NOAA TECHNICAL MEMORANDUM
National Weather Service, Eastern Region Computer Programs and Problems

The Eastern Region Computer Programs and Problems (ERCP) series is a subset of the Eastern Region Technical Memorandum series. It will serve as the vehicle for the transfer of information about fully documented AFOS application programs. The format of ERCP - No. 1 will serve as the model for future issuances in this series.

- 1 An AFOS version of the Flash Flood Checklist. Cynthia M. Scott, March 1981. (PB81 211252).
- 2 An AFOS Applications Program to Compute Three-Hourly Stream Stages, Alan P. Blackburn, September 1981. (PB82 156886).
- 3 PUPPY (AFOS Hydrologic Data Reporting Program). Daniel P. Provost, December 1981. (PB82 199720).
- 4 Special Search Computer Program. Alan P. Blackburn. April 1982.
- 5 Conversion of ALEMBIC\$ Workbins. Alan P. Blackburn. October 1982. (PB83 138313).

REAL-TIME QUALITY CONTROL OF SAOs

John A. Billet
National Weather Service Forecast Office
Charleston, W. Va.

I. General Information

A. Summary

This program, SAOCHEC, examines an aviation observation for errors and, if it finds any, indicates what the errors are. If no errors are detected, the program sends the observation out over AFOS addressed to ALL. The program is designed to provide real-time quality control for observations.

B. Environment

The program will run on the Eclipse computer in the background partition of AFOS. The program was written in FORTRAN IV.

C. References

National Weather Service, 1982: Surface Observations, Federal Meteorological Handbook No. 1, National Oceanic and Atmospheric Administration, U.S. Department of Commerce.

II. Application

A. Complete Program Description

SAOCHEC checks an observation (in a workbin) on a real-time basis before it reaches the world. The program will handle specials or hourlies and performs a series of checks on both.

For both specials and hourlies the checks include:

1. If the observation is a valid type, i.e., RS, SA, SP.
2. If there is a time group.
3. Nonreportable cloud height.
4. Ceiling without a ceiling designator.
5. Obscuration reported above 4000 ft.
6. Nonreportable visibility.
7. Visibility less than 7 miles with no obstruction to vision.

8. Visibility greater than 6 miles with an obstruction to vision other than precipitation or thunder.
9. Wrong intensity of drizzle or snow with visibility reported.
10. Fog with dewpoint depression greater than 8 degrees.
11. Blowing snow with wind speed less than 9 knots.
12. If there is a garbling or misplacement in the cloud weather group.
13. If there is an error in the placement of the temperature or pressure group or if they appear garbled.
14. If there is a wind group in the observation.
15. If the wind speed and direction are reportable values.
16. If there is a garbling or misplacement in the altimeter group.
17. If there is a garbling or misplacement in the remarks section.

Additional checks for the hourlies include:

1. Pressure tendency on 3- or 6-hourly.
2. Min max group on 6-hourly.
3. Cloud group on 3- or 6-hourly.
4. If the temperature is a realistic value somewhere between 120 and -60.
5. If the dewpoint is a realistic value somewhere between 90 and -60.
6. If the dewpoint exceeds temperature.
7. If there is a change between the previous hour and the present hour of more than 10 degrees in temperature.
8. If there is a change between the previous hour and present hour of more than 10 degrees in dewpoint.
9. If there is a change between the previous hour and present hour of more than 3 millibars in the sea level pressure.
10. If there is a change between the previous hour and present hour of more than .10 inches in the altimeter setting.

Additional checks are made to determine if a nonspecial should be a special. Checks are made for the following criteria:

1. Thunderstorms beginning, ending, or changing intensity.
2. Hail begins or ends.

3. Freezing precipitation begins, ends, or changes intensity.
4. Ice pellets begin, end, or change intensity.
5. Changes in visibility which would require a special anywhere in the country. Local criteria are not included.
6. Changes in ceiling which would require a special anywhere in the country. Local criteria are not included.

If there is an error in the observation, an appropriate message is written to a file which will be stored in the AFOS database, and the console is alerted. The observation remains in the workbin where it can be corrected. If no errors are found, the program stores the observation under the correct key and transmits it to ALL. The temporary file created for the error messages is deleted if the program finishes successfully.

B. Machine Requirements

The program requires 20K of memory to execute. SAOCHEC.SV and .OL take up around 70 blocks of disk space. Generally, runtime is 20 seconds or less. At most three channels are opened at any one time during program execution.

C. Structure of Software

See Figure 1.

D. Database

The database is accessed for the workbin containing the current observation as well as the various previous versions of the observation used. The database is also accessed when the checked current observation is stored and transmitted, and when the error message product is stored.

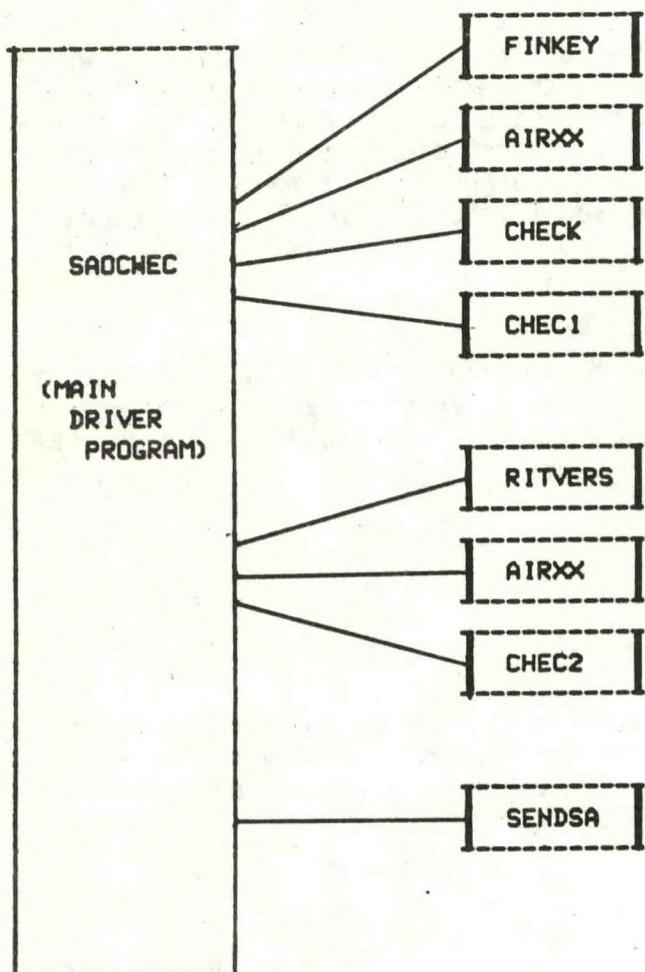

III. Procedures

A. Initiation of Program

Two products must be added to the database in order to run SAOCHEC. One is CCCWRKSA0, the workbin where the current observation is typed by the observer. The other is CCCWRKERR, where SAOCHEC will write the error messages.

To run the program each hour, write the current observation into CCCWRKSA0 using message composition. Once the workbin is stored, RUN:SAOCHEC at the ADM. Within 20 seconds the console will be alerted, saying either that product CCCSAOXXX has been stored (no errors found) or that CCCWRKERR has been stored (errors found and noted in this product). The error messages can be automatically displayed if CCCWRKERR is alarmed or alerted for the console where SAOCHEC will normally be run.

Figure 2 shows a sample observation with several errors in a workbin, and the error messages SAOCHEC produced.

EXTRACT (FINKEY) AND DECODE (AIRXX) THE CURRENT OBSERVATION IN CCCWRKSAO AND THE PREVIOUS OBSERVATION IN THE DATABASE. CHECK CHECKS THE CURRENT OB ITSELF, AND CHEC1 COMPARES THE CURRENT OB TO THE PREVIOUS ONE.

EXTRACT (RITVERS) AND DECODE (AIRXX) THE PREVIOUS HOURLY OBSERVATION AND COMPARE IT TO THE CURRENT OB (CHEC2).

IF NO ERRORS ARE FOUND, STORE THE CURRENT OB UNDER THE CORRECT KEY AND TRANSMIT (SENDSA). (IF THERE ARE ERRORS, SAOCHEC WILL WRITE ERROR MESSAGES TO CCCWRKERR.)

Figure 1. Structure of software (with subroutine functions).

Figure 2. Sample observation with errors in workbin (CRWWRKSAO), error messages that SAOCHEC produced (CRWWRKERR), and previous observation in database for comparison.

B. Cautions or Restrictions on Program Use

1. SAOCHEC must be octal edited to fit it to each site. The following locations should be changed (CCC refers to the node id, XXX to the observation i.d.):
 - in SAOCHEC.SV
 - words 455-461 should contain CCCSAOXXX
 - words 462-466 should contain CCCWRKSAO
 - words 435-442 should contain CCCWRKERR
 - words 442-446 " " "
 - in SAOCHEC.OL
 - words 34400-34404 should contain CCCSAOXXX
 - words 34407-34413 " " "
 - words 34424-34425 should contain the XXX of the station
2. SAOCHEC will indicate an error in 3-hourly observations that are more than 1 line long even if there are no actual errors. It will also return an error message on 6-hourlies when a 4 group is used for the maximum and minimum temperatures.

REAL TIME QUALITY CONTROL OF SAO'S

PART B: PROGRAM EXECUTION AND ERROR CONDITIONS

PROGRAM NAME: SAOCHEC.SV

AAL ID: XXXXXXXX
REVISION NO.: 2.00

PROGRAM EXECUTION

1. First, compose the observation in cccWRKSAO.
2. Then run SAOCHEC:

RUN:SAOCHEC/S XXX (or)

RUN:SAOCHEC XXX

If the global /S is used, the observation will be sent out on the RDC if no errors are found. Without the switch the ob will just be stored locally.

3. An alert will flash when SAOCHEC finishes. If the message is that cccSAOxxx has been stored, no errors were found and the ob has either been just stored locally or sent out (depending on whether /S was used). If the message is that cccWRKERR has been stored, errors were found in the ob. Error messages will appear in cccWRKERR.
4. It might be advantageous to set the alarm on cccWRKERR for the console where SAOCHEC will most often be run. This means anytime there are errors, they can be displayed just by hitting the alarm button.

NOAA SCIENTIFIC AND TECHNICAL PUBLICATIONS

The National Oceanic and Atmospheric Administration was established as part of the Department of Commerce on October 3, 1970. The mission responsibilities of NOAA are to assess the socioeconomic impact of natural and technological changes in the environment and to monitor and predict the state of the solid Earth, the oceans and their living resources, the atmosphere, and the space environment of the Earth.

The major components of NOAA regularly produce various types of scientific and technical information in the following kinds of publications:

PROFESSIONAL PAPERS — Important definitive research results, major techniques, and special investigations.

CONTRACT AND GRANT REPORTS — Reports prepared by contractors or grantees under NOAA sponsorship.

ATLAS — Presentation of analyzed data generally in the form of maps showing distribution of rainfall, chemical and physical conditions of oceans and atmosphere, distribution of fishes and marine mammals, ionospheric conditions, etc.

TECHNICAL SERVICE PUBLICATIONS — Reports containing data, observations, instructions, etc. A partial listing includes data serials; prediction and outlook periodicals; technical manuals, training papers, planning reports, and information serials; and miscellaneous technical publications.

TECHNICAL REPORTS — Journal quality with extensive details, mathematical developments, or data listings.

TECHNICAL MEMORANDUMS — Reports of preliminary, partial, or negative research or technology results, interim instructions, and the like.
