studies conducted by the U.S. Navy, NOAA, university, or the NMFS, to show that these areas are “safe” for these types of “discharges”. 14) In the U.S. Navy NWTRC Final Environmental Impact Statement (Page G417) is found this information: "The Navy is not 'testing' new weapons within the NWTRC. All weapons and platforms coming to the NWTRC as a result of the proposed action have been tested in other training ranges." Why does the Navy need to conduct redundant testing in in both the proposed Hawaii-Southern CA Range and NWTT? (Said testing is currently being conducted in the Atlantic, Pacific (Hawaiian & Southern California & Mariana Range Complexes), and the Gulf of Mexico)? 15) There are fifteen or more U.S. Navy Ranges which have been approved for full-scale warfare testing in the Atlantic, Pacific, and the Gulf of Mexico. These final EIS/OEIS documents show that many weapons systems, bombs, sonar, and other Navy testing is redundant in each of these ranges. This redundancy along with the ever expanding and exponential growth of these ranges costs large sums of money. Many of the practice weapons are costly and older thus their capabilities (like the Hellfire Missile and many bombs, munitions, etc.,) are well known and studied…many having been used for ten to thirty years in various military actions around the world and in the U.S. What justification does the U.S. Navy use when considering practice with live fire practice rather than practice using bombs, etc., which won’t explode but which can be used for practice purposes? It is the contention of many that the U.S. Navy (and all other branches of the U.S. military), should be protecting our oceans and our natural resources not destroying them in the name of war and war practice. Our oceans are a valuable source of food for millions of people, recreation, and sheer beauty. We have enjoyed this bounty and beauty for hundreds of years and now the U.S. Navy and other branches of the military are engaged, without restrictions, in destroying them. What rationale does the U.S. Navy use for destroying our oceans for redundant war practice? Who authorized the U.S. Navy to engage in this type of destruction of our oceans and the marine life therein? And who has authorized the U.S. Navy to conduct atmospheric testing without the proper Environmental Impact Statements like the U.S. Navy CARE Experiments? Our oceans and our atmosphere provide for life here on Earth. If we destroy them in the name of war and experimentation what future will our children and grandchildren have long after we live in a wasteland of war practice destruction? How will Navy personnel explain to their children why the only marine mammals, like whales,	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	that can only be seen are in old Navy warfare promotional movies due to the fact that our military destroyed them and their habitats in the name of perpetual war practice in the Atlantic, Pacific, and the Gulf of Mexico?	
A. Peterson-06	July 10, 2012 Public Comment: U.S. Navy Hawaii-Southern California Range Expansion To: U.S. Secretary of the Navy-Ray Mabus The Honorable President Barack Obama Naval Facilities Engineering Command, Southwest Attention: HSTT EIS/OEIS Project Manager – EV21.CS 1220 Pacific Highway, Building 1, Floor 3 San Diego, CA 92132-5190 I find myself, at the age of 97, having worked to establish many environmental protections for our oceans and our natural resources, wondering what the future will be for my children, grandson, and great grandchildren. In a short time the U.S. Navy and other branches of the military have begun destroying millions of marine mammals, ocean habitats, coral reefs...and so much more in the Pacific, Atlantic, and the Gulf of Mexico. The land and ocean world that our elected officials, the U.S. Department of Commerce, (NOAA & NMFS), and the various branches of our military, have elected to destroy with "shock and Awe" methods using military weapons of all kinds...including new weapons systems and atmospheric testing, is stunning in scope. There are no words to describe the carnage that already has been put into action...and worse yet...the carnage yet to come is almost incomprehensible. "Our military officers took an oath to uphold the U.S. Constitution which does not state that the military has the right to destroy the Earth in the name of war practice." And yet today, the sonarizing, bombing, new weapons and atmospheric testing by the military is destroying the Earth in the name of "conducting war practice" and physics experiments. Our military is conducting illegal satellite and drone surveillance on all of us...killing people with drones...stating that everyone is guilty until proven innocent of the charges, whether inside or outside of the United States, in violation of our U.S. Constitution and laws. It seems that if someone is now killed by a drone they still have to prove, while dead, to the U.S. that they were innocent whether American citizens or not...whether a child or an adult. This violates the principle that we have lived by, under the U.S. Constitution, laws, and our Bill of Rights, which states that everyone is innocent until proven guilty. The military and our elected officials have set themselves up to play "GOD", judge and jury. What happens when their next victim is you? When the police or homeland secruity, the military, shoots you down and later finds that you were innocent but now dead? No amount of guilt money can bring you back or reverse the decision. Now the U.S. Navy and other branches of our military have decided to play "GOD" with the Earth and its bounty of natural resources. Why? It is a good way to financially bankrupt the U.S. with perpetual war and war costs. (One day we will have to hire the U.S. Navy to repair our roads since their war practice is reducing domestic spending.) War practice is a good way to enrich those that produce weapons of war and keep the free enterprise market going through the U.S. selling war weapons to other countries making us less safe in the bargain. I once spoke to a sailor and I asked him if the U.S. decided that my trying to save 11.7 million marine mammals from war	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, “Today’s simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments.”

Commenter	Comment	Navy Response
	practice and weapons testing got me arrested by our U.S. government, for being outspoken, if he would rescue me for exercising my free speech rights under the U.S. Constitution and Bill of Rights? He stood mute... What will this sailor tell his family, his chidren and grandchildren in his later years about his role in this destruction? There is a question for all of us: What will you tell your family and children about why you stood mute and let this happen? The best that I can say is that I stand today against this war practice horror to be perpetuated against our oceans and the Earth. There is no reason or excuse for this destruction to be unleasesd against the Earth. The U.S. Navy can do better...they can protect our natural resources and protect those that have no voice...I stand here today as one voice for our oceans, as one voice who speaks for the whales and other marine life who have no voice, and as the Earth's voice to say "NO" more destruction in the name of war practice for perpetual wars. Sincerely, Ava Peterson	
D. Peterson-01 (Electronic)	Thank you for the opportunity to share my thoughts and concerns for our sea life. " According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises." Why would the Navy want to intentionally cause this kind of damage to Sea Life?? I am asking that planned exercises are stopped immediatly, Without hesitation. The animals that are still living in the sea and haven't been destroyed by industrial fishing deserve protection not Bombs!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
R. Peterson-01 (Electronic)	May 25, 2012 TO: The Honorable Secretary of the U.S. Navy, Ray Mabus RE: Formal Request & Action by the U.S. Navy in the Final HSTT EIS document. Dear Secretary Mabus: I am formally requesting, under the California Public Records Act, a hard copy and CD of the subsequent HSTT Final Environmental Impact Statement of the Hawaiian-Southern California Range Complex once prepared from your current draft HSTT EIS-OEIS document. I would also like notification of the dates when the final HSTT EIS/OEIS	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	public comments are noticed in the U.S. Federal Register so that comments may be made in a timely manner. The following information was release by U.S. Senator McCain and U.S. Senator Levin: http://startingpoint.blogs.cnn.com/2012/05/22/sen-carl-levin-counterfeit-military-parts-pose-significant-safety-risk/ CNN News & Video – May 22, 2012 Sen. Carl Levin: Counterfeit military parts pose 'significant safety risk' "…Because of a recent surge of counterfeit military parts– such as pieces of equipment used in aircrafts– the Senate Armed Services Committee has adopted new legislation to change the procedural laws for buying new or refurbished parts. Senator Carl Levin joins Starting Point this morning to explain the details of the new law, which he has been working on alongside Sen. John McCain. Levin explains that the news laws say that parts can only be bought from contracted, authorized distributors or certified suppliers and dictates that suppliers will be responsible for their own repairs. Regarding the threat posed by the counterfeit parts, Levin explains that the problem occurs almost exclusively with equipment produced in China, and poses a "significant" safety threat to the nation…" End The U.S. Navy is now conducting warfare testing in the Pacific, Atlantic, and the Gulf of Mexico. Nuclear submarines, aircraft, ships, missiles, drones, and a whole host of other warfare weapons are now being tested over land and ocean areas. What actions are you taking to address the issue of counterfeit and questionable refurbished parts being purchased by the U.S. Navy? These counterfeit and faulty parts not only cost the U.S. Navy money but they have the potential to cause injuries to our Naval personnel, civilians, and others when they subsequently fail. Secretary Mabus, I have seen you recently on television and on interview shows, speaking about the U.S. Navy, but never once demanding that action be taken to address the issue of counterfeit parts, especially from China. In addition, I didn't hear you state, for the record, that the Navy will refuse to use said parts, especially from China, in order to protect the sailors under your watch and the civilians that may be killed or injured when these counterfeit parts malfunction. It is time that military parts, software, and hardware be made in the United States where quality controls are in place. I expect that you will at the forefront in stopping the use of counterfeit parts from China and other foreign countries. I am looking forward to hearing from you in writing within the next few days on this critical issue and that you will require that those who prepare your final HSTT EIS/OEIS to address this critical issue in order to protect our troops and the U.S. civilian population. Sincerely, Rosalind Peterson	
R. Peterson-02	U.S. Navy Hawaii-Southern California Range Complex Expansion Public Comment on July 10, 2012 On May 17, 2012, news reports that "Mass dolphin deaths in Peru caused by acoustic trauma" were announced by "…Dr. Carlos Yaipen Llanos of ORCA in Peru informed Hardy Jones of Blue Voice that acoustical trauma is the cause of the Mass Mortality Event (MME) that killed an estimated one thousand dolphins along the coast of northern Peru in March 2012…" [28]. This is another reason to begin to limit sonar, laser, radar, and electromagnetic weapons testing in the Atlantic, Pacific, and the Gulf of Mexico. We believe that the U.S. Navy & NOAA should investigate and find out if the	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Commenter	Comment	Navy Response
	U.S. Navy was involved in causing this acoustic trama in March 2012, just after the Final EIS for the Gulf of Mexico GOMEX 5-year Warfare Testing & Take was finalized and approved. With the U.S. Navy practicing in almost every square inch of the Pacific, Atlantic, and Gulf of Mexico, the potential for harm to marine mammals increases exponentially. Since your own mitigation measures to protect marine mammals are effective only 9% of the time what new actions will the Navy be taking to improve sonar and bomb blast mitigation measures to 80% effectiveness? Respectfully, Rosalind Peterson CC: U.S. Congressman Mike Thompson U.S. Senator Barbara Boxer U.S. Senator Dianne Feinstein	actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
R. Peterson-03	July 10, 2012 Public Comment- U.S. Navy Hawaii-Southern California Range Expansion U.S. Navy / NASA C.A.R.E. (Charged Aerosol Release Experiment), September 19, 2009 Aluminum Oxide Dust Cloud Released Over the East Coast of the United States using a NASA Brandt Rocket: http://www.nasa.gov/centers/wallops/CARE.html 17, U.S. Navy / NASA C.A.R.E. Experiment – "…CARE's principal investigator, Paul Bernhardt of the Naval Research Laboratory in Washington: "The CARE experiment could also pave the way for future launches that would use the uppermost part of Earth's atmosphere as a large physics laboratory for studying charged dust…Dusty plasmas, like those that will be created in the CARE (aluminum oxide dust cloud) experiment…" Will the U.S. Navy be conducting atmospheric testing (Like CARE Experiment Above), over the Pacific Ocean? Will the U.S. Navy be conducting any atmospheric experiments where toxic chemicals will be released that could pollute air, water, oceans, rivers, streams, and coastal regions? Will the U.S. Navy be conducting more CARE experiments over the Pacific or the Atlantic Oceans or land areas where you have range complexes? Rosalind Peterson CC: U.S. Congressman Mike Thompson U.S. Senator Boxer & Feinstein	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
R. Peterson-04	July 10, 2012 - Public Comment - Hawaii-Southern California Range Expansion Drone Weapons Testing & Surveillance over the United States & Pacific, Atlantic & Gulf of Mexico The U.S. Navy is now working to expand their drone operations over the United States. In Oregon, a new draft Navy Environmental Impact Statement is due out this summer for public comment. Drones carrying and testing bombs, new weapons systems, testing new types of drones, and surveillance over land and ocean areas are planned for our future. Compounding this issue, as reported by The Guardian.co.uk on April 2, 2012, "…American scientists have drawn up plans for a new generation of nuclear-powered drones capable of flying over remote regions of the world for months on end without refueling…". In addition, there is increasing drone surveillance leading to questions over public privacy in the U.S. Accidents are increasing as the U.S. Navy and police departments in Texas and other areas are increasing drone usage. The U.S. Navy is now purchasing aircraft and other parts from China which have the potential to be substandard according to Senator Levin and may cause increasing accidents from all types of aircraft. What action is the Navy taking to stop the purchase of defective aircraft and other parts from other countries? How many U.S. Navy land-base drone ranges will	Thank you for participating in the NEPA process.

Commenter	Comment	Navy Response
	be conducting warfare testing, testing new weapons systems in unmanned aerial vehicles or aircraft, using nuclear powered drones, and will be carrying surveillance or weapons over land and ocean areas? Who will be conducting surveillance activities over land areas (private contractor or U.S. Navy or other Branches of the U.S. military in conjunction with the U.S. Navy), on American citizens and what will happen to the information collected? Why are these U.S. Navy drone ranges considered on a separate basis from other ranges when they are working in conjunction with the other ocean based range complexes? Rosalind Peterson CC: U.S. Congressman Thompson U.S. Senators Boxer & Feinstein	
R. Peterson-05	July 10, 2012 U.S. Navy Public Comment: Hawaii-Southern California Range Expansion I just found this BBC News item about underwater listening stations. It appears the U.S. Navy has a way to tract marine mammals with these devices which would be a more effective mitigation measure than is being used by the U.S. Navy & NOAA. I am raising this issue with both the U.S. Navy and NOAA. The new NWTT Range Expansion Public Comment period is over but this might be a way to protect schools of fish and also marine mammals in their testing areas and also in the new Southern California-Hawaii Expansion Range. Sonar Heard Underwater - BBC NEWS January 13 2012 "...Listening stations on the seabed all over the world are streaming sound in real time to websites that anyone can access, allowing people to hear everything from male humpback whales singing off Hawaii, to last year's Japanese earthquake. Conscious of security, the US Navy has brokered a deal with scientists in the north Pacific which allows the navy to delete any sounds of US or Canadian military shipping before the audio is sent out across the internet. It now wants to do similar deals with other scientists around the world, but some experts say that is both improbable, and in this new age of internet accessibility, unreasonable. This is the sound of a sonar system in operation, best known for being used by submarines to determine the position, nature and speed of objects under the water..." Will the U.S. Navy look into this method and advise on how effective this method might be in protecting marine mammals, migrating fish and marine mammals, and other marine life? Rosalind Peterson	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Commenter	Comment	Navy Response
	balance of oceans. A new EU directive on the sea has ruled that all member states must comply with a set of indicators for measuring marine noise pollution before 2012. Will be the U.S. Navy and NOAA be participating in this EU directive to meausre marine noise pollution? Will the U.S. Navy entertain using this method to help protect marine mammals and other marine life from excessive noise pollution, sonar use, laser and radar technologies now being tested or developed in the near future? Electromagnetic weapons systems are being developed which will also impact marine mammals and other aquatic life. Will the Navy be using or testing these devices in the Pacific Ocean areas of the Mariana Island Range, the Hawaiian Range, the Gulf of Mexico Range, the Southern California Range (and new expansion), or in the NWTRC? What impact do all of these new weapons systems have on marine life? What studies have been conducted to understand these impacts by the Navy, NOAA or other independent agencies or universities? Rosalind Peterson CC: U.S. Congressman Thompson U.S. Senators Boxer & Feinstein	Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, “Today’s simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments.”
R. Peterson-07	July 10, 2012 Questions for U.S. Navy Hawaii-Southern CA Expansion: 1) U.S. GAO 2002 Report: “…Unexploded ordnance are munitions that have been primed, fused, armed, or otherwise prepared for action, and have been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or material and remain unexploded either by malfunction, design or any other cause. Munitions constituents consist of such things as propellants, explosives, pyrotechnics, chemical agents, metal parts, and other inert components that can pollute the soil and/or ground water…” A. Please list all of the unexploded ordnances and also what mitigation measures the Navy is using now in the NWTRC and the proposed NWTT range for this type of unexploded ordnance. (Please include the Hawaii-Southern CA Range Complex Expansion in your answer.) B. Also advise on what impacts this type of ordnance will have on marine mammals, fish, aquatic environments, and what action the Navy will take if they wash ashore. How much funding does the Navy have allocated to protect shorelines? 2) September 10, 2010: U.S. Navy Final EIS Volume II Page G113 Answer to public comment question: "…No, the Navy does not plan on suspending sonar operations during the gray whale migration seasons…” A. Why won't the Navy suspend sonar operations during gray whale and fish migration periods in the NWTRC or the proposed NWTT Range Expansion which includes the NWTRC? And will the Navy suspend sonar and bomb blast operations in the Hawaii-Southern CA Range Complex Expansion during marine mammal and fish migration periods? 3) The U.S. Navy has ongoing 5-Year Warfare Testing Programs in their Southern California, Panama, Mariana Island, Hawaii Range, and other range	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	complexes? A. Does the Navy suspend sonar or bombing exercises during gray whale and other marine mammal or fish migrations in any of their 5-Year Warfare Range Complexes in the Pacific, Atlantic and the Gulf of Mexico active ranges? B. The Navy states in their Final EIS and ROD (Record of Decision) that they will be testing new weapons systems in the NWTRC. Will this be true in the proposed NWTT Range and the Hawaii-Southern CA Range Expansion? C. What precautions will be taken by the Navy to protect marine mammals from the unknown impacts of these new weapons systems? D. What impacts will the new testing of electromagnetic weapons systems have on marine mammals and please list which recent studies, if any, have been conducted to determine their impact on marine mammals, fish and other aquatic life? 4) Since NOAA has issued the Navy a permit and Letter of Authorization to allow the Navy to "take" marine mammals paving the way for full-scale warfare testing, which areas in the NWTRC and the Hawaii-Southern CA Ranges prior to any new expansion. Will the Navy avoid protect the endangered salmon and whales populations when they are in migration or feeding patterns? What actions will the Navy take to protect biologically sensitive areas and breeding habitats in this new Hawaii-Southern CA Range expansion? 5) U.S. Congressman Thompson has noted that NOAA & U.S. Navy mitigation measures to protect marine mammals are effective only 9% of the time...will the U.S. Navy be using mitigation measures now that are proven effective more than 9% of the time? If so, what studies were conducted by NOAA or the U.S. Navy that were proven effective more than 9% of the time and could be used today in the proposed NWTT Range? 6) The NWTRC, Hawaii and Southern CA are areas where the fishing and tourism industries make millions of dollars. Will the U.S. Navy be warning those who are operating such businesses of their activities in advance in order to protect our fishermen and tourists from the impacts of these bombing exercises or toxic chemical exposure from aluminum coated fiberglass particulates (Chaff), which can stay airborne up to 20 hours or airborne toxics like red and white phosphorus in the proposed Hawaii-Southern CA Range expansion? 7) The U.S. Navy Final Environmental Impact Statement lists many hazardous materials that will be used in many areas… and the dangers from unexploded ordinances that then sink to the bottom of the ocean. The Navy lists the following habitats that may be impacted by hazardous materials: • Open Ocean Habitat and Surface & Subsurface Areas • Bottom Dwelling Communities - Near Shore Habitat which includes bottom dwelling algaes including kelp forests, and seagrass beds A. Why doesn't the Navy restrict its testing to limit the impact on biological sensitive habitats in the NWTRC and the proposed NWTT and Hawaii-Southern CA Range? 8) In the Final Environmental Impact Statement the Navy notes that many hazardous materials will be "Containerized for Shore Disposal". Where will these contaminants and containers be stored onshore and at what Navy facility? 9) In the Final Environmental Impact Statement there are many hazardous materials which will be discharged overboard. Please designate on the NWTRC and the proposed NWTT and the Hawaii-Southern CA Range map where these ocean areas considered "safe" are located for these discharges	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	in the Pacific, Atlantic or the Gulf of Mexico? 10) In the U.S. Navy Final Environmental Impact Statement (Page G417) is found this information: "The Navy is not 'testing' new weapons within the NWTRC and other Pacific Navy Ranges. All weapons and platforms coming to the NWTRC as a result of the proposed action have been testing in other training ranges." A. Why does the Navy need to conduct redundant testing in the NWTRC and the proposed NWTT and Hawaii Southern CA Range? (Since said testing is currently being conducted in the Atlantic, Pacific (Hawaiian & Southern California Range Complexes), and the Gulf of Mexico.)	
R. Peterson-08	July 10, 2012 U.S. Navy Hawaii-Southern CA Range Expansion Public Comment – Scoping Under NEPA for Draft EIS There are a wide variety of chemicals used by the U.S. Navy in many warfare testing ranges. We are requesting that the following be addressed in the proposed U.S. Navy Draft EIS with respect to human health, ocean impacts, marine mammals and fish, servicemen in area of usage, air, ocean, and water pollution, also risks from airborne pollution to shoreline communities: U.S. Navy Chemicals Usage – Warfare Weapons Range Complexes in the United States. 1) *Titanium tetrachloride is a colorless to pale yellow liquid that has fumes with a strong odor. If it comes in contact with water, it rapidly forms hydrochloric acid, as well as titanium compounds. Titanium tetrachloride is not found naturally in the environment and is made from minerals that contain titanium. It is used to make titanium metal and other titanium-containing compounds, such as titanium dioxide, which is used as a white pigment in paints and other products and to produce other chemicals. Military use it as a component of spotting charges. Titanium tetrachloride is very irritating to the eyes, skin, mucous membranes, and the lungs. Breathing in large amounts can cause serious injury to the lungs. Contact with the liquid can burn the eyes and skin. HAZARDS: _ Explosive _ Red phosphorus or Titanium tetrachloride _ Smoke/incendiary 2) MK-20 Rockeye Description Physical Characteristics The MK-20 Rockeye is a free-fall, unguided cluster weapon designed to kill tanks and armored vehicles. The system consists of a clamshell dispenser, a mechanical MK-339 timed fuze, and 247 dual-purpose armor-piercing shaped-charge bomblets. The bomblet weighs 1.32 pounds and has a 0.4-pound shaped charge warhead of high explosives, which produces up to 250,000 psi at the point of impact, allowing penetration of approximately 7.5 inches of armor. Rockeye is most efficiently use against area targets requiring penetration to kill. Fielded in 1968, the Rockeye dispenser is also used in the Gator air delivered mine system. During Desert Storm US Marines used the weapon extensively, dropping 15,828 of the 27,987 total Rockeyes against armor, artillery, and antipersonnel targets. The remainder were dropped by Air Force (5,345) and Navy (6,814) aircraft. Filling: 247 bomblets 3) *Red Phosphorus may be harmful if absorbed through skin, ingested, or inhaled, and may cause irritation of the skin, eyes, upper respiratory tract, gastrointestinal tract, and mucous membranes. Inhalation of red phosphorus dust may cause bronchitis. Ingestion of red phosphorus may also cause stomach pains, vomiting, and diarrhea. Effects may	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	vary from mild irritation to severe destruction of tissue depending on the intensity and duration of exposure. Prolonged and/or repeated skin contact may result in dermatitis. Chronic exposure may cause kidney and liver damage, anemia, stomach pains, vomiting, diarrhea, blood disorders, and cardiovascular effects. Chronic ingestion or inhalation may induce systemic phosphorus poisoning. If red phosphorus is contaminated with white phosphorus, chronic ingestion may cause necrosis of the jaw bone ("phossy-jaw"). HAZARDS: Explosive; Red phosphorus or Titanium tetrachloride; Smoke/incendiary. 4) **Pyrotechnic and screening devices contain combustible chemicals which, when ignited, rapidly generate a flame of intense heat, flash, infrared radiation, smoke or sound display (or combinations of these effects) for a variety of purposes. Compared to other explosive substances, pyrotechnics are more adversely affected by moisture, temperature, and rough handling. Some compositions may become more sensitive, and even ignite, when exposed to moisture or air. Mixtures which contain chlorates and sulfur are susceptible to spontaneous combustion. Most pyrotechnics produce a very hot fire that is difficult to extinguish and most burn without serious explosions. Many chemicals used in pyrotechnics produce toxic effects when ignited. Other pyrotechnics, which contain propelling charges, create an extremely hazardous missile hazard if accidentally ignited. What types of precautions are used to protect U.S. Navy personnel to exposure when these and other toxic chemicals are being used in the NWTRC, the proposed NWTT, and the Hawaii-Southern California Range Expansion?	
R. Peterson-09	July 10, 2012 Public Comment: U.S. Navy Proposed Hawaii-Southern CA Draft EIS – NEPA The killer whales of the Salish Sea could be negatively impacted by both the Canadians and the U.S. Navy using sonar in their critical habitat. The proposed NWTT Draft EIS should consider that combined and individual Canadian and U.S. Navy Sonar usage will have a negative impact on marine mammals. Intense underwater noise like the "pings" from mid-frequency active sonar poses significant risks to killer whales and other migrating whales. All sources of sonar and acoustic noise should be considered in the proposed Draft NWTT EIS. On February 6, 2012, the Canadian Naval frigate HMCS Ottawa used its sonar system in critical habitat of the endangered Southern Resident Killer Whales during a training exercise east of Victoria, B.C. The calls of the Southern Residents' K and L pods were heard 18 hours later in Haro Strait, and sub-groups of K and L pods were identified 36 hours after the sonar use in Discovery Bay – a location where Southern Residents have never been sighted in 22 years of records. These observations are reminiscent of an incident in May, 2003, when the USS Shoup's sonar training exercise caused similar unusual nearshore surface milling behavior of Southern Residents in Haro Strait. New limits should be put on the use of mid-frequency active (MFA) sonar, particularly in the critical habitat of the Southern Residents. Killer whales are sensitive to the frequencies emitted by MFA sonar (2-10 kHz) and use the same frequency range to communicate with calls and whistles. Because MFA sonar is intense	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	(source levels ~220-235 underwater decibels), it could permanently or temporarily deafen whales that are unexpectedly nearby and thereby impact their ability to forage, navigate, and socialize. (There has been report of dolphins experiencing hearing losses in other areas.) Even temporary threshold shifts could be deleterious because the recovery of the Southern Residents hinges on their use of echolocation to find, identify, and acquire their primary prey, Pacific salmon. Since the NWTRC is being expanded to include Alaska Testing Ranges these issues should be studied and addressed in the Draft NWT EIS. Current procedures for mitigating underwater military noise are inadequate to protect either the resident or transient ecotypes. These procedures depend on the ability to detect whales within 1000 yards (U.S.) or 4000 yards (Canada), which neither passive acoustic listening nor visual surveillance can reliably accomplish. The unprecedented sighting of Southern Residents in Discovery Bay suggests that they may have been present during the pre-dawn sonar exercise on February 6, 2003, while remaining undetected by the Canadian Navy's marine mammal monitoring procedures. The 2003 Shoup incident and scientific literature that MFA sonar can disrupt marine mammal behavior well beyond the current mitigation distances, particularly in the sound propagation conditions of the Salish Sea. The U.S. Navy should investigate all recent scientific literature on sonar and not just rely on very old studies…many of which were not peer-reviewed. The U.S. Navy should restrict MFA sonar and other intense underwater sound sources in all training and testing conducted in the Salish Sea. We are interested in any sonar research on all whales and other marine mammals being included in the U.S. Navy draft NWTT EIS and the Hawaii-Southern CA draft EIS with regard to the ever-increasing amount and types of sounds that marine mammals and other aquatic organisms are being exposed to from military and non-military exercises and testing.	used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
R. Peterson-10	July 10, 2012 RE: U.S. Navy Hawaii-Southern CA Range Complex Expansion Public Comment Reducing Environmental Cancer Risk Annual Report NCI Presidential Cancer Panel Report April 2010: Reducing Environmental Cancer NCI – Presidential Cancer Panel 2008-2009 Report Released April 2010 See: Chapter 5 Exposure to Contaminants and Other Hazards from Military Sources Summary: "…The military is a major source of toxic occupational and environmental exposures that can increase cancer risk. Information is available about some military activities that have directly or indirectly exposed military and civilian personnel to carcinogens and contaminated soil and water in numerous locations in the United States and abroad..." "...Nearly 900 Superfund sites are abandoned military facilities or facilities that produced materials and products for or otherwise supported military needs. Some of these sites and the areas surrounding them became heavily contaminated due to improper storage and disposal of known or suspected carcinogens including solvents, machining oils, metalworking fluids, and metals. In some cases, these contaminants have spread far beyond their points of origin because they have been transported by wind currents or have leached into drinking	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	water supplies..." The U.S. Navy as a wide range of toxic materials that are used in all of their twelve 5-Year warfare testing ranges. In specific, please detail all of your plans for proper disposal of all toxic wastes, hazardous materials, and other waste in the new NWTT range and the new Hawaii-Southern CA Range Expansion, and also please detail where all of these hazardous wastes are disposed of properly that are used in the current NWTRC, the Hawaii Range, the Mariana Range, and the Southern CA Range. We oppose any ocean dumping of toxic wastes and materials in any of the Pacific Range Complexes. We request that all areas where the U.S. Navy dumps toxic chemicals in the ocean be designated on a map in the Hawaii-Southern CA Final EIS/OEIS. Please advise on all types of weapons testing that exposes U.S. Navy personnel and the public to environmental, health (carcinogens,etc.), or occupational hazards when training in the NWTRC, the proposed NWTT Range Complex or the Hawaii-Southern CA Range Proposed Expansion.	
R. Peterson-11	July 10, 2012 U.S. Navy Public Comment – Proposed Hawaii-Southern California Range Complex – NEPA Process to be addressed the Draft EIS: Exhibit 1) The U.S. Navy and NASA are also engaged in atmospheric test using aluminum oxide released by rockets (C.A.R.E.), which could have consequences if used in the NWTRC with ocean acidity and water pollution: http://www.nrl.navy.mil/pao/pressRelease.php?Y=2009&R=97-09r This test was conducted on September 19, 2009. Does the U.S. Navy plan additional upper atmospheric testing...possibly over the Pacific Ocean or the West Coast of California, Oregon, Washington, Alaska, Idaho or Hawaii? These dust clouds remain airborne and then the aluminum oxide returns to the Earth. The effects of these programs on our oceans and water supplies have not been investigated and may be have been used in the NWTRC testing range or will be used in the proposed NWTT or Hawaii-?Southern CA Range Complex Expansion. Will aluminum oxide dust clouds be released by the U.S. Navy over the NWTT or the Hawaii-Southern CA Range Complex? What studies have been conducted to determine the impact of these programs on marine mammals and ocean environment? Exhibit 2) New Types of Sonar that should be investigated and addressed in the new Hawaii-Southern CA EIS: 16A) http://www.navy.mil/search/display.asp?story_id=48201 Next Generation of Mine-hunting Sonar 2009 U.S. Navy – Impact on Marine mammals and fish in the NWTRC in 2011-2012 and also proposed for NWTT Range Complex? 16B) http://www.nrl.navy.mil/pao/pressRelease.php?Y=2009&R=63-09r 2009 - U.S. Navy Article We also don't know if this type of laser sonar has been used in the NWTRC or will be used in the proposed NWTT or Hawaii-Southern CA range complex and what impacts it will have on marine mammals and fish? Please advise. Exhibit 3) Also note use of U.S. Navy directed energy weapons systems 2009. U.S. Navy Thursday, October 01, 2009. Has the Navy used this technology in the NWTRC and will it be used in the proposed NWTT range? Naval Surface Warfare Center Dahlgren News New Energy Center to Impact Future Weapons for Naval and Joint Forces DAHLGREN, Va. (NNS) -- The Navy	The Navy shares your concern for the fate and transport of potentially hazardous materials and water quality. All of the reasonably foreseeable effects from the fate and transport of potentially hazardous materials were analyzed in Chapter 3 (Section 3.1, Sediments and Water Quality) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	demonstrated its commitment to "game-changing" directed energy technological programs at the Naval Directed Energy Center (NDEC) ribbon cutting ceremony held at Naval Surface Warfare Center Dahlgren Division (NSWCDD) Sept.17, 2009. What impact will this technology have on marine mammals and fish? What studies have been conducted by the Navy to determine impacts on marine life in the Pacific if this technology is used in either the NWTRC or the proposed NWTT and Hawaii-Southern CA range complexes? http://www.navy.mil/search/display.asp?story_id=48285 Exhibit 4) U.S. Navy Press Release June 26, 2010 http://www.nrl.navy.mil/pao/pressRelease.php?Y=2010&R=74-10r "…Complete with the ceremonious champagne christening, the USNS Howard O. Lorenzen (T-AGM 25) is the second ship in U.S. Navy history to honor an NRL scientist for contributions made to Naval and civilian scientific research. Operated by the Military Sealift Command the missile range instrumentation ship, equipped with a new dual band phased array radar system and other advanced mission technology, it will replace the USNS Observation Island launched in 1953…" Do we know what impact this new radar system will have on marine mammals and fish or other aquatic life? What studies have been conducted to determine said impacts? Exhibit 5) U.S. Navy Press Release February 12, 2010 http://www.nrl.navy.mil/pao/pressRelease.php?Y=2010&R=6-10r "…The new device, called the Swept Wavelength Optical resonant-Raman Device (SWOrRD), illuminates a sample with a sequence of as many as 100 laser wavelengths and measures the spectrum of light scattered from the sample at each laser wavelength…" This type of laser might have been used in the NWTRC and may be used in the proposed NWTT or Hawaii-Southern CA Range Complex. Will this device negatively impact marine life in either the NWTRC or proposed NWTT and Hawaii-Southern CA Ranges? Also what studies have been conducted (results), regarding its impact on marine mammals and fish? Exhibit 6) U.S. Navy Press Release September 4, 2009 "…Scientists at the Naval Research Laboratory are developing a new technology for use in underwater acoustics. The new technology uses flashes of laser light to remotely create underwater sound. The new acoustic source has the potential to expand and improve both Naval and commercial underwater acoustic applications, including undersea communications, navigation, and acoustic imaging…." This type of laser technology used in the NWTRC may negatively impact marine mammals and other marine life in the proposed NWTT and Hawaii-Southern CA Range Complexes. What studies have been conducted and what were the results of said studies on marine mammals, fish, and other aquatic organisms? Exhibit 7) There are 59 abstract studies regarding Acoustic Bubbles listed on this site some of which were conducted by the U.S. Navy-none of them involve sea life or marine mammal impacts: http://www.stormingmedia.us/search.html?q=acoustic+bubbles+ocean&search.x=13&search.y=7 What studies have been conducted to see if Acoustic Bubbles have impact on marine mammals and what were the results of those studies? Will the U.S. Navy be using this technology in the proposed NWTT and Hawaii-Southern CA Ranges? Has it	

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	been used in the NWTRC and what were the results of said tests on marine mammals? Exhibit 8) Oceans Studies are also showing that sound travels farther as the ocean becomes more acidic. http://www.mbari.org/news/news_releases/2008/co2-sound/co2-sound-release.html This could be problematic with ever-increasing sonar usage and the chemicals that Navy uses that would increase ocean acidification. The Navy E.I.S., does not address this issue nor do the NMFS proposed rules. Many studies indicate that our oceans are becoming more acidic. What studies have been conducted to determine the increasing sound distances caused by ocean acidity in the NWTRC and the proposed NWTT and Hawaii-Southern CA Ranges on marine mammals, fish, and other aquatic life? Please advise on study results. Exhibit 9) Oceans are 'too noisy' for whales – September 15, 2008 What recent studies has the Navy conducted in the past two years on the noise impact on marine mammals? Results? http://news.bbc.co.uk/2/hi/science/nature/7616283.stm Exhibit 10) California EPA Information - EPA Perchlorate Health Effects Report March 2008 http://www.swrcb.ca.gov/water_issues/programs/gama/docs/perchlorate_mar08_infosheet.pdf The toxic chemical listing by the Navy in their E.I.S., shows that many chemicals will be used during their NWTRC Warfare Testing Program Expansion. The California EPA lists the health hazards for most of these chemicals. Many of them are toxic to fish or accumulate in the food chain like Mercury. Thus, the toxicity of the chemicals used by the Navy should also be assessed by the Navy before use in proposed NWTT and Hawaii-Southern CA Range Complexes. Did the Navy conduct such testing in the NWTRC to determine the impacts of said chemicals used in the NWTRC range? What tests and what were the results of said tests? How many marine mammals were tested for toxic chemicals in the NWTRC, the Southern CA Range, the Mariana Range, and the Hawaii Range that are being used by the Navy at this time for warfare testing and experiments? Results?	
R. Peterson-12	July 10, 2012 U.S. Navy Hawaii-Southern CA Public Comment RE: NOAA Sonar Mitigation Measures – Permit for U.S. Navy to "TAKE" Marine Mammals NOAA Letter Dated January 19, 2010 – Regarding Sonar Mitigation Measures On January 19, 2010, NOAA sent a letter to Ms. Nancy Sutley, Chair, Council on Environmental Quality that states that a comprehensive review of mitigation measures was conducted and completed by the NMFS (NOAA). This NOAA letter also states: "…In the Environmental Assessments, NMFS (National Marine Fisheries Service-NOAA), also identified the relevant uncertainties regarding the impacts of the proposed training on marine mammals. Two are worth highlighting: • One involves lack of knowledge about the mechanism whereby some species of marine mammals…are adversely affected by mid-frequency sonar. • The other concerns the difficulties of limiting the impact of active sonar where the mitigation efforts depend on visual sighting of whales…" • These issues need to be resolved prior to the issuance of any more permits to the Navy for the "taking" of marine mammals in the proposed draft NWTT and proposed Hawaii-Southern CA	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Range Complex Expansion EIS. It should alleged that NOAA is using biased Navy data from "after action reports" rather than having unbiased and professional marine biologists present during and after these military actions to determine impacts from the use of sonar, bomb blasts, use of toxic chemicals and other warfare exercises that will impact marine mammals and other sea life. It is unacceptable to accept the premise that sonar is the only impact that will be felt by marine mammals and other sea life during Navy warfare exercises. It is also unacceptable that the only mitigation measures planned are for sonar use. The Navy is unlikely to report negatives because they would have to alter their methods if any adverse information showed up...and they don't want to alter their activities in any manner at this time. The determination that sonar caused certain impacts on marine mammals cannot be separated from the impacts caused by other warfare weapon testing such as bomb blasts or use of toxic chemicals. (When the U.S. Navy uses only their own statistics on mitigation measures with regard to marine mammal impacts, without oversight (on-the-sea) independent monitoring of their activities, you have the fox guarding the chicken coop and reporting on the number of chickens left after each military exercise...not a good idea if you want any of the chickens to survive.) The U.S. Navy should be protecting our ocean marine mammals and other sea life. The proposed Hawaii-Southern CA Range Expansion should consider protection these natural resources instead of destroying them. Some day we may need them…once destroyed they can't be replaced. There is definitely a conflict of interest because the Navy and NOAA (NMFS) are cooperating agencies. We need oversight from independent non-cooperating agencies not dependent on Navy funding, who will uphold U.S. laws which protect endangered and threatened species and other environmental laws. We are speaking about the Navy being allowed to "take" more than 11.7 million or more marine mammals over the course of multiple 5-Year warfare testing in the Atlantic, Pacific and the Gulf of Mexico. This does not include protections for any other marine life, habitats, national marine sanctuaries, marine reserves, and other biologically sensitive areas. And there are no protections or mitigation measures for toxic chemical usage, bomb blasts, missile exercises and other classified types of warfare testing. The Navy proposed Hawaii-Southern CA Range Expansion should consider the total number of "takes" from all forms of military testing and chemicals used in all of the active and proposed ocean ranges and from all branches of the military operating in the Pacific. Independent agencies doing surveys involving independent marine and other biologists will produce the best results. Those that have military connections and funding have a built in bias. The Mineral Management Service (MMS), is not qualified to provide this type of work considering they have been working hand-and-glove with business interests for years and will protect the Navy interests over the environment and the safety of marine mammals. This is not a satisfactory solution or an entity that can be trusted at this time. The NOAA letter also states that the NMFS will conduct workshops on the individual and cumulative impacts of sonar and other noise that now are part of our ocean environment. This letter goes on to state: "…There are no baselines with	at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	which to measure the cumulative sound impacts…" Also the Navy has now started to replace older sonar methods with new ones which will also be tested during Navy warfare exercises. We have few studies and little if any research on the impact of these new methods on marine mammals or other sea life." The U.S. Navy should provide current research on new weapons systems and sonar usage in their proposed Hawaii-Southern CA Range Expansion in order to protect all ocean sea life? The U.S. Navy and the NMFS (NOAA), are alleged to be conducting workshops on these issues along with mitigation and monitoring measures as cooperating agencies. The NOAA letter states: "…Protecting important marine habitat is generally recognized to be the most effective mitigation measure currently available…" This leads to the question: Why isn't the Navy being required to protect national marine sanctuaries, marine reserves, breeding and feeding grounds, and biologically sensitive areas from direct warfare activities? The U.S. Navy and the NMFS, according to this letter, agreed to "…conduct a pre-workshop in 2010, to allow the public an opportunity to provide input and prepare for the 2011 workshop…" What were the results of this workshop? Will they be published in the Hawaii-Southern CA Range Expansion EIS? The NOAA letter also states: "…the NMFS has required that the Navy convene a workshop to review and modify, as appropriate, the monitoring measures included in the regulations. This workshop is scheduled for 2011…" The NOAA letter goes on to state: "…All of the planned workshops should lead to substantial new information related to improved mitigation strategies for military activities…" Will the U.S. Navy be taking into consideration the findings from these NOAA workshops to improve their mitigation strategies in your Hawaii-Southern CA Range Expansion EIS? The Navy NWTRC FEIS and the ROD do not spell out this new monitoring and mitigation program which was apparently initiated earlier this year…It should be noted that monitoring only by the Navy leads one to believe that it is not in their self-interest to accurately reporting their findings...and there should be immediate independent oversight in with regard to the ongoing Hawaiian, Mariana, NWTRC, and Southern California warfare range testing. Important issues that the U.S. Navy should address in their proposed Hawaii-Southern CA Range Expansion EIS: 1) The issue seems to be only sonar related with no mitigation measures planned for birds, fish, and other marine life. 2) What about the damage to the ocean and habitats from toxic chemicals, bomb blasts, missile exercises, and other classified warfare testing? None of these issues are discussed by anyone and they should be raised. 3) No protections for breeding habitats, national marine sanctuaries, marine reserves and other sensitive areas are planned by either NOAA or the U.S. Navy in most areas. This needs to be changed and we need built-in protection for these areas and for areas that are prime food sources for all sea life. 4) The U.S. EPA, California EPA, and the U.S. Department of Fish & Game have also been excluded from these workshops and oversight of Navy activities… and they should be included along with various university biologists and others working in the marine biology fields.

Pickard (Electronic)	[Expletive deleted] the U.S. Navy and their destructive little boy war games. Each separate war game activity needs independent environmental review. Perhaps, maybe some of them are innocuous. I doubt it. Since the U.S. Military is the biggest polluter in the world I don't expect much in the way of concern for the environment or species in it.	Thank you for participating in the NEPA process.
Pinnisi (Electronic)	Cetaceans have been described as "non human persons" by scientists. I find this incredibly distressing and disgusting to be considered by my country.	Thank you for participating in the NEPA process.
Pinto (Electronic)	Hopefully, there is a less costly and more humane way to go forward with this exercise. Thank you for your consideration.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Pohl (Electronic)	I hope the Navy is engaging this EIS process with a sincere desire to learn, and that the results will strongly influence Navy policy. Too often the attitude to this process is that it is simply a required protocol - a procedural hoop through which we must jump. Given the precarious state of global environmental conditions, particularly in the oceans, we can no longer afford to threaten ecosystems. There should be zero tolerance for permanent damage to sea mammals. The potential for secondary harm is too extreme to justify the risk.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Pollman (Electronic)	Our Earth is beautiful fascinating, and human being's existence relies completely on that of our planet. The Earth's delicate ecosystem can only exist because of all integral components contained within it. All parts of the ecosystem are needed to maintain homeostasis, human existence will cease to exist if we do not stop destroying the world we live in. War isn't necessary for coexistence among men, or any other life form. Destroying and permanently maiming such an enormous population, regardless of the species or form is just ignorant, we too will die with our planet. Stop being idiots. Put your weapons away. Stop killing.., us, our children, and our future.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
B. Pollock (Oral-Kauai)	I want to address the piece in the paper about 1,600 instances of hearing loss and other injuries to marine mammals yearly. Speaking as one who is very hard of hearing, one of the first things you're asked when you take a hearing test is, Have you ever been exposed to a loud noise? All of God's creatures use sound for life. I invite you to be silent for five minutes. Don't hear the birds or the waves lapping on the shore. Don't hear it. What more can I say? I don't need to. Like the Indians said, the Indians said the white man, through his insensitivity to the way of nature, has desecrated the face of Mother Earth. The white man's advanced technological capacity has occurred as a result of his lack of regard for the spiritual path and for the way of all living things. The white man's desire for material possessions and power has blinded him to the pain that he caused Mother Earth for the quest for what he calls natural resources. And the path of the Great Spirit has become	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	difficult to see by almost all men, even by many Indians who have chosen instead to follow the path of the white man. Thank you very much.	
K. Pollock (Electronic)	I am asking that you think about life in all terms and that you stop your proposed testing as it affects us all. Thank You!!!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Pometta-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Pometta-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		ship and aircraft and then provide “a crude estimate” of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, “(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching.” When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60’. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in “calm sea conditions” is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier’s and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the “one or two personnel” described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy’s reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.

Pothof-Barlow (Electronic)	Since the early stages of testing Low Frequency Sonar equipment in Hawaii I have been extremely concerned about the effects of the Navy's activities on the health of the dolphin and whale populations. I have personally been involved in disentangling a dolphin from a fishing line in Hawaii and freeing humpback whales from fishing nets in Mexico and in both these encounters it was clear that I was working with sentient beings, highly evolved mammals who were actively cooperating and receptive to communication that allowed us to work on cutting the netting. The Navy's argument in the Environmental Impact Study that for most species the activities may cause harm and possibly death to individual animals but not affect the population as a whole to me is no more a reassurance as it would be to say that the activities of the Navy (in time of peace) may harm or kill individuals of a population of humans but not the population as a whole. It is UNACCEPTABLE to me that in the name of 'defense' we invade the living environment of cetaceans and pollute it with sound that effects their ability to 'hear', navigate, and can cause irreparable damage and death. In the EIS the Navy states they strive to be 'good neighbors', yet invading and polluting the environment of defenseless but highly intelligent and evolved marine mammals does not establish good neighbor manners at all. As a leading nation in the international whaling agreements we will completely loose our credibility if we are questioning other country's right to "take" whales and dolphins (read: Kill) for commercial, or "research" purposes, while we ourselves allow our Navy to harm and kill whales and dolphins. We as humans have a choice to not knowingly permeate the ocean, an environment that we share with other evolved mammals, with sounds that will harm and potentially kill them. I herewith express my sincere concern	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Commenter	Comment	Navy Response
	and objection to deploying the testing as proposed in areas known to be frequently traveled by whales and dolphins or within effective range of whales and dolphins, unless it is a time of war with imminent threat. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Sincerely, Saskia A. Pothof	
Powe (Electronic)	While I am far from completely informed about the issue, I feel compelled to note that I think that it is vital that the Navy take its responsibilities to mitigate environmental effects from this work very seriously.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Prell (Electronic)	Please consider our precious environment and don't harm the ocean's inhabitants.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Price (Electronic)	The US Navy has updated their estimates on how much and how many whales and dolphins would be impacted by the use of sonar and explosives in the ocean between Hawaii and southern California. This is another unbelievable tragedy that doesn't have to happen: if you or I were stunned into blindness for 10 minutes while walking on a street, it's not so unlikely that we might be killed by a car. Why are we doing this to the dolphins? I don't see the benefit in harming these creatures who have proven to be both intelligent and peaceful. We are the ones responsible for the wise stewardship of this amazing and beautiful planet Earth we call home, since dolphins and opther creatures obviously cannot advocate for themselves. The damage already done and continuing to be done to our planet is making our "home" less habitable. Please consider changing this policy of using sonar and explosives in the Pacific Ocean. Fukishima has already	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes

Printz (Electronic)	please dont do this	Thank you for participating in the NEPA process.
Pupo (Electronic)	I am saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. I would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. Cathy Pupo & Family	testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically Navy records have had few to no mortalities from sonar or explosives. Any model predicting takes is only an estimate.
Pusch (Electronic)	Do Not use Sonar in the Ocean. It is murderous, and much marine life is protected. This Sonar must stop now.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Puzzuoli (Electronic)	Please do not conduct further tests around Hawaii and her islands as well as California. It so tragic how you're military sonar and the like is affecting area marine life.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

		actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Quirk, MD (Electronic)	I am writing in reference to sonar. The new Navy report that reveals how millions of whales and dolphins may be harmed by sonar testing is very concerning. Here in Hawaii we are a whale birthing ground, and the whales and dolphins are protected by law. These beautiful creatures not only have an important place in the marine ecosystem, they also bring millions of tourist dollars into Hawaii. So please, for our sake as well as for their's, create a sonar free zone in Hawaii and find a way to test your equipment that will not harm any sea creatures. I also wanted to say thank you for all that you do in protecting America and Hawaii. You guys rock!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Of the millions of annual exposures resulting from the Navy's proposed training and testing activities, nearly all are expected to result in "Level B harassment," defined as harassment that, "disturbs or is likely to disturb a marine mammal or marine mammal stock in the wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering to a point where such behavioral patterns are abandoned or significantly altered." Only Level A harassment would have the potential to injure a marine mammal. As described in the Draft EIS/OEIS, marine mammals would potentially be exposed fewer than 1,000 times annually, throughout the entire Study Area, to sound levels that could result in Level A harassment. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities, designed to reduce marine mammal injury. As a result of these mitigation measures, the Navy expects no mortalities of marine mammals from training and testing activities, and impacts to marine mammals are not expected to decrease the overall fitness of any given population.
Raebeck (Oral-Kauai)	Aloha, I guess I'm last. So I just want to say that personally I'm not against anybody, and I know that all the people who work in the Navy are fine people and that living here on Kauai that you know as well as all of us what we have. So I just would like to suggest that in the position that you're in if you could instead of, you know, going back and going, Oh, well, we went there and we listened to all those people; to just take it to heart what the people have said and maybe see what you can do in your position to support the stuff that we all love about Kauai and to, you know, instead of just taking orders and going along. I've got to do this because this is my job. To see what maybe else can	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	happen that can bring us together. Like Puanani said, and that, you know, start focusing and working on a little bit more solution oriented. And also just I'd really like to see the testing be done maybe in-house somewhere. You know, if we can put people on the moon, if we can build all these aircrafts, we can certainly test in such a way that is not harming things, you know. And the last thing is, so the testing, are we preparing to have a war? And so then we're ready for war, so then what? We have a war here? So maybe, I don't know, I'd like us to work together towards something a lot more wholesome. And also, one last thing; sorry; is that I know that you Navy people are in a huge, great position to really know about the oceans. You know a lot more than a lot of us; me, for example. And I'd like to really, my real vision for the Navy is when we live in a world of peace, which we can do, is that our Navy is the absolute leader in everything ecological for the ocean and use the power that we have in the seas to clean the oceans and to preserve and protect the oceans. Thank you for having me.	
Rainwater (Electronic)	To Whom It May Concern, I'm writing to ask you to not harm our remaining sea mammals with Navy sonar and explosives. Just go to youtube, search for videos involving dolphins, whales and humans...esp when humans have stepped in to save whales that have been caught in fishing nets. There is an amazing communion between species that one wouldn't expect...in the past. They are amazing creatures. Dolphins have saved human beings as well. I'd like to think if I was ever in trouble at sea, assistance by dolphin would be possible. That could only happen if we protect them. Please find alternatives to your damaging sonar and explosives. Thanks, Gregg Rainwater	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ramakrishna (Electronic)	Please stop using sonar and explosives that kill dolphins and whales. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ramirez-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ramirez-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.

Rance (Electronic)	Please, the cost to marine life, the fragile eco systems and indeed our survival as a species is too great. These mad practices of war against each other and the degradation and destruction of our planet must cease and desist immediately. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Randazzo (Electronic)	Please consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Randolph (Electronic)	Now that we know and understand how intelligent and how sensitive these animals are, we can not in good conscience subject them to explosives or military training exercises that would impact their safety or well being. These animals have helped the Navy in the past. We owe it to them to be considerate of their lives and health. Now we must help them.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Raney (Written)	Aloha, my name is Dave Raney, and I am Team Leader of the Sierra Club's National Marine Action Team. The Sierra Club is soliciting comments from our affected Chapters and will submit written comments on this DEIS, and the Atlantic Fleet Training and Testing DEIS. This evening I will make a few preliminary comments. First, we recognize and appreciate the contributions of our armed services personnel, including the U.S. Navy, in providing for the security of our homeland under increasingly complex conditions. That includes the difficult task of seeking to balance the duties of providing such security while also fulfilling their responsibilities as environmental stewards. We value our freedom and security. As Pacific Islanders in particular, we also value our relationships with whales, dolphins, sea turtles, sea birds, and other creatures with which we share the Planet. They are more than just "natural resources" and we ask your help in protecting them from risks your training and testing activities may pose, as they also face increasing stresses in coming years from climate change impacts -- including rises in sea levels, and increases in sea temperatures and ocean acidification. You have invited our help in improving this DEIS. Here are two suggestions: 1. Use coastal and marine spatial planning tools, as promoted by the National Ocean Policy, to address the conflicts this DEIS attempts to address. NOAA and the Navy have a broad array of applicable tools, including a geographic information system data base showing the densities of marine mammal and sea turtle species found in specific areas. Avoiding areas of high population densities through the use of spatial planning, or zones, such as the National Marine Fisheries service proposed monk seal critical habitat, would be much more effective than the heavy reliance the DEIS currently places on the use of lookouts and limited area mitigation zones	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Ransom (Electronic)	Navy - Do not take. The world only works by giving. You give us nothing by taking what you propose. You take more than you will ever guess which is not your right. And you know it. Back off.	Thank you for participating in the NEPA process.
Rasmussen (Electronic)	Whales and dolphins communicate by sonar and your sonar can kill them. NO MORE SONAR TESTING!!! You kill whales and dolphins.STOP NOW!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Reeve (Electronic)	Thank you for the opportunity to comment. I attended the session in Hilo, Hawai`i and was impressed by the willingness of the presenters to explain the Navy's. Setting up informational posters in a large room with the experts standing by to answer questions was very successful, and I would encourage the Navy to use it in the future. I cannot agree with the Navy's dismissal of the impacts that will inevitably affect the whales and dolphins due to the training exercises. I am grateful for the willingness of Naval commanders and personnel to take on difficult missions to protect our country, but the area is vast, the list of marine mammals is long, and the remoteness of the area means that the full impacts to animals are unlikely ever to be completely known. I would urge the more expansive application of the precautionary approach to increase the margin for error. Sound travels very far and very fast in the ocean, and many marine mammals live very cryptic lives. At the event in Hilo, I was assured that it is possible to know where the animals are during the Navy's exercises, but my experience as a cetacean biologist tells me otherwise. Even allowing for classified state-of-the-art equipment aboard Naval vessels, beaked whales are notoriously difficult to detect as they spend long periods at depth, very little time at the surface, and have low body profiles when they are at the surface. Look-outs aboard ship will simply miss seeing the great majority of beaked whales no matter how dedicated or well-trained the sailors are. 1. In footnote 1, I suggest that "explosive" and "high explosive" not be used interchangeably throughout the document, as they are not exactly the same thing. 2. In Table 3.4-1, regarding the last column denoting ESA/MMPA status for the included species, some changes would make the information clearer: a. As much of the training area is located in the high seas beyond national jurisdiction and the DEIS acknowledges this fact by using the designation OEIS, the status of each species according to the International Union for Conservation of Nature (IUCN) Red List could also be given. Most of the species have the same status under the ESA and the Red List, but this would give more credibility. b. The spaces for species that are "data deficient" according to IUCN are currently filled by a " – " with no indication of what this means. I suggest that this leads to the mistaken impression that the species with this designation are not endangered or threatened, when that is simply not the case. Not enough is known about these species to make a determination of their status, and this could be clarified. As data are scarce on these species, the precautionary approach could be applied to ensure a margin of error. 3. Also regarding Table 3.4-1, the higher uncertainty CV in the stock assessments could be highlighted to indicate the low confidence in the figures. As the CVs range from 0.07 to	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Commenter	Comment	Navy Response
	1.43, it is obvious that not all stock assessments are of equal value to decision-makers or commenters, and this could be made clearer. 4. All cetaceans found within a group may not be alike in their contributions to the group. New research suggests that animals may take on specialized roles and that impact to these animals may be more detrimental to the group as a whole. While the Navy cannot tell by observation which animals fulfill which roles, this knowledge lends more support for use of the precautionary approach. 5. Overall, I am very impressed to see that the DEIS is excellently footnoted with references and explanations. This increases the credibility of the document in the eyes of the public, scientists, and skeptics, and I appreciate the effort. 6. It is important to make the point that the tests for odontocete temporary and permanent threshold shift were conducted on a very limited number of subjects, for instance one false killer whale. This violates the scientific method at its very basis and is further support for application of the precautionary approach. Two suggestions proceed from these circumstances: a. We must be skeptical of the results of biological studies with only one subject. The findings must be considered anecdotal evidence at best and applied with much precaution if at all. The argument that “this is all we have” may be the worst one possible, as it may prevent acknowledgement of the inadequacy of the research design and give decision-makers the false sense that they are basing decisions on sound science. The models of behavioral changes and other impacts are only as good as the data they are based upon. b. As the Navy is the major funder of marine mammal research, the Navy could shift the focus of research into marine mammal hearing capabilities away from captive cetaceans – which all too often is based on a very small number of animal – to populations in the wild. This would yield credible and usable scientific results for decision-makers.	
Reever (Electronic)	I have always been proud to be a NAVY family - please keepour faith in the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Commenter	Comment	Navy Response
Reghetti (Oral-Hilo)	My name is Denise Reghetti, and I'm here for myself and the world that I live in, and I'm here for the marine life, the mammals, the animals, the air, water, land. All my uncles and my father fought in World War II for my freedom, and I respect, but also I was given the right to be here today. And what I want to say is my being here in Hawaii has shown me something that I have grown to learn throughout my life, but also it is something that the man before me spoke to you about. And I don't think that a lot of people understand what he's saying, and this is something that we all need to come to terms with and realize because when you go in the form of what we are in, as this body, and you understand the Hawaiian culture and a little of what they have tried to explain to you over, I'm sure, a long period of time, the spirit is something that you can't destroy. The spirit is something that is here. And when the government is doing the wrong things to this land and to the people that this land belongs to, the spirits will be there protecting it. You may be in this form, and you may think that you can see and you can destroy with your guns and your ammunition and your weapons, but you can't destroy the spirit, and they're here, and this is what you're up against. So it's not a threat. It's a warning. They're present. Thank you.	Thank you for participating in the NEPA process.
Reghetti (Written)	The United States Government needs to "step-up-to-the-plate" and STOP! I am asking a great deal but 2012, is the time to honor what is right for all, every, and now. What I am saying I say for many, I am certain you have heard it said many times before myself. Honor what is the right thing to do! Mahalo. Marine, mammal, animal, plant, water, all forms of life on the Big Island of Hawaii -- and world, waters, land, air, etc.	Thank you for participating in the NEPA process.
Reid (Electronic)	KILLING OR HARMING INNOCENT ANIMALS - OR ANYTHING FOR THAT MATTER - IS TOTALLY UNCONSCIONABLE AND WILL NOT BE TOLERATED!!!!! ALL ANIMALS NEED OUR PROTECTION. WILD ANIMALS SHOULD BE LEFT ALONE IN THE WILD WHERE THEY BELONG, NOT TOYED WITH BY HUMAN BEINGS. NAIVE HUMANS, WITH SHORT SIGHTED ACTIONS, WHO DO NOT KNOW THAT IT IS WRONG TO KILL ANY CREATURE NEEDLESSLY, MUST BE EDUCATED. SOLUTIONS MUST BE FOUND THAT ALLOW ALL CREATURES TO COEXIST. THE PLANET'S ECOSYSTEMS DEMAND THIS BALANCE.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Reier (Electronic)	Please reconsider your training tactics along Cali and Hawaii. Having worked very closely with the Spinner dolphins in Hawaii and the many other dolphins and whales that pass through those waters, I can't tell you enough how incredible they are. Their intelligence and beauty bring so much joy and awe to all that encounter them. The Spinners only have the Hawaiian island to call home. Should you train in the way you plan off the coast of Hawaii, those Spinners will have no where to escape to and no home to return to, should they survive at all. Please reconsider your training plans and take these incredible creatures into consideration. It has been proven that sonar, explosions and other Navy exercises seriously, and often fatally, harm the marine	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. 	mammals in the area. Thank you.	whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Retter (Electronic)	There must be alternatives to this training & testing that is horrific for our magnificent & precious ocean animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
J. Reynolds (Electronic)	My family has been involved in the military for many years, indeed we have ancestors who served on the Virginia Line in the Revolution. I fully understand the need to protect our waters, but that also means to be a proper steward of the bounty that God has afforded the world. While I can see that there is a need for limited testing of naval weaponry, to do so with a sense of impunity is flouting our responsibility of that stewardship and besmirches the record of the U. S. Navy. We can test, but to a limited degree, and in limited locales that have a minimal effect on cetacean life. The oceans are huge. Remember that the concept of shipping in convoys during World War 2 was developed by mathematicians who recognized counterintuitively that if many ships steamed together, there was that much more oceanic vastness that ships were not in, and were therefore safer from detection and attack. So think, this concept is possible to apply in a way to cetacean pretection. Find areas where whales and dolphins don't tend to congregate, breed, gestate, and give birth. Locate tracts of open sea that avoid their migratory routes. Add to the pride of our Naval Forces by instigating plans to protect our wildlife. Lead the world, not only in naval power, but in naval responsibility by showing how it can be done, and set an example for other countries, and for those who come after us. Set standards for ocean wildlife protection that speak to and enhance the heritage that John Paul Jones began. Stop it now.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. 	Thank you	
Richards (Electronic)	I am a consulting mechanical engineer involved with the design and installation of HVAC systems in this area. I have become aware of some unique situations involving suspected electronic interference with some of our systems installed along the coastal region of San Diego. Specifically, remote controlled HVAC equipment (Daikin VRV systems) have a "mind of their own" at various times, often cycling on-off without being commanded by the local controller. Upon being cycled off, the unit promptly cycles on again and vice versa. The solution to the problem, in this case, was done by eliminating the remote control and going with a hard wired control. Based on other bizarre local observations with respect to garage door openers, the general consensus is that there are some unique electrical interference issues. It is unclear what the source of this interference is, however, I believe that you should be made aware of it and take steps to ensure that the proposed activities are sensitive to EMF issues for commercial and residential remotely controlled systems such as the ones discussed here. Should you have any questions, please email or call. Respectfully submitted, Mark E. Richards, P.E.	Thank you for participating in the NEPA process
Richardson (Electronic)	The use of your sonar and explosives will harm thousands of marine life, much more that you are estimating in your plans! Hawaii has 32 species of whale and dolphin year round, many of which are very rare and deep diving whales who depend upon their sonar for survival. Your sonar and explosive practice is going to harm and kill off many of the species we work so hard to protect here under the marine mammal protection act. You MUST find another way to practice your naval techniques without killing or harming animals and sea life that we NEED for our survival here on land. Do NOT use your sonar plans!!!!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ridabock (Electronic)	Unthinkable. Shame on the people creating this.	Thank you for participating in the NEPA process.
Riedel (Electronic)	PLEASE do NOT do the ocean testing. You state in your video your mission is to provide freedom of the seas. Please understand this needs to apply to animals too - all life - not just to humans. Trying to bring peace through the suffering of others is not the answer. Being kind to all of life is. Please work together towards that objective in order to bring about peace. Warfare escalates killing and damaging more and more people, animals	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly

		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Roach (Electronic)	The Navy's report states that the exercises could cause 1,600 marine mammals to suffer from hearing loss or other injury from its use of sonar and explosives each year for the next five years. The report also projects that 200 marine mammals will die each year. Whales use their hearing to communicate with each other and their survival is dependent on their hearing. Please rethink ways of doing these tests!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy historically has recorded few to no mortalities caused from sonar or explosives. The estimated number of marine mammals sonar testing could affect is based on a scientific model, and it is only an estimate.
L. Roberts (Electronic)	Your testing will irrepairably harm ocean life. It's highly likely that the creatures who use and require echolocation for survival are not the only lifeforms who will be affected, whether it be mildly or terminally! Please stop these tests altogether! Please stop this destruction! PLEASE!!! We are supposed to be intelligent beings!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. K. Rodriguez (Electronic)	The Navy's DEIS is fatally flawed and fails to comply with the basic requirements of NEPA. The Navy's assessment of impacts is consistently undermined by its failure to meet these fundamental responsibilities of scientific integrity, methodology, investigation, and disclosure. The Navy must revise its acoustic impacts analysis, including its thresholds and risk function, to comply with NEPA. The Navy fails to properly analyze impacts on marine mammals. For example Sonar impacts on cetaceans that are the likely cause of mass strandings are panic, bubble formation and/or decompression sickness. The following must be included in the DEIS: 1) Sonar caused panic reactions leading to strandings followed by death 2) Sonar caused decompression sickness (the bends) followed by death 3) The bends caused by sonar even in the absence of panic	Discussion of the general topics ("panic, bubble formation and/or decompression sickness") noted in the comment were thoroughly discussed in the Draft EIS/OEIS. In particular see Section 3.0.5.7.1.3 (Physiological Responses) for the presentation of the conceptual framework for analysis and Section 3.4.3.1.2.1 (Direct Injury). For a specific discussion of strandings, see Section 3.4.3.1.2.7 (Stranding) and note that a more detailed presentation was offered in a companion Cetacean Stranding Technical Report ("Marine Mammal Strandings Associated with U.S. Navy Sonar Activities") that is referenced in the DEIS/OEIS and available on the HSTT EIS/OEIS website (HSTTEIS.com). The three points raised ["1) Sonar caused panic

	The following scientific papers need to be included in the EIS: J. R. POTTER;, 'A Possible Mechanism for Acoustic Triggering of Decompression Sickness Symptoms in Deep-Diving Marine Mammals' Paper presented at the IEEE International Symposium on Underwater Technology 2004, Taipei Taiwan, April 2004. PARSONS, E. C. M.; SARAH J. DOLMAN; ANDREW J. WRIGHT; NAOMI A. ROSE and W. C. G. BURNS. MARINE POLLUTION BULLETIN 56(7):1248-1257. 2008. Navy sonar and cetaceans: Just how much does the gun need to smoke before we act? TYACK, PETER L. JOURNAL OF MAMMALOGY 89(32):549-558. 2008. Implications for marine mammals of large-scale changes in the marine acoustic environment. WRIGHT, A. J.; N. AGUILAR SOTO; A. BALDWIN; M. BATESON; C. BEALE; C. CLARK; T. DEAK; E. EDWARDS; A. FERNANDEZ; A. GODINHO; L. HATCH; A. KAKUSCHKE; D. LUSSEAU; D. MARTINEAU; L. ROMERO; L. WEILGART; B. WINTLE; G. NOTARBARTOLO DI SCIARA and V. MARTIN. INTERNATIONAL JOURNAL OF COMPARATIVE PSYCHOLOGY 20(2-3):274- 316. 2007. Do marine mammals experience stress related to anthropogenic noise? FAERBER, M .M., R. W. BAIRD. 2010. Does a lack of observed beaked whale strandings in military exercise areas mean no impacts have occurred? A comparison of stranding and detection probabilities in the Canary and main Hawaiian Islands. Marine Mammal Science DOI: 10.1111/j.1748-7692.2010.00370.x The DEIS fails to address the following: other impacts on marine mammals such as stress, indirect effects, cumulative impacts, effects of toxic chemicals, hazardous materials and waste oil spills. The Navy must adequately evaluate impacts and propose mitigation for each category of harm for all species marine life. Each individual potentially federal activity that is to have a significant environmental impact should have its own environmental analysis. For example, RIMPAC and DARPA each need separate EIS's. The Navy failed to analyze the impacts on fish and fisheries. Om gum ganapatayei namaha	reactions leading to strandings followed by death 2) Sonar caused decompression sickness (the bends) followed by death 3) The bends caused by sonar even in the absence of panic"], are covered within the material as described above. With regard to the references noted, while these particular five references were not cited, all were reviewed during preparation of the Draft EIS/OEIS except Potter (2004), which discusses a hypothesis covered in the Draft EIS/OEIS using the following more recent science and data from seven references: Dennison et al. (2011); Fahlman et al. (2006); Hooker et al. (2009); Moore et al. (2009); Southall et al (2007); Tyack et al. (2006); Zimmer and Tyack (2007). Finally, the EIS/OEIS has been created with National Marine Fisheries Service acting as a cooperating agency with input to both the Draft and Final versions. The team also includes a number of non-governmental scientists and subject matter experts.
Rogers (Oral-Kauai)	Aloha mai kakou. Aloha. I invoke the presence of my ancestors as I stand here to speak before you. I pray that they will come and stand here with me so my words will be their words. And I say, Ku\`e i ka hewa ku\`e ku i ka pono ku, ku\`e i ka hewa ku\`e ku i ka pono ku. Protest and resist the wrongs but stand for the righteousness is what that meant. I'm a Kanaka Maoli. I'm a Hawaiian nationalist. My country is kahawaii kai ana. That is what we call our country. I stand in strong protest to this. I haven't had a chance either to read the EIS, which is an environmental impact statement. And I believe that if it were a true environmental impact statement then this project would not happen. Because it is impacting negatively and in a very drastic way our environment. And thinking in a Hawaiian way, it all encompasses everything; our water, our oceans, our marine life, our air, our space. Anything that sustains life is sacred in our thoughts. So I'm sorry. I hope that there could be a way that we, the people, can get together with you, the Navy, and come together with some kind of an agreement or, I don't know, some kind of compromise. Because I don't come here with any malice or hate for the Navy or the military, although there may be reasons why I could be. But I stand here with pain and	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	hurt to know that these things can happen to us and to our environment. And, you know, war is like a kill. And I can't believe the Niihau people are supporting this because I know they believe in God, and I know they believe that thou shalt not kill. So through that aspect I think they have been misled. Please protect our island. I've been to the Marshall Islands. We went to commemorate the bombing of Bikini Island. It was called Bravo Project, and I met people there that were suffering illnesses-- Okay. So mahalo to all the people that came tonight, and I totally support all of your testimonies.	
Rogers (Electronic)	HAWAII-SOUTHERN CALIFORNIA TRAINING AND TESTING (HSTT) ENVIRONMENTAL IMPACT STATEMENT/OVERSEAS ENVIRONMENTAL IMPACT STATEMENT (EIS/OEIS) Open House Public Meeting Comments from Lihue, Kauai, June 12, 2012 (This is an addition to my oral testimony given on June 12th) Aloha! My name is Puanani Rogers, and I was born and raised in the ahupua`a of Kealia on the island of Kauai. I am Kanaka maoli, a true native of Hawai`i. What you call the State of Hawaii is actually an illegal entity with no legal jurisdiction in Hawaii. Ko Hawaii Pae `Aina is the name of my country and it is still in existence. We are a neutral and peace-abiding country and therefore, we are outraged about your plans to train and test your war weapons in our country's surrounding ocean waters and deliberately cause harm to our planet and all living things that live upon it. I cannot understand why it has to be here or anywhere, for that matter; because you know deep down in your guts that it WILL cause harm to corals, whales and dolphins, natural resources, ocean minerals, and all living creatures in our archipelago, and most importantly, human life. WE STRONGLY OPPOSE THIS EIS AND ITS INTENT!! IT LACKS TRUTH AND IS A BAD IDEA! I hope you will respond to the question of whether you are in compliance with the mission of the Advisory Council on Historic Preservation (ACHP) and its Section 106 process. It is a federal mandate that you should be aware of. (See testimony from Ed Kaiwi.) I expect a response to this question, please. People in our communities are AGAINST FURTHER expansion of your presence in the Pacific and beg you to stay away from our islands and do your war deeds where there will be less harm to the environment. We already know for a fact that the U.S. military has proven to be the worse and most insidious POLLUTION dealers on our planet. Examples are, Kaho`olawe island, Makua Valley, Pohakuloa, etc. in Hawai`i; Vieques Island, in Puerto Rico; Bikini and Eniwetok islands in the Republic of the Marshall Islands. This show of military dictatorship needs to cease and desist. Instead we ask that moneys expended for this project be used in projects that insure peace, benefits and well being for our people. Please stop the destruction of a living planet, yours as well as ours. Be responsible, do what is righteous and protect not destroy. Puanani Rogers, Kanaka maoli Ho`okipa Network – Kauai Ko Hawai`I Pae `Aina	Thank you for participating in the NEPA process.
Rohmer	Please, do not do this. A deaf whale is a dead whale.I am outraged that the U.S. Navy	The Navy shares your concern for marine life. All of the reasonably

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
(Electronic)	would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Rome (Electronic)	I am imploring the U.S. Navy to re-think its plans to conduct training exercises all along the U.S. East Coast and off the coast of California and Hawaii and to incorporate additional protective measures. I know that the United States needs a strong Navy to protect our national security, but the exercises you are planning which involve the use of live explosives and high-intensity sonar are not the answer. I know that the Navy anticipates that these exercises would kill up to 2,000 marine mammals including a large number of endangered species and would include thousands of others that would suffer permanent lung damage and would permanently or temporarily deafen others. There is no reason that these mammals have to die or suffer this senseless damage to their bodies when you can lessen the impact of this damage by avoiding the most harmful activities in areas used as calving grounds or migratory corridors, avoiding seasonal high-use feeding areas,creating a large safety zone around these exercises and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. These simple steps would allow for your military training exercises to go on while minimizing the likelihood that whales, dolphins and porpoises might be harmed or killed. If you must conduct these exercises, please do it in a compassionate way for the sake of the health of these creatures. The whales, dolphins and porpoises deserve to	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. 	live and to have a healthy ocean environment. Please show some compassion to these creatures when conducting these exercises. It is the right thing to do.	
Romer (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Rook (Electronic)	Please do not use the ocean for military testing. Sonar and explosives have detrimental affect on ocean inhabitants. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4: Responses to Comments from Private Individuals (continued)

Rosenwinkel (Electronic)	Please stop the use of sonar and explosives in our oceans! If we keep killing ocean life, we will not need the navy to protect people because we won't be here to protect!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Roth (Electronic)	As the daughter of a fighter pilot, I understand the need for protecting our country, but I am hoping that we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. For that reason, I am writing ask the Navy to re-think its plans and to incorporate additional protective measures as it conducts training exercises involving explosives/sonar along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. The Navy historically has recorded few to no mortalities caused from sonar or explosives. The estimated number of marine mammals sonar testing could affect is based on a scientific model, and it is only an estimate.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Rouse (Electronic)	I am writing today to ask that the Navy protect marine mammals from explosives and sonar along the East Coast and California/Hawaii. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Please consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. I respectfully request that the Navy re-think its plans and to incorporate additional protective measures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Royster (Electronic)	Please consider steps to reduce the harmful impacts to marine mammals when conducting your training activites on the Hawaiian coast and Western shores of the US. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. You can continue doing the invaluable work you do to protect our country AND protect animals as well. The two can coexist.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ruehle-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Ruehle-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Ruth (Electronic)	As a southern California resident, I am extremely concerned about the NAVY's new plans to increase the use of sonar at the expense of stressing / harming and killing marine mammals such as dolphins and whales. Although, I recognize the importance of having a strong military that uses the latest technology, this should not come at an increased risk to protected marine mammals. Whales and dolphins are already facing many direct and indirect threats to survival due to commercial fishing, pollution and global warming. Since these organisms depend so highly on sound for their survival, it is unacceptable to directly and intentionally harm them. Please consider alternatives that are less intrusive to the lifestyles of these highly social and intelligent cetaceans. Sincerely, Jayson Ruth	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as

		presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Ryan (Electronic)	I appreciate that the Navy is continuing to look at the issue of long range sonar effects on marine mammals. I note a story using the Navy's own data recently appeared that raised the estimates of marine mammal deaths. The story is available here - Navy Study: Marine Mammals Harmed By Training Navy Calculates 200 Marine Mammals Could Die Each Year Due To Training POSTED: 5:40 pm PDT May 11, 2012 UPDATED: 5:45 pm PDT May 11, 2012 http://www.10news.com/news/31051399/detail.html I am sure with so many clever individuals you can figure out some better way to handle this issue. Let's face facts - your navy is the best in the world, and does not need this to remain so. If it happens that there is a wartime effort that arises that necessitates the use of this technology, I'm sure a case can be made to the public at that time to do so. But in peacetime (or at least, peacetime on the high seas) this is unneeded and actively harmful. Don't do it. Thanks, Patrick Ryan	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Sacksteder (Electronic)	According to the U.S. Navy's own estimates, the use of high-frequency underwater sound for testing in Hawaii, off the California and Atlantic Coasts, and in the Gulf of Mexico will deafen 15,900 whales and dolphins and kill 1,800 more over the next five years. Whales and dolphins depend on sound to navigate and live. I respectfully request that the Navy stop the process that has the potential to kill 1,800 whales and dolphins and the deafen 15,900 more by ceasing the operation of the Navy's underwater sound system in the Hawaiian Islands, the California and Atlantic Coasts, and the Gulf of Mexico. There has to be a better way to achieve the necessary work without this type of specific type of testing. We have brilliant scientists who I'm confident can find another way to achieve the stated goals in a more humane and thoughtful manner.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of

Saez (Electronic)	Dear US NAVY, I am very upset about the practices taken to conduct training exercises in the US Navy. It does not matter that this is the "way you have always done it." In this day and age, there MUST be another way to practice you exercises without any injuries to our mammals. PLEASE, do not just FOLLOW PROTOCAL. Take action to make a CHANGE. We care and this really is upsetting to many people.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Salazar (Electronic)	To Whom It Concerns: I'm really against any type of testing that kills, maims and abuses marine life. With the potential outcome of deafness, you don't know what could happen	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	to the ecosystem. Don't mess it up. Please try to find another way to test these explosives. I can't believe in 2012 that that task would be impossible.	analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.
Salonek (Electronic)	Please stop the testing of sonar and explosives on marine life. These gentle creatures deserve to live a life of peace not be part of a barbaric Govt' test.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Salvo (Electronic)	Please stop the underwater testing in the Hawaii areas. These are beautiful creatures that God has given us to enjoy and you are endangering their well being. Future generations will no be able to enjoy them as we do. Please re-think this.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Salvo-Eaton (Electronic)	Please do not go through with actions that are "likely to adversely affect" an endangered species. I know it's the military, but how heartless can you be? You wouldn't kick an injured animal, so why would you "kick" a suffering population of animals? I think if the Navy proceeds with this course of action, I will lose faith in humanity altogether. Can't you find another test site? One that's far away from whale migration routes and breeding or feeding grounds? It's really asinine that I pay taxes and I have to explain the stupidity of this plan to you. Like explaining something simple to my toddler.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at

		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Sapiro-01 (Electronic)	Please cease & desist your destructive sonar testing. I have observed its consequences along with the US Navy's attempt to cover up the damage. Navy promotion of sonar testing is self-serving--for the good of the Navy, NOT for the good of the USA or what the USA treasures or stands for. Nobody on the face of the earth has reeked greater havoc in Hawaii than the U.S. Navy, bombing Kahoolawe and killing marine mammals--and causing more long term damage to Pearl Harbor than the Japanese attack. Anti-fouling bottom paint is mostly copper sulphate, rendering all reefs in the vicinity severely compromised or dead. The cold war is over. Stop your destructive testing. You should protect and defend the US from its enemies. You should be ashamed for this. You are wrong to think my assessment is isolated. Sonar testing has sullied the name & reputation of the U.S. Navy. Stop.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Sapiro-02	Please do not move forward with your plans to "test" underwater explosives in and around the Hawaiian Islands. Knowing that these explosions will be killing, maiming and injuring the whales, dolphins and many other creatures that inhabit these waters MUST cause you to rethink this concept. These waters have been safe haven for these, our fellow intelligent beings; where they come to have their babies and nurture them. How can the Navy, and the men and women who serve therein be so calculatingly cruel about these deaths and injuries? How can these inevitable deaths and injuries be considered ok on any level? I am horrified to know that this is how our government spends our money in the guise of "protecting" it's citizens.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Saunders (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Schiess (Electronic)	Dear Sirs; Please do everything you can to save all the sea life when you conduct your tests in the oceans. We have already lost so many dolphins, whales and calves to sonar testing, fishing trawler lines and other environmental causes like plastics in the oceans. We should not have to choose between marine life and national security. Surely we can work together to minimize the impacts on these magnificent creatures. Thanks for your consideration. Joan Schiess	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Schoenacher (Electronic)	It is an outrage that the U.S. Navy would continue its plan to use sonar testing, testing that could kill and harm marine mammals 2.8 million times a year over a five year period. Proposed training and testing off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. Projected damage to whales and dolphins -- through your own impact statements -- is astounding and vastly increased over previous estimates of potential harm for the same regions. The far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. Your analysis does not include reasonable alternatives to reduce the unprecedented damage to marine animals. Stationing lookouts to detect whales and dolphins -- your sorry mitigation plan -- will not achieve a significant reduction in damage to marine life. These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance is likely to be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	Even if it were fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, rather than savage torturers, it must reduce significantly the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment.	NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Schultz (Electronic)	It is everybody's job to protect the very little nature left on this planet before it's too late. Please consider safer alternatives.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Schunk (Electronic)	I am saddened by the thought that the Navy, knowing full well, what it's actions can do to whales, dolphins and other sea life, will continue on their path of destruction, by repeatedly broad-casting high-intensity sound waves into the ocean, (home) of these mammals. Yes, the ocean is their home. They cannot escape to save themselves from these horrible sounds. They cannot escape from the dizziness they must feel as it turns them upside down not knowing where to go. They need their sonar to communicate and to find food. But you'd be taking this away from them. They won't be able to feed themselves or their babies, because they will either be dead on impact or will drown, trying to escape the terrible, deafening noise. Imagine, if you will, having the worst case of dizziness you have ever had and not being able to get away from it. You know that old saying when your on board a ship and you get the worst case of sea sickness that you want to die...the saying goes that you're afraid that you WON"T die ! It's that bad. I can only imagine if I were the whales, that the sonar waves would effect me like dizziness. As a human that is the best analogy I can come up with. History has shown that the whales will do whatever they can to get away from these man made high density sounds...and that is to beach themselves, to get out of the water, which is a death sentence since they can't live out of the water. How can you live with your selves, knowing this ? Where are your hearts ? I read about a woman who attended a Kauai meeting, that the Navy people presented. She said they seemed nice, kind and even caring about the whales. But she came away with the stark reality that these people (the Navy personal) had turned away, turned off their hearts, in order to be part of the Navy. How can you be human and not have a heart? Please come back, come back from the reality that the mammals that die are simply "collateral". Please wake up from this. This is a lie. These are your fellow creatures that happen to live in the ocean, your neighbors, your friends even. Remember, as a child, drawing pictures of your friends the whales, dolphins, sea turtles and fish? Remember the rainbow you always drew as they jumped out of the water, in happiness ? You knew, as a child, that they were your friends. Don't	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	turn your back on them now that you are grown up. Be that child again, with all the important things you learned about taking care of our planet and the animals that live in it. Look down, you have a heart still..., it's beating, it has emotion, it has compassion. Please friends, remember you are a compassionate person. Don't allow this to happen. It's not to late. As with all things, there are alternatives. You are smart, please use your brain to come up with another way. Listen to the cry's of the animals. They need you to protect them. You don't want these animals to be SO dizzy that they want to die and will. Do you, would you ? You have a heart, follow it back to your child like self again. Do the RIGHT thing. The whales need you. Don't close your eyes. Please, listen to your heart, just like you use to. Will you ? Mahalo and Aloha.	
D. Scott-01 (Electronic)	The United States has regularly and publicly denounced Japan for harvesting whales. Why does the U.S. Navy deem it acceptable to take just as many whales as Norway, Iceland, and Japan combined? What underwater threats are so great to our country that the U.S. is willing to adversely affect endangered species on a such a large scale? It is hypocritical to decry Japan while at the same time causing such harm that it further endangers listed species and prevents the recovery of the species.	Thank you for participating in the NEPA process.
D. Scott-02	What percent of the whales' population (by species) is being impacted? The sonar/electromagnetic training will adversely impact whales, which will affect their ability to eat, breed, navigate, etc. These negative impacts will directly hurt the current populations which reduce their reproductive capabilities. Fewer young will be produced thus preventing the recovery of endangered species. Surely, the military can train in a less harmful manner that will still allow for them to be combat-ready. Have population models been developed to show how they will be affected by the training activities? Will the populations be resilient to the activities? Since whales take such a long time to reproduce, I doubt that they would be capable of rebounding from such a large long-term negative impact. I believe Texas A&M has conducted harvesting models on whales that may be useful in the environmental analysis.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Seligman (Electronic)	Dear Sirs, With all due respect, there is quite substantial evidence at this point, indicating the hazards facing marine life ,especially the hearing loss and navigation capabilities of whales and dolphins now as a result of not just sonar testing, but the level of attenutation being applied. Granted, if testing must be done for our nation's safety, it can be done farther from both where humans and marine life dwell in and out of the water. Sound frequencies do not stop at the water's edge, and what is known beyond a shadow of a doubt with no more research necessary, are the migrating and living hunting and dwelling patterns of these animals. that means the navy can test and go where they are not. They cannot live where food supply is not, but the testing can be done where they are not... It is not just economics. It is common sense and economics and good politics by this point. Thank you for your time.	The Navy thoroughly analyzed the potential for affecting hearing and navigation capabilities of marine mammals, as discussed in Section 3.4 (Marine Mammals). Regarding the locations where the Navy conducts it's training and testing activities; please refer to Section 2.5.1.1 (Alternate Training and Testing Locations) in the Draft EIS/OEIS. To summarize that discussion, the Navy's requirements dictate that much of the Navy's training and testing occur in locations proximate to shore-based facilities and infrastructure, near homeports, where instrumented ranges are located, and where environmental conditions maximize training realism and testing effectiveness. Those requirements preclude the Navy's training and testing in alternate locations.
Sesma (Electronic)	Please re-consider implementing these projects. They are harmful to all marine life... and by extension to all life. We are already harming ocean life in so many other ways....	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Shabad (Oral-Kauai)	Aloha, aloha. I live by that word. I've been a resident here 12 years on this island. I live in the Wailua Homesteads. And I was born in Richmond, Virginia. That was the original road to the White House. I come from the founding fathers of this country. And I didn't	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	plan to speak. I wanted to listen. I'm here to support my kupuna, my elders, and I'm here to witness all of us, you as career people who have taken the positions that you have taken because you believe in your country, you believe you're doing good. I'm saying we stand at a crossroads now. This crossroads is about fear. I love this country. I love everything about it. And since 2007 I have not paid my federal taxes and lived on $14,000 a year taking care of my ohana. And I'm a doctor's daughter. I know how to live well. I know how to contribute to people. And I'm not saying this to get you upset. I'm saying this to get you to move. Because there is a tidal wave that's happening right now, where we're all realizing we're not our careers and maybe the powers that be, the authority figures, the organizations that we've trusted do not have our best interests in mind. And maybe there will be more of us like me that say, I can't support something that doesn't support life. And I've suffered enough. I can't live like that anymore. I have to come back. I have to participate. I have to have life, food and sustenance to feed the future that's coming. I know our children that are being born now which I take care of and the generations that come up are going to do what our kupuna are laying out for us, the people that have lived here in Hawaii that lived in a peaceful way, a peaceful fashion where we had sections where everyone governed their section, and when there was something that was important for the whole island we got together. You are part of that. We are part of that. I want you to really think and understand who you were when you got into your career and your values and your beliefs. There's a change happening. And if we all invest our time, our effort, our resources and our money, which is a big voice, in what we believe, and if we back out and say, No, I can't support that. I want to come up with a better solution. I don't want to be a rebel rouser. I don't want to be angry. I've lived in fear for six years. What if the government finds out? Are they going to put me in an internment camp? I have been ashamed that I didn't have what it takes to participate and work and work and work and pay my federal income taxes and participate that way. And I want to honor everyone here that has. I'm asking you to wake up, feel the movement, let go of the fear. We have enough. We have created enough destruction. It's time to really listen from the heart and let the intuitive mind lead the way. Thank you.	
Shabsin (Electronic)	The planned testing in Hawaiian and California waters is dangerous for marine life and will undoubtedly result in unacceptedly high casualties. The sense of hearing is probably the most critical of senses for these animals. Deafening them or even injuring their sense of hearing will disorient them, prevent them from locating adequate food sources and affect location of others of their species. Reproduction will decline and survival on this planet for them may well cease These very animals you will harm by your testing are ones that have proven to help mankind. Do the right thing and skip the testing	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have

		been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Shalat (Electronic)	The U.S. Navy is proposing to conduct training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii. These exercises would involve the use of live explosives and high-intensity sonar. According to its own Environmental Impact Statements, the Navy estimates that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. The HSUS is joining other environmental and animal welfare groups to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. We are calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Sharan (Written)	Monk seals are endangered! And I speak for the seals as they cannot speak for themselves--Monk Seals have been tracked with monitors and the attachments have needed to be removed as they were found to interfere with normal healthy behavior--sonar--can disturb their feeding and reproductive life--even if 1 of the 1,100 that still exist are disturbed that is too many--any intervention should have to prove before they test--not after and count the dead. Killing individual Monk Seals or disturbing them in any way endangers the normal behavior and is endangering the whole population.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Impacts to Hawaiian monk seals are described in Section 3.4.3 (Environmental Consequences). Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Sheridan (Electronic)	PLEASE protect our marine life. Do not allow the senseless injury to these gentle creatures that live in the sea!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Shooltz (Oral-Kauai)	Hi, thank you. It feels to me like what we're talking about is a lot bigger than what we're actually addressing right here. In the past couple of years our military has been enabled to be used against the citizens of the United States. We have assassination lists coming out of our White House. We can arrest people with no cause and throw them in prison forever and have no rights at all. Each of these things starts here. And I've gone around today and talked to a number of the representatives, and each one I was struck with and they acknowledged and I could sense the concern for the damage they're doing to the	The U.S. Department of the Navy (Navy) carries out training and testing activities to be able to protect the United States against its enemies, as well as to protect and defend the rights of the United States and its allies to move freely on the oceans, and in addition, to provide humanitarian assistance to failed states. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	sea life, the whales, the dolphins, and cetaceans of all kinds. And yet I also watched how they were able to somehow shut off that little voice in their heart that knows that that's wrong, that knows that it's wrong to take life. And it isn't just the sea life. Somehow our culture has made it justifiable to take all life. And it starts with the people working here, the Military Industrial Complex. Somehow you know in your hearts what's right, and you know that what's happening is wrong. You know that us spending five times more than the next 15 countries or whatever the numbers are is obscene. It's wrong. There's so much need in this world. And what's happening here can only keep happening if you keep shutting off that voice in your heart that knows it's wrong. You, Commander, and you, and all these representatives that are drawing a paycheck from supporting Military Industrial Complex know that supporting war, supporting death is wrong. And you know it in your heart. And it will continue until you listen to that heart and step away and stop supporting what's going on. Whatever lies you tell yourself to justify it is not true. Your heart knows the truth. It's time, really time, to listen to that now. Killing dolphin and whales is no different than killing people. It's all the same. It's all the same justifications. We're all in this together. This is way out of hand, and we don't have a lot of time to turn the boat around. We don't have a lot of time. And you're driving the boat, and we're just the voice of conscious here. It's time.	Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Sidenstecker-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Sidenstecker-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Sillanpaa (Electronic)	Hawaii - Southern California training is dreadful idea. It is very harmful to the Pacific marine life, and should not be carried out. There is no humanity with it, only pitiful unnecessary showing off, trying to make the army look important but does exactly the contrary. Makes it look useless and harmful.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
K. Silva (Electronic)	I ask that you reconsider you HSTT sonar testing. The repeated use of sonar is detrimental to the marine life in the area and your own analysis indicates that marine mammals in this area will be significantly impacted by your use of sonar. Your own casualty estimates grow as your methods of determining them improves. Your effective rate cannot be estimated to be better than 10 percent. Using lookouts is a crude, ineffective and inadequate mitigation measure and has serious limitations, particularly in foggy conditions. There must be better alternatives right around the corner. You have some highly intelligent people in the Navy. I request that you put those minds together and spend a bit more time developing a system that does not have such a grave impact on the marine mammals in the area.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Sonar is the best means of locating small objects in the water. The Navy is constantly evaluating and funding research to assess improved technologies that will achieve Navy mission goals while protecting resources on land and at sea. Evaluation of these technologies continues to be a Navy focus as is research into all technologies that will protect and defend the United States.

N. Silva (Electronic)	Please stop hurting the animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
S. Silva (Electronic)	The incredible disregard for life continuously displayed by those supposedly engaged in the business of protecting life is breathtaking. May you get your ultimate wish, and find that there is no one left to play with but the Kochs and Waltons. I don't think there's enough alcohol on all of the planet to make that a fun day.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Simon (Electronic)	The life of a mammal is as important as any more worthless testing. Please do not undertake these life taking tests. Richard Simon	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Simonton (Electronic)	I am Military spouse and very proud to be one. I am also someone who finds that all life in all forms should be respected. I think the fallout from this project needs to be reevaluated. I know there are many things going on to protect us from enemies overseas and at home that are important, I just cannot see how the damage and destruction of life in this project can be justified. I am shocked at the Navy's estimates of the far-reaching harm that will be inflicted on marine mammals during proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard, and the Gulf states from 2014 to 2019, as stated in your Draft Environmental Impact Statements.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	The projected damage to whales and dolphins is staggering, with 33 million instances of "take" over five years, a vast increase over existing estimates of harm for the same regions. And I am appalled by the level of carnage reflected in these numbers: over 5 million instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. Your analysis fails to present and analyze reasonable alternatives that would significantly reduce the unprecedented level of harm to marine life. The mitigation scheme that the Navy principally relies on centered on the ability of lookouts to detect whales and dolphins will not result in an appreciable decrease in marine mammal injuries. Federal courts have found this same scheme inadequate and ineffective for good reason: it is largely useless in conditions (common at sea) that impair visual surveillance, it is unsuitable for detecting cryptic and deep-diving species that spend little time at the surface and, even if it were fully effective at detecting whales and dolphins, would only protect species from the most serious injuries. I call on the Navy to identify and set aside areas of high marine mammal density -- acknowledged to be the most effective means of reducing marine mammal injury. If the Navy wishes to be seen as an effective steward of the ocean environment, it simply must take steps to significantly reduce the level of harm that training and testing activities will inflict on marine life. Thank you for the opportunity to comment.	
Simpson (Electronic)	I appreciate that the NAVY has made an effort to study the potential and recognized impacts to marine mammals and other marine life. I further understand that casualties and collateral damages to the Maritime Environment are regrettable consequences to the security and defense of our Oceans. However, wouldn't it make more sense to test the sonars in environments where marine mammals, especially whales and porpoises, are at minimal numbers, such as under the Arctic Ice Sheets during winter, or in the Great Lakes, where there are no whales or porpoises? California and Hawaiian locations are teeming year-round with whales, porpoises, seals, and other marine wildlife that are dependent upon their hearing and sonar for survival. It does not seem logical to test sonars in regions with the highest densities of marine wildlife, especially marine mammals. Whale and Dolphin's natural sonar, for instance, seems to work quite well for echo location, without harming themselves or the environment. So, perhaps the key to perfection of NAVY sonar methods should look to these animal's Natural Sonar for better solutions. The success of our Nation's security also inherently includes preservation of our natural habitat and fisheries resources. More intelligent sonar options and opportunities are out there, if you will do the research. I sincerely appeal to the NAVY to seek alternative testing areas where the impacts to harm marine life, especially whales and porpoises, will be as minimal as possible. Respectfully, Garey L. Simpson, MS,PG	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. 		technologies that will protect and defend the United States.
Siragusa-Ortman (Electronic)	I am saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Sisson (Electronic)	It is not OK to kill cetaceans and sea mammals with your testing. It will negatively impact the health and welfare of our Hawaiian citizens as well. You need to get an EIS before beginning testing. Our citizens are against this type of warfare, or any warfare, in our local waters. We ask that you respect our health and welfare, and the health and welfare of our seas and animals living in them. Thank you!	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Skye (Electronic)	As Americans we love to chastise other countries for their ridiculous atrocities like Japan's horrible whaling activities and Canada's bloody seal clubbing. Why would the US Navy want to add our name to the list by wanting to kill, injure, or even harass the the most majestic marine mammals? Dolphins and whales are the very masters of sonar that inspired the first Navy use of sonar. It's like learning from your grandfather's stories and when you'd like to write your own stories, you start by kicking him in the few teeth he has left. Please, have some respect and consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at

		those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
B. Smith (Electronic)	What if we set the standards at the level where no living things are damaged? What if we developed the technology to "hear" and "see" underwater so that it is accurate but harmless? That should be the goal. No damage to living things. No more poisoning and damaging the air, earth and sea. That should be our standard. If we made that commitment, we could make it happen. Is the Navy going to have trained veterinarians on hand to euthanize the tortured animals? It is not worth it. It has never been worth it, to poison our atmosphere and waters and lands, for war. And I mean the earth's atmosphere, waters and lands, not just the US. We need to be respectful of the planet. We CAN have it both ways. We just have to develop non-damaging technology. If the technology is not safe, and if it cannot be cleaned up quickly and completely, then it should not be used. We still don't know how to safely store nuclear waste. Is that smart?	Currently, sonar is the best technology available that can help keep Sailors safe from mines and hostile submarines. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
C.. Smith (Electronic)	Why murder sentient creatures except when there is a cler n present danger. Your actions are disgraceful and dishonorable. I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. Copy and paste the above comment. Please add your own	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.

Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Steele (Electronic)	We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. We know that in the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Please re-think what and how this has to be done.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Stephens (Electronic)	According to the Navy's own EIS, this program will have impacts on critically important marine mammals that, while the numbers maybe uncertain, are clearly on the scale of doing significant damage to the populations in question. Given the uncertainties of scale (i.e. damage may be greater than anticipated), coupled with the accepted fact that some amount of damage will be done to these important populations, the only rational conclusion is that the program not be allowed to proceed. Besides, this program is a waste of tax payer dollars, given that no potential enemies have submarines sophisticated enough to evade more standard types of detection, i.e. detection at home ports by our own submarines. This is another DoD boondoggle.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Stevens (Electronic)	What gives the military the right to harm Dolphins and Whales? They won't even save any lives with these tests. Please don't hurt the wildlife.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Stidham (Electronic)	PLEASE do not conduct Naval testing in areas that could harm or torture marine life. I fully support our military and know that the need of protecting our nation is of great importance, and I immensely admire the dedication of our armed forces, but there has got to be a better way, one that we as a humane nation can feel proud- knowing we did not kill or harm these magnificent creatures God has given us. Lets not take the atrocities of mankind out on these sea creatures. If you do this, it will spread fast, citizens will find out, and you will lose support and respect of millions of Americans. This is our country, and we do not approve this type of vulgar and inhumane testing! Please listen up and do us proud. We are Americans for crying out loud, and you can find ways to do this without murdering God's creatures-who do we think we are to even think about doing this? Thank You, A very concerned Citizen of USA, California	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Stone (Written)	I can't understand how any human being can give any sound and thoughtful reason for killing or harming anything. Aggression and ardency in any form comes from ignorance of our own desire for understanding of our needs and meeting them in a way that respects others, honors their place in our world. We share planet earth and need to support and care for every living being on it. When over half of the U.S. budget is going to military budget with careless war as the seeming objective, isn't it time to find a better way to operate in the world than global occupation by the military? U.S. spends over $487 billion on War in Iraq which UN estimates less than half could provide clean water, adequate diet, sanitation services and basic education to every person on the planet. Paraphrase John Parkins author, "Confessions of an Economic Hit Man"	Thank you for participating in the NEPA process.
Stone (Oral-Kauai)	Hi, I'm Mary Stone, and I printed this out so I will remember everything. I can't understand how any human being can give away -- give any sound and thoughtful reason for killing or harming anything. Aggression and violence in any form comes from ignorance of our own desire for understanding of our needs and meeting them in a way that respects others, honors their place in our world. We share our planet Earth, and we need to support and care for every living thing on it. When over half of the U.S. debt budget is going to the military budget with an endless war as a seeming objective, isn't it time to find a better way to operate in the world than universal occupation by the military? The U.S. spends over -- or spent and is spending billions, specifically this man says 487 billion in the war in Iraq, which the U.N. estimates less than half of that could provide clean water, adequate diet, sanitation services and basic education to every person on the planet. So this was from a book by a man called John Perkins, title of which is Confessions of an Economic Hitman. So my point is that I just wonder why we need to militarize our Pacific. I don't feel that that's accomplishing the future that we want for ourselves and the rest of the living organisms on this planet. Thank you.	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Strang (Electronic)	Please consider the marine mammals that will be in danger during your tests. Consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Stratton (Electronic)	There is much we don’t know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless these safeguards are in place, do not allow Navy sound testing.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Suarez (Electronic)	Por favorrr......salvemos nuestro planetaa dont kill inocent animals just for money,power ,please we are humans	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Sumner (Electronic)	To Whom it May Concern: My comment was originally for the East Coast, if you could forward it along, it appears they've removed the comment section from that site. But just the same, my comments would also apply to the military games proposed for the West Coast as well, so please include them. While I have no doubt that these military training exercises are necessary and that every precaution would be taken to minimize the effect on marine wildlife in the areas, I believe the military is miscalculating the acceptable risk relating to the lives and well-being of the animals living within the proposed test area. These sonar and explosive tests WILL result in the needless injury and death of countless dolphins, whales and other marine mammals including some that are currently listed on the endangered species list. Any loss of life is unacceptable, and I would expect the Navy, which should have a deeper understanding of the global effects of the marine ecosystem, to know that. I'm sure that a lot of people have filed complaints about this, I know I'm not the first. I would like to, however, propose an alternative suggestion the military may not have considered yet. How about running these tests in waters that are closer to areas we are actively engaged in military combat. Sonar equipment or a torpedo with an active explosive may behave differently in our waters than they do in, say, the Arabian Sea. Conduct the proposed military tests there, destroy their fragile ecosystem, kill off their marine mammals. Besides, if you're going to have such an expensive [expletive deleted] contest, wouldn't it be better to do it in the other guy's	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. 	yard? Thank you for your time and consideration of my concerns involving the EIS/OEIS. Justin Sumner	
Sund (Electronic)	Please add my name to those opposing any more sonar testing in the ocean.	Thank you for participating in the NEPA process.
Suppers (Electronic)	Please do not proceed with these tests - killing innocent creatures is never acceptable, in the name of war or security. The price for this type of testing is too high a cost in lives lost and the effect it will have on the environment.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
A. Sutherland (Electronic)	National Security is important; that's a given, but at what cost to our environment and the majestic ocean creatures that help keep it diverse. If we keep disregarding the world we live in, what will be left to protect?	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
S. Sutherland (Electronic)	All life is to be respected, honored and protected if we are to survive as a species. This included the animals of the seas. Please honor yourself and others. It is my request that you stop this sound testing now. Some one has to turn the tide and you are in this position to make this happen. Thank you.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Sutton (Electronic)	Ladies and Gentlemen, I am a US citizen, and a frequent visitor to the Pacific region, especially Hawaii. I love and enjoy all the wildlife and ocean life there. I consider the whales, dolphins, seals and other marine creatures a tremendous national treasure to be preserved. Your plans are the opposite, by your own research --- to kill, wound, injure and even torture these animals in the name of national defense. This is a deeply misguided project and way of thinking, Please find some way of doing your job without disrupting our oceans and killing innocent creatures needed in the web of life. This is exactly the approach that has brought us to the edge of ecological disaster and species extinction in many cases. How will you explain this cruelty to your grandchildren? To my	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	grandchildren? Where is your humanity and respect? Please end this misguided testing and tactics, and place money where it is really needed and do some Good for the world. Thank you, david sutton	
Swanson (Electronic)	My comment is relatively simple and should be understood by anybody considering an operation that DOES NOT have to kill so many living beings. Compassion for animals is common among the good guys, but not among the bad ones. One of the surest signs that a biblical figure is a player in God's redemptive plan is the person's decency to the beasts of the field. Humane treatment of animals is seen here with Noah and will be repeated by Moses, Rebecca, Laban, and a host of others. It is not a coincidence that Christ is referred to as the 'Good Shepherd'. As St. Francis of Assisi said: "If you have men who will exclude any of God's creatures from the shelter of compassion and pity, you will have men who will deal likewise with their fellow men." Respectfully, Charles Swanson USAF Retired officer	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Swing (Electronic)	Please stop these tests. Our marine life is endangered as it is and cannot afford any more deaths.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Swingle (Electronic)	I am opposed to the proposed training exercises on the coast of California and Hawaii. I understand that these exercises would involve the use of live explosives and high-intensity sonar. According to your estimates, the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. Thank you for your time and consideration of this important matter.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and

		whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
K. Taylor-01 (Oral-Kauai)	Types of impacts, all potential impacts of the project, both direct and ultimate or long term must be considered including cumulative and growth-inducing impacts. Indirect impacts, if social or economic changes can directly cause environmental effects. These effects must be considered. Mandatory findings of significance, impacts which will substantially degrade the quality of the environment, substantially reduce the habitat of the fish and wildlife species that cause fish or wildlife population to drop below self-sustaining levels threaten to eliminate a plant or an animal community, reduce the number of -- restrict the range of a rare or endangered plant or animal. The study needs to look at the normally significant impacts, which is in conflict with adopted community environmental goals, degrade or deplete the natural resources include the wildlife, rare plants, habitat, water, air quality or prime ag lands if they're included.	Chapter 3 of the Draft EIS/OEIS provides discussion of the affected environment and environmental consequences, including socioeconomic impacts. The cumulative impacts are analyzed in Chapter 4 of the EIS/OEIS.
K. Taylor-02	But whether or not it induces population growth or concentrations, substantially increased traffic or ambient noise, specify in detail a map showing the location and boundaries of the project, a statement of project, a statement of the project objectives, a description of the projects' technical, economic and environmental characteristics. Project alternatives must discuss both mitigation measures and alternatives to the proposed project. Obviously a no-project alternatives must be looked at and each alternative must be described in sufficient detail to permit comparison with the proposed project. Thank you.	Chapter 2 of the Draft EIS/OEIS provides a figure showing the location and boundaries of the Study Area. Chapter 1 of the Draft EIS/OEIS provides the Purpose and Need of the EIS/OEIS, the environmental planning process, and the scope and content of the EIS/OEIS. All of the alternatives are analyzed in Chapter 3 and the mitigation measures are described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS.
S. Taylor (Electronic)	By your own accounts, the current form of planned naval testing in the ocean would be devastating to an incredible number of marine mammals. Knowing this, I cannot even comprehend how you could think that this is acceptable, national security or not. If we survive at the cost of loosing site of the value of other forms of life besides human, then when we begin to feel the results of the loss of our delicate environmental balance - we should deserve every single misery that it creates. We are disrupting the earth's natural balance that has kept us alive for centuries. BEWARE. This disregard for it will bring your future children's generations nothing but strife and heartache. PLEASE REVISE YOUR PLANS TO OPTIMIZE CARE AND RESPECT OF OTHER LIVING AND PERHAPS MORE INTELLIGENT THAN US.....BEINGS!!!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Most sincerely, Linda Terrell	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
A. Teubner (Electronic)	Unacceptable !!! We know better. The Navy needs to stop this now !	Thank you for participating in the NEPA process.
C. Teubner (Electronic)	Please please save our most important natural resources!!! Thank you. Chris.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly

		a decade.
Theis (Electronic)	Please find a way to conduct exercises that will not harm so much life.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Thelen (Electronic)	stop the navy experiments as long it kills our all sea life.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Thiruvengadam (Electronic)	Aloha! I live in Kona & have enjoyed the marine life here for many years. I was moved to share my humble opinion in the face of a situation that I do not know much about. I believe marine life is affected by sonar use & I feel if concerned citizens do not speak up for them then they have no voice. So I hope there can be precautions taken to prevent harm to the marine life and research done on the effects this sonar has on marine life. I am interested in balance and mindfulness when considering impacts on our Earth & if these comments from concerned people help to support & protect the life in our seas I feel that would add to balance in this world. Mahalo!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Tierney (Electronic)	Please actively take steps to reduce sonor and other technologies' harmful impacts to marine mammals. These steps include avoiding harmful activities in calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.

Timmerman-Thurstin (Written)	We understand that the Navy is moving ahead with plans for sonar and explosives training that threaten to deafen, injure and even kill countless whales, dolphins and other marine mammals. Starting in 2014, the Navy will harass, injure or kill marine mammals more than 33 million times in both the Atlantic and Pacific Oceans during its five years of testing and training with sonar and explosives. These alarming numbers come from the Navy itself. Inflicting such tremendous harm on marine mammals is simply unacceptable. Entire populations of marine mammals will be affected. Navy ships will flood millions of square miles of ocean with high intensity sonar, which is known to cause disorientation, hearing loss, stranding and death in whales. The Navy is supposed to be protecting people and mammals, not destroying them. Please stop the killing and harming of our animal and human populations, and stop destroying the environment that these are dependent upon for their survival. Thank you for your attention.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 (Affected Environment and Environmental Consequences) of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Tinch (Electronic)	This is impacting marine life in an alarming way that is totally unacceptable. Please stop these exercises.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Tisue (Electronic)	Dear U.S. Navy, Please protect marine mammals from explosives and sonar!!!!! We cannot do this! The negative environmental impact on marine life needs to be stopped!!!!!!! Protect our planet and its inhabitants!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

Tomasini (Electronic)	While I do appreciate the United States Navy's mission to serve our national security interests, I strongly believe that we need to do all we can to ensure that we are not causing damage to the natural environment, especially intelligent and wonderful creatures like whales and dolphins. If this means it will cost the government more to operate in an enviormentally safe manner, then please use my tax dollars to protect our precious world for our future generations. Thanks for this forum. Read the Earth Charter Iniative, this document says it all.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Traina (Electronic)	Please find another way to do your testing that does not involved the harming and death of dolphins and whales. We cannot, as human beings, keep treating the planet with such disregard and expect to be able to continue to live here in peace. Thank you for being kind stewards of the water that we all love here. Diane Traina	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Trombly (Electronic)	Please do not do ANY sonar testing in our oceans! We, as humans, have a jump first, then look mentality. Protecting our oceans is as important as protected lands and I do not feel as if ALL of the harm that will be done to marine life has been taken into consideration. At this time, we have enormous ocean pollution, I am thinking of garbage specifically. More specifically, radiated garbage from Japan. This, too, will be affecting the ocean wildlife. As a suggestion, our Navy can be tasked with finding an environmentally friendly solution to this problem. Why are we spending taxpayer money to scramble ocean creatures' brains, hearing, causing more death and detrimentally impacting the oceans' food chain? My last point is that on land, we have noise pollution laws. It is time to set some rules about underwater noise pollution because that is what the Navy is planning to do. Sincerely,	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
L. Tucker (Electronic)	I cannot imagine any greater damage being done through unnecessary noise pollution to our very valued whale and dolphin species. I am in the hearing field. I see patients daily who have damaged hearing due to noise exposure. Please don't inflict this damage on unsuspecting innocent creatures.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and

Table E.3-4: Responses to Comments from Private Individuals (continued)

T. Tucker (Electronic)	Please think. This is sooooooooooooo simple. Please ask your children and grand children. They can figure it out.	Thank you for participating in the NEPA process.
Tumey (Electronic)	Those animals are our country and the worlds' resources. If we harm and probably kill them (since many use sonar to find food they won't be able to eat) kill them whole sale we are destroying delicate ecosystems that humans rely on for food - not just the United States but all of the countries that fish in the Pacific Ocean. This technology has the possibility of directly impacting the worlds' future food resources. By harming this many animals we will affect many food chains in the ocean. This is Russian roulette with the environment of the Pacific ocean which is already impacted by over fishing and global warming. Please do not proceed with this program. The Navy's highly scientific guesses as to what will be impacted are limited by our present understandings of the interactions of various species and their impacts on the ocean. It is extremely difficult to extrapolate the full effects of this technology on our environment. This isn't worth the severe harm that could be caused.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Turchek (Electronic)	As a concerned citizen, I am urging the U.S. Navy to reconsider it's use of explosives and sonar along the waters of Hawaii and California. Please consider the effects of this testing on the animals living in these waters and work to find better alternatives.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during

Commenter	Comment	Navy Response
		actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Tutt-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Tutt-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.

Commenter	Comment	Navy Response
Tyson (Electronic)	The highest authority is life and love. To kill and deafen, one and the same to ocean mammals, is destruction and possible near extinction of helpless beings, deserving protection, not endangerment by military forces. Humanity has awakened to the realization that war is business for profit. Killing life for profit is inhumane and not required, unless the military is doing the dirty work for the elite. Come now, is destruction of life worth profit? How much more do you expect us to endure? Humans must turn this around now. If you have any awareness of your heart and love, inside of you, please end this plan. Wealthy war profiteers can find other ways to squeeze the final wealth from their contrived economy. Please, protect the ocean life from harm.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Uliana (Electronic)	In behalf of the valuable creatures of the ocean, please stop these horrible, horrific trials. No one wants to have their children deaf and if deaf to fend for themselves without being able to hear in a world that requires hearing for their survival. This is no different than the medical doctors doing exploratory surgery on humans during world war 11. We need to care for others not kill and harm them and that means other mamamals. Are we that inhumane to not recognize this horrific damage, They can practice and train on computers, not on life. That's what computers were made for. Real life training can be simulated. These sonar activities are absolutely, unquestionably wrong, unjust, unfair, criminal. Those involved in these trainings are indifferent and don't have the courage or guts to object. They follow orders mindlessly. Then they are no different than the SS soldiers sending lives into the gas chamber. This is absolutely wrong and needs to stop now. What more comment do you need. There is no justification for it especially when we have computers and simulators. No argument, money or rhetoric or sophistry justifies for these atrocities. Please stop. I'm one voice, but I speak for all those creatures who we all need to speak for. This is beyond criminal.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, "Today's simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Valdez (Written)	Opposed. Our islands are in eminent danger of destruction by military forces and heavy development. We rely on the sustainability of our fishery. A'ole to any kind of sonar testing.	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Valentine (Written)	Opposed.	Thank you for participating in the NEPA process.
Valenzuela (Electronic)	Dolphins & all marine life belong in our oceans. We should appreciate the beauty they give to us by being themselves. We shouldn't invade their homes, just as we wouldn't want our own homes to be invaded. We need to protect them & not hurt them.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Valerio (Electronic)	Please look at what you can do to minimize the impact that your testing will have on marine life. I am shocked that by your own numbers, thousands of animals will be killed or harmed. This is simply cruel and unethical. You're a smart bunch of people; please use your intelligence to do a better job of protecting our fragile ecosystem and the animals that inhabit it. Thanks much.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Van de Bijl (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, yours, Maartje Van de Bijl	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. (Electronic)	simulations why do we have to do so much damage to the sea? In more so why to we have to do it in places that are still worth going. There are whole islands of trash out there, can't you just blow up that? Or Jersey Shore?	technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Van Doren (Oral-Hilo)	My name is Mark Van Doren. I'm the state co-chair of the Green Party of Hawaii. I just have a couple of brief comments. I would like to bring up that KABC put a news release out that I believe you're aware of probably, maybe not, last month, May 11th, and they brought up the fact that last year -- and I met several of you at the meeting last year, the scoping meetings. The Navy analysis for 2009-2013 estimated injury or death to marine mammals to be about 100, of course unintentional. Now this year, one year later, they have revised that to say -- to calculate that explosives could potentially kill more than 200 marine mammals a year. So from 100 to 200 a year is about 100 percent off, and I'm just concerned about what might happen next year and, you know, if these figures are accurate at all. Now, I was inside, and they were showing me that this study area for Hawaii, the Hawaiian area, actually they told me that the sonar was actually done very close, in a much smaller area close to the islands, and which is exactly where the humpback whales spawn or -- spawn, I believe, or mate. Anyway, I was hoping that the Navy could possibly go elsewhere with the sonar on that. And I'm concerned about cumulative effects. I don't think -- I'm sure the Navy is very concerned about this, but we have fishermen impacting that area. We have illegal activities impacting that area, and just cumulatively I'm very concerned about marine mammals. So I hope you consider these comments. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Van Gampelaere (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as

	would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations. We look forward to hearing from you with your views on the above, if you have any queries please do not hesitate to contact us, Tommy Van Gampelaere yours,	presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Van Hoepen (Electronic)	Please consider using alternative testing methods.The proposed training exercises all along the U.S. East Coast and in the rich marine environment off the coast of California and Hawaii,involving the use of live explosives and high-intensity sonar could kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. These tragedies can be avoided if alternative methods are considered.Our National Security is of utmost importance,however there has to be a way to be able to preserve our planets oceans and marine life while protecting the country. Please consider taking steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Please consider !! Thank you for reading and your consideration. From a very concerned citizen, Karen van Hoepen	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Van Dieren (Electronic)	Please cancel planned under-water explosives/sonar exercises along the Eastern Seaboard and California and Hawaiian coasts to avoid harming and killing marine mammals. These exercises can be modified to avoid such destruction, and proceed later. In the past whales stranded and died in the wake of major military sonar exercises, bleeding from the ears and additional tissue damage, for example: Beaked whales died in the Canary Islands following sonar exercises. Panicked orcas and porpoises fled off Washington State in 2003. Dozens of whales (including pregnant females) from several species died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. Please cancel the planned exercises and take steps to protect marine mammals, such as: Avoid the most harmful activities in areas used as calving grounds or migratory corridors and seasonal high-use feeding areas. Create a larger “safety zone” around the exercises using aerial or acoustic monitoring to determine whether marine mammals are nearby. Taking these steps would allow important military training	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at

	exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Vasic (Electronic)	We understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. Stop using high intensity sonar testing and live explosions near important whale and dolphin habitat. This is ridiculous, please stop this before you start.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Vecchione (Written)	The Coronado Shores newsletter said that the Navy was asking for comments on how your military training will effect the environment. As a US citizen and a condo owner at the shores I say DO WHAT YOU HAVE TO DO to maintain military superiority on the seas. Some people worry more about the environment than maintaining our freedom. If the environment has to suffer a little to keep our military strong, then __ _ the environment. What good is a "clean" environment if we lose our freedom. Do what is best to keep us strong; every red blooded American should back you on this 100%	Thank you for participating in the NEPA process.
Vele (Electronic)	Your testing of weapons in our oceans will destroy everything. Take care of our oceans and have some respect.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures

VerVynck (Electronic)	Please re-think your plans in order to protect the marine life from explosives and sonar.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Vicente (Oral-Hilo)	My name is Dwight Vicente. I am representative of the Hawaiian Kingdom at this time, and I'm going to point out some of the history of this kingdom. In 1820 the United States dropped off a naval spy at Oahu. In 1825 a U.S. Naval officer signed the first treaty with the Hawaiian Kingdom, which is all illegal, and every treaty that the United States signed ever since violated the U.S. Constitution. So between the Hawaiian Kingdom and the United States government, there was no valid treaty. Even in 1887 the Reciprocity Treaty to have the U.S. Navy stationed at Pearl Harbor violated the U.S. Constitution Article I, Section 8, Clause 2 -- let me stand to correct myself -- Clause 1, Duties, Imposts, and Excises. They was trying to evade paying those taxes from a foreign country, importing stuff into the United States, and it violated Article I, Section 8, Clause 17, needful buildings, arsenals, dock yards, that are going to be purchased with the consent of the legislature of the state, and they only got 13 states. They cannot have them by treaty in a foreign country. What the United States has been doing since 1787, they have been using the Northwest Ordinance of 1787 to accomplish a lot of illegal	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	things which the Articles of Confederation prohibited and/or the U.S. Constitution prohibited. That's where they got the extra powers to do things. That actually is a violation of the Constitution. So you always got to be looking at which document are they speaking of, the Constitution or the Northwest Ordinance of 1787. A lot of the history the United States has is based on the Northwest Ordinance being that it only has 13 states and 37 are all unincorporated states under the Northwest Ordinance. And when you're going into other countries or even colonies, they've been using that ordinance. Most people refer to that as the Monroe Doctrine. That's how the United States has been taking its military way beyond what the constitutional authority gives them. The U.S. Navy is only the prosecuting (inaudible) on the high seas only. The Army is only in the United States, which is 13 states, and they have attached land forces with the Navy, which is illegal. They're separated in the Constitution, and there's a reason for that. It's because in the Declaration of Independence, they opposed the king's taking the standing army over to the 13 colonies, so that's why it's separated. The United States applied the Northwest Ordinance here to the kingdom in 1787 by first its businessmen here in Hawaii, Hawaiian Kingdom, brought over mercenaries from Europe, and that's how they accomplished the Bayonet Constitution. They wrote the 1887 Constitution for the Hawaiian Kingdom with a gun, and with that, it signed an illegal treaty, which is the Reciprocity Treaty. So the United States actually took over the kingdom in 1887. The only thing was left to do was to remove the queen in 1893 when she signed the lottery bill into law on the morning of January 13, and on the 14th, U.S. Minister Stevens landed an illegal standing army that was on board a Navy ship that was illegally stationed at Pearl Harbor, and that was how history started here with the takeover. So we've been under it ever since, the Northwest Ordinance, and that's why they have all the military bases here, which violates the U.S. Constitution. So I guess I'll end by reserving the rights of this kingdom under the Queen's Protest of January 17, 1893, against U.S. Minister Stevens. It has yet to make its way to the U.S. Supreme Court, Article III, Section 2, Clause 2, original jurisdiction but limited to U.S. ministers and consuls. Thank you.	
Vilello (Electronic)	PLEASE don't do it!! please don't harm the whales and dolphins	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Villasenor (Electronic)	The planet's cost of ocean sonar testing will be the lives of thousands of dophins and whales. The imminent vanishing of thousands is a known result. What are the long term effects? A planet devoid of these beautiful mammals? It is appalling and shocking to learn of the intended sonar testing in our oceans. My family, and surrounding community is horrified by the notion that our very own military is planning to pollute the oceans with sound so drastically as to committ mass homicide upon nature's creatures. Especially if this is an avoidable consequence. We would like to know that our honorable U.S. Military is seeking alternatives and will not proceed until all options are investigated and exhausted. Thank You. Concerned whale and dolphin watcher in San Jose, Calif.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Vogelgesang (Electronic)	Don't screw up the marine mammals any further than everything else man is doing to the oceans already are. Please reconsider the explosives and sonar exercises that are being planned for military purposes--there's got to be a way you can conduct some of these exercises that doesn't impact wildlife to the extent that the current way does. I'm sure you're looking at this and other letters expressing similar concerns as a joke, but try not to laugh and actually consider what you're doing to the environment. I realize that you don't give much of a thought to the environment and view all conservationists & environmentalists as crack heads that you can sit back and laugh at, but please try to take this seriously. The animals are important too---it's not just humans who live on this planet, and some of the species that will be affected are endangered.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Vollmer (Electronic)	Please I ask you to protect the marine mammals from explosives and sonar, it is so very important.....have mercy on these wonderful animals, please, please, please!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Waggoner (Electronic)	Please incorporate greater protective measures for marine life into the proposed training exercises off the coast of California and Hawaii. According to the Navy's own Environmental Impact Statements, the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. The massive harm to marine life that these exercises will cause is unacceptable. Please incorporate protective measures such as: avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Such measures will still allow military training exercises to proceed, but will minimize the likelihood that whales, dolphins, and porpoises might be harmed or killed. It is well-documented that in the past, military sonar exercises have caused injuries, death, and terrible suffering in marine life. For example, whales have stranded and died in the wake of military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. Please do the only right thing, and incorporate additional protective measures including those outlined above. Thank you for your consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Wagner (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Wagoner (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Most sincerely, Genesa Wagoner MD	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. (Electronic)	can be put in place and still allow the exercises to take place. Thank you for your consideration.	analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Wallis (Electronic)	I am writing to ask you to stop the killing of 1,800 whales and dolphins and the deafening of 15,900 more by ceasing the operation of the Navy's underwater sound system in the Hawaiian Islands, the California and Atlantic Coasts, and the Gulf of Mexico. These numbers, from your own estimates, are uacceptable, and completely preventable. Whales and dolphins depend on sound to navigate and live, and our scientists and researchers are intelligent enough to offer humane alternatives.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Walsh (Electronic)	PLEASE no testing. The Navy's report states that the exercises could cause 1,600 marine mammals to suffer from hearing loss or other injury from its use of sonar and explosives each year for the next five years. The report also projects that 200 marine mammals will die each year.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as

		presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Wargo (Electronic)	I would like to comment on the environmental impact statement that you are going to kill a astronomical amount of marine animals, including endangered species. I request first of all that you find alternative means to do this - and drastically reduce the amount of collateral damage to other beings who live in the sea. If you must conduct exercises they should be done far and away from important calving and feeding grounds. I really think its ridiculous in this day and age that the US Navy - the strongest and best Navy in the world cannot come up with an alternative solution. I respectively ask that you do everything possible to not kill marine animals. They have enough pressures without man adding needless ones.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
D. Wasson (Written)	The extensive EIS as prepared in this report violates the constitutional rights on international, national, and nature rights, and origin in regards to the extension of the continental land boundaries and nature spaces and all items in the sea. The extension of boundaries from the continental U.S. to and near the Hawaiian archipelago violates international which the U.S. government was a signator o the protection of nations to the 200 mile limit. The U.S. government must cease and desist breaking its own laws. Although I am a Hawaiian national my American citizenry was forced on Hawaiian nationals like myself. This proposal violates legal, judicial, international law of compliance and I have no choice but to oppose this EIS. The natural, physical, legal, political, and spiritual laws are violated in this report. The rights of native tenant rights such as fishing, water, gathering, and access will be violated.	Thank you for participating in the NEPA process. However this comment is outside the scope of this EIS/OEIS. Please see Chapters 1 (Purpose and Need) and 2 (Description of Proposed Action and Alternatives) of the Final EIS/OEIS for a clear definition of the scope of this project.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
M. Wasson (Electronic)	It's a sad state of affairs that our government in the name of almighty power systematically kills animals that cannot speak for themselves. Has our nation become so power hungry and uncaring that we don't care about the collateral damage. We are killing our planet. It's morally and ethically wrong. Permanently deafen????? How are these animals to survive without their hearing, that is, if they aren't killed first? The war machine is an evil creature created by man, wiping out anything good and beautiful in it's path.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
D. Watson (Electronic)	We the people and mother earth do not want your test there is no need for it the harm use people are doing to life and earth is sending us all to death we are the poeple when we come together as one you will not win do you people have kids and family of your own im sure you do. Do you not care about them and there future as thats what people like you are doing destroying there futures so sad to see things like you are on this planet	Thank you for participating in the NEPA process.
H. Watson-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
H. Watson-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation

Table E.3-4: Responses to Comments from Private Individuals (continued)

		has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
J. Watson (Oral-Kauai)	Thank you. My name is Joe Watson. I live in Kapahi. I'm here to read the words penned by a friend, Steve Backinoff of Kilauea, who had to leave. I am very concerned about the impact of sound and weapon testing on marine mammals and other sea life as well as humans. In the research I have done I have some documentation that some of the experts who have claimed that whales and dolphins are safe in relation to sonar testing are working under government grants or universities so they are biased by their funding resources. I am strongly for decreasing military expenditures and reallocating those funds to programs that will improve conditions for peaceful communication. Most people just want a safe home with food to eat, and that is much less expensive than high-tech weaponry and protective weaponry. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Regarding bias in the Navy's analysis, in conducting the analysis of impacts to marine mammals, the Navy uses hundreds of peer-reviewed scientific research studies.
P. Watson (Oral-Kauai)	I'm Peggy Watson, Kappa, Kauai. I am voicing our extreme concerns with the U.S. Navy plans to continue the sound testing in Hawaiian and California waters. The Navy has presented this program with an opportunity for the community to respond, and thank you for this compliance. I come as a voice for cetaceans as well as all of humanity which will be affected if this program ensues. I am here today to offer a bit of history that will show proof that the Navy has shown in the past that their beliefs in what they're testing brings to our future was not correct. Commander Robert L. Reaser served in the Navy in what they called Operation Crossroads. He served on the U.S.S. Burleson for the Bikini resurvey to assess the damage of the atomic bomb to warships, to equipment and to animals. He was given a commendation for this service. It was signed, if you want to check it out, by Executive Officer Captain Deaeder. As an older officer, my father volunteered to go to this duty because my twin and I were in high school and he and mom did not need more family. The Navy had promised its volunteers that they would be sterile for life if they went into that theater. Younger men did not want to volunteer. I have a kid brother who was born in 1954 which proved that the Navy had no way of knowing the effects of the testing on the future. The sterility wore off. Why should we believe our planet does not face a clear and present danger by these tests? The Navy projection that yearly 1,600 cetaceans will be deaf, which I understand, and 200 will die yearly in a program designed for seven years. Quick math spells 11,200 deaf cetaceans and 1,400 dead ones. Cetaceans do not live without sound. How dare they? You the Navy. How dare they design a program to kill any species that has gifted so much to our planet? How dare they use our government monies for this slaughter in the name of defense? Thank you, the Navy, for allowing us to feel this outrage and to respond with these	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	feelings. What will you do with our concerns? As spokesman for the cetaceans we ask that you use the funding more wisely to assist the cleaning up of our oceans to make a better world for our beloved peaceful cetacean community and to stop turning our beautiful Hawaiian Islands and California seas as a theater for war exploration. We ask that to remember, as the dolphins have said, we are here. Thank you.	
Watts (Electronic)	The Navy's training and testing will harm more than 50 species of whales and dolphins, including eight protected by the Endangered Species Act, such as the North Atlantic right whale (one of the most critically endangered whales), blue whale (the largest animal to have ever lived on the planet), and sperm whale (including populations harmed by the BP Deepwater Horizon disaster). Please reconsider these tests, and think about other species. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Webb (Electronic)	The negative impacts of sonar and seismic testing in ocean waters on marine mammals is well documented in numerous government and institutional studies. (One such reference was conducted by the U.S. Geological Survey for the National Science Foundation at http://www.nsf.gov/geo/oce/envcomp/usgs-nsf-marine-seismic-research/nsf-usgs-final-eis-oeis_3june2011.pdf). These impacts are far ranging and can be damaging and lethal to marine mammals, fisheries and other flora and fauna in the ocean. The benefits of this testing is far outweighed by the damage and destruction of the life in our oceans. The only responsible action is not to use this lethal technology.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Webber (Electronic)	Please discontinue any activity harmful to the whales.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Weed (Electronic)	Please do not go forward with your plans to conduct training exercises all along the U.S. East Coast <http://aftteis.com/GetInvolved/OnlineCommentForm.aspx> and in the rich marine environment off the coast of California and Hawaii <http://hstteis.com/GetInvolved/OnlineCommentForm.aspx> which would involve the use of live explosives and high-intensity sonar. Your estimates are that the planned exercises would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. That is devastating and irresponsible and something I find shocking that America would do. We need to stand tall and create an example for other countries. Please find an alternative for your tests. One that won't destroy life, precious resources and our oceans!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Weiand	Don't harm the dolphins and their hearing. I know from personal experience to have a	The Navy shares your concern for marine life. All of the reasonably

(Electronic)	severe hearing loss. It is terrible and you are not able to relate to the real world. The dolphins are almost human like and need to relate to their world. Hearing is essential. Every day I want to die, because I can no longer hear. Every day is a torment to exist. By the way, I am a Navy brat. My father retired with the rank of Admiral. Please "hear" my voice and no harm to the dolphins.	foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Weiner-01 (Electronic)	Sonic testing in the ocean is dangerous to our life in the ocean. You need to re-think this and stop the testing, stop maiming and injuring our aquatic mammals plus so many other life forms in the ocean that whose morbidity and mortality are increased directly due to this poorly thought out testing.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Weiner-02	Please stop using my tax payer money to fund these deplorably destructive and dangerous tests. Our neighbors, aquatic mammals and other species, are part of life on this planet and infliction of morbidity and mortality is deplorable and needs to stop now. Figure something else out that isnt so harmful to other life forms with whom we share our planet.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Weinfurter-01 (Electronic)	Please refrain from using explosives and sonar near Hawaii and Southern California. The damage to the whales and dolphins in the area and for miles around would be catastrophIc. It would be the equivalent of blowing an airhorn within 10 ft of your head. Save the whales & dolphins!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Commenter	Comment	Navy Response
	mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel"

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Weinstein (Electronic)	I agree that we need a robust and strong Navy to protect national security. I also agree that whales, dolphins, and porpoises deserve to live and to have a healthy ocean environment. According to its own Environmental Impact Statements, the Navy estimates that the training exercises planned along the East Coast and in the rich marine environment off the coast of California and Hawaii involving live explosives and high-intensity sonar would kill up to 2,000 marine mammals, including a large number of animals from endangered species, such as right whales. Thousands of others would suffer permanent lung damage. An additional 16,000 would be permanently deafened and 5 million would be temporarily deafened by the exercises. I understand the need for protecting our country, but we can find a way to ensure national security without sacrificing such an extraordinary number of whales, dolphins, and many other marine creatures. In the past, whales have stranded and died in the wake of major military sonar exercises, with bleeding from the ears and other tissue damage attributed to sonar. These have included incidents of beaked whales dying in the Canary Islands following sonar exercises, the panicked flight of orcas and porpoises off Washington State in 2003, and dozens of whales (including pregnant females) from several species who died in North Carolina in 2005. These tragedies can be avoided to a very significant degree. I urge the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger "safety zone" around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. See the FEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Historically the Navy has recorded of few to no mortalities from sonar and explosives. Any model used to predict impact is only an estimate.
Weiss (Electronic)	There is already soooo much working against our environment on which we depend. Please do not add to the problems! It's crucial for everyone to keep things in balance.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.

Commenter	Comment	Navy Response
Weller (Electronic)	I grew up in the Norfolk, VA area where the Navy is a vital and respected part of the fabric of the community. I have also had the privilege of visiting the California coast and the enchanting Hawaiian Islands. In Hawaii, I was able to watch gray whales and their calves frolic and breach in their natural environment. The sea is critical to the U.S. Navy and our national security and is also critical to the very survival of the dolphins and whales that must share it with our ships. I implore the Navy to find ways to lessen the impact on these amazing animals that already face survival challenges from so many man-made objects (i.e. trash, etc.) Surely there are intelligent scientists/biologists that can help our officers at the Pentagon come up with a strategy to fulfill the Navy's mission AND protect our sea life. To do anything less would be an abdication of responsibility as U.S. citizens and as caretakers of our fellow creatures. Thank you for the opportunity to comment.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Wesch (Electronic)	Please do not allow the taking of any marine mammals. Whales are intelligent mammals with complex social structures. Improved sighting methods need to be employed as whales often travel silently. Relying on the current sighting guidelines is inadequate. Sonar use needs to be restricted in every way possible: time allowed, strength, frequency . . . Use simulation methods for training and restrict open ocean testing.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
White-01 (Electronic)	I am appalled at the inevitable repercussions of this project. Applying sonar in areas known to be populated by marine mammals such as whales, who depend on sonar to survive is outrageous. We need to ensure the health of these creatures, and in effect of our oceans. The US Navy has the obligation to protect our country from harm--would that it does not harm our country in the process. This proposal seeks to gain the Navy the right to wreak destruction in our ocean--right off of our very coast. This is unacceptable. Those with direct power in this decision-making process have an absolute duty to look for less destructive alternatives to this project, and to deny this project completely as it is. We cannot afford to folly about with the health of something so vital as our ocean ecosystem. Regardless of how much we have sought to separate ourselves from nature, we are still very much dependent on it.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
White-02	I hope the fishermen are getting a word in about this, because their dependence is so direct and immediate. Please fulfill your duty to our country by rejecting this proposal.	Many Navy at-sea training and testing ranges are accessible to the public for recreational and commercial purposes. The Navy acknowledges that during specific exercises, its training and testing could briefly limit public access (usually lasting hours) to a very limited portion of coastal and ocean areas to ensure public safety. The Navy has conducted training in these operating areas regularly for approximately 60 years. Though the intensity of live training will increase, the events are of relatively short duration and therefore the Navy does not anticipate that fish will be affected as a result of the training exercises and testing activities. Fish may respond behaviorally to sound sources in their hearing range (most Navy sound sources are not in the hearing range for most fish species), but this reaction is only expected to be brief and not biologically significant. Most commercially important fish species are not believed to hear midand high-frequency sound sources which make up the majority of sound producing activities.

Commenter	Comment	Navy Response
Whiteman-01 (Electronic)	Today is the last day that I can submit my comments regarding the US Navy's intent to conduct sonar testing and oceanic bombing in the South Pacific. I am adamantly against this because it will severely harm marine mammals. The arrogance of us as human beings to believe that it is acceptable is misguided and plain wrong. I implore those that have the Power and the conscience to stop this effort in its tracks. Proceeding In this project will be devastating to the thousands, if not, hundreds of thousands of marine animals. It is devastating to my heart to think this could really happen. For what? The sake of knowledge, study, practice or national security. What more can we	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Wilkerson (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. 		development of alternatives.
Tracy Williams-02	The navy's blatant disregard for Sea mammals is Shameful. You make the U.S. look like a backward nation. Your lack of intelligence when it comes to aquatic species is mind boggling. I am ashamed to be an American nowdays. I understand why the world hates the US where once it was loved. I am saving my money to leave this BS Lie. Land of greed, land of idols and whores. YOU ARE KILLING WHAT IS LEFT OF THE SEAS! Moronic. Go for it. You will be held accountable. There is a G_d.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Trinidad Williams (Electronic)	I had commented on a Hawaii group blog that dismissed an EIS reporting meet; had previously signed a petition titled "... don't deafen the whales" ~ my interest generated by a news item of impending Naval Armada to conduct sonar research in Hawaiian waters' which I'd felt disturbing to the whales currently in the island channels raising young calves-possibly mating-feeding before traveling back to the West coastal waters. I am so pleased to find a link that has extensive research reports; I have a better understanding of purpose-have information to the ecological conditions-diverse lifeforms-marinelife protection measures. I am submitting comment of thank you for this available link to questions that I feel is an issue.	Thank you for participating in the NEPA process.
Williamson (Electronic)	The science is clear that the sonar equipment is harmful to whales and marine life. Don't use it and destroy many of the precious marine lives we are trying to preserve. For training it's unacceptable. I am sure there are alternative ways to stimulate the experience without causing death and destruction. As a health care provider we don't kill people and revive them to practice our skills! If we destroy our planet's diversity, air and water for security purposes we will have accomplished NOTHING.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of

		significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
A. Wilson (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing. Most sincerely, Amanda Wilson	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
David Wilson (Oral-Hilo)	My name is David Wilson. Is this loud enough? Is that loud enough? Okay. I'm kind of paranoid because -- well, just because of the situation in the world now. I'm just going to say one thing first. Do we know that every 80 minutes, an American vet commits suicide? Now, these wars -- they can talk about the whales, the turtles, okay. But they're not going to just say, "Oh, we didn't know that. Thank you. We'll stop this now." Everything else goes on, but the turtles and the whales are safe? It's just part of the whole -- I'm just saying like we had this sign out there, the legality has replaced morality. You will not -- you will not tell me (inaudible). Anyway, when I think about the military, I'm sad. My dad was a career Air Force guy, World War II and Korea. He retired as a (inaudible) major. But I wanted to go to West Point as a kid, but I wasn't smart enough of course. So I know all this strategy. My dad taught me all these strategy ideas and all this stuff, and I realize how the military is being used. We think the American military is doing whatever they're ordered. We're all under orders, right? All the way back to who's in charge of the whole thing, we don't know their names. We're only being used basically to -- one of the things is to depopulate the Muslim world and at the same time kill and maim	Thank you for participating in the NEPA process.

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
	thousands and thousands of American troops and, you know, people get the post-traumatic syndrome and all this stuff like that. So I'm just saying the military is not to blame. They're being used, and it's just sad because we cannot get back to the core by talking to a few. (Inaudible) ask what your rank is? You're a captain. Okay. Captain, well, you have a lot of responsibility. But I mean even so, I don't even think you're going to say, "Oh, we didn't know that. We'll change it." So I'm just saying whatever. I don't know what I'm saying. It's just depressing to me to be in this position. Anyway, the idea that until we've seen the thing, by next winter, 10 to 20 million tons -- 10 to 20 million tons of debris is going to hit the Kona Coast. What are you going to do then? And it's in the air now. There's radiation in the milk in Pennsylvania, in Iowa, the West Coast. I mean this is what's happening, and you can't fight it. You can't shoot it down. You can't sonar it away. And in 30 seconds, I'll just say let's all rely on the Lord. That's what we've got to do because otherwise we (inaudible). Otherwise, what are you going to do? Fix it? Sonar ain't going to fix it. God bless you. AUDIENCE MEMBER: Thank you, David. The problem isn't that you weren't smart enough. You just wouldn't be brainwashed. You were too smart.	
Denise Wilson (Electronic)	The HSUS is joining other environmental and animal welfare groups to ask the Navy to consider steps to reduce the harmful impacts to marine mammals. These steps include avoiding the most harmful activities in areas used as calving grounds or migratory corridors; avoiding seasonal high-use feeding areas; creating a larger “safety zone” around the exercises; and using aerial or acoustic monitoring to determine whether marine mammals are nearby and may be harmed. Taking these steps would allow important military training exercises to go forward, while minimizing the likelihood that whales, dolphins, and porpoises might be harmed or killed. Along with the HSUS, I am calling on the U.S. Navy to re-think its plans and to incorporate additional protective measures. Mrs. Denise Wilson	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. J. Wilson (Electronic)	There is much we don't know about whales but we do know they are highly intelligent, social, highly evolved mammals. We know their brains have as much or more surface area than ours which suggests their intelligence may parallel ours though it may be a very different kind of intelligence. Many marine mammal species are endangered because of human impacts upon their environment or hunting. Some whale populations which were in the past endangered are just beginning to return because of education and protection. We have no right to knowingly permanently injure these living creatures who never purposefully injure humans unless first provoked. The Navy has admitted that the sonar tests will cause harm to whales and dolphins ranging from discomfort to disorientation to permanent deafness which would interfere with navigation, self defense and finding food thereby seriously impairing their ability to survive. Increased beaching and deaths of marine mammals have certainly been linked to previous Navy sound testing. Unless it is a time of war with imminent threat these tests should not be performed in areas known to be frequently passaged by whales and dolphins or within effective range of whales and dolphins. Please limit Navy sound testing to areas outside the known paths of migration, reproduction and feeding of whales and dolphins and other effected marine mammals. Please also require scanning for the presence of marine mammals within the disturbance zone prior to testing and delay testing until the marine mammals depart from the affected area. Unless the rights of these marine mammals are respected, I cannot condone Navy sound testing.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Wiltse (Electronic)	Please stop training and testing EIS/OEIS.it does terrible damage to wildlife.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Winterbottom (Electronic)	We are saddened to hear that the Navy is considering conducting exercises involving the use of live explosives and high-intensity sonar. Do you feel that it is really necessary to conduct this testing that will affect such a volume of marine life? It would be a great pity to see so much of the conservation work the USA has undertaken towards its marine environment over the last number of years being undermined by these proposed exercises. These conservation initiatives deserve to be applauded and have made the USA one of the leaders in marine conservation. To conduct these exercises flies in the face of all the good work and progress that has been achieved to date. There is also the issue of sound channels in the oceans that can carry sounds over vast distances, so not only local populations may be affected but also populations in areas seemingly far removed from the testing activities. As these activities could potentially affect endangered species on both the high seas and possibly in the territorial waters of other nations we believe that any other nations that could potentially be affected should be fully consulted, and the findings of any such consultations made public, prior to any decision being made on whether these activities should progress to the next stage. We would ask you to give serious consideration to just how necessary these proposed exercises are and where the benefits of them lie versus the destruction of marine life that so many dedicated citizens have worked tirelessly to preserve and enhance for both current and future generations.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Wiseman (Electronic)	PLEASE rework this plan to provide better protection for marine mammals! The current plan is predicted to cause deafness, stranding, and death to thousands of animals. I appreciate military protection, but not at the cost of killing any innocent animals just for training; please do not carry on exercises that would cause marine mammals to suffer and die. Instead, consider and adopt alternative suggestions that animal welfare organizations can recommend, and consider exercises that don't require the actual deployment of explosives and high intensity sonar that cause so much suffering. Thank you.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.
Wolf (Electronic)	Please, we must stop this training and testing. We are at risk of endangering many marine animals. With all of the knowledge we have there has to be a better way for testing. please stop.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Wright (Electronic)	Please consider how important the balance of the Ocean Environment is to our lives. These amazing intelligent mammals deserved not to be harmed	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Wyse (Electronic)	Plenty of people are already stating well thought out reasons why this is a poor choice. Let's be frank - stop it. Marauding all over the planet destroying cultures and species that can never be replaced is poor behaviour. We were all taught this as children. Please stop.	A Cultural resources analysis appears in Section 3.10 (Cultural Resources) of the EIS/OEIS which addresses cultural artifacts and shipwrecks. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf]. Regarding the use of simulation, as described in Section 2.5.1.4.1 (Simulated Training) of the Draft EIS/OEIS, “Today’s simulation technology does not permit anti-submarine warfare training with the degree of fidelity required to maintain proficiency. While simulators are

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		used for the basic training of sonar technicians, they are of limited utility beyond basic training. A simulator cannot match the dynamic nature of the environment, such as bathymetry and sound propagation properties, or the training activities involving several units with multiple crews interacting in a variety of acoustic environments."
Xander (Electronic)	I am greatly concerned about the horrific impact of the mass use of sonar, sonar testing, and the auditory effects of explosions in waters which contain wildlife dependent upon hearing for navigation, calving, feeding, social interaction and development, and their entire existence. These mammals are highly intelligent; massive sonar blasts that inflict immense pain, disability and death are cruel, and will have a profoundly negative impact on entire social pod structures throughout the waters where this is used. If we, as a nation and military, are to use such methods in our arsenal, there MUST be safeguards in place to minimize negative impacts, and to protect the wildlife in the waters where we operate. Anything less is an exercise in animal cruelty and negligence unparalleled in human maritime existence. There is proof that intense mechanical sonar blasts can rupture the eardrums and cause life-threatening damage to dolphins and whales -- this is not only a fatal impact, but one which is extremely painful, causing these animals to die in agony. I believe there is no excuse whatsoever for the mass slaughter of our marine mammals on such an unimaginable scale, should this technology's use be widened and exercised with impunity throughout our national and international waters. Thank you for your consideration.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Yager Delagrang (Electronic)	Please do not kill marine life because of the explosive testing planned off the coasts of California and Hawaii.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from active sonar and explosives were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Youngs (Electronic)	Please Protect these mammals	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of

Commenter	Comment	Navy Response
		significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Yuen (Written)	Excellent presentation! Keep up the good work. Communicating with the public is where it is all at. Really surprised to see officers from Kauai at the function.	Thank you for participating in the NEPA process.
Yushin (Electronic)	Karma and compassion are universal concepts. Treat others as you'd like to be treated. We urge you to cease military action that would kill and disfigure life in the ocean and elsewhere. Sincerely, P. Yushin Honolulu, HI	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Zehel-01 (Electronic)	I am outraged that the U.S. Navy would go ahead with sonar testing that could kill and harm marine mammals 2.8 million times a year over a five year period. The proposed training and testing activities off the coasts of Hawaii, Southern California, the Atlantic seaboard and the Gulf States from 2014 to 2019 gives these figures in your Draft Environmental Impact Statements. The Navy's projected damage to whales and dolphins is astounding. It is a vast increase over previous estimates of potential harm for the same regions. The numbers for far-reaching harm that will be inflicted on marine mammals during these testing activities is staggering: over 5,000,000 instances of temporary hearing loss, 16,000 instances of permanent hearing loss, almost 9,000 lung injuries, and over 1,800 deaths. An estimated 11,200 whales and dolphins will be deafened. What is unstated is that whales and dolphins depend on sound to navigate, communicate and survive. What is not presented in your analysis are reasonable alternatives to reduce the unprecedented damage to marine animals.	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
Zehel-02	Your mitigation plan, based on the ability of lookouts to detect whales and dolphins, will not achieve a significant reduction in damage to marine life.These same plans have been found by Federal courts to be inadequate and ineffective. Visual surveillance may be impaired at sea and unsuitable for distinguishing deep-diving species that spend little time at the surface. If fully effective, it would only protect species from the most serious injuries. I call on the Navy to please identify and set aside areas of high marine mammal density which is acknowledged to be the most effective means of reducing marine mammal injury. If the United States and its Navy wish to be seen as a leader in saving marine life, it must significantly reduce the levels of death and injury to whales, dolphins and other marine life involved in these plans. Thank you for the opportunity to comment. I hope to hear this testing is stopped since the damage to our oceans would be horrific.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the “one or two personnel” described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy’s reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
Zelkovsky (Electronic)	Why is the ocean constantly being treated like some non-living non life supporting entity? Just because it is so large and pervasive and because human mistakes seem to disappear over time does not mean that the ocean is unaffected. The ocean supports life and food for people but somehow it is treated like a third class citizen. Recently on Kauai there was an electrical short in a sewage treatment plant. So automatically the partially treated sewage was dumped into the ocean, using it like a cesspool. I say no to using the ocean for any kind of testing.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Zorn (Electronic)	Please, just reconsider. Have we not done enough to harm our one frontier that is essential to the human race's continued preservation? Continuing efforts that harm more species is hardly moving forward, and for what cost? The cost is immeasurable, and potentially, irreversible. Please, just reconsider.	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Zuckert (Electronic)	I am opposed to Alternative 2. Any expansion of training would be detrimental to marine mammals and sea turtles. The Navy has adequate ocean area for training already and should not increase its footprint of disruption of natural processes and sea life. The EIS states the negative and unacceptable impacts quite succinctly: The aggregate impacts of past, present, and other reasonably foreseeable future actions are expected to result in significant impacts on marine mammal and sea turtle species.	The Alternatives carried forward meet the Navy's purpose and need to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and

Table E.3-4: Responses to Comments from Private Individuals (continued)

Commenter	Comment	Navy Response
		testing activities. Based on the analysis in the EIS and monitoring conducted during actual training events, the proposed training will not pose a risk to whales, fish, and other wildlife given that these same activities have been conducted for many years here and in other Range Complexes with no indications of broad-scale impacts that are either injurious or of significant biological impact to marine mammals, fish, or wildlife at those locations. Please see the recent results supporting this as presented in training ranges monitoring reports available at available at: [http://www.nmfs.noaa.gov/pr/pdfs/permits/hrc_socal_report.pdf].
Zullo (Electronic)	I am astounded at the lack of reguard for our marine wildlife by the Navy, yet another example of "Do what I say, not what I do" by a United States Government organization. What is the difference between those Japanese vessels killing and hauling mother whales and this, NOTHING....thats what!!!!! As a former U.S. Marine and loyal U.S Citizen that is decorated in defending this county, I am ashamed of our Navy and Governemnt, and it gets harder every day to call myself a proud American. Where are the environmentalist and other watchdog organizations that need to step up and protect us from our government.... HELP US HELP OURSELVES!	The Navy shares your concern for marine life. All of the reasonably foreseeable effects from Navy training and testing activities were analyzed in Chapter 3 of the Draft EIS/OEIS. Also, as described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Draft EIS/OEIS, the Navy implements, to the maximum extent possible, mitigation measures during its training and testing activities.
Name Withheld by Request (Written)	Unless we are Hawaiians, we are visitors to Hawaii. Visitors have an obligation to their hosts. I don’t believe that the Navy has satisfied their obligations as visitors to our island. Just as the rule in a hostel is, a visitor who leaves a place better than they found it. Action needs to be taken to clean up the supersite, the mess made by the military. By Hawaiian custom, lands belong to the people who care for them. Since the Navy has not in the past taken care of the seas, taken care of their harbors, taken care of our skies. Between munitions dumped, decaying housing, pollution in the harbors and on the lands and skies (from exhaust from airplanes), the Navy has no right to any lands here.	Thank you for participating in the NEPA process.

E.3.1 Form Letter

The Navy received a CD from the Natural Resources Defense Council containing approximately 76,000 versions of a letter from their members. Table E.3-5 provides the Navy's responses to the comments in the letter. Table E.3-6 provides the Navy's response to amendments to the basic letter. Responses to these comments were prepared and reviewed for scientific and technical accuracy and completeness.

Table E.3-5: Responses to Comments in the Form Letter from the Natural Resources Defense Council

Commenter	Comment	Navy Response
Natural Resources Defense Council (Form Letter)-01	Your analysis fails to present and analyze reasonable alternatives that would significantly reduce the unprecedented level of harm to marine life.	The Alternatives carried forward meet the Navy's purpose and need (see Section 1.4, Purpose and Need for Proposed Military Readiness Training and Testing Activities) to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. The Navy complied with NEPA requirements in the development and consideration of alternatives. This EIS/OEIS analyzes all alternatives in Section 2.5.2 (Alternatives Carried Forward) and explains why the Navy has eliminated other alternatives in Section 2.5.1 (Alternatives Eliminated from Further Consideration). The selection of an alternative by the decision-maker will be based on a review of all relevant facts, impact analyses, and comments received via the EIS/OEIS public participation process.
NRDC (Form Letter)-02	The mitigation scheme that the Navy principally relies on centered on the ability of lookouts to detect whales and dolphins will not result in an appreciable decrease in marine mammal injuries. Federal courts have found this same scheme inadequate and ineffective for good reason: it is largely useless in conditions (common at sea) that impair visual surveillance, it is unsuitable for detecting cryptic and deep-diving species that spend little time at the surface, and, even if it were fully effective at detecting whales and dolphins, would only protect species form the most serious injuries.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to Navy mitigation procedures for the following reasons. The authors note that seismic survey differs from marine mammal surveys in that, "(1) seismic surveys are also conducted at night; (2) seismic surveys are not limited to calm sea conditions; (3) mitigation observers are primarily searching with unaided eyes and 7x binoculars; and (4) typically only one or possibly two observers are searching." When the Navy implements mitigation for which adjustments to modeling output were made, the four conditions Barlow and Gisiner (2006) note

		are not representative of Navy procedures nor necessarily a difference in marine mammal line-transect survey procedures. The Navy accounts for reduced visibility (i.e., activities which occur at night, etc.) by assigning a lower value to the mitigation effectiveness factor. On Navy ships, hand-held binoculars are always available and pedestal mounted binoculars, very similar to those used in marine mammal surveys, are generally available to Navy Lookouts on board vessels over 60'. Also like marine mammal observers, Navy Lookouts are trained to use a methodical combination of unaided eye and optics as they search the surface around a vessel. The implication that marine mammal surveys only occur in "calm sea conditions" is not accurate since the vast majority of marine mammal surveys occur and data is collected in conditions up to sea states of Beaufort 5. The specific g(0) values analyzed by Barlow and Gisiner (2006) were derived from survey data for Cuvier's and Mesoplodon beaked whale that were detected in sea states of Beaufort 0-2 during daylight hours. However, marine mammal surveys are not restricted to sea states of Beaufort 0-2, many species g(0) values are based on conditions up to and including Beaufort 5 and, therefore, the conclusions reached by Barlow and Gisiner (2006) regarding the effect of sea state conditions on sightability do not apply to other species. Finally, when Lookouts are present, there are always more than the "one or two personnel" described by Barlow and Gisiner (2006) observing the area ahead of a Navy vessel (additional bridge watch personnel are also observing the water around the vessel). Finally, Navy's reliance on visual mitigation has been demonstrated to be effective over the seven years of monitoring associated with Navy training and testing at sea in publically available reports submitted to NMFS since 2006 and accessible on the NMFS Office of Protected Resources website.
NRDC (Form Letter)-03	I call on the Navy to identify and set aside areas of high marine mammal density acknowledged to be the most effective means of reducing marine mammal injury.	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of numerous potential mitigation measures. Section 5.3.1.2.4.1 (Detection Probabilities of Marine Mammals in the Study Area) has a detailed discussion of available literature on the sightability of marine mammals. Note that Navy does not employ only visual monitoring and makes use of passive acoustic detection when available and appropriate. Also note that not all beaked whale species are small and for example, Baird's beaked whale can reach in excess of 40 feet in length and generally have a detection rate g(0) in excess of 0.90 in the Pacific. More importantly, however, the characterization that visual detection rates for marine mammals, "generally approach only 5" is not accurate. Specifically in reference to the citation in the comment, Barlow and Gisiner (2006) provide a description of typical marine mammal survey methods from ship and aircraft and then provide "a crude estimate" of the difference in detection of beaked whales between trained marine mammal observers and seismic survey mitigation, which is not informative with regard to

Individuals who submitted the form letter made their own amendments, additions, changes, and editorial remarks. Most expressed general opposition to the Proposed Action; others were related to the topics described below. The Navy has responded to these additional comments in Table E.3-6.

Table E.3-6: Responses to the Additions and Changes to the Form Letter as Submitted by the Natural Resources Defense Council

Comment Topic	Response
Concern for harm to marine mammals/marine life	The Navy is committed to protecting the marine environment during the conduct of its training and testing activities. As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the EIS/OEIS, the Navy has used extensive measures to protect the marine environment while training and testing for nearly a decade.
Requests or suggestions for different alternatives	The Alternatives carried forward meet the Navy's purpose and need (see Section 1.4, Purpose and Need for Proposed Military Readiness Training and Testing Activities) to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives. The Navy complied with NEPA requirements in the development and consideration of alternatives. This EIS/OEIS analyzes all alternatives in Section 2.5.2 (Alternatives Carried Forward) and explains why the Navy has eliminated other alternatives in Section 2.5.1 (Alternatives Eliminated from Further Consideration). The selection of an alternative by the decision-maker will be based on a review of all relevant facts, impact analyses, and comments received via the EIS/OEIS public participation process.
Requests or suggestions for additional or other mitigation	As described in Chapter 5 (Standard Operating Procedures, Mitigation, and Monitoring) of the Final EIS/OEIS, the Navy evaluated the effectiveness and practicability of a number of potential mitigation measures. The Navy, in conjunction with NMFS, has determined what mitigation it can effectively use during its training and testing activities. Through careful exploration of all mitigation measures to determine which were the most effective (see Chapter 5, Standard Operating Procedures, Mitigation, and Monitoring]), the Navy has chosen the existing measures to mitigate harm to marine mammals while still being able to meet its operational needs to train for real-world conditions.
General misunderstanding for the need for the Proposed Action	The Alternatives carried forward meet the Navy's purpose and need (see Section 1.4, Purpose and Need for Proposed Military Readiness Training and Testing Activities) to ensure that it can fulfill its obligation under Title 10. See Section 2.5 (Alternatives Development) for more detailed information on the development of alternatives.

E.3.2 Petition

The Navy received a petition circulated by MoveOn.org containing approximately 477,000 signatures. Table E.3-7 provides the Navy's response to the petition itself. The response to the petition was prepared and reviewed for scientific and technical accuracy and completeness. Individuals who signed the petition added their own remarks. Most expressed general opposition to the Proposed Action; other additions were similar to the topics described above for the Natural Resources Defense Council form letter (see Table E.3-6).

Table E.3-7: Response to the Petition from MoveOn.Org

Comment	Navy Response
Stop the killing of 1,800 whales and dolphins and the deafening of 15,900 more by ceasing the operation of the Navy's underwater sound system in the Hawaiian Islands, the California and Atlantic Coasts, and the Gulf of Mexico.	Below is a summary of the facts and analyses related to the HSTT EIS/OEIS: • The Navy employs extensive mitigation measures during its training and testing activities, which the Navy believes significantly, minimizes the risk to marine mammals. • During several decades of training and testing with explosives, only four marine mammals are known to have died during one training accident. Following this incident and in accordance with standard operating procedures, the Navy has ceased all similar training, reviewed mitigation measures, worked with regulators, and have revised Navy mitigation measures. • There is evidence of fewer than 40 marine mammal stranding deaths worldwide connected to Navy sonar training, and no such incidents have occurred since 2006. By comparison, along the coasts of the continental United States, Alaska, and the U.S. Pacific Islands (including Hawaii) over a 9-year period (2001-2009), there were a total of 51,649 reported marine mammal strandings (12,545 cetaceans [average 1,394 per year] and 39,104 pinnipeds [average 4,345 per year]). There has never been a recorded marine mammal stranding in which Navy training or testing using sonar was a causal factor along the East Coast, West Coast, Gulf of Mexico, or Hawaii. • The Navy's modeling, which does not account for mitigation efforts, estimates there is a possibility marine mammals may be exposed to sound levels in certain frequencies that could result in a loss of hearing sensitivity. Using the mitigation measures, we expect the actual numbers of marine mammals affected by Navy training and testing to be much lower. See the Final EIS/OEIS for the refined analysis (refined in coordination with NMFS). The revised estimates now account for mitigation and avoidance, to provide a more holistic approach to analysis. Additionally, loss of hearing sensitivity at certain frequencies does not mean marine mammals will become deaf—they will still be able to hear, hunt for food, and perform other normal activities.

E.4 FINAL ENVIRONMENTAL IMPACT STATEMENT/OVERSEAS ENVIRONMENTAL IMPACT STATEMENT

The public has the opportunity to review the Navy's responses to their comments in this Final EIS/OEIS. All public comments are considered by the decision-maker prior to making a decision.

APPENDIX G STATISTICAL PROBABILITY ANALYSIS FOR ESTIMATING DIRECT STRIKE IMPACT AND NUMBER OF POTENTIAL EXPOSURES

This appendix discusses the methods and results for calculating the probability of a direct strike of an animal from any military items from the proposed training and testing activities falling toward (or directed at) the sea surface. For the purposes of this appendix, military items include non-explosive practice munitions (e.g., rounds from shipboard small-arms live-fire training), sonobuoys, acoustic countermeasures, and targets. Only marine mammals and sea turtles will be analyzed using these methods because animal densities are necessary to complete the calculations, and density estimates are currently only available for marine mammals and sea turtles within the Hawaii-Southern California Training and Testing (HSTT) Study Area (Study Area). Furthermore, the analysis conducted here does not account for explosive munitions because impacts from explosives are analyzed within the United States (U.S.) Department of the Navy (Navy) Acoustic Effects Model.

G.1 DIRECT IMPACT ANALYSIS

A statistical probability was calculated to estimate the impact probability (P) and number of exposures (T) associated with direct impact of military items on marine animals on the sea surface within the specified training or testing area (R) in which the activities are occurring. The statistical probability analysis is based on probability theory and modified Venn diagrams with rectangular "footprint" areas for the individual animal (A) and total impact (I) inscribed inside the training or testing area (R). The analysis assumes: (1) that all animals would be at or near the surface 100 percent of the time, when in fact, marine mammals spend the majority of their time underwater, and (2) that the animals are stationary, which does not account for any movement or any potential avoidance of the training or testing activity.

1. A = length*width, where the individual animal's width (breadth) is assumed to be 20 percent of its length for marine mammals and 112 percent of its length for sea turtles. This product for A is multiplied by the number of animals N_a in the specified training or testing area (i.e., product of the highest average seasonal animal density [D] and training or testing area [R]: N_a = D*R) to obtain the total animal footprint area ($A*N_a$ = A*D*R) in the training or testing area. As a worst case scenario, the total animal footprint area is calculated for the species with the highest average seasonal density in the training or testing area with the highest use of military items within the entire Study Area.

2. I = N_{mun}*length*diameter, where N_{mun} = total annual number of military items for each type, and "length" and "diameter" refer to the individual military equipment dimensions. For each type, the individual impact footprint area is multiplied by the total annual number of military items to obtain the type-specific impact footprint area (I = N_{mun}*length*diameter). Each training or testing activity uses one or more different types of military items, each with a specific number and dimensions, and several training and testing activities occur in a given year. When integrating over the number of military items types for the given activity (and then over the number of activities in a year), these calculations are repeated (accounting for differences in dimensions and numbers) for all military items types used, to obtain the type-specific impact footprint area (I). These impact footprint areas are summed over all military items types for the given activity, and then summed (integrated) over all activities to obtain the total impact footprint area resulting from all activities occurring in the training or testing area in a given year.

As a worst case scenario, the total impact footprint area is calculated for the training or testing area with the highest use of military items within the entire Study Area.

Though marine mammals and sea turtles are not randomly distributed in the environment, a random point calculation was chosen due to the intensive data needs that would be required for a calculation that incorporated more detailed information on an animal's or military item's spatial occurrence.

The analysis is expected to provide an overestimation of the probability of a strike for the following reasons: (1) it calculates the probability of a single military item (of all the items expended over the course of the year) hitting a single animal at its species' highest seasonal density; (2) it does not take into account the possibility that an animal may avoid military activities; (3) it does not take into account the possibility that an animal may not be at the water surface; (4) it does not take into account that most projectiles fired during training and testing activities are fired at targets; and so only a very small portion of those projectiles that miss the target would hit the water with their maximum velocity and force; and (5) it does not quantitatively take into account the Navy avoiding animals that are sighted through the implementation of mitigation measures.

The likelihood of an impact is calculated as the probability (P) that the animal footprint (A) and the impact footprint (I) will intersect within the training or testing area (R). This is calculated as the area ratio A/R or I/R, respectively. Note that A (referring to an **individual** animal footprint) and I (referring to the impact footprint resulting from the **total** number of military items N_{mun}) are the relevant quantities used in the following calculations of single-animal impact probability [P], which is then multiplied by the number of animals to obtain the number of exposures (T). The probability that the random point in the training or testing area is within both types of footprints (i.e., A and I) depends on the degree of overlap of A and I. The probability that I overlaps A is calculated by adding a buffer distance around A based on one-half of the impact area (i.e., 0.5*I), such that an impact (center) occurring anywhere within the combined (overlapping) area would impact the animal. Thus, if L_i and W_i are the length and width of the impact footprint such that $L_i*W_i = 0.5*I$ and $W_i/L_i = L_a/W_a$ (i.e., similar geometry between the animal footprint and impact footprint), and if L_a and W_a are the length and width (breadth) of the individual animal such that $L_a*W_a = A$ (= individual animal footprint area), then, assuming a purely static, rectangular scenario (Scenario 1), the total area $A_{tot} = (L_a + 2*L_i)*(W_a + 2*W_i)$, and the buffer area $A_{buffer} = A_{tot} – L_a*W_a$.

Four scenarios were examined with respect to defining and setting up the overlapping combined areas of A and I:

1. **Scenario 1:** Purely static, rectangular scenario. Impact is assumed to be static (i.e., direct impact effects only; non-dynamic; no explosions or scattering of military items after the initial impact). Hence the impact footprint area (I) is assumed to be rectangular and given by the product of military items length and width (multiplied by the number of military items). $A_{tot} = (L_a + 2*L_i)*(W_a + 2*W_i)$ and $A_{buffer} = A_{tot} – L_a*W_a$.

2. **Scenario 2:** Dynamic scenario with end-on collision, in which the length of the impact footprint (Li) is enhanced by Rn = 5 military items lengths to reflect forward momentum. $A_{tot} = (L_a + (1 + R_n)*L_i)*(W_a + 2*W_i)$ and $A_{buffer} = A_{tot} – L_a*W_a$.

3. **Scenario 3:** Dynamic scenario with broadside collision, in which the width of the impact footprint (W_i) is enhanced by R_n = 5 military items lengths to reflect forward momentum. Atot = $(L_a + 2*W_i)*(W_a + (1 + R_n)*L_i)$ and $A_{buffer} = A_{tot} – L_a*W_a$.

4. **Scenario 4:** Purely static, radial scenario, in which the rectangular animal and impact footprints are replaced with circular footprints while conserving area. Define the radius (R_a) of the circular individual animal footprint such that $\pi * R_a^2 = L_a * W_a$, and define the radius (R_i) of the circular impact footprint such that $\pi * R_i^2 = 0.5 * L_i * W_i = 0.5 * I$. Then $A_{tot} = \pi * (R_a + R_i)^2$ and $A_{buffer} = A_{tot} - \pi * R_a^2$ (where $\pi = 3.1415927$).

Static impacts (Scenarios 1 and 4) assume no additional areal coverage effects of scattered military items beyond the initial impact. For dynamic impacts (Scenarios 2 and 3), the distance of any scattered military items must be considered by increasing the length (Scenario 2) or width (Scenario 3), depending on orientation (broadside versus end-on collision), of the impact footprint to account for the forward horizontal momentum of the falling object. Forward momentum typically accounts for five object lengths, resulting in a corresponding increase in impact area. Significantly different values may result from these two types of orientation. Both of these types of collision conditions can be calculated each with 50 percent likelihood (i.e., equal weighting between Scenarios 2 and 3, to average these potentially different values).

Impact probability P is the probability of impacting one animal with the given number, type, and dimensions of all military items used in training or testing activities occurring in the area per year, and is given by the ratio of total area (A_{tot}) to training or testing area (R): $P = A_{tot}/R$. Number of exposures is $T = N*P = N*A_{tot}/R$, where N = number of animals in the training or testing area per year (given as the product of the animal density [D] and range size [R]). Thus, $N = D*R$ and hence $T = N*P = N*A_{tot}/R = D*A_{tot}$. Using this procedure, P and T were calculated for each of the four scenarios, for Endangered Species Act (ESA)-listed marine mammals and the marine mammal and sea turtle species with the highest average seasonal density (used as the annual density value) and for each military item type. The scenario -specific P and T values were averaged over the four scenarios (using equal weighting) to obtain a single scenario -averaged annual estimate of P and T.

G.2 Parameters for Analysis

Impact probabilities (P) and number of exposures (T) were estimated by the analysis for the following parameters:

1. **Three proposed alternatives:** No Action Alternative, Alternative 1, and Alternative 2. Animal densities, animal dimensions, and military item dimensions are the same for the three alternatives.

2. **Two Training or Testing Areas:** Hawaii Range Complex (HRC) and Southern California (SOCAL) Operating Areas (OPAREA). Areas are 235,000 square nautical miles (nm^2) and 120,000 nm^2, respectively. These two training areas were chosen because they constitute the areas with the highest estimated numbers and concentrations of military expended materials for each alternative, and would, thus, provide a reasonable comparison for all other areas with fewer expended materials.

3. **The following types of munitions or other items:**

    a) **Small-caliber projectiles:** up to and including 0.50 caliber rounds
    b) **Medium-caliber projectiles:** larger than 0.50 caliber rounds but smaller than 57 millimeter (mm) projectiles
    c) **Large-caliber projectiles:** includes projectiles greater than or equal to a 57 mm projectile

d) **Missiles:** includes rockets and jet-propelled munitions
e) **Bombs:** Non-explosive practice bombs and mine shapes, ranging from 10 to 2,000 pounds (lb.) (4.5 to 907.2 kilograms [kg])
f) **Torpedoes:** includes aircraft deployed torpedoes
g) **Sonobuoys:** includes aircraft deployed sonobuoys

4. **Animal species of interest:** the six species of ESA-listed marine mammals and the non-ESA listed marine mammal species with the highest average seasonal density in the training and testing areas of interest. The sea turtle species with the highest average seasonal density in the training and testing areas of interest.

G.3 INPUT DATA

Input data for the direct strike analysis include animal species likely to be in the area and military items proposed for use under each of the three alternatives. Animal species data include: (1) species ID and status (i.e., threatened, endangered, or neither), (2) highest average seasonal density estimate for the species of interest, and (3) adult animal dimensions (length and width) for the species with the highest density. The animal's dimensions are used to calculate individual animal footprint areas (A = length*width), and animal densities are used to calculate the number of exposures (T) from the impact probability (P): T = N*P. Military items data include: (1) military items category (e.g., projectile, bomb, rocket, target), (2) military items dimensions (length and width), and (3) total number of military items used annually.

Military items input data, specifically the quantity (e.g., numbers of guns, bombs, and rockets), are different in magnitude among the three proposed alternatives (No Action Alternative, Alternative 1, and Alternative 2). All animal species input data, the military items identification and category, and military items dimensions, are the same for the three alternatives, only the quantities (i.e., total number of military items) are different.

G.4 OUTPUT DATA

Estimates of impact probability (P) and number of exposures (T) for a given species of interest, were made for the specified training or testing area with the highest annual number of military items used for each of the three alternatives. The calculations derived P and T from the highest annual number of military items used in the Study Area for the given alternative. Differences in P and T among the alternatives arise from different numbers of events (and therefore military items) for the three alternatives.

Results for marine mammals and sea turtles are presented in Table G-1 and Table G-2.

RECORD OF DECISION

ISSUANCE OF MARINE MAMMAL PROTECTION ACT (MMPA) REGULATIONS TO TAKE MARINE MAMMALS INCIDENTAL TO U.S. NAVY TRAINING AND TESTING ACTIVITIES IN THE HAWAII-SOUTHERN CALIFORNIA TRAINING AND TESTING STUDY AREA

Supported by: U.S. Navy Final Environmental Impact Statement/
Overseas Environmental Impact Statement for Hawaii-Southern California Training and Testing

National Oceanic and Atmospheric Administration
National Marine Fisheries Service
Office of Protected Resources
Silver Spring, Maryland

In accordance with the National Environmental Policy Act (NEPA) and its implementing regulations and the National Oceanic and Atmospheric Administration's (NOAA's) Administrative Order 216-6 Environmental Review Procedures for Implementing the National Environmental Policy Act, this document comprises NOAA's National Marine Fisheries Service's (NMFS) Record of Decision (ROD) for issuance of regulations pursuant to section 101(a)(5)(A) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1361 *et seq.*) to the U.S. Navy (Navy) for the taking of marine mammals incidental to the conduct of specified activities in the Hawaii-Southern California Training and Testing Study Area.

I. INTRODUCTION

In April 2012, NMFS received an application from the Navy requesting five-year regulations and authorizations for the take of 39 species of marine mammals incidental to Navy training and testing activities to be conducted within the Navy's Hawaii-Southern California Training and Testing (HSTT) Study Area, for the period of December 2013 through December 2018. These training and testing activities may incidentally take marine mammals present within the HSTT Study Area by exposing them to sound from active sonar, underwater detonations, airguns, and/or pile driving and removal at levels that NMFS associates with the take of marine mammals as defined by the MMPA. In addition, incidental takes of marine mammals may occur from ship strikes. NMFS' issuance of MMPA regulations to the Navy governing the incidental take of marine mammals is a federal action for which NMFS is responsible for analyzing the effects on the human environment pursuant to NMFS' NEPA procedures.

NMFS participated as a cooperating agency in the development of the Navy's Final Environmental Impact Statement/Overseas Environmental Impact Statement (hereinafter, FEIS), which contained an analysis of the effects of the Navy's activities on the human environment. NMFS worked closely with the Navy to provide information in NMFS' area of expertise to support the FEIS' effects analyses for endangered species, marine mammals, and other marine resources. In accordance with the NEPA regulations at 40 CFR 1506.3, NMFS analyzed the Draft EIS and concluded that NMFS' comments and suggestions have been addressed. NMFS adopted the Navy's FEIS in December 2013.

A. Navy Proposed Action

As described in Chapter 2 of the FEIS, the Navy proposed action is to conduct training and testing activities - which may include the use of active sonar and explosives - primarily within existing range complexes and operating areas located along the coast of Southern California and around the Hawaiian Islands. The proposed action also includes activities such as sonar maintenance and gunnery exercises conducted concurrently with ship transits and which may occur outside Navy range complexes and testing ranges. The proposed action includes pierside sonar testing conducted as part of overhaul, modernization, maintenance, and repair activities at shipyards and Navy piers within the Study Area.

The Navy's proposed training activities are categorized into eight functional warfare areas (anti-air warfare; amphibious warfare; strike warfare; anti-surface warfare; anti-submarine warfare; electronic warfare; mine warfare; and naval special warfare). Testing activities may occur independently of or in conjunction with training activities. Many testing activities are conducted similarly to Navy training activities and are also categorized under one of the primary mission areas. Other testing activities are unique and described within their specific testing categories.

B. NMFS' MMPA Decision Authorities

Sections 101(a)(5)(A) and (D) of the MMPA direct the Secretary of Commerce (Secretary) to allow, upon request, the incidental, but not intentional taking of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) during periods of not more than 5 consecutive years if certain findings are made and regulations are issued or, if the taking is limited to harassment and of no more than 1 year, the Secretary shall issue a notice of proposed authorization for public review.

As described in the Navy's application, the specified Navy activities to be conducted in the HSTT Study Area are expected to take marine mammals as defined by the MMPA, and the Navy requested incidental take authorization in accordance with Section 101(a)(5)(A) of the MMPA. In order to issue the regulations and subsequent Letters of Authorization (LOAs) under this section, NMFS must make the determination that the specified activities will result in a negligible impact on the affected species or stocks and not result in an unmitigable adverse impact on the availability of marine mammal species or stocks for taking for subsistence uses. In addition, NMFS, as part of its regulatory process, is required to prescribe the permissible methods of taking, the means of effecting the least practicable adverse impact on the species or stock and its habitat (i.e., mitigation) and to set forth requirements pertaining to monitoring and reporting of such taking.

NMFS has defined "negligible impact" as “an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival.” (50 CFR § 216.103)

The National Defense Authorization Act (NDAA) (Public Law 108-136) amended the MMPA, by removing the “small numbers” and “specified geographical region” limitations and amending the definition of “harassment” as it applies to a “military readiness activity” to read as follows (Section 3(18)(B) of the MMPA):

(i) any act that injures or has the significant potential to injure a marine mammal or marine mammal stock in the wild [Level A Harassment]; or

(ii) any act that disturbs or is likely to disturb a marine mammal or marine mammal stock in the wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering, to a point where such behavioral patterns are abandoned or significantly altered [Level B Harassment].

The MMPA also contains a provision related to “military readiness activities” that requires NMFS, when making a determination of “least practicable adverse impact on such species or stock” to consider personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity. Before making the required determination, NMFS must consult with the Department of Defense regarding the mitigation measures and their effect on the aforementioned factors.

II. NMFS’ DECISION AND FACTORS CONSIDERED IN THE DECISION

A. The Decision

NMFS’ decision is to issue regulations and two 5-year LOAs (one for training and one for testing) for the unintentional take of marine mammals incidental to specified activities included within the FEIS Alternative 2, which was the preferred alternative identified in the Draft EIS and the action presented to NMFS in the Navy’s LOA application (as updated). The regulations will govern the unintentional taking of marine mammals incidental to training and testing activities conducted in the HSTT Study Area for the period of December 2013 through December 2018. Alternative 2 of the FEIS includes an analysis of all of the activities for which the Navy has requested incidental take authorization pursuant to the MMPA. The regulations will prescribe the permissible methods of taking, the means of effecting the least practicable adverse impact on the species or stock and its habitat (i.e., mitigation), and will set forth requirements pertaining to monitoring and reporting of such taking for the specified activities, as described in Alternative 2.

The Navy will be authorized to take individuals of 39 species of marine mammals by Level B harassment and 24 species of marine mammals by Level A harassment or mortality. NMFS will issue a final rule that establishes a framework in which incidental take can be authorized through issuance of LOAs.

B. Factors considered in Reaching the decision

In the FEIS, the affected environment and environmental consequences are both discussed in Chapter 3, within subsections arranged by Resource type, including: Sediments and Water Quality; Air Quality; Marine Habitats; Marine Mammals; Sea Turtles; Seabirds; Marine Vegetation; Marine Invertebrates; Fish; Cultural Resources; Socioeconomic Resources; Public Health and Safety. Supporting technical documents contain additional information on marine mammals and the modeling used by the Navy to quantitatively evaluate impacts to marine mammals. The Marine Mammals subchapter (3.4) and supporting technical documents contain the majority of the analysis that relates to NMFS' action of issuing incidental take regulations. Other sections of the FEIS contain analyses related to potential impacts on marine mammal habitat and further support NMFS' proposed issuance of regulations and the LOAs. In addition, Chapter 4 provides an assessment of potential cumulative impacts, including analyzing the potential for cumulatively significant impacts to the marine environment and marine mammals.

Within the Marine Mammals section (and supporting technical documents), the Navy's FEIS addresses potential acoustic impacts resulting from active sonar, explosive detonations, airguns, and pile driving and removal, as well as non-acoustic impacts (such as ship strikes). These sections describe in detail the acoustic thresholds that NMFS uses to indicate at what received sound levels marine mammals will be considered taken pursuant to the MMPA. The FEIS also describes in detail the analytical framework and model that the Navy uses to estimate take, based on NMFS' acoustic thresholds. Last, the Navy presents estimates (for each alternative) of the number of each species of marine mammal that will be exposed to levels of sound that NMFS has determined will result in Level A or Level B Harassment. The Navy uses these take estimates, combined with the other information included in this Chapter to conclude that none of the alternatives will result in any adverse population level effects on any of the affected species or stocks. The take estimates for the Navy's preferred alternative are the subject of the Navy's request to NMFS for MMPA Section 101(a)(5)(A) authorization.

As described above, the environmental consequences to the marine environment are of particular importance for NMFS' evaluation in reaching the decision to issue MMPA incidental take regulations. In particular, because NMFS' action is specific to authorizing unintentional take of marine mammals, the key factors considered in the decision are related to NMFS' statutory missions under the MMPA and the Endangered Species Act (ESA). The primary documents supporting this decision are the Navy's HSTT FEIS and the HSTT Biological Opinion.

As a cooperating agency, NMFS assisted the Navy by providing technical information and analyses to evaluate the effects of military readiness activities on marine mammals and their habitat. Via the MMPA process, NMFS reviewed the Navy's request to determine whether the total taking resulting from the activities would have a negligible impact on the affected species or stocks of marine mammals, would not have an unmitigable adverse impact on the availability of those species or stocks of marine mammals intended for subsistence uses, and that the permissible methods of taking and requirements pertaining to the mitigation, monitoring, and reporting of such takings are set forth. As supported by the FEIS, NMFS has made the requisite findings under the MMPA and will include these findings in a final rule.

Key relevant factors considered by NMFS in this decision include:

- Requiring mitigation. As noted above, for military readiness activities, NMFS is required to consider personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity when it makes its determination of "least practicable adverse impact." NMFS consulted with the Navy via the MMPA process and as a NEPA cooperating agency before making the required determination. NMFS and the Navy considered numerous mitigation measures and alternatives during the MMPA rulemaking process, including after the public comment period on the proposed rulemaking, with particular emphasis on whether these measures would be beneficial, effective, and practicable.

- Addressing uncertainty. The FEIS acknowledges a degree of uncertainty regarding the effects of underwater sound on marine mammals. NMFS provided extensive input in the FEIS process to address these uncertainties, and has included requirements for mitigation, monitoring, and reporting by the Navy in the final rule to manage uncertainty. The key issues and the manner in which they are addressed in the final rule include:

    1. Uncertainty regarding potential effects of sound sources on marine mammals (i.e., model input values) was addressed in the FEIS via taking a conservative approach to assure that potential effects are not under-estimated. For example, based on the onset mortality and slight lung injury criteria, many animals that are counted as a mortality or are estimated to suffer slight lung injury, may actually recover from their injuries or not incur injuries at all. As another example, many explosions from munitions such as bombs and missiles will actually occur upon impact with above-water targets; however, these sources were modeled as exploding at about 1 -m depth. This overestimates the amount of explosive and acoustic energy entering the water, and therefore the effects on marine mammals.
    2. Continuing management to reduce uncertainty will be implemented via the MMPA final rule by requiring extensive monitoring and reporting by the Navy, including the establishment and implementation of a monitoring plan specific to the HSTT Study Area, an Integrated Comprehensive Monitoring Plan, and a Strategic Planning Process. The Navy will update the status of its monitoring program and funded projects through their new Navy Marine Species Monitoring web portal. The Navy's monitoring program is designed to support NMFS' use of adaptive management throughout rule implementation, as presented in the FEIS and further explained in the final rule. The monitoring framework was made available for comment on the NMFS website concurrent with availability of the MMPA proposed rule and NMFS will provide one public comment period on the Navy's monitoring program during the 5-year regulations.
    3. Finally, while not a required component of the final rule, the Navy's FEIS describes the Navy's continuing commitment to marine mammal research, in particular research related to the effects of underwater sound on marine mammals. NMFS will continue to encourage and support the Navy's research efforts. The timeframe for completing the research and conducting an assessment of how that research factors into MMPA authorizations however, does not allow NMFS to wait for the results of the research prior to authorizing the Navy's request for incidental take.

NMFS finds that the FEIS appropriately acknowledges uncertainty and provides detailed analyses as to how existing information is incorporated to assess effects where uncertainties exist, and to address and manage uncertainty via mitigation, monitoring, reporting and research.

- Considering effects to ESA-listed marine mammals. The Navy consulted with NMFS pursuant to section 7 of the ESA, and NMFS also consulted internally on the issuance of LOAs under section 101(a)(5)(A) of the MMPA for training and testing activities in the HSTT Study Area. NMFS issued a Biological Opinion on the Navy's proposal to conduct training and testing activities in the HSTT Study Area from December 2013 through December 2018 and the Permits Division's proposal to issue regulations to authorize the Navy to "take" marine mammals incidental to the conduct of training and testing activities in the HSTT Study Area during the same period of time. The Biological Opinion concludes that the proposed regulations and any take associated with activities authorized by those regulations are not likely to jeopardize the continued existence of threatened or endangered species (or species proposed for listing) in the action area during any single year or as a result of the cumulative impacts of a 5-year authorization. The Biological Opinion includes an explanation of how the results of NMFS' baseline and effects analyses in Biological Opinions relate to those contained in the cumulative impact section of NEPA documents. In particular, these analyses consider the effects resulting from interactions of potential stressors, thereby augmenting the FEIS' cumulative impacts analysis.

  The Biological Opinion includes a discussion of the FEIS' marine mammal take estimates, but relies on exposure and response analyses. The exposure analysis identifies the listed resources that are likely to co-occur with effects in space and time and the nature of that co-occurrence, to identify the number, age (or life stage), and gender of the individuals that are likely to be exposed to an action's effects and the populations or sub-populations those individuals represent. The take estimate approach and the exposure/response approach are appropriate under the MMPA and ESA, respectively, and both were considered in reaching this decision regarding the issuance of a rule and 5-year LOAs for the Navy activities in the HSTT Study Area. The final rule addresses the manner in which the number of takes of listed marine mammals proposed to be authorized in LOAs issued under this regulation will be aligned with the exposure analysis methodologies and subsequent Incidental Take Statements issued in association with subsequent Biological Opinions.

- Approach to assessments. NEPA, ESA, and MMPA involve differing approaches to assessing effects on those resources considered under each statute, and this combination of analyses provides a robust basis for the decision on this action. The FEIS, Biological Opinion, and final rule for HSTT present the assessments in detail, but a few salient issues and difference are highlighted here. First, both the FEIS and the Biological Opinion include analysis of the significance of the Navy activities on marine mammals (listed marine mammals in the Biological Opinion). In the FEIS, the term "significance" is as commonly used in NEPA, without additional definition of significance related to marine mammals. The Biological Opinion describes how the use of the term is distinguished in the opinion among three different kinds of "significance," which includes an assessment of how any "significant" physical, chemical, or biotic responses are likely to have "significant" consequence for the fitness of the individual animal. As described earlier, the MMPA uses the term "negligible impact" (defined above). For this ROD, the FEIS evaluation of the significance of impacts to species was considered as input to NMFS' ESA and MMPA assessments; this decision is supported by the FEIS and also reached based on NMFS statutory responsibilities under the MMPA and ESA.

Coastal Zone Management Act Concerns. On January 13, 2013, the Navy submitted a Consistency Determination under 15 CFR Section 930 for the proposed action to the Hawaii Department of Business, Economic Development & Tourism. This was based on the Navy's determination that the conduct of HSTT activities is consistent to the maximum extent practicable with the enforceable policies of the Hawaii CZM Program. The Hawaii Office of Planning, CZM Program, State of Hawaii conditionally concurred with the Consistency Determination by letter on March 20, 2013.

On January 13, 2013, the Navy also submitted a Consistency Determination for the proposed action to the California Coastal Commission. The California Coastal Commission objected to the Navy's Consistency Determination on March 14, 2013, based on lack of sufficient information to determine the Program's consistency to the maximum extent practicable with the marine resource protection policy and the commercial fishing policies of the California Coastal Act. The Navy disagreed with the Commission's decision, but provided additional information to address the Commission's concerns on March 26, 2013.

Essential Fish Habitat. The Navy determined that their activities may adversely affect Essential Fish Habitat (EFH) within the HSTT Study Area and requested initiation of the Magnuson-Stevens Fishery Conservation and Management Act's EFH consultation process with NMFS Pacific Islands Regional Office (PIRO) on February 12, 2013. NMFS PIRO considered that the proposed activities may have more than minimal adverse effects to EFH and made recommendations to avoid, minimize, and offset adverse effects on April 8, 2013. The Navy responded in writing to each of NMFS PIRO's recommendations on April 17, 2013. Following some joint NMFS-Navy meetings, NMFS PIRO and the Navy agreed to a number of action items clarifying the Navy's proposed activities and providing further information to NMFS.

The Navy also requested initiation of the Magnuson-Stevens Fishery Conservation and Management Act's EFH consultation process with NMFS Southwest Regional Office (SWRO) on February 12, 2013. NMFS SWRO determined that the Navy's activities would have an adverse impact on EFH, but that the proposed conservation measures are sufficient to avoid, minimize, or offset impacts to EFH and provided no additional EFH Conservation Recommendations on April 3, 2013.

III. OTHER ALTERNATIVES CONSIDERED

The alternatives analyzed in the Navy's FEIS and their relationship to NMFS' alternatives are described here. NMFS' proposed action (issuance of regulations and LOAs) would authorize take of marine mammals incidental to a subset of the activities analyzed in the Navy's HSTT FEIS that are anticipated to result in the take of marine mammals, i.e., those activities that involve the use of active sonar, underwater detonations, airguns, and pile driving and removal. Thus, these components of the Navy's proposed action are the subject of NMFS' proposed MMPA regulatory action. (Note that, although NMFS fully (rather than partially) adopted the HSTT FEIS, the purely terrestrial activities described in the FEIS are not a component of NMFS' proposed action.) The Navy's FEIS contains a thorough analysis of the environmental consequences of their proposed action (with specific sections for MFAS/HFAS and underwater detonations) on the human environment, including a specific section on marine mammals.

A. Summary of the Alternatives Considered by the Navy

Three alternatives were analyzed in the FEIS, including two action alternatives (Alternatives 1 and 2) and the No Action Alternative.

No Action Alternative: The No Action Alternative is required by CEQ regulations as a baseline against which the impacts of the Proposed Action are compared. In the FEIS, the No Action Alternative is represented by baseline training and testing activities, as defined by existing Navy environmental planning documents. The baseline testing activities also include those testing events that have historically occurred in the Study Area and have been subject to previous analyses.

Alternative 1: Alternative 1 includes all ongoing Navy training associated with the No Action Alternative, and proposes an overall expansion of the Study Area plus adjustments to types and levels of activities from the baseline, as necessary to support current and planned Navy training and testing requirements. This Alternative considers analysis of areas where Navy training and testing would continue as in the past, but were not considered in previous environmental analyses. Alternative 1 would not expand the area where the Navy trains and tests, but would simply expand the area that is to be analyzed.

Alternative 2 (Preferred Alternative): Alternative 2 would include all of the activities described in Alternative 1 plus the establishment of new range capabilities, modifications of existing capabilities, and adjustments to type and levels of training and testing.

The following four alternatives were considered by the Navy, but not carried forward for analysis because, after careful consideration, the Navy determined that they did not meet the Navy's purpose and need for the Proposed Action:

- Alternative training and testing locations
- Reduced training and testing
- Mitigations including temporal or geographic constraints within the Study Area
- Simulated training and testing

B. Summary of Alternatives Considered by NMFS

For all of the Navy alternatives identified above, the Navy includes an associated list of standard protective measures specifically developed to minimize adverse impacts on marine mammals.

NMFS worked closely with the Navy throughout the development of the FEIS to identify additional mitigation measures (for marine mammals) that the Navy should consider in their analysis. As a result of this cooperating agency role, the Navy discussed and considered additional mitigation measures in its FEIS, but determined these were not able to be implemented either because the measures were not consistent with mission requirements or were prohibitively difficult to implement, or because the Navy's analysis concluded that the measures did not provide sufficient protective benefits to marine mammals. The inclusion of the analysis of these additional mitigation measures strengthens the FEIS' support and coverage of NMFS' FEIS alternatives, which are listed below. These alternatives are not enumerated in the Navy FEIS, but are supported by the analyses in that FEIS:

- The Navy's training activities (no active sonar) would continue at baseline levels. The Navy would not request, and NMFS would not issue, an incidental take authorization for an increased level of activity (for NMFS, this constitutes the NEPA-required No Action alternative);
- NMFS promulgates regulations and issues LOAs authorizing take of marine mammals incidental to a subset of the Navy training activities (i.e., those including the use of active sonar, underwater explosives, airguns, and pile driving and removal) described in the FEIS preferred alternative (Alternative 2), with the mitigation, monitoring and reporting measures presented in Chapter 5 of the FEIS (except those considered but eliminated); or
- NMFS promulgates regulations and issues LOAs authorizing take of marine mammals incidental to a subset of the Navy training activities (i.e., those including the use of active sonar, underwater explosives, airguns, and pile driving and removal) described in the Navy's preferred alternative (Alternative 2), but with additional mitigation requirements for marine mammals, potentially including measures considered but eliminated in Chapter 5 of the FEIS or other additional measures developed by NMFS or suggested to NMFS via public comment on the proposed rule.

Based on the FEIS and additionally supported by NMFS response to public comments in the preamble to the final rule, NMFS determined that the mitigation measures identified in the FEIS (Chapter 5, except those measures considered but eliminated) will effect the least practicable adverse impact on marine mammal species or stocks and their habitat. All of the measures chosen to be included in the MMPA final rule are components of the FEIS Alternative 2 (second bullet, above). Based on NMFS' purpose and the findings made in the final rule, NMFS selected to promulgate regulations and issue LOAs authorizing take of marine mammals incidental to a subset of the Navy training activities described in the FEIS preferred alternative, with the mitigation, monitoring, and reporting measures presented in Chapter 5 of the FEIS (except those considered but eliminated).

C. The Environmentally Preferable Alternative

The No Action Alternative described in the Navy's FEIS is the baseline level of training and testing being conducted in the HSTT Study Area, as defined by existing Navy environmental planning documents. Both Alternatives 1 and 2 (preferred alternative) include and expansion of the Study Area and an adjustment to the types and levels of activities from the baseline. The No Action is considered the environmentally preferred alternative.

IV. PUBLIC INVOLVEMENT

Public opportunities for review and comment have occurred in support of the FEIS preparation and the consideration of MMPA rulemaking. Detailed information on the publications in which the Notice of Intent to prepare an EIS and the Draft EIS were noticed are provided in Appendix E of the FEIS, and the FEIS was similarly made available on August 30, 2013.

NMFS personnel attended the information meetings and hearings on the Draft EIS, when available, which were held at various locations in Hawaii and California. The Navy received comments on the Draft EIS from individuals, agencies, and organizations. The comments expressed interest or concern for numerous issues including: marine mammals and effects from sonar and underwater detonations, fishing and tourism, airborne noise, NEPA process, alternatives selection, military expended materials, and mitigation measures. The FEIS addressed all oral and written comments received during the Draft EIS comment period. As a cooperating agency, NMFS assisted in the analysis and consideration of public comments in NMFS' areas of jurisdiction and expertise to support the development of the FEIS. The Navy ensured the FEIS was mailed to all individuals, agencies, and organizations that requested a copy of the final document, and that the FEIS remains available on the website at hstteis.com.

The Navy received four comment letters during the FEIS wait period and will include a summary of the comments in their ROD, when issued. NMFS was provided with and reviewed the FEIS comment letters. All of the comments on the HSTT FEIS that are related to NMFS' action (the issuance of an MMPA authorization) have been considered by NMFS in reaching this decision. The comments either (1) reiterated comments received on the Draft EIS and were already covered by Navy in the FEIS, (2) were related to mitigation and were similar to issues considered by NMFS and the Navy in the "Mitigation Measures Considered but Eliminated" section, or (3) were received as similar comments on the MMPA proposed rule and were considered in developing the final rule (these will be specifically addressed in the response to comments to be published in the preamble of the final rule).

Substantial public involvement also occurred in association with NMFS' rulemaking. On October 4, 2012 (77 FR 60678) NMFS published a notice of receipt of the application for LOAs for the Navy's training and testing activities conducted in the HSTT Study Area, with a request for comments and information open through November 5, 2012. On January 31, 2013 (78 FR 6978), NMFS published a proposed rule in response to the Navy's request to take marine mammals incidental to training and testing activities in the HSTT Study Area and requested comments, information, and suggestions concerning the request. During the 30-day public comment period, NMFS received comments from the Marine Mammal Commission, and several non-governmental organizations, including the Natural Resources Defense Council, Cascadia Research Collective, and Earthjustice (on behalf of the Center for Biological Diversity and Ocean Mammal Institute), as well as interested members of the public. The comments were considered in developing the final rule, and detailed responses to those comments are included in the preamble to the final rule. The categories of public comments addressed include additional mitigation recommendations, mitigation effectiveness, impact analyses, monitoring and reporting, general opposition to the rulemaking, and other comments not specific to a category.

Public input was carefully considered by NMFS in developing a final rule and in reaching this decision to issue the regulations for the activities specified in FEIS Alternative 2.

V. MITIGATION, MONITORING AND REPORTING MEASURES

The final rule includes detailed mitigation measures that must be implemented by the Navy when conducting specified activities in the HSTT Study Area. Inclusion of these requirements ensures that NMFS' action of issuing incidental take regulations specifies and requires all practicable means to avoid or minimize impacts to marine mammals from the selection of FEIS Alternative 2. In addition, NMFS' final rule will specify the requirements for the Navy to implement a monitoring and reporting program. In addition to the requirements that will be established in the rule and required of Navy, NMFS will meet annually with the Navy to discuss the required Navy monitoring reports, Navy R&D developments, and current science and whether mitigation or monitoring modifications are appropriate. This use of adaptive management via the MMPA process will allow NMFS to consider new data from different sources to determine (in coordination with the Navy) on an annual basis if mitigation or monitoring measures should be modified or added (or deleted) if new data suggests that such modifications are appropriate (or are not appropriate) for subsequent LOAs.

VI. CONCLUSIONS

Through the FEIS and as documented in this ROD, NMFS has considered the goals and objectives of the NMFS' proposed action and has analyzed a reasonable range of alternatives that adequately address the objective of the proposed action. Furthermore, NMFS has analyzed the associated environmental consequences of the identified alternatives and the mitigation measures and monitoring requirements needing to be analyzed and required under the final rule and LOAs. NMFS has also considered the public comments addressed to the Navy in the FEIS and the comments addressed to NMFS during the proposed rule comment period. Consequently, NMFS has selected the alternative of issuing regulations authorizing the unintentional harassment of marine mammals incidental to Navy activities in the HSTT Study Area in accordance with Alternative 2 of the FEIS for the period December 2013 through December 2018, including in that regulation specified requirements for mitigation, monitoring and reporting.
