NOAA TECHNICAL MEMORANDUM

National Weather Service, Eastern Region Computer Programs and Problems

The Eastern Region Computer Programs and Problems (ERCP) series is a subset of the Eastern Region Technical Memorandum series. It will serve as the vehicle for the transfer of information about fully documented AFOS application programs. The format ERCP - No. 1 will serve as the model for future issuances in this series.

1 An AFOS version of the Flash Flood Checklist. Cynthia M. Scott, March 1981. (PB81 211252).

Scientific Services Division Eastern Region Headquarters November 1985

ROTODRAW

Thomas Niziol National Weather Service Forecast Office Buffalo, NY

I. Introduction

A. Purpose

This program will draw a graphic product from a set of data points that are easily entered into an AFOS product from an ADM. The user has the ability to zoom, offset, and rotate the object on the GDM screen. The zoom feature of the program is much more precise than the standard AFOS zoom. Up to 700 sets of x-y data points can be plotted. The program uses the AFOS Graphics Library, AG.LB (MacDonald 1981), extensively. Drawing graphics is relatively straightforward, via the AFOS data product.

B. Motivation

There are many map backgrounds that are available on a national and regional scale, both from NMC and the Hydrology Offices. But many weather offices also may have the need to develop their own local map backgrounds that suit their own needs. Both operational forecasters and those working on local research projects can benefit from this program, limited only by their imagination.

C. Benefits to the User

The program gives the user complete control over the generation of graphics. It allows the user to draw objects, and move them around in a variety of ways on the GDM screen without having to create a program.

II. Methodology and Structure

Α.

ROTODRAW generates the graphic product from a set of x-y points stored in an AFOS product called ROTODATA. The user first plots the object to be drawn by hand on linear graph paper to obtain these points. The format of ROTODATA restricts the range of x and y from 0 to 998, so scale the x and y axes on the graph paper accordingly. Since ROTODRAW plots the data at 400 units to an inch on the final graphic, any image produced at a zoom of 1.0 will be rather small. It can be enlarged, however, by adjusting the zoom factor in ROTODATA and rerunning ROTODRAW. A point to keep in mind is that the GDM screen is shorter than it is wide (a ratio of .75) and that ROTODRAW will halt if any portion of the object it is drawing goes off the screen. You may want to reorient and/or rescale the object, either on the original paper drawing or by using the zoom and rotation features. Also, ROTODRAW will automatically center the object in the GDM screen unless you supply offset values. By repeated trial and error adjustments of zoom, rotation and offsets, the basic shape in ROTODATA can be manipulated into the final graphic.

ROTODATA must be set up in a certain prescribed format so ROTODRAW can read it (an initial ROTODATA is provided with the ROTODRAW package--see Figure 1). The header is located on the second line below the TTAA header. The zoom ratio occupies positions 12-16, corresponding to tens, units, decimal point, tenths and hundreths. The x and y offsets occupy positions 30-34 and 50-54. (These are the number of units to move the drawn object from the center of the screen in the x and y directions.) The first character of each offset must be either a plus or minus sign. The rotation angle occupies positions 65-67. Each position in the header must be occupied by a number or sign for the program to run correctly!

The data points begin three lines below the header, and seven sets of x-y values occupy each line. The x-y data sets occupy the following positions: 2-4,6-8 12-14,16-18 22-24,26-28 32-34,36-38 42-44,46-48 52-54,56-58 62-64,66-68. To create a blank line, i. e. "lift the pen" to move from one point to another without connecting them, place a minus sign in front of the x value of the destination point in positions 1, 11, 21, 31, 41, 51 or 61. Otherwise these positions can remain empty.

Following the last set of points, the value "999" must be entered into the next x-value position to indicate the end of the data set.

Β.

After filling out ROTODATA, the program is run at the ADM with the following command:

RUN: ROTODRAW

The two basic equations that are used for the rotation scheme are standard equations for the rotation of axes in a two dimensional system. They are:

$x=x^{\prime}\cos(\theta) - y^{\prime}\sin(\theta)$

$y=x'\sin(\theta) + y'\cos(\theta)$

The program accesses ROTODATA and dumps the numbers into a two-dimensional array. After number crunching to zoom, offset and rotate the data, the plotting routine begins.

The subroutines from AG.LB (MacDonald, 1981) are used to draw the object and transfer it to a graphic product.

The output plot is stored in test graphic NMCGPHTXX...and the RDOS file ROTO.01. You must add NMCGPHTXX to your wish list if it is not already in your database!

III. EXAMPLES OF INTERACTIVE USE

The ability to draw any type of object leaves a lot of room for interactive use on AFOS. Map backgrounds, graphs, spotter networks, etc., that may not be available from AFOS sources can be created for use at the local office. Both the operational forecaster and those involved in local research may find this program of value.

A couple of examples are shown in Figure 2. A county map and zone map were drawn for the upstate portion of New York State. These maps were eventually zoomed, rotated, and offset so they could be overlayed on regional map background B31.

IV. Cautions and Restrictions

If there are any problems opening the data file, or reading any of the information, the program will abort and return an error message at the ADM console.

If the plotted object goes off the limits of the GDM screen, then the program will abort, and an error message will be returned to the ADM console.

The AFOS test graphic NMCGPHTXX must be added to the wish list or database to properly store the graphic. The user must eventually transfer the graphic to another filename if it is to be a permanent file in AFOS. In other words, many graphic products can be originated for on-station use, temporarily stored in NMCGPHTXX, and later be transferred to a permanent graphic products file.

The AFOS data product ROTODATA must also be added to your wish list or database.

ROTODRAW

PART A: PROGRAM INFORMATION AND INSTALLATION PROCEDURE

PROGRAM NAME: ROTODRAW.SV

AAL ID: Revision No.: 1.00

<u>PURPOSE:</u> ROTODRAW will draw an object from a set of data points stored in an AFOS file. The programmer can very precisely zoom, offset and rotate the object in any manner on the screen.

PROGRAM INFORMATION

Development Programmer: T. Niziol Location: WSFO Buffalo, NY Phone: FTS 437-4800 Language: DG FORTRAN IV/5.20 Date: 04/17/85 Maintenance Programmer: T. Niziol Location: WSFO Buffalo, NY Phone: FTS 437-4800 Type: Standard Revision Date: NA

Running Time: 30-60 Seconds

Disk Space: Program Files 37 Blocks Data Files NA

COMMENTS

ROTODATA	Read	Holds input data
NMCGPHTXX	Created	Output graphic

LOAD LINE

RLDR ROTODRAW <AG AFREAD BG UTIL FORT>.LB

PROGRAM INSTALLATION

1-Put ROTODRAW.SV on DPØF and link from DPØ.

- 2-Put NMCGPHTXX into the database but do not assign it a map background.
- 3-Put the AFOS data product, ROTODATA, on the wish list or in the database and store the initial file ROTODATA (supplied with program) into it.

ROTODRAW

PART B: PROGRAM EXECUTION AND ERROR CONDITIONS

PROGRAM NAME: ROTODRAW.SV

AAL ID: REVISION NO.: 1.00

PROGRAM EXECUTION

- 1. The run line for ROTODRAW is RUN:ROTODRAW.
- An ADM alert "JOB ROTO COMPLETED: OUTPUT IN ROTODRAW.Ø1" will signal routine program completion.

ERROR CONDITIONS

ADM MESSAGES

MEANING

rotate attributes as necessary.

1.	ERROR CONDITION:	CANT OPEN	ROTODRAW cannot open ROTODATA. Check this productit may be bad.
2.	ERROR CONDITION:	CANT READ	ROTODRAW cannot read a line from ROTODATA. Check for bad data.
3.	ERROR CONDITION:	OUT OF BOUNDS	ROTODRAW tries to draw to a point that is off the GDM screen; change zoom, offset or

ROTODRAW

PART A: PROGRAM INFORMATION AND INSTALLATION PROCEDURE

PROGRAM NAME: ROTODRAW.SV

AAL ID: Revision No.: 1.00

Maintenance Programmer:

Phone: FTS 437-4800

Location: WSFO Buffalo, NY

T. Niziol

Type: Standard

Revision Date: NA

<u>PURPOSE:</u> ROTODRAW will draw an object from a set of data points stored in an AFOS file. The programmer can very precisely zoom, offset and rotate the object in any manner on the screen.

PROGRAM INFORMATION

. J. Um 3

Development Programmer: T. Niziol Location: WSFO Buffalo, NY Phone: FTS 437-4800 Language: DG FORTRAN IV/5.20 Date: 04/17/85

Running Time: 30-60 Seconds

Disk Space: Program Files 37 Blocks Data Files NA

PROGRAM REQUIREMENTS

PROGRAM FILES:

Name ROTODRAW.SV COMMENTS

DATA FILES:

NAME	DP LOCATION	READ/WRITE	COMMENTS
ROTO.Ø1	DPØ	Write	RDOS file of graphic
			(left on disk)

ſ	LIBRARY	
	JAN 1 6 1986	
	N.O.A.A. U. S. Dept. of Commerce	

AFOS PRODUCTS:

ID	ACTION	COMMENTS
ROTODATA	Read	Holds inp
NMCGPHTXX	Created	Output gr

olds input data Output graphic

4 .

LOAD LINE

RLDR ROTODRAW <AG AFREAD BG UTIL FORT>.LB

PROGRAM INSTALLATION

1-Put ROTODRAW.SV on DPØF and link from DPØ.

- 2-Put NMCGPHTXX into the database but do not assign it a map background.
- 3-Put the AFOS data product, ROTODATA, on the wish list or in the database and store the initial file ROTODATA (supplied with program) into it.

JAN 1 S. DBG A-2

ROTODRAW

PART B: PROGRAM EXECUTION AND ERROR CONDITIONS

PROGRAM NAME: ROTODRAW.SV

AAL ID: REVISION NO.: 1.00

PROGRAM EXECUTION

- 1. The run line for ROTODRAW is RUN:ROTODRAW.
- An ADM alert "JOB ROTO COMPLETED: OUTPUT IN ROTODRAW.Ø1" will signal routine program completion.

ERROR CONDITIONS

ADM MESSAGES

MEANING

1.	ERROR CONDITION:	CANT OPEN	ROTODRAW cannot open ROTODATA. Check this productit may be bad.
2.	ERROR CONDITION:	CANT READ	ROTODRAW cannot read a line from ROTODATA. Check for bad data.
3.	ERROR CONDITION:	OUT OF BOUNDS	ROTODRAW tries to draw to a point that is off the GDM screen; change zoom, offset or rotate attributes as necessary.

NOAA SCIENTIFIC AND TECHNICAL PUBLICATIONS

The National Oceanic and Atmospheric Administration was established as part of the Department of Commerce on October 3, 1970. The mission responsibilities of NOAA are to assess the socioeconomic impact of natural and technological changes in the environment and to monitor and predict the state of the solid Earth, the oceans and their living resources, the atmosphere, and the space environment of the Earth.

The major components of NOAA regularly produce various types of scientific and technical information in the following kinds of publications:

PROFESSIONAL PAPERS — Important definitive research results, major techniques, and special investigations.

CONTRACT AND GRANT REPORTS — Reports prepared by contractors or grantees under NOAA sponsorship.

ATLAS — Presentation of analyzed data generally in the form of maps showing distribution of rainfall, chemical and physical conditions of oceans and atmosphere, distribution of fishes and marine mammals, ionospheric conditions, etc. TECHNICAL SERVICE PUBLICATIONS — Reports containing data, observations, instructions, etc. A partial listing includes data serials; prediction and outlook periodicals; technical manuals, training papers, planning reports, and information serials; and miscellaneous technical publications.

TECHNICAL REPORTS — Journal quality with extensive details, mathematical developments, or data listings.

TECHNICAL MEMORANDUMS — Reports of preliminary, partial, or negative research or technology results, interim instructions, and the like.

Information on availability of NOAA publications can be obtained from:

ENVIRONMENTAL SCIENCE INFORMATION CENTER (D822) ENVIRONMENTAL DATA AND INFORMATION SERVICE NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION U.S. DEPARTMENT OF COMMERCE
