Penaeid Shrimp Tagging
Experiments in Louisiana,
1979

by

S. L. Hollaway and L. F. Sullivan

INTRODUCTION

Penaeid shrimp mark and recapture studies in Louisiana, initiated in 1977, were continued through 1979 in cooperation with the Louisiana Department of Wildlife and Fisheries (LDWF) and Louisiana State University. Shrimp were tagged and released in Caillou Lake, Barataria Bay and offshore between Calcasieu Pass and Grand Isle. The major program objectives were designed to meet data needs identified as management priorities in the regional shrimp fishery management plan for the Gulf of Mexico (Christmas and Etzold, 1977). They included investigation of growth, mortality and movement patterns of offshore overwintering populations of white shrimp (Penaeus setiferus) and to expand inshore studies of brown shrimp (P. aztecus) in Louisiana's extensive and productive estuarine systems to include white shrimp.

This report summarizes recovery data from shrimp marked and released in Louisiana waters during 1979. Individual recapture data, including distance travelled, days at large and change in length, are presented in Appendix I. Growth rate and mortality rate estimates are beyond the scope of this paper and will be reported elsewhere.

MATERIALS AND METHODS

Monthly tagging studies were conducted by the Louisiana Department of Wildlife and Fisheries (LDWF) at Caillou Lake and Barataria Bay from April to November, 1979. Shrimp for tagging were caught with shrimp trawls towed by outboard skiffs near the tagging sites. Tows were limited to five minutes in order to reduce stress on the shrimp. Shrimp were kept in aerated tanks for at least 30 minutes prior to tagging, and those in distress or dead were culled.

Shrimp were marked with individually numbered vinyl mini-ribbon streamer tags similar to those described by Marullo et al. (1972). Tags were attached to a slotted-eye needle which was dipped in a 10% antibiotic/petroleum jelly mixture prior to insertion between the first and second abdominal segments of the shrimp. The needle was then detached and appropriate data (tail length, sex and species) was recorded. Marked shrimp were held in aerated tanks for up to 12 hours to alleviate stress caused by handling and tagging. During this period, dead or moribund shrimp were culled. Tagged shrimp were released by hand on the surface in or adjacent to grass beds in channel areas. The releases were made at dusk to afford maximum protection from predators (Baxter and Hollaway, 1981; Hollaway and Baxter, 1981).

Offshore, white shrimp were marked and released between January 7 and 16 by personnel from the Galveston, Texas and Pascagoula, Mississippi National Marine Fisheries Service (NMFS) facilities and the LDWF, aboard the National Oceanic and Atmospheric Administration (NOAA) research vessel OREGON II. The operational area was between Calcasieu Pass and Grand Isle in depths ranging from 9.1 to 45.7 m (5-25 fm). White shrimp only were captured for marking during 15 minute hauls with a 12.2 m (40 ft) semi-balloon trawl during daylight hours. Offshore tagging was conducted using the same marking procedure as the inshore tagging. Fifty to

100 tagged shrimp were released in weighted canisters (Emiliani, 1971) at one-quarter to one-half mile intervals.

An incentive award program initiated during the 1977 shrimp marking studies (Baxter and Hollaway, 1981) was modified slightly for the 1979 studies, allowing additional winners during each drawing. Under the award system, anyone turning in a recaptured tagged shrimp with all necessary information became eligible for cash awards from \$50 to \$500. Winners were randomly selected by computer at designated intervals during the year. Posters (Figure 1) were distributed to fish houses along the Louisiana coast by NMFS port agents and LDWF personnel. Publicity and award presentations for the mark-recapture program were managed by the Louisiana State University Center for Wetland Resources, under contract to NMFS.

RESULTS

Releases and Returns

A total of 55,183 tagged brown and white shrimp were released at inshore and offshore locations in 1979. Release locations and numbers of shrimp released inshore and offshore are shown in Figure 2. Recaptures from Caillou Lake releases totalled 2,441 out of 31,378 (7.8%), while only 3.3% of the shrimp released in Barataria Bay were recaptured (Table 1). The overall return from the January offshore release was 6.6%.

Tag returns from Caillou Lake releases ranged from less than 1.0% of the November release to 17.5% of the April release (Table 2). Returns from Barataria Bay releases ranged from less than 1.0% of May releases to 7.7% of June releases (Table 3).

Return rates of white shrimp (< 1.0% to 42.9%) were generally higher than those of brown shrimp (< 1.0% to 7.7%) for inshore releases. No white shrimp were tagged in June and July in Caillou Lake or in June in Barataria Bay. No brown shrimp were available for tagging in April or May in Caillou Lake.

Days at Large

Within 60 days of release, 96% of shrimp recaptured from inshore releases were returned (Table 4). Only one shrimp was returned after one year (433 days, 46 nautical miles from release site).

Return characteristics of recaptured shrimp originating from offshore release sites were slightly different from those of inshore releases. Within 60 days of release, 75.9% of the returns were recovered. By 90 days after release, 90.4% of the returns were in. No shrimp were recaptured after 180 days.

Distance and Direction Travelled

Recapture locations by 10 minute squares¹ are shown in Figures 3 through 10 for the first 60 days after each monthly release in Caillou Lake. Locations for the second 60 days are also shown for the April release (Figure 4) because of the relatively high number of returns. Figures 11 through 15 show Barataria Bay returns. Shrimp returned from inshore releases moved mainly west, southwest and south (Table 5). Mean distances travelled in each of these directions were 31, 6 and 4 nautical miles. Of all recaptured inshore-tagged shrimp, 77.0% were recovered from inshore waters, reflecting the high levels of effort exerted by the Louisiana inshore fishery. The remaining 23.0% were recaptured in offshore areas generally west to southwest of the release areas, indicating movement similar to that reported by Baxter and Hollaway (1981) and Hollaway and Baxter (1981) in earlier mark-recapture studies conducted in the Louisiana central coast area.

Most shrimp released offshore were recaptured east, southeast, west, and southwest of the release site during the first 60 days at large (Figure 16). Mean distances travelled in each of these directions were 41, 31, 25 and 11 nautical miles (Table 6). Marked shrimp recaptured after 61 to 120 days of freedom (Fig. 17) showed movement into nearshore and inshore waters between Bastian Bay and Calcasieu Lake. Figure 18 shows a continued trend of inshore movement during 121 to 180 days at large, with most recaptures coming from inshore of the release locations.

¹ Computer generated graphics of shrimp recapture locations were programmed by Mr. Frank Patella, NMFS, Data Analysis Division, Galveston, Texas.

DISCUSSION

Both the Caillou Lake and the Barataria Bay study sites are included in Louisiana's management zone II. The 1979 spring season in this zone opened in mid-May and remained open through July 3, while the fall season opened on August 20 and extended until December 20. The closed season between July 4 and August 20 is reflected in the return data as an increase in the percentage of recaptures originating from offshore areas, indicating a shift of effort to offshore waters from inshore.

Overall, the return data from all inshore studies reflect the traditional patterns exhibited by the Louisiana fishery as described by Christmas and Etzold (1977). For April and May studies, return rates for shrimp released at Caillou Lake are much higher than those for Barataria Bay releases. During this period, effort is mainly concentrated west of the Houma navigation channel as late-recruited white shrimp return inland near the Vermillion Bay area, producing the high return rates for shrimp released at Caillou Lake. However, it must be noted that the low return rates for shrimp released at Barataria Bay during this period may also be induced or confounded by unusually high tagging mortalities associated with low salinities at the study site, caused by heavy rains and subsequent runoff, possibly reducing the number of shrimp available for recapture. In late May, effort shifts to brown shrimp in areas west of the Mississippi River and east of the Atchafalaya River, resulting in a dramatic decrease in return rate for shrimp released in June at Caillou Lake and a concurrent increase in return rate for shrimp released at Barataria Bay during the same period. Recapture rates for the Barataria Bay releases then decrease in July as effort again shifts toward the west, causing an increase in return rates for shrimp released at the Caillou Lake study site. The July return rate, however,

is depressed from previous levels due to the closing of the spring season on July 4 in zone II, after which returns are primarily from areas offshore of Zone II. With the opening of the fall season on August 20, an increase in return rates for both Caillou Lake and Barataria Bay studies is seen, primarily due to recapture of tagged white shrimp in inshore waters.

Previous studies have documented the offshore east to west movement exhibited by shrimp in Louisiana waters (Inglis, 1960; Gaidry and White, 1973; Perret and Boudreaux, 1976; Klima, 1980; Baxter and Hollaway, 1981; and Hollaway and Baxter, 1981). Shrimp released from inshore study sites exhibited a general east to west movement combined with movement to deeper Gulf waters, creating a west-southwesterly movement along the Louisiana coast.

With respect to the offshore releases in January, a significant proportion of marked white shrimp were recovered from areas south of the release site generally along the 20 fm contour, indicating a movement into waters deeper than the release sites during the first 60 days of freedom. By April to mid-May, the return data illustrate movement of the marked shrimp back into nearshore and inshore areas from Bastian Bay to Calcasieu Lake; these animals were then harvested by the inshore and nearshore fishery during the spring season (Gaidry and White, 1973). During mid-May through mid-July, returns originated chiefly from the offshore fishery due to closure of inshore waters on July 4 in zone II and the relatively large size and high value of white shrimp in offshore waters at this time (Gaidry and White, 1973).

AWARDS FROM \$50.00 TO \$500.00 IN EACH DRAWING

ONE AWARD OF \$500.00, ONE OF \$100.00, AND SIX OF \$50.00 WILL BE PRESENTED QUARTERLY IN LOUISIANA, TEXAS, AND MEXICO.

Winners will be randomly selected by computer from returned tagged shrimp. To qualify as an entry, the tag must be in the shrimp and the date and location the shrimp was caught must be given. Sets of awards will continue into 1980. Any tag number that hasn't been chosen remains eligible in the later drawings.

THESE STUDIES ARE BEING DONE ON A COOPERATIVE BASIS BY THESE AGENCIES:

NATIONAL MARINE FISHERIES SERVICE GALVESTON, TX		
LOUISIANA WILDLIFE AND FISHERIES COMMISSION NEW ORLEANS, LA		TEXAS PARKS AND WILDLIFE DEPARTMENT AUSTIN, TX
LOUISIANA STATE UNIVERSITY BATON ROUGE, LA		TEXAS A&M UNIVERSITY COLLEGE STATION, TX
AND THE INSTITUTO NACIONAL DE PESCA OF MEXICO

Louisiana Shrimp Recaptures from 1979 Releases

LEGEND

SPECIES CODE: W=WHITE; P=PINK; B=BROWN; U=UNKNOWN

SEX CODES: M=MALE; F=FEMALE; U=UNKNOWN

DISTANCE TRAVELLED IS IN NAUTICAL MILES

DIRECTION TRAVELLED IS COMPASS HEADING (AS THE CROW FLIES) FROM RELEASE LOCATION
TO POINT OF RECAPTURE IN DEGREES AND TENTHS OF DEGREES

DATES ARE IN THE FORM: YEAR.MONTH.DAY

NEGATIVE DAYS OUT ARE RECORDED AS RECEIVED

DAYS OUT HAS +- IF RECAPTURE DATE IS NOT KNOWN EXACTLY.
IF RECAPTURE DATE IS ONLY DATE FOUND; DAYS OUT WILL BE
ZERO AND NA FOR NOT APPLICABLE

ALL LENGTHS ARE IN MILLIMETERS TAIL

LENGTHS AT RECAPTURE ARE RECORDED AS RECEIVED EVEN IF NEGATIVE GROWTH IS INDICATED

RELEASE AREA KEY: I=INSHORE; O=OFFSHORE

RELEASE STATE KEY: L=LOUISIANA; T=TEXAS; M=MEXICO

INCOMPLETE RECORD TABULATION: COUNTS ARE NOT ADDITIVE;
I.E. A RECORD MAY BE MISSING A RECAPTURE LENGTH AND DATE
AND BE COUNTED IN BOTH CATEGORIES
