Pascagoula, MS 39567

INTRODUCTION

The National Oceanic and Atmospheric Administration (NOAA) Ship *Gordon Gunter* departed Pascagoula, MS on August 22, 2014 to initiate the Southeast Area Monitoring and Assessment Program (SEAMAP) Fall Ichthyoplankton Survey in the Gulf of Mexico (GOM). The SEAMAP Program is a cooperative State/Federal/University program designed to collect biological and environmental data from waters of the U.S. GOM. During the fall survey, plankton samples are collected from a systematic grid of stations to assess distribution, occurrence and abundance of the early life stages of a variety of species of fishes and invertebrates. A total of 31 successful sea days were worked over two legs during the cruise: Leg I, August 22 – September 8; Leg II, September 18 – 30.

The first leg of the survey was scheduled to begin on August 21st, however departure was delayed one day to repair a circuit board for the MSD system after an electrical surge earlier in the week damaged the part. Three full stations were skipped during Leg 1 due to inclement weather in the area of the station (LU007, B218, B216 -high winds/lightning). Two CTD casts at stations 032 and 068 were also skipped due to excessive winds or lightning at the end of the station. As the leg progressed, four offshore (B244, B245, B246, B247) stations were dropped to allow for the completion of all other planned stations. The transmissometer was found to be giving bad data early in Leg 1 and was subsequently removed from the CTD unit. There was not a spare transmissometer aboard the ship, therefore there was no reliable transmissometer data gathered for Leg 1 of the survey. Two transmissometers that were not in use were brought aboard for Leg 2, one from the Stennis facility and one from NOAA Ship *Oregon II*.

Departure for Leg 2 was delayed six days due to a damaged breaker in the port main engine. Due to the loss of so much time, all remaining secondary objective stations (LU stations & Dual Mesh tows) were cancelled at the beginning of the leg to focus on completing as many primary stations as possible. As the leg progressed, additional stations were skipped in consultation with the Chief Scientist, to ensure the best possible coverage of primary stations, this included seven dropped standard SEAMAP stations (B116, B113, B154, B097, B096, B088, B089) for Leg 2. In all, the dropped sampling included a total of seven standard SEAMAP stations, 16 LU stations, and 20 Dual-Mesh sampling tows from Leg 2 objectives.

OBJECTIVES

1. Assess the occurrence, abundance and geographical distribution of the early life stages of fall spawning fishes, especially king and Spanish mackerel, red drum, and snappers, on U.S. continental shelf waters in the GOM using a bongo frame fitted with 0.335 mm nets, and a neuston frame fitted with a 0.950 mm net at selected SEAMAP stations in support of annual stock assessments.
2. Describe the pelagic habitat of fish larvae through measurements of various physical and biological parameters:
 - a. Record profiles through the water column of temperature, salinity, fluorescence, dissolved oxygen, and turbidity using a CTD at SEAMAP stations.

- b. Measure chlorophyll *a* in replicate water samples taken at surface, mid or maximum chlorophyll layer and near bottom (to a maximum of 200 m) depths using bench top fluorometry.
 - c. Detect and measure frontal features along the survey cruise track using data from the ship's Fluoro-thermosalinograph flow-through system (TSG).
3. Map the distribution of fish eggs and invertebrate zooplankton along the cruise track using a Continuous Underway Fish Egg Sampler (CUFES).
 4. Study extrusion of smaller fish larvae through the standard SEAMAP 0.335 mm mesh bongo nets by using a secondary standard bongo frame outfitted with both 0.335 mm and 0.202 mm mesh nets. These dual-mesh tows will be done at selected stations throughout the trackline.
 5. Examine the spatial resolution of red and vermillion snapper distribution as compared with the standard 30 nm station grid by adding sampling stations at the 15 nm center points between standard stations in targeted areas. These stations will be sampled with a standard bongo, neuston, and CTD cast.
 6. Collect detailed observations of net-caught jellyfish and ctenophores.

SURVEY RESULTS **Ichthyoplankton Data**

Survey Design

A predefined cruise track of 143 stations, approximately 30 nm apart in a systematic grid, were targeted for this survey. An additional 37 non-SEAMAP stations (LU) were planned to examine spatial variability in areas within the SEAMAP grid. Each of these stations were positioned at a center-point equidistant (~15 nm) from the four surrounding standard SEAMAP stations. There were 44 planned Dual-Mesh stations throughout the trackline on both legs. The LU and Dual-Mesh stations were focused over areas where large numbers of snapper larvae have been collected on past surveys. The state of Louisiana planned to sample nine of the standard SEAMAP stations, Mississippi planned seven, and Alabama planned three stations.

Sampling Methodology

Sample and data collection were implemented in accordance with procedures outlined in the SEAMAP data collections manual. SEAMAP plankton samples were taken with the standard SEAMAP 61 cm bongo frame outfitted with two 0.335 mm mesh nets and towed in an oblique path from near bottom or 200 m maximum depth to the surface. A SBE19 SEACAT Profiler was attached on the towing wire above the frame to provide real time depth readings along with temperature and salinity. A flowmeter mounted inside each side of the bongo frame measured the volume filtered during the tow. SEAMAP plankton samples were also taken using a 0.950 mm mesh neuston net attached to a 1 x 2 m metal frame that was towed for 10 min at a vessel speed (~ 2 kt) sufficient to keep the net opening half submerged in the water maintaining a sampling depth of 0.5 m. In areas with a high density of sargassum or jellyfish, the total tow time

was reduced to 5 min. Preservation protocol called for the left bongo samples to be preserved in 10% formalin and then transferred to fresh 95% ETOH after 36 h in order to improve long term storage for genetic analysis. The right bongo and neuston samples were initially preserved in 95% ETOH and then transferred to fresh 95% ETOH after 24 h.

Additional plankton samples were taken using a SEAMAP dual-mesh bongo plankton sampler that is comprised of two 61 cm diameter collars mounted with a 0.335 and 0.202 mm net. Each dual-mesh tow was conducted exactly like standard SEAMAP bongo tows. This sampler was deployed to study extrusion of smaller fish larvae through the standard SEAMAP 0.335 mm mesh bongo nets. Samples from these dual-mesh tows were both initially preserved in 10% formalin and transferred to fresh 95% ETOH after 36 h.

LU stations were conducted like standard SEAMAP stations, which included a standard bongo tow, neuston tow, and CTD cast. All samples from the LU stations were initially preserved in 95% ETOH and then transferred to fresh 95% ETOH after 24 h.

Zooplankton and fish egg samples were collected between stations using a CUFES. Water sampled by the CUFES was pumped from the center sea chest which had an intake approximately 3 m below the surface of the water. Seawater was filtered through a 0.505 mm sieve within the CUFES and collected over 30 min intervals between stations.

CTD casts were conducted at each station and water was collected at the surface, chlorophyll maximum depth, and bottom depth, which was then used for chlorophyll extraction and measurement.

Collection Summary

Ichthyoplankton samples were collected at 128 stations by NOAA Ship *Gordon Gunter* during the survey (Figures 1 and 2). A total of 70 stations were sampled during Leg 1 resulting in 53 right bongo (RB), 53 left bongo (LB), 52 neuston (NN), 21 Dual-mesh right bongo (DM-RB), 21 Dual-mesh left bongo (DM-LB), and 17 full LU stations which each had a RB, LB, and NN (Table 1). A total of 58 stations were sampled during Leg 2 resulting in 57 right bongo, 58 left bongo, and 55 neuston (Table 1). High winds and lightening caused the cancelation of three full stations during Leg 1 and also cancelled the CTD at stations 032 and 068. In several situations the neuston sample was not retained due to very large amounts of sargassum (Station 016) or jellyfish present in the sample (Stations 92, 95, and 102). One neuston sample was lost when the neuston net failed during the tow (Station 034). An electronics issue was causing difficulty with some CTD casts making them unusable. Water samples were not collected for Chl *a* analysis at the end of Leg 1 (stations 069-070) due to the lack of proper time to process the samples.

A total of 648 near-surface fish egg and invertebrate zooplankton samples were collected between stations using a CUFES (Table 1, Figure 3). CUFES samples will remain at the NOAA/NMFS Mississippi Laboratories for sorting and analysis. These samples were collected along the trackline, including between station locations that were sampled by the state partners.

Jellyfish and ctenophores collected in bongo and neuston nets were thoroughly rinsed, removed from the plankton samples, and noted in the database. These organisms were identified, counted, and volume measured. Data were also recorded on data sheets for each station.

Sargassum spp. collected in bongo and neuston nets were thoroughly rinsed, removed from the plankton sample, and volume measured. The amount of *Sargassum* spp. in each net was recorded in the database.

State Vessels

The Louisiana Department of Fisheries and Wildlife sampled nine SEAMAP stations off southern Louisiana with bongo, neuston, and CTD gear from the R/V *Acadiana* (Table 1, Figure 1). Plankton samples taken by the Louisiana vessel were preserved similar to the way it was completed aboard the NOAA vessel. The primary bongo for Louisiana was the LB, so the LB and Neuston samples were initially preserved in 95% ETOH and transferred to new 95% ETOH after 24 h. Their RB was initially preserved in 10% Formalin and transferred to new 95% ETOH after 36 h following SEAMAP procedure. Seven stations were sampled with bongo, neuston, and CTD by the University of Southern Mississippi (USM), Gulf Coast Research Laboratory (GCRL) R/V *Tommy Munro* off Mississippi (Table 1, Figure 1). These samples were initially all preserved in 10% Formalin and transferred to new 95% ETOH after the ship returned to the dock. The Alabama Marine Resource Division (AMRD) sampled three standard SEAMAP stations with bongo, neuston and CTD gear (Table 1, Figure 1) aboard the R/V *Discovery*. Alabama samples were initially preserved in 10% formalin and were transferred to 95% ETOH upon arrival at the NOAA/NMFS Laboratories. All samples from state vessels were transferred to the NOAA/NMFS Laboratory in Pascagoula, MS.

Sample Processing / Archival Storage

Plankton samples were assigned SEAMAP numbers at sea on NOAA Ship *Gordon Gunter* (Table 2). Primary bongo samples (RB for NOAA, Mississippi, and Alabama; LB for Louisiana) and neuston samples will be shipped to the Sea Fisheries Institute, Plankton Sorting and Identification Center (ZSIOP), Gdynia, Poland for sorting. The LBs (RB for Louisiana) will be deposited in the SEAMAP Invertebrate Archive at GCRL, USM, Ocean Springs, MS. At this time, all Dual-Mesh samples will remain with the NOAA/NMFS Mississippi Laboratory until processed in the future. Data on gelatinous organisms and sargassum collected during the cruise will be archived at NMFS Pascagoula Laboratory for future analysis.

Environmental Data

Environmental data were collected with a Seabird SBE 9/11 Plus CTD at a total of 126 stations from NOAA Ship *Gordon Gunter* during the survey. At all stations sampled with the SBE 9/11 Plus CTD, a cast to near bottom or a maximum depth of 200 m was conducted. The Seabird SBE 9/11 Plus CTD was used with a dual suite of the following sensors: SBE 03 Temperature sensor, SBE digiquartz pressure sensor, and SBE 43 dissolved oxygen sensor. Only a single Wetlabs Wetstar fluorometer and Wetlabs C-Star transmissometer were used because of space limitations on the CTD. Additional environmental and station information was accessed from shipboard sensors via the Scientific Computer System (SCS), which continuously displayed and recorded the ship's position, heading, speed, wind direction, wind speed, barometric pressure, sea surface temperature, air temperature and water depth. Each sampling event was

conducted through the SCS and data (environmental and biological) were ingested into a Microsoft Access database. Aboard *Gordon Gunter*, water samples were taken at all stations using Niskin bottles attached to a SBE carousel sampler. Target depths for the water samples were at the surface (d5 m), chlorophyll maximum, and near-bottom (up to 200 m maximum). At stations where the water column was shallow and well mixed, only surface and bottom water samples were taken. Triplicate, 200 ml subsamples from the three sampled depths were analyzed for chlorophyll *a* concentration ($\mu\text{g/L}$) using a Turner Designs 10-AU-005 benchtop fluorometer with a 10-04R optical kit and the modified Welshmeyer method. Chlorophyll readings from each sample depth were averaged (Table 3) and entered into the Microsoft Access database. The CTD and chlorophyll data were processed at sea and ingested into the database. A copy of the database and CTD casts will be kept at the NOAA Laboratory in Pascagoula, MS.

Salinity (PSU), sea temperature ($^{\circ}\text{C}$), and dissolved oxygen (mg/L), were recorded from the sensors on the CTD for the same depths as water samples for the chlorophyll *a* measurements. Near surface (d 5 m depth) values of salinity, sea temperature, dissolved oxygen, and chlorophyll *a* concentrations for stations are presented in Figures 4 through 7.

Throughout the cruise, a SBE21 TSG equipped with a Turner Designs 10-AU fluorometer continuously measured surface salinity, temperature, and fluorescence. A dedicated computer recorded all the information and was backed up daily to the ship's server. This complete dataset was copied off the ship's server and returned to the NMFS Pascagoula Laboratory for analysis and archiving.

CRUISE PARTICIPANTS

Leg I (22 August – 8 September 2014)

Name / Title / Organization

Pam Bond / Field Party Chief / NMFS, Pascagoula, MS

* NOTE: Dual-mesh bongo at this station was accidentally filtered through a 0.333 mesh sieve, so the sample was re-coded as a 0.333 mesh LB.

Table 3. Summary of average chlorophyll *a* measurements at three depths (surface, chlorophyll maximum, bottom) for each station where the CTD was deployed during the 2014 Fall SEAMAP Plankton Survey conducted from the NOAA Ship *Gordon Gunter* cruise GU-14-05, 22 August – 30 September 2014. P-Sta # = Pascagoula station number; S-Sta # = SEAMAP station number or other station identifier; Depth = Depth (meters); D-Code = Sample location (meters) in water column (S = Surface, MAX = Chlorophyll maximum, B = Bottom); Chl-a = Chlorophyll *a* measurement ($\mu\text{g/L}$).

Figure 1. Plankton stations completed for the SEAMAP Fall Plankton Survey, 22 August - 30 September 2014. Bongo tows sampled by NOAA as part of the standard fall SEAMAP survey are represented by a plus. Closed diamonds represent LU stations that were sampled for spatial variability analysis (NOAA). Stations sampled by the state of Louisiana are represented with an 'L', state of Mississippi with an 'M', and Alabama with an 'A'. Open squares represent stations where an additional dual-mesh bongo tow was conducted for extrusion analysis.

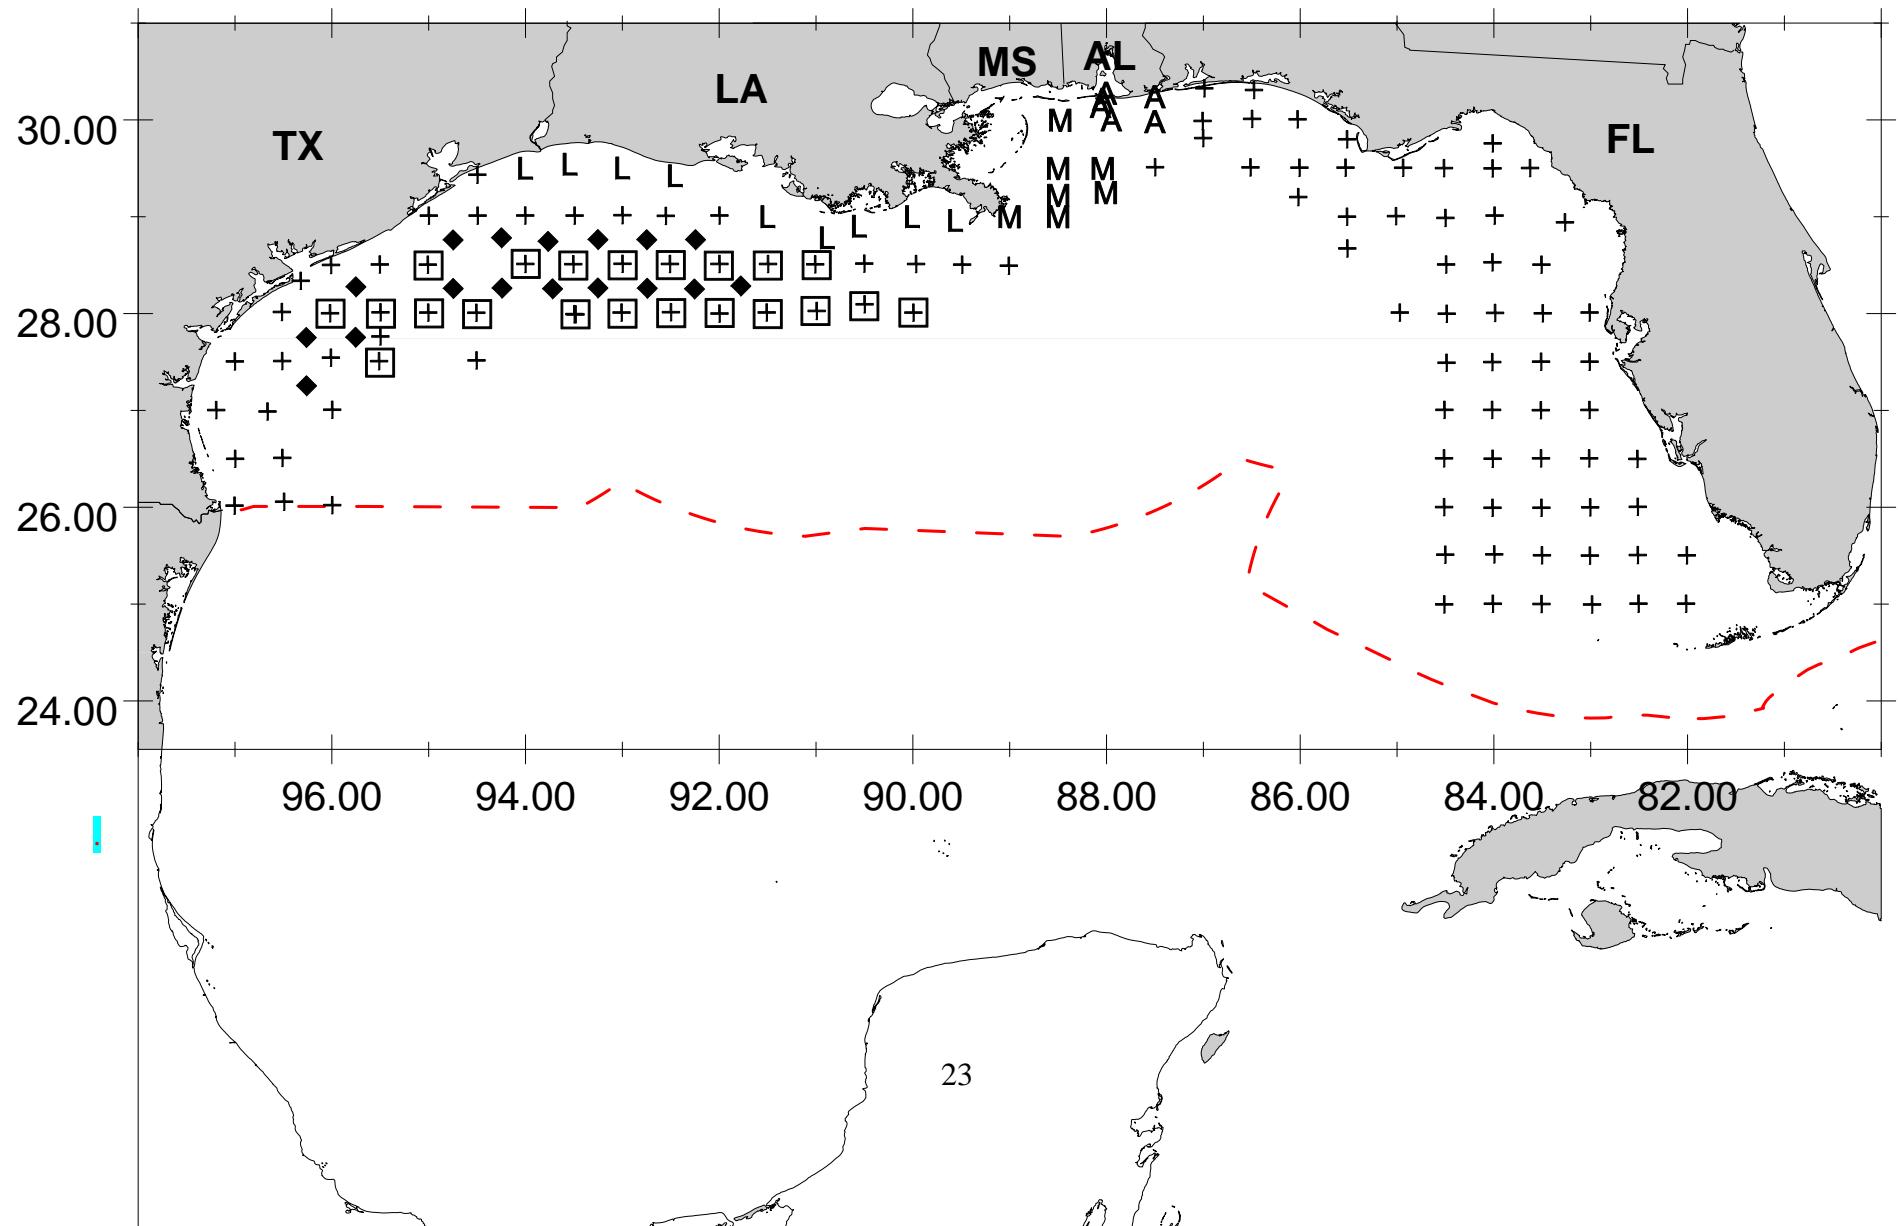

Figure 2. Plankton stations completed during the SEAMAP Fall Plankton Survey aboard the NOAA Ship *Gordon Gunter*, cruise GU-14-05, 22 August - 30 September 2014. Bongo tows are represented by a plus, neuston tows are represented by an “X”, and CTD casts are represented by open circles.

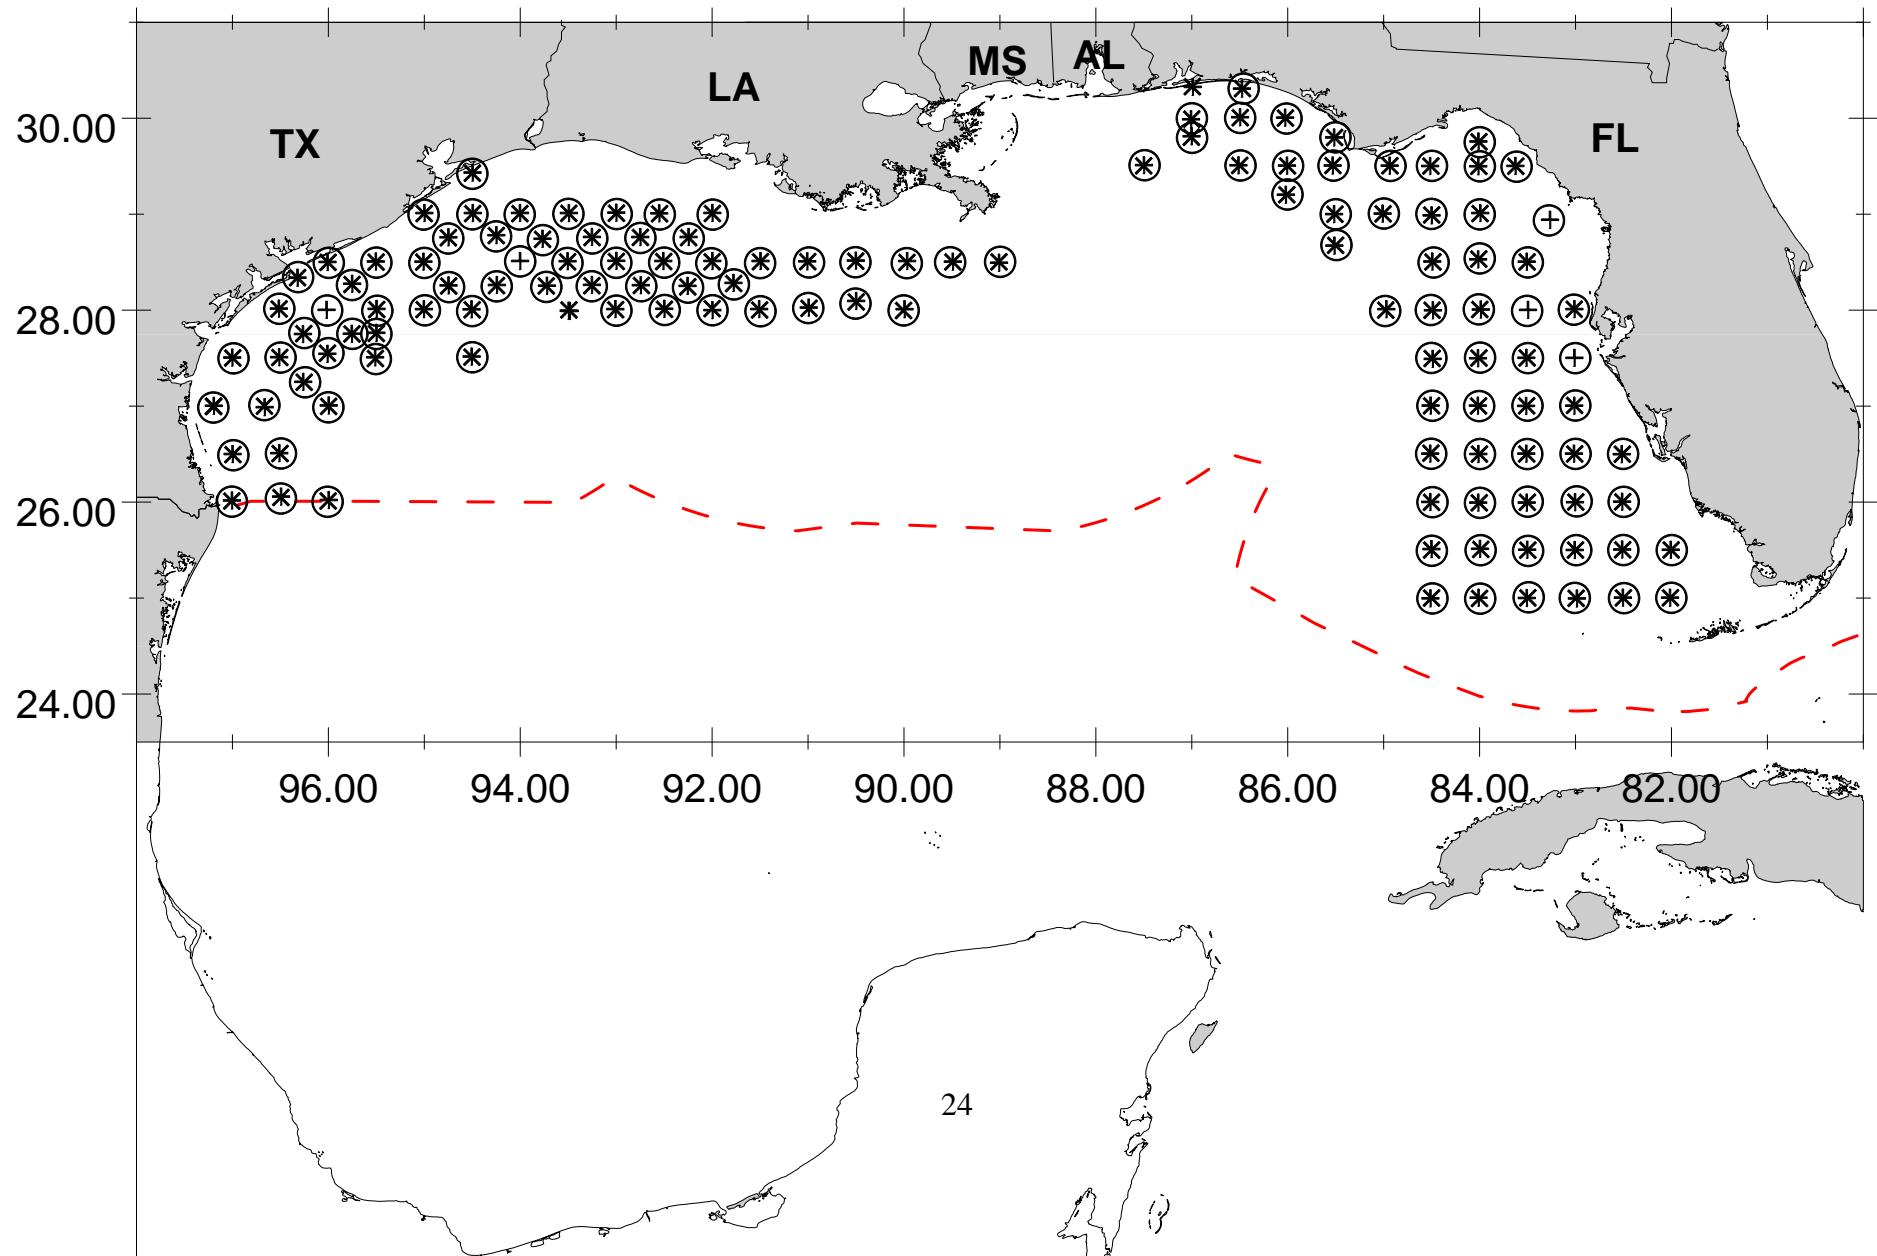

Figure 3. Locations of CUFES samples taken during the SEAMAP Fall Plankton Survey aboard the NOAA Ship *Gordon Gunter*, cruise GU-14-05, 22 August – 30 September 2014.

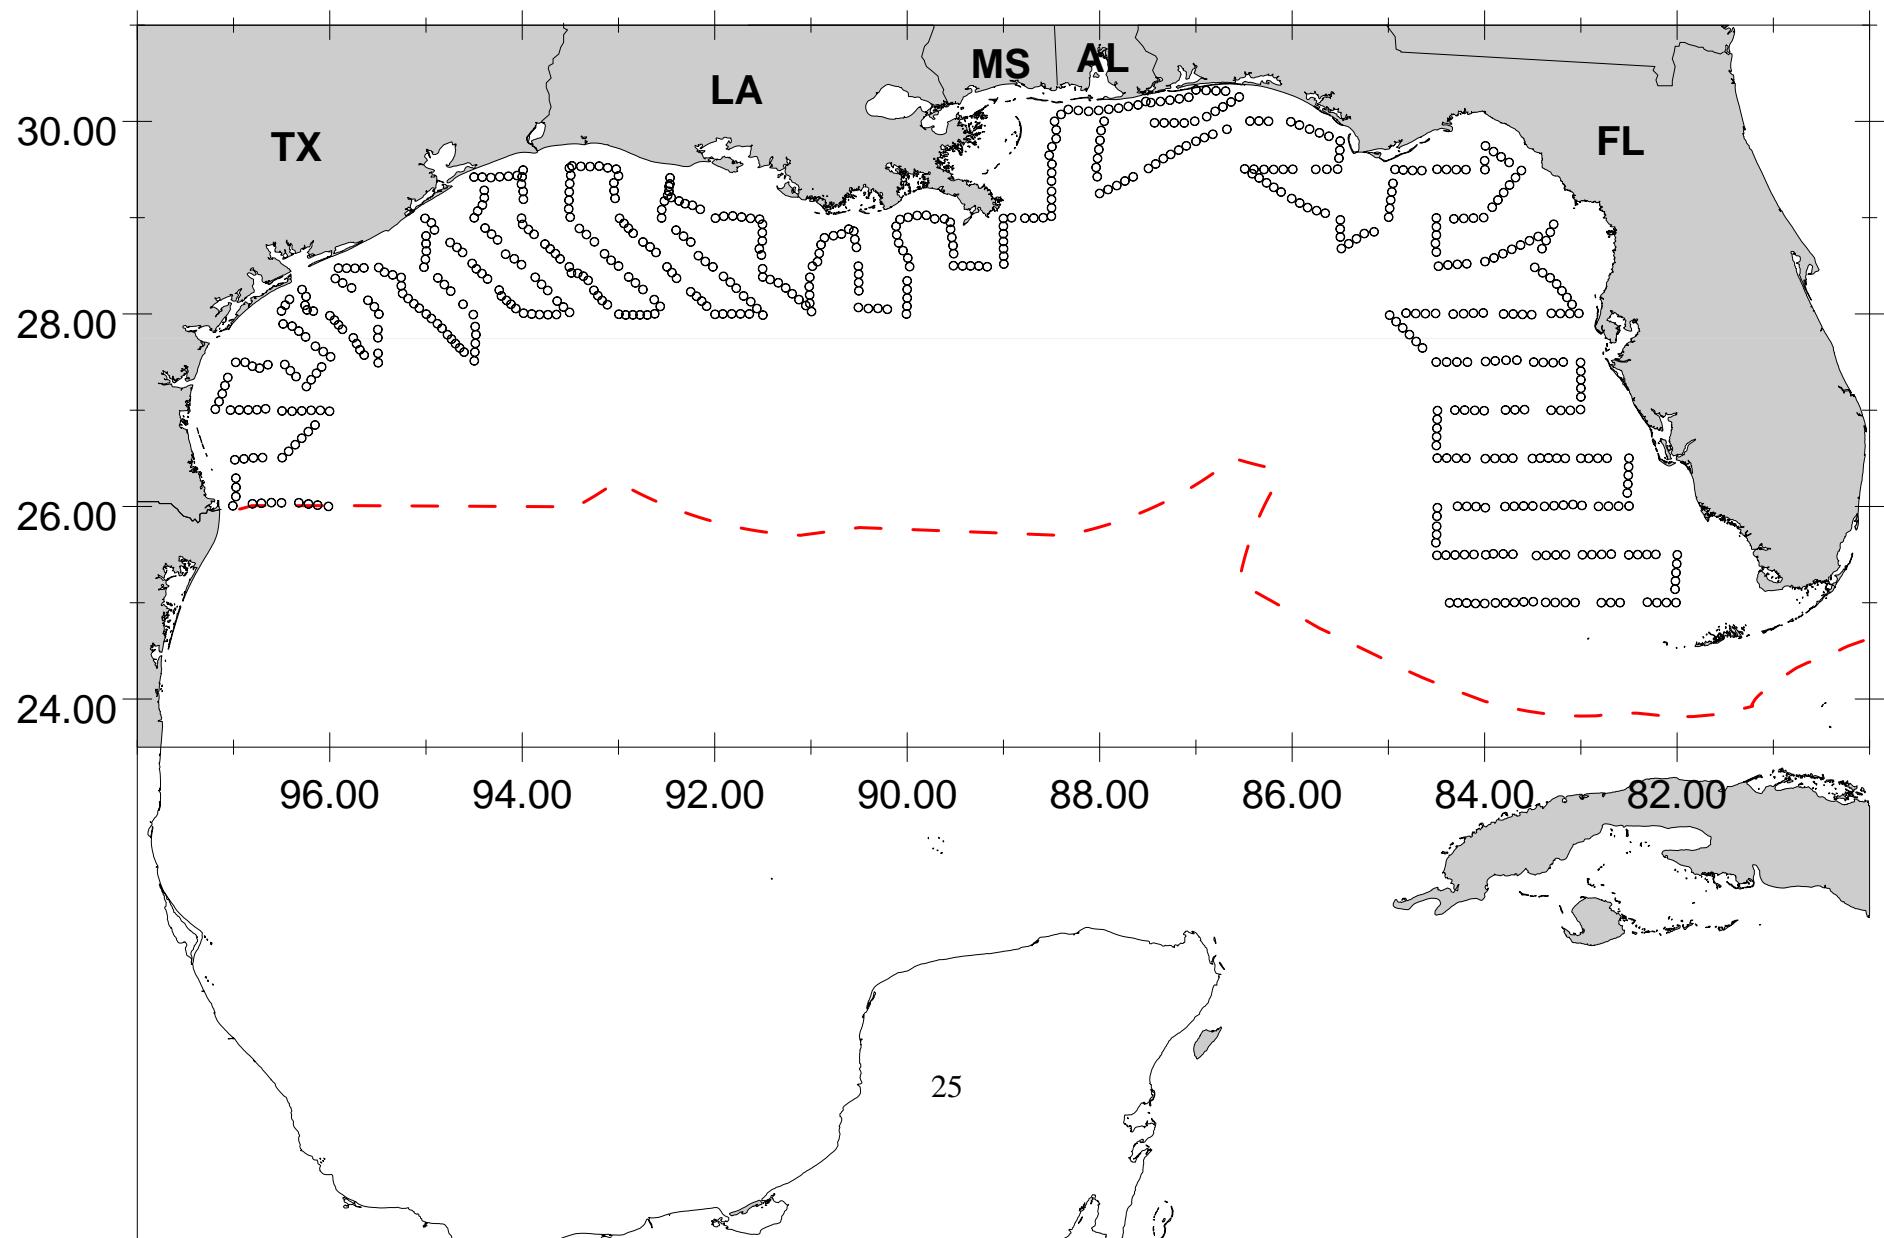

Figure 4. Sea temperature ($^{\circ}$ C) near the surface (d 5 m depth) at plankton stations during the SEAMAP Fall Plankton Survey aboard the NOAA Ship *Gordon Gunter* cruise GU-14-05, 22 August – 30 September 2014.

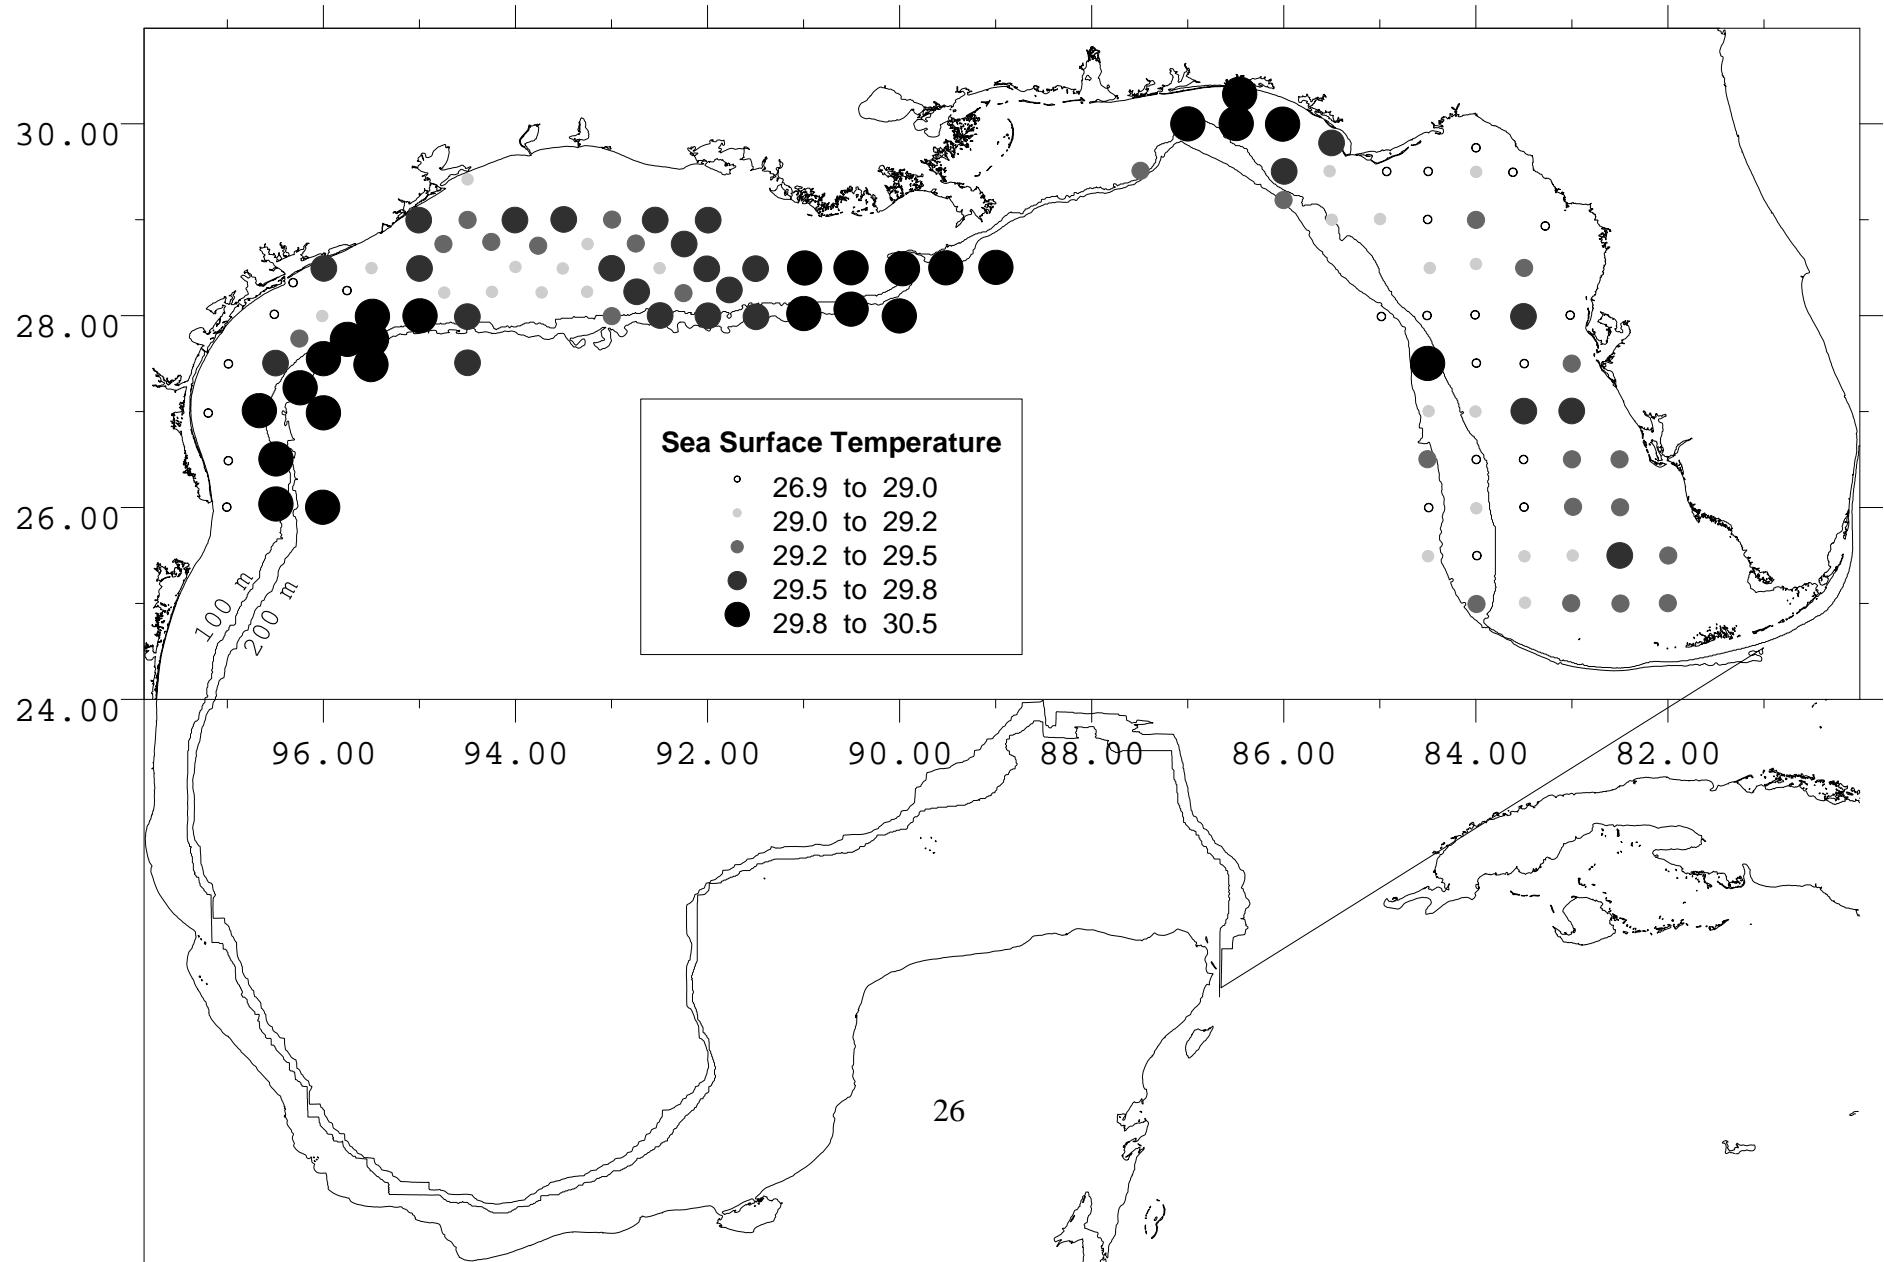

Figure 5. Salinity (PSU) near the surface ($d = 5$ m depth) at plankton stations during the SEAMAP Fall Plankton Survey aboard the NOAA Ship *Gordon Gunter* cruise GU-14-05, 22 August – 30 September 2014.

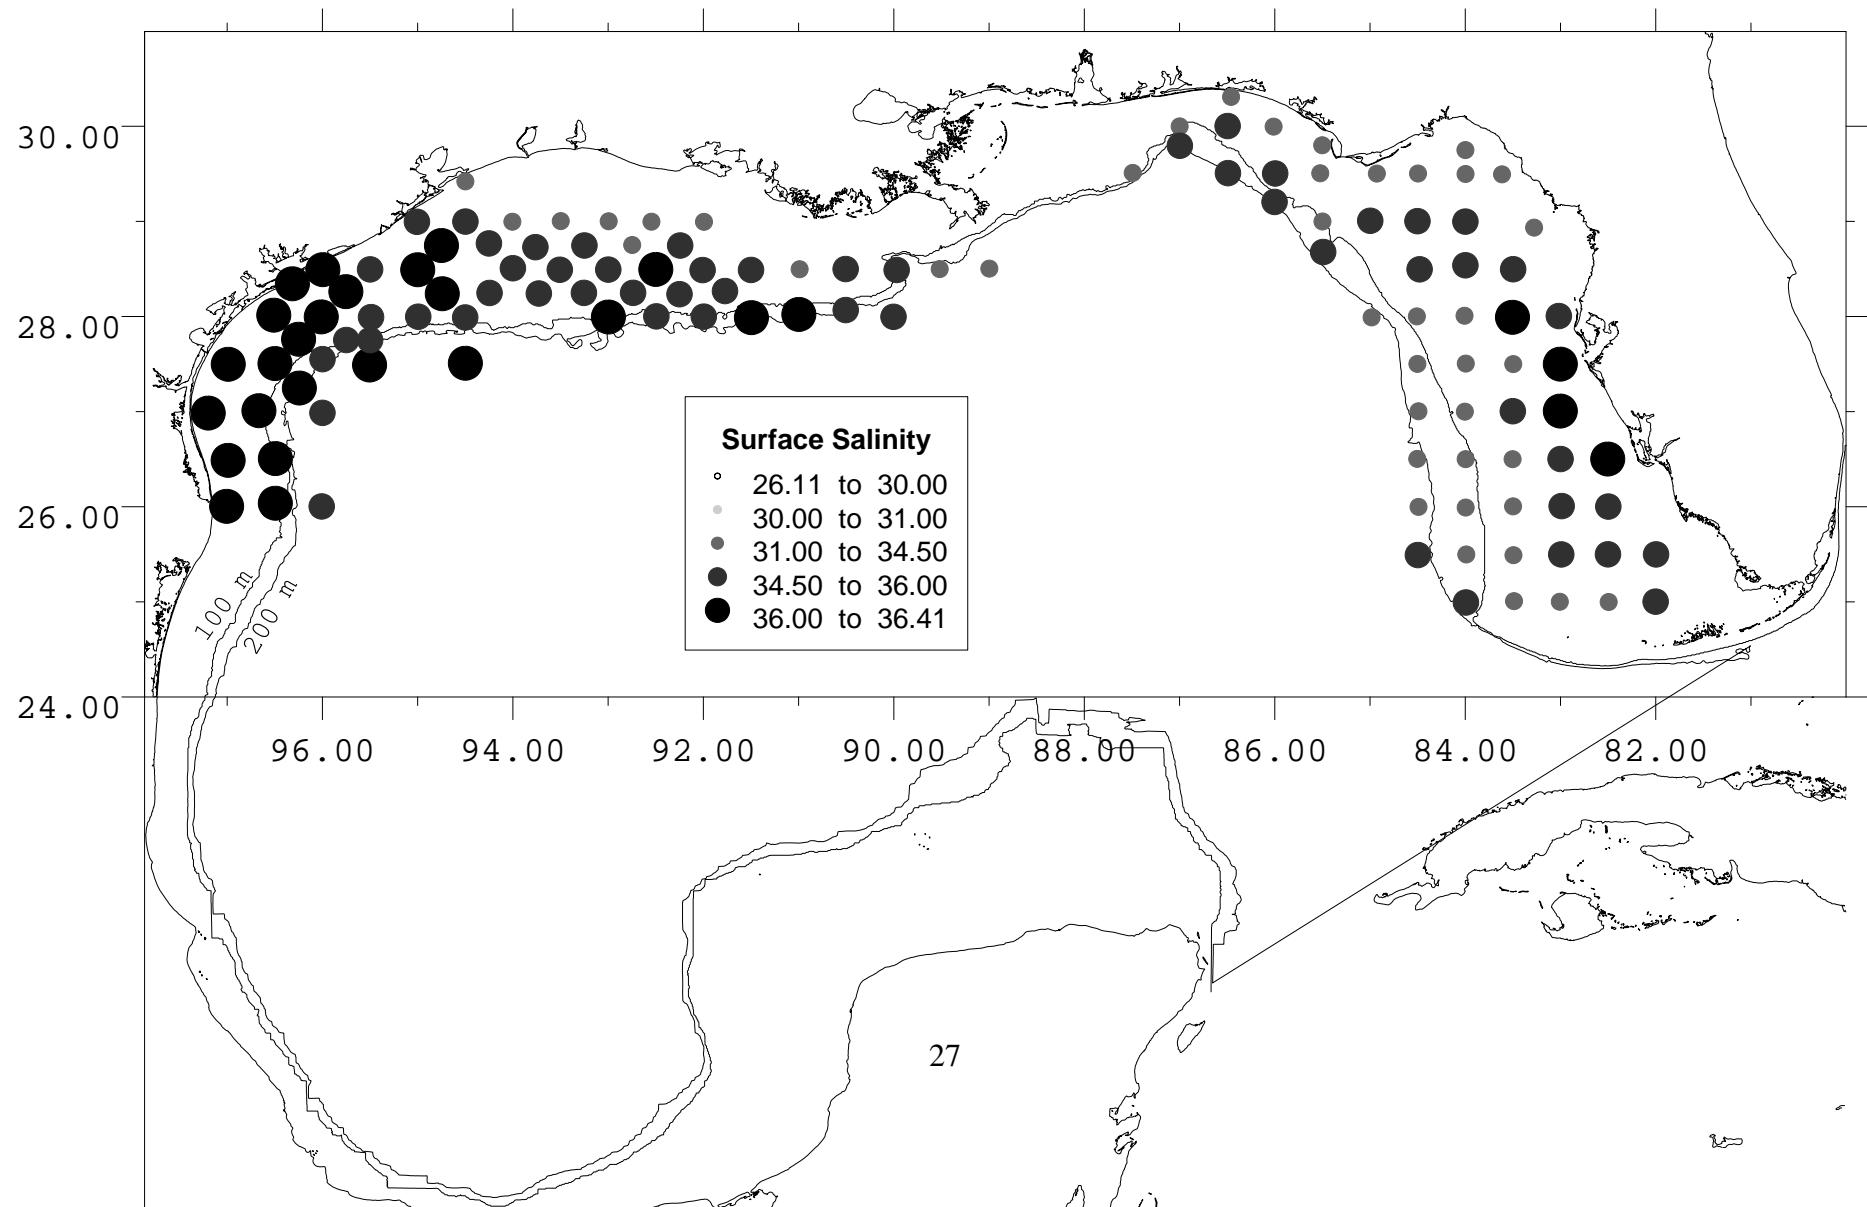

Figure 6. Dissolved oxygen (mg/L) near the surface (d 5 m depth) at plankton stations during the SEAMAP Fall Plankton Survey aboard the NOAA Ship *Gordon Gunter* cruise GU-14-05, 22 August – 30 September 2014.

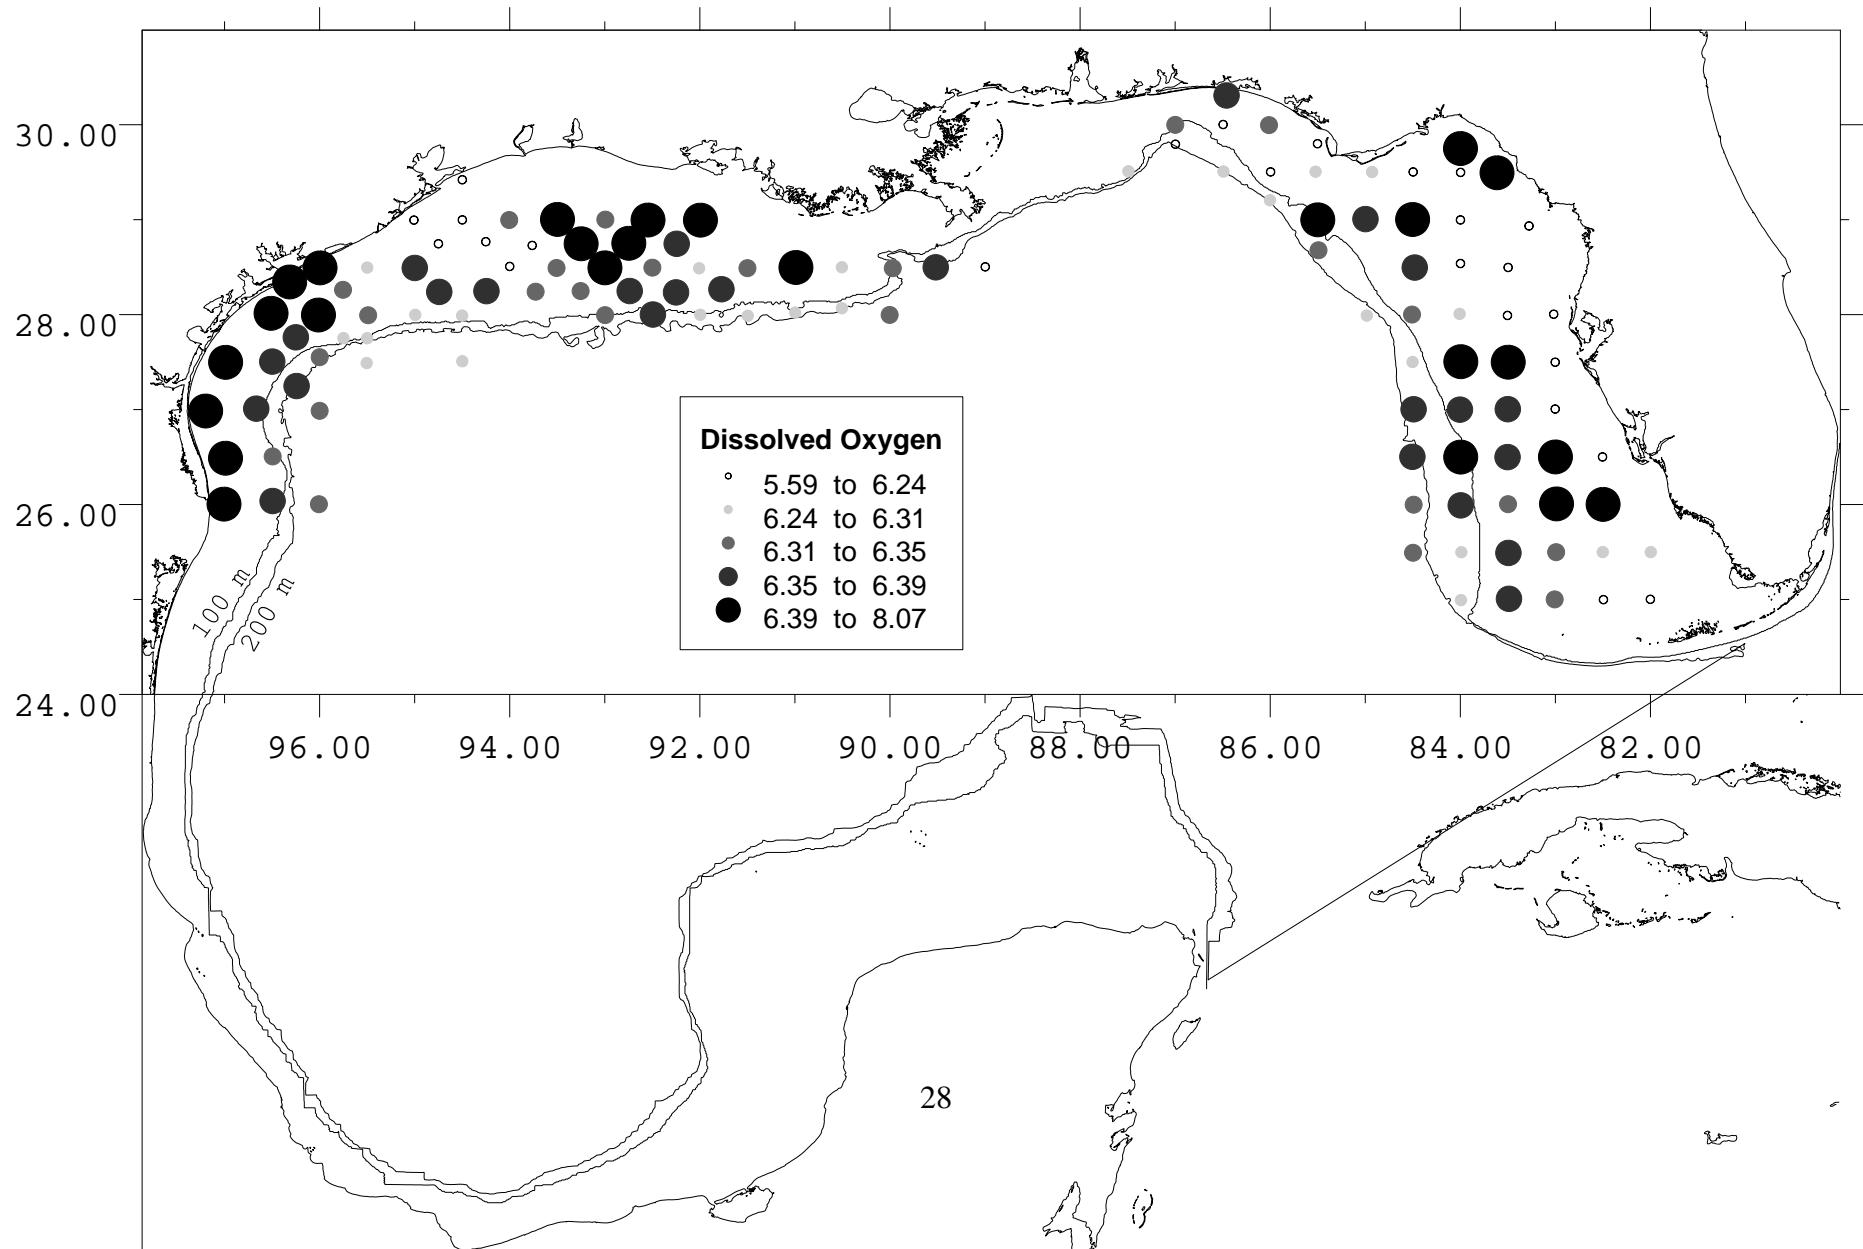

Figure 7. Surface chlorophyll a ($\mu\text{g/L}$) near the surface (at 5 m depth) at plankton stations during the SEAMAP Fall Plankton Survey aboard the NOAA Ship *Gordon Gunter* cruise GU-14-05, 22 August – 30 September 2014.
