ABSTRACT

The Resource Assessment and Conservation Engineering Division of the Alaska Fisheries Science Center conducts annual bottom trawl surveys to monitor the condition of the demersal fish and crab stocks of the eastern Bering Sea continental shelf. The standard study area, surveyed each year since 1979, encompasses a major portion of the eastern Bering Sea shelf between the 20-m and the 200-m isobaths and from the Alaska Peninsula north to approximately the latitude of St. Matthew Island (lat. 60° 50' N). In 1990, this area of 463,000 km^2 was again surveyed by two chartered trawlers, the 30.5 m Alaska and the 33.5 m Ocean Hope 3.

Demersal populations were sampled by trawling for 30 minutes at stations centered in 20 x 20 nautical mile grids covering the survey area. At each station, species composition of the catch was determined and commercially important species were sampled to obtain length distributions and age structure samples.

Survey results presented in this report include relative fishing powers of the survey vessels, abundance estimates for fish and invertebrates, geographic distributions of economically important fish species and major fish families, size composition of principal fish species, and age and growth information for selected species. Surface and bottom temperatures recorded at each sampling station are also presented.

Appendices provide detailed station data and computer listings of the analyses of abundance and biological data of the sampled populations.

CONTENTS

INTRODUCTION

The eastern Bering Sea continental shelf supports one of the most productive groundfish fisheries in the world (Bakkala 1988). Since 1970, annual commercial catches of groundfish have ranged from 1.2 to 2.2 million metric tons (t) (North Pacific Fishery Management Council 1990). Although many species are caught commercially, the most abundant has been walleye pollock (Theragra chalcogramma) which, since 1970, has comprised more than 70% of the total landings. The next most abundant species have been yellowfin sole (Pleuronectes asper) and Pacific cod (Gadus macrocephalus) which have comprised 8 and 5%, respectively, of the commercial landings.

Since 1971, the Resource Assessment and Conservation Engineering (RACE) Division of the Alaska Fisheries Science Center (AFSC) has conducted annual bottom trawl surveys of the eastern Bering Sea continental shelf. In 1975, the first large-scale survey of the eastern Bering Sea shelf was conducted under contract to the Bureau of Land Management in response to a need for baseline data to assess the potential impact of proposed offshore oil exploration and development on fishery resources (Pereyra et al. 1976). During this baseline survey, sampling was conducted over the Bering Sea shelf between the 20 m and 200 m isobaths and from the Alaska Peninsula north to approximately 62°N lat. (Fig. 1). Following 1975, the areal coverage of the annual surveys was reduced until 1979 when an even more comprehensive survey of the Bering Sea shelf than in 1975 was undertaken in cooperation with the Japan Fisheries Agency (Fig.

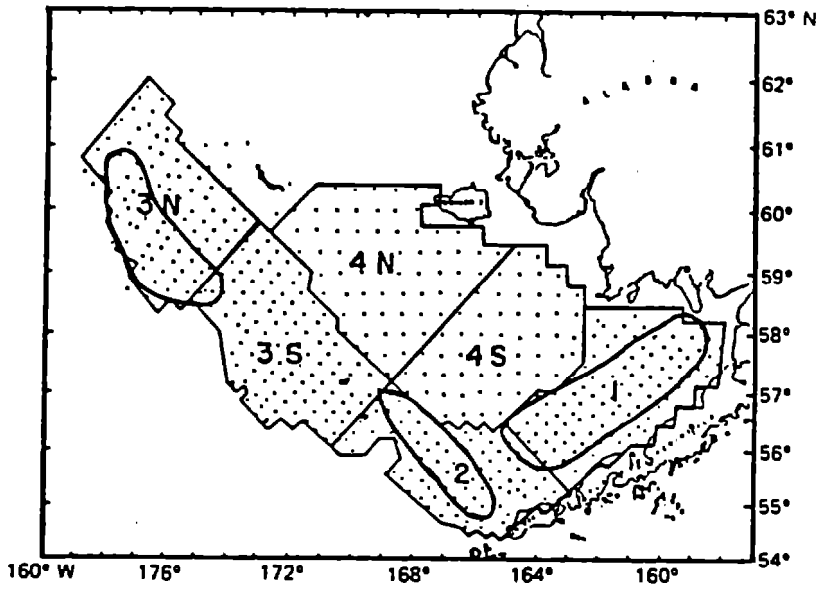

Figure l.--Sampling stations and survey stratificationused for analyses **of** data from the 1975 baseline survey on the eastern Bering Sea shelf, with approximate locations of oil lease areas (from Pereyra et al. 1976).

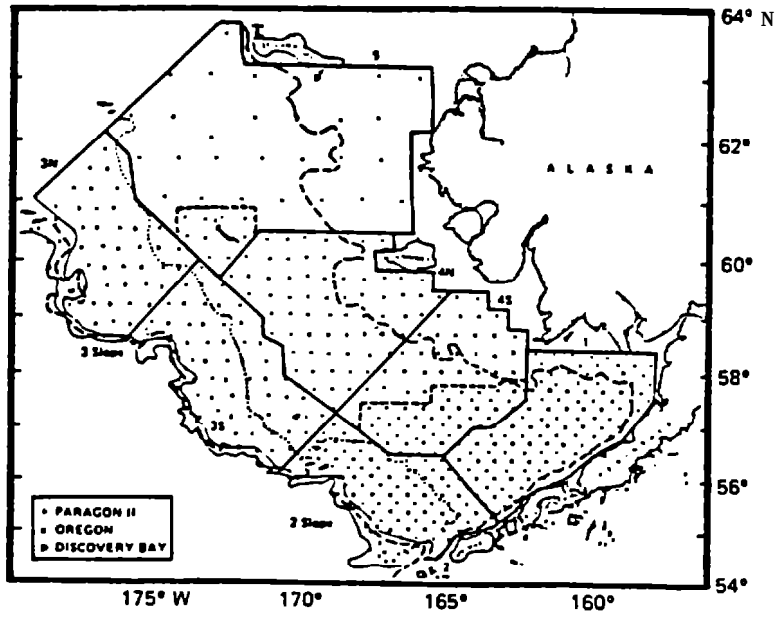

Figure 2. --Sampling stations and survey stratification used for analyses of data from the 1979 expanded triennial survey on the eastern Bering Sea shelf and slope (from Bakkala and Wakabayashi 1985).

2, Bakkala and Wakabayashi 1985). The 1979 survey encompassed the entire region sampled in the 1975 baseline study, and in addition, the continental slope waters between the Aleutian Islands and the U.S.-U.S.S.R. convention line, and the region between St. Matthew and St. Lawrence Islands. A hydroacoustic survey was also conducted in 1979 to assess the midwater component of the walleye pollock population. Subsequent annual bottom trawl surveys have essentially resampled the stations established during the 1975 survey, with slight modifications each year. This region has been found to encompass the major portion of economically important eastern Bering Sea groundfish populations, except those primarily located in continental slope waters. Every third year (1979, 1982, 1985, 1988) an extended survey has been conducted, including hydroacoustic assessment of midwater pollock, bottom trawl sampling of the continental slope, and bottom trawl sampling in the region between St. Matthew and St. Lawrence Islands. The information gathered by the annual surveys serves to: 1) provide the North Pacific Fishery Management Council with annual fishery-independent estimates of abundance and biological condition of commercially exploited stocks, 2) provide distribution and abundance information to commercial fishermen, and 3) develop a time-series data base contributing to our understanding of the population dynamics and interactions of groundfish species.

This report presents information collected by the AFSC in the eastern Bering Sea during the 1990 bottom trawl survey. The

groundfish/crab survey and several ancillary projects were conducted from 1 June to 8 August by two U.S. vessels. The survey area was also sampled by the Soviet research vessel Novokotovsk from 18 May to 17 July 1990. The survey data collected by the Soviet and the U.S. vessels have not been combined due to differences in survey timing and sampling gear. Results of the Soviet survey will be presented in a future report. Also, detailed information on principal crab species is not included here but can be found in a report by Stevens and Macintosh (1990).

METHODS

Survey Area and Sampling Design

A total of 352 standard and 28 special study stations were successfully sampled during the 1990 survey (Fig. 3). The standard station pattern was based on a systematic 20 x 20 nautical mile grid. In areas surrounding St. Matthew and the Pribilof Islands, grid block corners were also sampled to better assess blue king crab (Paralithodes platupus) concentrations. Starting with the eastern stations, the two vessels fished alternate north/south lines of stations such that coverage of the survey area was similar for each vessel. This sampling design facilitated the computation of relative fishing powers (or catch efficiencies) of the two vessels., The progression from east to west was established to prevent multiple encounters of yellowfin sole, Alaska plaice (Pleuronectes quadrituberculatus), and

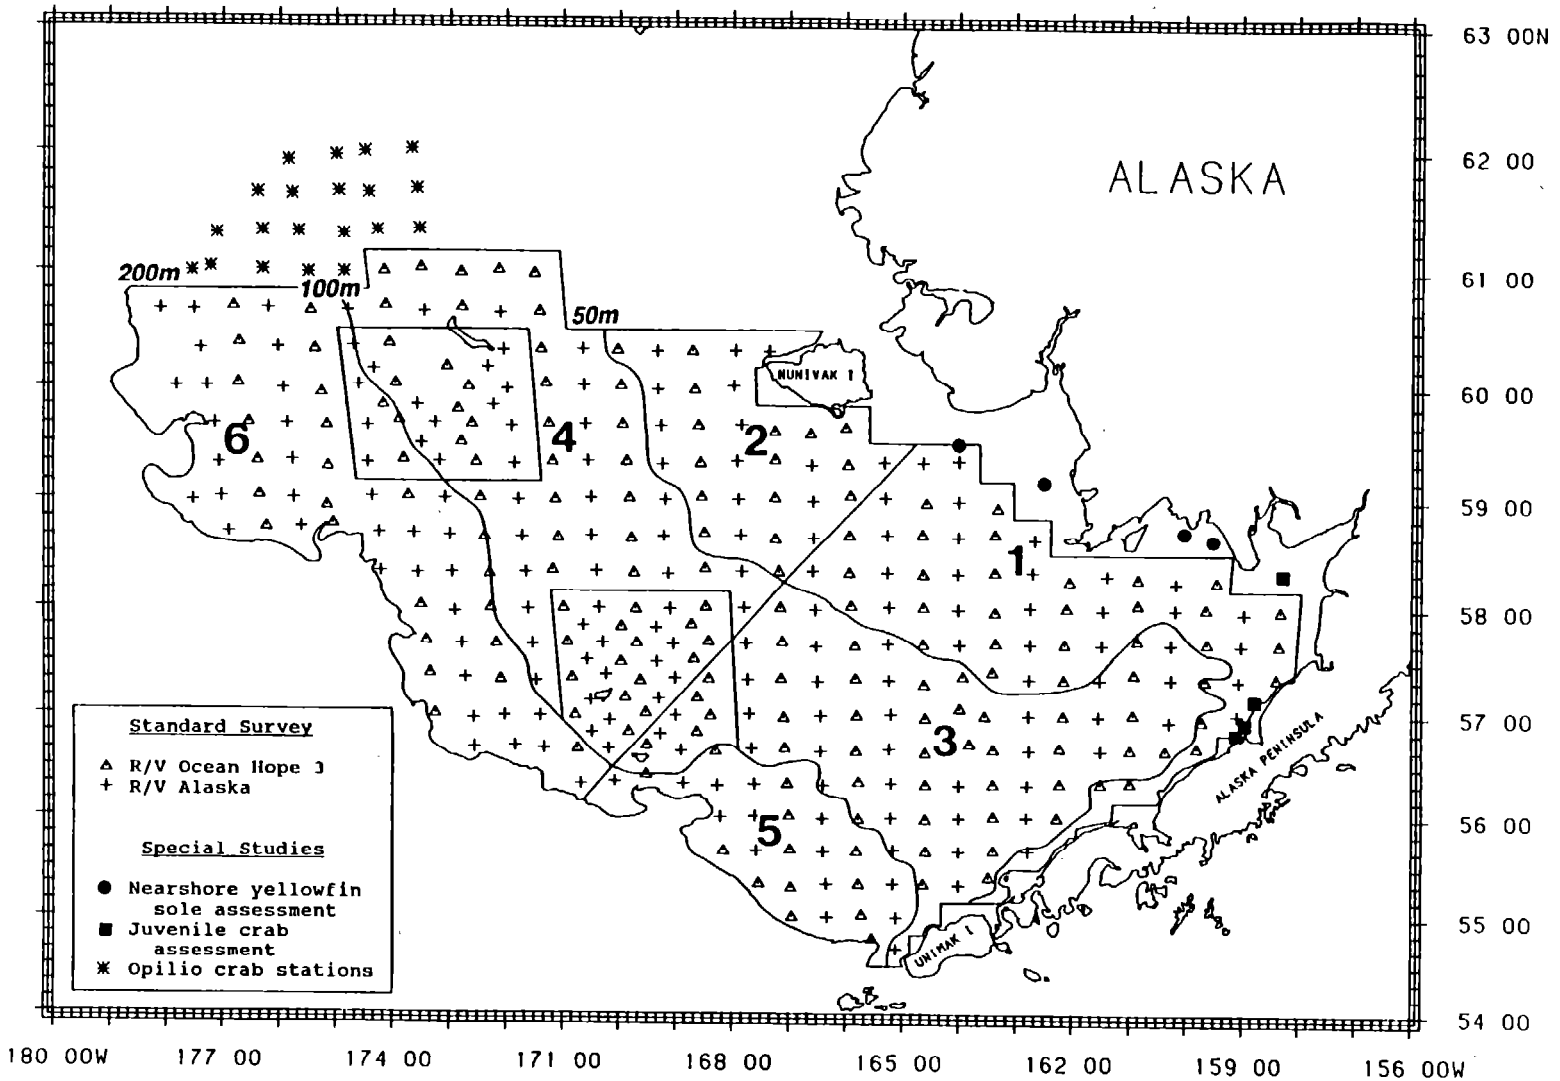

Figure 3.--Standard and special study stations sampled during the 1990 eastern Bering Sea bottom trawl survey, and stratification used for analyses of the data. Boxed areas s&rounding the Pribilof Islands and St. Matthew Island indicate locations of high-density sampling.

perhaps other species which may be migrating eastward during the course of the survey (Smith and Bakkala 1982). Tows were usually 30 minutes in duration and fishing was limited to daylight hours.

For data analysis, the survey region was divided into six subareas bounded by the 50 m, 100 m, and 200 m isobaths and by a line separating the northwest and southeast portions of the study area (Fig. 3). This stratification scheme was designed to reduce the variances of population and biomass estimates by conforming to oceanographic domains which seem to relate to distributions of fishes (Bakkala 1988). The presence of high-density sampling for blue king crab in subareas 3, 4, and 6 necessitated a further division of these subareas into high-density and standard-density sampling strata, resulting in a total of 10 geographic strata.

Of the 356 total standard survey stations, 352 were successfully sampled in 1990 (Appendix A). The overall sampling density for the entire survey area was one station per 1,316 km^2 (Table 1). However, because of the high-density sampling in subareas 3, 4, and 6, and the irregular subarea boundaries, sampling density among the six subareas varied from one station per 1,147 km^2 to one per 1,492 km^2.

Table l.--Size of subareas and sampling densities by subarea for the 1990 eastern Bering Sea bottom trawl survey (see also Fig. 3).

Subarea	Area (km^2)	No. stations allocated	No. stations successfully sampled	Sampling density (km^2/stn)
1	77,872	58	58	1,343
2	41,028	31	31	1,323
3	103,302	76	76	1,359
4	107,822	98	94	1,147
5	38,792	26	26	1,492
6	94,562	67	67	1,411
Subareas combined	463,376	356	352	1,316

Vessels and Fishing Gear

For the third consecutive year, the annual eastern Bering Sea bottom trawl survey was conducted aboard the 30.5 m University of Washington research vessel Alaska and the 33.5 m fishing vessel Ocean Hope 3 (Table 2). As in previous years, both vessels were equipped with 83-112 eastern otter trawls which have 25.3 m (83 ft) headropes and 34.1 m (112 ft) footropes (Appendix B). These nets were attached to tail chains with 54.9 m (30 fathoms) paired dandylines. Each lower dandyline had a 0.61 m chain extension connected to the lower wing edge to improve bottom tending characteristics. Steel "V"-doors measuring 1.8 x 2.7 m and weighing 816 kg were used.

Table 2. --Characteristics of vessels used during the 1990 eastern Bering Sea bottom trawl survey.

Vessel	Overall length(m)	Gross tonnage	Horsepower	Survey period Start	Finish
Alaska	30.5	219	600	1 June	8 August
Ocean Hope 3	33.5	197	850	1 June	8 August

SCANMAR[1] net mensuration systems were used aboard each vessel to measure net height and width. Net width was measured by the distance between two sensors attached to the upper dandyline, about 0.61 m in front of the net. For most tows, a mean net width was calculated from observations recorded during the tow. These data were also used to establish a net width-scope (wire-out) relationship for each vessel to enable prediction of net width for tows where net width data were not available (Fig. 4) as described by Rose and Walters (1990). Estimates of net width were used in area-swept calculations.

Data Collection

Sampling procedures used in RACE eastern Bering Sea assessment surveys are described in detail by Wakabayashi et al. (1985). A brief summary follows.

Samples were collected by trawling at the center of each 20 x 20 nautical mile grid block (or corner station, in the case of high-density strata) for 30 minutes (timed after the net had

[1] Reference to trade names does not imply endorsement by the National Marine Fisheries Service, NOAA.

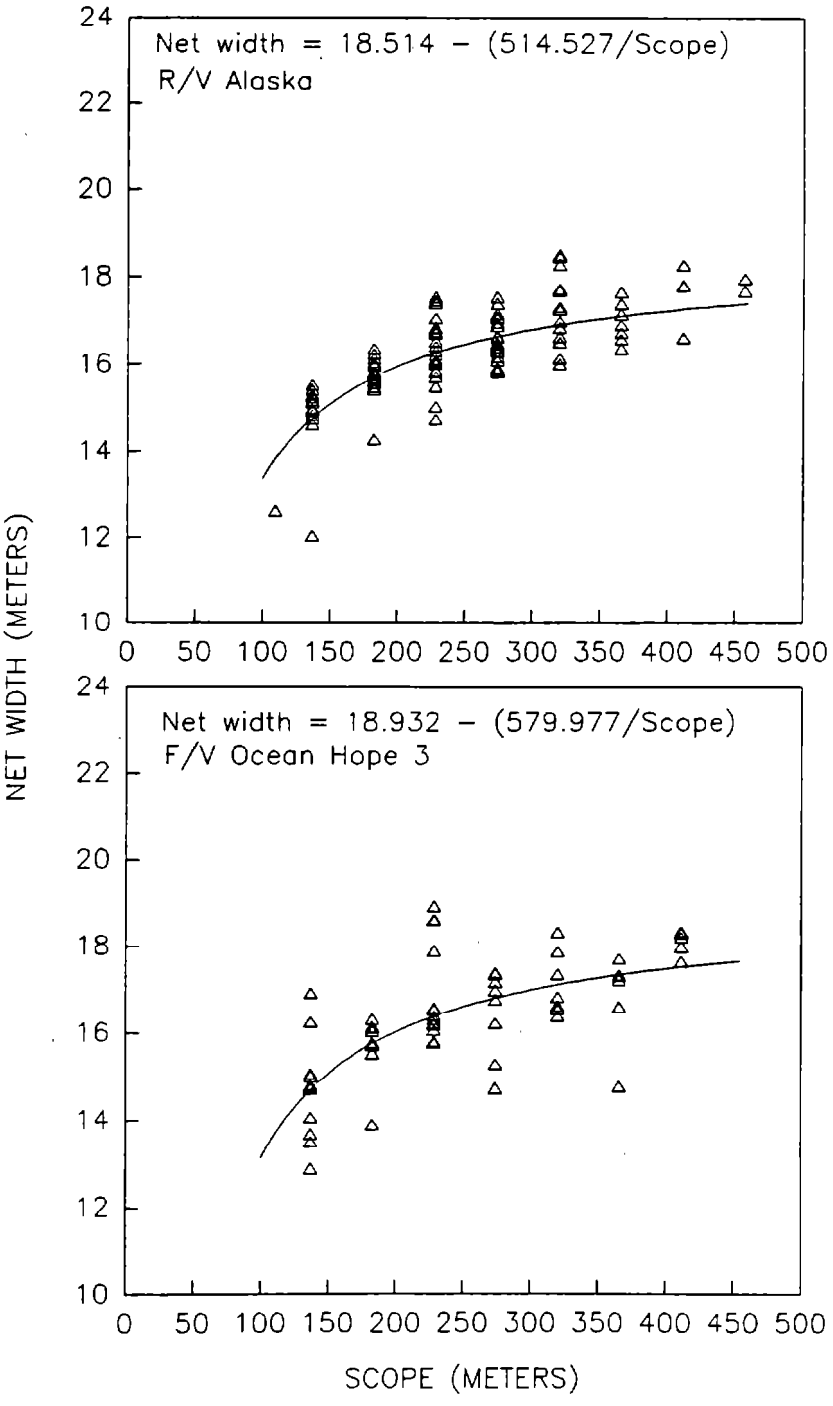

Figure 4. --Relationship between net-width and scope (wire-out) for the two vessels participating in the 1990 eastern Bering Sea bottom trawl survey.

settled on the bottom), towing at a speed of 1.54 m/sec (3 knots). If the bottom appeared to be untrawlable at the specified location, the nearest trawlable site within the same grid square was used. If the net was ripped or "hung up" on some object on the bottom during the tow, the catch was discarded and a new sample obtained.

Catches of less than approximately 1,150 kg (2,500 lb) were processed entirely while larger catches were subsampled. Economically important fish and invertebrates were sorted to species with the exception of four species of flatfish. Similar features between arrowtooth (Atheresthes stomias) and Kamchatka flounder (Atheresthes evermanni), and flathead sole (Hippoglossoides elassodon) and Bering flounder (Hippoglossoides robustus) made identification of these species difficult within the time constraints of the survey; thus, these species were grouped by genus for purposes of this report. Minor species of fish and invertebrates were sorted to the lowest taxonomic level practicable. Catch weights and numbers by species or species group were estimated directly or, when subsampled, estimated by extrapolating the proportion in the subsample to that of the entire catch weight. Pacific halibut (Hippoglossus stenolepis) and crab species of the genera Paralithodes (red and blue king crabs, camtschatica and platypus, respectively), Chionoecetes (snow and Tanner crabs, opilio and bairdi, respectively), and Erimacrus (hair crabs, isenbeckii) were usually weighed and enumerated from the entire catch.

Size composition data were collected for each commercially important species. Pacific halibut, walleye pollock, Pacific cod, and yellowfin sole were measured whenever caught while other species were measured as time permitted (Table 3). Pacific halibut were measured immediately upon capture and returned to the sea in an effort to reduce sampling mortality for this species. Random samples of the remaining species of up to approximately 200 individuals (300 in the case of walleye pollock) were sexed and measured to the nearest centimeter from the tip of the snout to the end of- the middle rays of the caudal fin (fork length).

Sagittal otoliths were collected from seven commercially important species (Table 4). In both the northwestern and southeastern divisions of the survey area, three otolith pairs per sex/centimeter interval were collected for Pacific cod and rock sole (Pleuronectes bilineatus), and five pairs per sex/centimeter interval for all other species. Scales as well as otoliths were taken from Pacific cod to aid in ageing young fish. Individual weight data were collected from Alaska plaice in conjunction with otolith sampling. In the case of the Hippoglossoides, otoliths were collected only from individuals that were identified with certainty as flathead sole. Age structures for roundfish were preserved in 50% ethanol/water; flatfish otoliths were preserved in 50% glycerol/water.

Temperature profiles were taken at each station with an expendable bathythermograph cast; surface temperatures were taken by bucket thermometer.

Table 3.--Number of length measurements taken during the 1990 eastern Bering Sea bottom trawl survey.

Species	Length measurements by subarea 1	2	3	4	5	6	Total
Walleye pollock	2,219	792	5,809	7,821	2,429	12,991	34,814[a]
Rock sole	11,798	4,392	8,658	6,130	66	1179	32,921[a]

Flathead sole	0	0	186	41	28	255	510
Alaska plaice	54	61	58	55	0	0	228
Greenland turbot	0	0	0	6	0	49	146[a]

[a]Some age structures were collected outside the standard survey area, therefore, the numbers collected for the six subareas do not add to the total.

[b]Scales were also taken.

Data Analysis

A brief description of the procedures used in analysis of PACE Bering Sea survey data follows (for a detailed description see Wakabayashi et al. 1985). Many of the species collected were grouped by family for data analysis because of their insignificant commercial value or questionable identification.

Since 1979, the Bayesian technique of Geisser and Eddy (1979) was used to compare the relative fishing powers of the two survey vessels. If the distribution of catch-per-unit-effort (CPUE) values for any one species were statistically different between vessels, catch rates of the less efficient vessel were expanded by the ratio of the mean CPUEs (more efficient divided

by less efficient) of the two vessels. Recent work at the AFSC determined that the ratio of means was extremely unstable and too sensitive to abnormally large values of CPUE. Consequently, a new method developed by Kappenman (1992) was used to compare CPUE 'distributions and determine a scaling factor for correction. All stations sampled by the two vessels during the standard survey (Fig. 3) were used in the analysis.

Mean CPUE values for each species were calculated in kilograms per hectare and number per hectare for each of the 10 strata; area swept (hectares) was computed as the distance towed multiplied by the mean net width (Alverson and Pereyra 1969). Mean CPUE values, weighted by strata areas, were calculated for individual subareas and for the overall survey area. Biomass and population estimates were derived for each stratum by multiplying the stratum mean CPUE by the stratum area. Stratum totals were then added together to produce estimates for each subarea and for the total survey area.

In estimating the size composition of populations of principal commercial species, length-frequency data obtained at each station were expanded to the station catch by proportion and then extrapolated to the stratum population by the weighted CPUE. Stratum estimates were summed to derive the estimated size composition by subarea and for the overall survey area.

Otolith and scale samples collected during the survey were read by the Age and Growth Determination Unit of the AFSC's Resource Ecology and Fisheries Management (REFM) Division. From

each centimeter interval. Population age composition was estimated by apportioning ages to the estimated population at each length interval. Age composition in terms of biomass was estimated by first calculating biomass at length using the equation:

$$B_L = P_L * [A * (L^B)]$$

where B_L = biomass at length L in grams,
P_L = population number at length L,
L = fork length in mm, and
A and B = constants based on the regression of previous species-specific length-weight data obtained from the RACE eastern Bering Sea database.

Values used for the constants A and B are as follows:

		A	B
1)	Walleye pollock		
	Male	0.0000081670	2.963988
	Female	0.0000063161	3.010031
	Unsexed	0.0000029701	3.167916
2)	Pacific cod		
	Male	0.0000044268	3.162674
	Female	0.0000043510	3.165096
	Unsexed	0.0000043973	3.163560
3)	Yellowfin sole		
	Male	0.0000135820	2.960426
	Female	0.0000111310	3.003173
	Unsexed	0.0000119530	2.987584
4)	Rock sole		
	All	0.0000047050	3.169881

After converting weight in grams into metric tons, B_L was then apportioned to biomass at age using the age-length key for each species.

Growth characteristics of principal species were described with von Bertalanffy (1938) growth curves fitted to age-length

data collected in this survey.

Special Studies

In addition to the 352 standard survey tows, 28 tows were made for special studies (Fig. 3). Nearshore sampling for juvenile crab and fish was conducted at three stations in Port Heiden, and at one station in Kvichak Bay. In addition, 2 tows each were made in Togiak and Kuskokwim Bays to assess the abundance and spawning condition of yellowfin sole inshore of the standard survey area, and 20 tows were made to assess the abundance of snow crab northwest of St. Matthew Island. Catches from these 28 tows were used to define geographic distributions of fish groups but were not used to estimate population parameters in order to maintain comparability with estimates from previous standard annual survey areas.

Stomach samples from several of the most prevalent commercial species in each haul were collected and preserved in formalin for later examination by the Food Habits Program of the AFSC's REFM Division (Table 5).

Additional activities included tagging Pacific cod (Table 5), collecting specimens or tissue samples for observer training programs and crab pathology studies, and fulfilling requests from academic institutions.

Table 5. --Biological samples collected for special studies and number of Pacific cod tagged during the 1990 eastern Bering Sea bottom trawl survey.

Species	Stomach samples collected	Number tagged

Flathead sole	958	--
Rock sole	613	--
Alaska plaice	393	--
Atheresthes spp.	281	--
Pacific halibut	270	--
Greenland turbot	27	--

RESULTS

Environmental Conditions

Sea surface temperatures recorded during the survey ranged from 2.3° to 10.8°C (Fig. 5). As in most previous years, surface temperature increased from east to west across the shelf, probably reflecting the progression of summer warming as the survey proceeded from east to west.

Bottom temperatures ranged from -1.5° to 6.8°C (Fig. 5). The warmest temperatures (above 4°C) occurred in shallow waters along the Alaska mainland, in the vicinity of the Pribilof Islands, and in the southern portion of the outer shelf just

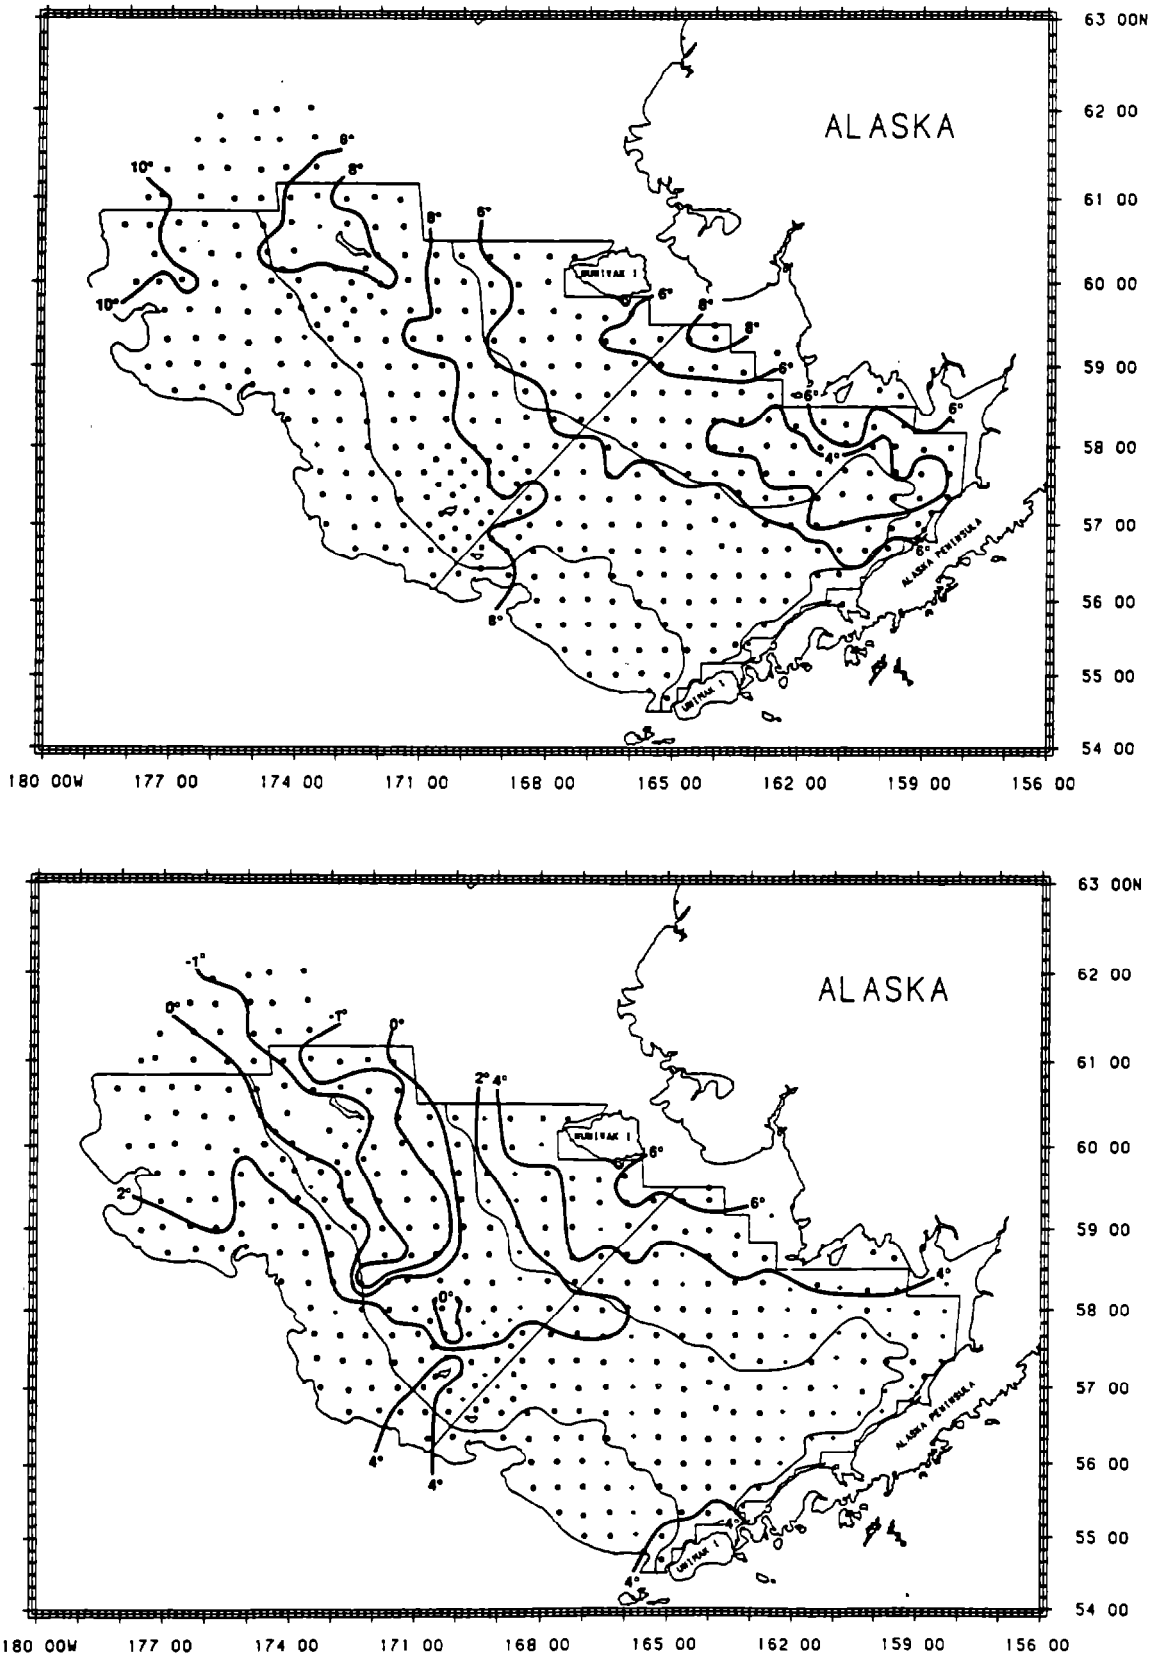

Figure 5.--Distribution of surface water (top panel) and bottom water (lower panel) temperatures ("C) observed during the 1990 eastern Bering Sea bottom trawl survey.

north of Unimak Pass. The coldest bottom temperatures observed were in the northern portion of the mid-shelf at depths between 50 and 100 m.

The mean bottom water temperature for the total survey area in 1990 was 2.3°C (Fig. 6). Historically, this is below average for mean summer bottom water temperatures in the standard survey area (range in annual means 1.8° to 5.1°C, average of annual means 2.9°C). Mean bottom temperatures observed over a more limited region of the southeast Bering Sea, which has been sampled annually since 1971, have ranged from 1.2° to 4.8°C; the 1990 value for this area was 3.2°C, near the long-term average (3.1°C). The distribution of bottom water temperatures was somewhat unusual in 1990 in that there was a relatively broad distribution of O°C and colder water on the northern midshelf, but the 2°C isotherm did not extend as far south as it normally does when the O°C and colder water is as extensive as it was in 1990. This would account for the total survey area mean in 1990 falling below average while the mean for the southeast Bering Sea was near average.

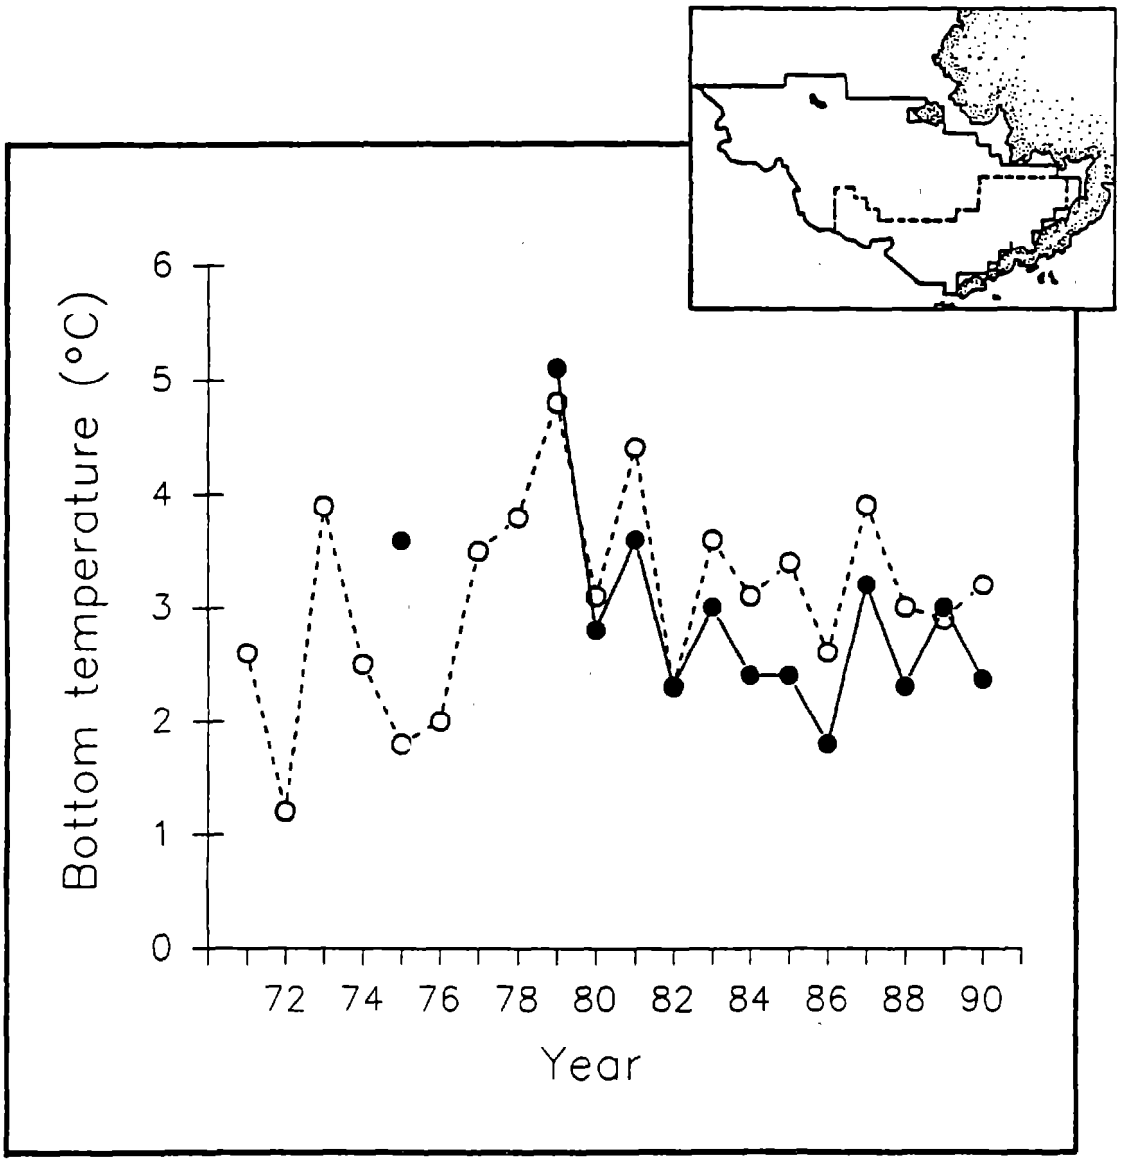

Figure 6.--Mean summer bottom water temperatures based on bathythermograph casts made during Alaska Fisheries Science Center bottom trawl surveys. The 1971-90 means (dashed line) are from the southeast Bering Sea (see inset) and the 1975 and 1979-90 means are from the larger survey area outlined on the inset. The 1975 data point for the overall survey area is based on data collected from August through September, while those in all other years and areas were collected from June through early August.

Relative Fishing Powers of Survey Vessels

A total of 352 alternate-row tows were used in the statistical comparison of vessel catch rates developed by Kappenman (1992). Based on this analysis, the Alaska was significantly more efficient than the Ocean Hope 3 at capturing the following species and species groups: walleye pollock, Pacific cod, Hippoglossoides spp., Alaska plaice, Atheresthes spp., Pacific halibut, Myoxocephalus spp., skates (Rajidae), Tanner crab, and snow crab. The Ocean Hope 3 was more efficient at catching rock sole. Fishing power corrections were applied to catches (by species) of the less efficient vessel (Table 6).

Table 6.--Species for which fishing power corrections were applied, and scaling factors determined by the method of Kappenman (1992).

	Hauls with catch		Catch multiplier	
Species	Alaska	Ocean Hope 3	Alaska	Ocean Hope 3
Walleye pollock	172	169	1.00	1.17
Pacific cod	166	163	1.00	1.05
Rock sole	155	159	1.04	1.00
Hippoglossoides spp.	155	151	1.00	1.24
Alaska plaice	110	127	1.00	1.12
Atheresthes spp.	88	74	1.00	1.11
Pacific halibut	104	93	1.00	1.14
Myoxocephalus spp.	113	104	1.00	1.09
Skates	118	104	1.00	1.49
Tanner crab	129	130	1.00	1.22
Snow crab	132	129	1.00	1.21

Estimated Biomass of Major Fish and Invertebrate Groups

Total demersal animal biomass for the overall survey area was estimated at 18.2 million t, of which fish species accounted for 80% (14.6 million t), and invertebrates 20% (3.6 million t). Concentrations of fish biomass were located in Bristol Bay and along the Alaska Peninsula, around the Pribilof Islands, and northwest of the Pribilofs (Fig. 7). Although 18 families and 70 species of fish were identified in the catches (Appendix C), the fish biomass was dominated by cods (Gadidae, 8.4 million t) and flatfishes (Pleuronectidae, 5.4 million t) (Table 7).

The biomass of invertebrates was comprised primarily of the phyla Crustacea (1.6 million t), Mollusca (0.4 million t), and Echinodermata (1.2 million t). A total of 96 invertebrate species were identified in the survey (Table 8, Appendix C).

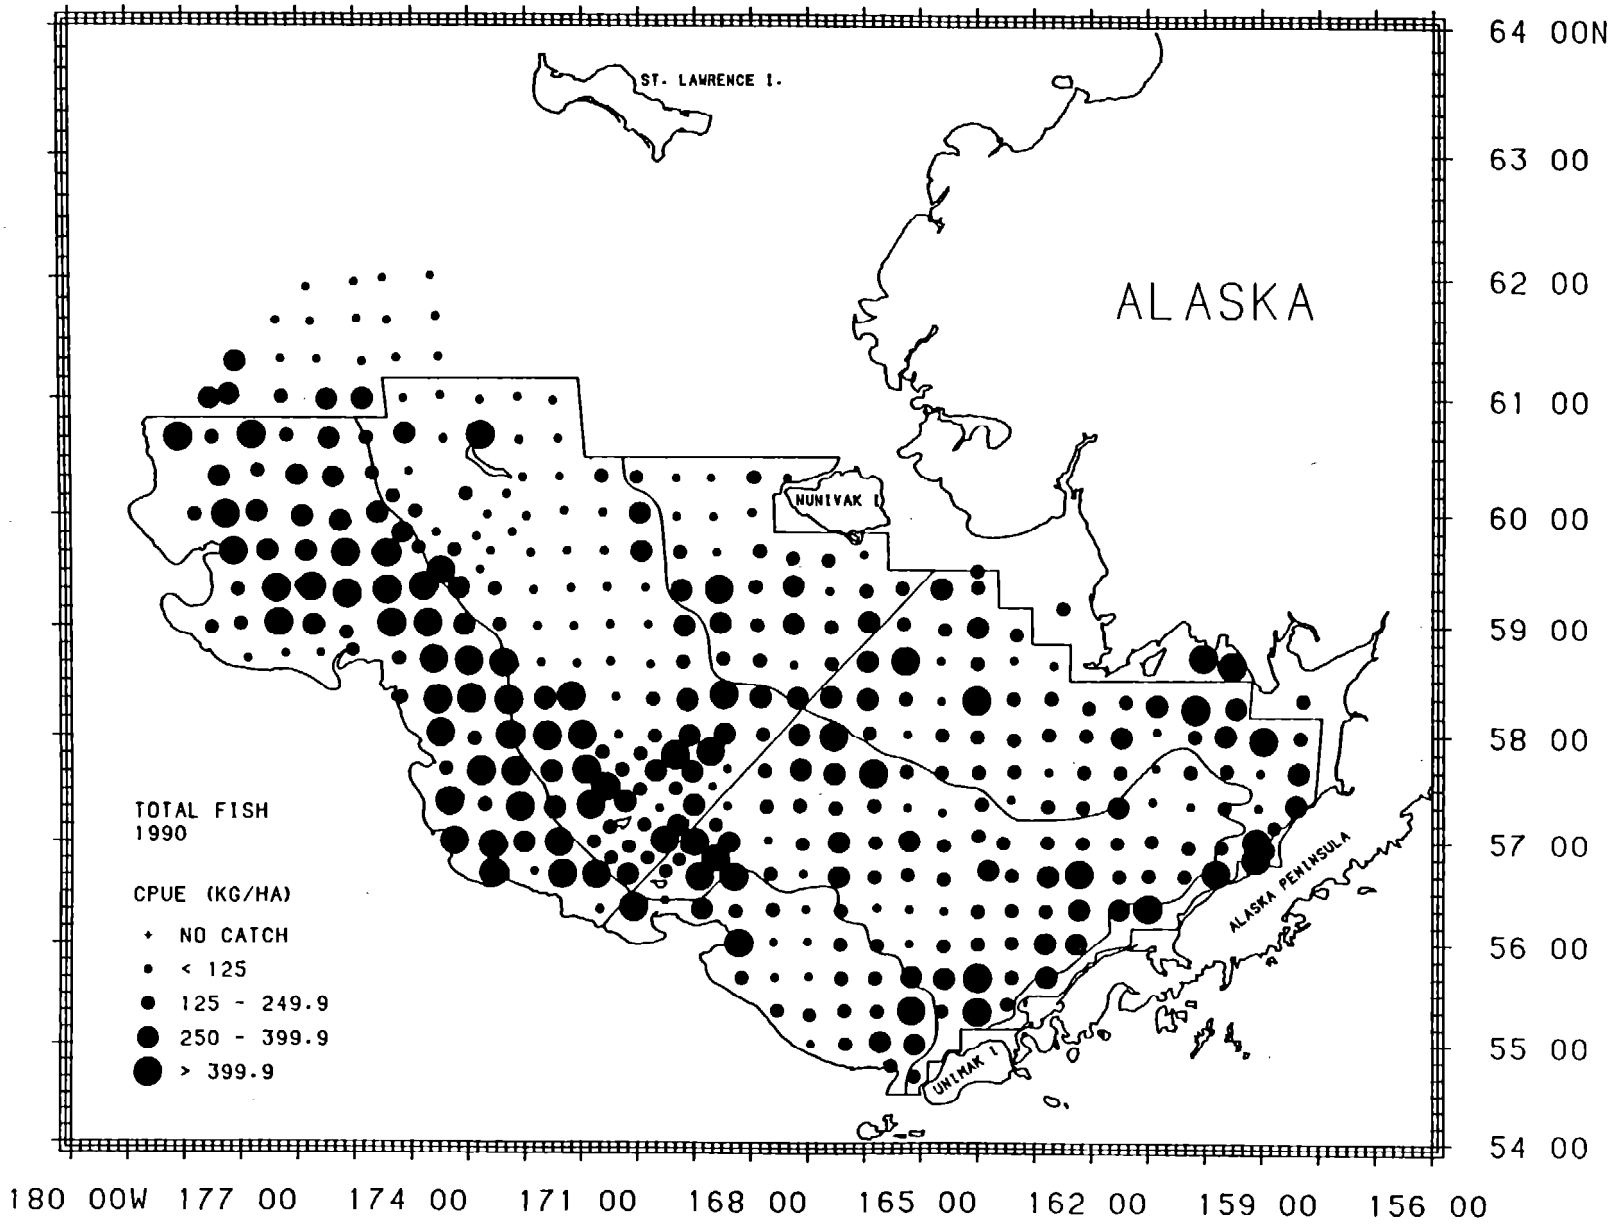

Figure 7.--Distribution and relative abundance in kg/ha of total fish, 1990 eastern Bering Sea bottom trawl survey.

Table 7.--Biomass estimates (metric tons) for major fish species and fish groups taken during the 1990 eastern Bering Sea bottom trawl survey.

Taxon	Estimated total biomass (t)[a] and 95% confidence interval	Proportion of total animal biomass[b]	Estimated biomass by subarea (t)

Relative Abundance of Individual Fish Species

The 11 most abundant species and species groups of fish are shown in Figure 8. These taxa accounted for 79% (309 kg/ha) of total animal mean CPUE (393 kg/ha) and 98% of total fish mean CPUE (316 kg/ha). Overall, but particularly in water deeper than 50 m, walleye pollock were the most dominant species in the catch with a mean CPUE of 165 kg/ha. Similarly, Pacific cod were more abundant at depths exceeding 50 m, but their overall mean CPUE was only 15 kg/ha. Yellowfin sole and rock sole, with overall mean catch rates of 47 kg/ha and 30 kg/ha respectively, dominated catches in water less than 50 m. Alaska plaice, butterfly sculpins (Hemilepidotus papilio) and Myoxocephalus sculpins were most prominent at depths less than 100 m. Conversely, Hippoglossoides spp., Atheresthes spp., and skates were most abundant in water greater than 100 m. Pacific halibut were present at low levels in all depth zones. See Appendix D for a descending rank of all organisms caught.

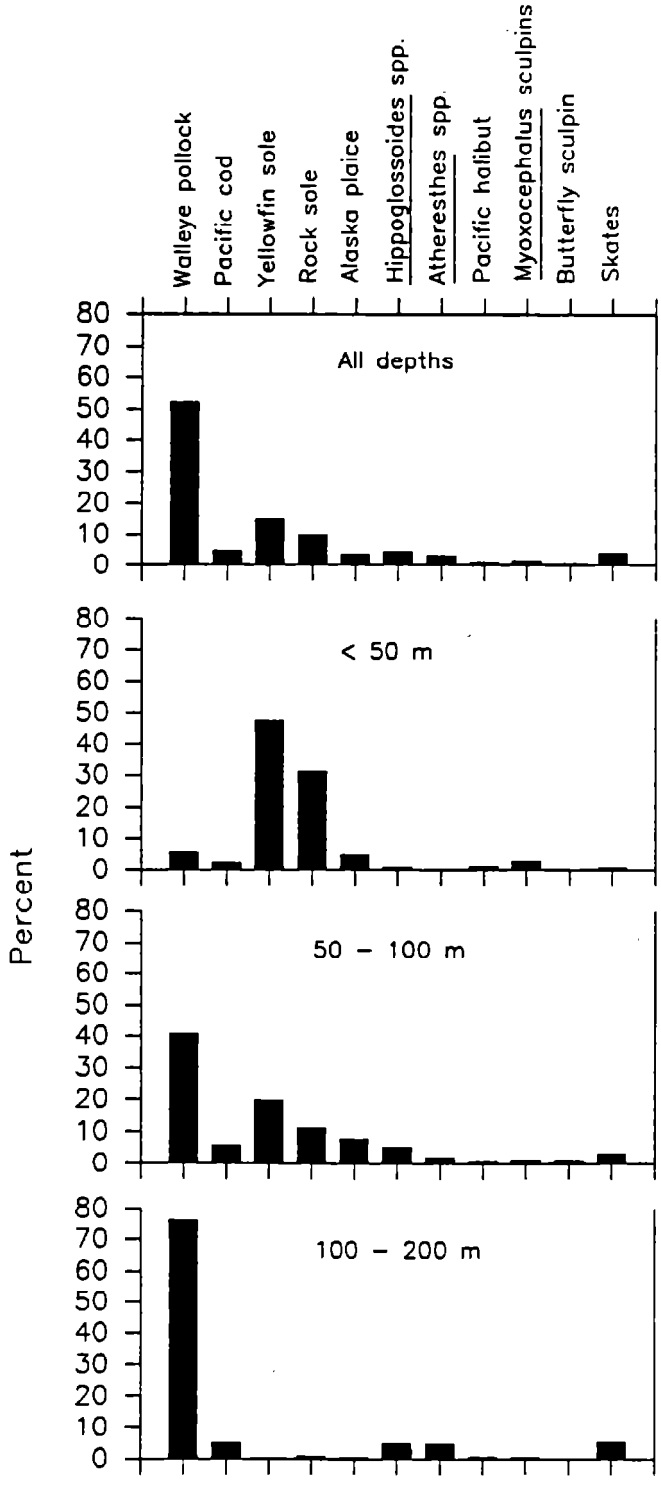

Figure 8. --Relative abundance (%CPUE in kg/ha) of principal groundfish species by depth zone and for all depths combined, 1990 eastern Bering Sea bottom trawl survey.

Abundance, Distribution, and Size and Age Composition of Principal Species and Species Groups

Geographical distributions, population numbers and biomass estimates, and size composition are presented for each of the following commercially important eastern Bering Sea groundfish: walleye pollock, Pacific cod, yellowfin sole, rock sole, Hippoglossoides spp., Alaska plaice, Greenland turbot, Atheresthes spp., and Pacific halibut (Tables 9-29 and Figs. 9-43). Estimated biomass, population number, and mean size (by length and weight) are summarized by subarea and for the entire survey area. Size composition data are illustrated in histograms relating the population percentage of length by centimeter interval for each subarea and in population numbers for the total survey area. Age composition and von Bertalanffy growth parameters are given for walleye pollock, Pacific cod, yellowfin sole, and rock sole. Geographical distributions for noncommercial fish groups are presented in Figures 44 to 49; biomass estimates for these groups are found in Table 7.

Appendices to the report contain detailed results of the analysis. CPUE, population, and biomass estimates are given for each species by stratum in Appendix E. Population estimates by sex and size class are listed for the total survey area in Appendix F. Age-length keys and population estimates by age are given in Appendices G and H, respectively.

APPENDIX A

Station Data, 1990 Eastern Bering Sea Bottom Trawl Survey

Appendix A contains station data by vessel for the 352 successfully completed standard survey stations. In using the tables the following should be noted:

1. Time represents the nearest hour at the start of the tow.
2. Haul numbers are not always sequential because special study and unsatisfactory hauls were omitted.

List of Tables

Table A-1. --Haul data for stations sampled by the RV Alaska during the 1990 eastern Bering Sea bottom trawl survey.

APPENDIX B

Schematic Diagram of Trawl Gear

List of Figures

83/112 EASTERN

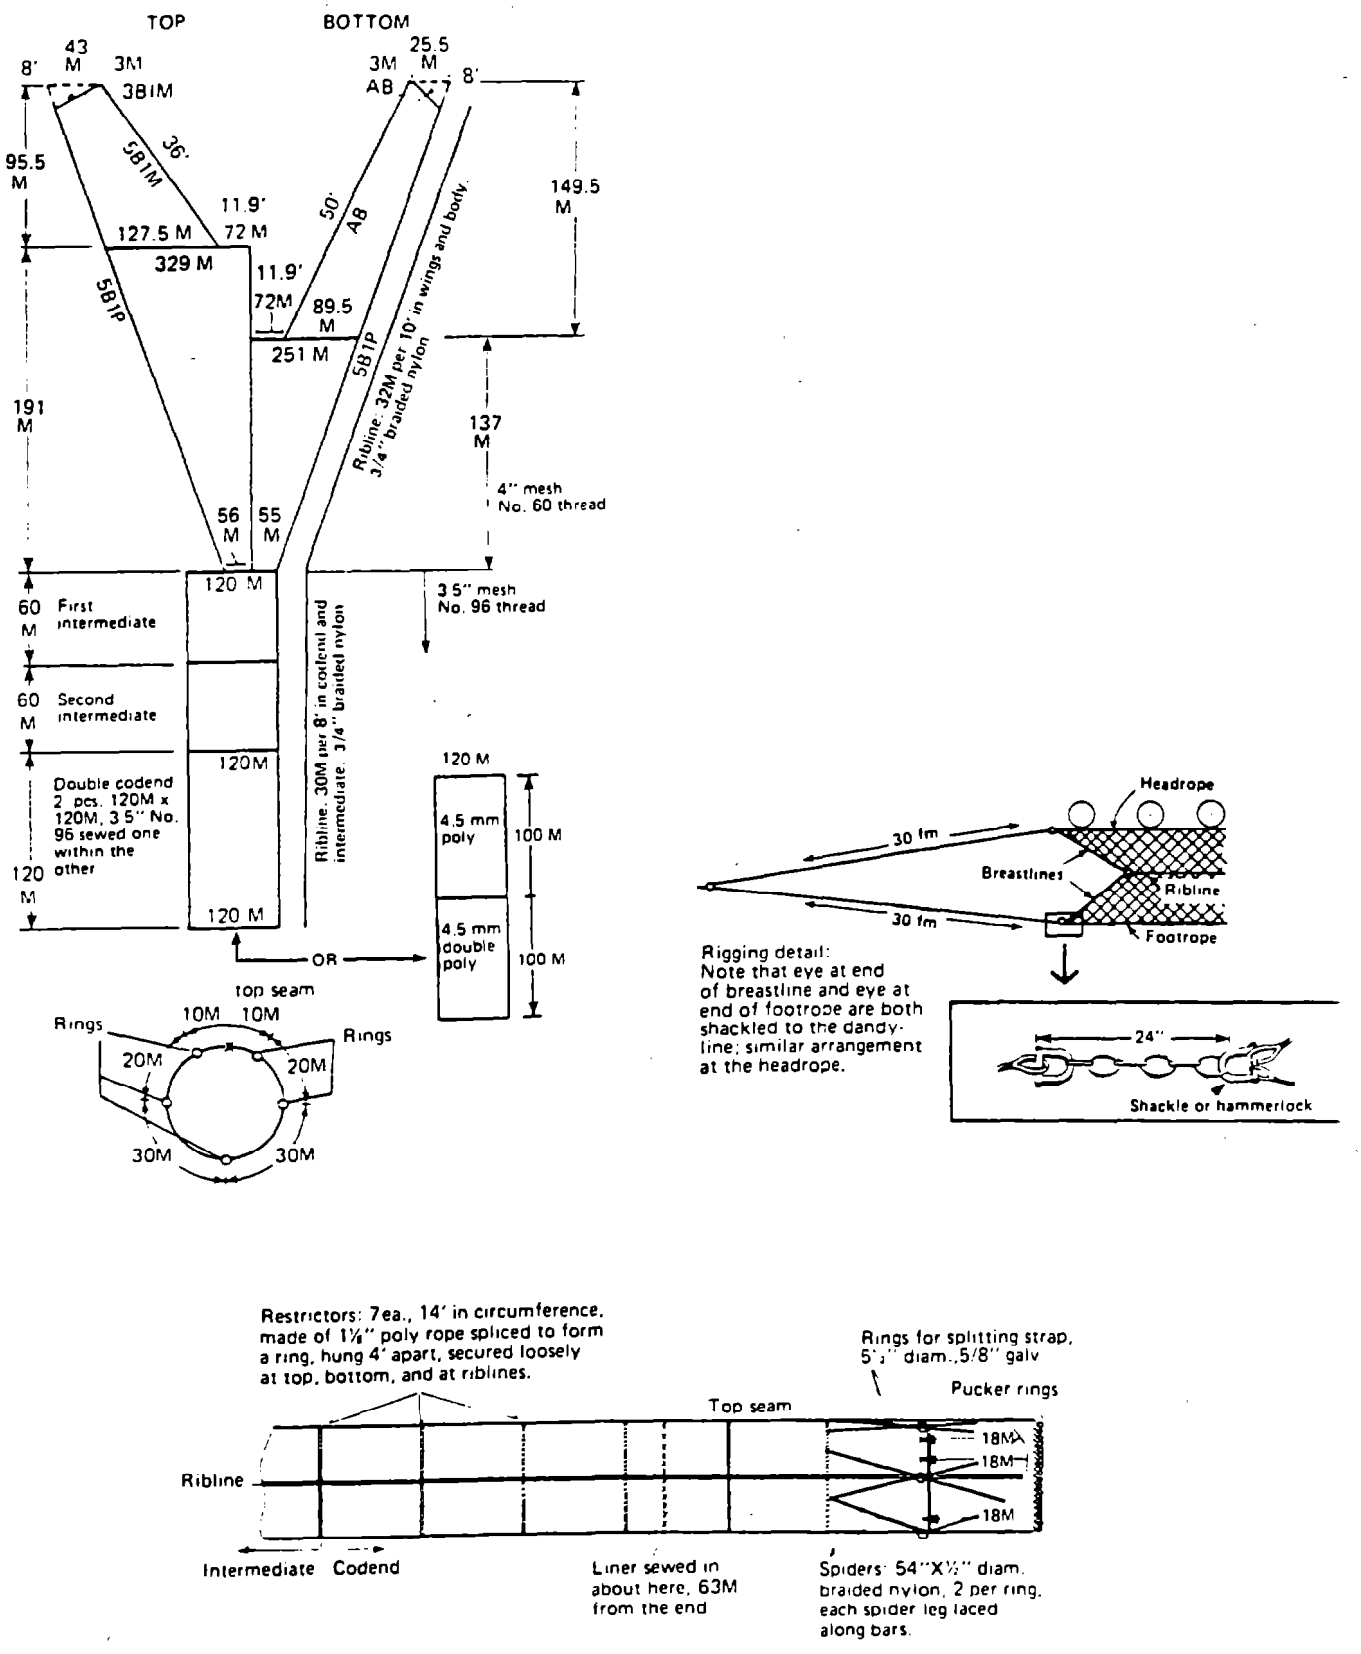

Figure B-l.--Schematic diagram of trawl used during the 1990 eastern Bering Sea bottom trawl survey.

APPENDIX C

List of Species Encountered

Appendix C contains a computer listing of all fish and invertebrate species taken during the 1990 eastern Bering Sea bottom trawl survey.

List of Tables

Table C-l.--Fish species encountered during the 1990 eastern Bering Sea bottom trawl survey.

Common name	Scientific name
Family Rajidae	
Skate unident.	Rajidae unident.
Family Clupeidae	
Pacific herring	Clupea pallasii
Family Osmeridae	
Capelin	Mallotus villosus
Smelt unident.	Osmeridae
Rainbow smelt	Osmerus mordax
Eulachon	Thaleichthys pacificus
Family Gadidae	
Arctic cod	Boreogadus saida
Saffron cod	Eleginus gracilis
Pacific cod	Gadus macrocephalus
Walleye pollock	Theragra chalcogramma
Family Scorpaenidae	
Rougheye rockfish	Sebastes aleutianus
Pacific ocean perch	Sebastes alutus
Northern rockfish	Sebastes polyspinis
Rockfish unident.	Sebastes sp.
Family Anaplopomatidae	
Sablefish	Anoplopoma fimbria
Family Hexagrammidae	
Kelp greenling	Hexagrammos decagrammus
Whitespotted greenling	Hexagrammos stelleri
Atka mackerel	Pleurogrammus monopterygius
Family Cottidae	
Artediellus unident.	Artediellus sp.
Crested sculpin	Blepsias bilobus
Spinyhead sculpin	Dasycottus setiger
Antlered sculpin	Enophrys diceraus
Leister sculpin	Enophrys lucasi
Enophrys unident.	Enophrys sp.
Armorhead sculpin	Gymnocanthus galeatus
Gymnocanthus unident.	Gymnocanthus sp.
Arctic staghorn sculpin	Gymnocanthus tricuspis
Red Irish lord	Hemilepidotus hemilepidotus
Yellow Irish lord	Hemilepidotus jordani

Table C-1. --Continued.

Common name	Scientific name
Family Cottidae (cont'd)	
Butterfly sculpin	Hemilepidotus papilio
Irish lord unident.	Hemilepidotus sp.
Bigmouth sculpin	Hemitripterus bolini
Icelus unident.	Icelus sp.
Spatulate sculpin	Icelus spatula
Thorny sculpin	Icelus spiniger
Pacific staghorn sculpin	Leptocottus armatus
Blackfin sculpin	Malacocottus kincaidi
Malacocottus unident.	Malacocottus sp.
Darkfin sculpin	Malacocottus zonurus
Plain sculpin	Myoxocephalus jaok
Great sculpin	Myoxocephalus polyacanthocephalus
Myoxocephalus unident.	Myoxocephalus sp.
Tadpole sculpin	Psychrolutes paradoxus
Ribbed sculpin	Triglops pingeli
Speckled sculpin	Triglops scepticus
Triglops unident.	Triglops sp.
Family Agonidae	
Poacher unident.	Agonidae
Aleutian alligatorfish	Aspidophoroides bartoni
Bering poacher	Occella dodecaedron
Tubenose poacher	Pallasina barbata
Dragon poacher	Percis japonica
Sturgeon poacher	Podothecus acipenserinus
Sawback poacher	Sarritor frenatus
Family Cyclopteridae	
Careproctus unident.	Careproctus sp.
Snailfish unident.	Cyclopteridae (Liparidinae)
Liparis unident.	Liparis sp.
Family Bathymasteridae	
Searcher	Bathymaster signatus
Northern ronquil	Ronquilus jordani
Family Zoarcidae	
Shortfin eelpout	Lycodes brevipes
Wattled eelpout	Lycodes palearis
Marbled eelpout	Lycodes raridens
Family Stichaeidae	
Decorated warbonnet	Chirolophis decoratus
Bearded warbonnet	Chirolophis snyderi
Daubed shanny	Lumpenus maculatus

Table C-1. --Continued.

Common name	Scientific name
Family Stichaeidae (cont'd)	
Snake prickleback	Lumpenus sagitta
Whitebarred prickleback	Poroclinus rothrocki
Prickleback unident.	Stichaeidae
Family Anarhichadidae	
Bering wolffish	Anarhichas orientalis
Family Zaproridae	
Prowfish	Zaprora silenus
Family Trichodontidae	
Pacific sandfish	Trichodon trichodon
Family Ammodytidae	
Pacific sand lance	Ammodytes hexapterus
Family Pleuronectidae	
Kamchatka flounder	Atheresthes evermanni
Arrowtooth flounder	Atheresthes stomias
Rex sole	Errex zachirus
Flathead sole	Hippoglossoides elassodon
Bering flounder	Hippoglossoides robustus
Pacific halibut	Hippoglossus stenolepis
Dover sole	Microstomus pacificus
Starry flounder	Platichthys stellatus
Yellowfin sole	Pleuronectes asper
Rock sole	Pleuronectes bilineatus
Butter sole	Pleuronectes isolepis
Longhead dab	Pleuronectes proboscideus
Alaska plaice	Pleuronectes quadrituberculatus
Sakhalin sole	Pleuronectes sakhalinensis
Greenland turbot	Reinhardtius hippoglossoides

Table C-2.--Invertebrate species encountered during the 1990 eastern Bering Sea bottom trawl survey.

Common name	Scientific name
Phylum Porifera	
Sponge unident.	Porifera
Phylum Coelenterata	
Sea anemone unident.	Actinaria (order)
Sea raspberry	Eunephthya rubiformis
Sea raspberry unident.	Eunephthya sp.
Hydroid unident.	Hydrozoa (class)
Kamchatka coral	Paragorgia arborea
Sea pen unident.	Pennatulacea (order)
Jellyfish unident.	Scyphozoa (class)
Tealia unident.	Tealia sp.
Phylum Ctenophora	
Comb jelly unident.	Ctenophora
Phylum Mollusca	
Gastropods	
Keeled aforia	Aforia circinata
Alaska volute	Artomelon stearnsii
Northern beringius	Beringius beringii
Kennicott's beringius	Beringius kennicottii
Beringius unident.	Beringius sp.
Stimpson's beringius	Beringius stimpsoni
Boreotrophon unident.	Boreotrophon sp.
Angled whelk	Buccinum angulosum
Sinuous whelk	Buccinum plectrum
Polar whelk	Buccinum polare
Ladder (silky) whelk	Buccinum scalariforme
Buccinum solenum	Buccinum solenum
Buccinum unident.	Buccinum sp.
Thin-ribbed whelk	Colus herendeeni
Colus unident.	Colus sp.
Thick-ribbed whelk	Colus spitzbergensis
Great slippersnail	Crepidula grandis
Slipper shell	Crepidula sp.
Oregon triton	Fusitriton oregonensis
Fusitriton unident.	Fusitriton sp.
Snail unident.	Gastropoda unident.
Aleutian moonsnail	Natica aleutica
Artic moonsnail	Natica clausa
Rusty moonsnail	Natica russa
Nautica unident.	Nautica sp.

Table C-2. --Continued.

Common name	Scientific name
Phylum Mollusca (cont'd)	
Gastropods (cont'd)	
Little neptune	Neptunea borealis
Northern neptune	Neptunea heros
Lyre whelk	Neptunea lyrata
Helmet whelk	Neptunea magma
Pribilof whelk	Neptunea pribiloffensis
Neptunea unident.	Neptunea sp.
Fat whelk	Neptunea ventricosa
Nudibranch unident.	Onchidoridae (family)
Kroyer's plicifus	Plicifusus kroyeri
Plicifusus unident.	Plicifusus sp.
Pale moonsnail	Polinices pallidus
Polinices unident.	Polinices sp.
Snail (gastropod) eggs	Snail (gastropod) eggs
Rosy tritonia	Tritonia diomedea
Volute whelk	Volutopsius castaneus
Warped whelk	Volutopsius deformis
Fragile whelk	Volutopsius fragilis
Tulip whelk	Volutopsius middendorffii
Volutopsius unident.	Volutopsius sp.
Shouldered whelk	Volutopsius stefanssoni
Bivalves	
Bivalve unident.	Bivalvia (class)
Cockle unident.	Cardiidae (family)
Chlamys unident.	Chlamys sp.
Hairy cockle	Clinocardium ciliatum
Nuttal cockle	Clinocardium nuttalii
Clinocardium unident.	Clinocardium sp.
Many-rib cyclocardia	Cyclocardia crebricostata
Arctic hiatella	Hiatella arctica
Macoma unident.	Macoma sp.
Artic surfclam	Macromeris polynyma
Macromeris unident.	Macromeris sp.
Northern horsemussel	Modiolus modiolus
Discordant mussel	Musculus discors
Mussel unident.	Mytilidae (family)
Nuculana unident.	Nuculana sp.
Weathervane scallop	Patinopectin caurinus
Scallop unident.	Pectinidae (family)
Alaska falsejingle	Pododesmus macroschisma
Greenland cockle	Serripes groenlandicus
Broad cockle	Serripes laperousii

Table C-2. --Continued.

Common name	Scientific name
Phylum Mollusca (cont'd)	
Bivalves (cont'd)	
Serripes unident.	Serripes sp.
Northern razor clam	Siliqua alta
Pacific razor clam	Siliqua patula
Siliqua unident.	Siliqua sp.
Tellin unident.	Tellina sp.
Boreal tridonta	Tridonta borealis
Cephalopods	
Gonatus unident.	Gonatus sp.
Octopus unident.	Octopodidae (family)
Pacific bobtail squid	Rossia pacifica
Squid unident.	Teuthoidea (order)
Phylum Annelida	
Sea mouse unident.	Aphroditidae (family)
Depressed scale worm	Eunoe depressa
Giant scale worm	Eunoe nodosa
Eunoe unident.	Eunoe sp.
Scale worm unident.	Polynoidae (family)
Tube worm unident.	Tube worm unident.
Phylum Arthropoda	
Giant barnacle	Balanus evermanni
Balanus unident.	Balanus sp.
Cirripedia unident.	Cirripedia (class)
Barnacle unident.	Thoracica (order)
Crab	
Dungeness crab	Cancer magister
Oregon rock crab	Cancer oregonensis
Broad snow crab	Chionoecetes bairdi
Hybrid snow crab	Chionoecetes hybrid
Narrow snow crab	Chionoecetes opilio
Horsehair crab	Erimacrus isenbeckii
Soft crab	Hapalogaster grebnitzkii
Circumboreal toad crab	Hyas coarctatus
North Pacific toad crab	Hyas lyratus
Hyas unident.	Hyas sp.
Longhorned decorator crab	Oregonia gracilis
Hermit crab unident.	Paguridae (family)
Alaskan hermit crab	Pagurus ochotensis
Fuzzy hermit crab	Pagurus trigonocheirus
Red king crab	Paralithodes camtschatica

Table C-2. --Continued.

Common name	Scientific name
Phylum Arthropoda (cont'd)	
Crab (cont'd)	
Blue king crab	Paralithodes platypus
Helmet crab	Telmessus cheiragonus
Shrimp	
Artic argid	Argis dentata
Northern argid	Argis lar
Argis unident.	Argis sp.
Common crangon	Crangon communis
Ridged crangon	Crangon dalli
Crangon unident.	Crangon sp.
Crangonid shrimp unident.	Crangonidae (family)
Eualus unident.	Eualus sp.
Short-scaled eualid	Eualus suckleyi
Hippolytid shrimp unident.	Hippolytidae (family)
Northern (pink) shrimp	Pandalus borealis
Humpy shrimp	Pandalus goniurus
Tank shrimp	Sclerocrangon boreas
Phylum Sipuncula	
Sipunculid worm unident.	Sipuncula (phylum)
Phylum Bryozoa	
Bryozoan unident.	Bryozoa (phylum)
Leafy bryozoan	Flustra serrulata
Phylum Echinodermata	
Holothuroidea	
Cucumaria unident.	Cucumaria sp.
Sea cucumber unident.	Holothuroidea (class)
Redscaled sea cucumber	Psolus sp.
Echinoidea	
Sand dollar unident.	Clypeasteroida (order)
Parma sand dollar	Echinarachnius parma
Sea urchin unident.	Sea urchin unident.
Green sea urchin	Strongylocentrotus droebachiensis
Asteroidea	
Purple-orange sea star	Asterias amurensis
Asterias unident.	Asterias sp.
Starfish unident.	Asteroidea (subclass)
Red bat star	Ceramaster japonicus
Orange bat star	Ceramaster patagonicus

Table C-2. --Continued.

Common name	Scientific name
Phylum Echinodermata (cont'd)	
Asteroidea (cont'd)	
Rose sea star	Crossaster papposus
Crossaster unident.	Crossaster sp.
Common mud star	Ctenodiscus crispatus
Ctenodiscus unident.	Ctenodiscus sp.
Pincushion sea star	Diplopteridae multipes
Giant sea star	Evasterias echinosoma
Mottled sea star	Evasterias troschelii
Henricia unident.	Henricia sp.
Tumid sea star	Henricia tumida
Arctic sea star	Leptasterias arctica
Knobby six-rayed sea star	Leptasterias polaris
Leptasterias unident.	Leptasterias sp.
Blackspined sea star	Lethasterias nanimensis
Obscure sea star	Pteraster obscurus
Pteraster unident.	Pteraster sp.
Cushion sea star	Pteraster tesselatus
Ophiuroidea	
Basket star	Gorgonocephalus caryi
Notched brittlestar	Ophiura sarsi
Brittlestarfish unident.	Ophiuroidea (subclass)
Phylum Chordata	
Aplidium unident.	Aplidium sp.
Tunicate unident.	Ascidian unident.
Sea onion	Boltenia ovifera
Sea onion unident.	Boltenia sp.
Compound ascidian unident.	Compound ascidian unident.
Sea peach	Halocynthia aurantium
Sea peach unident.	Halocynthis sp.
Sea potato	Styela rustica
Salps unident.	Thaliacea (class)

APPENDIX D

Rank Order of Relative Abundance of Fish and Invertebrates

Appendix D ranks all fish and invertebrates caught during the 1990 eastern Bering Sea bottom trawl survey by descending CPUE.

List of Tables

Table D-l. --Rank order of fish and invertebrate taxa by relative abundance (kg/ha) from the 1990 eastern Bering Sea bottom trawl survey.

APPENDIX E

Abundance Estimates for Principal Fish Species

Appendix E presents estimates of catch-per-unit-effort (CPUE), population numbers and biomass for the principal fish species. Estimates of variance and confidence intervals do not incorporate variation associated with fishing power corrections or measurements of effort. CPUE is measured in kilograms (kg) and numbers (no.) per hectare. Estimates are given separately for each of the 10 geographic strata used in the analysis; estimates for each of the six standard subareas are presented as subtotals of the component strata. Stratum codes correspond to subareas as follows:

Subarea	Stratum
1	10
2	20
3	31
	32 (Pribilof Island high density)
4	41
	42 (Pribilof Island high density)
	43 (St. Matthew Island high density)
5	50
6	61
	62 (St. Matthew Island high density)

APPENDIX F

Population Estimates by Sex and Size Groups for Principal Fish Species

Appendix F presents estimates of the numbers of individuals within the overall survey area by sex and size group for principal fish species.

APPENDIX G

Age-Length Keys for Principal Fish Species

Appendix G presents age-length keys for principal species of fish by sex and sexes combined. Lengths are expressed in millimeters. Asterisks indicate ages affected by the linear interpolation used to assign age distributions to length classes (in the age-length key) not represented by collected age data.

List of Tables

Table G-1.--Age-length keys for walleye pollock sampled during the 1990 eastern Bering Sea bottom trawl survey.

APPENDIX H

Population Estimates by Age for Principal Fish Species

Appendix H presents population estimates and mean lengths at age by sex and for sexes combined. Population estimates listed as "below minimum key length" and "above maximum key length" refer to fish lengths that lack age observations. Asterisks indicate ages affected by the linear interpolation used to assign age distributions to length classes (in the age-length key) not represented by collected age data.

List of Tables

Table H-1.--Population estimates of walleye pollock by age (years), derived from data collected during the 1990 eastern Bering Sea bottom trawl survey. Mean lengths are presented in millimeters.
