ABSTRACT

This report presents water-column temperature data for the Middle Atlantic Bight and Gulf of Maine during 1978-92. Data were collected by expendable bathythermographs deployed by merchant ships during monthly transects of both bodies of water. Data are presented as contoured vertical sections. Methods of data collection, management, and portrayal are discussed.

INTRODUCTION

In 1970, the National Marine Fisheries Service (NMFS) and the Maritime Administration (MARAD) initiated a cooperative expendable bathythermograph (XBT) survey to identify and describe seasonal and year-to-year variations of temperature, salinity, and circulation in major currents of the Gulf of Mexico and western North Atlantic. This survey, conducted in support of NMFS's Marine Resources Monitoring, Assessment, and Prediction Program (MARMAP), used merchant ships -- cooperating in MARAD's Ship of Opportunity Program (SOOP) -- as inexpensive collection platforms, and relied on Kings Point Maritime Academy cadets to gather the XBTs.

In the mid-1970s, the continuous plankton recorder (CPR) survey (Glover 1967; Jossi *et al.* 1982), also using ships of opportunity, merged with the XBT survey. The combined surveys concentrated on water masses, circulation, and plankton of the Middle Atlantic Bight and Gulf of Maine, with particular interest in continental shelf and slope waters.

Our report portrays monthly water-column thermal conditions along MARMAP Routes MB (Middle Atlantic Bight) and MC (Gulf of Maine) for 1978-92. CPR station locations also are shown on the temperature portrayals. Analyses of SOOP data regarding long-term mean conditions and interannual variability in surface temperature, surface salinity, and bottom temperature have been presented in Benway *et al.* (1993).

METHODS

STUDY AREAS

Ship routes were selected in regions of interest to fisheries research to provide regular sampling and to allow the characterization of oceanographic conditions. Repeated coverage is important for comparative analyses, so ships with the most regular schedules were chosen whenever possible. MARMAP ships of opportunity included research, commercial, and U.S. Coast Guard vessels outfitted with data sampling hardware and software from the National Marine Fisheries Service.

The track lines of the ships of opportunity varied on different occupations of a route. This variability made it necessary to develop route polygons with shapes such that only variations along the long axis of the polygon were

considered significant relative to program goals (Figures 1a and 1b).

The Middle Atlantic Bight sampling originates at Ambrose Light ($40^{\circ}27.5'N$, $73^{\circ}49.6'W$) and extends offshore 500 km (270 nautical miles) towards Bermuda (Figure 1a). The route polygon is termed MARMAP Route MB, the corners of which are: $40^{\circ}34'N$, $74^{\circ}00'W$; $40^{\circ}20'N$, $74^{\circ}00'W$; $38^{\circ}30'N$, $69^{\circ}00'W$; and $36^{\circ}44'N$, $70^{\circ}30'W$. This route traverses waters of the continental shelf, continental slope, and Gulf Stream.

The Gulf of Maine sampling extends from Boston, Massachusetts, to Cape Sable, Nova Scotia (Figure 1b), for a distance of approximately 452 km (244 nautical miles). This route polygon is termed MARMAP Route MC, the corners of which are: $43^{\circ}30'N$, $71^{\circ}00'W$; $43^{\circ}30'N$, $65^{\circ}37'W$; $43^{\circ}00'N$, $65^{\circ}37'W$; and $42^{\circ}00'N$, $71^{\circ}00'W$. This route traverses waters of Massachusetts Bay, Wilkinson Basin, the central gulf ledges, Crowell Basin, southern Jordan Basin, and western Scotian Shelf.

DATA AND SAMPLE PROCESSING

On all SOOP vessels, XBT and meteorological data were recorded and logged following the methods of Benway *et al.* (1993) (Tables 1 and 2). Middle Atlantic Bight SOOP vessels cast XBT's at 1-hr intervals (about 26 km or 14 nautical miles), whereas Gulf of Maine SOOP vessels dropped XBT's at 2-hr intervals (about 44 km or 24 nautical miles). In both regions, surface temperature was recorded hourly via bucket thermometer, and surface salinity was sampled whenever an XBT was deployed.

All XBT and meteorological data were sent via Geostationary Operational Environmental Satellite (GOES) transmitter to the Command and Data Acquisition System ground station at Wallops Island, Virginia, and relayed to the National Environmental Satellite, Data, and Information Service computer in Washington, D.C., for distribution to outside users. Transmissions were every 3 hr from Middle Atlantic Bight SOOP vessels, and every 6 hr from Gulf of Maine SOOP vessels. Temperature data transmitted via GOES were considered to be "real time."

Temperature and depth data collected aboard SOOP vessels were processed and quality controlled by personnel at the NMFS Narragansett (Rhode Island) Laboratory, following the methods of Benway *et al.* (1993).

CPR data were collected and processed following the methods of Thomas (1992). In brief, CPR's (Hardy 1939; Hardy 1944) were towed at a fixed depth of 10 m. Seawater

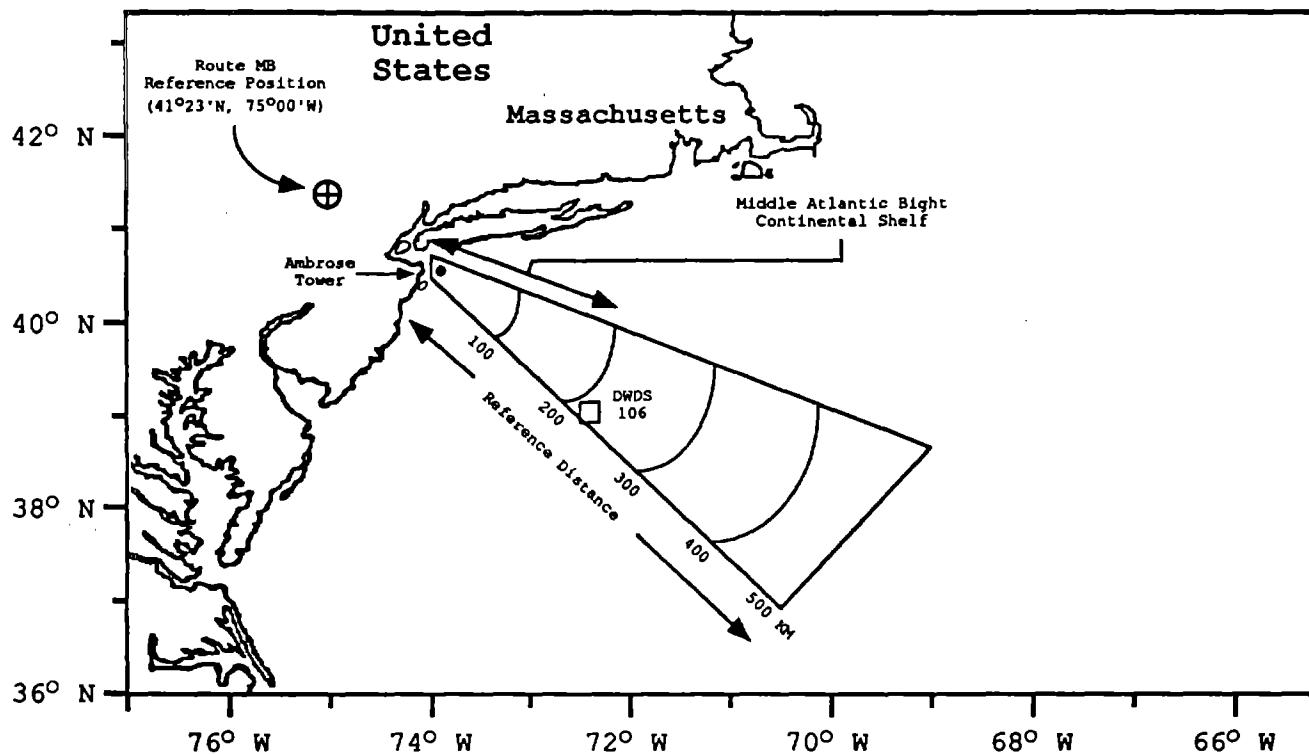

Figure 1a. Middle Atlantic Bight (Route MB) polygon, within which monitoring transects occurred, showing reference position and distance and major geophysical features.

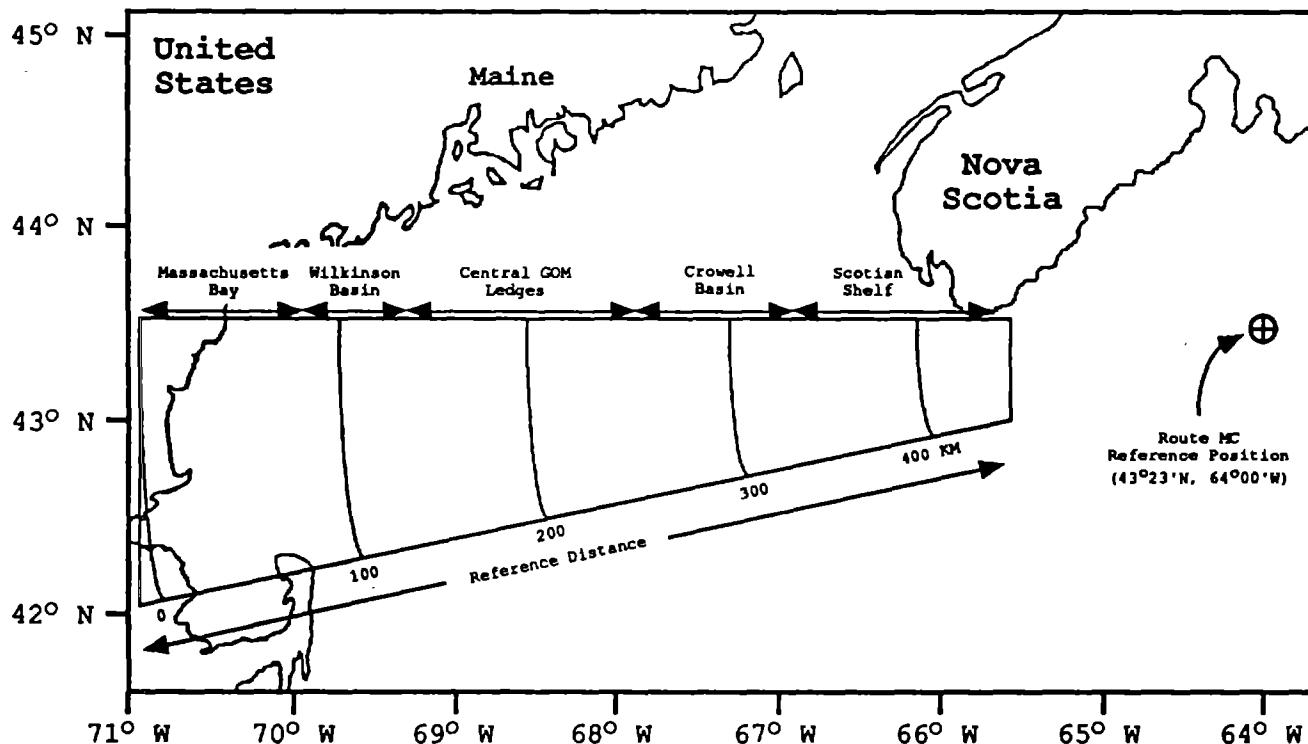

Figure 1b. Gulf of Maine (Route MC) polygon, within which monitoring transects occurred, showing reference position and distance and major geophysical features.

entered the front of the CPR and was filtered through a mechanically driven belt of Swiss bolting silk with a wet-mesh aperture of 225 m x 234 m. In the laboratory, the silk was divided into sections ("stations") corresponding to 10-nautical-mile (18.52-km) intervals. Geographic position and reference distance were calculated for the geometric center of each silk section, and successive silk sections were assigned sequential station numbers. The NMFS Narragansett Laboratory will publish CPR methods and data in future atlases.

GENERATION OF CONTOURED VERTICAL SECTIONS

The method of generating contoured vertical sections, or grids, was designed at the NMFS Narragansett Laboratory to overcome problems associated with irregular sampling in time and space (Thomas 1992; Benway *et al.* 1993; Goulet, pers. comm.¹). To create a contoured grid of monthly interpolated water-column temperatures, all XBT and bucket data from a single ship-of-opportunity cruise were used. Whenever possible, cruises were chosen that deployed XBT probes and towed a CPR.

All contoured sections of water-column temperatures (in degrees Celsius) have been constructed with route-polygon reference distances (in kilometers) along the x-axis, and water-column depths (in meters) along the y-axis. Grid intersections were chosen at intervals of 17.38 km and 10 m.

A search was performed of the elliptical space (100 km by 50 m) around every grid intersection, and all raw data values within the search ellipses were fitted to the grid by interpolation, thereby producing a temperature "map" by reference distance and depth. In the event of fewer than four raw data values within the search ellipse at a given grid intersection, no interpolation was performed, resulting in a blank region within the interpolated surface.

Note that data from cruises YC8505 and YC8506 were combined to calculate the March 1985 temperature map; data from cruise CU7904 were used to compute the July 1979 temperature map (Table 2).

RESULTS

During 1978-92, the total number of cruises conducted were 306 in the Middle Atlantic Bight (averaging approximately 20 per year) and 221 in the Gulf of Maine (averaging approximately 16 per year). Listings of the cruises are shown in Table 1 (Route MB, Middle Atlantic Bight) and Table 2 (Route MC, Gulf of Maine), along with information

on the types of data collected on each cruise. No XBT's were collected in the Gulf of Maine during 1986.

Portrayals of monthly water-column temperatures for the Middle Atlantic Bight (Route MB) are shown in Figures 2-91, and for the Gulf of Maine (Route MC) in Figures 92-147. Included in the portrayals are the locations of concomitant CPR stations.

Temperature data for any transect are available from the National Oceanographic Data Center (NODC) in a variety of forms. The complete SOOP hydrographic data base, collected on MARMAP Routes MB and MC during 1978-90, is described by Benway *et al.* (1993). Requests for, or inquiries about, SOOP XBT data held by NODC, as well as data products, should be directed to:

ACKNOWLEDGMENTS

Appreciation is extended to the officers and crews of the *Oleander* (Bermuda Container Lines) and *Yankee Clipper* (Claus Spect, Hamburg, Germany, and Boston Overseas, Boston, Massachusetts) for their generous cooperation in this program, the success of which is dependent upon them. Appreciation is also proffered to all individuals who have volunteered to collect SOOP data, especially aboard the *Oleander*. Special thanks are extended to the National Ocean Service, Office of Ocean Observations, and to the National Weather Service, Eastern Region Headquarters, for their continued support. A good deal of the success of this program can be credited to Steven K. Cook, National Ocean Service, who managed the Ship of Opportunity Program from 1970 to 1984, and to Captain Arthur Finley of the U.S. Maritime Administration, who strived to provide volunteers during those early years. Lastly, for all the employees who have passed through this office, and for all the other participating vessels over the last 22 years, too numerous to name, thanks for a job well done.

¹Goulet, J.R.; National Marine Fisheries Service, 28 Tarzwell Dr., Narragansett, RI 02882-1199; October 1991 - May 1992.

Table 1. MARMAP ship-of-opportunity cruises through the Middle Atlantic Bight (Route MB) polygon during 1978-92 which are portrayed in this report. An "X" indicates collection of a particular data type (CPR = continuous plankton recorder tow; XBT = expendable bathythermograph drop; SST = sea-surface temperature bucket sample; and SSS = sea-surface salinity sample).
