The 1977 Eastern Bering Sea Crab Survey

Annual trawl surveys by the National Marine Fisheries Service (NMFS) are conducted in the eastern Bering Sea to obtain information on condition, distribution and abundance of several species of crabs. Information from these surveys provides fishermen and processors help in locating productive fishing areas and judging the overall availability of crabs. Survey-derived data are further used as a source of technical information by management agencies. This report deals with results from the 1977 survey conducted aboard the NOAA RV Oregon and presents information on Tanner crabs in the eastern Bering Sea during June, July, and August. Similar survey information for king crabs has been compiled in a separate report.

A questionaire is provided at the end of this report so that readers may express their preference for the chart type considered most useful or comment on other aspects of this report. A postage free address form is also included for readers who wish to be added to our mailing list.

Survey Area and Methods

The area covered by the 1977 survey extended from inner Bristol Bay west to the Pribilof Islands and from Cape Newenham south to Unimak Pass. Survey coverage of the Pribilof Island region in 1977 was extended 40 nautical miles westward of the area covered in 1976 so that a greater portion of the geographic range of Tanner crab stocks could be examined. The survey area and locations of the sampling stations are shown in the accompanying charts.

Sampling stations were located 20 nautical miles apart in a grid pattern and at each station, a half-hour tow was made with a standard 400-mesh Eastern Otter Trawl having a 94-ft footrope and 71-ft headrope. The net was constructed of 4-inch (stretched mesh measure) web in the wings and 3½-inch web in the remainder of the net with a 1¼-inch liner in the codend. Eighteen (18) 8-inch floats were attached along the headrope and the trawl was fished with 5 x 7 ft "V" design trawl doors and 25-fathom dandylines (15 fathom single, 10 fathom double).

Trawl gear used during the 1977 survey differed somewhat from that used in 1976. Smaller trawl doors were used in 1977 (5 x 7 ft versus 6 x 9 ft in 1976) and the footrope of the trawl was not weighted with extra chain. Gear comparison studies conducted during the initial portion of the 1977 survey indicated that crab catch rates were equivalent for the weighted trawl with 6 x 9 ft doors and the unweighted trawl with 5 x 7 ft doors.

Once the trawl was aboard, crabs were separated from the rest of the catch and pertinent data such as numbers caught, size, shell condition, sex, and egg condition were obtained. Depth profiles were recorded with an echo sounder during each tow, and measurements of surface to bottom water temperature were obtained with an expendable bathythermograph (XBT) at selected stations throughout the survey region.

Survey information was processed to provide estimates of stock size and descriptions of crab distribution by sex-size grouping. Estimates of the number of crabs per sampling station were obtained by calculating the number of crabs caught per square nautical mile and expanding this figure to account for the entire 20 x 20 nautical mile area. Estimated stock size was obtained by computing the average number of crabs per square mile at each survey station and expanding this figure over the entire survey area. Distribution of crabs has been denoted on the accompanying charts in terms of numbers caught per half-hour trawl haul.

Results

One or more species of Tanner crabs were caught at 145 of 159 stations sampled during the 1977 survey. This incidence of occurrence (91%) is quite similar to levels encountered in earlier surveys (89% and 94% in 1975 and 1976, respectively).

Population estimates from the 1975 survey data for all species of Tanner crabs are presented by sex-size group in Table 1; numbers of crabs per square nautical mile trawled are given for each station in Table 2; and, specific position information for stations where Tanner crabs were caught are presented in Table 3. Information presented in Table 3 includes station position in both latitude-longitude and Loran C, depth (fathoms), and bottom temperature (C°).

Bairdi Tanner Crab

The estimated population of legal-sized male bairdi Tanner crabs in the eastern Bering Sea in 1977 was about 92 million crabs. This amount was smaller than that estimated for 1976 and continued a 3-year trend of declining abundance for large-sized crabs (Table 1). Although the abundance of large (legal) crabs continued downward, the estimated population of pre-recruits in 1977 was somewhat higher than in 1976 and suggests a probable increase in numbers of legal-sized males in future years.

Station catch rates for legal male (≥5.5" carapace width), pre-recruit male (4.0-5.5"), and female bairdi Tanner crabs are shown on Charts 1, 2, and 3, respectively. As in the past years, highest concentrations of legal and pre-recruit males occurred in the Amak Island and Pribilof Islands areas. Female bairdi Tanner crabs were found in highest abundance in these same areas and also north of Port Moller and west of the Pribilofs.

Station catches with high percentages of legal bairdi crabs were located mainly in the Amak Island and Pribilof Islands areas (Chart 4). In the Pribilof Islands area, these stations also had large catches of legal crabs; however, in the Amak area, stations with high percentages of legal crabs were more northerly than those with large catches.

Opilio Tanner Crab

The estimated population of large (≥4.3") male opilio Tanner crabs in the 1977 survey region was about 137 million crabs (Table 1). This amount is considerably lower than the survey estimate for 1976; however, it probably does not reflect an actual stock size decline. Recent energy-related Outer Continental Shelf (OCS) studies have indicated that a substantial segment of the opilio population may exist north of our current survey area. Since a segment of the population occurs outside the area covered by the survey, our survey estimate should not be interpreted as applying to the entire stock.

The distribution of large male opilio Tanner crabs was widespread throughout the survey area with the exception of inner Bristol Bay (Chart 5). The distribution of large males in the survey area in 1977 appears to be more northerly than in 1976. A northward shift was most noticeable north of the Pribilof Islands and in the region between the Pribilofs and Cape Newenham.

Hybrid Tanner Crab

The abundance of large (≥4.3") male hybrid crabs in 1977 does not appear significantly different from 1976 (Table 1). Results of this year's survey indicate that most of the population of large hybrids appears located south of the 57°-20' (Chart 6), with a more widespread distribution than in 1976, extending eastward to inner Bristol Bay.

Bottom water temperature was measured only at selected stations during the 1977 survey (Chart 7). This limited number of observations indicates that water temperatures near the sea bottom in the eastern Bering Sea

were somewhat warmer during the 1977 survey than during 1976. In 1976, temperatures lower than 2°C were encountered at over 40% of the 122 trawl stations where temperature information was obtained. Temperatures lower than O°C were recorded at 12% of the 1976 stations. During the 1977 survey, temperatures below 2°C were encountered at only 10% of the 69 stations where XBT casts were performed and sub-zero temperatures were not encountered at any stations.

Table 1.--Population estimates of Tanner crab in the eastern Bering Sea by species and size from NMFS annual surveys, 1973-1977 (sizes are carapace widths).

	MILLIONS OF CRAB BY YEAR

QUESTIONNAIRE

The purpose of this report is for use by the fishing and processing industries. This questionnaire is provided to help determine the type of report that is desired. Any comment or suggestion would be appreciated.

1. Several types of charts have been used in this and previous reports. Which of the following do you prefer:

a) Numbers of percentages per tow
b) Estimated numbers or percentages per square nautical mile
c) Symbols representing categories of b (above)
d) No preference
e) Other_____

2. Several charts have been excluded in this report which were present in previous reports. They include (1) the number of small C. opilio and small hybrid crabs and (2) the percentages of large C. opilio and large hybrid crab per area towed. These charts were excluded because their merit is questionable. Please indicate which of the following you prefer (circle as many as needed):

a) All size classes included on charts
b) Large and legal sizes only included on charts
c) Pre-recruits included on charts
d) Females included on charts
e) Percentages of large and legal
f) Percentages of C. bairdi only
g) No preference
h) Other_____

3. If there is data which you would like to be included in this report or changes you feel would be desirable, please comment on ways it may be improved:

_____

_____

_____

_____

To return this questionnaire, remove it from the report, fold so that the address shows and mail. No postage is necessary.

Thank you for your comments.
