Executive Summary

*Steven K. Cook
GOOS Center Manager
NOAA/AOML*

During calendar year 2000 the GOOS Center Global Drifter Program deployed 445 Drifting Buoys, with 236 deployed in the tropical Pacific, 77 in the tropical Atlantic plus 9 WOTAN's for the Hurricane array, 51 in the Indian Ocean and 72 in the southern Ocean. The Upper Ocean Thermal Center SEAS Program globally collected over 100,000 meteorological and 11,000 Expendable Bathythermograph (XBT) observations. Our data tracking activities monitored, in real-time, more than 365,000 wind, air temperature, sea level pressure and sea surface temperature measurements as well as more than 24,000 XBT measurements collected from ships observations and inserted onto the Global Telecommunications System. Additionally we monitored more than 730,000 real-time sea surface temperatures collected by the Global Drifter Center network plus more than 65,000 wind measurements collected by the Tropical Atmosphere-Ocean (TAO) array. These monitoring efforts identified and initiated corrective action for, several data drop-outs from several different sources.

The Data Assembly Center of the Global Drifter Program continued to successfully update the research quality database at two-month intervals even with declining personnel resources. The Atlantic XBT Data Assembly Center continued to import real-time data into the database at monthly intervals. We were able to continue XBT support and the upgrading of Drifting Buoys with barometer capability for our international colleagues with the financial help of NOAA's Office of Global Programs. We continued to participate in the DBCP, SOOPIP, VOSCLIM and the Working Group on Automated Systems. The development of AMVER/SEAS 2000 continued under ESDIM support.

GOOS Center Mission

To provide high quality ocean data and products in a timely and cost-effective manner to satisfy NOAA nowcast, forecast, detection, attribution and research mission requirements.

Major GOOS Center Operations

Voluntary Observing Ship (VOS) Program

The Global Ocean Observing System (GOOS) Center at NOAA's Atlantic Oceanographic and Meteorological Laboratory presently operates a global fleet of about 400 domestic and foreign commercial vessels. The GOOS global fleet mostly represents a subset of the larger National Weather Service Voluntary Observing Ship (VOS) fleet consisting of over 1500 vessels. These vessels voluntarily collect sea surface meteorological, sub-surface expendable bathythermograph, and shipboard thermosalinograph observations. They deploy Drifting Buoys and highly instrumented P-ALACE type floats and sometimes tow Continuous Plankton Recorders. The GOOS global VOS fleet is the mechanism used to collect observations and deploy instrumentation that transmit, in real-time, data to National Centers such as the National Center for Environmental Prediction. In any given year this network provides the following approximate number of observations:

630,000 Sea Surface Temperature Observations from Drifting Buoys
110,000 Meteorological Observations from VOS
30,000 Thermosalinograph Observations from VOS
15,000 Expendable Bathymeterograph Observations from VOS

Global Drifter Program (GDP)

The GOOS Center presently operates a global Drifting Buoy Center that annually deploys, via the (VOS) Program, research vessels and U.S. Navy aircraft, over 400 Drifters in all three ocean basins. These drifters are tracked daily via the ARGOS satellite system. Their positions and sea surface temperatures (and sometimes other parameters) are processed and inserted on to the Global Telecommunications System (GTS) for global distribution. Approximately 630,000 sea surface temperatures are collected annually via this program. Additionally, the GOOS Center performs the added function of a Data Acquisition Center (DAC) for the GDP. When the deployed Drifters are verified as operational

they are reported to the DAC. This effort insures that research quality Drifter data are available from other organizations and countries programs. The Global Drifter Program is a participating member of the Intergovernmental Oceanographic Commission (IOC) - World Meteorological Organization (WMO), Data Buoy Co-operation Panel (DBCP) and as such represents NOAA in this international forum.

Expendable Bathythermograph (XBT) Program

The GOOS Center operates a global XBT Program that utilizes approximately 70 VOS to monitor, on a monthly basis, 26 transects in all three ocean basins. The GOOS Center utilizes Shipboard Environmental data Acquisition Systems (SEAS) hardware/software to collect, quality control and transmit in real-time subsurface oceanographic observations (about 15,000 per year) and sea surface meteorological observations (about 110,000 per year). The XBT is an expendable temperature probe that is manually launched from the bridge wings of commercial vessels approximately 4 times per day, along certain scientifically selected shipping lanes. The data transmitted via the wire link from the XBT probe is stored on the SEAS computer where it is processed and formatted for satellite message transmission. The transmitted data is routed to the GOOS Center where it is further quality controlled and then inserted on to the Global Telecommunication System (GTS) for global distribution. The National Center for Environmental Prediction (NCEP) uses these data for weather and climate forecasting as well as for seasonal, inter-annual and decadal climate research. The XBT program is a participating member of the IOC - WMO, Ship of Opportunity Program Implementation Panel (SOOPIP) and as such represents NOAA in this international forum.

Argo Program

AOML has been funded by the National Oceanographic Partnership Program (NOPP) as part of a larger group to develop the infrastructure for the Argo experiment. Specifically, AOML is to develop the information management methodology for the profiling float experiment. This methodology will take the data from the sensor through a real-time quality control to submission onto the GTS for dissemination to the user community. In addition, delayed mode quality control, data accessibility and network evaluation issues will be addressed and procedures developed and implemented. The principle NOAA user for the float data is the climate forecast group of NCEP. AOML is working with NCEP to develop and implement real-time quality control procedures for the profile data. To satisfy a diverse group of users, data must be provided within 12 hours of collection, 24 hours a day, 7 days a week. Automatic quality control procedures are being developed to meet these requirements.

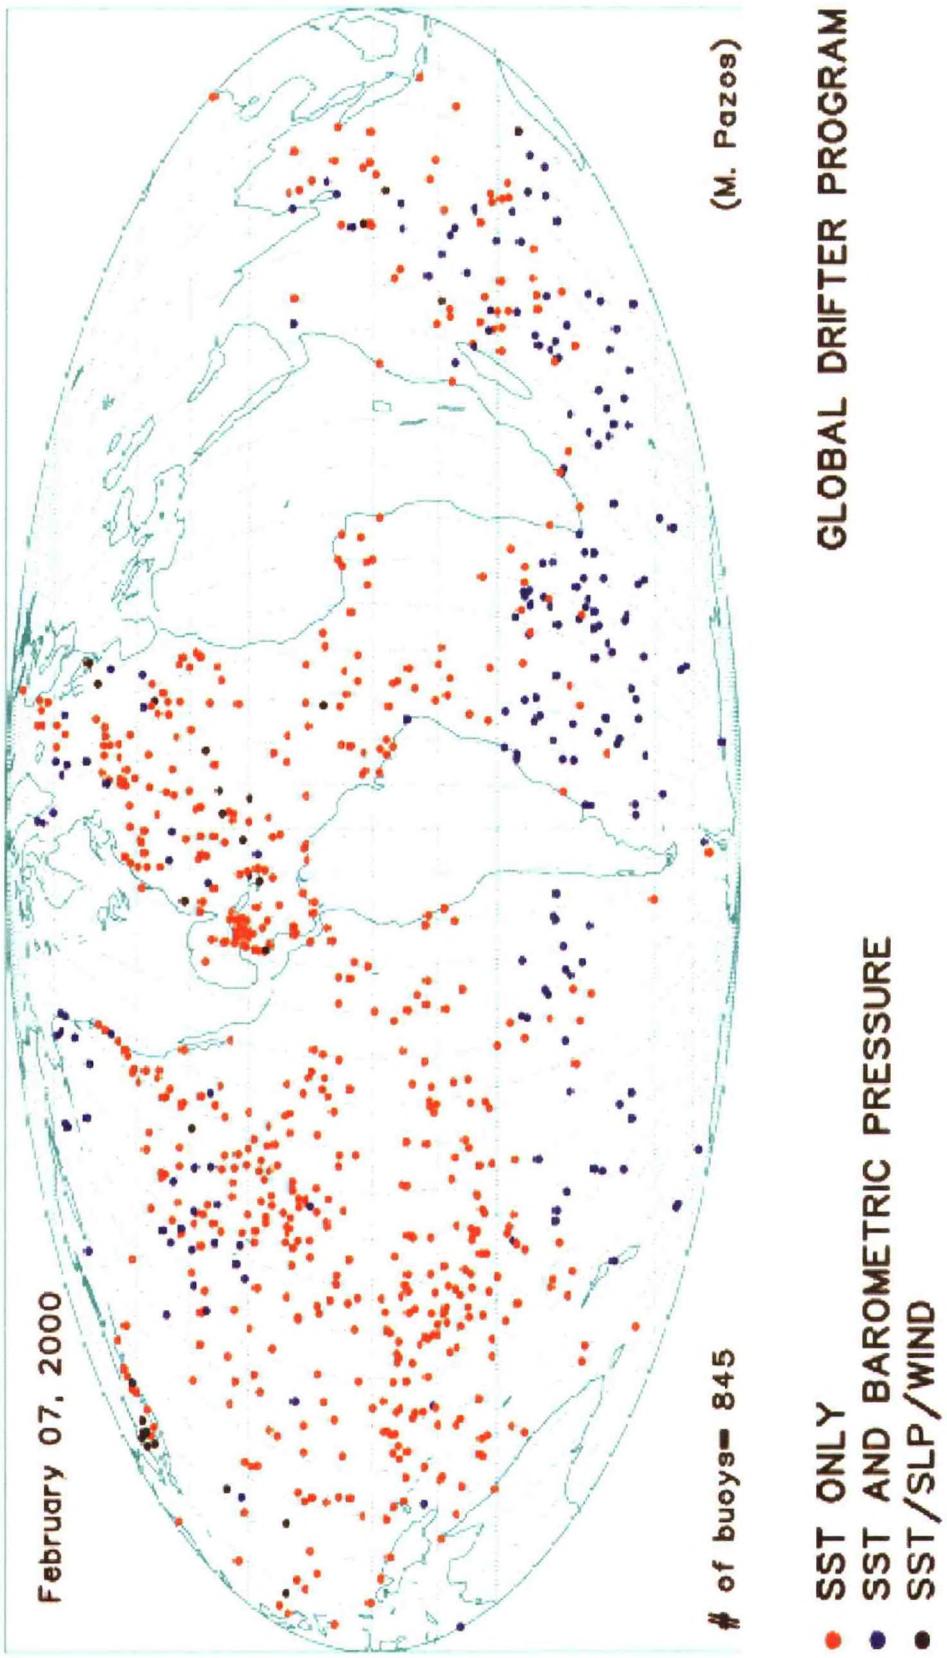

High Density XBT/Autolauncher Program

AOML presently operates a research and developmental High Density XBT/Autolauncher Program utilizing the VOS Program. Two routes (Mediterranean Sea to Miami, FL and New York, NY to San Juan, Puerto Rico) are sampled four times per year by placing ship riders on board to collect XBT temperature data. The XBT probe observations are collected at closely spaced intervals. To enable the ship riders to conduct their operations continuously for the duration of a cruise, engineers at AOML designed an XBT Autolauncher which allows the XBT probes to be launched automatically at preset times and/or positions. In addition to allowing around the clock operations, by deploying XBT probes off the fan tail we reduce potential XBT probe failures. The mission is to measure the seasonal to interannual temperature variability in the upper ocean heat content and transport across the center of the subtropical gyre. This effort will improve our ability to predict important climatic fluctuations such as the North Atlantic Oscillation. Plans are to integrate the Autolauncher System with SEAS 2000 to improve positioning via GPS and facilitate the real-time transmission of these data to the GOOS Center.

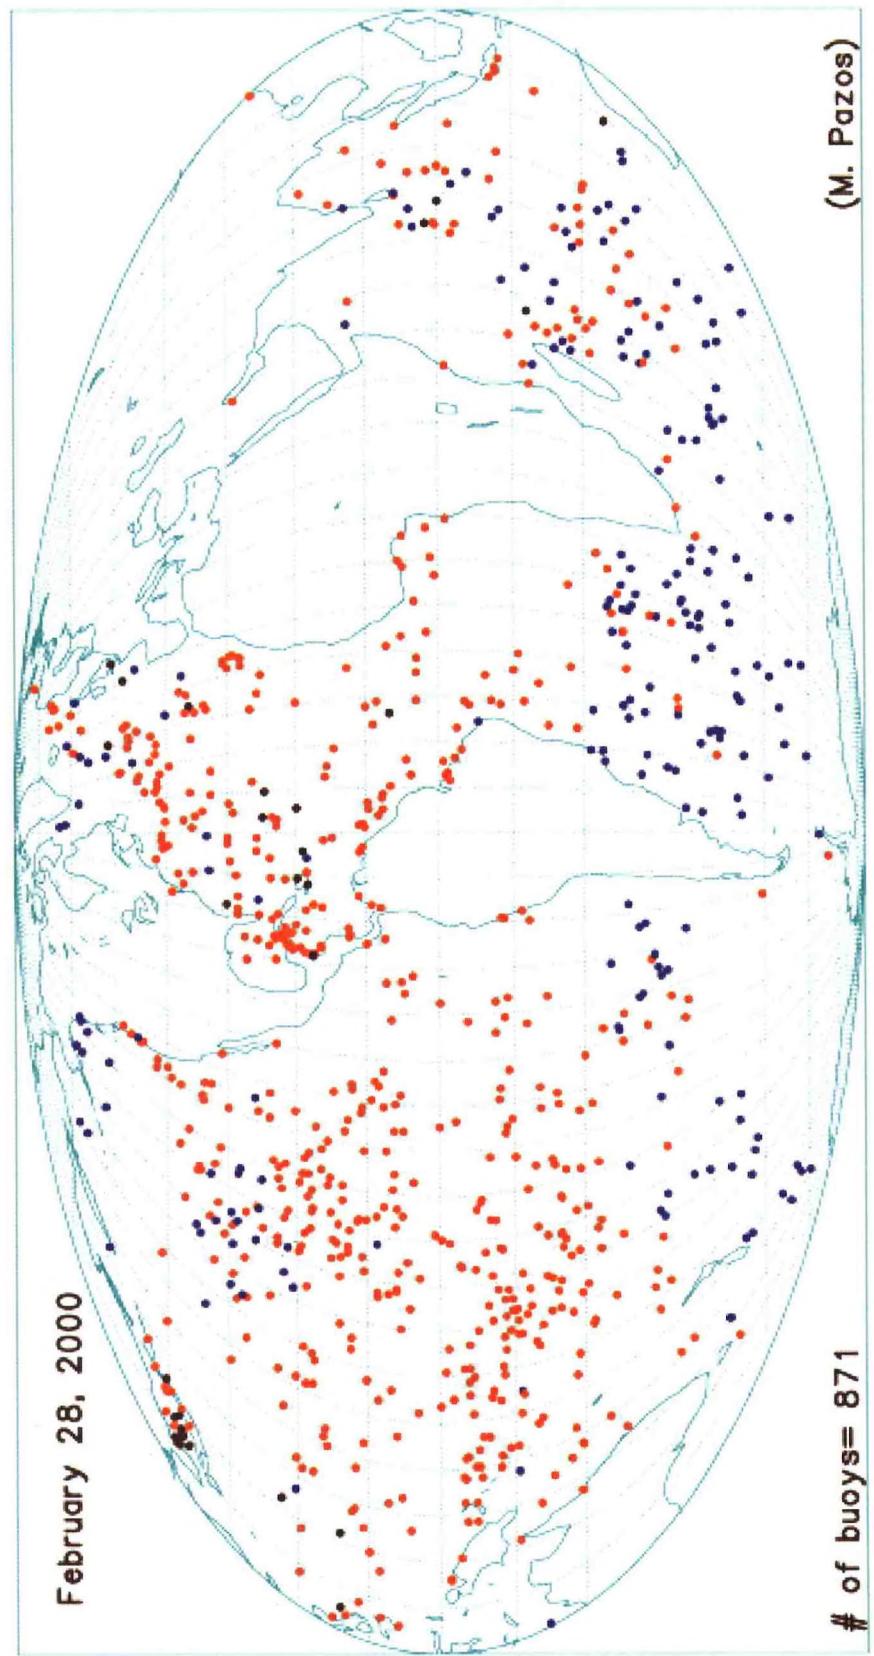

GOOS Center Products

Status of Global Drifter Arrays from January-December 2000

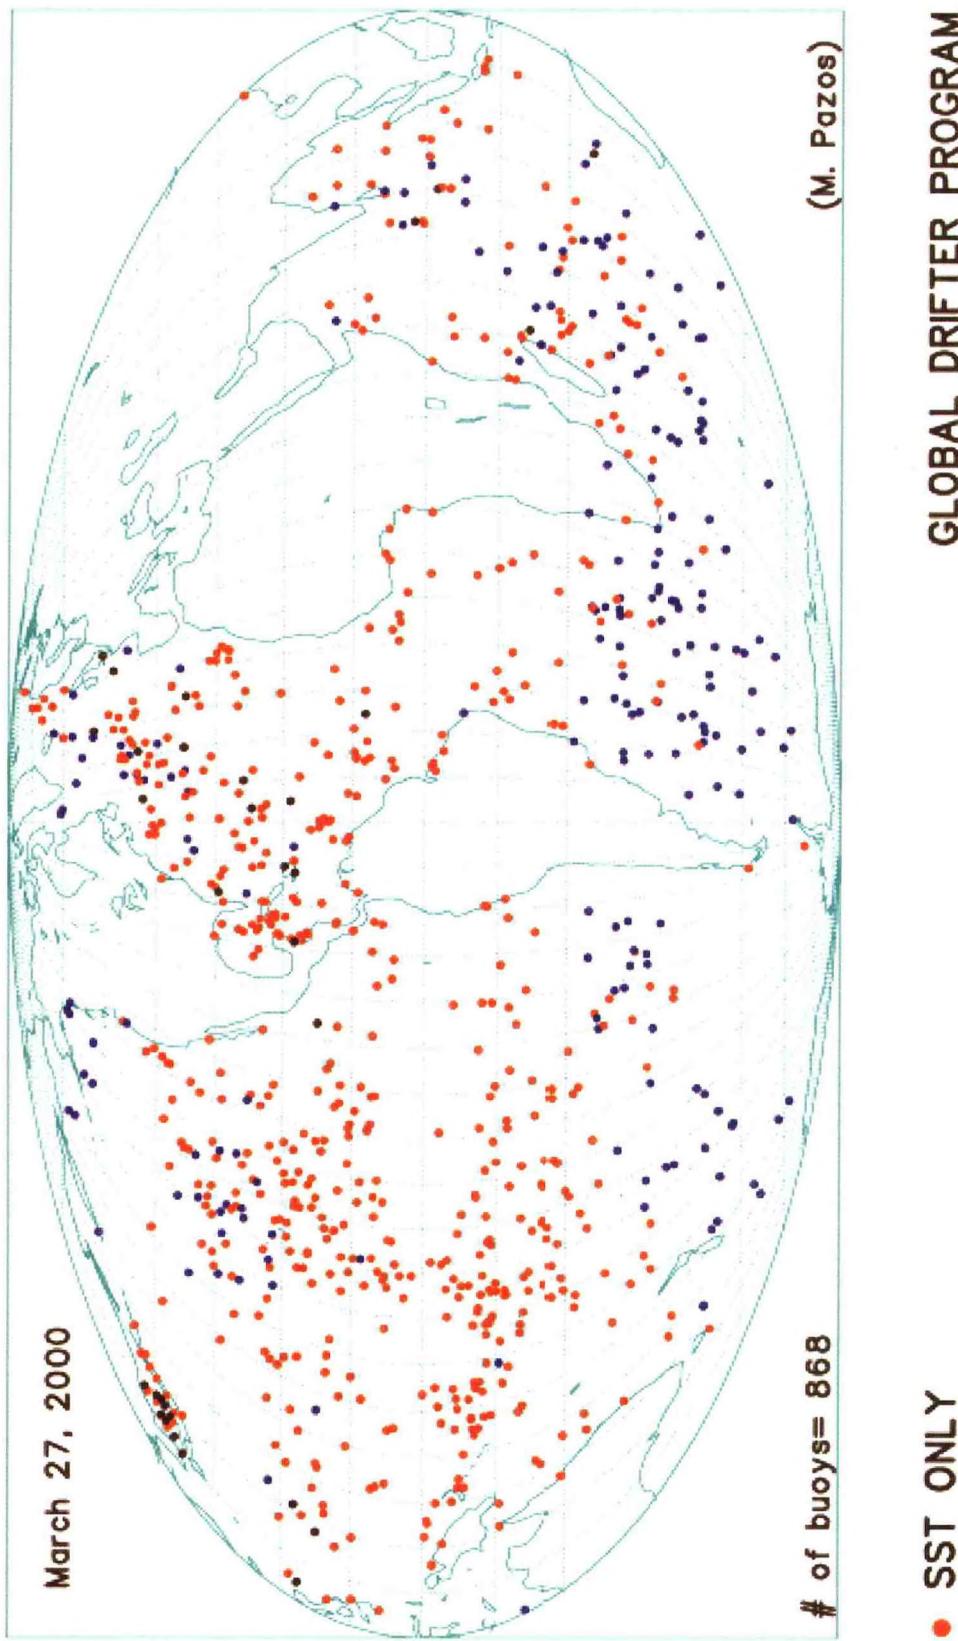

The number in the lower left corner of the plot indicates the number of drifters that were in the water as of the date listed in the upper left corner.

Data Collection

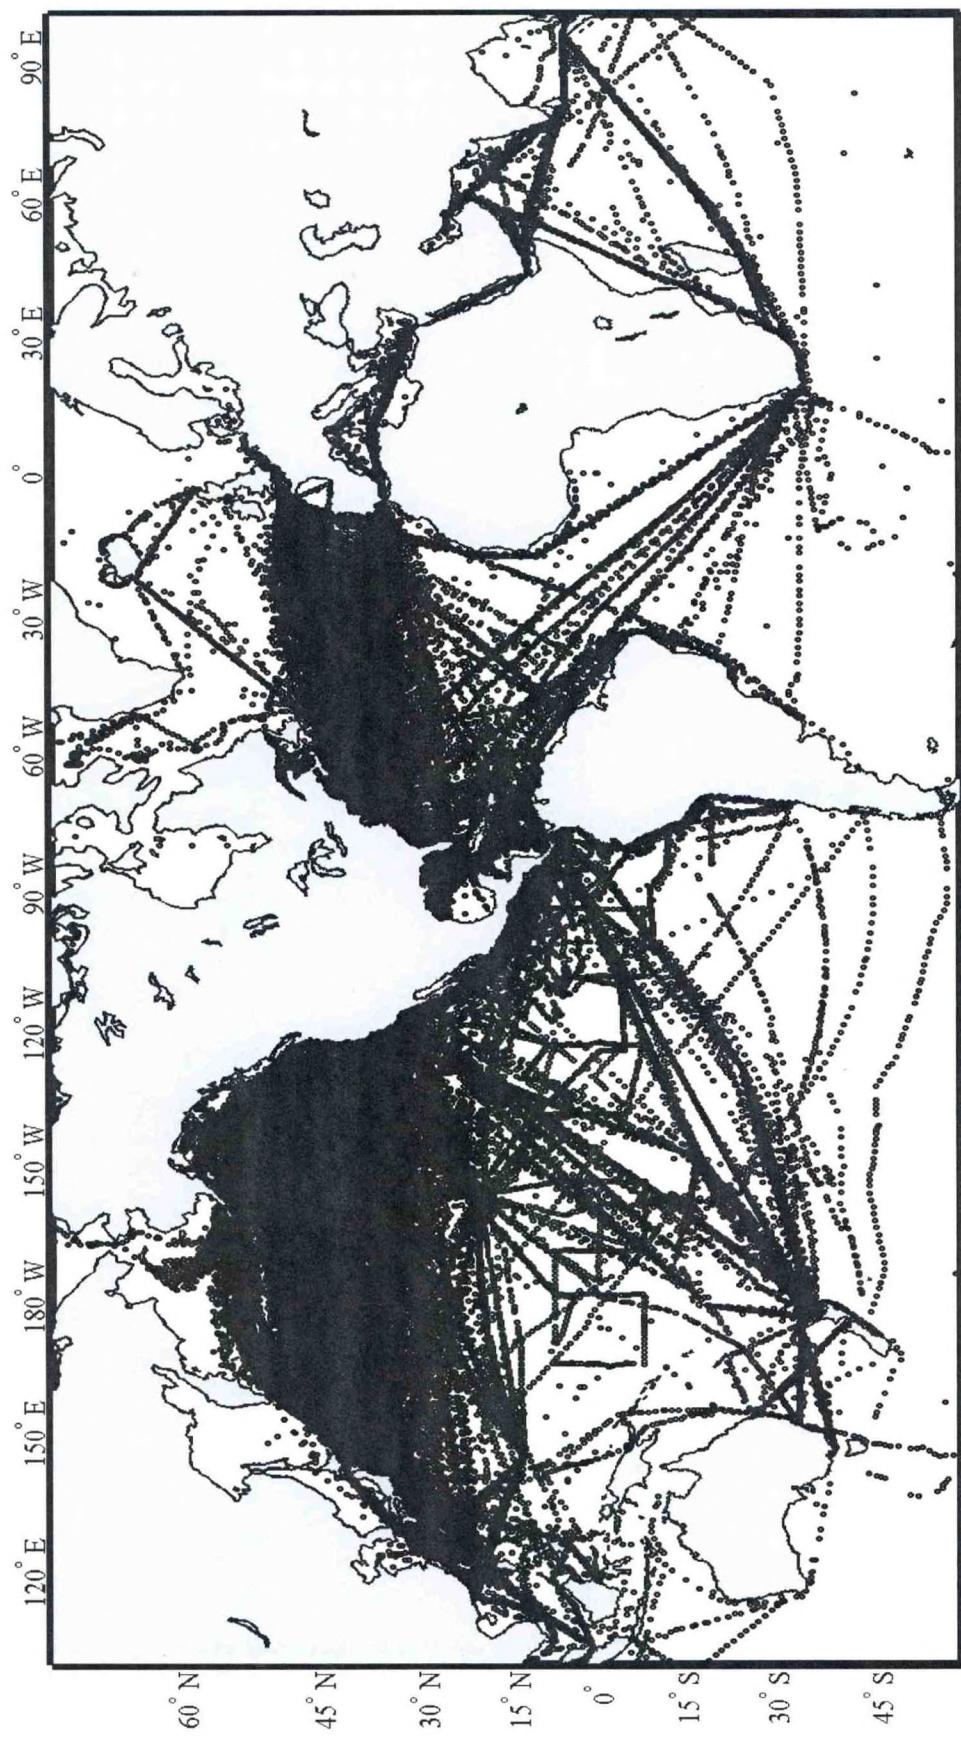

“Dot” plot of all XBT observations collected via SEAS during the year 2000

Total number of XBT observations = 11,569

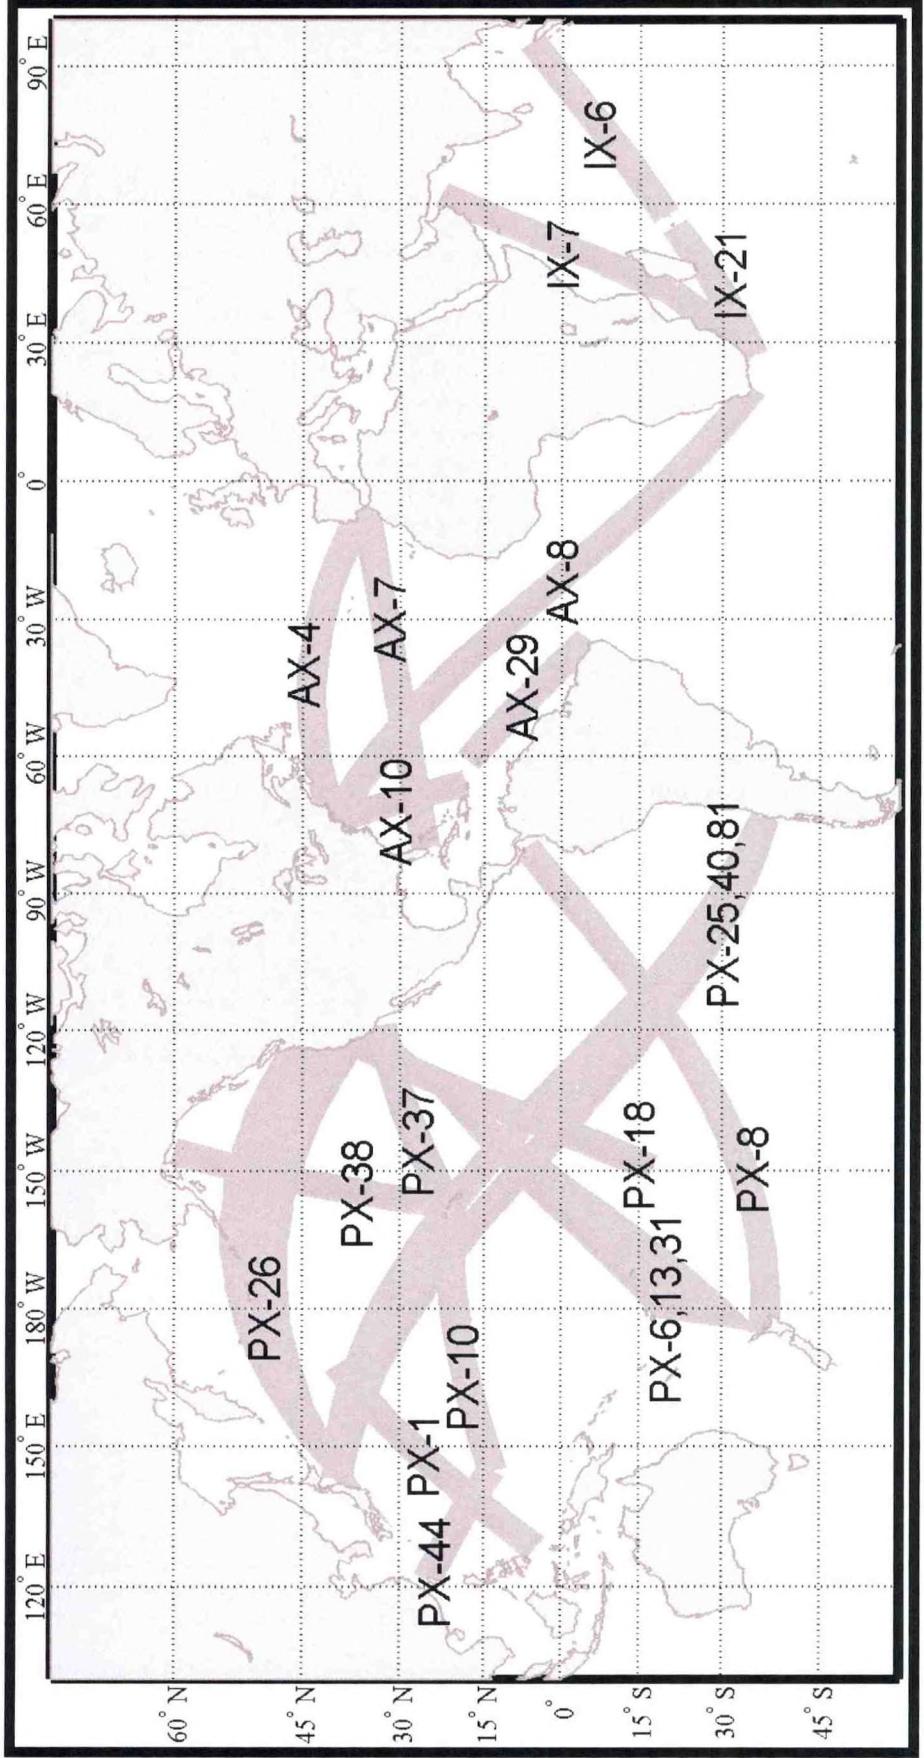

“Dot” plot of all Meteorological observations collected via SEAS during the year 2000

Total number of SEAS Meteorological observations = 107,030

Principal GOOS XBT Routes during 2000

Only principal XBT routes are shown in this schematic. Routes listed on the following pages that are not shown here are not principal routes.

SEAS XBT Counts by route for the year 2000

(as of February 14, 2001)

The Chart below is a list showing the XBT routes and the number of XBTs collected by each VOS ship for each month during the year 2000. The number per year indicates the required number of XBTs that should be collected per year as mandated by the SOOPIP. The number per month indicates the required number of XBTs that should be collected per month per ship. The monthly totals indicate the actual number of XBTs collected per month.

The plot on the following page shows new drifter deployments made during 2000

Status of Global Drifter Array

Statistics

The chart below displays plans for the deployment of drifters from October 2000 through September 2000.

2000 - 2001 Plans

Plans are for the deployment of 419 Drifters during the period between October 2000 and September 2001.

<u>Tropical Oceans</u>	<u># of Drifters</u>	<u>Southern Oceans</u>	<u># of Drifters</u>
• Tropical Pacific	205	• Pacific	35
• Tropical Atlantic	78	• Atlantic	20
• Tropical Indian	50	• Indian	22
• 20 buoys have been upgraded with Barometers by Meteo-France and the Australian Bureau of Meteorology			• 39% are being upgraded with Barometers

9 WOTAN (Tropical Atlantic) drifters will be deployed in the Hurricane formation Region at the beginning of the 2001 Hurricane Season.
