Introduction

NOAA Ship *Pisces* departed Pascagoula, MS on March 23, 2023 to conduct the SEAMAP reef fish survey of natural hard bottom areas located on the continental shelf and shelf edge of the northern Gulf of Mexico (GOM). The planned itinerary divided the cruise into four legs: Leg I) 03/23/2023 to 04/03/2023; Leg II) 04/06/2023 to 04/19/2023; Leg III) 04/22/2023 to 05/05/2023; and Leg IV) 05/08/2023 to 05/15/2023. Leg IV, 11 days at sea, was cancelled entirely in order to send available staff to assist with other critical mission surveys. That effort will be shifted to R/V *Southern Journey* and conducted in August. During Leg II, a required staffing swap caused a loss of a day at sea (4/16) and weather prevented operations for a single day of Leg III (4/29). Also during leg II, time was taken to assist with a HARP buoy deployment for Scripps Institute of Oceanography. De-staging occurred on arrival to the dock in Pascagoula, MS on May 5, 2023.

Objectives

- 1) Assess relative abundance of reef fish on the continental shelf edge-banks of the northern GOM.
- 2) Determine length frequency distributions of reef fish.
- 3) Collect conductivity, temperature, dissolved oxygen, fluorescence, and transmissivity data profiles of water column at each sample site.
- 4) Collect acoustic data with the Simrad EM 2040, multibeam sonar and Simrad EK 80 echosounder.
- 5) Collect water samples for environmental DNA analysis.

Methods

The Gulf Fishery Independent Survey of Habitat and Ecosystem Resources (GFISHER) sampling design, which is conducted in collaboration with NMFS Panama City and Florida Wildlife Research Institute, was implemented in 2020. We moved to this design because it was created from a composite of mapping and habitat data collated over several decades of mapping effort among the three cooperating laboratories. Most importantly the design optimizes sampling (e.g. minimizes coefficient of variation - CV) by allocating increased number of sites to habitats having the highest variability for target species abundance. Thus the new design increases precision without a consequent increase in sampling effort because of the statistical methods used to optimize site selection. The new design also divides the workload among the laboratories to take advantage of the strengths of each individual program (e.g. MS Labs has access to white ships and thus can work in remote locations more easily). Selection of sampling sites follows a two-stage approach habitat-based survey design. Stage 1 uses the survey select procedure in SAS to select microgrids according to frequency of habitat strata within each Spatial/Depth strata (i.e. weighted). Following the allocation assignment, Stage 2 imports the selected microgrids into GIS where a random point is then chosen for each habitat strata that were selected for that particular microgrid (e.g. microgrids with multiple habitat types can be selected multiple times). Selected reef sites were then sampled with the spherical/satellite arrays. Each spherical/satellite camera array had a mounted In-Situ Aqua TROLL 600 sonde, a CStar transmissometer, and two pressure housings (rated to 500m). SphereCam provides a spherical field-of-view (360 *70 degrees) while the satellite camera is used to capture stereo-images in a single orientation. One array also contained a single 5L Niskin bottle that was triggered at the depth at the beginning of the deployment to collect water for eDNA sampling exactly at the deployment location. The ship supplied Seabird 911 conductivity, temperature and depth (CTD) profiler was deployed prior to

the first array deployment and after the last array retrieval each day to validate SONDE data collections and to provide speed-of-sound measurements for the EM 2040. Additionally, the CTD was used as a backup system for collecting the eDNA water samples. Simrad EK 80 data was collected during daylight hours only. Bathymetric mapping was conducted at night at selected areas near the day's sampling with the Simrad EM 2040.

Bathymetric mapping operations focused on predetermined sites within or adjacent to sampling areas. HYPACK software was used to plan the survey transects over selected targets of interest. To optimize coverage for the EM 2040, the line spacing was calculated by $2.85(D) = LS$, where D is water depth in meters, and LS is distance between lines. EM 2040 configurations and EK 80 configurations were based on the guidance from National Marine Fisheries Service personnel at Stennis Space Center. A Seabird 911 CTD or Castaway CTD was deployed prior to, mid-way, and at end of mapping operations to obtain speed-of-sound through water column for post processing of collected EM 2040 mapping data.

Results

The 2023 SEAMAP Reef Fish survey sampled 374 stations in 56 blocks with the camera arrays. (Figure 1, Table 1). Video data were returned to the NOAA Fisheries Mississippi Laboratory for viewing, analysis and archiving. The Seabird 911 CTD profiler was deployed 64 times (Table 1). CTD data were processed at sea and uploaded to the National Coastal Data Development Center (NCDDC) server for real-time use. Castaway hand-deployed CTD was also utilized for mapping operation integrity.

Bathymetric data was collected at predetermined sites within selected blocks (Figure 2). Approximately 1,250 linear nautical miles were surveyed. EK 80 acoustic data was collected during day operations only. Acoustic and bathymetric data were returned to the NOAA Fisheries Mississippi Laboratory for processing and archiving.

Forty-four water samples were collected from either the Seabird 911 CTD array or the 5L Niskin bottle fired at depth on the camera array. The water samples were fixed and stored at sea and will be processed at the University of West Florida.

Cruise Participants:

Leg I: 03/23/2023 – 04/03/2023

12 DAS Pascagoula, MS – Galveston, TX

<u>Name</u>	<u>Title</u>	<u>Organization</u>
Jack Prior	Field Party Chief	Mississippi State/Northern Gulf Institute
Ryan Caillouet	General Engineer	NMFS - Stennis Space Center, MS
Paul Felts	Fisheries Biologist	NMFS – Pascagoula, MS

Leg II: 04/06/2023 – 04/19/2023 (Spent 4/16 in port to pick up engineer)

14 DAS Galveston, TX – Galveston, TX

<u>Name</u>	<u>Title</u>	<u>Organization</u>
Joseph Salisbury	Field Party Chief	ERT, Inc. - Pascagoula, MS

Jack Prior Fisheries Biologist
Kenneth Wilkinson Electronics Technician
Delaney Harrison-Peters Biologist

Mississippi State/Northern Gulf Institute
NMFS - Stennis Space Center, MS
University of West Florida

Leg III: 04/22/2023 – 05/05/2023

14 DAS Galveston, TX – Pascagoula, MS

<u>Name</u>	<u>Title</u>	<u>Organization</u>
Jack Prior	Field Party Chief	Mississippi State/Northern Gulf Institute
Joseph Salisbury	Fisheries Biologist	ERT, Inc. - Pascagoula, MS
James Johnson	Electronics Technician	NMFS - Stennis Space Center, MS
Julie Hayes	Teacher at Sea	Macon R-1 Middle School
Makailyn Hernandez	Biologist	University of West Florida
