FCM-P 12-1986
May 1986
Washington, D.C.

FOREWORD

An Interdepartmental Plan was first issued in 1962. This document is the 24th edition and presents procedures and agreements reached at the 40th annual Interdepartmental Hurricane Conference held at the USAF Conference Center, Homestead Air Force Base, Florida, 7-10 January 1986.

The Conference is sponsored annually by the Committee for Basic Services, Interdepartmental Committee For Meteorological Services and Supporting Research, and brings together cognizant Federal agencies to achieve agreement on items of mutual concern related to hurricane warning services. The host this year for the Conference was Headquarters, Air Weather Service, Scott AFB, Illinois.

William S. Barney
Federal Coordinator for
Meteorological Services and
Supporting Research

NATIONAL HURRICANE OPERATIONS PLAN

(ATLANTIC, EASTERN PACIFIC, AND CENTRAL PACIFIC)

CONTENTS

	<u>Page</u>
Foreword	i
Contents	ii
Chapter 1. Introduction.....	1-1
Appendix A--Area of Responsibility.....	1-4
Chapter 2. Responsibilities of Cooperating Federal Agencies.....	2-1
Chapter 3. General Operations and Procedures of the National Weather Service Hurricane Centers.....	3-1
Appendix A--Tropical Cyclone Names.....	3-7
Appendix B--Saffir/Simpson Hurricane Scale.....	3-11
Chapter 4. National Weather Service Products for the Department of Defense.....	4-1
Appendix A--Form 1 (WS Form C-13).....	4-3
Chapter 5. Aircraft Reconnaissance.....	5-1
Appendix A:	
Attachment 1 --Operational Flight Patterns	5-10
Attachment 2 --Recommended Pattern "A" Execution.....	5-12
Attachment 3 --Operational Flight Pattern Delta.....	5-13
Attachment 4 -- Drifting Buoy Deployment.....	5-15
Appendix B:	
Form 1--NHOP Coordinated Request for Aircraft Reconnaissance	5-16
Form 2--Tropical Cyclone Plan of the Day Format--Atlantic, Eastern, and Central Pacific Oceans	5-17
Form 3--Vortex Data Message Form.....	5-18
Form 4--Supplementary Vortex Data Message Form.....	5-19
Form 5--Mission Evaluation Form.....	5-20
Form 6--RECCO Recording Form.....	5-21
Appendix C:	
Aircraft Reconnaissance Communications.....	5-25
Reconnaissance Organization Communication Capabilities.....	5-28

Chapter 6. Satellite Surveillance of Tropical and Subtropical Cyclones.....	6-1
Appendix A:	
Attachment 1--GOES Operational Data Flow.....	6-3
Attachment 2--Satellites and Satellite Data Availability	6-4
Appendix B:	
Form 1--Satellite Tropical Disturbance Summary.....	6-5
Form 2--Center Fix Data Form and Message Format (Satellite).....	6-6
Current Intensity and "T" Number Classification Table.....	6-7
Chapter 7. Surface Radar Reporting.....	7-1
Appendix A--Participating Radar Stations.....	7-3
Chapter 8. National Data Buoy Center Reporting Stations.....	8-1
Appendix A--Code Form FM 13-VII (Ship) and Code Form FM14-VIII (DRIBU).....	8-5
Chapter 9. Marine Weather Broadcasts.....	9-1
Appendix A--List of Marine Tropical Cyclone Forecast Broadcast Stations.....	9-2
Chapter 10. Publicity.....	10-1

APPENDICES

APPENDIX I. Acronyms and Abbreviations as Used in This Plan.....	A-1
APPENDIX II. Bibliography of Official Interagency Agreements.....	B-1
APPENDIX III. Distribution List.....	C-1

NOTE: Significant changes from the previous edition are highlighted by a solid line on the left margin or on the bottom of the page.

CHAPTER 1

INTRODUCTION

1. General. The Tropical Cyclone Warning Service is an interdepartmental effort to provide the United States and designated international recipients with forecasts, warnings, and assessments concerning tropical and subtropical weather systems. The National Oceanic and Atmospheric Administration (NOAA) is responsible for providing forecasts and warnings for the Atlantic, and Eastern and Central Pacific Oceans, while the Department of Defense (DOD) provides the same for the West Pacific and Indian Oceans. Interdepartmental cooperation achieves economy and efficiency in the operation of the Tropical Cyclone Warning Service. This plan provides the basis for implementing the agreements of the Department of Commerce (DOC), Department of Defense, and the Department of Transportation (DOT) reached at the annual Interdepartmental Hurricane Conference (combined Atlantic and Pacific). The Hurricane Conference is sponsored by the Committee for Basic Services, Interdepartmental Committee for Meteorological Services and Supporting Research, to bring together cognizant Federal agencies and achieve agreement on items of mutual concern related to the Atlantic and Pacific Tropical Cyclone Warning Services.

2. Scope. The procedures and agreements contained herein apply to the Atlantic, Gulf of Mexico, Caribbean, and North Pacific east of the 180th meridian. This plan is intended to define the role of the individual agencies (organizations) participating in the hurricane warning service when more than one agency (organization) is involved in the delivery of service in any specific area. When a single agency (organization) is involved in any specific area, that agency's (organization's) procedures should be contained in internal documents and, to the extent possible, be consistent with NHOP practices and procedures.

3. Terms used in this Plan:

a. Center Fix. The location of the center of a tropical or subtropical cyclone obtained by means other than reconnaissance aircraft penetration.

b. Cyclone. An atmospheric closed-circulation rotating counterclockwise in the Northern Hemisphere.

c. Eye. The relatively calm center of a tropical cyclone which is more than 1/2 surrounded by wall cloud.

d. Hurricane Season. The portion of the year having a relatively high incidence of hurricanes. In the Atlantic, Caribbean, and Gulf of Mexico, this is the period from June through November; in the eastern Pacific, May 15 through November 30; and in the central Pacific the period from June through November.

e. Hurricane Warning Offices (HWO). The designated hurricane warning offices are: the National Hurricane Center, Miami, Florida; the Eastern Pacific Hurricane Center, Redwood City, California; and the Central Pacific Hurricane Center, Honolulu, Hawaii.

f. Hurricane Warning. A warning that sustained winds of 74 miles an hour (64 knots) or higher associated with a hurricane are expected in a specified coastal area in 24 hours or less. A hurricane warning can remain in effect when dangerously high water or a combination of dangerously high water and exceptionally high waves continue, even though winds may be less than hurricane force.

g. Hurricane Watch. An announcement for specific areas that a hurricane or an incipient hurricane condition poses a possible threat to coastal areas generally within 36 hours.

h. Miles. The term "miles" used in this plan refers to nautical miles unless otherwise indicated.

i. Mission Identifier. The nomenclature assigned to tropical and subtropical cyclone aircraft reconnaissance missions for weather data identification. It comprises an agency - aircraft indicator followed by a Chief, Aerial Reconnaissance Coordination, All Hurricane (CARCAH) assigned mission-system indicator.

j. Present Movement. The best estimate of the movement of the center of a tropical cyclone at a given time and at a given position. This estimate does not reflect the short-period, small-scale oscillations of the cyclone center.

k. Reconnaissance Aircraft Sorties. A flight which meets the requirements of the tropical cyclone plan of the day (TCPOD).

l. Relocated. A term used in an advisory to indicate that a vector drawn from the preceding advisory position to the latest-known position is not necessarily a reasonable representation of the cyclone's movement.

m. Storm Surge. An abnormal rise in sea level accompanying a hurricane or other intense storm, and whose height is the difference between the observed level of the sea surface and the level that would have occurred in the absence of the cyclone. Storm surge is usually estimated by subtracting the normal or astronomic tide from the observed storm tide.

n. Storm Tide. The actual level of sea water resulting from the astronomic tide combined with the storm surge.

o. Subtropical Cyclone. A low-pressure system developing over subtropical waters which initially has a non-tropical circulation but in which some elements of tropical cyclone cloud structure are present.

(1) Subtropical Depression. A subtropical cyclone in which the maximum sustained surface wind (1-minute mean) is 33 knots (38 statute mph) or less.

(2) Subtropical Storm. A subtropical cyclone in which the maximum sustained surface wind (1-minute mean) is 34 knots (39 statute mph) or greater.

p. Synoptic Track. Weather reconnaissance mission flown to provide vital meteorological information in data sparse ocean areas as a supplement to existing surface, radar and satellite data. Synoptic flights better define the upper atmosphere and aid in the prediction of tropical cyclone development and movement.

q. Tropical Cyclone Plan of the Day. A coordinated mission plan that tasks operational weather reconnaissance requirements during the next 05Z to 05Z day or as required; describes reconnaissance flights committed to satisfy both operational and research requirements; and identifies possible reconnaissance requirements for the succeeding 24-hour period.

r. Tropical Weather Systems:

(1) Tropical Disturbance. A discrete system of apparently organized convection--generally 100 to 300 miles in diameter--originating in the tropics or subtropics, having a nonfrontal migratory character and maintaining its identity for 24 hours or more. It may or may not be associated with a detectable perturbation of the wind field. As such, it is the basic generic designation, which in successive stages of intensification, may be classified as a tropical wave, depression, storm, or hurricane.

(2) Tropical Wave. A trough or cyclonic curvature maximum in the trade-wind easterlies. The wave may reach maximum amplitude in the lower middle troposphere or may be the reflection of an upper troposphere cold-low or equatorial extension of a middle-latitude trough.

(3) Tropical Cyclone. A warm-core, nonfrontal low pressure system of synoptic scale developing over tropical or subtropical waters and having a definite organized surface circulation.

(a) Tropical Depression. A tropical cyclone in which the maximum sustained surface wind (1-minute mean) is 33 knots (38 statute mph) or less.

(b) Tropical Storm. A tropical cyclone in which the maximum sustained surface wind (1-minute mean) ranges from 34 knots (39 statute mph) or more.

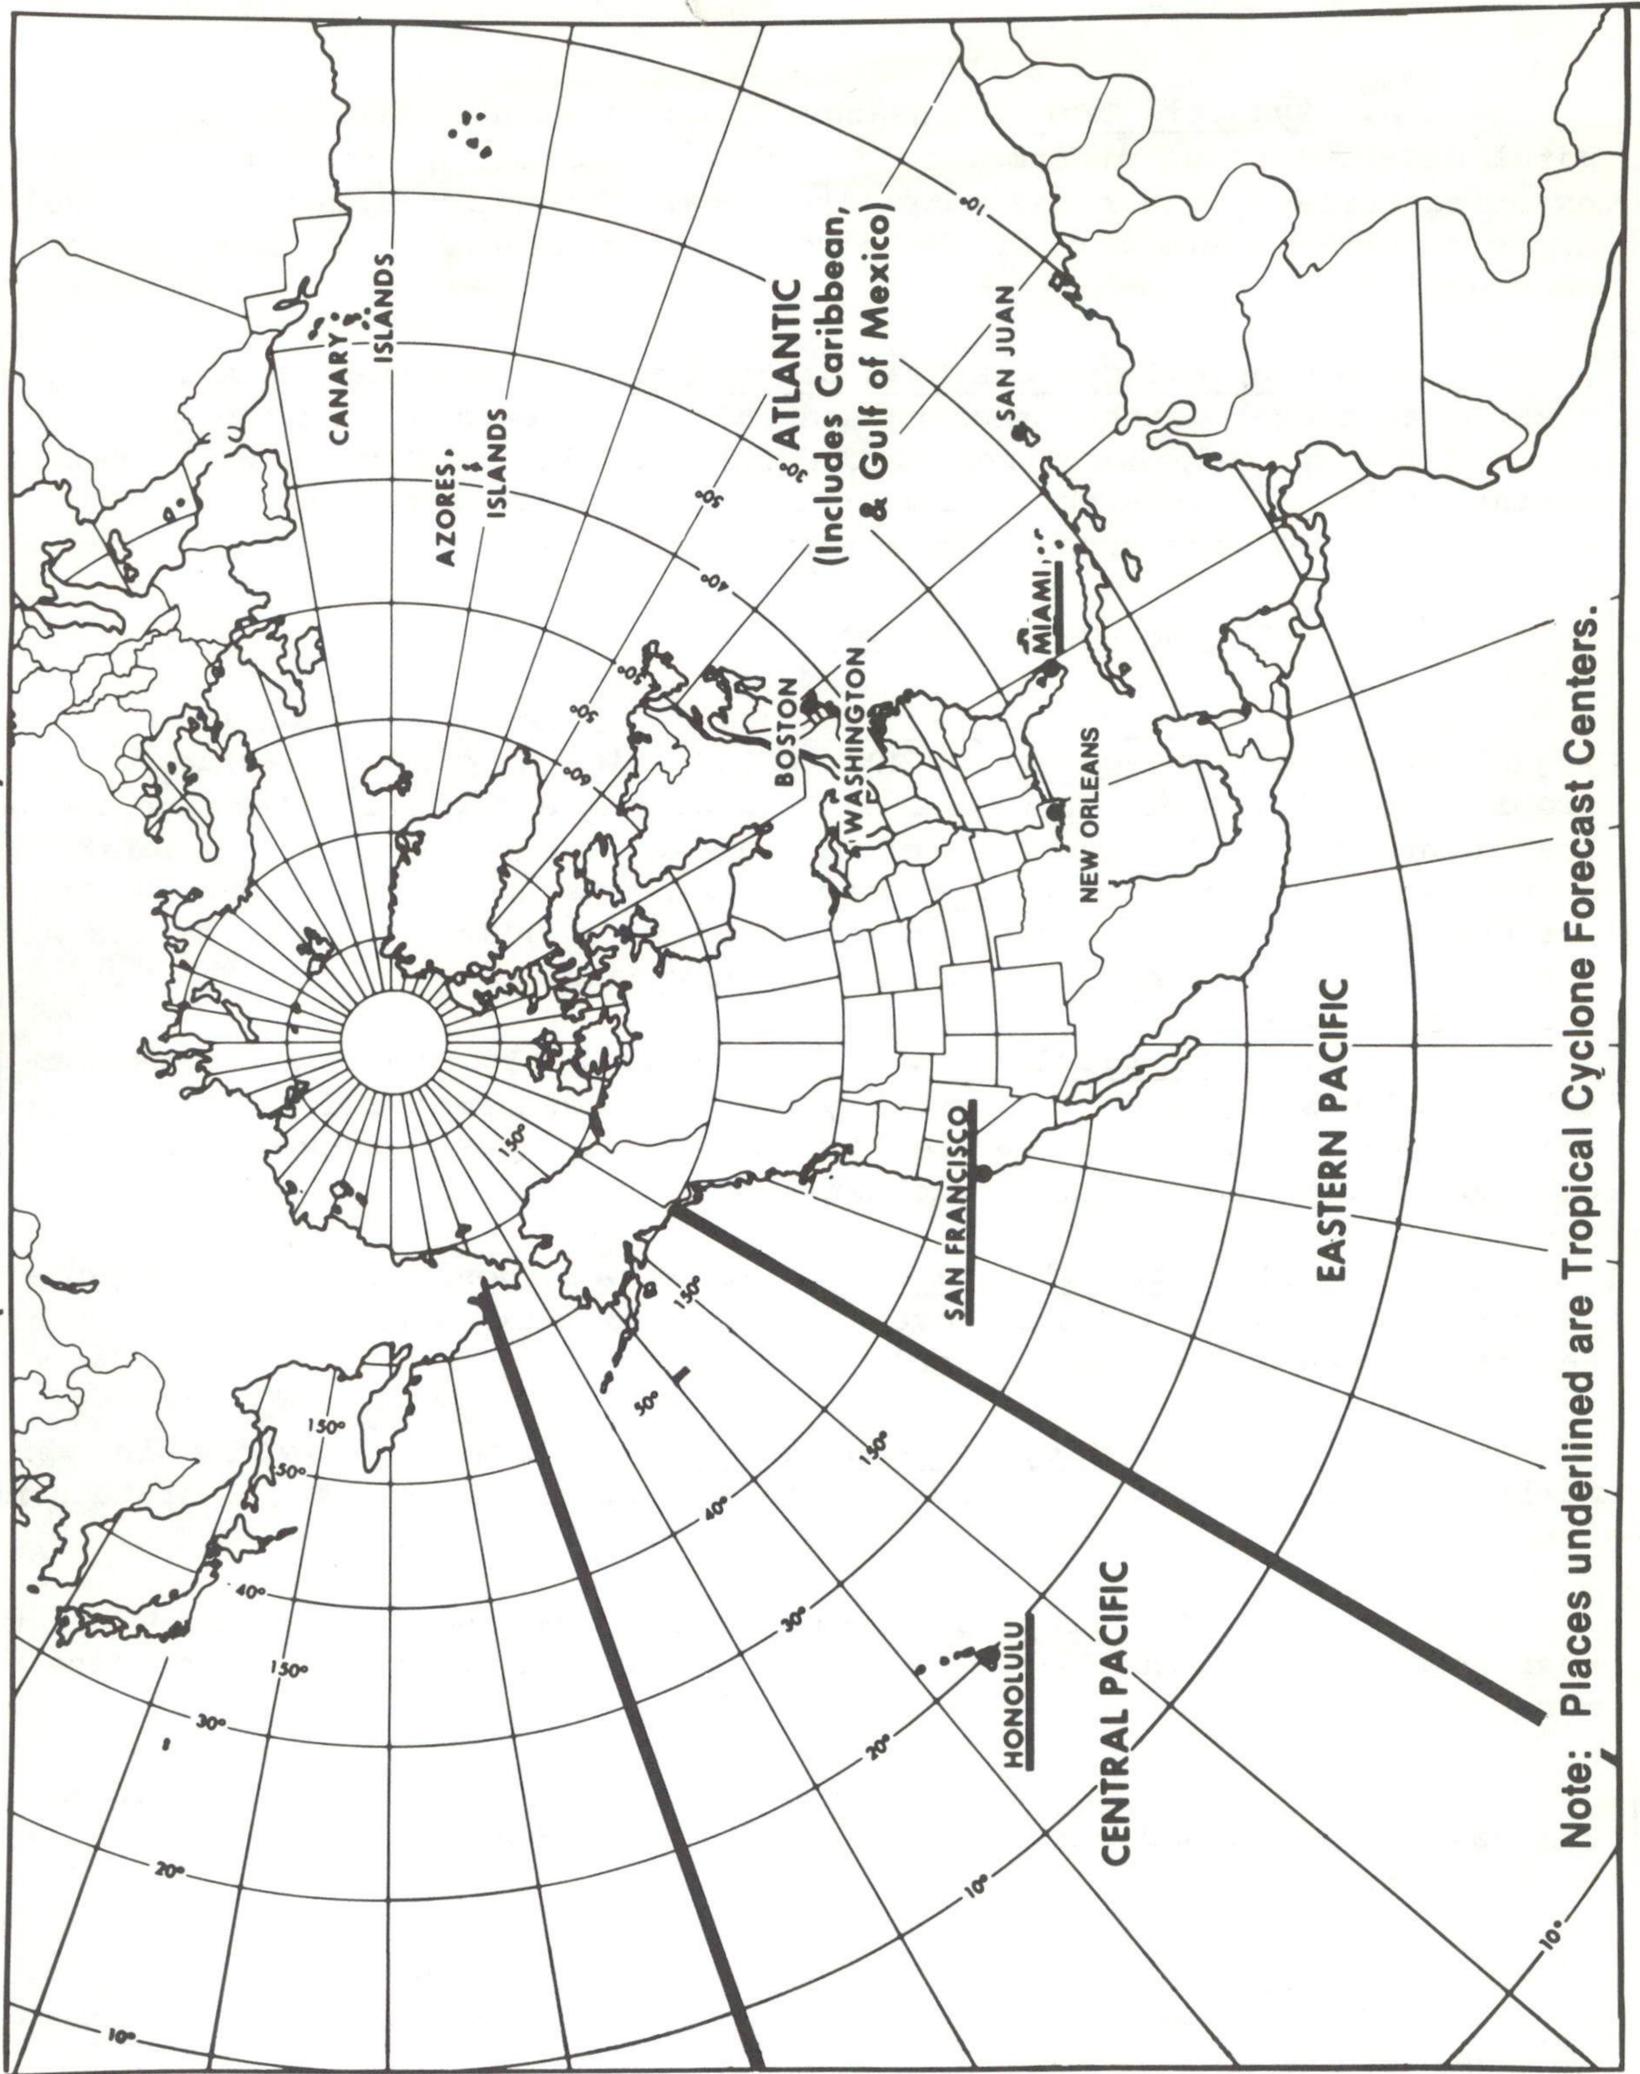

(c) Hurricane/Typhoon. A warm core tropical cyclone in which the maximum sustained surface wind (one-minute mean) is 64 knots (74 miles per hour) or more.

s. Vortex Fix. The location of the surface and/or flight level center of a tropical or subtropical cyclone obtained by reconnaissance aircraft penetration.

t. Wall Cloud. An organized band of cumuliform clouds immediately surrounding the center of a tropical cyclone. Wall cloud and eye wall are used synonymously.

NATIONAL HURRICANE OPERATIONS PLAN

(AREA OF RESPONSIBILITY)

Note: Places underlined are Tropical Cyclone Forecast Centers.

CHAPTER 2

RESPONSIBILITIES OF COOPERATING FEDERAL AGENCIES

1. General. The Department of Commerce is charged with the overall responsibility for the implementation of a responsive, effective national hurricane warning system. Many local, state and Federal agencies play a vital role in this system -- their cooperative efforts help insure necessary preparedness actions are undertaken to minimize loss of life and property destruction. The joint participation by the Department of Defense and the Department of Transportation with the Department of Commerce brings to bear those limited and expensive Federal resources considered essential to storm detection and accurate forecasting. This cooperative effort has proven to be a cost-effective, highly responsive endeavor to meet national requirements for hurricane warning information.

2. Department of Commerce (DOC) Responsibilities. The DOC will:

a. Provide timely dissemination of forecasts, warnings and all significant information regarding tropical and subtropical cyclones to appropriate agencies, general public, marine, and aviation interests.

b. Through the National Weather Service (NWS), provide the following additional support/services to the Department of Defense (DOD):

(1) Consult, as necessary, with DOD regarding their day-to-day requirements for cyclone assessments and attempt to meet these requirements within the capabilities of the Hurricane Warning Service.

(2) Prepare, through the National Hurricane Center (NHC), and distribute to DOD the coordinated DOC reconnaissance and other meteorological data requirements to be provided by DOD on tropical/subtropical cyclones and disturbances.

(3) Provide facilities, administrative support, and dissemination of weather observation data for Operating Location-G (OL-G), Air Weather Service (AWS) as agreed to by DOC and DOD.

(4) Provide DOD with basic meteorological information, warnings, forecasts, and associated prognostic reasoning concerning location, intensity and forecast movement of tropical and subtropical cyclones in the following maritime areas and adjacent states and possessions of the United States:

(a) Atlantic Ocean (north of the Equator including Caribbean Sea and Gulf of Mexico) - advices are the responsibility of the Director, NHC, Miami, FL. (NHC will consult with Naval Eastern Oceanography Center (NAVEASTOCEANCEN) Norfolk, VA, prior to issuance of an initial and final advisories and prior to issuance of any advisory which indicates a significant change in forecast of intensity or track from the last advisory.) Exchange of information is encouraged on subsequent warnings when significant changes are made, or as otherwise required.

(b) Eastern Pacific Ocean (north of the Equator and east of 140°W) - advices are the responsibility of the Director, Eastern Pacific Hurricane Center (EPHC), Redwood City, CA. [EPHC will consult with Naval Western Oceanography Center (NAVWESTOCEANCEN), Pearl Harbor, HI, before issuance of initial and final advisories and prior to issuance of any advisory which indicates a significant change in forecast of intensity or track from last advisory.]

(c) Central Pacific Ocean (north of the Equator between 140°W and 180°) - advices are the responsibility of Director, Central Pacific Hurricane Center (CPHC), Honolulu, HI. [CPHC will consult with NAVWESTOCEANCEN Pearl Harbor, HI, and Detachment 4, 20th Weather Squadron, Hickam AFB, HI, before issuance of an initial and final advisories and prior to issuance of any advisory which indicates a significant change in forecast of intensity or track from last advisory.] Exchange of information is encouraged on subsequent warnings when significant changes are made, or as otherwise required.

c. Through the NWS, conduct an annual post analysis for all tropical cyclones in the Atlantic and the Pacific regions east of 180° and prepare an annual hurricane report for issuance to interested agencies.

d. Through the National Environmental Satellite, Data, and Information Service (NESDIS), operate DOC environmental satellite systems capable of providing coverage of meteorological conditions in the Tropics during the tropical cyclone season, and monitor and interpret DOC satellite imagery. Obtain as necessary National Aeronautic and Space Administration (NASA) research/development satellite and DOD operational satellite data for NWS operational use. Comply with NHC, EPHC, and CPHC satellite data requirements.

e. Through the National Oceanic and Atmospheric Administration (NOAA) Data Buoy Center (NDBC), develop, deploy, and operate environmental data buoy systems to support data requirements of NHC, EPHC, and CPHC.

f. Through the NOAA Office of Aircraft Operations (OAO), provide weather reconnaissance flights as specified in Chapter 5, unless relieved of these responsibilities by the Administrator of the National Oceanic and Atmospheric Administration.

g. Through NOAA, reimburse the U.S. Air Force (USAF) for the aircraft reconnaissance flown in support of this plan in accordance with the NOAA/USAF memorandum of understanding, dated 16 March 1976 (see Appendix II).

3. Department of Defense (DOD) Responsibilities. The DOD will:

a. Provide NWS with timely dissemination of significant information received regarding tropical and subtropical cyclones.

b. Provide NHC, EPHC, and CPHC current DOD requirements for tropical and subtropical cyclone advices.

c. Meet DOC requirements for aircraft reconnaissance and other special observations as agreed to by DOD and DOC (see Appendix II).

d. Provide at NHC a 24-hour aircraft operation interface as necessary, (Chief, Aerial Reconnaissance Coordination, All Hurricanes--CARCAH).

e. Designate OL-G, AWS as the liaison to NHC and the military point of contact for NHC to request special DOD observations in support of this Plan, i.e., Defense Meteorological Satellite Program (DMSP) fixes, additional upper air observations, etc.

f. Provide broadcast facilities of radio station NAM for tropical storm and hurricane forecasts and warnings.

g. Provide access to North American Aerospace Defense (NORAD) Command long-range radar sites (See Chapter 7).

h. Provide weather reconnaissance data monitor services to evaluate and disseminate reconnaissance reports.

i. AFGWC, through analysis of satellite imagery obtained primarily from the DMSP system, will provide surveillance support and fixes/intensity estimates to all United States tropical cyclone warning agencies.

4. Department of Transportation (DOT) Responsibilities. The DOT will:

a. Provide NWS with timely dissemination of significant information received regarding tropical and subtropical cyclones.

b. Through the Federal Aviation Administration (FAA), provide air traffic control, communication, and flight assistance services.

c. Through the U.S. Coast Guard, provide personnel, vessel, and communication support to NDBC for development, deployment, and operation of moored environmental data buoy systems; provide surface observations to NWS from its coastal facilities and vessels; provide communication circuits for relay of weather observations to NWS in selected areas; provide primary guard Autodin support to OL-G, AWS; and provide coastal broadcast facilities at selected locations for tropical storm/hurricane forecasts and warnings.

5. DOD, DOC, and DOT will cooperate in arranging an annual trip to the Caribbean and the Gulf of Mexico area to carry out a continuing and effective liaison of the warning service with the Directors of Meteorological Services, Air Traffic Control Agencies, and Disaster Preparedness Agencies of nations in those areas.

6. ATC/Flight Operations Coordination. The operations officers of the principal flying units and the assistant managers for traffic management at key Air Route Traffic Control Centers (ARTCCs) will maintain a close working relationship on a continuing basis to ensure mission success under actual hurricane conditions. This will involve visits to each other's facilities, familiarization flights, and telephone and teletype communications to improve the understanding of each other's requirements and capabilities.

a. The 53WRS, 815WRS, and OAO (operations officers) shall maintain a close working relationship with the appropriate ARTCC and the Fleet Aerial Control and Surveillance Facility (FACSFAC) for the coordination of weather reconnaissance flights in the Gulf of Mexico and over the Caribbean Sea in particular, and in the United States in general. The operations officer will:

(1) Request the assistance of the appropriate ARTCC/FACSFAC in support of the National Hurricane Operations Plan.

(2) Provide current operations officer's name and telephone number to appropriate ARTCC and FACSFAC.

(3) Publish unit's telephone numbers (FTS/Autovon/Commercial) and teletype address code for Service B (Chapter 5, Appendix C).

b. Miami and Houston ARTCCs and appropriate FACSFAC shall maintain a close working relationship with the hurricane reconnaissance units and provide airspace and air traffic control assistance to the extent possible. Those organizations will:

(1) Provide current name and telephone number of point of contact to flying units.

(2) Publish telephone numbers (FTS/Autovon/Commercial) and teletype code for Service B (Chapter 5, Appendix C).

CHAPTER 3

GENERAL OPERATIONS AND PROCEDURES OF THE NATIONAL WEATHER SERVICE HURRICANE CENTERS

1. General. This chapter describes the products, procedures, and communications headers used by the National Hurricane Center (NHC), Eastern Pacific Hurricane Center (EPHC), and the Central Pacific Hurricane Center (CPHC).

2. Products.

a. Tropical Weather Outlook. Issued by NHC, CPHC, and EPHC during their respective hurricane seasons. In the Atlantic, it is transmitted at 0530, 1130, 1730, and 2230 Eastern Local Time (ELT). In the Central Pacific, it is transmitted at 1000Z and 2200Z. In the Eastern Pacific, it is transmitted at 1000Z and 2130Z. The outlook will briefly describe both stable and potentially unstable areas out to 48 hours. A tropical weather summary of Atlantic tropical cyclone activity will be prepared and issued at the end of each month during the hurricane season.

b. Tropical Cyclone Discussion.

(1) NHC will issue a Tropical Cyclone Discussion on Atlantic tropical cyclones at 0330Z, 0930Z, 1530Z, and 2130Z. Discussion will be disseminated for intragovernmental use only and will contain preliminary prognostic positions up to 72 hours; will describe objective techniques, synoptic features, and climatology used; and will provide reasons for track changes.

(2) EPHC and CPHC will issue a Tropical Cyclone Discussion twice daily. EPHC will issue discussions not later than 0900Z and 2100Z. CPHC will issue the discussions not later than 0330Z and 1530Z. The discussion will describe objective techniques, synoptic features and climatology used; and will provide reasons for track changes.

c. Public Advisories. Issued by NHC for all named tropical cyclones in the Atlantic, for tropical depressions when they are forecast to affect or are affecting and for subtropical storms when they are forecast to affect or are affecting the U.S. Mainland, U.S. territories, or U.S. installations. In the Eastern Pacific, public advisories are issued for storms and hurricanes that are expected to affect the United States within 48 hours. In the Central Pacific, public advisories are issued for all named storms and hurricanes within its area of responsibility. Scheduled public advisories are issued at the same time scheduled marine advisories are issued. When no coastal warnings are included, the 0400Z public advisory will be issued at 0230Z by NHC only. [Note: Public Advisories use statute miles for distance and miles per hour for speed. Nautical miles and knots may be added at the discretion of the Centers.]

d. Marine Advisories. Issued by NHC, EPHC, and CPHC. See chapter 4.3 for content and format of the advisories. Marine Advisories will be transmitted to high-seas shipping according to the details found in Worldwide Marine Weather Broadcasts, jointly published by U.S. Navy (USN) and NWS.

e. Probability of Hurricane/Tropical Storm Conditions.

(1) The probability of the storm center passing within 50 miles to the right or 75 miles to the left of specific forecast points within 24, 36, 48, and 72 hours is included in the marine and public advisories for all named storms in the Atlantic and the Gulf of Mexico. Probabilities may also be included for yet to be named storms that are developing rapidly near a coast line, dependent upon NHC assessment. Probabilities will not be included on intermediate public advisories. The probabilities, which are based on the official forecast track, will be issued when the 72-hour forecast position approaches the coast and will continue until the hurricane has made landfall and is not expected to reemerge over water. For storms forecast to parallel the coast, maximum value over water points will be included. NHC retains the right to discontinue issuance of probabilities earlier if other factors arise, such as difficulties with evacuation orders.

(2) The probabilities will be computed shortly after synoptic times for the periods 0-24, 24-36, 36-48, and 48-72. A total probability for the next 72 hours will be shown in the last column and represents a total of all forecast periods. If the probability of a storm hitting a coastal location within 48 hours is needed, add the 0-24, 24-36, and 36-48 hour probabilities. If the probability for a location is less than one percent, a "X" will be indicated in the table.

(3) When appropriate, specific probabilities will be computed for the following locations:

Brownsville, Texas
Corpus Christi, Texas
Port O'Connor, Texas
Galveston, Texas
Port Arthur, Texas
New Iberia, Louisiana
New Orleans, Louisiana
Buras, Louisiana
Gulfport, Mississippi
Mobile, Alabama
Pensacola, Florida
Panama City, Florida
Apalachicola, Florida
St. Marks, Florida
Cedar Key, Florida
Tampa, Florida
Venice, Florida
Fort Myers, Florida
Marco Island, Florida
Key West, Florida
Marathon, Florida
Miami, Florida
29°N 85°W
29°N 87°W
28°N 89°W
28°N 91°W

West Palm Beach, Florida
Fort Pierce, Florida
Cocoa Beach, Florida
Daytona Beach, Florida
Jacksonville, Florida
Savannah, Georgia
Myrtle Beach, South Carolina
Charleston, South Carolina
Wilmington, North Carolina
Cape Hatteras, North Carolina
Norfolk, Virginia
Ocean City, Maryland
Atlantic City, New Jersey
New York, New York
Montauk Point, New York
Providence, Rhode Island
Nantucket, Massachusetts
Hyannis, Massachusetts
Boston, Massachusetts
Portland, Maine
Bar Harbor, Maine
Eastport, Maine
28°N 93°W
28°N 95°W
27°N 96°W
25°N 97°W

f. Tropical Cyclone Updates. Tropical cyclone updates are brief statements in lieu of or preceding special advisories to inform of significant changes in a tropical cyclone or the posting or cancellation of watches and warnings.

g. Atlantic and Gulf of Mexico Tropical Cyclone Position Estimates. NHC may also issue hourly Tropical Cyclone Position Estimates when the tropical cyclone is under effective surveillance and within 200 nautical miles of land-based radar. These estimates when issued will be prepared a short time before each hour except at hours when advisories are issued. Position estimates will be disseminated to the public, DOD, and other Federal agencies will provide geographical positions in latitude and longitude, and also by distance and direction from a well-known point.

h. Special Tropical Disturbance Statement. Special tropical disturbance statements may be issued to furnish information on strong formative, non-depression systems.

i. Storm Summaries. Storm summaries are written by the National Severe Storms Forecast Center (NSSFC) after subtropical and tropical cyclones have moved inland and public advisories have been discontinued. Storm summaries will continue to be numbered in sequence with public advisories on named storms. Also, these summaries will reference the former storm's name and be issued as long as the remnants of the storm remain a serious flooding threat. Storm summaries will be transmitted at 0500Z, 1100Z, 1700Z, and 2300Z.

3. Designation of Tropical and Subtropical Cyclones.

a. Numbering of Depressions. Each depression will be assigned a number that will be retained throughout the life of the cyclone. This depression number will not, however, be disseminated on advices after a depression is named as a tropical storm/hurricane or is numbered as a subtropical storm. For each hurricane center's area, numbering will begin with 01 at the start of each calendar year. When forecast responsibility is passed from one warning center to another, the assigned number will be retained.

(1) For the Atlantic, Caribbean, and Gulf of Mexico, depression numbers will be assigned by NHC after advising the NAVEASTOCEANCEN, Norfolk.

(2) For the Pacific area east of longitude 140°W , depression numbers, (with the suffix E, i.e., 1E, 2E, 3E, etc.) will be assigned by EPHC after advising the NAVWESTOCEANCEN, Pearl Harbor.

(3) For the Pacific area west of longitude 140°W and east of 180° , depression numbers (with suffix C, i.e., 1C, 2C, 3C, etc.) will be assigned by CPHC after advising the NAVWESTOCEANCEN, Pearl Harbor.

b. Naming of Tropical Storms and Hurricanes.

(1) Atlantic and Eastern Pacific. A different set of names will be used each year. After a set is used, it will drop to the end of the list, to be used again in six years, except names of significant hurricanes will be retired and replaced with another. Lists of Atlantic and East and Central Pacific names are provided in Appendix A to this chapter.

(2) Central Pacific. When a tropical depression intensifies into a tropical storm or hurricane between longitude 140°W and the 180th meridian, the depression number will be discontinued and replaced by an appropriate name. The CPHC will select the name from the Central Pacific names in Appendix A to this chapter. All of the names listed in each column, beginning with column 1, will be used before going to the next column.

(3) Western Pacific. For the Pacific area west of longitude 180°, tropical storms and typhoons are named by the Joint Typhoon Warning Center (JTWC), Guam. The names are listed in Appendix A to this chapter for information only.

c. Numbering of Subtropical Storms. When a system becomes a subtropical storm, it will be assigned a storm number to indicate its sequence of occurrence among subtropical storms for that area. Numbering will begin with 1 and be consecutive, returning to 1 each new year.

4. Transfer of Warning Responsibility.

a. When a tropical/subtropical cyclone approaches longitude 140°W, the coordinated transfer of warning responsibility from Eastern Pacific Hurricane Center (EPHC) to Central Pacific Hurricane Center (CPHC) will be made and the appropriate advice issued.

b. When a tropical/subtropical cyclone crosses the 180 degree meridian from east to west, the coordinated transfer of warning responsibility from CPHC to the Joint Typhoon Warning Center (JTWC) through NAVWESTOCEANCEN, Pearl Harbor, will be made and appropriate advice issued.

c. When a tropical/subtropical cyclone crosses the 180 degree meridian from west to east, the coordinated transfer of warning responsibility from JTWC to CPHC will be made through NAVWESTOCEANCEN, Pearl Harbor. JTWC will append the statement "Next Advisory by CPHC-HNL" to their last advisory.

5. Alternate Warning Responsibilities.

a. In the event of impending or actual operational failure of a hurricane forecast center, responsibilities will be transferred to the appropriate alternate facility in accordance with existing directives and retained there until resumption of responsibility is made. Naval Eastern Oceanography Center, Norfolk, will be advised by National Hurricane Center (NHC) and Chief, Aerial Reconnaissance Coordination, All Hurricanes (CARCAH) of impending or actual transfer of responsibility by the most rapid means available.

b. Alternate facilities are as follows:

PRIMARY

(1) NHC

(2) EPHC

ALTERNATE

WSFO Washington (covers Atlantic only)
WSFO New Orleans (covers Gulf of Mexico and Caribbean)

NHC

c. In the event of the operational failure of CARCAH, direct communication is authorized between DET1,7WW and the forecast facility. Contact Detachment 5, AWS, at AV 868-2544/CO 601-377-2544, or through the Keesler AFB Command Post at AV 868-4330/CO 601-377-4330.

6. Abbreviated Communications Headings. Abbreviated communications headings are assigned to advisories on tropical and subtropical cyclones and other advices based on depression number (or storm name) and standard communication procedures. [Note: An abbreviated heading consists of three groups with ONE space between second and third groups. The first group contains a data type indicator (e.g., WH for hurricane), a geographical indicator (e.g., CA for Caribbean), and a number. The second group contains a location indicator of the message originator (e.g., KMIA for Miami). The third group is a date-time group in GMT. An example of a complete header is WHCA31 KMIA 180400.

a. Atlantic.

ABCA20 KMIA	Tropical Weather Outlook and Tropical Weather Summary (Monthly)
WTCA41-45 KMIA	Tropical Cyclone Discussion
WTCA31-35 KMIA	Public Advisory
WTCA21-25 KMIA	Marine Advisory
WWCA21-25 KMIA	Subtropical Storm Advisory
WTXX61 KMIA	Tropical Cyclone Update
WTXX51 KMIA	Tropical Cyclone Position Estimate
WOCA41 KMIA	Special Tropical Disturbance Statement
WTXX90 KMIA	Tropical Cyclone Discussion for WMO Region IV Stations

b. East and Central Pacific.

(1) All advisories on hurricanes, tropical storms, and depressions are under WT abbreviated headings as follows:

WTPA21-25 KSFO	Marine
WTPA21-25 PHNL	Marine
WTPA31-35 KSFO	Public
WTPA31-35 PHNL	Public

(2) Depressions are numbered internally and storms are named internally, but the number in the abbreviated headings does not relate to either the internal number of the depression or the name of the storm. The first cyclone would have 21 and 31 in the abbreviated headings, the second cyclone would have 22 and 32, the sixth cyclone would have 21 and 31, etc. The abbreviated heading would not change when a depression is upgraded to storm status.

SAFFIR/SIMPSON HURRICANE (SHH) SCALE

(Does not apply to Pacific Islands)

ONE

(a) WINDS* 75-95 mph at standard anemometer elevations (F-scale 1.0-1.4). **Damage primarily to shrubbery, trees, foliage, and unanchored mobile homes. No real damage to building structures. Some damage to poorly constructed signs, or

(b) STORM SURGE (nominally 4-5 feet above normal). Low-lying coastal roads inundated, minor pier damage, some small craft in exposed anchorages break moorings.

TWO

(a) WINDS 96-110 mph at standard anemometer elevations (F-scale 1.5-1.9). Considerable damage to shrubbery and tree foliage, some trees blown down. Major structural damage to exposed mobile homes. Extensive damage to poorly constructed signs. Some damage to roofing material, windows, and doors; no major damage to building structure or

(b) STORM SURGE (nominally 6-8 feet above normal). Coastal roads and low-lying escape routes inland cut by rising water 2-4 hours before arrival of center. Considerable pier damage, marinas flooded. Small craft in unprotected anchorages break moorings. Evacuation of some shoreline residences and low-lying island areas required.

THREE

(a) WINDS 111-130 mph at standard anemometer elevations (F-scale 2.0-2.4) Damage to shrubbery and trees. Foliage off trees, large trees blown down. Practically all poorly constructed signs blown down, some roofing material damage, some window and door damage, some structural damage to small residences and utility buildings, and mobile homes destroyed. Minor amount of curtainwall failures, or

(b) STORM SURGE (nominally 9-12 feet above normal). Serious flooding at coast with many smaller structures near coast destroyed. Larger structures damaged by battering of floating debris. Low-lying escape routes inland cut by rising water 3-5 hours before center arrives. Terrain continuously lower than 5 feet above sea level may be flooded inland 8 miles or more. Evacuation of low-lying residences within several blocks of the shoreline may be required.

FOUR

(a) WINDS 131-155 mph at standard anemometer elevations (F-scale 2.5-2.9). Shrubs and trees down, all signs down. Extensive roofing material damage, extensive window and door damage, complete failure of roof structures on many small residences, and complete destruction of mobile homes. Some curtainwall failure, or

(b) STORM SURGE (nominally 13 to 18 feet above normal). Terrain continuously lower than 10 feet above sea level may be flooded inland as far as 6 miles. Major damage to lower floors of structures near the shore due to flooding and battering action. Low-lying escape routes inland cut by rising water 3-5 hours before center arrives. Major erosion of beach areas. Massive evacuation of all residences within 500 yards of the shoreline may be required and of single-story residences on low ground within 2 miles of the shoreline.

FIVE

(a) WINDS greater than 155 mph at standard anemometer elevations (F-scale 3.0 or greater). Shrubs and trees down, roofing damage considerable, all signs down. Very severe and extensive window and door damage. Complete failure of roof structures on many residences and industrial buildings. Extensive glass failures, some complete building failures, small buildings overturned and blown over or away, and complete destruction of mobile homes, or

(b) STORM SURGE (height nominally greater than 18 feet above normal). Major damage to lower floors of all structures located less than 15 feet above sea level and within 500 yards of the shoreline. Low-lying escape routes inland cut by rising water 3-5 hours before center arrives. Massive evacuations of residential areas situated on low ground within 5-10 miles of the shoreline may be required.

* Definition of a sustained wind (from Fujita and Simpson 1972) - A sustained wind is one that persists for the minimum time period to establish optimal dynamic forces on a nominal building structure.

** T. Fujita, 1971: "Proposed Characterization of Tornadoes and Hurricanes by Area and Intensity," University of Chicago (SMRP) Research Paper No. 91.

CHAPTER 4

NATIONAL WEATHER SERVICE PRODUCTS FOR THE DEPARTMENT OF DEFENSE

1. General. The DOD and DOC weather forecasting, reconnaissance, and distribution agencies share technical information and some responsibilities. Mutually supportive relationships have developed over the years and have resulted into a mutual dependency. Due to the nature and distribution of DOD resources and operations, the DOD requires certain meteorological information beyond that available to the general public. Accordingly, the DOC provides DOD with special observations and advisories on tropical and subtropical storms threatening DOD resources or operations.

2. Observations. The National Hurricane Center (NHC), Eastern Pacific Hurricane Center (EPHC), and Central Pacific Hurricane Center (CPHC) will make available to DOD all significant tropical/subtropical cyclone observations that they receive.

3. Marine Advisories.

a. General. NHC, EPHC, and CPHC will provide DOD forecasts and related information for tropical and subtropical weather disturbances of depression intensity or greater. Forecasts will include advice as to location, movement, intensity, and dimension of these disturbances. Marine advisories will be disseminated through the NWS weather communications facility at Suitland, MD, to the Automated Weather Network (AWN) at Carswell AFB, TX, for further relay to DOD agencies. DOD forecasters who must give advice concerning an imminent operational decision may contact the appropriate Hurricane Center forecaster (see Chapter 2) when published marine advisories require elaboration. Phone numbers for the NHC/EPHC/CPHC are included in Appendix C to Chapter 5.

b. Marine Advisory Issue Frequency. The first marine advisory will normally be issued when meteorological data indicate that a tropical or subtropical cyclone has formed. Subsequent advisories will be issued at 0400Z, 1000Z, 1600Z, and 2200Z, (0300Z, 0900Z, 1500Z, 2100Z in the Eastern and Central Pacific). Advisories will continue to be issued until the system degenerates below depression level. In addition, special advisories will be issued whenever the following criteria are met (remarks stating the reason for the special advisory or the relocation will be mandatory in all special advisories or advisories that include a relocated position):

- (1) Conditions require a hurricane watch or warning to be issued.
- (2) A tropical depression becomes a tropical storm or vice versa.
- (3) A tropical storm changes to a hurricane or vice versa.
- (4) Conditions require initiation or upgrading of an existing coastal warning.
- (5) A tornado threat develops or becomes non-existent.

(6) Any other circumstances causing the hurricane forecaster to believe other significant changes have occurred.

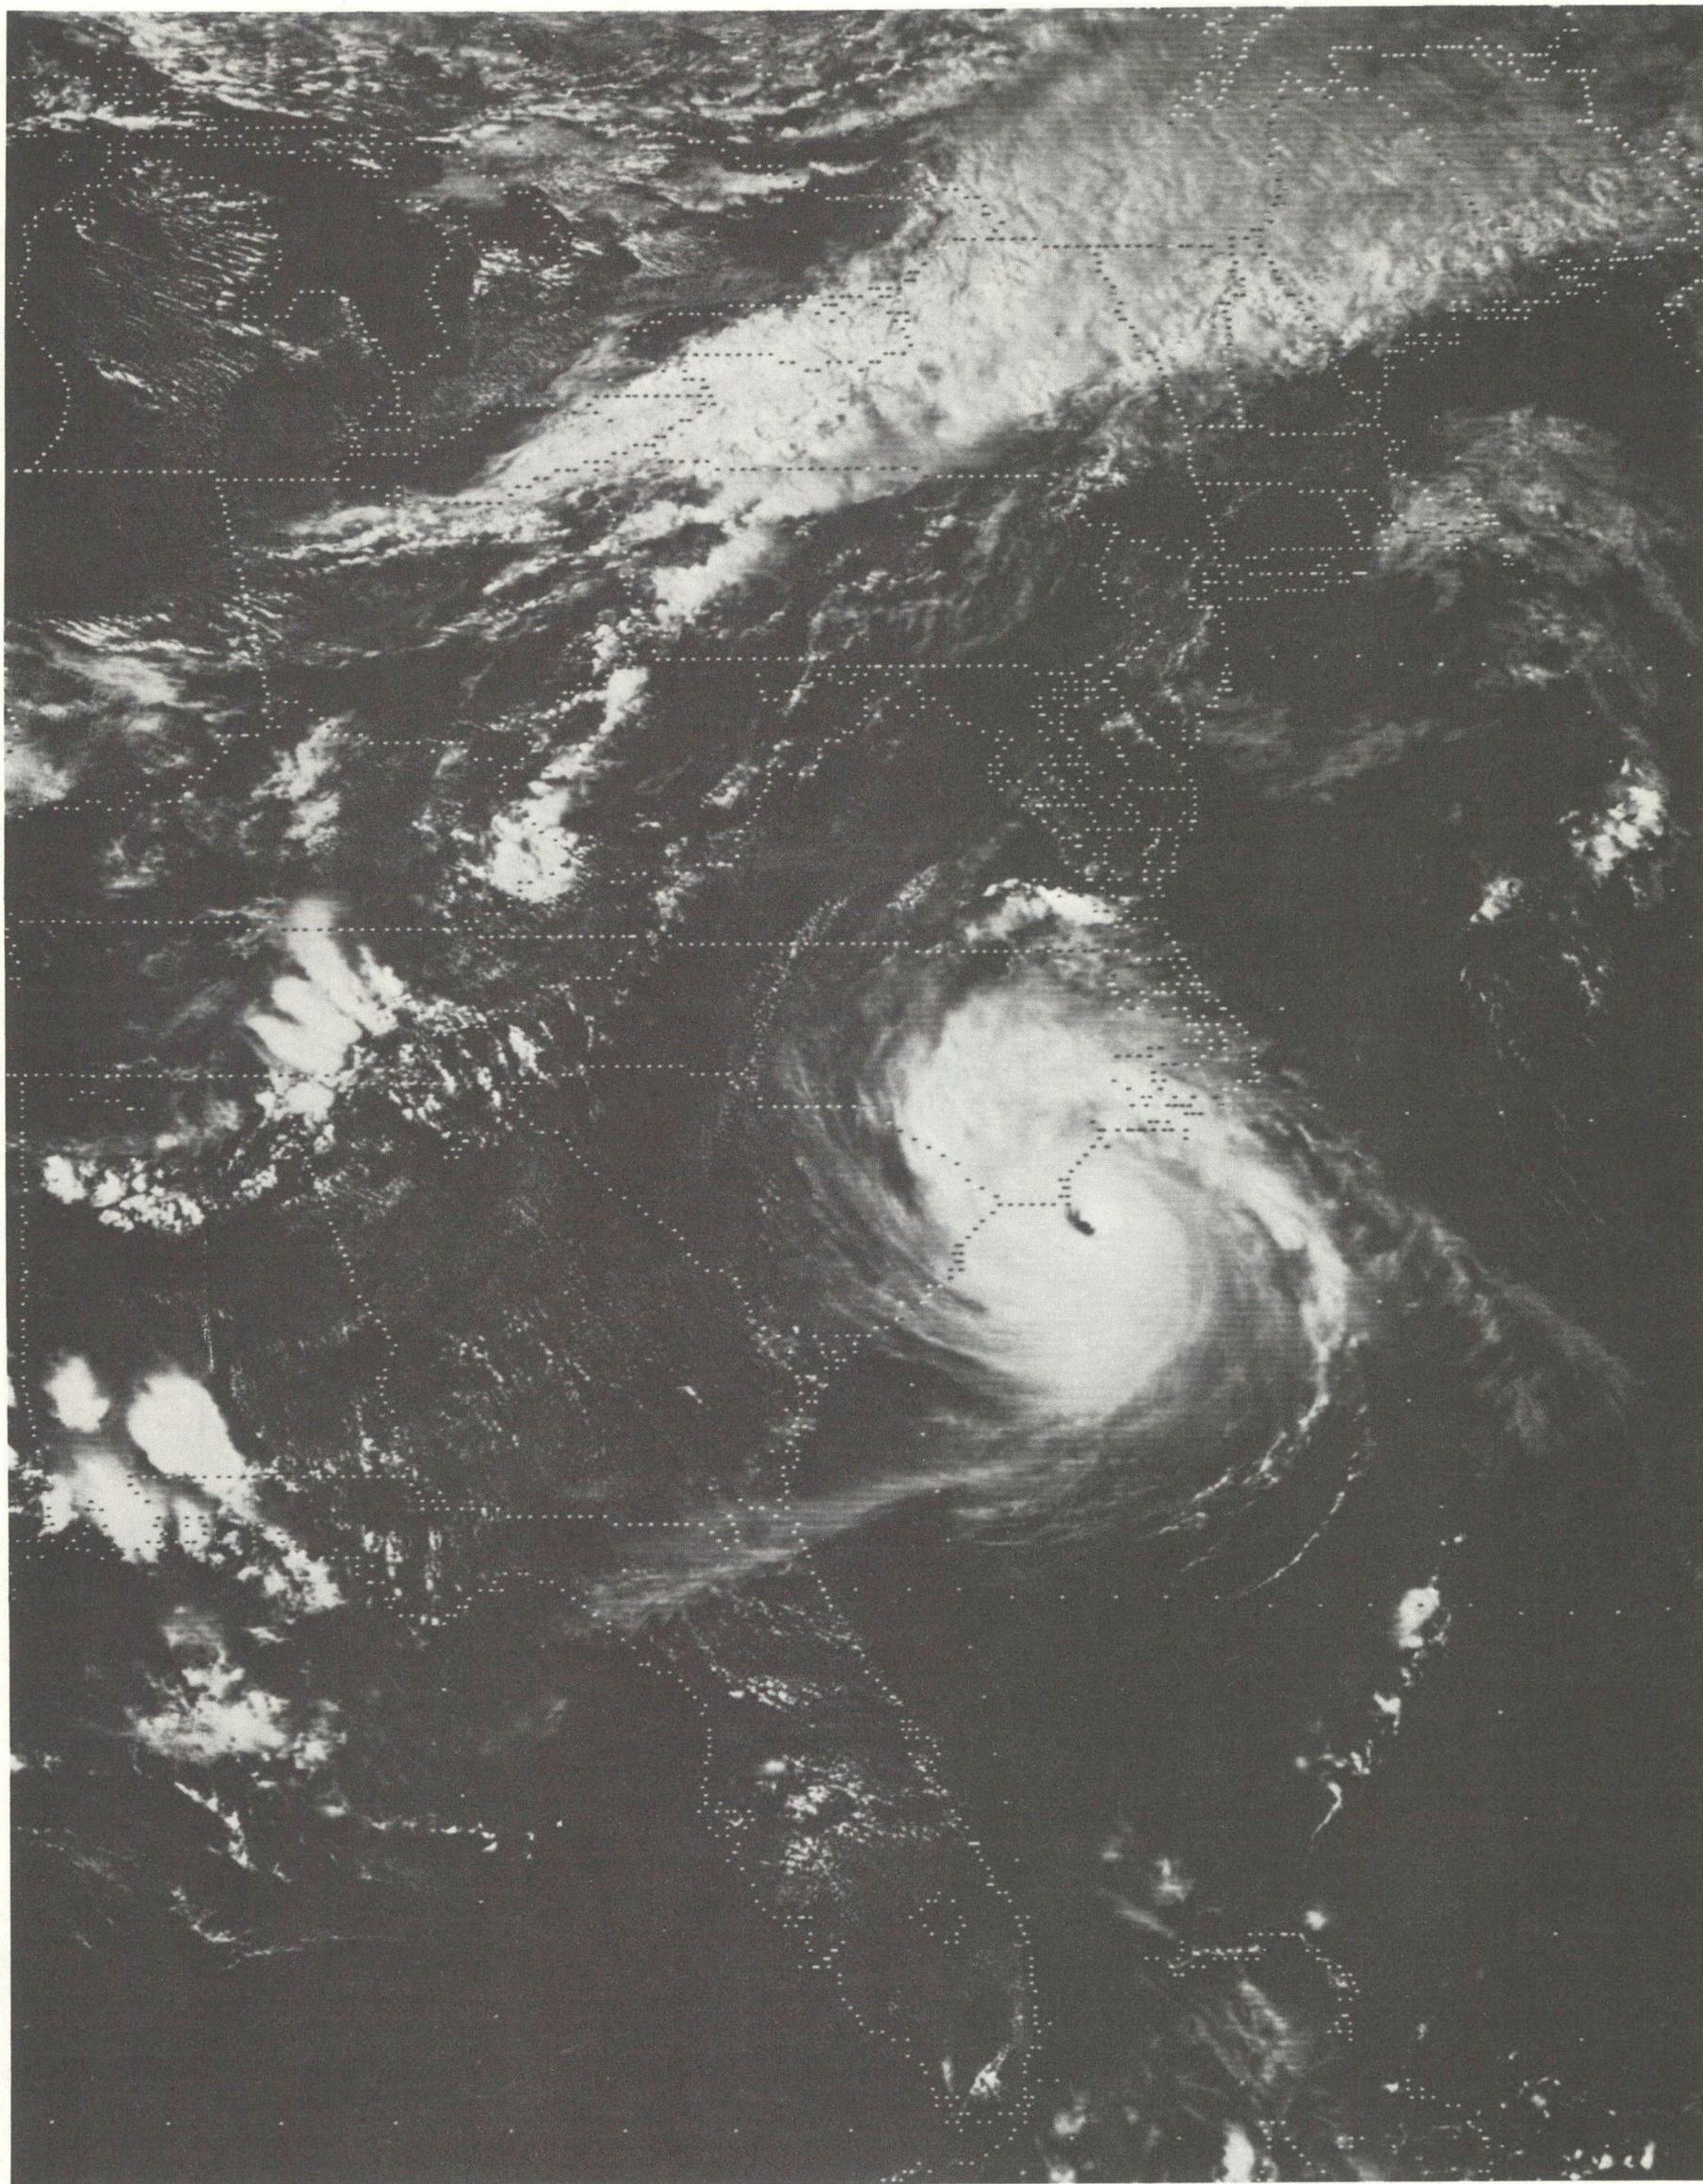

NOTE: Tropical Cyclone Updates are permitted without the requirement of a special advisory, including when coastal warnings are cancelled. However, in some cases a special advisory may follow.

c. Marine Advisory Content. Marine advisories will contain appropriate information as shown in Appendix A of this chapter (Form 1 -- WS Form C-13). Advisories will contain 12- and 24-hour forecasts and 48- and 72-hour outlooks valid from times based on the latest 6-hourly synoptic time. At a minimum, advisories in which the winds are forecast to be greater than 33 knots within 24 hours will include outlooks through 72 hours.

d. Numbering of Advisories. All advisories will be numbered sequentially in the Eastern and Central Pacific; i.e., Advisory Number 1 on tropical depression (TD) 1, Advisory Number 2 on TD 1, Advisory Number 3 on Tropical Storm Anita, Advisory Number 4 on Hurricane Anita, Advisory Number 5 on TD Anita, etc. The CPHC will append an alphabetic designator for intermediate advisories (e.g., 20A). In the Atlantic, Caribbean, and Gulf of Mexico advisories will be numbered consecutively beginning with each new depression. Special advisories will be numbered, but intermediate advisories will not be numbered. When the depression is numbered as a subtropical storm or named, the advisory numbering will revert to 1 and start all over again. In both the Atlantic and Pacific, once the system is named, however, that name will be retained on marine advisories until no further advisories are issued on that system; advisory numbering will continue sequentially.

CHAPTER 5

AIRCRAFT RECONNAISSANCE

1. General. All Department of Commerce (DOC) tropical and subtropical cyclone aircraft reconnaissance needs will be requested and provided in accordance with the procedures of this chapter. As outlined in the USAF/NOAA Memorandum of Understanding (MOU), March 16, 1976, DOC has identified a requirement for, and DOD maintains aircraft to support, up to five reconnaissance aircraft sorties per day. Requirements exceeding five sorties will be accomplished on a "resources permitting" basis. In times of national emergency or war, some or all DOD reconnaissance resources may not be available to fulfill DOC needs.

2. Responsibilities.

a. DOD is responsible for:

(1) Providing operational aircraft for vortex fixes/data, synoptic tracks and investigative flights in response to DOC needs.

(2) Developing operational procedures to deploy data buoys to satisfy DOC needs. For 1985, DOC requests 4 buoys be dropped on a resource permitting basis, into a given storm.

b. DOC is responsible for aircraft operations which may be requested to:

(1) Provide augmentation to the U.S. Air Force (USAF) for operational aircraft reconnaissance with high-density/accuracy data when storms are within 24 hours of landfall of the continental United States.

(2) Provide augmentation capabilities for USAF aircraft reconnaissance when DOC needs exceed the capabilities of DOD resources.

(3) Assume responsibility for hurricane reconnaissance over foreign airspace that may be restricted for military operations.

(4) Conduct research flights which assume an operational responsibility to the hurricane centers.

3. Control of Aircraft. Operational control of aircraft flying tropical or subtropical cyclone reconnaissance will remain with the operating agencies of DOD or DOC as appropriate.

4. Reconnaissance Requirements.

a. Meteorological Parameter Requirements. Data needs in priority order are:

(1) Geographical position of vortex center (vortex fix); surface center if known.

(2) Center sea-level pressure (by dropsonde or extrapolation from within 1,500 feet of sea surface).

(3) Minimum 700-millibar height (if available).

(4) Wind profile data (surface and flight level).

(5) Temperature (flight level).

(6) Sea-surface temperature.

(7) Dewpoint temperature (flight level).

b. Required Meteorological Reconnaissance Data, Ranges and Accuracies.

Required reconnaissance data accuracies are as follows:

(1) Geographic position:

(a) Data position (aircraft) - within 3 n.mi.

(b) Storm surface center (wind/pressure) - within 6 n.mi.

(c) Flight level storm center (wind/pressure) - within 6 n.mi.

(2) Wind direction:

(a) Surface - within 10 degrees.

(b) Flight level (winds greater than 20 kts.) - within 5 degrees.

(3) Wind speed:

(a) Surface - within 10 kts.

(b) Flight level - within 4 kts.

(4) Pressure Height:

(a) Surface - within 2 mb.

(b) Flight level - within 2 decameters above 500 mb, within 10 meters at or below 500 mb.

(5) Temperature:

(a) Sea surface - within 1°C.

(b) Flight level - within 1°C.

(6) Dew point:

(a) Range from -20°C to +40°C - within 1°C.

(b) Colder than -20°C - within 3°C.

(7) Absolute altitude - within 10 m.

(8) Vertical sounding:

- (a) Pressure - within 2 mb.
- (b) Temperature - within 1°C.
- (c) Dew point: Range -20°C to +40°C - within 1°C.
Colder than -20°C - within 3°C.
- (d) Wind direction - within 10°.
- (e) Wind speed - within 5 kts.

NOTE: Present weather reconnaissance capabilities do not completely satisfy these requirements; data will be collected as close to stated requirements as possible.

c. Required Frequency and Content of Observations.

(1) Automated Systems:

(a) Time, latitude, longitude, flight level - pressure altitude, radar altitude, D value, wind, temperature, dewpoint, height of standard pressure surface - every minute. Observations transmitted each one-half hour.

(b) Standard RECCO and Vortex observations as required.

(2) Standard (non-automated systems):

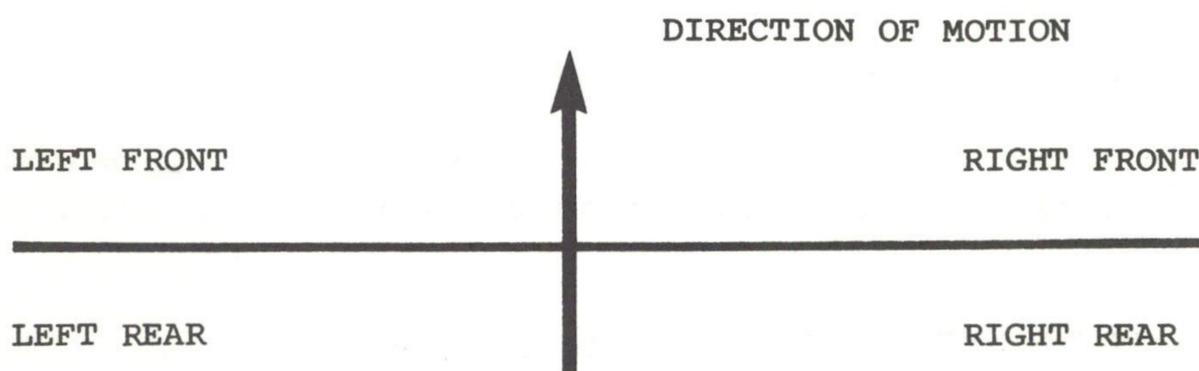

(a) Horizontal observations - RECCO Code Section 1 or Section 3 plus 4ddff and 9ViTwTwTw (4 and 9 groups if applicable) every 15 minutes enroute to and from storm within 15° from tasked coordinates (over water). 500 mb data preferred. RECCO obs transmitted hourly enroute to and from storm. Standard RECCO encoding and transmission IAW AWSR 105-25 outside of 15° from tasked coordinates. Horizontal observation data collection frequency, format, and transmission as specified (NHOP flight patterns) within tasked area.

(b) Vertical observations - Frequency enroute to and from tasked coordinates IAW AWSR 105-25 unless otherwise specified. Frequency as specified (NHOP flight patterns) within tasked areas. Format for all vertical observations is WMO TEMP DROP Code.

(c) Vortex and Supplementary Vortex observations collected, encoded, and transmitted IAW NHOP pattern requirements. (See Chapter 5, Appendix B, Forms 3 and 4, for data format.)

NOTE: Present weather reconnaissance capabilities are marginal in satisfying these requirements; data will be collected as close to stated requirements as possible. While the crews will attempt to meet customer requirements, it is understood that observations will not be considered unsatisfactory as long as they are accomplished every 30 minutes.

d. Standard Flight Patterns. Operational hurricane reconnaissance flights will fly designated flight patterns (Appendix A of this chapter) that use a quadrant system based upon the predicted direction of motion of the cyclone center. (See following diagram.) A tasked pattern may be adjusted by the flight meteorologist to best fulfill data requirements within operational capabilities of the aircraft or agency concerned.

e. High-Density Accuracy Requirements. DOC requires rapid acquisition and transmission of tropical cyclone data (especially within the last 24 hour period prior to landfall). Since only a limited number of aircraft currently have a high-density/high accuracy (HD/HA) capability, DOC reconnaissance requests should specify which tropical cyclone reconnaissance sorties should utilize HD/HA aircraft. DOD HD/HA aircraft will be provided on a "resources permitting" basis only.

f. High Level Profile Data Requirements. When required, NHC will request mid-tropospheric reconnaissance data on the periphery of systems approaching the United States. NHC will provide a specific track profile, including control point and control time, to CARCAH for coordination with the reconnaissance units.

5. Reconnaissance Planning and Flight Notification.

a. DOC Requests for Aircraft Reconnaissance Data.

(1) NHC will coordinate with Eastern Pacific Hurricane Center (EPHC) and Central Pacific Hurricane Center (CPHC) to determine a list of the total DOC requirements for data on tropical and subtropical cyclones or disturbances for the next 24-hour period (0500Z - 0500Z) and an outlook for the succeeding 24-hour period. This coordinated request will be provided to CARCAH as soon as possible, but not later than (NLT) 1630Z each day (in the format of Form 1, Appendix B). Amendments will be provided as required.

(2) From the above coordinated DOC request, CARCAH will publish the Tropical Cyclone Plan of the Day (TCPOD). When DOC reconnaissance needs exceed DOD and DOC resources, CARCAH will coordinate with NHC to establish priorities of requirements.

(3) The following reconnaissance requests can be anticipated for a forecast or actual storm location:

(a) Atlantic, Gulf of Mexico, Caribbean, Eastern and Central Pacific - up to four 6-hourly fixes per day when a storm is within 500 nautical miles of landfall west of 55°W and north of 8°N, and up to eight 3-hourly fixes per day when a storm is forecast to be within 300 nautical miles of the U.S. coast, Hawaiian Islands, Puerto Rico, Virgin Islands, DOD installations, and other DOD assets when specified.

(b) Investigative flights may be requested as required for disturbances in areas defined in paragraphs (a) and (b) above (i.e., one or two flights per day dependent upon proximity of landfall and upon known or suspected stage of development).

(c) Exceptions may be made when additional reconnaissance is essential to carry out warning responsibilities.

b. DOD Aircraft Reconnaissance Responsiveness.

(1) Notification of requirements must precede take-off time by at least 16 hours plus en route time to the area of concern.

(2) The "Succeeding Day Outlook" portion of the TCPOD provides advance notification of requirements and authorizes units to preposition aircraft to forward operating locations. For missions requiring prepositioning, the "Succeeding Day Outlook" may not provide adequate advance notification. In these situations an "Additional Day Outlook" may be included in the TCPOD to authorize units to preposition aircraft.

(3) When circumstances preclude the appropriate notification lead time, the requirement will be levied as "resources permitting". When a "resources permitting" requirement is levied in an amendment, NHC will indicate the priority of all existing or remaining requirements.

(4) If a storm develops unexpectedly and could cause a serious threat to lives and property within a shorter time frame than provided for in the paragraphs above, CARCAH will contact the reconnaissance units, or higher headquarters as appropriate, and request assistance in implementing emergency procedures not covered in this plan. NHC, EPHC and CPHC Directors have authority to declare an emergency.

c. Reconnaissance Tropical Cyclone Plan of the Day (TCPOD).

(1) Preparation. CARCAH will prepare the TCPOD (Appendix B, Form 2) daily during the period from 1 June through 30 November and at other times during the year as required.

(a) CARCAH will coordinate the TCPOD with NHC, 815th WRS, 53rd WRS, and OAO before publication.

(b) TCPOD will list all DOC and DOD required tropical/sub-tropical reconnaissance operational missions. The remarks section of the TCPOD will include appropriate comments whenever research and operational flights overlap.

(c) DOD-required tropical or subtropical cyclone reconnaissance missions in the Atlantic or the Pacific west to 180° will be identified in the TCPOD as USN or USAF requirements.

(d) Amendments to the TCPOD will be published only when requirements change. When amended, the impact on each listed flight will be identified (i.e., no change, change added, or cancel).

(2) Dissemination. The TCPOD will be made available to appropriate agencies that provide support or control reconnaissance aircraft or are a part of the cyclone warning service. The TCPOD will be disseminated by 1800Z each day. Amendments will be disseminated as required.

d. Air Traffic Control (ATC) Clearances.

(1) Air Traffic Control Agencies will provide air traffic control separation between all aircraft operating on storm missions and between storm aircraft and nonparticipating aircraft operating on Instrument Flight Rules (IFR) within controlled airspace. Mission commanders are reminded that nonparticipating aircraft may be operating near storm areas; thus, adherence to ATC clearances is mandatory for safety purposes. CARCAH will indicate in the POD if clearance into warning areas is required.

(2) When storm aircraft cannot maintain assigned altitudes due to turbulence, ATC should be advised. Normal vertical separation of 1,000 feet at FL 290 and below and 2,000 feet above FL 290 will be provided by ATC to aircraft operating in the storm area. Unless otherwise coordinated with ATC, the altitudes between storm-mission aircraft may be used by ATC for nonparticipating aircraft. Any procedure desired by storm-mission commanders which is outside these parameters must be coordinated with the appropriate ATC facility.

(3) Dropsonde releases will be coordinated with the appropriate Air Route Traffic Control Center (ARTCC) and participating aircraft if within controlled airspace, and with participating aircraft only, if outside controlled airspace. Contact between participating aircraft will be made using the frequencies listed in Chapter 5, Appendix C, paragraph 3.

6. Reconnaissance Effectiveness Criteria.

a. General. Specified reconnaissance times are established to allow sufficient time for the forecaster to analyze the data before issuing an advisory. Every effort should be made to obtain data at scheduled times. The following criteria will be used to assess reconnaissance mission effectiveness:

(1) ON-TIME - Fix is made not earlier than 1 hour before nor later than 1/2 hour after scheduled fix time. Investigative aircraft are within 250 nautical miles of the specified coordinates by the scheduled time.

(2) EARLY - Fix is made from 1 hour before scheduled fix time to one-half of the time interval to the preceding scheduled fix (not to exceed 3 hours).

(3) LATE - Fix is made within the interval from 1/2 hour after scheduled fix time to one-half of the time interval to the succeeding scheduled fix (not to exceed 3 hours). Investigative aircraft are within 250 nautical miles of specified coordinates no later than 2 hours after scheduled time.

(4) MISSED - Data are not obtained within the parameters specified for on-time, early, or late.

(5) EXCEPTIONS - Appropriate credit will be given when the aircraft arrives in the requested area but is unable to locate a center due to storm dissipation or rapid movement.

b. NHC, CPHC, or EPHC will provide CARCAH a written assessment of the reconnaissance mission anytime its timeliness or quality is outstanding or substandard (see Appendix B, Form 5). Requirements levied as "resources permitting" will not be assessed for timeliness, but may be assessed for quality of data gathered.

c. CARCAH will maintain monthly and seasonal reconnaissance summaries detailing missions actually flown to satisfy NHC levied requirements.

7. Aerial Reconnaissance Weather Encoding, Reporting and Coordination.

a. Vortex Data. The detailed Vortex Data Message (Form 3, Appendix B) will be prepared with all observed vortex fix information for all scheduled fixes. For intermediate fixes, either an abbreviated or detailed Vortex Data Message may be transmitted, depending upon availability of information and forecaster requirements.

b. Center Fix Data. All radar fix reports and other type aircraft center fixes will be made in plain text and appended to the RECCO observation also taken at fix time. Remarks stating the degree of confidence should be included for radar fixes in the same manner as in Chapter 7, paragraph 2.b.

c. Supplementary Vortex Data. Penetration and collection of supplementary vortex data on operational flight patterns A will normally start at 700 millibars at a radius of approximately 105 nautical miles from the center as determined by the flight meteorologist. The supplementary vortex data required are as shown in Appendix B, Form 4. Note: Present weather reconnaissance equipment is inadequate to provide full data for 15NM supplemental vortex data; data will be collected as close to stated requirements as possible and within the capabilities of the flight crew.

d. Mission Coordination. Mission coordination for all missions will be accomplished through CARCAH. Meteorological discussions for central and eastern Pacific missions may be accomplished directly with the appropriate hurricane center; however, any changes to tasking requirements will be accomplished through CARCAH.

e. Post-flight Debriefing. Unless otherwise directed, the flight meteorologist will provide either an airborne or post-flight debriefing to the appropriate hurricane center to ensure all observations were received and understood.

f. Mission Identifier. Each reconnaissance report will include the mission identifier as the opening text of the message. Regular weather and hurricane reconnaissance messages will include the five-digit agency/aircraft indicator followed by the CARCAH-assigned mission-system indicator. Elements of the mission identifier are:

Agency - Aircraft Indicator -- Mission System Indicator

Agency - Aircraft Number	No. of missions this system	Depression No. or XX if not a depression or greater (2 digits)	Storm name or words CYCLONE or INVEST
AF plus last 3 digits of tail number	(2 digits)		

NOAA plus last digit of aircraft
registration number

EXAMPLES:

AF985	01XX	INVEST	(Air Force aircraft 985 on the first mission to investigate a suspect area.)
AF987	0503	CYCLONE	(Air Force aircraft 987 on the fifth mission on depression No. 3. Invest or fix as specified in TCPOD.)
NOAA2	0701	AGNES	(NOAA aircraft 42RF on the seventh mission to fix depression No. 1, which has acquired the name AGNES.)

g. Observation Numbering and Content.

(1) The first weather observation will have appended as remarks the ICAO four-letter departure station identifier, time of departure, and estimated time of arrival (ETA) at the coordinates or storm.

EXAMPLE:

```
AF966 0308 EMMY OB 01
97779 TEXT TEXT...DPTD KBIX AT 10/2100Z ETA 31.5N 75.0W AT
11/0015Z
```

(2) All observations (RECCO, Vortex, Supplemental, and Dropsonde) from the first to the last will be numbered sequentially. When an aircraft is diverted from standard reconnaissance to fulfill NHC requirements, the next observation from the diverted aircraft will be labeled OB 01, will use the CARCAH assigned mission identifier, and will include time of diversion and ETA to coordinates of interest. If diverted from an NHC mission to fulfill new NHC requirements or if the aircraft is programmed to satisfy separate NHC system requirements, the same rule applies except that last report remarks will be added to the terminated mission.

EXAMPLE:

AF968 01XX INVEST OB 01
97779 TEXT TEXT...DPTD FOXTROT TRACK AT 05/1438Z ETA 18N
85W AT 05/1630Z

(3) If a CARCAH assigned mission identifier is changed inflight as a result of system intensity changes, observation numbers will continue sequentially and appropriate remarks made.

EXAMPLE:

AF987 0308 EMMY OB 06
97779 TEXT TEXT...OBS 01 THRU 05 XMTD AS AF987 0308 CYCLONE

(4) Appended to the final weather observation will be a last report remark, which will include destination, ETA, number of observations, and monitor(s) that copied the observations.

EXAMPLE:

AF553 0308 EMMY OB 16
XXAA TEXT TEXT...LAST REPORT ETA KBIX 11/0910Z OBS 01
THRU 10 and 12 THRU 16 KMIA OB 11 KMHR

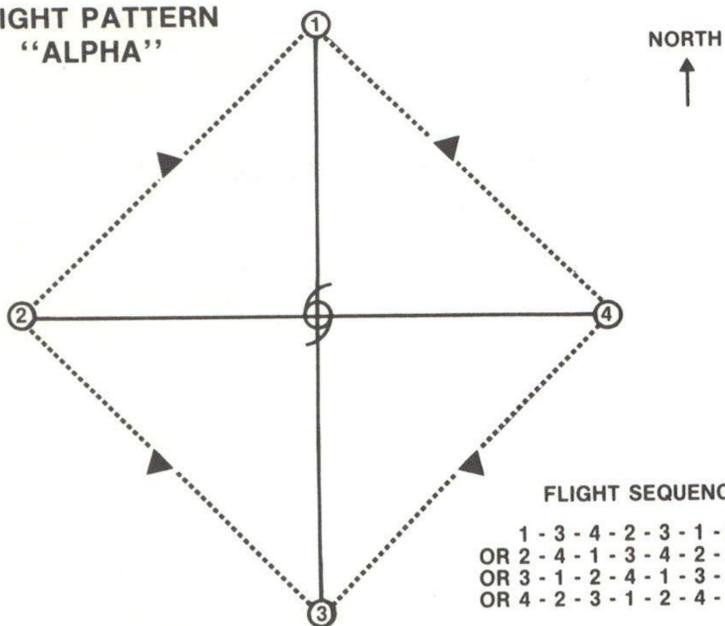

CHAPTER 5
APPENDIX A
ATTACHMENT 1

OPERATIONAL FLIGHT PATTERNS

Provides vortex and peripheral data on tropical and subtropical cyclones including two 6-hourly and intermediate fixes.

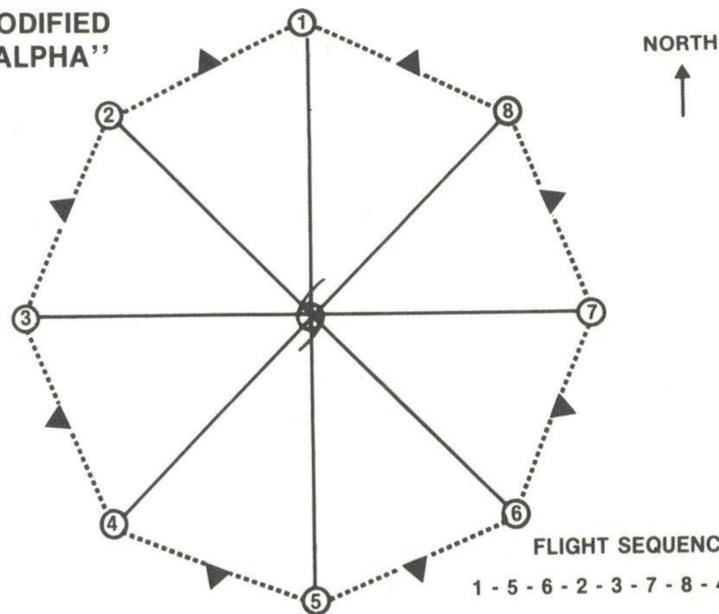

DATA REQUIREMENTS

FLIGHT PATTERN
"ALPHA"

FLIGHT SEQUENCE
1-3-4-2-3-1-2-4-1
OR 2-4-1-3-4-2-3-1-2
OR 3-1-2-4-1-3-4-2-3
OR 4-2-3-1-2-4-1-3-4

MODIFIED
"ALPHA"

FLIGHT SEQUENCE
1-5-6-2-3-7-8-4-5-1

OBSERVATION DETAILS

1. Flight levels will normally be at 1500 feet, 850 mb, or 700 mb, dependent on data requirements and flight safety. The flight sequence is shown. The pattern sequence can be entered at any point and then repeated for mission duration.

2. RECCO (Section 1 plus 4ddff and 9ViTwTwTw) is required for each transit of a triangle position. Transmit immediately. RECCO (Section 3 plus 4ddff and 9ViTwTwTw) is required for each transit of a darkened circle position (appended to next RECCO Section observation). Groups with indicator 4 or 9 are included in observations only when surface winds are discernible or flight is at low level. Open circle positions indicate the beginning or ending of supplementary vortex data inbound or outbound radials.

3. Supplementary Vortex data are required for each radial flown inbound or outbound. Transmit data to the appropriate monitor at the end of each pair of inbound/outbound radial legs flown.

4. On each transit of the center a fix will be made and a Vortex Data Message completed. If it is a scheduled fix, the Detailed Vortex Data Message will be completed using data gathered since the previous fix and will be transmitted immediately. If it is an intermediate (nonscheduled) fix, an Abbreviated Vortex Data Message using data gathered since the previous fix may be prepared in lieu of the detailed message and transmitted immediately. Center dropsonde data will also be provided for scheduled fixes made at 700 millibars or above.

5. Dropsonde data, when required in the periphery of the storm, will be taken at the triangular positions indicated. The requirement for these data will be determined on a case-by-case basis and coordinated through the POD.

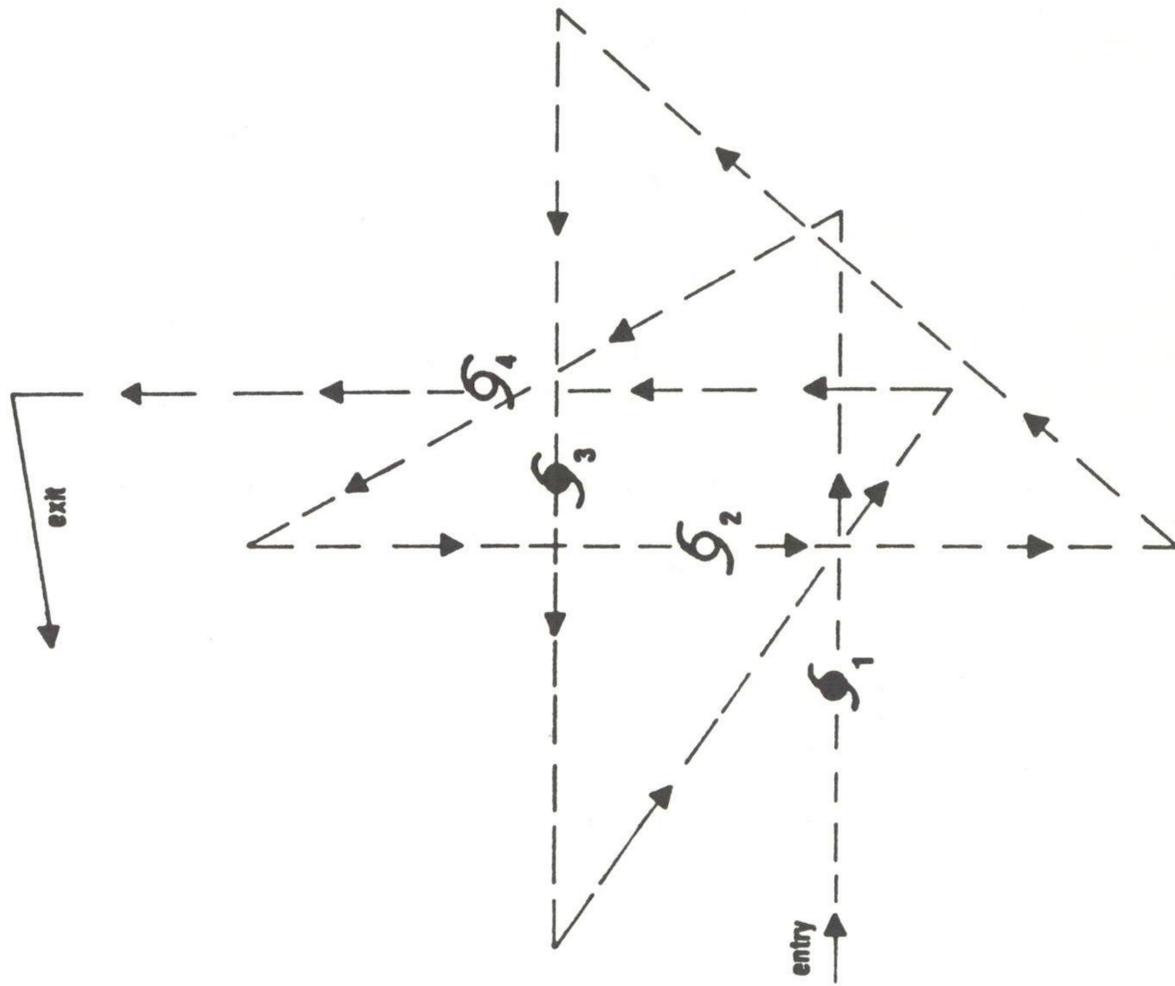

6. Entry and exit courses should be one of the cardinal directions (see recommended pattern "A" execution, Attachment No. 2). These courses should be maintained within 20° .

7. Lack of automated data collection on DOD aircraft may preclude complete and timely satisfaction of all requirements.

Weather Instrumented USAF WC-130 Flown
for Hurricane Reconnaissance

↔ DIRECTION OF FLIGHT

CHAPTER 5
APPENDIX A
ATTACHMENT 3

OPERATIONAL FLIGHT PATTERN DELTA

Provides a suggested approach to the investigation of a disturbance to ascertain the existence or nonexistence of a closed circulation, supply RECCO observations in required areas, and locate the vortex center. This pattern is normally not tasked when a closed circulation has been identified and scheduled fixes are required.

OBSERVATION DETAILS

1. Flight level 1500 feet, but may be adjusted as dictated by data requirements, meteorological conditions, or flying safety factors. During day or night operations when flying safety conditions dictate, an 850 milibar or higher altitude may be flown.
2. RECCO (Section 1 plus 4ddff and 9ViTwTwTw) required every 30 minutes. RECCO (Section 3 plus 4ddff and 9ViTwTwTw) required approximately every 15 minutes. Section 3 data are appended to next RECCO Section 1 observation. The 4 or 9 Group will not be reported if data are not available.
3. Detailed Vortex Data Message required if vortex fix is made.

DISCUSSION:

The Delta pattern is designed to provide the flexibility required in the investigation of a disturbance as follows:

1. The pattern is converted west-east to a mirror image if entry is to be made from the east.

2. The length of the legs is to be adjusted during the pattern to coincide with cyclonic circulation wind shifts, i.e., turn points are selected by the flight meteorologist after observing appropriate sustained wind shifts.

3. If observed data indicate that the aircraft is on the southern side of the circulation, the pattern is converted south-north to a mirror image pattern to enable investigation in the proper areas.

4. If data indicate to the flight meteorologist that the aircraft is far north of any existing circulation, the pattern is extended (as shown by dashed lines) to allow further investigation.

5. If the location of the center becomes obvious, the pattern may be broken off to accomplish a vortex fix. Forecast agencies may request changes in the pattern as dictated by their data requirements.

CHAPTER 5
APPENDIX A
ATTACHMENT 4

DRIFTING BUOY DEPLOYMENT

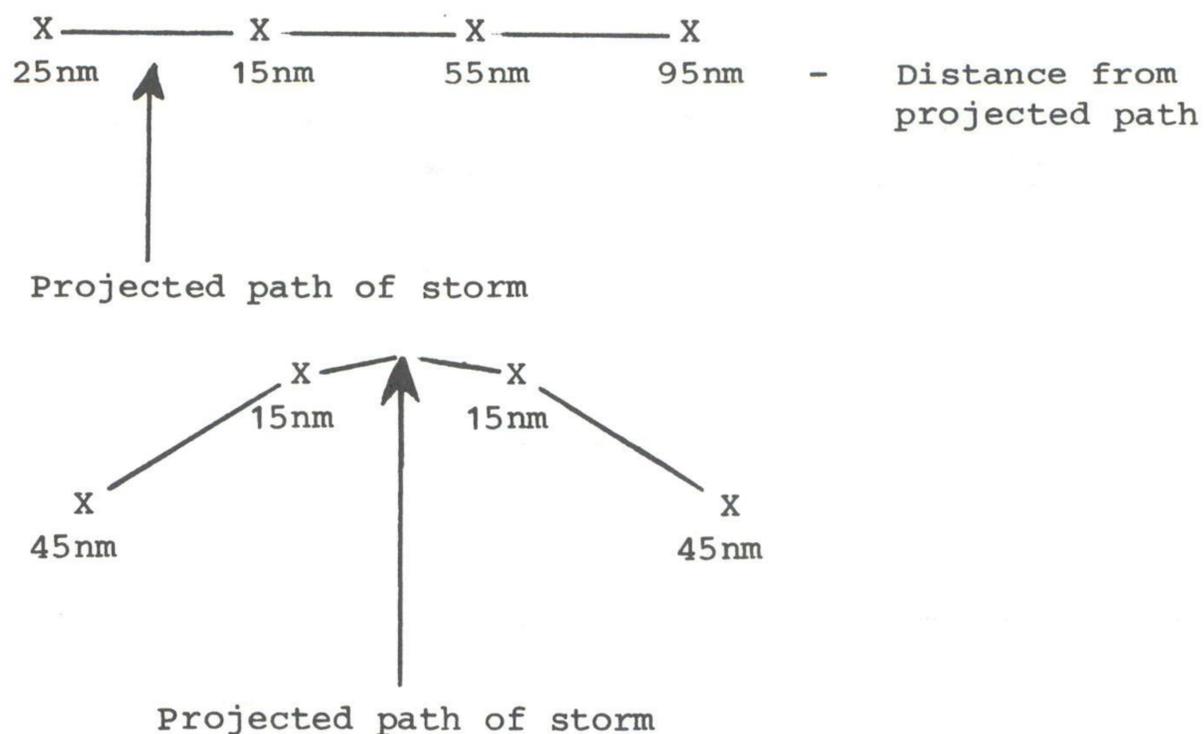

Recommended Procedures:

1. The National Hurricane Center (NHC) hurricane forecasters would issue an alert or outlook for a possible request for drifting buoy deployment 48 hours prior to the planned deployment. A formal request for deployment would be issued 24 hours prior to the event. At this point either a cancellation or an extension of the alert would be issued. Decisions would normally be made by 0900 EDT.

2. DOC desires the deployment of up to four drifting buoys between 100 and 180 nm from the storm center, depending on the dynamics of the storm system. DOC would ensure the buoys and mission related DOC personnel are available for pickup by DOD aircraft. The specific DOC request for placement of the buoys to be deployed relative to the storm would be dependent on several factors, including:

- (a) Characteristics of the storm including size, intensity, and speed;
- (b) Storm position relative to the coast and population centers.

3. The final deployment position will be provided prior to the flight crew briefing. Two possible examples of the buoy deployment would include the following:

CHAPTER 5
APPENDIX B
FORM 6
NOTES

1. At the time of the observation the aircraft observing platform is considered to be located on the axis of a right vertical cylinder with a radius of 30 nautical miles bounded by the earth's surface and the top of the atmosphere. Present weather, cloud amount and type, turbulence, and other subjective elements are reported as occurring within the cylinder. Flight level winds, temperature, dew point, and geopotential values are sensed or computed and reported as occurring at the center of the observation circle. Radar echoes, significant weather changes, distant weather, and icing are phenomena that may also be observed/reported. Code groups identifying these phenomena may be reported as necessary to adequately describe met conditions observed.
2. The intermediate observation (Section Three) is reported following Section One (or Section Two if appended to Section One) in the order that it was taken.
3. Plain language remarks may be added as appropriate. These remarks follow the last encoded portion of the horizontal or vertical observation and will clearly convey the intended message. Vertical observations will not include meteorological remarks. These remarks must begin with a letter or word—E.G. "FL TEMP" vice "700 MB FL TEMP". The last report plain language remarks are mandatory, i.e., "LAST REPORT. OBS 01 thru 08 to RJTY, OBS 09 and 10 to RPKM".
4. The hundreds digit of longitude is omitted for longitudes from 100° to 180°.
5. Describe conditions along the route of flight actually experienced at flight level by aircraft.
6. TT, T_dT_d. When encoding negative temperatures, 50 is added to the absolute value of the temperature with the hundreds figure, if any, being omitted. A temperature of -52°C is given as 02, the distinction between -52°C and 2°C being made from i_d. Missing unknown temperatures are reported as //. When the dew point is colder than -49.4°C, Code T_dT_d as // and report the actual value as a plain language remark — E.G. DEW POINT -52°C.
7. When two or more types of w co-exist, the type with the higher code figure will be reported. Code Figure 1, 2 and 3 are reported based on the total cloud amount through a given altitude, above or below the aircraft, and when other figures are inappropriate. The summation principle applies only when two or more cloud types share a given altitude.
8. When j is reported as a 9, HHH is encoded as ///.
9. If the number of cloud layers reported exceeds 3, k_n in the first 1-group reports the total number of cloud layers. The second 1-group reports the additional number of layers being reported exclusive of those previously reported. In those cases where a cloud layer(s) is discernible, but a descriptive cloud picture of the observation circle is not possible, use appropriate remarks such as "clouds blo" or As blo" to indicate the presence of lclouds. In such cases, coded entries are not made for group 9. The sequence in which cloud amounts are encoded depends upon type of cloud, cloud base, and vertical extent of the cloud. The cloud with the largest numerical value of cloud type code (C) is reported first, regardless of coverage, base, or vertical extent. Among clouds of the same cloud type code sharing a common base, the cloud of greatest vertical extent is reported first. The summation principle is not used; each layer is treated as though no other clouds were present. The total amount of clouds through one altitude shared by several clouds will not exceed 8 oktas. Only use code figure 0 as a place holder when you can determine that no additional cloud layers exist. In case of undercast, overcast, etc., use code figure 9 as a placeholder.
10. Due to limitations in the ability to distinguish sea state features representative of wind speeds above 130 knots, surface wind speeds in excess of 130 knots will not be encoded. Wind speeds of 100 to 130 knots inclusive will be encoded by deleting the hundreds figure and adding 50 to dd. For wind speeds above 130 knots, dd is reported without adding 50 and ff is encoded as // with a plain language remark added, i.e., -sfc wind above 130 knots.
11. Significant weather changes which have occurred since the last observation along the track are reported for Ws.
12. When aircraft encounters icing in level flight, the height at which the icing occurred will be reported for h_ih_i. The H_iH_i will be reported as //.

CHAPTER 5
APPENDIX C

AIRCRAFT RECONNAISSANCE COMMUNICATIONS

1. General. USAF and NOAA aircraft will normally transmit reconnaissance observations via HF radio through USAF Aeronautical Stations to the appropriate weather reconnaissance data monitor. Monitors will evaluate these reports and disseminate them to either the AWN, Carswell AFB, TX or the weather communications facility at Suitland, MD.

2. Air Ground Communications. The weather reconnaissance crew will relay weather data via direct phone patch to the weather monitor through the appropriate USAF aeronautical station, as listed in en-route flight publications. When requested, Aeronautical Stations will provide a discrete frequency for mission use, if possible. Specific radio procedures and terminology will comply with Allied Communications Publication (ACP) 125. Because of the perishable nature and potential operational impact of weather data, USAF has authorized the use of "Immediate" precedence for transmission of hurricane reconnaissance data. Data will be routed as follows:

a. Primary: Direct phone-patch between aircraft and Miami Monitor (Atlantic and Eastern Pacific) or Hickam Weather Monitor (Central Pacific).

b. Secondary: Direct phone-patch between aircraft and any weather monitor.

3. Air-to-Air Communications. When more than one reconnaissance aircraft is known to be operating in a particular area of interest, the following frequencies will be used for plane-to-plane communications and coordination:

a. Primary: VHF 123.05 MHz.

b. Secondary: UHF 304.8 MHz

c. Back-up: HF 4701 KHz USB

4. Aircraft Satellite Data Link (ASDL) Equipped Aircraft. Aircraft equipped with ASDL have the option to utilize the ASDL system using the following procedures:

a. Data Format. The following format will be used for data transmission by the ASDL System:

(1) One Minute Observation - All locations
(Message Header) (Date/Time)
URNT40 KMIA 291630
(Platform Identifier) (Date/Time-NESDIS)
15C9419C 23012 3220
(Mission Identifier)
NOAA2 0401 ANA
(TIME) (LATITUDE) (LONGITUDE) (PRESS ALT) (D VALUE)
1233 2803 08037 06173 +0436

(WIND) (TEMP) (DP)
 213010 +138 +096
 NNNN

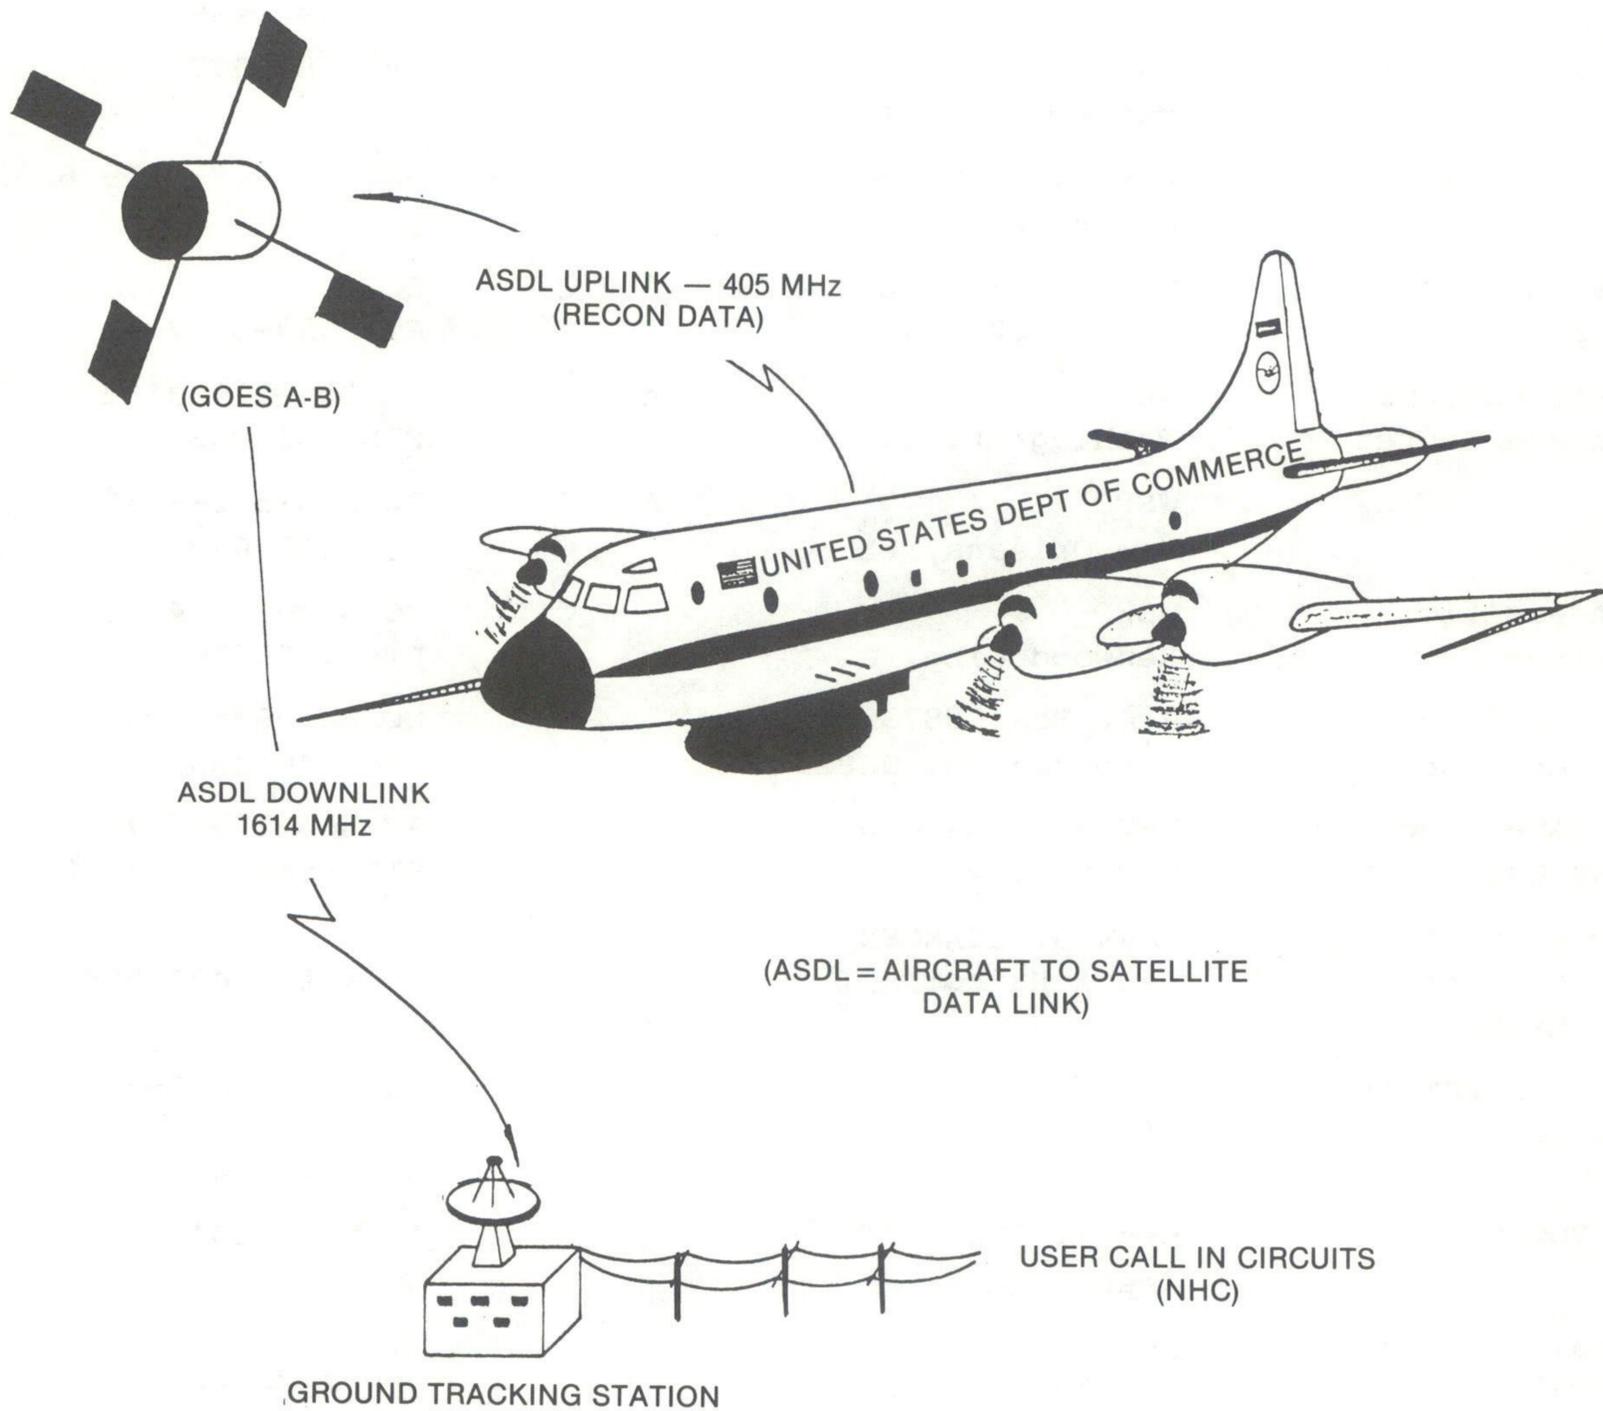

- (2) RECCO Observation - Atlantic Area
 (Message Header) (Date/Time) Same as for 1 minute observation.
 (Platform Identifier) (Date/Time-NESDIS) - Same as for 1 minute observation.
 (Observation Manop Heading) (Date/Time)
 URNT11 KMIA 281642
 NOAA2 0401 ANA OB 03
 (RECCO text)
 97779 12428.....93275
 NNNN
- (3) RECCO Observation - Eastern and Central Pacific - Same as for Atlantic except that observation manop heading is URPN11 KMIA.
 Note: 11 used for routine tropical cyclone observation
 12 used for vortex reports, etc.

b. Data Transmission Schedule. To facilitate the transmission of data from several aircraft through one circuit, each aircraft will be assigned a specific block of time within the 30-minute interval for transmission of its data using the following schedule:

0——+5	+5——+10	+10——+15	+15——+20
	OAO	OAO	
	42RF	43RF	
	P-3(A)	P-3(B)	
+20——+25	+25——+30	+30——+35	+35——+40
RADAR	RADAR		OAO
			42RF
			P-3(A)
+40——+45	+45——+50	+50——+55	+55——+60
OAO		RADAR	RADAR
43RF			
P-3(B)			

Because only 4 minutes and 28 seconds of each 5-minute time block can be used for data transmission, roughly 1/2 minute is left in each transmission block. This schedule is designed to eliminate diagnostic statements that would appear at the NESDIS computer if data from specific sources arrived at the computer at unscheduled times.

c. Data Transmission Test - Prior to the beginning of the hurricane season (June), each aircraft equipped with ASDL will perform a ground or airborne test of the equipment and data ground handling procedures to determine the equipment reliability, transmission errors, and time lapse between transmission of the data from the aircraft and receipt of the data by the hurricane forecaster. Test data will be forwarded to the Chairman of the Working Group for Hurricane and Winter Storms Operations.

SATELLITE SURVEILLANCE OF TROPICAL AND SUBTROPICAL CYCLONES

1. Satellites.

a. Geostationary Operational Environmental Satellite (GOES). The GOES system currently consists of one operational spacecraft, GOES-6 at 108 degrees west. GOES-6 will move to 98 degrees west late spring of 1985 and return to 108 degrees west in November of 1985. The principal GOES products are 1/2-hourly pictures with implanted grids automatically applied to all sectors. During daylight hours, approximately 1, 2, and 4 km resolution fixed standard sectors are produced. During the night (also available in daylight), the same geographical coverage standard sectors are produced with 7 Km resolution infrared (IR). The IR data may be enhanced to emphasize various features. Floating sectors which are scheduled by the Satellite Field Services Stations (SFSS's) are produced to augment the standard sector coverage support. All products are delivered in near real time to the National Environmental Satellite, Data and Information Service (NESDIS) Synoptic Analysis Branch (SAB), the SFSS's, and Weather Service Forecast Offices (WSFOs). (See GOES Operational Data Flow, Appendix A, Attachment 1; Satellite Data Availability, Appendix A, Attachment 2.)

b. NOAA Polar-Orbiting Satellites. These satellites cross the U.S. twice daily near the equatorial crossing times as indicated in Appendix A, Attachment 2. Data are available via direct read-out (HRPT and APT) or central processing. AVHRR data are available on a limited basis through the GOES distribution system. The Air Force Global Weather Central (AFGWC) Offutt AFB, NB, receives global NOAA imagery data direct from central readout sites on pass by pass basis. Data are processed in mapped and unmapped form for use internally.

2. Satellite Field Services Stations (SFSS).

a. Support Concept. GOES imagery in support of the hurricane warning service is distributed to the Central Data Distribution Facility (CDDF) at Marlow Heights, MD, to the SFSS's in Miami, San Francisco, Washington, New Orleans, and Honolulu. These SFSS's are colocated with NWS hurricane warning offices and are responsible for providing direct satellite support to the warning center. This support includes the use of floating sectors at 1, 2, and 4 km visible and 7 km IR positioned over the storm area. SFSS's and SAB routinely provide classification of storms using Dvorak Techniques for both visible and IR data.

b. Station Contact. SFSS satellite meteorologists can be contacted as follows:

(1) Miami - 24 hours a day at (305) 350-4460 or FTS 350-4460.

(2) San Francisco - 24 hours a day at (415) 876-9122/23 or FTS 470-9122/9123.

(3) Honolulu - 24 hours a day at (808) 836-2776.

(4) Washington - 24 hours a day at (301) 763-8239 or FTS 763-8425.

(5) New Orleans - 24 hours a day at (504)649-5130 or FTS 682-2807.

c. Satellite Tropical Disturbance Summary. The Miami, San Francisco, and Honolulu SFSS's distribute twice daily at the times indicated (Appendix B, Form 1 to this Chapter) a satellite summary which describes significant weather in the tropical regions of the Atlantic, Eastern Pacific, and Central Pacific (north and south between 140° W to 100° E, respectively).

3. NESDIS Synoptic Analysis Branch (SAB). SAB operates 24 hours a day to provide satellite support to the National Meteorological Center (NMC). The SAB also distributes twice daily a "Satellite Tropical Disturbance Summary for the Pacific (West of 170° E) and the Indian Ocean." SAB may be contacted at (301) 763-8444 or FTS 763-8444.

4. AFGWC Support and the Defense Meteorological Satellite Program (DMSP). AFGWC uses all available METSAT data when providing fix information. DMSP will provide coverage of tropical/subtropical cyclones whenever possible. Data covering the National Hurricane Operations Plan (NHOP) areas of interest will be received centrally at the AFGWC and locally at the direct readout site at Hickam AFB, HI.

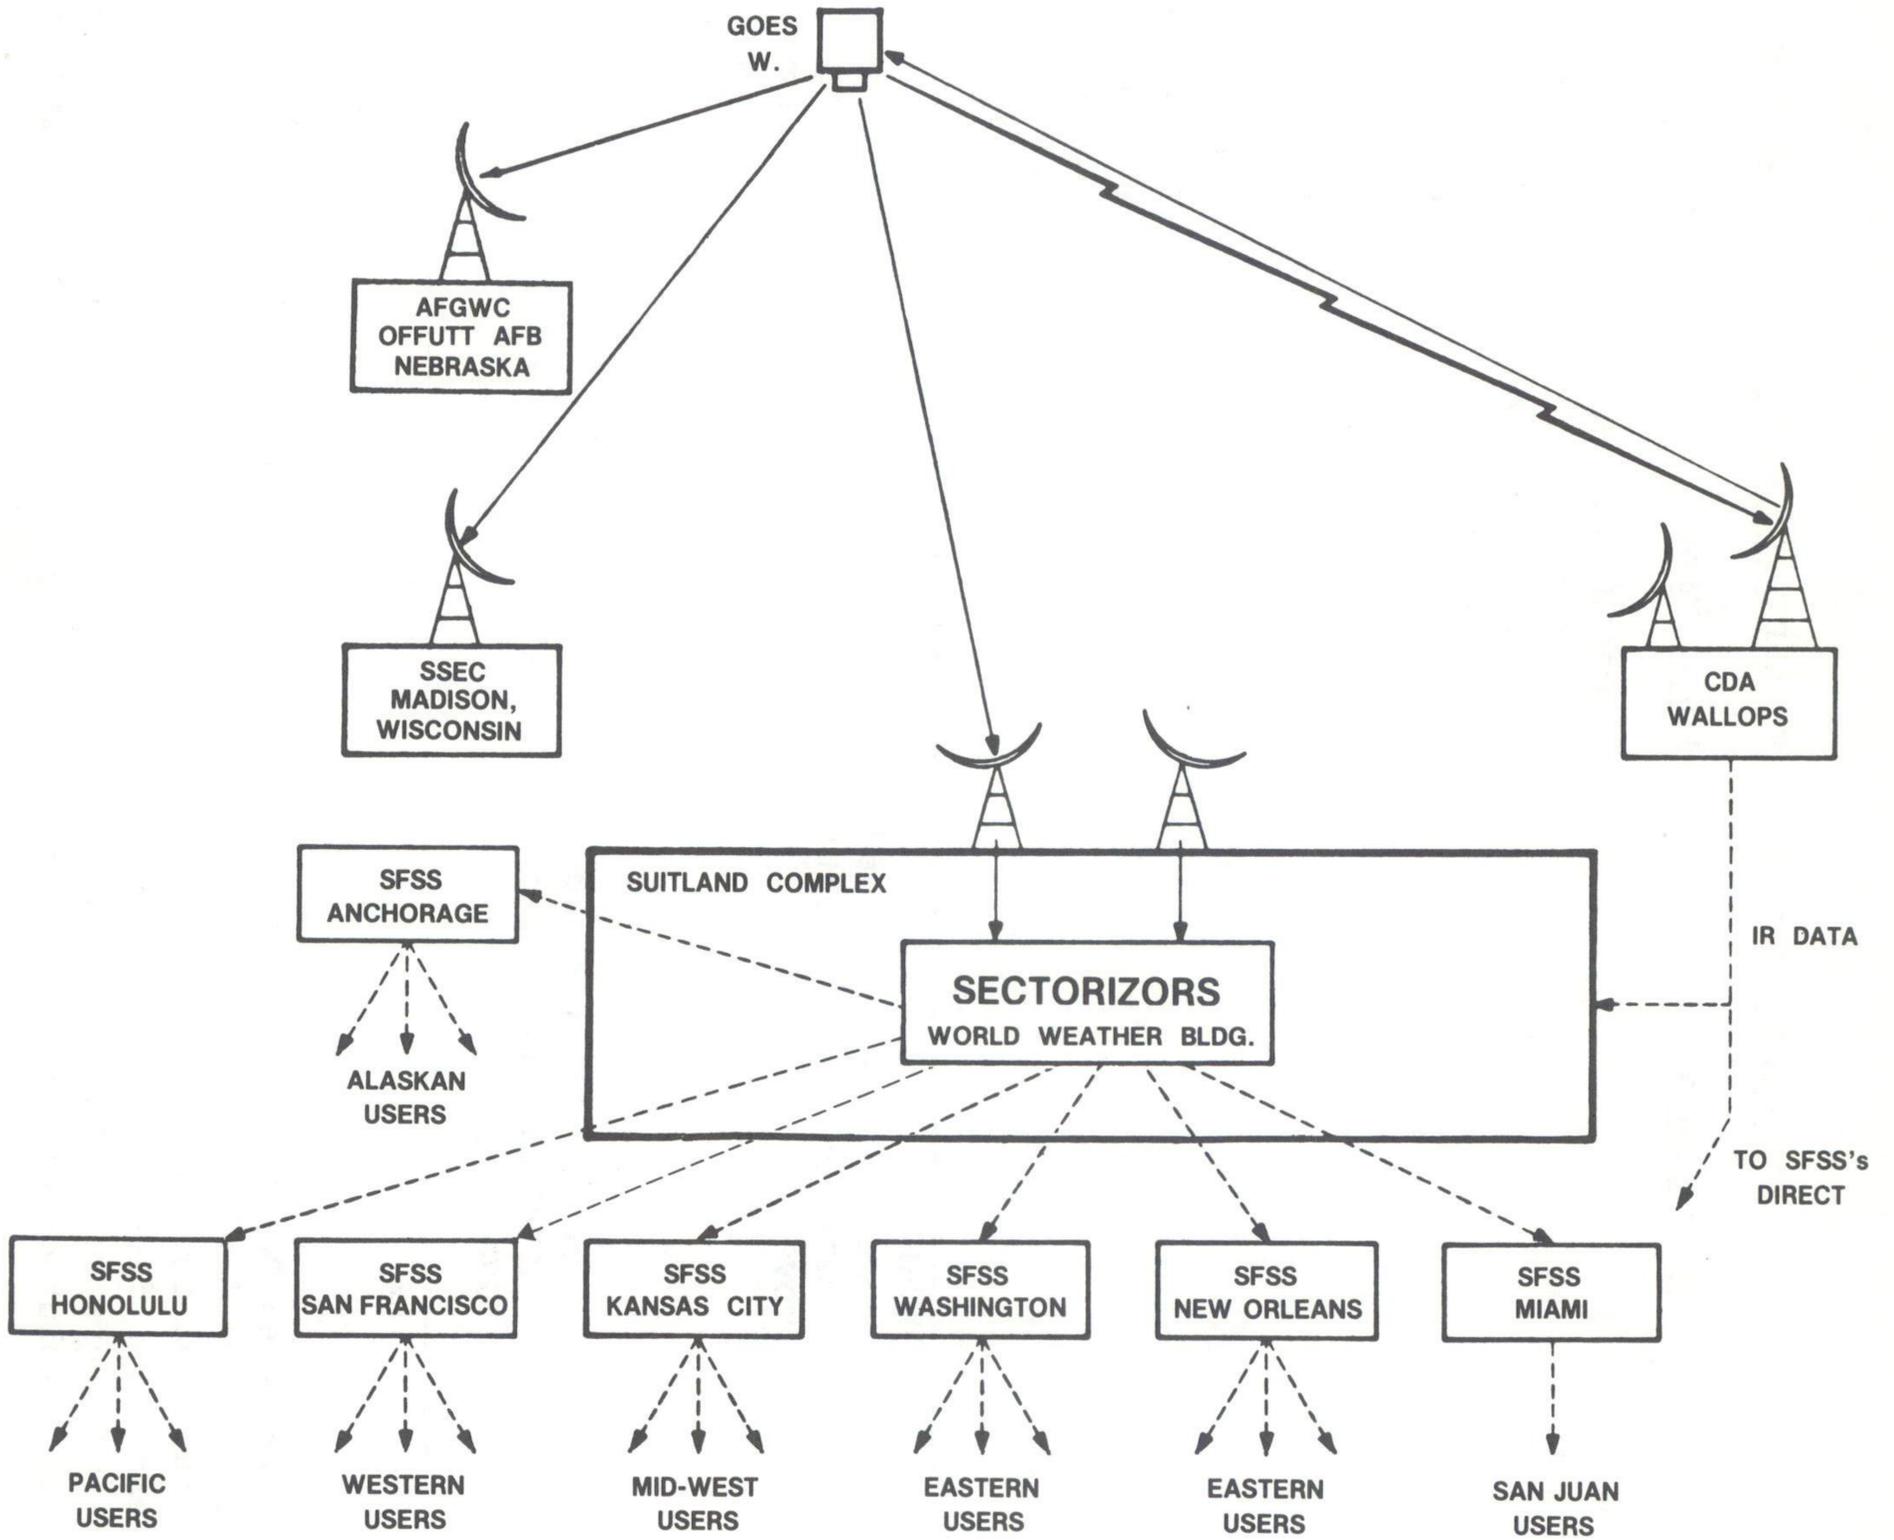

a. North Atlantic and Central Pacific Surveillance. AFGWC readouts will augment NESDIS surveillance for the North Atlantic and Central Pacific. AFGWC will transmit teletype bulletins describing the location and intensity classification of the system (in the format shown in Appendix B, Form 2) to the NHC or CPHC as appropriate, on organized disturbances evident at the Tropical Classification - 1 (T-1) level or higher.

b. Eastern Pacific Surveillance. If EPHC determines the coverage from available NESDIS satellites should be supplemented, they will request the data from AFGWC.

5. Satellites and Satellite Data Availability for the 1984 Hurricane Season. Appendix A, Attachment 2 of this chapter lists satellite capabilities for the 1985 hurricane season.

GOES

OPERATIONAL DATA FLOW

SATELLITES AND DATA AVAILABILITY FOR 1986 HURRICANE SEASON

<u>Satellite</u>	<u>Type of Data</u>	<u>Local Time</u>	<u>Remarks</u>
GOES-6 - 98.0 W 4 Spacecraft (standby) limited operational capability	VISSR VAS	Every 30 minutes (24 hr/day) (Limited scan for short-interval viewing available)	1. 1, 2, and 4 km resolution visible standard sectors covering Western United States, Midwest and Eastern United States (daylight). 2. 9 km resolution equivalent IR standard sectors for the entire United States (night). 3. E POSITION CODE NUMBER	E. Enter Position Code number (PCN) and source of data (DMSP, NOAA 2, etc.). Spell out PCN number. Select PCN number from code below: <table border="0"> <thead> <tr> <th colspan="2"><u>GEOGRAPHICAL GRIDDING</u></th> <th colspan="2"><u>EPHEMERIS GRIDDING</u></th> </tr> </thead> <tbody> <tr> <td>ONE:</td> <td>eye fix</td> <td>TWO:</td> <td>eye fix</td> </tr> <tr> <td>THREE:</td> <td>well defined circulation center</td> <td>FOUR:</td> <td>well defined circulation center</td> </tr> <tr> <td>FIVE:</td> <td>poorly defined circulation center</td> <td>SIX:</td> <td>poorly defined circulation center</td> </tr> </tbody> </table> Sample entry: ONE/DMSP	<u>GEOGRAPHICAL GRIDDING</u>		<u>EPHEMERIS GRIDDING</u>		ONE:	eye fix	TWO:	eye fix	THREE:	well defined circulation center	FOUR:	well defined circulation center	FIVE:	poorly defined circulation center	SIX:	poorly defined circulation center
<u>GEOGRAPHICAL GRIDDING</u>		<u>EPHEMERIS GRIDDING</u>															
ONE:	eye fix	TWO:	eye fix														
THREE:	well defined circulation center	FOUR:	well defined circulation center														
FIVE:	poorly defined circulation center	SIX:	poorly defined circulation center														
F DVORAK CLASSIFICATION	F. Dvorak classification for storm intensity as described in NOAA technical Memorandum NESS 45 and IWW/TN-81/001. Dvorak classification will be made once each day and must be based on visual data. If a new Dvorak classification number cannot be derived, use the last reported number. Include in parenthesis the date and nodal time of the data on which the Dvorak analysis is based. Sample entry: T 4.5/4.5/D1.0/25HRS (252305Z)																
G REMARKS	G. Include information, as appropriate, on data type, eye characteristics, spiral rainbands, unexpected changes in storm movement, departures from Dvorak (modelled) intensities, etc.																

CHAPTER 6
APPENDIX B

CURRENT INTENSITY AND "T" NUMBER
CLASSIFICATION TABLE

The current intensity (C.I.) number relates directly to the intensity of the storm. The empirical relationship between the C.I. number and a storm's wind speed is shown in this table.

The C.I. number is the same as the T-number (Tropical Classification number) during the development stages of a tropical cyclone, but is held higher than the T-number while a cyclone is weakening. This is done because a lag is often observed between the time a storm pattern indicates weakening has begun and the time when the storm's intensity decreases. An added benefit from this rule is the stability it adds to the analysis when short-period fluctulations in the cloud pattern occur. In practice, the C.I. number is not lowered until the T-number has shown weakening for 12 hours or more.

<u>C.I. Number</u>	<u>MWS (Knots)</u>	<u>T- Number</u>	<u>MSLP (Atlantic)</u>	<u>MSLP (NW Pacific)</u>
1	25K	1		
1.5	25K	1.5

The empirical relationship between the current intensity (C.I.) number and the maximum wind speed (MWS), and the relationship between the T-number and the minimum sea level pressure (MSLP).

CHAPTER 7

SURFACE RADAR REPORTING

1. General. Radar observations of tropical cyclones will be made at Department of Defense (DOD), National Weather Service (NWS), and Federal Aviation Administration (FAA) radar facilities and at other cooperating radar facilities according to established agreements with NWS.

2. Procedures.

a. Radar observation of tropical cyclones will be made in accordance with the Federal Meteorological Handbook (FMH) No. 7, Part A, Weather Radar Observations. Stations that normally transmit hourly radar weather observations (network stations) will include tropical cyclone features in routine reports (H+35) and will make and transmit special observations at H+10 whenever an eye or center is observed. It is highly desirable for stations that do not normally transmit hourly reports (local warning radars) to make and transmit a radar observation whenever an eye, center, or spiral band is observed. The local warning radar sites may transmit only abbreviated special observations, defined in FMH-7, at H+10 and H+35.

b. If the central region of a storm is defined by an identifiable wall cloud; the radar fix is reported as an EYE. If the central region is recognizable, but not well defined by a wall cloud, it is reported as a CENTER. When the EYE or CENTER is only occasionally recognizable or some other central region uncertainty exists, the EYE or CENTER is reported as PSBL EYE or PSBL CENTER. Remarks stating degree of confidence will be included with EYE fixes only and will be classified as either GOOD, FAIR, or POOR. A GOOD fix is reported when the EYE is symmetrical - virtually surrounded by wall cloud; a POOR fix is reported when the EYE is asymmetrical - less than 50 percent surrounded by wall cloud; a FAIR fix is reported to express a degree of confidence between GOOD and POOR.

c. Timely transmission of tropical cyclone radar reports is essential. Normally, radar reports are transmitted over the Automation of Field Operations and Service (AFOS) System, or CONUS Meteorological Data System (COMEDS) circuit equipment. Those radar facilities not having weather transmission capability may call the nearest Weather Service Office (WSO) collect.

3. Special Provisions.

a. If NWS network weather radars (WSR 57 and selected WSR-74s) and DOD weather radar facilities are collocated (within 25 nautical miles), the NWS radar will have the primary responsibility for making and transmitting tropical cyclone radar reports - DOD will provide backup service. If a radar facility is less powerful than the WSR 57 and is collocated with North American Aerospace Defense Command (NORAD) long-range radar facility, the NORAD long-range radar facility will have the primary responsibility for making and transmitting tropical cyclone radar reports provided it is manned by a qualified weather radar operator, the less powerful radar facility will provide backup service. Any backup radar facility, however, may transmit radar reports as desired.

b. If radar reports are needed from NORAD long-range radar facilities NWS will dispatch weather radar specialists to these facilities to make and transmit tropical cyclone radar observations. DOD has authorized the Director, NWS, to dispatch NWS radar specialists to NORAD sites during critical hurricane threat situations to make and transmit hurricane radar observations. Specific procedures regarding notification, access to sites, clearances, etc., as agreed to by DOD and NWS will be the responsibility of the Severe Weather Branch, Operations Division, NWS Headquarters, and will be strictly adhered to.

c. Air Weather Service staff weather officers providing support to NORAD long-range radar units act as coordinators for visits. These coordinators are: Commander, Det. 9, 3 Weather Sq., 23rd NORAD Regional Operations Control Center (ROCC), Tyndall AFB, FL. (904) 283-2856; Commander Det. 8, 26 Weather Sq., 24 NORAD ROCC, Griffiss AFB, NY (314) 330-2410; Commander, Det. 4, 20 Weather Squadron, Hawaii ROCC(HIROCC), Hickam AFB, HI (315-449-6262). Sites are listed in Appendix A of this chapter.

at Brownsville, Texas (250 Nautical Mile Range)

CHAPTER 8

National Data Buoy Center Reporting Stations

1. General.

a. The National Data Buoy Center (NDBC) maintains reporting stations in the Gulf of Mexico, off the U.S. east and west coasts, and coastal land areas. Also, a stockpile of four rapid response drifting data buoys are available for aerial deployment in the event of emergency situations. These data acquisition systems obtain measurements of meteorological and oceanographic parameters for operational and research purposes. Station location and configuration are given in paragraph 4. The status and capability of stations can be obtained from the Data Systems Division, National Data Buoy Center, NSTL, MS 39529, telephone: COM (601) 688-2836, FTS 494-2836, and AV 485-4411, ext. 2836. During non-working hours, NDBC can be contacted through the U.S. Coast Guard in New Orleans, LA, telephone: COM (504) 589-6225, or FTS 682-6225.

b. Reporting stations routinely acquire, store and transmit data every hour. Data obtained operationally include sea-level pressure, wind speed and direction, air temperature, sea-surface temperature, and wave spectral data. Drifting buoys are available in two types called Wind Speed Direction (WSD) and Air Sea Interaction Drifter (ASID). The WSD buoy measures sea-level pressure, wind speed and direction, air temperature and sea-surface temperature. The ASID buoy measures the same parameters except wind direction and can be configured with a subsurface thermistor array to measure hydrostatic pressure and subsurface ocean temperatures.

2. Procedures.

DOC/NOAA will initiate a request through OFCM to DOD AF for each desired aerial deployment of drifting data buoys for a pre-storm array in the Atlantic and/or Pacific oceans. These requests should allow at least a 30 day lead-time. For deployments in advance of a U.S. land-threatening hurricane, a 36 to 48 hour notification is required. All requests will include specifics regarding on loading base, accompanying technicians, desired pickup times and offload points, reimbursement funding, plus other pertinent data.

3. Communications.

Buoy and Coastal Marine Automated Network (C-MAN) data are transmitted by UHF communications via the GOES satellite to NESDIS and then are relayed on to NMC for processing and dissemination. Moored buoy data are formatted into WMO FM13-VII synoptic code and C-MAN data are formatted into the WMO FM12-VII synoptic code. These codes are defined in FMH2, Surface Synoptic Codes. Drifting buoy data are telemetered through the NOAA polar orbiting satellites to Service ARGOS in Toulouse, France, for processing. These data are formatted by Service ARGOS into the WMO FM14-VIII (DRIBU) code defined in the WMO Manual on Codes, Volume I and then are routed to NMC over the Global Telecommunications Service (GTS) for distribution and dissemination to U.S. users. For emergency purposes, NDBC operates a portable satellite ground station at Bay St. Louis, MS to acquire and distribute drifting buoy data in real-time to operational users.

4. Data Buoy, C-MAN Site Locations and Configuration

CHAPTER 9

MARINE WEATHER BROADCASTS

1. General. The Department of Defense (DOD) and Department of Transportation (DOT) are responsible for broadcasting marine tropical cyclone advisories issued by the National Hurricane Center, the Eastern Pacific Hurricane Center and the Central Pacific Hurricane Center. Appendix A of this chapter lists the stations involved. The broadcasts are for the purpose of providing warnings to meet U.S. international obligations in Department of Commerce areas of forecast responsibility given in Chapter 2.

2. Broadcast Procedures. DOT and DOD will arrange for broadcast of all marine tropical cyclone advices immediately upon receipt. The latest tropical cyclone forecast will be transmitted according to the schedule and on the frequencies given in Worldwide Marine Weather Broadcasts. The latest position estimate will be used by DOT and DOD along with the latest forecast for storms on which position estimates are being issued. These broadcasts will be made in both voice and CW mode.

APPENDIX II

BIBLIOGRAPHY OF OFFICIAL INTERAGENCY AGREEMENTS

The following references are pertinent to the agreed interagency responsibilities designated in this plan:

1. Memorandum of Understanding (MOU) between the Department of the Air Force (DAF) and the National Oceanic and Atmospheric Administration (NOAA), dated March 16, 1976. Purpose: to establish policies, principles and procedures under which the DAF will provide aircraft weather reconnaissance to NOAA.

2. MOU between Military Airlift Command (MAC) and the Director of Operations, Logistics and Emergency Planning (NOAA), dated October 12, 1976. Purpose: to establish procedures by which NOAA will reimburse MAC and AFRES for airborne weather reconnaissance.
