The only difference between Alternative 1 and 2 is that, under Alternative 2, all SSTC-N oceanside beach training areas would be available for Navy training, regardless of time of year. Under Alternative 2, the proposed change in access and availability to existing beach and inland training areas would not change current range control and coordination procedures. These procedures would continue to be implemented under Alternative 2. Under Alternative 2, risks to public safety would be similar to that under Alternative 1. Increased training and more visible use of Blue 2, Orange 1, and Orange 2 may further discourage unauthorized access.

## 3.16.4 Proposed Mitigation Measures

Mitigation measures for other resources that affect public health and safety (e.g. noise, hazardous materials and waste, water resources) would be implemented. Current measures in place to ensure that nonparticipants are not endangered by Navy actions would continue (Section 3.16.2.4). No additional mitigation measures are warranted.

## 3.16.5 Unavoidable Adverse Environmental Effects

There are no unavoidable adverse environmental effects to public health and safety as a result of implementation of the alternatives.

### 3.16.6 Summary of Effects

Table 3.16-2 summarizes the effects of and mitigation measures for the No Action Alternative, Alternative 1, and Alternative 2.

**Table 3.16-2: Summary of Effects**

| Alternative | Effects |
|---|---|
| **No Action Alternative** | • Routine training activities conducted within SSTC pose little risk to public health or safety outside of the training areas.<br>• Risks to the public from rotary-wing aircraft supporting SSTC training is minimal, based on past safety record, low number of flights, and over-water flight paths.<br>• Risks to the public from marine vessels supporting SSTC training and small craft participating in training are minimal based on past safety record and established right-of-way conventions and avoidance procedures. |
| **Alternative 1** | • On-site training activities would increase. The Navy would continue to implement Range Control Coordination Procedures to avoid public safety issues. Unauthorized access may decrease because more frequent and visible use of beach training areas by military units could discourage the public from entering beach training areas.<br>• Air support and marine vessel support would increase, but for the reasons noted under the No Action Alternative, public safety would be maintained. |
| **Alternative 2** | • Impacts would be similar to those under Alternative 1. Increased training and more visible use of Blue 2, Orange 1, and Orange 2 may further discourage unauthorized access. |
| **Mitigation Measures** | • Mitigation measures for other resources that affect public health and safety (e.g. noise, hazardous materials and waste, water resources) would be implemented. Current measures in place to ensure that nonparticipants are not endangered by Navy actions would continue: safety buffers for underwater detonations, existing guards or gates around many training areas, and monitoring for non-participants during training. |

# 4 Cumulative Impacts

# 4 CUMULATIVE IMPACTS

## 4.1 PRINCIPLES OF CUMULATIVE IMPACTS ANALYSIS

The approach taken to analyze cumulative impacts (or cumulative effects)[1] follows the objectives of National Environmental Policy Act (NEPA) of 1969, Council on Environmental Quality (CEQ) regulations, and CEQ guidance. CEQ regulations (40 Code of Federal Regulations [CFR] Parts 1500-1508) provide the implementing procedures for NEPA. The regulations define "cumulative effects" as:

> ". . . the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." (40 CFR 1508.7)

CEQ provides guidance on cumulative impacts analysis in *Considering Cumulative Effects under the National Environmental Policy Act* (CEQ 1997). This guidance further identifies cumulative effects as those environmental effects resulting "from spatial and temporal crowding of environmental perturbations. The effects of human activities will accumulate when a second perturbation occurs at a site before the ecosystem can fully rebound from the effects of the first perturbation." Noting that environmental impacts result from a diversity of sources and processes, this CEQ guidance observes that "no universally accepted framework for cumulative effects analysis exists," while indicating that certain general principles have gained acceptance. One such principle provides that "cumulative effects analysis should be conducted within the context of resource, ecosystem, and community thresholds—levels of stress beyond which the desired condition degrades." Thus, "each resource, ecosystem, and human community must be analyzed in terms of its ability to accommodate additional effects, based on its own time and space parameters." Therefore, cumulative effects analysis normally will encompass geographic boundaries beyond the immediate area of the Proposed Action, and a time frame including past actions and foreseeable future actions, in order to capture these additional effects. Bounding the cumulative effects analysis is a complex undertaking, appropriately limited by practical considerations. Thus, CEQ guidelines observe, "[i]t is not practical to analyze cumulative effects of an action on the universe; the list of environmental effects must focus on those that are truly meaningful."

### 4.1.1 Identifying Geographical Boundaries for Cumulative Impacts Analysis

Geographic boundaries or Regions of Interest (ROI) for analyses of cumulative impacts in this Environmental Impact Statement (EIS) vary for different resources and environmental media. For air quality, the potentially affected air quality region is the appropriate boundary for assessment of cumulative impacts from releases of pollutants into the atmosphere. For terrestrial biological resources, the area in which Silver Strand Training Complex (SSTC) activities occur, or are proposed to occur, is the appropriate geographical area for assessing cumulative impacts. For wide-ranging or migratory wildlife, specifically marine mammals, sea turtles, and migratory birds, any impacts from the Proposed Action or alternatives might combine with impacts from other sources within the ranges of each population.

### 4.1.2 Past, Present, and Reasonably Foreseeable Future Actions

Identifiable effects of actions occurring in the past and present are analyzed along with reasonably foreseeable future actions to assess additive impacts of the Proposed Action. In general, the Navy need not list or analyze the effects of individual past actions; cumulative impacts analysis of past actions focus

[1] CEQ Regulations provide that the terms "cumulative impacts" and "cumulative effects" are synonymous (40 CFR § 1508.8[b]); the terms are used interchangeably.

on aggregate effects. Reasonably foreseeable future actions that may have impacts additive to the effects of the Proposed Action also are to be analyzed, and are listed in Section 4.2 (Table 4-1).

## 4.2 ACTIVITIES ANALYZED FOR CUMULATIVE IMPACTS

### 4.2.1 Specific Projects Analyzed

Projects in the SSTC EIS ROI (listed in Table 4-1) are considered on a resource-specific basis in the cumulative effects analysis. Other activities are addressed in Section 4.2.2.

**Table 4-1: Past, Present, and Planned Projects in the SSTC EIS ROI**

| Number | Project | Description | Status |
|---|---|---|---|
| 1. | Glorietta Bay Marina | Dredging of the marina and installation of new docks. | Planned |
| 2. | Sand Removal & Sand Relocation at Naval Radio Receiving Facility | Removal and relocation of excess sand along perimeter fence line on the southwest corner of the SSTC. | Ongoing |
| 3. | Naval Air Station, North Island (NASNI), Naval Base Coronado (NBC) Lodge Expansion | Demolition of four existing Navy Lodge buildings and several smaller structures and the construction of a lodge building and cottages to increase room capacity. Construction of recreation facilities, parking lots and road upgrades, retail shops, a restaurant, and landscaping and utility upgrades. | Ongoing (construction phase) |
| 4. | The Marina at Naval Amphibious Base Coronado, NBC | Erosion control, restoration of deteriorated marina facilities, and enhancement and expansion of existing recreational functions of the marina at NBC. | Ongoing |
| 5. | Sixth and Orange Drainage Improvements | The City of Coronado is planning the preparation of drainage studies and improvements for the Fourth and Alameda drainage basin and the Sixth and Orange drainage basin. | Ongoing (construction phase) |
| 6. | Traffic Tunnel Environmental Phase | A City of Coronado project study to determine costs and design of two side-by-side 1.4-mile traffic tunnels commencing east of Glorietta Boulevard and exiting west of Alameda Boulevard onto NASNI. | Project stopped due to citizen ballot measure |
| 7. | Coronado Cays Storm Drain Rehabilitation Phase III | Repair of storm drains in the Coronado Cays that show failed joint lines, non-storm related flow, and heavy debris and soil build up within the lines. | Past, Present, and Proposed |
| 8. | Beach Public Safety and Restrooms | Replacement of the Silver Strand State Beach Central Beach Lifeguard Tower and restroom construction. | Completed |
| 9. | Roadway Preventive Maintenance | Slurry seal of one-sixth of the City of Coronado's streets. Slurry seal is a thin mixture consisting of fine sand, water, and emulsified asphalt applied to asphalt. | Past, Present, and Proposed |
| 10. | Fiber Optic Cabling Connection Project | The City of Coronado plans an interconnection of the main sewer pump stations for monitoring purposes and future automated control. | Present |

**Table 4-1: Past, Present, and Planned Projects in the SSTC EIS ROI (Continued)**

| | | | |
|---|---|---|---|
| 11. | Wastewater Master Plan | A City of Coronado plan for sewer main replacement, rehabilitation of the Cays main pump station, and Margarita Avenue sewer main replacement. | Past |
| 12. | U.S. Navy Lighterage | Construction of a Waterfront Command and Control Facility for Amphibious Construction Battalion One facilities to support the introduction of the improved Navy Lighterage System at NBC. | Ongoing |
| 13. | Mobile Security Forces and Naval Special Clearance Team-One Pier and Boat Ramp | Provision of facilities for the co-location of two new commands at NASNI, the Mobile Security Forces and the Naval Special Clearance Team-One, including construction of a pier, boat ramp, and several buildings; paving; site improvements with security fencing and lighting, landscaping and irrigation; and a paved vehicle storage yard. | Planned |
| 14. | Dredging and Sand Replenishment Projects | Projects range from Regional Sediment Management Plans for regional scale management to specific dredging projects. The San Diego Bay maintenance dredging is currently conducted as well as future projects such as San Diego Association of Government's Regional Beach Sand Replenishment Project that is in planning stages for the City of Imperial Beach. Specific information on projects can be found on websites maintained by the projects' lead agencies, including the Army Corps of Engineers Los Angeles District. | Past, Present, and Planned |
| 15. | Seacoast Inn Project | Part of Imperial Beach redevelopment plan to increase investment to the downtown areas. Consists of the building of a 4-story, 78-room, 111-subterranean parking space hotel/condo structure. | Planned to begin in 2009 with 2010 completion |
| 16. | Imperial Beach Redevelopment Projects | Redevelopment projects for Palm and Carnation street ends, including sidewalk and street construction, sound and visual walls, landscaping, emergency vehicle access, pollution diversion system, public art, ramp installation, and direct beach access for emergency vehicles and individuals with disabilities. | Planned but unfunded |
| 17. | Development of Home Port Facilities for the Three NIMITZ-Class Aircraft Carriers in Support of the Pacific Fleet | Construction and operation of facilities and infrastructure needed to support the capacity to homeport three NIMITZ-class nuclear-powered aircraft carriers within the U.S. Pacific Fleet. | Completed |
| 18. | AIMS Cable Array Installation | A cable array to extend from a proposed building on NRRF inland, onto the beach, into the water on oceanside SSTC-S, and within the boat lanes. Being evaluated under the BRAC Ingleside EA, Phase II. | Completed |

**Table 4-1: Past, Present, and Planned Projects in the SSTC EIS ROI (Continued)**

| | | | |
|---|---|---|---|
| 19. | Camp Surf Improvements | Leased area held by the YMCA will undergo improvements to existing structures on the YMCA Camp Surf site within the SSTC-S fenced area. | Ongoing |
| 20. | USFWS Refuges Comprehensive Conservation Plan (CCP) | The CCP addresses topics of resource management, visitor use, refuge operations, and development in general terms. | Past |
| 21. | Final Environmental Impact Statement (FEIS) for the Introduction of the P-8A Multi-Mission Maritime Aircraft (MMA) into the U.S. Navy Fleet | This FEIS evaluates the environmental consequences associated with homebasing twelve P-8A Fleet squadrons and one Fleet Replacement Squadron at established maritime patrol home bases. The FEIS analyzes personnel transition, new construction and renovation of structures, and all airfield operations necessary to accommodate the basing of P-8A MMA. The P-8A is being introduced to replace the aging P-3C Orion aircraft. Currently, P-3C patrol squadrons have periodic detachments at NASNI. The Notice of Record of Decision was published in the Federal Register on January 2, 2009. | Completed |
| 22. | Current, Emerging, and Future Training Operations in the Southern California (SOCAL) Range Complex | Within the SOCAL Range Complex, continuation of training, an increase in training activities, force structure changes associated with introduction of new weapons systems, new classes of ships, and the introduction of new types of aircraft into the Fleet. | Present, Planned |
| 23. | Naval Base Coronado Small Arms Range | Installation of a small arms firing range at Naval Base Coronado. | Completed |
| 24. | MH-60 EA | The introduction of the MH-60S aircraft meets the Navy's need to support EOD MU-11 in their activities at SSTC. To implement the proposed action, the Navy must ensure that adequate hangar, training, maintenance and personnel support facilities are available to meet production and delivery schedules and to satisfy operational commitments. | Ongoing |

## 4.2.2 Other Activities

### 4.2.2.1 Commercial and Recreational Marine Traffic

The Port of San Diego is an important commercial cargo and cruise ship port. In 2005, cargo volume reached over 2,900,000 metric tons. Annually, approximately 400 commercial cargo vessels utilize port facilities (Economic Research Associates 2007). In 2006, San Diego recorded 219 cruise ship calls (619,000 passengers) (San Diego Unified Port District [SDUPD] 2007).

While the U.S. Coast Guard has indicated that there are no precise estimates for recreational or commercial fishing or boating activity in the area, it is estimated that San Diego Bay accommodates over 7,000 boat slips in several marinas (SDUPD 2007). According to statistical data maintained by the California Department of Fish and Game (CDFG), commercial fishing is not considered to constitute a significant nonmilitary use in the vicinity of NASNI (CDFG 2002); recreational fishing occurs on a limited scale in these waters.

#### 4.2.2.2 Activities Contributing to Ocean Pollution

Commercial and recreational vessels are potential sources of pollutants, including fuel or oil leaks and toxins from antifouling paints. These vessels constitute an environmental concern that has not been quantified. Sewage, sludge, blackwater, graywater, bilge water, plastics, and other trash components and waste materials are routinely discharged from vessels into coastal and ocean waters in Southern California. Polluted runoff, or non-point source pollution, is considered the major cause of impairment of California's ocean waters. Storm water runoff from coastal urban areas and beaches carries waste such as petroleum, plastics, and styrofoam into coastal waters. Sewer outfalls also are a source of ocean pollution in Southern California. The Tijuana River, located directly south of Imperial Beach, is a major source of pollution for Southern California beaches. Bacteria levels are measured routinely to determine the quality of water at recreational beaches, and as indicators of the possible presence of other harmful microorganisms.

#### 4.2.2.3 Activities Contributing to San Diego Bay Pollution

Due to the high density of commercial vessel traffic in San Diego Bay, commercial vessels are a potentially significant source of pollutants, including, fuel leaks, antifouling paint toxins, and illegal trash dumping. San Diego Bay also accommodates a large number of recreational boaters that potentially contribute pollutants through illegal dumping. Other sources of vessel-related pollution include naval boat activities, dumping by bayside industries, and San Diego Bay's numerous marinas. The high density of urban development on the eastern shore of San Diego Bay produces runoff which can contribute to concentrations of pollutants such as pesticides, household waste, and several other non-point source pollutants. Local streams and creeks that feed into San Diego Bay also augment contaminated sedimentary deposits and are a major source of coliform bacterial concentrations.

#### 4.2.2.4 Air Quality Emissions

In the California Air Resources Board (CARB) emission inventories by category (CARB 2008), the San Diego Air Basin (SDAB) includes emissions (Reactive Organic Gases [ROG], carbon monoxide [CO], oxides of nitrogen [$NO_X$]) and particulate matter less than 10 microns [$PM_{10}$]) from aircraft, ships, and commercial boats. Emission estimates are based on emissions from onshore (land) or nearshore (<3 nm from mean high tide line) activities. These emissions account for a small percentage of the overall air emissions budgets for the air basin. Emissions from marine vessels operating in offshore areas are not included in the State Implementation Plan (SIP) emissions budget and in air quality planning because they are assumed to have a negligible effect on the ambient air quality, and because reductions in emissions from these sources would not generate a great improvement in the ambient air quality. The SIP emissions inventory also includes emissions from motor vehicles and construction activities within the SDAB.

## 4.3 CUMULATIVE IMPACT ANALYSIS

### 4.3.1 Land Use and Recreation

The Proposed Action would include activities that are consistent with long-established military land uses. Activities are consistent with established land uses within and outside of SSTC and NASNI boundaries. Cumulative effects associated with increased noise levels are addressed in Section 4.3.6 (Acoustic Environment [Terrestrial]). At SSTC-South (SSTC-S), some activities require public access to be restricted in one or more beach training lanes below the high tide line for public safety or mission security purposes (Section 3.1.2.2.2). If public access restrictions are required, they would typically last one to four hours; however, on average, these activities could require the beach to be closed for about 2 hours at a time; even then, the closures would only occur in one of the beach lanes, allowing public access to other public areas of the beach.

Cumulative impacts on land use would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in increased noise levels or restrict public access to beaches. None of the projects identified as past, present, or planned in the SSTC EIS ROI (Table 4-1) involve permanent public access restrictions to the beach. In addition, any changes to land use as a result of implementation of Navy projects would be compatible with existing military uses of the installation. Therefore, cumulative effects related to land use due to implementation of the Proposed Action in combination with past, present, or planned projects in the ROI would be minimal.

### 4.3.2 Geology and Soils

Cumulative impacts on marine geology and sediments would consist of the aggregate effects of the Proposed Action and other projects, actions, and processes that deposit sediment or debris, alter bathymetry, or disturb ocean bottom sediments. Relevant effects would include debris contributions from recreational fishing, dredging and sand replenishment projects, coastal development, and other ocean industries (Projects 1, 3, 4, 6, 13, 14, 15, 16, 18, 22, and 23 in Table 4-1). The effects of these activities are known only in a very general sense. The ROI for the Proposed Action with regard to cumulative impacts to geology and soils is the Silver Strand peninsula and adjacent areas of San Diego Bay and the Pacific Ocean.

The Proposed Action would affect marine geology and sediments by creating craters in bottom sediments and depositing training debris on the ocean bottom. In addition, previously disturbed surface soils in existing training areas on SSTC would be further disturbed. The Proposed Action is expected to increase the level of soil disturbance in both beach and inland portions of SSTC (Section 3.2). It also is expected to disturb small areas of benthic habitat associated with underwater detonations required for training, increases in erosion or off-site sediment transport, and changes in topography. The Proposed Action would expend small amounts of training materials (e.g., flare residues) that would not be recovered.

Dredging mostly occurs in nearshore Pacific Ocean areas, harbors, and San Diego Bay. Disposal areas for dredged materials, other than sand for beach replenishment projects, are located farther offshore in deep waters. These projects temporarily alter ocean and San Diego Bay bottom contours, which tend to reestablish themselves (mounded materials being dispersed and dredged basins being filled in) over time. This activity is closely regulated by the U.S. Army Corps of Engineers, in order to ensure that major alterations of bathymetry have no significant adverse environmental effects. Replenishment of sandy beaches on the Silver Strand would have beneficial effects. The Proposed Action would not affect the quantities of materials dredged or deposited in the ROI in the future.

Existing coastal development generates large amounts of surface runoff into the San Diego Bay and ocean during winter storms; this runoff contains substantial quantities of fine sediments that are deposited on the bottom. Construction of the coastal development projects proposed for the ROI (see Table 4-1) would denude and disturb surface soils, possibly generating additional sediments that would be conveyed to the San Diego Bay or ocean. These projects also would increase the aggregate area of paved surfaces on the Silver Strand, thus increasing incrementally the volume of runoff generated during storms. Combined with the Proposed Action, which also would incrementally increase sediment transport into marine areas, the quantities of sediments deposited in these nearshore areas would increase by an insignificant degree.

Cumulative impacts on terrestrial SSTC geology and soils would consist of the combined effects of the Proposed Action and other Navy actions at SSTC that alter the local topography or disturb surface soils. Periodic removal of excess sand under the Naval Radio Receiving Facility (NRRF) Sand Removal and Relocation (Project 2 in Table 4-1) would serve to maintain the existing topography along the southwestern edge of SSTC-S. New construction (Projects 3, 13, 15, 16, 19, and 21 in Table 4-1) would remove ground cover, disturb surface soils, alter surface drainage patterns, and, by increasing the ground coverage of impervious surfaces, increase the volume of surface water flows during storms. These new activities, along with elements of the Proposed Action (see Section 3.2) would contribute locally and incrementally to increased sediment transport and deposition; however, the cumulative effects on local beach erosion still would be negligible relative to the scale of the natural processes that occur in the ROI (e.g., northward transport of sediments by longshore currents, as discussed in Section 3.2). Best Management Practices for soil-disturbing activities, such as drainage improvements, and road improvements would be implemented for any construction activity. Therefore, the cumulative effects on geology and soils from implementation of the Proposed Action in combination with past, present, or planned projects in the ROI would be minimal.

### 4.3.3 Air Quality

Cumulative impacts on air quality would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in increases in emissions of air pollutants. The ROI for assessing cumulative impacts to air quality is the SDAB.

Emissions estimates for the Proposed Action would account for a small percentage of the overall air emissions budgets for the SDAB; these estimates do not include marine vessel emissions for vessels operating in surrounding air basins or outside of U.S. territorial waters. These emissions are not included in the SIP emissions budget and in air quality planning because they are assumed to have a negligible effect on the ambient air quality; and because reductions in emissions from these sources would not generate a great improvement in the ambient air quality.

The Proposed Action would be required to conform to the applicable SIP, which would require a demonstration that the Proposed Action would not result in a cumulatively significant impact for nonattainment pollutants. As discussed in Section 3.3.5, emissions associated with the Proposed Action are below the *de minimis* levels for the SDAB, and are within the SIP emissions budget. The analysis of air pollutant emissions to determine conformance to ambient air quality standards is a regional analysis that, by nature, is cumulative. The SIP and 2010 emissions inventory consider foreseeable projects (including those on the cumulative list) and cumulative growth. Section 3.3, Air Quality, demonstrates conformance with the SIP.

Activities affecting air quality in the region include mobile sources such as automobiles and aircraft, and stationary sources such as power generating stations, manufacturing operations, and other industry. In CARB emission inventories by category (CARB 2010), SDAB includes emissions from aircraft, ships, and commercial boats. These emissions are included in the mobile source category. Traditionally, the emission estimates are based on emissions from onshore or nearshore operations. The emission inventory for the SDAB also includes emissions from motor vehicles and construction activities.

The background ambient air quality data presented in Table 4-2 includes contributions from those projects listed in Table 4-1 that are past and ongoing projects. As indicated in Table 4-2, the data in the SDAB shows that ambient pollutant concentrations are below the required National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) for most criteria pollutants. Currently, the air basin is considered a maintenance area for CO and a maintenance plan has been adopted. The SDAB is also considered a basic nonattainment area for the NAAQS for ozone ($O_3$), and an *Eight-Hour Ozone Attainment Plan for San Diego County* has been adopted as the SDAB portion of the California SIP. The SDAB is in attainment for the NAAQS for all other criteria pollutants. The SDAB is currently classified as a nonattainment area under the CAAQS for $O_3$, $PM_{10}$, and $PM_{2.5}$. However, cumulative impacts on air quality would be less than significant due to the minimal increase expected to be attributable to the Proposed Action and programs in the air basin designated to reduce emissions over time. Those projects listed in Table 4-1 that are planned projects for the future would result in emissions associated with construction and motor vehicles. Growth in these activities has been accounted for in the SIP, and emissions from the projects listed in Table 4-1 would be minor. Therefore, the cumulative effects on air quality from implementation of the Proposed Action in combination with past, present, or planned projects and other activities would be minimal.

**Table 4-2: Background Ambient Air Quality – Chula Vista Monitoring Station**

| Pollutant | Averaging Time | 2004[1] | 2005[1] | 2006[1] | 2007[1] | 2008[1] | CAAQS[1] | NAAQS[1] |
|---|---|---|---|---|---|---|---|---|
| $O_3$ | 8 hour | 0.087 | 0.081 | 0.068 | 0.087 | 0.083 | 0.070 | 0.075 |

#### 4.3.3.1 Global Climate Change

The increase in operational tempo, consisting of specific activities listed in Table 2-1, along with regional growth of urban areas and regional increases in recreational visitors, would incrementally increase regional emissions of $CO_2$ and other green house gases (GHG). Scientists are in general agreement that the Earth's climate is gradually changing, and that change is due—at least in part—to emissions of $CO_2$ and other GHG from man-made sources. The anticipated magnitude of global climate change is such that a significant cumulative impact on global climate exists.

Executive Order (EO) 13514, *Federal Leadership in Environmental, Energy, and Economic Performance*, was signed by President Obama on October 5, 2009. EO 13514 defines three scopes of emissions, which include the following: scope 1: direct greenhouse gas (GHG) emissions from sources that are owned or controlled by the Federal agency; scope 2: direct greenhouse gas emissions resulting from the generation of electricity, heat, or steam purchased by a Federal agency; and scope 3: greenhouse gas emissions from sources not owned or directly controlled by a Federal agency but related to agency activities such as vendor supply chains, delivery services, and employee travel and commuting. The

Department of the Navy will be subject to the requirements of EO 13514. Although the new EO 13514 for the first time calls for GHG emission reductions from federal agencies, the exact amount of GHG reductions and the required Strategic Sustainability Performance Plan to achieve those reductions is still under development and therefore not included in the analysis for this document.

Table 4-3 summarizes the annual GHG emissions associated with the No Action Alternative in comparison with Alternatives 1 and 2. These data show the increase in annual $CO_2$-equivalent ($CO_2e$) emissions estimated for the Preferred Alternative (60,554 metric tons) and the $CO_2e$ emissions generated from all sources in the U.S. in 2006 (7,054 million metric tons) (USEPA 2009). Therefore, $CO_2e$ emissions associated with the preferred alternative would amount to approximately 0.00086 percent of the total $CO_2e$ emissions generated by the U.S. Under any of the alternatives, cumulative impacts to global climate change would be minimal.

**Table 4-3: Greenhouse Gas Emissions**

| | Emissions (tons/year)[1] | | | |
|---|---|---|---|---|
| **Emission Source** | **CO2** | **CH4** | **N2O** | **CO2e** |
| **No Action Alternative** | | | | |
| Aircraft | 4,635 | 0.3 | 0.2 | 4,709 |

*Notes:*

1 $CO_2e = (CO_2 * 1) + (CH_4 * 21) + (N_2O * 310)$ (GWPs from California Climate Action Registry General Reporting Protocol, Version 3.1, January 2009).

2 USEPA 2009.

Although the proposed action would not contribute substantially to cumulative impacts associated with global climate change, this important topic warrants discussion of DoN leadership in broad-based programs to reduce energy consumption and shift to renewable and alternative fuels, thereby reducing emissions of carbon dioxide and other greenhouse gases.

The Secretary of the Navy has established several goals for reducing the Navy’s consumption of fossil fuels:

- Mandate that energy usage, efficiency, life-cycle costs and other such factors be part of the Navy's decision when acquiring new equipment or systems, as well as vendors' efficiency or energy policies.

- Cut petroleum use by half in the Navy's fleet of commercial vehicles by 2015, by phasing in new hybrid trucks to replace older ones.

- Procure half the power at Navy shore installations from alternative energy sources—including wind or solar—by 2020 and, where possible, supply energy back to the grid, as the Navy does today at Naval Air Weapons Station China Lake, California.

- Reach the point that half the energy used throughout the Navy, including in ships, aircraft, vehicles and shore stations, comes from alternative fuel or alternative sources by 2020. Today that percentage is about 17 percent.

These examples illustrate the leadership role that the Navy has in achieving energy reductions that will contribute to the national effort to mitigate global climate change.

### 4.3.4 Hazardous Materials and Wastes

Cumulative impacts on hazardous materials would consist of the effects of the Proposed Action and other proposed projects, actions, and processes in the ROI that would use large quantities of hazardous materials, or that otherwise affect the hazardous materials management system. The ROI for hazardous materials is the Silver Strand peninsula and adjacent San Diego Bay and nearshore Pacific Ocean waters, all of which share local hazardous waste recycling and treatment, storage, and disposal (TSD) facilities and regional transportation networks that link the region to more distant TSD facilities.

The Proposed Action would increase releases into the environment of hazardous materials (see Section 3.4). However, the Navy’s existing hazardous materials and hazardous wastes management systems—responsible for safely storing and transporting these materials—would be able to accommodate the anticipated increases in throughput and would have no adverse effects.

The primary impact of hazardous materials use in the marine and terrestrial environment in the ROI would be an increase in the amounts of munitions, petroleum products, or other chemicals that are released. Hazardous materials settling out of the water column would contribute to contamination of ocean bottom sediments. Activities resulting in this contamination would include releases of hazardous constituents from fishing vessels or other ocean vessels, wastewater treatment plant outfalls, and non-point source pollution from terrestrial sources.

Hazardous materials would accumulate differently within San Diego Bay and in the Pacific Ocean because of differences in their circulation and currents. Hazardous materials released from sources in the eastern and southern portions of San Diego Bay would be concentrated by a long residence time (i.e., the amount of time that pollutants remain in a contained body of water). High to medium residence times of contaminants would contribute to further degradation of the San Diego Bay’s water and sediment quality. Hazardous materials released in western and northern portions of San Diego Bay have much shorter average residence times; shorter residence times are due to the proximity of open-ocean in the northern portion of the Bay and circulation patterns in other areas of the Bay. Hazardous constituents are eventually either incorporated into bottom sediments or flushed out of the San Diego Bay into the ocean by tidal exchanges. The quality of San Diego Bay bottom sediments has improved in recent years, indicating that recent levels of hazardous materials discharges are generally not resulting in adverse effects. The estimated quantities of hazardous materials from the Proposed Action (Sections 3.4.2.3 and 3.4.2.4), in combination with those anticipated from other reasonably foreseeable future projects and activities in the ROI, are not expected to alter that trend.

Commercial ocean industries, such as fishing and ocean transport, are dispersed over broad areas of the Pacific Ocean. Small-scale deposits of trash and debris from these activities are quickly degraded and buried in ocean bottom sediments. In combination with small-scale deposition of debris from the Proposed Action, the cumulative effect would be a low-density of deposited materials in heavily used areas and a very low density in lesser used areas. There is no central point of contaminant discharge, but the intensity of ocean uses, and correspondingly the density of hazardous materials discharges, declines with increasing distance from the coast. Discharges of hazardous constituents from non-point source runoff and treatment plant outfalls contribute contaminants to the area, mostly affecting the waters within three nautical miles of the coast. Ocean currents and sediment transport processes disperse the released materials over a much larger area. Overall, the quality of Pacific Ocean waters and bottom sediments offshore of Southern California are relatively high, indicating that current releases of hazardous materials are not causing adverse effects. Accidental release or spill of hazardous materials associated with the Proposed Action, along with those of other reasonably foreseeable future projects and activities in the ROI, would not substantially alter the quantities of these materials being discharged, and thus would not affect resources in the ROI.

Hazardous materials used on land by non-Navy activities in the vicinity of SSTC consist of fuels and other petroleum products to include paint, adhesives, glues, and other coatings, as well as other materials used in construction projects (see Table 4-1). Some hazardous materials could be stored in bulk on construction sites. Use of these materials is closely regulated by local, state, and federal agencies, and off-site release of substantial quantities of these items is rare. The overall risk of a substantial release of such materials from the Proposed Action or other projects is low.

Hazardous wastes generated aboard vessels engaged in training activities under the Proposed Action would offload those wastes to Navy shore facilities, where they would become part of the overall hazardous waste stream managed aboard Naval Base Coronado. Hazardous waste generated during terrestrial SSTC training activities under the Proposed Action also would be managed as part of the overall hazardous waste stream aboard Naval Amphibious Base (NAB) Coronado. Increased levels of training would result in increased throughput of hazardous wastes, but likely would not require additional storage, transport, or disposal facilities ashore for these materials. The Navy's hazardous waste management system and procedures are adequate to accommodate an increase in hazardous waste volumes. Other hazardous waste generators in the region, along with the Navy, would require the services of hazardous waste transporters and treatment, storage, and disposal facilities. While the costs for hazardous waste transport, treatment, storage, and disposal could increase in response to increased cumulative demand, the hazardous waste management industry in the region has sufficient physical capacity to respond to this increased demand.

Therefore, the cumulative effects of hazardous materials use and hazardous waste generation from the Proposed Action and other reasonably foreseeable future projects on environmental resources in the ROI and on the regional hazardous wastes treatment, storage, and disposal infrastructure would be minimal.

### 4.3.5 Water Resources

Cumulative impacts on water resources would consist of the effects of the Proposed Action when added to other projects, actions, and processes that affect surface or groundwater hydrology, or consistency with the *Basin Plan* and the National Ambient Water Quality Criteria (NAWQC), those that release potential water pollutants or otherwise result in long-term degradation of marine, surface, or groundwater quality, and those that have substantial effects on public uses of state or federal waters. The ROI for water resources with regard to assessment of cumulative impacts consists of the Silver Strand peninsula and adjacent portions of San Diego Bay and the Pacific Ocean.

Effects from the Proposed Action on marine, surface, or groundwater quality is discussed in Section 3.5, Water Resources. The Proposed Action would be consistent with the *Basin Plan* and with the NAWQC. Releases of potential water contaminants from training activities would be minimal, and no long-term degradation of water quality would occur.

The Proposed Action could release water pollutants into the marine environment, directly or via surface flows to the marine environment. Cumulative impacts on ocean water quality would consist of the effects of the Proposed Action along with other industrial, commercial, and municipal sources of water pollution in San Diego Bay and offshore. The effects of these activities on the SSTC ROI are frequently monitored, but the individual effects are not well known. The Tijuana River discharge has become a problem for local beaches and ocean water quality because the local currents along Imperial Beach and Coronado cause contaminated waters to flow north from the international boundary, resulting in frequent beach closures from contamination. In addition to these effects, the San Diego Bay and Pacific Ocean waters continue to be affected by urban storm water runoff through non-point source pollution of roads, parking areas, and residential drain pipes that flush to the sea.

Cumulative impacts on terrestrial SSTC water quality would consist of the aggregate effects of the Proposed Action and other military and civilian projects and activities on and adjacent to SSTC (see Table 4-1). Because of a relatively high water table in the area, the use of pesticides, leaks and spills from motor vehicles, seepage from sewer lines, and other pollutants, the water quality is affected by various sources in the area. Navy training activities would result in materials expended in the water that are considered pollutants. However, according to Section 3.5, federal and state standards such as those presented in the Basin Plan are not exceeded.

### 4.3.6 Acoustic Environment (Terrestrial)

Cumulative impacts on the acoustical environment would consist of the effects of the Proposed Action when added to other projects, actions, and processes that would result in an increase in intrusive noise sources, a substantial long-term increase in average ambient noise levels, or a substantial increase in the number of impulsive sound events. The ROI for the acoustical environment consists of the Silver Strand peninsula, San Diego Bay and ocean training areas, and adjacent public areas.

Under the Proposed Action, training at SSTC would result in an increase in intrusive noise events, such as aircraft, vehicle/vessel pass-bys, and personnel activity but hourly sound levels would not generally be affected. Activities associated with the Proposed Action could occur simultaneously (e.g., Elevated Causeway activities and Hellweek) and could produce a cumulative effect on intrusive noise. However, loud activities would rarely occur at the same time or within close proximity to each other. Therefore, cumulative effects from these increases in noise levels would be minimal.

The Silver Strand is home to two naval air installations, Naval Air Station North Island (NASNI) and Naval Outlying Landing Field Imperial Beach (NOLF-IB). Fourteen squadrons of helicopters based at NASNI, operate out of 13 helipads. NASNI helicopter squadrons train primarily at NOLF-IB. NOLF-IB has two runways (9 and 27) and five helipads available for touch-and-go operations. In 2003, NOLF-IB supported approximately 250,000 annual operations with 1,000 peak-day operations. Sikorsky SH-60 aircraft accounted for 87 percent of annual operations and touch-and-go operations accounted for 87 percent of annual operations (County of San Diego 2005). Helicopters flying in and out of NOLF-IB and between NASNI and NOLF-IB (via north-south routes along San Diego Bay or the Pacific Ocean) for training generate several hundred helicopter flights per day. This helicopter traffic contributes substantially to the background noise level in the vicinity of SSTC.

Several local construction projects (Projects 2, 3, 6, 13, 15-18, and 24 in Table 4-1) would generate short-term intrusive noise. Construction of the Mobile Security facilities and Navy Lodge Expansion would generate construction noise for short periods on NASNI, and construction of a new traffic tunnel could generate construction noise along the San Diego Bay side of NASNI and SSTC-North (SSTC-N). Construction along Palm Avenue in Imperial Beach in combination with redevelopment would raise the background noise level, with various types of construction equipment and activities generating intermittent periods of intrusive noise and occasional impulse noise events. Periodic removal of excess sand along the SSTC-S fenceline will continue to generate occasional construction-type noise.

Construction of higher density residential and commercial facilities in the area, especially redevelopment of the Palm Avenue area of Imperial Beach, could result in substantially increased weekday traffic volumes on local roads, most notably State Route 75. Construction of new transportation corridors, such as the proposed tunnel connecting the northern portion of Coronado Bridge and NBC, could encourage more vehicular traffic on the peninsula, especially weekend visitors to recreational facilities such as Silver Strand State Beach. Traffic volume increases on major roads would be insufficient to substantially affect long-term background noise levels. Therefore, cumulative effects of traffic noise in the ROI from the Proposed Action, and in combination with other proposed new sources of vehicular traffic would be minimal.

In summary, the Proposed Action, along with other anticipated projects and activities, could result in minor increases in intrusive noise, traffic noise, and marine vessel noise that would incrementally degrade the acoustical environment of the ROI, but cumulative effects would be minimal.

### 4.3.7 Marine Biological Resources

Cumulative impacts on marine plants, algae, and invertebrates could result from the effects of the Proposed Action in conjunction with other past and future projects, actions, and processes that occur collectively and over a period of time. The ROI for potential cumulative effects varies widely among the various marine organisms. Marine plants and macroalgae are sedentary, attaching to substrate and growing where physical and chemical conditions are suitable, including light transmissivity, water and sediment quality, and substrate conditions such as grain size (e.g., sand versus silt or cobble). Invertebrate communities may be localized in their life cycle, never moving more than a few feet through generations (such as benthic infauna). In contrast, macroinvertebrates such as the California spiny lobster may have the ability to move in and out of San Diego Bay and the nearshore coastal waters of the Southern California Bight (SCB).

Cumulative impacts on marine plants and invertebrates would include release of munitions, petroleum products, and other chemicals into the water, introduction of debris into the water column and onto the sea floor, mortality and injury of marine organisms near the detonation or impact point of ordnance or explosives, and destruction of eelgrass or other habitat or substrate modification by foot or propeller wash within the activity areas. These impacts could in turn indirectly affect the foraging activities of fish, birds, and marine mammals in and around the SSTC.

Contributory activities from the projects listed within Table 4-1 can be categorized into sources of potential impact such as vessel activity, dredging, and harvesting of macroinvertebrates. Projects listed within Table 4-1 (e.g. Projects 1, 4, 7, 12, 13, and 14-18) that involve dredging or shoreline development temporarily disturb invertebrates and modify their habitat within a localized area. Changes to substrate from dredging and shoreline modifications that do not require mitigation would also not be sufficient to affect individual populations or productivity to a measurable degree. These changes would result in minimal disturbance of sandy bottom habitat and increased turbidity from amphibious landings and underwater demolitions. The areas of highest abundance and diversity for marine invertebrates such as mudflats, salt ponds, and salt marsh are avoided under the Proposed Action and other proposed activities in Table 4-1.

Vessel activity from other naval activities, commercial traffic, and private pleasure craft have steadily increased for decades and are not considered to adversely affect marine plants and invertebrates or their habitat. Commercial and recreational harvesting of invertebrates typically targets specific species (such as California spiny lobster or sea urchins) within the ROI and are managed by CDFG and National Marine Fisheries Service (NMFS). The level of mortality within San Diego Bay and adjacent nearshore waters attributed to harvesting activities is minimal due to regulations that permit recreational versus commercial harvest.

Therefore, cumulative effects related to marine plants and invertebrates due to implementation of the Proposed Action in conjunction with past, present, or planned projects in the ROI would be minimal.

### 4.3.8 Fish

Cumulative impacts on fish would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in an incremental increase in fish mortality, disturbance, and habitat modification within San Diego Bay and the adjacent coastal nearshore waters. Contributory activities such as vessel activity, in-water development (e.g., dredging), and fishing are potential sources of impact. The ROI for potential cumulative effects to fish includes San Diego Bay and coastal nearshore waters of Southern California. Fish within the ROI range from resident to migratory species that utilize the ROI to various degrees, both in time and space.

Potential effects to fish from the Proposed Action include mortality, injury, disturbance, and habitat modification. Injury and mortality can occur from physical and acoustic impacts associated with activities such as pile driving and underwater detonations, while behavioral modification can be associated with vessel traffic and other sound sources.

Vessel activity from naval activities, commercial traffic, and private pleasure craft have steadily increased for decades, and are not considered to adversely impact fish or their habitat. Other sound sources that are of major concern to fish and fisheries include strong underwater shock pulses that can cause physical damage to fish, and underwater noise that could affect their biology or catchability by fishermen. Naval training activities coupled with sources from commercial and recreational activities would not create a considerable impact.

Habitat modification can occur from naval vessel traffic, primarily beach landings, underwater detonations, and in-water construction associated with several training activities. However, impacts are reduced as training is limited to specific areas, to avoid sensitive or special aquatic sites. Projects that involve dredging or shoreline development (1, 4, 5, 13, 14, 17, and 18 in Table 4-1) can temporarily disturb fish and modify fish habitat within a localized area. Changes to fish habitat from dredging and shoreline modification not requiring mitigation would not be sufficient to affect individual fish populations or productivity to a measurable degree.

Commercial and recreational fishing target specific fish species within the ROI, and are managed by CDFG and the NMFS. Potential impacts of commercial fishing include overfishing of targeted species and bycatch, both of which negatively affect fish stocks; recreational fishing also poses a threat because of the large number of participants and the intense, concentrated use of specific habitats. However, increased regulation and management have led to population increases of several species (e.g., white sea bass, California halibut) near San Diego Bay and the ROI.

Given the transient nature of the training exercises and the minor, localized potential effects, there would not be incremental or synergistic impacts from present or reasonably foreseeable future uses of the SSTC, and the overall effect on fish stocks would be negligible compared to the impact of commercial and recreational fishing. Implementation of protective measures designed to avoid long-term impacts would further protect marine life and the environment. Therefore, cumulative effects related to fish as a result of implementation of the Proposed Action in combination with past, present, or planned projects in the ROI would be minimal.

### 4.3.9 Marine Mammals

Cumulative impacts on marine mammals would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in an incremental increase in injury or disturbance within San Diego Bay and the adjacent coastal nearshore waters. Contributory activities can be categorized into vessel activity, fishing, shoreline development, and acoustic disturbance as sources of potential impact. The ROI for potential cumulative effects to marine mammals includes San Diego Bay and coastal nearshore waters of Southern California.

Potential cumulative impacts of Navy training activities conducted in the SSTC on marine mammals would result primarily from possible commercial, recreational, and military ship strikes, underwater detonation, and pile driving effects within the training areas. Injury and disturbance of marine mammals and modification of habitat that could affect marine mammal foraging are based on physical and acoustic impacts of vessel activity, pile driving, and explosives within the area the individual actions encompass, and the value and type of habitat known to occur within the specific footprint.

Ship strikes, or ship collisions with whales, are a recognized source of whale mortality worldwide (Laist et al., 2001; Geraci and Lounsbury, 2005; de Stephanis and Urquiola, 2006). All types of ships can hit whales, with animals usually either seen too late, not observed until the collision occurs, or not detected. An animal at the surface could be struck directly by a vessel, a surfacing animal could hit the bottom of a vessel, or an animal just below the surface could be cut by a vessel's propeller. The severity of injuries typically depends on the size and speed of the vessel and the size of the animal (Knowlton and Kraus, 2001; Laist et al., 2001; Vanderlaan and Taggart, 2007). The ability of a ship to avoid or detect a collision depends on a variety of factors, including environmental conditions, ship design, size, and manning. A review of recent reports on ship strikes provides some insight regarding the types of whales, locations, and vessels involved, but review also reveals significant gaps in the data. The Large Whale Ship Strike Database provides a summary of the 292 worldwide confirmed or possible whale/ship collisions from 1975 through 2002 (Jenson and Silber 2003). The report notes that the database represents a minimum number of collisions, because the vast majority probably goes undetected or unreported.

The growth in commercial ports and associated commercial vessel traffic is a result of the globalization in trade. The Final Report of the National Oceanic and Atmospheric Administration (NOAA) International Symposium on Shipping Noise and Marine Mammals: A Forum for Science, Management, and Technology stated that the worldwide commercial fleet has grown from approximately 30,000 vessels in 1950 to over 85,000 vessels in 1998 (National Research Council, 2003; Southall, 2005). It is unknown how international shipping volumes and densities will continue to grow. However, current statistics support the prediction that the international shipping fleet will continue to grow at the current rate or at greater rates in the future. Shipping densities in specific areas and trends in routing and vessel design are as, or more, significant than the total number of vessels. Densities along existing coastal routes are expected to increase both domestically and internationally. New routes are also expected to develop as new ports are opened and existing ports are expanded. Vessel propulsion systems are also advancing toward faster ships operating in higher sea states for lower operating costs; and container ships are expected to become larger along certain routes (Southall, 2005).

While there are reports and statistics of whales struck by vessels in U.S. waters, the magnitude of the risks that commercial ship traffic poses to marine mammal populations is difficult to quantify or estimate. In addition, there is limited information on vessel strike interactions between ships and marine mammals outside of U.S. waters (de Stephanis and Urquiola, 2006). Laist et al. (2001) concluded that ship collisions may have a negligible effect on most marine mammal populations in general, except for regionally-based small populations where the significance of low numbers of collisions would be greater, given smaller populations or populations segments.

NOAA continues to review all shipping activities and their relationship to cumulative effects, particularly on large whale species. According to the NOAA report, the factors that contribute to ship strikes of whales are not clear, nor is it understood why some species appear more vulnerable than others. Nonetheless, the number of known ship strikes indicates that deaths and injuries from ships and shipping activities remain a threat to endangered large whale species.

One of the greatest threats to cetacean mortality and injury occurs in the commercial fishing industry. More whales die every year through entanglement in fishing gear than from any other cause. Gillnets, set nets, trammel nets, seines, trawling nets, and longlines pose the biggest threat. Gillnets contribute a very high proportion of global cetacean bycatch because of their low cost and widespread use. Traps and pots are often left in the water for extended periods of time. Whales may become entangled in the lines and have been observed swimming with portions of the gear wrapped around fins, flukes, neck, and mouth. Animals may travel long distances over time before they free themselves of the gear or die from the entanglement (Angliss and Demaster 1998). Programs targeted specifically to address the effects on large whales from commercial fisheries include a gear research and development program to reduce the amount of potentially hazardous gear in the water, and the disentanglement network whose personnel work to locate, assess, and remove gear from entangled whales. Recommendations under the recovery plan specific for right whales, designed to reduce commercial fishery interactions with whales, include gear restrictions and modifications, research, and regulatory and enforcement actions (NMFS 2007).

Entanglements may also occur with recreational fishing gear. Little data exists for recreational fishing interactions with marine mammals. As with commercial fishing, large whale entanglements may also result from interactions with recreational fishing. Finfish recreational fisheries typically involve rod and reel and hand lines while traps/pots are common for the lobster and crab industry. The risk of entanglement in recreational gear is relatively small for marine mammals (NMFS 2007).

In northern San Diego Bay, California sea lions use available docks, piers, and buoys to haul-out. It should be noted that San Diego Bay is heavily commercialized with significant amount of civilian pleasure boat traffic (7,000 berthed yachts and sailboats) (San Diego Harbor Police, unpublished data), commercial shipping traffic, and military vessel traffic that all pass by these haul-out locations. In addition, low level military jet and helicopters, and civilian aircraft from local airports constantly overfly the same haul-outs without visible pinniped reaction. The periodic occurrence of coastal stock of bottlenose dolphins have been exposed to the same background noise as well (overflights, vessels).

While the SSTC EIS discusses increases in some training events, the vessels and generally small boats involved are distributed in both time and space, so that typical events happen throughout the year without significant overlap. There is very little empirical data on marine mammal reaction to ambient vessel noise within Southern California integrated over time. In conclusion, the sound from the increased vessel activities would not have a significant cumulative effect on marine mammals within SSTC because no pinniped land haul-outs are within the action area, there is limited at-sea marine mammal occurrence within SSTC ocean areas, there is no marine mammal occurrence within the south San Diego Bay SSTC training areas, and local pinnipeds and dolphins are acclimated to regional anthropogenic sounds.

Habitat loss and degradation is now acknowledged to be a significant threat to cetacean populations (Kemp 1996). The impact of coastal development on whales has not been thoroughly investigated. Habitat alteration has the potential to disrupt the social behavior, food supply, and health of whales. Such activities may stress the animals and cause them to avoid traditional feeding and breeding areas or migratory routes. The most serious threat to cetacean populations from habitat destruction may ultimately prove to be its impact on the lower trophic levels in their food chains (Kemp 1996). Projects that involve dredging or shoreline development (1, 4, 5, 13, 14, 17, and 18 in Table 4-1) could temporarily disturb fish and modify fish habitat within a localized area and indirectly affect individual marine mammals. However, changes to fish habitat from dredging and shoreline modifications not considered to require mitigation would not be sufficient to affect individual fish populations or productivity to a measurable degree.

Insufficient information is available to determine how, or at what levels and in what combinations, environmental contaminants may affect cetaceans (Marine Mammal Commission [MMC] 2003). There is growing evidence that high contaminant burdens are associated with several physiological abnormalities, including skeletal deformations, developmental effects, reproductive and immunological disorders, and hormonal alterations (Reijnders and Aguilar 2002). It is possible that anthropogenic chemical contaminants initially cause immunosuppression, rendering whales susceptible to opportunistic bacterial, viral, and parasitic infection (De Swart et al. 1995).

Several mortality events (die-offs) have been reported for cetaceans. Biotoxins, viruses, bacteria, and El Niño events have been implicated in recent mass mortality events (Domingo et al. 2002). A mass mortality event for humpback whales, apparently associated with biotoxins, occurred along the beaches of Massachusetts in 1987 and 1988. Geraci et al. (1989) concluded that the whales had died from saxitoxin poisoning after consumption of Atlantic mackerel containing the toxin. During the summer of 2003, 17 humpback whales, 3 fin whales, 1 minke whale, 1 long-finned pilot whale, and 3 whales of undetermined species were found dead in the vicinity of Georges Bank. Although a biotoxin (saxitoxin) was found in several samples collected, it was not at lethal levels. Domoic acid was also detected and suspected as a probable cause, but because no brain samples were collected, the role of this biotoxin could not be confirmed (MMC 2004).

Underwater detonations may also have effects on marine mammals. Naval activities within the ROI include underwater detonations. Marine mammals that can be found in the area include gray whales, harbor seals, California sea lions, and bottlenose dolphins. Navy standard operating procedures (SOPs) include the observation of the activity area for 30 minutes prior to detonation and for 30 minutes after to ensure limited effects. Navy SOPs also require that Beaufort sea conditions are less than three before the activity is performed, so that adequate observation is possible. The likelihood that an injury would occur for marine mammal species typically present within the ROI would be negligible because of the low density, lack of high quality foraging habitat, and these species are often near the surface and the water area is relatively shallow. This last condition allows for successful sitings by personnel observing the area before training activities occur.

Risks to marine mammals emanate primarily from ship strikes, exposure to chemical toxins or biotoxins, exposure to fishing equipment that may result in entanglements, underwater detonation, and disruption or depletion of food sources from fishing pressure and other environmental factors. Past, present, and proposed activities within the ROI do not pose a threat to whale populations within the Pacific range. Ship strike, entanglement, and habitat impacts will not have a considerable impact on marine mammal species within the ROI. The cumulative impact of the Proposed Action and the identified projects in Table 4-1 could impact individual marine mammals but these effects would not be at a marine mammal stock level. Therefore, cumulative effects related to marine mammals due to implementation of the Proposed Action in conjunction with past, present, or planned projects in the ROI would be minimal.

### 4.3.10 Sea Turtles

Cumulative impacts on sea turtles would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in an incremental increase in sea turtle mortality, disturbance, and habitat modification. Contributory activities can be categorized into vessel activity, dredging, shoreline development, disturbance, and fishing as sources of potential impact. The ROI for potential cumulative effects to sea turtles encompasses a large area that includes San Diego Bay, nearshore waters of Southern California, and coastal waters and beaches of Mexico. Green sea turtles are the only known sea turtle species likely to be encountered in the ROI. Green sea turtles are considered resident occupants and are not documented to breed within the waters of the ROI.

Potential effects to green sea turtles from the Proposed Action include injury, disturbance, and modification of habitat. Injury and disturbance of green sea turtles and modification of green sea turtle habitat from activities are based on physical and acoustic impacts from vessel activity, pile driving, and explosives within the area the individual actions encompass, and the value and type of habitat known to occur within the specific footprint. (Sections 3.9.2.3 and 3.9.2.4).

Projects that involve dredging or shoreline development (1, 4, 5, 13, 14, 17, 18, and 23 in Table 4-1) could temporarily disturb green sea turtles and may modify foraging habitat within a localized area. Changes to green sea turtle foraging habitat from dredging and shoreline modification not considered to require mitigation would not be sufficient to affect individual green sea turtle populations or productivity to a measurable degree. Impacts from subsistence fishing, coastal development, and disturbance at green sea turtle breeding beaches in Mexico remain the largest threats to green sea turtle populations and breeding success. Vessel activity from other naval activities, commercial traffic, and private pleasure craft have steadily increased for decades and are not considered to adversely impact green sea turtles or their habitat. Green sea turtle mortalities from vessel strikes have not been increasing relative to the increased vessel traffic within the ROI. Historically, commercial fishing activities utilizing long lines and gill nets are documented to adversely impact green sea turtle populations but impacts to the San Diego Bay resident population foraging outside the Bay is unknown. Acoustic sources that are of major concern to green sea turtles include strong underwater shock pulses that can cause physical injury and underwater noise that could affect their behavior or foraging success. Navy training activities coupled with other consistent underwater noise sources from commercial and recreational sources would not be anticipated to create a considerable impact based on acoustic thresholds of the green sea turtle and the fact that the resident population of sea turtles is in San Diego Bay (away from areas most utilized for training activities and underwater detonations).

The status and trend of the resident San Diego Bay green sea turtle population has not been well studied and is based on limited formal data sets. Considering the variability and limited nature of available data sets in conjunction with the green sea turtles' large geographic range and migratory patterns, potential cumulative effects to green sea turtles attributed to San Diego County regional activities are below any measurable threshold. Therefore, cumulative effects related to green sea turtles due to implementation of the Proposed Action in combination with past, present, or planned projects in the ROI would be minimal.

### 4.3.11 Terrestrial Biological Resources

Cumulative impacts on terrestrial biota could result from the effects of the Proposed Action in conjunction with other past and future projects, actions, and processes that occur collectively and over a period of time. The area of influence for potential cumulative effects varies among the various mammals, reptiles, invertebrates (including the San Diego fairy shrimp), and plants including a number of special status species. In general, these plants and wildlife are limited to coastal Southern California and are resident in the terrestrial areas of the SSTC. The San Diego fairy shrimp is found in vernal pools and other seasonally filled soil depressions in coastal Southern California, from Santa Barbara County to northern Baja California, Mexico. Other species are more limited to Southern California dune complexes, including spiders and special status beetles, due to increased training tempo and access to training lanes.

The types of military training activities that could affect terrestrial biological resources include all those taking place on the upper beach above the wrack line (just above the high tide line), the dunes, and vegetated and unvegetated inland areas including vernal pools. These actions are amphibious and beach activities, vehicle use, fluid transfer actions, foot traffic, pyrotechnics including simunitions and blanks, manual excavations, and inland activities at SSTC-S. Several activities contribute to increased foot traffic and human presence that can degrade habitat; this may be through direct trampling of native vegetation and rare plants, the spread of invasive nonnative species, soil compaction, and erosion and sedimentation. These activities may also increase the potential for altering the competitive status of special status plants and wildlife through favoring more habitat generalists. In the inland area of SSTC-S, mammals such as the San Diego black-tailed jackrabbit could experience increased defensive behaviors due to increased human presence and noise. Navy training activities proposed at SSTC may have an effect on the San Diego fairy shrimp; however, management plans through INRMP guidelines would minimize potential effects from occurring in sensitive areas.

The potential impacts on terrestrial species and their respective habitats as a result of the projects identified in Table 4-1 stem from new beachfront development and public access improvements, such as NRRF Dredging, City of Coronado and Coronado Cays Storm Drain Rehabilitation, Beach Public Safety and Restrooms, Wastewater Master Plan, and Sand Replenishment Projects (Projects 2, 5, 7, 8, 11, and 14 respectively). Also, potential impacts may occur from construction associated with the NASNI/NBC Lodge Expansion, U.S. Navy Lighterage, Seacoast Inn Project, Imperial Beach Redevelopment, NRRF Cable Array, and Camp Surf Improvements (Projects 3, 11, 15, 16, 18, 19, and 23 in Table 4-1, respectively) which contribute to effects on terrestrial biological resources by eliminating or degrading habitat. By far, the greatest past and future potential cumulative impact from the collective effect over time and space of non-Navy activities is terrestrial habitat loss.

According to various Navy Integrated Natural Resources Management Plan (INRMPs) for San Diego, Coronado, and Imperial Beach, the Navy is addressing potential effects on terrestrial biota in several important ways, including measures to prevent the establishment of invasive plant species by minimizing the potential for introductions of seed or other plant parts (propagules) of exotic species and finding and eliminating incipient populations before they are able to spread. Key measures include 1) regular monitoring and treatment to detect and eliminate establishing exotic species; 2) effective measures to foster the reestablishment of native vegetation in areas where nonnative vegetation is present; 3) measures to correct developing erosion problems, such as correcting drainage from roads and culvert outlets where they contribute to concentration of flow potentially leading to gullying, and measures designed to stop the progression of existing gullies associated with developed sites and roads; and 4) maintenance of an up-to-date inventory of sensitive plant and wildlife species locations and consulting the inventory in all environmental reviews.

The Proposed Action’s effects on terrestrial biology in the ROI would be mitigated through INRMP guidelines, general management practices, and Endangered Species Act consultation. Any Navy contribution to cumulative effects of all past, present, and proposed projects within the ROI as it relates to habitat degradation and subsequent species impacts is reduced as a result of implementation of the specific mitigation measures identified. Therefore, cumulative effects related to terrestrial biological resources due to implementation of the Proposed Action in conjunction with past, present, or planned projects in the ROI would be minimal.

### 4.3.12 Birds

Cumulative impacts on birds could result from the Proposed Action in conjunction with other past and future projects, actions, and processes that occur collectively and over a period of time. Bird species encompass varying distribution patterns; thus cumulative impacts have varying areas of influence. Some are resident breeders, while others are fall or winter migrants that come to rest and forage, and still others arrive to nest (mostly seabirds) in the spring and summer. Each species uses the area in various ways in time and space. The area of influence for potential cumulative effects is very wide for migratory birds of the Pacific Flyway coming from Canada and Alaska, as well as the neotropical migrants arriving from southern Mexico, Central America, and farther. Resident breeders have a much more constrained range, generally coastal Southern California's wetland areas.

Potential effects to birds from the Proposed Action include mortality and injury, disturbance, and modification of habitat. Mortality, injury, and disturbance of birds or modification of habitat could stem from most of the activities described for the Proposed Action, including physical and acoustic impacts of detonations, pyrotechnics, pile driving, vessel traffic that causes flushing or direct impact, vehicle use or foot traffic that tramples nests or flushes birds, shoreline construction or amphibious activities that alter substrate conditions or create temporary turbidity, activities that might release chemicals into the water, or introduction of debris into the water column. Impacts to diving birds in the vicinity of underwater detonation points are avoided and minimized because these activities are halted until the birds have left the area (Sections 3.12.2.3 and 3.12.2.4 for full analysis).

Contributory activities from the projects listed within Table 4-1 can be categorized into the following sources of potential impact: 1) restoration plans that involve habitat type conversion or foster increased predation, 2) beachfront development, 3) dredging, and 4) increased public access of areas used by birds. Projects listed within Table 4-1 that involve shoreline development or dredging (1, 4, 5, 13, 14, 17, 18, 23, and 24) temporarily or permanently disturb habitat used by birds within a localized area, and can create habitat for predators of shorebirds and nesting seabirds. Changes to substrate from shoreline modification not requiring mitigation would not be sufficient to affect individual populations or productivity of avian forage to a measurable degree. Vessel activity from other naval activities, commercial traffic, and private pleasure craft have steadily increased for decades and are not considered to have adversely impacted bird populations or their habitat. The areas of highest abundance and diversity for invertebrate forage for birds, such as mudflats, salt pond, and salt marsh, are avoided by the Proposed Action as well as other proposed activities in Table 4-1, with the exception of the Comprehensive Conservation Plan (CCP) restoration proposal (Project 21 in Table 4-1). Restoration plans that involve habitat type conversion can affect one class of bird over another. The United States Fish and Wildlife Service USFWS' CCP for the South Bay National Wildlife Refuge, if implemented, could favor salt marsh over shorebird habitat. Therefore, there could be a cumulative impact to shorebirds due to development or restoration plans in combination with projects that degrade intertidal areas preferred by shorebirds for foraging or resting. However, this concern is minimized or even eliminated because of the protection from development afforded to shorebirds by the presence of the Refuge, and because of the requirement to mitigate any losses under the Clean Water Act.

Large scale concerns for bird populations, such as climate change, reduced fish populations, discharge of hazardous chemicals and sewage, and development in other regions or countries are not well defined for individual species; however, the overall decline of birds has been attributed to these causes and so they must be considered. The single greatest concern is the loss of suitable habitat for nesting and roosting shorebirds and seabirds throughout coastal California due to land development and human encroachment. No permanent habitat loss is expected from the Proposed Action. Overall, the protection from urban development afforded by the security and safety requirement of military training activities has maintained the habitat for a wide array and abundance of migratory birds. By default, open space within military installations in coastal locations has become vital to the persistence of bird breeding and roosting populations because effective Navy training requires land to be in its natural state.

The cumulative impact of the Proposed Action and the identified projects in Table 4-1 could impact individual birds, their overall foraging success, and breeding opportunity, but these would not affect any overall bird populations. The consequences of the proposed military training on nonfederally listed migratory birds or modification of their habitat are evaluated based on the significance criteria described in the final rule authorizing the Department of Defense to take migratory birds during military readiness activities (50 CFR 21). As mentioned previously (Section 3.12.1.1.1), military readiness activities are exempt from the take prohibitions of the Migratory Bird Treaty Act provided they do not result in a significant adverse effect on a population of a migratory bird species. Analysis within Section 3.12 states that all native, indigenous birds are covered under the Migratory Bird Treaty Act (3.12.1.1.1). Further analysis states that there would be no adverse effect on overall populations of bird species with the implementation of the Proposed Action. Similarly, contributing stressors from Table 4-1 listed above would not adversely affect overall populations of bird species. Therefore, cumulative effects related to birds due to implementation of the Proposed Action in conjunction with past, present, or planned projects in the ROI would be minimal.

### 4.3.12.1 California Least Tern

California least terns are present in the area of San Diego Bay from about mid-April to early September. Effects from activities described under the Proposed Action are analyzed in detail in the Biological Assessment associated with this EIS, and cumulative effects from other nonfederal actions in the SSTC ROI are also considered in the assessment. The additional vessels, shoreline development, human access, and other effects of the projects listed in Table 4-1 are not expected to make a measurable difference on the California least tern's success because the other nesting sites nearby and in the region are for the most part already protected from development and human access. An exception may be the cumulative effect of actions that increase the probability of invasive weeds in nesting areas or predation at nesting sites, such as by the gull-bill tern, rats, feral cats, and ants. Fewer, more densely occupied protected sites on both federal and nonfederal lands for nesting terns also increases the probability of impacts from predation, disease, or other catastrophic events. Counteracting these cumulative effects would be the expected enhancement of areas of intertidal habitat in San Diego Bay, such as at the Chula Vista Wildlife Reserve. The Navy's comprehensive management program for the California least tern on its training areas in San Diego Bay includes intensive monitoring of the birds as well as predator control and habitat enhancement projects. These management measures can help mitigate, with additional effort, adverse effects from off-site sources.

### 4.3.12.2 Western Snowy Plover

The western snowy plover nests in colonies on sandy beaches in the San Diego Bay area from March into mid-to-late September. Kelp wrack provides an abundant food source for the invertebrates that frequent these kelp piles, and mudflats are also used for foraging. Effects of increased human access, increased predation, and loss or conversion of intertidal mudflats to vegetated habitat could have cumulative impacts on the snowy plover. Intrusion of salt marsh vegetation, or of nonnative vegetation, on plover nesting grounds poses problems for plover chicks, possibly preventing them from moving freely to forage or escape incoming tides (Copper 1997a, b). Predation by birds and mammals (especially ravens and crows) is the primary cause of reproductive failure for plovers (Copper 1997a, b; USFWS 1997b). Several of the projects identified in Table 4-1 include increased public usage to SSTC beaches, specifically projects 3, 15, and 16. This increased public usage could result in adverse cumulative effects in combination with the Navy's Proposed Action. However, the Navy's comprehensive management program for the western snowy plover on its training areas in San Diego Bay includes intensive monitoring of the birds, predator control, limiting public usage of nesting beaches, and habitat enhancement projects. Other unknown causes of mortality in and around San Diego Bay have been documented and studied by the USFWS with full support of the Navy. These management measures can help mitigate, with additional effort, adverse effects from off-site sources.

#### 4.3.12.3 California Brown Pelican

In the SSTC ROI, pelicans, especially postbreeding juveniles gather before fall migration, roost, and prepare to scatter to find new territory. The only breeding population in United States waters is the SCB population, which consists of breeding birds on the Channel Islands. The USFWS estimates that 12,000 individual California brown pelicans (6,000 pairs) have bred in southern California in recent years, composing approximately 12 percent of the California subspecies (about 100,000 breeding birds). None of the actions described under the Proposed Action or in the projects listed in Table 4-1 are expected to have a cumulative impact on this species. Previous causes of decline have been greatly reduced largely through the Environmental Protection Agency's banning of the use of dichlorodiphenyltricholoroethane and similar pesticides in 1972. Other factors implicated in the decline of this subspecies include human disturbance at nesting colonies and food shortages (USFWS 2008). The brown pelican nests mostly on offshore islands, so such disturbance is not possible by any of the activities under the Proposed Action. Food shortages are part of a larger climate effect and are not affected by any of the activities under the Proposed Action.

### 4.3.13 Cultural Resources

Cumulative impacts on cultural resources would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in potential impacts on cultural, archaeological, and historic sites. Implementation of the Proposed Action would have little or no contribution to impacts on known underwater and terrestrial cultural resources, due to the few cultural sites present and the limited use of the activity area and because training activities actively avoid these locations.

Projects listed in Table 4-1 with the potential to disturb cultural resources would undergo environmental review and, if necessary, be assigned mitigation measures similar to those described for the Proposed Action. All digging and dredging around any recorded archeological sites with known or potential eligibility for listing with the National Register of Historic Places (NHPA) would be restricted. All eligible or potentially eligible archeological sites, if located, would be restricted to foot traffic only. With mitigation measures observed, most other ongoing and anticipated projects described in Table 4-1 would not substantially affect underwater cultural resources. Military projects detailed in Table 4-1 would be addressed under the NHPA. As dictated by the NHPA, the U.S. Navy is obligated to protect its own historic properties in a way that emphasizes preservation and minimizes the impact of undertakings that might adversely affect such properties.

In conclusion, proposed and ongoing projects by surrounding cities and municipalities may cause effects to cultural resources but they would not be the same resources potentially affected by the Navy. Therefore, cumulative effects related to cultural resources as a result of implementation of the Proposed Action in combination with past, present, or planned projects in the ROI would be minimal.

### 4.3.14 Transportation and Circulation

Implementation of the Proposed Action would generate an increase in vehicle trips and vessel traffic associated with military training activities. Since no increase in employment is associated with the Proposed Action, increases in traffic volumes would be associated with proposed increases in training tempo. The Proposed Action would contribute to increased traffic at intersections in front of NAB in Coronado and at the NRRF gate in Imperial Beach. Military training activities along Silver Strand Boulevard would represent approximately two percent of the total daily traffic volume.

Cumulative impacts on transportation and circulation would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in increased traffic volumes or vessel traffic in the ROI. Traffic generation associated with military and civilian projects that are completed, in progress, or planned for development in Coronado and Imperial Beach detailed in Table 4-1 have been factored into San Diego Association of Governments traffic forecasts. Therefore, while individual projects would contribute to traffic generation on roadways affected by the Proposed Action, regional level planning has taken place to consider associated traffic levels. Increased traffic from three NIMITZ-Class aircraft carriers (Project 17 in Table 4-1) was determined to have a minimal cumulative effect due to the fact that the three carriers would be in port concurrently an average of twenty nine intermittent, non-consecutive days each year (DoN 2008). Projects in the past, present, or planned in the SSTC ROI involving marine vessels generally do not result in disruptions to vessel traffic in the area. Therefore, cumulative effects related to transportation and circulation (vehicles and vessels) due to implementation of the Proposed Action in combination with past, present, or planned projects in the ROI would be minimal.

### 4.3.15 Socioeconomics, Environmental Justice, and Protection of Children

Cumulative impacts on socioeconomics, Environmental Justice, and Protection of Children would consist of the effects of the Proposed Action in combination with other projects, actions, and processes that would result in effects on regional employment, income, housing, or infrastructure.

Implementation of the Proposed Action would not result in an increase in permanently stationed personnel or employees at SSTC. Despite an increase in training tempo, proposed activities would be conducted by Navy personnel and staffing employed in the region. Therefore, existing regional population and associated housing impacts, employment rates, and regional economy would remain unchanged as a result of implementation of the Proposed Action. In addition, implementation of the Proposed Action would not create any disproportionately high and adverse human health or environmental effects on minority or low income populations, nor would the safety risks of the Proposed Action disproportionately affect children. Implementation of the Proposed Action would not affect the hearing of children, but may momentarily disrupt communication in nearby residences and schools (See Sections 3.15.2.3 and 3.15.2.4).

The Proposed Action would not contribute to cumulative effects in the region due to lack of effect on regional employment, income, housing, or infrastructure. In conclusion, cumulative effects related to socioeconomics due to implementation of the Proposed Action in combination with past, present, or planned projects in the ROI would be minimal.

### 4.3.16 Public Health and Safety

Cumulative impacts on public health and safety would consist of the aggregate effects of the Proposed Action and other projects, actions, and processes that could increase risks to people within the ROI. The ROI for public health and safety consists of Silver Strand peninsula, bayside and oceanside training areas, and adjacent public areas. Relevant effects in marine areas would include danger from the Proposed Action, recreational and commercial fishing, dredging and sand replenishment projects (see Table 4-1), ship collisions/ ship strike, and other natural ocean dangers. Relevant effects in terrestrial areas would include danger from proximity to construction vehicles and equipment. The cumulative effects of these activities are known only in a very general sense.

Training at SSTC has the potential to pose a risk to the public primarily through off-site aircraft and vessel operations, underwater detonations, and intrusion of the public into SSTC training areas. Under the Proposed Action, the level of unauthorized access to training areas could decrease in response to more intense use of beach areas by the Navy. Aircraft and marine vessel support for Navy training activities would increase, but public safety is expected to be maintained (see Section 3.16). The volume of Navy underwater detonation activities poses a risk that training equipment could be lost and recovered by beachgoers, recreational fisherman, or divers. The Navy has specific and documented procedures in place to ensure that nonparticipants are not endangered by Navy actions.

Marine and terrestrial naval training activities could affect nearby individuals; however this potential is mitigated by United States Coast Guard regulations on the water, vehicle and traffic laws of surrounding areas, and local ordinances. Navy range clearance measures after completion of training evolutions and active monitoring for nonparticipant activity on the beach, ocean, and bayside training areas are mitigation measures established by the military to prevent harm and ensure public safety. Training and support activities in joint military-public use areas outside of SSTC, such as aircraft and watercraft transiting to and from the training areas, have the most potential for impacts on public health and safety.

The Proposed Action and other activities performed and proposed by surrounding commercial, industrial, and recreational interests do not normally increase the risk of impacts on health and public safety resources. The incremental impacts of the Proposed Action do not represent any appreciable contribution to cumulative health and safety risks when added to other past, present, and reasonably foreseeable future actions. Therefore, cumulative effects on public health and safety from implementation of the Proposed Action when added to past, present, or planned projects in the ROI would be minimal.

# 5 Mitigation

# 5 MITIGATION

As part of the Navy's commitment to sustainable use of resources and environmental stewardship, the Navy incorporates measures that are protective of the environment into all of its activities. These include employment of best management practices, standard operating procedures, adoption of conservation recommendations, and other measures that mitigate the impacts of Navy activities on the environment. Some of these measures are applicable and others are designed to apply to certain geographic areas during certain times of year and for specific types of Navy training. Mitigation measures covering habitats and species occurring in the Silver Strand Training Complex (SSTC) have been developed through various environmental analyses conducted by the Navy for land and sea ranges and adjacent coastal waters. These mitigation measures are promulgated through the use of Navy messages issued to all units and commands training on SSTC. The following discussion describes mitigation measures applicable to Navy activities at SSTC.

In addition to identification of current mitigation measures, the EIS also identifies, in compliance with 40 Code of Federal Regulations (CFR) 1502.14 (h), further measures not currently being undertaken that would mitigate environmental impacts to a given resource. Each of the alternatives, including the Proposed Action considered in the Environmental Impact Statement (EIS), includes mitigation measures intended to reduce the environmental effects of Navy activities.

## 5.1 LAND USE AND RECREATION

There are no mitigation measures implemented to minimize impacts specific to land use in the SSTC Region of Interest (ROI). However, the Navy strives to be a good neighbor to the community by maintaining, to the greatest extent practicable, land use compatibility with the surrounding neighborhood and providing public access whenever possible. The Navy recognizes the importance of public access and works with the community to ensure access to the public beach areas. Further, there are mitigation measures in place for other resources that apply to land use on SSTC, mainly through the stipulation of training parameters (e.g., Acoustic Environment [Section 3.6], Biological Resources [Sections 3.7-3.12], Public Health and Safety [Section 3.16]).

## 5.2 GEOLOGY AND SOILS

The Navy has implemented the following measures to mitigate the effects of its training activities on soils:

- Sand (of a quality that is appropriate for nesting California least terns) is periodically replenished on Delta beaches when available.
- Vegetation on the back dunes of SSTC beaches is maintained to reduce water and wind erosion.
- In inland SSTC-South (S) areas, vehicles are restricted to existing roads to minimize the loss of vegetation.

No new measures are necessary to mitigate effects of the Proposed Action on SSTC soils or sediments. No substantial impacts on soils from these activities were identified. However, current mitigation measures, in place to mitigate the effects of training activities on soils, would continue to be implemented at SSTC.

## 5.3 AIR QUALITY

The Navy has a comprehensive air quality management program. Mitigation measures that are part of the Navy's air quality management practices are implemented at SSTC. Vehicles participating in training exercises that occur on unpaved surfaces travel at slow speeds, which minimizes fugitive dust generation.

Training areas at SSTC include beach areas, where vehicles travel on hard-packed or wet sand with minimal silt content, which also minimizes fugitive dust generation. Aircraft, marine vessels, ground vehicles, and TSE are required to be maintained and meet applicable emission standards (such as smog certification for on-road vehicles) in accordance with state requirements.

The current Navy air quality management program and practices would continue to be implemented at SSTC.

## 5.4 HAZARDOUS MATERIALS AND WASTE

The Navy's general instructions (e.g., Chief of Naval Operations Instruction [OPNAVINST] 5090.1) and training activity planning and review processes serve to ensure that hazardous materials and hazardous wastes are stored and handled appropriately. The Navy’s current mitigation measures include its *Business Plan* (Section 3.4.1.3), *Naval Base Coronado (NBC) Hazardous Substance Release Integrated Contingency Plan* (DoN 2008), and *Regional Explosive HWMP* (Section 3.4.1.4). Navy personnel also collect expended training materials at the conclusion of a training activity to the extent practicable.

Current mitigation measures, including implementation of practices outlined in Navy plans (listed in Section 3.4.1.5) and the collection of expended training materials, would continue to be implemented.

## 5.5 WATER RESOURCES

The Navy’s current practices affecting water quality, primarily hazardous materials handling and waste disposal practices, are based on requirements in OPNAVINST 5090.1. Those requirements, in turn, were developed primarily to comply with federal environmental regulations. Efforts to preserve vegetation on the backsides of dunes along the shoreline may reduce erosion and thus reduce transport of sediments into adjacent surface waters. Collection of spent training materials at the conclusion of training activities also may incrementally reduce the amounts of contaminants transported into adjacent waters.

With respect to water use, the Navy mitigates potential effects by avoiding washing causeway pier sections in the ocean and by pumping seawater through its Offshore Petroleum Discharge System during training instead of using petroleum products. OPNAVINST includes guidance on shipboard operations afloat.

Current mitigation measures implemented to protect water quality would continue to be implemented.

## 5.6 ACOUSTIC ENVIRONMENT (TERRESTRIAL)

Noise effects of Navy training activities at SSTC are managed via administrative controls (planning). Activity planning considers location (e.g., Breacher training are located in inland areas) and time of day. Call-outs during physical conditioning training are minimized at night and when in residential areas. The Navy notifies local emergency personnel prior to training exercises that include the use of pyrotechnics or blanks.

There are no new proposed mitigation measures for any of the alternatives. Current mitigation measures (Section 3.6.1.6) will continue to be implemented for Navy training at SSTC.

## 5.7 MARINE BIOLOGICAL RESOURCES

### 5.7.1 Current Management of Marine Special Aquatic Sites

Eelgrass is mapped throughout San Diego Bay about every three to five years jointly by the Navy and Port of San Diego as part of implementing the San Diego Bay Integrated Natural Resources Management Plan (INRMP). Eelgrass transects are monitored on an annual basis by the Navy and Port of San Diego.

### 5.7.2 Current Management of Invertebrates as Water and Sediment Quality Indicators

The Navy participates in the national water quality monitoring program called Mussel Watch. National Oceanic and Atmospheric Administration's (NOAA) National Status and Trends Program Mussel Watch Project (1986-present) monitors bioaccumulation in mussels, plus other parameters offshore in south San Diego Bay and intertidal and offshore in north San Diego Bay. NOAA also conducts the National Benthic Surveillance Program (1984-present) to examine physical, chemical, and biological (diseases and bioaccumulation in fish) parameters in offshore areas of central and north San Diego Bay.

### 5.7.3 Current Mitigation Measures

The sections above describe special aquatic sites, and what the Navy does to monitor their status and to comply with state and federal regulations. Essential Fish Habitat (EFH) is discussed in Section 3.7 and 3.8.

Eelgrass is managed in compliance with the Southern California Eelgrass Mitigation Policy, created jointly in 1991 by United Stated Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), and California Department of Fish and Game (CDFG), which established protocols for mitigating adverse impacts to eelgrass. Project sponsors must follow the guidelines of how and when to survey, map, choose a mitigation site, replant, monitor, and meet success criteria for the eelgrass. Delays in any of these stages can result in financial penalties. The Navy has established several Navy Eelgrass Mitigation Sites (NEMS) to compensate for past impacts and to mitigate future impacts on eelgrass habitat within San Diego Bay. Eelgrass that has been planted and not used to compensate for previous losses is banked for future use in accordance with the Southern California Eelgrass Mitigation Policy. Five eelgrass mitigation sites contributing to the bank have already been constructed and met the five-year performance standards required by NMFS. This mitigation banking agreement between the Navy and NMFS was recently signed as the Navy's Eelgrass Mitigation Bank Management Plan, and establishes a system of management, administration, and accounting for the Navy (Department of the Navy [DoN], 2008). The principal goal of the mitigation bank is to establish functional eelgrass habitat qualifying as a special aquatic site, as defined in 40 CFR 230.40-45, within San Diego Bay for mitigating impacts associated with projects and operational training needs, and to establish credits from surplus habitats for future use. A Mitigation Bank Technical Team, a multiagency team, provides technical expertise in and support for implementing the Bank. The team includes the Navy as Chair, U.S. Army Corps of Engineers, USFWS, NMFS, and CDFG.

Besides the NEMS, the Navy maintains permanent eelgrass monitoring transects in San Diego Bay that are monitored every year (Figure 3.7-9) and bay-wide mapping of eelgrass density classes is conducted every three to five years in a joint Navy-Port of San Diego effort (1994, 1999/2000, 2004, and 2008, the most current 2008 data was recently made available (DoN, 2009). This monitoring program allows the Navy to track fluctuations in the coverage, extent, and health of eelgrass in San Diego Bay. These data provide a valuable long-term perspective that can help identify effects from catastrophic, as well as seasonal natural and anthropogenic events.

### 5.7.4 Proposed Mitigation Measures

Mitigation for impacts to 1.13 acres of eelgrass (designated as EFH) for larger boat landings, Elevated Causeway (ELCAS), and causeway insertions in the designated training lane on Bravo Beach will be mitigated and consistent with the Southern California Eelgrass Mitigation Policy. This mitigation will occur at an established NEMS and be drawn as part of the Navy Eelgrass Mitigation Bank.

As a result of consultation with the NMFS for EFH, the Navy will conduct a new bottom habitat mapping survey to more accurately detail potential habitat types (ex., sand, cobble, rocks) within the oceanside SSTC boat lanes. This effort, scheduled to begin in 2011, is designed to update bottom type classification at finer resolution and spatial scales than previous California State funded surveys from 2002. The goal from this Navy funded survey would be to provide information to NMFS on habitat types within SSTC, and to Navy commands conducting underwater detonations at SSTC for consideration in selection of appropriate bottom-laid detonation sites.

## 5.8 FISH

Habitat mitigation for intertidal and subtidal areas (see Section 3.7), including eelgrass, provide a degree of mitigation for fish species documented to reside within those habitats.

All species groups are monitored through the San Diego Bay INRMP, including, at a minimum, baseline inventory and regular monitoring. A portion of the fish species are also intermittently evaluated through the project site approval process. The most recent comprehensive San Diego Bay survey effort was in April and July 2005 (Pondella et al. 2006). Surveys identify and quantify San Diego Bay's utilization of fishery populations, identify habitats that support juvenile fish, and determine areas of San Diego Bay that support important populations of forage fish species. The INRMP and surveys are funded jointly by the U.S. Navy and the Port of San Diego.

Since most of the local marine environment consists of soft-bottom habitat with few rocky habitats, the local fish populations are not robust, thus most Navy activities implemented for Alternatives 1 and 2 will not affect fish populations within the ROI. The largest expected impact to fish species and assemblages comes from underwater detonations and the modification or destruction of eelgrass habitat within Bravo training area. The mitigation for 1.13 acres of lost eelgrass habitat stipulated in Section 3.7 would compensate for fish and fish habitat lost or displaced by Navy activities, thus partially mitigating effects to fish and eelgrass habitat. Additionally, the set aside of undeveloped shoreline for training assures that high value eelgrass and saltmarsh habitat remains available to fish for foraging and reproduction.

As a result of the EFH consultation with the NMFS, the Navy will conduct a new bottom habitat mapping survey to more accurately detail potential habitat types (ex., sand, cobble, rocks) within the oceanside SSTC boat lanes. This effort, scheduled to begin in 2011, is designed to update bottom type classification at finer resolution and spatial scales than previous California State funded surveys from 2002. The goal from this Navy funded survey would be to provide information to NMFS on habitat types within SSTC, and to Navy commands conducting underwater detonations at SSTC for consideration in selection of appropriate bottom-laid detonation sites. Similar to the measures used to avoid sensitive habitats when selecting underwater explosive device detonation sites, the nearshore habitat survey data will also be used to ensure the OPDS system is not placed within any sensitive habitats.

The Navy will conduct April to May pre-event surveys for grunion prior to SSTC training events that could to disturb intertidal beach areas. From Table 2-1, events identified for grunion pre-event surveys include 41- Causeway Pier Insertion and Retraction training (max. of 10 per year), and 42-ELCAS (max. of four per year). These training events generally occur within only a few boat\beach lanes in SSTC-N and can occur throughout the year. For events that have a requirement to occur in April and May, the

Navy will use predicted grunion spawning periods obtained from the California Department of Fish and Game (http://www.dfg.ca.gov/marine/grunionschedule.asp ) to anticipate times to survey 10-14 days prior to the next ELCAS or Causeway Pier Insertion and Retraction.

This survey will identify if grunion spawning occurred or did not occur on the beach area scheduled for training. If grunion spawning is documented, then a determination on the spatial extent of spawn across the planned training area and magnitude of spawning (on the standard grunion 0-5 spawning scale) will be made. If a significant spawning run is observed (4 or 5 on the spawning scale) coincidental with and at the same location as the beach-impacting training event, the Navy will attempt to delay the event or move to a training area of lower density spawning or an area of no spawning. If such a shift cannot be done due to schedule conflict over multiple SSTC boat and beach lanes, logistic requirements to use a specific lane or area within a lane that precludes a shift, or safety considerations (ex., weather conditions, sea state), then the Navy will inform NMFS Southwest Region that training was conducted on that site for the specified reason.

Under the NMFS Incidental Harassment Authorization (IHA) consultation, there will likely be annual SSTC-specific reporting requirements on the quantities (number of detonations) and types (charge weight) of individual explosive used. In addition, also as part of the IHA monitoring requirement, the Navy will be conducting representative mitigation monitoring for a sub-set of the total underwater detonations authorized by NMFS. This is approximately 4-16 individual detonation training events. During this monitoring, civilian marine biologists will independently observe the oceanside detonation site for marine mammals and sea turtles to ensure and document that the correct protective measures are applied. Under the EFH consultation, these biologists will also document the extent and quantity of any fish morality (or lack of mortality). This information will be included in the Navy's annual monitoring report to NMFS.

## 5.9 MARINE MAMMALS

As discussed in Section 3.9, the measures implemented by the Navy to reduce impacts to marine mammals apply to marine mammals that transit through the offshore training lanes. In particular, establishment of marine mammal exclusion zones for underwater detonations of explosives, pile driving/removal activities and pre- and post-exercise surveys, all serve to reduce or eliminate potential impacts of Navy activities marine mammals that may be present in the vicinity.

Effective training in the SSTC dictates that activity participants utilize their sensors and exercise weapons to their optimum capabilities as required by the mission. This section is a comprehensive list of mitigation measures that would be utilized for training activities analyzed in the SSTC in order to minimize potential for impacts on marine mammals in the SSTC.

This section includes protective and mitigation measures that are followed for all types of exercises; those that are associated with a particular type of training event; and those that apply to a particular geographic region or season. Appropriate measures are also provided to non-Navy participants (other Department of Defense [DoD] and allied forces) as information in order to ensure their use by these participants.

### 5.9.1 Current Mitigation Measures

The following mitigation measures, which are situation/location dependent (e.g., substrate type, water depth, charge weights, etc) for underwater detonations incorporate the existing range procedures at SSTC and are consistent with existing training objectives and activities as well as established human safety procedures. In case of unanticipated conflict, human safety considerations will take precedence and such conflicts are always used to make incremental improvements in the procedures used in subsequent activities.

Mitigation measures for very shallow water (VSW) underwater detonations on SSTC oceanside (0-24 feet):

- Easily visible anchored floats will be positioned on a 1,200 foot or 400 yard radius of a roughly semi-circular zone (the shoreward half being bounded by shoreline and immediate off-shore water) around the detonation location for small explosive exercises at the SSTC. These mark the outer limits of the mitigation zone.
- For each VSW underwater detonation event, a safety-boat with a minimum of one observer is launched 30 or more minutes prior to detonation and moves through the area around the detonation site. The task of the safety observer is to exclude humans from coming into the area and to augment a shore observer's visual search of the mitigation zone for marine mammals. The safety-boat observer is in constant radio communication with the exercise coordinator and shore observer discussed below.
- A shore-based observer will also be deployed for VSW detonations in addition to boat based observers. The shore observer will indicate that the area is clear of marine mammals after 10 or more minutes of continuous observation with no marine mammals having been seen in the mitigation zone (1,200 feet or 400 yards) or moving toward it.
- At least 10 minutes prior to the planned initiation of the detonation event-sequence, the shore observer, on an elevated on-shore position, begins a continuous visual search with binoculars of the mitigation zone. At this time, the safety-boat observer informs the shore observer if any marine mammal has been seen in the zone and, together, both search the surface within and beyond the mitigation zone for marine mammals (and other protected species such as sea turtles).
- The observers (boat and shore based) will indicate that the area is not clear any time a marine mammal is sited in the mitigation zone or moving toward it and, subsequently, indicate that the area is clear of marine mammals when the animal is out and moving away and no other marine mammals have been sited.
- Initiation of the detonation sequence will only began on final receipt of an indication from the shore observer that the area is clear of marine mammals and will be postponed on receipt of an indication from that any observer that the area is not clear of marine mammals.
- Following the detonation, visual monitoring of the mitigation zone continues for 30 minutes for the appearance of any marine mammal in the zone. Any marine mammal appearing in the area will be observed for signs of possible injury.
- Any marine mammal observed after an VSW underwater detonation either injured or exhibiting signs of distress will be reported to Navy environmental representatives from the regional Navy shore commander (Commander, Navy Region Southwest) and U.S. Pacific Fleet, Environmental Office, San Diego Detachment. The Navy will report these events to the Stranding Coordinator of NMFS' Southwest Regional Office using Marine Mammal Stranding communication trees and contact procedures established for the Southern California Range Complex. These voice or email reports will contain the date and time of the sighting, location (or if precise latitude and longitude is not currently available, then the approximate location in reference to an established SSTC beach feature), species description (if known), and indication of the animal's status.

Mitigation measures for shallow water underwater detonations on SSTC oceanside (24-72 feet):

- A mitigation zone of 1,500 feet or 500 yards will be established around each underwater detonation point. This mitigation zone is based on the maximum range to onset-TTS (either 23 psi or 182 dB).

- A minimum of two boats, including but not limited to small zodiacs and 11-meter Rigid Hulled Inflatable Boats (RHIB) will be deployed. One boat will act as an observer platform, while the other boat is typically the diver support boat.
- Two observers with binoculars on one small craft/boat will survey the detonation area and the mitigation zone for marine mammals from at least 30 minutes prior to commencement of the scheduled explosive event and until at least 30 minutes after detonation.
- In addition to the dedicated observers, all divers and boat operators engaged in detonation events can potentially monitor the area immediately surrounding the point of detonation for marine mammals (and other protected species such as sea turtles).
- If a marine mammal is sighted within the 1,500 foot or 500 yard mitigation zone or moving towards it, underwater detonation events will be suspended until the marine mammal has voluntarily left the area and the area is clear of marine mammals for at least 30 minutes.
- Immediately following the detonation, visual monitoring for marine mammals within the mitigation zone will continue for 30 minutes. Any marine mammal observed after an underwater detonation either injured or exhibiting signs of distress will be reported to Navy environmental representatives from the regional Navy shore commander (Commander, Navy Region Southwest) and U.S. Pacific Fleet, Environmental Office, San Diego Detachment. The Navy will report these events to the Stranding Coordinator of NMFS' Southwest Regional Office using Marine Mammal Stranding communication trees and contact procedures established for the Southern California Range Complex. These voice or email reports will contain the date and time of the sighting, location (or if precise latitude and longitude is not currently available, then the approximate location in reference to an established SSTC beach feature), species description (if known), and indication of the animal's status.

Mitigation for ELCAS/Pile Driving Activities on SSTC oceanside:

- A mitigation zone will be established at 150 feet or 50 yards from ELCAS pile driving and pile removal events. This mitigation zone is base on the predicted range to Level A harassment (180 dB RMS) for cetaceans, and is being applied conservatively to both cetaceans and pinnipeds.
- Monitoring will be conducted within the 150 foot or 50 yard mitigation zone surrounding ELCAS pile driving and removal events for the presence of marine mammals (and other protected species such as sea turtles) before, during, and after pile driving and removal events.
- If marine mammals are found within the 150 foot or 50 yard mitigation zone, pile removal events will be halted until the marine mammals (or sea turtles) have voluntarily left the mitigation zone.
- Monitoring for marine mammals (or sea turtles) will take place concurrent with pile removal events and 30 minutes prior to pile driving and removal commencement. A minimum of one trained observer will be placed on shore, on the ELCAS, or in a boat at the best vantage point(s) practicable to monitor for marine mammals.
- Monitoring observer(s) will implement shut–down/delay procedures when applicable by calling for shut–down to the hammer operator when marine mammals (or sea turtles) are sighted within the mitigation zone.
- Soft Start - Providing additional protection for marine mammals (and sea turtles), ELCAS pile driving includes a soft start as part of normal construction procedures. The pile driver increases impact strength as resistance goes up. At first, the pile driver piston drops a few inches. As resistance goes up, the pile driver piston will drop from a higher distance thus providing more impact due to gravity. This will allow marine mammals in the project area to vacate or begin vacating the area minimizing potential harassment. The ELCAS soft start is not the traditional soft-start used in bigger civilian construction projects, and doesn't include a waiting period (an initial set of several strikes from the impact hammer at 40-60 percent energy levels, followed by a

one minute waiting period, then two subsequent 3 strike sets), but does provide additional time for marine mammals to vacate the area. Including waiting periods as part of training would be inconsistent with Navy training objectives that requires the ELCAS to be constructed as quickly as possible in real world conditions to ensure rapid supply of equipment and materials to shore in a hostile territory during wartime, or during humanitarian assistance operations.

### 5.9.2 Proposed Mitigation Measures

Mitigation measures for oceanside underwater detonations would remain the same as described above. The buffer increase would accommodate the largest Level B behavioral harassment ZOI (distance to sub-TTS threshold) under Alternatives 1 and 2 (MMS sequential detonations).

In addition, the Navy would implement mitigation measures for underwater detonations involving Shock Wave Generator (SWAG), which are proposed in Alternative 1 and 2, but are not currently conducted. For SWAG charges laid bayside on SSTC:

- A buffer zone of 180 feet will be established around each SWAG detonation point.
- Observer(s) with binoculars and small craft will survey the detonation area and the buffer zone for marine mammals from at least 10 minutes prior to commencement of the scheduled explosive event until at least 10 minutes after detonation. Lookouts will pay extra attention within the buffer zone to large amounts of floating kelp strands and other marine debris (if any), since these may provide shelter and food for prey.
- Divers placing charges on mines and dive support vessels will check the area immediately around the mine location for marine mammals.
- If a marine mammal or turtle is sighted within the buffer zone or moving towards it, exercises will be suspended until the animal has voluntarily left the area and the area is clear of marine mammals for at least 10 minutes.
- Immediately following the detonation, visual monitoring for marine mammals within the buffer zone will continue for 10 minutes. Any animals appearing will be observed for signs of injury. Injured marine mammals will be reported to the CNRSW Environmental Director, the PACFLT Environmental Office, and the NMFS Southwest Regional Office.

Mitigation for ELCAS/Pile Driving Activities on SSTC oceanside:

- The Navy proposes, under the associated SSTC marine mammal monitoring plan, to conduct underwater acoustic propagation monitoring during the first available ELCAS deployment at the SSTC under the Incidental Harassment Authorization application. This acoustic monitoring would provide empirical field data on ELCAS pile driving and removal underwater source levels, and propagation specific to ELCAS training at the SSTC. These results will be used to either confirm or refine the Navy's exposure predictions.

### 5.9.3 Alternative Mitigation Measures Considered but Eliminated

As described in Section 3.9.2.7 and 3.9.2.8, estimated sound exposures of marine mammals during proposed training activities are not expected to cause injury. Potential behavioral effects on marine mammals would be reduced by the mitigation measures described in Section 3.9.1.7 and 3.9.3. Therefore, the Navy concludes the Proposed Action and mitigation measures would achieve the least practical adverse impact on species or stocks of marine mammals.

A determination of "least practicable adverse impacts" includes consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity in consultation with the DoD. Therefore, the following additional mitigation measures were analyzed and eliminated from further consideration:

- Visual monitoring using third-party observers from air or surface platforms.
  - Reliance on the availability of third-party personnel would also impact training flexibility, adversely affecting training effectiveness.
  - Some training events (e.g., ELCAS) will span extended 24-hour periods, with operations underway continuously in that timeframe. It is not feasible to maintain non-Navy surveillance of these activities, given the length of time the exercises are conducted.
  - Scheduling civilian vessels or aircraft to coincide with training events would impact training effectiveness, since exercise event timetables cannot be precisely fixed and are instead based on the free-flow development of tactical situations. Waiting for civilian aircraft or vessels to complete surveys, refuel, or be on station would slow the unceasing progress of the exercise and impact the effectiveness of the military readiness activity.
- Vessel speed: Establish and implement a set vessel speed.
  - Navy personnel are required to use caution and operate at a slow, safe speed consistent with mission and safety. Vessels need to be able to react to changing tactical situations in training as they would in actual combat. Placing arbitrary speed restrictions would not allow them to properly react to these situations, resulting in decreased training effectiveness and reduction the crew proficiency.
- Increasing buffer zones:
  - The current buffer zones were developed to minimize exposing marine mammals to sound levels that could cause temporary or permanent threshold shifts, levels that are supported by the scientific community. Implementation of the buffer zones discussed above will prevent exposure to sound levels that could cause Marine Mammal Protection Act Level A Harassment or injury for animals sighted. The safety range the Navy has developed is buffer zones within a range sailors can realistically maintain situational awareness and achieve visually during most sea conditions.

As discussed in Section 3.9.1.7, the Navy will monitor an ELCAS mitigation zone for the presence of marine mammals (before, during and after pile driving and removal events). If marine mammals are found in the mitigation zone, pile driving and removal will be halted until the marine mammals have voluntarily left the zone. Mitigation measures that other, generally longer term and much larger pier and bridge construction projects have implemented in the past are listed as follows, with an explanation of why the Navy is not proposing to implement them.

A significant reason for not considering these mitigations is that the engineering needed to both develop, and more importantly field deploy, these mitigations is often not available under the remote expeditionary nature that characterizes field training with the ELCAS. There is generally a lack of facility based infrastructure to support the mitigation deployment. In addition, these measures are part of a much longer term (sometime several years) projects where deployment time of the mitigation can be factored into a given construction project over several months. By contrast, an entire ELCAS training event from construction, to use, to disassembly usually is only scheduled to occur for periods of up to two to three weeks or shorter. Deploying of additional significant hardware-based mitigations would be impractical, nor meet the Navy’s Title 10 requirements for training. The range of additional ELCAS mitigations considered but rejected fall into two classes. One is deploying various engineering solutions such as sound dampening measure or material change, and the other is seasonal or daily restrictions.

The Navy asserts that sound dampening measures that other pier construction and repair projects have considered or used in the past that help to attenuate some sound from pile driving, are not practical for ELCAS training. These measures are not used in actual ELCAS operations overseas or easily adaptable for ELCAS training at SSTC. In addition, the purpose of ELCAS training is to teach personnel to construct an ELCAS as they would overseas in as quick a manner as possible. Adding in sound dampening measures that are not used in real world conditions would not only confuse personnel trying to learn and recertify their capabilities in ELCAS construction, but divert the limited amount of Navy personnel available to ELCAS support units away from necessary training while they implement these measures.

- *Bubble curtain* - Air bubble curtains infuse the area surrounding the pile with air bubbles, creating a bubble screen that inhibits the propagation of some sound from pile driving and removal. The effectiveness of air curtain design in reducing underwater sound propagation is highly variable ranging from reduction of zero to perhaps 15 dB in source level (CADOT 2009). However, the exact optimum design of air bubble curtains is still slightly qualitative, based on site conditions and engineering issues. As designed, there is no latitude in the ELCAS construction equipment to allow installation of bubble curtains. Typical bubble curtain arrangements for larger pier construction projects would not have the necessary support (power, air compressors, piping, etc.) found at remote ELCAS deployment sites within the SSTC.

- *Cofferdam* - Cofferdams are temporary structures used to isolate an area generally submerged underwater from the water column. Cofferdams are most commonly fabricated from sheet piling or inflatable water bladders. As designed, there is no latitude in the ELCAS construction equipment to allow installation of cofferdams;

- *Isolation casing* - Isolation casings are hollow casings slightly larger in diameter than the piling to be driven. The casing, typically a larger hollow pile, is inserted into the water column and bottom substrate. The casing then is dewatered, and the piling is driven within the dewatered isolation casing. As designed, there is no latitude in the ELCAS construction equipment to allow installation of isolation cases;

- *Cushion blocks* - Cushion blocks are blocks of material used with impact hammer pile drivers. They consist of blocks of material placed atop a piling during pile driving to minimize the noise generated while driving the pile. Materials typically used for cushion blocks include wood, nylon, and micarta blocks. The effectiveness of these materials within both the construction world and as potential ELCAS mitigation is not sufficiently studied, and its unknown if cushion blocks would effectively and significantly lower pile driving noise levels. Use of cushion blocks would require additional time to prepare and deploy on each ELCAS pile. The result could be significant time delays between individual ELCAS pile driving resulting is delays to the overall ELCAS training.

- *Changing pile material or size* - Different pile materials, such as concrete, and/or smaller piles could reduce the sound intensity and associated ZOIs during ELCAS construction at SSTC. The ELCAS, however, is a pre-manufactured system using 24 inch steel piles, designed for optimal operation overseas and deployment on specified Navy cargo ships. Navy personnel are not able to use incompatible piles in this pre-manufactured system, which might compromise the ELCAS’ military specifications and design.

Changing the time when pile driving or removal occurs is another construction based technique. The following are two temporal measures that other civilian pier construction and repair projects have considered or used in the past to help minimize impacts to marine mammals, but for which the Navy asserts are not practical for ELCAS training.

- *Constructing ELCAS at a different time of year* - Shifting ELCAS training to summer months may help with transitory migratory species, such as the gray whale, which are not present during the summer within Southern California. The actual amount of pile removal exposures for gray whales is very small, and as explained earlier much more easy to mitigate with the applicable mitigation zone. Navy training cycles and curriculums are set to a fixed annual training schedule, however, to ensure that personnel are adequately trained for deployment, and resources are available to conduct that training. Restricting ELCAS training to by season would adversely impact the Navy's ability to ensure that personnel are adequately prepared for deployment, while not lending significant protection to marine mammals.

- *Daylight Restriction* - Restricting ELCAS pile driving and removal to only daylight hours could conceivably avoid impact to marine mammals by making visual sighting within the ELCAS mitigation zone easier. However, ELCAS operations in real world conditions are performed 24 hours a day to enable forces to offload materials from the ship to shore (via the ELCAS) as quickly as possible. Sailors need to train for these real world conditions, including night-time operations. Navy training cycles and curriculums, as well as resulting field deployments to training sites such as the SSTC, are set to a fixed annual training schedule with daily milestones of accomplishments that also include night time training. In addition, while under construction, there is significant floodlight use both on the ELCAS itself and at the pile driving or removal location pointing into the water so that operators can observe the results of these events. This same lighting would afford additional sighting opportunities for marine mammals within the 50 yards ELCAS mitigation zone at night.

## 5.10 SEA TURTLES

The measures implemented by the Navy to reduce impacts to marine mammals, as discussed in Section 5.9, also serves to mitigate potential impacts on sea turtles. The measures listed above for marine mammals apply to sea turtles that may be present in the vicinity of the training activity. In particular, establishment of marine mammal exclusion zones for underwater detonations of explosives, and pile driving/removal activities and pre- and post-exercise surveys, all serve to reduce or eliminate potential impacts of Navy activities on sea turtles and that may be present in the vicinity.

As a result of the informal green sea turtle consultation with NMFS, the Navy will implement an additional mitigation measure:

- If there are sea turtles known to be equipped with sonic tags in the area of and during pile driving operations, Navy will collaborate with NMFS to analyze movements of these turtles in the immediate area during pile driving. Following any monitoring of sound attenuation associated with pile driving, the Navy will share the results with NMFS and provide recalculations of buffer zones as they are available.

## 5.11 TERRESTRIAL BIOLOGICAL RESOURCES

The following sections identify general and specific management and mitigation measures that take place for terrestrial resources. However, the largest benefit to natural resources has arisen from Navy control of the SSTC; this control precludes the development of these lands in a manner similar to adjacent properties. The Navy needs these lands for the open space for training; by restricting development and acting as a steward for the resources, the needs of sensitive habitats and special status species can be better met. The Navy's extensive and long-term engagement with its partner agencies in managing these resources has led to these natural resources thriving on Navy lands.

### 5.11.1 Integrated Natural Resources Management Plan

Navy natural resources are managed through Integrated Natural Resources Management Plans (INRMPs), which are intended to take an ecosystem approach to natural resources planning. These are long-term, collaborative strategies for managing natural resources as required by the Sikes Act Improvement Act of 1997 (SAIA). Conservation responsibilities for natural resources on all DoD installations are required by laws and Executive Orders, and specified in the relevant INRMPs' instructions and guidance. An INRMP's scope is largely defined by the SAIA, DoD Instruction 4715.3 (Naval Facilities Real Estate Manual), and the Navy's Environmental and Natural Resources Program Manual (OPNAVINST 5090.1 October 2007).

INRMPs are developed jointly by the Navy and fish and wildlife agencies such as the CDFG, USFWS, and other resource agencies as appropriate. Mutual agreement from these agencies is sought for the fish and wildlife component of natural resources management identified in the INRMP, and an annual review with the agencies discussing Navy-wide natural resources is mandatory. For this reason, there is a long history of collaboration between the Navy and its agency partners in managing resources of the SSTC. As a result of this and the implementation of INRMP strategies by Navy natural resources professionals, the Navy management program is successful and occurs in a multiple-use environment. Terrestrial and marine aspects of natural resources management are addressed in the NBC INRMP. The NBC INRMP was completed in 2002 and is in the process of being revised; natural resources staff also provides day-to-day management based on current circumstances.

### 5.11.2 Terrestrial Habitat and Vegetation Management

Terrestrial habitats and vegetation have benefited from implementation of INRMP-funded projects such as invasive species control and habitat enhancement, but also as a collateral benefit of the long-term collaborative approach undertaken by the Navy and its partner agencies to protect nesting, federally listed birds (See Section 3.12).

The protected status of certain aquatic habitats under Section 404 of the Clean Water Act (CWA), as well as occupation of certain of these habitats by federally listed species (San Diego fairy shrimp and the clapper rail), have also framed the management of these areas. The jurisdictional status of wetlands and waters under Section 404 of the CWA drives certain management actions.

The Navy has an established management program for vegetation and soils. Revegetation and habitat enhancement are important elements of the Navy program, such as on the dunes and for vernal pools Vegetation management and erosion control plans are developed and implemented. Vegetation management includes survey and monitoring of federally listed and other special status species. It also includes a prioritization program for invasive species control. Invasive plant issues related to the implementation of specific projects or activities are minimized through pre-project planning. High-priority invasive plants are targeted for control. The current landscaping guidelines for CNRSW require that the NBC Botanist, NBC Wildlife Biologist, and Navy Landscape Architect review and approve the plant palettes for all landscaping projects at NBC. The landscaping guidelines prohibit the planting of species listed on the California Invasive Plant Council Invasive Plant Inventory, all non-native grasses (except those used for turf/lawns), and other non-native species observed or expected to have the potential to become invasive at the installation. Current management also includes delineation and monitoring of wetlands, and implementing avoidance and minimization measures as necessary to ensure no net loss of these areas under the CWA. Other management is accomplished through habitat protection as described above, and through public access limits to natural resource areas.

Elements of the California least tern and western snowy plover management program and the requirements of related Biological Opinions (BOs) dominate the Navy's natural resources strategy in the ROI, and therefore influence the habitat condition of vegetation, and the status of plant and other wildlife species. For instance, as stated below, vegetation and the soil substrate are prepared and managed to attract the least tern in designated nesting areas at Delta Beach North and South, while marking for avoidance special status plant species. In active training lanes where conflict may occur with operations, historic site preparation may include means to discourage nesting before the terns arrive in the spring, such as the creation of sand hummocks. In some cases, as at SSTC-S, vegetation such as iceplant is not cleared in case such clearing may attract terns to establish nests, and thus create a conflict with operations. At Naval Air Station, North Island (NASNI), vegetation is mowed consistent with Bird/Animal Aircraft Strike Hazard reduction while accommodating special status plants such as Brand's phacelia.

#### 5.11.2.1 Delta Beach North and South

Delta Beach North and Delta Beach South are managed as a preserve for the California least tern, although military training is not restricted outside of the nesting season. Past management measures of these lands that were partly created by fill have included grading, disking, fencing, signage, and herbicide application, Prior to disturbances such as grading or herbicide treatment, the locations of two sensitive plants, Nuttall's lotus and coast woolly-heads, are marked to minimize the impacts to these species. While the primary vegetation condition is sparse, low cover on the Delta beaches, tidal mudflats and salt marsh rim the shoreward edge of both properties. The marsh between Delta Beach North and South is about 12 acres in area. Approximately 9.8 acres of coastal dunes are graded annually at North Delta Beach.

#### 5.11.2.2 Dune Management

A dune management area along the ocean side of NASNI provides broad-based ecological benefits as a habitat restoration project.

A second dune restoration site (1.2 acres) is bayside at NASNI and is intended to restore sand verbena-beach bursage habitat and Nuttall's lotus individuals affected by the remediation of smelter slag wastes disposed at the site from 1943 to 1967 (AMEC 2003). Qualitative and quantitative monitoring is conducted. Maintenance and monitoring includes regularly maintaining the native dune habitat landscape and the evapotranspiration cover plant species in the Waste Consolidation Area.

Invasive species removal is a regular activity on all dune areas.

### 5.11.3 Habitat Areas that are Leased or Licensed

In the project area entire habitats are protected through special-purpose leases or licenses to the California Department of Parks and Recreation (CDPR), the City of Coronado for a South Bay Marine Biological Study Area, the City of Coronado for a dog walking beach, and the YMCA for a youth surf camp.

#### 5.11.3.1 South Bay Marine Biological Study Area

The South Bay Marine Biological Study Area (also called "South Bay Wildlife Preserve" or "Ecological Preserve" on some maps and signs) is a 27-acre site in the northeast corner of SSTC-S that has been leased to San Diego County since May 1972, but this lease has since been transferred to the City of Coronado (as of February 2009). As of 1974, the Navy has issued five-year licenses to San Diego County for "the establishment of an Educational Ecological Preserve which is open to the public," with use limited to the study of marine biology and open to the students of the Unified School Districts of San Diego County. As conditions of the lease, the Navy requires a parking limit of 50 cars, and compliance with the CWA's Section 404 conditions for wetlands. The site contains 26.35 acres of "federally protected wetlands" and the county cannot conduct any manipulation projects, including restoration, without a "Modification of License" from the U.S. Navy to ensure Section 404 permit compliance. The County Parks and Recreation Department manages the South Bay Marine Biological Study Area.

#### 5.11.3.2 YMCA Camp Surf

YMCA Camp Surf operates on the southwestern 45 acres of SSTC-S on land leased from the U.S. Navy in a long-term agreement that expires in 2048. For over 30 years the YMCA has served about 10,000 youth per year here. The YMCA remains responsible for the planning and management of the site and is liable for all activities on the site as well as those of any contractor used in the site's day-to-day operations.

The YMCA pays for their current lease by maintaining and enhancing the natural resources of the leased property, which includes maintenance of fences, invasive weed control, and signage.

#### 5.11.3.3 Lease to California Department of Parks and Recreation

The 40-acre NAB Coronado parcel leased to CDPR supports the wandering skipper, a Federal Species of Concern, and Brand's phacelia, which is a Federal Candidate Species for listing under the Endangered Species Act (ESA). The San Diego Coastal State Park System General Plan (1984) guides the management of the 40-acre parcel leased to CDPR. The purpose is to preserve and protect opportunities for the public to enjoy quality beaches and to provide recreational opportunities in the ocean and nearshore environments.

#### 5.11.3.4 Salt Pond Connection to South San Diego Bay NWR

A portion of SSTC-S that includes a salt pond and associated levee ("Pond 11" in the National Wildlife Refuge [NWR] Comprehensive Conservation Plan [CCP]; USFWS 2006)) is part of the NWR's Approved Acquisition Area. The USFWS may seek a lease agreement with the Navy in this area; at a minimum, the CCP states that the NWR may seek approval to alter the current conditions in the northwestern corner of Pond 11 (USFWS 2006). The Navy also owns and manages 35 acres of open water and associated intertidal habitat within the NWR's approved acquisition boundary. According to the CCP, no management actions are proposed for the NWR on submerged lands north of and adjacent to Emory Cove that would restrict Navy access to SSTC-S (USFWS 2006). However, the Navy provided comments on the NWR CCP regarding NWR plans in the vicinity of the Emory Cove as well as other areas that could result in habitat changes that affect Navy activities or that convert habitat for least terns and snowy plovers at the NWR (16 November 2001 Ser N45RN.tc/353; 23 August 2004 5216 Ser NOOC/43619; September 2005 Ser N45JNW.tc/0313). The Navy requested that the USFWS plans avoid reducing or modifying the amount of habitat available for the California least tern or western snowy plover such that Navy lands would have an higher proportion of available habitat for these species; that proposed NWR activities adjacent to and north of Emory Cove be modified; that all land and water owned by the Navy at SSTC-S be removed from the CCP; and that management recommendations that increase the presence of gull-billed terns be changed. In 2009, the USFWS, Port of San Diego, and California State Coastal Conservancy completed an Environmental Assessment for the restoration and enhancement of the South San Diego Bay wetlands, including restoration of Ponds 10 and 11. The planned restoration of these ponds includes returning much of the open water habitat to salt marsh by breaching the current levees and restoring tidal flows.

### 5.11.4 Species-Specific Management and Mitigation Measures

In addition to the current management elements of the Natural Resources Program (see Section 3.11.1.6), impacts are avoided or minimized through pre-project site approval and planning process. All species groups are managed through implementing habitat and species conservation guidelines and projects identified in the INRMPs. At a minimum an extensive invasive plant control program is implemented annually in the ROI. Natural resources staff adapts strategies based on the INRMP, personal observation, or new information such as resource inventories, weather, operational requirements, etc.

A Metro Area Instruction and Family Housing Occupant Handbook has been developed to advise personnel of what to do if they come in contact with sick, dead or injured wildlife. There is a DoD

Instruction, Chief of Naval Operations Letter (5090 Ser N456M/1U595820 of 10 Jan 2002), and NBC Instruction regarding pet management. Except for dogs restrained by fences in family housing areas, animals (including cats and birds) are not permitted to run loose on Navy property. Possession or feeding of wild animals (including feral animals), regardless of docility or tameness, is prohibited. All dogs must be licensed, registered with security, and confined to a leash. Stray/loose animals should be reported to San Diego County Animal Control or Station Police for violations of policy. The Family Housing Occupant Handbook contains guidelines for properly disposing of trash so as not to attract feral animals. NBC has a domestic cat management policy associated with the housing area. Cats are not allowed to be loose outdoors, nor may pet food be left outdoors.

A Metro Area Pest Management Plan (per OPNAVINST 6250.4B ) has been drafted that directs how the Navy uses pesticides and herbicides in the ROI, including means to protect non-target plants and wildlife. DoD and Navy policies require that use of pesticides is minimized on their property (OPNAVINST 5090.1 [30 October 2007]). The pest management plan incorporates new direction for management of invasives on DoD installations (Executive Order 13112 of February 3, 1999 and July 14, 2000 DoD implementing direction). Chapter 17 of OPNAVINST 5090.1 requires that the use of pesticides comply with applicable regulations to prevent pollution.

### 5.11.4.1 Special Status Plants

Three rare plants exist within the area of influence of the SSTC: Brand’s phacelia, coast wooly-heads and Nuttall’s lotus. All are considered rare by the California Native Plant Society, while Brand’s phacelia is a Federal Candidate species under the ESA. These special status plants are managed through habitat protection, described above, but most occur in areas that receive some degree of use. As part of the project siting process, avoidance measures are undertaken, where practicable, to protect these special status plants. Known locations are mapped, and site-specific surveys are conducted to confirm the locations of sensitive plants. Invasive plant control and some habitat enhancement are periodically undertaken by the Navy as part of INRMP project planning.

Specific mitigation measures from past projects are sometimes undertaken. When 14 acres of upland were excavated for the first nuclear carrier berthing project in 1995, the Navy agreed to establish a seed bank for Nuttall’s lotus. To minimize impacts to these species, locations of special status species are marked prior to routine grading on Delta Beach North and Delta Beach South. When herbicide is used, it is applied to target species only; weed crews are able to distinguish between target and non-target species.

Brand’s phacelia is an extremely rare species managed through habitat protection, inventory, and monitoring. It was recently listed as a Candidate species by the USFWS. When Brand’s phacelia was mapped on NASNI, the population number was estimated at approximately 5,000 individuals occurring on site in the ruderal habitat south of the airfield. This may be the largest known population within its range in the United States. The current mowing of the ruderal habitat around the airfield does not appear to negatively affect this species and may, in fact, reduce competition with non-native grasses. The iceplant spreading in the ruderal habitat may be of concern as it is unaffected by mowing. The Navy has been removing iceplant from this area for the past several years through a combination of herbicide application and hand-pulling. The newly discovered populations in Bravo and Charlie training areas receive similar management treatment through INRMP-funded inventory, monitoring, and invasive species control. The population that exists on the 40-acre lease is adjacent to Alpha training area, but is not part of the Proposed Action for this EIS.

### 5.11.4.2 Salt Marsh Bird’s Beak

The only federally listed plant in the ROI, salt marsh bird’s beak, is located on the YMCA Camp Surf leased property, and is protected with signage to prevent entry into the wetland area by YMCA staff members or campers. YMCA Camp Surf is not in the operations and training footprint of the SSTC. A 1998 report (RECON 1998) discussed this plant's distribution, pollinators, seed set, and general population health based on field work done in the mid-1990s. Because this species is federally listed as endangered, formal consultation with the USFWS under Section 7 of the ESA would be required prior to any potential impacts. Certain habitat restoration work done by the YMCA Camp Surf under their lease agreement benefits this species (Conkle 2006).

#### 5.11.4.3 Management of San Diego Fairy Shrimp

Management in the inland area of SSTC-S benefits the vernal pools:

- Prior to routing grading and/or herbicide application to reduce vegetation cover within the California least tern preserve, the locations of Nuttall's, coast woolly heads, and other desirable patches of native vegetation are marked to minimize impacts.

- Vernal pools in the inland area of SSTC-S that are occupied by San Diego fairy shrimp have undergone some restoration as a result of an incident during a training activity in which there was some damage to vernal pools.

Current management of vernal pools restricts all activities from the pools at all times. Vehicle traffic in the inland area of SSTC-S is always limited to roads. Vehicle traffic adjacent to vernal pools is limited to paved roads except by emergency vehicles (e.g. security, fire, and medical support) in emergency situations only.

### 5.11.5 Proposed Mitigation Measures

Current mitigation measures will be continued. Proposed mitigation measures for terrestrial biological resources under the Alternatives are summarized below.

Current natural resource protection measures would continue, such as those derived through Navy Instructions, ecosystem-based planning in the INRMPs, and the employment of best management practices and standard operating procedures to avoid and minimize environmental impacts. Existing measures include invasive species control, erosion control, inventory, monitoring, and habitat enhancement.

For the San Diego fairy shrimp, under the Proposed Action, the Navy will avoid vernal pools occupied by San Diego fairy shrimp and their watersheds when designating parachute drop zones in SSTC-S Inland. While the existing Kaufman Drop Zone overlaps several vernal pools, only the southern portion of the drop zone is used for activities, effectively avoiding vernal pools occupied by California fairy shrimp. Vernal pools will be identified to assure that drop zones are located at least 30 m (100 ft) from each occupied pool. The Navy will consider the location of vernal pools occupied by San Diego fairy shrimp and their watersheds when planning training involving off-road foot traffic at SSTC-S Inland. To the maximum extent consistent with training need, off-road foot traffic will avoid the occupied vernal pools and their watersheds. The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7, marked with flexi-stakes) year round to the maximum extent consistent with training need. Avoidance may be accomplished using markers, maps, GPS coordinates or any other means consistent with training needs.

The Navy will be completing and submitting a Vernal Pool Monitoring and Management Plan to the USFWS and the California Coastal Commission in order to help identify whether the impacts identified in this EIS remain at the low levels expected. The Plan will include focused invasive plant survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. The Vernal Pool Management and Monitoring Plan will list: 1) what criteria are used to determine that the pools are dry, and 2) who makes the “dry” determination, i.e., the qualifications of the person responsible for determining wet and dry conditions. Training would not be allowed in the remaining vernal pools when conditions are wet. Foot traffic would only be permitted in the pools when conditions are dry.

The Plan will identify measures to minimize the potential for adverse effects to fairy shrimp from weed abatement, pool restoration, or pool augmentation. The Navy will be establishing the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. The Navy will report monitoring results and any observed incidental take to the USFWS and the California Coastal Commission annually, and will adjust management to the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring. If impacts are more than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.

Under the No Action Alternative and Alternative 1, Vehicle Patrolling and Lighter, Amphibious, Resupply, Cargo-5 ton (LARC V) Operator Training are limited to training lanes Yellow 1 and 2 and Green 1 and 2, and will not occur in Red, Blue, or Orange Beach Lanes. Training activity restrictions serve to minimize effects to terrestrial biological resources in these lanes. This mitigation measure only occurs under the No Action Alternative and Alternative 1.

Coincidental benefit to special status plants would occur through measures that are designed that may be implemented to support nesting by the California least tern and western snowy plover. For instance, the Long-term Site Enhancement Plan for the tern would benefit terrestrial plants and wildlife. In this scenario, the dunes on the windward (west) edges of Delta North and South would be enhanced for plovers, the least tern nesting area would be enhanced with sand, which also benefits special status plants.

## 5.12 BIRDS

The following describes efforts the Navy has undertaken to protect avian species listed under ESA present in military training areas. For over 30 years, the Navy has built a comprehensive program to protect and manage resources on SSTC and NASNI. The program has been adaptive in nature, adjusting to changes in natural resource conditions and training needs, and adding to and modifying management measures based on experience and past effectiveness. The Navy and USFWS have worked extensively together to hone these measures over the years.

### 5.12.1 California Least Tern and Western Snowy Plover Management

The following describes efforts the Navy has undertaken to protect avian species listed under ESA present in military training areas. For over 30 years, the Navy has built a comprehensive program to protect and manage resources on SSTC and NASNI. The program has been adaptive in nature, adjusting to changes in natural resource conditions and training needs, and adding to and modifying management measures based on experience and past effectiveness. The Navy and USFWS have worked extensively together to hone these measures over the years. The Navy’s current mitigation measures are discussed in Section 3.12.1.5. Areas mentioned in the following text are indicated on figures in the Terrestrial Section of this EIS, Figures 3.11-5, 3.11-6 and 3.11-7.

#### 5.12.1.1 Origin of the Navy’s Establishment of Protected Nesting Sites for Terns

The early days of the Navy’s tern management program originated with the construction of a helicopter Maintenance and Training (MAT) facility, including a Light Airborne Multipurpose System (LAMPS) MK III, that resulted in the loss of a nesting area and displacement of what was 13 tern nests in 1977, the year terns were first documented as nesting there. By 1979, according to the BO that was signed in 1980 (USFWS BO 1-1-80-F-18 5 March 1980), about 68 nests were located at the facility. A total of 63.45 acres were affected by the project, including 36 acres to resurface the asphalt.

In order to establish a defined site where the nests could be protected, a 21.55-acre area of the existing nesting area called the MAT site was preserved, indefinitely, for nesting terns at NASNI. An additional 29.2 acres were prepared on an annual basis as alternate nest sites, including predator and vegetation control, in the event the MAT site was not successful.

In addition to the sites at NASNI, the Navy agreed in a 1983 BO (USFWS BO 1-1-82-F-123 2 March 1983) to "exclude 75 acres of land at Delta Beach from public access by fencing for least terns under the terms of a Memorandum of Understanding between the USFWS and NAB Coronado…" The BO required that the area be "fenced and officially established as a nesting site." The designation of the Delta beaches as a "least tern preserve" was formalized in a 1984 MOU between the U.S. Navy and USFWS (DoN and USFWS 1984) that was drawn up to provide long-term management of the 75 acres identified for least tern nesting at the Delta beaches in the 1983 BO 1-F-82-F-123. The MOU did not intend to inhibit the use of Delta beaches for military maneuvers, but it attempted to restrict these maneuvers to the north and east perimeters during the nesting season. Up until the time of this BO and MOU, Delta Beach North had been used both for Navy training and as a public boat launching facility. Installing fencing around the area eliminated the site for use as a public boat launch facility. The Navy was required to address the loss of public recreational access to the site, and under a California Coastal Commission (CCC) Consistency Determination (CD-4-84 22 February 1984), was required to leased 40 acres of land (Alpha Beach) to the State of California to develop for park and recreation purposes. The Navy also graded a road to Alpha Beach to facilitate public access there.

The Navy implemented a number of measures to promote nesting at the Delta site. The Navy began controlling vegetation at the site to enhance suitability for terns which do not prefer highly vegetated areas for nesting habitat. The Navy also added sand to the site to enhancing the substrate for nesting. The Navy employed decoys on the site at the beginning of the nesting season to attract nesting terns to the protected site. The Navy also began a program for controlling predators on the site and a program for monitoring the site for nesting success.

#### 5.12.1.2 Navy Adaptation to the Expansion of Least Tern and Snowy Plover Nesting Colonies on SSTC

In 1994, California least terns began nesting on oceanside beaches where military training takes place. Protections had to be established to protect the terns, and this began the development and evolution of a series of adaptive set of measures, with each year bringing ever-increasing tern numbers and a new sets of circumstances. As nesting on oceanside training beaches continued to increase, the Navy adapted and improved their approach as a result of information gained from monitoring and experimentation.

In 1996, the Navy coned off 500 yards of Green 2 Beach from training activity to avoid incidental take of nests, and also added decoys to attract birds to a designated nesting area where they could be protected and training could continue unimpeded elsewhere (BO 1-6-97-F-37 2 June 1997). Around the same time, the Navy enhanced the substrate of Delta Beach South, which expanded that nesting area from 10 to 15 acres. This resulted in an increase from one nest to 21 nests at Delta Beach South, and the expansion of nesting on the oceanside beaches continued, amplifying the challenge of protecting the terns (Copper 2003).

In 1992, monitoring for western snowy plover nests began at SSTC-North (SSTC-N) oceanside beaches and the species was noted there and have nested in this area every year since. The Navy began establishing avoidance zones by emplacing stakes less than 30 meters around the nests which were avoided during training. 1,200 yards of Green Beach were coned off by the Navy to protect nesting in the lanes. Poles for powerlines along the Silver Strand Highway were also removed and the powerlines were placed underground to reduce perches for predators. The Navy also purchased receivers to monitor peregrine falcons and increased predator control on SSTC-N. Along the eastern boundary of SSTC-N oceanside beaches, the Navy installed no trespassing signs to deter the public from entering or wandering into the nesting area.

The Navy and USFWS continued to collaboratively re-think the strategy to protect terns. In 2000, the Navy added beach crossing lanes to allow training groups to move between the sand road near Highway 75 and the hard-packed area near the water's edge (BO 1-6-99-F-28 3 May 1999 and extensions in 2000 and 2001). This was to protect nesting birds from accidental disturbance or mortality due to military activities (there had been incidental take (mortality) due to military activities of one western snowy plover and several terns in 2000). The coning off of Green Beach was discontinued as attempts to attract the birds to this safe area had failed, and by then almost 50 percent of San Diego Bay Navy terns were on the oceanside beaches. The bright orange and large cones were abandoned in favor of smaller and more portable blue stakes. The blue color was selected as it was believed that the bright orange color of the cones might attract avian predators (primarily ravens and crows). Instead of coning off the entire beach, individual tern nests were marked with a three-foot stake, but this created confusion for operators as to where training was permitted to occur.

The Navy changed its strategy in 2002 when lanes Green 2 and Blue 1 became the focus of concern about nesting in needed training areas (BO 1-6-02-F-2645.1 16 April 2002). The beaches were raked with an instrument dragged behind a High Mobility Multipurpose Wheeled Vehicle to deter nesting in those lanes and eggs were collected if present during pre-raking surveys. Collected eggs were taken for care to Project Wildlife (a wildlife rehabilitation non-governmental organization). Raking continued as often as twice per day, with the intent of discouraging tern nesting without affecting plovers. Other measures to discourage nesting were also undertaken, such as placing wooden stakes with flagging. Beach raking was found to be labor intensive, costly, and ineffective since terns continued to attempt to nest behind the raking activity. Raking was abandoned after one year (2002) as ineffective. However, the Navy continued to collect eggs that were in harm's way and take them to Sea World to be hatched, where it was determined if the chicks could be reared in captivity. The Navy set aside three unraked lanes for nesting. Tern nests outside the three lanes were marked with tongue depressors and subject to incidental take. Plover nests continued to be afforded protection with marking and buffer distances of less than 30 meters; military personnel were instructed to avoid the staked areas. At the same time, efforts continued to attract the oceanside birds to nest on the Delta beaches. A fence was removed at Delta Beach South and grading was expanded to the entire southern site (Copper 2003). At the same time, the Navy also implemented efforts to retain washed-up vegetation on the oceanside beaches to promote foraging of western snowy plover where it didn't interfere with military operations.

Around 2003, it was determined that annual disking of the Delta sites to improve the substrate for nesting habitat was promoting undesirable weeds, so the Navy switched its practice of disking to grading the sites. Also, despite efforts to deconflict training activity on the beaches and attract the birds to the Delta nesting sites, there were double the birds on the oceanside beaches compared to the previous year. For unknown reasons, the training beaches continued to be preferred by the birds despite efforts at preparing the Delta beach sites and heavier training activity on the oceanside training lanes. Despite this, the Navy successfully avoided incidental take of the birds, which remained far below the incidental take authorized in its biological opinions.

Pursuant to BO FWS-SDG-3452.1, the Navy continued the seasonal restriction of training in the three beach lanes in 2003, with beach crossing lane alignments modified, as needed, to minimize the number of nests requiring relocation (15 May 2003). Trying another approach, a lane in front of Green 1, called the Alpha lane, was added to allow high tide crossing by training groups. Incidental take was permitted for up to 50 eggs to be collected and taken to Sea World for captive rearing. Up until the 2003 breeding season, predator management was conducted in all Navy nesting areas; however, in another effort to deter terns from nesting on the beach, predator control was discontinued on the NAB ocean beaches in 2003 (only conducted in Orange 1 and 2). The effort was undertaken as an experiment, to see if discontinuing predator control would deter terns and move to the safer Delta Beach areas to nest, as previous efforts had been costly and unsuccessful (Martin Kenney, pers. comm. 2004). A change in nesting pattern was never apparent, and predator management on all sites resumed in 2004. Around this time, the Navy also began installing mini-exclosures around western snowy plover nests to reduce predation on eggs and fledglings.

In 2005, the Navy worked to further improve its predator control efforts. Nixilite™ (a deterrent material applied to structures to prevent roosting and repel birds) was installed on the fence by Delta South to deter predators from perching on the fence and preying on nests on Delta South. The Navy also installed video and still cameras to better understand which species are predating on the terns. In a new approach to attract terns to where they could be protected, about 3,000 cubic yards of sand were added to Delta Beach to benefit the substrate conditions for both least tern and snowy plover nesting there. The Navy graded and topographically modified Green 1 and Green 2 with hummocks (small sand hills) to reduce their attractiveness for nesting; the hummocks were effective in deterring terns from nesting in that area. The Delta beaches, Blue 2, Orange 1, and Orange 2 were treated with herbicides to enhance nesting attractiveness. The same management strategies used in 2005 and 2006 were implemented in 2007 with an extension of the 2005 BO (FWS-SDG-3452.3 16 July 2007).

#### 5.12.1.3 Western Snowy Plover Management Evolution With Measures Adapted for NASNI Airfield and Expansion of the Navy Lodge

Two BOs discuss snowy plover management at NASNI and resulted in changes in the action area regarding how snowy plovers are managed. The BO on NASNI Ongoing Operations addressed Bird/Animal airstrike hazards on the runway, as well as recreational and military training use of the southern NASNI beaches) (FWS-SDG-3908.3 2005). One of the historic problems at NASNI has been plover nesting on the airfield runway to the north, which may be due to inadequate availability of alternative areas for the plovers closer to the shoreline. Also, in some years the southern beaches have narrowed and have been temporarily unsuitable for nesting. The Navy Lodge Expansion (BO FWS-SDG-3908.5 20 July 2005) addressed the expansion of the Navy Lodge and its potential effect on western snowy plovers that nest on adjacent beaches. Among other requirements, the BO required (1) continued marking for 30-meter diameter buffers and monitoring; (2) avoidance of staked areas when beach raking; (3) setting aside of 14.9 acres of suitable (and historically used) plover habitat as off-limits to foot traffic, vehicle traffic, beach raking, and pets during the snowy plover breeding season; (4) implementation of predator controls including anti-perch materials on buildings; (5) placement of signage and distribution of educational materials to patrons, employees, life guards; (6) training for construction workers; and (7) shielding of lighting away from the beach during nesting season. The CCC added a requirement in its Consistency Determination (CCC ND-93-05 15 December 2005) as follows: “During the plover nesting season (March 1 through August 15), the Navy agrees to monitor the beach for plover nests in front of the NASNI Navy Lodge prior to each raking event. However if our [i.e. Navy] natural resources personnel determine that our efforts are meeting the objectives set forth in our BOs, specifically that NASNI supports 12-13 pairs or a maximum number of 12 nests. The Navy, at its discretion, may refrain from monitoring prior to raking.” The stated informal management objective of 12-13 nesting pairs (20 breeding season adults) for NASNI is carried forward in the Final Recovery Plan for the western snowy plover (Unit CA-127 in USFWS 2007b).

#### 5.12.1.4 Other Navy Agreements Related to California Least Terns

The Navy’s management measures for the California least tern and western snowy plover with regard to training activities in the SSTC are covered above. In addition to these measures, further avoidance and minimization measures are undertaken for past military construction projects, and for routine in-water construction and maintenance works. Two important elements of the Navy program are described below.

**In-Water Construction Noise and Turbidity Programmatic Agreement.** A programmatic agreement between the USFWS and the U.S. Navy establishes standards and conditions for in-water construction activities in San Diego Bay to protect the endangered California least tern (DoN and USFWS 1987, 1993, 1999, 2000, 2004). Originally a five-year Memorandum of Understanding (MOU), it was most recently renewed for two years in 2004, and a letter from USFWS allows for recognition of that MOU until a new one is signed (Letter from Therese O'Rourke to Capt. Anthony T. Gaiani FWS-SDG-08B0211-08I0203 December 18, 2007). This MOU was developed concurrently with the development and improvement of the management program on SSTC, and many of the protective measures described above were formalized in this MOU agreement. The MOU provided an additional 10 acres of tern nesting area at South Delta Beach, as well as an additional three to five acres of California least tern foraging habitat, the removal of overhead power lines at Delta Beach, predator control efforts for tern colonies, studies to determine effects of various in-water construction activities, end-of-year reports on tern population monitoring, and a list of proposed U.S. Navy projects to be conducted in San Diego Bay. In exchange, ongoing maintenance and new construction activities could be conducted by the U.S. Navy in San Diego Bay without the need for formal consultation with USFWS on each activity as long as specific, delineated least tern foraging areas were not affected. Under the agreement, the U.S. Navy provides an annual funding source of $250,000 for management and monitoring of the least tern, as well as a one-time funding source of $500,000 to be used to create additional tern foraging or nesting habitat. In addition, the U.S. Navy provides a permanent position within the U.S. Navy to oversee the implementation of the MOU. The 1987 MOU was updated in 1993 and provided for annual funding by the U.S. Navy to continue least tern management and predator control.

The western snowy plover derives coincident benefit from the California least tern protection measures afforded through the Navy-USFWS MOU on in-water construction activities, as well as other measures that enhance nesting success in the same locations where the plovers nest.

**Fiddler's Cove Surface Coverage Biological Opinion.** A BO addressing marina repairs and improvements at Fiddler's Cove was issued in 2007 regarding least tern foraging concerns (FWS-SDG-4032.6). These concerns arose as the result of the development of additional dock structures in Fiddler's Cove Marina that would cover bay waters adjacent to the Delta South least tern colony. The USFWS determined that this project would not result in any incidental take of the California least tern, but noted that the significance of any future net losses of such habitat on the survival and recovery of the species would be magnified, given the importance of protecting or enhancing high quality foraging habitat in San Diego Bay in close proximity to nesting colonies.

Based on the management experience gained by the Navy and its agency partners over the years, the following sections list current management that would be carried forward under the No Action Alternative for both the least tern and snowy plover on training beaches. Modifications to this management under Alternatives 1 and 2 are discussed in Sections 3.12.2.3 and 3.12.2.4, respectively. Management measures have been adaptive in the past and will continue to be in the future as changing circumstances dictate a modified approach.

### 5.12.1.5 Beach Lane Seasonal Conservation Areas and Marking/Avoidance Measures

- Two bayside training areas (Delta North and South) of beachfront Navy-administered lands are restricted from military foot and vehicle traffic during the breeding seasons of western snowy plover and California least tern except for a Beach Crossing Lane on South Delta. Access to the three oceanside lanes (Blue 2, Orange 1, and Orange 2), which under current management measures are set aside during the breeding season, will be modified by the two access criteria discussed in Section 3.12.2.3 for Alternative 1. When restricted from use, the perimeter of the oceanside training lanes is delineated with blue flexi-stakes or cones when terns first arrive. No military training is permitted within the protected areas except for designated beach crossing lanes. Since plovers nest individually or in loose groups rather than in dense colonies like the terns do, plover nest scrapes are marked with approximately 30-meter buffers for avoidance beginning approximately March 1. The beach crossing lanes are positioned to avoid the largest number of nests that would require relocation. Beach crossing lanes are marked with stakes for their entire length. Differences in training lane access do occur between the alternatives in this EIS, such that all SSTC-N surfside beach training areas would be available for use under Alternative 2, regardless of time of year, whereas usage is dependent on training needs in Alternative 1.

- Beach scheduling procedures bias activities with heavier beach use towards beach lanes with fewer nests, when it does not impact the realism of training or training needs.
- Plover nests are marked except in the training lanes set aside during nesting season. A surrounding buffer area of approximately 30 meters, or smaller, is also marked with blue flexi-stakes which are removed seven days after hatching, or when biologically practical to minimize impacts to plovers. No military training is permitted to occur within the delineated buffer or protected areas. Under Alternative 1 and 2, the Navy will limit the number of western snowy plover nests that will be marked and buffered for avoidance on SSTC-N and SSTC-S oceanside beaches to no more than 22 concurrent nests plus any additional nests that exceed 22 that are initiated in beach lanes Orange 1 and Orange 2.
- Also depending on site-specific circumstances, some plover nests are covered with a mini-enclosures (MEs) to protect from mammalian and avian predators. Once chicks hatch, markers and MEs are removed within seven days, or when biologically practical to minimize impacts to plovers. The MEs are not installed when the risk of attracting humans that will potential disturb the nest appears to outweigh the risk of predation.
- Due to the high predation rate from gull-billed terns, “wickets” or domes are used to offset predation by this species. Wickets are made of two pieces of small gage wire and formed into a one-foot dome. Domes are placed over least tern nests to discourage gull-billed terns from preying on eggs or chicks and/or destroying eggs when feeding from flight. A study on the effectiveness of domes that documents reproductive success of the terns with domes is being funded by the Navy. Due to this study wickets or any other form of exclusion that is developed will be used unless they are determined to be ineffective.
- To reduce harassment of nesting plovers, symbolic fencing with blue stakes (fencing that marks the area for people to avoid but does not prevent birds from entering or leaving) is practiced on NASNI in front of the golf course, building 710 of Breakers Beach (the recreational beach), and the Small Arms Range surface danger zone.

#### 5.12.1.6 Communication of Training Area Protocols

- The Navy works to ensure effective communication and coordination among the biological monitors, the Natural Resource Office, and the scheduling commands for NASNI, SSTC-N and SSTC-S. Beach users are informed: (1) that blue flexi-stakes or cones denote the boundaries of nests or protected nesting areas for least terns and snowy plovers; (2) that the presence of tongue depressors within beach lanes mark the location of least tern nests; (3) which training areas are authorized; and (4) that take of least terns and snowy plovers at SSTC-N and SSTC-S shall be avoided to the extent consistent with effective, realistic training. These access restrictions will be modified and communicated as necessary as the Navy meets criteria and thresholds for opening additional lanes.

### 5.12.1.7 Nest Relocation

- Nests may be moved small distances, as necessary and appropriate, to reduce conflicts with training, although such moving is infrequent. Snowy plover and least tern nests located in the Beach Crossing Lanes are relocated to safe areas as conflict is expected, and nests have been relocated due to the threat of flooding. The Navy contacts the USFWS and reports the circumstance that necessitated movement of any tern or plover nest. This is done with submittal of the Navy's weekly reports to the USFWS Carlsbad Field Office. If relocation is necessary, nests are moved the shortest distance possible into suitable habitat to increase the chances for nest success.

### 5.12.1.8 Predator Management and Control

- Predator control of mammalian and avian predators of the least tern and snowy plover is conducted at all nesting sites. Due to the rarity and overall status of the gull-billed tern, management of this known predator has not been possible. To date, the Navy has not been authorized to capture, relocate, shoot, or otherwise deter this species although annual Migratory Bird Depredation permit applications have been submitted to the USFWS since 2005. Isolated attempts by U.S. Department of Agriculture (USDA) Wildlife Services to discourage gull-billed terns from entering least tern nesting colonies were considered ineffective.

- The Navy has been using pole traps on and off since the inception of the program dependent on discussions with the USDA and the USFWS. These pole traps are designed to catch avian predators that prey on least tern and plover chicks, such as the gull billed tern.

- Predator control to manage southern fire ants, field ants, Argentine ants, and pyramid ants found on North and South Delta Beaches and NASNI is conducted prior to and during the snowy plover and least tern nesting season.

- The Navy, USFWS, and CDFG work cooperatively each season regarding the relocation of American peregrine falcons if they are determined to be impacting the least tern or snowy plover.

- In cooperation with USFWS Refuges, peregrine falcons are removed and relocated if necessary from Navy California least tern nesting sites, as described in the 2005 Training BO (FWS-SDG-3452.3 10 March 2005), under the USFWS take permit.

- Cameras are used to monitor least tern colonies on Navy property for predators. Cameras are also used as a tool for monitoring, specifically collecting status information.

### 5.12.1.9 Nesting Deterrence through Habitat Modification and Harassment

- Sand hummocks or other substrate modification may occur in the Green Beach Lanes prior to the breeding season to discourage nesting there. If necessary, sand hummocks or other substrate modification may be considered for other lanes, in a manner that is compatible with military training requirements.

### 5.12.1.10 Continued Site Preparation for Maintenance

- Site preparation, in accordance with the USFWS's BO on the MAT Development Program (1980-BO 1-1-80-F-18; 1983-BO 1-1-82-F-123 Navy's LAMPS MKIII facilities development program) and the California least tern MOUs, is performed on North and South Delta Beach and NASNI. Continued maintenance of these sites offsets the effects of previous construction projects and associated loss of habitat at NASNI as well as some of the effects of the current Proposed Action.

Site preparation includes grading or mowing to remove annual plant growth, inspection, replacement or reinstallation of the site grid poles and of chick barriers around the site perimeter, use of tern decoys, and placement of chick shelters throughout the nesting colony.

- Sand enhancement of nesting sites occurs as feasible.

- Although site preparation was discontinued on all NASNI alternate nest sites in the past, it will continue at the current alternate nest site north of Weapons as an experiment in the event that the MAT site needs to be moved.
- In order to provide nesting cover for chicks, minimize invasive weeds, and protect rare plants, the locations of coastal woolly-heads (*Nemacaulis denudata*), and Nuttall's lotus (*Lotus nuttallianus*), are marked for avoidance prior to grading or herbicide use. Coast woolly-heads and Nuttall's lotus are indicators of a healthy, natural habitat that is conducive to nesting by providing a mosaic of vegetation for chick shelter and escape cover.

- No kelp or other natural marine vegetation that collects on beach tidal areas is removed from the oceanside beaches of SSTC-N or SSTC-S. Kelp is managed at YMCA Camp Surf by relocating it to areas where it does not provide an unsafe environment for children. All marine vegetation at YMCA Camp Surf is not buried, but it is left on the surface for use as forage material by plovers.

- Mowing is practiced at NASNI airfield to maintain a habitat condition that is not preferred by nesting birds, in order to deter bird-related airstrikes. Areas within and adjacent to the airfield are mowed when 25 percent of the vegetation reaches eight inches or higher as measured from the soil. The mowing schedule is coordinated with the NBC Botanist and Wildlife Biologist.

- Beach cleanup in targeted areas will be conducted.

#### 5.12.1.11 Nest Substrate Enhancement

- In order to provide suitable nesting substrate that does not foster weed invasion that may harm nesting or fledging success, the Navy treats invasive exotic plants. Because iceplant can help dune stabilization and removal can be expensive, some iceplant may be left in place. This iceplant may be subsequently removed when money is available for natives to be planted at the site.

- Substrate enhancement of nesting sites occurs as opportunities arise with available sand or dredge spoil.

#### 5.12.1.12 Signage and Education

- Signs have been positioned every 500 feet on the sand road that parallels State Route (SR)-75. They inform the public of the need to avoid areas marked that designate nesting locations of snowy plovers or least terns on the beach.

- Signs are also placed at South Delta such as the large sign informing about least terns. Most plover areas also include a sign to explain the blue stakes.

- Signs are occasionally provided by State Parks to help with managing trespassers at Orange Beach and north of SSTC-S.

- An interpretive sign on least terns and snowy plovers is in development for the bike trail near South Delta Beach.

#### 5.12.1.13 Recreational Use Restriction

- The Navy works to eliminate recreational or casual use of the beaches by military personnel and their dependents who live in the Naval housing that is across SR-75 from Blue 2, Orange 1, and Orange 2. An annual letter is sent out to educate military housing residents about recreational use restrictions. In addition, the Navy works to eliminate nonmilitary civilian use of nesting beaches through security patrols and guards. Signage, fencing, public awareness campaigns, and/or enforcement are all necessary to achieve successful control.

#### 5.12.1.14 Rearing of Collected Eggs, Injured, and Sick Individuals

- All injured or sick individuals are taken to a wildlife rehabilitation center, preferably Project Wildlife, for rehabilitation.

- If needed, least tern eggs that have been collected are provided to Project Wildlife or Sea World, as appropriate, for hatching and rearing. Terns were reared in captivity in 2002 and 2003 after the eggs were collected to discourage nesting on the operational beaches. The least tern chicks proved very difficult to raise, whereas snowy plover chicks, which are precocial, are easier to raise. Tern survival after rehabilitation proved to be minimal if at all. All chicks are released in areas approved by the Navy with guaranteed predator management.

- The success of reared western snowy plovers as adults is tracked and evaluated to develop more effective rearing methods, with a few releases that were preliminarily successful.

#### 5.12.1.15 Western Snowy Plover Health Study

- Due to an unknown cause of mortality in adult snowy plovers in and around San Diego Bay that began in 2005, the Navy supports studies and efforts by the USFWS to determine the cause of the mortality.

#### 5.12.1.16 Monitoring for Effects and Adaptive Management

- California least terns and WSP are monitored for take at all San Diego Bay NBC training locations. The Navy prepares an end of the year report that documents, at a minimum, the locations of nests collected, number of nests/eggs collected, the hatch date of each egg collected, the unique band combination given each captive-reared chick, the approximate fledgling date and the release date/location of each fledglings, and suggestions to improve the efficacy of this process if used in future years. This information is necessary to assess the amount of incidental take, and the effectiveness of using this approach to minimize impacts.

- Biological monitoring of the least tern and the snowy plover during the breeding season is performed by qualified and USFWS-permitted experts at all nesting sites. The general schedule for monitoring is provided below but is modified based on findings in the field and/or operational requirements.

    - NAB Ocean Beach: Monitoring for least terns and snowy plovers is conducted three to four days each week from March 1 to April 15, five to six days per week from April 15 to August 1, and three to four days per week from August 1 to August 31.

    - NAB North and South Delta Beach: Monitoring for least terns and snowy plovers is conducted three days a week from April 15 to April 30, four to five days a week from April 30 to July 31, and three days a week from July 31 to August 31.

  - Monitoring for snowy plover occurs one day per week from September through February.

  - Monitoring at SSTC-S for snowy plovers is conducted one to three days a week from March 1 to mid-September (and one day per week during the winter).

- Banding of least tern and snowy plover adults and chicks is done in conjunction with monitoring of nests at NASNI, SSTC-N and SSTC-S. Due to the large number of nests that must be monitored and the number of quality bands received from the USFWS, not all adults or chicks are banded. Any least tern or snowy plover nest relocations are reported to the USFWS Carlsbad Field Office. Semi-monthly and annual reports are provided to the USFWS.

- A California least tern foraging study was conducted in 2009 to examine foraging patterns to evaluate if certain areas have higher foraging value than others. This study report is currently under preparation.

### 5.12.2 Light-Footed Clapper Rail Management

Since the light-footed clapper rail is listed as federally endangered, formal consultation with the USFWS under Section 7 of the ESA is required prior to any potential impacts to this species. The Navy currently does not conduct activities at the location where this species may breed, which is leased to the County of San Diego for the South Bay Marine Biological Study Area. Periodic surveys are conducted to determine species presence and breeding status.

Management of the clapper rail is addressed in the NBC INRMP with a program at Naval Outlying Landing Field (NOLF) Imperial Beach driving the management of this species at SSTC-S. The NOLF Imperial Beach program was established in 1992 through an MOU between the U.S. Navy and the USFWS. The focus of management is a little over 600 acres of the south and west NOLF Imperial Beach property that is managed as part of the Tijuana River National Estuarine Research Reserve and Tijuana Slough National Wildlife Refuge. The MOU is reviewed for renewal every five years.

The NBC INRMP identifies three primary approaches for protecting the light-footed clapper rail:

1. Develop and participate with other agencies in a regional approach and formal agreements for conserving salt marsh across the species' range in the context of local land use requirements;

2. Protect cordgrass sites from erosion; and

3. Improve nesting and foraging opportunities when habitat restoration or creation projects are undertaken. The Navy has participated as a partner in the light-footed clapper rail captive propagation program at the Sweetwater Marsh NWR (USFWS 2006).

#### 5.12.2.1 Underwater Detonation Measures

A buffer zone is established around each detonation point. This buffer is 1,200 feet for detonations occurring in zero to 24 feet of water depth and 1,500 feet for detonations in 24 to 72 feet of water depth. Observer(s) (two per activity) with binoculars and small craft survey the detonation area and buffer zone for birds. If flocks of birds or foraging birds are sighted within the buffer zone or moving towards it, activities are suspended until the birds voluntarily leave the area. Immediately following the detonation, visual monitoring for birds within the buffer zone takes place for 30 minutes. Observations are made for animals with signs of injury; injured animals are reported to the NRSW Environmental Director and the PACFLT Environmental Office. Sequential detonations are conducted either less than 10 seconds apart or greater than 30 minutes apart to allow for birds attracted by fish kill to vacate the area.

### 5.12.3 Proposed Mitigation Measures

All listed species management measures currently employed under No Action alternative are in accordance with previous USFWS Biological Opinions (as described in detail in Section 3.12.1.5) and will continue, with the exception of lane management of SSTC-N training lanes Blue 2 through Orange 2 as previously described in 3.12.1.5.3. In addition, the following mitigation measures are proposed, which are consistent with the USFWS Biological Opinion on SSTC operations (FWS-SDG-08B0503-09F0517).

#### 5.12.3.1 California Least Tern and Western Snowy Plover Measures

Due to anticipated impacts to California least tern and western snowy plover from the action alternatives and following consultation with USFWS resulting in a signed Biological Opinion (July 7, 2010), the following measures will be implemented to minimize and manage these impacts:

- Develop and implement a Long-term Site Enhancement Plan that includes invasive vegetation control on SSTC oceanside beach lanes, establishing dunes on the windward (west) edges of Delta North and South that would enhance this area for plovers, create a source of sand for the least tern nesting area, and establish a better visual barrier between SR-75 and the nesting colony.

- Install temporary barriers and improved signage on the southern end of SSTC-N to more clearly notify the public of the Navy's exclusive use of SSTC-N beach and existing restrictions on public usage of those beaches.

- The Navy will consider the tide conditions when developing training schedules, and schedule training activities that could be conducted on the hardpack during low tides when consistent with training needs.

- The Navy will mark and buffer up to 22 concurrent snowy plover nests established at SSTC-N and SSTC-S beaches plus any additional nests that exceed 22 that are initiated in beach lanes Orange 1 and Orange 2.

- Under baseline conditions, the southern 3 beach lanes are marked to facilitate avoidance of tern and plover nests. The Navy is developing a marking strategy to delineate least tern and snowy plover nesting areas that does not encumber training activities. Such a marking strategy may entail signage affixed to existing beach lane sign posts and a limited number of additional markers.

- If relocation of any least tern or snowy plover nest/egg is necessary as a protective measure, each nest/egg will be relocated the shortest distance possible into suitable habitat by Service-approved monitors to increase the chances for nest success. The weekly reports to be submitted to the CFWO under the proposed project will include: a) date the nests/eggs were moved, b) number of nests/eggs moved, c) original and ending location of nests/eggs moved, and (d) distance the nests/eggs were moved.

- The Navy will delineate the boundary of SSTC-S that parallels the mean high tide line in a manner that does not encumber training exercises.

- The NBC Natural Resources staff will brief all dog handlers annually, or more frequently if necessary, of guidelines pertaining to the use of military working dogs on SSTC beaches.

- Military working dog handlers will be notified weekly of the locations of plover nests and, to the maximum extent possible, remain a minimum of 30 m (90 ft) from markers that delineate the locations of nesting plovers. Outside of the nesting season (15 Sept through end of February), training may occur unencumbered.

- If physical conditioning on soft pack sand is necessary, handlers and military working dogs will run on the sand road (SSTC-N only) or within 20 feet of the hard pack sand (SSTC-S only) to reduce the disturbance and impact to nesting terns and plovers.

- At SSTC-N, military working dogs will exercise primarily between beach lanes Yellow 1 and Blue 1, where they may cross the beach to get to the sand road at the existing route immediately to the north of the demo pit. The Navy will not conduct physical conditioning using dogs in the southern three beach lanes until: a) completing a study to evaluate the effects of military working dogs on terns and plovers and b) coordinating with the USFWS to develop conservation measures to minimize any additional effects.

- If military working dog training is requested as part of Platoon Over-the-Beach activities at SSTC-N, these activities will be scheduled in beach lanes Yellow 1, the north half of Yellow 2, Green 1 or Green 2, pending the results of the Navy’s study to evaluate the response of terns and plovers to military working dog presence.

- The Navy will coordinate with the Service in the development of the study to evaluate the effects of military working dogs on terns and plovers and will submit the study design and scope of work to the Service for review and approval. The Navy will allow the Service 30 days to submit comments and an additional 30 days to approve the final study design and scope of work.

- The Navy will coordinate with the Service in the development of the Long Term Habitat Enhancement Plan for SSTC and will submit the plan to the Service for review and approval. The Navy will allow the Service 30 days to submit comments and an additional 30 days to approve the final study design and scope of work.

- The Navy will include the following information in the yearly reports to be submitted to the USFWS under the proposed project: a) the number and distribution of terns and plovers observed in each training lane; b) the number of any dead or injured least terns or snowy plovers (including eggs, chicks or adults) observed in each training lane; c) the hatching rate of terns and plovers in each beach lane; d) maps of the locations of tern and plover roosts within the action area; e) the timing and number of training events within the southern 3 beach lanes, and other beach lanes, to the extent available; f) the date and condition of any dead or injured tern or plover; and g) any measures taken to prevent additional tern or plover death or injury.

- The Navy will ensure that biological monitors look for and document the location of least tern or snowy plover nests, eggs and chicks prior to and after all military training exercises, to allow assessment of take associated with training activities.

- The Navy will provide California Coastal Commission staff monitoring reports prepared for the U.S. Fish and Wildlife Service under the July 7, 2010 Biological Opinion.

- Consistent with other applicable laws and to the extent possible and practical, the Navy will maintain signs and enforce the existing ban on the public bringing non-military working dogs to Navy-controlled beaches.

#### 5.12.3.2 Training Activity Restrictions

Vehicle Patrolling and LARC V Operator Training. Vehicle patrolling and LARC V Operator training will not occur in Red, Blue, or Orange Beach Lanes**.**

## 5.13 CULTURAL RESOURCES

The Navy strives to ensure that it retains access to ocean training areas as necessary to accomplish its mission, while facilitating joint military-civilian use of such areas to the extent practicable and consistent with safety. These goals of military access, joint use, and safety are promoted through various coordination and outreach measures. The Navy currently employs the following management practices to avoid impacts to cultural resources:

- Restrict digging near any cultural resource site that is known to be eligible for listing in the National Register of Historic Places (NRHP).
- Limit operational training access on or across the recorded areas of eligible or potentially eligible archaeological sites to foot traffic only.
- No alteration or damage to the appearance, structure, or features of NRHP-eligible built properties is permitted without appropriate Section 106 review and compliance.

Specifically, digging would be restricted (whether as a part of a training activity or infrastructure development) at site CA-SDI-5454/12,270, which is a site formally determined to be eligible for listing on the NRHP. This site contains prehistoric human remains and is thus subject to the provisions of the Native American Graves Protection.

For the Single Anchor Leg Moor component of Offshore Petroleum Discharge System the Navy procedure is to send down a diver to reconnoiter the bottom. This procedure avoids fouling of ground tackle and avoids impacts to submerged cultural resources. During other vessel activities, it is current practice that navigators avoid known obstructions and shipwrecks.

Current mitigation measures to avoid impacts to cultural resources will continue to be implemented under the action alternatives.

## 5.14 TRANSPORTATION AND CIRCULATION

The Navy strives to ensure that it retains access to oceanside and bayside training areas as necessary to accomplish its mission, while facilitating joint military-civilian use of such areas to the extent practicable and consistent with safety. These goals of military access, joint use, and safety are promoted through various coordination and outreach measures, including publication of potentially hazardous activities planned for the oceanside and bayside areas through Notices to Mariners issued by the U.S. Coast Guard.

Current measures, which facilitate joint military-civilian use of SSTC consistent with safety, would continue.

## 5.15 SOCIOECONOMICS, ENVIRONMENTAL JUSTICE AND PROTECTION OF CHILDREN

There are no current mitigation measures related to socioeconomics, environmental justice, and protection of children. However, the Navy strives to be a good neighbor to the community by maintaining, to the greatest extent practicable, land use compatibility with the surrounding neighborhood and providing public access whenever possible. The Navy recognizes the importance of public access and works with the community to ensure access to the public beach areas. Mitigation measures in place for other resources (e.g., Water Resources [Section 3.5], Acoustic Environment [Section 3.6], and Public Health and Safety [Section 3.16]) also ensure that non-participants, including children, are not affected by Navy actions.

## 5.16 PUBLIC HEALTH AND SAFETY

The Navy has specific and documented procedures in place to ensure that nonparticipants are not endangered by Navy actions. Emergency medical personnel and first aid kits are on site for each training activity in the unlikely event of an injury.

### 5.16.1 Exercise Planning

The Navy considers public safety in planning its exercises. Factors considered in evaluating the impact of the training on public safety include proximity of the activity to public areas; access control; schedule (time of day, day of week); public notification; frequency, duration, and intensity of activities; range safety procedures; operational control of hazardous activities or events; and safety history.

### 5.16.2 Range Control

Current range control procedures at SSTC-N and SSTC-S limit the potential for unanticipated interactions with the public. On SSTC-N bayside, a fence parallel to Silver Strand Highway from Rendova Housing to Fiddler’s Cove prevents public access from the land to bayside training areas. Oceanside access to the beach is controlled by a watch guard posted on the northern edge of Yellow 1. SSTC-S inland areas are fully fenced. Entrance into this area is controlled by manned gates. During all land and water training activities, trainers and exercise participants are responsible for assuring that nonparticipants are not close enough for their safety to be at risk.

### 5.16.3 Range Inspection

Range users are instructed to discuss planned activities with the range scheduling activity to ensure the current and applicable range inspection procedures are applied prior to conducting any activities. Scheduling officials regularly inspect beach areas.

### 5.16.4 Coordination Procedures

Close coordination between military and civilian facilities enables effective real-time shared use. Notices to Mariners are issued for all underwater detonation activities. An individual activity must be coordinated between the appropriate range scheduling activity and range user at the time the range is scheduled for the operation.

# 6 Other Considerations

# 6 OTHER CONSIDERATIONS REQUIRED BY NEPA

## 6.1 POSSIBLE CONFLICTS WITH OBJECTIVES OF FEDERAL, STATE, AND LOCAL PLANS, POLICIES, AND CONTROLS

Implementation of the Navy's alternatives, including the Proposed Action for the Silver Strand Training Complex (SSTC) Environmental Impact Statement (EIS), would not conflict with the objectives or requirements of Federal, state, regional, or local plans, policies, or legal requirements. The Navy has consulted with regulatory agencies as appropriate during the National Environmental Policy Act (NEPA) process and prior to implementation of the Proposed Action to ensure requirements are met. Table 6-1 provides a summary of environmental compliance requirements that may apply. Appendix G provides a list of the Silver Strand Training Complex (SSTC) regulatory agency consultation documentation. Agency correspondence and supporting documentation can be found on the SSTC EIS website at www.silverstrandtrainingcomplexeis.com.

**Table 6-1: Summary of Environmental Compliance for the Proposed Action**

| Plans, Policies, and Controls | Responsible Agency | Status of Compliance |
|---|---|---|
| NEPA of 1969 (42 United States Code [U.S.C] §§ 4321 *et seq*.); Council on Environmental Quality (CEQ) Regulations for Implementing the Procedural Provisions of NEPA (40 Code of Federal Regulations [C.F.R.] §§ 1500-1508); Department of the Navy Procedures for Implementing NEPA (32 C.F.R. § 775) | U.S. Navy | This EIS has been prepared in accordance with NEPA, CEQ regulations, and Navy NEPA procedures. Public participation and review has been conducted in compliance with NEPA. |
| Clean Air Act (CAA) (42 USC §§ 7401 *et seq*.); CAA General Conformity Rule (40 C.F.R. § 93[B]); State Implementation Plan (SIP) | U.S. Environmental Protection Agency (USEPA) and San Diego Air Pollution Control District | The Proposed Action would be compatible with attainment and maintenance goals established in the SIP. A CAA conformity determination will not be required because emissions attributable to the alternatives including the Proposed Action would be below the *de minimis* thresholds for requiring a full conformity determination, and the General Conformity Rule is therefore not applicable. A Record of Non-Applicability is included in Appendix D. |
| Federal Water Pollution Control Act (Clean Water Act [CWA]) (33 U.S.C. §§ 1344 *et seq.*) | USEPA | CWA Section 401 water quality certification and CWA Section 404 permit will be prepared for Elevated Causeway System, Causeway Pier activities; and other activities involving fill below the high tide line within the SSTC. An amendment request to the existing Naval Base Coronado (NBC) National Pollutant Discharge Elimination System permit to include Reverse Osmosis Water Purification Unit discharge into the bay and ocean has been submitted. |

**Table 6-1: Summary of Environmental Compliance for the Proposed Action (Continued)**

| Plans, Policies, and Controls | Responsible Agency | Status of Compliance |
|---|---|---|
| Rivers and Harbors Act (RHA)<br>(33 U.S.C. §§ 401 et seq.) | United States Army Corps of Engineers (USACE) | A RHA Section 10 permit is required for Elevated Causeway and Causeway Pier construction and training. The permit application will be submitted to the USACE. |
| Coastal Zone Management Act (CZMA) (16 C.F.R. §§ 1451 *et seq*.) | California Coastal Commission (CCC) | A Coastal Consistency Determination (CCD) was prepared in compliance with the CZMA, which states that Federal actions that have reasonably foreseeable effects on coastal uses or resources must be consistent to the maximum extent practicable with the enforceable policies of approved state coastal management programs. Applicable sections of the California Coastal Act of 1976 (14 California Code of Regulations § 13001 *et seq*.) were thoroughly analyzed against the Proposed Action.<br>• The Navy submitted the CCD to the CCC on May 26, 2010.<br>• Coastal Consistency Determination conditional concurrence received on August 17, 2010.<br>• The Navy submitted a conditional concurrence response letter to the California Coastal Commission on August 20, 2010.<br>• Final Consistency Determination Notification letter to California Coastal Commission dated November 23, 2010. The Navy determined that the conditions of concurrence proposed by the California Coastal Commission are not necessary for the proposed activities to be consistent to the maximum extent practicable with the applicable enforceable policies of the California Coastal Management Program (CCMP) as the Navy's proposed activities are consistent to the maximum extent practicable with the CCMP. |
| Magnuson-Stevens Fishery Conservation and Management Act (16 U.S.C. §§ 1801-1802) | National Oceanic and Atmospheric Administration (NOAA) - National Marine Fisheries Service (NMFS) | Implementation of the Proposed Action would result in a direct effect on eelgrass. However, based upon the minimal short-term impacts associated with the Proposed Action and extensive mitigation through eelgrass planting, there will not be any adverse effects to Essential Fish Habitat (EFH). The Navy submitted an EFH assessment to NMFS that reviews the impacts of the Proposed Action on EFH that includes applicable mitigation measures. The Navy has completed consultation with NMFS.<br>• The Navy submitted an EFH assessment to NMFS on March 22, 2010.<br>• EFH updated to reflect discussions during the consultation process. A revised EFHA was submitted (September 27, 2010) to NMFS with inclusion of measures in the proposed action to include updated benthic habitat mapping, pre-event beach survey, eelgrass mitigation, and underwater detonation reporting.<br>• NMFS provided Essential Fish Habitat Conservation Recommendations to the Navy on October 13, 2010.<br>• Consultation with NMFS was completed on November 10, 2010 with the Navy's response letter to NMFS. |

**Table 6-1: Summary of Environmental Compliance for the Proposed Action (Continued)**

| Plans, Policies, and Controls | Responsible Agency | Status of Compliance |
|---|---|---|
| Endangered Species Act (ESA) (16 U.S.C. §§ 1531 et seq.) | U.S. Navy, U.S. Fish and Wildlife Service (USFWS) | The EIS analyzes potential effects to species listed under the ESA. In accordance with ESA requirements, the Navy has completed consultation under Section 7 of the ESA with USFWS and which indicates that the Proposed Action may affect, not likely to adversely affect, ESA-listed species. With regard to USFWS jurisdiction over species present in SSTC, the Navy has conducted its activities in accordance with any applicable Biological Opinions.<br>• The Navy initiated consultation with USFWS on September 22, 2008.<br>• Between November 18, 2008 and April 27, 2009, the Navy and USFWS met regularly to discuss the Proposed Action, effects to species and associated incidental take, and conservation measures to avoid, minimize, and monitor impacts.<br>• USFWS provided a draft Biological Opinion to the Navy for review and comment on August 28, 2009. The Navy provided preliminary comments on the draft biological opinion on September 28, 2009. The Navy and USFWS discussed the Navy's comments at meetings held on September 21 and September 29, 2008. USFWS addressed these comments and provided a revised draft biological opinion to the Navy on January 15, 2010. The Navy provided additional comments on the revised draft Biological Opinion to USFWS, via electronic mail, on March 3, 2010. The Navy and USFWS discussed the Navy's additional comments at meetings held on March 4 and May 26, 2010. The USFWS addressed the Navy's comments in the final Biological Opinion.<br>• USFWS Biological Opinion signed on July 7, 2010 (FWS-SDG-08B0503-09F0517). |
| Endangered Species Act (ESA) (16 U.S.C. §§ 1531 et seq.) | U.S. Navy and NMFS | The Navy has also conducted informal consultation with NMFS for the green sea turtle. In accordance with ESA requirements, the Navy has completed informal consultation under Section 7 of the ESA with NMFS. NMFS has concurred that that the Proposed Action may affect, but is not likely to adversely affect, ESA-listed species.<br>• The Navy initiated informal consultation with NMFS for potential impacts to green sea turtles on March 15, 2010.<br>• The Navy coordinated two exchanges of comments and responses with NMFS.<br>• NMFS informal consultation on green sea turtles completed with letter of concurrence on November 17, 2010. |

**Table 6-1: Summary of Environmental Compliance for the Proposed Action (Continued)**

| Plans, Policies, and Controls | Responsible Agency | Status of Compliance |
|---|---|---|
| Marine Mammal Protection Act (16 U.S.C. §§ 1431 *et seq*.) | NOAA-NMFS | The Navy has submitted an application for an Incidental Harassment Authorization (IHA) to NMFS per the requirements of MMPA for proposed training activities that have the potential to incidentally take marine mammals.<br>• Received comments from NMFS on the IHA request on September 9, 2010.<br>• The Navy submitted the Final IHA to NMFS on September 15, 2010.<br>• Notice of Receipt of the IHA request published in the Federal Register on (October 19, 2010).<br>• After consideration of public comments on the IHA application, NMFS may grant the authorization to take small numbers of marine mammals by harassment if it finds that the taking will have a negligible impact on the species or stock(s) on subsistence uses (where relevant). NMFS will identify appropriate mitigation, monitoring and reporting requirements. |
| The National Marine Sanctuaries Act (16 U.S.C. §§ 1431 et. seq.) | NOAA | Implementation of the Proposed Action will have no effect on sanctuary resources in the offshore environment of southern California. Review of agency actions under Section 304 is not required. |
| The Sikes Act of 1960 (16 U.S.C. §§ 670a-670o, as amended by the Sikes Act Improvement Act of 1997, Pub. L. No. 105-85) | Department of Defense | Implementation of the Proposed Action will be implemented in accordance with the management and conservation criteria developed in the Sikes Act Integrated Natural Resources Management Plans for NBC. |
| National Historic Preservation Act (16 U.S.C. §§ 470 *et seq*.) | U.S. Navy | The Proposed Action will be implemented in compliance with Section 106 through a programmatic agreement with the State Historic Preservation Office, and pursuant to the criteria developed by the Navy for cultural resources management practices. As a result of cultural resource management practices, implementation of the Proposed Action will not result in any adverse effects to cultural resources. |
| Executive Order (EO) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations | U.S. Navy | Implementation of the Proposed Action would not result in any disproportionately high and adverse human health or environmental effects on minority or low-income populations. |
| EO 13045, Protection of Children from Environmental Health Risks and Safety Risks | U.S. Navy | Implementation of the Proposed Action would not result in disproportionate environmental health or safety risks to children. |

**Table 6-1: Summary of Environmental Compliance for the Proposed Action (Continued)**

| Plans, Policies, and Controls | Responsible Agency | Status of Compliance |
|---|---|---|
| EO 13112 Invasive Species | U.S. Navy | EO 13112 requires agencies to identify actions that may affect the status of invasive species and take measures to avoid introduction and spread of these species. To the extent invasive species management relates to ESA compliance on SSTC, the BO ensures compliance with EO 13112. This EIS also otherwise satisfies the requirement of EO 13112. |
| EO 11990 Protection of Wetlands | U.S. Navy | Section 2 (b) of EO 11990 requires federal agency action when there would be a significant impact to wetlands. Implementation of the Proposed Action would not have a significant impact on wetlands. |
| EO 12962 Recreational Fisheries | U.S. Navy | EO 12962 requires agencies to conserve, restore and enhance aquatic systems to provide for increased recreational fishing opportunities nationwide. Implementation of the Proposed Action will comply with these duties. |
| California Marine Life Protection Act (MLPA); Marine Managed Areas Improvement Act (California Department of Fish and Game [CDFG] Code §§ 2850-2863) | CDFG | MLPA requires CDFG to confer with the Navy regarding issues related to Navy activities. However, there are no proposed or existing Marine Managed Areas within the SSTC boundaries. |
| Migratory Bird Treaty Act (MBTA) (16 U.S.C. §§ 703-712) | USFWS | Implementation of military readiness activities will not have a significant adverse effect on any population of migratory birds, and will comply with the MBTA, and will not require a permit under the MBTA. |

Note: Relevant agency correspondence is provided in Appendix G.

## 6.2 RELATIONSHIP BETWEEN SHORT-TERM USES AND LONG-TERM PRODUCTIVITY

NEPA requires an analysis of the relationship between a project's short-term impacts on the environment and the effects that these impacts may have on the maintenance and enhancement of the long-term productivity of the affected environment. Impacts that narrow the range of beneficial uses of the environment are of particular concern. This means that choosing one option may reduce future flexibility in pursuing other options, or that committing a resource to a certain use may often eliminate the possibility for other uses of that resource.

The majority of activities addressed in this EIS would be categorized as long-term. For example, although the use of training areas for individual training activities (e.g., breacher) may be of short duration, the training areas would continue to receive increased and repeated use for the foreseeable future. As the proposed action includes an increase in training tempo, areas designated for training would accommodate a higher level of operational uses in the long-term which would, in turn, affect the long-term productivity of environmental resources in those areas. The Navy's proposal to increase access and availability of SSTC-N and SSTC-S oceanside beach training lanes and SSTC-S inland areas for military training is an example of the balancing of long-term productivity of the environment with the need to address range capability shortfalls. Addressing such shortfalls through planning and accommodation of future training tempo requirements and deployment schedules will allow the Navy to more readily facilitate long-term resource management strategies while achieving the near-term goal of providing the capacity and capabilities to fully support required training tasks and meet the Title 10 mandate.

## 6.3 IRREVERSIBLE OR IRRETRIEVABLE COMMITMENT OF RESOURCES

NEPA requires that environmental analysis include identification of "any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented." Irreversible and irretrievable resource commitments are related to the use of non-renewable resources and the effects that the uses of these resources have on future generations. Irreversible effects primarily result from the use or destruction of a specific resource (e.g., energy or minerals) that cannot be replaced within a reasonable time frame. Irretrievable resource commitments involve the loss in value of an affected resource that cannot be restored as a result of the action (e.g., the disturbance of a cultural site).

Construction activities associated with increased training activities at the SSTC would result in the irretrievable commitment of nonrenewable energy resources, primarily in the form of fossil fuels (including fuel oil), natural gas, and gasoline construction equipment. Implementation of the Proposed Action would require fuels used by aircraft, vessels, and ground-based vehicles. Since fixed- and rotary-wing flight, amphibious vessels, and small craft activities could increase, total fuel use would increase. Fuel use by ground-based vehicles involved in training activities would also increase. Therefore, total fuel consumption would increase and this nonrenewable resource would be considered irreversibly lost.

## 6.4 ENERGY REQUIREMENTS AND CONSERVATION POTENTIAL

Increased training activities on SSTC would result in an increase in energy demand over the No Action Alternative. Although the required electricity demands would be met by the existing electrical infrastructure at SSTC, energy requirements would be subject to any established energy conservation practices. The use of energy sources would be minimized wherever possible without compromising safety, training, or testing operations.

## 6.5 NATURAL OR DEPLETABLE RESOURCE REQUIREMENTS AND CONSERVATION POTENTIAL

Resources that will be permanently and continually consumed by project implementation include water, electricity, natural gas, and fossil fuels. To the extent practicable, pollution prevention considerations are included. In addition, sustainable range management practices are in place that protect and conserve natural and cultural resources while preserving of access to training areas for current and future training requirement.

# 7 List of Preparers

# 7 LIST OF PREPARERS

## GOVERNMENT PREPARERS

Linda Burgum, Technical/Staff Director, Expeditionary Warfare Training Group Pacific (EWTGPAC)
*Ph.D. Public Administration, San Diego State University*
*M.A. Education/Teaching Credential, San Diego State University*
Years of Experience: 26

Rob Chichester, Current NBPL IEPM, Former Water Program Manager, Naval Facilities Engineering Command Southwest (NAVFAC SW)
*B.S. Civil Engineering, San Diego State University*
Years of Experience: 15

Tamara Conkle, Former Natural Resources Manager, NAVFAC SW, Naval Base Coronado (NBC) Botanist
*B.S. Biology, George Fox College*
Years of Experience: 15

J.T. Hesse, Former Marine Resources Specialist, Navy Region Southwest (CNRSW)/NBC
*B.S. Marine Ecology, Oregon State University*
Years of Experience: 8

Chip Johnson, Marine Mammals Specialist, COMPACFLT
*M.A. Marine Science, Virginia Institute of Marine Science, College of William and Mary*
*B.S. Biology, University of North Carolina at Wilmington*
Years of Experience: 17

Tim Latas, Range Complex Sustainment Coordinator, NBC
*M.A. Anthropology, University of Washington*
*B.S. Geology, Wichita State University*
Years of Experience: 30

Delphine Lee, Project Coordinator, COMPACFLT
*M.S. Environmental Engineering, Pennsylvania State University*
*B.S. Civil Engineering, Pennsylvania State University*
Years of Experience: 12

Jenny Marshall, Range Complex Sustainment Coordinator, FACSFAC
*M.A. Marine Science, Moss Landing Marine Labs, California State University*
*B.S. English Literature, University of California, Los Angeles*
Years of Experience: 9

Glen Mitchell, Environmental Planner and Oceanographer, Naval Undersea Warfare Center (NUWC)
*B.S. Zoology, University of Rhode Island*
*B.S. Electrical Engineering, University of Rhode Island*
Years of Experience: 16

Kim O'Connor, Botanist, NAVFAC SW
*M.S. Natural Resources, Cornell University*
*B.A. Botany, University of California, Berkeley*
Years of Experience: 13

Kathryn Ostapuk, NEPA Coordinator, CNRSW
*J.D. California Western School of Law*
*B.A. Communication, University of Arizona*
Years of Experience: 3

Scott Penwell, Environmental Specialist, Naval Special Warfare (NAVSPECWAR)
*B.S. Industrial Technology, San Diego State University*
Years of Experience: 16

Patricia Ryan, Environmental Public Affairs, CNRSW/NBC
*B.A. Communications, California State University at Sacramento*
Years of Experience: 22

Tiffany Shepherd, Biologist, NAVFAC SW
*M.S. Biology, San Diego State University*
Years of Experience: 5

Molly Thrash, Former NEPA Planner, NAVFAC SW
*B.A. Anthropology, University of Colorado*
Years of Experience: 9

Glen White, Program Manager for Strategic Sealift Training, EWTGPAC
*M.A. Strategic Studies, Naval War College*
*B.A. Geography, University of Washington*
Years of Experience: 13

Andy Yatsko, Archaeologist, NAVFAC SW
*Ph.D. Anthropology, University of California Los Angeles*
*M.A. Anthropology, California State University, Chico*
*B.A. Anthropology, San Diego State University*
Years of Experience: 35

## CONTRACTOR PREPARERS

Matthew Bartlett (Parsons Infrastructure and Technology), Analyst
*B.S. Environmental Policy and Planning, Virginia Polytechnic Institute and State University*
Years of Experience: 4

Blair Brownyard (ManTech SRS), Deputy Project Manager
*J.D. Touro Law Center*
*B.A. History, California State University, San Marcos*
Years of Experience: 7

Bruce Campbell (Parsons Infrastructure and Technology), Lead Analyst, Geology and Soils, Hazardous Materials and Waste, Noise, Public Health and Safety, Water Resources
*M.S. Environmental Management, University of San Francisco*
*B.S. Environmental Biology, University of California, Santa Barbara*
Years of Experience: 28

Steffanie Chan (ManTech SRS), Terrestrial Biologist
*B.S. Biology, George Mason University*
*B.B.A. International Business, Marymount University*
Years of Experience: 12

Erica Cunningham (Tierra Data, Inc.), Ecologist/Subject Matter Expert
*M.S. Environmental Science, College of Charleston, S.C.*
*B.S. Marine Biology, University of Miami, Ohio*
Years of Experience: 3

Lawrence Honma (Merkel & Associates, Inc.), Analyst, Marine Biology and Fish
*M.S. Marine Sciences, Moss Landing Marine Laboratory, California State University, San Francisco*
*B.S. Wildlife and Fisheries Biology, University of California, Davis*
Years of Experience: 19

Elizabeth Kellogg (Tierra Data, Inc.), President/Senior Subject Matter Expert
*M.S. International Agricultural Development with specialization in Range Management, University of California at Davis*
*B.S. Agricultural Science and Management, University of California at Davis*
Years of Experience: 21

Krystal Kermott (ManTech SRS), Senior Subject Matter Expert
*B.S. Biological Sciences, University of California at Santa Barbara*
Years of Experience: 7

Derek Lerma (Tierra Data, Inc.), Senior Marine Biologist
*M.S. Oceanography, Humboldt State University*
Years of Experience: 11

Thanh Luc (Parsons Infrastructure and Technology), Senior Sound Engineer
*B.S. Mechanical Engineering, California State Polytechnic University, Pomona*
Years of Experience: 18

Daniel Nelson (ManTech SRS), Document Production Specialist
*B.S. Aerospace Engineering, San Diego State University*
Years of Experience: 1

Karyn Palma (ManTech SRS), Technical Editor
*B.A. Environmental Studies, University of California, Santa Barbara*
Years of Experience: 16

Molly Rodriguez (ManTech SRS), Geospatial Analyst
*B.S. Geography, Pennsylvania State University*
Years of Experience: 3

Valorie L. Thompson (Scientific Resources Associated), President/Lead Analyst, Air Quality
*Ph.D. Chemical Engineering, Purdue University*
*M.S. Chemical Engineering, Purdue University*
*B.S. Chemistry, Eastern Michigan University*
Years of Experience: 23

Phil Thorson (ManTech SRS), Senior Research Biologist/Marine Mammal Biologist
*Ph.D. Biology, University of California at Santa Cruz*
Years of Experience: 28

Brian Tucker (ManTech SRS), Environmental Planner
*J.D. Loyola Law School, Los Angeles*
*B.A. History, University of Notre Dame*
Years of Experience: 22

Jackson Underwood (RECON), Senior Archaeologist/Ethnographer
*Ph.D. Anthropology, University of California Los Angeles*
*M.A. Anthropology, San Diego State University*
*B.A. Anthropology, San Diego State University*
Years of Experience: 25

Karen Waller (ManTech SRS), Vice President/Quality Assurance
*B.S. Public Affairs, Indiana University*
Years of Experience: 21

Lawrence Wolski (ManTech SRS), Project Manager/Marine Scientist
*M.S. Marine Sciences, University of San Diego*
*B.S. Biology, Loyola Marymount University*
Years of Experience: 13

# Appendix A
# Federal Register Notice of Intent

# Appendix A: Notice of Intent

Federal Register / Vol. 66, No. 151 / Monday, August 6, 2001 / Notices 41009

1. The SSA will use 60–0103, entitled 'Supplemental Security Income Record and Special Veterans Benefits', last published on February 21, 2001 at 66 FR 11080.

2. The DMDC will use S322.10 DMDC, entitled 'Defense Manpower Data Center Data Base', last published on May 31, 2001 at 66 FR 29552.

E. DESCRIPTION OF COMPUTER MATCHING PROGRAM:

SSA, as the source agency, will provide DMDC with an electronic file which contains the data elements. Upon receipt of the electronic file, DMDC, as the recipient agency, will perform a computer match using all nine digits of the SSN of the SSI/SVB file against a DMDC database which contains the data elements. The DMDC database consists of extracts of personnel and pay records of retired members of the uniformed services or their survivors. The ''hits'' or matches will be furnished to SSA. SSA is responsible for verifying and determining that the data on the DMDC electronic reply file are consistent with the SSA source file and resolving any discrepancies or inconsistencies on an individual basis. SSA will also be responsible for making final determinations as to eligibility for /entitlement to, or amount of payments/ benefits, their continuation or needed adjustments, or any recovery of overpayments as a result of the match. The DMDC database consists of extracts of personnel and pay records of retired members of the uniformed services or their survivors.

1. The electronic SSA query file contains approximately 6.5 million records extracted from the Supplemental Security Income Record.

2. The electronic DMDC database contains records on approximately 2.15 million retired uniformed service members or their survivors.

F. INCLUSIVE DATES OF THE MATCHING PROGRAM:

This computer matching program is subject to public comment and review by Congress and the Office of Management and Budget. If the mandatory 30 day period for comment has expired and no comments are received and if no objections are raised by either Congress. The Office of Management and Budget within 40 days of being notified of the proposed match, the computer matching program becomes effective and the respective agencies may begin the exchange at a mutually agreeable time on a quarterly basis, shifting to a monthly basis when and if the computer system work can be completed to effectuate the increased frequency. By agreement between SSA and DMDC, the matching program will be in effect for 18 months with an option to renew for 12 additional months unless one of the parties to the agreement advises the other by written request to terminate or modify the agreement.

G. ADDRESS FOR RECEIPT OF PUBLIC COMMENTS OR INQUIRIES:

Director, Defense Privacy Office, 1941 Jefferson Davis Highway, Suite 920, Arlington, VA 22202–4502. Telephone (703) 607–2943.

## DEPARTMENT OF DEFENSE

### Department of the Navy

### Notice of Intent To Prepare an Environmental Impact Statement (EIS) for Optimizing Current and Future Operations, Training and Maintenance at the Beaches of Naval Amphibious Base (NAB) Coronado and Naval Radio Receiving Facility (NRRF) Imperial Beach and To Announce Public Scoping Meetings

**AGENCY:** Department of the Navy, DOD.

**ACTION:** Notice.

**SUMMARY:** The Department of the Navy (Navy) announces its intent to prepare an Environmental Impact Statement (EIS) to evaluate the environmental effects of current and future operations, training and maintenance at the beaches of Naval Amphibious Base Coronado, ''NAB'', Naval Radio Receiving Facility Imperial Beach, ''NRRF'', and within the fenced compound at NRRF.

**DATES AND ADDRESSES:** Public scoping open houses will be held to receive oral and/or written comments on environmental concerns that should be addressed in the EIS. Public scoping open houses will be held from 7:00 to 8:30 p.m. the following dates and locations: Tuesday, August 28, 2001 at the Coronado Public Library (Winn Room), 640 Orange Avenue, Coronado, CA; Wednesday, August 29, 2001 at Bayside Elementary School, 490 Emory Street, Imperial Beach, CA.

**FOR FURTHER INFORMATION CONTACT:** Ms. Jenny Boyd, South Bay Area Focus Team, Southwest Division, Naval Facilities Engineering Command, 2585 Callagan Highway, Building 99, San Diego, CA 92136–5198, telephone (619) 556–8589.

**SUPPLEMENTARY INFORMATION:** Pursuant to section 102(2)(c) of the National Environmental Policy Act (NEPA) of 1969, as implemented by the Council on Environmental Quality Regulations (40 CFR Parts 1500–1508), the Department of the Navy (Navy) announces its intent to prepare an Environmental Impact Statement (EIS) to evaluate the environmental effects of current and future operations, training and maintenance at the beaches of Naval Amphibious Base Coronado, ''NAB'', Naval Radio Receiving Facility Imperial Beach, ''NRRF'', and within the fenced compound at NRRF.

NAB Coronado is the only Navy amphibious base on the West Coast. It includes 5,500 yards of Pacific Ocean and bayside beachfront that is used for training. This area, along with 2,000 yards of Pacific Ocean beachfront at NRRF, provide operators with 7,500 yards of expansive beaches, unique topography, and on-base facilities that encompass a critical area for amphibious and clandestine training in support of littoral, unconventional, and special warfare operations.

The proposed action is to allocate operations and training between NAB and NRRF in a manner that optimizes use of those facilities while protecting threatened and endangered species. Operationally realistic training at NAB and NRRF is critical to military mission readiness requirements. However, due to the Navy's on-going, successful resource management program, threatened and endangered biological resources are thriving on the beaches at NAB Coronado. This poses a problem for scheduling required training because the increase in least tern and snowy plover populations is decreasing the size of beachfront available for crucial training and the time during which it is available.

NAB has reviewed its current and future operations, training and maintenance requirements as well as the training needs of tenant commands and other commands in Southern California that use the training facilities at NAB. The EIS will address three alternatives (including the No Action Alternative) for optimizing training at NAB and NRRF based on that internal review.

The No Action Alternative would continue current levels of operations at NAB and NRRF and utilize natural resource management strategies identified in NAB's natural resource management plan. While most operations and training currently are conducted at NAB, a limited number of amphibious training operations are conducted at NRRF. Specific operations are delineated for each location. Current operations delineated for NAB include Warfare Training (amphibious assaults and combat training, clandestine shore assaults, mine countermeasures,

41010 Federal Register / Vol. 66, No. 151 / Monday, August 6, 2001 / Notices

navigation/surf handling training, SCUBA training, ship surveillance) and Strategic Sealift Training (Elevated Causeway System Training) on the Pacific Ocean beachfront. Current bayside operations also include Warfare Training (amphibious assaults and clandestine shore assaults) and Strategic Sealift Training (ELCAS, amphibious assault bulk fuel/water systems). NAB also supports several training area users that have unique training requirements. One of the larger users is the Marine Corp's Expeditionary Warfare Training Group, Pacific. Their primary mission is to conduct warfare training courses for expeditionary and amphibious operations with emphasis on landing force operations using amphibious platforms. Current operations delineated for NRRF include inflatable landing craft, practice assault beaching and underwater navigation techniques. Current resource management strategies will continue with the habitat maintenance practice of predator control, decoy placement, beach maintenance, and coning off Western snowy plover nests on the beaches at NAB. It will also continue using the formal scheduling process for training operations.

Alternative One proposes a more integrated use of NAB and NRRF for current operations as well as the addition of new types of operations at NAB and NRRF. Under Alternative One, all 7,500 yards of beach area at NAB and NRRF would be available to support current operations. This alternative recognizes the dynamic that exists between operational uses and protection of natural resources. As the most significant natural resource issues at NAB involve nesting and foraging, location and timing of operations are critical considerations. Training operations often conflict with nesting season of growing least tern and snowy plover populations. Alternative One would provide operators with the option of training at NAB or NRRF during nesting season and would address the complete range of impacts of training at both NAB and NRRF.

Rather than a rigid matrix that pairs specific operations with a specific location, Alternative One proposes that decisions on the location of operations be based upon the ability of the location to handle a given type and level of operations at a given time of year. This would allow greater flexibility for year round use of NAB and NRRF. The following operations are included under Alternative One: Warfare Training, Strategic Sealift Training, and landing force operations currently conducted at NAB; inflatable landing craft, practice assault beaching, and underwater navigation techniques currently conducted at NRRF; and new operations consisting of mine disabling training in San Diego Bay along the NAB shoreline; new operations consisting of ordnance disposal training and land reconnaissance exercises on the beach and within the fenced compound at NRRF.

In addition to the current habitat maintenance practice of predator control, decoy placement, beach maintenance, coning off Western snowy plover nests and using a formal scheduling procedure, Alternative One proposes to incorporate coning off California least tern nests and clearly delineating beach-crossing lanes.

Alternative Two proposes to relocate the majority of current Warfare Training, Strategic Sealift Training, and landing force operations from NAB to NRRF during nesting season. Current operations involving inflatable landing craft, practice assault beaching, and underwater navigation techniques would continue at NRRF. Alternative Two also includes: the addition of mine disabling training in San Diego Bay along the NAB shoreline, new ordnance disposal training, and land reconnaissance exercises on the beach and within the fenced compound at NRRF. Alternative Two also proposes the additional habitat maintenance practices of coning off California least tern nests and clearly delineating beach-crossing lanes, as proposed in Alternative One at NAB.

In addition to analyzing impacts on the full range of natural, biological, and cultural resources, the EIS will examine aesthetic and socioeconomic issues, management practices for California least tern and Western snowy plover nesting habitat avoidance, and management practices for the salt marsh bird's beak.

To facilitate preparation of its EIS, the Navy has initiated this scoping process. The purpose of the scoping process is to identify community concerns and local issues that should be addressed. Federal, state, and local agencies, elected officials, non-governmental organizations, and interested persons are encouraged to attend scheduled scoping meetings and provide comments on the scope of issues to be addressed in the EIS. Scoping comments that clearly describe specific issues or topics are particularly helpful.

All comments not received at the scheduled public meetings must be in writing and must be postmarked by September 14, 2001. Comments should be mailed or faxed to: Southwest Division, Naval Facilities Engineering Command, Attn: Ms. Jenny Boyd, South Bay Area Focus Team, 2585 Callagan Highway, Building 99, San Diego, CA 92136–5198, fax (619) 556–8929.

Dated: July 30, 2001.

**T.J. Welsh,**

*Lieutenant Commander, Judge Advocate General's Corps, U.S. Navy, Federal Register Liaison Officer.*

BILLING CODE 3810–FF–P

## DEPARTMENT OF ENERGY

### Idaho Operations Office; Emerging Technology Deployment

**AGENCY:** Idaho Operations Office, DOE.

**ACTION:** Notice of availability of financial assistance solicitation No. DE–PS07–01ID14181.

**SUMMARY:** The U.S. Department of Energy (DOE) Idaho Operations Office (ID) is soliciting the submission of proposals for field testing of technologies to reduce energy consumption, enhance economic competitiveness, and reduce environmental impacts, specifically in the Industries of the Future (IOF) industrial sectors. The objective of the solicitation is to find ways to mitigate the risk to industries of accepting and using emerging technologies developed by the IOF program. It is not the intent of DOE–ID to solicit research and development projects. At least a 50% cost share will be required.

This solicitation is commissioned on behalf of the DOE's Office of Industrial Technology (OIT) BestPractices Program, which has been established to provide integrated delivery of energy-saving products, services, and technologies to the nine IOF sectors. Additional information about the BestPractices Program can be found on the website (*http://www.oit.doe.gov/bestpractices*). The IOF industry-specific vision documents and technology roadmaps are available at *http://www.oit.doe.gov/* under individual IOF program areas.

**DATES:** The deadline for receipt of applications is October 19, 2001. Awards are expected to be made on or about January 15, 2002.

**ADDRESSES:** The solicitation in its full text is available on the Internet at the following URL address: *http://e-center.doe.gov.* All applications must be submitted through the DOE e-center site.

**FOR FURTHER INFORMATION CONTACT:** T. Wade Hillebrant, Contract Specialist, hillebtw@id.doe gov.

# Appendix B
# Description of Vessels

# Appendix B

## Descriptions of Vessels, Vehicles, and Aircraft used at SSTC

| TYPE OF EQUIPMENT | DESCRIPTION |
|---|---|
| **MARITIME VESSELS** | |
| Small Insertion/Extraction Vessels | Consists of different types of crafts such as the Combat Rubber Raiding Craft (CRRC), Inflatable Boats (IBS), and Sea Kayak. The CRRC is a 15-foot rubber raft and may be equipped with a small engine. IBS and Kayak boats are propelled by paddling. CRRCs and IBS hold up to 9 crew members. |
| Support/Transport Vessels | The Mark V Special Operations Craft (Mark V SOC) is an 82-foot vessel used to carry Special Operations Forces (SOF), primarily SEAL combat swimmers, into and out of operations.<br>The Landing Craft, Mechanized and Utility (LCM/LCU) and Maritime Prepositioned Force Utility Boat (MPFUB) are capable of transporting cargo, tracked and/or wheeled vehicles and troops from amphibious assault ships to beachheads or piers. LCUs are 135-foot propeller driven craft that are typically used to land/retrieve personnel and equipment (tanks, artillery, equipment, motor vehicles) during amphibious operations. LCMs have a bow ramp for unload/offload. Holds 14 crew members.<br>Landing Craft, Air Cushioned (LCAC) is an 87-foot high-speed, over-the-beach fully amphibious landing craft, capable of carrying a 60- to 75-ton payload and capable of speeds of more than 40 knots over water. Capable of operating from existing and planned well deck ships, it is used to transport weapons systems, equipment, cargo and personnel from ship to shore and across the beach. The LCAC, like all "hovercraft," rides on a cushion of air. The air is supplied to the cushion by four centrifugal fans driven by the craft's gas turbine engines. The air is enclosed by a flexible skirt system manufactured of rubberized canvas. Holds 5 crew members. |
| Propeller Driven Crafts | Rigid Hull Inflatable Boats (RHIBs) are 35-foot high-speed, high-buoyancy, extreme-weather craft with the primary mission of SEAL insertion/extraction, which have a rigid hull and inflatable tube gunwale made of reinforced fabric. The rugged, seaworthy, versatile 36-foot RHIB has a 200-nm range at 32 knots, with a 45-knot top speed. It can carry 8 passengers or 3,200-pound payload and 3 crew members. |
| Water-Jet Driven Craft/Personal Watercraft | The Jet-boat craft that will replace outboard engine RHIB vessels in the future. Small jet-driven vessel (i.e., wave runner) is primarily used for safety support and in the surf zone. |
| Ship to Shore Logistics Equipment | Causeway Section Powered/Warping Tug and Barge Ferrys make up the main building blocks for the modular causeway section and ELCAS activities. The causeway sections are 24 foot x 80 foot platforms configured from compatible floating pontoons. Causeway sections are assembled to configure three sub-systems: Floating Causeway, Roll On/Roll Off Discharge Facility (RRDF), and Causeway Ferry. The OUB (Offshore Petroleum Discharge System [OPDES] Utility Boat) to support ship to shore transfer of fluids. |
| Unmanned Underwater Vehicles (UUV) | Self-propelled submersible used in reconnaissance activities for either fully autonomous (programmed) or under minimal supervisory control. Vehicles range from 63-70 inches in length and have a 7.5-inch diameter. |

| TYPE OF EQUIPMENT | DESCRIPTION |
|---|---|
| **VEHICLES** | |
| Construction/ Excavation Equipment | Bulldozers, forklifts, payloaders, and cranes, used for grading, digging, and transport of equipment. |
| Amphibious Vehicles | Lighter, Amphibious, Resupply, Cargo-5 ton (LARC V) is a 63-ft aluminum hulled amphibious cargo vehicle capable of transporting 5 tons.<br><br>The tracked Amphibious Assault Vehicle (AAV) is a 26-ton (23,991-kilograms [kg]) fully combat-loaded vehicle with a 3-man crew. With a road speed of 45 miles per hour (mph), it is also fully amphibious with water speeds up to 8 mph. |
| Light-Wheeled Vehicles | Consists of light tactical vehicles for command and control, special purpose shelter carriers, and special purpose weapons platforms. Types used include the High Mobility Multipurpose Wheeled Vehicle (HMMWV) or 4-wheeled drive pick-up trucks. |
| **AIRCRAFT** | |
| Helicopters | Helicopters typically used are CH-60, SH-60, MH-60S (proposed), CH-53E, and CH-46E. AH-1W attack and UH-1N may also be used. |
| Unmanned Aircraft System (UAS) | Small, light, unmanned electric driven crafts that are remotely flown. UASs less than 20 lbs and with a 5 foot wingspan are typically used. |

Assumptions: Assume that SH-60 and CH-46 operation for Cast and Recovery are Special Personnel Insertion and Extraction Rig operations.
Assume 4 hours of cruise time for Amphibious Raid Operations, and one touch and go operation
SH60 from AESO Memorandum Report No. 9929, February 1999
CH53 from AESO Memorandum Report No. 9822 Rev C, February 2000
CH46 from AESO Memorandum Report No. 9816 Rev F, January 2001
UH1N from AESO Memorandum Report No. 9904 Rev A, May 1999
AH-1W from AESO Memorandum Report No. 9824 Rev A, April 1999
Assume Aircraft participate for one day during Amphibious Raid Operations and Direct Action Operations
Assume 1 LTO and 3 hours of cruise for CQC/CQD SH-60 operation.
(a) Days = the number of days per operation
(b) Operations = the number of operations per year

| Scenario | Type Training | Reference | Days (a) | Operations (b) | Ship/Boat Type | Number | Ship Time on Range (hrs) (e) | Engines and Generators | | | | Ave. Speed (Knots) | Power Level (%) or horsepower | Engines on Line | Generator - Load (kW) | Emissions Factors (lb/hr) (c) | | | | | Emissions, (lbs/year) | | | | |

Assumptions: Assume that SH-60 and CH-46 operation for Cast and Recovery are Special Personnel Insertion and Extraction Rig operations.
Assume 4 hours of cruise time for Amphibious Raid Operations, and one touch and go operation
SH60 from AESO Memorandum Report No. 9929, February 1999
CH53 from AESO Memorandum Report No. 9822 Rev C, February 2000
CH46 from AESO Memorandum Report No. 9816 Rev F, January 2001
UH1N from AESO Memorandum Report No. 9904 Rev A, May 1999
AH-1W from AESO Memorandum Report No. 9824 Rev A, April 1999
Assume Aircraft participate for one day during Amphibious Raid Operations and Direct Action Operations
Assume 1 LTO and 3 hours of cruise for CQC/CQD SH-60 operation.
(a) Days = the number of days per operation
(b) Operations = the number of operations per year

| Scenario | Type Training | Reference | Days (a) | Operations (b) | Ship/Boat Type | Number | Ship Time on Range (hrs) (e) | Engines and Generators | | | | Ave. Speed (Knots) | Power Level (%) or horsepower | Engines on Line | Generator - Load (kW) | Ship hp | Ship Load Factor | kW | Fuel Use, g/kWh | Fuel Use, gallons/hr | Emissions Factors (lb/hour) | | | Emissions, (lbs/year) | | |

Assumptions: Assume that SH-60 and CH-46 operation for Cast and Recovery are Special Personnel Insertion and Extraction Rig operations.
Assume 4 hours of cruise time for Amphibious Raid Operations, and one touch and go operation
SH60 from AESO Memorandum Report No. 9929, February 1999
CH53 from AESO Memorandum Report No. 9822 Rev C, February 2000
CH46 from AESO Memorandum Report No. 9816 Rev F, January 2001
UH1N from AESO Memorandum Report No. 9904 Rev A, May 1999
AH-1W from AESO Memorandum Report No. 9824 Rev A, April 1999
Assume Aircraft participate for one day during Amphibious Raid Operations and Direct Action Operations
Assume 1 LTO and 3 hours of cruise for CQC/CQD SH-60 operation.
(a) Days = the number of days per operation
(b) Operations = the number of operations per year

| Scenario | Type Training | Reference | Days (a) | Operations (b) | Ship/Boat Type | Number | Ship Time on Range (hrs) (e) | Engines and Generators | | | | Ave. Speed (Knots) | Power Level (%) or horsepower | Engines on Line | Generator - Load (kW) | Emissions Factors (lb/hr) (c) | | | | | Emissions, (lbs/year) | | | | |

Assumptions: Fuel truck is equivalent to 4WD vehicle; large trucks modeled as MDTs. Busses assumed to be diesel powered
Emission factors from ARB's OFFROAD 2007 Model
Generator Emissions from Table C-12
(a) Days = the number of days per operation
(b) Operations = the number of operations per year
Heater is assumed to be "other industrial equipment" from URBEMIS Model.

| Scenario | Type Training | Reference | Days (a) | Operations (b) | Ordnance | Number | Type | Compound | Number or Amount | Weight of Compound, grams | CO | NOX | ROG | SOX | PM10 | Emissions, lbs/year | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Assumptions: Assume that SH-60 and CH-46 operation for Cast and Recovery are Special Personnel Insertion and Extraction Rig operations.
Assume 4 hours of cruise time for Amphibious Raid Operations, and one touch and go operation
SH60 from AESO Memorandum Report No. 9929, February 1999
CH53 from AESO Memorandum Report No. 9822 Rev C, February 2000
CH46 from AESO Memorandum Report No. 9816 Rev F, January 2001
UH1N from AESO Memorandum Report No. 9904 Rev A, May 1999
AH-1W from AESO Memorandum Report No. 9824 Rev A, April 1999
Assume Aircraft participate for one day during Amphibious Raid Operations and Direct Action Operations
Assume 1 LTO and 3 hours of cruise for CQC/CQD SH-60 operation.
(a) Days = the number of days per operation
(b) Operations = the number of operations per year

Assumptions: Fuel truck is equivalent to 4WD vehicle; large trucks modeled as MDTs. Busses assumed to be diesel powered
Emission factors from ARB's OFFROAD 2007 Model
Generator Emissions from Table C-12
(a) Days = the number of days per operation
(b) Operations = the number of operations per year
Heater is assumed to be "other industrial equipment" from URBEMIS Model.

| | CO2 | CH4 | N2O |
|---|---|---|---|
| **Emissions, short tons/year** | **10451** | **3.87** | **3.05** |
| **Emissions, metric tons/year** | **9481** | **4** | **3** |

# Appendix D
# Record of Non-Applicability

# RECORD OF NON-APPLICABILITY (RONA) FOR CLEAN AIR ACT CONFORMITY
## Silver Strand Training Complex EIS

## INTRODUCTION

The U.S. Environmental Protection Agency (USEPA) published *Determining Conformity of General Federal Actions to State or Federal Implementation Plans; Final Rule*, in the 30 November 1993, Federal Register (40 CFR Parts 6, 51, and 93). The U.S. Navy published *Interim Guidance on Compliance with the Clean Air Act General Conformity Rule* in Appendix F, OPNAVINST 5090.1C, dated 30 October 2007. These publications provide implementing guidance to document Clean Air Act Conformity Determination requirements.

Federal regulations state that no department, agency, or instrumentality of the Federal Government shall engage in, support in any way or provide financial assistance for, license to permit, or approve any activity that does not conform to an applicable implementation plan. It is the responsibility of the Federal agency to determine whether a Federal action conforms to the applicable implementation plan, before the action is taken (40 CFR Part 1 51.850[a]).

Federal actions may be exempt from conformity determinations if they do not exceed designated *de minimis* levels for criteria pollutants (40 CFR Part 51.853[b]). *De minimis* levels (in tons/year) for the air basin potentially affected by the Proposed Action are listed in Table 1.

**Table 1**
***De minimis* Levels for Criteria Pollutants in the San Diego Air Basin**

| Criteria Pollutant | *De minimis* Level (tons/year) |
|---|---|
| Carbon Monoxide (CO) | 100 |
| Reactive Organic Gases (ROG) | 100 |
| Oxides of Nitrogen ($NO_x$) | 100 |

## PROPOSED ACTION

Action Proponent: The U. S. Department of the Navy.

Location: Silver Strand Training Complex, NAB Coronado, San Diego, California.

Proposed Action Name: Silver Strand Training Complex EIS

Proposed Action Summary: The Navy proposes to conduct and enhance existing and future readiness training at Silver Strand Training Complex to meet the evolving military mission of combat readiness. The Proposed Action would increase the tempo of training, introduce new types of training activities, conduct existing routine training at new locations within SSTC training areas, construct a demolition pit at SSTC-S, introduce new platforms and equipment, and increase access and availability to SSTC training areas.

SSTC is located on a narrow, sandy isthmus separating San Diego Bay from the Pacific Ocean in San Diego County, California. Comprising SSTC-North (SSTC-N) (historically referred to as Naval Amphibious Base [NAB] Coronado) and SSTC-South (SSTC-S) (formerly Naval Radio Receiver Facility [NRRF]), SSTC has supported naval training operations since 1942. Included in this EIS as part of SSTC is that part of the shore and near shore waters of Naval Air Station North Island (NASNI) utilized for amphibious and special warfare training, historically from sandy Breaker's Beach to the rocky Zuniga Point and Jetty.

The goals of the range enhancements are to: (1) increase training realism and diversity by supporting dynamic joint U.S. homeland defense requirements, unit and command level mission essential training elements, and non-traditional overseas deployment needs; (2) improve access to contiguous coastline and over-the-beach training areas; and (3) reduce the constraints of encroachment on training, readiness, and Research, Development, Test and Evaluation (RDT&E).

The Proposed Action addressed in this EIS combines three elements:

- Realign existing training activities to achieve training diversity and increased realism
- Increase existing training operations and introduce new training activities
- Implement range sustainability measures to enhance training capabilities while meeting conservation and stewardship obligations

Emissions associated with the Proposed Action are attributable to increases in training operations and tempo.

Air Emissions Summary: As described above, the Proposed Action includes increases in training tempo and new training activities on the SSTC range. Participants in training activities include aircraft, marine vessels, and ground vehicles. Ordnance use is also proposed for training activities.

Factors needed to derive construction source emission rates were obtained from *Compilation of Air Pollutant Emission Factors, AP-42, Volume I* (USEPA 2007), the EMFAC2007 model (for ground vehicles), the Navy Aircraft Environmental Support Office (for aircraft), and the database developed for Naval Sea Systems Command (NAVSEA) by JJMA Consultants (JJMA 2001) (for marine vessels).

Based on the air quality analysis for the proposed action, the maximum estimated emissions would be below conformity *de minimis* levels for the SDAB (Table 2).

| Table 2<br>Estimated Total Net Project Emissions - Tons per Year | | | |
|---|---|---|---|
| | Pollutant | | |
| | CO | NOx | ROG |
| Baseline Emissions | 200.4 | 176.5 | 52.1 |
| Proposed Action Emissions | 248.2 | 216.3 | 64.1 |
| Net Emissions Increase (Decrease) | **47.8** | **39.8** | **12.0** |
| General Conformity *De minimis* Thresholds (Tons per year) | 100 | 100 | 100 |
| Exceed threshold? | No | No | No |

Date RONA prepared: June 19, 2010

## EMISSIONS EVALUATION AND CONCLUSION

Emissions associated with operations for the proposed action were calculated based on standardized methodologies. Emissions were then compared with *de minimis* thresholds for the air basins in which they would occur.

The Department of the Navy concludes that *de minimis* thresholds for applicable criteria pollutants would not be exceeded as a result of implementation of the proposed action. The emissions data supporting that conclusion are shown in Table 2, which provide a summary of the calculations, methodology, data, and references included in Appendix C of the EIS for the proposed action. Therefore, the Department of the Navy concludes that further formal Conformity Determination procedures are not required, resulting in this Record of Non-Applicability.

## RONA APPROVAL

To the best of my knowledge, the information presented in this Record of Non-Applicability is correct and accurate and I concur in the finding that the Proposed Action is not subject to the General Conformity Rule.

Approved: C. L. Stathos Date: 14 October 2010

C. L. STATHOS CNRSW N40

# APPENDIX E

## TABLE OF CONTENTS

# E PUBLIC COMMENTS

The Navy received public comments on the Silver Strand Training Complex (SSTC) Draft Environmental Impact Statement (EIS) via four media: written comments, information station comments, website comments, and oral comments. Regardless of the medium, all comments have been treated equally. The comments are from the public comment period (January 22, 2010 through March 9, 2010) and the public comment period extension for the document (March 9, 2010 through March 30, 2010).

Comments were received primarily through the mail, website, and orally or at information stations at the public hearings. Written comments were submitted directly to the Navy. Website comments were submitted to the Navy via the project website. Oral comments were taken directly from the official court reporter transcripts. The comments have been reproduced faithfully and as accurately as possible. In some cases, the editors may have made minor errors in the translation of some handwritten letters. For this reason, a copy of each of the comments has been placed in Appendix E. Private individuals are presented first and are sorted alphabetically. Comments submitted by organizations are then presented, also in alphabetic order. Appendix E also contains the official court transcripts of the oral comments made at the public hearings. Website and information station comments were electronically submitted and copied directly into this Appendix, so no other reproduction was necessary.

In preparing the Draft EIS each resource section was prepared and reviewed by numerous qualified individuals, each specialists in their respective fields, to ensure that the resources and issues received a rigorous and thorough assessment. The best available scientific data and the latest peer-reviewed studies were considered.

In this Final EIS, the Navy has made changes to the Draft EIS, based on comments received during the public comment period. These changes included factual corrections, additions to existing information, and improvements or modifications to the analyses in the Draft EIS. This section presents the public comments received and the Navy's responses to these comments. The public should note that these changes are non-substantive and do not result in any significant modifications to the proposed action, the alternatives considered, the affected environment, or the environmental effects analyses of the Draft EIS.

Although all comments have been read and considered, some comments were not specific regarding the analyses or the alternatives in the Draft EIS and, therefore, could not be given specific responses and are not reproduced in Appendix F. As stated in the Council on Environmental Quality's (CEQ) Regulations for Implementing the National Environmental Policy Act (NEPA), 40 CFR Part 1503.3(a), "Comments on an environmental impact statement or on a proposed action shall be as specific as possible and may address either the adequacy of the statement or the merits of the alternatives discussed or both."

To allow side-by-side review of the comments and the Navy responses, all comments have been converted to text and entered into a table format that follows in Appendix F, with the comment in one column and the Navy's response in the next column. Comments are presented in the same order in Appendix F as they are in this Appendix.

## E.1 COMMENTS FROM PRIVATE INDIVIDUALS

The comments in this section were received in written form by organizations, agencies, tribes and individuals.

Re: Draft EIS for Silver Strand Training Complex – ***Section 3.8 Fish***

Dear Mr. Randall:

This letter is in regard to the Silver Strand Training Complex draft EIS, dated January, 2010. The comments are in reference to Section 3.8 Fish, specifically in regards to SAND CRABS along the Silver Strand beach and Coronado beach.

Here is some information about myself. I am a surf fisherman and have fished in Coronado and on the Silver Strand since 1949, along with many others. I have provided, at the end of this letter, the names and telephone numbers of some of them who are still alive and continue to fish, so that you can contact them if you wish to do so.

Besides these people, you may want to contact the following and ask the question, "who is this guy."

| | |
|---|---|
| Larry Kracht | (619) 435-9027 |
| Tom Smisek | (619) 435-3710 |
| Frances Adams | (619) 435-2923 |

For those who do not know what sand crabs are, they are the primary food for fish, sharks, rays, birds and specifically Corbina (during the summer months). The Corbina is a primary fish that surf fisherman are after during the summer. However, during a GRUNION run, they are the primary food for large Corbina and Halibut.

FACT: Over the last six or seven years the population of sand crabs has dropped to almost zero. Any surf fisherman can tell you that. Of course, there are lots of theories of what has caused this. Some people believe it is because of the raking of the sea weed off the beach, etc. But the Navy does not do this along their beach and still there are no sand crabs.

The primary question that should be answered is why there are sand crabs at Imperial Beach, Mission Beach, Carlsbad and Huntington Beach.

I believe that one of the major problems is the fuel emissions from the boats, etc., along the Silver Strand beach is the cause of the problem.

What I am asking for is the following:

(1) Delay for at least 60 days before this report is final so that other fishermen can comment on this draft.

(2) The City of Coronado updates its water pollution equipment to measure the fuel emissions along Coronado beach.

(3) Have an independent, scientific statistical study (at some level of confidence) to find out what happened to the sand crabs along Coronado beach. Maybe SDSU, SDU, or UCSD could perform this study with the funds being provided by the Federal Government.

(4) Until this study is completed, stick with ALTERNATIVE I, NO ACTION ALTERNATIVE.

Following is a list of the fishermen you may want to contact:

| | | |
|---|---|---|
| Tom Williams | (714) 964-4434 | ** |
| William Adams | (619) 435-2923 | |
| Ernie Mauro | (619) 887-1076 | ** |
| Russell Elwell | (619) 435-3833 | ** |
| Tom Noonan | (619) 435-4097 | ** |
| Tom Jeter | (619) 437-4646 | |
| Tom Christienson | (619) 435-7176 | |
| Wilson Whitmire Capt, USN, Ret. | (615) 591-5289 | ** |

** Surf fishermen since 1949.

Sincerely,

William J. Adams

Re: Draft EIS for Silver Strand Training Complex – **Section 3.8 Fish**

Dear Mr. Randall:

Thank you very much for extending the comments (to the Draft EIS) until late March.

This letter expands on my comments to you dated March 5, 2010 on Section 3.8 Fish. Since then, some fishermen and others have asked me to add the following comments:

(1) Sand crabs feed on tiny "plankton".

(2) A female may produce thousands of eggs. She carries them until the eggs hatch. For two to four months, the "larvae" drift as "plankton".

What I believe is that these and other types of "plankton" are being killed by fuel emissions from the boats, etc. Along the Silver Strand Training Complex, since the Navy has expanded the use of the beach over the last six to seven years, the water has become more polluted from the fuel emissions.

What I am asking for is that until some studies are conducted to determine what has happened to the sand crabs, the Navy go with the "NO ACTION ALTERNATIVE".

Sincerely,

William J. Adams

Subject: Military Training Activities

Comment: As a resident of Coronado for 15 years I have witnessed the increase of military training & understand the importance of this to protect our country. I have read the proposal in re to the increase of training & in my opinion the increase is tremendous!!! Yes,you need more training but you also have to consider the area that this is in. We want our children to have the best & not hear the helicopters,etc. all day long. The military housing is in this area & the families there will have to live with these noises. I do believe you have to increase the training but not to the extent that you are proposing.

Dear Mr. Randall,

I am a resident of Coronado and I live in Coronado Shores, Cabrillo Building.

I have learned that the Department of the Navy is planning on increasing the levels of training at the Silver Strand Training Center.

Suggested comments: I would appreciate your cooperation and efforts to maintain the quiet enjoyment atmosphere of the Coronado Shores, Cays, and Village as it currently exists.

Sincerely,

VIRGINIA ASPE ARMELLA

EDUARDO CORTINA I.

### E.1.6 Andrew Bailey

Representing: Private Individual

Organization:

Name: Andrew Bailey

Date: 3/10/2010 3:00:21AM

Subject: Environmental Justice

Comment: Overall, after perusing the SSTC Draft EIS, I still want to be super-supportive of the Sailors and Marines (DofN) but have exceptions to some of the proposals and assumptions in the EIS. I realize that training these forces well will be good for the environment in the aspect that they will be able to wage war more efficiently. Still, we – they – are at war, and there will be "unavoidable adverse environmental effects." I was impressed and entertained by the EIS and support Alternative One but suggest more consideration in the following areas: • Contingency plans for Alternative Two • Public notice about public access to beaches • Notice about nighttime activities • Mitigation measures in land use and detonations Please, send a strong message by making contingency plans to implement Alternative Two. DofN should be ready to go a level higher to achieve objectives, and still have best practices. I also encourage beach activities "not limited to any day of the year" (3.1.2.2.2). [Did a lawyer write that?] At the same time, DofN could keep us civilian-beach-patrons informed about open beach hours. Perhaps the EIS Website can be converted into a beach-recreation information platform, with the option to call the NBC switch board. This would count as a land-use mitigation (3.1.1.7). If you're having a party, you invite your neighbors.... Unfettered access to wet-sand areas on – say – four (4) daytime ultra-low tide events (-1.5' or more), and a couple daytime ultra-high tide events (6.5' or more) is fair quiet enjoyment. Concerted planning is already a protocol (5.15.3-4). Occasional access to Breakers Beach up to Zuniga Point seems fair too. The SP, duty assignments, and service members with restriction can keep civilians below the high-tide line. Perhaps DofN, in all its magnanimity, could share a drinking fountain, or a toilet. Look at the MAS Mira Mar Air Show. A staff member for this EIS, Alex, who like myself, enjoys beach running, did not know that we have access to most wet sand areas when there are no SSTC training activities. I carefully questioned another staff member about this (Bruce), but it seems contradicted by the EIS (3.1.2.2.2). I wish the beach entrance between SSTC-N & Coronado Shores was better marked with a fair sign. I noticed that the SSTC-N lease extends only to the mean high tide line but shifts to "100 to 500 feet offshore." I can share the beach. Coronado residents should have advance notice about night operations so they can have the option to spend the night elsewhere. SSTC needs to have better communication with civilians and a website as a beach-recreation information platform could serve day-to-day needs. Overall, the lands leased by the DofN spend more time unused, than with activities. Mitigation like restoring beaches after activities is expected and training protocols help, but the fact is that activities will increase 20% - other mitigations should be considered to offset this increase. I read that one mitigation measure is to manage predators. An extension would be to coerce other beach users to observe a higher level of stewardship. DofN with its unfathomable resources needs to outreach. SSTC spends most of its time as an absentee landowner. Bruce, an EIS staffer, explained that dog owners loose there dogs in the training areas. Dogs (and cats) area a terror to wildlife, wreak habitat, and leave damaging feces. Off-the-leash dogs are a problem city-wide and on the beach. One section mentioned "avoidance and minimization." I could see a special program with the Cays, educational signs, and volunteer enforcement. MAYBE Cesar Milan would lend a hand. Other mitigation was dismissed in this EIS "alternative" (5.9.3). Third-party observers are a cultural norm in the United States today: some people would kill Flipper for a tuna sandwich! There's no excuse for not trying to manage it, especially considering the extremity of the action. I'd be pleased to say a little prayer for the fish: that they fatten the beachmaster. I can see Point Loma from my house, and my neighborhood's topography is in one of the charts. The Strand may be my home break. I could write more.

### E.1.7 Richard Barck

Silver Strand Training Complex EIS – RESPONSE

To: Naval Facilities Engineering Command, Southwest

Attn: Mr. Kent Randall, Silver Strand Training Complex EIS

1220 Pacific Highway, Building 1, 5th Floor, San Diego, CA 92132

From: Richard Barck 86 Kingston Court West, Coronado CA 92118 Richard T. Barck March 3, 2010

**Subject: Response to Draft EIS, SSTC**

I have listed below a number of points related to Navy anticipated use of SSTC-S which cause me concern:

1) **SSTC -S (nee NRRF)** – The Navy comments that SSTC has been established for over 60 years is disingenuous with regard to stating the local residential community around SSTC-S "should expect air and ground noise" in the proximity of the base. For residents building/purchasing homes in the SSTC-S/NRRF area, there was nothing more quiet than a radio receiving facility. **SSTC-S was renamed from NRRF (**Naval Radio Receiving Facility) during the period of the EIS study. The Federal Register of August 6, 2001 describes the **Notice of Intent to Propose EIS (pp. 41009-41010)** as including the NAB and the NRRF. In fact several references in the EIS still refer to NRRF, not SSTC-S (e.g., Fig. 3.11-4).
   Any training of amphibious landing and helicopter support has taken place **only** in the past few years. And it is NOT quiet – per the EIS, noise from both munitions and helicopters is projected to dramatically increase. This should NOT be done in a residential zone.
2) **Helicopter, Aircraft & Amphibious Noise –** As residents local to SSTC-S we live in a particularly quiet area, especially during evenings and nights. There is relatively little traffic on CA-79 and many of us have doors/windows open to the sounds of breaking waves. Over the past couple of years we have been increasingly subject to LOUD helicopters/aircraft flying "close" to our homes. The sound prevents us from hearing evening TV -- or awakens us at night. When awakened, we often cannot immediately return to sleep. The noise could be greatly reduced by flying the helicopters/aircraft further offshore while on sorties north/south along the Silver Strand. We, as well as the residents of Navy housing, would appreciate that very much!
3) **SSTC-N** – The portion of SSTC now called STTC-N (but formerly NAB) has been used for amphibious landing training for an extended period. Increased amphibious landings, helicopter activities and munitions training should be restricted to Boat Lanes 1 – 10.
4) **Snowy Plovers** – Fish & Wildlife has formulated a significant effort in the last few years to increase Snowy Plover nesting/fledging in the SSTC -S area. *Results for 2009 are in the table on the following page. Silver Strand SB is the beach area with overnight facilities for RVs and heaviest beach use. Silver Strand NP contains staked-off area protecting nesting for the Snowy Plovers and Least Terns.* The Navy should also be aware of the success in nesting and fledglings in the SSTC -S/NRRF.
5) **Vernal Pools and Fairy Shrimp –** Vernal Pools are becoming few and far between, both as a result of drought and/or heavy pedestrian or vehicle use of the area(s) where they are found. There are very good protected Vernal Pool locations within SSTC -S/NRRF.
   Although the Navy has said that these area would be "protected" while wet, they would be used as trails and subject to traffic during "dry periods". Trails through Vernal Pools will effectively destroy them! They should continue to be protected.
6) **Beach White 1 / Boat Lane 11 –** From the view in Fig. 1-3, the training area appears to encroach on the southern edge of Silver Strand State Beach, an especially significant area for nesting of Snowy Plovers.
7) **Beach Access –** Many morning walkers and joggers use the Silver Strand NP as their starting point for extended exercise. A significant number continue these workouts headed south to the Imperial Beach area – or vice-versa. The access past NRRF has been through the sand area below the high tide line. The apparent closing of this area deprives the public of even more beach access in a beach-limited area.
8) **Silver Strand State Scenic Highway and Scenic Highway Overlay Zone –** What impacts will the increased activities have on CA-79 as a scenic highway in this area?

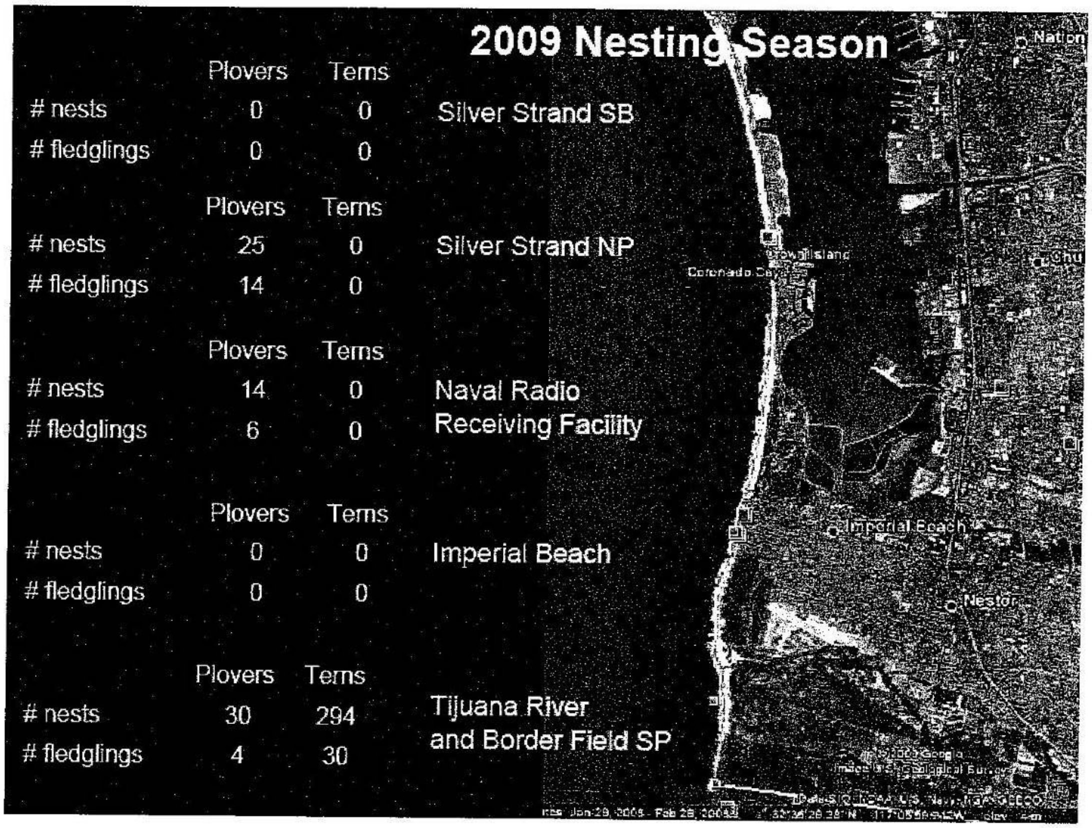
Page **1** of **2**

Silver Strand Training Complex EIS – RESPONSE

9) **Silver Strand Elementary School** – What effect will the escalated training have on our elementary school including noise and pollution affecting our students and teachers?

10) **Surf Camp** – The surf camp at the southwest end of the NRRF site serves ~ 10,000 kids/year. We would like this to continue and their access to the beaches to remain safe and free of pollutants.

Thank you.



### E.1.8 Edward Baumer

I am a resident of Coronado and I live at Coronado Shores in El Mirador and overlook your facility from the 16th floor. The address is Ann Kennedy, 1820 Avenida del Mundo, #1603, Coronado, Ca 92118.

I have learned that the Department of the Navy is planning on increasing the levels of training at the Silver Strand Training Center. I hope that you can provide the level of quiet enjoyment that I have experienced for the last 8 years as I am a full time resident.

### E.1.9 Michael B. Baxter

Kent Randall 3/9/2010
Silver Strand Training Complex EIS
Naval Facilities Command, Southwest
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Dear Mr. Randall,

I appreciate the opportunity to offer some further input and perspective on the proposed expansion of activities which will occur in the Imperial Beach area and Silver Strand Training Complex (SSTC).

As a matter of disclosure, I have reviewed the letter sent to you by the City of Imperial Beach dated March 5, 2010, and agree with their observations and requests.

My comments herein should be considered in addition to theirs, and will be, I believe, concordant with them. I also have had the advantage of living on the oceanfront on South Seacoast Drive, north of Ream Field and south of Imperial Beach Boulevard for roughly the past 38 years. My comments are based on that period of observation.

My first observation is that helos departing Ream Field do not maintain the centerline of the runway, or projection of it, from the field or landing pads all the way out to sea for a distance of about 1 3/4 miles

1.

which I believe is the prescribed route for a visual departure (VFR Rules of Departure). I have publically asked for a copy of these departure rules in public in the past and they have never been provided. I hereby ask for them again under the Freedom of Information Act.

Instead of following the VFR departure rules, too many times the aircraft drift off their departure radial, towards the Pier. My observation, and that of others, is that once they are over the surfline too many times They begin their turn toward the north and head for the pier. This turn should not be commenced until the seaward track is complete, about 1 3/4 miles.

Many of us have observed Navy helos well inside the end of the pier. They then turn to sea again to "get around" the end of the pier before continuing north.

All this could be avoided by simply following the VFR Departure Rules, as I believe I've seen in the past.

I would also ask that the VFR Departure pattern be amended so that departing helos continue to climb, perhaps to 450-500' as they depart Ream Field. This would also reduce noise considerably.

2. Let me address the night hours of operation next.

I agree with the City's position (Item 4b) that "there should be no helicopter training at Ream Field after 9:30 pm."

I understand that from time-to-time a helo goes off course in its VFR departure from Ream Field. But I believe that far too much of this occurs and the community and residents are unable to effectively document this for the Navy with the present Complaint System.

It is a system which has failed you and costs The Navy in public support and goodwill.

With the proposed increase in flight operations out of Ream Field, I recommend the following:

1. Place the officer who takes Citizen Complaints related to Ream Field Helos in the Ream Field tower, or a location very close by so he can easily determine the probable sidenumber of aircraft over the beach. Require that the aircraft commander 'report' the completion of his seaward track when he is 1 3/4 miles out, back to the Tower or Duty Officer. Remember that a citizen can not often see the sidenumber against the setting sun, twilight or night-time conditions. This step would materially improve a complaint system which most of us rate as nonresponsive and a failure.

3.

2. Require that the Citizen Complaint Officer stay at his post during his watch period. I would presume that these are four hour watches when flight operations are underway. He can bring a bag lunch, or a box lunch can be provided him. The main point is that he/she is there to receive citizen complaints as they are occuring, not sometime later, from some very distant spot
3. He should provide some sort of file number to the Caller for future reference or follow up.
4. The results should be reported to the community, perhaps Quarterly, to inform the policy-makers and the citizens.

I wish to acknowledge that many departures out of Ream Field are correctly done now, day and night both. And further, we appreciate everything which the military does to protect and defend this nation.

By the same token, we should be willing to receive and take to heart constructive criticism when it is warranted. I offer my observations and comments in that spirit.

Sincerely,

Michael B Bybee
1192 Seacoast Dr
Imperial Beach, Ca 91932

Subject: Noise

Comment: Mayor and City Council City of Coronado Coronado, California March 2, 2010 Dear Mayor Tanaka: The letter below reflects several previous attempts to address the problems caused by intensified military air training over the Silver Strand. The current level of training has seriously impacted residents and visitors since 2007. We have not received any answers to reasonable questions or been asked to participate in co-creating alternatives. There are clear alternative helicopter routes and obvious means of notification and community education that would ease of the stress we live with. Only a few weeks ago we learned that we are part of a newly named Silver Strand Training Complex (SSTC) with high intensity, high profile maneuvers planned along the length of our State designated Scenic Route 75. Many City, County, and Federal funds and tireless volunteer and staff time and multiple interagency collaboration has gone into preserving the Silver Strand's scenic views, natural resources and unparalleled recreational and residential opportunities for military and civilians alike. Similar to the goal of the National Wildlife Refuge, we thought this area would be an outdoor haven for people and families in perpetuity. The projections in the proposed EIS do not reflect an understanding of this City, State and County mission, but rather suggest a militarization of an area previously shared with residents, visitors and the natural environment. In closing this memo, I would like to emphasize one of the most troubling aspects, perhaps the most egregious aspect, of the EIS. The increase in helicopter operations from 700 to 2300 is in addition to the current daily low flying helicopters that fly back and forth over the eastern shore of the Cays, Grand Caribe, Loews, and the State Park during peak hours 3-10pm. In the summer, they can do circular patterns every four minutes, often going later in the night. Perhaps, this routine helicopter exercise is an area where we can dialogue with the navy about 'balance' and community respect for their neighbors of forty years. Thank you for considering this background. It is pasted below as well as sent in an attachment format. Liza Butler

Comment: August 2009 Mark Ochenduszko, City Manager City of Coronado Coronado, California 92118 August 2009 Re: MILITARY TRAINING OVER THE SILVER STRAND Dear Mark, This is a friendly request for public information. It would be very helpful if you would facilitate the process of obtaining answers to the following questions: What AIR TRAINING is planned for the peak summer months July - October 2009? What part of this is 'routine' NBC practice? What constitutes 'routine' flying: what are the designated patterns or paths; what are the allowed weekday daily start and end times; are there different paths or curfews for weekends and holidays? What is the allowed or legally mandated flying height for helicopters over densely populated residential and recreational areas (i.e., how many feet above rooftops and bathers on a beach is considered safe or even 'courteous'? ). Are there safety height regulations set by the FAA and are there military exemptions? Are there other FAA regulations that say helicopters should fly a certain distance from the bay or ocean shoreline? Are the helicopters who fly round and round paths up the channels of the Cays performing a sanctioned practice? What part will be "SPECIAL" TRAINING MANEUVERS involving squadrons whose home base is located elsewhere? What are the start and end dates of the 'special' maneuvers? What time of day will they begin and end? Will the impacted time be the same for weekends as weekdays? Are major holidays included? When there are AIRSHOWS (e.g., Redbull Races, Miramar Airshow) or ceremonial demonstrations (e.g., off the Midway museum) in the San Diego area, routine military practice and/or practice for the special event are often diverted over the Cays and the Silver Strand. What is the summer/fall schedule for these activities? ***************** In the last two summers, the residents, real estate rentals, and other tourist businesses were not notified or prepared in any way for the negative impact of continuous low-flying helicopter and jet practice. This air activity is in addition to the advertising, fixed-wing planes which go back and forth above the State Beach and Park and often crisscross the Cays during summer months. The 'surprise' element of the last summers intense air activity evoked a range of negative emotions: fear from the 'high alert' noise and vibrations of helicopters; anger from having special family events and vacations ruined; and disbelief that all this was happening without notification from the City or any known public planning process. Trying to get information was difficult. People were referred to the navy control tower to make a "noise complaint" and asked to produce photographs of the plane, the number on the plane, the time and direction of the flight. The problem was not the disturbance produced by an aberrant, ill-trained, low-flying pilot. THE FEAR AND DISTURBANCE CAME FROM MILITARY TRAINING THAT COMBINED ROUTINE PRACTICE WITH INTENSIFIED SPECIAL MANEUVERS OVER A HIGH DENSITY RESIDENTIAL MARINE COMMUNICTY, ABOVE A POPULOUS STATE BEACH AND A 450 ROOM HOTEL-RESORT, SCHEDULED IN THE HOTTEST, PEAK USE SUMMER/FALL MONTHS. This inquiry is a request for information. It is also a request for some 'balance' and courtesy in the planning of training exercises. My experience with the military in recent years was that military leadership valued the commitment to be 'good neighbors' to impacted communities. Last summer, the Navy was not a good neighbor; it exploited our previous goodwill and caused us many problems. Perhaps, leadership in the military and the City have attempted to address these problems in their monthly meetings. It would be helpful to know if the environmental impacts of air training are discussed and planned for in these meetings. Thank you for your help. Respectfully, Liza Butler 13 Kingston Court East cc Loews Coronado Bay Resort Silver Strand State Park Beach

Subject: Noise

Comment: It seems foolish to me that the Navy would jeopardize the health and welfare of local residents in order to prepare to fight those who wish to damage the health and welfare of Americans. There seems to be no recognition in the Navy's plans that piercing noise, especially helicopter noise, will cause harm to local residents including local Navy families. It isn't necessary for helicopters to fly low over homes and continuously circle over the bay, state beaches and residential communities regardless of nighttime hours, weekends and holidays. This routine practice which intensifies in the hot months is not necessary. Helicopters can fly over the ocean. The residents of South Bay have worked their entire lives in order to save sufficient money to live in this desirable community. We are hard working, patriotic, taxpaying citizens who deserve better treatment than what has been occurring over the past three years and what is being proposed now Currently, helicopter noise causes nervousness, inability to relax and loss of sleep. There is a certain arrogance in the Navy which allows these unhealthy intrusions into private living space with no notice or consideration. I beseech the Navy to do two things: 1) Give additional time to the community to comment on this plan and make carefully researched suggestions. 2) Work with the community to consider alternatives to the noise and pollution impacts of current air training as well as the other more egregious elements of the proposed plan (as highlighted in the City's response). A cooperative plan that genuinely considers human needs for health, comfort and security would be a plan that benefits military families at the same time it benefits other local families. The Navy bruised its standing and respect locally by issuing an EIS that suggested that Americans employed in the military should "sleep in their own beds" while other Americans' sleep is dispensable. Please consider our needs as one. I

*Abstract and summary of the first three pages: It is not to say that there is not a win-win to what the Navy intends to do, but to impart on you in the only, and I know, lengthy way I can manage to articulate, that what you and I have here is very, very special and very unique in the weird world, -a diminishing natural world, -of Southern California. It would be honest to say that over the course of 2 decades when I was looking for the lucid and rational, and peaceful on short order, I came here.*

Dear Mr. Randall:

I am the adoptive parent of the proposed Eagle Peak Wilderness, a position that came as an outgrowth of some volunteer work documenting, leading hiking outings for the Sierra Club, and photographing the remote unseen and wild portions of San Diego Backcountry. The people who have heard me endlessly speak of the beauty of San Diego in recent years was with respect to the many waterfalls, and breathtaking vistas in our back country up in the mountains of the Julian area. I probably have thousands of pages, as well as thousands of photos, out on the net on this subject. But what most people do not know about was the life before the waterfalls.

Today I am speaking purely on behalf of my self as a homeowner in Imperial Beach, and twenty year runner/walker on the Silver Strand State Beach.

I used to live in North Park and still have a home there. My former husband is a friend, life time resident of San Diego, and grew up in La Jolla. His brother is a commander. His great uncle was a four star admiral, the late Admiral Voth. There have been many significant people in my life in the Navy at all ranks. In San Diego who couldn't say this?

A long time ago I lived a very different life in Myrtle Beach, S. C., at that time an air force base. I don't want to recount the times I almost wrecked a car from over fascination with the things flying in perfect formation above. What I will tell you is that one day, bathed in oil and sweating in the sun on the beach, I had had enough of just sitting still in pretentious tanning. I hired a baby sitter to play with my son long enough to try running. At that time I was about wiry 70 pounds less than today. The first day, pacing myself I ran from Myrtle Beach State Park to a certain large hotel in Surfside beach. I rested only momentarily and ran back. Barefooted. Within the month I was running six miles in 50 minutes two or three times a week from the state beach to what was then the Holiday Inn in Surfside Beach, and back without stopping. Barefooted. I knew very quickly what part of the sand would provide the proper cushioning (where the water meets dry sand). I probably had about 400 miles there before I moved here.

Running in that capacity is like flying. I wish I could do it now. I developed a unique, almost personified, relationship with the beach where I ran, nearly always, barefooted. There is nothing else like this. AT that time there were long sections of uninterrupted beach that had not been developed. I think there is at least one ranger at the Myrtle Beach State Park that was a bait house clerk at the time, that still remembers.

When I moved here I wanted to continue running. I ran quite a bit at what was called Blacks. This was a very interesting experience for a shy southern girl. In spite of the crazy new Californians, however, that existed on that beach, I was often uniquely the only female running, (in shorts) and barefooted. I still wanted somewhere to run that was like home. Pacific Beach came next. It was crowded, commercial, though delightful in many ways, the sand is very hard. One day I ran at Coronado. I knew I was getting warm but the parking, crowds, and even affluent neighborhood was not the relaxed escape I was searching for. When I got to Silver Strand I *was* home. I probably have well over a 1000 miles running and walking there over the next many years. Even when I was exploring the back country, a short escape was to take off for the strand, run to "tha big round thing" or on a better day to the pier to chat with someone named "Clemente", eat the best tacos this side of Ensenada, run back stopping long enough to admire the local art at the end of Palm on the children's wall and water fountain. (now relocated behind the Mexican restaurant at 3rd ave in a little mini park)

Whether the back country or at Silver Strand, one of the most difficult tasks is to define the difference between "unspoiled" and "mitigatable" or mitigated, or even urbanized to the regular guy who is content with a beach to kick back and read a paper or body surf upon. Rightfully so.

For a place that is truly untouched *there is no* Mitigation. Once you compromise on true unspoiled –off the urban-matrix this status no longer exists. It is basically the equivalent of multiplying by 0. I find that most people in the city urban environment do not thoroughly grasp what that is to be completely in a spot that is still really natural and at its mercy or better yet comfortably integrated with its natural laws. **Even more difficult is to explain why this is so coveted and desired by the people who speak up for it.**

The pristine wild is the caviar and 5 star drooled upon talked about and near worshiped of the people who go there; the medicine and meditation of water gurgling in memory for days after exposure. This one, otherwise labeled, "in town" , square, flat, smooth, pre-traversed, thoughtlessness -imposed and determined by halls, sidewalks and roads, is the fake. For what its worth, it is the knowledge of the true off the matrix world, thus far, more beautiful than a thousand star hotel, that both sustains and empowers, prevailing through the worst of social propriety, or embarrassing lack thereof. It may not be the mental status of military trained focus or hierarchical reverence, but perhaps a brief juxtapose debriefing, as scaling of diverse, and absolute self reliance, a self perspective to all else still wild in true form. What is this to a service man home from the wild of war?

The beach between the SilverStrand State Beach and "the big round thing" , I now know, thanks to this action, is called "the elephant cage" , is not quite at pure unspoiled status. However in San Diego given the nature of all of the other beaches it is absolutely remarkable. It was even voted in a poll on wild beaches, as number 7 in Southern California. (Blacks, or Torry Pines State Beach made the list at 3)

I recall fondly the effort that took place on the South Carolina beaches to reestablish dunes and a plant called sea oats, that effectively glues them together, when for a time they were taken for granted.

At a 200 or so dollar fine for picking a sea oat or two, they are no longer taken for granted. The mundane now promoted.

Here in one of the densest parts of the CON-USA lays one of the most diverse counties, species- wise, in the nation. This little treasure of dunned and relatively unspoiled isthmus, at least un-urbanized beach front for many miles ; it is the only place reminiscent of the eastern long wind swept wild beaches that seemed to stretch and dissipate almost mysteriously and magically into blue and grey salty misty sky and floating liquid sand.

The first time maybe 14 years ago I thought to jog on the fourth of July I was in for the learning of a well kept secret. Even though no parking was to be had at the State Beach, and confiscating one a serious effort in Imperial Beach, once I broke free of the crowd running north of the elephant cage, I saw on the busiest day of the year about 3 other people. That number has grown, but not much. It may stand at 2 dozen, over the course of three miles.

**It is not to say that there is not a win-win to what the Navy intends to do, but to impart on you in the only, and I know, lengthy way I can manage to articulate, that what you and I have here is very, very special and very unique in the weird world, -a diminishing natural world, -of Southern California. It would be honest to say that over the course of 2 decades when I was looking for the lucid and rational, and peaceful on short order, I came here.**

Long story short, in a year when 200,000 thousand acres of unobstructed natural beauty are being threatened in far more senseless rational, by steel and voltage, it seems as though there is no place left to un-attach and be, or whose activity isn't left personal and creative.

To my much unaware lack of newcomer saavy, my then husband and acquaintances were much surprised that I would pick, of all places, Imperial Beach as my heartthrob. They were fully integrated into the beach at La Jolla and any where else they pleased. By and large, Imperial Beach was not the social climax on the societal register with people who grew up in LaJolla. I am ok to leave it that way. San Diego is blessed with awesome public beaches. Ironically only 10 miles away, the five star Hotel Del Beach has won number one and number two beach status in the world only second by one authority travel magazine, to Poipu in Hawaii.

However none are like this one, not even close. When the opportunity presented itself, I moved in.

When I discovered the even bigger secret that we sit next door to one of only two National wildlife estuary refuges on the west coast, I knew all too well what that meant. I have a BS in Biology from a marine biology school at UNCW and did my senior honors paper research on copepods. (Diapause eggs of Anomolocera ornata *Sutcliff* , UNCW and the Student paper CANCUS for the North Carolina Achedemy of Science) I thought I would never have an opportunity to bring this chapter up from the past. Many marine critters that make an environment diverse and healthy depend on estuaries, either directly or indirectly, for their start in life. The estuary is essential to the life of the ocean near the shore. The health of what we have here if it works the same may be extremely critical because it is *all* we have. When I did plankton tows for my paper the water was teaming with copepods one week and the tiny newborn stages of many fish and crustacean species the next. We speculated then about the protection of the enormous estuaries in the Wilmington and Wrightsville Beach areas that played into the life cycle of the copepods and in turn their eventual position as food for the early days of newborn fish and crab zoea among other things.

**Does this happen at the Tijuana estuary as well?** This needs more research.

The navy , and the military in general have become very good environmental partners.

**What can the Navy do to keep the wild quality at a maximum albeit the times it is using the beach for exercises? Are there covert training maneuvers that are more subtle or invisible, and less impacting to the land? Is there a way the local public might help or become a part of the solution? What activities could be done south of the first jetty on the public beach? Could the public be involved in mock rehearsals? And thereby reduce the impacts north? Would the Navy make use of the resources at the public peer? The public could be used to identify what is effective "covert" and what isn't? Can the Navy make use of areas that are not on the beach?**

I can not know in full , nor I hope does anyone commenting that isn't in the Navy, but it would be honest to say, I do not know why after WWII, Korea, Vietnam, Desert Storm, and whatever post 911 is that now we find this expansion inescapably necessary. **What are the alternatives considered?**

The Navy is already doing a very good job. And I am very grateful.

In the last year, along with a number of hot environmental issues, Sunrise Powerlink not withstanding, I "was made aware" of the MLPA by my environment colleagues volunteering day and night to establish sustainable guidelines for our oceans. Our local coast has many impacts, not only from the Navy and tourists, but in no small way from bait fishing and other commercial endeavors. **What measures could the Navy take to help establish sustainable guidelines if they are to enter in larger capacity the current mix of impacting interest groups?** The shore birds that are often the focus of marine environmental debate and concern depend upon this zone for survival. Unfortunately because the public has taken a zesty proportion of the urban share, there are few places for the birds to nest with reliable success.

The preserve around the elephant cage happens to be one of them. The shore birds may also feed on sand crabs. **What impact does vehicle traffic have on san crabs and in turn on the shore birds that feed on them?** I think this question needs some research. I would be concerned that the traffic would reduce another food source for the birds.

I was taken back by the notion that they Navy would run through the vernal pool when it is dry. **Where do the critters go when it is dry?** It is my understanding that they are still there, just dormant. (I mentioned a paper on diapause?) Running across this area, kicking up the top soils, disturbing whatever vehicle the plants and animals and microorganisms have for staying alive suspended throughout a dry summer would be radically abused by playing and training there. **Is there someway to build a mock cover over this area to protect it? Would such a cover work?**

This vernal pool is a beach vernal pool. **Does this make it additionally rare and fragile?**

In our backcountry, our streams become corridors of algae parchment; a vehicle I propose may play a role to perpetuate the fauna that takes life when the streams are running. **Does such a vehicle exist for vernal pools? If so , and the creatures are there, buried, how will you protect them in the dry season?**

The Navy has been flying increasingly at night, and increasingly directly overhead, though since the public made considerable of it at the public forum, it may be a bit better lately. I have been nearly asleep to be awakened by the helicopters. Sometimes leaving the windows open is impossible to do. One day I came home to find that my dog had gone through, literally through, a large window out of fright from loud noises. I confirmed with the neighbors who heard the noise and the window crash. It cost hundreds and lost me thousands in down time as I had to rebuild the wall with three double pane windows and all new trim to hold them. I really had no warning or decision as to when. Several weekends were taken through the Christmas Season to finish the project.

The Ymca is far closer than my house. I know how to extrapolate the meaning of training. Children at the Y may not. Many children that attend do so on scholarship as one of the first natural experiences or experiences at a a camp they have ever had and for some ever will. The Y hosts over 10000 children every year. I know one such child, a woman now, who had difficulty learning in school. I saw many positive changes in her in the several seasons she attended this camp. She now pays her own way and holds a job with promotion and respect for several years. I think the Y played a roll in her turn around. In 1993 congressman Bilbray and Senator Boxer insured the continued existence of the Y for the next 50 years by establishing a 50 year least with the Navy. In 1998 the Navy decommissions the radar antennae, or elephant cage. I do not recall any loud noises back then. The Y Camp Surf has been in harmony with the Navy for many years prior as well.

**What can the Navy do to minimize the startling and even frightening noise around children?**

I have found on occasion, cylinders, with warnings of phosphorous. **What can the Navy do to ensure the refuse of their activities will be removed?**

I have seen whales breeching offshore during migration times. **What can the Navy do to ensure the safety and integrity of these mammals? What research and precautions can you do to protect their sonar capabilities near yours as it is vital to their survival?**

**Have you reviewed the original grant to the Navy for use at the Southern end**? I think this needs to be done.The EIS mentions a grant for the Navy when they were established there of fee simple. I have a question about this. Have you reviewed the original grant to the Navy for use just north of the Northern end of Imperial Beach. I think this needs to be done. See below an explanation from **Wikipedia on line. Fee Simple can be absolute or it can be fee simple defeasible. Fee Simple defeasible can be fee simple determinable and fee simple subject to a condition subsequent. Since the Navy suspended the use of the radar tracking and because the use by the children and family camp at the Y is well understood and established I find it hard to believe that in the establishment of the Navy grant with children present and the public walking through, that the intention was that of fee simple absolute. I especially find it difficult to believe that that intention included the sounds of bombs bursting in air, so to speak.

**Have you checked to see what the stipulation was in the grant when the radar was no longer used and what was that intention? Who provided the grant? What were its conditions?** It make more logic that the Grant with an intention of mitigating the military usage of the beach originally, would included the portions used by the Y for families. I would not be surprised If the level of review were still in place to curtail an activity or in this case "frightening" noises near the camp with fee simple subject to a condition subsequent.

**What can the Navy do to reduce the noise for training? I do understand there comes a time when training has to include operating under the startle of noise. Can this portion happen somewhere else? Can the solution integrate with the public presence as much as possible?**

* Types of fee simple http://en.wikipedia.org/wiki/Fee_simple

If previous grantors of a fee simple estate do not create any conditions for subsequent grantees to own the conveyed property in fee simple title, which is commonly the case these days, then the title is called **fee simple absolute**. Other fee simple estates in real property include **fee simple defeasible** (or **fee simple determinable**) estates. A defeasible estate is created when a grantor places a condition on a fee simple estate (in the deed). Upon the happening of a specified event, the estate may become void or subject to annulment. Two types of defeasible estates are the fee simple determinable and the fee simple subject to a condition subsequent. If the grantor uses durational language in the condition such as "to A as long as the land is used for a park" then upon the happening of the specified event, the estate will automatically terminate and revert to the grantor or the grantor's estate; this is called a fee simple determinable. If the grantor uses language such as "but if alcohol is served" then the grantor or the heirs have a right of entry, but the estate does not automatically revert to the grantor; this is a fee simple subject to a condition subsequent. In the United States many of these concepts have been modified by statute in some states. Generally speaking, fee simple determinable was preferred by courts in the Common Law of the early United States. Recently, that trend has reversed, and most courts in the United States today will find a fee simple subject to condition subsequent (instead of a fee simple determinable) in situations where the conveying document's language is unclear.

Thank you for reading a long comment letter.

Thank you for defending my right to write it!

Thank you for defending our great and beautiful country!

Thank you for working together to keep it that way!

Sincerely,

Cynthia M. Buxton

Naval Facilities Engineering Command
Attn: Mr. Kent Randall
Silver Strand Training Complex EIS
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Dear Mr. Randall,

I am a resident of Coronado and I live at 860 Cabrillo Ave..
I have learned that the Department of the Navy is planning on increasing the levels of training at the Silver Strand Training Center. I agree entirely with the Navy plan. Their training is a necessity for the defense of the United States! Those that think otherwise should spend some time in/with the military, and see for themselves, and quit complaining. These Navy men/women training are willing to give their lives for their/your country, and do the local citizens' contributions and complaining match that? The Navy did provide for the least terns on the bay side and it is fenced off, which was Navy property.

Sincerely, Earle Callahan
Earle Callahan

Subject: Other

Comment: If anyone complains about the necessary Navy exercises on the Strand, they really must be pacifists, and unAmerican. All they can do is complain when they are living in the greatest country of the world, and probably none of them would fight and die for their country like the men/women on the ships and beaches at these exercises. They gladly prefer others to do it, so they can complain, and enjoy their good lfe in the USA. The Navy has already given lots of bay front property for the protection of the least terns, and even fenced it off. As far as water pollution,ask Tijuana to quit dumping sewage into the Tijuana River. When it rains,even the old tires and garbage ends up on U.S. beaches all the way to Coronado, when it follows the north flowing eddy currents from the south.Imperial Beach surf is always contaminated with Mexico's sewage. That is worth bitching about, and not the U.S. Navy manuevers getting ready for battle!!

Subject: Noise

Comment: Add a sensitive receptor in Imperial Beach at Oneonta Elementary School. Noise extends further south than EIS indicates. Reduce helicopter overflights in general. NO helicopter overflights over residential neighborhoods. I saw no reference to this in the EIS but it happens in Imperial Beach all the time.

Subject: Public Health and Safety

Comment: Amphibious landing craft training poses minimal risk to the safety of residents living on Silver Strand. However, the increase in aircraft sorties in a combat training environment poses significant risk to residents in Navy Housing and the Cays. The Navy does not need another incident where an aircraft goes down on civilian housing, when realistic training could have been held in a low risk area like Camp Pendleton. Our pilots need to focus on realistic and unencumbered combat training, without concern for endangering residential homes.

Subject: Noise

Comment: As a resident of IB, I appreciate the military base and what it brings to the community. That said, please consider strongly any nighttime noise (2200 to 800). I don't care about daytime noise, but anything before 8am is a concern. At night I often hear helicopter noise emanating from Navy, local police, and border patrol. I also heard substantial noise that woke me up (and I sleep tight) and kept me awake when Transformers II was filmed at the Radio premises in the southern end of the Silver Strand. Since no one told the neighbors in IB, I thought that it was related to the violence in Tijuana, or something bad happening in IB. Please remember that you are not the only group and that the effect of all the noise is cumulative, and can actually be very frightening. Please avoid all noise possible from 2200 to 800 and give IB residents advance notice if you're going to have a night where you make noise anywhere approaching the noise made during the filming of Transformers. Thank you for all you do for our country.

Subject: Land Use

Comment: I like to jog on the beach side of the Silver Strand with my dog. Please ensure I continue to be able to do so! Also, I noticed the new big signs on the beach north of Palm (by the surf camp). You might think it's common sense to say people have to stay below the "mean" tidal line, but it doesn't. I assume you mean average by saying "mean," but when I'm on the beach, I only know where the tide is at that moment. It changes seasonally and daily and yearly, and can also depend on whether sand rejuvenation projects (sand dumping) happen. So please clarify whether you mean that we have to stay below where the vegetation grows, or what? Also, many hispanic-only speakers come to the beach, and if I have trouble understanding what is meant, I think non-native speakers will too.

Comment: your program keeps erasing my comment entry before i even get 100 words on the screen - hope this isn't an indication of the Navy's true interest in feedback from the public. An important issue I don't see addressed anywhere relates to a major step the Navy took a few years ago the last time they sought public input re these beach areas - they Navy tried to close about 2 miles of beach between the ymca camp and the south end of the state beach. this area has for many years - if not since time immemorial - been open to the public and is one of few beach areas of significant length in san diego where beachgoers can walk or run with their dogs. what i saw happen was that the day the navy tried to close the beach, the public simply wouldn't stand for it and defied the orders of navy security staff on the beach and simply walked up and down the beach right past obstacles the navy tried to use to prevent the public from entering the beach. it is troubling that the navy used such poor judgment in even considering trying to close this beach to which the public has always had such a long and strong connection and that they navy either didn't think thru or actually was ok with putting their security staff in a hugely problematic position of trying to stop the public by what? - arresting or shooting decent taxpaying citizens who simply can't believe the navy would be so arrogant as to presume that there is any reason for the navy to abscond with 2 miles of beach which should remain as it always has - open to the public?! so my concern at this time is whether in the midst of this ridiculously long document describing the navy's latest project for this beach there may somehow be a hidden agenda of again trying to close the beach? if so i'm sure they navy has learned they will have to string claymores to pull it off this time and even then they may have to explain some severed body parts (human and canine) in the national news for awhile. i wish i could view the navy and dod as being sane enough that we wouldn't have to even imagine the navy trying to close this beach but based on what i saw just a few years ago i see we have to be ever vigilant for some wash dc dod bureaucrat to come up with another arrogant and brilliant idea of affronting the very public whose tax $ fund everything the dod does thru out the world. so - to wit - is the navy in any way planning to curtail any public access to any of the beach between the ymca camp and the south end of the state beach (silver strand)?

Subject: Noise
Comment: The noice level of the helicopter flying up and down the bay side has increased almost every year that we have lived here over the past 10 years. Often in the summer the sound is so loud it is difficult to carry on a conversation outside. We in the Cays will now have it on both sides if this goes into effect. This is a residental community and the Navy can use camp Pendleton which has many miles of beach and without the impact of the noice to residents. This will be negative impact on all of us.

Re: Silver Strand Training Complex Draft Environmental Impact Statement

I attempted to submit my comments via the website and encountered the 5,000 character limitation. I am emailing my comments to Mr. Randall and will also mail a copy of my comments which will be postmarked March 30, 2010 but clearly will not be received on this date as called for on the website. Given the length of the document and the complexity of the issues the limited comment space does not seem adequate.

I do appreciate the opportunity to comment and as a contractor privileged to work with the endangered birds at Naval Base Coronado I applaud the Navy's many years of efforts on behalf of natural resources at their facilities at NBC. The military and particularly the Navy deserve the primary credit for increases in the population of the California least tern having pioneered the methods and set the standards that are now applied at successful sites throughout the range. Because of their outstanding efforts the Navy has been given significant regulatory relief to address the constraints imposed by the presence of such species as the least tern and the Western snowy plover. The benefits to the terns of this bargain and the significance of these efforts were clear in 2009, when NBC supported 22 percent of the least tern nesting attempts in California. NBC also supported the second largest population of nesting snowy plovers in Recovery Unit 6 and fledged as many young as sites with larger populations.

This Environmental Impact Statement (EIS) represents a lengthy effort to identify points of conflict between endangered species' management and Navy training and address potential resolution of those conflicts. However, the current status of the California Least Tern and the Western Snowy Plover neither of which is faring well, is not clearly portrayed in the EIS which may mislead the public regarding the potential consequences of the proposed actions.

Since 2001, Least Tern reproductive success in San Diego County has been declining with the steepest drops being seen at sites around San Diego Bay. This downward population trend is not addressed in the EIS. Methods for calculating population figures are under review and are relevant to providing a clear picture of the status of the species prior to approval of increased adverse effects. In 2009, only 72 young least terns fledged from Naval Base Coronado sites from 3,232 eggs laid and 2,364 chicks hatched. The losses are in no way attributable to the Navy, which has been diligent in attempting to reduce the predation that is the primary cause of these losses but it is nonetheless in this context that increased take is being sought by the Navy. It is NBC's 22 percent of the statewide population that suffered near complete reproductive failure in 2009. Both the increasing reliance on NBC and San Diego County military facilities to support the tern population and the declining populations at these sites suggests a need for the most diligent evaluation of projects that may adversely affect these birds.

In 2009, NBC supported almost one third of the snowy plover nesting population in San Diego County. Unfortunately, while the population numbers have wavered , breeding bird survey results in 2009 showed the entire coastal population to be down by 12 percent from what was recorded in 2005 despite aggressive management efforts throughout the range. The minimum number of pairs at NBC in 2009 was only 35. In addition to problems of predation and habitat loss, in San Diego there has been a continuing occurrence of unexplained adult mortality with 15 adults found sick or dead at NBC in 2009 alone. This gloomy context needs to be clearly provided in the EIS to enable the public to evaluate the potential consequences of project approval.

The absence of the Biological Opinion (BO), the U.S. Fish and Wildlife Service's review and response to the proposed actions, from this Draft EIS fatally handicaps the ability of the public to review the consequences of the proposed actions. The discussion of the complexity of the endangered species issues, e.g., downward population trends, plover adult mortality, unresolved predator issues, variation in management approaches, lack of control of public access, and perhaps most importantly the take allowances, reasonable and prudent alternatives and terms and conditions that will be applied to minimize loss, is accessible only in the Biological Opinion. I do not believe the public can adequately evaluate the impacts of the proposed alternatives until that BO is included. The 30-day time period between circulation of the Final EIS and publication of the Record of Decision would be inadequate to review the relationship between the Biological Opinion and the proposed actions and therefore the EIS should be re-circulated as a Draft including the Biological Opinion.

Knowing how dramatically the nest numbers of the terns on the beach increased at NAB Ocean, I can understand that someone unfamiliar with plover biology might be fearful of the same kind of problem arising with the plovers. However, their nesting strategies are completely different. Neither snowy plovers nor any of their relatives nest in dense colonies anywhere in the world.

The snowy plover population in Recovery Unit 6 is unstable, has not met the Recovery Unit goals, and needs more aggressive management not less. The call for a cap on the number of plover nests to be protected is seemingly contrary to the mandate to recover this species. The justification offered for the cap suggests a misunderstanding of how plover nests are protected and does not take advantage of other opportunities to support training and minimize take. In 2.1.3.7. in the discussion of the proposed cap, protecting no more than 22 simultaneously active plover nests in SSTC-S and N combined, is identified as the only way to prevent the presence of protected plover nests from rendering the beach lanes unusable. This is apparently based on some assumptions which are not correct or are not likely to occur. While the worst-case scenario could occur in which three plover nests would be established in a line at the crest 30m apart, this would not result in establishment of protected areas that would preclude the use of a beach lane. The size and configuration of the buffers provided for the plover nests is <u>not to exceed</u> 30m on a side but is often much smaller and nest marking has always been done to satisfy both the protective needs of the plovers and to accommodate training activities. The presence of 3 simultaneously active nests in the training lanes occurred twice in 2009 once in Yellow 2 and once in Red 1, the most heavily used training beaches at NAB Ocean. The calculation that 22 simultaneous nests would equal 2 nests per training lane is somewhat misleading as plover nests have historically been established in 9 of the 10 beach lanes at NAB Ocean and five of six beach lanes at NRRF (4 of them are training lanes) = ~1.67 nests per lane.

The provision of protected beach lanes has resulted in a clear concentration of plover nests in the protected lanes with 60 percent of the nests at NAB Ocean being established in those protected areas in 2009, achieving the goal of minimizing the effects of plovers on training and maximizing their nesting potential. Adding training in the protected lanes and removing the protective markers may disperse what nests are established into fully active training lanes and increase the likelihood of plover loss while decreasing the protection provided. The creation of the protected areas was a minimization measure which was successful but removal of protection should require more mitigation not lessen the existing protection with a cap. Without the Biological Opinion it is not possible to know how FWS has viewed this adverse result, what additional take would be allowed, how the allowance is justified, and what compensation is required to mitigate for the increased vulnerability.

The concern that two active nests would significantly impede training is belied by the fact that throughout the season in 2009, in many weeks, three of the training lanes at a time supported two active plover nests each. The calculation that 2 nests would obstruct 12 percent of a lane is also misleading. While 60m is approximately 12% of the length of a lane, even if the nests were lined up in a way that resulted in a 60m long line the actual acreage of the area protected by maximum buffers provided for two nests is only 0.4 acres (30mx30m square) – only 3 percent of the acreage of the smallest training lane.

The protected beach lanes offer a benefit in concentrating plover nesting and tern nesting contributing to a reduction in the number of nests in the regularly used training lanes and the potential for interference with training. Nesting density was higher in the protected beach lanes (8, 9, and 10) with a maximum of 5 simultaneous active plover nests occurring in a single lane at one time. Even with 5 simultaneous active nests protected by the maximum 30m square buffers the smallest beach lane would have no more than 8 percent of the lane lost to the protected plovers.

Even with 22 nests, simultaneously active, in beach training lanes with each given the maximum 30m square the acreage removed from training availability would be less than 4.4 acres of the 191+ acres available (128 – NAB Ocean; 63.9 – SSTCS). If all 22 simultaneously active nests were established only at NAB Ocean, using the maximum buffer they would occupy 3 percent of the training lane acreage. If the number of simultaneously active nests were doubled to 44 but the buffer was halved the area occupied between SSTCS and SSTCN would still be only 2 percent of the beach. This is but one minimization measure that might be recommended if needed. Again, the absence of the Biological Opinion does not allow the public to evaluate the consequence of the proposed actions.

Knowing how dramatically the nest numbers of the terns on the beach at NAB increased, I can understand that someone unfamiliar with plover biology might be fearful of the same kind of problem arising with the snowy plovers. However, their nesting strategies are completely different. This is not a species that ever nests in large or dense colonies. Even the current density found at NBC is exceptional. The differences cannot be emphasized enough and the their requirements for recovery are not currently being met.

There is not adequate compensation identified for increased losses of terns and plovers that may occur as a result of heightened training tempo in what are the most concentrated nesting areas, The lack of adequate compensation is of particular concern in light of the continued reproductive failures at these sites for the last eight years.

The level of unrestricted public use of all the training areas is not accurately portrayed with the beaches at NAB Ocean being described as closed to the public so that the effect of the removal of protective markers in the southern lanes would not be significant. The beaches at NAB Ocean are used constantly by the public coming both from Coronado and from Silver Strand State Beach as well as by people from nearby military housing. The NAB beach has been identified on the Park website as a recommended walk from the adjacent State Park. Despite military presence, suspected vandalism of snowy plover nests and take of snowy plover chicks has been documented at NRRF. Vandalism of Navy property in the training lanes is also a regular occurrence. Off-leash dogs are constantly present at NRRF. The signs providing rules and identifying training areas are few, many of them have fallen down, some are covered with graffiti, and all are ignored. There is currently little to no enforcement by military personnel of restrictions on recreational activity. The ability to control public recreational activity is critical to any successful resources program regardless of the project alternative approved.

The Delta beaches which are mitigation for the loss of least tern nesting habitat at Naval Air Station North Island need to be evaluated for the presence of contaminants. The sites are subject to management constraints based on the presence of ordnance and have not been evaluated for contaminants. The presence of the former argues strongly for evaluation of the latter. Future clean-up of ordnance may affect the availability of these sites. As the Delta beaches are the fallback nesting location for terns and plovers displaced by increased training at SSTC the quality of the sites should be assured.

I applaud the efforts the Navy has expended in its management of endangered species at NBC and it is the Navy's demonstrated ability to support both training and natural resources that has set the standard for resource management for much of the country.

Sincerely,

Elizabeth Copper

Re: Silver Strand Training Complex Draft EIS

Training at the expense of endangered species is our concern. Endangered species are to be restored to a point that they are removed from the federal list.

We are opposed to the training activities, if you won't put protective fencing around each Endangered San Diego Fairy Shrimp's Vernal Pool habitat complex at the Navy Silver Strand Training Complex. Without fencing, foot traffic, military dogs, and vehicles may irrevocably destroy, by crushing impacts, the cysts, eggs of the San Diego Fairy Shrimp in dry season. While the EIS states it will try to avoid the vernal pools when they are wet, it clearly states that it expects there to be foot traffic in dry season.

The Navy is committed to complying with all applicable federal law, regulations and policies. Current management of vernal pools restricts all activities from the pools at all times. Environmental programs and policies have been developed to protect and improve air, water, and land, cultural resources, and national resources. The protection of natural and cultural resources has become an integral part of planning for training on S.S.T.C. However, the protected sanctuary of the vernal pools is about to change for the worse from foot traffic, other traffic, pyrotechnic chemicals, and hydrocarbon residue from overhead aircraft. Chemicals introduce poisons into the pools. Hydrocarbons cover the surface of the water and restrict oxygen from the air reaching the water in the pools. Over time, the cumulative effect leads to destroying the ecological habitat of the vernal pool.

The San Diego Fairy Shrimp ( Branchinecta sandiegonensis ), species code K049 101, has been designated an endangered species in 1993 by the federal Environmental Protection Act of 1973.

Why not designate 6 acres as a fairy shrimp pool complex preserve as the pools are separated on the order of meters? Currently, it looks like there are three complexes of pools at S.S.T.C.-S . In that the antenna array is no longer being used, which has a diameter of approximately 944 feet, that has an existing perimeter fence around this antenna array, which occupies an area of approximately 16 acres and could add 10 new available acres for training and set aside 6 new available acres for the fairy shrimp pool preserve. Figure 3.11-4 ( Ephermeral Pools ) shows the occupied pools have an area of 4.65 acres. Training could use the area between the pool complexes, but not through the pool complexes.

History has recorded the steady decline of the San Diego Fairy Shrimp vernal pools. These pools have existed for thousand of years. The major decline started in the 1940 to 1950 time period because of World War II. Additional decline occurred between 1979 and 1986 from urban development.
Before development there was approximately 28,500 acres of vernal pool habitat in San Diego County.

By 1986, only 7% of those acres remained. On February 3, 1997 it was reported that 70% of the remaining vernal pools were on N.A.S. Miramar or Camp Pendleton. By 1995 95% of the vernal pools were destroyed. In 2001 it was reported that 2,400 vernal pools existed. Between 2002 and 2003 only 3% of the vernal pools remain. In 2002, under President George W. Bush, a federal judge invalidated the critical habitat for the San Diego Fairy Shrimp. In 2009 President Barack Obama went to the National Environmental Protection Agency and ordered that all the protections of the endangered species that had been dismantled during the Bush era be put back which reestablished the critical habitat for the San Diego Fairy Shrimp.

So, the pools are down to 3% remaining. Most (70%) are on government property. Some of the pools do not have the San Diego Ferry Shrimp which makes the pools that do have, become more significant in importance. Development was the main cause of the decline in the pools. Now the Navy wants to develop S.S.T.C. – S which will further the decline of the pools if not protected as a fenced pool complex preserve.

We are patriotic and want our service men and women to have the best training. They deserve nothing less. Détente, the easing of strained relations, also applies to nature. A constant vigil of good stewardship needs to be kept for the endangered species to get off of the federal list. Thank you for considering our comments on this important matter.

Respectfully, Shannon and William Davis

Comment: Imperial Beach is a very quiet and peaceful community. We enjoy the quiet of the evenings and walks along the beach. We feel that this training facility has and will interupt the peacfulness of our nights and our use of the beach. I understand the need for training, but feel that Imperial Beach is such a family area that training needs to be moved to a less populous area that would not limit the training times and days that are required to create the perfect military personel. There must be balance and we have lived in, although not perfect, balance with the military for over 20 years. Extended training hours and area would not only affect the harmony we have acheived it would destroy the quality of family life in Imperial Beach. Please consider the option that allows us to continue as is.

Comment: We bought our home in Imperial Beach over 20 years ago. Although we could have moved anywhere, we chose this special area to raise our children. We felt at that time that there was no where on earth that offered all the advantages that were offered here. We knew that IB had a questionable reputation and that we would be sharing our area with a strong military presence, but these were small prices to pay to live in such a diversified area. Not only culturally, but biologically. The mornings spent on the beach, watching the seals and porposises. The afternoons spent over by the bay observing sea birds and turtles. The times we watched the military training were all special times of great education for my children. The best scenario would be for the Navy to find another location and allow the area to go back to a natural and untouched state. We need to protect all the environment from human encrouchment and no where in the state do we have such a fragile area as we have been entrusted with here in Imperial Beach. Since, I know that this possibility is just a dream, please consider the option of keeping the training and land use as you have been doing and not extending the hours and amount of use here. There are schools and children and real people who need to continue with their lives, without having to be stressed over the noise, additional traffic, diminished access to the beach and the possibility that all the wildlife that is habitating and at this point thriving, will be affected by our careless use of what is an area of such living beauty. We need to consider other options. The decision to add addtional training here would diminish our quality of life and what price is the Navy willing to pay for that.

Subject: Public Health and Safety

Comment: My concerns deal with the new use of Training Lanes 11 through 14, currently referred to by the Navy as SSTC-South. Let's be clear, until approx. 2 years ago, the Navy did not use this section for assault / beach access training or helicopter sortes. Now it's called SSTC-South? When did that happen? This half-moon shaped piece of land is bordered on one side by the ocean. The other side is surrounded literally by YMCA Camp Surf, which is attended by over 10,000 local children annually; Westview Elementary School, Imperial Beach; Over 500 private homwowners in Imperial beach; San Diego Bay National Wildlife Refuge; Coronado Cays, a residential community of 1200 homes, Silver Strand State Beach Park used by over 1 million people a year; Loew's Coronado Hotel, which adds tremendously to the local economy and tax base and finally Camp Able, which serves Handicapped and challenged children and adults from throughout the southern CA area. SSTC-North and SSTC-South are separated on the ocean side of the strand by the CA Silver Strand State Beach Park. To have 2200 helicopter sortes and assault and beach access training, including the discharge of munitions will harm the area marked SSTC-South and have a very negative environmental impact on the surrounding community. If this is to be used for training, it should be very low impact and classroom type training. Confine the assault and sorte exercises to SSTC North, Lanes 1 to 10, where it has always been. The noise, pollutants, increased traffic and air quality will be harmed further in an area historically used for outdoor activities and wildlife sanctuary. The SSTC-South did not exist 2 years ago. That area has always been the antenna site. Nothing could have less of an impact on the area than an antenna site. To now convert it to overt and dnagerous training and use the argument that the community should expect it is ridiculous. The helicopter traffic alone poses a huge potential for disaster to surrounding community sites that I just listed. The nosie is well above what is has been historically. The Navy has let helicopters fly throughout the south bay area not heeding to the restricted flight corridors or following the agreed upon protocol. The ocean corrifor is never used. To now triple the helicopter flights from 770 to 2200 a year and add the assault training at SSTC-South in the middle of residential locales, all less than 1/2 mile away is putting the public in danger unnecessarily. Continue to train in Lanes 1 to 10 and leave the antenna site, Lanes 11 to 14 for non-invasive, non-polluting activities.

Comment: As a frequent tourist to Coronado, I especially enjoy seeing the Seals, the helicopters, and the ships offshore in exerciises. This shows me where my defense tax dollars are going, and makes me proud to be an American. I salute the men of the Seal Teams and those men and women who support them, and encourage more exercises. The exercises do not damage the enviironment, and sharpen our defense capabilities. Do not think for one minute that they are not under observation by those who may be on the receiving end of the exercises one day, so they act as a wonderful deterrent to those who would do America harm. Please allow the Seals to expand their exercises as they desire.

## E.1.36 Beverley Dyer

March 6,2010

Naval Facilities Engineering Command, Southwest
Attn: Mr. Kent Randall-Silver Strand Training Complex EIS
1220 Pacific Highway, Building l, 5th Floor
San Diego, Ca 92132

It was a shock on February 23rd to read in the San Diego Union of the Navy plans to increase the training along the Coronado coastline many times over the previous use. Even though I have lived in my home in Coronado Cays for over 30 years, never have we been contacted nor informed of this plan which has been studied for 10 years. Now we are allowed only two weeks to make any comment.

Since there have been no public nor individual contacts previously made with the local population during your Environmental Impact study few, if any, of the local population were aware of these drastic changes. The noise of helicopters and other aircraft, besides leaving an oily residue are already a hindrance without your increasing it three-fold. Blasts of gunfire and detonation already awaken us, create a dangerous odor. You expect that humans and all living creatures will not be affected by an increase of 10 times?

It was totally unethical and unprincipled for our government supported Navy to inhibit us from previous information. Why didn't the study include the many people who live on the Strand, the hotels, the many guests and tourists and campers who spend time in the area? Were the various organizations that sponsor beach activities informed and questioned? In which way was the human factor studied? We would like an answer.

At the poorly attended Coronado meeting at the Coronado Recreation Center on February 25 it was obvious that few people knew anything about your plans even though Environmental Impact report had begun 10 years ago.

Unfortunately, the public has only been given until March 9th to make comments concerning this issue. Is that fair?

Sincerely,
Beverley Dyer

mfield1@san.rr.com

March 6, 2010

Naval Facilities Engineering Command, Southwest
ATTN: Mr. Kent Randall - Silver Strand Training Complex EIS
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Mr.Randall:

I am writitng with comments on the Navy's proposed expansion of training activities on the Silver Strand:

1) The Navy should not be increasing its operations on Coronado. Coronado is a small residential community which is already impacted by Navy traffic , noise and pollution. This has greatly increased with the nuclear aircraft carrier homeporting operations about 10 years ago. It is inappropriate to increase the burden on this small community when the Navy has other sites which might be used for training which do not burden any community - Camp Pendleton springs to mind and there are other sites as well. It may not be quite as convenient but it is unfair to ruin a small community in the name of Navy convenience, not necessity.

2) NEPA requires that all impacts related to a proposed course of action be analyzed in the EIS. However, the Navy has deferred analysis of the impacts from helicopter trips to and from the training areas. I believe this violates NEPA.)

3) Helicopter sorties will increase by about 300%. If helicopters and fixed wing aircraft take off from North Island and transit to the training sites on the Silver Strand they should be required to fly over the ocean at a sufficient distance from land so as not to disturb residents on the ocean side of Coronado. No aircraft should be permitted to fly to or from the training areas over the Bay. Residents along the Bay are already impacted by Navy helicopter noise. The Bay is so narrow that it is not possible for aircraft to fly far enough away from residences to eliminate or minimize noise.

4) The EIS describes the folllowing activites: triple the helicopter sorties, new (presumably larger) helicopters and amphibious craft, pyrotechnics, pile driving, nighttime helicopter hovering for 1- 2 hours, 50% increase in training incidences, almost tenfold increase in firearm firings and admits there may be sleep disturbances and communications disruptions. Yet the EIS concludes that there will not be sigificant noise increase because the training is dispersed over a larger area. On this basis, no mitigation is proposed. It is not credible that these activities will not cause significant noise increases to the residents of adjacent areas. These disturbances cannot be mitigated and therefore should not be permitted.

5) The EIS notes that berms will be built in places along the Strand. This will effectively wall off the view of the ocean which residents and tourits enjoy.

6) The new and expanded training activities and the construction activites noted (including retail, recreational, housing and restaurant facilities) will increase traffic which is already greatly overburdening Coronado. There is no good solution to mitigate traffic and the Navy has been unwilling to contemplate any solutions which would significantly reduce the Navy's traffic . No activities which increase Coronado traffic should be permitted.

Respectfully submitted,

Marilyn Y. Field

Subject: Military Training Activities

Comment: The Navy should not be increasing its operations on Coronado: Coronado is a small residential community which is already being severely impacted by the Navy's operations. Coronado and the Navy share this small island but the Navy's increase in operations over the past 10-15 years has created noise, increased traffic and air pollution. It is inappropriate to increase the burden on this small community - in essence ruin with further increases in noise, traffic, air pollution and adverse visual impacts when the Navy has other options for training which would not burden any community- Camp Pendleton springs to mind. It may not be as convenient but it is unfair to ruin a small community in the name of Navy convenience.

### Public Hearing Comment Form

**Location:** ____________________ **Date:** ____________________

**Thank you for providing comments on the U.S. Navy's Silver Strand Training Complex Draft Environmental Impact Statement (EIS).** Please provide comments no later than March 9, 2010. Comments may be submitted at the meeting, by visiting the project Web site at www.silverstrandtrainingcomplexeis.com, or via U.S. Postal Service to the address below.

Helicopter noise on San Diego Bay is already a major annoyance, especially in the summer. The ramp up in training on the Silver Strand will increase dramatically helicopter flights (up to 3x I am told), including flights from new helicopters to be stationed at North Island.

We live on the Bay in Coronado (Coronado Point). Any significant increase in helicopter traffic over the Bay will make living there intolerable. In part this is because Navy pilots fly at less than 500 feet most of the time, but even at higher elevations the noise is a nuisance.

At the meeting I was told that helicopter traffic patterns are not included in the EIS. This appears to be a violation of NEPA, which requires the total impacts of any project be included in an EIS.

Subject: Noise

Comment: As a resident of Imperial Beach for 18 years, I have a few comments. The east view from my residence on Seacoast Drive looks down the center line of the Navy's OLF runway approximately 1/2 mile away. There are helicopters conducting flight operations on most days. The noise is not at all a problem. What I hear is the sound of freedom. I truly want these pilots and air crew to be as proficient as possible in defense of our country. As for the Silver Strand Training Complex, I want our Navy SEALS to conduct as much training as they need, no matter the noise,in the proximity of their base along the Silver Strand, recognizing their importance and vital mission for our defense. No bird, fish, ground cover or sensitive ear should have a higher priority over the vital training of our Navy SEALS. Thank you for the opportunity to comment.

Mr. Kent Randall
Sliver Strand Training Complex EIS
Naval Facilities Engineering Command Southwest
1220 Pacific Highway
Building 1, 5th Floor
San Diego, CA 92132. Dear Mr. Randall: This is in regard to the Silver Strand Traning Area the navy proposes to expand. I am a native of Coronado and have watched the navy's activities all my life in and around the Silver Strand. For the most part, they have taken good care of the natural resorces in the area and I have no complaints. But I must object to the increased activity in and around the old Fort Emory, the area just north of Imperial Beach. Much has changed since WWII when that area was so very important to national security. It has been repopulated with the wild species that were there 100 years ago, they have reclaimed it for their own. In my opinion, it would do much harm to the environment to reclaim this area for navy purposes. The navy should leave it alone and allow the public access to the beach area. There is still alot of beach area available to the navy at North Island and Camp Pendleton. Give the citizens a break and do not extend your already large claim on the small area of Coronado. Sincerely, Vincent J. Flynn,MD 1021 Adella Ave. Coronado, CA 92118

18% increase in Sound-generating activities

The projected increase in activities could ~~create~~ cause a noticable difference in the peacefulness of north I.B. Please choose the No-action alternative and maintain current level of activities. IB residents should be considered first and foremost in making this decision as we will be the most impacted.

Beach access and the bird life along the Silver Strand are also coveted and are part of what make this a special place. Please leave the current situation as-is.

Choose the No-action alternative and do the extra training elsewhere where the public will not be as impacted.

Subject: Noise

Comment: Having lived in Imperial Beach next to the Naval Antennae for over 40 years we are familiar with Naval Warfare training (which has only increased in recent years). We have not complaned one bit about the noise at night (bomb blasts and machine gun fire) nor the increased helicopter traffic OVER our houses. Now you are telling us we will not only have this noise continue but it will be for longer hours and be even more disruptive to our once quiet neighborhood? The helipcopter take offs and landings echo off the walls as it is and you want to do hundreds more? We are living in this community and we respect the Navy but feel that they do not respect us back. We deserve peace and quiet. The noise concerns we have are real and I don't think any of you would want to relocate your beautiful home to right across from a loud, disruptive training facility so why are you making us do that? You already take half the Strand for your training--leave us to our peaceful part down in Imperial Beach.

### E.1.45 Gerd Geissler

We are on Silver Strand and Carnation. The traffic goes directly in front of our lot. We are concerned about excessive speed and traffic backing up along Silver Strand. We would like to recommend that the northerly gate be used for access into the base. We would also recommend considering a light at Silver Strand and Palm Ave. Speed limit needs to posted. Also concerned about noise levels after 10 pm.

Subject: Traffic or Transportation

Comment: We live along Silver Strand Boulevard and have had to contend with traffic going in and out of the Naval base at all hours. The people who are driving take no heed to the fact that this is a residential area and should be driven at under 25 mph. They speed out of the base at about 40-50 mph putting chidren and pets at risk. Now you say you want to increase training which would in turn increase the number of cars using Silver Strand Blvd. as their route? Why should we have to put up with the dangerous conditions these cars pose? Why do we have to fear an accident will occur when these hazardous drivers are speeding along our negihborhood roads? We do not want the heavy traffic congestion along our peaceful street and we do not want the added pollution associated with so many extra cars. Why not open the gate along the Silver Strand (after the berm) and make that available if you are to continue with more traning excercises? Our neighborhood was not built to be a thoroughfare for large amounts of cars and we don't like the dangers they would bring.

### E.1.47 Dani S. Grady and Ralph J. Greenspan, Ph.D.

1020 Glorietta Blvd.
Coronado, CA 92118
March 9, 2010

Dear Mayor Tanaka and Council,

We are writing to express our serious concern and opposition to the Navy's planned expansion of military exercises on The Strand. There are several reasons for our opposition: human health, environmental concerns, impact on residential atmosphere, and impact on the local economy.

Our family is proud of the Navy and strongly supportive and proud of our military, and we understand the need for expanded military training. The eldest son in a Coronado family with whom we are very close is currently in the Navy Seal training program, and so we have an additional personal connection with the need for the best training possible. Over the past few years, the level of military exercises in Coronado has been increasing in both frequency and intensity. It is plainly audible from our home on Glorietta Blvd. Thus, we have been patient with the expanded use of these training areas, but now feel that the noise levels we currently experience are near the tolerable limit. We feel strongly that the place to expand such operations, however, is not Coronado, but the Navy's more isolated sites at Camp Pendleton and at the offshore islands.

The noise we experience at our home, however, is not the only reason for our concern. There are many more:

Human health – One of the principal consequences of expanded war exercises on The Strand would be noise pollution, which is well documented to cause hypertension, high stress levels, tinnitus, hearing loss, sleep disturbances, and harmful emotional effects. The radius affected by this noise pollution extends well beyond the area immediately adjacent to the site, given the magnitude of the noise and the efficiency with which sound travels over water, thus exposing the entire southern half of Coronado.

Another major effect would be air and water borne pollutants, toxic debris, and shoreline contamination from toxic chemicals that are carried in or produced by exploded ordinance. These include toxins and carcinogens such as depleted uranium, mercury, and lead, as well as irritants and irritant producers such as titanium tetrachloride, red and white phosphorus. This is to name just a few of the ordinance-associated chemicals known to be harmful to humans.

Loss of residential atmosphere – We have just spent several years instituting a new revision of zoning requirements based on the widespread sentiment that Coronado residents wanted to preserve their village atmosphere. Nothing will destroy that atmosphere more quickly or thoroughly than the frequent and continual sounds and smells of war exercises.

Our troops are crucial to our safety and we support them, their training, and their families. Many of them and their families also live here in Coronado. Proper support requires that we provide appropriate separation between domestic living arrangements and war simulations. This is especially relevant given the widespread occurrence of PTSD and related disorders in returning service personnel.

Ecological impact – The Navy's own Environmental Impact Statement[1] acknowledges that there will be a significant impact on marine ecology, including bioaccumulation of chemicals in the food chain, death from exposure to toxic chemicals and bomb blasts. In addition to direct physical harm, there is also the impact of noise on animal life in the reduction of usable habitat, which in the case of endangered species hastens the path towards extinction. The Navy's training use of sonar has already increased the deleterious exposure of marine mammals, and this expansion will further increase the burden of noise pollution on them.

Local Economy – The Hotel Del is Coronado's major tourist destination, and it sits adjacent to the area where these exercises would be increased. The noise and smell from these activities would effectively ruin anyone's stay at the hotel, or at any of the nearby hotels. The repercussions for Coronado's standing as one of America's most desirable tourist and vacation destinations would be rapid and detrimental, and this would be felt as a permanent blow to the local economy and tax base.

In short, we feel strongly that the proposed increase of Navy exercises on The Strand would be certain to have severe and long-term detrimental effects on the quality of life in Coronado, lasting well beyond the period of time in which the exercises actually occur. For this reason, we urge the City Council and Mayor to take a strong stand against such expansion of activities.

Sincerely,

Dani S. Grady

Comment: As a San Diego resident for more than 30 years, I have enjoyed Silver Strand and the peace that it offers. Increasing military activity in this location would be harmful both from an environmental standpoint and aesthetic standpoint. Silver Strand is not only a resource for San Diego residents, but for tourists as well. And while the EIS does address the impact the increased military activities would have on terrestrial animals, the full impact is never certain, and the impact on aquatic flora and fauna is unknown and therefore a "risk" that should not be taken. I fully understand the need for training, but not at the expense of the environment and people. The military would be better served increasing moral, cultural, and ethical training, which would create a more enlightened military, rather than one that knows how to kill. I call on the people in charge to not increase military activity in this area. Our dwindling resources do not need to come under attack from our own military.

Comment: Having visited the Coronado area several times over the years, we always enjoy the presence of the military and their training in the area. It reminds us of where we are, how we got there and what it takes to remain free to travel about. If the folks upset with additional training of our armed forces to allow them to better perform their duties, let THEM (the protesters) take up arms and put it on the line for us. That should settle the debate!

### E.1.52 Carol Humphrey

Carol Humphrey

Dear Mr. Randall,

As a resident of Coronado, I am writing to express my support for the Navy exercises as I am profoundly grateful for all the military does. With appreciation,

Carol Humphrey

### E.1.53 John Hunter

DEAR UNITED STATES NAVY, FEBRUARY 25, 2010

I WRITE BECAUSE I AM TIRED OF OTHERS SPEAKING FOR ME. I HAVE LIVED ABOUT 55 FEET FROM THE BASE SINCE THE SUMMER OF 2002. THE BASE HAS NEVER BEEN A PROBLEM. THE PROBLEMS IN THE NEIGHBORHOOD ARE NOT RELATED TO THE BASE. PLEASE CONTACT ME IF YOU WISH TO DISCUSS WHAT I FEEL ARE ETHICS VIOLATIONS REGARDING COMPLAINTS TO YOUR EXPANSION.

GO FOR IT!

THANK YOU FOR ALL YOU DO,

JOHN HUNTER
512 4TH ST
IMPERIAL BEACH, CA 91932

### E.1.54 Miriam Iosupovici

Representing: Private Individual

Organization:

Name: Miriam IOSUPOVICI

Date: 3/22/2010 9:49:19PM

Subject: Social or Economic Conditions

Comment: Choosing to do this in one of the most beautiful beach environments in the US, close to major population centers that need a peaceful resource, seems a poor choice.

Representing: Private Individual

Organization:

Name: Miriam IOSUPOVICI

Date: 3/22/2010 9:49:19PM

Subject: Water Resources

Comment: We already have problems with pollution in this area. What will the effect be on the military if they contact illnesses during training? What will increased pollution effects be from training vessels?

Representing: Private Individual

Organization:

Name: Miriam IOSUPOVICI

Date: 3/22/2010 9:49:19PM

Subject: Noise

Comment: I simply don't trust that the noise levels will NOT be intolerable at the increased level proposed. I don't want to hear the echo of bombardment PERIOD. What ab the fact that we have many vets living here. Will there be increased PTSD responses to the sounds? Nothing I have read discusses this potential issue, one I am aware of as a mental health professional. Helicopter overflight noise already impacts my environment at present levels. Increases predicted will be intrusive. We have no idea what the impact will be on birds utilizing the Tijuana Estuary, part of the Pacific Flyway, despite the EIS document's assertions.

Representing: Private Individual

Organization:

Name: Miriam IOSUPOVICI

Date: 3/22/2010 9:49:19PM

Subject: Birds

Comment: The Pacific Flyway is under this area. Over 350 species of birds may be impacted, assertions to the contrary that they would not be. Imperial Beach has a difficult economic situation and visitation to this area due to bird life is one of the few income generating parts of our economy. Why would birdwatchers choose to come to an area where they are forced to watch birds with an incessant sound of helicopters, even assuming this wouldn't alter migration patterns (an assumption that strains credulity) The Silver Strand plan to increase training will inevitably negatively impact the nesting and fledgling of Least Terns due to increased foot and vehicle traffic. This Least Tern project has been successful until now. Why should we believe this EIS will be enforced after it is approved?

Subj: Lack of Navy Stewardship for Public Health and Safety in Imperial Beach

Sirs;

On the occasion of the meeting this date on your proposed expansion of activities at your SSTC Complexes and associated EIR I want to take the opportunity to inform you about your lack of attention and dangerous disregard of your property in Imperial Bch which has created a dangerous condition for years.

Your misuse of the word "Stewardship" in your Eis to expand training activity in your SSTC may serve the Fairy Shrimp and Snowey Plover well, but your neglect for the welfare of the inhabitants of my City who have been subjected to your dangerous threatening activity for years is deplorable.

You are hereby put on notice that first, your steel Seawall outside of the Camp surf fence at the Beach has huge holes and serves no purpose except to attract children and has become a serious hazard to the safety and welfare of all of us. Its jagged rusted steel rim and bottom are hazardous and constitute a daily accident-waiting-to-happen for the numerous children who climb upon it both within and without the confines of Camp Surf. Since these children have little supervision anyway , you must take control and remediate this problem. This rusty steel nuisance has fallen in such disrepair that it has not served a purpose for at least ten years, and I fear for my own as well as the safety of others whenever I approach it to get down to the beach area. Would you have us wait another ten years for you to remediate and remove it. Hopefully not, now that you are formally on notice with Legal effect. Your personnel--police and others entering the camp at Antenna Station (SSTC South) often speed down Carnation avenue when your personnel should instead be using Silver Strand St in mornings which goes directly to their station. Please post signs on your side of Carnation, the North side, with warnings to slow down as numerous children and people frequent that area to the corner going to and from the Beach.

I feel like I live in a War Zone in summer when SEALS shoot guns and explode munitions within SSTC SouthEast. Could you please put a time limit on this activity so I can sleep at night and provide a schedule of upcoming events so I can leave town. Also, your planes from NASNI fly late overhead doing exercises in violation of agreements you have made with our Congressional and Civic leaders. Please don't allow this activity to continue past 9PM and afford us a timetable so I can leave town with my animals and children.

Your YMCA Camp is a nuisance, continuing to play loud music and solicit screaming and yelling well past the 9PM agreed-upon time. Please have this activity cease. (Read the Police Report on your Camp Director, Mr Thompson who assaulted my friend a Navy SEAL's wife next door when she went over to tell him to turn down the music and was 8 months pregnant and later lost her baby). I feel forced to sell my home which I must further depreciate by declaring in Real Estate papers that I live in a War Zone due to the above activity which threatens and annoys constantly in Summer months. A former Air Force Officer, I cannot begin to understand how the Navy can be allowed to perpetrate such damage on a Community when my fellow Air Force personnel would never have dared. Why don't you go to Corregador or the Phillipines where you can conduct your endless and mindless training missions. General MacArthur drove out the Japanese over there so they can't hurt you anymore- Unless you drive a Toyota. Or better still, Puerto Rico where the Air Force goes, or Haiti. In short I protest this EIS which, in the aggregate, continues to wreak more havoc on my Community. And I have no doubt that in a few years, with the perverbial Camel's Nose already in the door, you will be sending invitations to a like event.

Signed,

Rina Kelley

Subject: Military Training Activities

Comment: I have just submitted a lengthy comment, but when I pressed the ADD COMMENT button it was deleted. I gave many reasons and examples for my position in my former comment, and I am reluctant to retype it all. In general: I am opposed to the increase in Naval Training Exercises at the Silver Strand Complex Naval Training Area. We are long time residents and homeowners in Coronado and we have witnessed the increase in traffic, noise, and pollution of this gem of a town which has the U.S. Navy as it's neighbor. While not all negative environmental impacts are attributable to the Navy, the fact is that many of them are, and when you combine them with the already overwhelming levels of noise, traffic, air and water pollution, it makes no sense to increase it all by ramping up Navy Training Exercises on the Strand. Helicopter flights down the bay are very noisy and bothersome. The exhaust which we can see coming out of those machines is certainly unhealthy. Increasing their activity is unacceptable. The gunfire we hear with the war games and training is a frightening and bothersome sound for civilians such as ourselves. Please do not increase the amount of gunfire we must hear. I imagine the amphibious craft are gross polluters of the sea as well. While it is admirable that the Navy has participated in the Least Tern preservation efforts, we would like to see efforts towards preservation of clean air, water, and peace and quiet as well. Coronado has grown over the years and has become densely populated with the addition of the Coronado Shores and Cays residential projects. All areas of Coronado, as well as all areas of the southern San Diego bay and coast, are affected by Naval training exercises. Please do not increase any of it, as we are already enduring way too much. Perhaps consider Camp Pendleton as a spot to increase the training exercises. It provides a vast coast and inland area which affects far fewer civilian residents. Thank You

Subject: Air Quality

Comment: As a SBC and active duty member of NSW since 2000, I feel the need to convey some of my concerns. I do sympathize with the balancing act of training our warriors economically, efficiently, and to the standard that our country and NSW warriors require and deserve. I fully understand that our countries security is at stake; however, the amount of training and location of that training must be balanced with the surrounding communities and environment. Many studies have proven that people who live near airports have a much higher than national average of cancer due to all the exhaust and fuel that is released into the air. Under the proposed plans, helo flight hours would increase dramatically certainly affecting the air quality surrounding Imperial Beach and outlaying areas. Camp Pendleton offers large training areas to include military air space, small and heavy weapon ranges, beach access for amphibious operations, ammunition storage, helo landing sites, and various supporting facilities and infrastructure. This area is much larger than the limited area on the strand and there is much more open acreage between San Diego and San Clemente. Although not as convenient to NAB Coronado or the Advanced Training Center, it is close and would meet the "balancing act" that I stated earlier. The impact at Camp Pendleton would be much less felt than here on the strand.

Subject: Noise

Comment: As a SBC and active duty member of NSW since 2000, I feel the need to convey some of my concerns. I do sympathize with the balancing act of training our warriors economically, efficiently, and to the standard that our country and NSW warriors require and rightfully deserve. I fully understand that our countries security is at stake; however, the amount of training and location of that training must be balanced with the surrounding communities and environment. With the proposed increase of helo operations, noise pollution would increase dramatically affecting ALL citizens of Imperial Beach, especially those like myself and our family that live close to the beach and existing training areas. If the amount of helo operations and training that you are proposing already existed, then certainly we would have no right to complain, but we bought our home and have lived here since 2002. We chose to make this our home and to retire here because we like the peacefulness and small town feel of I.B. We enjoy listening to the sound of breaking waves and wildlife, not the sound of helos. If we wanted to hear flight ops all the time, we would have bought our home by the airfield. It is currently 2010 and one plane has flown directly overhead and 3 helos have passed by while I type this. I do not believe it is fair that we should have to suffer through increased noise when other training areas exist that would meet the Navy's NSW training requirements. Camp Pendleton offers large training areas to include military air space, small and heavy weapon ranges, beach access for amphibious operations, ammunition storage, helo landing sites, and various supporting facilities and infrastructure. This area is much larger than the limited area on the strand and there is much more open acreage between San Diego and San Clemente. Although not as convenient to NAB Coronado or the Advanced Training Center, it is close and would meet the "balancing act" that I stated earlier. The impact at Camp Pendleton would be much less felt than here on the strand. My wife and I sincerely hope that you will find alternative training sites that already exist that can handle a larger capacity of training that will not be nearly as detrimental to a small beach community such as I.B. which already faces so many challenges in these tough economic times. Subject: Other

Comment: Although Imperial Beach is an extremely unique small town beach community, we continue to struggle economically for several reasons: Our proximity to the Mexican border and Tijuana, degraded water quality due to runoff and pollution from Mexico, lack of small business infrastructure, school ratings, and past stigmas are just a few of those reasons. Even with all the challenges I.B. faces, we have a lot in our favor, and every year brings more and better change albeit slowly. If you push forward with the proposed increases of training, helo operations, and live fire, you will certainly hinder this city and the people of I.B immensely. This area, and the surrounding area just can't handle the volume of increased training that you are proposing. Property value will be affected and home ownership will decrease. It will be even harder than it already is to attract new families to our town with all the noise and disruption that will certainly be experienced if your training proposals get approved. You currently aren't conducting training in front of the Hotel Del or the area between the hotel and North Island, or even the beaches on North Island, why I.B.? Because we don't hold the clout and financial means as a community that Coronado does? Other training areas already exist that would meet the Navy's NSW training requirements. Spare I.B.

Subject: Air Quality

Comment: Many studies have proven that people who live near airports have a much higher than national average of cancer due to all the exhaust and fuel that is released into the air. Under the proposed plans, helo flight hours would increase dramatically certainly affecting the air quality surrounding Imperial Beach and outlaying areas.

Subject: Environmental Justice

Comment: Again, having been a member of the NSW community since 1990 and a NSW operator since 1994, I have seen a lot. Although the Navy has taken big steps in recent times to address environmental concerns, and as a nation, we have become much more aware of our environment and how our actions affect everything around us, the amount of detrimental effects on the environment along the silver strand training areas will increase drastically. Unused ammo (blanks) get dumped over the side. Food wrappers, MRE packaging, various operating items (550 chord, line, rubber bands, night sticks, etc) all get mixed into the environment. Shell casings, links for the ammunition, fuel oil from the zodiacs, exhaust from the craft and air assets, batteries, etc. Even with the best of intentions, all this is unavoidable. Men get wet, cold, hungry, tired, mentally and physically exhausted, and everything always goes wrong at the worst possible time. Believe me, I know from experience! The precious beaches that encompass and surround these training sites provide endangered habitat and wildlife refuge and the ability to recreate. These species of animals and plants struggle for survival everyday in a world that continues to build and shrink there natural habitat. The noise pollution, air pollution, water pollution, and human pollution that is simply unavoidable during the types of amphibious operations that will be conducted with alarming frequency will only continue to make the environmental concerns bigger. Along with all of these issues, is the simple fact that people live here to enjoy the beach, wildlife, and ocean. Increasing the training that you are proposing does nothing to benefit anyone or anything in I.B or the Silver Strand. Please use training areas that already exist that can better support the large volume of training that you are proposing.

# Questions and Comments on the Silver Strand Training Complex Draft Environmental Impact Statement of January 2010

This was a very long and complex report. I have tried to put my concerns and questions in the order in which they are considered in the IES. There are numerous redundancies of the many issues considered in this report, many without cross reference locations, consequently some of my questions and concerns are also redundant. I have tried to refer to the specific location in the EIS when addressing a concern or question. The questions and concerns presented here apply only to the SSTC-S.

3.1.2.3.2 Beach Activities
How many more activities and restrictions will take place over and above what is done now at SSTC-S?

3.5.1.4.2 & 3.5.1.5.2 Pacific Ocean
Contaminants
Your report states that most of the contamination of the area is cause by sewage from the river mouth and/or the South Bay Ocean outfall. Storm water runoff has a relatively minor influence on local water quality.
Table 3.5-5
Will increased training at SSTC-S cause more contaminates to reach the ocean by storm water runoff. Rain events occur mainly in the winter when ocean currents in the area are north to south. Were seasonal changes in ocean water movement taken into account when the findings on contaminants were formulated?

3.5.1.5.2 Pacific Ocean
Silver Strand State Beach does have day and overnight use numbers that were not included in this report.
I would question the conclusion that the information presented is not representative of the use of the municipal beach in Coronado. The report, in other sections, extrapolated information that was used for conclusions without complete numbers.
Navy recreational areas (Gator Beach and Fiddler's Cove) should not be included as recreational opportunities. They have restricted access and are not open to the general public.

3.6.1.5.2 & 3.6.1.5.3
Will LCACS be used on both Purple 1 and Purple 2?

3.6.1.6
The Navy should also notify residents. The sound of M16's and 50's along with concussion grenades without notice very late at night or early in the morning can lead to apprehension if a person does not know that training is taking place. Explosions and small arms fire are easily detectable from my home, and loud enough to wake me up.

Table 3.6-5 Helicopter Pass-by Sound
It has been my experience that the Helicopters used during training are, during many of the evolutions, closer then stated in the table.

3.6.2.3.1 Traffic on ST-75 (local roads)
Silver Strand Blvd in Imperial Beach leads to the main gate of the South Complex. How much will traffic increase on this residential street? How will this increase in traffic affect the acoustical environment of this residential neighborhood?

3.6.2.3.2
New training activities will increase helicopter use. (TRAP) (N9, Table 2-2)
Disagree with conclusion that noise level will not change. Each flight is a separate event, with individual consequences regarding sound. Weather, temperature, wind direction, and pilot skill all contribute to each event. Suggesting that the helicopters will always be in their assigned flight lanes without data is an assumption. The helicopters get out of their flight lanes many times (personal observation). Training evolutions may have variations that are not foreseen. This fact needs to be taken into consideration when making conclusions. More use equals more sound in the adjacent residential areas.
Citing the ambient sound of the surf supplies no useful data without knowing; the size of the surf, the direction of the swell, the direction and strength of the wind, and the tidal level. None of this information is contained in the table.

3.6.2.3.4 Amphibious Training
Increase from 10,000 to 13,800
LCAC 8 to 40 (increase of 5 times current)
I must disagree with the conclusion. While the average sound during each evolution may not increase the amount of times of discomfort will increase by a factor of 5. (40 instances verses 5 instances). Each time an LCAC lands is an individual event with individual consequences regarding sound Depending on wind conditions I can easily hear the LCACs when they are used on the purple beaches at the north end of the South complex.

3.6.2.3.5 Munitions
Sound generating activities will increase by 48%. How much of this 48% will be at the South complex and at what times of the day or night?

3.6.2.3.7 Summary Alt 1
Finding of no adverse effects. The last paragraph states the sound levels would increase during all days and hours of the week with no notice to residents. I would disagree with the conclusion of no adverse effects. Residential areas will be affected.

3.6.4 Table
Why were no residents of Calla or Citrus Avenues interviewed?

Table 3.6-11 Summary of Effects
Mitigation: Please add notifies residents and local emergency personnel.

3.14.1.4.2 Palm Avenue & 3.14.1.4.3
The description is wrong. To continue West on Palm after the four way stop at 3rd street you must be in the left hand lane. The right hand lane on Palm is right turn only. This causes large backups at times at the four way stop and also makes it very hard to turn left onto Palm from Silver Strand Blvd. Palm Avenue has been restriped for two lanes West of Third street until Seacoast Drive. Rainbow Drive is striped for two lanes.
What counting devices were used and when was traffic counted by SANDAG?

3.14.1.4.4
The entrance to Silver Strand Blvd. from Palm Avenue has changed in the last year. It is now a sharp right hand turn to a narrow road that slowly winds left and widens. Why was no study to measure ADT done by the Navy?

3.14.1.5.2 SSTC-S
The Camp Surf entrance is on the West side of Silver Strand Blvd, half a block from the entrance gate to the Training Complex.

3.14.2.2.2 Ground Transportation
Last paragraph: No data on Silver Strand Blvd. to support conclusion.

3.14.2.3.1
249 trip in means 249 trips out for a total of almost 500. This is a significant increase in traffic on a short residential street.

3.14.3 Mitigation Measures
I would suggest opening the North Gate for groups of over three vehicles to help reduce the approximately 500 daily trips to the South Gate on such a short residential street as Silver Strand Blvd.

4.2.1 Table 4-1
Why does sand need to be removed and relocated? Where is the sand that is removed being relocated?

4.3.6
Sounds associated with redevelopment in Imperial Beach have nothing to do with sounds that come from training activities in the South Complex.

Thank you for considering my suggestions and questions.

Subject: Traffic or Transportation

Comment: I would encourage the EIS to do a more thorough study of the traffic impact on the Silver Strand/Hwy. 75. I read the interview Delphin Lee did with KPBS in which she commented that current traffic is 1% of the throughput there. My address is a "rim" home in the Coronado Cays residential area. Weekdays, I can tell what time it is from the volume/noise of traffic, in spite of double paned windows and two useless "sound walls" along the perimeter of the complex here.

Comment: I believe the residents of Coronado, Imperial Beach and the Silver Strand areas could use more information published or mailed in regard to this EIS study. I ran across terms in online pages regarding the study such as "elevated causeway system", "fluid transfer system", "new platforms and equipment", and "new training". Without knowing what those are, how can we consider the impact they might have? The full pdf document would not download for me, and there are many who cannot access it at all or make it to the public meetings. I hope you will use your resources to make the information we need more available.

Subject: Military Training Activities

Comment: Your comment dropdown list should allow you to comment on several issues since many are interconected. I am VERY MUCH AGAINST the military increasing it's activities and foot print in the silver strand area. If anything they should be considering downsizing and eventually closing the bases since they are incompatible with domestic and social harmony. Any considered activities should be relocated to the Camp Pendelton base due to it's substantial land area and distance from populated locations. Military drones and the removal of personnel from Afganistan and Iraque make this increase in activity unwarrented and unneccesary. As general and president Dwight D Eisenhaur said, "beware the military industrail complex". Increased military activities = increased military contracts= a negative draw on society and the economy. Thank you, Stephen LaPalme

### E.1.63 Barbara Lathrop

San Diego, CA 92132

Re: Silver Strand Training Complex EIS

Dear Mr. Randall

As an owner and resident of the Coronado Cays I would like to express my very serious concerns regarding the proposed increase of training and helicopter flights along the Silver Strand. At present helicopters are flying over the Cays although it was my understanding this was not to happen. With the proposed increase of helicopter flights by 185% this is frightening to me.

The expanded activities will disrupt the lives, well being and sleep of the residents of the Cays considerably unless the paths of travel to and from the training areas are limited to at least 1000 yds off of the ocean and into the bay on the bay side. All residents on the Silver Strand will be affected as well as beach users at the Silver Strand Beach Park, a park used by many all summer. I live halfway between the bay and the ocean and am disturbed by the current helicopters flying now and the proposed night flights and increases will cause great distress and disturbed sleeping that will affect the health and quality of life for us all. The entire Strand is a recreation area used by runners, joggers and bicycle riders and the increased training with the noise and smoke from some of this training will destroy one of the loveliest areas available for these pursuits.

I beseech you to give my requests your consideration to preserve the environment of this beautiful area.

Yours truly,

Barbara Lathrop

Subject: Military Training Activities

Comment: To Whom It May Concern, this is in response to the request to increase training activity along Silver Strand State Beach and IB. While we understand the need to train and perhaps to increase training, many of us do not feel as if the area can sustain the levels of ramped up training you are requesting. This is not a "not in my backyard" issue. This request for increased activity is just plain too much in a relatively small space. There has to be more alternatives and/or a creative way for the Navy to get the training they require (share with Pendleton?) without causing so much potential harm. Quality of life will be severely impacted. Too much noise (often late at night) will cause much disruption to the community which supports you. Beyond that, most are very concerned about the environmental impact. The stretch of beach is very narrow and the many protected species of bird are at risk. Further, the multitude of requested beach landings, more concussion type grenades, more land pollution, and more fuel polluting the water, means there is obvious potential to inflict a lot of damage to the sea life. Please know that we as a community want to continue to support the military. However, the request to increase training to the levels stated is not supported. Many won't state their objection out of fear and feelings of helplessness. So, please consider the community (as we do pay our taxes to support you) when determining what is appropriate.

Naval Facilities Engineering Command, Southwest
ATTN: Mr. Ken Randall – Silver Strand Training Complex EIS
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Mr. Randall:
We attended the presentation in Imperial Beach, February 23. Unfortunately, we had to leave before all the comments had been heard, but we were encouraged to voice our concerns, and here are ours:

Concerns: Traffic on Silver Strand Blv. Leading into the radio station
Noise factor due to increase in the sorties
Number of exercises
Concern for children's safety at Camp Surf.
Height of platforms etc. to be built
Effect on Property values

We have lived in North IB for 20 years - just a few houses from the gate leading to the radio station. We are enjoying an unobstructed view from our balcony from Point Loma to Coronado to Silver Strand, unbelievable sunsets, sound of the surf – peace and tranquility, and we like it that way. Even Camp Surf took care not to disturb the views when they expanded.

We understand the need for training to stay alert. Believe us, we are all for the military- (my husband is a WWII D-Day 13 veteran with the RAF.) But having the peace in this, as yet undiscovered, quiet little town suddenly being disturbed by that huge increase in sorties (up to 2200) , firearms (from 150 to 1400) and training excercises to 5,343 – and in addition the mine-fields, vernal pools, and disruption of the life of endangered species - is a lot to ask of us.

5,343 exercises – There are 365 day a year! So how many a day, month? Time of day? And how many here at beaches white and purple..? Will the helicopters take off from and land close to North end of IB? -

Is it not possible to incorporate the training with the all the area you have now and have had for 60 years.?

Yes, it is nice for our nice young military men to be able to go home to their own beds – but what about us, the residents, who will have our nights and sleep disrupted? And the building of "platforms" - will they obstruct the view?

Children at Camp Surf - Concern for their safety with possible discharged bullet casings, mine debris? not to mention the air pollution from the helicopters.

Effect on property value, with the increased noise and disturbances. Who would want to buy (now) prized beach properties when they will be having the noise of helicopters and machine guns to contend with?

Would suggest that in addition to notifying the fire station and police station of upcoming exercises, why not place a notice in our local paper, The Imperial Beach Eagle with a date ( of course, if that is not a secret) so we will not be concerned when we hear the machine gun fires.

Last but not least, the speed of cars must be controlled on Silver Strand Blvd. There are children, not only in Camp Surf, animals, bicyclist and elderly slow walking People crossing the street. We would like to see a 25 miles zone and a speedbump On Silver Strand Blvd.

You asked for comments, - and we are giving you ours. Not that we expect to get answers to our concerns directly, but perhaps through some of the additional meetings you no doubt will be conducting some of them will be addressed. We hope so.

Thank you for your time.

Sincerely yours,

William + Erna Lockhart

William and Erna Lockhart

## E.1.66 Donna MacKersie

Representing: Private Individual

Organization:

Name: Donna MacKersie

Date: 3/18/2010 11:23:03PM

Subject: Military Training Activities

Comment: I have been a homeowner in/resident of Imperial Beach since 1993, and I am very concerned about the Navy developing the Silver Strand further for military training, killing more flora and fauna in that delicate area, and creating additional noise in Imperial Beach, which is already inundated by helicopter noise. I am aware that some people are impervious to noise, but I am not one of them. Since I've lived in I.B., I've been awakened MANY nights by loud helicopters circling my area, typically around 11-12pm, either Border Patrol or Sheriff agents, searching for illegals or whatever they're doing. Additionally, since, after 40 years as a legal secretary, I have been largely unemployed for the past year and a half and have been spending a lot of time at home during the weekdays, there is a CONSTANT roar of airplane engines that we must suffer through during the daytime hours. I understand that there is value in training near the shoreline, but is it not possible to create training locations in areas where we residents and the flora and fauna of the area will not be negatively affected? What about the vast areas in Otay Mesa -- why not train out there? I feel the same about this as I do about the idiocy of building ANOTHER stadium in downtown San Diego, which is already heavily overcrowded, traffic is impossible, etc., etc. -- why don't they build a stadium in Otay Mesa? It's close to San Diego, and there's a huge amount of space out there, and they wouldn't be wasting oceanfront space and creating additional traffic and noise problems for local residents! I cannot even imagine what the traffic would be like if they built a stadium in the National City beach area as was being considered! I-5 is a nightmare as it is during rush hours -- are these developers really that clueless, or are they only looking for increased income? The attorney promoting building the Chargers stadium says that events there won't conflict with the rush hour -- who does he think he's fooling? Please -- train elsewhere! The Olympic Training Center built in the east where there was space -- certainly the Navy can do likewise. I do not want to have to sell my home and move elsewhere because the noise has become intolerable. Donna MacKersie, 869 5th Street, Imperial Beach, CA 91932

## E.1.67 Zeke Mazur

Since the military requires exclusive use of the beach at certain times; I would like the Union Tribune, on its weather page, to list when the beach is closed.

## E.1.68 Patricia W. McCoy

**March 8, 2010**

Mr. Kent Randall
Naval Facilities Engineering Command Southwest
Code: OPME
2730 McKean St. Bldg. 291
San Diego, CA 92136-5198

Dear Mr. Randall:

Thank you for the opportunity to address issues of concern in the Draft Environmental Impact Statement at the Silver Strand Training Complex.

First, let me state that I do understand the U.S. Navy's need for combat training readiness to accomplish their mission in various arenas around the globe.

However, I do believe there are some items that could be changed enough to make life bearable for people in Imperial Beach, particularly those of us who reside in the northern portions of the city.

We have been good neighbors to the Navy in all the years this base has been operational. Now we are asking you for a small quid pro quo. Since some of the noise related exercises are really not mitigable we would request that you consider an earlier cessation of noise causing events, perhaps to 10:00 P.M. This seems eminently reasonable on a work night. The neighborhoods and your soldiers could be home and in bed at a reasonable hour and would conform to demands as outlined in the DEIS that military personnel not be deployed out of country to do this type of training. Many of us have to be up early for work and some of these workers are employed at North Island.

We had a dog park opened by the Navy under Captain Gianni (now Admiral) for our use but it was taken away and closed. We would ask that this facility be reopened for use when it is inadvisable to use the beach. This way neighbors can exercise their companion animals and have a pleasant place to go.

While you are not expanding the footprint of operations there is concern over the increased intensity of those exercises. The Navy has done a good job with their stewardship of the endangered California Least Tern and the Western Snowy Plover. There is concern for continued viability of these birds due to their habits of beach foraging and nesting, a behavior honed after many thousands of years of developmental evolution. These traits are not changed overnight just because we have a use for their habitat. Protection of vernal pools is essential for the survival of button celery and fairy shrimp. These species may seem unimportant and inconsequential in the scheme of things but I would emphasize that they are indicators of the state of our living environment. The environment is the underpinning of life for all living things including civilian and military alike and the mission of the Navy is to protect not only the civilan population of this country but also the land that sustains us.

As you state in the DEIS, this area is unique and as far as I am concerned it is uniquely beautiful and irreplaceable in its current form. I urge you to go the extra mile to protect the nation's endangered species and avoid a "take" of any of them.

As a former California Coastal Commissioner I have seen well meaning uses degrade and destroy entire ecosystems on which we all rely.

The comment period is all too short for a document ten years in the making. It would be greatly appreciated if the comment period could be extended at least another 45 days to accommodate those who would still like to respond to this eight hundred plus page document.

In conclusion I would like to remind you of the inconsistency of water quality due to sewage contamination particularly in the winter months. I do not like the idea of your young service people working in water whose quality leaves, at times, a lot to be desired. I would suggest you implement a water testing component into the document as part of your operations.

I noticed a deficiency in the document where there is no mention of climate change and sea level rise. I realize this is a NEPA document and it may not cover this topic. I would like to see realistic measures taken to cope with sea level rise. How do you propose to deal with these climate change issues in order to protect our investments at this site?

Thank you again for the chance to respond the SSTC DEIS

Sincerely

Patricia W. McCoy

Comment: I find access to the draft EIS problematic. While the electronic version is available in pdf, it is an extremely large file that takes time to download. Accessibility to the document would be enhanced if it were available in smaller, downloadable files. An excellent example of this is the format used by the Southern California Range Complex EIS website whereby you can search for information by chapter or section. I can dig down to the areas that interest or affect me and not have to wade through the entire, voluminous document.

Subject: Birds

Comment: The Recovery Plan for least terns is old and based on outdated information so there is no valid way to conclude that the additional take by alternatives 1 and 2 will not further jeopardize the species. Can the EIS provide a Species Viability Analysis that reflects current knowledge and cumulative impacts? Alternatives 1 and 2 describe the potential taking of the endangered least tern and snowy plover with the expanded military activity. I understand the law that allows incidental taking of birds during military readiness activity. What specific actions will you take in adaptive management if it is determined that excessive taking of least terns and snowy plovers is occuring? Military training in Alternatives 1 and 2 will produce significant noise impacts that could flush significant numbers of migratory birds in the Bay and along the Strand. As you referenced, this impact is more detrimental to birds naive to noise created by military activity. What adaptive management strategies will you use to study noise effects on migratory birds and make appropriate adjustments to protect birds during the migratory season? I applaud the Navy for their past efforts to protect the endangered least tern and snowy plover. However, I am not convinced that the proposed Alternatives 1 and 2 will adequate protect these species.

Subject: Environmental Justice

Comment: I am not convinced that the proposed increased military training activity in SSTC-S in Alternatives 1 and 2 does not raise the question of environmental justice for the City of Imperial Beach. As you indicated, this community has more poverty, 16.8% of persons living below the poverty line compared to 7.6% for the City of Coronado and 11.3% for San Diego County. Imperial Beach also has a higher % of Hispanics (43.9%) compared to Coronado (13.1%) and the County (29.9%). This community will experience more noise related to the military training activity with Alternatives 1 and 2.

Subject: Other

Comment: 4.3.3.1 Global Climate Change Table 4-3: Greenhouse Gas Emissions describes a doubling of emissions in tons/year with either Alternatives 1 and 2. The Secretary of the Navy has established several goals for the Navy's consumptions of fossil fuels with hybrid vehicles by 2015 and alternative energy sources including wind and solar by 2020. Alternative 1 and 2 will increase CO2 emissions by 60,554 tons/year. Why can't this EIS describe specific actions at SSTC, NASNI and NAB to offer at least 50% offsets in alternative and renewable energy for Alternatives 1 and 2?

Subject: Other
Comment: 6.2 Relationship between short-term and long-term productivity. The EIS describes military activities in Alternatives 1 and 2 as long-term. Does this mean these areas will be needed for decades? What if our need for military readiness declines in 5 or 10 years and peace breaks out? What adaptive management procedures will be undertaken to restore lost habitat and species impacted by this military activity? I endorse the No Action alternative and urge the Navy to reconsider the use of the vast Camp Pendleton site for this surge period of training.

Comment: Growing up in San Diego just before and during the Second World War and living in San Diego, Coronado and Imperial Beach allows for a perspective on this ribbon of sand known as the Silver Strand. I lived in the Coronado Shores for over ten years and looked out on the Strand many times each day. Being in Imperial Beach for the past fifteen years I have been up and down the Strand countless times, mostly driving, but occasionally on foot. This site is world class – sun, warmth, light, open space, mild climate, ocean breezes, ocean, beautiful beaches, harbor, blue skies, aquatic activities – you name it. Housing, lodging and recreational facilities and military activities existing alongside habitat preservation and restoration makes for a unique combination that has been developed over the decades and cannot be found anywhere else. However, walking from North Island all the way to Camp Surf in Imperial Beach it is obvious that this narrow spit of sand is past the saturation point and cannot tolerate more human activity without there being a wholesale change of character. This area is overwhelmed by traffic, military, civilian and recreational activities and plainly, to me, has passed the tipping point. Sincerely, Robert E. Miller

Comment: While everyone should be concerned about all the items on the subject list, we also should be aware that the Navy has always been a good neighbor in Coronado and tries it's best not to disrupt people's lives or the habitat more than is absolutely necessary. Coronado is a Navy town and we should be happy and proud the Navy is so prominent in our community. Some citizens may be inconvenienced by heavy traffic for a few hours each day and there may be some impact on the beaches or the birds, but it's a small price to pay for the freedom we enjoy from having a highly trained military force. We're in two wars at the moment and there is a need to train more troops..so we all need to let the Navy get on with their hard work. I know many of our neighbors who don't feel comfortable commenting publicly share our thoughts. We're behind the Navy and it's fine training operation 100%.

Comment: As a resident in the Coronado Cays, and a retired USNR officer previously stationed on a DDR in San Diego in 1953. My new bride and I rented in Coronado during that period and decided at that time that Coronado would be our eventual retirement location. Since 1997 we have been fortunate to be living that dream. The news of the Navy's plans to impact our paradise in such a huge way comes as a great shock and disappointment to us. We have always been happy with the thoughtful and considerate presence of the US Navy in our beautiful community of Coronado. I must point out, however, that the aircraft passing overhead on their landing approach to North Island Naval Air Station does result in noticeable pollution in the air we breathe as well as the layer of fuel and exhaust deposited on our community as the aircraft pass overhead. This, when multiplied as a result of the proposed large increase in air traffic over our area will certainly result in considerably aggravated detrimental healh impact to our citizens. And, as Coronado and the Coronado Cays populations are made up of many retirees, the health impact would undoubtedly be even greater. And, of course, the added noise pollution must not be overlooked. With regard to the EIR, I would respectfully request that my concerns be received with consideration and the good Navy neighbor policy which has been appreciated over the years. Let me conclude by suggesting that a location for such a large amount of air traffic should take place in largly unpopulated areas such as the Marine Base at Camp Pendleton, and other such underpopulated areas. Sincerely, Roland Moritz

Naval Facilities Engineering Command,Southwest.
Attn.: Mr. Ken Randall-
Silver Strand Training Complex EIS,
1120 Pacific Highway,Building 1,5th. floor,
San Diego,CA.92132

Dear Mr. Randall:

I live in Montego 4,at the Cays,just in front of the ocean
I am 80 years old and my wife is 70.
I worked hard for my weekly check until I was 72.My wife did the same. and now our golden years are plagued by the excessive
noise of the helicopters that deprive me to sleep , and the intrusive black dust that keeps my wife obsessed with cleanliness
Now to crown the situation,comes your 10 years in the making draft: Lets occupy the rest of the open spaces; lets go from 700
flies to over 2,000...
I understand the frustrations of the Ministry of Defense with the uncertain results of the regular troops after many years of war
in Irak and Afghanistan.I understand that with strategic attacks with drones and tough professional Seals,we could obtain
better results...

BUT, TO PROTECT ME YOU WANT TO MAKE MY LIFE MORE IMPOSSIBLE TO LIVE ??

In my working life,I invented a motto that hanged in my office and showed to any big shot that disagreed with a position I took:

" LOGIC SHOULD SUPERSEDE AUTHORITY "

I wish you or your superiors could read it today and think about it...

Hopping for a positive replay,

Respectfully,

Omar Nicieza

Naval Facilities Engineering Command
Attn: Mr. Kent Randall
Silver Strand Training Complex EIS
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Dear Mr. Randall,

I am a resident of Coronado and have lived in Coronado Shores for 26 years.

I recently learned that the Department of the Navy is planning to increase the levels of training at the Silver Strand Training Center. Our family hears the training that goes on throughout the year. It is already loud and obtrusive. We live under a flight path that has substantially raised its activities in recent years. Planes and now helicopters not only fly more often, they fly closer to our buildings at all hours of day and night. In the past, planes flew out further over the ocean instead of buzzing close to our residences.

To discover that you are proposing to increase training from 3926 annual activities to 5543, helicopter sorties from 800 to 2200, and firearm discharges from 150 to 1400, the noise will further disrupt peaceful living. Helicopter noise is grating on the nerves and you are expanding their sorties by nearly two-thirds.

I understand that we share Coronado island. The Navy has to take into account that you operate around civilians who live in Coronado. So your sensitivity to our home life is of utmost importance. The Navy has many facilities around the country. So if you choose to expand your training in a residential neighborhood, you must look out for the residents.

I hope you will come up with a solution that includes flying planes and helicopters further out over the ocean when training and landing as well as designing your training schedule and location to be as least intrusive as possible.

We hope for some semblance of peace and quiet in our home and neighborhood. You are the one to make sure this happens.

Sincerely,

Deirdra Price

Expansion of Training Activities along the Silver Strand, Coronado

Dear Sir,

This family fully supports the expansion program which we have seen in the local newspapers and as received in a separate mailing to our home.

We have lived at the Coronado Shores with a unit facing the beach/ocean for many years and have nothing but respect and support for the training that goes on for the Navy Seals and associated military activities both in the ocean and on the strand.

We also would point out that those who bought property or otherwise decided to live in the area were fully cognizant of the presence and importance of the military training and associated activities in this area and do not feel that their complaints are justified.

Feel free to use/present this letter in any hearings or reviews that may be underway.

Respectfully,

Edgar A. Sack

The Sack Family

ATTN: Mr. Kent Randall – Silver Strand Training Complex EIS

Dear Naval Facilities, et al,

We have major concerns about the proposed expansion of increased training activity along the Silver Strand. Increasing the helicopter sorties from 778 per year to 2,200 is unacceptable. The helicopters make a significant noise when they pass anywhere near our home. We do not want to live under the conditions occurring around Ream Field. We looked at homes by the Tijuana Estuary in Imperial Beach before we purchased our home in March 1991. Homes in that area are significantly cheaper than the one we purchased because the helicopter noise is intolerable for most people. Our quality of life, health & financial situation would be decreased 100% if sorties were increased to the degree stated.

The endangered species living on the bay need to be protected in order to continue to exist on this earth. The Navy should respect that. Another consideration is the amount of noise firearm discharges create. We are sometimes awakened at night by that noise. It seems that the Navy wants to take over most of the area not already inhabited by animals and people. We agree that training our military is important but it should not be at the expense of the quality of life of those of us who live near by. Please consider protecting endangered species including humans by scaling back the training sites, helicopter sorties and firearm discharges. Let's create an environment in which we can live together as good neighbors.

Very truly yours,

Ray Saez

**15 THE POINT**

**CORONADO, CA 92118**

March 23, 2010

NAVAL FACILITIES ENGINEERING

COMMAND, SOUTHWEST

Attn: Mr. Kent Randall

Silver Strand Training Complex EIS

1220 Pacific Highway

Bldg. 1, 5th Floor

San Diego, CA 92132

Dear Mr. Randall:

I have reviewed the EIS regarding the USN's proposal to intensify training along the Silver Strand. I excerpted the following two paragraphs as follows:

*Alternative 1, the Navy's preferred alternative, is designed to meet Navy and Department of Defense (DoD) current and near-term operational training requirements. It meets the selection criteria listed in Section 2.1.2. Under Alternative 1, the Navy would increase the tempo of training, introduce new platforms and systems into training, conduct existing routine training at additional locations within SSTC training areas, introduce new platforms and equipment, and increase access and availability to SSTC training areas. The tempo of training would be increased to meet 100 percent of Navy NTA requirements. This represents an increase from the baseline tempo of 3,926 activities to approximately 5,543 activities annually. New platforms and equipment would include replacement of Amphibious Assault Vehicles with Expeditionary Fighting Vehicles, an updated Offshore Petroleum Discharge System, and the MH-60R/SSeahawk Multi-Mission helicopter.*

*SSTC is located in a populated coastal area, and its use for realistic military training is constrained by adjacent residential, commercial, recreational, cultural, and sensitive natural resource uses. As part of the Navy's commitment to sustainable use of resources and environmental stewardship, the Navy incorporates measures that are protective of the environment into all of its activities. These include employment of best management practices, standard operating procedures, adoption of conservation recommendations, and other measures that mitigate the impacts of Navy activities on the environment.*

NFEC,SW
March 23, 2010
Page Two

*Some of these measures are generally applicable and others are designed to apply to certain geographic areas during certain times of year and for specific types of Navy training. Mitigation measures covering habitats and species occurring in the SSTC have been developed through various environmental analyses conducted by the Navy for land and sea ranges and adjacent coastal waters. These mitigation measures are issued to units and commands participating in an exercise.*

The EIS is long and detailed. Therefore, I stopped incorporating salient passages. The report itself states that the impact of alternative two is not substantially different than the impact of the first alternative.

While the law requires a lengthy and detailed EIS, common sense does not. The report's brief description of the adjoining areas says it all. The populated coastal area simply cannot support more than fifteen hundred additional sorties and deafening helicopter flights. The children (mostly military family kids) at the Strand Elementary School will be unable to concentrate on their studies and may likely suffer hearing impairment. The families in military housing will equally suffer from increased noise levels. Motorists will be increasingly distracted by the sorties on the beach leading to a possible increase in vehicle accidents.

An increase in the demise of wildlife seems to have been written off as "friendly fire." Exactly how many birds and sea life are expendable? Do we have a ratio demonstrating how many human lives will be spared as a result of increasing the intensity of training at the expense of wildlife?

Is the USN expecting to increase the number of recruits to be trained at the location? It appears the number of recruits is limited by demographics and the lack of a draft. The peninsula-type geography of the area limits the number of recruits who can be run through any program. The Navy Seal Program is reported to have a 2/3 "dropout rate." It appears the Navy Seal training program is sufficiently difficult.

Common sense dictates this expansion should not be approved.

Very truly yours,

Elizabeth Schulman

Subject: Military Training Activities

Comment: The requirements of properly training sailors for future missions in support of our country's strategic goals cannot be subjugated to the voices of a relatively small group of people who complain about potential negative effects on marine life, noise pollution and other potential effects of increased training but in fact this group only looks out for it's own selfish interests, i.e., their over-valued coastal properties. I lived in Coronado from 1969 until 2003. "New Money" moved into Coronado in the early 80s and since then various actors have incessantly complained about the Navy and how the Navy is inconveniently disturbing their tranquility; after all, these folks paid dearly for their homes on Ocean Blvd and Coronado Avenue and they conveniently forgot about the monument at Sunset Part at Gate 5 of North Island that says the Navy's first Navy Flying School was established around 1915 at North Island. Huh, so the Navy was there first eh? The Navy bends over backwards to maintain harmony with nature and the Snowy Plover and California Least Tern are direct benefactors of Navy determination to conserve nature. Hell, if it weren't for Camp Pendleton, the Greater Southern California Megalopolis would extend from Ventura County to Tijuana. The increased training activities and concomitant construction in support of this are critical to national security and we as a people owe a debt of gratitude to the U.S. Navy.

Organization:
Name: Robert Shugert
Date: 3/2/2010 9:27:02AM
Subject: Noise

Comment: I live in the Coronado Cays. I served 5 years in the US. Air Force and 5 years in the National Guard and I strongly support our Military including the U.S. Navy, U.S. Army and Marines that will be involved in increased military training in the adjacent area to my home. I am concerned about the increased helicopter noise that will result from the sunstanial increase in "sorties" down the south bay and over my home. I have "learned to live with the present noise" , but to increase it by ten times would certaintly impact my life style as well as potentially lowering the value of not only my home but the 1200 homes that exists in the Coronado Cays. I hope that when training that involves helicopters will be limited to day time hours and that the flyway be either out over the ocean or down the middle of south bay. Thank you for your consideration.

## E.1.88 Marie Simovich

Subject: Terrestrial Plants or Animals

Comment: My comments focus on vernal pools and particularly Branchinecta sandiegonensis. 3.11.1.4.2 Please use current references from the primary literature. This section is poorly referenced and does not reflect a current and solid understanding of the subject. Give details of the vernal pool surveys that were done in reference to B. sandiegonensis including number of pools surveyed, whether surveys were both wet and dry as required by the US Fish and Wildlife Service, the density of cysts in pools, the number of seasons surveyed, the number of fillings surveyed etc. 5.10 The mitigation section lacks sufficient details to evaluate. 5.10.5 Foot traffic should be severely restricted. Any path can result in altered hydrology and potential pool drainage. Population surveys should be done more frequently than every five years. Plans should include modifications for dry years. Populations should be evaluated for viability and increasing or decreasing population reproduction via both live animals and the cyst bank. Other floral and faunal elements should be monitored. The full crustacean community should be evaluated for richness and composition and this should be included in restoration, mitigation, monitoring and criteria for success plans. Efforts should focus on maintaining not only viable populating of fairy shrimp, but a vernal pool community with species diversity appropriate for the area.

## E.1.89 Kent Smith

Representing: Private Individual

Subject: Geology and Soils

Comment: I have reviewed many of the outlines for and against the increased use of the Silver Strand beach for training. My opinion is undecided because there are many positives and negatives to both sides of this important and relatively permanent decision. I am concerned that no mention has been made of the fact that there are underground tunnels or observation pits that were put in place 30 years ago that may still exist between the shoreline and the roadway. These should be included in any analysis of the environmental impact. As a frequent user of that beach when it more available to the public there were two occasions when I noticed military personnel observing the ocean and beach from ground locations that had to enjoy at least six feet of excavation for it to occur. It is unlikely that these structures (if they still exist) would pose a challenge to the type of wildlife in question but a total lack of mention in an environmental impact statement is not appropriate.

Subject: Noise

Comment: I previously lived in a beach community when the Navy upped fighter jet training flights during the war in Vietnam at a nearby Naval air station. Complaints were many and frequent, but were silenced when the CO hung a wall banner facing the residential area which was most vocal. It read, PARDON OUR NOISE; IT IS THE SOUND OF FREEDOM. That is applicable here and now, as well as a like comment re beaches and bird sanctuaries - the Navy was here first and used these beaches unfettered long ago.

### E.1.93 Kimberly Tolles

Representing: Private Individual

Organization:

Name: Kimberly Tolles

Date: 3/29/2010 4:07:39PM

Subject: Noise

Comment: As a 20-year resident of Coronado and homeowner in the Coronado Cays (and currently homeowners association board member), I am extremely concerned about the Navy's training complex proposal from the point of view of increased noise, increased numbers of aircraft, more air fuel pollution than we alreacy get, live fire next to homes and public beaches and nighttime activities. I felt the Navy's presentation before the Coronado Cays Homeowners Association Board understated the potential changes represented by this plan to the point of possibly being untruthful. I agree completely with the concerns expressed in the City of Coronado's letter and with the letter from the City of Imperial Beach. Training activities are necessary, of course, and have always been conducted in our extremely small community but to increase them to the extent proposed by the Navy amounts to reckless public endangerment.

### E.1.95 Normandie Trovato-Wilson

There are a lot of complex factors in play when it comes to evaluating the impact this will have on endangered and threatened species. Of my particular concern is the training in the vernal pools. 90% of California's vernal pools have been destroyed due to development. I believe the Navy is committed to maintaining environmental integrity at the Silver Strand complex-however, protecting a vernal pool is not as simple as erecting a barrier around a WSP nest. There are hundreds, if not thousands, of species that coexist within vernal pools and it seems impossible to predict the effects that training in the vernal pools would have upon these species, including the endangered San Diego Fairy Shrimp. Extinction, and the loss of these sensitive habitats, is forever. Also of special concern is the fact that the California least tern is still in decline and there seems to be little explanation as to why, and there is no species recovery plan for the terns. More information needs to be gathered about the Least Terns and the Western Snowy Plovers- especially information on how the species are doing from Oceanside all the way to the border- before making a choice about the use of the 3 shipping lanes during the breeding season. There seems to be little to no mention of mitigation within the current EIS, which is also concerning. In addition, there is no mention of returning to the current state of use should Navy training levels decrease in the future. I realize the Navy is not predicting such a reduction, but there should be a stipulation that should Navy training levels decrease in the future, that the use of the land would revert to the way it is now, should the Navy end up going with Alternative #1. I compliment the Navy on their commitment to environmental stewardship. It is refreshing to see the military take such a stand for environmental integrity. It gives me hope. Ultimately, there is very little way to predict the effects that these changes would have on the WSP and the California Least Tern and until more answers are provided as to these species' progress, it seems hasty to change while these species are still making efforts to recover. A solution could be to gradually phase in these changes over the next 1-5 years and chart the progress of the endangered species. An alternative for the vernal pool training would be to conduct some training around/in a vernal pool which is in poor condition, and chart the effects (weeds, etc) of foot traffic around the vernal pools. This would also provide the Navy with time to figure out mitigation measures for the use of the vernal pools and test solutions for the inevitable problems and imbalances in the ecosystem which will result once foot traffic is allowed in the vernal pools. Thank you for reading my statement.

RE:

SILVER STRAND TRAINING COMPLEX EIS

I WOULD LIKE TO SUPPORT PROPOSED NAVAL TRAINING ENHANCEMENTS ALONG THE SILVER STRAND COASTLINE OF SAN DIEGO. FAR TOO MANY OF OUR NATIONS TRAINING RESOURCES ARE COMPROMIZED BECAUSE OF PUBLIC STUPIDITY IN PURCHASING RESIDENTIAL PROPERTIES IN AREAS DESIGNATED FOR MILITARY USE. WHEN OUR COUNTRY IS AT WAR IT IS NECESSARY FOR OUR TROOPS TO TRAIN AS MUCH AS POSSIBLE FOR SAFETY'S SAKE. WAR DOES NOT RUN FROM 8-5, AND THERE ARE OBVIOUS REASONS WHY TRAINING AT NIGHT OR ON WEEKENDS IS REQUIRED. THE NAVY HAS OBSERVED HIGH STANDARDS OF HAZARDOUS MATERIALS MANAGEMENT. BEACH ACCESS IS AVAILABLE TO THE PUBLIC IN NUMEROUS ALTERNATIVE AREAS - OUR COASTAL COMMISSION ASSURES THIS. THE ADDITIONAL TRAFFIC & NOISE ASSOCIATED WITH NAVY TRAINING FOR A NATION AT WAR SHOULD BE REGARDED AS AN ACCEPTABLE CONSEQUENCE FOR PROVIDING TRAINING THAT COULD SAVE LIVES.

Dear Sirs:

We are responding to the article in the Union Tribune concerning the possible increase in the number of sorties being proposed by the navy. We sincerely hope that you will listen to our concerns.

We live in Point Loma and have been greatly concerned over the increase in helicopter and fighter jet noise. The possibility of vastly increasing the number of sorties is unacceptable to us.

We recognize the necessity for properly trained troops and we certainly appreciate what our troops do for us. But before you increase the level of noise and vibration in our neighborhood we would like some facts. You stated in the article that the recent number of sorties has been at 700+ in the past year. How many sorties were practiced in 2008 and 2007? Our guess and fear is that the number of sorties has been increasing continually over recent years.

We certainly agree that naval troops must be properly trained, but we also want the navy to continue to be good neighbors with our community. To that end, we oppose any increase in the number of sorties in Imperial Beach, Coronado, and Point Loma.

Thank you for listening. We look forward to hearing from you.

Sincerely,

Susan J. Weddle
Monte R Weddle

Comment: My wife and I have visited your area and think the strand is very nice. However, we really think military needs (as in SEAL training) must come first. We would love for our SEALS to use the strand as much as they need to for training. Keep in mind that the military is the only reason we enjoy the freedoms we do.

Naval Engineering Command Southwest
Attn: Mr. Kent Randall
Silver Strand Training Complex EIS
1220 Pacific Highway
Building 1, 5th. Floor
San Diego, Ca 92132

Dear Mr. Randall:

I have lived at 154 Calla Ave Imperial Beach since 1962. I have invested a lot to improve my home. My bedroom windows overlook the Silver Strand Training Center. In all those years I have enjoyed the view and the quiet. Occasionally the navy would use the beach for landing boats and men or for running on the beach. But until the last year or so, I haven't heard gunfire, explosions, or frequent helicopters.

Now I understand the navy intends to increase the intrusive noise events. Intrusive noise events will destroy the peace of our neighborhood. Please reconsider and move the noisy training to Camp Pendleton where there is no peaceful neighborhood to destroy.

Sincerely,

Karen S. Wright

Subject: Traffic or Transportation

Comment: Comments on Silver Strand Training Complex I live right next to the entrance of the Training Complex. One problem that only happens when it rains is the storm drain (It makes a 90 degree turn just to the east of the guard bldg.) and it gets plugged up and is insufficient to handle the water flow. It backs up, floods and makes a small pond then runs over your entrance road. But, the main problem these past number of years is the speed / traffic when vehicles enter or depart the base gates. I have spoken with many of my neighbors and we have contacted the city of Imperial Beach. They have used a mobil speed detector machine on occasion. But, we would like you to consider more permanent and enforceable options. A few suggestions are: 1) There is a Stop sign when exiting the base, but no one uses it. There is a speed bump when exiting the base, but anyone driving fast out of there just bottoms out a bit and continues on at a fast speed. If you would require all exiting traffic to stop at the stop sign, then cars would not be at such a high speed as they leave the base. 2) Neighbors have suggested installing a Stop sign at Silver Strand Blvd. and Carnation Ave. 3) Neighbors have suggested installing at least two speed bumps, maybe three along Silver Strand Blvd. 4) Install 25 mph speed signs. 5) Install a Pedestrian crossing that requires drivers to stop. Drivers race down the street, because they like to drive fast, they are late, or they are trying to beat the automatic gate when they see someone ahead of them already has the gate open. And this is specifically for my situation. I drive a small car and when I back out of my driveway, I cannot see down the street when there are cars parked in front of my neighbors. (There are usually vans, suvs, or large trucks.) If I am lucky I can see a little 2 foot opening between the vehicles and I sit and watch that opening to see if anything passes in front of it. But, lately there haven't even been any of those openings. In addition, I have to look towards the inside of the base to see if any vehicles are driving down the road to exit, because I know they will not stop at the stop sign. Then there is the driveway for Camp Surf right across the street, (they should put up stop sign also), because during their busy season their guests just pull out without looking to see if anyone is exiting the navy base. So, I am trying to monitor three different directions without having a clear view. Sometimes, the only thing I can do is look at the guard to see if he is looking down the street or getting up, because, then I know a vehicle is coming from at least one direction. 6) I was wondering if you could install a convex mirror outside of the base that shows oncoming traffic on Silver Strand Blvd. that I would be able to use. I know this is not really your concern, but I am afraid with increased traffic due to your plans, the odds of me making it out of my driveway without getting hit are getting worse for me. Thank you for considering my comments on your future plans.

Subject: Traffic or Transportation

Comment: I attended the Public Hearings Open House in Imperial Beach. Thank you for providing this opportunity for one-on-one discussions with representatives who could offer clarification on various topics. I spent most of my time at the Community Interests desk talking about traffic safety on Silver Strand Blvd. leading up to the entrance of the complex. They suggested that I write additional comments or suggestions. First off one of the representatives mentioned that they were uninformed about the complaints that many neighborhood residents have voiced about the speeding drag racing and problems pulling out of driveways or side streets when on-street parking blocks a clear view of oncoming traffic. Some of these problems were brought to the attention of Imperial Beach traffic control. In the past (though not for a number of years) an electronic traffic monitoring machine was placed on our street to remind drivers to slow down. I know of one time when a traffic ticket was issued but heard that it was thrown out of court as "entrapment". As part of your review, I'm guessing that you've asked the city of Imperial Beach to share any information gathered over the past seven years. I was also told that there are "warrants" that a situation must meet in order to be able to install anything from a speed limit sign to a stop sign to any other traffic control measure. Examples given were things like numbers of tickets issued, numbers of accidents, numbers of complaints, numbers of deaths. But the problem with those limitations is that after a flurry of complaints by neighbors especially about the speeding problem, nothing lasting was done to address this ongoing situation and it seemed pointless to email or call or leave another message with the City and no messages were ever responded to after calling and leaving a message at the phone number listed on the sign at the Training Complex entrance. Another problem that comes up is who has jurisdiction over street safety issues. I believe the west side of the street at Camp Surf might belong to Coronado and the rest of the street is the responsibility of Imperial Beach. It would benefit the neighborhood if all three parties including the Navy would join together to try and address residents' concerns. I have a feeling that many people who have complained about the traffic in the past have not taken part in this "Comment" opportunity. It would serve community relations if additional outreach was attempted. I suggest that you ask the city of Imperial Beach to set up the electronic message board on Silver Strand Blvd. closer to Palm Avenue so that the people coming out of the other side streets will see it. If you flashed a message: "Traffic safety issues? Please comment here or visit www.silverstrandtrainingcompleseis.com." And then provide a drop box and blank comment forms right next to the sign. I have seen parents with young children crossing Silver Strand Blvd. on there way to the school just around the corner. They do not always go down to the corner crosswalk, because there is a little parkway next to the El Tapatio Restaurant that is a shortcut. In my previous comments I submitted I listed "pedestrian crosswalks" (maybe like the kind with signs that are on Seacoast Drive?) Another traffic issue is pulling out onto Palm Ave. from Silver Strand Blvd. It seems that there were more street parking spots added on Palm which can cut down on visibility to see oncoming traffic. There are stop signs at 3rd and to the west on Palm Ave. at the corner of the 2nd. With planned increase in traffic for the Complex it would help if you would consider a traffic light or a three-way stop at the corner of Palm and Silver Strand Blvd. If all else fails and Silver Strand Blvd. does not meet the "warrants" to take any traffic control actions, I suggest that the Navy consider using temporary signs. In the past I have spoken to some of the trainers who work at the complex. They told me that every time a new group comes in to start training, they give a speech about speeding and other traffic do's and don'ts when traveling through this neighborhood, but that the majority of participants are young and full of fire and will on occasion disregard these warnings. Maybe at the beginning of each training period a set of temporary signs could be used on the exiting side of the street. Example: First and foremost an enforced "STOP" sign before exiting the base. Then a "25 mph" speed limit sign. Then a friendly reminder that you are driving through a "Neighborhood". I have run out of room on this form and will finish my comments on another form.

Comment: continuing my comments from previous comment form ID # 8-650-1 ... But, the problem with this is it doesn't address cars coming into the base or problems with visibility for residents to pull out of side streets or their driveways when you're not sure how fast a car might be coming down the road. Also, if the warrants are not met for street signs etc. then maybe the Navy could install signs like those listed above on their property before the exit gate, then you wouldn't have to meet the warrants? My last suggestion is that you check the schedule for planned complex activities, then come down and sit in your car on our street and see for yourself. The street is not always busy, but traffic is heaviest in the a.m. as trainers and participants are arriving or later when leaving after a training exercise. This visit would not take into consideration the after hours traffic throughout the night or over the weekends. Thank you in advance for at least considering these issues and concerns. I'm hoping that this time some discernible action will be taken to alleviate some of the unsafe traffic situations.

## E.2 COMMENTS FROM ORGANIZATIONS

The comments in this section were received in written form by organizations, agencies, tribes and individuals

### E.2.1 Airport Trust

LEON E. CAMPBELL
ATTORNEY AT LAW

Naval Facilities Engineering Command
Southwest
Attn: Mr. Kent Randall-Silver Strand
Training Complex EIS
1220 Pacific Hwy, Building 1, 5th Floor
San Diego, CA 92132

Dear Mr. Randall:

I represent Donald W. Rogers, Trustee of the Airport Trust, a private trust which has the proprietary interest in an exclusive license under Patent No. US 7,469,859 B1. The patent was issued on December 30, 2008 and describes an airport design having three 12,000 foot runways, a 2,000 acre footprint, two levels surrounded by water, access to the shore by underwater tubes and located in South San Diego Bay.

Enclosed are (1) Aerial photograph of the bay with the airport superimposed; (2) Description of Proposed Airport dated February, 2010; and (3) Copy of patent.

The site of the airport has been carefully selected to avoid interference with marine traffic, habitats, other air traffic and is outside the amphibious base security zone.

The trustee welcomes the expanded use of the Silver Strand provided it does not conflict with the proposed airport. At this time no conflict is apparent except amphibious operations within the bay which would involve water area within the boundaries of the airport.

The proposed airport includes a second entrance to the bay, as shown in the photograph. The advantages are discussed in the description. Such advantages include its use for military vessels. The second entrance is not essential for the proposed airport, but would have beneficial effect to the area, including environmental benefits.

Over 50 years have been spent and recently over $17 million in a futile effort to find an alternate airport site to Lindbergh Field which will reach its capacity circa 2020 with no room to expand with any additional runways. The proposed airport is the *only* feasible solution.

It is requested that any expanded use be consistent with the proposed airport.

Sincerely,

LEON E. CAMPBELL

### E.2.2 California American Water

CALIFORNIA
AMERICAN WATER

Mr. Kent Randall
Naval Facilities Engineering, Southwest
Silver Strand Training Complex, EIS
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Dear Mr. Randall,

I recently read in the San Diego Union-Tribune, the Monday, Februrary 22nd edition, that the Navy is utilizing a larger amount of the property on the Silver Strand Training Complex and will be having a larger footprint of operations at that site. I would like to remind those of you responsible for this property that California American Water Company has a 16" cast iron water main that traverses the base from the south end to the north end of it. This main provides a connection between Imperial Beach and Coronado, feeding the Coronado Cays along with the Navy Base. This main was installed in 1912 and has been in continuous service since then. I would make you aware of this critical main so that you always take into consideration the location of the main when you make plans to install new infrastructure on the base. Last year at the very north end of the base there was some sort of large poly-ethylene pipeline bored from the road to the Pacific ocean. It was bored in very near proximity to our 16" main and I believe we all dodged a bullet when that main was not damaged. Also, there are a number of vehicles parked in the same area near the fence along Hwy 75 on a day to day basis that are adjacent to two air/vaccum valves we have on the 16" main. I would hope that the vehicles never hit one of those valves and knock them off as it would create a bit of damage and cause us to shut down the 16" main which would put the base out of water and create a low pressure issue in the Coronado Cays. Thank you for your consideration with regards to my comments.

Re: Coastal Commission Staff Comments, U.S. Navy Draft EIS for the Silver Strand Training Complex (STCC)

Dear Mr. Randall:

Thank you for the opportunity to comment on this DEIS. We agree with the Navy that the proposed expansion of training at the STCC will affect coastal zone resources, and we appreciate that the DEIS states that the Navy will submit a consistency determination for these activities. Please consider these comments in preparing your consistency determination.

Our most significant concerns are: (1) overall increases in noise levels from the large increase in levels of training activities, and in particular, the effects of such noise on habitat and public recreation; (2) expansion of training into currently protected sensitive habitat areas, in particular: (a) least tern and snowy plover nesting areas in Boat Lanes 8-10 in STCC-North (which are currently off limits to training during the nesting season); and (b) vernal pools in STCC-South; and (3) the proposal to limit the number of plover nests to be protected to no more than 22 nests. Despite the length of the document, it remains unclear as to why these decisions have been made and how decision criteria will be analyzed to determine whether such training is needed in these areas.

The Navy has narrowly construed the available alternatives being considered, in terms of those brought forth in the final analysis. The extensive increases in loud activities warrants serious consideration of conducting at least some of them, including the more intrusive ones, in less heavily populated areas, for both social and resource protection reasons. If the Navy does proceed as proposed, it will need to provide a more detailed and compelling explanation to establish that there are no available less damaging alternatives. We understand the concept of keeping training near the home base, but given that Camp Pendleton is within the same county, a clearer explanation is needed for dismissal of use of this site for the activities proposed in sensitive areas. Stating it is rejected based on the need to "achieve training tempo requirements" does not provide the reviewer with any information with which to assess this assertion.

DEIS Comments
Navy SSTC
Page 2

We understand that decision-criteria were used and are listed in the DEIS (on page 2-1). However the analysis explaining why the criteria are applied in certain situations (e.g., a statement on page 2-2 is that relocating some activities to STCC-S would conflict with criteria 2 and 6) is not provided. Also, we note that page ES-5 states the Navy bases its need projections on models of future exercises. While we inherently support and understand the Navy's need to train, without the modeling assumptions and additional information, it is difficult to weigh future training needs against environmental and social impacts.

Given that the Navy is proposing a significant expansion of training, which will increase conflicts with habitat protection, it would appear that listed species such as snowy plovers and least terns warrant *increased* protection, whereas the DEIS appears to be proposing simply to maintain the status quo (at least with respect to the number of snowy plover nests). We would argue that the increase in activities in Boat Lanes 1-7 would seem to make it all the *more* imperative that these species have an area set aside (during the nesting season) and left undisturbed.

Alternatives eliminated from further consideration include training at locations other than the STCC. It is not clear why proposed training in Boat Lanes 8-10 during the nesting season, which the Navy estimates (based on its models) to occur approximately 24 times/year, could not be relocated to Camp Pendleton, or why Camp Pendleton beaches could not "provide a realistic training environment that simulates real world littoral combat conditions."

The criteria provided by the Navy (DEIS, page 2-34) indicate these Boat Lanes would be used either: (a) when other suitable lanes are occupied, or (b) "if [lane] attributes make them more suitable for meeting training needs than other available training lanes." Examples of such attributes include beach topographic conditions, distance from other training locations, and a need for diversity in training locations. These criteria appear overly broad, and we believe there should be a much greater burden needing to be satisfied before the Navy would use these lanes. We question why, for example, if the Navy is able to modify beach topography for the purpose of attempting to discourage nesting in heavily trained areas, the Navy is not also able to modify beach topography to provide desired *training condition* topography in other areas (and thereby avoid Lanes 8-10 during the nesting season). If feasible, such an alternative should be explored for both Camp Pendleton beaches, as well as the remaining Boat Lanes at the STCC. If infeasible, the Navy should explain why.

The Navy's stated argument for eliminating the alternative of protecting all the snowy plover nests, rather than limiting protection to only 22 nests, is not well explained. Stating a third nest in a given training lane "could render the entire lane unusable" appears speculative, depending on the location of the nests. We would like historic information about conflicts the Navy has experienced in training in these lanes over, say, the past decade. For example, how often have there been more than two active plover nests within a given lane, and what has this meant for Navy training? Has the Navy had to cancel, modify, or relocate training? Is it a given that more than two active nests in a lane at one time makes the lane unusable? If

DEIS Comments
Navy SSTC
Page 3

so, please explain. Wouldn't the location of the nests (including proximity to each other, as well as to nests in other lanes) have an important bearing on this question? Has the Navy been able to successfully train in a lane when nests have exceeded two in that lane?

In addition, if there were greater numbers of nests, but most of those were in Lanes 8-10, which the Navy indicates would be used sparingly, then would it not be easier to protect more than 22 nests? Also, it is not clear how the number 22 was derived, when there are 14 Boat Lanes. If the number was derived from the number of lanes times two nests/lane, shouldn't that total be 28 nests?

It is also not clear from the document how the Navy intends to phase in the increased numbers of activities. If the timing of the increases allows sensitive areas proposed for training to be off limits for several years (or some other period) until they are needed, that should be considered as an alternative as well, or at least explained. We recognize that the Navy states these areas will not be used unless needed, but it would be helpful to understand the pace of the proposed increases.

We have similar concerns over the proposal to expand training to allow foot traffic in vernal pools. The DEIS does not make a compelling case that these pools could not be avoided. At a minimum, it is not clear why fencing (and thereby avoidance) of at least the smaller vernal pools could not be conducted consistent with training needs.

It appears from the discussion in several sections of the DEIS that the primary reason for dogs on the beach is for their exercise, and the primary *training* activities necessitating dog use occur at or near buildings (i.e., away from beaches and sensitive areas). We understand that the dogs are trained not to disturb wildlife, but wildlife may still be intimidated by dogs to the extent they could abandon nesting areas, especially in the cumulative context of overall increases in training levels. Is there a reason, for example, why dog runs could not be excluded from Boat Lanes 8-10 during the nesting season, with their exercise limited to other areas?

Page 3.6-24 states that loud activities would occur infrequently at night or on weekends. Can the Navy provide an estimate of the amount of proposed increases in loud noise-producing activities on weekends, holidays, and at night?

The reference on page 3.6-25 to noise mitigation (referring to Section 3.6.2) is presumably meant to be a reference to Section 3.6.1.6. Also, that section is rather vague. We would appreciate it if the Navy would spell out in greater detail how noise effects on sensitive species and on recreation will be factored into decisions on locating and timing training.

Page 3.9-12 discusses marine mammal monitoring during underwater detonations and pile driving. The discussion should describe how much training the marine mammal observers will receive. Also, we will want to be added to the list of entities contacted in the event of an

DEIS Comments
Navy SSTC
Page 4

observed marine mammal injury. We will also want to receive any monitoring reports on snowy plover, least tern, and/or vernal pool habitat impacts that the Navy may be providing to the U.S. Fish and Wildlife Service.

Page 3.1-15 references a new activity affecting public access, referenced as N14. New activities are only numbered N1-N11, so this may be a typo. Please identify this activity.

Page 3.12-26, Fig. 3.12-11, contains a graph showing plover nesting through 2008. Does the Navy have 2009 data for snowy plover nest numbers? If so, please provide, for all the sites shown in Fig. 3.12-11. Also, are there any plover nests yet this year? Please keep us apprised of current nest numbers and locations as the season progresses.

The City of Coronado's comments on the DEIS (Item No. 27) state that the ferry service to NASNI has been discontinued. As this service was, in part, mitigation for traffic impacts from the homeporting of nuclear aircraft carriers, please update us on the status of the ferry service.

Page 3.7-44 contains an error message.

Thank you for this opportunity to comment on this important Navy DEIS. If you have any questions about these comments, or about preparation of the Navy's upcoming consistency determination, please feel free to contact me at (415) 904-5289.

Sincerely,

MARK DELAPLAINE
Manager, Energy, Ocean Resources
and Federal Consistency Division

cc: San Diego District Office (Deborah Lee)
U.S. Fish and Wildlife Service
National Marine Fisheries Service
Cities of Coronado and Imperial Beach
California Dept. of Parks and Recreation
California Dept. of Fish and Game

### E.2.4 California Department of Fish and Game

capacity, the Department administers the California Endangered Species Act, the Native Plant Protection Act, as well as other provisions of the California Fish and Game Code and Title 14 of the California Code of Regulations that afford protection to the State's fish and wildlife. The Department is also responsible for marine biodiversity protection and restoration in coastal marine waters of California. Pursuant to our jurisdiction, the Department would like the following concerns and issues regarding the project adequately addressed in the Final Environmental Impact Statement (FEIS).

**Biological Impacts and Mitigation Strategies**

Increasing repetitive Navy training activities along with decreasing existing conservation measures may cause long term impacts and significantly add to cumulative impacts to terrestrial and marine species and their habitats. The Department has the following comments, concerns, and recommendations: 1) the FEIS should more fully analyze and address the potential cumulative or long term coastal ecosystem impacts associated with each phase and type of the proposed increased training/construction; 2) the FEIS should include additional studies and/or increased biological monitoring, additional conservation measures, and mitigation plans for the potential long term impacts to listed and sensitive terrestrial and marine species, rare and unique coastal strand habitat, and State- and federally-listed marine birds and their nesting habitat. 3) the Department views the Navy's proposed mitigation and decreases in avoidance and minimization measures for sensitive or listed species and the sensitive coastal strand, dune and eelgrass habitats, as insufficient protection and compensation from cumulative impacts.

1) Cumulative or Long Term Impacts not fully Addressed in the DEIS:

The FEIS should address the potential for the following types of impacts and show how they will be avoided, minimized, mitigated and monitored for SSTC-North and South and Bayside Training Ranges as applicable:

- During bird nesting and California grunion (*Leuresthes tenuis*) spawning season the fully protected and state and federally endangered California least tern (*Sternula antillarum browni*) and the California species of special concern and federally threatened Western snowy plover (*Charadrius alexandrinus nivosus*) as well as other sensitive bird species and their habitats may potentially be impacted due to the proposed significant increases in vehicle, air and foot/dog traffic in the intertidal and upland areas of SSTC-North and South and bayside. A proposed buffer zone limiting bird nesting distribution and a proposal to eliminate sensitive habitat markers is described in the DEIS and indicates that the Integrated Natural Resources Management Plan (INRMP) for this area has been revised recently to support such a proposal. The Department was not aware that the Coronado INRMP (2002) was revised recently to support and accommodate a reduction in bird conservation. Additionally, the biological resource discussion does not clearly identify an analysis on how these sensitive species could potentially be affected due to cumulative impacts.

- After near shore disturbances, (training activities and construction), an increase in opportunistic, non-native, terrestrial and marine species may be seen within the project vicinity. An increase in non-native species would cause

Kent Randall
April 30, 2010
Page 3 of 6

increased disturbance of ecosystem processes and decreased native biodiversity. This may be due to spreading/dispersal of non-native species during construction or from non-native species aggressively taking advantage of a newly disturbed area.

- Significant and repetitive vehicle, helicopter, and detonation impacts to terrestrial and marine biological resources, including sensitive and listed birds, may occur at the site causing cumulative impacts. Some of these effects may include the destruction of marine plants and algal species and their substrate such as surf grass, eelgrass and kelp species. Vehicle impacts from driving in the intertidal and on the beach may cause impacts to the kelp wrack on the beach used for forage and shelter by various terrestrial and marine species, including western snowy plovers that feed primarily on terrestrial and aquatic invertebrates (brine flies, brine fly larvae and brine shrimp). Significant burial or destruction of fish and their habitat from detonations may also occur at scattered rock bottom habitats that are found immediately offshore of the project site, thus reducing the prey base for California least terns that feed primarily on small fish. Vehicles may also impact active California least tern, Western snowy plover and other listed and sensitive bird eggs, chicks and nests. Helicopters flying over actively-nesting California least terns and western snowy plovers may flush adults off the nest and leave the eggs and chicks vulnerable to predation.

- Coastal strand habitat is an important and diminishing California natural resource and supports a unique ecological community (Dugan and Hubbard, 2009). The DEIS does not discuss the impacts to biodiversity and the uniqueness, importance and sensitivity of strand habitat nor how it should be conserved due to proposed increase in impacts.

- Significant fragmentation of marine and onshore habitats may occur due to the proposed increase in training activities and detonations in the intertidal, subtidal and upland. This may cause a reduction in habitat suitable for native species distribution especially as it relates to eelgrass on the bayside training range and onshore sensitive bird breeding, roosting, and foraging habitat.

- There are known Pismo clam, *Tivela stultorum,* beds near SSTC-North and South training ranges that are surveyed by the Department every year. Invertebrates are an important part of near shore and beach ecology. In particular, Pismo clams, a state managed and sensitive species, tend to develop high concentrations or beds on flat beaches in the surf zone and at the mouths of bays, rivers and estuaries. This makes them more susceptible to Navy vehicle training, detonations or burial impacts. Impacts to Pismo clams, as well as other concentrations of marine invertebrate species, should be identified, monitored and mitigated. The DEIS should have addressed the potential for these types of impacts.

- Sea level rise should be analyzed and addressed in the FEIS as a potential cumulative impact to unique and dwindling coastal strand habitat, eelgrass habitat and bird nesting habitat on beaches in southern California.

Kent Randall
April 30, 2010
Page 4 of 6

2) <u>Concerns and Recommendations related to Potential Cumulative and Long term Impacts:</u>

Since the property leased by the Navy at SSTC-North is state-owned property and SSTC-South and bayside is adjacent to Silver Strand State Beach, the Department expects that a higher level of adherence to standard practices, as well as proposing additional mitigation and conservation measures for protecting sensitive coastal ecosystems and biological communities, will be practiced by the Navy as the tenant and neighbor of such land. The following comments and recommendations should be considered and addressed in the FEIS:

- Mitigation for 1.13 acres of eelgrass habitat loss is proposed in the DEIS based on Navy estimates. An enhanced monitoring and surveying program is recommended for the remaining eelgrass habitat that may be adversely affected before, during and after the proposed training activities and construction. The Department is concerned that the actual impacts to eelgrass and eelgrass habitat in this area may be significantly higher at the bayside Navy training range due to cumulative or long term impacts of proposed increased training.

- Monitoring plans that incorporate adaptive management for developing marine wildlife and habitat conservation measures are recommended. Monitoring plans should be developed in collaboration with the resource agencies. Experienced and qualified independent biologists should be retained to adequately implement the biological monitoring and studies.

- The Department recommends marking and avoiding all western snowy plover and California least tern nests and any suitable nesting habitat to offset impacts to these species that may occur as a result of the disturbances and activities (e.g., foot and vehicle traffic) associated with military training exercises.

- Existing buffer zones and signs to designate sensitive habitat (e.g., for California least tern and western snowy plover) should continue and be increased in the future for the proposed training increases on State property.

- The project should include a vehicle route plan that sufficiently avoids and minimizes impacts to sensitive species and habitats. The vehicle route plan should include, but not be limited to, the following areas: a) pismo clam beds and grunion nests; b) identified sensitive bird breeding, roosting, and foraging habitat and other significant biological areas of the intertidal, strand, and dunes; and c) beach wrack and eelgrass.

- Helicopters flying over actively-nesting California least terns and western snowy plovers should stay at least 500 feet above the ground to avoid flushing adults off the nest and leaving the eggs and chicks vulnerable to predation.

- To assess impacts of training activities on the California least tern and western snowy plover, the Department recommends annual documentation of the distribution of California least terns and western snowy plovers at SSTC-N in relation to the timing, number, type, and distribution of training activities in each training lane during the breeding seasons for these sensitive species.

Kent Randall
April 30, 2010
Page 5 of 6

- The Department recommends increased enforcement of civilian and non-training trespass at SSTC-N to reduce impacts to the California least tern and western snowy plover.

- The Department recommends that the FEIS address the potential occurrence of Pacific pocket mouse and coast horned lizard, and the potential for long-term conservation of these species on-site.

- Grunion season monitoring and avoidance/minimization strategies should include but are not limited to the following:

  a. When grunion monitoring surveys indicate grunion habitat exists on site, and significant grunion runs are seen, avoid sand disturbing activities during the grunion spawning season. The Grunion spawning season is typically March 1st to August 31st.

  b. If avoiding the grunion spawning season is not feasible, then the Department recommends development of spawning and egg avoidance, minimization and monitoring plans for significant spawning events on site.

  c. Predicted grunion spawning runs should be monitored prior to, during and post training or construction by a qualified grunion biologist.

  d. Avoid sand disturbing activities in the intertidal areas during the two-week incubation period after significant spawning runs are seen. Subsequent monitoring should also indicate that no additional spawning has occurred before proceeding with sand disturbing activities. Identifying and marking grunion nests and use of buffer zones is another avoidance option.

  e. In order to determine significant grunion spawning on the beach, monitoring plans should generally include four nights of monitoring with the first night being the night of the new or full moon. At least two hours of monitoring, the first day to begin after the peak high tide and the 2nd, 3rd and 4th days of monitoring should begin at least one-half hour before peak high tide. Two hundred grunion or more seen over the four day predicted spawning run beginning with the night of the new or full moon should be sufficient to indicate significant spawning activity.

3) Conservation Planning for Future Impacts to Listed and Sensitive Marine and Terrestrial Species and their Habitats.

The Department recommends that existing methods and criteria to designate species buffer zones and sensitive habitat should be revised to provide adequate fish and wildlife protection in order to accommodate the Navy's future proposed activities on and adjacent to state property located at SSTC-North and South and the Bayside. Such proposals should be approved by the resources agencies.

San Diego, CA 92136-5198

Dear Mr. Randall,

California State Parks (CSP) appreciates the U.S. Department of the Navy (Navy)'s commitment to resource conservation in the southern San Diego region. This commitment is particularly evident with respect to conservation of California least tern and Western snowy plover. CSP appreciates the effort put into the Silver Strand Training Complex Draft Environmental Impact Statement (Draft EIS), including its documentation of our region's natural and cultural heritage and its review of the complex responsibilities charged to the Navy. CSP has several concerns with the proposed project with respect to sensitive species conservation, adequate mitigation for impacts to sensitive species, lack of specificity concerning increased presence of emissions and hazardous materials, and potential impacts to marine life within the adjacent off-shore property that is considered part of Silver Strand State Beach. This letter also includes comments on cultural resources for lands adjacent to park holdings, and questions the effects of increased ground and air traffic on the experience of visitors at Silver Strand State Beach.

The Draft EIS proposes:

- the continuation of current training and test and evaluation activities conducted within the study area;
- an increase in training tempo from baseline conditions and additions to types of training;
- the carrying out of existing, routine training at additional locations within SSTC established training areas;
- the introduction of new platforms and equipment;
- increased access and availability to existing beach and inland training areas.

Noted in section 3.1.1.5.2 SSTC-N Surrounding Land Use, and elsewhere throughout the document, the text and figures incorrectly refer to "Silver Strand State **Park"**, instead of the correct title of "Silver Strand State Beach". In addition, the document omits recognition of the Silver Strand Natural Preserve. A Natural Preserve is a CA State land designation used to identify the presence of highly significant natural resources. CSP feels that the Draft EIS should include specific mention of this land designation and also, where appropriate, denote its boundaries in figures within the document. Similarly, the Draft EIS should note the extent of marine area managed by CSP. California State Parks holds fee title to off-shore lands, 3 miles out, that include, roughly, boat lanes 3 through boat lane 10 and extends to the southern end of

Kent Randall
March 9, 2010
Page 2

Silver Strand State Beach. CSP should be both considered and listed as an "affected jurisdiction" on the EIS Cover Sheet, and throughout the document as a whole.

CA State Parks understands that the Navy must allow for a significant level of flexibility when forecasting training needs, however we also feel that take of endangered species should be avoided or mitigated appropriately. The proposed expanded use of the training grounds, especially Beach Blue 2, Beach Orange 1, and Beach Orange 2, will most likely result in take of California least tern and Western snowy plover, and deter and disrupt current levels of nesting. CSP feels that the proposed mitigation for this take offered in the Draft EIS is inadequate to meet the standards of the U.S. and California State Endangered Species legislation. The Draft EIS lacks specificity with respect to training activities to adequately quantify potential take of protected species. Therefore, identification of an appropriate mitigation agreement prior to project implementation is difficult. Although options exist for additional on-site mitigation and avoidance, and those options should be further explored, we offer the following suggestions for a potential off-site mitigation scenario:

1. Commit to increased level of avian monitoring necessary to accurately quantify take of tern and plover resulting from the proposed actions in the Draft EIS.
2. Continue consultations with USFWS to develop an adaptive management agreement in which take of tern and plover is appropriately mitigated through suitable actions. Based on the success the U.S. Navy has had with the establishment of the 75-acre preserve at Delta North and South, it seems that a similar mitigation scenario could offer the appropriate long-term mitigation. Opportunities exist in the region for creation of additional off-site nesting locations.

It is the understanding of CSP that the Navy's current Western snowy plover avoidance protocol involves the buffering of each snowy plover nest that is located during the breeding season. The Draft EIS proposes to reduce this management action such that only 22 concurrent plover nests are buffered. This proposed decrease in avoidance measures, when coupled with the proposed increase in training, presents a management scenario in which take of Western snowy plover, above current levels of take, seems likely. The Draft EIS does not appear to include adequate mitigation for this increased take of Western snowy plover.

CSP ownership at Silver Strand State Beach extends 3 miles out to sea. This off-shore portion of Silver Strand State Beach generally includes Boat Lanes 3 through 10 and is adjacent to Boat Lane 11, which immediately borders Silver Strand SB to the south. The EIS fails to adequately consider the effects on this area or proposed appropriate mitigation of its actions. This area was created to ensure the public's continued enjoyment of the coastal marine environment. It is the Navy's responsibility, as part of the EIS, to delineate this state ownership and to evaluate the EIS proposals' potential effects on the public's use of this off-shore area.

In addition, the 3-mile marine area is eligible to be designated as a State Marine Protected Area. While CSP appreciates the consideration of marine life already included within the Navy's

Kent Randall
March 9, 2010
Page 3

protocol for disruptions to the under-water acoustic environment we are concerned that existing activity and increases proposed in the Draft EIS will result in additional harm to marine life that use waters managed by CSP. CSP requests that activities involving acoustic disturbances known to damage marine life (pile driving, underwater detonations, SWAG operations, blasts, pyrotechnics, etc.) be located at distances far enough from ocean waters managed by CSP such that impacts to resources within these waters are avoided.

Current and increased naval activity in SSTC South, particularly in Beach White 1 and Beach White 2, may result in disturbance to Western snowy plover dependent upon protected habitat within the adjacent Silver Strand Natural Preserve, managed by CSP. CSP requests that the Navy inform CSP staff of training activities in this region such that CSP staff can accurately monitor potential impacts from these adjacent land uses. If negative effects are documented, CSP requests that the Navy work with CSP and USFWS to mitigate these negative effects.

CSP appreciates the Navy's assistance with the clean-up of expended materials that occasionally wash to shore on SSSB and the SSNP. CSP is concerned that some of the activities proposed in the Draft EIS will result in additional occurrences of munitions constituents and other expended materials on the public beaches managed by CSP. CSP requests that the Navy continue this cooperation and allow for increased communications and response for clean-up of future expended materials found on SSSB and SSNP. Additionally, CSP requests that Navy staff work with CSP interpretive staff to identify interpretation needs and public education and outreach necessary to protect the visiting public and CSP staff from these potential dangers.

CSP is concerned that the activities proposed in the Draft EIS will result in Naval activity (training exercises, aircraft fly-over, beach landings, traversing from SSTC North and SSTC South, etc.) on or over SSSB and SSNP. CSP is a public safety agency and as such is committed to protecting the resources and visitor experience on these beaches. CSP requests that any desired increased use of CSP-managed lands be approved by the CSP San Diego Coast District Superintendent prior to initiation.

The natural landform and habitat present within SSTC South is extremely unique and regionally rare. The Draft EIS proposes increased impacts to this valuable resource but fails to propose adequate mitigation. The proposed training in the vernal pools exemplifies this oversight. Every effort should be made to protect the vernal pool resources and other unique habitat elements found in SSTC South. Proposed activity within the vernal pools when dry has the potential to disrupt the soil integrity and the long-term sustainability of this habitat, the plant life and the San Diego fairy shrimp that occupy this niche. If the Navy must increase training within the sensitive habitats of SSTC South, the impacts should be quantified and appropriate mitigation measures should be undertaken.

Table 3.3-4, "Operational Emissions at SSTC and Portions of NASNI with Evaluation of Conformity" reports emissions increases of monitored pollutants at levels anticipated to be up to nearly 4 times the 'No Alternative' emissions estimation. Additionally, the Draft EIS mentions hazardous air pollutants (HAP's) but provides inadequate data for assessment of the current level

Kent Randall
March 9, 2010
Page 4

of HAP's emitted by Naval activities and anticipated proposed increases. Given these proposed increases, and the apparent lack of data on HAP's, CSP feels that the Navy should increase its commitment to monitoring and reporting air pollutants throughout the region to all affected jurisdictions. Specific attention should be directed toward supplementing existing monitoring protocols with sampling stations and efforts that allow the Navy to identify the contribution of Naval-generated emissions, including HAP's, long-term, and to mitigate appropriately when necessary.

The Draft EIS contains a fairly extensive write-up on the policies, plans and regulations that govern the management of hazardous materials at SSTC however, given the relatively short public review period, an adequate review of these reference materials was not possible. The Draft EIS does note that, under the Preferred Alternative, the amounts of expended training materials would increase, the weight of expended flare and smoke canister residues would increase and the amounts of residues from detonations of underwater explosives would increase. The EIS would benefit from a more specific discussion of the updated offshore petroleum discharge system (ES-9). CSP is concerned with the health of the environment for the park visitors, State Park staff, local public, and the sensitive natural resources living in this region. Review of this section would be facilitated by the inclusion of data from studies that have evaluated of levels of hazardous materials in the local environment with particular inclusion of effects on sensitive receptors. CSP feels that, with the proposed increases in expended materials, the Navy should clearly outline and commit to a testing and evaluation protocol designed to identify the degree to which hazardous materials may or may not be emitted through the SSTC operations, and the levels at which they are accumulating in the local environment. Additionally the Draft EIR states that the Navy submits EPCRA 312, Tier II forms to the emergency responders (Fed Fire) and the San Diego County Certified Unified Program Agency (CUPA), and the EPCRA 313 Toxic Release Inventory (TRI) Form R to USEPA, with courtesy copies to the California Environmental Protection Agency (Cal-EPA) and the Regional Water Quality Control Board. CSP feels that we would benefit from updated knowledge on this subject and requests that these forms be submitted to the Peace Officer Lifeguard staff stationed at Silver Strand State Beach.

The Draft EIS does not include an adequate assessment of the potential negative effects of increased activities, especially amphibious and beach activities, on spawning success of the California grunion. This species is largely endemic to Southern California and requires undisturbed natural intertidal sandy beach habitat. The Navy manages a significant portion of this species remaining suitable spawning habitat. Potential negative effects to this species should be quantified, avoided when possible, and mitigated when necessary.

Given the level of detail for specific training schedules provided in the Draft EIS, it is also difficult to assess the long-term impacts of the proposed increased activities on rare and special-status plant species occurring within the SSTC (*Cordylanthus maritimus* ssp. *maritimus, Astragalus tener* var. *titi,* and others listed in Table 3.11-2). CSP shares conservation responsibility with many of these resources and is committed to providing high quality habitat for the successful persistence of these species. CSP feels that the proposed activities in the Draft EIS have the potential to result in significant negative population-level effects for these special-status and rare plants. Suggested additional mitigation measures for rare and special-status plants found in the SSTC may include such actions as:

Kent Randall
March 9, 2010
Page 5

1. Annual population-level surveys that quantify various impacts from increased training activity;
2. Commitment to a regional rare plant conservation program in which unavoidable impacts resulting from increased training activities are mitigated through off-site restoration and enhancement. Contribution toward a special status and rare plant conservation seed-bank should also be explored;
3. Further consideration and implementation of on-site special-status and rare plant preserves and protected conservation areas.

Section 3.11 should address the potential occurrence of Pacific pocket mouse, and the applicability of SSTC South as a viable habitat for long-term conservation of this species.

Section 3.11 should address coast horned lizard presence and conservation.

Section 3.12 should more accurately address the level to which the SSTC is critically important to the long-term sustainability of healthy migratory and shore bird populations throughout the Pacific flyway. Potential long-term negative effects from the proposed increases identified in the Draft EIS should be more accurately quantified and appropriate mitigation and avoidance measures proposed.

Section 3.13 addresses cultural resources on lands adjacent to CSP properties. CSP reviewers found the history of dredging on the strand inadequate to review mitigating measures, and as a result, questioned conclusions such as:

> As mentioned in 3.13.1.1.2, the training areas in SSTC-North are located on fill deposits that resulted from the dredging of San Diego Bay and the construction of Zuniga Jetty. These fill areas have no potential for in situ heritage resource deposits (3.13-5).

From experience on adjacent CSP properties, the dredged areas are non-contiguous, and depending upon depths, cover cultural materials that should be addressed both in the SSTC-North and SSTC–South areas. Should the SSTC-South prehistoric sites assumed to be eligible to the National Register have been on CSP land, the 'Summary of Effects' (Table ES-2) conclusion that foot traffic is not an adverse impact would have been questioned. This is especially true to the west of the highway where CSP staff have noted cultural materials in shell middens located undisturbed within centimeters of the surface.

Regarding submerged cultural sites, underwater shipwrecks and other offshore cultural materials deserve better protection than promised avoidance. As reported in the cultural resource history, Manila galleons have been passing Silver Strand since 1565. The more deeply-submerged prehistoric materials would be difficult to impact with the increased operations described, but some of the submerged historic sites will be impacted by the activities in Alternatives 1 and 2. Assurances that more specific locations and depths will be recorded with the federal clearinghouse (the South Coastal Information Center), and that Navy cultural resource managers will take an active part in designing these avoidances is requested.

Kent Randall
March 9, 2010
Page 6

The EIS considers the potential effects on traffic flow and concludes that the capacity of Highway 75 will not be significantly affected. However, CSP is also concerned about the effects that the significant increase in military operations will have as a distraction to motorists on Highway 75. The potential for creating hazardous driving conditions due to military distractions may be exacerbated during peak beach visitation periods. The EIS should analyze this aspect of its proposals potential effects on highway safety and propose appropriate mitigations.

Nearly ½ million people visit Silver Strand State Beach each year, most during the spring and summer between April 30 and September 15. The EIS fails to adequately evaluate the effect that increased military operations will have on the visual experience these beach goers have grown accustomed to. Visitors come to Silver Strand to enjoy surf-play, wide sandy beaches and eye-level views of the ocean, frames by scenic Pt. Loma (to the north) and the Coronado Islands (to the south). The EIS needs to propose means by which the negative visual effects of increased military operations can be minimized, including, but not limited to, considering the seasonality of operations.

.

California State Parks appreciates the opportunity to comment on the DEIS and hopes that our comments contribute to a better project.

Sincerely,

Clayton Phillips
Acting District Superintendent

March 22, 2010

File Ref: Silver Strand Training Complex
Draft EIS, US Navy, San Diego County

Mr. Kent Randall
Naval Facilities Engineering Command Southwest
Code: OPME
2730 McKean St. Bldg. 291
San Diego, CA 92136-5198

**Subject: Silver Strand Training Complex Draft Environmental Impact Statement, United States Navy, North Island, San Diego County**

Dear Mr. Randall:

Staff of the California State Lands Commission (Commission) has reviewed the above referenced document and offers the following comments on the draft Environmental Impact Statement (DEIS). We understand that this project has not undergone review under the California Environmental Quality Act (CEQA). Depending on what other State or local agencies have discretionary action over the proposed project, the CSLC may take the role of a Lead Agency or a Responsible or Trustee Agency under CEQA.

As background, the State acquired sovereign ownership of tidelands and submerged lands and beds of navigable waterways upon its admission to the United States in 1850. All tidelands and submerged lands, as well as navigable rivers, sloughs, etc. are impressed with the Common Law Public Trust.

The Public Trust is a sovereign public property right, in the nature of an easement, held by the State or its delegated trustee for the benefit of all the people. This right limits the uses of these lands to waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, open space, or other recognized Public Trust purposes. A lease from the CSLC is required for any portion of a project extending onto state-owned sovereign lands, which are under its exclusive jurisdiction. As to lands involving the Public Trust Easement, the property is subject to certain land use restrictions and public rights and any inconsistent use with the easement may be prevented by the CSLC.

CSLC has issued a lease to the Navy for a portion of the beach at the Silver Strand, Lease PRC 6319.9, between the Ordinary High Water Mark of 1941 and the Ordinary High Water Mark of 1948. The Pacific Ocean waterward of the Ordinary High Water Mark of 1948 is not covered by a lease from CSLC.

Kent Randall Page 2 March 22, 2010

Based on a review of the information provided, it has been determined that the Alternative 1 (Preferred Alternative) for the proposed project will be located within state sovereign lands under the leasing jurisdiction of the Commission. The U.S. Navy will need to apply to the Commission for a lease for that portion of the beach which is not currently covered by the existing lease.

The Commission will need to make a CEQA determination prior to consideration of lease approval. Based on the information provided in the DEIS, a CEQA document will most likely need to be prepared for the proposed project in order to cover our discretionary action (lease within state sovereign lands). The CEQA document would need to include all information required under Public Resources Code, section 21000 et seq., including identifying the project's potentially significant impacts and mitigation measures to clearly avoid or mitigate those significant impacts. Public review and all appropriate noticing of the CEQA document (CEQA Guidelines, sections 15072 and 15073), as well as a Mitigation Monitoring Program, will need to be completed.

In addition to the information provided in the EIS, the CSLC would need copies of any cultural resource reports completed on land under the jurisdiction of the Commission. Any artifacts found on lands under the jurisdiction of the Commission are considered the property of the state of California. Any disposition of these artifacts requires the approval of the Commission and a transfer of title may be required.

The Commission would also like to receive copies of the following documents:

- Applicable State regulatory agency permit applications prepared for the project; and
- California Coastal Commission Consistency Determination if or when available.

If you have any questions regarding the lease application process, please contact Alan Scott at (916) 574-1861 or by e-mail at scotta@slc.ca.gov. If you have any questions regarding environmental issues, please contact Christopher Huitt at (916) 574-1938 or by e-mail at huittc@slc.ca.gov.

Sincerely,

Marina R. Brand

Marina R. Brand, Acting Chief
Division of Environmental Planning
and Management

### E.2.9 City of Imperial Beach, California, Office of the City Manager

City of Imperial Beach, California

OFFICE OF THE CITY MANAGER

March 5, 2010

Mr. Kent Randall
Silver Strand Training Complex EIS
Naval Facilities Engineering Command, Southwest
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Dear Mr. Randall:

The City of Imperial Beach appreciates the opportunity to review and comment on the environmental document that assesses the potential impacts of the Navy's proposal to provide increased operationally and realistic training for naval personnel at the Silver Strand Training Complex (SSTC).

The City also appreciates the national security role that the Navy provides for the country. However, the City suffers fiscally and economically in not being able to fully exploit our beach-oriented resources for our tourist industry. The City has embarked upon an aggressive redevelopment program to enhance this economic base and make overall quality-of-life improvements to the City. The City is apprehensive that increased military activities in our area might result in impacts that would work against the City's efforts to provide an attractive and quiet environment in which to live and work. We believe that we can work together in mutually achieving the City's goals and the Navy's mission to provide adequate training for our military personnel. It is in this spirit that we offer the following comments on the environmental document:

1. Due to limited staff and time, our review was not as thorough as we wished. Also given the length of the document and approximately a decade it took to prepare, we request an additional review period of 45 days.
2. The DEIS does not adequately allow a reader to assess the current and proposed activities within each lane and thus it's difficult to distinguish the impacts in the southern zones from the northern ones, and the changes from current to proposed activities.
3. With the increase in aircraft activities and firearm discharges, we request that helicopter sorties and firearm discharges stop no later than 10:00pm and start no sooner than 7:00 a.m.
4. In light of the decrease in beach access due to the increase of training activities, we suggest three mitigation steps:
   a) The Navy create an alternative pathway running from the general vicinity of the western end of Carnation Street heading in a northeasterly direction along the perimeter of the southern boundary of the base (roughly the northern boundary of IB) to the eastern boundary of the base that parallels SR-75; then proceeding northward on an existing path

825 Imperial Beach Boulevard • Imperial Beach, California 91932 • (619) 423-8303 • Fax (619) 429-9770

currently available to the public until the path ceases a bit south of the Cays; then proceeding in a northwesterly direction on Navy property to connect with Silver Strand State Park. This would provide walkers, joggers, runners, bicyclists a north-south pathway/trail to mitigate for the loss of beach access.

b) People also walk their dogs along the part of the beach that will be greatly affected by the increased training, and therefore we suggest that the Navy create and maintain a "dog park" somewhere along the southern perimeter of the base somewhere east of Camp Surf. (The Navy had allowed the public to use an area just east of the entry gate on Silver Strand in IB as a dog park. The area is now closed to the public, but it is a possible site to mitigate the impact of the training activities that reduce access to the beach.)

c) The Navy should assist in funding beach sand replenishment efforts. For example, the Navy could help the Corps of Engineers with dredging the entry to San Diego Bay and placing the dredge materials (sand) nearshore or on the beach along the coast of Imperial Beach. The City prefers that sand be placed onshore because this is the best way to preserve our beaches. Preserving the beach between Carnation Street and the mouth of the Tijuana River would be a measure that mitigates the reduced beach access caused by the increase of naval activities along the Silver Strand north of Carnation.

4. In light of the overall increase in noise due to helicopter activities, firearms and other training activities, mitigation activities should include:

a) Strict adherence to flight patterns at Ream Field that will not allow fixed-wing and helicopter flights over homes in Imperial Beach.

b) There should be no helicopter training at Ream Field after 9:30pm. All flights should be heading back to their home base after 9:30pm.

c) Work with the City in developing a more effective notification system of planned training activities that have the potential to impact residents of Imperial Beach (in addition to the standard notification provided to our Public Safety Department when exercises involve pyrotechnics or firearm discharges).

5. Table 3.6-9 indicates that Camp Surf is situated further away from the noise source than the residential areas of Imperial Beach when the other tables show Camp Surf closer to the noise source than the Imperial Beach residential areas. Please explain.

**Table 3.6-9: Sound from Blanks used during Immediate Action Drills**

| Sensitive Receptor | Approximate Distance (feet/m) | Sound Level (dBA) | |
|---|---|---|---|
| | | Peak | One-Hour $L_{eq}$ |
| Coronado Shores | 5,950 / 1,810 | 74 | 67 |
| Rendova Housing | 2,260 / 690 | 83 | 75 |
| Military Family Housing / Silver Strand Elementary School | 5,370 / 1,630 | 75 | 68 |
| Coronado Cays | 13,110 / 3,990 | 68 | 60 |
| Silver Strand State Beach | 10,390 / 3,160 | 70 | 62 |
| Coronado Cays | 2,560 / 778 | 80 | 72 |
| Silver Strand State Beach | 890 / 271 | 80 | 72 |
| South Bay Biological Study Area | 8,790 / 2,672 | 81 | 73 |
| YMCA Camp Surf | 16,520 / 5,022 | 77 | 69 |
| Imperial Beach Residential | 13,820 / 4,201 | 75 | 67 |

Note: Peak noise levels and $L_{eq}$'s estimated from reference sound level of 99 dBA at 350 feet and the source-receptor distances shown above, assuming distance attenuation of six decibels per doubling of source-receptor distance for a point source.

Again, we extend our appreciation for your outreach efforts to involve our community in being able to comment on this document.

Sincerely,

Gary Brown
City Manager
City of Imperial Beach

## E.2.10 City of Imperial Beach, California, Office of the City Manager

# *City of Imperial Beach, California*

*OFFICE OF THE CITY MANAGER*

March 30, 2010

Mr. Kent Randall
Silver Strand Training Complex EIS
Naval Facilities Engineering Command, Southwest
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Dear Mr. Randall:

The City of Imperial Beach appreciates the additional time the Navy has afforded the public to review and comment on the environmental document that assesses the potential impacts of the Navy's proposal to provide increased operationally and realistic training for naval personnel at the Silver Strand Training Complex (SSTC).

The City offers the following additional comments on the environmental document:

1. The City of Imperial Beach concurs with the comment by the City of Coronado that the DEIS does not adequately address the increased environmental impacts to surrounding properties that would result with the proposed activities. While the DEIS acknowledges that the preferred plan will result in increased impacts, additional or more effective mitigation measures are not proposed to reduce the impacts preferably to a level of insignificance. The lack of mitigation measures despite the major increase in activities and impacts seems, at best,

825 Imperial Beach Boulevard • Imperial Beach, California 91932 • (619) 423-8303 • Fax (619) 429-9770

illogical. Mitigation measures are necessary to reduce the significant impacts resulting from the increase in quantity and types of activities proposed.

2. The City also wishes to modify our previous comment of our letter of March 5, 2010 wherein the City proposed a pedestrian and bicycle path from Carnation Avenue to Silver Strand State Park. We would like to refer to this path as a "Proposed Coastal Mitigation Trail" due to the potential loss and/or adverse impacts to the existing and long-utilized beach access along the shoreline adjacent to the Navy Radio Receiving Facility (NRRF).

3. We request that the Draft EIR carefully analyze the impacts the increased activities will have on traffic on SR 75 and Palm Avenue to Interstate 5.

Again, we extend our appreciation for being able to provide additional comments on this document.

Sincerely,

Gary Brown

RE: Silver Strand Training Complex Draft EIS

Dear. Mr. Randall:

Thank you for extending the draft environmental impact statement (DEIS) public comment review period. It allowed me to speak with Coronado citizens that were unable to review and understand the DEIS prior to the earlier March deadline.

I submit these comments individually as a City Councilwoman for the City of Coronado [hereinafter Coronado] in which the proposed increased training will occur. I incorporate the concerns raised in Coronado's official comments submitted by Acting City Manager James Benson on March 4, 2010 and provide additional concerns as a parent with children in the Coronado Unified School District (CUSD), as a .business owner who works in the area covered by the proposed increased training and as a resident of the City of Coronado.

The citizens of Coronado appreciate and support the training of our military forces to insure their safety and efficacy when they are sent to perform their duty in hazardous conflicts around the world. However there needs to be a balance between developing realistic training scenarios on bases and ranges that are in the midst of highly developed residential areas. I provide the following additional recommendations for traffic, noise, and public safety mitigation. These actions would increase the cooperation between Coronado residents and the Department of the Navy (DON) for status quo operations, as well as for Alternative A increased tempo operations.

1. Mitigation Measure 3.16.2.4.1 Exercise Planning. The DEIS lists the blanket statement "The Navy considers public safety in planning its exercises. Factors considered in

## Coronado City Councilwoman Carrie A. Downey SSTC EIS comments

evaluating the impact of the training on public safety include proximity of the activity to public areas; access control; schedule (time of day, day of week); public notification…."

Considering isn't the same thing as doing. DON should notify the Coronado City Manager and CUSD Superintendent of ANY change in daily operations greater that 1% over the status quo. This is different than 1% over baseline in the DEIS. As the document point out the navy is attempting to get the historical activities NEPA compliant not what is currently taking place. " The U.S. military commenced operations in Afghanistan and Iraq as part of the Global War on Terror; the deployment of units overseas caused many range complexes, including SSTC, to experience temporary decreases in usage….Thus to include additional: A). personnel movements, B) equipment or supply deliveries, C) vehicle (including boats, cars, tanks, helicopter drop offs, etc.) that could increase traffic or noise levels, and/or security procedures at the base gates. In the past all of these activities have caused significant traffic delays among Coronado residents without explanation.

Currently the Department of the Navy notifies Coronado in advance of the deployment and return date of the aircraft carriers home ported in Coronado. This allows Coronado to make operational changes in the public safety and public works departments to have the appropriate city staff on hand to try to move civilian traffic should the need arise. Likewise the City Public Works Department makes sure Coronado does not schedule sewer repair work, or CALTRANS does not schedule road repair work on days where the military bases on Coronado will be experiencing increased traffic going to and from the bases. This system has worked well for large events such as movement of aircraft carriers but it would work equally well for events that do not rise to the level of a ship's movement but would increase traffic and noise in the surrounding community such as using the beaches and or base facilities as part of a Fleet exercise or other larger training evolution.

Should the Navy need to use all 14 of the beach lanes in the Silver Strand Training Complex (SSTC) at both ends of Coronado, this would undoubtedly raise the noise levels and traffic along the Silver Strand Highway past the Coronado Cays residential development and the Silver Strand Elementary School. Both contain sensitive noise receptors, as acknowledged on page 3.6.1.4.1. The advance notification to the CUSD Superintendent would allow the option to move planned outside activities at the Silver Strand School inside or reschedule them to avoid the additional noise and or distraction it would provide the students. It would allow notification to the parents living in the Cays to expect increased traffic on the strand during school drop off time in the morning to insure school start time is not delayed.

2. Silver Strand Elementary School. Although the DEIS identify Navy Housing areas on Naval Base Coronado within the SSTC, and the location of the Silver Strand Elementary School, Table 3.6-4 Acoustic measurements during Fleetex 2002 does not provide measurements for the Silver Strand School. Please provide those measurements or an explanation that they area was not measured or is too far to receive noise from Fleetex if that is appropriate.

Noise and traffic are not the only concerns for students and parents at the Silver Strand School. The lease agreement between to CUSD and the Department of the Navy is an example of how the military and community can work together to best serve the needs of military families

2

## Coronado City Councilwoman Carrie A. Downey SSTC EIS comments

and the community. The majority of the students educated at the Silver Strand Elementary School are dependants of active duty military service members, however there is a significant portion that reside in the Coronado Cays housing development that may not have exposure to military training or military weapons. The DEIS does not explain in depth what types and frequency of training will be visible to the students attending Silver Strand Elementary School.

Under Alternative 1, the DEIS states in Section 3.16.3.3 that "SSTC land training activities would not employ live ammunition, with the exception of shotgun shells for breacher training and small arms for training inside bunkers on SSTC-S. ….Flares, smoke grenades, and other small pyrotechnics unused in training do not release projectiles or scatter fragments, and thus have no potential for effects in the absence of direct contact."

While some students would enjoy glimpses or military training, others may become frightened by the sight of Navy SEALs coming ashore with weapons. The exact nature of the visuals students and staff at the school could be exposed to should be clarified. Additionally, if there will be no live weapons of any kind used within sight of the school that needs to be clarified. The teachers and staff should be aware in advance of what might distract their students during lessons and plan accordingly. Advance notice to the CUSD Superintendant would be appropriate mitigation.

Thank you for the opportunity for extended comments by the military. The relationship between the Coronado and the military is an important part of this community. No one likes surprises, least of all those responsible for planning municipal or educational organizations. I request that the Final EIS respond to the comments filed by Coronado on March 4th and address the issues I raised above with appropriate mitigation.

Respectfully,

Carrie Anne Downey

Carrie Anne Downey
Coronado Councilwoman

Naval Facilities Engineering Command, Southwest
Attn: Mr. Kent Randall – Silver Strand Training Complex EIS
1220 Pacific Highway, Building 1, 5th floor
San Diego, CA 92132

Re: Draft EIS for Silver Strand Training Complex

Dear Mr. Randall:

The City of Coronado has reviewed the above document and concluded that further information and analyses are required to determine the cumulative environmental impacts associated with the planned activities for the Silver Strand Training Complex (SSTC). Of particular concern are the statements contained throughout the document that the military facilities and/or operations are not expanding; rather, just the frequency; therefore, no environmental mitigation is required.

The draft EIS contains several areas where it acknowledges new operations and new activities will be occurring at SSTC. If more military operations and activities will be occurring at SSTC, then more personnel will be arriving in Coronado, and more vehicles will be commuting to and through Coronado impacting local streets. Not only will the additional traffic lead to impacts to intersections currently at unacceptable Levels of Service, but the overall preferred plan of continued plus new activities and operations will lead to significant cumulative impacts on traffic, noise, greenhouse gas emissions, and the public's access to utilize the waters of the State, which, when considered together, should be mitigated.

Please revise the draft EIS to address the questions and concerns described on the attachment.

Of note is that the draft EIS does not appear to adequately address the expanded activities of the Preferred Alternative and associated traffic, noise, and coastal access impacts to surrounding properties within SSTC corridor, both individually and cumulatively. The draft EIS acknowledges increased noise impacts, durations, and sound levels; however, no mitigation is proposed based upon the assumption that activities currently exist and there will be an expansion over a broader area that will minimize noise impacts. The draft EIS needs to be revised to properly address, analyze, and quantify the items detailed in the list attached to this letter.

SSTC EIS
Page 2

Lastly, it was pointed out to the Coronado City Council at their meeting of March 2, 2010, that the citizens of Coronado have not had adequate time to review this document. Given the fact that the plan has been understudy since 2001, it would seem appropriate to provide the public with more than 45 days to review such a voluminous document. The City requests an extended public review and comment period for the EIS.

Thank you in advance for reviewing and responding to our questions and requests for further information so the City can adequately determine the scope of anticipated environmental impacts to the Silver Strand corridor associated with the Navy's Silver Strand Training Complex. The City also appreciates your serious consideration of an extended period of time to review the document to allow for full public participation and review of this important study.

Sincerely,

James F. Benson
Interim City Manager

JFB/mlc

Attachment: List of issues to be addressed in the draft EIS

Ann McCaull, Senior Planner

ATTACHMENT

## LIST OF ISSUES TO BE ADDRESSED IN THE DRAFT EIS

1. The draft EIS acknowledges there will be new squadrons, flight patterns and helicopter training occurring at SSTC. The draft EIS fails to identify the location points where the helicopters will take off and the paths of travel to and from the training areas and any increased public safety risks to residents, school populations, and beach users due to the increased amount of flight activity as well as the increased frequency and noise associated with the increased frequency of activity. The draft EIS should address, quantify, and analyze these issues.

2. Section 3.1-12 notes that 80% of flight occurs over the water and aircraft are required to approach and depart from training activities over the water. Is there a map that shows this flight pattern? What is the flight pattern for the remaining 20% including both approach and departure locations? The draft EIS should address, quantify, and analyze these issues.

3. Section 3.1.2.3.1 notes a new activity, N8 Tactical Recovery of Aircraft and Personnel, would involve landing or hovering of helicopters at SSTC-S at nighttime. Where exactly within the southern area of the training complex would this activity occur? How many aircraft, how frequent and for what duration would this occur?

4. Section 3.6-26 discusses Acoustic Impacts associated with the Preferred Alternative. The draft EIS notes sound levels will remain the same but training events producing sound would increase in frequency. No mitigation is proposed. The draft EIS needs to analyze the noise impacts of the increased number of training events both individually and cumulatively.

5. Section 3.6.2.3.2 notes existing aircraft noise is increasing from 778 helicopter sorties per year to 2,220 per year representing a 185% increase. What is the duration and frequency of the sorties? The Amphibious Raid activity is noted to represent the most intense aircraft sound event at SSTC and the frequency of the events would increase to 18 per year. What is the duration of these events? It is not clear from the tables and maps where these activities would be located. An additional activity noted as Tactical Recovery of Aircraft and Personnel (TRAP) notes 5 helicopters could be employed and the activity would occur at night, lasting one to two hours. It does not appear to be identified in Table 2-2 and it is not clear where this activity would occur. Cumulatively, the analyses conclude the types of activities described have occurred over time and the only difference is the frequency and no mitigation is required. If the number of activities, duration of activities, and type of activities increases, the amount of noise will unquestionably increase representing significant changes in noise levels to the area and should be mitigated.

6. How do the planned flight paths for new helicopters (to and from SSTC) align with the current Airport Land Use Study for the military bases? How will these planned/proposed paths affect a study that is currently underway for the NAB and those existing uses within the project boundary?

7. The draft EIS does not identify the flight path and accident potential zones (APZs) areas for the helicopters and aircraft in transit to SSTC. The document references NAVFAC P-80.3 indicating APZ is not required. Provide documentation from the referenced document justify/explaining why none is required.

8. The Acoustic Environmental analysis notes there will be an increase in the frequency of aircraft; increase in amphibious vehicle training; increase with ELCAs and associated pile driving; increase in Breacher activities and use of shotgun blasts. The draft EIS notes while all of these activities will be generating increased noise levels, only the frequency of activity will be increasing; therefore, no mitigation is proposed. Mitigation is identified as the Navy's ongoing process and procedures to notify adjoining agencies/facilities when disturbances will occur. Public notification that noise impacts will occur does not mitigate the noise impacts experienced by students and school officials, residents and tourists.

9. Section 2.3, page 2-27 discusses Alternative 1 as the Navy's Preferred Alternative and is "designed to meet Navy and Department of Defense (DOD) current and near-term operational training requirements." How is "near-term" operational training requirements defined? Is there an estimate for how long these expanded activities, increased training tempos and operations will meet the 100% training needs as identified in the draft EIS? Is this for a period of 5 years, 10 years or longer? If some of the "new" activities and training operations need to be expanded in the future to meet Navy mission requirements, will a supplemental Environmental Assessment be completed?

10. The Purpose and Need section discusses "increased training tempo" from current baseline conditions. This needs to be better defined to be properly analyzed. For example, the baseline tempo of 3,926 activities indicates it is not associated with personnel. The Preferred Alternative indicates an increase in activities approximately 41% to 5,543 activities but there are no associated man hours to correspond to these activities. The draft EIS should be revised to address/clarify increased training tempo of approximately 41% without increased personnel.

11. Section ES 1.3.1 documents the increase of Naval Special Warfare personnel operating on NAB Coronado, equivalent to one additional Sea, Air and Land team. It also documents the realignment of the Explosive Ordnance Disposal groups, which has necessitated expanded use of the Southwest Region training venue, including SSTC. The Marine Corps will also increase the number of personnel cycling through training programs at SSTC. Finally, it discusses new platform, training equipment, and service life extension programs to keep up with current needs. All of the needs correspond to additional personnel training at SSTC but they are not quantified nor are their impacts on the community accounted for in the draft EIS. In particular, what are the impacts to daily traffic as these new personnel travel to and from NBC to participate in this training?

12. The Traffic and Circulation section notes there will be an increase in trips resulting from increased activities and operations; however, it will be less than 2% of the total daily traffic generated. The draft EIS acknowledges Gates 1 & 2 currently experience unacceptable Level of Service. The draft EIS notes that since the increased activity will amount to 2% of traffic, no mitigation is proposed. Any further decrease to the level of service to these intersections should be analyzed and addressed.

13. Section 4.3.14, Page 4-22 Transportation and Circulation cumulative analysis does not adequately analyze the impacts associated with the "increased tempo" of activities proposed with SSTC Preferred Alternative. Where are the estimated traffic generation rates to arrive at the conclusion of a less than 2% increase in traffic? How can an argument be made that since the number of employed are not increasing, therefore, there will be no increase in traffic? What about the new and expanded activities and training planned for SSTC? Where are these "employees" coming from when some of the activities are "new" to SSTC? The document should analyze all the trips associated with the increased training activities including commuter access to/from SSTC/NBC.

14. Table 2.1, Baseline and Proposed Tempos for SSTC Training Activities, identifies 78 training activities along with duration and number of events per year. The document should relate the activities to number of personnel. How many people are training under the baseline and how many will be training under the proposed activities?

15. Table 2-2, Proposed New Training Activities at SSTC for Alternatives 1 and 2, identifies 11 new activities. The document should relate the new activities to the number of personnel. How many additional people will be trained under the new activities compared to the baseline?

16. The draft EIS notes baseline activities will increase from 3,926 activities to 5,343. Many of the new activities are a result of new helicopter training activities such as 200 new mine hunting; 48 new helicopter mine detection; 100 helicopter activity; 48 MH-60s helicopters; 124-154 helicopter rope training; and 109 to 198 Close Quarter Combat with helicopter use. Amphibious Raise (with possible helicopter use) will expand from 6 days a year to 54 activities a year. Perhaps even more significantly, CRRC OTB Insertions and Pyrotechnics will increase from 4 day events approximately 52 times a year to 86 times a year. This change results in almost 365 days per year this activity will occur. The draft EIS does not analyze the cumulative impact of the entire new helicopter activities will have on the air when cumulatively combined. The draft EIS does not contain a section where analysis of combined activities along SSTC can be visualized and analyzed in terms of cumulative activities and noise.

17. Section 3.3.2.1.1, Emissions Evaluation Methodology, discusses emissions from ground vehicles only and should include vehicles involved in the training activities. It should also include all additional vehicles trips to get the personnel to the training (commuter trips).

18. Transportation and Circulation, Page 3.14-4 last paragraph states: The Rendova Road (Gate 1) and Tarawa Road (Gate 2) intersections operate at LOS E during the busiest morning commute hours and Tarawa again operates at LOS E during the busiest afternoon commute hour. This conflicts with Table 3.14-3 which has a LOS F for Tarawa in both a.m. and p.m. peak hours.

19. Transportation and Circulation Page 3.14-5, second paragraph states: The City of Coronado is currently in the process of analyzing traffic conditions for SR-75 to determine the best long-term traffic solutions for the community. This project is actually the SR 75/282 Transportation Corridor Project which is analyzing traffic conditions along the corridor between the bridge and NASNI, not SR-75 adjacent to SSTC.

20. Section 3.14.2.3.1 Ground Transportation indicates under Alternative 1, military training activities are estimated to generate approximately 336 ADTs. The draft EIS should analyze all trips generated from the increased activities and increased training tempo.

21. 3.14-5 Summary of Effects section: Silver Strand at Rendova Road and Silver Strand at Tarawa are signalized intersections with LOS E or worse. All additional traffic generated by the increased activity should be analyzed and the amount of delay calculated in accordance with the SANTEC/ITE Guidelines for the San Diego Region. In addition, there is no mention of the number of pedestrian crossings between the bay side and ocean side of NAB, which affects the signal capacity and causes delay. The document should quantify the number of pedestrian trips across SR-75 that occur and how many more would be expected under Alternatives 1 and 2.

22. 5.13 Transportation and Circulation section does not propose or identify mitigation for the increased transportation and circulation in the proposed alternatives.

23. List of Preparers: A Traffic Engineer was not identified under the list of preparers. Who analyzed the Transportation and Circulation sections?

24. The draft EIS does not identify the potential impacts to the intersections due to increased foot and boat traffic from bay side to beach side. Do the increased activities warrant re-evaluation of an underpass or overpass?

25. Section 5-5 refers to mitigation for underwater detonations and security precautions. When planned activities are underway, will areas of the public beach/water be cordoned off?

26. Section 5-19 notes there is an interpretive sign planned for the bike trail near south Delta Beach. This sign would be located in the Scenic Highway Corridor zone and should be designed to be consistent with the overall Silver Strand Enhancement plan.

27. Table 4-1, Page 4-2 notes future planned improvements for the Navy Lodge. It notes four existing buildings and several smaller structures will be demolished and will be replaced with a lodge building to increase room capacity as well as new recreational facilities, parking, retail shops and a restaurant. What is the approximate square footage of this new facility and net increase in units? Are these additional lodge units to be temporary "resort" type facilities or housing for living purposes as a BOQ or BEQ? Are these additional housing units being proposed to accommodate expanded military operations such as the two new commands at NASNI? The draft EIS further notes in this section that along with the commands, there will be construction of a pier, boat ramp, and several buildings. Where is this project being located and could it also serve as a potential pier/boat ramp to re-instate the ferry service to NASNI that was recently discontinued?

28. Table 4-1, Page 4-3 briefly discusses the U.S. Navy Lighterage project, which involves construction of a waterfront command and control facility for amphibious construction Battalion One facilities to support the introduction of the improved Navy Lighterage System at NBC. The draft EIS does not describe this new system at NBC and should describe the activities associated with the system.

29. Section 4.3.16, Page 4-23 Public Health and Safety cumulative analysis notes there will be momentary disruptions in communication to nearby residences and schools. The draft EIS does not identify how frequently and for what duration. The draft EIS identifies impacts associated with the expanded activities planned for SSTC individually; however, it fails to cumulatively analyze the activities combined to determine the length and period of all activities combined on the residential and school areas. For example, it appears there will be full time operation of the beach lanes at SSTC almost every day throughout the year. Where have those activities – length, time, duration – been analyzed?

30. Table 3-1- states Coronado Beach is the only public beach in Coronado. This statement is incorrect. The Silver Strand State Beach is also located within the City of Coronado.

31. Section 3.6.2.3.3 indicates current Breacher Training operations are 14/day when an event occurs and an event occurs 20 times per year. The draft EIS notes operations will increase to 1,400 annually. How does the increase in activity affect the number of events per year and number per day so an assessment can be made regarding the degree of change on a daily, weekly, or monthly basis?

32. Section 3.6.2.3.4 describes Amphibious Training operations increasing landings from 10,000 to 13,800 per year and LCAC activities (generating the most noise) will increase from 8 to 40 per year. The draft EIS identifies LCAC landings along with associated pile driving that occurs for at least 1 to 2 hours generating decibel levels of 74 to 104, 100' away. The draft EIS notes this activity has the potential to generate the largest number of increased complaints regarding noise and activity levels, particularly due to the proximity of the activity to Silver Strand housing and Silver Strand School. The draft EIS does not propose any mitigation, however, notes the training could result in sleep and communication disturbances. If the draft EIS acknowledges impacts, why aren't mitigation measures proposed? To state the Navy will advise surrounding agencies when potential impacts may occur is simply public notification and does not mitigate the related noise impacts. For example, could changes be made to the school to improve sound attenuation?

33. The draft EIS does not identify the entire Silver Strand as a State Scenic Highway and the Silver Strand (bay to ocean) as a Scenic Highway Overlay zone. The draft EIS should address the potential visual and environmental impacts associated with any new large equipment or improvements that would be visible along the Silver Strand. The City and Navy have worked cooperatively in the past to eliminate unnecessary signs, dilapidated training equipment, and vertical obstructions along the Silver Strand to improve the overall aesthetic improvement to the Silver Strand and assist with Least Tern and Snowy Plover preservation efforts.

34. The draft EIS proposes to institute beach sand berming activities, which negatively impacts the scenic highway and the public use of view corridors. For example, the berming of sand on SSTC has directly impacted the public in the past by blocking sunlight to the Solstice Clock feature in Natures Bridge (Silver Strand's Bayside Nature Trail). In December 2009, at the request of a group of citizens that meet for the winter solstice at this site, the City requested the Navy to lower the berm on December 21 so the sunlight could shine through to the Solstice Clock. The Navy was unable to accommodate this request but did not preclude this request from being accommodated in the future. The draft EIS should address how berming activities will be minimized to avoid the conflicts described in this example as well as other potential berming conflicts along the Strand. This could be addressed through an action plan that identifies how

City and Navy communication will be coordinated and improved to ensure present and future berming activities along the Strand do not negatively impact the Scenic Highway.

35. Several years ago, the Navy bermed up areas on the ocean side of NAB. This activity affected beach sand deposits in front of the Coronado Shores. It has also appeared to accelerate beach erosion at the south end of the Shores. The draft EIS does not address sand movement for training operations and impacts.

36. Figure ES-1 shows anchorage areas directly offshore of Coronado's Central Beach area, which are a direct encroachment into the public's view corridor. There are ample anchorage areas adjacent to Federal (US Navy) property; therefore, there is no necessity for anchorage areas for military craft as shown.

37. Section 3.5.243 of the draft EIS indicates that, if all increased training activities were performed individually, there would be an 85% increase in the amount of time that portions of the bay and/or ocean would be closed to public use. The report also points out that if activities occur simultaneously, that percentage would decrease. Even with that, it is not clear how the public interest is served by this monopolization of ocean and bay use by the military. This proposed increase would have a definite negative impact on public use of these natural resources.

38. The City's beaches are already impacted by trash and other debris from a variety of sources. The draft EIS does not provide for any programs to mitigate the effects of the expanded programs adding to this trash and debris. The City is not aware of any current, ongoing program to clean the Navy's beach areas. The Navy's trash and debris, as well as that from other sources, accumulates on Navy property; tidal action and currents then deposit this trash and debris on public beaches. Expanded training activities will not only disturb buried trash and debris, releasing it into the environment; expanded water-based activities will re-suspend particulate debris deposited on the ocean bed. In summary, expanded training activities will likely lead to an increase in the amount of trash and other debris accumulating on Coronado's beaches in the area. The draft EIS should be revised to address these issues and mitigation.

39. The draft EIS refers to OPNAVINST 5090.1 in several locations; however, this document was not provided as an attachment. Some sections of the report indicate that the discharge of bilge water and grey water is not allowed; other sections of the report seem to indicate that this discharge is allowed under certain conditions. Discharge of grey water and/or bilge water from any Navy vessel in the training area should be prohibited for any reason.

40. The draft EIS describes training activities, which would include the creation of salt water ponds for temperature training. This ponded water would experience human contact for extended periods of time. Any ponded water used for this type of training should be tested to ensure that it meets established water quality standards prior to release back to the ocean and/or bay. The draft EIS should be revised to address this issue.

41. The draft EIS should further discuss, explain and analyze the permit for reverse osmosis water purification and unit discharge into the Bay and Ocean as discussed in Chapter 6 of the draft EIS.

42. In the course of describing training activities, the draft EIS indicated that some running exercises would be performed with military working dogs traversing beach areas. Dogs are prohibited on the City's beaches, except for the area designated as Dog Beach, located at the northwest end of the City's Central Beach, near the Air Station's Ocean Boulevard gate.

RE: Silver Strand Training Complex Project - DEIS

Dear Mr. Randall:

The California Department of Transportation (Caltrans) appreciates the opportunity to have reviewed the Draft Environmental Impact Statement (DEIS) for the Silver Strand Training Complex Project located along State Route 75 (SR-75) south of the City of Coronado. Caltrans has the following comments:

The AM peak Intersection Volumes at Rendova Road is 3,328 with level of service (LOS) E. The AM peak and PM peak Intersection Volumes at Tarawa Road are 3,284 and 3,406 with LOS F. These two intersections LOS are exceeding Caltrans threshold to maintain a target LOS between "C" and "D". Any trips added to an intersection already operating at LOS F typically reduces the intersection measure of effectiveness (MOE operating capacity). A corridor segment or intersection currently operating at LOS F has reached its maximum effective operating capacity. Any additional trips added without maintaining the existing MOE's would further degrade the operational function and does not allow an intersection or segment to continue to operate within its capacity, as the segment or intersection has failed. Significant delays are expected at an intersection or roadway segment operating at LOS F. This should be documented as such in the EIS. The above intersections should also be analyzed for Existing plus Project to specify the significance of traffic generated by Marine activities additional trips.

On page 3.14-4 to 3.14-5, the Rendova Road intersection operates at LOS E during the AM peak hour; and Tarawa Road intersection operates at LOS F for both AM peak and PM peak hour. Please revise.

On page3.14-5, section 3.14.1.4.2 Traffic volumes along Palm Avenue between 2005 and 2006 have decreased by 39%. The same applies for Table 3.14-4. Please revise.

*"Caltrans improves mobility across California"*

Mr. Kent Randall
March 9, 2010
Page 2

The Traffic Impact Analysis (TIA) within the EIS did not address potential increase (or decrease) in pedestrian related trips at the analyzed intersections. The TIA should address the potential impacts that may occur as a result of any increase in pedestrian trips from Oceanside training to bayside training etc. Increased pedestrian trips can have a substantial impact on intersection operations, as the existing pedestrian crossing time may not be adequate to handle additional trips and may require the pedestrian crossing phase time to be increased to meet the added demand, thus lowering the overall capacity of intersections where this may occur. This would be especially important to know for the peak periods analyzed within the TIA.

Any reduction in pedestrian trips during the peak periods that may increase the capacity of any of the signalized intersections analyzed, such as new eating facilities on the beach side training facility, which would reduce the need for trips at the analyzed intersections would be helpful to note as well.

Based on the inclusion of these revisions to the EIS, Caltrans has no further comments.

If you have any questions or require further information, please contact Christian Bushong at (619) 688-2510 or Christian.Bushong@dot.ca.gov.

Sincerely,

JACOB M. ARMSTRONG, Chief
Development Review Branch

Subject: Silver Strand Training Complex, Draft Environmental Impact
San Diego, CA (CEQ # 20100016)

Dear Mr. Randall:

The U.S. Environmental Protection Agency (EPA) has reviewed the subject document pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

EPA acknowledges the importance of military training, and the challenge of balancing training programs with environmental requirements. EPA compliments the Navy on its role in aiding the recovery of the least terns.

We have rated the Draft Environmental Impact Statement (DEIS) as Environmental Concerns – Insufficient Information (EC-2) (see enclosed "*Summary of Rating Definitions*"). We are concerned about the project's impacts on water resources and biological resources, and about the need for waste minimization. We also request clarification of the baseline training tempo. Additional information about our concerns is provided in the enclosed detailed comments.

We appreciate the opportunity to review this DEIS. When the FEIS is released for public review, please send one (1) hard copy to the address above (mail code: CED-2). If you have any questions, please contact me at (415) 972-3521, or contact Tom Kelly, the lead reviewer for this project. Tom can be reached at (415) 972-3852 or kelly.thomasp@epa.gov.

Sincerely,

Tom Kelly

**EPA DETAILED COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) FOR SILVER STRAND TRAINING COMPLEX, SAN DEIGO COUNTY,CA, MARCH 2010**

**Water Resources**

*Vernal Pools*

As stated in EPA's website[1], "[m]ore than 90% of California's vernal pools have already been lost. Great efforts are being made to protect the remaining vernal pools, as their disappearance marks the loss of rare and important habitat and some of the associated plant and animal species as well." At the Silver Strand Training Complex – South (SSTC-S), the vernal pools cover 3.2 acres in total (Table 3.11-1). Additionally, many contain endangered San Diego fairy shrimp "found in 11 of 25 vernal pools and salt marshes surveyed" (page 3.11-12).

In the preferred alternative, the DEIS states on page ES-10, "[t]he Navy would allow limited training involving foot traffic, but not vehicle traffic, in the vernal pools when vernal pool conditions are determined to be dry." The DEIS also states in Table 3.11-4, "[d]ry conditions would be determined by a qualified person overseen by a NBC [Naval Base Coronado] Botanist or Wildlife Biologist." While foot traffic in the vernal pools when the soil is dry and hard is unlikely to damage fairy shrimp, determining when the pools are dry enough for foot traffic is complex.

**Recommendation:**
EPA recommends the Navy work with U.S. Fish and Wildlife Service to identify the highest quality vernal pools, and fence those to minimize impacts from training.

Alternatively, EPA suggests

- the FEIS commit to an inspection of vernal pools by a wildlife biologist, prior to upland training at beach Purple 2, or
- the FEIS list the factors that will be used to determine the vernal pools are dry enough to withstand foot traffic.

*Sediment Quality*

The DEIS states on page 3.5-14, "[r]ecent sediment sampling in the San Diego Bay near SSTC-N indicates – while concentrations of some contaminants are elevated above background levels – no contaminants were present at concentrations which would adversely affect marine organisms (Port of San Diego 2002)." EPA encourages a fuller discussion of sediment sampling results near SSTC-N and any screening levels used to

[1] http://www.cpa.gov/wetlands/types/vernal.html

1

determine that no contaminants were present at concentrations of concern. The purpose of the sediment sampling in the report cited (San Diego Harbor Deepening EIS/EIR, USACOE, November 25, 2002) most likely was intended to characterize the quality of the sediment to be dredged, and may not have specifically addressed the sediment at SSTC-N. Even more so than dredging, underwater explosions are likely to make contaminated sediments bioavailable to fish and marine mammals.

**Recommendation:**
The FEIS should provide additional discussions of sediment sampling at SSTC-N, including a brief description of the number of samples, depth of sampling and contaminant concentrations.

**Biological Resources**

*Least Terns*

The DEIS discusses physical training for groups averaging 30 – 150 people (Table 2-1, page 2-24), and includes that "trainees may occasionally have a military working dog participate in the physical conditioning." Page 3.11-39 also clarifies that military working dogs "are typically on the hard packed sand (SSTC-S) or sand road (SSTC-N), they can also be on the soft packed sand in both areas." While federal endangered least terns may have acclimated to the presence of humans nearby, barking dogs in nesting areas does not seem prudent, particularly when exercise in the nearby hard packed sand would be much less intrusive.

**Recommendation:**
The FEIS should include a mitigation measure that avoids conditioning military working dogs in least tern nesting areas (i.e. the soft packed sand of Blue 2, Orange 1 and Orange 2).

**Waste Minimization**

EPA recognizes the Naval Region Southwest's commitment to sustainability, including renewable energy, water conservation, green buildings and more. We commend the Navy for "pumping seawater through its Offshore Petroleum Discharge System during training, instead of using petroleum products." In comparison, the DEIS does not explain whether a high level of scrutiny has been applied to the explosive training exercises, although it does identify potential munitions constituents of concern and explosives residue (on page 3.4-10 and 11). EPA acknowledges that in many instances the success of training exercise may not be judged without using the actual amount of explosive also used in field conditions, however, that may not be the case for all explosives training exercises.

**Recommendation:**
The FEIS should assess the potential to reduce explosive charges in meeting its training needs.

**Clarification of Baseline Training Tempo**

Various sections of the DEIS provide information on baseline training tempo, including Table 2-1. EPA encourages a more thorough discussion of the development of the baseline training tempo, to clarify the concept. The FEIS should, for example, explain whether the values in Table 2-1 represent the amount of training conducted in a specific year or the amount of training that could be conducted given the current restrictions on training. Where the baseline training tempo is not reflective of recent training activities, EPA suggests the FEIS include a comparison with recent training activities. This will foster better understanding of the FEIS. EPA is not suggesting additional factors need to be used for comparison throughout the FEIS, only that it should link training tempo to recent levels of training at SSTC.

3

# SUMMARY OF EPA RATING DEFINITIONS*

This rating system was developed as a means to summarize the U.S. Environmental Protection Agency's (EPA) level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the Environmental Impact Statement (EIS).

## ENVIRONMENTAL IMPACT OF THE ACTION

***"LO" (Lack of Objections)***

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

***"EC" (Environmental Concerns)***

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

***"EO" (Environmental Objections)***

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

***"EU" (Environmentally Unsatisfactory)***

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

## ADEQUACY OF THE IMPACT STATEMENT

***"Category 1" (Adequate)***

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

***"Category 2" (Insufficient Information)***

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

***"Category 3" (Inadequate)***

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

Kent Randall – Silver Strand Training Complex EIS
Naval Facilities Engineering Command, Southwest
1220 Pacific Highway, Building 1, 5th Floor
San Diego, California 92132

Dear Mr. Randall:

This is in response to your request for comments on the Silver Strand Training Complex Environmental Impact Statement in the County of San Diego, Cities of Coronado and Imperial Beach, California.

Please review the current effective countywide Flood Insurance Rate Maps (FIRMs) for the County of San Diego (Community Number 060284), and Cities of Coronado (Community Number 060287) and Imperial Beach (Community Number 060291), Maps revised September 29, 2006. Please note that the Cities of Coronado and Imperial Beach, San Diego County, California are participants in the National Flood Insurance Program (NFIP). The minimum, basic NFIP floodplain management building requirements are described in Vol. 44 Code of Federal Regulations (44 CFR), Sections 59 through 65.

A summary of these NFIP floodplain management building requirements are as follows:

- All buildings constructed within a riverine floodplain, (i.e., Flood Zones A, AO, AH, AE, and A1 through A30 as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level in accordance with the effective Flood Insurance Rate Map.

- If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, any ***development*** must not increase base flood elevation levels. **The term *development* means any man-made change to improved or unimproved real estate, including but not limited to buildings, other structures, mining, dredging, filling, grading, paving, excavation or drilling operations, and storage of equipment or materials.** A hydrologic and hydraulic analysis must be performed *prior* to the start of development, and must demonstrate that the development would not cause any rise in base flood levels. No rise is permitted within regulatory floodways.

www.fema.gov

Kent Randall
Page 2
March 8, 2010

- All buildings constructed within a coastal high hazard area, (any of the "V" Flood Zones as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structural member, (excluding the pilings and columns), is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components.

- Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA for a FIRM revision. In accordance with 44 CFR, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall notify FEMA of the changes by submitting technical data for a flood map revision. To obtain copies of FEMA's Flood Map Revision Application Packages, please refer to the FEMA website at http://www.fema.gov/business/nfip/forms.shtm.

**Please Note:**

Many NFIP participating communities have adopted floodplain management building requirements which are more restrictive than the minimum federal standards described in 44 CFR. Please contact the local community's floodplain manager for more information on local floodplain management building requirements. The Coronado floodplain manager can be reached by calling Gary Fausett, Senior Building Inspector, at (619) 522-7326. The Imperial Beach floodplain manager can be reached by calling Edward Wilczak, Building Official, at (619) 628-1357. The San Diego County floodplain manager can be reached by calling Cid Tesoro, Flood Control District Manager, at (858) 694-3672.

If you have any questions or concerns, please do not hesitate to call Michael Hornick of the Mitigation staff at (510) 627-7260.

Sincerely,

Gregor Blackburn, CFM, Branch Chief
Floodplain Management and Insurance Branch

## E.2.17 San Diego County Archaeological Society, Inc.

**San Diego County Archaeological Society, Inc.**

Environmental Review Committee

4 March 2010

To: Mr. Kent Randall
Naval Facilities Engineering Command, Southwest
Building 1, 5th Floor
1220 Pacific Highway
San Diego, California 92132

Subject: Draft Environmental Impact Statement
Silver Strand Training Complex

Dear Mr. Randall:

I have reviewed the cultural resources aspects of the subject DEIS on behalf of this committee of the San Diego County Archaeological Society.

Based on the information contained in the DEIS, while we appreciate the actions the Navy has taken to protect cultural resources in the Silver Strand Training Complex, we have the following comments:

1. The DEIS describes actions the Navy routinely takes to avoid significant impacts to cultural resources, such as notification of restrictions prior to activities. What actions does the Navy take to audit the effectiveness of impact avoidance? Is there a periodic monitoring or inspection program, with provision for remedial action should any problems be identified?

2. The DEIS considers potential impacts to ground-disturbing activities "in the immediate area of an archaeological site" (see Section 3.13.2). It does not address the possibility of such activities impacting buried sites. A monitoring program is warranted for areas where previously-undisturbed subsurface areas will be subjected to excavation, grading or similar disturbances. Both archaeological and Native American monitors need to be part of such a monitoring program.

3. Please explain where the collections from previous archaeological investigations on the SSTC are curated. An inspection of the listing of curated collections at the San Diego Archaeological Center identified none of the sites listed (other than an apparent error for SDI-13968, which is listed for a site inventory project on Camp Pendleton). Are the collections curated at another facility meeting the requirements of 36CFR79? If not, what actions will be taken to bring their curation status into compliance with 36CFR79?

P.O. Box 81106 • San Diego, CA 92138-1106 • (858) 538-0935

SDCAS appreciates the opportunity to participate in the navy's environmental review process for this important project.

Sincerely,

James W. Royle, Jr., Chairperson
Environmental Review Committee

## E.2.18 San Diego Audubon Society

*Fostering the protection and appreciation* SAN DIEGO AUDUBON SOCIETY *of birds, other wildlife and their habitats...*

March 30, 2010

Naval Facilities Engineering Command, Southwest
Attn: Mr. Kent Randall – Silver Strand Training Complex EIS
1220 Pacific Highway, Building 1, 5th Floor
San Diego, CA 92132

Via email: tory.randall@navy.mil

Dear Mr. Randall:

SUBJECT: Silver Strand Training Complex Environmental Impact Statement dated January 2010

Please withdraw the comment letter that we submitted on March 9, 2010, and replace it with this letter. We appreciate the extension of time for the comments on this EIS.

The San Diego Audubon Society is very concerned with the proposed project. We greatly appreciate the current efforts of the Navy to protect and enhance the safe nesting of California Least Terns and Western Snowy Plovers on the Silver Strand. Section 5.11.1. is a very interesting history of Navy environmental responsibility and leadership. We also appreciate the expanded training needs for the Navy because of our Nation's current high level of military activity. However, we think that the plan needs to be more protective than the current Alternative 1 or 2. Therefore we support the No Project alternative unless Alternate 1 can be improved substantially. We strongly urge that Alternative 2 not be selected because of its large and irresponsible impact on least terns and snowy plovers. The San Diego Audubon Society also supports the Bay Council letter to which we are a cosigner.

**IMPACTS ON LEAST TERNS**

The population of Least Terns has risen substantially over the last 15 years, as the EIS shows. But, the reproduction of Least Terns has generally been declining over the last decade as the EIS also shows. This suggests that the species is not doing nearly as well as it looks. It is also thought that the average age of the birds is increasing, which could reduce future reproductive success. This is clearly not a good time to increase the take of the species, particularly when that take is avoidable. We will be more specific in the following subheadings.

CUMULATIVE IMPACTS NOT ADDRESSED, LEAST TERNS

The EIS provided a long list of likely activities for which the cumulative impacts have been addressed. We are concerned that several very relevant activities were not addressed that, when combined with Alternative 1 or 2 could help put the recovery, and perhaps even the survival of the species in jeopardy.

The U.S. Fish and Wildlife Service has proposed downlisting the least terns from Endangered to Threatened. This would reduce the priority for funds, for priority for other resources such as locations for new nesting areas, negotiating site management agreements, predator management, protection and enhancement of the fish needed for foraging, research, monitoring, planning, analysis, site maintenance, etc. This reduction in resources and priorities will take a toll on the species, in both predictable and unpredictable ways.

Global Climate Change appears to be making the quantity and timing of the supply of small fish for least tern consumption more variable and more uncertain. This affects the likelihood that chicks will survive. Changes are happening very quickly which could leave the entire population more vulnerable.

858-273-7800 • 4010 Morena Blvd., Suite 100, San Diego, CA 92117 • Fax 858-273-7801 • www.sandiegoaudubon.org

The impacts of Gull-bill terns on tern reproductive have been significant and appear to be increasing. There appears to be no real progress toward identifying how to manage the two species to assure the recovery of least terns. This lack of resolution is likely to result in a large and unmanaged take of least terns for at least several years while regulations are developed, reviewed, and finally implemented.

The Recovery Plan for least terns is almost three decades old and is based on outdated information. As a result, there is no effective comprehensive and broadly accepted plan for the recovery of least terns. This deficiency in planning and management means that there is no valid way to conclude that the additional take proposed by Alternatives 1 or 2 will not help put the species in jeopardy.

We urge that the EIS acknowledge each of the additional cumulative impacts mentioned above and incorporate their effects into its analysis.

SPECIES VIABILITY ANALYSIS, LEAST TERNS

The Species Viability Analysis is based on reproduction rates measured in 1981 to 1984, according to page 3.12-21. At this time the productivity was 0.62 fledgling per nest in good years and 0.27 for years dominated by El Nino/Southern Oscillation (ENSO). The ENSO influence was expected about one out of seven years.

According to a figure in the handout from the public presentation, in the last 8, the good years have had productivity around 0.15 for the good years and 0.05 for the bad ones. It appears that we have had 8 bad years in a row vs. the one bad year in seven anticipated in the Species Viability Analysis.

As mentioned above the Species Viability analysis assumes one ENSO year for every 7 normal years. However, some climate models now suggest that with global warming the average may become more like the ENSO state which will make least tern reproduction more difficult.

The model also does not address other trends that could increase the risk to the food supply for least tern recovery such ocean warming, reduced oxygen levels in the ocean, and ocean acidification. Each of these issues suggests that the Species Viability Model is probably wildly optimistic.

We urge that this EIS not conclude that a lower population of least terns will not jeopardize the recovery of the species unless that conclusion can be substantiated with current and relevant data and the best analysis of future trends. Such an analysis should also incorporate the effects of the cumulative impacts listed previously in this letter. Any model used should include the uncertainty range of the input information, the uncertainties of the assumptions the model is based on, how the uncertainties propagate through the model, and the uncertainty of the results. A model that produces a number without clear quantification of the uncertainty of that number will probably be more misleading than useful.

The species viability analysis only appears to address keeping the species from declining to extinction. The purpose of the Endangered Species Act is recovery. This analysis needs to be redirected to identify a population and population growth rate that will lead to a high probability of recovery of CA least terns in a reasonable period of time.

**IMPACTS ON WESTERN SNOWY PLOVERS**

The EIS proposes a maximum number of 22 Snowy Plover nests that will be marked for protection. Other nests, eggs, and chicks will be unmarked. As they are very well camouflaged the destruction of a large number of chicks and eggs appears likely. The EIS fails to provide any analysis to quantify the likely number of unmarked nests, eggs, and chicks in the lanes would destroyed accidentally. But it concludes that this will not be a significant impact with no data or analysis to support this conclusion.

From 2005 to 2009, Snowy Plover population on the West Coast has declined about 13%. The Recovery Plan emphasizes the need for increased protection of nesting areas to allow recovery.

2

Backing off on protection of these nests appears to be a significant risk to the viability of this species and directly contradicts the recommendations of the Recovery Plan.

EIS also fails to provide any direct mitigation for the losses of Western Snowy Plovers that will be caused by this project as is required by NEPA. Ironically the protection of these three lanes during nesting season was provided as mitigation for the losses that were anticipated for the other 11 lanes. In view of this, If this project is implemented, we strongly urge that the EIS provide estimates of anticipated losses of WSPs from the training operations on all of the 14 Silver Strand project area and provide adequate mitigation to directly offset those losses in all 14 lanes.

**BIOLOGICAL OPINION NOT AVAILABLE**

The Biological Opinion from the US Fish and Wildlife Service will have an important impact on the future of this project. It is inappropriate that the public must review this EIS without seeing the final Biological Opinion for the project. The BO would provide additional information and the opinion of the FWS. It is essential that reviewers be able to review this opinion and its background information and see how the Navy intends to deal with that opinion.

We strongly urge that the DEIS be recirculated for comment after the BO is received, its results are integrated into the project, and the mitigation is identified. This transparency is especially important for this project in view of its large potential impacts on two very important at-risk species. If the public is only allowed to see this information in the FEIS, there will be no formal comment period, and the public will have been denied the intended benefits of the NEPA process.

**IMPACT OF NOISE AND DISTURBANCE ON LEAST TERNS AND SNOWY PLOVERS**

We were pleased to see the substantial analysis of the average and peak noise resulting from the project in Section 3.6, ACOUSTIC ENVIRONMENT. But we were extremely disappointed to discover that the noise analysis was only related to "sensitive receptors" of the human kind. The EIS provides no analysis to determine if the increases in average noise or peak noise from the increases in gunfire, flares, and detonation would result in a take, or a reduction of reproductive success, of least terns or snowy plovers. This loss could result from either least terns or snowy plovers being deterred from nesting or abandoning eggs or chicks because of the additional noise, either on the ocean side or the bay side of the Silver Strand.

We strongly urge that the EIS include analysis of the indirect take of chicks and eggs that will result from permanent nest abandonment that is likely to result from the increase in noise, both average and peak. We also urge that the EIS include analysis of the indirect take of chicks and eggs that is likely to result from temporary abandonment that would make the eggs and chicks more vulnerable to death from heat, cold, predators, and starvation.

**ALTERNATIVES**

The limited range of alternatives that are presented in the EIS do not provide a reasonable starting point for a productive process to resolve the project's operational and environmental problems. The lack of meaningful alternatives is not consistent with the letter or intent of NEPA. We urge that the EIS alternatives be expanded to lead to a reasonable solution to the Navy's training issues.

The EIS needs to provide an alternative that identifies scheduling efficiencies that will preserve the land portion of blue 2, orange 1, and orange 2 during nesting season. A very large portion of the use of the training area is for physical fitness training which provides considerable opportunities for more efficient use of the area. The EIS's allegation that expanding operations into those three lanes is essential to the mission is not supported by any specific information provided in the EIS.

Many of the missions that are proposed can be accomplished in the water section of the lanes, with virtually no beach access. We urge that the uses of lanes blue 2, orange 1, and orange 2 be limited to those water-only missions during nesting season. Needed access for them could be by boat vs. land. If emergency access is occasionally needed over the beach, that could be considered valid unavoidable "incidental take." Such an alternative should be developed and analyzed.

We also urge that an alternative be analyzed that allows lanes at Camp Pendleton to be used to relieve some of the scheduling pressure on the Silver Strand Beach Lanes without destroying least tern and snowy plover eggs and chicks.

We strongly urge that a set if meaningful alternatives be identified that will address the Navy's training needs in a much more environmentally protective manner. Such an alternative is essential to satisfy the letter and the intent of NEPA.

**MITIGATION FOR LEAST TERNS AND SNOWY PLOVERS**

The mitigation measures for the impacts of this project are defined in section 12.4.1: "Develop a site enhancement plan that includes establishing dunes on the windward edges of Delta North and South that would enhance this area for plovers, create a source of sand for the least tern nesting area, and establish a better visual barrier between SR-75 and the nesting colony."

It is not clear what is meant by "Develop a site enhancement plan..." Does that mean that the enhancement would actually be built? How big? When would it be built? Would it be in place and functioning before Alternative 1 or 2 would be implemented? Would it be maintained in perpetuity, or just constructed? This sort of information about the scale and viability of the mitigation should have been a major element of the EIS.

We would appreciate habitat enhancements. But, is it anticipated that these measures would result in an improvement in productivity in terns and plovers that would offset the anticipated direct and indirect take that would result from Alternative 1 or 2? It appears very doubtful that it would. One of the purposes of the EIS is to identify the net impact of the project with the mitigation. This EIS does not identify the impact and it does not identify how much of that impact is offset by the mitigation. It fails to provide the fundamental elements of an EIS.

A better visual barrier between SR-75 and the nesting colony will also mean a better approach path for avian predators to approach the tern colony without being detected. We doubt that will improve the productivity of the colony. Thus it does not appear to have any value as mitigation.

Section 12.4.2 states: "Vehicle patrolling and LARC V operator training will not occur in Red, Blue, or Orange Beach Lanes." How many least terns of snowy plovers will this save? Will the terns and plovers that are saved by this measure survive the other activities that will occur in these lanes under Alternatives 1 and 2? It does not appear that they would. Again, the EIS fails to identify the impacts of this measure, which is one of its main purposes.

The two mitigation measures in the EIS may tend to reduce or offset the take a little, but they do not appear to minimize or to offset the impacts of the Project. If Alternatives 1 or 2 are adopted in spite of their inappropriate impacts, we urge that mitigation be provided that will actually offset the take that results from those actions.

The EIS does not indicated that any accounting will be done to identify how much of the environmental impact of the project is expected to be offset by the mitigation. How would a regulator or decision maker be able to identify how much environmental impact has occurred and how much has been offset by the mitigation over time? We urge that the EIS provide how such an ongoing net impact assessment will be accomplished to facilitate the adaptive management process that is mentioned.

If the project results in a substantial increase in a net take, or if the viability of the terns and plovers begins to diminish, will the project include additional specific mitigation measures to restore protection of the nesting at the three lanes or more to offset the loss? Though adaptive management is suggested, there are no specifics of what is meant by it for this project.

It appears that there are areas in the SSTC South area that could be used to mitigate for the impacts of this project that would be difficult and costly to use for training. We urge that the Final version of this document explore that possibility.

**IMPACTS ON DIVING BIRDS**

We appreciate the analysis that was performed relating to the impacts of underwater detonations on diving birds and marine mammals. However, we have not had the resources to verify the data, rationale, or conclusions at this time. We also appreciate the plan to discourage diving birds from the exercise area to prevent injuries or death to them.

**PROTECTION OF SENSITIVE PLANT SPECIES**

We do not think that the protection of sensitive dune and upland species proposed by the EIS is adequate, but have not had the resources to comment specifically on them at this time. Volunteer from our chapter spend many hundreds of hours removing invasive vegetation to provide habitat for some of these sensitive plant species. It is disappointing to hear that there will be no protection for these sensitive species in this project.

**IMPACTS ON VERNAL POOLS**

Vernal pools are one of the most endangered habitat types in all of California. These pools house a vast array of life forms, including endangered species like the San Diego Fairy Shrimp. Trails running through the vernal pools will disturb the sensitive hydrology of the pools, even if they are only used during the dry season. Cysts can be crushed and damaged even in the dry season. There is no way to predict the damage that could be caused to the vernal pools by crossing through them, even limited to just the dry season. The complex ecology of vernal pools is easily disturbed. We urge that the vernal pools be fenced, and that crossing of vernal pools be prohibited.

Paragraph 3.11.1.1.1, Regulatory Framework, states that the Fish and Wildlife service may issue a Biological Opinion that will state measures that will avoid or minimize the take of any listed species. Table 3.11-3 acknowledges that Alternatives 1 and 2 could adversely impact individual fairy shrimp. The foot traffic will have direct and indirect impact on the vernal pools, even if the foot traffic through the pools is limited to dry seasons. The direct impact is that cysts will be damaged or destroyed by the foot traffic. This is addressed in the EIS. When people walk through an area that contains weedy species, the seeds of the weeds often attach themselves to the shoes, clothes, and equipment of the people. These seeds drop off as the people walk elsewhere, helping to disburse the weed seeds. The invasion of these weeds can have many negative impacts on the pools, including shadowing, increasing evaporation and transpiration rates, degrading the hardpan, etc. There is no way to minimize this impact. Foot traffic could also wear depressions in the containment mounds of the pools eventually changing the hydrology of the pools, preventing the pooling from occurring. Foot traffic could also change land contours separating a pool from its immediate watershed. The EIS does not address any of these significant impacts as it needs to. Clearly these impacts will progressively degrade the pools and will reduce the likelihood that fairy shrimp will be able to recover.

Clearly, allowing foot traffic through the vernal pools will not "minimize" (as stated several times in the EIS, including Table 3.11-3) the take of fairy shrimp in any sense and is a violation of the Endangered Species Act. Limiting the access to foot traffic in dry weather may slightly reduce it, but that is very far from minimizing it in either a legal or practical sense. Pinocchio got a very long nose when he said things like that.

Unfortunately the EIS does not address the conservation of the pools that are not occupied by fairy shrimp. The objective of the Endangered Species Act is Recovery, not just hanging on, or not facilitating the incremental decline of the species. For recovery to occur, a reasonable amount of unoccupied habitat must be protected to accommodate more populations. We urge that a significant portion of unoccupied and restorable pools be protected as well as occupied pools.

5

The survey for fairy shrimp, on which this document is based, was conducted in 2001 and 2003. A more recent survey is required to know how many pools are currently occupied. We urge that decisions be based on a more timely survey.

We strongly urge that the Project require that all occupied, and all unoccupied pools with a reasonable chance of being restored for future occupation, be fully fenced and that regulations be implemented that forbid entry at any time of the year except for needed maintenance or emergencies. We also urge that the watershed of these pools also be protected so the hydrology of these pools and their necessary watersheds will be viable.

If the Project intends to use vernal pools for foot traffic in spite of the potentially serious impacts, we urge that a multi-year experiment be conducted to assess the impacts on a single test pool, and that all other pools be fully fenced and protected until the potential impacts are fully understood and disclosed.

**WHEN THE CURRENT DEMAND FOR BEACH TRAINING RELAXES**

The EIS addresses the need for additional training capability because of the additional deployments to war zones. It does not address returning to the current protection of nesting birds in the three lanes when the need for training is relaxed. If Alternative 1 is adopted, will it be a temporary measure? If Alternative 1 or 2 are implemented, we urge that the EIS contain a commitment that it will revert to the No Project configuration when the need for additional training is reduced in the future.

**CONCLUSION**

This document does not satisfy the letter or the intent of NEPA. We strongly urge that the "No Project" Alternative be adopted. However, it appears that a more thoughtful alternative, with real mitigation measures, could be put together that would allow an increase in the training capacity of the Silver Strand while protecting or even enhancing its extremely valuable natural resources. We encourage the Navy to move in that direction in a future Draft of the EIS.

The Navy has had laudable success in its well conceived and well managed mitigation projects for past impacts to terns and plovers on Silver Stand. It is regrettable that this project will seek to significantly dismantle some of that success.

If the Navy decides to move ahead with the current alternatives, we strongly urge that the next Draft quantify what impacts of the project will and will not be offset by the mitigation proposed. We urge that the Navy then identify mitigation that will fully offset the deficit.

We strongly urge that the Species Viability Model used in this Draft be substantially updated or not used. It is not the least bit certain that the current population of least terns is viable in view of our environmental and climate uncertainties. That model clearly does not provide credible justification to the assertion the species will do just fine with a drop of a couple thousand birds.

In case of questions or follow-up, the undersigned can be reached at 619-224-4591 or peugh@cox.net .

Respectfully,

James A. Peugh

**Re: Silver Strand Environmental Impact Statement Comments**

Dear Mr. Randall:

The San Diego Bay Council respectfully submits the following comments on the Navy Silver Strand Draft Environmental Impact Statement. The San Diego Bay Council is a coalition of environmental organizations dedicated to the protection and restoration of regional coastal waters in the San Diego. Member organizations, representing 22,000 San Diegans, act through community involvement, regulatory participation, and legal action to ensure the protection and restoration of San Diego Bay, Mission Bay, and the region's coastal waters.

The San Diego Bay Council recognizes that the Navy desires to protect the environment to the fullest extent possible while training the men and women that protect our nation. But the Navy's analysis in the Silver Strand Draft Environmental Impact Statement falls short of showing how the Navy's plan to expand training at the Silver Strand facility will actually protect the environment.

The San Diego Bay Council has serious concerns with the Navy's plan to vastly expand training activities and frequencies at the Silver Strand Training Complex and the hefty toll it will take on the local community and the environment. The Navy's plan has serious long-term negative impacts to water quality, air quality, endangered species, public access to the ocean, bay, and beaches, noise, traffic, and other aspects of quality of life and the environment.

Despite the voluminous Draft Environmental Impact Statement, the Navy has not taken a hard look at the direct, indirect, and cumulative impacts this increased training will have on the community and the environment. The heart of the National Environmental Policy Act is for the Navy to fully analyze and weigh the consequences of each of its possible project alternatives, before selecting one. As part of this process, the Navy must inform members of the public of the burdens the Navy is expecting it—and the environment it uses and enjoys—to bear as a result of the project, before the project is approved and an alternative selected. Here, the Navy's conclusory "analysis" and lack of meaningful alternatives makes NEPA nothing more than a meaningless exercise and deprives the public of the important information it is entitled to under the law.

While the San Diego Bay Council has a multitude of serious concerns about the Navy's proposed training increased activities and frequencies, this letter focuses on only three of our main concerns. We appreciate the extension the Navy granted so that we could submit these comments, but even with the extension, we were unable to delve into all our concerns in detail. We reserve the right to rely on other comments submitted during the public comment process, and we fully adopt here all comments submitted by the San Diego Audubon Society.

Mr. Kent Randall
Re: Bay Council Comments on Navy Silver Strand Training Complex Draft EIS
March 30, 2010
Page 2 of 8

## I. The Draft EIS Fails to Analyze Anticipated Water Quality Impacts From Increased Smoke Grenades, Flares, and Surface and Underwater Detonations.

The Navy's proposed ramp-up in training at the Silver Strand Training Complex involves a significant increase in the amount of hazardous ordinance the Navy will be using. For example, the Navy plans to increase the use of smoke grenades and flares from 2,990 pounds to 4,410 pounds. *See* SSTC DEIS at 3.4-13. The smoke grenades and flares may contain aluminum, magnesium, zinc, strontium, barium, cadmium, nickel, and perchlorates. *See* SSTC DEIS at 3.4-11. The Draft EIS states that these hazardous pollutants will not cause any problems because "most of them are present in small amounts or low concentrations...." *See* SSTC DEIS at 3.4-11. The Draft EIS summarily concluded that the "low concentrations of leachable metals" in the No Action Alternatives do not rise to the level of hazardous materials. *See* SSTC DEIS at 3.4-11.

The Draft EIS then deferred to the "Hazardous Waste" analysis in its water quality impacts analysis. *See* SSTC DEIS at 3.5-21. Specifically, the Draft EIS states that the "Hazardous Waste" analysis "concluded that only trace amounts of these residues are deposited on the ranges, and they are not expected to affect surrounding biological or physical resources." *See* SSTC DEIS at 3.5-21. But nowhere does the Navy actually analyze the impact of nearly doubling the amount of pollutants it plans to deposit during training. Instead, the Draft EIS characterizes the pollutants as "trace" amounts and summarily dismisses their potential environmental impact. Even at low concentrations, pollutants can cause serious problems. Because the Navy plans to almost double the amount of pollutants from smoke grenades and flares, it needs to take a hard look at the potential environmental impacts of such a drastic increase in pollution.

Likewise, the Navy plans to double its surface and underwater detonations. *See* SSTC DEIS at 3.5-22, tbl 3.5-7; 3.5-25, tbl 3.5-8. Yet the Draft EIS assumes there will be no measurable impact on water quality, even though "combustion is less than 100 percent and residues of these hazardous materials may remain in the water and sediment." *See* SSTC DEIS at 3.5-25. The Draft EIS provides no support or justification for this conclusion.

The Draft EIS also fails to examine the cumulative, long-term impacts of increasing the amount of pollutants released into the ocean and bay. Under NEPA, the Navy must examine the direct, indirect, and cumulative impacts of its proposed action. Here, the Navy has failed to examine the cumulative impacts of doubling the amount of hazardous pollutants it puts into our waters each year. To satisfy its NEPA requirements, the Navy must fully examine the cumulative impacts of increased water pollution.

## II. The Navy's Proposed Plan Will Interfere With Public Access to the Ocean and Bay.

The Draft EIS states that in total, "training would require closure of portions of the ocean or bay for about 7,500 hours per year" or 312 days per year. *See* SSTC DEIS at 3.5-25. This would mean that portions of the ocean or bay would be closed "for about 85 percent of the year if no training were conducted currently." *See* SSTC DEIS at 3.5-25. The Draft EIS suggests that training will "likely overlap in time in an unpredictable way, which would result in multiple areas being closed for a shorter percentage of the year." *See* SSTC DEIS at 3.5-25.

What the Draft EIS does not address is how many of those hours of closure and training activity would occur during the daylight hours when the public is most likely to use the ocean or bay. If San Diego receives, on average, between seven and ten hours of sunlight per day, that can add up to only around 3,000 hours of sunlight per year.[1] If the Navy plans to close the ocean and bay 7,500 hours per year, it is possible to have the bay and ocean closed during all hours of sunlight in a given year.

[1] Based on San Diego's average conditions, it is estimated that San Diego receives approximately 3,012 hours per year of sunlight. *See* http://www.bbc.co.uk/weather/world/city_guides/results.shtml?tt=TT001510. While these

Disturbingly, the Draft EIS includes—but completely disregards—the City of Imperial Beach's annual estimates of use for shore and nearshore recreation. *See* SSTC DEIS at 3.5-18. Those estimates show that along Imperial Beach's 3.5 miles of beach front, there were 1.8 million beachgoers, 8,000 beach anglers, and 400 fishing boats providing an estimated 10,000 fishing trips. *See* SSTC DEIS at 3.5-18. The Draft EIS ignores the data, claiming it is not "quantitative information on the actual use of ocean waters off Imperial Beach, and may not be representative of other beach areas, such as Silver Strand State Beach or Coronado Municipal Beach." *See* SSTC DEIS at 3.5-18.

By ignoring the best information available on ocean use and recreation, the Draft EIS downplays the impact the proposed project will have on public access to the ocean and bay. The Draft EIS actually suggests that the impact will be negligible because "the size of the water area that would be closed for each training activity is relatively small when compared to the total bay and ocean waters available for the uses described in the *Basin Plan*...." SSTC DEIS at 3.5-26. But the Draft EIS fails to look at the cumulative impact of all the training activities on the waters' designated uses, including recreation. This lack of analysis fails to meet the necessary hard look the National Environmental Policy Act requires.

**III. The Navy Fails to Take a Hard Look at the Impacts of Increased Training on Endangered Species.**

The Navy's plan to expand training activities and increase training frequency will have negative impacts on several endangered species, including the western snowy plover, the California least tern, and the San Diego fairy shrimp. The San Diego Audubon Society has already articulated several concerns we have about the proposed project's impact on endangered species. Among these concerns are cumulative impacts, lack of meaningful alternatives, noise impacts, mitigation, and lack of analysis of the indirect impacts on chicks and eggs abandoned because of increased training activities. We are also seriously concerned about the decline in the number of lest tern fledglings over the past several years. The Navy's analysis fails to address how the increased training will not further exacerbate this serious decline in fledglings. Also, the Navy fails to articulate a well-reasoned, scientifically-based justification for protecting only 22 western snowy plover nests and how that alternative will protect the species. The Navy must take a hard look at the direct, indirect, and cumulative impacts on the western snowy plover and California least tern in order to satisfy its NEPA requirements. Also, the Navy must satisfy its requirements under the Endangered Species Act to protect these endangered birds.

In addition to the snowy plover and the California least tern, the San Diego fairy shrimp also calls Silver Strand Training Complex home. *See* Silver Strand Training Complex Draft EIS (SSTC Draft EIS) at 3.11-13, Fig. 3.11-4. The San Diego fairy shrimp is among the most endangered species in the country; on a scale of 1-18, with one being the highest, the San Diego fairy shrimp ranks as a "2" on the recovery priority scale. *See* SSTC Draft EIS at 3.11-12.

So far, the Navy has taken important steps to protect the San Diego fairy shrimp. Under the current management plan, the Navy "restricts all activities from the [vernal] pools at all times." *See* SSTC Draft EIS at 3.11-33. But now the Navy plans to roll back protections for the San Diego fairy shrimp and "allow foot traffic associated with training activities in vernal pools when conditions are dry." *See* SSTC Draft EIS at 3.11-41. The Navy has failed to explain why it needs to allow foot traffic in vernal pools that house a critically endangered species or how allowing foot traffic in the pool when the Navy deems the pools "dry" protects the San Diego fairy shrimp. By failing to provide this information and analysis, the Navy has failed to take a hard look at the environmental impacts of its proposed increased training.

Mr. Kent Randall
Re: Bay Council Comments on Navy Silver Strand Training Complex Draft EIS
March 30, 2010
Page 4 of 8

**A. The Navy Fails to Explain Why It Needs to Allow Foot Traffic in the San Diego Fairy Shrimp's Vernal Pools to Meet the Project's Basic Purpose of Improved Training.**

The Navy suggests that it needs to allow foot traffic in the vernal pools because some training activities require space to maneuver. *See* SSTC Draft EIS at 3.11-43. But the Silver Strand Training Complex—South is 548 acres of land, and the San Diego fairy shrimp has been found in vernal pools taking up only around 4 acres of land. *See* SSTC Draft EIS at 1-3; 3.11-13, Fig. 3.11-4. The Navy does not explain why walking in those very small, ecologically fragile areas is fundamental to providing better training. Further, the Navy suggests that allowing foot traffic in the vernal pools is "needed" if "other areas are scheduled and no other training areas are available" *See* SSTC Draft EIS at 3.11-43. In other words, the Navy wants to trade protection of a critically endangered species for added scheduling convenience—for only 11 of the 78 different activities the Navy schedules. *See* SSTC Draft EIS at 3.11-43, 2-26. The Navy also suggests that walking in the vernal pools might be "needed" for "training diversity" without explaining what "training diversity" walking in the vernal pools would provide—other than trampling a fragile ecosystem.

**B. The Navy Fails to Analyze the Impacts to the San Diego Fairy Shrimp of Allowing Foot Traffic in the Vernal Pools When the Pools are "Dry."**

The Navy proposes to allow people to tramp through the vernal pools the San Diego fairy shrimp call home when a botanist or wildlife biologist determines that the pools are "dry." *See* SSTC Draft EIS at 3.11-43. The Navy has not analyzed the environmental impacts of this plan to the existing fairy shrimp populations or to the ongoing viability of the fairy shrimp population at Silver Strand Training Complex—South.

**1. The Navy May Determine the Vernal Pools are "Dry" when Fairy Shrimp are Maturing or Adult Shrimp are Present.**

The Navy anticipates that the vernal pools will be deemed "dry" "50 to 95 percent of the year", which could also include "intermittent times during the rainy season, rather than during a defined dry period." *See* SSTC Draft EIS at 3.11-43. The Draft EIS does not explain how the "qualified person" overseen by a Navy botanist or wildlife biologist will determine when the vernal pools are wet or dry. *See* SSTC Draft EIS at 3.11-43. The fact the Navy anticipates that the pools will be dry up to 95% of the year is problematic.

The Draft EIS recognizes that "[a]dult San Diego fairy shrimp are observed from January to March" but "in years with early or late rainfall, the hatching period may be extended." *See* SSTC Draft EIS at 3.11-12. The Navy's 2002 Integrated Natural Resource Management Plan for the Naval Base Coronado (the "2002 Plan") also acknowledges that San Diego fairy shrimp "may appear after late fall, winter, or spring rains sufficiently fill their small, shallow pools (<30 cm deep)" and "[o]nce hatched, the fairy shrimp will mature in 10–20 days… and can live for over a month." *See* 2002 Plan at 3-76, citing Eriksen and Belk 1999. But the Draft EIS provides no explanation of how the vernal pools could be dry up to 95% of the year when adult shrimp can be observed for at least 25% of the year and possibly in late fall, winter, or spring. Either this means that the Navy anticipates determining the vernal pools are "dry" when there are still adult fairy shrimp present, or the Navy has serious flaws in its analysis.

**2. The Navy Cites No Scientific Evidence That Allowing Foot Traffic Through the Vernal Pools When "Dry" Will Protect the Fairy Shrimp Population.**

The Navy attempts to justify purposely scheduling foot traffic in the vernal pools when the pools are "dry" because "[t]his is the time when the shrimp are least vulnerable because they are encased in hard cysts at or near the soil surface… awaiting the return of wet conditions." *See* SSTC Draft EIS at 3.11-

44. But the Navy provides no evidence that the force of foot traffic through the vernal pools will not crush the fairy shrimp cysts.

On the contrary, it is well-settled that human encroachment into San Diego fairy shrimp habitat on foot or on motorized or non-motorized vehicles affects the species by crushing San Diego fairy shrimp cysts. *See* San Diego Fairy Shrimp 5-Year Review, U.S. Fish and Wildlife Service, 2008 ("5-Year Review") at 28. Scientists have demonstrated that San Diego fairy shrimp cysts can be crushed under minimal weight—less than 100 grams, or 0.2 pounds, of force—when dry. *See* 5-Year Review at 28, citing Hathaway et al. (1996). Because cysts are so fragile, even when the vernal pools are dry, allowing people to walk or run through the vernal pools will crush and destroy the fairy shrimp cysts.[2]

The Navy has not analyzed the short-term or long term impacts of allowing foot traffic in the vernal pools when they are "dry." The Navy "conservatively" estimates that "10 percent of the people conducting training activity would enter into the vernal pools." *See* SSTC Draft EIS at 3.11-43. The Navy provides no explanation of why this estimate is conservative other than "each activity is dispersed across the vernal pool area." *See* SSTC Draft EIS at 3.11-43. And even under the conservative estimate, the Navy still anticipates that 207 people could enter the vernal pools each year. *See* SSTC Draft EIS at 3.11-43.

The Navy has not analyzed what effect moving from no foot traffic to over 200 people tramping through the vernal pools each year will have on the short-term and long-term viability of the San Diego fairy shrimp population. The Navy acknowledges that the fairy shrimp could be negatively impacted by being moved to unsuitable locations or by changing the topography or water quality in the vernal pools, but never acknowledges that foot traffic can and will crush fairy shrimp cysts. *See* SSTC Draft EIS at 3.11-44. Because the Navy ignores the reality that foot traffic in the vernal pools will crush cysts, it never analyzes how devastating foot traffic will be to the long-term viability of the fairy shrimp.

San Diego fairy shrimp cyst "banks" develop in pool soils that are composed of cysts from several years of breeding. *See* 5-Year Plan at 5. This partial hatching of cysts allows the San Diego fairy shrimp to persist in its extremely variable environment, since pools commonly fill and dry before hatched individuals can reproduce, and if all cysts hatched during an insufficient filling the species could be extirpated from a pool. *See* 5-Year Plan at 28, citing Philippi et al. 2001, Simovich 2005a, Simovich and Hathaway 1997. The U.S. Fish and Wildlife Service has emphasized that the ability of San Diego fairy shrimp to develop and maintain cyst banks is vital to the long-term survival of San Diego fairy shrimp populations. *See* 5-Year Plan at 5, citing Ripley et al. 2004, Simovich 2005a.

The Navy must take a hard look at the long-term impacts of foot traffic on the fairy shrimp. The U.S. Fish and Wildlife Service has cautioned that cyst-crushing impacts, like foot traffic, may accumulate over time, leading to a decline of cysts below a number necessary to support a viable population. *See* 5-Year Plan at 17.

The Navy must do a thorough analysis of the impact of its proposed plan on the critically endangered San Diego fairy shrimp. The Navy must at least address the following questions:

- Which vernal pools at Silver Strand Training Complex—South have cysts in them?
- How many steps will be taken in each vernal pool each year?
- How many cysts will be crushed by each footstep in the vernal pool?
- How many cysts are in each vernal pool?
- How many cysts need to survive in order to ensure a long-term viable population of fairy shrimp?

---

[2] The American Academy of Podiatric Sports Medicine estimates that, while running, the feet strike at a force of three to four times the body's weight. *See* http://www.aapsm.org/running.html.

- How will the foot traffic in the vernal pools impact fairy shrimp breeding?
- What impact will long-term foot traffic through the vernal pools have on the fairy shrimp population at Silver Strand Training Complex—South?

Answering these questions is crucial not only to comply with the Endangered Species Act, but to meet the National Environmental Policy Act's requirements that the Navy take a hard look at the environmental impacts of its proposed project. Without answering these questions, the Navy cannot meet its National Environmental Policy Act obligations.

**3. The Navy Must Survey Existing Fairy Shrimp Populations in Order to Analyze the Impacts of the Proposed Action on the Fairy Shrimp.**

The Navy's analysis in the Draft EIS is based on a study from 2003 of whether or not the San Diego fairy shrimp was present in a vernal pool. *See* SSTC Draft EIS at 3.11-13 Fig. 3.11-4. Before taking such a drastic measure as to allow foot traffic in the vernal pools, the Navy must gather more updated information about the existing population of fairy shrimp in vernal pools at the Silver Strand Training Complex—South. The Navy should have been monitoring fairy shrimp populations under its plan set forth in the 2002 Plan, as the plan states that the Navy will "monitor the status of the fairy shrimp population." 2002 Plan Coronado at 4-29.

According to the Draft EIS, the Navy plans to start surveying for the fairy shrimp every five years. *See* SSTC Draft EIS at 3.11-43. But relying on 7-year old information as a baseline and then not looking at impacts to the fairy shrimp population for 5 years is insufficient to protect the critically endangered fairy shrimp. In 5 years, the Navy could potentially cause such extensive damage to the fairy shrimp as to devastate the population. This is directly contrary to the Navy's promise in the 2002 Plan to "seek opportunities to restore vernal pool habitats that have been disturbed, while considering potential impacts to the federally endangered San Diego fairy shrimp." *See* 2002 Plan at 4-29.

**C. The Navy's Plan to Allow Foot Traffic in the Vernal Pools is Inconsistent with the Navy's Commitments it Made to Protect the San Diego Fairy Shrimp.**

The Navy's plan to reverse its prior policy of protecting the San Diego fairy shrimp at Silver Strand Training Complex—South reneges promises made to "provide a benefit to the San Diego fairy shrimp." *See* Designation of Critical Habitat for San Diego Fairy Shrimp, 72 Fed. Reg. 70,648, 70,678 (Dec. 12, 2007).

When the U.S. Fish and Wildlife Service designated critical habitat for the San Diego fairy shrimp, it considered designating vernal pools at the Silver Strand Training Complex—South as critical habitat.[3] But the U.S. Fish and Wildlife Service determined that conservation efforts in the 2002 Plan "provide a benefit to the San Diego fairy shrimp." 72 Fed. Reg. 70,678. Based on those conservation measures, the U.S. Fish and Wildlife Service exempted vernal pools at Silver Strand Training Complex—South from critical habitat designation under Section 4(a)(3) of the Endangered Species Act.

Endangered Species Act §4(a)(3)(B)(i) provides that the Secretary of the U.S. Fish and Wildlife Service shall not designate lands controlled by the Department of Defense as critical habitat if the land is: ***(1)*** subject to an integrated natural resources management plan and ***(2)*** if the Secretary determines in writing that such plan provides a benefit to the species. *See* 16 U.S.C. § 1533(a)(3)(B)(i). In 2007, the U.S. Fish and Wildlife Service determined that the 2002 Plan protected and benefitted the San Diego fairy shrimp.

[3] The Silver Strand Training Complex—South was referred to as the "Naval Radio Receiving Facility" in the Federal Register in 2007.

Specifically, the U.S. Fish and Wildlife Service determined that the Navy would protect and benefit the San Diego fairy shrimp because the Navy promised in the 2002 Plan to: ***(1)*** monitor the status of San Diego fairy shrimp populations; ***(2)*** post signs around vernal pools; ***(3)*** advise personnel to keep vehicles on the main roads while traveling through the property; and ***(4)*** seek opportunities to restore disturbed vernal pool habitats while considering potential impacts to the San Diego fairy shrimp. *See* 72 Fed. Reg. 70,678.

The U.S. Fish and Wildlife Service also determined in 2007 that "[a]ctivities occurring on [Silver Strand Training Complex—South] are currently being conducted in a manner that minimizes impacts to San Diego fairy shrimp habitat." 72 Fed. Reg. 70,678. In 2007, management of vernal pools under the 2002 Plan restricted "all activities from the pools at all times." SSTC Draft EIS at 3.11-33.

The Navy's plan to degrade the vernal pools by allowing foot traffic through the pools and authorizing emergency vehicles to drive through the pools is a sharp departure from its prior management. The Navy is essentially pulling a "bait and switch" on the U.S. Fish and Wildlife Service, escaping protective critical habitat designation for its land based on a management plan it is scrapping just three years later. The Navy plans to allow emergency vehicles to drive in the vernal pools, despite the fact that the U.S. Fish and Wildlife Service "consider[s] vehicle use in vernal pool habitat... a substantive threat to the San Diego fairy shrimp." 5-Year Review at 17. And the Navy plans to allow virtually unrestricted foot traffic in the vernal pools without first surveying the extent of existing fairy shrimp populations and analyzing the impact the inevitable crushing of fairy cysts will have on the ongoing viability of the critically endangered San Diego fairy shrimp population at Silver Strand Training Complex—South.

The Navy's plan to allow foot traffic and emergency vehicles in the vernal pools at Silver Strand Training Complex—South could be disastrous for the critically endangered San Diego fairy shrimp. The Navy should abandon this ill-conceived and un-examined plan unless and until it can demonstrate with a thorough and honest analysis that the plan will satisfy the Navy's promise to "provide a benefit to the San Diego fairy shrimp." *See* 72 Fed. Reg. 70,678.

## CONCLUSION

The Navy must analyze the direct, indirect, and cumulative impacts that pollutants from grenades, flares and explosives will have on water quality. It should provide scientifically-supported analysis of those impacts in the final environmental impact statement. The Navy still needs to take a hard look at the impacts the increased training will have on public access to the ocean, bay, and beaches, air quality, traffic, and noise.

The Navy's analysis of the proposed project's impacts to endangered species such as the western snowy plover, the California least tern, and the San Diego fairy shrimp is woefully inadequate. The Navy cannot withhold serious environmental impacts analysis from the public during the NEPA process, regardless of any future plans the Navy might have to work with U.S. Fish and Wildlife Service to satisfy Endangered Species Act requirements. The National Environmental Policy Act requires that the Navy take a hard look at all the reasonably foreseeable environmental impacts of the project—that it look before it leaps—and that the analysis be available to the public to fully vet the information. The Navy has not met its burden with regard to the San Diego fairy shrimp.

Dear Mr. Randall:

Subject: Silver Strand Training Complex, Draft Environmental Impact Statement dated January 2010

The San Diego Chapter of the Sierra Club appreciates and welcomes the opportunity to comment on the Silver Strand Training Complex (hereinafter "SSTC") draft environmental impact statement (hereinafter "DEIS"). The Sierra Club would like to recognize and commend the Navy for acting as an environmental steward, protecting and improving the nesting sites of California Least Terns and Western Snowy Plovers on the SSTC, as well as, the current policy restricting all activities from vernal pools regardless of wet or dry conditions. The Sierra Club understands and appreciates that the SSTC area sets forth unique "real world" conditions that are essential in optimized operational readiness for Navy and Marine Corps amphibious, special warfare, and mine countermeasure training.

At this time the Sierra Club is not requesting additional protective measures outside the current prevailing policy. In this regard, we strongly support the No Project alternative unless substantial improvements to the protectionist measures are made to Alternative 1. However, the Sierra Club alternatively makes its position known that Alternative 2 is highly undesirable in large part due to the reckless and permanent damage that will befall the endangered California Least Terns and Snowy Plovers in the project area.

San Diego Country has more endangered species than any other county in the United States. If biodiversity indicates ecological well-being, San Diego County should be diagnosed with a near fatal disease and the only treatment is an aggressive stance for protection and conservation. The proposed increase in training operations has the catastrophic potential of affecting 13-20% of the statewide California Least Tern population as well as some of the most important Snowy Plover nesting habitats in Southern California.

If increased training operations are found to be an absolute necessity, preferential training sites must be identified. Those sites should be areas with the least possible amount of nesting and foraging. In order to properly identify these areas, the Navy must actively engage in research, data collection, and monitoring activities. Upon critical examination of the data collected, optimal nesting and foraging sites can be properly designated and military training can be conducted in accordance with all necessary precautions.

Vernal Pools
Vernal pools are environmentally important and highly sensitive areas. Vernal pools have been around for thousands of years, at their peak there were approximately 28,500 acres of vernal pool habitat in San Diego County. By 1986, only 7% of those acres remained. A 1997 a report indicated that 70% of the remaining vernal pools were found on N.A.S. Miramar or Camp Pendleton. By 1995 95% of the vernal

pools were destroyed. In 2001 it was reported that 2,400 vernal pools existed, and presently only 3% of the area's vernal pools remain.

In order to preserve this ever-diminishing vital natural resource, the Sierra Club endorses the continuation of the Navy's existing policy restricting **all** actives from vernal pools at **all** times. We appreciate the Navy's environmental intentions through the proposed wet season closures of the vernal pools. However, the limited closure is not sufficient to sustain the resource. Several species reside in this habitat, including endangered species like the San Diego Fairy Shrimp (*Branchinecta Sandiegonenis*). The Fairy Shrimp find the vernal pools indispensable to their lifecycle when they are inundated with water as well as when they are dry.

By the Navy's own admonition (see Table 3.11-3) both Alternatives 1 and 2, could adversely impact the Fairy Shrimp. Dry season impacts from potentially high volumes of foot traffic (2 to 207 individuals per year estimation, DEIS 3.11-43) carry with it the high probability of causing an extinction of the species. The fairy shrimp cysts (eggs) can be crushed and damaged, especially during the dry season. Foot traffic through the area would not only result in destruction of the cysts, but also allow for the introduction of invasive weeds, as soils are disturbed and changes to watershed hydrological system occur. As the soldiers traverse through the SSTC they are walking through areas that contain weedy species, and the seeds become attached to the soldier's shoes, clothing, and equipment. The seeds once transmitted to the vernal pools act as an invasive species resulting in shadowing, increased evaporation and transpiration rates, degrading the hardpan. Moreover, the USFWS has recognized that habitat degradation (and loss) is the single greatest threat to a species' survival. The Sierra Club would strongly encourage the Navy to continue working closely with the USFWS to implement the findings of their Biological Opinion when it is completed.

What the plan requires is the designation of an area off-limits form training operations while data is collected and evaluated. The area would consist of all the existing and identified vernal pools. While the Navy does place a limit on the amount of activity when other shoreline areas are occupied, unavailable, or less suitable for training, this limitation merely bestows unfettered discretion and no actual limitations. An appropriate method, which should be explored as an alternative, in order to protect vital natural resources and critical habitat, is placing and maintaining, clearly designated barriers within 100 feet of the vernal pools and their functional watershed.

It is also strongly suggested that the Navy conduct new baseline studies, since those studies currently in use were conducted over seven years ago, between 2001 and 2003. Thus, the current conditions remain unknown and the only means of arriving at an adequate accounting of the pools, which currently contain Fairy Shrimp, is to conduct a more recent survey. Until such time that a sufficient and timely survey has been performed, all pools exhibiting reasonable conditions for habitability by Fairy Shrimp should be fenced for protection of the species.

It is unwise to estimate the damage that could be caused to the complex ecology of the vernal pools from increased foot traffic. The Navy should proceed with their existing policy: restricting all activities from the pools at all times. If the Navy plans to proceed with the increased training operations within areas where vernal pools are known to exist, a multiyear analysis must be performed in order to fully evaluate the adverse impacts to the fairy shrimp and to the basic hydrology of the pools.

The Navy must also make note that species on the threatened and endangered lists are to be protected so they may achieve such numbers as to be delisted. The only methodology capable of achieving this goal is to protect their critical habitats. In the case of the San Diego Fairy Shrimp that critical habitat is the vernal pools during both the wet and dry periods.

It is kindly requested that the Navy respond to the comments offered throughout this letter. At this time the Sierra Club would make an additional request in support of response to comments referencing numerous other significant and inadequately addressed environmental impacts associated with the SSTC DEIS by The Southwest Wetlands Interpretive Association, Sustainable Wildlands United and The San Diego Audubon Society. The Sierra Club shares the San Diego Audubon Society's well-founded concern relating to inadequate noise assessment in Section 3.6 Acoustic environment. Sierra Club reaffirms the directive to perform a noise study on indirect impacts of the increase in average noise and/or peak noise from the increased gunfire, flares and detonation on the least terns and snowy plovers eggs and chicks.

Thank you for your consideration of these comments.

Respectfully Submitted,

## E.2.21 Southwest Wetlands Interpretive Association

SWIA

March 4, 2010

Mr. Kent Randall
Naval Facilities Engineering Command Southwest
Code: OPME
2730 McKean St. Bldg. 291
San Diego, CA 92136-5198

Dear Mr. Randall

The Southwest Wetlands Interpretive Association (SWIA) appreciates the opportunity to comment on the Draft Environmental Impact Statement for the Silver Strand Training Complex, SSTC. SWIA has had the opportunity to work with the US Navy, USN, for over 30 years at the Tijuana Estuary and San Diego Bay. SWIA along with the Navy and a number of other agencies and jurisdictions serves on the Management Authority at the Tijuana River National Estuarine Research Reserve, TRNERR.

SWIA worked with the Navy, the US Fish and Wildlife Service, USFWS, the California Department of Fish and Game, CDFG and the California Department of Parks and Recreation, CDPR, to establish the Tijuana Slough National Wildlife Refuge in 1980, the TRNERR under the National Oceanic and Atmospheric Administration, NOAA, in 1981 and the San Diego Bay National Wildlife Refuge in 1999. SWIA has been directly involved with the Marine Life Protection Act establishing Marine Protected Areas off the coast of California. Again the Navy was directly involved in this process.

SWIA realizes that SSTC is a critical program training area that is difficult or cannot be duplicated anywhere else. We realize that the mission is to support USN and Marine Corps amphibious, special warfare and mine countermeasure training.

SWIA also realizes that the USN has jurisdiction over lands from the international border to Orange County that are critical for maintaining and protecting some of the most important habitat types supporting many endangered and threatened species in Southern California. Biodiversity is an indicator of ecological health and endangered and threatened species like the Least Tern and Western Snowy Plover are indicative that the health of an ecological complex is at risk. San Diego County has more endangered species than any county in the United States.

SWIA views the USN not only as a military security force but also as an ecological security force. The USN, USFWS, biological contractors and other agencies have worked very well together to address, maintain and enhance ecological protection. We hope that these relationships will continue as we proceed even with the additional training at SSTC.

Southwest Wetlands Interpretive Association ▪ P.O. Box 575 ▪ Imperial Beach, CA 91933
tel. (619) 575-0550 ▪ fax (619) 424-6420 ▪ www.swia4earth.org

There is concern that potential additional operations could affect 13-20% of the statewide California Least Tern Population as well as some of the most important Snowy Plover nesting habitat in southern California but through cooperative effort with agencies like the USFWS this may be resolved.
It is assumed the effects of training on Least Tern nesting sites at lanes 1-7 north of Silver Strand State Beach, SSSB, are compatible. Is there enough research data to support the concept of compatibility between tern nesting and training exercises at this site? This makes the important assumption that these birds are able to adapt to these activities without disruption which is important to know as training escalates. It is our hope that research and data collection will be carried out at this site and help answer these important questions about bird adaptation and military training.

We hope that there will be a high level of protection for Least Tern nesting and foraging including lanes 8 through 10.

Preferential training should be considered in lanes with the least nesting and foraging. But research, data collection and monitoring should lead to better management enhancing training and environmental protection.

We also want to encourage a high level of protection at Delta II North and Delta I South. These have been successful nesting and recruitment sites and we hope that they will continue to be maintained through management, and monitoring.

We hope that ongoing operations will be designed to maintain optimal nesting and foraging while carrying out the military mission.

Other issues that must be addressed include protection of vernal pools, predation and use of military working dogs.

We believe that vernal pools should be monitored and that research data collection will enable a reasonable approach to management meeting the needs of military operations and environmental protection. These sensitive habitats should be incorporated into biological off limit areas for training while data collection is evaluated.

Predation is a serious problem. The Gull Billed Tern presents a danger for tern and plover chicks. It is not a listed species at this date but is under consideration. Predation is exacerbated by habitat loss for all these species and this problem must also be addressed.

Using the Endangered Species Act to protect a species must be solely a decision made by qualified scientists. The decision to list or delist a species must be made by the recovery team and should never be influenced by political policy and or public pressure.

The utilization of military working dogs should be coordinated in a way that does not lead to environmental impact.

The impact on near shore habitat and the interrelationship between the marine and beach ecosystems must be taken into consideration. This is especially important concerning least tern foraging. There is also interest in looking at the impact commercial bait fishing has on least tern foraging along the Silver Strand and the barrier beach at the Tijuana Estuary. The opportunity for research at these two sites has been suggested allowing for a comparative analysis of tern foraging success. Commercial bait fishing and military operations may impact tern foraging. Both sites are important to the bait fishing industry.

The potential impact of climate change and sea level rise is of great importance to extended use of the Silver Strand for military operations and as a nesting site for terns and plovers. Sea level rise will have ecological and military impacts at this site. The rise in sea level is at least 10 cm higher than it was in 1974 which is significant. This number is with reference to the TRNERR site which is relevant to the Silver Strand and the Cities of Imperial Beach and Coronado.

The SSTC-South is also an important issue. There are Western Snowy Plover nests on the beaches at this site. The Navy has not been able to control civilian recreational beach use and off leash dogs. This has been a major issue with the destruction of nests and has led to low population success. A coordinated effort should be made to control this site. The YMCA Camp Surf should be able to continue their youth program but must follow the rules. Violations would lead to potential closure of the site.

We want to encourage the Navy to work closely with the USFWS and implement the findings in the Biological Opinion when it is completed.

The City of Imperial Beach has worked with the Navy in the past to establish a dog park near the base entry off Silver Strand Blvd. If the legal issues could be worked out between the Navy and the City this would enable people to use the dog park rather than the beach especially during the nesting season.

The City and SWIA would also like to work with the Navy on completion of the Coast Trail from Oregon to Mexico. This is dependent upon the ability of the City, County and State to work with the Navy allowing this trail to cross Navy lands on the Silver Strand. The trail concept would go between the eastern Navy fence boundary and Highway 75 then continue to the area previously described as the dog park. From there it would go along Carnation Ave outside Navy land. See the included map.

The Dog Park and the coastal trail would help to mitigate recreational beach use and hence allow military operations and protection of plover nesting sites. The dune system from the Coronado/Imperial Beach City boundary to the Silver Strand State beach is in better condition than most dune systems in San Diego County but they are heavily invaded by non native species. State Parks has done a commendable job restoring the dunes along their beach. It is hoped that the Navy and state might be able to look at similar dune enhancement on the Navy lands.

The City of Imperial Beach is concerned about increased noise levels as operations are enhanced. We urge the Navy to install a 10:00 PM curfew on high decibel activities. Neighbors need their sleep in order to be ready for work the next day. This is a reasonable request in a suburban area.

In conclusion SWIA suggests an organization like the Management Authority that currently exists at the TRNERR be established on Silver Strand. The Navy has been a member of this body since its inception in 1982. This organizational structure has worked successfully to resolve many issues in a way conducive to carrying out the missions of international, federal, state and county agencies, NGO'S, universities, private contractors and jurisdictions including San Diego County, and the Cities of Imperial Beach and San Diego. It also serves as an important forum for public input and can solve problems in their early stages. SWIA played an important role in helping to formulate the TRNERR Management Authority and would be interested in helping to do the same at the Silver Strand site.

Again SWIA appreciates this opportunity to give input on this draft document.

Sincerely,

Michael A. McCoy, DVM

**RE: Silver Strand Training Complex, Draft EIS January, 2010**

Dear Mr. Randall:

The affiliated organizations/advisors of Sustainable Wildlands United offer the following comments upon the draft EIS.

Vernal Pools

While we appreciate the proposed wet season closure of vernal pools, the closure is not sufficient to sustain the resource. The existing policy restricting all activities from vernal pools at all times should be maintained. Dry season impacts from potentially high volumes of foot traffic (12 to 207 individuals per year estimation, DEIS 3.11-43) would result in mortality of the endangered San Diego fairy shrimp. Crushing of fairy shrimp cysts, introduction of invasive weeds as soils are disturbed and changes to watershed hydrological systems would occur relative to patterns of ground impacts. The impacts associated with establishing repetitive seasonal foot traffic are likely to lead to the loss of San Diego fairy shrimp from the site. The USFWS has acknowledged that habitat *degradation* (and loss) is the greatest ongoing threat to species survival.

To achieve effective and real avoidance, please place and maintain barriers that notice and identify vernal pools and their functional watershed within 100 feet, and maintain existing policy restricting all activities at all times.

For any vernal pool that absolutely cannot be avoided, annual baseline surveys should be conducted. In the event of a survey showing a decline in San Diego fairy shrimp from the previous year, activities should be halted until surveys demonstrate recovery to baseline levels. The proposed surveys in five-year intervals are too infrequent to timely detect significant decline. Annual surveys could allow implementation of protective adaptive management measures to attempt recovery.

***Sustainable Wildlands United***

California Least Terns

The proposed action has the potential to adversely affect a very substantial portion of the statewide California least tern population. The federally-listed endangered least tern is a noteworthy Endangered Species Act success story in terms of breeding pairs, but it has not fully recovered, and as the DEIS indicates (3.12-18), fledgling rates have remained static or declined in recent years.

Unfortunately, the DEIS discusses the effects of the proposed action on least tern recovery primarily in terms of breeding pairs rather than reproductive success. Reproductive success rates should be an additional criterion for determining the significance of the action's impacts. In addition, the EIS should evaluate the potential for the action to contribute to impacts to least terns through increased predation or other indirect effects.

Greater noise from operations are likely to reduce nest productivity for least terns and due to temporary and permanent nest abandonment that leaves eggs and chicks vulnerable to predators. The DEIS, however, omits discussion of noise impacts to these sensitive biological receptors. The EIS should analyze and mitigate for this impact.

We appreciate the inclusion of avoidance measures in Alternative 1, but remain concerned that the loss of up to 105 least tern nests would represent a significant impact to the species and would impede recovery of the least tern. Additional least tern mitigation or avoidance measures should be incorporated in Alternative 1.

Western Snowy Plovers

As noted for the least tern, the EIS should evaluate the potential for the action to contribute to impacts to snowy plovers through increased predation (including predation by least terns) or other indirect effects. In addition, the EIS should include a thorough analysis of the direct and indirect noise effects on snowy plovers, and adopt additional mitigation measures for these impacts.

Thank you for considering these comments,

10 March 2010

Mr. Kent Randall
Naval Facilities Engineering Command, Southwest
Silver Strand Training Complex EIS
1220 Pacific Highway, Bldg. 1, 5th floor
San Diego, CA 92132

Subject: Review of Draft Environmental Impact Statement (DEIS) for the Silver Strand Training Complex, San Diego, CA

Dear Mr. Randall:

Please disregard the Department of the Interior's no comment letter sent electronically on March 8, 2010. Please consider these comments from the U.S. Fish and Wildlife Service.

The San Diego Bay National Wildlife Refuge includes the South San Diego Bay Unit, located at the southern end of San Diego Bay. The 2,300-acre refuge unit includes open bay, solar salt evaporation ponds (salt ponds), and downstream end of the Otay River floodplain. Salt ponds consist of diked open water cells with differing levels of salinity, which provide roosting habitat for a variety of migratory birds during high tide, supplemental foraging habitat for various shorebirds, and primary foraging habitat for other species such as phalaropes and eared grebes.

Salt pond levees also provide nesting habitat for a variety of ground nesting birds, including the endangered California least tern, the threatened western snowy plover, and an array of other tern species, some of which only nest in a few locations in the United States. The American Bird Conservancy has designated the South San Diego Bay Unit as a Globally Important Bird Area due to presence of globally significant numbers of nesting gull-billed terns and continentally significant numbers of surf scoters, Caspian terns, and western snowy plovers.

The entire southern end of San Diego Bay, including Sweetwater Marsh and South San Diego Bay Units, has been recognized as a Western Hemisphere Shorebird Reserve Network Site.

The primary issue of concern is the U.S. Navy's proposal to significantly expand training activities utilizing helicopters at Silver Strand Training Center (SSTC) South. The U.S. Navy's

SSTC South is located immediately west of the South San Diego Bay Unit. The Kaufman Drop Zone, which is located in SSTC South, would experience an increase in helicopter activities based on the DEIS. Proposed changes would result in helicopter activities increasing from 724 flights per year to 1,262 flights per year with actual landings increasing from 4 lands per year to 40 landings per year.

It is not clear from information provided what percentage of helicopter flights and landings would occur in SSTC South as compared to SSTC North. Additionally, specific training exercises (e.g., Tactical Recovery of Aircraft and Personnel and Amphibious Raid) would employ between 5 and 16 helicopters at a given time which may fly over the South San Diego Bay Unit. When approaching from the bay side to land at the Kaufman Drop Zone, helicopters may fly low over the South San Diego Bay Unit.

These low-altitude flights have potential to adversely affect Refuge resources (e.g. nesting migratory birds, federally endangered California least tern, and federally endangered western snowy plover).

The Service is providing the following recommendations to address concerns presented in this comment letter.

1. The Final EIS should include a map depicting anticipated helicopter flight routes and heights at SSTC South. The Service recommends flight routes avoid flying over South San Diego Bay Unit and instead travel to SSTC South along routes that avoid important wildlife areas or via the Pacific Ocean. We believe these alternative flight routes would reduce impacts of expanded helicopter training on South San Diego Bay Unit.

2. The Final EIS should describe the San Diego Bay National Wildlife Refuge South San Diego Bay Unit in the Affected Environments section. While the DEIS recognizes the Refuge, significant biological resources within this Unit should be fully described. We recommend the Final EIS provide a thorough analysis of effects resulting from proposed expanded training on Refuge resources (e.g., nesting migratory birds, federally endangered California least tern, and federally threatened western snowy plover). We believe that expanded training activities may affect listed species on the South San Diego Bay Unit and recommend the Navy consult under section 7 of the Endangered Species Act with our Carlsbad Fish and Wildlife Office.

The Service appreciates the opportunity to comment on this DEIS. If you have any questions, please contact Kurt Roblek at (619) 575-2704.

Sincerely,

Patricia Sanderson Port

San Diego, CA 92132

March 5, 2010

RE: SILVER STRAND TRAINING COMPLEX DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) 5090 Ser No1CE1/046 14 Jan 10

We appreciate the opportunity to comment on the DEIS referenced above. Our expertise has been in the area of wetlands, marine environments, and vernal pool ecosystems. We have been involved with the protection of endangered and threatened species and their necessary supporting environments and ecosystems for more than 40 years, particularly in the San Diego County region.

As an example, during the late 1960s and 1970s we were instrumental in protecting the endangered California Least Tern nesting sites in San Diego County, particularly those that remained in Mission Bay, San Diego. At this time we formed citizen patrols to protect the nesting birds, their eggs and their chicks. After bringing continuous attention to the need to preserve and protect these dwindling impacted nesting areas, the State of California, in conjunction with the US Fish & Wildlife Service, formed the Least Tern Recovery Team. Consequently, some remaining areas were designated as protected California Least Tern nesting sites, and some have subsequently afforded the endangered Snowy Plover protection in these areas as well.

For the past 20 years we have been actively educating the public and our decision makers to the plight of our endangered Fairy Shrimp and their Vernal Pool Ecosystems. With less than 2% (two percent) of these unique biomes remaining in San Diego County we worked with the agencies and municipalities to help bring the Multiple Species Conservation Plan (MSCP) to fruition.

Specifically we've noted that present vernal pool sites will be subjected to foot-traffic only during the dry season months; such activity would eventually destroy the dry pool pan and make the necessary accumulation of rain water eventually impossible; the subject here is the **survival of vernal pools**. Also, vehicular and/or foot-traffic would destroy an intolerable, even though unspecified, percentage of the cyst embryos.

We, of course, recognize the need for trained United States Navy personnel; God bless them; however, we believe the proposed Naval Training activities within the Silver Strand Training Complex and southern near shore areas of Naval Air Station North Island expansions (the specific vernal pool subject herewith) will have a **NEGATIVE impact** on the endangered species which rely on these areas to at least sustain their populations.

Under **Table ES-2: Summary of Effects 3.11 Birds,** there is no way that this statement in regards to "Birds" from Alternative I and/or Alternative II can be relied upon: "...Loss in California least terns nesting would not decrease the nesting total below the 5,722 annual nests to maintain a stable range wide population, and would be below the 2007 incidental take allowance issued by the USFWS. ..."

Unforeseen impacts will always occur and the populations will continue to be unable to sustain themselves in the long term.

Nor is there any reasonable assumption that the following stated impacts from **Table ES-2: Summary of Effects 3.11 Terrestrial Biological Resources** under Alternative I and/or Alternative II, particularly to Vernal Pool species can be relied upon:

"... • Foot traffic in vernal pool areas could adversely impact individual fairy shrimp. However, impacts would be minimized, due to the low levels of foot traffic that would occur in the pools, and the limitation of those activities to when the vernal pools are dry. Potential impacts to the San Diego fairy shrimp are also associated with emergency vehicle use of unpaved roads in the vernal pool area.

• Potential increased training on SSTC-N beach lanes Blue 2, Orange 1, and Orange 2 could increase impacts to special status plants and invertebrates in these areas while decreasing impacts at other locations. Some trampling of vegetation at these locations is expected, though the overall effect on non-avian biological resources is expected to be short term and of moderate intensity due to the potential overlap of concentrated activities in the dunes and upper beach areas. These activities do not pose long term impacts, effects are expected to be temporary and cease at the termination of an activity.

• Increased foot traffic could cause behavioral impacts to surrounding wildlife, though this effect is expected to be temporary. • Various activities have the potential to impact Brand's phacelia on the beach in the Bravo training area. ..."

There is no logical reason to assume that the proposed Mitigation measures will negate any impacts which occur despite the Navy's and US Fish & Wildlife Service' best intentions.

As to the MITIGATION pleading , we have been of the opinion that no such procedure is any longer viable and therefore not even a conceivable solution for requesting any form of vernal pool destruction permit. The vernal pools that have thus far survived the onslaught of civilization's encroachments have already left them with, we believe, less than 1% (one percent) of their original population. These vernal pool creatures are not just Endangered but CRITICALLY ENDANGERED, and ALL vernal pools are to be protected, NONE available to be offered for mitigation. Upon investigation past mitigation attempts are failures.

The species in question and their necessary, supporting ecosystems which remain today require all the protection we can afford them. They CANNOT accept any further impacts if we wish to have any hope for their continued existence let alone expectations for their Recovery.

Therefore, we recommend the NO ACTION ALTERNATIVE.

Peterson Reporting, Video & Litigation Services

(5:08 P.M.)

ORAL COMMENTS

* * * * *

ZEKE MAZUR
522 Seventh Street, Apartment E
Imperial Beach, California

MR. MAZUR: They were talking about having training sessions on the beach, exclusive training sessions. They don't want people around. I think it would be a good idea to have them notify the Union Tribune -- I can't tell if I'm going too fast -- notify and put that on the weather page where they have water temperatures, tide heights and polluted beaches. It would be nice if they had a notice that Silver Strand area is going to be off limits to the public during such and such times. Thank you.

* * * * *

(6:03 P.M.)

WELCOME TO PUBLIC HEARING

* * * * *

MR. MICHAELSON: Good evening and thank you for coming tonight. My name is Lewis Michaelson, and I will be the moderator for tonight's hearing on the Navy's Silver Strand Training Complex draft environmental impact statement, which you will hear referred to tonight as the draft EIS.

Here to receive your comments are Captain Yancy Lindsey, commanding officer at Naval Base Coronado, and Ms. Delphine Lee, project manager for the Navy's Pacific Fleet. We also have Mr. Kent Randall. He's the project coordinator from Naval Facilities Engineering Command Southwest. He's a primary point of contact -- you'll notice the address -- for sending your comments to. His name is the one on it. All right. So he's that primary point of contact.

Let's go over tonight's agenda. Hopefully, you've had -- most of you, I believe, had the opportunity to talk to the many staffers at all the poster stations and got as many of your questions answered as possible tonight. The primary purpose of this portion of the hearing is for the panel members to listen to your comments firsthand. They will not be answering questions during this phase of the proceedings.

Any comments and questions at this point will be addressed in the final EIS, which comes next. After I finish this introduction, Captain Lindsey is going to give a brief overview of the Navy's Silver Strand Training Complex and training activities. Next, Ms. Delphine Lee will brief you on the environmental impact analysis process and summarize the results reported in the draft EIS.

The last item on the agenda, however, is really the most important. The public comment session is your opportunity to provide information and make statements on the record. Your input ensures that the decision-makers can benefit from your knowledge of the local area and any environmental effects you think may result from the proposed action or alternatives.

To request an opportunity to make a verbal comment, we've asked as you came in the door -- hopefully everyone had the opportunity to fill out a comment card. If you haven't done that yet, let us know and just get one from the registration table. I have quite a few already, and I will be calling on people in the order in which they signed up to speak.

Every speaker, including public officials, organizational spokespersons and private individuals, will have three minutes each to provide his or her comments. However, if you don't feel comfortable standing up here tonight to make a statement, you may submit a written

5

Peterson Reporting, Video & Litigation Services

statement tonight. We also have the touchscreens where you can type in your comments.

You can also mail them in, or you can submit them online electronically as long as they are received or postmarked by March 9th. Written comments, keep in mind, are given the same weight and consideration as verbal comments here tonight. So it's just as good a way to comment as it is orally.

And now it is my pleasure to introduce Captain Lindsey.

CAPTAIN LINDSEY: Thanks, Lewis.

STAFF PRESENTATION

* * * * *

CAPTAIN LINDSEY: Good evening and welcome to the public hearings for the Silver Strand Training Complex draft EIS. My name is Captain Yancy Lindsey, and I'm the commanding officer of Naval Base Coronado.

I want to thank you on behalf of the United States Navy for attending this evening. This is one of two public hearings the Navy is holding in Southern California for the Silver Strand Training Complex draft EIS. For simplification, during the remainder of my presentation, I may refer to the Silver Strand Training Complex by its acronym, SSTC or "stick," is one of the words we use to -- I

6

Peterson Reporting, Video & Litigation Services

think it will shorten down the number of times I -- my presentation if I can refer to it as "stick."

Okay. The Navy has been training at the Silver Strand Training Complex for over 60 years. It is comprised of the Silver Strand Training Complex, north, this area, and the Silver Strand Training Complex to the south. Training activities are conducted in the Pacific Ocean, San Diego Bay, on the beach and inland. Training is also conducted on the southern near-shore areas in the Naval Station North Island, this area here.

The North Island area is not technically part of the SSTC area but is included in this study because of similar types of training that are conducted there. Navy airfield operations at North Island and Imperial Beach are not of the scope or not part of the scope of this EIS. I just want to say that again: Airfield operations at North Island and at Imperial Beach, the outlying field in Imperial Beach are not part of the scope of this EIS.

The overall mission of the Silver Strand Training Complex is to support U.S. Navy and Marine Corps amphibious, special warfare and mine countermeasure and other near-shore training by providing local land, sea and airspace support services, equipment and supplies and training facilities that will help naval and Marine Corps forces achieve and maintain the highest levels of operational readiness.

There are a number of Navy commands that rely upon SSTC to conduct required training. These include the Navy SEALs, explosive ordnance disposal teams, assault craft units, beach master units, amphibious construction battalion, special boat units, Marine Corps small boat raid companies and coastal defense units.

SSTC is used to support the training of these commands and their personnel, who, for the most part, are stationed in the San Diego metropolitan area. The Navy also conducts basic new recruit training on SSTC. This training is conducted in formal courses with syllabi and instructors, including both classroom and field work. For example, all SEAL recruits must complete the basic underwater demolition training program on the Silver Strand Training Complex to be qualified as a Navy SEAL.

There are over 70 different types of training activities that occur at the SSTC. One of the most common activities is basic physical fitness, that is, running, exercising, swimming, those types of things. Personnel may also learn how to operate different small Navy vessels and maneuver them across calm water or more challenging surf conditions.

Advanced students learn how to collect intelligence through reconnaissance, beach raids and assault coordination. Personnel also learn to seek, find and identify simulated mines to include dismantling and neutralizing them.

There is also logistics-related training. Personnel work together to move equipment, vehicles and supplies from a large offshore ship to onshore areas. This may involve shuttling craft and people between the ship and the shore and/or reeling out hoses to transfer fluids from ship to shore.

The Silver Strand Training Complex has a unique combination of attributes that make it an ideal venue to train servicemen and women in amphibious warfare, special warfare and mine warfare operations. SSTC contains large stretches of water, beach and inland areas.

Access to both the calm bay and rough ocean allow personnel to initiate training in a calmer environment and then quickly and easily transition to a more challenging environment on the ocean side as they improve their skills and fitness levels.

Southern California's temperate climate also allows for year-round training. The SSTC is also centrally located within our nation's largest concentration of naval forces. Its close proximity to necessary infrastructure, logistics, personnel and other complimentary training ranges makes it a critical training range for a wide range of military commands. This allows our servicemen and women stationed in the San Diego area to fulfill their daily training

9

Peterson Reporting, Video & Litigation Services

requirements without having to travel away from home.

In other words, the ranges are close to home so they can do realistic, quality training and sleep in their bed that night, a luxury that not many military folks are able to take advantage of with the increased deployment schedules that we've been experiencing.

To accomplish our mission in Southern California, it is critical for the Navy to maintain and operate these training areas so that naval forces and other military services can train realistically. Realistic training is critical for military readiness and is the single greatest asset the military has in preparing and protecting American servicemen and women to defend our nation.

There is no such thing as routine training when it comes to practicing combat skills. The first training opportunities ensure Navy personnel are able to react swiftly and decisively in a wide range of potential situations. Ensuring Navy forces are prepared for deployment requires training where military personnel can learn through practical hands-on experience the skills necessary to effectively plan and conduct operations.

Additionally, advancing technologies require more complex and varied training scenarios. The SSTC is unique and provides training opportunities essential for the safety and readiness of military personnel and the success of our

10

Peterson Reporting, Video & Litigation Services

Navy's mission.

While fulfilling our mission to train sailors, protecting the environment is a priority for the Navy. The Navy is committed to complying with its legal responsibilities for protecting the physical and natural environment and has established a successful track record of environmental stewardship while meeting our mission.

To accomplish its environmental stewardship goals, the Navy implements protective measures on land and in the water to reduce potential effects on the terrestrial and marine environment while ensuring public safety and accessibility.

I will now turn the presentation over to Ms. Delphine Lee from the United States Pacific Fleet, who will tell you about the Navy's proposed action and give you an overview of the draft EIS and the environmental analysis process.

MS. LEE: Thank you, Captain Lindsey.

My name is Delphine Lee, and I'm the project manager for the Silver Strand Training Complex environmental impact statement. I'm here tonight to give you an overview of the findings contained in the draft EIS. The draft EIS was prepared by the Navy to comply with the National Environmental Policy Act, or I'll be calling it NEPA.

It's an important part of the Navy's overall

11

Peterson Reporting, Video & Litigation Services

commitment to environmental stewardship as it trains. The Navy is the lead agency for this environmental impact statement, and the National Marine Fishery Service is a cooperating agency on this EIS in addition to their role as the regulator.

The Navy proposes to improve the availability and quality of training opportunities at the Silver Strand Training Complex to achieve the required levels of operational readiness as mandated under federal law. To meet training requirements, the Navy proposes to, one, continue current training activities, two, increase training frequencies and types of training, three, conduct existing routine training activities at additional locations within the established Silver Strand range.

And just to be clear, the Navy is not proposing to expand the training area, just where we train within the existing Silver Strand range.

Four, we're proposing to introduce new platform and equipment into training. And, five, we're proposing to increase the access and availability of existing beach and inland areas. The proposed action is needed to accommodate the future military readiness requirements, including increased usage of Silver Strand Training Complex, year-round access to training areas and flexibility in realistic training.

12

Peterson Reporting, Video & Litigation Services

Three alternatives were analyzed in the environmental impact statement to help determine the appropriate levels and types of training activities required for the Navy to meet its needs.

Under the no action alternative, the Navy would continue training as it has historically at the Silver Strand Training Complex. Training would not be different from what you've seen over the past five to ten years. This alternative provides a baseline for assessing the potential environmental impacts of other alternatives.

Alternative 1 is designed to meet the Navy and Department of Defense's current and near-term training requirements, and it is the Navy's preferred alternative. Specifically, Alternative 1 proposes to increase the frequency of training from roughly 4,000 activities to over 5,000 activities annually.

Two, we're proposing to increase -- introduce new types of mine countermeasure, amphibious and special warfare training activities. Three, we're proposing to conduct existing routine training at additional locations within the Silver Strand Training Complex to improve the diversity of training.

Four, we're proposing to increase -- excuse me -- introduce new platforms and equipment and to train specifically the MH-60S helicopter. We're going to replace

13

Peterson Reporting, Video & Litigation Services

the amphibious assault tracked vehicle with an expeditionary assault vehicle and upgrade the existing ship-to-shore fluid transfer system.

And lastly, Alternative 1 proposes to additionally increase the availability and accessibility of beach and inland training areas to accommodate the proposed increase in training activities. Alternative 1 is the Navy's preferred alternative because it would fully support the types and frequency of activities required to achieve complete fleet readiness training -- readiness and allow the Navy to carry out its mission at the Silver Strand Training Complex.

Alternative 2 is also designed to meet current and near-term training requirements. This alternative includes the proposals identified under Alternative 1. Unlike Alternative 1, it would also allow year-round access to all 7,000 yards of ocean-side beaches along the Silver Strand Training Complex, north and south, for continuous year-round training. California Least Tern nesting habitat at delta north and south would continue to be preserved.

In preparing the draft EIS, the Navy evaluated the potential effects of the alternatives on the marine, natural and human environment. The Navy took a comprehensive approach in assessing the potential environmental effects on 16 different physical, biological and socioeconomic resource areas. We will present some of these findings here.

14

Peterson Reporting, Video & Litigation Services

We encourage you, if you haven't already, to review the draft environmental impact statement, which presents the findings of the Navy's environmental analysis for each of these resource areas. We welcome your comments on the findings or the methods of the analysis.

For most of the resources analyzed in the draft EIS, we found no significant impact or long-term effects from the Navy's proposed action. Training at Silver Strand Training Complex creates intermittent short-term noise from various sources such as aircraft, vessels and vehicles. Although these training activities could be audible, they would not contribute substantially to the overall average sound levels of the area.

Increased training activities would increase the tempo of intermittent short-term noise. The Navy has established protective measures to reduce the effects of noise in the surrounding community. It works to minimize noise by considering the location and the time of day of the training activities.

The use of training materials may deposit small amounts of material on land and underwater training areas. Deposited materials are collected whenever feasible. The training [sic] amounts are not expected to affect biological or physical resources.

Many sensitive species, including endangered or

threatened species, are found on or near the Silver Strand Training Complex. For many years, the Navy has taken proactive steps to protect the natural resources on its land. Threatened, endangered birds on the Silver Strand Training Complex include the California Least Tern, the western snowy plover and the light-footed clapper rail.

Training activities have the potential to impact the Least Tern and the snowy plover, both of which nest on the training beaches. Since the mid-1980s, the Navy has implemented a comprehensive and adaptive natural resource management program and spends over half a million dollars annually to maintain protection for these species.

Thanks to the program, we've seen a dramatic increase in Least Tern and western snowy plover nesting on the Silver Strand beaches. The nesting continues to expand even with the Navy training on the same beaches.

No significant impacts on sea turtles or marine mammals are expected from the proposed action. Various measures will help to protect these species during training. For instance, the Navy will monitor for these species and halt training as necessary to protect them from harm. Effects on other marine biological resources and terrestrial biological resources will be minimal, as they are temporary and localized.

Commercial fishing, sports fishing, diving, boating and other ocean recreational activities occur regularly within or near the Silver Strand Training Complex. The Navy understands the concerns the community may have regarding public access. Training activities will continue to be conducted in long-established military training areas. The training areas would not be expanded.

The public would continue to have access to public beach and water areas adjacent to active training. During some training activities, public access to the training site may be limited for public safety and security reasons.

Significant impacts to cultural resources, transportation and circulation and socioeconomics are not anticipated from the Navy's proposed action. The Navy must comply with numerous federal environmental laws, regulations and executive orders such as those that are listed here. To help ensure compliance with these environmental requirements, the Navy has worked with and will continue to work with a number of regulatory agencies, including the Fish and Wildlife Service, the California Coastal Commission and the Regional Water Quality Control Board.

At this time, the Navy has completed the first three steps of the NEPA process, and we are now in the phase of providing the draft EIS for public review. Let me review the progress so far.

The EIS was initiated on August 6th, 2001, and the

17

Peterson Reporting, Video & Litigation Services

Navy held two public scoping meetings to invite the public to provide input on the proposed action, the alternatives under consideration and the environmental resources and issues to be analyzed. Government agencies, organizations and the public were encouraged to submit comments throughout the public comment period.

The comments received were considered in the preparation of this draft EIS that we are discussing here tonight. We are now at the 45-day public document review period and at the public hearing. This phase is an essential part of the NEPA process because it allows the public, such as yourself, to review the document and comment on the NEPA process and the Navy's analysis of potential environmental effects.

We encourage you to provide your input today or by March 9th so that it can be considered for incorporation in the development of the final environmental impact statement. All comments will be considered.

The Navy is committed to keeping the community informed throughout the development of this EIS. These public hearings are just one opportunity to share information and, more importantly, encourage your feedback and comments.

I will now turn the presentation back to Lewis to describe how to obtain more information and how to comment on the draft EIS.

18

Peterson Reporting, Video & Litigation Services

MR. MICHAELSON: Thank you.

In addition to holding these public hearings, the Navy has established a website to make it easier for you to find and comment on the environmental document. The address is up here, but I don't expect anyone to write it down. It's on virtually everything we've handed out to you tonight. Just look for it. Okay?

The draft EIS will be posted -- is on the website, and fact sheets are there. Our intent is to post the video that you were able to see back there, as well as anything else we can think of, including we're actually videotaping this public hearing tonight. We're testing out some new technologies.

One of them was the touchscreens for information, also leaving comments, something new we're trying out. And this is something that we hope to also provide on the website to make it as easy as possible for people who are unable to attend to still see what happened and what were the comments and presentations at the public hearing.

So you may also review a hard copy of the draft EIS, however, by visiting the Coronado or Imperial Beach libraries. So if you prefer to do it that way, you can do it. And the addresses of these libraries are provided on the NEPA process handouts, which you received when you came in tonight.

Okay. So here's the part about making public comments. There are several ways for you to submit them. One of them is by handing them in tonight. One of them is by making them orally. You can also go on the website through March 9th and provide them electronically if you want more time to think about it and digest it. You have up until that time to do that as well. Comments -- let's see. All comments must be postmarked or received by March 9th.

We're now ready to begin the oral comment portion of the public hearing. If there is anyone who wishes to comment, hopefully you have already filled out one of these cards. If you haven't, she's holding them up back there. Just raise your hand, and she'll bring you one. You can fill it out, and I'll add it to the list. I'll be calling on people in the order in which they signed to speak.

To make sure that we get an accurate record of what you have to say, we do have a court reporter here. She's making a verbatim transcript of everything said during this portion of the hearing. So we have a few ground rules just to try and make sure that this process works effectively and we get your comments on the record.

I'm going to ask you, when I call your name, to come up to this microphone and speak slowly and clearly starting with your name and any organization that you represent. We do not need your address.

Second, each person is allotted three minutes to speak. If you've prepared a written statement, you can turn it in to the registration table or you may read it out loud if you can fit it within the three-minute time limit.

Please honor any requests that I make for you to stop speaking when you reach the three-minute time limit. In order to make that as easy for you to do as possible, when there's 30 seconds left in your three minutes, I will hold up this card. Okay. Pretty clear, right? And if you make it to three minutes, I'm going to hold up this one. And I think the meaning of that one is pretty clear, too. All right? So this should allow you to find a comfortable place to wrap up your comments.

And with that, we are ready to begin. I do want to mention -- I'll read several speakers ahead, because the way you're seated here, sometimes you got to crawl over somebody to get to the microphone. So I'm going to read several ahead so you know where you're going to come up in the rotation, so to speak.

So the first names that I have are: Jim Knox, Leon Campbell, Jeff Foster, Normandie Trovato-Wilson, Richard Barck and John Warner. So if you would please do us the honor of leading us off, Jim Knox. Would you step up here to the microphone, and again, all we need is your name and organization, if you want.

21

Peterson Reporting, Video & Litigation Services

PUBLIC COMMENTS

* * * * *

MR. KNOX: No organization. My name is James Knox. I had submitted these already. I do have some things I'd like to read out loud. One is on .3.5.1.4.2 and .3.5.1.5.2, the Pacific Ocean, about contaminants, report states that most of the contamination of the area is caused by sewage from the river mouth and/or the South Bay ocean outfall.

Storm water runoff has a relatively minor influence on local water quality, which is Table 3.5-5 -- will increase training at the south complex, cause more contaminants to reach the ocean by storm water runoff. Rain events occur mainly in the winter when ocean currents in the area are from north to south. Were seasonal changes and ocean water movement taken into account when the finding of contaminants were formulated?

The next is 3.5.1.5.2., Pacific Ocean. I believe that the Silver Strand State Beach does have day and overnight use numbers that were not included in this report. I request in the conclusion that the information presented is not representative of the use of the municipal beach in Coronado. The report in other sections extrapolated information that was used for conclusions without complete numbers, and I believe you could have done it for that particular part of the report.

22

Peterson Reporting, Video & Litigation Services

The Navy recreational areas, Gator Beach, Fiddler's Cove and so on, I don't believe should be included as recreational opportunities. They have restricted access not open to the general public. So I think you should only include those that the general public could go to. I can't read it all because we have three minutes.

3.6.2.3.2 of .2, new training activities will increase helicopter use. That's the TRAP. It's N9 on Table 2.2. I must disagree with the conclusion the noise level will not change. Each flight is a separate event with individual consequences regarding sound. Weather, temperature, wind direction and pilot skill all contribute to each event.

Suggesting that the helicopters will always be in their assigned flight lanes without data is an assumption. The helicopters get out of their flight lanes many times. I've noticed this, and I think training people -- willing to tell you that. Training evolutions may have variations that are not foreseen. This fact needs to be taken into consideration when making conclusions.

More use equals more sound in the adjacent residential areas. Citing the ambient sound of the surf supplies no useful data without knowing the size of the surf, the direction of the swell, the direction of strength of wind and the tidal level. None of this information is contained

in the table. Thank you.

Skip the other ones. Good.

I do have a mitigation area I think -- that I think would be nice, and that is to use the north gate if you have more than three vehicles coming to the south complex. Silver Strand is a small kind of windy-to-the-left street, and you will find that the traffic will back up pretty quickly, and they're going in and coming out.

Thanks for this opportunity and the assistance of forthright answers that were given to me to my questions and concerns in the open-house portion of this event. Thank you very much.

MR. MICHAELSON: Thank you very much. A model commenter, stuck right to the three minutes.

Okay. Next is Leon Campbell.

MR. CAMPBELL: Thank you. I represent the Airport Trust. It's a private trust. It has the proprietary interest as a licensee under a U.S. patent issued about a year ago, and briefly, it represents a new airport for San Diego. Not withstanding the fact we spent over 50 years and over $17 million trying to find an alternate site, this is an alternate site. It is feasible, and it will indeed work.

I've also met with the FAA in Washington, and they encouraged us to pursue the concept. And briefly, what it is is an airport that would be located within south San Diego Bay, and it would be analogous to an aircraft carrier. It would have a top level for aircraft operations and a lower level for parking, terminal, facilities, et cetera. It would even have an underwater tube for access to and from the shore.

The advantages from an environmental standpoint is that it observes water areas completely around it. It is not invading any habitats. It will not cause any excessive noise. The airplanes will be taking off over and across the bay. It does not interfere with air traffic, military or civilian, and basically we've had a lot of good feelings about what we're trying to do.

Tonight, I discovered that the airport, for its location, will be invading, if you will, part of the bay area for amphibious training for the so-called quiet-water training, and that would be the delta areas and the echo area.

Now, logically, we should find an alternate site for our airport so we're not interfering with that area. Unfortunately, there is no alternate site. We have the only site in San Diego County that's feasible. So we would respectfully ask that an alternate site be generated for at least part of your in-bay amphibious operations.

And I think, somehow, we kind of balance the

25

Peterson Reporting, Video & Litigation Services

interest so that that can happen. And otherwise, we are very much in favor of what's being done. We think that there's no environmental complex whatsoever between us. And as an incidental benefit, we'd like to create a second entrance to San Diego Bay so that the amphibious base can go ahead and get their vehicles or vessels out into the ocean and back very easily.

The airport does respect the amphibious security zones, so we're not involved there. And we're just down to an old-fashioned tradeoff where we think that the alternate site for the amphibious training in-bay, there is no alternate site for a new airport, which incidentally will be billions of dollars for the economy of the South Bay.

MR. MICHAELSON: Thank you.

The next speaker is Jeff Foster.

MR. FOSTER: I'm a resident of north IB, and so I think that this increase would affect us the most, living up in that area. The increase in activities of shotgun blasts from 150 to 1400, helo sorties from 778 to 2,220, I think. And I guess that, in general, it's a 48 percent increase in sound-generating activities. We definitely will notice that. A lot of them are at night, and it's -- we can hear it.

Let's see. I -- so I -- I just implore you to choose the no action alternative. I think that us residents of IB should be considered first and foremost in this

26

Peterson Reporting, Video & Litigation Services

decision, because I think we're going to be affected the most.

Also, we -- one of the -- one of the most coveted things about IB is the wildlife and the wildlife along the Silver Strand beach adjacent to the south training facility is -- it's really nice down there, and reading this, I can see there's a pretty good impact to that.

And I just ask that you choose the no action alternative. Thank you.

MR. MICHAELSON: The next speaker is Normandie Trovato-Wilson.

MS. TROVATO-WILSON: I'll move it back.

I'm Normandie Trovato-Wilson, and I'm here with San Diego Audubon. Some of the concerns Jim is going to be talking about in a little bit, my personal and biggest concern with the increased level of activities is the introduction of training within the vernal pool areas. These are highly sensitive, complex ecosystems, and I have no doubt about the Navy's commitment after speaking with Delphine last night about protecting the western snowy plovers, the Least Terns -- I'll get into that later.

But whereas the Navy can very easily barricade off an area around the western snowy plover nest, it's not quite so easy to determine what the impact is going to be once foot traffic is let into the vernal pool areas, and these are

27

Peterson Reporting, Video & Litigation Services

ecosystems of which 90 percent have been destroyed in California.

An alternative for the vernal pools, since the complex ecological effects seem to be unstudied and unpredictable, would be to maybe phase in some of the training around a vernal pool that is in poor condition and track what happens in that vernal pool. You may have unexpected results, and it may be better. It could be worse. We don't know.

The potential down-listing of the California Least Tern presents a very bad thing in terms of Audubon perspective. We don't really know what the cumulative impact is going to be on both the western snowy plover and the Least Terns. There don't seem to be a real quantification of the sets of numbers. We heard an estimated take number on the high side. We didn't hear one on the low side. There wasn't one in the middle either, and I find that a little concerning.

It seems that an option could be to slowly phase in some of these alternatives, such as phasing in the one lane for six months out of the year and seeing how that goes, et cetera. And I didn't see that as part of the plan. And I think that maybe phasing in some of the alternatives and studying the effects could provide the Navy with alternatives to mitigate what may or may not happen.

28

Peterson Reporting, Video & Litigation Services

Because as we've known from some of these, many, many, many of these experiments, what happens when we start dealing with these issues is very, very unpredictable. And that's all. Thank you.

MR. MICHAELSON: Thank you very much.

I'm ready to read ahead a few more speakers, so you can be prepared. Richard Barck is going to be next, followed by John Warner, Jim Peugh, Rina Kelley and Ed Sorrels.

Richard?

MR. BARK: She didn't adjust it for me, did she?

MR. MICHAELSON: You'll have to bring that up. Yeah, that needs some work. That ain't going to work. Can somebody help him with that? Thank you. There we go. Thank you.

MR. BARK: Richard Barck, and I guess my description would be local resident. I have a couple of thoughts here. And reading through the report -- a lot to read, a lot of work went into that -- some of the things that I would look at from a statistical standpoint are sound levels, which you always describe as average. I assume that means over a 24-hour period?

What we're mostly interested in when we live locally and especially at night is how loud it is for very brief periods. If you dampen it out over a day, yeah, it's not very loud, but it's very loud when it happens.

29

Peterson Reporting, Video & Litigation Services

For us, especially if we have any doors open facing west, helicopters go by. You cannot hear the TV. In the middle of the night, if you have a few sorties -- and a sortie, as I understand it, contains more than one helicopter in a formation -- they get very loud. They're only there for a few minutes, but if it wakes you up, you don't go back to sleep immediately.

And they happen throughout the night. My impression is that many of those flights can be more offshore, because I believe they're not attacking the shore or part of a mission. That would be a comment on that.

We have very quiet nights in this area. At night, we hear the surf. We like to hear the surf. We like to have the doors open to do that. We would not like to have to close them to shut out the noise. The second thing is that sometimes there's an offshore breeze. We hear the traffic on I-5 and the trains across the bay. It's quiet down here. We would like that to be maintained.

And basically, I am talking about the impact of your Lanes 11 through 14 or your white and purple. I don't know how you'd like to call them.

Secondly, been a big effort by local people, as well as Fish and Wildlife and the state parks, to further develop the snowy plover -- western snowy plover nesting areas. Some of those in Silver Strand State Beach south are

30

Peterson Reporting, Video & Litigation Services

immediately adjacent to all SSTC south.

As I looked at the maps, which are very large scale or small scale that you have on there, it actually appears that you've extended into what was part of Silver Strand State Beach for some of those zones. It is an area that we had good fledglings and nests actively occupied by snowy plovers. Department of Fish and Wildlife has the statistics, and I'm sure they will make it available to you.

MR. MICHAELSON: Thank you very much.

The next speaker is John Warner.

MR. WARNER: Yes, my name is John Warner. I'm a resident and a proud taxpayer.

Aside from these issues mentioned, I have two very serious concerns. For the first, I'd like to go back to December of 2008. There was an F18, left the carrier offshore, developed engine problems. He was instructed by commanders to bypass the open runway at North Island Naval Air Station. He was ordered to attempt a landing at Miramar Marine Air Station. We all know the catastrophe that ensued.

My point is that we need hyper-efficient communication, coordination and cooperation between the Navy and the Marines. Commander Perry in the paper today stated we need a very realistic training environment. That would be afforded by the vast wide open spaces in Camp Pendleton, not an area sandwiched between two civilian populations and youth

31

Peterson Reporting, Video & Litigation Services

camps.

Have I cut off?

MR. MICHAELSON: No.

MR. WARNER: My second major concern, anybody that's been in this area for a while knows that in the waters out here, we have viral. We have chemical. We have bacterial pollutants that contaminate this water for weeks on end. That's -- in an El Nino cycle, that's magnified.

Now that's not to mention the potential catastrophe if Rodriguez Dam fails. The structural integrity of Rodriguez Dam is at question. Built in the early '30s, it would not take much of a man-made or natural event. We've been having a little movement on the earth here recently. I guarantee you it wouldn't take much for Rodriguez to pop, the waters out here to be contaminated for months.

Now I've been told one SEAL team member, that's about $200,000 to train that man. That's quite an investment. That's quite a valuable asset. To put that valuable asset in an environment where he is exposed or she is exposed to hepatitis, waterborne pathogens, parasitic amoeba, that is unconscionable. It's negligent. It's reckless.

To expand -- yeah, give me the 30.

To expand this facility, it may be comfortable and convenient. You may be able to sleep in your beds at night,

32

Peterson Reporting, Video & Litigation Services

but I sincerely believe it's compromising the readiness of our troops. Pendleton, that vast area, would provide the opportunity. That's the resource that needs to be explored. Thank you.

MR. MICHAELSON: The next speaker is Jim Peugh. You don't have to adjust that. Just pull the mic down a little bit. There you go.

MR. PUGH: You probably should order speakers by height, and so we can gradually make it up or down.

I'm Jim Peugh. I'm the conservation chair of the San Diego -- is this working -- I'm the conservation chair of the San Diego Audubon Society. We appreciate the Navy's long-term work to protect the Least Terns and snowy plovers on the strand. And we understand, you know, the desire to have more training operations, but we think you can do it with considerably less impact to the environment.

And we'll mention a little bit -- our letter will try to be more specific, but it is interesting that you're working to increase the training capability where, just a few years ago, the Navy was looking to put a golf course on the same area, also in the city of Coronado, which seems ironic.

The Least Terns, you know, some of your data shows that the populations are really high. It is important to notice the complementary number, that the reproduction of -- the successful reproduction has been plummeting for the last

33

Peterson Reporting, Video & Litigation Services

few years. So Lest Terns are not the least bit, you know, in a good position for the future.

The purpose of the Endangered Species Act isn't to let species hang on for decade after decade. It's for recovery, and I hope that you'll orient, you know, your actions and your plan to enable the recovery of the Least Tern, and I don't think that the way it is set up it does now.

The project -- I understand that -- that -- figuring out what the -- the take impact is difficult, but it just seems like you need to have better quantification of what the take is. You run some models, apparently run worst-case models, and that's really misleading to the public and decision-makers when you're only saying this is the worst case when there's something significantly less than that.

You really need to say what the uncertainty intervals in the modeling is. You need to come up with a worst case, an expected value and a best case and -- so people at least know what -- you know, how precise your calculations are. And you don't have that.

And the same thing is true of your mitigation measures. The mitigation measures are really kind of fuzzy. They're not mitigation in the sense that I've ever seen before in any other project, and I've reviewed hundreds of EISs and EIRs.

34

Peterson Reporting, Video & Litigation Services

You need to be able to quantify what the benefit is going to be to the species, and you really need to show how the difference between the impact and the benefit is going to facilitate the recovery of the species, and I don't -- you know, to me, I don't think you've reached that level.

And then as Ms. Wilson mentioned, the services working on -- for some strange reason is working on down-listing the Least Tern, which seems to be the most inappropriate action I've ever heard of. But you need to look to see what the cumulative impact of down-listing will be with your project.

We're really concerned also with the vernal pools. I don't know if you ever had to do trail maintenance, but trails are an increasingly degrading thing. They just go deeper and deeper the more years it's used. I don't know what's going to happen to the contours of vernal pools, but I think that you need to take up a pool, as Ms. Wilson said, and do a lot of experiment over a lot of years before you actually start manipulating.

That's the most endangered habitat type in our entire region. And so I just hope that you'll work hard -- and another thing, too, is that the staff so far in their command has been very serious about the environment. But people change, and I want this project to be so they really will protect the environment, not just depending on the

personality of who's in charge. Thank you.

MR. MICHAELSON: Thank you.

The next speaker I'm going to read ahead is Rina Kelley -- and if I mispronounce anyone's name, I apologize -- Ed Sorrels, Van Collinsworth, RG Head and Cindy Buxton.

All right. Rina?

MS. KELLEY: Yes, hello. I'm an inhabitant of the north area of Imperial Beach. I am not a snowy plover --

MR. MICHAELSON: Could you state your name for us, please.

MS. KELLEY: Oh, Rina Kelley. I'm not a snowy plover or a fairy shrimp. However, I am an inhabitant. I don't feel also that you have mitigated enough sufficiently for me, being north of Imperial Beach, your mitigation of what you intend to do.

I would like to inform you at this time about your lack of attention and the dangerous disregard of your property in Imperial Beach that has put the inhabitants of my city into a dangerous, threatening activity -- subject -- being subjected to your dangerous, threatening activity for years.

I would like to put you on notice first that your steel wall outside the Camp Surf fence at the beach has huge holes, serves no purpose except to attract children, has become a serious hazard to the safety of us. Jagged, rusted steel rim and bottom are hazardous on a daily basis. It is an accident waiting to happen for children.

MR. MICHAELSON: Rina.

MS. KELLEY: Yes.

MR. MICHAELSON: You're going to have to slow down a little bit. I can tell the court reporter is not getting it. Sorry. Just a little bit. She's really good, but not that good.

MS. KELLEY: She can paraphrase it. This is not poetry. So -- thank you, though.

Anyway, okay. It's a hazard, anyway. And it's -- for about ten years, it's been a hazard there with holes, jagged. So would you have us wait another ten years to remediate and remove it? Hopefully not, that you are now formally put on legal notice with legal effect.

MR. MICHAELSON: Thank you.

MS. KELLEY: Camp Surf -- Camp Surf opened onto the street in a residential area for years. You did nothing about it. It ran over the animals on our street, one animal in particular. I called the Navy Chaplin, and the people were distraught. And hit a child in front of my home. It was not -- you did nothing. We are the ones that had to make that camp in the same manner that I just served you with a notice to move that gate to the other end.

I want to tell you that this EIS in and of itself

37

Peterson Reporting, Video & Litigation Services

is like the nose's camel -- the camel's nose in the tent's door. On SSTC northeast, you do a little bit more -- you could request more activity, permission for an EIS. Then you do it at NASNI. Then you do it in the south where the Navy SEALs are. It's an aggregate effect.

The aggregate effect is that, gentlemen, we live in a war zone. I live in a war zone in the summer where Navy SEALs shoot guns and explode munitions outside all night. I can't sleep. Could you please put a time limit on this activity. Your EIS specifically addresses the intensity, the intervals and another thing -- the intervals, the intensity of the activity.

We'd like to know the intervals. I'd like to have a -- you know, a timetable so that I can leave town. Also, in addition, the planes that NASNI fly overhead doing these endless, mindlessly seeming exercises -- I was an Air Force officer. I was on Air Force bases. I don't understand how the Navy can destroy a city like this.

You shouldn't even be here. This is property that is coveted south shore property in the south -- Southern California, and, you know, I really hope that you could provide us with some timetables at least in mitigation of this. And, you know, go to the Philippines. General MacArthur took care of the Japanese. You don't have to worry about them over there, unless you drive a Toyota. Thank you.

38

Peterson Reporting, Video & Litigation Services

MR. MICHAELSON: Our next speaker is Ed Sorrels.

MR. SORRELS: I can tell already I'm not going to be a happy speaker for you folks. The captain mentioned -- oh, my name is Ed Sorrels. I'm a Marine veteran. I've lived in Imperial Beach almost 40 years, two different places, one over on Hemlock next to the axillary landing field, and now I live on the north side of Imperial Beach.

I've heard floating airports. I've heard "I can't sleep at night." I've heard birds and vernal pools and one thing and another. The one thing I haven't heard addressed was, the captain, when he gave his introduction, talked about the importance of realistic training and surviving a combat situation. And there's nobody here yet in this whole group that has addressed the improvement of training, proportioned it to the survival abilities of a marine or a sailor in combat situations.

Now, I'm sorry you can't sleep at night. Neither can I. But damn it, that's the sound of freedom. And to -- I'm for option one. There's a sign down here at MCRD over the door of the drill instructor's training facility, and what that sign says is "Let no man's ghost say to me 'If only you had done your job,'" and that applies to all of us now.

And that's all I have to say.

MR. MICHAELSON: Thank you.

Our next speaker is RG Head. Oh, excuse me. I had

one stick to another one. It's Van Collinsworth. Sorry.

MR. COLLINSWORTH: Hi. I'm Van Collinsworth, and I'm the conservation -- actually vernal pool conservation director for a coalition of environmental groups. Those include the San Diego Chapter of Sierra Club, the San Diego Audubon Society, Center for Biological Diversity, the California Chaparral Institute, and I'm most known if it involves Santee. I actually live out in Santee.

The issue I wanted to most focus on is the vernal pool impacts. And, first, let me say I appreciate the fact you've already acknowledged there's not going to be any activity during the wet seasons. But I am still concerned that the impacts -- the foot traffic during the dry periods would result in mortality of endangered -- the endangered San Diego fairy shrimp.

So the best, I guess, opportunity or best route is actually to avoid those vernal pools possibly with some fencing or signage to identify the resource and so there aren't any impacts there whatsoever.

Now, the previous speaker made an excellent point about readiness and the importance of training, and we certainly appreciate that. And so if you were to find in your analysis that there couldn't be avoided -- even though we still feel that that foot traffic will create a significant impact, we'd like to see that mitigated elsewhere.

Now one of the things I have with me tonight is a map of vernal pools actually that are directly adjacent to Marine Corps Air Station Miramar on Bonita (phonetic) Ranch. That property is for sale. It has a wealth of vernal pool resources. It's a perfect candidate for the readiness and environmental protection initiative that the military has, the buffer program. So I would like to see that given some serious consideration in this EIS and see if that might actually meet the needs for mitigation.

Thank you very much. And if I could leave the map?

MR. MICHAELSON: Yes. Thank you.

Next is RG Head.

MR. HEAD: Good evening everyone. My name is RG Head, and I'm a resident of Coronado Cays. I've spent a lot of time in Imperial Beach. I have a Bachelor of Science degree in engineering and a Ph.D. in public policy. For the past 20 years, I've worked in the environmental planning industry, and now I'm a private citizen.

I've observed tonight's comments are mostly negative with the exception of Ed Sorrels', and I would like to add a few to provide some balance. First of all, naval training is critical. It's absolutely critical to our survival as a country just like it is for the Olympics.

In fact, the phases are very similar. Basic

41

Peterson Reporting, Video & Litigation Services

training is physical conditioning just like for a ski jumper. Pre-deployment training for combat is indispensable to train young men and women before they go to Iraq and Afghanistan. And thirdly, training between deployments is very important to get new technology, new ideas, constantly improved communications.

Secondly, training area environmental impact statements are very unique. Training areas, you can't move the area. The area is where it is. I think the 60-year experience of the Navy in this area states for itself that if the training could have been moved to Miramar or to Camp Pendleton, it would have been done so long ago.

I'll say something about the ease of which you throw off "use Camp Pendleton." Camp Pendleton's 17 miles of beach are so critically inhabited by endangered species, that less than five miles are available for continuous Marine Corps training. They're not going to walk them another 5,000 operations up there. There is no better place for this type of training in the bay and in the ocean than this location.

Thirdly, the constraints that are put upon the Navy and the Marine Corps in their training are already immense. Yes, there are environmental issues. Yes, there's public concern over noise and economic impact. But most of the -- some of the speakers that you have seen are single-issue advocates. They're worried about a vernal pool,

42

Peterson Reporting, Video & Litigation Services

or they're worried about the snowy plover.

The Navy does not have the luxury to be a single-issue advocate. It is like the rest of us. We are multi-facetted. We have to deal with all the issues at the same time and make tradeoffs. As the Supreme Court -- as the United States Supreme Court ruled in 2008 in "NRDC versus the U.S. Navy," we and the citizens must give adequate attention to the common defense, and that's what I see done in this EIS.

Training and environmental stewardship are compatible, and I believe the Navy has achieved a good balance in this set of analysis. Thank you very much.

MR. MICHAELSON: The last speaker for whom I have a card is Cindy Buxton. If there is anyone else that would like to speak, again, if you hold up your hand, someone will bring you a card, and we'll get you in. We want everyone to speak who wants to.

MS. BUXTON: Hi. My name is Cindy Buxton. Some of you know me from Mountains and Waterfalls. I've made some observations for stuff. I cannot know all of your point of view. I think that's obvious, so thank you very much for the Navy keeping the good communication over the years.

And with all due respect, and I most definitely do, I'm going to make a few observations from my point of view since I have a hard time seeing all of yours. The training

43

Peterson Reporting, Video & Litigation Services

has already been very, very effective, and I think we're all very grateful since World War II and Vietnam and Korea and Desert Storm.

So I look at the two miles up there as I drive to work every day, and I look at the half mile of particularly critical areas down here, and I go "Why do we really need this?" I don't -- I haven't yet really seen the compelling argument to do some of the things that they want to do.

And they talk about the criticality of training and the unique area that -- that area up in Coronado seems to me to be very similar as a beach to this one, the one difference being is that this beach has natural dunes, and it's one of the few places in Southern California where you have a long wide swept area of natural dunes.

I moved down here, believe it or not, to Silver Strand and to Imperial Beach specifically because that was such a gorgeous, gorgeous beach. And I certainly do think that we should share our beach where we can or they with us, as you guys are Navy.

This town has worked very hard, I've noticed. I thought it was pretty wonderful anyway, though they've worked very, very hard to improve it and improve property values, and I think a lot of heavy artillery will probably compromise that considerably.

The one thing I noticed in the EIS was that the

44

Peterson Reporting, Video & Litigation Services

camp, Camp Surf, apparently hosts 10,000 children in a year, and I don't think when they originally leased that that they were thinking of a lot of blasting. So what I saw in there was that the Navy holds that property in a fee simple, and I looked this up and noticed that fee simple can be fee differential or circumstantial subsequent, and I'm wondering if there are any extra contingencies on that.

The blasting does affect people and children. This is where my dog went through a window one night when she got scared, and I think children would, too. So I would ask you to consider that and modify and attenuate for the birds and the blasting in this area. Thank you.

MR. MICHAELSON: Thank you very much.

Do we have anymore cards that have been turned in? Corey, anybody?

Okay. What oftentimes happens at this point in the evening is that someone has gotten inspired by something someone else has said, so I want to make sure that before we adjourn here, is there anyone else here who wanted to take advantage of this opportunity to make an oral comment, whether they filled out a card or not? If not -- yes. Would you like to come up? Come on up. We'll just give you a card and have you fill it out afterwards. How's that?

MS. DAVIS: That's fine.

MR. MICHAELSON: All I need is your name.

45

Peterson Reporting, Video & Litigation Services

MS. DAVIS: I'm Shannon Davis, and what's on my mind is the fact this is an environmental impact statement. It's a draft. And we're focussing on the environmental issues and NEPA compliance. This is not about patriotism. This is not about being -- protecting our freedom. This is about saving endangered species on critical habitat that maybe apparently should have been paid more attention to by U.S. Fish and Wildlife.

And possibly some of these areas should have been sanctioned as refuge, study areas by U.S. Fish and Wildlife to be held under their jurisdiction, not in cooperation with the U.S. Navy.

MR. MICHAELSON: Thank you very much.

Anyone else? Sure. Come forward.

MR. FELTIS: My name is Edward Feltis, and I'm a resident of Imperial Beach. I've been coming down here since 1960 walking the strand, and this is a single -- single-cast issue. I'm not sure exactly how you put it, but single-person issue.

Upon reading the impact statement, I noticed that the tide flats are public, and I'm a pretty regular walker. My wife takes me down to Silver Strand. I walk up to the IB pier. I have no problems with -- and according to the statement, most of the training that's going to take place will take place for an hour or two hours, eight hours at the

46

Peterson Reporting, Video & Litigation Services

most, things will be posted. I have no problem with walking the beach, running up to a sign that says "Restricted area for the next 48 hours. We're going to be doing this. We're going to be doing that," turn around, walk right back to IB.

But my concern is that in 11 through 14, we'll get a sign put up like we had put up two years ago that said "Nobody past this point. This is naval property. You can't walk down to the Silver Strand," and what everybody did was ignore it. If they didn't see anything going on, they ignored it.

Readiness training, all part of that. I've got two kids that work -- or live down the hall from me that are in SEAL Team 3, and I want those guys ready, professional and able to do their job whatever it takes. I just want a little assurance that -- on those days when nothing's going on, I want to walk the Silver Strand between the state park and here -- I won't be in any kind of jeopardy or I won't be in the way of any activities. Thank you very much.

MR. MICHAELSON: Thank you. If we could get you to fill out a card, we'd appreciate it. Thank you.

Anyone else? See, I told you a few people would get inspired, didn't I? Anyone else?

If not, if you look behind you, you'll see all those eager faces at all those poster stations. They just can't wait for you to come back and ask them more questions.

And since we're here until 7:30, we're happy to do that.

So we're going to adjourn, and if anyone else wants to make oral comments, let me know and we have -- we can accommodate that.

All right. Yes, sir?

MR. SORRELS: I'd just like --

MR. MICHAELSON: Oh, you know what?

MR. SORRELS: Can you use my card again?

MR. MICHAELSON: For a second helping?

MR. SORRELS: Yeah.

MR. MICHAELSON: Let me confer. Yeah, sure. Go ahead. I'll give you another three.

MR. SORRELS: Okay. I won't --

MR. MICHAELSON: I don't think you used up your full three the first time.

MR. SORRELS: Okay. Summer of 1957, I was flown in from Hawaii to Camp Pendleton, and I worked all that summer as a lifeguard on the beaches there by Del Mar where they do the Amtrak and rubber boat training for the Marines. And I can assure you of one thing: The environment here on the strand is entirely different than the beach approach environment in Camp Pendleton.

You go from water to a very small beach, and then you start inland, and it goes uphill. You don't go from water to beach to water. And it is -- to compare the Silver

Strand to Camp Pendleton training areas is apples and oranges. The two don't compare at all.

MR. MICHAELSON: All right. Thank you.

All right. So we're going to be here until 7:30. We're going to adjourn and ask you to ask anymore clarifying questions that you want at the poster stations. Thank you very much.

(Hearing adjourned at 7:09 p.m.)

(4:32 P.M.)

ORAL COMMENTS

* * * * *

ANONYMOUS SPEAKER: Basically, I understand that the Navy told me that the species are thriving where they're doing training. I think that's great. My concern is that a lot of environmental groups are not doing their homework and not paying attention to what the federal people are telling them.

For example, my son works for National Marine Fisheries, and the environmental groups don't read the reports that are coming out. They need to do their homework instead of filing lawsuits to stop everything. So maybe there's a middle ground here where everybody has to meet. You know, people have to pay attention to each other.

They're wasting taxpayers' money. We shouldn't have to take nine years to find something out and figure out a scope of work. We need to talk to each other and put aside our emotional differences. Amen.

* * * * *

Peterson Reporting, Video & Litigation Services

(6:03 P.M.)

WELCOME TO PUBLIC HEARING

* * * * *

MR. MICHAELSON: Good evening and thank you for coming tonight. My name is Lewis Michaelson, and I will be the moderator for tonight's hearing on the Navy's Silver Strand Training Complex environmental impact statement, or as you will hear it referred to for the rest of this evening, the draft EIS.

Here to receive your comments are Captain Yancy Lindsey, Commanding Officer at Naval Base Coronado, and then Delphine Lee, project manager for the Navy Pacific Fleet. Mr. Kent Randall -- I think I see him over there. He is raising his hand -- is the project coordinator for the Naval Facility Engineering Command, and his is the actual primary point of contact and address that you see on everything for mailing your comments to.

Let's look at the agenda for tonight. Hopefully you have all had the opportunity, or most of you did, to talk to the many knowledgeable experts who are at the poster stations during the open house. The primary purpose of this portion of the hearing is for the panel members to listen to your comments firsthand. They will not be answering questions during this phase of the proceedings.

Any comments and questions during this phase will

4

Peterson Reporting, Video & Litigation Services

be addressed in the final EIS. So in terms of the agenda, after I've finished this introduction, Captain Lindsey will give a brief overview of the Navy Silver Strand Training Complex and training activities. Then Ms. Delphine Lee will brief you on the environmental impact analysis process and summarize the results reported in the draft EIS.

The last item on the agenda, however, is really the most important. The public comment session is your opportunity to provide information and make statements for the record. Your input ensures the decision-makers can benefit from your knowledge of the local area and any environmental effects you think may result from the proposed action and its alternatives.

Keep in mind, the EIS process is intended to ensure the decision-makers will be fully informed about the potential environmental impacts associated with the various alternatives before they decide on a course of action. To request an opportunity to make a verbal comment during tonight's hearing, please fill out a speaker comment card. I have several filled out already. If you decide you want to speak after we've begun, just raise your hand, and someone will bring you a comment card from the registration table.

I call on people in the order in which they've signed up. Every speaker, including public officials, organizational spokespersons and individuals, will have three

5

Peterson Reporting, Video & Litigation Services

minutes each to provide his or her comments. If you do not feel comfortable standing up here tonight, there are several other ways you can make the statement.

We have touchscreen screens back there that you can use to enter your comments. You can hand in written comments here tonight. You can mail in written comments, or you can use the project website to provide written comments as well, as long as they're postmarked or received by March 9th.

I also have a court reporter here. She's here to make a verbatim transcript of any comments offered orally. Keep in mind, the written comments have the same consideration as verbal comments, so there's no obligation to speak verbally if you're more comfortable doing it in written form. Now it is my pleasure to introduce Captain Lindsey.

CAPTAIN LINDSEY: Make sure I get this figured out where you can actually hear me. Is the lighting on me when I stand back here better? I thought it might be, so I'm going to move this back. Is that better? Good. Make this command decision here. I'm just going to take this out. That way, I don't have to lean over.

MR. MICHAELSON: Are you sure, because I can get it down to your mouth if you want.

Peterson Reporting, Video & Litigation Services

STAFF PRESENTATION

* * * * *

CAPTAIN LINDSEY: That's okay.

All right. Thank you, Lewis.

And welcome to the public hearings for the Silver Strand training draft -- or complex draft EIS. My name is Captain Lindsey, and I'm the commanding officer, Naval Base Coronado. I want to thank you on behalf of the United States Navy for attending this evening. This is one of two public hearings the Navy is holding in Southern California for the Silver Strand Training Complex draft EIS.

For simplification, during the remainder of my presentation, I may refer to the Silver Strand Training Complex by its acronym of SSTC or "stick." "Stick" is the common term we use when we're saying Silver Strand Training Complex. I think that will shorten my presentation if I can just say "stick."

The Navy has been training at the SSTC for over 60 years. The SSTC is comprised of the Silver Strand Training Complex north, which is this area here in gray and these lanes and the areas of the bay, blue, and the Silver Strand Training Complex to the south, which is this area here. Training activities are conducted in the Pacific Ocean, San Diego Bay, on the beach and inland. Training is also conducted on the southern near-shore areas of Naval Air

7

Peterson Reporting, Video & Litigation Services

Station North Island, which is this area here.

The North Island area is not technically part of the Silver Strand Training Complex but is included in this study because similar types of training are conducted there. Navy airfield operations at North Island and Imperial Beach, which is down about here, are not part of the scope of this draft EIS. And I want to repeat that. The airfield operations, that is the helicopters using the airfield or transiting between the air fields of North Island and Imperial Beach are not part of the scope of this EIS.

The overall mission of Silver Strand Training Complex is to support U.S. Navy and Marine Corps amphibious, special warfare, mine countermeasure and other near-shore training by providing local land, sea and airspace support services, equipment and supplies and training facilities that will help naval and Marine Corps forces achieve and maintain the highest levels of operational readiness.

There are a number of Navy commands that rely upon the SSTC to conduct required training. These include Navy SEALs, explosive ordnance disposal teams, assault craft unit, beach master unit and amphibious construction battalion, special boat units, Marine Corps small boat raid companies and coastal defense units.

The SSTC is used to support the training of these commands and their personnel, who, for the most part, are

8

Peterson Reporting, Video & Litigation Services

stationed in the San Diego metropolitan area. The Navy also conducts basic new recruit training on the SSTC. This training is conducted in formal courses with syllabi and instructors, including both classroom and fieldwork. For example, all SEAL recruits must complete the basic underwater demolition training program on the Silver Strand Training Complex to be qualified as a Navy SEAL.

There are over 70 different types of training activities that occur on the SSTC. One of the most common activities is the -- is basic physical fitness, that is, running, exercising and swimming. Personnel may also learn how to operate different small Navy vessels and maneuver them across calm water or more challenging surf conditions.

Advanced students learn how to collect intelligence through reconnaissance, beach raids and assault coordination. Personnel also learn to seek, find and identify simulated mines to include dismantling and neutralizing them. There are also logistics-related training. Personnel work together to move equipment, vehicles and supplies from a large offshore ship to onshore areas. This may involve shuttling craft and people between the ship and/or reeling out hoses to transfer fluids from ship to shore.

The Silver Strand Training Complex has a unique combination of attributes that make it an ideal venue to train servicemen and women in amphibious warfare, special

warfare and mine warfare operations. SSTC contains large stretches of water, beach and inland areas. Access to both the calm bay and rough ocean allow personnel to initiate training in a calmer environment, then quickly and easily transition into a more challenging environment on the ocean side as personnel improve their skills and fitness levels.

Southern California's temperate climate also allows for year-round training. The SSTC is also centrally located within our nation's largest concentration of naval forces. Its close proximity to necessary infrastructure, logistics, personnel and other complimentary training ranges makes it a critical training range for a wide range of military commands.

This allows our servicemen and women stationed in the San Diego area to fulfill their daily training requirements without having to travel away from home. And that's a significant aspect of the Silver Strand Training Complex, is that people can do a large majority of their training in -- literally in the backyard of where they're stationed so they can maximize the amount of nights they get to sleep at home. They can go to Jimmy's soccer tournament. They can go to Sally's play. They can go to PTA meetings because they can do high-quality, realistic training right here, and they're home that night sleeping in their bed.

And you can imagine with the amount of time that protecting the environment is a priority for the Navy. The Navy is committed to complying with its legal responsibilities for protecting the physical and natural environment and has established a successful track record of environmental stewardship while meeting our mission.

To accomplish its environmental stewardship goals, the Navy implements protective measures on land and in water to reduce the potential effects from the terrestrial and marine environment while ensuring public safety and accessibility.

I will now turn the presentation to Ms. Delphine Lee from the United States Pacific Fleet, who will tell you about the Navy's proposed action and give you an overview of the draft EIS and the environmental analysis process.

MS. LEE: Can you guys hear me? Okay. Great.

Thank you, Captain Lindsey.

My name is Delphine Lee, and I'm the project manager -- I'm the project manager for the Silver Strand Training Complex environmental impact statement. I'm here tonight to give you an overview of the findings contained in the environmental -- the draft EIS.

The draft EIS was prepared by the Navy to comply with the National Environmental Policy Act or NEPA. It is an important part of the Navy's overall commitment to environmental stewardship as it trains. The Navy is the lead

agency for this EIS. The National Marine Fishery Service is the cooperating agency on the EIS in addition to their role as a regulator.

The Navy proposes to improve the availability and quality of training opportunities at the Silver Strand Training Complex to achieve the required levels of operational readiness as mandated under federal law. To meet training requirements, the Navy proposes to, one, continue current training; two, increase training frequency and types of training; three, conduct existing routine training activities at additional locations within established training areas. And I want to be clear that the Navy is not proposing to expand the training area, just where we train within the existing range.

Four, we're proposing to introduce new platform and equipment into training and, five, introduce access -- excuse me -- increase access and availability of existing beach and inland training areas.

The proposed action is needed to accommodate the future military readiness requirements, including increased usage of the Silver Strand Training Complex, year-round access to training areas and flexibility and realistic training.

Three alternatives were evaluated in the draft EIS to help determine the appropriate level and type of training activities required for the Navy to meet its needs. Under the no action alternative, the Navy would continue to conduct training as it has historically at the Silver Strand Training Complex. Training would not be different from what you've seen over the last five to ten years. This alternative provides a baseline for assessing the potential environmental impacts of other alternatives.

Alternative 1 is designed to meet the Navy and Department of Defense's current and near-term training requirements and is the Navy's preferred alternative. Specifically, Alternative 1 proposes to, one, increase the frequency of training from about 4,000 activities to over 5,000 activities annually; two, it proposes to introduce new types of mine countermeasure, amphibious and special warfare training activities.

Three, we're proposing to conduct existing routine training at additional locations within the Silver Strand Training Complex to improve the diversity of training. Four, we're proposing to introduce new platforms and equipment into training, specifically the MH-60S helicopter. We're going to replace the amphibious assault track vehicle with an expeditionary assault vehicle and upgrade the existing ship-to-shore fluid transfer system.

And lastly, Alternative 1 proposes to conditionally increase the availability of beach and inland training areas

14

Peterson Reporting, Video & Litigation Services

to accommodate this proposed increase in training activities. Alternative 1 is the Navy's preferred alternative because it would fully support the types of training -- type and frequency of activities required to achieve complete fleet readiness and allow the Navy to carry out its mission at the Silver Strand Training Complex.

Alternative 2 is also designed to meet current and near-term training requirements. This alternative includes proposals identified under Alternative 1. Unlike Alternative 1, however, it would also allow for year-round access to all 7,000 yards of ocean-side beaches along the Silver Strand Training Complex, north and south, for continuous year-round training. California Least Tern nesting habitat at delta north and south would continue to be preserved.

In preparing the draft Environmental Impact Statement, the Navy evaluated potential effects of the alternatives on the marine, natural and human environment. The Navy took a comprehensive approach in assessing the potential effects on 16 different physical, biological and socioeconomic resource areas. We will present some of these findings here.

We encourage you, if you haven't already, to review the draft EIS, which presents the findings of the Navy's environmental analysis for each of these resource areas. We

15

Peterson Reporting, Video & Litigation Services

welcome your comments on the findings or the methods of analysis.

For the most part, the resources analyzed in the draft EIS, we found no significant impacts or long-term effects from the Navy's proposed action. Training at the Silver Strand Training Complex creates intermittent short-term noise from various sources such as aircraft, vessels and vehicles. Although these training activities could be audible, they would not contribute substantially to the overall average sound levels of the area. Increased training activities would increase the tempo of intermittent short-term noise.

The Navy has established protective measures to reduce the effects of noise on the surrounding community. It works to minimize noise by considering the location and time of day of training activities.

The use of training materials may deposit small amounts of material on land and underwater training areas. Deposited materials are collected wherever feasible. The trace amounts left are not expected to affect biological or physical resources.

Many sensitive species including endangered and threatened species are found on or near the Silver Strand Training Complex. For many years, the Navy has taken proactive steps to protect the natural resources on its land.

16

Peterson Reporting, Video & Litigation Services

Threatened and endangered birds on the Silver Strand Training Complex include the California Least Tern, the western snowy plover and the light-footed clapper rail. Training activities have the potential to impact the Least Tern and the snowy plover, both of which nest on training beaches.

Since the mid-1980s, the Navy has implemented a comprehensive and adaptive natural resource management program and spends over half a million dollars annually to maintain protection for these species. Thanks to this program, we've seen a dramatic increase in the Least Tern and western snowy plover nesting on the Silver Strand beaches.

The nesting continues to expand even with the Navy training on the same beaches. No significant impacts on sea turtles or marine mammals are expected from the proposed action. Various measures will help to protect these species during training. For instance, the Navy will monitor for these species and hold training as needed to protect them from harm. Effects on other marine biological resources and terrestrial biological resources will be minimal, as they are temporary and/or localized.

Commercial fishing, sports fishing, diving, boating and other ocean recreational activities occur regularly within or near the Silver Strand Training Complex. The Navy understands the concerns the community may have regarding public access. Training activities would continue to be

17

Peterson Reporting, Video & Litigation Services

conducted in long-established military training activities -- excuse me -- training areas. The training areas would not be expanded.

The public would continue to have access to the beach and water areas adjacent to active training. During some training activities, public access to the training site may be limited for public safety and security reasons.

Significant impacts to cultural resources, transportation circulation and socioeconomics are not anticipated from the Navy's proposed action. The Navy must comply with numerous federal environmental laws, regulations and executive orders such as those that are listed here. To help ensure compliance with these environmental requirements, the Navy has worked with and will continue to work closely with a number of regulatory agencies, including the U.S. Fish and Wildlife Service, the California Coastal Commission and the Regional Water Quality Control Board.

At this time, the Navy has completed the first three steps in the NEPA process, and we are now in the phase of providing the draft EIS for public review. Let me review the progress so far. The EIS was initiated on August 6th, 2001, and the Navy held two public scoping meetings to invite the public to provide input on the proposed action, the alternatives under consideration and the environmental resources and issues to be analyzed.

18

Peterson Reporting, Video & Litigation Services

Government agencies, organizations and the public were encouraged to submit comments throughout the public comment period. The comments received were considered in the preparation of the draft EIS that we have here tonight. We are now at the 45-day public document review period and at the public hearing. This phase is an essential part of the NEPA process because it allows the public to review the document and comment on the Navy's analysis and potential of environmental effects.

We encourage you to provide your input today or by March 9th so that it can be considered for incorporation in the development of the final EIS. All comments will be considered. The Navy is committed to keeping the community informed throughout the development of this EIS. These public hearings are just one opportunity to share information and, more importantly, to encourage your feedback and comments.

I will now turn the presentation back over to Lewis to describe how to obtain more information and how to comment on the draft EIS.

MR. MICHAELSON: Will you bring the lights back on? I had someone assigned to bring them down. I don't know where he went to bring them back up. Breanna, do you mind? No. She's got to go to the master. My light-turner left the room. Okay. Good. Thank you.

19

Peterson Reporting, Video & Litigation Services

In addition to holding these public hearings, the Navy has established a website to make it easy for you to find and comment on the environmental documents. The draft EIS, for example, is posted on the website. It also has additional background information and links to the fact sheets and posters that are available here tonight.

You may also review a hard copy, if you would like, of the draft EIS by visiting either the Coronado or Imperial Beach library. The addresses of these libraries are provided on the NEPA process handout you received tonight when you came in.

Thanks.

The Navy does, in fact, welcome your review and input on the analysis. I hope they've made that very clear to you both here and at the poster stations earlier this evening. And there are several ways for you to submit comments. Obviously, we're going to be accepting oral comments here shortly tonight after this presentation.

Written comments may also be submitted by filling out the comment form that you were handed when you came in. We have the table over there. You can also use the touchscreen to type them in if you would like to. There is also the -- as I pointed out, Kent Randall, the point of contact, this is the address. It's also on all the handouts. You don't have to copy it here.

So you can submit them in writing and mail them in using a postal -- you know, there's postal mail, or you can log onto the website and leave your comments electronically. Just keep in mind that March 9th is the deadline for postmarking or receiving those comments.

We'll now begin the oral comment session portion of the public hearing. If there is anyone who wishes to speak, we would ask you to fill out one of these cards. This is how we keep track of who is going to be speaking and what order they're going to do that. Is there anyone who hasn't yet signed up who would like to speak?

Actually, if you could just go pick those up for her, and hold up your hand if you would like to fill one of these out. Thank you. I want to make sure everyone who wants to speak gets an opportunity to do that. Thank you, Corey.

To ensure that we get an accurate -- here's some more pens if you would like.

To ensure that we get an accurate record of what you have to say, please help me, if you're going to speak tonight, by respecting the following ground rules: First, please speak clearly and slowly into the microphone over at the lectern there. We have a court reporter here, as I pointed out. She's going to be making a verbatim transcript, and we want to make sure we get an accurate record of what you have to say.

All we need is your name and any organization you represent. We don't need addresses. Second, each person will have three minutes to speak. Third, if you have a prepared written statement -- and you may turn it in at the registration table or you may read it out loud if you can do so within the three-minute time limit. Fourth, please honor any requests that I make for you to stop speaking when you've reached the three-minute time limit.

In order to make it easy for you to know when that is going to occur, I have this sign. It says "30 seconds." That means you have 30 seconds left of your three minutes. And if you manage to make it to the end of three minutes, I'll hold up this one. It says "end." And that way, you can wrap up your comments comfortably at the end of the three minutes.

With that -- let's see. I did want to mention that we are trying out some new technologies to involve people in the EIS. Some of you people may have used that touchscreen for either getting information or for leaving your comments.

We are also videotaping, trying to experiment with the ability to make copies of that and put that on the website as well so that people can see what happened at the hearing. So I just wanted you to be aware that we were doing that.

22

Peterson Reporting, Video & Litigation Services

So with that in mind, let me go ahead and read the speaker comment cards I have already to have some idea of where you're coming up in the rotation so you can be ready to come up to the microphone. The first speakers will be Bill Adams, followed by Jennifer Blair, Beverly Dyer, Normandie Trovato-Wilson, Gary Trump and Marilyn Field. So, again, if you would kick us off, Bill Adams. Thank you.

PUBLIC COMMENTS

* * * * *

MR. ADAMS: Yeah, my name is, of course, Bill Adams, and I'm primarily interested in -- I'm a shore fisherman. I've been shore fishing Coronado beaches since 1949. As a matter of fact, when I was ten years old -- my dad was in the Marine Corps -- I was fishing off the Coronado jetty in front of the hotel in 1943 at age ten. So I know a little bit about shore fishing.

Now I'm particularly interested in your Section 3.8, quote, fish. And I'm going to be talking mostly about what we shore fisherman use as bait. Those are called, especially in the summertime, sand crabs. That's the backbone of shore fishing in this area here. On your section references, you talk about -- you have 75 references on 15 -- 15 pages, I think it is.

I wrote reports for the Navy for over 30 years. So

23

Peterson Reporting, Video & Litigation Services

I was a little surprised when I opened up this document -- a young man earlier explained to me why you're not doing it, but usually when you have a reference, you would have -- if I went to the reference section, it would say in the report what page this came from, or pages. All right. That's not done.

It's almost impossible to go through that report and find out where you're talking about. For example, you've got one report dated 1892, some author who wrote something in 1892. I'd like to know what was so important that was required to be in the reference -- 75 references.

The other thing that many of us shore fishermen are concerned about, and both the lifeguards in Coronado are well aware of the situation, especially shore fishermen, and that is wheeled vehicles on the beaches. Okay? Now, years ago, when I was on the city council in Coronado, we managed to talk the Navy into getting off the wet part of the sand. That's where the sand crabs are at.

But I noticed just recently they're still driving those vehicles on the wet sand, especially at low tide. That's almost a no-no. You're killing the sand crabs.

Now, you say there's no long-term effect. Well, I can tell you, as a fisherman, there is. There are no sand crabs on Coronado beach right now. If I go down to Silver Strand, there are sand crabs. If I go down to Imperial Beach

24

Peterson Reporting, Video & Litigation Services

by the pier, there are sand crabs.

Oh, my God. I guess I'm going to be cut off real short here. Amazing. I don't see how you can have a real impact on a discussion when you only have three minutes. I mean, that's ridiculous. And then tell us, "Oh, by the way, we've got a thick document here," and you want us to respond by March 9th. That is ridiculous, too. And there's only one copy of that report in the Coronado library.

Yeah. Well, I've said my piece.

MR. MICHAELSON: Next speaker is Jennifer Blair.

Actually, the court reporter needs to be able to make an adjustment, if you don't mind. Ready?

Okay. Go ahead. Thank you. Just state your name.

MS. BLAIR: Jennifer Blair.

My question -- I noticed in the agencies that the California Environmental Quality Act really was not addressed in there, and my specific question is related to noise, and the helicopter noise is the main problem that I'm seeing. I live in the Cays, and I understand we're not talking about the helicopters that are going from -- transporting from Miramar and down to the south end in IB, but you're considering -- I forgot how many sorties that you want to have in addition of the helicopters, and how is that addressing the environmental noise act? That's just a question I have.

25

Peterson Reporting, Video & Litigation Services

MR. MICHAELSON: Okay. Thank you.

The next speaker is Beverly Dyer. Brandon, can you do me a favor and bring the microphone up a little bit? Thank you.

MS. DYER: I think it's ludicrous that the Navy has suddenly thrown this upon our public.

MR. MICHAELSON: Would you state your name, please.

MS. DYER: I want to know how long they have been studying this, why we haven't heard about it before. I know they've been saying they're going to get all this money, and they can do all these things, but did they ever tell any of us that they were going down the strand? None. I have never seen it released until last night, and I didn't have time to write up all of my questions that I have, all the comments that I have.

But I have been jotting down different things as you've gone along. But it just doesn't seem right that suddenly we know -- we read about it in the paper, and a lot of people didn't see it in the paper, and there has been very, very little about it on the television. Now that isn't fair. It isn't fair for the Navy to suddenly come in to say "We're doing all these things, and we've done all these things and we've looked up all the environmental necessities and for the project."

But why haven't we known? Why haven't they told us

26

Peterson Reporting, Video & Litigation Services

if we live here? I live in the Cays. I've lived there 40 years, and I've watched things. I haven't seen any kind of action in that area. In fact, at one time they were going to build a golf course up where you now have buildings on the hill. We used to walk there. There wasn't anything going on there. So -- and suddenly, you've done all these things. You're going to take it over, and there has been very little going on even north of the -- of Silver Strand park where people park right up -- up to the Navy property.

But I haven't seen actions going on that far down, and perhaps I missed a few, but I doubt it, because I drive there all the time. And that's another thing that you did not bring up, and that is traffic. The traffic has gotten absolutely horrible because of the Navy, because of North Island. They've been working on that tunnel for North Island, and that's ridiculous because we have -- already have all this traffic coming up from the -- the helicopter base down in Imperial Beach, coming up the strand. They're just continual already.

Now you want to do all these other things. You want to save the Navy from having to go far away from their homes. Well, what about the people that live here, that have -- live in Imperial Beach or live in the Cays or live in Coronado? You just add that much more to the people that are here. Even though you keep your people from driving, there

27

Peterson Reporting, Video & Litigation Services

are other people that live here, too, and the people that work for the Navy.

Thank you. I'm going to also include a letter, so -- later on. Also -- and I agree with the noise and the pollution, you have -- nothing has been said about the pollution in the air that we breathe from the planes going over anything that's on the beach that we get from any of their -- their vehicles and any of the pollution that's in the water. They have the Silver Strand beach there where public comes in and uses up all summer, even in the wintertime, and they use that beach as do the surfers. Thank you.

MR. MICHAELSON: Thank you. That was Beverly Dyer who just finished speaking.

Normandie Trovato-Wilson, please.

MS. TROVATO-WILSON: Hi. I'm Normandie Trovato-Wilson, and I'm with the San Diego Audubon. I want to thank Captain Lindsey and Delphine and Lewis for hosting again tonight. I have just a few things that didn't come up last night.

The first thing was we know that there is anticipated projection in -- an increase in levels of recruitment, and we completely understand that with the level of new recruits that are needed to maintain the fleet readiness. However, if levels drop in the future, we would

28

Peterson Reporting, Video & Litigation Services

be interested in including a provision that indicates if for some reason there is complete peace everywhere on earth, for instance, and training levels dropped dramatically, that certain training lanes which are not currently used, if they are used in this future Alternative 1, that they might be phased back.

It was brought up last night about peak noise events and how peak noise events might be a helpful statistic to include in the second draft of the EIS as opposed to average noise levels, because if we're talking about peak noise, we can have one really loud peak noise, and then the rest of the day could be quiet, and that would be an average noise level, but that wouldn't analyze the data of the peak noise and how loud it would be.

The other thing that I want to repeat from last night is that the California Least Tern is currently in limbo of being down-listed by the U.S. Fish and Wildlife Service, and that would have a big effect on what would be going on at the SSTC. And just as a side, recovery efforts are often unpredictable and hard to predict what's going on. And there is a commitment, clear commitment by the Navy to maintain the environmental integrity of the SSTC.

And it's my personal opinion, not necessarily Audubon's, that maybe some phasing in could be added into the -- the use -- the plans, so maybe trying something, if

29

Peterson Reporting, Video & Litigation Services

you see a negative impact, phasing it out. I don't know exactly what the protocol is for that.

And it is our hope, from Audubon, that these steps are not towards general reduced protection of wildlife in general, but maintaining of the Navy's commitment to the environmental integrity of the SSTC. Thank you.

MR. MICHAELSON: Thanks.

Our next speaker is Gary Trump.

MR. TRUMP: My name is Gary Trump. I live in the Cays. Ma'am, sirs, thank you for having us. I was a little late, so I'm not so sure what's been covered, but my major question would be: Are you going to have an independent study to corroborate what your positions are? Because I think without that, nobody's going to believe you, at least the skeptics won't.

The other thing is, we live at the very bottom of the Cays. There's a lot of unburnt fuel from the helicopter passages. There is a lot, and it's all over the patio furniture. It's not thick, but it's there. And if you increase your level of helicopter flights, you're going to increase that, too.

The other thing is we sit out on the patio quite a bit, and there are times, with your helicopter noise, that we have to stop talking. And I'm quite sure that you don't really want to have that happen in this environment. It's a

30

Peterson Reporting, Video & Litigation Services

lovely environment.

We came from Los Angeles, and we've never known you people before. We live in the Cays, and there are a lot of people in the Navy there. We love you very much. We're worried about you, and yet I think there are some things about your proposition which probably is not -- I don't think withstand a peer review. So maybe you can think about that. Thank you so much.

MR. MICHAELSON: Thank you. I'm going to read ahead the next speakers so you can know where you're coming up. Marilyn Field -- and if I mispronounce names, I apologize in advance -- I believe this is Steve Cohan, followed by Ryan Short and Judy Haims.

MS. HAIMS: Good evening. I'm Marilyn Field. I'm a Coronado resident, and I'm very concerned about this project. I'm very concerned about the noise impacts and the pollution impacts. The newspaper said there was going to be live fire. I was told tonight there wasn't, but I think it would be good if we understood exactly what was going on.

As far as the noise impact, it simply defies credibility that there's going to be no significant increase in noise. It may -- you can do all kinds of things with statistics. You can average it out over a long period, and somebody said you could play all kinds of games with it, but it's simply not credible that this is not going to add to

31

Peterson Reporting, Video & Litigation Services

noise in Coronado.

This is a small residential community, and you just cannot keep using this as though this is your only training facility. You have other places where people can train. And, yes, it's more convenient here, but you have to balance that against the needs of the small community, and you are very definitely going to be impacting the quality of life here.

Already, we have serious impacts of helicopter noise. We live on the other side. We live on the San Diego Bay side, and yet we are constantly, in the summers particularly, affected by helicopter noise so that we can't watch the evening news. We can't have telephone conversations. We can't conduct conversations around the dinner table because the helicopters will come in fleets going south or north on the bay. And they're supposed to stay offshore, but they don't.

Now, I'm told that this project did not analyze the helicopters going to and from the training areas. Now that seems to me it's probably a violation of NEPA. Under the National Environmental Policy Act, you're supposed to consider all of the environmental impacts, whether they're remote or anything that's affected by this project.

You said you've been working on this since 2001, and yet you've chosen to analyze the helicopter traffic

32

Peterson Reporting, Video & Litigation Services

patterns and noise to and from the training area separately. Now that's called segmentation. It's illegal under NEPA. You're supposed to analyze the whole thing, and the public is supposed to have an opportunity to understand and comment on the total effects of the project, not chopped up into little pieces so that it looks benign, but the entire impact of the project. That needs to be done before you proceed here.

Secondly, I think the gentleman who just spoke made an excellent idea. I think we do need some independent analysis of your conclusions, because they're simply not credible. And I think it's important to consider the quality of life here and the human element, as well as the wildlife.

So I'd like you to think about what you're doing to Coronado. It's not just about the Navy. This is a small community, and we really need to be very aware that you cannot simply continue to load Navy operations here without ruining this small town. Thank you.

MR. MICHAELSON: The next speaker is Steve Cohan.

MR. COHAN: My name is Steve Cohan. I just wanted to make sort of a summary statement about my impression of the project. People have talked and brought up some very good points. The impression is that there's going to be a really significant change of impact on the beach. The fact that this process was started in 2001, that now you're -- it was ten years ago and you're now having public hearings, I

33

Peterson Reporting, Video & Litigation Services

think that the presentation has tended to minimize what the likelihood is of the impact, that it's going to be significant.

The people have mentioned these really important areas that really haven't been fully addressed, the impact on wildlife, the noise impact, the possibility of future cutbacks of these operations, legal compliance with preparation of the report.

All of these things can't be dealt with, of course, in three minutes, and I'm not prepared to make any technical statement about it, but I think you should take into consideration that the impression of the community is -- is that this is going to be a significant degradation of what is a very beautiful beach, very unusual beach condition in Southern California.

There aren't many white-sand beaches that are left that are in the quality condition that it's in. I would just make one further statement that this isn't entirely a problem that I would attribute to the Navy. Having lived around the Navy and watched its operations, including the helicopter operations, the Navy's done a good job, I think, of trying to concern itself with public impact. This isn't entirely the Navy's doing.

It has to do, perhaps, with what really is a long-term problem of our poor political leadership out of

34

Peterson Reporting, Video & Litigation Services

Washington. Nevertheless, it looks like a very significant degradation of the community. Thank you.

MR. MICHAELSON: The next speaker is Ron Short.

MR. SHORT: Hi. My name is Ron Short, and I live in Imperial Beach about a block south of Camp Surf, which is the southern border of your training complex. My concerns are basically the -- sort of like the infringement on our quality of life down there. One is noise. You know, my wife and I were awakened in the middle of the night by live machine gunfire, and I suspect this sort of activity will continue to go on.

I would appreciate a heads-up if that's going to be the case. At least we know what to expect. I know when they filmed Transformers II at that complex, they gave everybody in the community some heads-up, so we knew the pyrotechnics and stuff like that was coming.

Another concern is the -- perhaps the increase in traffic on Silver Strand Boulevard going to the gate there at the southern end of the complex. You know, I would be -- I would like to know if you anticipate an increase in traffic, because that would also impact the quality of life down there. Thank you.

MR. MICHAELSON: The next speaker is Judy Haims.

MS. HAIMS: My name is Judy Haims, and I live at the Cays. I agree with the noise. That is a tremendous

35

Peterson Reporting, Video & Litigation Services

issue. You have no idea how much noise is generated down there. I've been there for 18 years. You -- the paper says that you have like 150 -- 150 sessions, and they're going to go up to 700-and-something. That's not a small increase.

And they talk about the decibel level. It's ingenuous to say the decibel level may stay the same. It may stay the same, but the amount and time and duration for the extra 550 sorties that you're going to have is tremendous, and that needs to be addressed.

And also, the strand -- the Silver Strand is used tremendously all year long by campers. It's going to affect these people who don't have the opportunity that we do to live in Coronado. And this has just been too fast and too soon. You may have known about it, but the people who live here and enjoy this way of life are not aware or have not been until now.

MR. MICHAELSON: That exhausts the list of speaker cards that I have. However, as is often the case, something that someone else has already said may have inspired you to want to also offer comments. Is there anyone else here in the audience who would like to?

Go ahead and just come up to the microphone, and we'll get you to fill out a card afterwards. And use your name for now.

MS. DAVIS: I'm Shannon Davis. I live in Imperial

36

Peterson Reporting, Video & Litigation Services

Beach. One issue that has not been addressed on the south end of the project at Radio Receiving Facility is ambient lighting. I have driven down the strand in the middle of the night and seen lights on that were way too bright, and I have concern for the endangered species there and how that ambient lighting would affect the birds.

And I'm also very concerned about the fact that you mentioned that you may want to take 200 men in a year's time of foot traffic through the vernal pools when they're dry. And you must understand that that is a very delicate ecotone. Some of it -- some of the vernal pools took thousands of years to come into the making, and there are sediments there that can be irrevocably destroyed.

The eggs, though they are dormant and dry, come alive when the rain season comes. But they can be there for years without any activity there. And I'm concerned as to why you wouldn't fence those vernal pools and keep them in and the foot traffic out of there. So that's very much a concern.

Also, I would have liked to have seen some studies included from U.S. Fish and Wildlife and from your biologist on the populations of the San Diego fairy shrimp. I would like to see if there are any other species in the vernal pools, if there is any possible genetic corruption from another species there.

37

Peterson Reporting, Video & Litigation Services

There was a study done by a Dr. Marie Sinedich S-i-n-e-d-i-c-h. She got her doctorate. In 2004, she did a study in all the vernal pools here in San Diego County, and she did it in cooperation with U.S. Fish and Wildlife, and the vernal pools at the Radio Receiving Facility were not included. And I -- my question is: Did the Navy not cooperate in those studies, and why wasn't that included in that inventory and in that study?

And also, I would like to alert you to the fact that there is a steady decline in the endangered fairy shrimp and that they could go extinct if you have foot traffic in there. You could do irrevocable damage.

MR. MICHAELSON: Thank you.

Corey, if we could get her a card to fill out, I would appreciate that.

Is there anyone else who has not yet had the chance to speak this evening? Yes. Go ahead.

MS. LAMBERT: Good evening. I'm Vicki Lambert, and I'm a resident here in Coronado. We've talked a little bit about traffic mainly on the strand, but I live here in the village. And I can only see -- or foresee that traffic across the bridge and down Orange on 75 is going to increase with the number of people that are going to come from their homes in the San Diego area to do their training here. And I don't know if that has actually been -- that level of

38

Peterson Reporting, Video & Litigation Services

increase has been taken into account in the city planning.

And with the tunnel discussions that we've been having, we need to also look at how we would deal with that increase along with our new carriers coming in. So thank you.

MR. MICHAELSON: Thank you. See, there were more of you that wanted to say something. Anyone else who would like to add their thoughts to this?

Can I just make sure everyone's had a first chance first? Anyone else? We did last night run by the same rules, and we did provide the opportunity for what I like to refer to as "second helpings," so if you would like to do that, please do. All I need is your name again.

MS. HAIMS: My name is Judy Haims.

Let me ask you this: What other sites could you use, and have you thought of other sites to use? Has there been a choice, or you just haven't told us that there was choices? And the thing that comes to my mind is what about using Camp Pendleton or renting the area from Pendleton or doing some kind of a swap or something, because you're going to have your beaches, you're going to have your landings, and you don't have the city with the quality of Coronado right in the middle of Pendleton.

MR. MICHAELSON: Just to be clear, we don't answer questions, so we'll take that as a comment. It will be

39

Peterson Reporting, Video & Litigation Services

looked at in the final EIS.

MS. HAIMS: Okay.

MR. MICHAELSON: Okay. Thank you.

Anyone else who didn't have a chance to speak? Because if not, we are here until 7:30 and -- just as we did last night. We adjourned, and we had our poster staff go back and continue to provide information and answer questions. So if there is no one else who would like to speak, we are adjourned, and we'll be here until 7:30.

Thank you.

(Hearing adjourned at 6:57 p.m.)

# Appendix F
# Response to Comments

# APPENDIX F

## TABLE OF CONTENTS

# F RESPONSE TO COMMENTS

The Navy received public comments on the Silver Strand Training Complex (SSTC) Draft Environmental Impact Statement (EIS) via four sources: written comments, information station comments, website comments, and oral comments. Regardless of the source, all comments have been treated equally. The comments were submitted during the public comment period (January 22, 2010 through March 9, 2010) and during the public comment period extension for the document (March 9, 2010 through March 30, 2010).

Comments were received primarily through the mail, website, or at the public hearings. Written comments were submitted to the Navy via the mail. Website comments were submitted to the Navy via the project website. Oral comments were taken directly from the official transcripts prepared by a court reporter. The comments have been reproduced as accurately as possible. In some cases, the editors may have made minor errors in the translation of some handwritten letters. For this reason, a copy of each comment has been placed in Appendix E. Private individuals are presented first, and are sorted alphabetically. Comments submitted by organizations are then presented, also in alphabetic order. Appendix E also contains the official transcripts of the oral comments made at the public hearings.

In preparing the Draft EIS each resource section was prepared and reviewed by numerous qualified individuals, to ensure that the proposed activities and issues received a rigorous and thorough assessment. The best available scientific data and the latest peer-reviewed studies were considered.

In this Final EIS, the Navy has made changes to the Draft EIS, based on comments received during the public comment period. These changes included factual corrections, additions to existing information, and improvements or modifications to the analyses in the Draft EIS. This section presents the public comments received and the Navy's responses to these comments. The public should note that these changes are non-substantive and do not result in any substantial modifications to the proposed action, the alternatives considered, the affected environment, or the environmental effects analyses of the Draft EIS.

Although all comments have been read and considered, some comments were not specific regarding the analyses or the alternatives in the Draft EIS and, therefore, could not be given specific responses and are not reproduced in this Appendix. As stated in the Council on Environmental Quality's (CEQ) Regulations for Implementing the National Environmental Policy Act (NEPA), 40 CFR Part 1503.3(a), "Comments on an environmental impact statement or on a proposed action shall be as specific as possible and may address either the adequacy of the statement or the merits of the alternatives discussed or both."

To allow side-by-side review of the comments and the Navy responses, all comments have been transcribed and entered into a table format that follows in this Appendix, with the comment in one column and the Navy's response in the next column. Comments are presented in the same order in Appendix E as they are in this Appendix.

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| **F.1 COMMENTS FROM PRIVATE INDIVIDUALS** | | | |
| 1. | William J. Adams | This letter is in regard to the Silver Strand Training Complex draft EIS, dated January, 2010. The comments are in reference to Section 3.8 Fish, specifically in regards to SAND CRABS along the Silver Strand beach and Coronado beach.<br><br>For those who do not know what sand crabs are, they are the primary food for fish, sharks, rays, birds and specifically Corbina (during the summer months). The Corbina is a primary fish that surf fisherman are after during the summer. However, during a GRUNION run, they are the primary food for large Corbina and Halibut. FACT: Over the last six or seven years the population of sand crabs has dropped to almost zero. Any surf fisherman can tell you that. Of course, there are lots of theories of what has caused this. Some people believe it is because of the raking of the sea weed off the beach, etc. But the Navy does not do this along their beach and still there are no sand crabs.<br><br>The primary question that should be answered is why there are sand crabs at Imperial Beach, Mission Beach, Carlsbad and Huntington Beach. I believe that one of the major problems is the fuel emissions from the boats, etc., along the Silver Strand beach is the cause of the problem. What I am asking for is the following:<br>(1) Delay for at least 60 days before this report is final so that other fishermen can comment on this draft.<br>(2) The City of Coronado updates its water pollution equipment to measure the fuel emissions along Coronado beach.<br>(3) Have an independent, scientific statistical study (at some level of confidence) to find out what happened to the sand crabs along Coronado beach. Maybe SDSU, SDU, or UCSD could perform this study with the funds being provided by the Federal Government.<br>(4) Until this study is completed, stick with ALTERNATIVE I, NO ACTION ALTERNATIVE. | The Navy appreciates the public's involvement in the NEPA process. In response to requests by the cities of Imperial Beach and Coronado and citizens, the public and agency response period for the FEIS was extended to March 30th.<br><br>The City of San Diego Metropolitan Wastewater Department has monitored water quality offshore of Silver Strand since 1999 under the City's South Bay Ocean Outfall, located south of the Tijuana River estuary on the U.S-Mexico border. Ocean water quality monitoring by the City over the last three to five years provides a good understanding of typical water quality conditions in the area of potential effect. Local ocean water quality is generally good, with episodes of poor water quality associated with heavy storm runoff and sewage spills. As indicated in Section 3.5.2.3 of the FEIS, minor quantities of petroleum products, including fuel, oil, hydraulic fluids, and lubricants, may enter San Diego Bay and ocean waters during routine transits of Navy vessels and equipment conducting training activities. However, the small quantities of these substances released into the environment are not anticipated to affect water quality or marine invertebrates.<br><br>The Pacific sand crab (*Emerita analoga*) is usually abundant, burrowed in the sand between tide marks on surf-swept beaches from Kodiak Island, Alaska to Bahia Magdalena, Mexico (Morris et al 1980). Pacific sand crabs are not currently listed as a sensitive species, and are extremely widespread, abundant, and seasonally variable. Factors such as regional oceanographic dynamics, variations in longshore transport, and local circulation patterns that determine sediment grain size and food supply (they are filter feeders) are what is likely regulating sand crab populations along SSTC beaches. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 2. | William J. Adams | Thank you very much for extending the comments (to the Draft EIS) until late March. This letter expands on my comments to you dated March 5, 2010 on Section 3.8 Fish.<br>Since then, some fishermen and others have asked me to add the following comments: (1) Sand crabs feed on tiny "plankton".<br>(2) A female may produce thousands of eggs. She carries them until the eggs hatch. For two to four months, the "larvae" drift as "plankton". What I believe is that these and other types of "plankton" are being killed by fuel emissions from the boats, etc. Along the Silver Strand Training Complex, since the Navy has expanded the use of the beach over the last six to seven years, the water has become more polluted from the fuel emissions.<br>What I am asking for is that until some studies are conducted to determine what has happened to the sand crabs, the Navy go with the "NO ACTION ALTERNATIVE". | The sand crab (*Emerita analoga*) has a long planktonic larval phase that implies a high dispersal potential, and coastal water transport is an important factor in determining its local and latitudinal distribution. An extended larval period allows individuals to colonize new areas with suitable habitats, and is a mechanism for annually restocking pre-existing populations (Tam et al., 1996). Factors such as regional oceanographic dynamics, variations in longshore transport, and local circulation patterns that determine sediment grain size and food supply (they are filter feeders) are what is likely regulating sand crab populations along SSTC beaches rather than fuel emissions, which was analyzed in Section 3.5.2.3 of the FEIS. The FEIS concluded that the minor amounts of fuel release during training activities would not affect the areas water quality. |
| 3. | Barbara Angioletti | As a resident of Coronado for 15 years I have witnessed the increase of military training & understand the importance of this to protect our country. I have read the proposal in re to the increase of training & in my opinion the increase is tremendous!!! Yes, you need more training but you also have to consider the area that this is in. We want our children to have the best & not hear the helicopters, etc. all day long. The military housing is in this area & the families there will have to live with these noises. I do believe you have to increase the training but not to the extent that you are proposing. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts on the surrounding area. The Navy considered time and location of training so as to avoid disturbing the local community, and does its best to conduct noise-producing activities during the day. To train in real-world scenarios that may occur overseas, however, Navy personnel must train at various times of day, and in varying terrain and conditions.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, as well as to and from SSTC-S, occur only over water. The only nighttime helicopter overflights of residential areas are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS. |
| 4. | Virginia Aspe Armella and Eduardo Cortina | I am a resident of Coronado and I live in Coronado Shores, Cabrillo Building. I have learned that the Department of the Navy is planning on increasing the levels of training at the Silver Strand Training Center. Suggested comments: I would appreciate your cooperation and efforts to maintain the quiet enjoyment atmosphere of the Coronado Shores, Cays, and Village as it currently exists. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. As indicated in Section 3.6 of the FEIS, noise effects of Navy training activities at SSTC are managed via administrative controls (planning). Activity planning considers location (e.g., Breacher training is located in inland areas) and time of day. Call-outs during physical conditioning training are minimized at night and when in residential areas. The Navy notifies local emergency personnel prior to training exercises that include the use of pyrotechnics or blanks. Cumulative effects of noise are presented in Section 4.3.6 of the FEIS. |
| 5. | Andrew Bailey | Overall, after perusing the SSTC Draft EIS, I still want to be super-supportive of the Sailors and Marines (D of N) but have exceptions to some of the proposals and assumptions in the EIS. I realize that training these forces well will be good for the environment in the aspect that they will be able to wage war more efficiently. Still, we – they – are at war, and there will be "unavoidable adverse environmental effects." I was impressed and entertained by the EIS and support Alternative One but suggest more consideration in the following areas:<br>• Contingency plans for Alternative Two<br>• Public notice about public access to beaches<br>• Notice about nighttime activities<br>• Mitigation measures in land use and detonations<br>Please, send a strong message by making contingency plans to implement Alternative Two. D of N should be ready to go a level higher to achieve objectives, and still have best practices. I also encourage beach activities "not limited to any day of the year" (3.1.2.2.2). [Did a lawyer write | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the adjacent neighborhoods of Imperial Beach and Coronado through contact with City |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | that?] At the same time, D of N could keep us civilian-beach-patrons informed about open beach hours. Perhaps the EIS Website can be converted into a beach-recreation information platform, with the option to call the NBC switch board. This would count as a land-use mitigation (3.1.1.7). If you're having a party, you invite your neighbors….<br>Unfettered access to wet-sand areas on – say – four (4) daytime ultra-low tide events (-1.5' or more), and a couple daytime ultra-high tide events (6.5' or more) is fair quiet enjoyment. Concerted planning is already a protocol (5.15.3-4).<br>Occasional access to Breakers Beach up to Zuniga Point seems fair too. The SP, duty assignments, and service members with restriction can keep civilians below the high-tide line. Perhaps D of N, in all its magnanimity, could share a drinking fountain, or a toilet. Look at the NAS Miramar Air Show. | offices or the Naval Base Coronado website.<br><br>Public access to Breaker's Beach and Zuniga jetty is restricted for military security and public safety. Chapter 3.1, Land Use, presents information regarding land use, leased areas, and public access.<br><br>Regarding 'contingency plans' for Alternative 2, all three alternatives discussed in Sections 2.2, 2.3, and 2.4 of the FEIS have been considered. One alternative (Alternative 1, Preferred Alternative) will be selected for implementation in the Record of Decision. In the unlikely event that some future situation necessitates changes to the selected alternative, the Navy will examine those needs and, if necessary, take appropriate actions under NEPA, which may include supplementing the Final EIS. |
| 6. | Andrew Bailey | A staff member for this EIS, Alex, who like myself, enjoys beach running, did not know that we have access to most wet sand areas when there are no SSTC training activities. I carefully questioned another staff member about this (Bruce), but it seems contradicted by the EIS (3.1.2.2.2).<br>I wish the beach entrance between SSTC-N & Coronado Shores was better marked with a fair sign. I noticed that the SSTC-N lease extends only to the mean high tide line but shifts to "100 to 500 feet offshore." I can share the beach.<br>Coronado residents should have advance notice about night operations so they can have the option to spend the night elsewhere.<br>SSTC needs to have better communication with civilians and a website as a beach-recreation information platform could serve day-to-day needs.<br>Overall, the lands leased by the Dof N spend more time unused, than with activities. Mitigation like restoring beaches after activities is expected and training protocols help, but the fact is that activities will increase 20% - other mitigations should be considered to offset this increase.<br>I read that one mitigation measure is to manage predators. An extension would be to coerce other beach users to observe a higher level of stewardship. D of N with its unfathomable resources needs to outreach. SSTC spends most of its time as an absentee landowner.<br>Bruce, an EIS staffer, explained that dog owners lose their dogs in the training areas. Dogs (and cats) area a terror to wildlife, wreak habitat, and leave damaging feces. Off-the-leash dogs are a problem city-wide and on the beach.<br>One section mentioned "avoidance and minimization." I could see a special program with the Cays, educational signs, and volunteer enforcement. MAYBE Cesar Milan would lend a hand.<br>Other mitigation was dismissed in this EIS "alternative" (5.9.3). Third-party observers are a cultural norm in the United States today: some people would kill Flipper for a tuna sandwich! | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. New signs were placed at SSTC-S in March 2009 clarifying public access for pedestrians travelling on the beach. As described in Section 3.1.1.5.1 of the FEIS, the wet sand areas at SSTC-S are available for public use when training is not occurring below the mean high tide line. However, the wet sand areas at SSTC-N are not available for public use; they are leased by the State of California to the Navy for its exclusive use. The Navy plans to improve signage on both SSTC-N and SSTC-S to inform the public on how to help protect sensitive species.<br><br>To further inform the public of training, the Navy has identified additional mitigation measures for alerting the adjacent communities about events which may be considered intrusive, and has posted signs and other controls on public access to the beaches. The Navy is coordinating with volunteer members of the public, the 'Plover Patrol', who are interested in helping manage public plover impacts. The public is not |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | There's no excuse for not trying to manage it, especially considering the extremity of the action. I'd be pleased to say a little prayer for the fish: that they fatten the beachmaster. I can see Point Loma from my house, and my neighborhood's topography is in one of the charts. The Strand may be my home break.<br>I could write more. | permitted to allow dogs off-leash in the training areas primarily because of the risk to native species.<br><br>Regarding third party observers, the general public is restricted from participating in these training activities both for military security and for public safety. |
| 7. | Richard Barck | I have listed below a number of points related to Navy anticipated use of SSTC-S which cause me concern:<br>1) SSTC -S (see NRRF) - The Navy comments that SSTC has been established for over 60 years is disingenuous with regard to stating the local residential community around SSTC-S "should expect air and ground noise" in the proximity of the base. For residents building/purchasing homes in the SSTC-S/NRRF area, there was nothing more quiet than a radio receiving facility. SSTC-S was renamed from NRRF (Naval Radio Receiving Facility) during the period of the EIS study. The Federal Register of August 6, 2001 describes the Notice of Intent to Propose EIS (pp. 41009-41010) as including the NAB and the NRRF. In fact several references in the EIS still refer to NRRF, not SSTC-S (e.g., Fig. 3.11-4).<br>Any training of amphibious landing and helicopter support has taken place only in the past few years. And it is NOT quiet - per the EIS, noise from both munitions and helicopters is projected to dramatically increase. This should NOT be done in a residential zone. | Navy operations at SSTC-S began in 1920 when the Navy Radio Compass Station was established at the site. The installation included ship-to-shore navigational antennas and radio receivers, and was used for advanced communications training up to 1999. Blanks, small arms, and pyrotechnics have been associated with NSW training on SSTC-N since the 1960s. The nature and intensity of training on beaches at SSTC-S by NSW and EOD have remained unchanged since 2001. |
| 8. | Richard Barck | 2) Helicopter, Aircraft & Amphibious Noise - As residents local to SSTC-S we live in a particularly quiet area, especially during evenings and nights. There is relatively little traffic on CA-79 and many of us have doors/windows open to the sounds of breaking waves. Over the past couple of years we have been increasingly subject to LOUD helicopters/aircraft flying "close" to our homes. The sound prevents us from hearing evening TV -- or awakens us at night. When awakened, we often cannot immediately return to sleep. The noise could be greatly reduced by flying the helicopters/aircraft further offshore while on sorties north/south along the Silver Strand. We, as well as the residents of Navy housing, would appreciate that very much! | Helicopters support several SSTC training events. Under the No Action Alternative, up to 740 helicopters may be involved with SSTC training events. Approximately 100-150 helicopters per year fly into SSTC-S inland under the No Action Alternative. The remaining 590-640 helicopter operations occur offshore in the boat lanes or bay training areas.<br><br>As proposed under Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations in the western portions of the boat lanes.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, |

|---|---|---|---|
| | | | and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, as well as to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. |
| 9. | Richard Barck | 3) SSTC-N - The portion of SSTC now called STTC-N (but formerly NAB) has been used for amphibious landing training for an extended period. Increased amphibious landings, helicopter activities and munitions training should be restricted to Boat Lanes 1- 10. | To train in real-world scenarios that may occur overseas, Navy personnel must train at various times of day, and in varying terrain and conditions. For example, the differences in training lane attributes at SSTC-S (nearshore in-water conditions such as the presence of sand bars or holes, beach conditions such as slope and depth of the beach, distance from other training activities occurring on SSTC-N oceanside beach and boat lanes) make them more suitable for meeting training needs than other available training lanes, and also fulfill the need for diversity in training locations |
| 10. | Richard Barck | 4) Snowy Plovers - Fish & Wildlife has formulated a significant effort in the last few years to increase Snowy Plover nesting/fledging in the SSTC -S area. Results for 2009 are in the table on the following page. Silver Strand S8 is the beach area with overnight facilities for RVs and heaviest beach use. Silver Strand NP contains staked-off area protecting nesting for the Snowy Plovers and Least Terns. The Navy should also be aware of the success in nesting and fledglings in the SSTC -S/NRRF. | The nesting and fledging success of snowy plovers at SSTC-S is accounted for in the Navy's analysis. The Navy has consulted with the USFWS, and has received a signed Biological Opinion (July 7, 2010) which concluded that, with mitigation measures in place, the Proposed Action would not jeopardize the continued existence of ESA-listed species. One condition of the Biological Opinion is that the Navy will coordinate with the USFWS in the development of the Long Term Habitat Enhancement Plan for SSTC and will submit the Plan to USFWS for review and approval. The Navy will allow USFWS 30 days to submit comments and an additional 30 days to approve the final study design and scope of work. |
| 11. | Richard Barck | 5) Vernal Pools and Fairy Shrimp - Vernal Pools are becoming few and far between, both as a result of drought and/or heavy pedestrian or vehicle use of the area(s) where they are found. There are very good protected Vernal Pool locations within SSTC -S/NRRF. Although the Navy | The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | has said that these area would be "protected" while wet, they would be used as trails and subject to traffic during "dry periods". Trails through Vernal Pools will effectively destroy them! They should continue to be protected. | maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. Thus, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Also, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include focused invasive plant inspection surveys in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |
| 12. | Richard Barck | 6) Beach White 1/ Boat Lane 11- From the view in Fig. 1-3, the training area appears to encroach on the southern edge of Silver Strand State Beach, an especially significant area for nesting of Snowy Plovers. | The current locations of White and Purple lanes reflect the locations of these lanes as portrayed on NOAA Chart 18772. No Navy records have been found that indicate when the lanes were designated. It has been determined that these differences in the delineations are a result of an archival data error. The Navy is working with NOAA so that the location of these lanes can be corrected by submitting a request to NOAA with corrected latitudes and longitudes. Please note that no Navy training occurs on the State Beach. |
| 13. | Richard Barck | 7) Beach Access - Many morning walkers and joggers use the Silver Strand NP as their starting point for extended exercise. A significant number continue these workouts headed south to the Imperial Beach area - or vice versa. The access past NRRF has been through the sand area below the high tide line. The apparent closing of this area deprives the public of even more beach access in a beach-limited area. | Beach access at SSTC-S is not restricted below the high-tide line unless there is a Navy activity that needs to restrict access for either safety reasons or security concerns. Training activities, when they occur, may require public access restrictions to one or more beach lanes below the mean high tide line, depending on the nature of the training activity (hazards, security, etc.). If and when restricted access is required, safety personnel are stationed to keep nonparticipants from harm, and to ensure mission security. |
| 14. | Richard Barck | 8) Silver Strand State Scenic Highway and Scenic Highway Overlay Zone - What impacts will the increased activities have on CA-79 as a scenic highway in this area? | Training activities presented in this EIS are typically not within the sightline of CA-79, and are not expected to affect the view from this designated Scenic Highway |
| 15. | Richard Barck | 9) Silver Strand Elementary School- What effect will the escalated training have on our elementary school including noise and pollution affecting our students and teachers? | Noise effects on Silver Strand Elementary School are described in Sections 3.6.2.2.3, 3.6.2.2.4, and 3.6.2.3.7 of the FEIS. The FEIS notes that some existing and proposed training |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | activities may occasionally disrupt the classroom environment, consisting of interference with speech and hearing, and distraction for 20 additional days per year. |
| 16. | Richard Barck | 10) Surf Camp - The surf camp at the southwest end of the NRRF site serves ~10,000 kids/year. We would like this to continue and their access to the beaches to remain safe and free of pollutants. | The FEIS does not identify any adverse effects of the Proposed Action on the safety of Camp Surf residents. Other than noise, offsite effects of the training activities proposed at SSTC-S would be minimal. |
| 17. | Edward Baumer | I have learned that the Department of the Navy is planning on increasing the levels of training at the Silver Strand Training Center. I hope that you can provide the level of quiet enjoyment that I have experienced for the last 8 years as I am a full time resident. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy has developed mitigation plans for activities that may cause an impact to the environment or surrounding areas, and has presented these in the EIS. As indicated in Section 3.6 of the FEIS, noise effects of Navy training activities at SSTC are managed via administrative controls (planning). Activity planning considers location (e.g., Breacher training is located in inland areas) and time of day. Call-outs during physical conditioning training are minimized at night and when in residential areas. As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. |
| 18. | Michael B. Baxter | I appreciate the opportunity to offer some further input and perspective on the proposed expansion of activities which will occur in the Imperial Beach area and Silver Strand training Complex<br>As a matter of disclosure, I have received the letter sent to you by the City of Imperial beach dates March 5, 2010 and agree with their observations and requests.<br>My comments herein should be considered in addition to theirs, and will be, I believe, concordant with them. I also have had the advantage of living on the oceanfront on South Seacoast Drive, north of Ream Field and south of Imperial Beach Boulevard for roughly the past 38 years. My comments are based on that period of observations.<br>My first observation is that helps departing ream Field do not maintain the centerline of the runways, or projection of it, from the field or landing pads all the way out to sea for a distance of about 1 3/4 miles, which is i believe the prescribed route for a visual departure (VFR Rules of Departure). I have publically asked for a copy of these departure rules in public in the past and they have never been provided. I hereby ask for them again under the Freedom of Information Act. | The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Instead of following the VFR departure rules, too many times the aircraft drift off their departure radial, towards the Pier. My observation, and that of others, is that once they are over the surfline too many times they begin their turn to the north and head for the pier. This turn should not be commenced until the seaward track is complete, about 1 3/4 miles.<br>Many of observed Navy helos well inside the end of the pier. They then turn to sea again to "get around" the end of the pier before continuing north.<br>All this could be avoided by simply following the VFR Departure rules, as I believe I've seen in the past.<br>I would also ask that the VFR Departure pattern be amended so that departing helos continue to climb, perhaps to 450-500' as they depart Ream Field. This would reduce noise considerably.<br>Let me address the night hours of operation next. I agree with the City's position (#46) that "there should be no helicopter training at Ream Field after 9:30 pm."<br>I understand that from time to time a helo goes off course in its VFR departure from Ream Field. But I believe that far too much of this occurs and the community and residents are unable to effectively document this for the Navy with the present complaint system.<br>It is a system which has failed you and costs the Navy in public support and goodwill.<br>With the proposed increase in flight operations out of ream Field, I recommend the following:<br>1. Place the officer who takes citizen complaints related to Ream Field helos in the Ream Field tower, or a location very close by so he can easily determine the probable sidenumber of aircraft over the beach. require that the aircraft commander 'report' the completion of his seaward track when he is 1 3/4 miles out, back to the tower or Duty Officer. remember that a citizen cannot see the sidenumber against the setting sun, twilight, or night-time conditions. this step would naturally improve a complaint system which most of us rate as nonresponsive and a failure.<br>2. require that the citizen complaint officer stay at his post during his watch period. I would presume that there are four hour watches when flight operations are underway. He can bring a bag lunch, or a box lunch can be provided for him. The main point is that he/she is there to receive citizen complaints as they are occurring, not sometime later. from some very distant spot.<br>3. He should provide some sort of file number to the caller for future reference or follow up.<br>4. the results should be reported to the community, perhaps quarterly, to inform the policy-makers and the citizens.<br>I wish to acknowledge that many departures out of Ream Field are correctly done now, day and night both. And further, we appreciate everything which the military does to protect and defend this nation. By the same token, we should be willing to receive and take to heart constructive criticism when it is warranted and offer my observations and comments in that spirit. | helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, as well as to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the FEIS. The Navy acknowledges the FOIA request, and is processing the request in accordance with the FOIA. The Naval Base Coronado Public Affairs Officer can be contacted for noise complaints and operational suggestions.<br><br>Your comment addresses an issue that is outside the scope of this EIS. The NBC Commanding Officer has established air operations course rules for Naval Air Station North Island and the Naval Outlying Landing Field (NOLF, note formally known as NOLF Field) to conduct safe required training and operational flights while minimizing impacts on the surrounding community. These course rules are designed to promote safe air operations, meet Navy aviation training requirements, and protect communities beneath established flight paths. Pilots are given annual course rule briefs to ensure their familiarity with course rules, procedures, and noise abatement measures. Currently published air operation instructions (course rules) advise pilots when departing NOLF westward to either fly 1/4 mile south of beach houses or cross over beach houses at or above 800 feet above mean sea level (300 feet above the Federal Aviation Administration's minimums set in Federal Aviation Regulation 14 CFR Part 91, see reference below) until they are near the communication station (old Navy Radio Receiver Facility). Weather conditions, other aircraft in the flight patterns, etc. can and do affect the aircraft's flight route and altitude. Federal Aviation Regulation 14 CFR, Part 91 Section 119, titled Minimum Safe Altitudes, paragraph d indicates that helicopters may be operated at less than the following minimums prescribed for |

| | | | Environment) of the FEIS. |
| 20. | Fred Brown | I have lived here for 17 yrs and until recently found the Navy to be good neighbors. I appreciate the work you do and support your efforts.<br>But.... about a month ago after your announcement of planned increases in training the air activities and noise have become overwhelming to the point of intimidation. If this is a test to see how much noise we can tolerate, you have exceeded my threshold 4 weeks ago. I am very concerned that this will affect our quality of living and negatively affect our property values. | Increases in training activities associated with the Proposed Action and alternatives, which have not yet occurred, are not expected to disrupt normal business operations or affect property values in the ROI. As indicated in the Socioeconomic section of the FEIS (Section 3.15.2.3) regional and community employment, housing, and population growth are not expected to be affected by the Proposed Action. |
| 21. | Pat Brunson | The noise from the helicopters is quite bad at our house but I can't imagine how all the birds in this area can take. Plus the air pollution from that pink smoke floating over the Strand can't be good for us or the wildlife. | Reproductive success is routinely measured by Navy-funded monitors under the Navy's biological monitoring program. Background noise levels are sufficiently high such that noise as a result of training activity increases would not result in detectable effects. Considering the current success of least tern and snowy plover, noise was not expected to be an issue.<br><br>The Navy has a comprehensive air quality management program. Mitigation measures that are part of the Navy's air quality management practices are implemented at SSTC. Aircraft, marine vessels, ground vehicles, and military equipment are well-maintained, and meet applicable emission standards (such as smog certification for on-road vehicles) in accordance with state requirements. As indicated in Section 3.3.2.1.1 of the FEIS, emission factors for specific types of ordnance (including smoke grenades and flares) were obtained from the USEPA's AP-42 emission factor database. Section 3.3 and Appendix C analyze the pollutant emissions from all components of training activities presented in the EIS, and indicate that the emissions from all training activities are within air quality standards.<br><br>There will be little use of smoke grenades and flares directly in or over water. Use per training event in which smoke and |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | flares apply is also small (2-11 items). In addition, this use is spaced out both in time and space throughout the year and at various locations within SSTC, so there are no hot spots of air pollutants on the ranges.<br><br>Smoke grenade filler has approximately 11 ounces of a colored smoke mixture (white, red, yellow, green and violet). The smoke material is composed of a mixture of potassium chlorate, sodium bicarbonate, lactose, and a dye, none of which have—in the amounts or quantities specified in the EIS—significant environment effect. In addition, most of the filler is consumed during use. Chemicals in military flares can be a combination of magnesium, boron, potassium perchlorate, and barium chromate (USAF 1994), or in some cases red phosphorus. Red phosphorus is a common ignition compound used for instance in matches. Red phosphorus is a relatively non-toxic compound, although highly flammable and subject to environmental degradation in marine systems (Spanggord et al. 1985, EFRB 2010). In an analysis of military flares, the US Air Force found that most of the common flare constituents were consumed during flare ignition. Residual ash from flares contained small quantities of magnesium and boron (USAF 1994). Measured values of magnesium in flare ash [86 part per million (ppm)] were found to be below the natural seawater composition of magnesium (1290 ppm). |
| 22. | Elizabeth H. Butler | The letter below reflects several previous attempts to address the problems caused by intensified military air training over the Silver Strand. The current level of training has seriously impacted residents and visitors since 2007. We have not received any answers to reasonable questions or been asked to participate in co-creating alternatives. There are clear alternative helicopter routes and obvious means of notification and community education that would ease of the stress we live with. Only a few weeks ago we learned that we are part of a newly named Silver Strand Training Complex (SSTC) with high intensity, high profile maneuvers planned along the length of our State designated Scenic Route 75. Many City, County, and Federal funds and tireless volunteer and staff time and multiple interagency collaboration has gone into preserving the Silver Strand's scenic views, natural resources and unparalleled recreational and residential opportunities for military and civilians alike. Similar to the goal of the National Wildlife Refuge, we thought this area would be an outdoor haven for people and families in perpetuity. The projections in the proposed EIS do not reflect an understanding of this City, State and County | As proposed for Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur\ with the 386 new MH-60 mine hunting operations in the western portions of the boat lanes.<br><br>The typical flight pattern in support of SSTC-S inland training |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | mission, but rather suggest a militarization of an area previously shared with residents, visitors and the natural environment. In closing this memo, I would like to emphasize one of the most troubling aspects, perhaps the most egregious aspect, of the EIS. The increase in helicopter operations from 700 to 2300 is in addition to the current daily low flying helicopters that fly back and forth over the eastern shore of the Cays, Grand Caribe, Loews, and the State Park during peak hours 3-10pm. In the summer, they can do circular patterns every four minutes, often going later in the night. Perhaps, this routine helicopter exercise is an area where we can dialogue with the navy about 'balance' and community respect for their neighbors of forty years. | consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS. |
| 23. | Elizabeth Butler | What AIR TRAINING is planned for the peak summer months July - October 2009? What part of this is 'routine' NBC practice? What constitutes 'routine' flying: what are the designated patterns or paths; what are the allowed weekday daily start and end times; are there different paths or curfews for weekends and holidays? What is the allowed or legally mandated flying height for helicopters over densely populated residential and recreational areas (i.e., how many feet above rooftops and bathers on a beach is considered safe or even 'courteous'? ). Are there safety height regulations set by the FAA and are there military exemptions? Are there other FAA regulations that say helicopters should fly a certain distance from the bay or ocean shoreline? Are the helicopters who fly round and round paths up the channels of the Cays performing a sanctioned practice? What part will be "SPECIAL" TRAINING MANEUVERS involving squadrons whose home base is located elsewhere? What are the start and end dates of the 'special' maneuvers? What time of day will they begin and end? Will the impacted time be the same for weekends as weekdays? Are major holidays included? When there are AIRSHOWS (e.g., Redbull Races, Miramar Airshow) or ceremonial demonstrations (e.g., off the Midway museum) in the San Diego area, routine military practice and/or practice for the special event are often diverted over the Cays and the Silver Strand. What is the summer/fall schedule for these activities? ***************** In the last two summers, the residents, real estate rentals, and | As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS.<br><br>A discussion of helicopter activity has been added to Cumulative; Section 4.3.6. The Section discusses the various squadrons based out of NASNI and the number of helicopter |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | other tourist businesses were not notified or prepared in any way for the negative impact of continuous low-flying helicopter and jet practice. This air activity is in addition to the advertising, fixed-wing planes which go back and forth above the State Beach and Park and often crisscross the Cays during summer months. The 'surprise' element of the last summers intense air activity evoked a range of negative emotions: fear from the 'high alert' noise and vibrations of helicopters; anger from having special family events and vacations ruined; and disbelief that all this was happening without notification from the City or any known public planning process. Trying to get information was difficult. People were referred to the navy control tower to make a "noise complaint" and asked to produce photographs of the plane, the number on the plane, the time and direction of the flight. The problem was not the disturbance produced by an aberrant, ill-trained, low-flying pilot. THE FEAR AND DISTURBANCE CAME FROM MILITARY TRAINING THAT COMBINED ROUTINE PRACTICE WITH INTENSIFIED SPECIAL MANEUVERS OVER A HIGH DENSITY RESIDENTIAL MARINE COMMUNICTY, ABOVE A POPULOUS STATE BEACH AND A 450 ROOM HOTEL-RESORT, SCHEDULED IN THE HOTTEST, PEAK USE SUMMER/FALL MONTHS. This inquiry is a request for information. It is also a request for some 'balance' and courtesy in the planning of training exercises. My experience with the military in recent years was that military leadership valued the commitment to be 'good neighbors' to impacted communities. Last summer, the Navy was not a good neighbor; it exploited our previous goodwill and caused us many problems. Perhaps, leadership in the military and the City have attempted to address these problems in their monthly meetings. It would be helpful to know if the environmental impacts of air training are discussed and planned for in these meetings. | flights that these squadrons generate. The Navy AICUZ study is being updated to identify all flights generated from NASNI and NOLF.<br><br>Your comment also addresses an issue that is outside the scope of this EIS. The NBC Commanding Officer has established air operations course rules for Naval Air Station North Island and the Naval Outlying Landing Field (NOLF, note formally known as NOLF Field) to conduct safe required training and operational flights while minimizing impacts on the surrounding community. These course rules are designed to promote safe air operations, meet Navy aviation training requirements, and protect communities beneath established flight paths. Pilots are given annual course rule briefs to ensure their familiarity with the course rules, procedures, and noise abatement measures. Currently published air operation instructions (course rules) advise pilots when departing NOLF westward to either fly 1/4 mile south of beach houses or cross over beach houses at or above 800 feet above mean sea level (300 feet above the Federal Aviation Administration's minimums set in Federal Aviation Regulation 14 CFR Part 91, see reference below) until they are near the communication station (old Navy Radio Receiver Facility). Weather conditions, other aircraft in the flight patterns, etc. can and do affect the aircraft's flight route and altitude. Federal Aviation Regulation 14 CFR, Part 91 Section 119, titled Minimum Safe Altitudes, paragraph d indicates that helicopters may be operated at less than the following minimums prescribed for other aircraft, e.g. over congested areas, 1000 feet above the highest obstacle within a horizontal radius of 2000 feet of the aircraft, and over other than congested areas 500 feet above the surface. The NOLF is open for flight operations during Pacific Standard Time (PST) from the last Sunday in October to the first Sunday in April, Monday through Thursday, from 0800 to 2230 PST and on Friday from 0800 to 1800 PST. The airfield is open during Pacific Daylight Time (PDT) from the first Sunday in April to the last Sunday in October, Monday |

These prescribed days and times are needed to conduct the required training to sustain pilot ratings and deployment qualifications. |
| 24. | Harry Butler, Ph.D. | It seems foolish to me that the Navy would jeopardize the health and welfare of local residents in order to prepare to fight those who wish to damage the health and welfare of Americans. There seems to be no recognition in the Navy's plans that piercing noise, especially helicopter noise, will cause harm to local residents including local Navy families. It isn't necessary for helicopters to fly low over homes and continuously circle over the bay, state beaches and residential communities regardless of nighttime hours, weekends and holidays. This routine practice which intensifies in the hot months is not necessary. Helicopters can fly over the ocean. The residents of South Bay have worked their entire lives in order to save sufficient money to live in this desirable community. We are hard working, patriotic, taxpaying citizens who deserve better treatment than what has been occurring over the past three years and what is being proposed now Currently, helicopter noise causes nervousness, inability to relax and loss of sleep. There is a certain arrogance in the Navy which allows these unhealthy intrusions into private living space with no notice or consideration. I beseech the Navy to do two things: 1) Give additional time to the community to comment on this plan and make carefully researched suggestions. 2) Work with the community to consider alternatives to the noise and pollution impacts of current air training as well as the other more egregious elements of the proposed plan (as highlighted in the City's response). A cooperative plan that genuinely considers human needs for health, comfort and security would be a plan that benefits military families at the same time it benefits other local families. The Navy bruised its standing and respect locally by issuing an EIS that suggested that Americans employed in the military should "sleep in their own beds" while other Americans' sleep is dispensable. Please consider our needs as one. | Military training is continuous, evolving, and essential to keep pace with emerging requirements in the work place, e.g. new equipment, personnel turnover, and changing requirements to list a few. The Navy, like the other military services, must sustain and enhance individual, team, unit, and organizational skills and proficiency. Military training includes tactics, techniques, and procedures that must be rehearsed, refined, and recorded to certify Navy personnel (e.g. individuals, crews, teams, units, and organizations) qualified to carry out their respective assigned missions.<br><br>Additionally, the training activities associated with the SSTC have been specifically analyzed in the resource sections of the EIS. The additional training activities that are not associated with SSTC have been analyzed in the cumulative section of the EIS. The Navy has analyzed the activities associated with SSTC with both the public and the environment in mind to achieve operational readiness while minimizing impacts to the surrounding area.<br><br>The Navy appreciates the public involvement in the NEPA process. In response to requests by the cities of Imperial Beach and Coronado and citizens, the public and agency comment period for the FEIS was extended to March 30th. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 25. | Cynthia Buxton | The navy , and the military in general have become very good environmental partners. What can the Navy do to keep the wild quality at a maximum albeit the times it is using the beach for exercises? Are there covert training maneuvers that are more subtle or invisible, and less impacting to the land? Is there a way the local public might help or become a part of the solution? What activities could be done south of the first jetty on the public beach? Could the public be involved in mock rehearsals? And thereby reduce the impacts north? Would the Navy make use of the resources at the public pier? The public could be used to identify what is effective "covert" and what isn't? Can the Navy make use of areas that are not on the beach?<br><br>I cannot know in full, nor I hope does anyone commenting that isn't in the Navy, but it would be honest to say, I do not know why after WWII, Korea, Vietnam, Desert Storm, and whatever post 911 is that now we find this expansion inescapably necessary. What are the alternatives considered? | The purpose of and need for these training activities are described in Section 2 of the EIS, which lists activities that require the use of beach or boat lanes, and those that can use inland training areas. Also as described in Section 2 of the FEIS, the Navy considered, but rejected, alternatives that included moving these exercises to other locations. Such alternatives fail to meet the purpose of and need for the Proposed Action. Additionally, alternatives were eliminated that investigated the distribution of military activities to different locations within SSTC. While the Navy appreciates your recommendation for public assistance in rehearsals, the general public is restricted from participating in these training activities for both military security and public safety. |
| 26. | Cynthia Buxton | The Navy is already doing a very good job. And I am very grateful.<br><br>In the last year, along with a number of hot environmental issues, Sunrise Powerlink not withstanding, I was made aware" of the MLPA by my environment colleagues volunteering day and night to establish sustainable guidelines for our oceans. Our local coast has many impacts, not only from the Navy and tourists, but in no small way from bait fishing and other commercial endeavors. What measures could the Navy take to help establish sustainable guidelines if they are to enter in larger capacity the current mix of impacting interest groups? The shore birds that are often the focus of marine environmental debate and concern depend upon this zone for survival. Unfortunately because the public has taken a zesty proportion of the urban share, there are few places for the birds to nest with reliable success.<br><br>The preserve around the elephant cage happens to be one of them. The shore birds may also feed on sand crabs. What impact does vehicle traffic have on san crabs and in turn on the shore birds that feed on them? 1think this question needs some research. 1 would be concluded that the traffic would reduce another food source for the birds. | Nesting areas for both the California least tern and western snowy plover have been established at the Delta beach areas, and mitigation measures are in place for nesting that occurs outside of these areas and within SSTC training areas. The concern for shorebird foraging is acknowledged; however, the best shorebird areas are avoided: mudflat, salt marsh, and salt pond. Beach wrack is left undisturbed (not raked). The remaining sandy shores and artificial structures are resilient to disturbance.<br><br>The analysis of foot, and vehicle traffic and amphibious landings indicated that impacts to the intertidal zone where sand crabs may occur is expected to be minimal due to the highly dynamic nature of the intertidal zone as well as the high recolonization rate of the organisms that inhabit this zone. |

|---|---|---|---|
| 27. | Cynthia Buxton | I was taken aback by the notion that they Navy would run through the vernal pool when it is dry. Where do the critters go when it is dry? It is my understanding that they are still there, just dormant. (1 mentioned a paper on diapauses?) Running across this area, kicking up the top soils, disturbing whatever vehicle the plants and animals and microorganisms have for staying alive suspended throughout a dry summer would be radically abused by playing and training there. Is there someway to build a mock cover over this area to protect it? Would such a cover work?<br><br>This vernal pool is a beach vernal pool. Does this make it additionally rare and fragile?<br><br>In our backcountry, our streams become corridors of algae parchment; a vehicle I propose may play a role to perpetuate the fauna that takes life when the streams are running. Does such a vehicle exist for vernal pools? If so , and the creatures are there, buried, how will you protect them in the dry season? | The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in negligible impact to population viability. Additionally, the Navy has consulted with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>Under conditions listed in the USFWS Biological Opinion, the Navy will complete a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include focused invasive plant inspection survey in the pools and their watersheds: plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will determine the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |

| 28. | Cynthia Buxton | The Navy has been flying increasingly at night, and increasingly directly overhead, though since the public made considerable of it at the public forum, it may be a bit better lately. 1have been nearly asleep to be awakened by the helicopters. Sometimes leaving the windows open is impossible to do. One day I came home to find that my dog had gone through, literally through, a large window out of fright from loud noises. I confirmed with the neighbors who heard the noise and the window crash. It cost hundreds and lost me thousands in down time as I had to rebuild the wall with three double pane windows and all new trim to hold them. I really had no warning or decision as to when. Several weekends were taken through the Christmas Season to finish the project.<br><br>The YMCA is far closer than my house. I know how to extrapolate the meaning of training. Children at the Y may not. Many children that attend do so on scholarship as one of the first natural experiences or experiences at a camp they have ever had and for some ever will. The Y hosts over 10000 children every year. I know one such child, a woman now, who had difficulty learning in school. I saw many positive changes in her in the several seasons she attended this camp. She now pays her own way and holds a job with promotion and respect for several years. I think the Y played a roll in her turn around. In 1993 congressman Bilbray and Senator Boxer insured the continued existence of the Y for the next 50 years by establishing a 50 year least with the Navy. In 1998 the Navy decommissions the radar antennae, or elephant cage. I do not recall any loud noises back then. The Y Camp Surf has been in harmony with the Navy for many years prior as well.<br><br>What can the Navy do to minimize the startling and even frightening noise around children? | Helicopters support several existing SSTC training events. Under the No Action alternative, up to 740 helicopters may be involved with SSTC training events. Approximately 100-150 helicopters per year fly into SSTC-S inland under baseline training. The remaining 590-640 helicopter operations occur offshore in the boat lanes or bay training areas.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS,.<br><br>The effects on the sound environment at the Surf Camp of Navy training at SSTC-S are addressed in Section 3.6 of the FEIS. This analysis concluded that the changes in the YMCA's sound environment associated with the Proposed Action would be minimal. Therefore, no sound-related mitigation measures were proposed. |

| 29. | Cynthia Buxton | I have found on occasion, cylinders, with warnings of phosphorous. What can the Navy do to ensure the refuse of their activities will be removed? | As presented in Section 3.4 of the FEIS, most of the training materials used at SSTC are non-hazardous, or are rendered non-hazardous when they function as designed (e.g., blanks). Trainees collect and remove expended materials to the extent practicable at the conclusion of their training events. Very rarely, energetic items may not function as designed, resulting in their temporary presence until promptly retrieved by Navy personnel. The incidence rate of unretrieved expended items that would pose a risk to the public is so low that a public education and outreach program is not warranted. Given the extent of recreational, commercial, research, and industrial operations in the ocean and bay waters adjacent to SSTC, a wide variety of non-military wastes accumulate on the training beaches. In the event of finding expended material, contacting the POC at Naval Base Coronado will ensure that a team will arrive at the site, identify the item, and ensure its proper disposal. |
| 30. | Cynthia Buxton | I have seen whales breeching offshore during migration times. What can the Navy do to ensure the safety and integrity of these mammals? What research and precautions can you do to protect their sonar capabilities near yours as it is vital to their survival? | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities and mitigation measures to achieve operational readiness while minimizing potential impacts to the surrounding area. As described in the EIS (Section 3.9), Navy personnel monitor "buffer zones" surrounding activities that may cause underwater noise for the presence of marine mammals or turtles. If an animal is observed in one of the buffer zones, the activity is suspended until the animal is no longer within the buffer zone. |
| 31. | Cynthia Buxton | Have you reviewed the original grant to the Navy for use at the Southern end? I think this needs to be done. The EIS mentions a grant for the Navy when they were established there of fee simple. I have a question about this. Have you reviewed the original grant to the Navy for use just north of the Northern end of Imperial Beach. I think this needs to be done. See below an explanation from **Wikipedia on line. Fee Simple can be absolute or it can be fee simple defeasible. Fee Simple defeasible can be fee simple determinable and fee simple subject to a condition subsequent. Since the Navy suspended the use of the radar tracking and because the use by the children and family camp at the Y is well understood and established I find it hard to believe that in the establishment of the Navy grant with children present and the public walking | Based on property records, SSTC-S comprises about 548 acres of land that is held in fee-simple by the Navy. SSTC-S is owned by the federal government down to the mean high tide line.<br><br>Additionally, the Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | through, that the intention was that of fee simple absolute. I especially find it difficult to believe that that intention included the sounds of bombs bursting in air, so to speak. Have you checked to see what the stipulation was in the grant when the radar was no longer used and what was that intention? Who provided the grant? What were its conditions? It makes more logic that the Grant with an intention of mitigating the military usage of the beach originally, would include the portions used by the Y for families. I would not be surprised If the level of review were still in place to curtail an activity or in this case *life* frightening noises near the camp with fee simple subject to a condition subsequent. | potential impacts to the surrounding area. In light of this proximity, the Navy has developed mitigation measures for activities that may impact the environment or surrounding area, and has presented these measures in the EIS. |
| 32. | Cynthia Buxton | What can the Navy do to reduce the noise for training? I do understand there comes a time when training has to include operating under the startle of noise. Can this portion happen somewhere else? Can the solution integrate with the public presence as much as possible? | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness and realistic training while minimizing potential impacts to the surrounding area. In this manner, the Navy is adding additional mitigation measures for alerting the adjacent communities about events which may be considered intrusive, as well as posting signs and other controls about public access to the beaches.<br>Additionally, and as described in Section 2 of the FEIS, the Navy considered, but rejected, alternatives that included moving these exercises to other locations. Such alternatives fail to meet the purpose of and need for the Proposed Action. |
| 33. | Earle Callahan CDR USN (Ret) | I have learned that the Department of the Navy is planning on increasing the levels of training at the Silver Strand Training Center. I agree entirely with the Navy plan. Their training is a necessity for the defense of the United States! Those that think otherwise should spend some time in/with the military, and see for themselves, and quit complaining. These Navy men/women training are willing to give their lives for their/your country, and do the local citizens' contributions and complaining match that? The Navy did provide for the least terns on the bay side and it is fenced off, which was Navy property. | Your comment has been noted. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 34. | Earle Callahan | If anyone complains about the necessary Navy exercises on the Strand, they really must be pacifists, and un-American. All they can do is complain when they are living in the greatest country of the world, and probably none of them would fight and die for their country like the men/women on the ships and beaches at these exercises. They gladly prefer others to do it, so they can complain, and enjoy their good life in the USA. The Navy has already given lots of bay front property for the protection of the least terns, and even fenced it off. As far as water pollution, ask Tijuana to quit dumping sewage into the Tijuana River. When it rains, even the old tires and garbage ends up on U.S. beaches all the way to Coronado, when it follows the north flowing eddy currents from the south. Imperial Beach surf is always contaminated with Mexico's sewage. That is worth bitching about, and not the U.S. Navy maneuvers getting ready for battle!! | Your comment has been noted. |
| 35. | Benton Calmes | Add a sensitive receptor in Imperial Beach at Oneonta Elementary School. Noise extends further south than EIS indicates.<br><br>Reduce helicopter overflights in general. NO helicopter overflights over residential neighborhoods. I saw no reference to this in the EIS but it happens in Imperial Beach all the time. | The FEIS identifies Mar Vista High School and West View, Bay Side, and Imperial Beach Elementary Schools in Imperial Beach as noise-sensitive receptors. Oneonta Elementary School is located to the south of these schools, and would experience lower sound levels from military training activities on SSTC-South; however, this school has been added to the list of potential sensitive receptors in Imperial Beach.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS. |

|---|---|---|---|
| 36. | Ted Camaisa | Amphibious landing craft training poses minimal risk to the safety of residents living on Silver Strand. However, the increase in aircraft sorties in a combat training environment poses significant risk to residents in Navy Housing and the Cays. The Navy does not need another incident where an aircraft goes down on civilian housing, when realistic training could have been held in a low risk area like Camp Pendleton. Our pilots need to focus on realistic and unencumbered combat training, without concern for endangering residential homes. | The Navy strives to be a good neighbor, and analyzed all training activities at SSTC with respect to applicable federal regulations. The location of training has also been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Section 2.1.3 of the EIS explains why the Navy cannot conduct these training activities in alternate locations. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), Silver Strand was determined to be the best location for training among the identified alternatives.<br><br>San Diego Bay is at the center of a complicated airspace. The Navy has analyzed its flight tracks in the area for safety, as discussed in Sections 3.16.3.2.2 and 3.16.3.3.2. The Navy has determined that risks to the public from rotary-wing aircraft supporting SSTC training are minimal, based on its past safety record, the low number of flights, and the over-water flight paths. Flight tracks originating out of NASNI travel offshore and over the middle of San Diego Bay before accessing training areas to limit potential impacts to nearby communities. |

| 37. | Joan Cameron | The helicopters begin practice well before the time this is written. Today I heard them by 4:30AM! | The current scope of the helicopter noise analysis is summarized in Section 3.6 of the EIS. As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS. |
| 38. | Jim Cavanaugh | This is absurd... we need our military to be first in the world... stop trying to thwart them... support them. | Your comment has been noted. |
| 39. | Jennifer Chapman | As a resident of IB, I appreciate the military base and what it brings to the community. That said, please consider strongly any nighttime noise (2200 to 800). I don't care about daytime noise, but anything before 8am is a concern. At night I often hear helicopter noise emanating from Navy, local police, and border patrol. I also heard substantial noise that woke me up (and I sleep tight) and kept me awake when Transformers II was filmed at the Radio premises in the southern end of the Silver Strand. Since no one told the neighbors in IB, I thought that it was related to the violence in Tijuana, or something bad happening in IB. Please remember that you are not the only group and that the effect of all the noise is cumulative, and can actually be very frightening. Please avoid all noise possible from 2200 to 800 and give IB residents advance notice if you're going to have a night where you make noise anywhere approaching the noise made during the filming of Transformers. Thank you for all you do for our country. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the adjacent neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website. |
| 40. | Jennifer Chapman | Please be sure to inform IB residents individually and directly (by a paper notice to each abode, for instance, not just by posting something on a website no one from IB reads regularly or posting a notice in a newspaper), if there are any Hazardous Materials or Wastes relating to this proposal known now or discovered in the future. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy does notify local public safety agencies and city governments about specific upcoming high-noise night training events. Local governments, in turn, are |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | responsible for informing their communities. The Navy is adding mitigation measures to the Proposed Action for alerting the adjacent communities about events which may be considered intrusive, as well as posting signs and other controls about public access to the beaches. |
| 41. | Jennifer Chapman | I like to jog on the beach side of the Silver Strand with my dog. Please ensure I continue to be able to do so! Also, I noticed the new big signs on the beach north of Palm (by the surf camp). You might think it's common sense to say people have to stay below the "mean" tidal line, but it doesn't. I assume you mean average by saying "mean," but when I'm on the beach, I only know where the tide is at that moment. It changes seasonally and daily and yearly, and can also depend on whether sand rejuvenation projects (sand dumping) happen. So please clarify whether you mean that we have to stay below where the vegetation grows, or what? Also, many hispanic-only speakers come to the beach, and if I have trouble understanding what is meant, I think non-native speakers will too. | As stated in Section 3.1.2.2.2 and 3.1.2.3.2 of the SSTC EIS, the Navy would not preclude the public from access to the public beach adjacent to an active training area. Active training does not typically occupy the entire stretch of beach at SSTC-S, but rather one or two training lanes. The public would be able to continue to use public beach adjacent to active training. On SSTC-N there is no public beach. The entire beach, including that portion of the beach below the high tide line, is leased from the State of California to the Navy for exclusive military use. On SSTC-S, the Navy owns the beach down to the high tide line. The State of California owns the beach below the high tide line. The Navy is adding mitigation measures to the Proposed Action for alerting the adjacent communities about events which may be considered intrusive, as well as posting signs and other controls about public access to the beaches. |
| 42. | Jim Clifford | An important issue I don't see addressed anywhere relates to a major step the Navy took a few years ago the last time they sought public input re these beach areas - they Navy tried to close about 2 miles of beach between the ymca camp and the south end of the state beach. this area has for many years - if not since time immemorial - been open to the public and is one of few beach areas of significant length in san diego where beachgoers can walk or run with their dogs. what i saw happen was that the day the navy tried to close the beach, the public simply wouldn't stand for it and defied the orders of navy security staff on the beach and simply walked up and down the beach right past obstacles the navy tried to use to prevent the public from entering the beach. it is troubling that the navy used such poor judgment in even considering trying to close this beach to which the public has always had such a long and strong connection and that they navy either didn't think thru or actually was ok with putting their security staff in a hugely problematic position of trying to stop the public by what? - arresting or shooting decent taxpaying citizens who simply can't believe the navy would be so arrogant as to presume that there is any reason for the navy to abscond with 2 miles of beach which should remain as it always has - open to the public?! so my concern at this time is whether in the midst of this ridiculously long document describing the navy's latest project for this beach there may | As stated in Section 3.1.2.2.2 and 3.1.2.3.2 of the SSTC FEIS, public access to public beaches adjacent to active training areas would continue to be allowed. Active training does not typically occupy the entire stretch of beach at SSTC-S, but rather one or two training lanes. The public would be able to continue to use public beach areas adjacent to active training areas. On SSTC-N there is no public beach. The entire beach, including the beach below the high tide line, is leased from the State of California to the Navy for exclusive military use. On SSTC-S, the Navy owns the beach down to the high tide line. The State of California owns the beach below the high tide line. Access below the high-tide line would only be restricted during some training activities for either public safety or |

|---|---|---|---|
| | | somehow be a hidden agenda of again trying to close the beach? if so i'm sure they navy has learned they will have to string claymores to pull it off this time and even then they may have to explain some severed body parts (human and canine) in the national news for awhile. i wish i could view the navy and dod as being sane enough that we wouldn't have to even imagine the navy trying to close this beach but based on what i saw just a few years ago i see we have to be ever vigilant for some wash dc dod bureaucrat to come up with another arrogant and brilliant idea of affronting the very public whose tax $ fund everything the dod does thru out the world. so - to wit - is the navy in any way planning to curtail any public access to any of the beach between the ymca camp and the south end of the state beach (silver strand)? | mission security. |
| 43. | Lois Cohen | NO! On increasing training along Coronado's coastline! Unfair to Coronado and really a bad idea. | Your comment has been noted. |
| 44. | Mark Conrad | The noise level of the helicopter flying up and down the bay side has increased almost every year that we have lived here over the past 10 years. Often in the summer the sound is so loud it is difficult to carry on a conversation outside. We in the Cays will now have it on both sides if this goes into effect. This is a residential community and the Navy can use camp Pendleton which has many miles of beach and without the impact of the noise to residents. This will be negative impact on all of us. | As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS. A discussion of this helicopter transport will be included in the Cumulative Impacts section of the FEIS, Section 4.3.6.<br><br>The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. Possible alternate locations for training |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training. |
| 45. | Mark Conrad | The terns have their nest along the shore lines and you suggest in your EIS draft that it is going to have little effect on the nesting. I think the noise itself will drive the birds away. The traffic and surely destroy many of the nest. | This is a high ambient noise environment in which nesting persists. Navy has achieved nesting success adjacent to the North Island airfield, which is a very high noise environment. As presented in Section 3.12 of the EIS, many of the noise inducing activities involving pyrotechnics, simunitions, and blanks take place inside bunkers, which reduces the intensity of noise that reaches nesting areas and other adjacent habitat. |
| 46. | Mark Conrad | Grunion along this beach have been laying their eggs in great numbers. In fact at high tide and full moon the beach is crowded with many people fishing for them. The demolitions and other activities of the Navy will have negative effect of the grunion. | It is probable that both excavation and crushing effects from landings would be localized. Overall species assemblages would be unaffected considering extent of adjacent habitat and infrequent nature of intrusive activities. Overall impacts to specific fish species and assemblages from underwater detonation activities would be temporary and local considering the expansive nature of the adjacent habitat, the population size, and dispersed nature of potentially effected fish populations. |
| 47. | Mark Conrad | There are many clams along the beach and I often go out at low tide and collect the legal limit. The impact of training and traffic will have negative impact on the clams. | The EIS noted that training activities could have impacts on marine plants or invertebrates from sediment disturbance caused by compression of the beach below the high tide line. However, all such disturbances would be highly localized and short term, given the highly variable intertidal environment, and would not have any lasting effects on plants or invertebrates. Additionally, invertebrates recolonize quickly because that is what they are adapted to do in a shifting environment; for instance, invertebrate beach dwellers tend to be very fast burrowers in the surf zone |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 48. | Mark Conrad | The noise and loss of the beach will have a negative impact upon real estate values in the area. | The SSTC training areas have been used by the Navy for over 60 years. Increases in training activities associated with the Proposed Action and alternatives are not expected to disrupt normal business operations or affect property values in ROI. In addition, there will not be a loss of beach area as a result of implementation of the Proposed Action. The analysis presented in the FEIS determined that regional and community employment, housing, and population growth would not be affected by the Proposed Action. |
| 49. | Elizabeth Copper | I do appreciate the opportunity to comment and as a contractor privileged to work with the endangered birds at Naval Base Coronado I applaud the Navy's many years of efforts on behalf of natural resources at their facilities at NBC. The military and particularly the Navy deserve the primary credit for increases in the population of the California least tern having pioneered the methods and set the standards that are now applied at successful sites throughout the range. Because of their outstanding efforts the Navy has been given significant regulatory relief to address the constraints imposed by the presence of such species as the least tern and the Western snowy plover. The benefits to the terns of this bargain and the significance of these efforts were clear in 2009, when NBC supported 22 percent of the least tern nesting attempts in California. NBC also supported the second largest population of nesting snowy plovers in Recovery Unit 6 and fledged as many young as sites with larger populations.<br><br>This Environmental Impact Statement (EIS) represents a lengthy effort to identify points of conflict between endangered species' management and Navy training and address potential resolution of those conflicts. However, the current status of the California Least Tern and the Western Snowy Plover neither of which is faring well, is not clearly portrayed in the EIS which may mislead the public regarding the potential consequences of the proposed actions. | The DEIS has been amended to explain the level of loss anticipated for the California least tern of the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year. The difference in incidental take for snowy plover between the No Action Alternative and Alternative 1 is one nest, on average, in a typical year. As indicated in the July 7, 2010 USFWS Biological Assessment, the Navy will implement mitigation measures to schedule training in areas where less nesting occurs, when possible, and still meet training needs. In addition, the Navy will consider the tidal stage when developing training schedules, and schedule training activities that could be conducted on the hardpack during low tides when consistent with training needs. The Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that does not encumber training activities. Such a marking strategy provides visual references that identify sensitive nesting areas. The Navy may affix signs to existing beach lane sign posts and a limited number of additional markers, as determined appropriate by Navy staff.<br><br>The extensive monitoring program that the Navy implements has allowed for adaptive management to ensure avoidance and minimization of take, as well as positive contributions to recovery of both species. Nesting activity has increased despite the average historical annual loss of 38 nests (Figure 3.12-9), indicating a capability of the species to not only |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | continue to persist on SSTC, but also to increase, with training occurring in the nesting beaches during the nesting season. Much of this has to do with the Navy's mitigation measures and management practices. Based upon the available data, training activities at historical and proposed levels appear to be compatible with persistence of the least tern and western snowy plover at SSTC. Nesting areas have already been set aside on the bay side of the Silver Strand that exceeds the mitigation required for all past and current consultations. The Long Term Site Enhancement Plan which is part of the Proposed Action could increase the carrying capacity for terns by hundreds of nests. For snowy plovers, the long-term site enhancement plan is estimated to realistically mitigate for 34 nests annually. |
| 50. | Elizabeth Copper | Since 2001, Least Tern reproductive success in San Diego County has been declining with the steepest drops being seen at sites around San Diego Bay. This downward population trend is not addressed in the EIS. Methods for calculating population figures are under review and are relevant to providing a clear picture of the status of the species prior to approval of increased adverse effects. In 2009, only 72 young least terns fledged from Naval Base Coronado sites from 3,232 eggs laid and 2,364 chicks hatched. The losses are in no way attributable to the Navy, which has been diligent in attempting to reduce the predation that is the primary cause of these losses but it is nonetheless in this context that increased take is being sought by the Navy. It is NBC's 22 percent of the statewide population that suffered near complete reproductive failure in 2009. Both the increasing reliance on NBC and San Diego County military facilities to support the tern population and the declining populations at these sites suggests a need for the most diligent evaluation of projects that may adversely affect these birds.<br><br>In 2009, NBC supported almost one third of the snowy plover nesting population in San Diego County. Unfortunately, while the population numbers have wavered , breeding bird survey results in 2009 showed the entire coastal population to be down by 12 percent from what was recorded in 2005 despite aggressive management efforts throughout the range. The minimum number of pairs at NBC in 2009 was only 35. In addition to problems of predation and habitat loss, in San Diego there has been a continuing occurrence of unexplained adult mortality with 15 adults found sick or dead at NBC in 2009 alone. This gloomy context needs to be clearly provided in the EIS to enable the public to evaluate the potential consequences of project approval.<br><br>The absence of the Biological Opinion (BO), the U.S. Fish and Wildlife Service's review and response to the proposed actions, from this Draft EIS fatally handicaps the ability of the public | The information and mitigation measurements from the July 7, 2010 Biological Opinion have been input into the appropriate sections, and the mitigation measures will be updated as well. Additional analysis has been provided in the FEIS on the indirect and direct impacts of current and proposed military training, to include both an average anticipated impact as well as a high-intensity anticipated impact (See Section 3.12.3.1 (4), for example). Mitigation measures have been added to the Proposed Action. The benefits of current and proposed mitigation are also described and quantified to the extent practicable. As discussed in the analysis, the benefits of mitigation are expected to outweigh potential adverse impacts of training. In response to this and other comments received, the Navy has revised the EIS analysis on the California least tern (Section 3.12.3.1) and the western snowy plover (Section 3.12.3.2) to provide a more in-depth analysis of impacts that training is expected to have on the species.<br><br>Predation is discussed in Section 3.12.1.3.1; California Least Tern and Section 3.12.1.3.2; Western Snowy Plover. Gull-billed tern predation studies are underway by the Navy and other funders (including USFWS), and the Navy has requested |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | to review the consequences of the proposed actions. The discussion of the complexity of the endangered species issues, e.g., downward population trends, plover adult mortality, unresolved predator issues, variation in management approaches, lack of control of public access, and perhaps most importantly the take allowances, reasonable and prudent alternatives and terms and conditions that will be applied to minimize loss, is accessible only in the Biological Opinion. I do not believe the public can adequately evaluate the impacts of the proposed alternatives until that BO is included. The 30-day time period between circulation of the Final EIS and publication of the Record of Decision would be inadequate to review the relationship between the Biological Opinion and the proposed actions and therefore the EIS should be re-circulated as a Draft including the Biological Opinion. | approval to relocate gull-billed terns from USFWS, without success. The Navy is working closely with the USFWS to assist it in addressing gull-billed tern predation. The Navy has submitted an application for a depredation permit to the USFWS annually since 2005 and has continued to document the impacts of this species. The Navy is supporting a radio-telemetry study by San Diego State University and USFWS during the 2010 nesting season. This study will research movements of gull-billed tern around San Diego Bay and analyze diet through stable isotopes.<br><br>A Biological Opinion has been provided by USFWS (9 July 2010), and its contents are incorporated in this EIS. The incidental take of California least tern is described in this Biological Opinion as: up to 8 percent per year of least tern eggs and chicks at SSTC North beaches; up to one least tern adult; and up to 10 nests moved. For western snowy plover, the incidental take is described as up to one active nest; up to five plover chicks; up to three nests moved; and up to three nests abandoned and brought into captivity.<br><br>Finally, among other avoidance and minimization measures that are Terms and Conditions of the Biological Opinion, the Navy will be coordinating with the USFWS in the development of the Long Term Habitat Enhancement Plan for SSTC. |
| 51. | Elizabeth Copper | Knowing how dramatically the nest numbers of the terns on the beach increased at NAB Ocean, I can understand that someone unfamiliar with plover biology might be fearful of the same kind of problem arising with the plovers. However, their nesting strategies are completely different. Neither snowy plovers nor any of their relatives nest in dense colonies anywhere in the world.<br><br>The snowy plover population in Recovery Unit 6 is unstable, has not met the Recovery Unit goals, and needs more aggressive management not less. The call for a cap on the number of plover nests to be protected is seemingly contrary to the mandate to recover this species. The justification offered for the cap suggests a misunderstanding of how plover nests are protected and does not take advantage of other opportunities to support training and minimize take. In | The Navy has proactively prepared for the expected take through actions taken prior to this request for take. This has been through site enhancement, management of lane usage, nest protection, and monitoring. Snowy plover nests are not necessarily going to be taken, just not protected over the 22 proposed. As a mitigation measure, the Navy will mark and buffer up to 22 concurrent snowy plover nests established at SSTC-N and SSTC-S beaches plus any additional nests that |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | 2.1.3.7 in the discussion of the proposed cap, protecting no more than 22 simultaneously active plover nests in SSTC-S and N combined, is identified as the only way to prevent the presence of protected plover nests from rendering the beach lanes unusable. This is apparently based on some assumptions which are not correct or are not likely to occur. While the worst-case scenario could occur in which three plover nests would be established in a line at the crest 30m apart, this would not result in establishment of protected areas that would preclude the use of a beach lane. The size and configuration of the buffers provided for the plover nests is not to exceed 30m on a side but is often much smaller and nest marking has always been done to satisfy both the protective needs of the plovers and to accommodate training activities. The presence of 3 simultaneously active nests in the training lanes occurred twice in 2009 once in Yellow 2 and once in Red 1, the most heavily used training beaches at NAB Ocean. The calculation that 22 simultaneous nests would equal 2 nests per training lane is somewhat misleading as plover nests have historically been established in 9 of the 10 beach lanes at NAB Ocean and five of six beach lanes at NRRF (4 of them are training lanes)= ~1.67 nests per lane. | exceed 22 that are initiated in beach lanes Orange 1 and Orange 2.<br>The FEIS explains the level of loss anticipated under the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year. The Navy will ensure that biological monitors look for and document the locations of least tern or snowy plover nests, eggs, and chicks prior to and after all military training exercises, to allow assessment of take associated with training activities.<br><br>The Navy has now added a more moderate scenario than the worst case scenario previously submitted in the Draft EIS, with results that are believed to be more realistic (see Section3.12.3.1).<br><br>Finally, the Navy's Proposed Action includes: ongoing nesting site preparation at the Delta Beaches; predator management; population monitoring; a Long Term Habitat Enhancement Plan; and measures to eliminate unauthorized recreational trespass, which are all conservation measures that support the recovery of the least tern. The Navy expects that implementation of these conservation measures will maintain the suitability of least tern habitat within the action area over the long term. The Navy's actions will increase the capacity of oceanside beaches and the Delta beaches to accommodate least terns and snowy plovers. |
| 52. | Elizabeth Copper | The provision of protected beach lanes has resulted in a clear concentration of plover nests in the protected lanes with 60 percent of the nests at NAB Ocean being established in those protected areas in 2009, achieving the goal of minimizing the effects of plovers on training and maximizing their nesting potential. Adding training in the protected lanes and removing the protective markers may disperse what nests are established into fully active training lanes and increase the likelihood of plover loss while decreasing the protection provided. The creation of the protected areas was a minimization measure which was successful but removal of protection should require more mitigation not lessen the existing protection with a cap. Without the Biological Opinion it is not possible to know how FWS has viewed this adverse result, what additional take would be allowed, how the allowance is justified, and what compensation is required to mitigate for the increased vulnerability. | Impacts to military training cannot be calculated on an acreage basis as you've suggested, because of the way training is conducted. Under current training conditions, as listed in Section 3.12 of the FEIS, Navy training officers are notified of the locations of the nests and buffers, and plan their training activities to avoid entering the buffer areas. A few training activities, such as individual basic physical fitness activities, may be able to work around the training buffers. These activities incorporate identifying and avoiding plover nest and |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | The concern that two active nests would significantly impede training is belied by the fact that throughout the season in 2009, in many weeks, three of the training lanes at a time supported two active plover nests each. The calculation that 2 nests would obstruct 12 percent of a lane is also misleading. While 60m is approximately 12% of the length of a lane, even if the nests were lined up in a way that resulted in a 60m long line the actual acreage of the area protected by maximum buffers provided for two nests is only 0.4 acres (30m x 30m square)–only 3 percent of the acreage of the smallest training lane. | buffer areas into the activity. Other training does not require the use of beach areas, and thus would not be affected by the presence of plovers. Most other activities, however, are unable to operate around the buffers. The buffers are artifacts on the beach that do not occur in real world wartime situations, and thus adversely affect the value of training (e.g., presence of the plover nests restrict flexibility for maneuvering across the beach and inhibits real-time, tactical decision-making). Personnel may also focus on the stakes and no-go areas rather than learning their training mission. Restrictions imposed by stakes during training may lead to habitual avoidance measures and self-imposed concentrations of personnel, even in a combat environment, due to repetitious training with excessive staked boundaries. Activities involving heavy equipment and vessels require large unconstrained maneuvering space without encumbrances, precluding areas with buffered plover nests. To accommodate training requirements for these activities, the activities are often shifted in their entirety to the north or south, far enough away from the buffers so that personnel and equipment will not encounter or see the buffers/stakes. Under current conditions, this approach is feasible. Where needed, training activities can and are moved to other available training lanes that are free of plover nests or contain a maximum of two plover nests at one time. SSTC has historically typically had less than 22 active nests, at most, at one time. With the anticipated increase in training tempo of the SSTC training beaches (see Sections 1.5.1.1 and 3.12.3.1), training activities may not be able to be moved to other less encumbered beach lanes like they can be and are under current conditions. |
| 53. | Elizabeth Copper | The protected beach lanes offer a benefit in concentrating plover nesting and tern nesting contributing to a reduction in the number of nests in the regularly used training lanes and the potential for interference with training. Nesting density was higher in the protected beach lanes (8, 9, and 10) with a maximum of 5 simultaneous active plover nests occurring in a single lane at one time. Even with 5 simultaneous active nests protected by the maximum 30m square buffers the smallest beach lane would have no more than 8 percent of the lane lost to the protected plovers. | The Navy intends to enforce public access management of beach areas, and to assure the quality of the Delta Beach sites (which are not at capacity). The Navy's current and proposed mitigation measures more than compensate for any loss that could occur due to the Proposed Action, see FEIS Sections 3.12.3.1 and 3.12.3.2. The overall impact is expected to be low |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Even with 22 nests, simultaneously active, in beach training lanes with each given the maximum 30m square the acreage moved from training availability would be less than 4.4 acres of the 191+ acres available (128 –NAB Ocean; 63.9 –SSTC S). If all 22 simultaneously active nests were established only at NAB Ocean, using the maximum buffer they would occupy 3 percent of the training lane acreage. If the number of simultaneously active nests were doubled to 44 but the buffer was halved the area occupied between SSTC S and SSTC N would still be only 2 percent of the beach. This is but one minimization measure that might be recommended if needed. Again, the absence of the Biological Opinion does not allow the public to evaluate the consequence of the proposed actions.<br><br>Knowing how dramatically the nest numbers of the terns on the beach at NAB increased, I can understand that someone unfamiliar with plover biology might be fearful of the same kind of problem arising with the snowy plovers. However, their nesting strategies are completely different. This is not a species that ever nests in large or dense colonies. Even the current density found at NBC is exceptional. The differences cannot be emphasized enough and their requirements for recovery are not currently being met.<br><br>There is not adequate compensation identified for increased losses of terns and plovers that may occur as a result of heightened training tempo in what are the most concentrated nesting areas, The lack of adequate compensation is of particular concern in light of the continued reproductive failures at these sites for the last eight years. | as provided in the revised impact analysis of birds in Sections 3.12.3.1 and 3.12.3.2 of the FEIS, as well as the USFWS Biological Opinion, which concluded that with implementation of mitigation measures, training activities would not jeopardize the continued existence of ESA-listed species. The conditions of the Biological Opinion have been integrated into the FEIS, and are briefly described below.<br>The Navy will consider the tidal stage when developing training schedules, and schedule training activities that could be conducted on the hard pack during low tides when consistent with training needs.<br>Under baseline conditions, the southern three beach lanes are marked to facilitate avoidance of tern and plover nests. Since the Navy has determined that the level of marking done under baseline conditions presents an impediment to training, the Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that does not encumber training activities. Such a marking strategy may entail signs affixed to existing beach lane sign posts and a limited number of additional markers, as determined appropriate by Navy staff.<br>If relocation of any least tern or snowy plover nest/egg is necessary as a protective measure, each nest or egg will be relocated the shortest distance possible into suitable habitat by USFWS approved monitors to increase the chances of nest success. The weekly reports to be submitted to the CFWO under the proposed action will include: a) date the nests/eggs were moved; b) number of nests/eggs moved; c) original and ending location of nests/eggs moved; and (d) distance the nests/eggs were moved.<br>The Navy will include the following information in the yearly reports to be submitted to the USFWS under the proposed action: a) the number and distribution of terns and plovers observed in each training lane; b) the number of any dead or injured least terns or snowy plovers (including eggs, chicks or adults) observed in each training lane; c) the hatching rate of terns and plovers in each beach lane; d) maps of the locations |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | of tern and plover roosts within the action area; e) the timing and number of training events within the southern three beach lanes, and other beach lanes, to the extent available; f) the date and condition of any dead or injured tern or plover; and d) any measures taken to prevent additional tern or plover death or injury.<br>The Navy will ensure that biological monitors look for and document the locations of least tern or snowy plover nests, eggs and chicks prior to and after all military training exercises, to allow an assessment of take associated with training activities. |
| 54. | Elizabeth Copper | The level of unrestricted public use of all the training areas is not accurately portrayed with the beaches at NAB Ocean being described as closed to the public so that the effect of the removal of protective markers in the southern lanes would not be significant. The beaches at NAB Ocean are used constantly by the public coming both from Coronado and from Silver Strand State Beach as well as by people from nearby military housing. The NAB beach has been identified on the Park website as a recommended walk from the adjacent State Park. Despite military presence, suspected vandalism of snowy plover nests and take of snowy plover chicks has been documented at NRRF. Vandalism of Navy property in the training lanes is also a regular occurrence. Off-leash dogs are constantly present at NRRF. The signs providing rules and identifying training areas are few, many of them have fallen down, some are covered with graffiti, and all are ignored. There is currently little to no enforcement by military personnel of restrictions on recreational activity. The ability to control public recreational activity is critical to any successful resources program regardless of the project alternative approved.<br><br>The Delta beaches which are mitigation for the loss of least tern nesting habitat at Naval Air Station North Island need to be evaluated for the presence of contaminants. The sites are subject to management constraints based on the presence of ordnance and have not been evaluated for contaminants. The presence of the former argues strongly for evaluation of the latter. Future clean-up of ordnance may affect the availability of these sites. As the Delta beaches are the fallback nesting location for terns and plovers displaced by increased training at SSTC the quality of the sites should be assured.<br><br>I applaud the efforts the Navy has expended in its management of endangered species at NBC and it is the Navy's demonstrated ability to support both training and natural resources that has set the standard for resource management for much of the country. | The Navy is not proposing to remove protective marking on the southern three lanes of SSTC-S, nor was this stated in the FEIS. As indicated in the USFWS Biological Opinion and described in the FEIS, the Navy will improve the delineation of base boundaries to facilitate improved enforcement in these areas. This enhancement will include the installation of improved signage, k-rails, and a guard shack. At SSTC-N, temporary barriers and improved signage will be used to more clearly notify the public of the Navy's exclusive use of SSTC-N beach and existing restrictions on public use of those beaches. |

|---|---|---|---|
| 55. | Shannon and William Davis | Training at the expense of endangered species is our concern. Endangered species are to be restored to a point that they are removed from the federal list.<br>We are opposed to the training activities, if you won't put protective fencing around each Endangered San Diego Fairy Shrimp's Vernal Pool habitat complex at the Navy Silver Strand Training Complex. Without fencing, foot traffic, military dogs, and vehicles may irrevocably destroy, by crushing impacts, the cysts, eggs of the San Diego Fairy Shrimp in dry season. While the EIS states it will try to avoid the vernal pools when they are wet, it clearly states that it expects there to be foot traffic in dry season.<br>The Navy is committed to complying with all applicable federal law, regulations and policies. Current management of vernal pools restricts all activities from the pools at all times. Environmental programs and policies have been developed to protect and improve air, water, and land, cultural resources, and national resources. The protection of natural and cultural resources has become an integral part of planning for training on 5.S.T.C. However, the protected sanctuary of the vernal pools is about to change for the worse from foot traffic, other traffic, pyrotechnic chemicals, and hydrocarbon residue from overhead aircraft. Chemicals introduce poisons into the pools. Hydrocarbons cover the surface of the water and restrict oxygen from the air reaching the water in the pools. Over time, the cumulative effect leads to destroying the ecological habitat of the vernal pool.<br>The San Diego Fairy Shrimp (*Branchinecta sandiegonensis*), species code K049 101, has been designated an endangered species in 1993 by the federal Environmental Protection Act of 1973. Why not designate 6 acres as a fairy shrimp pool complex preserve as the pools are separated on the order of meters? Currently, it looks like there are three complexes of pools at S.S.T.C.-S. In that the antenna array is no longer being used, which has a diameter of approximately 944 feet, that has an existing perimeter fence around this antenna array, which occupies an area of approximately 16 acres and could add 10 new available acres for training and set aside 6 new available acres for the fairy shrimp pool preserve. Figure 3.11-4 (Ephermeral Pools) shows the occupied pools have an area of 4.65 acres. Training could use the area between the pool complexes, but not through the pool complexes.<br>History has recorded the steady decline of the San Diego Fairy Shrimp vernal pools. These pools have existed for thousands of years. The major decline started in the 1940 to 1950 time period because of World War II. Additional decline occurred between 1979 and 1986 from urban development. Before development there was approximately 28,500 acres of vernal pool habitat in San Diego County. By 1986, only 7% of those acres remained. On February 3, 1997 it was reported that 70% of the remaining vernal pools were on N.A.S. Miramar or Camp Pendleton. By 1995 95% of the vernal pools were destroyed. In 2001 it was reported that 2,400 vernal pools existed. Between 2002 and 2003 only 3% of the vernal pools remain. In 2002, under President George W. Bush, a federal judge invalidated the critical habitat for the San Diego Fairy Shrimp. In 2009 President Barack Obama went to the National Environmental Protection Agency and ordered that all the protections of the endangered species that had been dismantled during the Bush era be put back which reestablished the critical habitat for the San Diego Fairy Shrimp. So, the pools are down to 3% remaining. Most (70%) are on government property. Some of the pools do not have the San Diego Ferry Shrimp which makes the pools that do have, become | Foot traffic entering the pool, as described in the EIS, does not mean troops of people walking back and forth over the pools. The nature of these training activities is dispersed. Each event is more likely to be one traverse over one pool, along a different path each time. The Navy agrees that cysts will be crushed and damaged in the dry season. However, there are tens of thousands if not millions of cysts, and the take of some during training on foot is not expected to be a population level effect. The 12 to 207 persons walking in a dispersed manner in the training area is not a large effect, considering the percent of the training area occupied by the pools. The nature and level of expected take have been addressed in a BA, and the Navy has completed consultation with USFWS (Biological Opinion signed July 7, 2010). The USFWS concluded that with mitigation measures in place, training activities associated with the Proposed Action would not jeopardize the continued existence of ESA-listed species.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. |

|---|---|---|---|
| | | more significant in importance. Development was the main cause of the decline in the pools. Now the Navy wants to develop 5.S.T.C. - 5 which will further the decline of the pools if not protected as a fenced pool complex preserve.<br>We are patriotic and want our service men and women to have the best training. They deserve nothing less. Detente, the easing of strained relations, also applies to nature. A constant vigil of good stewardship needs to be kept for the endangered species to get off of the federal list. Thank you for considering our comments on this important matter | In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |
| 56. | Ed Degenhart | I live just up the street from the helicopter base in Imperial Beach and have acclimated to the touch and go operations there for the past 20 years with no incidents or harm to the environment. I have no issue with the proposed increase in training and trust the US Navy to protect our environment and community's health and safety. I also respect the will of the Naval leadership to get their people the highest and best training for their call to service by our government. Anyone who is willing to risk their lives for our country has my total commitment and support to be properly trained to perform their duty.<br>May God Bless our Servicemen and thank you for your service to our country | Your comment has been noted. |
| 57. | William Dick | I have no problems with the Navy increasing the frequency of exercises on the Strand. My condominium is right above the SEAL compound and I have a direct view of activities to the south and west. I fully support all military activities on the Strand. I am never bothered by the military exercises and the Navy seems to be very responsible by minimizing noise when holding night activities. The Navy and the SEAL teams are part of my community and make living at Coronado Shores that much more exciting and enjoyable!! I love them. | Your comment has been noted. |
| 58. | Bill Dimmock | Imperial Beach is a very quiet and peaceful community. We enjoy the quiet of the evenings and walks along the beach. We feel that this training facility has and will interrupt the peacefulness of our nights and our use of the beach. I understand the need for training, but feel that Imperial Beach is such a family area that training needs to be moved to a less populous area that would not limit the training times and days that are required to create the perfect military personnel. There must be balance and we have lived in, although not perfect, balance with the military for over 20 years. Extended training hours and area would not only affect the harmony we have achieved it would destroy the quality of family life in Imperial Beach. Please consider the option that allows us to continue as is. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. The Navy has developed mitigation for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS.<br><br>The Navy considered time and location of training so as to minimize disturbances to the local community and does its best to conduct noise-producing activities during the day. However, to train in real-world scenarios that may occur, Navy personnel must train at night. Personnel need to train in these dark, late night conditions to ensure they are prepared for real-world operations. |

| 59. | Cheryl Dimmock | We bought our home in Imperial Beach over 20 years ago. Although we could have moved anywhere, we chose this special area to raise our children. We felt at that time that there was no where on earth that offered all the advantages that were offered here. We knew that IB had a questionable reputation and that we would be sharing our area with a strong military presence, but these were small prices to pay to live in such a diversified area. Not only culturally, but biologically. The mornings spent on the beach, watching the seals and porpoises. The afternoons spent over by the bay observing sea birds and turtles. The times we watched the military training were all special times of great education for my children. The best scenario would be for the Navy to find another location and allow the area to go back to a natural and untouched state. We need to protect all the environment from human encroachment and nowhere in the state do we have such a fragile area as we have been entrusted with here in Imperial Beach. Since, I know that this possibility is just a dream, please consider the option of keeping the training and land use as you have been doing and not extending the hours and amount of use here.<br>There are schools and children and real people who need to continue with their lives, without having to be stressed over the noise, additional traffic, diminished access to the beach and the possibility that all the wildlife that is habituating and at this point thriving, will be affected by our careless use of what is an area of such living beauty. We need to consider other options. The decision to add additional training here would diminish our quality of life and what price is the Navy willing to pay for that. | The Navy strives to be a good neighbor and analyzed all training activities at SSTC with respect to applicable resources and regulations. The EIS analyzed a number of resources including land use and recreation (which addressed potential impacts to schools in the area), air quality, water resources, acoustic environment, socioeconomics, etc, air and water regulations.<br><br>As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible.<br><br>Additionally, the Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. In light of this proximity, the Navy has developed mitigation for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS. |
| 60. | William Dorr | My concerns deal with the new use of Training Lanes 11 through 14, currently referred to by the Navy as SSTC-South. Let's be clear, until approx. 2 years ago, the Navy did not use this section for assault / beach access training or helicopter sorties. Now it's called SSTC-South? When did that happen? This half-moon shaped piece of land is bordered on one side by the ocean. The other side is surrounded literally by YMCA Camp Surf, which is attended by over 10,000 local children annually; Westview Elementary School, Imperial Beach; Over 500 private homeowners in Imperial beach; San Diego Bay National Wildlife Refuge; Coronado Cays, a residential community of 1200 homes, Silver Strand State Beach Park used by over 1 million people a year; Loewe's Coronado Hotel, which adds tremendously to the local economy and tax base and finally Camp Able, which serves Handicapped and challenged children and adults from throughout the southern CA area. SSTC-North and SSTC-South are separated on the ocean side of the strand by the CA Silver Strand State Beach Park.<br>To have 2200 helicopter sorties and assault and beach access training, including the discharge of | As indicated in Chapter 2 of the FEIS and in Section 3.1.2.3, the increase in training activities is spread out over the whole of SSTC, rather than just at SSTC-S. The Navy has developed mitigation for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS and these are listed in Chapter 5.<br><br>As proposed for Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | munitions will harm the area marked SSTC-South and have a very negative environmental impact on the surrounding community. If this is to be used for training, it should be very low impact and classroom type training. Confine the assault and sortie exercises to SSTC North, Lanes 1 to 10, where it has always been. The noise, pollutants, increased traffic and air quality will be harmed further in an area historically used for outdoor activities and wildlife sanctuary. The SSTC-South did not exist 2 years ago. That area has always been the antenna site. Nothing could have less of an impact on the area than an antenna site. To now convert it to overt and dangerous training and use the argument that the community should expect it is ridiculous. The helicopter traffic alone poses a huge potential for disaster to surrounding community sites that I just listed. The noise is well above what is has been historically. The Navy has let helicopters fly throughout the south bay area not heeding to the restricted flight corridors or following the agreed upon protocol. The ocean corridor is never used. To now triple the helicopter flights from 770 to 2200 a year and add the assault training at SSTC-South in the middle of residential locales, all less than 1/2 mile away is putting the public in danger unnecessarily.<br>Continue to train in Lanes 1 to 10 and leave the antenna site, Lanes 11 to 14 for non-invasive, non-polluting activities. | helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations in the western portions of the boat lanes.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS. |

| 61. | Douglas Dribben | As a frequent tourist to Coronado, I especially enjoy seeing the Seals, the helicopters, and the ships offshore in exercises. This shows me where my defense tax dollars are going, and makes me proud to be an American. I salute the men of the Seal Teams and those men and women who support them, and encourage more exercises. The exercises do not damage the environment, and sharpen our defense capabilities. Do not think for one minute that they are not under observation by those who may be on the receiving end of the exercises one day, so they act as a wonderful deterrent to those who would do America harm. Please allow the Seals to expand their exercises as they desire. | Your comment has been noted. |
| 62. | Beverley Dyer | It was a shock on February 23rd to read in the San Diego Union of the Navy plans to increase the training along the Coronado coastline many times over the previous use. Even though I have lived in my home in Coronado Cays for over 30 years, never have we been contacted nor informed of this plan which has been studied for 10 years. Now we are allowed only two weeks to make any comment.<br><br>Since there have been no public nor individual contacts previously made with the local population during your Environmental Impact study few, if any, of the local population were aware of these drastic changes. The noise of helicopters and other aircraft, besides leaving an oily residue are already a hindrance without your increasing it three-fold. Blasts of gunfire and detonation already awaken us, create a dangerous odor. You expect that humans and all living creatures will not be affected by an increase of 10 times?<br><br>It was totally unethical and unprincipled for our government supported Navy to inhibit us from previous information. Why didn't the study include the many people who live on the Strand, the hotels, the many guests and tourists and campers who spend time in the area? Were the various organizations that sponsor beach activities informed and questioned? In which way was the human factor studied? We would like an answer.<br><br>At the poorly attended Coronado meeting at the Coronado Recreation Center on February 25 it was obvious that few people knew anything about your plans even though Environmental Impact report had begun 10 years ago.<br><br>Unfortunately, the public has only been given until March 9th to make comments concerning this issue. Is that fair? | The Navy has conducted numerous outreach events and briefs to local governments and special interest groups. Information was provided to your Association board regarding the EIS in late January 2010, timed with the public release of the DEIS. In response to requests by the cities of Imperial Beach and Coronado and citizens, the public and agency comment period for the FEIS was extended to March 30th. ,<br><br>The Navy recognizes its proximity to adjacent communities and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy has developed mitigation plans for activities that may cause an impact to the environment or surrounding area, and has presented these in the EIS. |
| 63. | Marilyn G. Field | I am writing with comments on the Navy's proposed expansion of training activities on the Silver Strand:<br>1) The Navy should not be increasing its operations on Coronado. Coronado is a small residential community which is already impacted by Navy traffic, noise and pollution. This has greatly increased with the nuclear aircraft carrier homeporting operations about 10 years ago. It is inappropriate to increase the burden on this small community when the Navy has other sites which might be used for training which do not burden any community Camp Pendleton springs to mind and there are other sites as well. It may not be quite as convenient but it is unfair to ruin a small community in the name of Navy convenience, not necessity. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | EIS to illustrate why alternate locations are not feasible. |
| 64. | Marilyn G. Field | 2) NEPA requires that all impacts related to a proposed course of action be analyzed in the EIS. However, the Navy has deferred analysis of the impacts from helicopter trips to and from the training areas. I believe this violates NEPA. | This FEIS analyzes training that would occur in the training areas of the SSTC. Additional information on aircraft overflights and a description of their flight paths that are not associated with SSTC training activities are now presented in Chapter 2, Section 3.6 and Section 4.3.6.<br><br>Helicopter activity discussion has been added to Cumulative; Section 4.3.6. The Section discusses the various squadrons based out of NASNI and the number of helicopter flights that these squadrons generate. The Navy AICUZ study is currently being updated to identify all flights generated from NASNI and NOLF. |
| 65. | Marilyn G. Field | 3) Helicopter sorties will increase by about 300%. If helicopters and fixed wing aircraft take off from North Island and transit to the training sites on the Silver Strand they should be required to fly over the ocean at a sufficient distance from land so as not to disturb residents on the ocean side of Coronado. No aircraft should be permitted to fly to or from the training areas over the Bay. Residents along the Bay are already impacted by Navy helicopter noise. The Bay is so narrow that it is not possible for aircraft to fly far enough away from residences to eliminate or minimize noise.<br>4) The EIS describes the following activities: triple the helicopter sorties, new (presumably larger) helicopters and amphibious craft, pyrotechnics, pile driving, nighttime helicopter hovering for 1- 2 hours, 50% increase in training incidences, almost tenfold increase in firearm firings and admits there may be sleep disturbances and communications disruptions. Yet the EIS concludes that there will not be significant noise increase because the training is dispersed over a larger area. On this basis, no mitigation is proposed. It is not credible that these activities will not cause significant noise increases to the residents of adjacent areas. These disturbances cannot be mitigated and therefore should not be permitted. | As proposed for Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations in the western portions of the boat lanes.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific |

| | | | Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS.<br><br>Helicopter noise is addressed in Sections 3.6.2.2.1 and 3.6.2.3.2 of the FEIS. The analysis of helicopter sound indicates that, while the number of helicopter sorties would increase substantially under Alternatives 1 and 2, the increased frequency of short-term sound exposures from increased helicopter pass-bys would not be sufficient to noticeably change the hourly average sound level at any one off-installation location. Because of the logarithmic nature of sound; a doubling of sound energy results in only a three-decibel increase, which under typical conditions is barely discernable. The analysis of helicopter sound is based upon broadly defined flight paths, consistent with a normal degree of variability introduced by pilot discretion, weather, time of day, and safety concerns such as other aircraft. |
| 66. | Marilyn G. Field | 5) The EIS notes that berms will be built in places along the Strand. This will effectively wall off the view of the ocean which residents and tourists enjoy. | As listed in Table 2-1, the berms will be built in support of ROWPU training, which is located close to the shoreline and has a relatively small footprint. There are no other manmade dunes on Navy training lanes. |

|---|---|---|---|
| 67. | Marilyn G. Field | 6) The new and expanded training activities and the construction activities noted (including retail, recreational, housing and restaurant facilities) will increase traffic which is already greatly overburdening Coronado. There is no good solution to mitigate traffic and the Navy has been unwilling to contemplate any solutions which would significantly reduce the Navy's traffic. No activities which increase Coronado traffic should be permitted. Respectfully submitted, | SSTC EIS adequately addresses impacts to traffic based on increased training activities. There are no construction projects associated with this Proposed Action. The Average Daily Traffic (ADT) of Coronado roads was discussed in Table 3.14-2. The ADT of all public roads was calculated for all traffic, which would include any military traffic. The EIS analyzed the Level of Service (LOS) of local roads to determine the contribution to overall traffic on public roads from military activities. Based on the analysis, increases in military training vehicle trips per day would represent less than two percent of the total daily traffic, and the local road network would experience an acceptable LOS, except for intersections at Gates 1 and 2; those intersections would experience an unacceptable LOS. However, traffic generated under Alternatives 1 and 2 represent less than one percent of the morning volume and less than two percent of the evening traffic at these intersections, and this increased LOS would be well within the capacities of the existing regional roadway network. |
| 68. | Marilyn Field | The Navy should not be increasing its operations on Coronado:<br>Coronado is a small residential community which is already being severely impacted by the Navy's operations. Coronado and the Navy share this small island but the Navy's increase in operations over the past 10-15 years has created noise, increased traffic and air pollution. It is inappropriate to increase the burden on this small community - in essence ruin with further increases in noise, traffic, air pollution and adverse visual impacts when the Navy has other options for training which would not burden any community- Camp Pendleton springs to mind. It may not be as convenient but it is unfair to ruin a small community in the name of Navy convenience. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |
| 69. | William S. Field | Helicopter noise on San Diego bay is already a major annoyance, especially during the summer. The ramp up in training on the Silver Strand will increase historically helicopter flights (up to 3x I'm told), including flights from new helicopters to be stationed at North Island.<br>We live on the Bay in Coronado (Coronado Point). Any significant increase in helicopter traffic over the Bay will make living there intolerable. In part, this is heavy use. Navy pilots fly at less than 500 feet most of the time, and even at higher elevations the noise is a nuisance.<br>At the meeting I was told that the helicopter traffic patterns are not included in the EIS. This appears to be a violation of NEPA, which requires the total impacts of any project be included in | As proposed under Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. | 70. | Gregory Fischer | As a resident of Imperial Beach for 18 years, I have a few comments. The east view from my residence on Seacoast Drive looks down the center line of the Navy's OLF runway approximately 1/2 mile away. There are helicopters conducting flight operations on most days. The noise is not at all a problem. What I hear is the sound of freedom. I truly want these pilots and air crew to be as proficient as possible in defense of our country. As for the Silver Strand Training Complex, I want our Navy SEALS to conduct as much training as they need, no matter the noise in the proximity of their base along the Silver Strand, recognizing their importance and vital mission for our defense. No bird, fish, ground cover or sensitive ear should have a higher priority over the vital training of our Navy SEALS. Thank you for the opportunity to comment. | Your comment has been noted. |
| 71. | Vincent J. Flynn, M.D. | This is in regard to the Silver Strand Training Area the navy proposes, to expand. I am a native of Coronado and have watched the navy's activities all my life in and around the Silver Strand. For the most part, they have taken good care of the natural resources in the area and I have no complaints. But I must object to the increased activity in and around the old Fort Emory, the area just north of Imperial Beach. Much has changed since WWII when that area was so very important to national security. It has been repopulated with the wild species that were there 100 years ago, they have reclaimed it for their own. In my opinion, it would do much harm to the environment to reclaim this area for navy purposes. The navy should leave it alone and allow the public access to the beach area. There is still a lot of beach area available to the navy at North Island and Camp Pendleton. Give the citizens a break and do not extend your already large claim on the small area of Coronado. | The Navy strives to be a good neighbor, and analyzed all training activities at SSTC with respect to biological resources. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is provided in the FEIS to illustrate why alternate locations are not feasible. Additionally, the Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy has developed mitigation plans for activities that may cause an impact to the environment or surrounding area, and has presented these mitigation plans in Chapter 5 of the FEIS. |
| 72. | Jeffrey G. Foster | The projected increase in activities, 48% increase in sound-generating activities, could cause a noticeable difference in the peacefulness of north I.B. Please choose the no action alternative and maintain current level of activities. I.B. residents should be considered first and foremost in making this decision as we will be the most impacted. beach access and the bird life along the Silver Strand are also coveted and are part of what make this a special place. Please leave the current situation as is. Choose the no action alternative and do the extra training elsewhere where the public will not be as impacted. | The projected increase in activities at SSTC-S would not translate into a general 48-percent increase in sound exposure of Imperial Beach residents. While helicopter sorties, shotgun breacher training, and amphibious landing exercises on SSTC-S all would increase, they also would occur in various locations at different points in time. The distribution of these activities over time and space is such that the change in the sound environment for any individual resident cannot be quantified. The commenter’s preference for the No Action |

| | | | Alternative is noted. |
| 73. | Frank Gaines | The need has long been established as has the wise stewardship of our military on the lands needed. I totally support the request and the uses identified. | Your comment has been noted |
| 74. | Gerd Geissler | Having lived in Imperial Beach next to the Naval Antennae for over 40 years we are familiar with Naval Warfare training (which has only increased in recent years). We have not complained one bit about the noise at night (bomb blasts and machine gun fire) nor the increased helicopter traffic OVER our houses. Now you are telling us we will not only have this noise continue but it will be for longer hours and be even more disruptive to our once quiet neighborhood? The helicopter take offs and landings echo off the walls as it is and you want to do hundreds more? We are living in this community and we respect the Navy but feel that they do not respect us back. We deserve peace and quiet. The noise concerns we have are real and I don't think any of you would want to relocate your beautiful home to right across from a loud, disruptive training facility so why are you making us do that? You already take half the Strand for your training--leave us to our peaceful part down in Imperial Beach. | As proposed under Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations, in the western portions of the boat lanes.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS. |
| 75. | Gerd Geissler | We are on Silver Strand and Carnation. The traffic goes directly in front of our lot. We are concerned about excessive speed and traffic backing up along Silver Strand. We would like to recommend that the northerly gate be used for access into the base. We would also recommend considering a light at Silver Strand and Palm Ave. Speed limit needs to posted. Also concerned about noise levels after 10 pm. | The Navy is responsible for traffic on its controlled land. Once personnel leave SSTC-S, they are subject to Department of Transportation regulations. Speed and traffic control measures are the responsibility of the City of Imperial Beach. Please note that due to this and similar comments, the Navy is considering increasing signage or providing a message board requesting Navy personnel to obey all posted speed limits, keep radios turned down, etc., as personnel leave the base, as the Navy currently does at Naval Base Coronado, Naval Amphibious Base – Coronado, and Naval Base San Diego.<br><br>Please note that due to your comment and other similar comments, the Navy is assessing the feasibility of using the north SSTC-S gate for ingress/egress. Such use would depend on many factors, such as CALTRANS signal/signage changes and the City of Coronado authorization of the new access point.<br><br>Your concern about noise from nighttime training activities is noted. Traffic noise along Silver Strand from late night training activities would be minimal and infrequent, as few training activities take place on SSTC-S, and those that do typically involve small groups. Night training is an essential element of the Navy's training program at SSTC because many military activities, such as clandestine operations, are conducted at night and military personnel must train under realistic conditions. Noise from nighttime training activities at SSTC is addressed in Sections 3.6.2.2.6 and 3.6.2.3.7 of the EIS. As listed in NBCINST 3502-1, the Navy notifies local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the |

| | | | Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website. |
| 76. | Lilo Geissler | We live along Silver Strand Boulevard and have had to contend with traffic going in and out of the Naval base at all hours. The people who are driving take no heed to the fact that this is a residential area and should be driven at under 25 mph. They speed out of the base at about 40-50 mph putting children and pets at risk. Now you say you want to increase training which would in turn increase the number of cars using Silver Strand Blvd. as their route? Why should we have to put up with the dangerous conditions these cars pose? Why do we have to fear an accident will occur when these hazardous drivers are speeding along our neighborhood roads? We do not want the heavy traffic congestion along our peaceful street and we do not want the added pollution associated with so many extra cars. Why not open the gate along the Silver Strand (after the berm) and make that available if you are to continue with more training exercises? Our neighborhood was not built to be a thoroughfare for large amounts of cars and we don't like the dangers they would bring. | The Navy has reviewed applicable traffic studies and has presented their results in the Section 3.14.1.2 of the EIS. While there is an abundance of traffic along the Silver Strand/Highway 75, it should be noted that the comment being referenced only accounts for traffic that is associated with the training activities at SSTC. The impact of that traffic (only associated with the SSTC training activities) relative to the overall traffic on area roads is presented in the resource section of the EIS as well as the cumulative section of the EIS. Currently, intersections and roadways within the ROI typically experience an acceptable LOS. Although the intersections at Gates 1 and 2 experience unacceptable LOS, traffic related to the Proposed Action represents less than 1 percent of the morning volume and less than 2 percent of the evening traffic at these intersections. |

| 77. | Dani S. Grady and Ralph J. Greenspan, Ph.D. | We are writing to express our serious concern and opposition to the Navy's planned expansion of military exercises on The Strand. There are several reasons for our opposition: human health, environmental concerns, impact on residential atmosphere, and impact on the local economy. Our family is proud of the Navy and strongly supportive and proud of our military, and we understand the need for expanded military training. The eldest son in a Coronado family with whom we are very close is currently in the Navy Seal training program, and so we have an additional personal connection with the need for the best training possible. Over the past few years, the level of military exercises in Coronado has been increasing in both frequency and intensity. It is plainly audible from our home on Glorietta Blvd. Thus, we have been patient with the expanded use of these training areas, but now feel that the noise levels we currently experience are near the tolerable limit. We feel strongly that the place to expand such operations, however, is not Coronado, but the Navy's more isolated sites at Camp Pendleton and at the offshore islands. The noise we experience at our home, however, is not the only reason for our concern. There are many more: | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. The Navy has developed mitigation for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS. The EIS addressed socioeconomics and beneficial impacts associated with the Navy's Proposed Action. Existing regional population and associated housing impacts, employment rates, and regional economy would remain unchanged.<br><br>The Navy considered time and location of training so as to minimize disturbances to the local community and does its best to conduct noise-producing activities during the day. However, to train in real-world scenarios that may occur overseas, Navy personnel must train at night. Personnel need to train in these dark, late night conditions to ensure they are prepared for real-world operations. All potential impacts related to noise are addressed in the Acoustic Section; Section 3.6.<br><br>As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |
| 78. | Dani S. Grady and Ralph J. Greenspan, Ph.D. | Human health – One of the principal consequences of expanded war exercises on The Strand would be noise pollution, which is well documented to cause hypertension, high stress levels, tinnitus, hearing loss, sleep disturbances, and harmful emotional effects. The radius affected by this noise pollution extends well beyond the area immediately adjacent to the site, given the magnitude of the noise and the efficiency with which sound travels over water, thus exposing the entire southern half of Coronado. | The acoustic analysis presented in the FEIS describes the real-time effects of the various types of training sound on exposed individuals, such as speech interference and sleep disturbance, that can result in annoyance and stress. The FEIS acknowledges that such effects would occur occasionally, but |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | concludes that the incremental effects of sound from the proposed training activities at SSTC would not have a substantial effect on the acoustic environment.<br><br>Hearing loss may occur where individuals are exposed to a sustained noise level of 85 dB or above. The training activities at SSTC do not result in sustained sound levels of this intensity in off-installation areas. Therefore, tinnitus and hearing loss would not occur as a result and are not a concern for SSTC training activities.<br><br>Emotional reactions to noise are not related to the intensity of the sound, generally are based on the life experiences or expectations of the receptor, and may be influenced by several factors other than noise. Environmental noise metrics and community noise standards thus do not provide a basis for assessing such effects. The relationship between noise and such conditions is thus unpredictable, although the Navy acknowledges that a substantial increase in the frequency of impulsive noise events is likely to result in some increase in such reactions in the community. |
| 79. | Dani S. Grady and Ralph J. Greenspan, Ph.D. | Another major effect would be air and water borne pollutants, toxic debris, and shoreline contamination from toxic chemicals that are carried in or produced by exploded ordinance. These include toxins and carcinogens such as depleted uranium, mercury, and lead, as well as irritants and irritant producers such as titanium tetrachloride, red and white phosphorus. This is to name just a few of the ordinance-associated chemicals known to be harmful to humans. Loss of residential atmosphere – We have just spent several years instituting a new revision of zoning requirements based on the widespread sentiment that Coronado residents wanted to preserve their village atmosphere. Nothing will destroy that atmosphere more quickly or thoroughly than the frequent and continual sounds and smells of war exercises. Our troops are crucial to our safety and we support them, their training, and their families. Many of them and their families also live here in Coronado. Proper support requires that we provide appropriate separation between domestic living arrangements and war simulations. This is especially relevant given the widespread occurrence of PTSD and related disorders in returning service personnel. | Toxic debris and shoreline contamination are addressed in Section 3.4 (Hazardous Materials and Waste) and Section 3.5 (Water Quality) in the EIS. Depleted uranium is not used in training at SSTC.<br><br>A full analysis of air quality has been performed and the results are presented in Section 3.3 as well as Appendix C of the FEIS. |

|---|---|---|---|
| 80. | Dani S. Grady and Ralph J. Greenspan, Ph.D. | Ecological impact – The Navy's own Environmental Impact Statement acknowledges that there will be a significant impact on marine ecology, including bioaccumulation of chemicals in the food chain, death from exposure to toxic chemicals and bomb blasts. In addition to direct physical harm, there is also the impact of noise on animal life in the reduction of usable habitat, which in the case of endangered species hastens the path towards extinction. The Navy's training use of sonar has already increased the deleterious exposure of marine mammals, and this expansion will further increase the burden of noise pollution on them. | The EIS analyses disturbance to habitat and direct impacts to fish and other marine animals. Habitat impact has been determined to be minimal, and mitigation measures decrease the possibility of impact to marine mammals.<br><br>Regarding ecological impacts: all alternatives avoid effects on marine algae, plants, and invertebrates in areas where densities of these organisms are the greatest: the salt marsh, mudflats, and salt pond. On the beach, vehicle use, boat landings, helicopter landings, and foot traffic associated with a range of activities could cause temporary localized disturbances of infaunal invertebrates of the sand.<br><br>Minimal disturbance of sandy bottom habitat and increased turbidity from amphibious landings and underwater demolitions.<br><br>A total of 1.13 acres of eelgrass habitat may be impacted in the designated training lane within the Bravo training area. Management practices are in place for jurisdictional waters and special aquatic sites. This includes the Navy Eelgrass Mitigation Bank management practice within San Diego Bay. This is consistent with the Southern California Eelgrass Mitigation Policy.<br><br>Adverse modifications to benthic habitat resulting in effects to EFH occur on limited bases during amphibious landing and beach construction activities within the Bravo training area. |

| 81. | Dani S. Grady and Ralph J. Greenspan, Ph.D. | Local Economy – The Hotel Del is Coronado's major tourist destination, and it sits adjacent to the area where these exercises would be increased. The noise and smell from these activities would effectively ruin anyone's stay at the hotel, or at any of the nearby hotels. The repercussions for Coronado's standing as one of America's most desirable tourist and vacation destinations would be rapid and detrimental, and this would be felt as a permanent blow to the local economy and tax base. | The Socioeconomic section addresses any anticipated impact in the area of southwestern San Diego County, surrounding SSTC. As listed in Section 3.15.2.3.1, existing regional population and associated housing impacts, employment rates, and regional economy would remain unchanged. This includes the hotel, tourism, and restaurant commerce in southwestern San Diego County. |
| 82. | Dani S. Grady and Ralph J. Greenspan, Ph.D. | In short, we feel strongly that the proposed increase of Navy exercises on The Strand would be certain to have severe and long-term detrimental effects on the quality of life in Coronado, lasting well beyond the period of time in which the exercises actually occur. For this reason, we urge the City Council and Mayor to take a strong stand against such expansion of activities. | Your comment has been noted |
| 83. | Ralph Greenspan | My wife and I are writing to express our serious concern and opposition to the Navy's expansion of military exercises in Coronado. Our reasons include: human health, environmental concerns, impact on residential atmosphere, and impact on the local economy.<br>Our family is proud of the Navy and strongly supportive of our military, and we understand the need for expanded military training. Over the past few years, the level of war training exercises in Coronado has been increasing in both frequency and intensity. It is plainly audible from our home on Glorietta Blvd. We have been understanding of it up to now, but the noise levels we are experiencing currently are near the tolerable limit. We feel strongly that the place to expand such operations, however, is not Coronado, but the Navy's more isolated sites.<br>The noise at our home is not the only concern:<br>Human health -- One of the principal consequences of expanded war exercises in Coronado is noise pollution, which is well documented to cause hypertension, high stress levels, tinnitus, hearing loss, sleep disturbances, and harmful emotional effects. The radius affected by this noise pollution extends well beyond the area immediately adjacent to the site. Given the magnitude of the noise and the efficiency with which sound travels over water, this exposes the entire southern half of Coronado.<br>Another major effect is air and water borne pollutants, toxic debris, and shoreline contamination | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible.<br><br>The EIS does analyze noise and its effect on wildlife (See Sections 3.11.2 Terrestrial Biological Resources Environmental Consequences; 3.12.2.2.1 Air Activities; 3.12.2.2.2 Pyrotechnics, Simunitions, and Blanks; 3.12.2.2.4 |

|---|---|---|---|
| | | from toxic chemicals that are carried in or produced by exploded ordinance. These include toxins and carcinogens such as depleted uranium, mercury, and lead, as well as irritants and irritant produces such as titanium tetrachloride, red and white phosphorus. This is to name just a few of the associated chemicals known to be harmful to humans.<br>Loss of residential atmosphere -- Our troops are crucial to our safety and we support them, their training, and their families. Many of them and their families also live here in Coronado. Proper support requires that we provide appropriate separation between domestic living arrangements and war simulations. This is especially relevant given the widespread occurrence of PTSD and related disorders in returning service personnel.<br>Environmental impact -- The Navy's own EIS acknowledges that there will be a significance impact on marine ecology, including bioaccumulation of chemicals in the food chain, death from exposure to toxic chemicals and bomb blasts. In addition to direct physical harm, there is also the impact of noise on animal life in the reduction of usable habitat, which in the case of endangered species hastens the extinction process. The Navy's training use of sonar has already increased the deleterious exposure of marine mammals, and this expansion will further increase the burden of noise pollution on them.<br>Local economy -- The Hotel Del Coronado is Coronado's major tourist destination, and it sits adjacent to the area where exercises are increasing. The noise and smell from these activities would effectively degrade anyone's experience of staying in Coronado. The repercussion for Coronado's standing as one of America's most desirable tourist and vacation destinations would be rapid and detrimental, and this would be felt as a permanent blow to the local economy and tax base.<br>In short, we strongly feel that the the proposed increase of Navy exercises in Coronado would be certain to have serious and long term detrimental effects on the quality of life in Coronado, lasting well beyond the period of time in which the exercises actually occur. For this reason, we take a strong stand against such expansion. | Amphibious and Beach Activities; and parallel sections under the other Alternatives). Section 3.11.2 discusses the noise impacts on wildlife from current activities and from a proposed increase in these activities. The level of noise generated by these activities is not quantifiable above current background noise, including ocean surf, highway traffic, human-generated noise from surrounding neighborhoods, and current military flight patterns over the SSTC. Wildlife in the area has likely habituated to these noise patterns and, combined with the small area of impact compared to the larger area of available habitat, any noise-generated impacts would occur on a short-term and individual basis with no expected detriment to long-term population levels.<br><br>The noise analysis in the FEIS estimated sound levels along Silver Strand from various training activities, and determined that the intensity, frequency, and duration of these events were not sufficient to have substantial effects on human health. The FEIS also evaluated the potential effects of toxic substances from expended training materials and effects on water quality.<br><br>The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. In this manner, the Navy is adding additional mitigation measures for alerting the adjacent communities regarding events which may be considered intrusive.<br><br>The EIS addressed socioeconomics and potential impacts associated with the Navy's Proposed Action. The Navy has been conducting training activities on the Silver Strand for 60 years; the areas of activity are shown in Figure 1.2. These areas will not change with implementation of the Proposed Action and as listed in Section 3.15.2.3.1,the increase of activities in these areas will not be appreciable by tourists or the local economy because the Navy is an integral part of the |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | Silver Strand. The activity increases in these areas will not have a considerable effect on the local economy and tourism industry. |
| 84. | Reiko Gregory | As a native San Diegan of over 50 years and one who has enjoyed the serenity of Silver Strand from Coronado to Imperial Beach for many years, especially as a natural habitat for many birds and other animal species, I am appalled that the Navy is requesting to expand its activities there. I call on all those in power to keep the Navy activities out of these areas. Save our natural habitat, save the Strand. We don't need more military buildup. We need to preserve our peaceful natural habitats and our beautiful environmental surroundings. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area and habitats. As indicated in Sections 3.11 and 3.12 of the FEIS, the Navy has developed and will continue active management of the biological resources of the base. The Navy has developed mitigation measures for activities that may cause an impact to the environment or surrounding area and has presented these in Chapter 5 of the FEIS. |
| 85. | Steven Gregory | As a San Diego resident for more than 30 years, I have enjoyed Silver Strand and the peace that it offers. Increasing military activity in this location would be harmful both from an environmental standpoint and aesthetic standpoint. Silver Strand is not only a resource for San Diego residents, but for tourists as well. And while the EIS does address the impact the increased military activities would have on terrestrial animals, the full impact is never certain, and the impact on aquatic flora and fauna is unknown and therefore a "risk" that should not be taken. I fully understand the need for training, but not at the expense of the environment and people. The military would be better served increasing moral, cultural, and ethical training, which would create a more enlightened military, rather than one that knows how to kill. I call on the people in charge to not increase military activity in this area. Our dwindling resources do not need to come under attack from our own military. | While the full impact of the military activities may not be entirely certain, the Navy has attempted to quantify, by using the best available science, the amount of impact that these activities would have. Sections 3.7 through 3.10 of the EIS discuss and analyze these impacts and any mitigation thereof. |
| 86. | Robert Hrodey | Having visited the Coronado area several times over the years, we always enjoy the presence of the military and their training in the area. It reminds us of where we are, how we got there and what it takes to remain free to travel about. If the folks upset with additional training of our armed forces to allow them to better perform their duties, let THEM (the protesters) take up arms and put it on the line for us. That should settle the debate! | Your comment has been noted. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 87. | Carol Humphrey | As a resident of Coronado, I am writing to express my support for the Navy exercises as I am profoundly grateful for all the military does. | Your comment has been noted. |
| 88. | John Hunter | I write because I am tired of others speaking for me. I have lived about 55 feet from the base since the summer of 2002. The base has never been a problem. The problems in the neighborhood are not related to the base. Please contact me if you wish to discuss what I feel are ethics violations regarding complaints to your expansion. Go for it! | Your comment has been noted. |
| 89. | Miriam Iosupovici | Choosing to do this in one of the most beautiful beach environments in the US, close to major population centers that need a peaceful resource, seems a poor choice. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. Additionally, the Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. |
| 90. | Miriam Iosupovici | We already have problems with pollution in this area. What will the effect be on the military if they contact illnesses during training? What will increased pollution effects be from training vessels? | The effects of the Proposed Action, including the effects of training vessels on air quality as well as ocean and bay water quality, are addressed in Section 3.3 and 3.5 of the FEIS, respectively. Because the purpose of the EIS is to address the effects of the Proposed Action on the public and the environment, rather than on itself, the effects of ocean water quality on military trainees are not addressed in the FEIS. The Navy takes the health and fitness of its personnel seriously, however, and closely monitors the conditions under which training activities are conducted. |

|---|---|---|---|
| 91. | Miriam Iosupovici | I simply don't trust that the noise levels will NOT be intolerable at the increased level proposed. I don't want to hear the echo of bombardment PERIOD. What ab the fact that we have many vets living here. Will there be increased PTSD responses to the sounds? Nothing I have read discusses this potential issue, one I am aware of as a mental health professional.<br><br>Helicopter overflight noise already impacts my environment at present levels. Increases predicted will be intrusive. We have no idea what the impact will be on birds utilizing the Tijuana Estuary, part of the Pacific Flyway, despite the EIS document's assertions. | The Proposed Action does not include bombardments. Other types of military training sounds (e.g., small arms fire) could be audible in nearby portions of Imperial Beach. While impulsive noise events clearly play a role in post-traumatic stress disorder incidents, so do a variety of other factors. Given the number of variables involved, it is not possible to describe the relationship of SSTC training activities, if any, to post-traumatic stress disorder incidents in Imperial Beach.<br><br>Helicopter overflights of Imperial Beach and the Tijuana Estuary consist of pilots transiting from NASNI to NOLF, or performing touch-and-go's at NOLF, for training activities unrelated to the SSTC training activities addressed in the FEIS. Helicopter flights in support of SSTC training activities depart from NASNI, transit over water to the north of Imperial Beach, and approach and depart from the training beaches with as little overflight of land areas as possible. |
| 92. | Miriam Iosupovici | The Pacific Flyway is under this area. Over 350 species of birds may be impacted, assertions to the contrary that they would not be. Imperial Beach has a difficult economic situation and visitation to this area due to bird life is one of the few income generating parts of our economy. Why would birdwatchers choose to come to an area where they are forced to watch birds with an incessant sound of helicopters, even assuming this wouldn't alter migration patterns (an assumption that strains credulity)<br><br>The Silver Strand plan to increase training will inevitably negatively impact the nesting and fledgling of Least Terns due to increased foot and vehicle traffic. This Least Tern project has been successful until now. Why should we believe this EIS will be enforced after it is approved? | The most important shorebird areas are avoided (salt marsh, mudflats, salt pond), and many minimization measures are implemented in compliance with Migratory Bird Treaty Act and Endangered Species Act. Salt marsh, salt pond, and mudflats are nearly completely avoided. Impact to birds is expected at low levels, but site improvements are also planned where birds can be protected. With regards to nesting terns/plovers, the Navy is required under the Endangered Species Act to implement the terms and conditions of the final Biological Opinion. Also, the Navy will be required under the Biological Opinion to re-initiate consultation with USFWS if the populations of terns or plovers at Naval Base Coronado decline below current baseline nesting levels. Please see the analysis of impacts to Migratory Birds in Section 3.12. The Navy is committed to work with the Port to fund surveys for waterfowl and shorebirds throughout San Diego Bay every 3 years. Baywide surveys follow consistent protocol and will be used to document future changes in bird abundance, diversity, and use of the Bay. Section 3.12.1.2 summarizes over 500,000 |

| | | | observations of San Diego Bay birds by species, location, abundance, diversity, and bird group. |
| 93. | Rina Kelley | On the occasion of the meeting this date on your proposed expansion of activities at your SSTC Complexes and associated EIS I want to take the opportunity to inform you about your lack of attention and dangerous disregard of your property in Imperial Bch which has created a dangerous condition for years.<br><br>Your misuse of the word "Stewardship" in your EIS to expand training activity in your SSTC may serve the Fairy Shrimp and Snowy Plover well, but your neglect for the welfare of the inhabitants of my City who have been subjected to your dangerous threatening activity for years is deplorable.<br><br>You are hereby put on notice that first, your steel Seawall outside of the Camp surf fence at the Beach has huge holes and serves no purpose except to attract children and has become a serious hazard to the safety and welfare of all of us. Its jagged rusted steel rim and bottom are hazardous and constitute a daily accident-waiting-to-happen for the numerous children who climb upon it both within and without the confines of Camp Surf. Since these children have little supervision anyway, you must take control and remediate this problem. This rusty steel nuisance has fallen in such disrepair that it has not served a purpose for at least ten years, and I fear for my own as well as the safety of others whenever I approach it to get down to the beach area. Would you have us wait another ten years for you to remediate and remove it. Hopefully not, now that you are formally on notice with Legal effect. | The Navy is now aware of your concern about condition of Camp Surf fence. This FEIS is intended to analyze the training activities occurring at SSTC and does not address the condition of preexisting structures. However, NBC Planning prepared a planning document (DD Form 1391), dated 28 May 2009, for FY 2010 Special Projects Program for repair seawall near Camp Surf |
| 94. | Rina Kelley | Your personnel--police and others entering the camp at Antenna Station (SSTC South) often speed down Carnation avenue when your personnel should instead be using Silver Strand St in mornings which goes directly to their station. Please post signs on your side of Carnation, the North side, with warnings to slow down as numerous children and people frequent that area to the corner going to and from the Beach. | Navy is responsible for traffic on their controlled land. Once personnel leave the base, they are subject to Department of Transportation regulations. Various speed and traffic control measures would be the responsibility of the City of Imperial Beach. Additionally, due to your comment and other similar comments, the Navy is considering implementing increased signage or message board requesting Navy personnel to obey all posted speed limits, keep radios turned down, etc., as personnel leave the base. |

|---|---|---|---|
| 95. | Rina Kelley | I feel like I live in a War Zone in summer when SEALS shoot guns and explode munitions within SSTC South East. Could you please put a time limit on this activity so I can sleep at night and provide a schedule of upcoming events so I can leave town. Also, your planes from NASNI fly late overhead doing exercises in violation of agreements you have made with our Congressional and Civic leaders. Please don't allow this activity to continue past 9PM and afford us a timetable so I can leave town with my animals and children. Your YMCA Camp is a nuisance, continuing to play loud music and solicit screaming and yelling well past the 9PM agreed-upon time. Please have this activity cease. (Read the Police Report on your Camp Director, Mr Thompson who assaulted my friend a Navy SEAL's wife next door when she went over to tell him to turn down the music and was 8 months pregnant and later lost her baby). I feel forced to sell my home which I must further depreciate by declaring in Real Estate papers that I live in a War Zone due to the above activity which threatens and annoys constantly in Summer months. A former Air Force Officer, I cannot begin to understand how the Navy can be allowed to perpetrate such damage on a Community when my fellow Air Force personnel would never have dared. Why don't you go to Corregador or the Phillipines where you can conduct your endless and mindless training missions. General MacArthur drove out the Japanese over there so they can't hurt you anymore- Unless you drive a Toyota. Or better still, Puerto Rico where the Air Force goes, or Haiti. In short I protest this EIS which, in the aggregate, continues to wreak more havoc on my Community. And I have no doubt that in a few years, with the perverbial Camel's Nose already in the door, you will be sending invitations to a like event. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Additionally, due to your comment and other similar comments, Navy is investigating additional means of alerting the adjacent communities regarding events which may be considered intrusive as well as posting signage and controls regarding public access to the beaches.<br><br>No fixed-wing aircraft are included in the Proposed Action. The helicopters associated with training operations at SSTC-S do not overfly Imperial Beach. The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic |

|---|---|---|---|
| | | | Environment) of the SSTC FEIS.<br><br>As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |
| 96. | Ann S. Kennedy and General Edward Baumer | I have learned that the Department of the Navy is planning on increasing the levels of training at the Silver Strand Training Center. I hope that you can provide the level of quiet enjoyment that I have experienced for the last 8 years as I am a full time resident. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. The Navy has developed mitigation plans for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS. |
| 97. | Celeste Kennedy | I am opposed to the increase in Naval Training Exercises at the Silver Strand Complex Naval Training Area. We are long time residents and homeowners in Coronado and we have witnessed the increase in traffic, noise, and pollution of this gem of a town which has the U.S. Navy as its neighbor.<br>While not all negative environmental impacts are attributable to the Navy, the fact is that many of them are, and when you combine them with the already overwhelming levels of noise, traffic, air and water pollution, it makes no sense to increase it all by ramping up Navy Training Exercises on the Strand.<br>Helicopter flights down the bay are very noisy and bothersome. The exhaust which we can see coming out of those machines is certainly unhealthy. Increasing their activity is unacceptable.<br>The gunfire we hear with the war games and training is a frightening and bothersome sound for civilians such as ourselves. Please do not increase the amount of gunfire we must hear. I imagine the amphibious craft are gross polluters of the sea as well.<br>While it is admirable that the Navy has participated in the Least Tern preservation efforts, we would like to see efforts towards preservation of clean air, water, and peace and quiet as well.<br>Coronado has grown over the years and has become densely populated with the addition of the Coronado Shores and Cays residential projects. All areas of Coronado, as well as all areas of the southern San Diego bay and coast, are affected by Naval training exercises. | The Navy strives to be a good neighbor and analyzed all training activities at SSTC with respect to applicable air and water regulations. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Please do not increase any of it, as we are already enduring way too much.<br>Perhaps consider Camp Pendleton as a spot to increase the training exercises. It provides a vast coast and inland area which affects far fewer civilian residents. | |
| 98. | Gary Klopp | As a SBC and active duty member of NSW since 2000, I feel the need to convey some of my concerns. I do sympathize with the balancing act of training our warriors economically, efficiently, and to the standard that our country and NSW warriors require and deserve. I fully understand that our countries security is at stake; however, the amount of training and location of that training must be balanced with the surrounding communities and environment.<br><br>Many studies have proven that people who live near airports have a much higher than national average of cancer due to all the exhaust and fuel that is released into the air. Under the proposed plans, helo flight hours would increase dramatically certainly affecting the air quality surrounding Imperial Beach and outlaying areas.<br><br>Camp Pendleton offers large training areas to include military air space, small and heavy weapon ranges, beach access for amphibious operations, ammunition storage, helo landing sites, and various supporting facilities and infrastructure. This area is much larger than the limited area on the strand and there is much more open acreage between San Diego and San Clemente. Although not as convenient to NAB Coronado or the Advanced Training Center, it is close and would meet the "balancing act" that I stated earlier. The impact at Camp Pendleton would be much less felt than here on the strand. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible.<br><br>Additionally, the Navy has analyzed the emissions from helicopter flights associated with training activities at SSTC in the EIS and has found the emissions do not exceed current regulatory limits |
| 99. | Gary Klopp | As a SBC and active duty member of NSW since 2000, I feel the need to convey some of my concerns. I do sympathize with the balancing act of training our warriors economically, efficiently, and to the standard that our country and NSW warriors require and rightfully deserve. I fully understand that our countries security is at stake; however, the amount of training and location of that training must be balanced with the surrounding communities and environment.<br><br>With the proposed increase of helo operations, noise pollution would increase dramatically affecting ALL citizens of Imperial Beach, especially those like myself and our family that live close to the beach and existing training areas. If the amount of helo operations and training that you are proposing already existed, then certainly we would have no right to complain, but we bought our home and have lived here since 2002. We chose to make this our home and to retire here because we like the peacefulness and small town feel of I.B. We enjoy listening to the sound of breaking waves and wildlife, not the sound of helos. If we wanted to hear flight ops all the time, we would have bought our home by the airfield. It is currently 2010 and one plane has | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. |---|---|---|---|
| | | flown directly overhead and 3 helos have passed by while I type this. I do not believe it is fair that we should have to suffer through increased noise when other training areas exist that would meet the Navy's NSW training requirements.<br><br>Camp Pendleton offers large training areas to include military air space, small and heavy weapon ranges, beach access for amphibious operations, ammunition storage, helo landing sites, and various supporting facilities and infrastructure. This area is much larger than the limited area on the strand and there is much more open acreage between San Diego and San Clemente. Although not as convenient to NAB Coronado or the Advanced Training Center, it is close and would meet the "balancing act" that I stated earlier. The impact at Camp Pendleton would be much less felt than here on the strand.<br><br>My wife and I sincerely hope that you will find alternative training sites that already exist that can handle a larger capacity of training that will not be nearly as detrimental to a small beach community such as I.B. which already faces so many challenges in these tough economic times. | alternate locations are not feasible.<br><br>No fixed-wing aircraft are included in the Proposed Action. The helicopters associated with training operations at SSTC-S do not overfly Imperial Beach. These helicopters depart from and return to NASNI. They approach the training areas from offshore, approaching and departing from the training areas over water. |
| 100. | Gary Klopp | Although Imperial Beach is an extremely unique small town beach community, we continue to struggle economically for several reasons: Our proximity to the Mexican border and Tijuana, degraded water quality due to runoff and pollution from Mexico, lack of small business infrastructure, school ratings, and past stigmas are just a few of those reasons. Even with all the challenges I.B. faces, we have a lot in our favor, and every year brings more and better change albeit slowly. If you push forward with the proposed increases of training, helo operations, and live fire, you will certainly hinder this city and the people of I.B immensely. This area, and the surrounding area just can't handle the volume of increased training that you are proposing. Property value will be affected and home ownership will decrease. It will be even harder than it already is to attract new families to our town with all the noise and disruption that will certainly be experienced if your training proposals get approved. You currently aren't conducting training in front of the Hotel Del or the area between the hotel and North Island, or even the beaches on North Island, why I.B.? Because we don't hold the clout and financial means as a community that Coronado does? Other training areas already exist that would meet the Navy's NSW training requirements. Spare I.B. | The SSTC training areas have been used by the Navy for over 60 years. Increases in training activities associated with the Proposed Action and alternatives are not expected to disrupt normal business operations or affect property values in southwestern San Diego County. The analysis presented in the EIS in Section 3.15.2.3.1 determined that regional and community employment, housing, and population growth would not be affected by the Proposed Action. Currently, training is conducted on the rocks in front of the Hotel Del Coronado as well as all training areas discussed in Chapter 2. |
| 101. | Gary Klopp | Many studies have proven that people who live near airports have a much higher than national average of cancer due to all the exhaust and fuel that is released into the air. Under the proposed plans, helo flight hours would increase dramatically certainly affecting the air quality surrounding Imperial Beach and outlaying areas. | The Navy has analyzed the emissions from helicopter flights associated with training activities at SSTC in the EIS and has found that neither the current nor future emissions exceed current regulatory limits |

|---|---|---|---|
| 102. | Gary Klopp | Again, having been a member of the NSW community since 1990 and a NSW operator since 1994, I have seen a lot. Although the Navy has taken big steps in recent times to address environmental concerns, and as a nation, we have become much more aware of our environment and how our actions affect everything around us, the amount of detrimental effects on the environment along the silver strand training areas will increase drastically. Unused ammo (blanks) get dumped over the side. Food wrappers, MRE packaging, various operating items (550 chord, line, rubber bands, night sticks, etc) all get mixed into the environment. Shell casings, links for the ammunition, fuel oil from the zodiacs, exhaust from the craft and air assets, batteries, etc. Even with the best of intentions, all this is unavoidable. Men get wet, cold, hungry, tired, mentally and physically exhausted, and everything always goes wrong at the worst possible time. Believe me, I know from experience! The precious beaches that encompass and surround these training sites provide endangered habitat and wildlife refuge and the ability to recreate. These species of animals and plants struggle for survival everyday in a world that continues to build and shrink their natural habitat. The noise pollution, air pollution, water pollution, and human pollution that is simply unavoidable during the types of amphibious operations that will be conducted with alarming frequency will only continue to make the environmental concerns bigger. Along with all of these issues, is the simple fact that people live here to enjoy the beach, wildlife, and ocean. Increasing the training that you are proposing does nothing to benefit anyone or anything in I.B or the Silver Strand. Please use training areas that already exist that can better support the large volume of training that you are proposing. | Most of the training materials used at SSTC are non-hazardous, or are rendered non-hazardous when they function as designed (e.g., blanks). Trainees collect and remove expended materials to the extent practicable at the conclusion of their training events. Very rarely, energetic items may not function as designed, resulting in their temporary presence until promptly retrieved by Navy personnel. The incidence rate of expended items that would pose a risk to the public is so low that a public education and outreach program is not warranted. The species management explained in this EIS establish habitat areas within the training areas to protect species. |
| 103. | James M. Knox | 3.1.2.3.2 Beach Activities<br>How many more activities and restrictions will take place over and above what is done now at SSTC-S? | Information on activities and restrictions is listed in Section 2.2.3 as well as in further detail in Section 3.1.2.3.2. Listing the exact number of activities that will take place at SSTC-S is not possible given that many activities could also occur at SSTC-N and NASNI. An additional sentence has been added to 3.1.2.3.2 to indicate as such. Tables 2-1, 2-2, and 2-3 in Section 2 of the FEIS list the training activities and areas where training activities may be scheduled. |
| 104. | James M. Knox | 3.5.1.4.2 &3.5.1.5.2 Pacific Ocean<br>Contaminants<br>Your report states that most of the contamination of the area is cause by sewage from the river mouth and/or the South Bay Ocean outfall. Storm water runoff has a relatively minor influence on local water quality.<br>Table 3.5-5<br>Will increased training at SSTC-S cause more contaminates to reach the ocean by storm water runoff. Rain events occur mainly in the winter when ocean currents in the area are north to south. Were seasonal changes in ocean water movement taken into account when the findings on contaminants were formulated?<br><br>3.5.1.5.2 Pacific Ocean<br>Silver Strand State Beach does have day and overnight use numbers that were not included in this report. I would question the conclusion that the information presented is not representative | The potential for increased concentrations of pollutants in waters along the Silver Strand under the Proposed Action is negligible. Seasonal changes in littoral currents along the Silver Strand may affect the dispersal pattern of pollutants from the Tijuana River or from water treatment plant outfalls. Section 3.5.1.4 of the FEIS indicates that contaminants entering the ocean during storm events are generally conveyed via impervious surfaces. For contamination to occur, the contaminants must be present at the surface during a precipitation event, and the surface must be relatively impervious. Residues from the use of flares and smoke grenades constitute the majority of contaminants from training |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | of the use of the municipal beach in Coronado. The report, in other sections, extrapolated information that was used for conclusions without complete numbers. Navy recreational areas (Gator Beach and Fiddler's Cove) should not be included as recreational opportunities. They have restricted access and are not open to the general public. | at SSTC. These materials are widely dispersed over the training areas at very low concentrations. Wind erosion of sand and loose surface soils likely results in further dispersal of these materials. When precipitation occurs, most of the rainfall - along with any traces of these residues - infiltrates the soil or sand, and does not run off into the ocean.<br><br>The EIS states that the use numbers for visitors to SSSB are not representative of the actual use of the ocean waters adjoining the beach. In other words, there is no known correlation between the number of visitors and: (a) the number of individuals that enter the water, (b) how far from the beach those water users travel, (c) the time those individuals spend in the water, and (d) the times of day this use occurs.<br><br>W/re recreational use of SSSB, this issue has been addressed in 3.1 Land Use, and any implications for Pacific Ocean water use will be carried over into the 3.5 Water Resources section. |
| 105. | James M. Knox | 3.6.1.5.2 & 3.6.1.5.3<br>Will LCACS be used on both Purple 1 and Purple 2?<br><br>3.6.1.6<br>The Navy should also notify residents. The sound of M16's and 50's along with concussion grenades without notice very late at night or early in the morning can lead to apprehension if a person does not know that training is taking place. Explosions and small arms fire are easily detectable from my home, and loud enough to wake me up.<br><br>Table 3.6-5 Helicopter Pass-by Sound<br>It has been my experience that the Helicopters used during training are, during many of the evolutions, closer then stated in the table.<br><br>3.6.2.3.1 Traffic on ST-75 (local roads)<br>Silver Strand Blvd in Imperial Beach leads to the main gate of the South Complex. How much will traffic increase on this residential street? How will this increase in traffic affect the acoustical environment of this residential neighborhood?<br><br>3.6.2.3.2<br>New training activities will increase helicopter use. (TRAP) (N9, Table 2-2) Disagree with conclusion that noise level will not change. Each flight is a separate event, with individual | LCACs can train on Purple 1 and 2, but are typically trained on Green, Red and/or Blue.<br><br>The Navy is currently discussing alternate means of notification than those already described currently in Section 3.6.1.6.<br><br>Baseline traffic volumes on Silver Strand Blvd. are discussed in Section 3.14.2.2.1 and increases in traffic volumes on Silver Strand Blvd. under Alternative 1 are discussed in Section 3.14.2.3.1. The Proposed Action would increase military training traffic along Silver Strand at the entrance to SSTC-S from about 147 to about 249 round trips per day, or by about 102 round trips. Residents would notice a 69-percent increase in vehicle pass-by noise. As discussed in Section 3.6 of the Final EIS, however, the additional vehicles would increase traffic noise along the street by less than three decibels, which is a barely noticeable change in the average hourly sound |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | consequences regarding sound. Weather, temperature, wind direction, and pilot skill all contribute to each event. Suggesting that the helicopters will always be in their assigned flight lanes without data is an assumption. The helicopters get out of their flight lanes many times (personal observation). Training evolutions may have variations that are not foreseen. This fact needs to be taken into consideration when making conclusions. More use equals more sound in the adjacent residential areas. Citing the ambient sound of the surf supplies no useful data without knowing; the size of the surf, the direction of the swell, the direction and strength of the wind, and the tidal level. None of this information is contained in the table. | level.<br><br>The reference to the sound of the surf masking the sound from distant training events has been deleted from the Final EIS. With regard to helicopter sound, the analysis indicates that, while the number of helicopter sorties would increase substantially under Alternatives 1 and 2, the increased frequency of short-term sound exposures from increased helicopter pass-bys would not be sufficient to noticeably change the hourly average sound level at any one off-installation location. Because of the logarithmic nature of sound; a doubling of sound energy results in only a three-decibel increase, which under typical conditions is barely discernable. The analysis of helicopter sound is based upon broadly defined flight paths, consistent with a normal degree of variability introduced by pilot discretion, weather, time of day, and safety concerns such as other aircraft.<br><br>The typical flight pattern in support of SSTC-S inland training usually consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean. |
| 106. | James M. Knox | 3.6.2.3.4 Amphibious Training<br>Increase from 10,000 to 13,800 LCAC 8 to 40 (increase of 5 times current) I must disagree with the conclusion. While the average sound during each evolution may not increase the amount of times of discomfort will increase by a factor of 5. (40 instances verses 5 instances). Each time an LCAC lands is an individual event with individual consequences regarding sound Depending on wind conditions I can easily hear the LCACs when they are used on the purple beaches at the north end of the South complex.<br><br>3.6.2.3.5 Munitions | LCAC landings associated with the Craft Landing Zone would remain the same under Alternatives 1 and 2 as under the No Action Alternative (4 per year). However, LCAC landings associated with Amphibious Raid activities would increase from 4 per year to 36 per year. Thus, overall, LCAC landings would increase from 8 per year to 40 per year. Because these activities would be distributed over time and likely occur at different locations along the beach, the increase in LCAC sound at any one receptor would not increase proportionately. |

<tr><th>#</th><th>Name or Organization</th><th>Comment</th><th>Response</th></tr>
<tr><td></td><td></td><td>Sound generating activities will increase by 48%. How much of this 48% will be at the South complex and at what times of the day or night?<br><br>3.6.2.3.7 Summary Alt 1<br>Finding of no adverse effects. The last paragraph states the sound levels would increase during all days and hours of the week with no notice to residents. I would disagree with the conclusion of no adverse effects. Residential areas will be affected.<br><br>3.6.4 Table<br>Why were no residents of Calla or Citrus Avenues interviewed?<br><br>Table 3.6-11 Summary of Effects<br>Mitigation: Please add notifies residents and local emergency personnel.</td><td>Additionally, the audibility (ability to hear) of an event does not equate with discomfort.<br><br>See response to comment #1 regarding proposed increases in sound-generating activities. The distribution of activities between day and night is variable, but most training activities would occur during daylight hours on weekdays.<br><br>Last paragraph does not conclude that there would be no adverse impacts nor does it indicate that there would be "no notice to residents". The paragraph simply states that acoustic sources will generate noticeable noise on weekdays and infrequently at night or on weekends.<br><br>Interviews were only done near locations where sound level measurements were taken for correlation purposes.<br><br>The Navy is currently discussing alternate means of notification than those already described currently in Section 3.6.1.6. This table has not been modified.</td></tr>
<tr><td>107.</td><td>James M. Knox</td><td>3.14.1.4.2 Palm Avenue & 3.14.1.4.3<br>The description is wrong. To continue West on Palm after the four way stop at 3rd street you must be in the left hand lane. The right hand lane on Palm is right turn only. This causes large backups at times at the four way stop and also makes it very hard to turn left onto Palm from Silver Strand Blvd. Palm Avenue has been restriped for two lanes West of Third street until Seacoast Drive. Rainbow Drive is striped for two lanes. What counting devices were used and when was traffic counted by SANDAG?<br><br>3.14.1.4.4<br>The entrance to Silver Strand Blvd. from Palm Avenue has changed in the last year. It is now a sharp right hand turn to a narrow road that slowly winds left and widens. Why was no study to measure ADT done by the Navy?<br><br>3.14.1.5.2 SSTC-S<br>The Camp Surf entrance is on the West side of Silver Strand Blvd, half a block from the entrance gate to the Training Complex.<br><br>3.14.2.2.2 Ground Transportation<br>Last paragraph: No data on Silver Strand Blvd. to support conclusion.<br><br>3.14.2.3.1<br>249 trip in means 249 trips out for a total of almost 500. This is a significant increase in traffic</td><td>The ADT of Silver Strand was taken from the County of San Diego Department of Public Works, 1999. Public Road Standards. Adopted July 14, 1999. This is a public road and the ADT was calculated for all traffic, which would include any military traffic. FEIS used these ADT amounts to determine the contribution to overall traffic on public roads from military activities. In lieu of funding an additional ADT study, this was assumed to be an appropriate method for determining military contribution to overall traffic.<br><br>As previously discussed, traffic volumes were not available for Silver Strand Blvd., the roadway that provides access into SSTC-S. However, based on the County of San Diego Public Road Standards, typical roadway capacity for a residential street operating at a LOS C is 1,500. The assumption is that without an ADT, the roadway is operating at this typical capacity. Section 3.14.2.2.1 states that the current level of trips associated with military activities is 147 into SSTC-S. As stated in Section 3.14.2.3.1, the increase in ADT from the No</td></tr>

| 109. | N.J. Kuebler | I would encourage the EIS to do a more thorough study of the traffic impact on the Silver Strand/Hwy. 75. I read the interview Delphine Lee did with KPBS in which she commented that current traffic is 1% of the throughput there.<br>My address is a "rim" home in the Coronado Cays residential area. Weekdays, I can tell what time it is from the volume/noise of traffic, in spite of double paned windows and two useless "sound walls" along the perimeter of the complex here. | The Navy has reviewed applicable traffic studies and has presented their results in the respective section of the EIS. While there is an abundance of traffic along the Silver Strand / Highway 75, it should be noted that the statement being referenced only accounts for traffic that is associated with the training activities at SSTC. The impact of that traffic (only associated with the SSTC training activities) relative to the overall traffic on area roads is presented in the Section 3.14 of the EIS as well as the cumulative section of the EIS. Currently, intersections and roadways within the Region of Influence typically experience an acceptable LOS. Although the intersections at Gates 1 and 2 experience unacceptable LOS, traffic related to the Proposed Action represents less than 1 percent of the morning volume and less than 2 percent of the evening traffic at these intersections. |
| 110. | N.J. Kuebler | I believe the residents of Coronado, Imperial Beach and the Silver Strand areas could use more information published or mailed in regard to this EIS study. I ran across terms in online pages regarding the study such as "elevated causeway system", "fluid transfer system", "new platforms and equipment", and "new training". Without knowing what those are, how can we consider the impact they might have?<br>The full pdf document would not download for me, and there are many who cannot access it at all or make it to the public meetings. I hope you will use your resources to make the information we need more available. | The terms in question are defined in full in Section 2 of the EIS as well as Appendix B. The potential impacts of training activities using these platforms or equipment is analyzed in respective sections of the EIS, which is also available at both the Coronado and the Imperial Beach public libraries. |
| 111. | Stephen LaPalme | Your comment dropdown list should allow you to comment on several issues since many are interconnected. I am VERY MUCH AGAINST the military increasing it's activities and foot print in the silver strand area. If anything they should be considering downsizing and eventually closing the bases since they are incompatible with domestic and social harmony. Any considered activities should be relocated to the Camp Pendleton base due to it's substantial land area and distance from populated locations. Military drones and the removal of personnel from Afghanistan and Iraq make this increase in activity unwarranted and unnecessary. As general and president Dwight D Eisenhower said, "beware the military industrial complex". Increased military activities = increased military contracts= a negative draw on society and the economy. | The Navy strives to be a good neighbor and analyzed all training activities at SSTC with respect to applicable air and water regulation. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. Navy and Marine Corps |

| 114. | Becki Lock | While we understand the need to train and perhaps to increase training, many of us do not feel as if the area can sustain the levels of ramped up training you are requesting. This is not a "not in my backyard" issue. This request for increased activity is just plain too much in a relatively small space. There has to be more alternatives and/or a creative way for the Navy to get the training they require (share with Pendleton?) without causing so much potential harm. Quality of life will be severely impacted. Too much noise (often late at night) will cause much disruption to the community which supports you. Beyond that, most are very concerned about the environmental impact. The stretch of beach is very narrow and the many protected species of bird are at risk. Further, the multitude of requested beach landings, more concussion type grenades, more land pollution, and more fuel polluting the water, means there is obvious potential to inflict a lot of damage to the sea life. Please know that we as a community want to continue to support the military. However, the request to increase training to the levels stated is not supported. Many won't state their objection out of fear and feelings of helplessness. So, please consider the community (as we do pay our taxes to support you) when determining what is appropriate. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |

|---|---|---|---|
| 115. | William and Erna Lockhart | We attended the presentation in Imperial Beach, February 23. Unfortunately, we had to leave before all the comments had been heard, but we were encouraged to voice our concerns, and here are ours:<br>Concerns: Traffic on Silver Strand Blvd. Leading into the radio station<br>Noise factor due to increase in the sorties<br>Number of exercises<br>Concern for children's safety at Camp Surf.<br>Height of platforms etc. to be built<br>Effect on Property values<br>We have lived in North IB for 20 years - just a few houses from the gate leading to the radio station. We are enjoying an unobstructed view from our balcony from Point Lorna to Coronado to Silver Strand, unbelievable sunsets, sound of the surf peace and tranquility, and we like it that way. Even Camp Surf took care not to disturb the views when they expanded.<br>We understand the need for training to stay alert. Believe us, we are all for the military (my husband is a WWII D-Day 13 veteran with the RAF.) But having the peace in this, as yet undiscovered, quiet little town suddenly being disturbed by that huge increase in sorties (up to 2200), firearms (from 150 to 1400) and training exercises to 5,343 - and in addition the mine-fields, vernal pools, and disruption of the life of endangered species - is a lot to ask of us.<br>5,343 exercises - There are 365 day a year! So how many a day, month? Time of day? And how many here at beaches white and purple..? Will the helicopters take off from and land close to North end of IB?-<br>Is it not possible to incorporate the training with the all the area you have now and have had for 60 years? Yes, it is nice for our nice young military men to be able to go home to their own beds but what about us, the residents, who will have our nights and sleep disrupted? And the building of "platforms" - will they obstruct the view?<br>Children at Camp Surf - Concern for their safety with possible discharged bullet casings, mine debris? not to mention the air pollution from the helicopters. Effect on property value, with the increased noise and disturbances. Who would want to buy (now) prized beach properties when they will be having the noise of helicopters and machine guns to contend with?<br>Would suggest that in addition to notifying the fire station and police station of upcoming exercises, why not place a notice in our local paper, The Imperial Beach Eagle with a date ( of course, if that is not a secret) so we will not be concerned when we hear the machine gun fires.<br>Last but not least, the speed of cars must be controlled on Silver Strand Blvd. There are children, not only in Camp Surf, animals, bicyclist and elderly slow walking people crossing the street.<br>We would like to see a 25 miles zone and a speed bump on Silver Strand Blvd.<br>You asked for comments, - and we are giving you ours. Not that we expect to get answers to our concerns directly, but perhaps through some of the additional meetings you no doubt will be conducting some of them will be addressed. We hope so. Thank you for your time. | The Navy appreciates your concern and has analyzed traffic (Section 3.14; Transportation and Circulation), noise (Section 3.6; Acoustics), number of exercises (Chapter 2; tempo of training), children's safety (3.15; Protection of Children), platforms (Section 2.3.4; Introductions of platforms and equipment), and property values (Section 3.15; Socioeconomics within the SSTC EIS.<br><br>Navy is responsible for traffic on its controlled land. Once personnel leave the base, they are subject to Department of Transportation regulations. Various speed and traffic control measures would be the responsibility of the City of Imperial Beach. Please note that due to this and other similar yours and others comments, the Navy is considering implementing increased signage or message board requesting Navy personnel to obey all posted speed limits, keep radios turned down, etc., as personnel leave the base (similar to what is done on NASNI, Naval Base Coronado, and Naval Amphibious Base).<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. | | | | residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC FEIS.<br><br>Air pollution and noise at Camp Surf are addressed in the EIS within Section 3.1; Air Quality and Section 3.6; Acoustics.<br><br>The health and safety of the public, in general, relative to the existing and proposed training activities at SSTC, are addressed in Section 3.16, Public Health and Safety. No substantial adverse effects on public health or safety from activities at SSTC-S were identified. The anticipated effects on residents of Camp Surf would be as described for the general public. The potential for mine debris to wash ashore exists, but such an event is very unlikely given the Navy's standard operating procedures. The potential for blank or simunition cartridges expended on land during training to migrate onto Camp Surf from SSTC-S is negligible.<br><br>All increases in operation tempo are discussed in Chapter 2. To address comment regarding "building of platforms”, please refer to Section 2.3.4 of the EIS. Under military terms, a 'platform' refers to new Navy vessels, aircraft, and vehicles and not physical raised areas or stages. The Navy also refers to 'causeway platforms' in the EIS when discussing Elevated Causeway Systems and Roll-on Roll-off Facilities activities in Table 2-1. These platforms will not be obstructing any viewsheds.<br><br>With regard to property values, the Navy has analyzed the effect of Navy training on the area within Section 3.15; Socioeconomics. Based on the analysis within Section 3.15, existing regional population and associated housing impacts, employment rates, and regional economy would remain unchanged. |

|---|---|---|---|
| | | | As listed in NBC INST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website. |
| 116. | Donna MacKersie | I have been a homeowner in/resident of Imperial Beach since 1993, and I am very concerned about the Navy developing the Silver Strand further for military training, killing more flora and fauna in that delicate area, and creating additional noise in Imperial Beach, which is already inundated by helicopter noise. I am aware that some people are impervious to noise, but I am not one of them. Since I've lived in I.B., I've been awakened MANY nights by loud helicopters circling my area, typically around 11-12pm, either Border Patrol or Sheriff agents, searching for illegals or whatever they're doing. Additionally, since, after 40 years as a legal secretary, I have been largely unemployed for the past year and a half and have been spending a lot of time at home during the weekdays, there is a CONSTANT roar of airplane engines that we must suffer through during the daytime hours. I understand that there is value in training near the shoreline, but is it not possible to create training locations in areas where we residents and the flora and fauna of the area will not be negatively affected? What about the vast areas in Otay Mesa -- why not train out there? I feel the same about this as I do about the idiocy of building ANOTHER stadium in downtown San Diego, which is already heavily overcrowded, traffic is impossible, etc., etc. -- why don't they build a stadium in Otay Mesa? It's close to San Diego, and there's a huge amount of space out there, and they wouldn't be wasting oceanfront space and creating additional traffic and noise problems for local residents! I cannot even imagine what the traffic would be like if they built a stadium in the National City beach area as was being considered! I-5 is a nightmare as it is during rush hours -- are these developers really that clueless, or are they only looking for increased income? The attorney promoting building the Chargers stadium says that events there won't conflict with the rush hour - - who does he think he's fooling?<br><br>Please -- train elsewhere! The Olympic Training Center built in the east where there was space -- certainly the Navy can do likewise. I do not want to have to sell my home and move elsewhere because the noise has become intolerable. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible.<br><br>Additionally, the Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. The Navy has developed mitigation measures for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS, most notably Sections 3.11 and Section 3.12, which describe various mitigation for flora and fauna. Helicopter overflights of Imperial Beach consist of pilots transiting from NASNI to NOLF, or performing touch-and-go's at NOLF, for training activities unrelated to the SSTC training activities addressed in the FEIS. Helicopter flights in support of SSTC training activities depart from NASNI, transit over water to the north of Imperial Beach, and approach and |

|---|---|---|---|
| | | | depart from the training beaches with as little overflight of land areas as possible |
| 117. | Zeke Mazur | Since the military requires exclusive use of the beach at certain times; I would like the Union Tribune, on its weather page, to list when the beach is closed. | Due to the necessary flexibility inherent in scheduling training activities, it would be extremely difficult to publish notifications in the local newspapers in a timely manner. However, based on your comments and those of others, the Navy is investigating various methods by which to notify the public. |
| 118. | Patricia W. McCoy | First, let me state that I do understand the U.S. Navy's need for combat training readiness to accomplish their mission in various arenas around the globe. However, I do believe there are some items that could be changed enough to make life bearable for people in Imperial Beach, particularly those of us who reside in the northern portions of the city.<br>We have been good neighbors to the Navy in all the years this base has been operational. Now we are asking you for a small quid pro quo. Since some of the noise related exercises are really not mitigable we would request that you consider an earlier cessation of noise causing events, perhaps to 10:00 P.M. This seems eminently reasonable on a work night. The neighborhoods and your soldiers could be home and in bed at a reasonable hour and would conform to demands as outlined in the DEIS that military personnel not be deployed out of country to do this type of training. Many of us have to be up early for work and some of these workers are employed at North Island.<br>We had a dog park opened by the Navy under Captain Gianni (now Admiral) for our use but it was taken away and closed. We would ask that this facility be reopened for use when it is inadvisable to use the beach. This way neighbors can exercise their companion animals and have a pleasant place to go.<br>While you are not expanding the footprint of operations there is concern over the increased intensity of those exercises. The Navy has done a good job with their stewardship of the endangered California Least Tern and the Western Snowy Plover. There is concern for continued viability of these birds due to their habits of beach foraging and nesting, a behavior honed after many thousands of years of developmental evolution. These traits are not changed overnight just because we have a use for their habitat. Protection of vernal pools is essential for the survival of button celery and fairy shrimp. These species may seem unimportant and inconsequential in the scheme of things but I would emphasize that they are indicators of the state of our living environment. The environment is the underpinning of life for all living things including civilian and military alike and the mission of the Navy is to protect not only the | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. The Navy has developed mitigation for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS.<br><br>The Navy considered time and location of training so as to minimize disturbances to the local community and does its best to conduct noise-producing activities during the day. However, to train in real-world scenarios that may occur overseas, Navy personnel must train at night. Personnel need to train in these dark, late night conditions to ensure they are prepared for real-world operations.<br><br>The area referred to as a Dog Park has not been formally established through a formal real estate agreement in accordance with Navy policy. The Navy currently has identified this area as needed for training and is not available for public use.<br><br>The Navy will be completing a Vernal Pool Management and |

|---|---|---|---|
| | | civilian population of this country but also the land that sustains us.<br>As you state in the DEIS, this area is unique and as far as I am concerned it is uniquely beautiful and irreplaceable in its current form. I urge you to go the extra mile to protect the nation's endangered species and avoid a “take" of any of them.<br>As a former California Coastal Commissioner I have seen well meaning uses degrade and destroy entire ecosystems on which we all rely.<br>The comment period is all too short for a document ten years in the making. It would be greatly appreciated if the comment period could be extended at least another 45 days to accommodate those who would still like to respond to this eight hundred plus page document.<br>In conclusion I would like to remind you of the inconsistency of water quality due to sewage contamination particularly in the winter months. I do not like the idea of your young service people working in water whose quality leaves, at times, a lot to be desired. I would suggest you implement a water testing component into the document as part of your operations.<br>I noticed a deficiency in the document where there is no mention of climate change and sea level rise. I realize this is a NEPA document and it may not cover this topic. I would like to see realistic measures taken to cope with sea level rise. How do you propose to deal with these climate change issues in order to protect our investments at this site? | Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. If impacts are more substantial than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. The Plan will include focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. No button celery has been documented in any of these pools during past surveys, only San Diego fairy shrimp.<br><br>The Navy appreciates the public involvement in the NEPA process. In response to requests by the cities of Imperial Beach and Coronado and citizens, the public and agency comment period for the FEIS was extended to March 30th.<br><br>Ocean and bay water quality, including the effects of discharges of treated sewage and storm water runoff, are addressed in Section 3.5 of the FEIS. Because the purpose of the EIS is to address the effects of the Proposed Action on the public and the environment, rather than on itself, the effects of ocean water quality on military trainees are not addressed in the FEIS. The Navy takes the health and fitness of its personnel seriously, however, and closely monitors the conditions under which training activities are conducted.<br><br>Climate change is addressed in Section 4 of the FEIS as a cumulative impact on the public and the environment to which the Proposed Action would make an insignificant contribution. Because the purpose of the EIS is to address the effects of the Proposed Action on the public and the environment, rather than on itself, the effects of sea level rise on the Proposed |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | Action are not addressed in the FEIS. While sea level rise was not specifically addressed, the proposed training activities do not require any fixed facilities that would require protection or relocation. The primary effect of sea level rise on Navy training activities on SSTC would be a decrease in the width of the training beaches. Ground access to the beaches and local weather conditions might also be affected. |
| 119. | Deb McKay | I find access to the draft EIS problematic. While the electronic version is available in pdf, it is an extremely large file that takes time to download. Accessibility to the document would be enhanced if it were available in smaller, downloadable files. An excellent example of this is the format used by the Southern California Range Complex EIS website whereby you can search for information by chapter or section. I can dig down to the areas that interest or affect me and not have to wade through the entire, voluminous document. | Your comment has been noted |
| 120. | M. Dan McKirnan | The Recovery Plan for least terns is old and based on outdated information so there is no valid way to conclude that the additional take by alternatives 1 and 2 will not further jeopardize the species. Can the EIS provide a Species Viability Analysis that reflects current knowledge and cumulative impacts? Alternatives 1 and 2 describe the potential taking of the endangered least tern and snowy plover with the expanded military activity. I understand the law that allows incidental taking of birds during military readiness activity. What specific actions will you take in adaptive management if it is determined that excessive taking of least terns and snowy plovers is occuring? Military training in Alternatives 1 and 2 will produce significant noise impacts that could flush significant numbers of migratory birds in the Bay and along the Strand. As you referenced, this impact is more detrimental to birds naive to noise created by military activity. What adaptive management strategies will you use to study noise effects on migratory birds and make appropriate adjustments to protect birds during the migratory season? I applaud the Navy for their past efforts to protect the endangered least tern and snowy plover. However, I am not convinced that the proposed Alternatives 1 and 2 will adequate protect these species. | The USFWS is responsible for such a viability assessment, while the Navy is responsible for management and contributions to least tern recovery, which are listed in detail in Section 3.12 of the FEIS.<br>The take estimates are worst case scenario, and in actuality the birds tend to redistribute to safer areas. The Navy is proposing to develop and implement a long-term site enhancement plan for SSTC-N, including both the oceanside and the bayside beaches. The long-term site enhancement plan is estimated to more realistically mitigate for an estimated 360 nests annually. This site enhancement plan will work to control and where possible remove invasive non-native vegetation on the beaches, and if appropriate, replace it with native vegetation. SSTC-N oceanside training lanes currently contain over 16 acres of overgrown invasive vegetation (Table 3.12-13), mostly towards the back one third of the beach. While this additional depth of beach is needed for several reasons, including providing separation from the highway, most training has a minimal footprint on this area. Training is most heavily concentrated in areas closest to the tide line. Removal or replacement of invasive overgrown vegetation in the back beach area will open these safer areas up to nesting activity. |

|---|---|---|---|
| | | | Additionally, the nature and level of expected take has been addressed in a Biological Assessment and the Navy has completed consultation with the USFWS and a Biological Opinion was signed July 7, 2010, which concluded that with mitigation measures in place, training activities associated with the Proposed Action would not jeopardize the continued existence of Endangered species Act -listed species. |
| 121. | M. Dan McKirnan | I am not convinced that the proposed increased military training activity in SSTC-S in Alternatives 1 and 2 does not raise the question of environmental justice for the City of Imperial Beach. As you indicated, this community has more poverty, 16.8% of persons living below the poverty line compared to 7.6% for the City of Coronado and 11.3% for San Diego County. Imperial Beach also has a higher % of Hispanics (43.9%) compared to Coronado (13.1%) and the County (29.9%). This community will experience more noise related to the military training activity with Alternatives 1 and 2. | The analysis in the FEIS indicated that both communities will be affected by the increase of military training activities. The discussion in Section 3.15 of the EIS states that this is not disproportional towards one community or the other. |
| 122. | M. Dan McKirnan | 4.3.3.1 Global Climate Change Table 4-3: Greenhouse Gas Emissions describes a doubling of emissions in tons/year with either Alternatives 1 and 2. The Secretary of the Navy has established several goals for the Navy's consumptions of fossil fuels with hybrid vehicles by 2015 and alternative energy sources including wind and solar by 2020. Alternative 1 and 2 will increase CO2 emissions by 60,554 tons/year. Why can't this EIS describe specific actions at SSTC, NASNI and NAB to offer at least 50% offsets in alternative and renewable energy for Alternatives 1 and 2? | As stated in Table 4-3, these data show the increase in annual $CO_2$-equivalent ($CO_2e$) emissions estimated for the Preferred Alternative (60,554 metric tons) and the $CO_2e$ emissions generated from all sources in the U.S. in 2006 (7,054 million metric tons) (USEPA 2009). Therefore, $CO_2e$ emissions associated with the preferred alternative would amount to approximately 0.00086 percent of the total $CO_2e$ emissions generated by the U.S. Under any of the alternatives, cumulative impacts to global climate change would be minimal.<br><br>The Navy does not have offsets for the Proposed Action however, the Navy has been at the forefront of nonrenewable fuel reduction. The Navy has decreased energy usage on base through mandatory requirements; activities on the Silver Strand have been scheduled to reduce the numbers of vehicles transporting troops to activity areas to reduce driving time. Navy Secretary Ray Mabus stated that 50 percent of the Navy's energy will come from alternative resources by the year 2020. In the past year, the Navy has invested more than $100 million in renewable energy projects throughout the Southwest. For example, the Navy is developing are |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | geothermal energy projects. These and other initiatives have lowered the Navy's overall energy use by almost 18 percent over the past six years, and it is on track to achieve a 30 percent reduction by 2015. |
| 123. | M. Dan McKirnan | 6.2 Relationship between short-term and long-term productivity. The EIS describes military activities in Alternatives 1 and 2 as long-term. Does this mean these areas will be needed for decades? What if our need for military readiness declines in 5 or 10 years and peace breaks out? What adaptive management procedures will be undertaken to restore lost habitat and species impacted by this military activity? I endorse the No Action alternative and urge the Navy to reconsider the use of the vast Camp Pendleton site for this surge period of training. | The increase in training activities is not the only driver for the Navy's Proposed Action but also the changes in types of training and platforms, as well as a need for diversity in training. If there is a decrease in training, many of the conditions will tend towards current use because of the natural tendency of training towards training lanes 1-7 and 11-14 (vs. 8-10) as well as a natural tendency towards the northern developed area of SSTC-S (vs. the undeveloped southern areas of SSTC-S). Implementation of the Proposed Action would occur over a five year period. Training activities will be evaluated in five years (2015) for the accuracy of meeting 100 percent of the training requirements as analyzed in the EIS. If new mission requirements are necessary to support training needs, supplemental NEPA documentation may be required.<br><br>Management practices as well as measures to mitigate potential impacts to the SSTC environment have been presented in the individual resource sections of the EIS. Possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training. |

|---|---|---|---|
| 124. | Tracy McPherson | I simply want to say that the city Councils of Imperial Beach ( the no growth/no change/no communication council) and Coronado City Council (the now yuppified group that has forgotten that the U.S. Navy has supported them for decades) need to get their collective heads out of the sand or wherever they are and get out of the way. You have a job to do, train these people and help keep America America. Go Navy. I am in the flight path of the helicopters and I do hear the gunfire occasionally. I am right across S75 from the old ComCenter.<br>I am reminded every time I hear this or the jets from North Island, those are our planes and guns, the voices I sometimes hear are American. Thank You God I am safe today and tonight. I am a civilian, my former/late husband flew Willie Victors out of North Island. God Bless all of you, do your job as it needs to be done. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. In light of this proximity, the Navy has developed mitigation for activities that may cause an impact to the environment or surrounding area and has presented these in the EIS. Mitigation measures and management practices are discussed within each resource section and within Chapter 5; Mitigation. |
| 125. | Robert Miller | Growing up in San Diego just before and during the Second World War and living in San Diego, Coronado and Imperial Beach allows for a perspective on this ribbon of sand known as the Silver Strand. I lived in the Coronado Shores for over ten years and looked out on the Strand many times each day. Being in Imperial Beach for the past fifteen years I have been up and down the Strand countless times, mostly driving, but occasionally on foot.<br><br>This site is world class - sun, warmth, light, open space, mild climate, ocean breezes, ocean, beautiful beaches, harbor, blue skies, aquatic activities - you name it. Housing, lodging and recreational facilities and military activities existing alongside habitat preservation and restoration makes for a unique combination that has been developed over the decades and cannot be found anywhere else.<br><br>However, walking from North Island all the way to Camp Surf in Imperial Beach it is obvious that this narrow spit of sand is past the saturation point and cannot tolerate more human activity without there being a wholesale change of character. This area is overwhelmed by traffic, military, civilian and recreational activities and plainly, to me, has passed the tipping point. | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |
| 126. | Ronald and Nancy Mires | While everyone should be concerned about all the items on the subject list, we also should be aware that the Navy has always been a good neighbor in Coronado and tries it's best not to disrupt people's lives or the habitat more than is absolutely necessary. Coronado is a Navy town and we should be happy and proud the Navy is so prominent in our community. Some citizens may be inconvenienced by heavy traffic for a few hours each day and there may be some impact on the beaches or the birds, but it's a small price to pay for the freedom we enjoy from having a highly trained military force. We're in two wars at the moment and there is a need to train more troops..so we all need to let the Navy get on with their hard work. I know many of our fine training operation 100%. | Your comment has been noted. |
| 127. | Roland Moritz | As a resident in the Coronado Cays, and a retired USNR officer previously stationed on a DDR in San Diego in 1953. My new bride and I rented in Coronado during that period and decided at that time that Coronado would be our eventual retirement location. Since 1997 we have been fortunate to be living that dream. The news of the Navy's plans to impact our paradise in such a huge way comes as a great shock and disappointment to us. We have always been happy with the thoughtful and considerate presence of the US Navy in our beautiful community of | The Navy recognizes its proximity to surrounding communities and has attempted to structure its training activities to achieve operational readiness while minimizing any potential impact to the surrounding area. Due to a number of factors (training area availability, environmental constraints, |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Coronado. I must point out, however, that the aircraft passing overhead on their landing approach to North Island Naval Air Station does result in noticeable pollution in the air we breathe as well as the layer of fuel and exhaust deposited on our community as the aircraft pass overhead. This, when multiplied as a result of the proposed large increase in air traffic over our area will certainly result in considerably aggravated detrimental healh impact to our citizens. And, as Coronado and the Coronado Cays populations are made up of many retirees, the health impact would undoubtedly be even greater. And, of course, the added noise pollution must not be overlooked. With regard to the EIR, I would respectfully request that my concerns be received with consideration and the good Navy neighbor policy which has been appreciated over the years. Let me conclude by suggesting that a location for such a large amount of air traffic should take place in largly unpopulated areas such as the Marine Base at Camp Pendleton, and other such underpopulated areas. Sincerely, Roland Moritz | proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |
| 128. | Omar Nicieza | I am 80 years old and my wife is 70. I worked hard for my weekly check until I was 72.My wife did the same, and now our golden years are plagued by the excessive noise of the helicopters that deprive me to sleep, and the intrusive black dust that keeps my wife obsessed with cleanliness Now to crown the situation,comes your 10 years in the making draft: Lets occupy the rest of the open spaces; lets go from 700 flies to over 2,000...<br>I understand the frustrations of the Ministry of Defense with the uncertain results of the regular troops after many years of war in Irak and Afghanistan. I understand that with strategic attacks with drones and tough professional Seals,we could obtain better results...<br>BUT, TO PROTECT ME YOU WANT TO MAKE MY LIFE MORE IMPOSSIBLE TO LIVE ??<br>In my working life,I invented a motto that hanged in my office and showed to any big shot that disagreed with a position I took:<br>“LOGIC SHOULD SUPERSEDE AUTHORITY”<br>I wish you or your superiors could read it today and think about it... | As proposed for Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations, in the western portions of boat lanes.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC EIS document |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 129. | Laura Orozco | I would just like to say that I would not be very happy if the increase in training would mean more "night flying" by planes and helicopters over our houses. The noise at night would not make any of the Cay's Resident's happy. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC EIS document. |
| 130. | Cathy Potter | We were very disappointed to read that you are planning to expand the Navy's training program in Coronado.<br><br>The areas we've seen on maps for this increased activity seem way too close the lovely Hotel Del Coronado and the residential towers south of the hotel.<br><br>It seems the increased activity and noise will be detrimental to the enjoyment and safety of the beach by residents and visitors.<br><br>We strongly urge you to reconsider your plan and move the training farther down the beach or use other sights such as North Island or even Camp Pendleton away from residential areas. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |
| 131. | Ann Price | Our Military is in need of every training resource it can utilize. While I am all for protecting the environment I feel that the Navy needs to have areas to train in order to protect the American people AND the environment. We need to start thinking about human life first, then nature preserves, etc. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy has developed mitigation for activities that may cause an impact to the environment or surrounding area, and has presented these in the EIS. Mitigation measures and management practices are discussed within each resource section and within Chapter 5; Mitigation. |

|---|---|---|---|
| 132. | Dierdra Price, Ph.D. | I am a resident of Coronado and have lived in Coronado Shores for 26 years. I recently learned that the Department of the Navy is planning to increase the levels of training at the Silver Strand Training Center. Our family hears the training that goes on throughout the year. It is already loud and obtrusive. We live under a flight path that has substantially raised its activities in recent years. Planes and now helicopters not only fly more often, they fly closer to our buildings at all hours of day and night. In the past, planes flew out further over the ocean instead of buzzing close to our residences. To discover that you are proposing to increase training from 3926 annual activities to 5543, helicopter sorties from 800 to 2200, and firearm discharges from 150 to 1400, the noise will further disrupt peaceful living. Helicopter noise is grating on the nerves and you are expanding their sorties by nearly two-thirds.<br><br>I understand that we share Coronado island. The Navy has to take into account that you operate around civilians who live in Coronado. So your sensitivity to our home life is of utmost importance. The Navy has many facilities around the country. So if you choose to expand your training in a residential neighborhood, you must look out for the residents. I hope you will come up with a solution that includes flying planes and helicopters further out over the ocean when training and landing as well as designing your training schedule and location to be as least intrusive as possible.<br><br>We hope for some semblance of peace and quiet in our home and neighborhood. You are the one to make sure this happens. | Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC EIS document.<br><br>As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. |---|---|---|---|
| 134. | The Sack Family | This family fully supports the expansion program which we have seen in the local newspapers and as received in a separate mailing to our home. We have lived at the Coronado Shores with a unit facing the beach/ocean for many years and have nothing but respect and support for the training that goes on for the Navy Seals and associated military activities both in the ocean and on the strand.<br><br>We also would point out that those who bought property or otherwise decided to live in the area were fully cognizant of the presence and importance of the military training and associated activities in this area and do not feel that their complaints are justified.<br><br>Feel free to use/present this letter in any hearings or reviews that may be underway. | Your comment has been noted |
| 135. | Ray and Lorreta Saez | We have major concerns about the proposed expansion of increased training activity along the Silver Strand. Increasing the helicopter sorties from 778 per year to 2,200 is unacceptable. The helicopters make a significant noise when they pass anywhere near our home. We do not want to live under the conditions occurring around Ream Field. We looked at homes by the Tijuana Estuary in Imperial Beach before we purchased our home in March 1991. Homes in that area are significantly cheaper than the one we purchased because the helicopter noise is intolerable for most people. Our quality of life, health & financial situation would be decreased 100% if sorties were increased to the degree stated.<br>The endangered species living on the bay need to be protected in order to continue to exist on this earth. The Navy should respect that. Another consideration is the amount of noise firearm discharges create. We are sometimes awakened at night by that noise. It seems that the Navy wants to take over most of the area not already inhabited by animals and people. We agree that training our military is important but it should not be at the expense of the quality of life of those of us who live near by. Please consider protecting endangered species including humans by scaling back the training sites, helicopter sorties and firearm discharges. Let's create an environment in which we can live together as good neighbors. | Realism in training is an essential element of SSTC training. Nighttime operations are an important part of training at SSTC-S, to ensure that personnel are prepared for real world situations.<br><br>The Navy recognizes its proximity to adjacent communities, and seeks to structure its training activities to achieve operational readiness while minimizing potential impacts on nearby residents. The Navy has developed mitigation plans for activities that may affect the environment or adjacent urban areas, and has presented these in the EIS.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Helicopter overflights of Imperial Beach and the Tijuana Estuary consist of pilots transiting from NASNI to NOLF, or performing touch-and-go's at NOLF, for training activities unrelated to the SSTC training activities addressed in the FEIS. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters |

| 136. | Elizabeth Schulman | The EIS is long and detailed. Therefore, I stopped incorporating salient passages. The report itself states that the impact of alternative two is not substantially different than the impact of the first alternative.<br>While the law requires a lengthy and detailed EIS, common sense does not. The report's brief description of the adjoining areas says it all. The populated coastal area simply cannot support more than fifteen hundred additional sorties and deafening helicopter flights. The children (mostly military family kids) at the Strand Elementary School will be unable to concentrate on their studies and may likely suffer hearing impairment. The families in military housing will equally suffer from increased noise levels. Motorists will be increasingly distracted by the sorties on the beach leading to a possible increase in vehicle accidents.<br>An increase in the demise of wildlife seems to have been written off as "friendly fire." Exactly how many birds and sea life are expendable? Do we have a ratio demonstrating how many human lives will be spared as a result of increasing the intensity of training at the expense of wildlife?<br>Is the USN expecting to increase the number of recruits to be trained at the location? It appears the number of recruits is limited by demographics and the lack of a draft. The peninsula-type geography of the area limits the number of recruits who can be run through any program. The Navy Seal Program is reported to have a 2/3 "dropout rate." It appears the Navy Seal training program is sufficiently difficult. Common sense dictates this expansion should not be approved. | As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Helicopter overflights of Imperial Beach and the Tijuana Estuary consist of pilots transiting from NASNI to NOLF, or performing touch-and-go's at NOLF, for training activities unrelated to the SSTC training activities addressed in the FEIS. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC EIS document.<br><br>As proposed for Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. | | | | Proposed Action. There is an increase in activities performed by existing personnel under the Proposed Action. This clarification has been added to Section 2 of the FEIS |
| 137. | Teresa Scott | We live in the Coronado Cays and I and my family strongly support the Navy's training requirements. You folks please do what is needed to train our fine military and we the local community will do our patriotic duty to support you. Thank you for serving our country. | Your comment has been noted. |
| 138. | Timothy Searfus | The requirements of properly training sailors for future missions in support of our country's strategic goals cannot be subjugated to the voices of a relatively small group of people who complain about potential negative effects on marine life, noise pollution and other potential effects of increased training but in fact this group only looks out for it's own selfish interests, i.e., their over-valued coastal properties. I lived in Coronado from 1969 until 2003. "New Money" moved into Coronado in the early 80s and since then various actors have incessantly complained about the Navy and how the Navy is inconveniently disturbing their tranquility; after all, these folks paid dearly for their homes on Ocean Blvd and Coronado Avenue and they conveniently forgot about the monument at Sunset Part at Gate 5 of North Island that says the Navy's first Navy Flying School was established around 1915 at North Island. Huh, so the Navy was there first eh? The Navy bends over backwards to maintain harmony with nature and the Snowy Plover and California Least Tern are direct benefactors of Navy determination to conserve nature. Hell, if it weren't for Camp Pendleton, the Greater Southern California Megalopolis would extend from Ventura County to Tijuana. The increased training activities and concomitant construction in support of this are critical to national security and we as a people owe a debt of gratitude to the U.S. Navy. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy has developed mitigation measures for activities that may impact the environment or surrounding area, and has presented these in the EIS. Mitigation measures and management practices are discussed within each resource section and within Chapter 5; Mitigation. |
| 139. | Louis Semon | My wife and I welcome all activities of the military. We have been living on Coronado both in the Cays and now downtown and found no changes in our quality of life. Continue with the great mission at hand. | Your comment has been noted. |

|---|---|---|---|
| 140. | Robert Shugert | I live in the Coronado Cays. I served 5 years in the US. Air Force and 5 years in the National Guard and I strongly support our Military including the U.S. Navy, U.S. Army and Marines that will be involved in increased military training in the adjacent area to my home. I am concerned about the increased helicopter noise that will result from the substantial increase in "sorties" down the south bay and over my home. I have "learned to live with the present noise" , but to increase it by ten times would certainly impact my life style as well as potentially lowering the value of not only my home but the 1200 homes that exists in the Coronado Cays. I hope that when training that involves helicopters will be limited to day time hours and that the flyway be either out over the ocean or down the middle of south bay. | The current scope of helicopter noise analysis in the EIS is summarized in Section 3.6. Helicopter overflights, including night flights, consist mostly of pilots transiting between NASNI and NOLF for training activities unrelated to the SSTC training activities in addressed in the FEIS. The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean. |

|---|---|---|---|
| 141. | Marie Simovich | My comments focus on vernal pools and particularly Branchinecta sandiegonensis.<br><br>3.11.1.4.2 Please use current references from the primary literature. This section is poorly referenced and does not reflect a current and solid understanding of the subject. Give details of the vernal pool surveys that were done in reference to B. sandiegonensis including number of pools surveyed, whether surveys were both wet and dry as required by the US Fish and Wildlife Service, the density of cysts in pools, the number of seasons surveyed, the number of fillings surveyed etc.<br><br>5.10 The mitigation section lacks sufficient details to evaluate.<br><br>5.10.5 Foot traffic should be severely restricted. Any path can result in altered hydrology and potential pool drainage. Population surveys should be done more frequently than every five years. Plans should include modifications for dry years. Populations should be evaluated for viability and increasing or decreasing population reproduction via both live animals and the cyst bank. Other floral and faunal elements should be monitored. The full crustacean community should be evaluated for richness and composition and this should be included in restoration, mitigation, monitoring and criteria for success plans. Efforts should focus on maintaining not only viable populating of fairy shrimp, but a vernal pool community with species diversity appropriate for the area. | USFWS Protocol surveys were conducted involving two wet samplings. Dry season samplings are unnecessary under this protocol. The Navy will use scheduling and other planning tools to minimize avoid impacts to vernal pools.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |
| 142. | Kent Smith | I have reviewed many of the outlines for and against the increased use of the Silver Strand beach for training. My opinion is undecided because there are many positives and negatives to both sides of this important and relatively permanent decision. I am concerned that no mention has been made of the fact that there are underground tunnels or observation pits that were put in | Excavations are discussed in Section 3.2 of the EIS, and the analysis presented there indicate that there would be negligible impacts from the minimal number of excavations associated with military training activities presented in the EIS. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | place 30 years ago that may still exist between the shoreline and the roadway. These should be included in any analysis of the environmental impact. As a frequent user of that beach when it more available to the public there were two occasions when I noticed military personnel observing the ocean and beach from ground locations that had to enjoy at least six feet of excavation for it to occur. It is unlikely that these structures (if they still exist) would pose a challenge to the type of wildlife in question but a total lack of mention in an environmental impact statement is not appropriate. | |
| 143. | Yvonne Stowe | The noise from the training that is currently going on is bad enough without more! Sometimes they come so close to the top of our three story condo building it is down right scary. Please reconsider for those of us who live near by. We can't even talk on a cell phone outdoors facing the ecstasy when the copters are going up and down! | Helicopter overflights of Imperial Beach consist of pilots transiting from NASNI to NOLF for training activities unrelated to the SSTC training activities addressed in the EIS. The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>The NBC Commanding Officer has established air operations course rules for Naval Air Station North Island and the Naval Outlying Landing Field (NOLF, note formally known as Ream Field) to conduct safe required training and operational flights while minimizing impacts on the surrounding community. These course rules are designed to promote safe air operations, meet Navy aviation training requirements, and protect communities beneath established flight paths. Pilots are given annual course rule briefs to ensure their familiarity with course rules, procedures, and noise abatement measures. Current air operation instructions (course rules) advise pilots when departing NOLF westward to either fly 1/4 mile south of beach houses or cross over beach houses at or above 800 feet above mean sea level (300 feet above the Federal Aviation Administration's minimums set in Federal Aviation Regulation 14 CFR Part 91, see reference below) until they are |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | near the communication station (old Navy Radio Receiver Facility). Weather conditions, other aircraft in the flight patterns, etc. can and do affect the aircraft's flight route and altitude. Federal Aviation Regulation 14 CFR, Part 91 Section 119, titled Minimum Safe Altitudes, paragraph d states, helicopters may be operated at less than the following minimums prescribed for other aircraft, e.g. over congested areas, 1,000 feet above the highest obstacle within a horizontal radius of 2,000 feet of the aircraft, and over other than congested areas 500 feet above the surface. |
| 144. | Anna Stump | I was driving home down the Strand late the other night when out of nowhere I heard machine gun fire, pretty close. I had my car windows closed. I was very startled. If I was not a resident of the area, I would have freaked out, maybe swerved off the road in fear. I feel there should be signs warning drivers, bikers and joggers that military exercises are happening, especially at night. I've also experienced driving through heavy smoke from military beach activities that is distracting and even cuts visibility. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website. Mitigation measures and management practices are discussed within each resource section and within Chapter 5; Mitigation. |
| 145. | Rick Taylor | I previously lived in a beach community when the Navy upped fighter jet training flights during the war in Vietnam at a nearby Naval air station. Complaints were many and frequent, but were silenced when the CO hung a wall banner facing the residential area which was most vocal. It read, PARDON OUR NOISE; IT IS THE SOUND OF FREEDOM.<br>That is applicable here and now, as well as a like comment re beaches and bird sanctuaries - the Navy was here first and used these beaches unfettered long ago. | Your comment has been noted. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 146. | Kimberly Tolles | As a 20-year resident of Coronado and homeowner in the Coronado Cays (and currently homeowners association board member), I am extremely concerned about the Navy's training complex proposal from the point of view of increased noise, increased numbers of aircraft, more air fuel pollution than we already get, live fire next to homes and public beaches and nighttime activities. I felt the Navy's presentation before the Coronado Cays Homeowners Association Board understated the potential changes represented by this plan to the point of possibly being untruthful. I agree completely with the concerns expressed in the City of Coronado's letter and with the letter from the City of Imperial Beach. Training activities are necessary, of course, and have always been conducted in our extremely small community but to increase them to the extent proposed by the Navy amounts to reckless public endangerment. | The letter from the City of Coronado has been reviewed and the concerns highlighted therein have been responded to and, where applicable, changes have been made to the EIS. The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy has developed mitigation measures for activities that may impact the environment or surrounding area, and has presented these in the EIS. Mitigation measures and management practices are discussed within each resource section and within Chapter 5; Mitigation. |
| 147. | Gary Trieschman | Create public viewing area of exercises (of course w/security clearance) and involve public in reason for training | Adding a public viewing area would encumber training activities (loss of training space) and would be a security issue. In addition, Department of Defense security clearance regulations are only given for a specified need and would not be extended to civilians for observation of training. |
| 148. | Normandie Trovato-Wilson | There are a lot of complex factors in play when it comes to evaluating the impact this will have on endangered and threatened species. Of my particular concern is the training in the vernal pools. 90% of California's vernal pools have been destroyed due to development. I believe the Navy is committed to maintaining environmental integrity at the Silver Strand complex-however, protecting a vernal pool is not as simple as erecting a barrier around a WSP nest. There are hundreds, if not thousands, of species that coexist within vernal pools and it seems impossible to predict the effects that training in the vernal pools would have upon these species, including the endangered San Diego Fairy Shrimp. Extinction, and the loss of these sensitive habitats, is forever.<br><br>Also of special concern is the fact that the California least tern is still in decline and there seems to be little explanation as to why, and there is no species recovery plan for the terns. More information needs to be gathered about the Least Terns and the Western Snowy Plovers-especially information on how the species are doing from Oceanside all the way to the border-before making a choice about the use of the 3 shipping lanes during the breeding season.<br><br>There seems to be little to no mention of mitigation within the current EIS, which is also concerning.<br><br>In addition, there is no mention of returning to the current state of use should Navy training levels decrease in the future. I realize the Navy is not predicting such a reduction, but there should be a stipulation that should Navy training levels decrease in the future, that the use of the | The Navy is proposing to introduce limited foot traffic in some of the vernal pools at SSTC-S when they are dry. This activity is not the same as a development project that eliminates the pools completely. The 12 to 207 people entering the vernal pools each year would generally be individuals transiting through a pool on foot (e.g. on a reconnaissance mission), not large troop movements through every pool.<br><br>The Navy will establish the baseline distribution and abundance of San Diego fairy shrimp and condition of their vernal pool habitat at SSTC-S Inland and monitor training activities to ascertain the impact of training activities on San Diego fairy shrimp distribution and abundance within the action area. The Navy will report the monitoring results and any observed incidental take to the USFWS annually, and will manage the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring. The DEIS has been revised to indicate these terms and conditions. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | land would revert to the way it is now, should the Navy end up going with Alternative #1.<br><br>I compliment the Navy on their commitment to environmental stewardship. It is refreshing to see the military take such a stand for environmental integrity. It gives me hope. Ultimately, there is very little way to predict the effects that these changes would have on the WSP and the California Least Tern and until more answers are provided as to these species' progress, it seems hasty to change while these species are still making efforts to recover. A solution could be to gradually phase in these changes over the next 1-5 years and chart the progress of the endangered species. An alternative for the vernal pool training would be to conduct some training around/in a vernal pool which is in poor condition, and chart the effects (weeds, etc) of foot traffic around the vernal pools. This would also provide the Navy with time to figure out mitigation measures for the use of the vernal pools and test solutions for the inevitable problems and imbalances in the ecosystem which will result once foot traffic is allowed in the vernal pools. Thank you for reading my statement. | The Navy will work to avoid the pools where possible when developing training plans. The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round to the maximum extent consistent with training need.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include focused invasive plant inspection surveys in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>The effects analyses for the Western snowy plover and California least tern have been updated in the FEIS to add an explanation of how each mitigation measure helps to conserve the species (see Section 3.12.4).<br><br>The increase in training activities is not the only driver for the Navy's Proposed Action but also the changes in types of training and platforms, as well as a need for diversity in training. If there is a decrease in training, many of the conditions will tend towards current use because of the natural tendency of training towards training lanes 1-7 and 11-14 (vs. 8-10) as well as a natural tendency towards the developed northern area of SSTC-S (vs. the undeveloped southern areas of SSTC-S). |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | The changes that the Navy proposes are not expected to occur immediately, but are expected to be phased in gradually at SSTC as the Navy implements its force structure changes nationwide. The gradual implementation of the Navy's Proposed Action, combined with its intense monitoring program, will allow the Navy and the USFWS to quickly identify changes in the population as the changes are training is implemented. |
| 149. | Joan Van Der Hoeven | I would like to support proposed naval training enhancements along the Silver Strand coastline of San Diego. Far too many of our nations training resources are compromised because of pubic stupidity in purchasing residential properties in areas designated for military use. When our country is at war it is necessary for our troops to train as much as possible for safety's sake. War does not run 8-5, and there are obvious reasons why training at night or on weekends is required. The Navy has observed high standards of hazardous materials management. Beach access is available to the public in numerous alternative areas - our coastal commission assures this. The additional traffic and noise associated with Navy training for a nation at war should be regarded as an acceptable consequence for providing training that could save lives. | Your comment has been noted. |
| 150. | Susan and Monte Weddle | We are responding to the article in the Union Tribune concerning the possible increase in the number of sorties being proposed by the navy. We sincerely hope that you will listen to our concerns.<br>We live in Point Loma and have been greatly concerned over the increase in helicopter and fighter jet noise. The possibility of vastly increasing the number of sorties is unacceptable to us. We recognize the necessity for properly trained troops and we certainly appreciate what our troops do for us. But before you increase the level of noise and vibration in our neighborhood we would like some facts. You stated in the article that the recent number of sorties has been at 700+ in the past year. How many sorties were practiced in 2008 and 200n Our guess and fear is that the number of sorties has been increasing continually over recent years.<br>We certainly agree that naval troops must be properly trained, but we also want the navy to continue to be good neighbors with our community. To that end, we oppose any increase in the number of sorties in Imperial Beach, Coronado, and Point Lorna. | As proposed under Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations, in the western portions of boat lanes.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific |

|---|---|---|---|
| | | | Ocean.<br><br>Helicopter noise is addressed in Sections 3.6.2.2.1 and 3.6.2.3.2 of the FEIS. The analysis of helicopter sound indicates that, while the number of helicopter sorties would increase substantially under Alternatives 1 and 2, the increased frequency of short-term sound exposures from increased helicopter pass-bys would not be sufficient to noticeably change the hourly average sound level at any one off-installation location. Because of the logarithmic nature of sound; a doubling of sound energy results is only a three-decibel increase, which under typical conditions is barely discernable. The analysis of helicopter sound is based upon broadly defined flight paths, consistent with a normal degree of variability introduced by pilot discretion, weather, time of day, and safety concerns such as other aircraft. |
| 151. | Dewey Wells | My wife and I have visited your area and think the strand is very nice. However, we really think military needs (as in SEAL training) must come first. We would love for our SEALS to use the strand as much as they need to for training. Keep in mind that the military is the only reason we enjoy the freedoms we do. | Your comment has been noted. |
| 152. | Richard Wilson | I support the Navy's expanded use of their Coronado training facilities. We must all make contributions to protect our country. Accepting some inconvenience is a reasonable contribution for the civilians of Coronado to make in support of the Navy's role in defending our county and its interests. | Your comment has been noted. |
| 153. | Karen S. Wright | I have invested a lot to improve my home. My bedroom windows overtook the Silver Strand Training center. In all those years I have enjoyed the view and the quiet occasionally the navy would use the beach for landing boats and men or for running on the beach. But until the last year or so, I haven't heard gunfire, explosions, or frequent helicopters.<br>Now I understand the navy intends to increase the intrusive noise events. Intrusive noise events will destroy the peace of our neighborhood. Please reconsider and move the noisy training to camp Pendleton where there is no peaceful neighborhood to destroy. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |

|---|---|---|---|
| 154. | Susan Yamagata | I live right next to the entrance of the Training Complex. One problem that only happens when it rains is the storm drain (It makes a 90 degree turn just to the east of the guard bldg.) and it gets plugged up and is insufficient to handle the water flow. It backs up, floods and makes a small pond then runs over your entrance road.<br>But, the main problem these past number of years is the speed / traffic when vehicles enter or depart the base gates. I have spoken with many of my neighbors and we have contacted the city of Imperial Beach. They have used a mobile speed detector machine on occasion. But, we would like you to consider more permanent and enforceable options. A few suggestions are:<br>1) There is a Stop sign when exiting the base, but no one uses it. There is a speed bump when exiting the base, but anyone driving fast out of there just bottoms out a bit and continues on at a fast speed. If you would require all exiting traffic to stop at the stop sign, then cars would not be at such a high speed as they leave the base.<br>2) Neighbors have suggested installing a Stop sign at Silver Strand Blvd. and Carnation Ave.<br>3) Neighbors have suggested installing at least two speed bumps, maybe three along Silver Strand Blvd.<br>4) Install 25 mph speed signs.<br>5) Install a Pedestrian crossing that requires drivers to stop.<br>Drivers race down the street, because they like to drive fast, they are late, or they are trying to beat the automatic gate when they see someone ahead of them already has the gate open. And this is specifically for my situation. I drive a small car and when I back out of my driveway, I cannot see down the street when there are cars parked in front of my neighbors. (There are usually vans, suvs, or large trucks.) If I am lucky I can see a little 2 foot opening between the vehicles and I sit and watch that opening to see if anything passes in front of it. But, lately there haven't even been any of those openings. In addition, I have to look towards the inside of the base to see if any vehicles are driving down the road to exit, because I know they will not stop at the stop sign. Then there is the driveway for Camp Surf right across the street, (they should put up stop sign also), because during their busy season their guests just pull out without looking to see if anyone is exiting the navy base. So, I am trying to monitor three different directions without having a clear view. Sometimes, the only thing I can do is look at the guard to see if he is looking down the street or getting up, because, then I know a vehicle is coming from at least one direction.<br>6) I was wondering if you could install a convex mirror outside of the base that shows oncoming traffic on Silver Strand Blvd. that I would be able to use.<br>I know this is not really your concern, but I am afraid with increased traffic due to your plans, the odds of me making it out of my driveway without getting hit are getting worse for me. Thank you for considering my comments on your future plans. | The Navy is responsible for traffic on its controlled land. Once personnel leave SSTC-S, they are subject to local jurisdiction traffic regulations. Various speed and traffic control measures are the responsibility of the City of Imperial Beach. The Navy is considering adding signage or providing a message board requesting that Navy personnel obey all posted speed limits, keep radios turned down, etc., as personnel leave the base, as the Navy does at Naval Base Coronado, Naval Amphibious Base – Coronado, and Naval Base San Diego. Signage is enforced on Navy property. |

|---|---|---|---|
| 155. | Susan Yamagata | I attended the Public Hearings Open House in Imperial Beach. Thank you for providing this opportunity for one-on-one discussions with representatives who could offer clarification on various topics. I spent most of my time at the Community Interests desk talking about traffic safety on Silver Strand Blvd. leading up to the entrance of the complex. They suggested that I write additional comments or suggestions. First off one of the representatives mentioned that they were uninformed about the complaints that many neighborhood residents have voiced about the speeding drag racing and problems pulling out of driveways or side streets when on-street parking blocks a clear view of oncoming traffic. Some of these problems were brought to the attention of Imperial Beach traffic control. In the past (though not for a number of years) an electronic traffic monitoring machine was placed on our street to remind drivers to slow down. I know of one time when a traffic ticket was issued but heard that it was thrown out of court as "entrapment". As part of your review, I'm guessing that you've asked the city of Imperial Beach to share any information gathered over the past seven years. I was also told that there are "warrants" that a situation must meet in order to be able to install anything from a speed limit sign to a stop sign to any other traffic control measure. Examples given were things like numbers of tickets issued, numbers of accidents, numbers of complaints, numbers of deaths. But the problem with those limitations is that after a flurry of complaints by neighbors especially about the speeding problem, nothing lasting was done to address this ongoing situation and it seemed pointless to email or call or leave another message with the City and no messages were ever responded to after calling and leaving a message at the phone number listed on the sign at the Training Complex entrance. Another problem that comes up is who has jurisdiction over street safety issues. I believe the west side of the street at Camp Surf might belong to Coronado and the rest of the street is the responsibility of Imperial Beach. It would benefit the neighborhood if all three parties including the Navy would join together to try and address residents' concerns. I have a feeling that many people who have complained about the traffic in the past have<br>not taken part in this "Comment" opportunity. It would serve community relations if additional outreach was attempted. I suggest that you ask the city of Imperial Beach to set up the electronic message board on Silver Strand Blvd. closer to Palm Avenue so that the people coming out of the other side streets will see it. If you flashed a message: "Traffic safety issues? Please comment here or visit www.silverstrandtrainingcompleseis.com." And then provide a drop box and blank comment forms right next to the sign. I have seen parents with young children crossing Silver Strand Blvd. on there way to the school just around the corner. They do not always go down to the corner crosswalk, because there is a little parkway next to the El Tapatio Restaurant that is a shortcut. In my previous comments I submitted I listed "pedestrian crosswalks" (maybe like the kind with signs that are on Seacoast Drive?) | The Navy is responsible for traffic on its controlled land. Once personnel leave SSTC-S, they are subject to local jurisdiction traffic regulations. Various speed and traffic control measures are the responsibility of the City of Imperial Beach. Due to this and similar comments, the Navy is considering increasing signage or providing a message board requesting that Navy personnel obey all posted speed limits, keep radios turned down, etc., as personnel leave the base, as the Navy does at Naval Base Coronado, Naval Amphibious Base – Coronado, and Naval Base San Diego. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 156. | Susan Yamagata | Another traffic issue is pulling out onto Palm Ave. from Silver Strand Blvd. It seems that there were more street parking spots added on Palm which can cut down on visibility to see oncoming traffic. There are stop signs at 3rd and to the west on Palm Ave. at the corner of the 2nd. With planned increase in traffic for the Complex it would help if you would consider a traffic light or a three-way stop at the corner of Palm and Silver Strand Blvd. If all else fails and Silver Strand Blvd. does not meet the "warrants" to take any traffic control actions, I suggest that the Navy consider using temporary signs. In the past I have spoken to some of the trainers who work at the complex. They told me that every time a new group comes in to start training, they give a speech about speeding and other traffic do's and don'ts when traveling through this neighborhood, but that the majority of participants are young and full of fire and will on occasion disregard these warnings. Maybe at the beginning of each training period a set of temporary signs could be used on the exiting side of the street. Example: First and foremost an enforced "STOP" sign before exiting the base. Then a "25 mph" speed limit sign. Then a friendly reminder that you are driving through a "Neighborhood".<br>But, the problem with this is it doesn't address cars coming into the base or problems with visibility for residents to pull out of side streets or their driveways when you're not sure how fast a car might be coming down the road. Also, if the warrants are not met for street signs etc. then maybe the Navy could install signs like those listed above on their property before the exit gate, then you wouldn't have to meet the warrants? My last suggestion is that you check the schedule for planned complex activities, then come down and sit in your car on our street and see for yourself. The street is not always busy, but traffic is heaviest in the a.m. as trainers and participants are arriving or later when leaving after a training exercise. This visit would not take into consideration the after hours traffic throughout the night or over the weekends. Thank you in advance for at least considering these issues and concerns. I'm hoping that this time some discernible action will be taken to alleviate some of the unsafe traffic situations. | The Navy is responsible for traffic on its controlled land. Once personnel leave SSTC-S, they are subject to local jurisdiction traffic regulations. Various speed and traffic control measures are the responsibility of the City of Imperial Beach. Due to this and similar comments, the Navy is considering increasing signage or providing a message board requesting that Navy personnel obey all posted speed limits, keep radios turned down, etc., as personnel leave the base, as the Navy does at Naval Base Coronado, Naval Amphibious Base – Coronado, and Naval Base San Diego. |
| **F.2 COMMENTS FROM ORGANIZATIONS** | | | |
| 157. | Airport Trust | I represent Donald W. Rogers, Trustee of the Airport Trust, a private trust which has the proprietary interest in an exclusive license under Patent No. US 7,469,859 B1. The patent was issued on December 30, 2008 and describes an airport design having three 12,000 foot runways, a 2,000 acre footprint, two levels surrounded by water, access to the shore by underwater tubes and located in South San Diego Bay.<br>Enclosed are (1) Aerial photograph of the bay with the airport superimposed; (2) Description of Proposed Airport dated February, 2010; and (3) Copy of patent.<br>The site of the airport has been carefully selected to avoid interference with marine traffic, habitats, and other air traffic and is outside the amphibious base security lone.<br>The trustee welcomes the expanded use of the Silver Strand provided it does not conflict with the proposed airport. At this time no conflict is apparent except amphibious operations within the bay which would involve water area within the boundaries of the airport. | The Navy acknowledges your concern over the area that you are suggesting for an airport. The Navy has analyzed current and proposed training activities and analyzed the cumulative impacts of these activities, which include reasonable present and future proposed activities. The Navy has not included the airport in the cumulative analysis because the timeframe and design of the proposed project is not within the reasonably foreseeable future. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | The proposed airport includes a second entrance to the bay, as shown in the photograph. The advantages are discussed in the description. Such advantages include its use for military vessels. The second entrance is not essential for the proposed airport, but would have beneficial effect to the area, including environmental benefits.<br>Over 50 years have been spent and recently over $17 million in a futile effort to find an alternate airport site to Lindbergh Field which will reach its capacity circa 2020 with no room to expand with any additional runways. The proposed airport is the only feasible solution. It is requested that any expanded use be consistent with the proposed airport. | |
| 158. | California American Water | I recently read in the San Diego Union-Tribune, the Monday, February 22nd edition, that the Navy is utilizing a larger amount of the property on the Silver Strand Training Complex and will be having a larger footprint of operations at that site. I would like to remind those of you responsible for this property that California American Water Company has a 16" cast iron water main that traverses the base from the south end to the north end of it. This main provides a connection between Imperial Beach and Coronado, feeding the Coronado Cays along with the Navy Base. This main was installed in 1912 and has been in continuous service since then. I would make you aware of this critical main so that you always take into consideration the location of the main when you make plans to install new infrastructure on the base. Last year at the very north end of the base there was some sort of large poly-ethylene pipeline bored from the road to the Pacific o Ocean. It was bored in very near proximity to our 16" main and I believe we all dodged a bullet when that main was not damaged. Also, there are a number of vehicles parked in the same area near the fence along Hwy 75 on a day to day basis that are adjacent to two air/vacuum valves we have on the 16" main. I would hope that the vehicles never hit one of those valves and knock them off as it would create a bit of damage and cause us to shut down the 16" main which would put the base out of water and create a low pressure issue in the Coronado Cays. | In this EIS, the Proposed Action does not include new infrastructure. Potential for water main damage from training (a remote possibility) is a utilities / domestic water supply issue rather than a Public Health and Safety issue, and your information has been passed on to NBC Public Works Department. The NBC Public Works Department has access to and processes in place to identify and locate utilities and other important site conditions, i.e. such as but not limited to installed infrastructure, natural resources, cultural resources and more prior to any construction or site disturbance. |
| 159. | California Coastal Commission | Our most significant concerns are: (1) overall increases in noise levels from the large increase in levels of training activities, and in particular, the effects of such noise on habitat and public recreation; (2) expansion of training into currently protected sensitive habitat areas, in particular: (a) least tern and snowy plover nesting areas in Boat Lanes 8-10 in STCC-North (which are currently off limits to training during the nesting season); and (b) vernal pools in STCC-South; and (3) the proposal to limit the number of plover nests to be protected to no more than 22 nests. Despite the length of the document, it remains unclear as to why these decisions have been made and how decision criteria will be analyzed to determine whether such training is needed in these areas. | The potential effects of the Proposed Action on the sound environment are described in Section 3.6 of the FEIS, including effects on adjacent land uses. The analysis indicates that the effects of occasional impulsive noise events from military training activities would have no effect on public use of Silver Strand State Beach or other local recreation areas.<br><br>Given the need to train, the Navy has a robust plan for conserving vernal pool habitat and species. The Navy will use scheduling and other planning tools to avoid minimize impacts to vernal pools.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | through 7 marked with flexi-stakes) year-round to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>The degradation of habitat by noise sufficient to alter animal behavior is addressed in both 3.11 and 3.12. Helicopter noise and air turbulence is likely to result in temporary displacement of foraging least terns. Clapper rails may have disrupted communication signals and their predator detection may be disrupted as well. The effects of military noise on wildlife were reviewed by Larkin (1996). Noise affects wildlife differently from humans and the effects of noise on wildlife vary from serious to nonexistent in different species and situations. Pyrotechnics are known to result in bird dispersal |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | because they are used as a tool in managing airport runways for bird-aircraft strike hazard (Blokpoel 1976). In many cases, such acoustic stimuli lose their effect as birds habituate to them (Larkin 1976). Flares and smoke are expected to have sound exposure levels of 60 to 65 decibels at 50 feet (U.S. Army 2003). A greater effect is observed in species from populations that are unstable and low in number compared to those that are relatively abundant. Long-lasting and repeated exposure could cause a bird to retreat from otherwise suitable habitat. |
| 160. | California Coastal Commission | The Navy has narrowly construed the available alternatives being considered, in terms of those brought forth in the final analysis. The extensive increases in loud activities warrants serious consideration of conducting at least some of them, including the more intrusive ones, in less heavily populated areas, for both social and resource protection reasons. If the Navy does proceed as proposed, it will need to provide a more detailed and compelling explanation to establish that there are no available less damaging alternatives. We understand the concept of keeping training near the home base, but given that Camp Pendleton is within the same county, a clearer explanation is needed for dismissal of use of this site for the activities proposed in sensitive areas. Stating it is rejected based on the need to "achieve training tempo requirements" does not provide the reviewer with any information with which to assess this assertion. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |
| 161. | California Coastal Commission | We understand that decision-criteria were used and are listed in the DEIS (on page 2-1). However the analysis explaining why the criteria are applied in certain situations (e.g., a statement on page 2-2 is that relocating some activities to STCC-S would conflict with criteria 2 and 6) is not provided. Also, we note that page ES-5 states the Navy bases its need projections on models of future exercises. While we inherently support and understand the Navy's need to train, without the modeling assumptions and additional information, it is difficult to weigh future training needs against environmental and social impacts. | A new explanation of criteria has been added to Section 2.1.2 in the EIS and an explanation of the logistics and transportation hurdles present in moving training activities has been added to Section 2.1.3.2. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 162. | California Coastal Commission | Given that the Navy is proposing a significant expansion of training, which will increase conflicts with habitat protection, it would appear that listed species such as snowy plovers and least terns warrant increased protection, whereas the DEIS appears to be proposing simply to maintain the status quo (at least with respect to the number of snowy plover nests). We would argue that the increase in activities in Boat Lanes 1-7 would seem to make it all the more imperative that these species have an area set aside (during the nesting season) and left undisturbed. | The Navy has proactively prepared for the expected take through actions taken prior to this request for take. Preparation includes site enhancement, management of lane usage, nest protection, and monitoring, and decades of adaptive management. Snowy plover nests are not necessarily going to be taken, but no more than 22 proposed nests would be protected. In response to this and other comments received, the Navy has revised the EIS analysis on the California least tern (Section 3.12.3.1) and the western snowy plover (Section 3.12.3.2) to provide a more in-depth analysis of impacts that training is expected to have on the species. Additional mitigation measures have been added to the Proposed Action. The benefits of current and proposed mitigation measures are also described and quantified as far as practicable. As discussed in the analysis, the benefits of mitigation are expected to outweigh potential adverse impacts of training. The Navy works each year on site-maintenance and monitoring, plus periodic site enhancement or management approaches to manage terns, and to increase the attractiveness of Delta beaches. The FEIS has been updated (Section 3.12.3.1) to explain the level of loss anticipated under the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year. The Navy will ensure that biological monitors look for and document the locations of least tern or snowy plover nests, eggs and chicks prior to and after all military training exercises, to allow assessment of take associated with training activities. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 163. | California Coastal Commission | Alternatives eliminated from further consideration include training at locations other than the STCC. It is not clear why proposed training in Boat Lanes 8-10 during the nesting season, which the Navy estimates (based on its models) to occur approximately 24 times/year, could not be relocated to Camp Pendleton, or why Camp Pendleton beaches could not "provide a realistic training environment that simulates real world littoral combat conditions."<br><br>The criteria provided by the Navy (DEIS, page 2-34) indicate these Boat Lanes would be used either: (a) when other suitable lanes are occupied, or (b) "if [lane] attributes make them more suitable for meeting training needs than other available training lanes." Examples of such attributes include beach topographic conditions, distance from other training locations, and a need for diversity in training locations. These criteria appear overly broad, and we believe there should be a much greater burden needing to be satisfied before the Navy would use these lanes. We question why, for example, if the Navy is able to modify beach topography for the purpose of attempting to discourage nesting in heavily trained areas, the Navy is not also able to modify beach topography to provide desired training condition topography in other areas (and thereby avoid Lanes 8-10 during the nesting season). If feasible, such an alternative should be explored for both Camp Pendleton beaches, as well as the remaining Boat Lanes at the STCC. If infeasible, the Navy should explain why. | Under current training conditions, Navy training officers are notified of the locations of the nests and buffers, and plan their training activities to avoid entering the buffer areas. A few training activities, such as individual basic physical fitness activities, may be able to work around the training buffers. These activities incorporate identifying and avoiding plover nest buffer areas into the activity. Other training does not require use of beach areas, and thus would not be affected by the presence of plovers. Most other activities however, are unable to operate around the buffers. The buffers are artifacts on the beach that do not occur in real world wartime situations, and thus adversely affect the value of training (e.g., presence of the plover nests restrict flexibility for maneuvering across the beach and inhibit real-time, tactical decision-making. Personnel may habituate to worrying about avoiding stakes, even while they are fighting at war. Restrictions imposed by stakes during training may lead to habitual avoidance measures and self-imposed concentrations of personnel, even in a combat environment, due to repetitious training with staked boundaries. Personnel may also focus on the stakes and no-go areas rather than learning their training mission). Activities involving heavy equipment and vessels require large unconstrained maneuvering space without encumbrances, precluding areas with buffered plover nests. To accommodate training requirements for these activities, the activities are often shifted in their entirety to the north or south, away from the buffers, so that personnel/equipment will not encounter the buffers/stakes. Under current conditions, this approach is feasible. Where needed, training activities can and are moved to other available training lanes that are free of plover nests or contain a maximum of two plover nests at one time. Historically, SSTC has typically had less than 22 maximum active nests at one time.<br><br>As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. The Navy considered creating an avoidance cap of more than 22 concurrent western snowy plover nests, but found that approach could render lane(s) unusable. Twenty-two concurrent nests would translate into approximately two concurrent nests in each viable lane on SSTC (i.e., 14 training lanes excluding Lanes 1, 5, and 6, which have not historically had nests due to the shallow beach and hummocks). If plover nests increase, buffering each nest will constrain the available beach area such that the beach will not adequately support military readiness training activities. Two nests per training lane at the same time by themselves could encumber 60 meters of the 500 meter beach lane width (12 percent). If the nests happen to be spaced closely together and/or close to the edge of the lane, the area in between the nests or between the nests and the edge of the lane may also become unusable for training (e.g., if there are 100 m between the nests and 50 m between the nests and the edge of the lane, then approximately 40 percent of the lane could be rendered unusable). Snowy plovers are not colony breeders, and prefer to distance their nesting activities as far as they can from other nesting plovers. As such, plover nests are more likely to be evenly spaced and encumber larger, rather than smaller sections of the training beach. Also, as discussed above, many training activities require that an additional buffer be provided away from the staked buffers to ensure that the stakes are not visible or an encumbrance to personnel being trained. Adding a third nest could render the entire lane unusable. With the anticipated increase in training tempo of the SSTC training beaches (see Sections 1.5.1.1 and 3.12.3.1), training activities may not be able be moved to other less encumbered beach lanes like they can be and are under current conditions. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | There will not necessarily be more nests in Lanes 8-10. If the plovers increased their nesting activities in Lanes 8, 9, and 10, activities that were scheduled for these lances would need to be shifted to another lane. If all the lanes were occupied, then the activity would need to be shifted to a lane with another activity, and that lane would need to be free of buffered nests or have a maximum of one buffered nest. |
| 164. | California Coastal Commision | The Navy's stated argument for eliminating the alternative of protecting all the snowy plover nests, rather than limiting protection to only 22 nests, is not well explained. Stating a third nest in a given training lane "could render the entire lane unusable" appears speculative, depending on the location of the nests. We would like historic information about conflicts the Navy has experienced in training in these lanes over, say, the past decade. For example, how often have there been more than two active plover nests within a given lane, and what has this meant for Navy training? Has the Navy had to cancel, modify, or relocate training? Is it a given that more than two active nests in a lane at one time makes the lane unusable? If so, please explain. Wouldn't the location of the nests (including proximity to each other, as well as to nests in other lanes) have an important bearing on this question? Has the Navy been able to successfully train in a lane when nests have exceeded two in that lane?<br><br>In addition, if there were greater numbers of nests, but most of those were in Lanes 8-10, which the Navy indicates would be used sparingly, then would it not be easier to protect more than 22 nests? Also, it is not clear how the number 22 was derived, when there are 14 Boat Lanes. If the number was derived from the number of lanes times two nests/lane, shouldn't that total be 28 nests? | Under current training conditions, Navy training officers are notified of the location of the nests/buffers, and plan their training activities to avoid entering the buffer areas. A few training activities, such as individual basic physical fitness activities, may be able to work around the training buffers. These activities incorporate identifying and avoiding plover nest buffer areas into the activity. Other training does not require use of beach areas, and thus would not be affected by the presence of plovers. Most other activities however, are unable to operate around the buffers. | 165. | California Coastal Commission | It is also not clear from the document how the Navy intends to phase in the increased numbers of activities. If the timing of the increases allows sensitive areas proposed for training to be off limits for several years (or some other period) until they are needed, that should be considered as an alternative as well, or at least explained. We recognize that the Navy states these areas will not be used unless needed, but it would be helpful to understand the pace of the proposed increases.<br><br>We have similar concerns over the proposal to expand training to allow foot traffic in vernal pools. The DEIS does not make a compelling case that these pools could not be avoided. At a minimum, it is not clear why fencing (and thereby avoidance) of at least the smaller vernal pools could not be conducted consistent with training needs. | Information has been added to the FEIS indicating the "natural" phase in of activities. By their nature, all activities will not begin at the same time, rather they are spread temporally. Therefore, the phase in period of all these activities will therefore occur over a longer period of time.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. |---|---|---|---|
| | | | EIS remain at the low levels expected. The Plan will include focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>Finally, the vernal pools are not considered part of the Coastal Zone. |
| 166. | California Coastal Commission | It appears from the discussion in several sections of the DEIS that the primary reason for dogs on the beach is for their exercise, and the primary training activities necessitating dog use occur at or near buildings (i.e., away from beaches and sensitive areas). We understand that the dogs are trained not to disturb wildlife, but wildlife may still be intimidated by dogs to the extent they could abandon nesting areas, especially in the cumulative context of overall increases in training levels. Is there a reason, for example, why dog runs could not be excluded from Boat Lanes 8-10 during the nesting season, with their exercise limited to other areas? | Military working dogs are highly trained and under constant voice or leash control of the handler. While effects of recreational dogs in nesting areas are documented in scientific literature, the effects of leashed dogs that are highly trained in obedience and avoidance of wildlife in an area that is heavily used for military training is not yet known. Dogs need to be able to run on the beach rather than on harder paved surfaces to protect their sensitive pads. Repeated long distances on hard surfaces will wear down their pads. The dogs need to be able to train on a full 10-kilometer loop on an infrequent basis to ensure that they have long distance training as well as speed training. As part of the consultation with USFWS, the Navy is proposing a study to assess impacts of military working dogs on California least terns and western snowy plover nesting, such that potential effects can be better understood. |

|---|---|---|---|
| 167. | California Coastal Commission | Page 3.6-24 states that loud activities would occur infrequently at night or on weekends. Can the Navy provide an estimate of the amount of proposed increases in loud noise-producing activities on weekends, holidays, and at night?<br><br>The reference on page 3.6-25 to noise mitigation (referring to Section 3.6.2) is presumably meant to be a reference to Section 3.6.1.6. Also, that section is rather vague. We would appreciate it if the Navy would spell out in greater detail how noise effects on sensitive species and on recreation will be factored into decisions on locating and timing training. | Given the variability of training schedules, it is difficult to reliably predict the extent to which various types of training activities could be conducted at night, on weekends, or on holidays. Most training activities occur during the day on weekdays, as noted in the FEIS. The reference on page 3.6-25 correctly refers to Current Mitigation Measures in Section 3.6.2. Airborne noise effects on sensitive species are addressed in Section 3.11 (Terrestrial Biology), and Section 3.12 (Birds) of the FEIS. Noise effects on recreation are addressed in FEIS Section 3.6; Silver Strand State Beach is specifically addressed as a nearby sensitive receptor. |
| 168. | California Coastal Commission | Page 3.9-12 discusses marine mammal monitoring during underwater detonations and pile driving. The discussion should describe how much training the marine mammal observers will receive. Also, we will want to be added to the list of entities contacted in the event of an observed marine mammal injury. We will also want to receive any monitoring reports on snowy plover, least tern, and/or vernal pool habitat impacts that the Navy may be providing to the U.S. Fish and Wildlife Service. | The Navy provides biological monitoring reports and marine mammal strike reports to the appropriate federal agencies.<br><br>Observers are trained to determine the presence or absence of marine mammals. Due to the low density of marine mammals in the area and shallow waters of SSTC, the expected animals in the area are dolphins and pinnipeds. |
| 169. | California Coastal Commission | Page 3.1-15 references a new activity affecting public access, referenced as N14. New activities are only numbered N1-N11, so this may be a typo. Please identify this activity. | The Activities in question are now listed as N9 and N11 in Section 3.1.2.3.2 of the FEIS. |
| 170. | California Coastal Commission | Page 3.12-26, Fig. 3.12-11, contains a graph showing plover nesting through 2008. Does the Navy have 2009 data for snowy plover nest numbers? If so, please provide, for all the sites shown in Fig. 3.12-11. Also, are there any plover nests yet this year? Please keep us apprised of current nest numbers and locations as the season progresses. | The 2009 data have been added to the figure for snowy plover and the figure for least terns. |

| 171. | California Coastal Commission | The City of Coronado's comments on the DEIS (Item No. 27) state that the ferry service to NASNI has been discontinued. As this service was, in part, mitigation for traffic impacts from the homeporting of nuclear aircraft carriers, please update us on the status of the ferry service. | Your comment addresses an issue that is outside the scope of this EIS. The SSTC EIS only looks at cumulative impacts from the increase of personnel and traffic from the homeporting of nuclear carriers within San Diego Bay. Specific mitigation within the CVN homeporting EIS was not discussed within the SSTC EIS. However, Naval Base Coronado has established a commuter working group comprised of the selected base personnel, city of Coronado, CALTRANS, Metropolitan Transit System, and others to explore both short and long term actions to enhance, restore, or add to the suite of on-going and past transportation incentive programs, e.g. van pools, car pools, bus ridership, and or bay ferry service pick up points. |
| 172. | California Coastal Commission | Page 3.7-44 contains an error message. | This error message has been corrected in the FEIS |
| 173. | California Department of Fish and Game | The Navy addresses potential short term and cumulative impacts and impact minimization measures, to some extent, from the proposed increases in Navy training activities. However, the Navy does not sufficiently address monitoring, avoidance and habitat compensation for sensitive, rare and unique biological areas. Additionally, potential increases in recreational human and dog disturbances within the ocean side training ranges, expected increased impacts to listed birds by predation, increases in future projects and expected sea level rise due to global climate change have not been fully analyzed for cumulative impacts. | Monitoring, avoidance, and habitat compensation for sensitive, rare, and unique biological areas are described in Sections 3.11 and 3.12. Additional mitigation measures for potential impacts of proposed activities are listed at the end of these respective sections, as well as in Section 5.<br>As indicated in the USFWS Biological Opinion and described in the FEIS, the Navy will improve the delineation of base boundaries to facilitate improved enforcement in these areas to reduce potential impacts of human and dog disturbances. This will include the installation of improved signage, k-rails, and a guard shack. At SSTC-N, temporary barriers and improved signage will be used to more clearly notify the public of the Navy's exclusive use of SSTC-N beach and existing restrictions on public usage of those beaches.<br><br>Climate change is addressed in Section 4 of the FEIS as a cumulative impact on the public and the environment to which the Proposed Action would make an insignificant contribution. Because the purpose of the EIS is to address the effects of the Proposed Action on the public and the environment, rather than on itself, the effects of sea level rise on the Proposed Action are not addressed in the FEIS. While sea level rise was |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | not specifically addressed, the proposed training activities do not require any fixed facilities that would require protection or relocation. The primary effect of sea level rise on Navy training activities on SSTC would be a decrease in the width of the training beaches. Ground access to the beaches and local weather conditions might also be affected.<br><br>To address recreation user concerns, the Navy is considering increased signage as a result of this and other public comments received. The Navy will delineate the boundary of SSTC-S that parallels the mean high tide line in a manner that does not encumber training exercises. |
| 174. | California Department of Fish and Game | Biological Impacts and Mitigation Strategies<br>Increasing repetitive Navy training activities along with decreasing existing conservation measures may cause long term impacts and significantly add to cumulative impacts to terrestrial and marine species and their habitats. The Department has the following comments, concerns, and recommendations: 1) the FEIS should more fully analyze and address the potential cumulative or long term coastal ecosystem impacts associated with each phase and type of the proposed increased training/construction; 2) the FEIS should include additional studies and/or increased biological monitoring, additional conservation measures, and mitigation plans for the potential long term impacts to listed and sensitive terrestrial and marine species, rare and unique coastal strand habitat, and State- and federally-listed marine birds and their nesting habitat. 3) the Department views the Navy's proposed mitigation and decreases in avoidance and minimization measures for sensitive or listed species and the sensitive coastal strand, dune and eelgrass habitats, as insufficient protection and compensation from cumulative impacts. | The individual effects analyses of military activities (short-term and long-term) are presented in their respective sections, where the potential impacts are discussed in more detail. The determinations of the impacts of military activities are also presented there. The cumulative impacts section discusses the impact on the environment which results from the incremental impact of the military training activities when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. The discussion of applicable impacts from the respective sections have been carried forward into the cumulative impacts discussion. |
| 175. | California Department of Fish and Game | 1) Cumulative or Long Term Impacts not fully Addressed in the DEIS:<br><br>The FEIS should address the potential for the following types of impacts and show how they will be avoided, minimized, mitigated and monitored for SSTC North and South and Bayside Training Ranges as applicable:<br><br>During bird nesting and California grunion (*Leuresthes tenuis*) spawning season the fully protected and state and federally endangered California least tern (*Sternula antillarum brownii*) and the California species of special concern and federally threatened Western snowy plover (*Charadrius alexandrinus nivosus*) as well as other sensitive bird species and their habitats may potentially be impacted due to the proposed significant increases in vehicle, air and foot/dog traffic in the intertidal and upland areas of SSTC-North and South and bayside. A proposed buffer zone limiting bird nesting distribution and a proposal to eliminate sensitive habitat markers is described in the DEIS and indicates that the Integrated Natural Resources Management Plan (INRMP) for this area has been revised recently to support such a proposal. | The 2002 INRMP for Naval Base Coronado is being revised, and will be consistent with the analysis and conclusions of this FEIS.<br><br>The individual effects analyses of military activities (short-term and long-term) are presented in their individual sections, where the potential impacts are discussed in more detail. The determinations of the impacts of military activities are also presented there. The cumulative impacts section discusses the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | The Department was not aware that the Coronado INRMP (2002) was revised recently to support and accommodate a reduction in bird conservation. Additionally, the biological resource discussion does not clearly identify an analysis on how these sensitive species could potentially be affected due to cumulative impacts. | other actions. The applicable impact analyses from the Environmental Consequence sections have been carried forward into the cumulative impacts discussion. |
| 176. | California Department of Fish and Game | After near shore disturbances, (training activities and construction), an increase in opportunistic, non-native, terrestrial and marine species may be seen within the project vicinity. An increase in non-native species would cause increased disturbance of ecosystem processes and decreased native biodiversity. This may be due to spreading/dispersal of non-native species during construction or from non-native species aggressively taking advantage of a newly disturbed area. | The Navy conducts annual surveys and treatments for invasive plants, and will be expanding treatment of iceplant in the near future. A vegetation management plan under development to support terns and plovers also benefits sensitive plant species. Focused rare plant management includes *Phacelia stellaris, Dudleya variegata*, among other rare plants that are less locally abundant on Silver Strand. Additionally, the Navy conducts surveys for *Caulerpa taxifolia*, and invasive non-native marine algae for all construction projects, and introductions of non-native marine fish and invertebrates are highly unlikely because neither ballast water nor equipment is transported to SSTC without cleaning and inspection. |
| 177. | California Department of Fish and Game | Significant and repetitive vehicle, helicopter, and detonation impacts to terrestrial and marine biological resources, including sensitive and listed birds, may occur at the site causing cumulative impacts. Some of these effects may include the destruction of marine plants and algal species and their substrate such as surf grass, eelgrass and kelp species. Vehicle impacts from driving in the intertidal and on the beach may cause impacts to the kelp wrack on the beach used for forage and shelter by various terrestrial and marine species, including western snowy plovers that feed primarily on terrestrial and aquatic invertebrates (brine flies, brine fly larvae and brine shrimp). Significant burial or destruction of fish and their habitat from detonations may also occur at scattered rock bottom habitats that are found immediately offshore of the project site, thus reducing the prey base for California least terns that feed primarily on small fish. Vehicles may also impact active California least tern, western snowy plover and other listed and sensitive bird eggs, chicks and nests. Helicopters flying over actively-nesting California least terns and western snowy plovers may flush adults off the nest and leave the eggs and chicks vulnerable to predation. | The individual effects analyses of military activities (short-term and long-term) are presented in their individual sections, where the potential impacts are discussed in detail. The determinations of the impacts of military activities are also presented there. The cumulative impacts section discusses the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions. The applicable impact analyses from the Environmental Consequence sections have been carried forward into the cumulative impacts discussion. |
| 178. | California Department of Fish and Game | Coastal strand habitat is an important and diminishing California natural resource and supports a unique ecological community (Dugan and Hubbard 2009). The DEIS does not discuss the impacts to biodiversity and the uniqueness, importance and sensitivity of strand habitat nor how it should be conserved due to proposed increase in impacts. | Terrestrial habitats are discussed and analyzed in Section 3.11 of the FEIS. Mitigation and monitoring plans discussed in representative resource sections discuss conservation methods under the Action Alternatives. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 179. | California Department of Fish and Game | Significant fragmentation of marine and onshore habitats may occur due to the proposed increase in training activities and detonations in the intertidal, subtidal and upland. This may cause a reduction in habitat suitable for native species distribution especially as it relates to eelgrass on the bayside training range and onshore sensitive bird breeding, roosting, and foraging habitat. | The individual effects analyses of military activities (short-term and long-term) are presented in their individual sections, where the potential impacts are discussed in detail. The determinations of the impacts of military activities are also presented there. The cumulative impacts section discusses the impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions. The applicable impact analyses from the Environmental Consequence sections have been carried forward into the cumulative impacts discussion. Potential impacts on or fragmentation of marine and offshore habitats is unlikely based on the temporal and spatial frequency of physical disturbance from wind and wave action along SSTC offshore beaches, relative to the Proposed Action. Detonations only occur underwater in the oceanside boat lanes (with the exception of Shock Wave Generator , which occurs in bayside training area Echo). Underwater detonations were evaluated in Section 3.7.2.2.2 of the FEIS for all benthic invertebrates. Impacts to eelgrass habitat within the bay are addressed within the current analysis and mitigation measures are identified. Furthermore potential impacts to sensitive bird species are already monitored by the Navy, and SSTC birds have displayed positive trends compared to similar areas within California. Moreover, the restriction of public access from portions of SSTC beaches likely benefits coastal dune and upland habitat continuity to a greater degree than intermittent training activities cause fragmentation. Habitat conversation remains a focused effort of Navy natural resource personnel. |

|---|---|---|---|
| 180. | California Department of Fish and Game | There are known Pismo clam, *Tiveta sfultorum*, beds near SSTC-North and South training ranges that are surveyed by the Department every year. Invertebrates are an important part of near shore and beach ecology. In particular, Pismo clams, a state managed and sensitive species, tend to develop high concentrations or beds on flat beaches in the surf zone and at the mouths of bays, rivers and estuaries. This makes them more susceptible to Navy vehicle training, detonations or burial impacts. Impacts to Pismo clams, as well as other concentrations of marine invertebrate species, should be identified, monitored and mitigated. The DEIS should have addressed the potential for these types of impacts. | During the analysis of potential impacts to benthic infauna, various clam species were assessed for impacts, as described in Section 3.7.2.2 of the FEIS. The best available data for SSTC training beaches were used, and impacts to invertebrates and subtidal habitats have been discussed. Impacts of training activities taking place within the washzone habitat above the Mean Low Water mark were determined to have a low potential for eliciting adverse effects to marine benthic infauna. Additionally, underwater detonations were evaluated in 3.7.2.2.2 of the FEIS for all benthic invertebrates. |
| 181. | California Department of Fish and Game | Sea level rise should be analyzed and addressed in the FEIS as a potential cumulative impact to unique and dwindling coastal strand habitat, eelgrass habitat and bird nesting habitat on beaches in southern California. | Climate change is addressed in Section 4 of the FEIS as a cumulative impact on the public and the environment to which the Proposed Action would make an insignificant contribution. Because the purpose of the EIS is to address the effects of the Proposed Action on the public and the environment, the effects of sea level rise on the Proposed Action are not addressed in the FEIS. While sea level rise was not specifically addressed, the proposed training activities do not require any fixed facilities that would require protection or relocation. The primary effect of sea level rise on Navy training activities on SSTC would be a decrease in the width of the training beaches. Ground access to the beaches and local weather conditions might also be affected. |
| 182. | California Department of Fish and Game | 2) Concerns and Recommendations related to Potential Cumulative and Long term Impacts: Since the property leased by the Navy at SSTC-North is state-owned property and SSTC-South and bayside is adjacent to Silver Strand State Beach, the Department expects that a higher level of adherence to standard practices, as well as proposing additional mitigation and conservation measures for protecting sensitive coastal ecosystems and biological communities, will be practiced by the Navy as the tenant and neighbor of such land. The following comments and recommendations should be considered and addressed in the FEIS: | Sensitive coastal ecosystems are delineated by the Navy as part of assessing snowy plover and California least tern nesting habitat. Standard practices related to construction and training activities regularly create avoidance areas focused on minimizing long-term impacts and reducing cumulative effects. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 183. | California Department of Fish and Game | Mitigation for 1.13 acres of eelgrass habitat loss is proposed in the DEIS based on Navy estimates. An enhanced monitoring and surveying program is recommended for the remaining eelgrass habitat that may be adversely affected before, during and after the proposed training activities and construction. The Department is concerned that the actual impacts to eelgrass and eelgrass habitat in this area may be significantly higher at the bayside Navy training range due to cumulative or long term impacts of proposed increased training. | Besides the Navy Eelgrass Mitigation Sites, the Navy maintains permanent eelgrass monitoring transects in San Diego Bay that are monitored every year (Figure 3.7-9). Bay wide mapping of eelgrass density classes is conducted every three to five years in a joint Navy-Port of San Diego effort (1994, 1999/2000, 2004, and 2008). The most current (2008) data were recently made available (DoN, 2009). This monitoring program allows the Navy to track fluctuations in the coverage, extent, and health of eelgrass in San Diego Bay. |
| 184. | California Department of Fish and Game | Monitoring plans that incorporate adaptive management for developing marine wildlife and habitat conservation measures are recommended. Monitoring plans should be developed in collaboration with the resource agencies. Experienced and qualified independent biologists should be retained to adequately implement the biological monitoring and studies. | Monitoring plans and existing mitigation measures are presented in sections 3.7 through 3.12 of the FEIS, as well as an independent chapter in Section 5. These mitigation and monitoring plans have been created with the assistance of and in consultation with resource agencies such as National Oceanic and Atmoshperic Administration and U.S. Fish and Wildlife Service. |
| 185. | California Department of Fish and Game | The Department recommends marking and avoiding all western snowy plover and California least tem nests and any suitable nesting habitat to offset impacts to these species that may occur as a result of the disturbances and activities (e.g., foot and vehicle traffic) associated with military training exercises. | The Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that do not encumber training activities. Such a marking strategy would provide visual references identifying sensitive nesting areas and may entail signage affixed to existing beach lane signposts and a limited number of additional markers, as determined appropriate by Navy staff.<br><br>As indicated in the USFWS Biological Opinion and described in the FEIS, the Navy will improve the delineation of base boundaries to facilitate improved enforcement in these areas. This measure will include the installation of improved signage, k-rails, and a guard shack. At SSTC-N, temporary barriers and improved signage will be used to more clearly notify the public of the Navy's exclusive use of SSTC-N beaches and existing restrictions on public use of those beaches. Please see FEIS Section 2.1.3.7 for a detailed explanation of why more than 22 concurrent western snowy plover nests would impede proposed military training at SSTC. Restrictions imposed by |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | stakes during training may lead to habitual avoidance measures and self-imposed concentrations of personnel, even in a combat environment, due to repetitious training with excessively staked boundaries. Personnel may habituate to worrying about avoiding stakes, even while they are fighting at war. Personnel may also focus on the stakes and no-go areas rather than learning their training mission. Historically, SSTC has typically had less than 22 maximum active nests at one time. With the anticipated increase in training tempo of the SSTC training beaches (see Sections 1.5.1.1 and 3.12.3.1), training activities may not be able to be moved to other less encumbered beach lanes like they can be under current conditions. |
| 186. | California Department of Fish and Game | Existing buffer zones and signs to designate sensitive habitat (e.g., for California least tern and western snowy plover) should continue and be increased in the future for the proposed training increases on State property. | Under current training conditions, Navy training officers are notified of the locations of the nests and buffers, and plan their training activities to avoid entering the buffer areas. A few training activities, such as individual basic physical fitness activities, may be able to work around the training buffers. These activities incorporate identifying and avoiding plover nest buffer areas into the activity. Other training does not require use of beach areas, and thus would not be affected by the presence of plovers. Most other activities however, are unable to operate around the buffers. The buffers are artifacts on the beach that do not occur in real world wartime situations, and thus adversely affect the value of training (e.g., presence of the plover nests restricts flexibility for maneuvering across the beach and inhibits real-time, tactical decision-making). Activities involving heavy equipment and vessels require large, unconstrained maneuvering space, precluding the use of areas with buffered plover nests. To accommodate training requirements for these activities, the activities are often shifted to the north or south, far enough away from the buffers so that personnel and equipment will not encounter or see the buffers and stakes. Under current conditions, this approach is feasible. Where needed, training activities can and are moved to other available training lanes that are free of plover nests or contain |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | a maximum of two plover nests at one time.<br><br>The Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that does not encumber training activities. Such a marking strategy would provide visual references to identify sensitive nesting areas, and may entail signage affixed to existing beach lane signposts and a limited number of additional markers, as determined to be appropriate by Navy staff. |
| 187. | California Department of Fish and Game | The project should include a vehicle route plan that sufficiently avoids and minimizes impacts to sensitive species and habitats. The vehicle route plan should include, but not be limited to, the following areas: a) pismo clam beds and grunion nests; b) identified sensitive bird breeding, roosting, and foraging habitat and other significant biological areas of the intertidal, strand, and dunes; and c) beach wrack and eelgrass. | Under current training conditions, Navy training officers are notified of the locations of the nests and buffers, and plan their training activities to avoid entering the buffer areas. Vehicle use that could adversely affect Pismo clam beds are constrained to large amphibious vehicles accessing beach slopes within training lanes from nearshore waters. Because of the variability of the proposed training activities, and based on the temporal and spatial variability of clam beds as well as grunion spawning areas, an excessive amount of monitoring would be required to develop avoidance areas. SSTC beaches are high-energy, physically disturbed environments that incur dynamic change with respect to wave action and sand movement on both weekly and seasonal bases. Potential impacts of training activities on infaunal species such as clams and benthic invertebrates would be difficult to measure and would not affect foraging avian fauna or fish.<br><br>As a result of the Essential Fish Habitat consultation with NMFS, The Navy will conduct April to May pre-event surveys for grunion prior to SSTC training events that could to disturb intertidal beach areas (Causeway Pier Insertion and Retraction training (max. of 10 per year), and ELCAS (max. of four per year). For events that have a requirement to occur in April and May, the Navy will use predicted grunion spawning periods obtained from the California Department of Fish and Game (http://www.dfg.ca.gov/marine/grunionschedule.asp ) to anticipate times to survey 10-14 days prior to the next ELCAS |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | or Causeway Pier Insertion and Retraction. This survey will identify if grunion spawning occurred or did not occur on the beach area scheduled for training. If grunion spawning is documented, then a determination on the spatial extent of spawn across the planned training area and magnitude of spawning will be made. For cases in which a significant spawning run is observed coincidental with and at the same location as a planning training event, the Navy will make every attempt possible to laterally shift the training to avoid the deposited grunion eggs to the best extent practical. |
| 188. | California Department of Fish and Game | Helicopters flying over actively-nesting California least terns and western snowy plovers should stay at least 500 feet above the ground to avoid flushing adults off the nest and leaving the eggs and chicks vulnerable to predation. | California least terns have persisted, nested, and their populations expanded parallel to Navy activities for many years. Currently California least terns nest on the runway at Naval Base Coronado, where supersonic jets takeoff and land regularly. This is a high ambient noise environment in which nesting persists. The Navy has nesting success adjacent to the North Island airfield, which is a very high noise environment. Western snowy plovers have not been documented to flush from occupied nests during aviation operations, and western snowy plover's typically move only a short distance on the ground when not directly disturbed by ground based activities. The FEIS addresses noise and its effects on the least tern and snowy plover.<br><br>The mixture of civilian, military, and commercial aviation makes for complex airspace traffic patterns and procedures. The NBC Commanding Officer has established air operations course rules for Naval Air Station North Island and the Naval Outlying Landing Field (NOLF, note - formerly known as Ream Field) to conduct safe required training and operational flights while minimizing impacts on the surrounding community. These course rules are designed to promote safe air operations, meet Navy aviation training requirements, and protect communities beneath established flight paths. Pilots are given annual course rule briefs to ensure their familiarity with course rules, procedures, and noise abatement measures. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | Currently published air operation instructions (course rules) advise pilots when departing NOLF westward to either fly 1/4 mile south of beach houses or cross over beach houses at or above 800 feet above mean sea level (300 feet above the Federal Aviation Administration's minimums set in Federal Aviation Regulation 14 CFR Part 91, see reference below) until they are near the communication station (old Navy Radio Receiver Facility). Weather conditions, other aircraft in the flight patterns, etc. can and do affect the aircraft's flight route and altitude. Federal Aviation Regulation 14 CFR, Part 91 Section 119, titled *Minimum Safe Altitudes*, Paragraph d indicates that helicopters may be operated at less than the following minimums prescribed for other aircraft, e.g. over congested areas, 1000 feet above the highest obstacle within a horizontal radius of 2000 feet of the aircraft, and over other than congested areas 500 feet above the surface. Helicopters in SSTC training primarily support offshore training and , when involved with SSTC-S inland training, are not permitted to hover over beaches but may transit over the beach at altitudes less than 500 feet altitude as required by the training curriculum. |
| 189. | California Department of Fish and Game | To assess impacts of training activities on the California least tern and western snowy plover, the Department recommends annual documentation of the distribution of California least terns and western snowy plovers at SSTC-N in relation to the timing, number, type, and distribution of training activities in each training lane during the breeding seasons for these sensitive species. | As indicated in the USFWS Biological Opinion (July 7, 2010). the Navy will include the following information in the yearly reports to be submitted to the USFWS in conjunction with the Proposed Action: a) the numbers and distributions of terns and plovers observed in each training lane; b) the numbers of any dead or injured least terns or snowy plovers (including eggs, chicks or adults) observed in each training lane; c) the hatching rates of terns and plovers in each beach lane; d) maps of the locations of tern and plover roosts within the action area; e) the timing and number of training events within the southern 3 beach lanes, and other beach lanes, to the extent available; f) the date and condition of any dead or injured tern or plover; and d) any measures taken to prevent additional tern or plover death or injury. The Navy will ensure that biological monitors look for and document the locations of least tern or |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | snowy plover nests, eggs, and chicks prior to and after all military training exercises, to allow for assessment of the take associated with training activities. |
| 190. | California Department of Fish and Game | The Department recommends increased enforcement of civilian and non-training trespass at SSTC-N to reduce impacts to the California least tern and western snowy plover. | As indicated in the USFWS Biological Opinion and described in the FEIS, the Navy will improve the delineation of base boundaries to facilitate improved enforcement in these areas. This delineation will include the installation of improved signage, k-rails, and a guard shack. At SSTC-N, temporary barriers and improved signage will be used to more clearly notify the public of the Navy's exclusive use of SSTC-N beaches and existing restrictions on public use of those beaches. |
| 191. | California Department of Fish and Game | The Department recommends that the FEIS address the potential occurrence of Pacific pocket mouse and coast horned lizard, and the potential for tong-term conservation of these species on-site. | A survey for the Pacific pocket mouse *(Perognathus longimembris pacificus)* was performed at SSTC-S in 2002 using USFWS trapping protocol (USFWS 2000). It was not detected. Four transects were completed on-site within vegetation communities that exhibited suitable sandy soil conditions. Surveyors reported that the species is not expected to occur at SSTC-S due to lack of suitable habitat (RECON 2004). The Navy will continue to survey for this species during future biological inventories. Due to possible future training requirements, it is the Navy's position that Threatened and Endangered species not be experimentally introduced to unoccupied habitat.<br><br>A survey for the coast horned lizard (*Phrynosoma coronatum blainvillii*) was also performed at SSTC-S in 2001-2002 (RECON 2004). It was not detected, and the surveyors attributed this result to a lack of suitable habitat. The survey assessed the remnant coastal sage scrub patches, and found them to be too small to support a population of this species, |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | and no native harvester ant forage (*Pogonomyrmex* sp.) was found. |
| 192. | California Department of Fish and Game | Grunion season monitoring and avoidance/minimization strategies should include but are not limited to the following:<br>a. When grunion monitoring surveys indicate grunion habitat exists on site, and significant grunion runs are seen, avoid sand disturbing activities during the grunion spawning season. The Grunion spawning season is typically March 1st to August 31st.<br>b. If avoiding the grunion spawning season is not feasible, then the Department recommends development of spawning and egg avoidance, minimization and monitoring plans for significant spawning events on site.<br>c. Predicted grunion spawning runs should be monitored prior to, during and post training or construction by a qualified grunion biologist.<br>d. Avoid sand disturbing activities in the intertidal areas during the two-week incubation period after significant spawning runs are seen. Subsequent monitoring should also indicate that no additional spawning has occurred before proceeding with sand disturbing activities. Identifying and marking grunion nests and use of buffer zones is another avoidance option.<br>e. In order to determine significant grunion spawning on the beach,<br>monitoring plans should generally include four nights of monitoring with the first night being the night of the new or full moon. At least two hours of monitoring, the first day to begin after the peak high tide and the 2nd, 3rd and 4th days of monitoring should begin at least one-half hour before peak high tide. Two hundred grunion or more seen over the four day predicted spawning run beginning with the night of the new or full moon should be sufficient to indicate significant spawning activity. | Beaches from Zuniga Jetty to the Mexican border, including SSTC training areas, are potential grunion habitat. Considering the temporal and spatial variability of local populations, in conjunction with their dependence on moon phases and tidal cycles during spawning, the potential for adverse impacts from dispersed training activities was considered to be extremely low. As a result of the EFH consultation with the NMFS, the Navy will conduct a new bottom habitat mapping survey to more accurately detail potential habitat types (ex., sand, cobble, rocks) within the oceanside SSTC boat lanes. This effort, scheduled to begin in 2011, is designed to update bottom type classification at finer resolution and spatial scales than previous California State funded surveys from 2002. The goal of this Navy funded survey would be to provide information to NMFS on habitat types within SSTC, and to Navy commands conducting underwater detonations at SSTC for consideration in selection of appropriate bottom-laid detonation sites.<br><br>The Navy will conduct April - May surveys for grunion prior to SSTC training events that could to disturb intertidal beach areas. For events that are required to occur in April and May, the Navy will use predicted grunion spawning periods obtained from the California Department of Fish and Game (http://www.dfg.ca.gov/marine/grunionschedule.asp) to anticipate times to survey 10-14 days prior to the next ELCAS or Causeway Pier Insertion and Retraction. This survey will identify if grunion spawning occurred or did not occur on the beach scheduled for training. If grunion spawning is documented, then a determination on the spatial extent of spawn across the planned training area and magnitude of spawning (on the standard grunion 0-5 spawning scale) will be |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | made. For cases in which a substantial spawning run is observed (4 or 5 on the spawning scale) coincidental with and at the same location as a planning training event, the Navy will attempt to laterally shift the training to avoid the deposited grunion eggs to the greatest extent practical. If such a shift cannot be made due to schedule conflict over multiple SSTC boat and beach lanes, logistic requirements to use a specific lane or area within a lane that precludes a shift, or safety considerations (ex., weather conditions, sea state), then the Navy will inform NMFS Southwest Region that training was conducted on that site for the specified reason. |
| 193. | California Department of Fish and Game | 3) Conservation Planning for Future Impacts to Listed and sensitive Marine and Terrestrial Species and their Habitats.<br>The Department recommends that existing methods and criteria to designate species buffer zones and sensitive habitat should be revised to provide adequate fish and wildlife protection in order to accommodate the Navy's future proposed activities on and adjacent to state property located at SSTC-North and South and the Bayside. Such proposals should be approved by the resources agencies. | Please see response to other portions of your letter (above) for a discussion of buffers with respect to federally listed birds. With implementation of the Proposed Action, losses in California least terns and western snowy plover nesting are expected to be minimally increased from baseline levels. The Navy and U.S. Fish and Wildlife Service (USFWS) have established mitigation measures to compensate for these losses. The Navy has consulted with the USFWS under Section 7 of ESA for the Proposed Action, and received a Biological Opinion.<br><br>The NBC Integrated Natural Resources Management Plan is a venue in which the Department may partner with the Navy in developing further management strategies. |
| 194. | California State Parks | California State Parks (CSP) appreciates the U.S. Department of the Navy (Navy)'s commitment to resource conservation in the southern San Diego region. This commitment is particularly evident with respect to conservation of California least tern and Western snowy plover. CSP appreciates the effort put into the Silver Strand Training Complex Draft Environmental Impact Statement (Draft EIS), including its documentation of our region's natural and cultural heritage and its review of the complex responsibilities charged to the Navy. CSP has several concerns with the proposed project with respect to sensitive species conservation, adequate mitigation for impacts to sensitive species, lack of specificity concerning increased presence of emissions and hazardous materials, and potential impacts to marine life within the adjacent off-shore property that is considered part of Silver Strand State Beach. This letter also includes comments on cultural resources for lands adjacent to park holdings, and questions the effects of increased ground and air traffic on the experience of visitors at Silver Strand State Beach. | Figures and text have been updated with "Silver Strand Natural Preserve". The document recognizes the SSNP and the extent of the offshore boundaries.<br><br>Regarding ownership of boat lanes 3-10, the Navy recognizes that California owns the fee in the tide and submerged lands from the 1941 Mean High Tide Line out to three nautical miles and that the California State Lands Commission administers and controls this land, subject to a lease to the United States and a reversion in State Parks. The reversion to State Parks is effective upon the expiration or earlier termination of the 1982 lease. The term of the 1982 lease is 40 years – or until August |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | The Draft EIS proposes:<br>• the continuation of current training and test and evaluation activities conducted within the study area;<br>• an increase in training tempo from baseline conditions and additions to types of training;<br>• the carrying out of existing, routine training at additional locations within SSTC established training areas;<br>• the introduction of new platforms and equipment;<br>• increased access and availability to existing beach and inland training areas.<br><br>Noted in section 3.1.1.5.2 SSTC-N Surrounding Land Use, and elsewhere throughout the document, the text and figures incorrectly refer to "Silver Strand State Park", instead of the correct title of "Silver Strand State Beach". In addition, the document omits recognition of the Silver Strand Natural Preserve. A Natural Preserve is a CA State land designation used to identify the presence of highly significant natural resources. CSP feels that the Draft EIS should include specific mention of this land designation and also, where appropriate, denote its boundaries in figures within the document. Similarly, the Draft EIS should note the extent of marine area managed by CSP. California State Parks holds fee title to off-shore lands, 3 miles out, that include, roughly, boat lanes 3 through boat lane 10 and extends to the southern end of Silver Strand State Beach. CSP should be both considered and listed as an "affected jurisdiction" on the EIS Cover Sheet, and throughout the document as a whole. | 31, 2021. Regarding ownership of boat lanes 3-10, the Navy has a determinable fee in the submerged lands from the Mean High Tide Line out to three nautical miles, subject to a reversion in the State of California if the lands are no longer needed for government purposes, which expires in August 31, 2021.<br><br>The Navy, as a federal agency, analyzes the potential environmental impacts of its proposed actions under NEPA. CEQA applies to the discretionary actions of California State public agencies. The actions proposed within this EIS require no new leases of land from the State; and there are no other anticipated State or local agency discretionary actions that would trigger a CEQA review. However, if a real estate action, such as a lease, is determined to be in the best interests of the Navy and the State, the State may be required to conduct a CEQA review of the lease agreement. If the State needs to conduct a CEQA analysis, the Final EIS may be referenced in the State's CEQA analysis.<br><br>Under the Commerce Clause, Article 1, Section 8 of the U.S. Constitution, the federal government is conferred a "dominant servitude" over navigable waters and the underlying land. Exercise by the federal government of this Constitutional power is not an invasion of any property rights in the water or underlying lands and is not a taking of property within the meaning of the Fifth Amendment. None of the actions proposed below the ordinary high water mark create permanent fixtures or permanent attachments to the underlying land. It is the Navy's position that the federal actions proposed in this EIS create no obligation to enter into real estate leases or agreements with the State owners of lands underlying these navigable waters. |

|---|---|---|---|
| 195. | California State Parks | CA State Parks understands that the Navy must allow for a significant level of flexibility when forecasting training needs, however we also feel that take of endangered species should be avoided or mitigated appropriately. The proposed expanded use of the training grounds, especially Beach Blue 2, Beach Orange 1, and Beach Orange 2, will most likely result in take of California least tern and Western snowy plover, and deter and disrupt current levels of nesting. CSP feels that the proposed mitigation for this take offered in the Draft EIS is inadequate to meet the standards of the U.S. and California State Endangered Species legislation. The Draft EIS lacks specificity with respect to training activities to adequately quantify potential take of protected species. Therefore, identification of an appropriate mitigation agreement prior to project implementation is difficult. Although options exist for additional on-site mitigation and avoidance, and those options should be further explored, we offer the following suggestions for a potential off-site mitigation scenario:<br><br>1. Commit to increased level of avian monitoring necessary to accurately quantify take of tern and plover resulting from the proposed actions in the Draft EIS.<br>2. Continue consultations with USFWS to develop an adaptive management agreement in which take of tern and plover is appropriately mitigated through suitable actions. Based on the success the U.S. Navy has had with the establishment of the 75-acre preserve at Delta North and South, it seems that a similar mitigation scenario could offer the appropriate long-term mitigation. Opportunities exist in the region for creation of additional off-site nesting locations.<br><br>It is the understanding of CSP that the Navy's current Western snowy plover avoidance protocol involves the buffering of each snowy plover nest that is located during the breeding season. The Draft EIS proposes to reduce this management action such that only 22 concurrent plover nests are buffered. This proposed decrease in avoidance measures, when coupled with the proposed increase in training, presents a management scenario in which take of Western snowy plover, above current levels of take, seems likely. The Draft EIS does not appear to include adequate mitigation for this increased take of Western snowy plover. | With implementation of the Proposed Action, losses in California least terns and western snowy plover nesting are expected to be minimally increased from baseline levels. The Navy and U.S. Fish and Wildlife Service have established mitigation measures to compensate for these losses. The Navy has consulted with the U.S. Fish and Wildlife Service under Section 7 of ESA for the Proposed Action, and received a Biological Opinion on July 7, 2010.<br><br>In response to this and other comments received, the Navy has revised the EIS analysis on the California least tern (Section 3.12.3.1) and the western snowy plover (Section 3.12.3.2) to provide a more in-depth analysis of impacts that training is expected to have on the species. Additional analyses have been provided on the indirect and direct impacts of current and proposed military training, to include both an average anticipated impact as well as a high-intensity anticipated impact. Additional mitigation measures have been incorporated into the Proposed Action. The benefits of current and proposed mitigation are also described and quantified to the extent practicable. As discussed in the analysis, the benefits of mitigation are expected to outweigh potential adverse impacts of training. The Navy has consulted with the USFWS, and received a Biological Opinion for take of the listed species associated with military training.<br><br>The FEIS addresses the level of loss anticipated under the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year.<br><br>As described in the FEIS and the U.S. Fish and Wildlife Service Biological Opinion, the Navy will implement a mitigation measure to schedule training in areas where less nesting occurs when possible and still meet training needs. In addition, the Navy will schedule training activities that could be conducted on the hardpacked portion of the beach during low tides when it is consistent with training needs. The Navy |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | will develop a marking strategy to delineate least tern and snowy plover nesting areas that do not encumber training activities. Such a marking strategy may entail signage affixed to existing beach lane sign posts and a limited number of additional markers, as determined appropriate by Navy staff. The Navy will include the following information in the yearly reports to be submitted to the U.S. Fish and Wildlife Service under the proposed action: a) the numbers and distributions of terns and plovers observed in each training lane; b) the numbers of any dead or injured least terns or snowy plovers (including eggs, chicks or adults) observed in each training lane; c) the hatching rates of terns and plovers in each beach lane; d) maps of the locations of tern and plover roosts within the action area; e) the timing and number of training events within the southern three beach lanes, and other beach lanes, to the extent available; f) the date and condition of any dead or injured tern or plover; and d) any measures taken to prevent additional tern or plover death or injury. The Navy will ensure that biological monitors look for and document the locations of least tern or snowy plover nests, eggs, and chicks prior to and after all military training exercises, to allow the assessment of take associated with training activities.<br><br>Finally, the Navy's Proposed Action includes: ongoing nesting site preparation at the Delta Beaches; predator management; population monitoring; a Long Term Habitat Enhancement Plan; and measures to eliminate unauthorized recreational trespass, which are all conservation measures that support the recovery of the least tern. The Navy expects implementation of these conservation measures to maintain the suitability of least tern habitat within the action area over the long term. The Navy's actions will increase the capacity of oceanside beaches and the Delta beaches to accommodate least terns and snowy plovers. |

| 196. | California State Parks | CSP ownership at Silver Strand State Beach extends 3 miles out to sea. This off-shore portion of Silver Strand State Beach generally includes Boat Lanes 3 through 10 and is adjacent to Boat Lane 11, which immediately borders Silver Strand SB to the south. The EIS fails to adequately consider the effects on this area or proposed appropriate mitigation of its actions. This area was created to ensure the public's continued enjoyment of the coastal marine environment. It is the Navy's responsibility, as part of the EIS, to delineate this state ownership and to evaluate the EIS proposals' potential effects on the public's use of this off-shore area.<br><br>In addition, the 3-mile marine area is eligible to be designated as a State Marine Protected Area. While CSP appreciates the consideration of marine life already included within the Navy's protocol for disruptions to the under-water acoustic environment we are concerned that existing activity and increases proposed in the Draft EIS will result in additional harm to marine life that use waters managed by CSP. CSP requests that activities involving acoustic disturbances known to damage marine life (pile driving, underwater detonations, SWAG operations, blasts, pyrotechnics, etc.) be located at distances far enough from ocean waters managed by CSP such that impacts to resources within these waters are avoided. | Regarding ownership of boat lanes 3-10, the Navy recognizes that California owns the fee in the tidal and submerged lands from the 1941 Mean High Tide Line out to three nautical miles and that the California State Lands Commission administers and controls this land, subject to a lease to the United States and a reversion in State Parks. The reversion to State Parks is effective upon the expiration or earlier termination on the 1982 lease. The term of the 1982 lease is 40 years – or until August 31, 2021. The Navy has submitted a Coastal Consistency Determination to the California Coastal Commission and received a conditional concurrence from the Commission.<br><br>The analysis in Section 3.1 – Land Use, analyzes the public lands on all borders of the range complex. SSSB and the SSNP are part of the public lands that surround SSTC, and the public would be able to continue to use public beach adjacent to active training.<br><br>The Navy has analyzed all marine communities located offshore and nearshore from SSSB and SSNP in Section 3.7.2.2 of the SSTC EIS, and has also submitted an Essential Fish Habitat assessment to NMFS. The conclusions reached in the EIS and the Essential Fish Habitat assessment indicate that effects are temporary and localized, and without impact to overall biotic assemblages.<br><br>The current locations of White and Purple lanes reflect the locations of these lanes as portrayed on NOAA Chart 18772. No Navy records have been found that identify when the lanes were designated. The locations of these lanes can be corrected by submitting a request to NOAA with corrected latitudes and longitudes. However, the Navy does not conduct amphibious training activities on the State Beach portion on this boat lane. |

| 197. | California State Parks | Current and increased naval activity in SSTC South, particularly in Beach White 1 and Beach White 2, may result in disturbance to Western snowy plover dependent upon protected habitat within the adjacent Silver Strand Natural Preserve, managed by CSP. CSP requests that the Navy inform CSP staff of training activities in this region such that CSP staff can accurately monitor potential impacts from these adjacent land uses. If negative effects are documented, CSP requests that the Navy work with CSP and USFWS to mitigate these negative effects. | The Navy has consulted with the USFWS, and has received a Biological Opinion (signed July 7, 2010) for take of the listed species associated with military training; the BO includes appropriate avoidance, minimization, and mitigation measures. The Navy will not add CSP to the list of entities that are alerted when training activities are anticipated because the Navy has consulted with the USFWS on take and appropriate minimization, avoidance and mitigation measures. The Navy's consultation has also identified appropriate monitoring for the species, which is detailed in Section 3.12 of the FEIS.<br><br>As part of the conditions of the Biological Opinion, appropriate monitoring for the species was identified. The Navy will include the following information in the yearly reports to be submitted to the USFWS under the proposed project: a) the numbers and distributions of terns and plovers observed in each training lane; b) the number of any dead or injured least terns or snowy plovers (including eggs, chicks or adults) observed in each training lane; c) the hatching rates of terns and plovers in each beach lane; d) maps of the locations of tern and plover roosts within the action area; e) the timing and number of training events within the southern three beach lanes, and other beach lanes, to the extent available; f) the date and condition of any dead or injured tern or plover; and d) any measures taken to prevent additional tern or plover death or injury. The Navy will ensure that biological monitors look for and document the locations of least tern or snowy plover nests, eggs, and chicks prior to and after all military training exercises, to allow the assessment of take associated with training activities. |

|---|---|---|---|
| 198. | California State Parks | CSP appreciates the Navy's assistance with the clean-up of expended materials that occasionally wash to shore on SSSB and the SSNP. CSP is concerned that some of the activities proposed in the Draft EIS will result in additional occurrences of munitions constituents and other expended materials on the public beaches managed by CSP. CSP requests that the Navy continue this cooperation and allow for increased communications and response for clean-up of future expended materials found on SSSB and SSNP. Additionally, CSP requests that Navy staff work with CSP interpretive staff to identify interpretation needs and public education and outreach necessary to protect the visiting public and CSP staff from these potential dangers. | Most of the training materials used at SSTC are non-hazardous, or are rendered non-hazardous when they function as designed (e.g., blanks). Trainees collect and remove expended materials to the extent practicable at the conclusion of their training events. Very rarely, energetic training munitions may not function as designed, resulting in their temporary presence until promptly retrieved by Navy personnel. The incidence rate of expended items that would pose a risk to the public is so low that a public education and outreach program is not warranted. |

|---|---|---|---|
| 199. | California State Parks | CSP is concerned that the activities proposed in the Draft EIS will result in Naval activity (training exercises, aircraft fly-over, beach landings, traversing from SSTC North and SSTC South, etc.) on or over SSSB and SSNP. CSP is a public safety agency and as such is committed to protecting the resources and visitor experience on these beaches. CSP requests that any desired increased use of CSP-managed lands be approved by the CSP San Diego Coast District Superintendent prior to initiation. | The only activities that occur on SSSB or SSNP are physical training activities which include running and swimming. The physical activities performed in this area are the same as those done by the public. No landings, aircraft overflights, or other high-intensity activities use these two areas.<br><br>The Navy appreciates CSP's dedication to maintaining public safety and a positive experience for visitors to SSSB and SSNP. As cooperative neighbors, the Navy intends to maintain the same respect for SSSB and SSNP lands as for Navy-owned or leased lands. The only activities that occur on SSSB or SSNP are physical training activities which include running and swimming.<br><br>The Navy has a determinable fee in the submerged lands from the Mean High Tide Line out to three nautical miles subject to a reversion in the State of California if the lands are no longer needed for government purposes, which expires in August 31, 2021.<br><br>Additionally, the Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. In light of this proximity, the Navy has developed mitigation measures for activities that may cause an impact to the environment or the surrounding area, and has presented these measures in the EIS. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 200. | California State Parks | The natural landform and habitat present within SSTC South is extremely unique and regionally rare. The Draft EIS proposes increased impacts to this valuable resource but fails to propose adequate mitigation. The proposed training in the vernal pools exemplifies this oversight. Every effort should be made to protect the vernal pool resources and other unique habitat elements found in SSTC South. Proposed activity within the vernal pools when dry has the potential to disrupt the soil integrity and the long-term sustainability of this habitat, the plant life and the San Diego fairy shrimp that occupy this niche. If the Navy must increase training within the sensitive habitats of SSTC South, the impacts should be quantified and appropriate mitigation measures should be undertaken. | The Navy will use scheduling and other planning tools to minimize impacts to vernal pools. The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |

|---|---|---|---|
| 201. | California State Parks | Table 3.3-4, "Operational Emissions at SSTC and Portions of NASNI with Evaluation of Conformity" reports emissions increases of monitored pollutants at levels anticipated to be up to nearly 4 times the 'No Alternative' emissions estimation. Additionally, the Draft EIS mentions hazardous air pollutants (HAP's) but provides inadequate data for assessment of the current level of HAP's emitted by Naval activities and anticipated proposed increases. Given these proposed increases, and the apparent lack of data on HAP's, CSP feels that the Navy should increase its commitment to monitoring and reporting air pollutants throughout the region to all affected jurisdictions. Specific attention should be directed toward supplementing existing monitoring protocols with sampling stations and efforts that allow the Navy to identify the contribution of Naval-generated emissions, including HAP's, long-term, and to mitigate appropriately when necessary. | The Navy has a comprehensive air quality management program that includes monitoring and mitigation for Naval-generated emissions, including HAPs. Mitigation measures that are part of the Navy's air quality management practices are implemented at SSTC. Aircraft, marine vessels, ground vehicles, and military equipment are well-maintained, and meet applicable air emission standards (such as smog certification for on-road vehicles) in accordance with State requirements. Section 3.3 and Appendix C analyze the pollutant emissions from the training activities presented in the EIS and indicate that the emissions from all training activities are within air quality standards. |
| 202. | California State Parks | The Draft EIS contains a fairly extensive write-up on the policies, plans and regulations that govern the management of hazardous materials at SSTC however, given the relatively short public review period, an adequate review of these reference materials was not possible. The Draft EIS does note that, under the Preferred Alternative, the amounts of expended training materials would increase, the weight of expended flare and smoke canister residues would increase and the amounts of residues from detonations of underwater explosives would increase. The EIS would benefit from a more specific discussion of the updated offshore petroleum discharge system (ES9). CSP is concerned with the health of the environment for the park visitors, State Park staff, local public, and the sensitive natural resources living in this region. Review of this section would be facilitated by the inclusion of data from studies that have evaluated of levels of hazardous materials in the local environment with particular inclusion of effects on sensitive receptors. CSP feels that, with the proposed increases in expended materials, the Navy should clearly outline and commit to a testing and evaluation protocol designed to identify the degree to which hazardous materials mayor may not be emitted through the SSTC operations, and the levels at which they are accumulating in the local environment. Additionally the Draft EIR states that the Navy submits EPCRA 312, Tier 'II forms to the emergency responders (Fed Fire) and the San Diego County Certified Unified Program Agency (CUPA), and the EPCRA 313 Toxic Release Inventory (TRI) Form R to USEPA, with courtesy copies to the California Environmental Protection Agency (CalEPA) and the Regional Water Quality Control Board. CSP feels that we would benefit from updated knowledge on this subject and requests that these forms be submitted to the Peace Officer Lifeguard staff stationed at Silver Strand State Beach. | The comment cites the Executive Summary (page ES-9) in requesting a more specific discussion of the Offshore Petroleum Discharge System; that discussion is found in Section 2.2.2 and Table 2-1 of the EIS. The comment postulates that "studies that have evaluated levels of hazardous materials in the local environment" exist that have not been incorporated into the FEIS; the Navy believes that relevant studies and local data have been considered in its analysis. The comment requests a testing program, the need for which has not been established in the FEIS. Finally, the commenter requests copies of the Toxic Release Inventory for NAB Coronado, which are available from the CUPA or USEPA.<br><br>While the SSTC FEIS discusses a cumulative increase in the quantity of smoke grenades and flares used in training events, the increase is quantified in terms of individual grenades and flares, and not necessarily the small quantities of potentially hazardous substances. There will be little direct use of smoke grenades and flares directly in or over water. Use per training event in which smoke and flares apply is also small (2-11 items). In addition, this use is spaced out both in time and space throughout the year and at various locations within SSTC, so there are no hot spots of air pollutants on the ranges. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | Smoke grenade filler has approximately 11 ounces of a colored smoke mixture (white, red, yellow, green and violet). The smoke is composed of a mixture of potassium chlorate, sodium bicarbonate, lactose, and a dye, all of which have—in the amounts or quantities specified in the EIS—no significant environment effect. In addition, most of the filler is consumed during use. Chemical composition of military flares can be a combination of magnesium, boron, potassium perchlorate, and barium chromate (USAF 1994), or in some cases red phosphorus. Red phosphorus is a common ignition compound used for instance in matches. Red phosphorus is a relatively non-toxicity compound although highly flammable, and subject to environmental degradation in marine systems (Spanggord et al. 1985, EFRB 2010). In an analysis of military flares, the US Air Force found that most of the common flare constituents were consumed during flare ignition. Residual ash from flares contained small quantities of magnesium and boron (USAF 1994). Measured values of magnesium in flare ash [86 part per million (ppm)] were found to be below the natural seawater composition of magnesium (1290 ppm).<br><br>Potassium perchlorate was not a significant residue and was not detected in ash samples measured. In the rare instance that any perchlorate were to remain, perchlorates are also highly soluble, and the ions have a limited tendency to interact with other dissolved chemical species or to adsorb to aquifer materials under typical environmental conditions (Clausen et al 2007). Pechlorate in marine aquatic systems is subject to substantial bacterial degradation (Urbansky 1998, Logan et al. 2001, Brown and Gu 2006, Petrisor 2006, Wilkin et al. 2007).<br><br>Therefore, given the limited, short-term potential for smoke grenade and flare residuals to fall into San Diego Bay and the ocean, the relatively low levels of constituents actually released, and natural environmental degradation of these compounds, the relative risk from use of these items is not |

|---|---|---|---|
| | | | substantial.<br><br>A comparison to related pyrotechnics with substantially more constituents can be made within the San Diego region. For example, the San Diego Regional Water Quality Control Board required water and sediment monitoring by Sea World due to daily firework displays over Mission Bay. On average, Sea World conducts 100-120 shows per year, with each show using up to 250 shells, and up to 1,750 shells for special holidays (SDRWQCB 2007). In support of a the concern for potential environmental contamination from fireworks residue, water and sediment samples were taken from 2001 through 2006 as part of a Coastal Commission permit requirement. Samples were analyzed for various constituents found in fireworks, including oxidizers (ammonium perchlorate and potassium perchlorate), metals (antimony, barium, copper, strontium), and salts (magnesium, sodium, etc.). The final monitoring report concluded that there were no substantial spatial or temporal patterns in concentrations of critical metals in sea water or sediments in the small area of Mission Bay subject to repeated large scale fireworks displays (SDRWQCB 2007)<br><br>Under the No Action Alternative, SSTC training activities require the detonation of small amounts of explosives on the water surface and underwater. While up to 1,610 pounds of explosives are used each year for underwater detonations (Table 3.5-7), the majority of these training events occur on the open ocean side of SSTC.<br><br>As discussed in Section 3.4.2.1.1 through 3.4.2.1.3, high-order combustion of typical military explosives used at SSTC, such as Royal Demolition Explosive (RDX) and pentaerythritol tetranitrate (PETN), consumes over 99.997 percent of the original explosive material. Major detonation by-products consist of common inert gases and relatively inert inorganic salts. For example, exploding 10 pounds of Composition (C)- |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | 4, which is 91 percent RDX, produces about 3.7 pounds of nitrogen, 25 pounds of carbon dioxide ($CO_2$), 1.6 pounds of water, 1.8 pounds of carbon monoxide, 0.2 pound of ethane, 0.03 pound of hydrogen, 0.02 pound of propane, 0.09 pound of ammonia, and 0.02 pound of methane. The major products of combustion-nitrogen, $CO_2$, and water-are all common natural components of the atmosphere and water. Any explosive residue (<0.003 percent) would be relatively insignificant, and would be either quickly dispersed by local ocean currents (Section 3.5.1.3.4) or buried in ocean sediments. Field studies conducted by the US Army indicate that explosives residue includes 0.003 percent or less of the original quantity of material detonated, although the amounts of explosives residues vary among different types of ordnance. Land-based studies show that, for large ordnance items such as bombs, high-order detonations may spread residual particles in the micron and submicron-sized range over hundreds of square meters. However, individual quantities of explosives used at SSTC are substantially smaller than those tested by the Army, which means smaller amounts of the original detonation materials and less explosive velocity. In addition, SSTC explosive events occur in water rather than on land, and would be subject to substantially less dispersion due to the non-compressibility of water. Given the nature of training events at SSTC, low order detonations, while possible, are not the desired training outcome and any remnants are retrieved to the greatest extent practical to diagnose what may have caused the low-order detonation.<br><br>The environmental fate and effect of military munitions constituents, including RDX, have been the subject of a number of scientific studies to determine if these compounds represent a risk in the marine environment, including water and sediment (Hawari 2000, Belden et al. 2005, Lotufo and Lydy 2005, Houston and Lotufo 2005, Rosen and Lotufo 2005, Juhasz and Naidu 2007, Rosen and Lotufo 2007a, 2007b, Boyd et al. 2008, Monteil-Rivera et al. 2008, Mukhi et |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | al. 2008, Weber 2008, Lotufo et al. 2009, Lotufo et al. 2010, Rosen and Lotufo 2010, Zhao et al. 2010).<br><br>As a compound in the environment, RDX is subject to natural processes in marine systems that break down (i.e., degrade) the parent molecule to inert nitrogen compounds. Processes include hydrolysis in marine water, photodegradation from light, uptake and metabolism from marine plants, and bacterial degradation in water and sediment (Hawari 2000, Juhasz and Naidu 2007, Boyd et al. 2008, Monteil-Rivera et al. 2008, Lotufo et al. 2009, Weber 2008, Zhao et al. 2010). Based on both laboratory toxicity testing and more realistic environmental exposure scenarios, RDX has also shown low to no toxicity and no potential for bioaccumulation in a variety of marine species, including amphipods, mussels, and fish (Belden et al. 2005, Lotufo and Lydy 2005, Houston and Lotufo 2005, Rosen and Lotufo 2005, Rosen and Lotufo 2007a, 2007b, Mukhi et al. 2008, Lotufo et al. 2009, Lotufo et al. 2010, Rosen and Lotufo 2010).<br><br>Therefore, based on the limited amounts of explosive residues actual deposited during SSTC training events, dispersion and natural degradation of any small amounts of residue, and limited toxicity to marine organisms, the overall effect on the environment of in-water explosives use would be insignificant. |

|---|---|---|---|
| 203. | California State Parks | The Draft EIS does not include an adequate assessment of the potential negative effects of increased activities, especially amphibious and beach activities, on spawning success of the California grunion. This species is largely endemic to Southern California and requires undisturbed natural intertidal sandy beach habitat. The Navy manages a significant portion of this species remaining suitable spawning habitat. Potential negative effects to this species should be quantified, avoided when possible, and mitigated when necessary. | The analysis presented in the EIS indicates that the impacts to the intertidal zone would be minimal, as this is a dynamic energy environment, and any affects in the intertidal zone would be temporary and localized. Considering the limited draft of the vehicles that would be making landings through the intertidal zone, in conjunction with the steep slope of the beach throughout the SSTC-N and SSTC-S, bottom disturbance would be limited and not expected to adversely impact fish habitat. |
| 204. | California State Parks | Given the level of detail for specific training schedules provided in the Draft EIS, it is also difficult to assess the long-term impacts of the proposed increased activities on rare and special-status plant species occurring within the SSTC (*Cordylanthus maritimus* ssp. *maritimus*, *Astragalus tener* var. *titi*, and others listed in Table 3.11-2). CSP shares conservation responsibility with many of these resources and is committed to providing high quality habitat for the successful persistence of these species. CSP feels that the proposed activities in the Draft EIS have the potential to result in significant negative population level effects for these special-status and rare plants. Suggested additional mitigation measures for rare and special-status plants found in the SSTC may include such actions as:<br><br>1. Annual population-level surveys that quantify various impacts from increased training activity;<br>2. Commitment to a regional rare plant conservation program in which unavoidable impacts resulting from increased training activities are mitigated through off-site restoration and enhancement. Contribution toward a special status and rare plant conservation seed-bank should also be explored;<br>3. Further consideration and implementation of on-site special-status and rare plant preserves and protected conservation areas.<br><br>Section 3.11 should address the potential occurrence of Pacific pocket mouse, and the applicability of SSTC South as a viable habitat for long-term conservation of this species. | The *Cordylanthus* does not occur in the Navy action area - it occurs at YMCA Camp Surf and it is managed and monitored jointly by the Navy and the YMCA at that location for its protection. The dune-dwelling *Astragalus tener* var. *titi* has not been seen on the Silver Strand for many years, and is presumed to be extirpated from southern California. Upland rare plants can be locally relatively abundant, and benefit from the Navy's program of annual invasive species control and monitoring. Some benefit occurs through restoration that primarily involves weed control, but sometimes appropriate special status plants are incorporated into restoration efforts. Avoidance and minimization measures are implemented at the Delta beaches for plants identified as rare by California Native Plant Society as List 1B or higher. The Navy conducts annual surveys and treatment for invasive plants, and in recent years has been expanding treatment of iceplant. A vegetation management plan is under development to support least terns and snowy plovers, and this will incidentally benefit rare plant species. Focused rare plant management and annual monitoring includes *Phacelia stellaris, Dudleya variegata,* among other rare plants that are less locally abundant on Silver Strand, or are known to be at risk from disturbance. Finally, |

|---|---|---|---|
| | | Section 3.11 should address coast horned lizard presence and conservation. | the Navy avoids impacts to rare species through its site approval process under NEPA.<br>The Pacific pocket mouse (*Perognathus longimembris pacificus*) was surveyed for at SSTC-S in 2002 using a USFWS trapping protocol (USFWS 2000). The mouse was not detected. Four transects were surveyed on-site within vegetation communities that exhibited suitable sandy soil conditions. Surveyors reported that the species is not expected to occur at SSTC-S due to a lack of suitable habitat (RECON 2004). The Navy will continue to survey for this species during future biological inventories. Due to possible future training requirements, it is the Navy's position that Threatened and Endangered species not be experimentally introduced to unoccupied habitat.<br><br>The coast horned lizard *(Phrynosoma coronatum blainvillii)* was also surveyed for at SSTC-S in 2001-2002 (RECON 2004). It was not detected and the surveyors attributed this to a lack of suitable habitat. They assessed the remnant coastal sage scrub patches to be too small to support a population of this species, and no native harvester ant forage (*Pogonomyrmex* sp.) was found. |
| 205. | California State Parks | Section 3.12 should more accurately address the level to which the SSTC is critically important to the long-term sustainability of healthy migratory and shore bird populations throughout the Pacific flyway. Potential long-term negative effects from the proposed increases identified in the Draft EIS should be more accurately quantified and appropriate mitigation and avoidance measures proposed. | Please see the analysis of impacts to Migratory Birds in Section 3.12. The Navy is committed to work with the Port to fund surveys for waterfowl and shorebirds throughout San Diego Bay every three years. Baywide surveys follow a consistent protocol, and will be used to document future changes in bird abundance, diversity, and use of the Bay. Section 3.12.1.2 of the EIS summarizes over 500,000 observations of San Diego Bay birds by species, location, abundance, diversity, and bird group. The FEIS text will be revised to state that The American Bird Conservancy has designated the South San Diego Bay Unit as a Globally Important Bird Area due to the presence of globally significant numbers of nesting gull-billed terns and continentally significant numbers of surf scoters, Caspian terns, and western snowy plovers. The entire southern end of San Diego Bay, including Sweetwater Marsh and South San Diego Bay Units, has been recognized as a Western Hemisphere Shorebird |

| | | | Reserve Network Site. |
| 206. | California State Parks | Section 3.13 addresses cultural resources on lands adjacent to CSP properties. CSP reviewers found the history of dredging on the strand inadequate to review mitigating measures, and as a result, questioned conclusions such as:<br><br>As mentioned in 3.13.1.1.2, the training areas in SSTC-North are located on fill deposits that resulted from the dredging of San Diego Bay and the construction of Zuniga Jetty. These fill areas have no potential for in situ heritage resource deposits (3.13-5).<br><br>From experience on adjacent CSP properties, the dredged areas are non-contiguous, and depending upon depths, cover cultural materials that should be addressed both in the SSTC-North and SSTC-South areas. Should the SSTC-South prehistoric sites assumed to be eligible to the National Register have been on CSP land, the 'Summary of Effects' (Table ES-2) conclusion that foot traffic is not an adverse impact would have been questioned. This is especially true to the west of the highway where CSP staff have noted cultural materials in shell middens located undisturbed within centimeters of the surface.<br><br>Regarding submerged cultural sites, underwater shipwrecks and other offshore cultural materials deserve better protection than promised avoidance. As reported in the cultural resource history, Manila galleons have been passing Silver Strand since 1565. The more deeply-submerged prehistoric materials would be difficult to impact with the increased operations described, but some of the submerged historic sites will be impacted by the activities in Alternatives 1 and 2. Assurances that more specific locations and depths will be recorded with the federal clearinghouse (the South Coastal Information Center), and that Navy cultural resource managers will take an active part in designing these avoidances is requested. | The dredge-spoil fill areas described in the EIS as having no potential for in-situ heritage resource deposits are those on the seaward side of SSTC-North. Over time, these deposits have been repeatedly disturbed by amphibious support training activities without any direct or indirect evidence of buried cultural deposits ever observed in the zones used for training. There is a buffer immediately adjacent and parallel to the western side of SR 75 coincidental to the original Silver Strand shoreline that is avoided by training activities and within which are located the recorded archaeological deposits listed in Table 3.13-1.<br><br>The Summary of Effects reference to foot-traffic-only activities not being accountable as an adverse effect applies principally to the terrestrial training area at SSTC-South. This programmatic finding derives from both the dispersed nature of pedestrian-only NSW training activities at SSTC and past consultion determinations of the effect of these kinds of training there and on other NB Coronado ranges, including San Clemente Island. This finding is supported by the prescription that the areas of recorded archaeological sites are restricted to foot traffic only. The finding is also supported by the understanding developed through site evaluations at SSTC-South in 2007 (Underwood 2008), which found that none of the five recorded site areas tested (out of an overall 12 |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | recorded sites) across the northern portion of SSTC-South possessed sufficient integrity to recommend the NRHP eligibility. For the purposes of this EIS, this no adverse effect precedent is applied in accordance with authorities stipulated under the San Diego Metro Area PA.<br><br>Regarding submerged cultural resources, the primary potential derives from the point-specific Single Anchor Leg Moor (SALM) component of Offshore Petroleum Discharge System (OPDS) training activities. This is a point-specific disturbance described to occur in a zone approximately one mile across all the SSTC-North boat lanes. While late-19th and early-20th-century shipwrecks are documented to have occurred in the vicinity of the SSTC offshore training areas, only the general locations of these resources are known, and none of these appear to fall within the zone of potential effects of SALM/OPDS activities. In the absence of referenced shipwreck locations within this zone, the type comprehensive underwater survey to identify specific locations and depths for submerged resources is deemed unnecessary, and impractical at the several square km scale that would be required. The existing training activity protocol to have divers directly observe the bottom in advance of placement of the SALM to avoid hazards, including shipwrecks, fouling the mooring anchor and associated tackle is considered the better training-activity-specific approach to avoiding inadvertent effects to any observable submerged resources that might be present. |
| 207. | California State Parks | The EIS considers the potential effects on traffic flow and concludes that the capacity of Highway 75 will not be significantly affected. However, CSP is also concerned about the effects that the significant increase in military operations will have as a distraction to motorists on Highway 75. The potential for creating hazardous driving conditions due to military distractions may be exacerbated during peak beach visitation periods. The EIS should analyze this aspect of its proposals potential effects on highway safety and propose appropriate mitigations. | The majority of activities are out of sight of SR-75. Existing and proposed activities will not cause a visual distraction to drivers. The Navy is responsible for motorists on federally controlled land and the California Department of Transportation is responsible for regulation of vehicles on public roadways and lands. While hazardous driving conditions due to military activities are extremely unlikely, drivers' adherence to various speed and traffic control measures are the responsibility of the State, the City of Imperial Beach, and the City of Coronado, and outside of Navy jurisdiction. |

|---|---|---|---|
| 208. | California State Parks | Nearly 1/2 million people visit Silver Strand State Beach each year, most during the spring and summer between April 30 and September 15. The EIS fails to adequately evaluate the effect that increased military operations will have on the visual experience these beach goers have grown accustomed to. Visitors come to Silver Strand to enjoy surf-play, wide sandy beaches and eyelevel views of the ocean, frames by scenic Pt. Loma (to the north) and the Coronado Islands (to the south). The EIS needs to propose means by which the negative visual effects of increased military operations can be minimized, including, but not limited to, considering the seasonality of operations.<br><br>California State Parks appreciates the opportunity to comment on the DEIS and hopes that our comments contribute to a better project. | The Navy has analyzed all potential Land Use and Socioeconomic conflicts within the ROI. The increase in proposed training activities will not result in a change in the public's visual experience because training is currently being conducted in the areas around SSSB. There are no proposed changes in the view shed. The Navy is not infringing on any public lands that are used by the adjacent communities. |
| 209. | California State Lands Commission | Staff of the California State Lands Commission (Commission) has reviewed the above referenced document and offers the following comments on the draft Environmental Impact Statement (DEIS). We understand that this project has not undergone review under the California Environmental Quality Act (CEQA). Depending on what other State or local agencies have discretionary action over the proposed project, the CSLC may take the role of a Lead Agency or a Responsible or Trustee Agency under CEQA.<br><br>As background, the State acquired sovereign ownership of tidelands and submerged lands and beds of navigable waterways upon its admission to the United States in 1850. All tidelands and submerged lands, as well as navigable rivers, sloughs, etc. are impressed with the Common Law Public Trust. The Public Trust is a sovereign public property right, in the nature of an easement, held by the State or its delegated trustee for the benefit of all the people. This right limits the uses of these lands to waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, open space, or other recognized Public Trust purposes. A lease from the CSLC is required for any portion of a project extending onto state-owned sovereign lands, which are under its exclusive jurisdiction. As to lands involving the Public Trust Easement, the property is subject to certain land use restrictions and public rights and any inconsistent use with the easement may be prevented by the CSLC.<br><br>CSLC has issued a lease to the Navy for a portion of the beach at the Silver Strand, Lease PRC 6319.9, between the Ordinary High Water Mark of 1941 and the Ordinary High Water Mark of 1948. The Pacific Ocean waterward of the Ordinary High Water Mark of 1948 is not covered by a lease from CSLC.<br>Based on a review of the information provided, it has been determined that the Alternative 1 (Preferred Alternative) for the proposed project will be located within state sovereign lands under the leasing jurisdiction of the Commission. The U.S. Navy will need to apply to the Commission for a lease for that portion of the beach which is not currently covered by the existing lease.<br><br>The Commission will need to make a CEQA determination prior to consideration of lease approval. Based on the information provided in the DEIS, a CEQA document will most likely | The Navy, as a federal agency, analyzes the potential environmental impacts of its proposed actions under NEPA. CEQA applies to the discretionary actions of California State public agencies. The actions proposed within this EIS require no new leases of land from the State; and there are no other anticipated State or local agency discretionary actions that would trigger a CEQA review. However, if a real estate action, such as a lease, is determined to be in the best interests of the Navy and the State, the State may be required to conduct a CEQA review of the lease agreement. If the State needs to conduct a CEQA analysis, the Final EIS may be referenced in State CEQA analysis.<br><br>Under the Commerce Clause, Article 1, Section 8 of the U.S. Constitution, the federal government is conferred a "dominant servitude" over navigable waters and the underlying land. Exercise by the federal government of this Constitutional power is not an invasion of any property rights in the water or underlying lands and is not a taking of property within the meaning of the Fifth Amendment. None of the actions proposed below the ordinary high water mark create permanent fixtures or permanent attachments to the underlying land. It is the Navy's position that the federal actions proposed in this EIS create no obligation to enter into real estate leases or agreements with the State owners of lands underlying these navigable waters. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | need to be prepared for the proposed project in order to cover our discretionary action (lease within state sovereign lands). The CEQA document would need to include all information required under Public Resources Code, section 21000 et seq., including identifying the project's potentially significant impacts and mitigation measures to clearly avoid or mitigate those significant impacts. Public review and all appropriate noticing of the CEQA document (CEQA Guidelines, sections 15072 and 15073), as well as a Mitigation Monitoring Program, will need to be completed. In addition to the information provided in the EIS, the CSLC would need copies of any cultural resource reports completed on land under the jurisdiction of the Commission. Any artifacts found on lands under the jurisdiction of the Commission are considered the property of the state of California. Any disposition of these artifacts requires the approval of the Commission and a transfer of title may be required.<br>The Commission would also like to receive copies of the following documents:<br>• Applicable State regulatory agency permit applications prepared for the project; and<br>• California Coastal Commission Consistency Determination if or when available. | |
| 210. | City of Imperial Beach, California, Office of the City Manager | 1. Due to limited staff and time, our review was not as thorough as we wished. Also given the length of the document and approximately a decade it took to prepare, we request an additional review period of 45 days. | The Navy recognizes the public involvement in the NEPA process. In response to requests by the cities of Imperial Beach and Coronado and citizens, the public and agency comment period for the FEIS was extended to March 30, 2010. |
| 211. | City of Imperial Beach, California, Office of the City Manager | 2. The DEIS does not adequately allow a reader to assess the current and proposed activities within each lane and thus it's difficult to distinguish the impacts in the southern zones from the northern ones, and the changes from current to proposed activities. | Scheduling flexibility and requirements prohibit the Navy from analyzing its training activities in this manner. The Navy has performed an equally proficient method of analysis within the SSTC EIS by analyzing all individual affected resources within the region of influence and not specific areas of training. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 212. | City of Imperial Beach, California, Office of the City Manager | 3. With the increase in aircraft activities and firearm discharges, we request that helicopter sorties and firearm discharges stop no later than 10:00pm and start no sooner than 7:00 a.m. | Realism in training is an essential element of SSTC training. Nighttime operations are an important part of training at SSTCS to ensure personnel are prepared for real world situations. NASNI and NOLF-IB, Imperial Beach have a suite of policies, procedures, and programs to address and promote measures to minimize aircraft noise.<br><br>NOLF-IB is open for flight operations from the last Sunday in October to the first Sunday in April on Monday-Thursday from 0800 to 2230 and on Friday from 0800 to 1800 Pacific Standard Time. NOLF-IB is open from the first Sunday in April to the last Sunday in October on Monday - Thursday from 0800 to 2300 and on Friday from 0800 to 1800 Pacific Daylight Time. The airfield is closed from 1800 local time the day prior to and during all government holidays. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC EIS document. |
| 213. | City of Imperial Beach, California, Office of the City Manager | 4. In light of the decrease in beach access due to the increase of training activities, we suggest three mitigation steps:<br>a) The Navy create an alternative pathway running from the general vicinity of the western end of Carnation Street heading in a northeasterly direction along the perimeter of the southern boundary of the base (roughly the northern boundary of 18) to the eastern boundary of the base that parallels SR-75; then proceeding northward on an existing path currently available to the public until the path ceases a bit south of the Cays; then proceeding in a northwesterly direction on Navy property to connect with Silver Strand State Park. This would provide walkers, joggers, runners, bicyclists a north-south pathway/trail to mitigate for the loss of beach access.<br>b) People also walk their dogs along the part of the beach that will be greatly affected by the increased training, and therefore we suggest that the Navy create and maintain a "dog park" somewhere along the southern perimeter of the base somewhere east of Camp Surf. (The Navy had allowed the public to use an area just east of the entry gate on Silver Strand in IB as a dog park. The area is now closed to the public, but it is a possible site to mitigate the impact of the training activities that reduce access to the beach.)<br>c) The Navy should assist in funding beach sand replenishment efforts. For example, the Navy could help the Corps of Engineers with dredging the entry to San Diego Bay and placing the dredge materials (sand) nearshore or on the beach along the coast of Imperial Beach. The City | The Navy analysis within the EIS in Section 3.1; Land Use conclude that no impacts on SSTC-S beaches required mitigation. The Navy will not be including a pedestrian trail as mitigation.<br>The suggested mitigation measure has no real "nexus" with the perceived impact, and the non-significant impact does not require mitigation. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | prefers that sand be placed onshore because this is the best way to preserve our beaches. Preserving the beach between Carnation Street and the mouth of the Tijuana River would be a measure that mitigates the reduced beach access caused by the increase of naval activities along the Silver Strand north of Carnation. | |
| 214. | City of Imperial Beach, California, Office of the City Manager | 5. In light of the overall increase in noise due to helicopter activities, firearms and other training activities, mitigation activities should include:<br>a) Strict adherence to flight patterns at Ream Field that will not allow fixed-wing and helicopter flights over homes in Imperial Beach.<br>b) There should be no helicopter training at Ream Field after 9:30pm. All flights should be heading back to their home base after 9:30pm.<br>c) Work with the City In developing a more effective notification system of planned training activities that have the potential to impact residents of Imperial Beach (in addition to the standard notification provided to our Public Safety Department when exercises involve pyrotechnics or firearm discharges). | Navy operations at NOLF are outside of the scope of the Proposed Action, but are addressed under Cumulative Impacts. Airfield restrictions for NOLF and NASNI are discussed above in comment response #212. The Proposed Action addressed in this EIS does not involve helicopter activity at NOLF, so impacts of those activities cannot be mitigated in this EIS.<br>As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website. |
| 215. | City of Imperial Beach, California, Office of the City Manager | 6. Table 3.6-9 indicates that Camp Surf is situated further away from the noise source than the residential areas of Imperial Beach when the other tables show Camp Surf closer to the noise source than the Imperial Beach residential areas. Please explain. | The reason the distances vary is because the locations of the sources change from table to table. |
| 216. | City of Imperial Beach, California, Office of the City Manager | The City of Imperial Beach appreciates the additional time the Navy has afforded the public to review and comment on the environmental document that assesses the potential impacts of the Navy's proposal to provide increased operationally and realistic training for naval personnel at the Silver Strand Training Complex (SSTC). The City offers the following additional comments on the environmental document:<br><br>1. The City of Imperial Beach concurs with the comment by the City of Coronado that the DEIS does not adequately address the increased environmental impacts to surrounding properties that would result with the proposed activities. While the DEIS acknowledges that the preferred plan will result in increased impacts, additional or more effective mitigation measures are not proposed to reduce the impacts preferably to a level of insignificance. The lack of mitigation measures despite the major increase in activities and impacts seems, at best, illogical. Mitigation measures are necessary to reduce the significant impacts resulting from the increase in quantity and types of activities proposed. | The City of Coronado's letter has been received and the component concerns have been addressed, and the EIS has been modified where applicable. The Navy appreciates the comments from both City Councils. The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness and realistic training while minimizing potential impacts to the surrounding area. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 217. | City of Imperial Beach, California, Office of the City Manager | 2. The City also wishes to modify our previous comment of our letter of March 5, 2010 wherein the City proposed a pedestrian and bicycle path from Carnation Avenue to Silver Strand State Park. We would like to refer to this path as a "Proposed Coastal Mitigation Trail" due to the potential loss and/or adverse impacts to the existing and long-utilized beach access along the shoreline adjacent to the Navy Radio Receiving Facility (NRRF). | Your comment has been noted, and the Navy is committed to a continued dialogue on the Coastal Trail. |
| 218. | City of Imperial Beach, California, Office of the City Manager | 3. We request that the Draft EIR carefully analyze the impacts the increased activities will have on traffic on SR 75 and Palm Avenue to Interstate 5. | The SSTC EIS has analyzed traffic impacts from the proposed increase in training activities at SSTC. There would be no increase in personnel stationed at SSTC as a result of the implementation of the Proposed Action. Currently, intersections and roadways within the ROI typically experience an acceptable LOS. Although the intersections at Gates 1 and 2 experience unacceptable LOS, traffic related to the Proposed Action represents less than one percent of the morning volume and less than two percent of the evening traffic at these intersections. |
| 219. | City of Coronado, Office of the City Council – Carrie A. Downey | The citizens of Coronado appreciate and support the training of our military forces to insure their safety and efficacy when they are sent to perform their duty in hazardous conflicts around the world. However there needs to be a balance between developing realistic training scenarios on bases and ranges that are in the midst of highly developed residential areas. I provide the following additional recommendations for traffic, noise, and public safety mitigation. These actions would increase the cooperation between Coronado residents and the Department of the Navy (DON) for status quo operations, as well as for Alternative A increased tempo operations.<br><br>1. Mitigation Measure 3.16.2.4.1 Exercise Planning. The DEIS lists the blanket statement "The Navy considers public safety in planning its exercises. Factors considered in evaluating the impact of the training on public safety include proximity of the activity to public areas; access control; schedule (time of day, day of week); public notification...."<br><br>Considering isn't the same thing as doing. DON should notify the Coronado City Manager and CUSD Superintendent of ANY change in daily operations greater that 1% over the status quo. This is different than 1% over baseline in the DEIS. As the document point out the navy is attempting to get the historical activities NEPA compliant not what is currently taking place. "The U.S. military commenced operations in Afghanistan and Iraq as part of the Global War on Terror; the deployment of units overseas caused many range complexes, including SSTC, to experience temporary decreases in usage....Thus to include additional: A). personnel movements, B) equipment or supply deliveries, C) vehicle (including boats, cars, tanks helicopter drop offs, etc.) that could increase traffic or noise levels, and/or security procedures at the base gates. In the past all of these activities have caused significant traffic delays among Coronado residents without explanation. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website.<br><br>Regarding the increase in transportation at SSTC, an increase in SSTC training activities does not have the same traffic impacts as the homeporting of multiple aircraft carriers has had on the Coronado area. There would be no increase in personnel stationed at SSTC as a result of the implementation of the Proposed Action. The Proposed Action does include an increase in activities performed by existing personnel. The SSTC EIS adequately addresses impacts to traffic from |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Currently the Department of the Navy notifies Coronado in advance of the deployment and return date of the aircraft carriers home ported in Coronado. This allows Coronado to make operational changes in the public safety and public works departments to have the appropriate city staff on hand to try to move civilian traffic should the need arise. Likewise the City Public Works Department makes sure Coronado does not schedule sewer repair work, or CALTRANS does not schedule road repair work on days where the military bases on Coronado will be experiencing increased traffic going to and from the bases. This system has worked well for large events such as movement of aircraft carriers but it would work equally well for events that do not rise to the level of a ship's movement but would increase traffic and noise in the surrounding community such as using the beaches and or base facilities as part of a Fleet exercise or other larger training evolution.<br><br>Should the Navy need to use all 14 of the beach lanes in the Silver Strand Training Complex (SSTC) at both ends of Coronado, this would undoubtedly raise the noise levels and ' traffic along the Silver Strand Highway past the Coronado Cays residential development and the Silver Strand Elementary School. Both contain sensitive noise receptors, as acknowledged on page 3.6.1.4.1. The advance notification to the CUSD Superintendent would allow the option to move planned outside activities at the Silver Strand School inside or reschedule them to avoid the additional noise and or distraction it would provide the students. It would allow notification to the parents living in the Cays to expect increased traffic on the strand during school drop off time in the morning to insure school start time is not delayed. | increased training activities. The ADT of Coronado roads is discussed in Table 3.14-2. The EIS analyzed the Level of Service (LOS) of local roads to determine the contribution of military activities to overall traffic on public roads. Based on the analysis, increases in military training vehicle trips per day would represent less than two percent of the total daily traffic, and local roads would experience an acceptable LOS, with the exception of intersections at Gates 1 and 2; which would experience an unacceptable LOS. However, traffic generated under Alternatives 1 and 2 would represent less than one percent of the morning traffic volume and less than two percent of the evening traffic volume at these intersections, and this increased LOS would be well within the capacities of the existing regional roadway network. |
| 220. | City of Coronado, Office of the City Council – Carrie A. Downey | 2. Silver Strand Elementary School. Although the DEIS identify Navy Housing areas on Naval Base Coronado within the SSTC, and the location of the Silver Strand Elementary School, Table 3.6-4 Acoustic measurements during Fleetex 2002 does not provide measurements for the Silver Strand School. Please provide those measurements or an explanation that they area was not measured or is too far to receive noise from Fleetex if that is appropriate.<br><br>Noise and traffic are not the only concerns for students and parents at the Silver Strand School. The lease agreement between to CUSD and the Department of the Navy is an example of how the military and community can work together to best serve the needs of military families and the community. The majority of the students educated at the Silver Strand Elementary School are dependants of active duty military service members, however there is a significant portion that reside in the Coronado Cays housing development that may not have exposure to military training or military weapons. The DEIS does not explain in depth what types and frequency of training will be visible to the students attending Silver Strand Elementary School.<br><br>Under Alternative 1, the DEIS states in Section 3.16.3.3 that "SSTC land training activities would not employ live ammunition, with the exception of shotgun shells for breacher training and small arms for training inside bunkers on SSTC-S.....Flares, smoke grenades, and other small pyrotechnics unused in training do not release projectiles or scatter fragments, and thus have no potential for effects in the absence of direct contact." | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness and realistic training while minimizing potential impacts to the surrounding area. In this manner, the Navy is adding mitigation measures for alerting the adjacent communities about events which may be considered intrusive as well as posting signage and controls regarding public access to the beaches.<br><br>Impacts to Military Family Housing on Silver Strand, including the Silver Strand Elementary School, have been specifically discussed in 3.6.2.2.6 and 3.6.2.3.7 of the EIS. Measurements were not made at Navy housing areas or Silver Strand Elementary School because the primary noise concern was for residents closest to SSTC-S sound sources. However, sound from SSTC-N training would have the greatest effect on the Military Family Housing across from Boat Lanes 7-10 and on Silver Strand Elementary School. ELCAS training on |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | While some students would enjoy glimpses or military training, others may become frightened by the sight of Navy SEALs coming ashore with weapons. The exact nature of the visuals students and staff at the school could be exposed to should be clarified. Additionally, if there will be no live weapons of any kind used within sight of the school that needs to be clarified. The teachers and staff should be aware in advance of what might distract their students during lessons and plan accordingly. Advance notice to the CUSD Superintendant would be appropriate mitigation. | Bravo Beach may produce sound levels at the Military Family Housing of up to 81 dBA, 15-minute Leq during pile driving, which would occur periodically during the day and night. Intermittent pile-driving would have a greater effect on the houses that are closest to Bravo Beach during training at Bravo Beach, and on the houses closest to the Highway for training on the oceanside beach lanes. Sound from blanks and simunitions used during Hell Week could produce noise at Military Family Housing and the Elementary School, which would be above the typical daytime urban background sound level. Training exercises early in the morning would have a greater effect on residents than those occurring later in the day because the background sound level is lower at that time.<br><br>The acoustic analysis presented in the FEIS describes the real-time effects of the various types of training sound on exposed individuals, such as speech interference and sleep disturbance, that can result in annoyance and stress. The FEIS acknowledges that such effects would occur occasionally, but concludes that the incremental effects of sound from the proposed training activities at SSTC would not have a substantial effect on the acoustic environment. As listed in NBCINST 3502-1 (dated 26 Mar 2008), the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities.<br><br>Training activities presented in this EIS are typically not within the line of sight of CA-79, and are not expected to have an impact on the view from the Scenic Highway or from neighboring communities. Regarding the impacts on children at SSTC, no live weapons are used at SSTC. Simunition weapon activities used by Navy personnel are conducted at SSTC-S, and out of view of local schools and communities as well. |
| 221. | City of Coronado, Office of the City Manager – James F. | The City of Coronado has reviewed the above document and concluded that further information and analyses are required to determine the cumulative environmental impacts associated with the planned activities for the Silver Strand Training Complex (SSTC). Of particular concern are | The individual effects analyses of military activities (short-term and long-term) are presented in their individual sections, where the potential impacts are discussed in detail. The |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | Benson | the statements contained throughout the document that the military facilities and/or operations are not expanding; rather, just the frequency; therefore, no environmental mitigation is required. | determinations on the cumulative impacts of military activities are presented in Section 4 of the FEIS. The discussion in the cumulative impacts section is intended to present the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions. The applicable impact analyses from the Environmental Consequences sections have been carried forward into the cumulative impacts discussion.<br>As discussed in each resource section and summarized in Chapter 5 of the EIS, the Navy has analyzed the increases in frequencies of training events and has developed mitigation and protective measures to minimize potential impacts of the Proposed Action. |
| 222. | City of Coronado, Office of the City Manager – James F. Benson | The draft EIS contains several areas where it acknowledges new operations and new activities will be occurring at SSTC. If more military operations and activities will be occurring at SSTC, then more personnel will be arriving in Coronado, and more vehicles will be commuting to and through Coronado impacting local streets. Not only will the additional traffic lead to impacts to intersections currently at unacceptable Levels of Service, but the overall preferred plan of continued plus new activities and operations will lead to significant cumulative impacts on traffic, noise, greenhouse gas emissions, and the public's access to utilize the waters of the State, which, when considered together, should be mitigated. | Regarding personnel-pedestrian and vehicle increases in traffic, there would be no increase in personnel stationed at SSTC from the implementation of the Proposed Action. The Proposed Action does include an increase in activities performed by existing personnel.<br><br>The activities associated with the Proposed Action would be increased, but would not increase the signal phase times at NAB intersections. There would be no increase in greenhouse gases from personnel transit because personnel tempo will remain the same, as indicated above. A further discussion of greenhouse gas emissions is presented in Chapter 4. |
| 223. | City of Coronado, Office of the City Manager – James F. Benson | Please revise the draft EIS to address the questions and concerns described on the attachment.<br><br>Of note is that the draft EIS does not appear to adequately address the expanded activities of the Preferred Alternative and associated traffic, noise, and coastal access impacts to surrounding properties within SSTC corridor, both individually and cumulatively. The draft EIS acknowledges increased noise impacts, durations, and sound levels; however, no mitigation is proposed based upon the assumption that activities currently exist and there will be an expansion over a broader area that will minimize noise impacts. The draft EIS needs to be revised to properly address, analyze, and quantify the items detailed in the list attached to this letter. | The training activities associated with the SSTC have been directly analyzed in the respective resource sections of the EIS. The expanded activities discussed in the EIS have been analyzed in the respective sections of Chapter 3 and the additional training activities that are not associated with SSTC have been analyzed in the cumulative section of the EIS.<br>The Navy has developed mitigation plans for activities that may cause an impact to the environment, and has presented these in the EIS. The Navy has analyzed the activities associated with SSTC, with both the public and the environment in mind, to achieve operational readiness while minimizing impacts to the surrounding area. Based on this analysis, mitigation has been added to Navy procedure where the potential for an adverse effect has been found; these measures are described in full in Section 5 of the FEIS. |

| 224. | City of Coronado, Office of the City Manager – James F. Benson | Lastly, it was pointed out to the Coronado City Council at their meeting of March 2, 2010, that the citizens of Coronado have not had adequate time to review this document. Given the fact that the plan has been understudy since 2001, it would seem appropriate to provide the public with more than 45 days to review such a voluminous document. The City requests an extended public review and comment period for the EIS.<br>Thank you in advance for reviewing and responding to our questions and requests for further information so the City can adequately determine the scope of anticipated environmental impacts to the Silver Strand corridor associated with the Navy's Silver Strand Training Complex. The City also appreciates your serious consideration of an extended period of time to review the document to allow for full public participation and review of this important study. | The Navy has conducted numerous outreach events and briefs to local governments and special interest groups. In response to requests by the cities of Imperial Beach and Coronado and citizens, the public and agency comment period for the FEIS was extended to March 30th. |
| 225. | City of Coronado, Office of the City Manager – James F. Benson | 1. The draft EIS acknowledges there will be new squadrons, flight patterns and helicopter training occurring at SSTC. The draft EIS fails to identify the location points where the helicopters will take off and the paths of travel to and from the training areas and any increased public safety risks to residents, school populations, and beach users due to the increased amount of flight activity as well as the increased frequency and noise associated with the increased frequency of activity. The draft EIS should address, quantify, and analyze these issues. | Potential public safety risks are discussed in Section 3.16.2.1 of the FEIS and potential acoustic impacts from aircraft activities are discussed in Section 3.6.2.2 and 3.6.2.3 of the FEIS.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1.5 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to Sections 2 and 3.6 (Acoustic Environment) of the SSTC EIS document, and beginning a descent into SSTC-S Department of Homeland Security or U.S. Coast Guard |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 226. | City of Coronado, Office of the City Manager – James F. Benson | 2. Section 3.1-12 notes that 80% of flight occurs over the water and aircraft are required to approach and depart from training activities over the water. Is there a map that shows this flight pattern? What is the flight pattern for the remaining 20% including both approach and departure locations? The draft EIS should address, quantify, and analyze these issues. | A map presenting flight routes will not be added to the FEIS; however, Chapter 9, paragraph C (Noise Abatement) of NBC Instruction 3710.7U (Air Operations), dated September 10, 2008 states that: (a) pilots shall ensure altitude minima as prescribed in the OPNAVINST 3710.7 series and course rules, (b) flights directly over the city should be avoided, and (c) H-53 model aircraft are prohibited from using NOLF-IB.<br><br>Helicopter overflight patterns are described in Section 3.6 for use in the acoustic analysis. Navy activities at NOLF IB are outside the scope of the Proposed Action, but are addressed under Cumulative Impacts. Airfield restrictions for NOLF and NASNI are discussed above in comment response #212. The Proposed Action addressed in this EIS does not involve helicopter activity at NOLF, so impacts of those activities cannot be mitigated in this EIS. |
| 227. | City of Coronado, Office of the City Manager – James F. Benson | 3. Section 3.1.2.3.1 notes a new activity, N8 Tactical Recovery of Aircraft and Personnel, would involve landing or hovering of helicopters at SSTC-S at nighttime. Where exactly within the southern area of the training complex would this activity occur? How many aircraft, how frequent and for what duration would this occur? | As discussed in Chapter 2, Table 2-2, all TRAP activities will occur on SSTC-S beaches and within the SSTC-S fence line. The Navy proposes four TRAP activities under Alternatives 1 and 2, which involve up to four helicopters (Appendix C). The helicopter landing zone is located near Bunker 99 in the northern portion of SSTC-S. No helicopters will hover over the beach. |
| 228. | City of Coronado, Office of the City Manager – James F. Benson | 4. Section 3.6-26 discusses Acoustic Impacts associated with the Preferred Alternative. The draft EIS notes sound levels will remain the same but training events producing sound would increase in frequency. No mitigation is proposed. The draft EIS needs to analyze the noise impacts of the increased number of training events both individually and cumulatively. | With regard to helicopter sound, the analysis in Section 3.6 indicates that, while the number of helicopter sorties would increase substantially under Alternatives 1 and 2, the increased frequency of short-term sound exposures from increased helicopter pass-bys would not be sufficient to noticeably change the hourly average sound level at any one off-installation location. Because of the logarithmic nature of sound; a doubling of sound energy results in only a three-decibel increase, which under typical conditions is barely discernable. The analysis of helicopter sound is based upon broadly defined flight paths, consistent with a normal degree of variability introduced by pilot discretion, weather, time of day, and safety concerns such as other aircraft.<br>Helicopter activity discussion has been added to Cumulative; Section 4.3.6. The Section discusses the various squadrons based out of NASNI and the number of helicopter flights that these squadrons generate. The Navy AICUZ study is being |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | updated to identify all flights generated from NASNI and NOLF.<br><br>The acoustic analysis presented in the FEIS describes the real-time effects of the various types of training sound on exposed individuals, such as speech interference and sleep disturbance, that can result in annoyance and stress. The FEIS acknowledges that such effects would occur occasionally, but concludes that the incremental effects of sound from the proposed training activities at SSTC would not have a substantial effect on the acoustic environment. Therefore, other than existing administrative controls on the placement of activities discussed in Section 3.6.1.6, no sound-related mitigation measures were proposed. |
| 229. | City of Coronado, Office of the City Manager – James F. Benson | 5. a. Section 3.6.2.3.2 notes existing aircraft noise is increasing from 778 helicopter sorties per year to 2,220 per year representing a 185% increase. What is the duration and frequency of the sorties? The Amphibious Raid activity is noted to represent the most intense aircraft sound event at SSTC and the frequency of the events would increase to 18 per year. What is the duration of these events? It is not clear from the tables and maps where these activities would be located.<br><br>b. An additional activity noted as Tactical Recovery of Aircraft and Personnel (TRAP) notes 5 helicopters could be employed and the activity would occur at night, lasting one to two hours. It does not appear to be identified in Table 2-2 and it is not clear where this activity would occur.<br><br>c. Cumulatively, the analyses conclude the types of activities described have occurred over time and the only difference is the frequency and no mitigation is required. If the number of activities, duration of activities, and type of activities increases, the amount of noise will unquestionably increase representing significant changes in noise levels to the area and should be mitigated. | a. As proposed under Alternatives 1 and 2, up to 1,643 helicopters could be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. While the Amphibious Raid activity as a whole may take up to three days to complete, the use of helicopters may only be approximately four hours (Appendix C).<br><br>The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations, in the western portions of boat lanes. The NBC PAO can be contacted for noise complaints and operational suggestions.<br><br>b. TRAP is identified in Table 2-2, and states that; "TRAP consists of the insertion of up to 75 personnel ashore via four to six helicopters hovering and/or landing at a designated inland drop zone in northern part of SSTC-S."<br><br>c. The individual effects analyses of military activities (short-term and long-term) are presented in their individual sections, where the potential impacts are discussed in detail. The determinations of the impacts of military activities are also presented there. The discussion in the cumulative impacts section is intended to present the impact on the environment which results from the incremental impact of the action when |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions. The applicable impact analyses from the Environmental Consequence sections have been carried forward into the cumulative impacts discussion. |
| 230. | City of Coronado, Office of the City Manager – James F. Benson | 6. How do the planned flight paths for new helicopters (to and from SSTC) align with the current Airport Land Use Study for the military bases? How will these planned/proposed paths affect a study that is currently underway for the NAB and those existing uses within the project boundary? | The planned flight paths under the Proposed Action remain unchanged from existing flight corridors, and are in line with the current Airport Land Use Study. The current AICUZ study will not be impacted because there are no changes to the flight paths. |
| 231. | City of Coronado, Office of the City Manager – James F. Benson | 7. The draft EIS does not identify the flight path and accident potential zones (APZs) areas for the helicopters and aircraft in transit to SSTC. The document references NAVFAC P-80.3 indicating APZ is not required. Provide documentation from the referenced document justify/explaining why none is required. | The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean. As listed in P80.3, APZs are developed for runways and landing pads rather than for transit routes.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Helicopter transits from NOLF and NASNI, as well as to and from SSTC-S, occur only over water at nighttime. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns as well as the percentage of sorties associated with training at SSTC has been added to the SSTC EIS document in Sections 2 and 3.6 (Acoustic Environment).and beginning a descent into SSTC-S Department of Homeland Security or U.S. Coast Guard |
| 232. | City of Coronado, Office of the City Manager – James F. Benson | 8. The Acoustic Environmental analysis notes there will be an increase in the frequency of aircraft; increase in amphibious vehicle training; increase with ELCAs and associated pile driving; increase in Breacher activities and use of shotgun blasts. The draft EIS notes while all of these activities will be generating increased noise levels, only the frequency of activity will be increasing; therefore, no mitigation is proposed. Mitigation is identified as the Navy's ongoing process and procedures to notify adjoining agencies/facilities when disturbances will occur. Public notification that noise impacts will occur does not mitigate the noise impacts experienced | Hearing loss may occur where individuals are exposed to a sustained noise level of 85 dB or above The training activities at SSTC do not result in sustained sound levels of this intensity in off-installation areas. Therefore, tinnitus and hearing loss would not occur as a result of SSTC training activities. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | by students and school officials, residents and tourists. | The activities will increase with implementation of the Proposed Action and the Navy acknowledges that a substantial increase in the frequency of impulsive noise events is likely to result in some increase in such reactions in the community. The acoustic analysis presented in the FEIS describes the real-time effects of the various types of training sound on exposed individuals, such as speech interference and sleep disturbance that can result in annoyance and stress. The FEIS acknowledges that such effects would occur occasionally, but concludes that the incremental effects of sound from the proposed training activities at SSTC would not have a substantial effect on the acoustic environment. Therefore, other than existing administrative controls on the placement of activities discussed in Section 3.6.1.6, no sound-related mitigation measures were proposed. |
| 233. | City of Coronado, Office of the City Manager – James F. Benson | 9. Section 2.3, page 2-27 discusses Alternative 1 as the Navy's Preferred Alternative and is "designed to meet Navy and Department of Defense (DOD) current and near-term operational training requirements." How is "near-term" operational training requirements defined? Is there an estimate for how long these expanded activities, increased training tempos and operations will meet the 100% training needs as identified in the draft EIS? Is this for a period of 5 years, 10 years or longer? If some of the "new" activities and training operations need to be expanded in the future to meet Navy mission requirements, will a supplemental Environmental Assessment be completed? | Near-term operational requirements are defined as baseline training tempo that was established by taking into consideration the historical usage data at SSTC, specifically, from 2001 through 2007. It's important to note that during this period, the U.S. military commenced operations in Afghanistan and Iraq as part of the Global War on Terror. Many of the units that would normally be training at SSTC were deployed overseas. Additionally, the focus of the individual and unit training temporarily shifted to inland (desert or mountainous) environments to prepare personnel for conditions they would encounter in combat operations overseas. As such, SSTC has experienced temporary decrease in training usage and tempo during the period being evaluated (2001 through 2007). To establish baseline training tempos, the Navy evaluated available 2001 through 2007 training data, considering year-to-year fluctuations as well as the recent progressive decline in training tempo at SSTC. For each training activity, the Navy selected 2001- 2007 data that were most reflective of the average historical training conditions over the past few decades.<br>Implementation of the Proposed Action would occur over a five year period. Training activities will be evaluated in five years (2015) for the accuracy of meeting 100 percent of the training requirements as analyzed in the EIS. If new mission requirements are necessary to support training needs, supplemental NEPA documentation may be required. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 234. | City of Coronado, Office of the City Manager – James F. Benson | 10. The Purpose and Need section discusses "increased training tempo" from current baseline conditions. This needs to be better defined to be properly analyzed. For example, the baseline tempo of 3,926 activities indicates it is not associated with personnel. The Preferred Alternative indicates an increase in activities approximately 41% to 5,543 activities but there are no associated man hours to correspond to these activities. The draft EIS should be revised to address/clarify increased training tempo of approximately 41% without increased personnel. | There is no increase in personnel stationed at SSTC as a result in the implementation of the Proposed Action. The Proposed Action does include an increase in activities performed by existing personnel. This clarification has been added to Section 2 of the FEIS |
| 235. | City of Coronado, Office of the City Manager – James F. Benson | 11. Section ES 1.3.1 documents the increase of Naval Special Warfare personnel operating on NAB Coronado, equivalent to one additional Sea, Air and Land team. It also documents the realignment of the Explosive Ordnance Disposal groups, which has necessitated expanded use of the Southwest Region training venue, including SSTC. The Marine Corps will also increase the number of personnel cycling through training programs at SSTC. Finally, it discusses new platform, training equipment, and service life extension programs to keep up with current needs. All of the needs correspond to additional personnel training at SSTC but they are not quantified nor are their impacts on the community accounted for in the draft EIS. In particular, what are the impacts to daily traffic as these new personnel travel to and from NBC to participate in this training? | Personnel participating in activities under the Proposed Action have been accounted for within Chapter 2.<br>The SSTC EIS has analyzed traffic impacts as a result of the increase in activities at SSTC. There is no increase in personnel stationed at SSTC as a result in the implementation of the Proposed Action. Overall, there is an increase in military vehicle traffic and traffic related to the Proposed Action represents less than 1 percent increase of the morning volume and less than 2 percent increase of the evening traffic at these intersections. |
| 236. | City of Coronado, Office of the City Manager – James F. Benson | 12. The Traffic and Circulation section notes there will be an increase in trips resulting from increased activities and operations; however, it will be less than 2% of the total daily traffic generated. The draft EIS acknowledges Gates 1 & 2 currently experience unacceptable Level of Service. The draft EIS notes that since the increased activity will amount to 2% of traffic, no mitigation is proposed. Any further decrease to the level of service to these intersections should be analyzed and addressed. | The SSTC EIS has analyzed traffic impacts as a result of the increase in activities at SSTC. There is no increase in personnel stationed at SSTC as a result in the implementation of the Proposed Action. Currently, intersections and roadways within the ROI typically experience an acceptable LOS. Although the intersections at Gates 1 and 2 experience unacceptable LOS, traffic related to the Proposed Action represents less than 1 percent of the morning volume and less than 2 percent of the evening traffic at these intersections. |
| 237. | City of Coronado, Office of the City Manager – James F. Benson | 13. Section 4.3.14, Page 4-22 Transportation and Circulation cumulative analysis does not adequately analyze the impacts associated with the "increased tempo" of activities proposed with SSTC Preferred Alternative. Where are the estimated traffic generation rates to arrive at the conclusion of a less than 2% increase in traffic? How can an argument be made that since the number of employed are not increasing, therefore, there will be no increase in traffic? What about the new and expanded activities and training planned for SSTC? Where are these "employees" coming from when some of the activities are "new" to SSTC? The document should analyze all the trips associated with the increased training activities including commuter access to/from SSTC/NBC. | The Proposed Action does not include an increase in personnel stationed at SSTC; therefore, traffic generation rates were not calculated on increased personal vehicle trips into the region of influence. However, traffic generation was estimated based on the additional military vehicles needed to support the proposed increase in training and the time of day the increased military vehicle use would occur. Based on these estimates, the increase in military vehicle traffic and traffic related to the Proposed Action represented less than 1 percent increase of the morning volume and less than 2 percent increase of the evening traffic at these intersections. Based on the analysis, increases in activities did not have a substantial impact on the existing LOS because new and expanded activities would not occur at times when intersections are at their busiest; in the morning and afternoon peak hours. In addition, activities |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | contributing to peak hour traffic are already accounted for in the baseline. Any new activities would not be scheduled at the peak hours but at other times of the day when the LOS is acceptable. |
| 238. | City of Coronado, Office of the City Manager – James F. Benson | 14. Table 2.1, Baseline and Proposed Tempos for SSTC Training Activities, identifies 78 training activities along with duration and number of events per year. The document should relate the activities to number of personnel. How many people are training under the baseline and how many will be training under the proposed activities? | As stated above, existing personnel tempo will not change as a result of implementation of the Proposed Action. This information is presented in detail in Appendix C and this appendix is now referenced in Section 2 of the FEIS. |
| 239. | City of Coronado, Office of the City Manager – James F. Benson | 15. Table 2-2, Proposed New Training Activities at SSTC for Alternatives 1 and 2, identifies 11 new activities. The document should relate the new activities to the number of personnel. How many additional people will be trained under the new activities compared to the baseline? | As stated above, there is no increase in personnel stationed at SSTC as a result in the implementation of the Proposed Action; the tempo of training will increase with the Proposed Action. Appendix C of the FEIS presents a detailed account of all components of training activities associated with the Proposed Action. |
| 240. | City of Coronado, Office of the City Manager – James F. Benson | 16. The draft EIS notes baseline activities will increase from 3,926 activities to 5,343. Many of the new activities are a result of new helicopter training activities such as 200 new mine hunting; 48 new helicopter mine detection; 100 helicopter activity; 48 MH-60s helicopters; 124-154 helicopter rope training; and 109 to 198 Close Quarter Combat with helicopter use. Amphibious Raise (with possible helicopter use) will expand from 6 days a year to 54 activities a year. Perhaps even more significantly, CRRC OTB Insertions and Pyrotechnics will increase from 4 day events approximately 52 times a year to 86 times a year. This change results in almost 365 days per year this activity will occur. The draft EIS does not analyze the cumulative impact of the entire new helicopter activities will have on the air when cumulatively combined. The draft EIS does not contain a section where analysis of combined activities along SSTC can be visualized and analyzed in terms of cumulative activities and noise. | As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Helicopter transits from NOLF and NASNI, as well as to and from SSTC-S, occur only over water at nighttime. The only helicopters overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns as well as the percentage of sorties associated with training at SSTC has been added to the SSTC EIS document in Sections 2 and 3.6 (Acoustic Environment). Department of Homeland Security or U.S. Coast Guard Community noise levels from cumulative helicopter traffic is addressed in Section 4 of the EIS (Cumulative Impacts).<br><br>With regard to impacts to the air from training activities, Section 3.3 and 4.3 present impacts to air from the summation of all training activities. |
| 241. | City of Coronado, Office of the City Manager – James F. Benson | 17. Section 3.3.2.1.1, Emissions Evaluation Methodology, discusses emissions from ground vehicles only and should include vehicles involved in the training activities. It should also include all additional vehicles trips to get the personnel to the training (commuter trips). | There is no increase in personnel stationed at SSTC as a result in the implementation of the Proposed Action. Therefore, the analysis focused on emissions from training vehicles, aircraft, vessels, and ordnance from training activities presented in the FEIS. Appendix C, which is referenced in Section 3.3, includes the emissions calculations for all vehicles, vessels, aircraft, and ordnance used in all activities. |
| 242. | City of Coronado, Office of the City | 18. Transportation and Circulation, Page 3.14-4 last paragraph states: The Rendova Road (Gate 1) and Tarawa Road (Gate 2) intersections operate at LOS E during the busiest morning | This has been updated in the FEIS to indicate the correct LOS in both locations. |

|---|---|---|---|
| | Manager – James F. Benson | commute hours and Tarawa again operates at LOS E during the busiest afternoon commute hour. This conflicts with Table 3.14-3 which has a LOS F for Tarawa in both a.m. and p.m. peak hours. | |
| 243. | City of Coronado, Office of the City Manager – James F. Benson | 19. Transportation and Circulation Page 3.14-5, second paragraph states: The City of Coronado is currently in the process of analyzing traffic conditions for SR-75 to determine the best longterm traffic solutions for the community. This project is actually the SR 75/282 Transportation Corridor Project which is analyzing traffic conditions along the corridor between the bridge and NASNI, not SR-75 adjacent to SSTC. | This paragraph has been edited to describe the appropriate traffic conditions analyzed. |
| 244. | City of Coronado, Office of the City Manager – James F. Benson | 20. Section 3.14.2.3.1 Ground Transportation indicates under Alternative 1, military training activities are estimated to generate approximately 336 ADTs. The draft EIS should analyze all trips generated from the increased activities and increased training tempo. | The ADT of all public roads was calculated for all traffic, which would include any military traffic. The EIS analyzed the Level of Service (LOS) of local roads to determine the contribution of military activities to overall traffic on public roads. Based on the analysis, increases in military training vehicle trips per day would represent less than two percent of the total daily traffic, and local roads would experience an acceptable LOS, with the exception of intersections at Gates 1 and 2; which would experience an unacceptable LOS. However, traffic generated under Alternatives 1 and 2 would represent less than one percent of the morning traffic volume and less than two percent of the evening traffic volume at these intersections, and this increased LOS would be well within the capacities of the existing regional roadway network. |
| 245. | City of Coronado, Office of the City Manager – James F. Benson | 21. 3.14-5 Summary of Effects section: Silver Strand at Rendova Road and Silver Strand at Tarawa are signalized intersections with LOS E or worse. All additional traffic generated by the increased activity should be analyzed and the amount of delay calculated in accordance with the SANTEC/ITE Guidelines for the San Diego Region. In addition, there is no mention of the number of pedestrian crossings between the bay side and ocean side of NAB, which affects the signal capacity and causes delay. The document should quantify the number of pedestrian trips across SR-75 that occur and how many more would be expected under Alternatives 1 and 2. | Activities associated with foot and/or boat traffic that transfer from the bay side to beach side (e.g. Around the World, Activity 67) would not have impacts to intersections because personnel use the SSSB tunnel to go from bay to ocean. Established beach crossing lanes are also defined. |
| 246. | City of Coronado, Office of the City Manager – James F. Benson | 22. 5.13 Transportation and Circulation section does not propose or identify mitigation for the increased transportation and circulation in the proposed alternatives. | Section 3.14.3 indicates that no adverse effects on transportation and circulation were identified; therefore, no additional mitigation measures are warranted. The information presented in Section 5.13 includes the current measures, which facilitate joint military-civilian use of SSTC consistent with safety. |
| 247. | City of Coronado, Office of the City Manager – James F. Benson | 23. List of Preparers: A Traffic Engineer was not identified under the list of preparers. Who analyzed the Transportation and Circulation sections? | Commander, Pacific Fleet staff were responsible for preparing traffic generation estimates. The contractor for the EIS (SRS-Parsons Joint Venture) used the traffic estimation data to prepare the Transportation and Circulation section of the EIS. |
| 248. | City of Coronado, Office of the City Manager – James F. | 24. The draft EIS does not identify the potential impacts to the intersections due to increased foot and boat traffic from bay side to beach side. Do the increased activities warrant reevaluation of an underpass or overpass? | Activities associated with foot and boat traffic that transfer from the bay side to beach side (e.g., Around the World, Activity 67) would not have impacts to intersections because |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | Benson | | personnel use the SSSB tunnel to go from bay to ocean. Established beach crossing lanes are also defined. |
| 249. | City of Coronado, Office of the City Manager – James F. Benson | Section 5-5 refers to mitigation for underwater detonations and security precautions. When planned activities are underway, will areas of the public beach/water be cordoned off? | As described in Section 3.16.3.2.3, event participants will establish an appropriate exclusion zone for each event prior to detonation. Activities are not conducted if non-participants are observed in the exclusion zone. |
| 250. | City of Coronado, Office of the City Manager – James F. Benson | Section 5-19 notes there is an interpretive sign planned for the bike trail near south Delta Beach. This sign would be located in the Scenic Highway Corridor zone and should be designed to be consistent with the overall Silver Strand Enhancement plan. | Your comment has been noted |
| 251. | City of Coronado, Office of the City Manager – James F. Benson | Table 4-1, Page 4-2 notes future planned improvements for the Navy Lodge. It notes four existing buildings and several smaller structures will be demolished and will be replaced with a lodge building to increase room capacity as well as new recreational facilities, parking, retail shops and a restaurant. What is the approximate square footage of this new facility and net increase in units? Are these additional lodge units to be temporary "resort" type facilities or housing for living purposes as a BOQ or BEQ? Are these additional housing units being proposed to accommodate expanded military operations such as the two new commands at NASNI? The draft EIS further notes in this section that along with the commands, there will be construction of a pier, boat ramp, and several buildings. Where is this project being located and could it also serve as a potential pier/boat ramp to re-instate the ferry service to NASNI that was recently discontinued? | The Navy Lodge at NASNI is located adjacent to Breaker's beach, and is a recreational, resort facility for military and retired military families – not a housing facility for sailors assigned to NBC. The Mobile Security Forces and Naval Special Clearance Team-One Pier and Boat Ramp project will assess boat ramps and piers at NASNI and NAB. An NBC Commuter Working Group is evaluating options for another pier for Coronado ferry service. |
| 252. | City of Coronado, Office of the City Manager – James F. Benson | Table 4-1, Page 4-3 briefly discusses the U.S. Navy Lighterage project, which involves construction of a waterfront command and control facility for amphibious construction Battalion One facilities to support the introduction of the improved Navy Lighterage System at NBC. The draft EIS does not describe this new system at NBC and should describe the activities associated with the system. | The activity that is associated with the Improved Navy Lighterage System (INLS) is Causeway Pier Insertion and Retraction (Activity 41), and has been analyzed by the Navy. |
| 253. | City of Coronado, Office of the City Manager – James F. Benson | Section 4.3.16, Page 4-23 Public Health and Safety cumulative analysis notes there will be momentary disruptions in communication to nearby residences and schools. The draft EIS does not identify how frequently and for what duration. The draft EIS identifies impacts associated with the expanded activities planned for SSTC individually; however, it fails to cumulatively analyze the activities combined to determine the length and period of all activities combined on the residential and school areas. For example, it appears there will be full time operation of the beach lanes at SSTC almost every day throughout the year. Where have those activities - length, time, duration - been analyzed? | Section 4.3.6 describes activities associated with the Proposed Action that could occur simultaneously (e.g., Elevated Causeway activities and Hellweek) and that could produce a cumulative intrusive noise effect. However, loud activities would rarely occur at the same time or close to each other. Therefore, the cumulative effects of these increases on ambient noise levels would be minimal. |
| 254. | City of Coronado, Office of the City Manager – James F. Benson | Table 3-1- states Coronado Beach is the only public beach in Coronado. This statement is incorrect. The Silver Strand State Beach is also located within the City of Coronado. | This statement has been removed from the table in the FEIS. |
| 255. | City of Coronado, Office of the City Manager – James F. Benson | Section 3.6.2.3.3 indicates current Breacher Training operations are 14/day when an event occurs and an event occurs 20 times per year. .The draft EIS notes operations will increase to 1,400 annually. How does the increase in activity affect the number of events per year and number per day so an assessment can be made regarding the degree of change on a daily, | As clarified in Section 3.6.2.3.3 of the FEIS, each of the 20 training activities takes approximately five days to complete, with an average of 14 shotgun blasts on each of those days. The number of shotgun blasts under the NAA is three. The |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | weekly, or monthly basis? | analysis in this section is based on this increased number. |
| 256. | City of Coronado, Office of the City Manager – James F. Benson | Section 3.6.2.3.4 describes Amphibious Training operations increasing landings from 10,000 to 13,800 per year and LCAC activities (generating the most noise) will increase from 8 to 40 per year. The draft EIS identifies LCAC landings along with associated pile driving that occurs for at least 1 to 2 hours generating decibel levels of 74 to 104, 100' away. The draft EIS notes this activity has the potential to generate the largest number of increased complaints regarding noise and activity levels, particularly due to the proximity of the activity to Silver Strand housing and Silver Strand School. The draft EIS does not propose any mitigation, however, notes the training could result in sleep and communication disturbances. If the draft EIS acknowledges impacts, why aren't mitigation measures proposed? To state the Navy will advise surrounding agencies when potential impacts may occur is simply public notification and does not mitigate the related noise impacts. For example, could changes be made to the school to improve sound attenuation? | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities to achieve operational readiness while minimizing potential impacts to the surrounding area. The Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high visibility training events consistent with NBCINST 3502.1, dated 26 Mar 2008. Local governments, in turn, are responsible for informing their communities. The Navy is determining the best solution for notification to neighboring communities and, where appropriate, additional measures for alerting the adjacent communities about events that may be considered intrusive.<br>The FEIS acknowledges that sleep or communication disturbances could occur occasionally, but concludes that the incremental effects of sound from the proposed training activities at SSTC would not have a substantial effect on the acoustic environment. Therefore, other than existing administrative controls on the placement of activities discussed in Section 3.6.1.6, no sound-related mitigation measures were proposed. With regard to changes to the school, a detailed evaluation of the existing school structures and operation (e.g., operable windows and locations of classes and other activities) would be required to determine whether its noise attenuation could be enhanced, but that is outside of the scope of the EIS since noise impacts were deemed not to be significant. |
| 257. | City of Coronado, Office of the City Manager – James F. Benson | The draft EIS does not identify the entire Silver Strand as a State Scenic Highway and the Silver Strand (bay to ocean) as a Scenic Highway Overlay zone. The draft EIS should address the potential visual and environmental impacts associated with any new large equipment or improvements that would be visible along the Silver Strand. The City and Navy have worked cooperatively in the past to eliminate unnecessary signs, dilapidated training equipment, and vertical obstructions along the Silver Strand to improve the overall aesthetic improvement to the Silver Strand and assist with Least Tern and Snowy Plover preservation efforts. | The Navy has analyzed all potential Land Use and Socioeconomic conflicts within the ROI. The increase in proposed training activities will not result in a change in the public's visual experience because training is currently being conducted on the Silver Strand. There are no proposed changes in the view shed as the majority of the training events occur near the tideline or offshore in the bay training areas or ocean boat lanes. |
| 258. | City of Coronado, Office of the City Manager – James F. Benson | The draft EIS proposes to institute beach sand berming activities, which negatively impacts the scenic highway and the public use of view corridors. For example, the berming of sand on SSTC has directly impacted the public in the past by blocking sunlight to the Solstice Clock feature in Natures Bridge (Silver Strand's Bayside Nature Trail). In December 2009, at the request of a group of citizens that meet for the winter solstice at this site, the City requested the Navy to lower the berm on December 21 so the sunlight could shine through to the Solstice Clock. The Navy was unable to accommodate this request but did not preclude this request from being | Section 3.2.3.2.2 indicates that, where training activities require natural beach contours to be altered, they are restored using bulldozers, to the extent practical, at the conclusion of the activity. These beach alterations occur above the high tideline to approximately 100 feet inland from the tideline and consist of low (2-3 foot) hummocks. Section 3.12.3.1.1 of the FEIS discusses past berming efforts that were related to least |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | accommodated in the future. The draft EIS should address how berming activities will be minimized to avoid the conflicts described in this example as well as other potential berming conflicts along the Strand. This could be addressed through an action plan that identifies how City and Navy communication will be coordinated and improved to ensure present and future berming activities along the Strand do not negatively impact the Scenic Highway. | tern recovery efforts.<br><br>No Navy berming efforts adjacent to Silver Strand Highway as are associated with the Proposed Action.. |
| 259. | City of Coronado, Office of the City Manager – James F. Benson | Several years ago, the Navy bermed up areas on the ocean side of NAB. This activity affected beach sand deposits in front of the Coronado Shores. It has also appeared to accelerate beach erosion at the south end of the Shores. The draft EIS does not address sand movement for training operations and impacts. | These beach alterations occur above the high tideline to approximately 100 feet inland from the tideline, and consist of low (2-3 foot) hummocks; any beach alterations not related to training, such as those referenced in front of the Coronado Shores, are not addressed in the SSTC EIS. Section 3.2.3.2.2 addresses the potential for impacts to soils from training activities. This section also indicates that where training activities require natural beach contours to be altered, they are restored using bulldozer at the conclusion of the activity to the extent practical. Thus, training units ensure that heavy equipment use on SSTC beaches has no long-term effect on beach sands. |
| 260. | City of Coronado, Office of the City Manager – James F. Benson | Figure ES-l shows anchorage areas directly offshore of Coronado's Central Beach area, which are a direct encroachment into the public's view corridor. There are ample anchorage areas adjacent to Federal (US Navy) property; therefore, there is no necessity for anchorage areas for military craft as shown. | Anchorage's are displayed on the SSTC maps as they are shown on the NOAA Chart 18772 and Chart 18773. Anchorages are used for anchoring, towing, and mooring to buoy training, as well as anchorages for vessels support amphibious operations. The anchorages located with the ocean boat lanes are expected to be the most highly used anchorages. At these anchorages, vessels are expected to be present for training activities associated with the Proposed Action for up to four hours at a time, minimizing impacts to the public's view corridor. |
| 261. | City of Coronado, Office of the City Manager – James F. Benson | Section 3.5.243 of the draft EIS indicates that, if all increased training activities were performed individually, there would be an 85% increase in the amount of time that portions of the bay and/or ocean would be closed to public use. The report also points out that if activities occur simultaneously, that percentage would decrease. Even with that, it is not clear how the public interest is served by this monopolization of ocean and bay use by the military. This proposed increase would have a definite negative impact on public use of these natural resources. | Section 3.5.2.4.3 has been revised to indicate that the area of water that would be closed for each training activity is relatively small when compared to total bay and ocean waters available for the uses described in the Basin Plan. In addition, the durations of most training activities would be short, usually less than one day. The public would have several alternate, equally suitable ocean and bay locations that it could use during training activities. In addition, the areas would not be permanently closed to public use; closures would be temporary, and areas would be reopened at the conclusion of training. Areas closed off to use would also change from training activity to training activity. Permanent loss of water use is not anticipated for any area of the ocean or bay. For these reasons, under Alternative 1, Navy training activities at SSTC are consistent with the Basin Plan. |

|---|---|---|---|
| 262. | City of Coronado, Office of the City Manager – James F. Benson | The City's beaches are already impacted by trash and other debris from a variety of sources. The draft EIS does not provide for any programs to mitigate the effects of the expanded programs adding to this trash and debris. The City is not aware of any current, ongoing program to clean the Navy's beach areas. The Navy's trash and debris, as well as that from other sources, accumulates on Navy property; tidal action and currents then deposit this trash and debris on public beaches. Expanded training activities will not only disturb buried trash and debris, releasing it into the environment; expanded water-based activities will re-suspend particulate debris deposited on the ocean bed. In summary, expanded training activities will likely lead to an increase in the amount of trash and other debris accumulating on Coronado's beaches in the area. The draft EIS should be revised to address these issues and mitigation. | The Navy recognizes its proximity to adjacent communities, and has attempted to structure its training activities and mitigation measures to achieve operational readiness while minimizing potential impacts to the surrounding area. Most of the training materials used at SSTC are non-hazardous, or are rendered non-hazardous when they function as designed (e.g., blanks). Trainees collect and remove expended materials to the extent practicable at the conclusion of their training events. Given the extent of recreational, commercial, research, and industrial operations in the ocean and bay waters adjacent to SSTC, however, a wide variety of non-military wastes accumulate on the training beaches. In the event that expended materials are found, contacting the POC at Naval Base Coronado will ensure that a team will arrive at the site, identify the item, and properly remove it. |
| 263. | City of Coronado, Office of the City Manager – James F. Benson | The draft EIS refers to OPNAVINST 5090.1 in several locations; however, this document was not provided as an attachment. Some sections of the report indicate that the discharge of bilge water and grey water is not allowed; other sections of the report seem to indicate that this discharge is allowed under certain conditions. Discharge of grey water and/or bilge water from any Navy vessel in the training area should be prohibited for any reason. | OPNAVINST 5090.1 is cited in the FEIS as a reference, and thus it is not included as an attachment to the document. Additionally, sections have been revised to clarify that discharges of grey or bilge water are not allowed under any conditions. |
| 264. | City of Coronado, Office of the City Manager – James F. Benson | The draft EIS describes training activities, which would include the creation of salt water ponds for temperature training. This ponded water would experience human contact for extended periods of time. Any ponded water used for this type of training should be tested to ensure that it meets established water quality standards prior to release back to the ocean and/or bay. The draft EIS should be revised to address this issue. | Section 3.1.1.4.3 of the FEIS indicates that this ponding of water typically occurs only on a single day, and would not experience human contact for extended periods. As indicated in the same section, water is not released directly into the ocean or bay, it percolates through the sand. |
| 265. | City of Coronado, Office of the City Manager – James F. Benson | The draft EIS should further discuss, explain and analyze the permit for reverse osmosis water purification and unit discharge into the Bay and Ocean as discussed in Chapter 6 of the draft EIS. | Under current conditions discussed in Section 3.4.2.2 of the FEIS and under Alternative 1 and 2, wastes from training activities at SSTC include waste petroleum products, used coolants, various types of expended training materials, brine and backwash from the ROWPU training, and batteries. Most of these waste types are nonhazardous, some (e.g., batteries) may qualify as universal wastes (wastes that are not designated as hazardous wastes, but containing materials that need to be prevented from release into the environment), and some are hazardous under RCRA. Hazardous wastes are stored in satellite accumulation areas on SSTC and in a 90-day storage area at NAB Coronado, and transported along SR-75 by truck to regional hazardous waste TSD facilities. Chapter 6 indicates that a amendment request has been filed, but at this time, water from ROWPU activities is containerized and transported offsite for disposal. |
| 266. | City of Coronado, | In the course of describing training activities, the draft EIS indicated that some running exercises | The SSTC Biological Opinion from the US Fish and Wildlife |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | Office of the City Manager – James F. Benson | would be performed with military working dogs traversing beach areas. Dogs are prohibited on the City's beaches, except for the area designated as Dog Beach, located at the northwest end of the City's Central Beach, near the Air Station's Ocean Boulevard gate. | Service outlines the constraints on military dog training on portions of SSTC-N and SSTC-S. Military dogs are not allowed outside of these areas until the Navy completes a study on the effects of military dogs on nesting birds. Section 3.11 of the FEIS clarifies that military working dogs "are typically on the hard packed sand (SSTC-S) or sand road (SSTC-N), they can also be on the soft packed sand in both areas." |
| 267. | Department of Transportation | The California Department of Transportation (Caltrans) appreciates the opportunity to have reviewed the Draft Environmental Impact Statement (DElS) for the Silver Strand Training Complex Project located along State Route 75 (SR-75) south of the City of Coronado. Caltrans has the following comments:<br><br>The AM peak Intersection Volumes at Rendova Road is 3,328 with level of service (LOS) E. The AM peak and PM peak Intersection Volumes at Tarawa Road are 3,284 and 3,406 with LOS F. These two intersections LOS are exceeding Caltrans threshold to maintain a target LOS between "C" and "0". Any trips added to an intersection already operating at LOS F typically reduces the intersection measure of effectiveness (MOE operating capacity). A corridor segment or intersection currently operating at LOS F has reached its maximum effective operating capacity. Any additional trips added without maintaining the existing MOE's would further degrade the operational function and does not allow an intersection or segment to continue to operate within its capacity, as the segment or intersection has failed. Significant delays are expected at an intersection or roadway segment operating at LOS F. This should be documented as such in the EIS. The above intersections should also be analyzed for Existing plus Project to specify the significance of traffic generated by Marine activities additional trips.<br><br>On page 3.14-4 to 3.14-5, the Rendova Road intersection operates at LOS E during the AM peak hour; and Tarawa Road intersection operates at LOS F for both AM peak and PM peak hour. Please revise.<br><br>On page3.14-5, section 3.14.1.4.2 Traffic volumes along Palm Avenue between 2005 and 2006 have decreased by 39%. The same applies for Table 3.14-4. Please revise.<br><br>The Traffic impact Analysis (TIA) within the EIS did not address potential increase (or decrease) in pedestrian related trips at the analyzed intersections. The TIA should address the potential impacts that may occur as a result of any increase in pedestrian trips from Oceanside training to bayside training etc. Increased pedestrian trips can have a substantial impact on intersection operations, as the existing pedestrian crossing time may not be adequate to handle additional trips and may require the pedestrian crossing phase time to be increased to meet the added demand, thus lowering the overall capacity of intersections where this may occur. This would be especially important to know for the peak periods analyzed within the TIA.<br>Any reduction in pedestrian trips during the peak periods that may increase the capacity of any | The LOS for Tarawa and Rendova have been added to Section 3.14.1.4.1 of the FEIS, and text has been added about the operating capacity of roads at a LOS F.<br><br>The decrease in traffic volumes from 2005-2006 has been revised to 39% and amended in table 3.14-4.<br><br>Regarding pedestrian increases in signal phase time, there are no new eating facilities or pedestrian destinations that would affect signal phases. There is no increase in personnel stationed at SSTC as a result in the implementation of the Proposed Action. The Proposed Action does include an increase in activities performed by existing personnel. The activities associated with the Proposed Action will be increased but will not increase the signal phase times at NAB intersections. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | of the signalized intersections analyzed, such as new eating facilities on the beach side training facility, which would reduce the need for trips at the analyzed intersections would be helpful to note as well.<br><br>Based on the inclusion of these revisions to the EIS. Caltrans has no further comments. If you have any questions or require further information, please contact Christian Bushong at (619) 688-2510 or Christian.Bushong@dol.ca.gov. | |
| 268. | Environmental Protection Agency, Region IX | Water Resources<br>Vernal Pools<br>As stated in EPA's website (http://www.epa.gov/wetlands/types/vemal.html), "[m]ore than 90% of California's vernal pools have already been lost. Great efforts are being made to protect the remaining vernal pools, as their disappearance marks the loss of rare and important habitat and some of the associated plant and animal species as well." At the Silver Strand Training Complex South (SSTC-S), the vernal pools cover 3.2 acres in total (Table 3.11-1). Additionally, many contain endangered San Diego fairy shrimp "found in 11 of 25 vernal pools and salt marshes surveyed" (page 3.11-12).<br>In the preferred alternative, the DEIS states on page ES-IO, "[t]he Navy would allow limited training involving foot traffic,. but not vehicle traffic, in the vernal pools when vernal pool conditions are determined to be dry." The DEIS also states in Table 3.11-4, "[d]ry conditions would be determined by a qualified person overseen by a NBC [Naval Base Coronado] Botanist or Wildlife Biologist." While foot traffic in the vernal pools when the soil is dry and hard is unlikely to damage fairy shrimp, determining when the pools are dry enough for foot traffic is complex.<br><br>Recommendation:<br>EPA recommends the Navy work with U.S. Fish and Wildlife Service to identify the highest quality vernal pools, and fence those to minimize impacts from training.<br>Alternatively, EPA suggests | The Navy's analysis was based on the best available science; however, there is inherent variability and uncertainty in occupancy of the vernal pools. For this reason, the Navy does not know the impact of introducing training to this area. As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | • the FEIS commit to an inspection of vernal pools by a wildlife biologist, prior to upland training at beach Purple 2, or<br>• the FEIS list the factors that will be used to determine the vernal pools are dry enough to withstand foot traffic'. | with the USFWS.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp. |
| 269. | Environmental Protection Agency, Region IX | Water Resources<br>Sediment Quality<br>The DEIS states on page 3.5-14, "[r]ecent sediment sampling in the San Diego Bay near SSTC-N indicates - while concentrations of some contaminants are elevated above background levels - no contaminants were present at the concentrations which would adversely affect marine organisms (Port of San Diego 2002)." EPA encourages a fuller discussion of sediment sampling results near SSTC-N and any screening levels used to determine that no contaminants were present at concentrations of concern. The purpose of the sediment sampling in the report cited (San Diego Harbor Deepening EIS/EIR, USACOE, November25, 2002) most likely was intended to characterize the quality of the sediment to be dredged, and may not have specifically addressed the sediment at SSTC-N. Even more so than dredging, underwater explosions are likely to make contaminated sediments bioavailable to fish and marine mammals.<br><br>Recommendation:<br>The FEIS should provide additional discussions of sediment sampling at SSTC-N, including a brief description of the number of samples, depth of sampling and contaminant concentrations. | The sediment sampling for the San Diego Harbor Deepening project was, as indicated in the comment, performed not to identify contaminant hotspots but to characterize the general quality of a large quantity of Bay sediments intended for ocean disposal. Such samples are likely to be more representative of general conditions in the Bay than samples collected in known or suspected contaminant hot spots. The Navy is not aware of any other relevant sediment sampling in the vicinity of the SSTC training areas. |
| 270. | Environmental Protection Agency, Region IX | Biological Resources<br>Least Terns<br>The DEIS discusses physical training for groups averaging 30 - 150 people (Table 2-1, page 2-24), and includes that "trainees may occasionally have a military working dog participate in the physical conditioning." Page 3.11-39 also clarifies that military working dogs "are typically on the hard packed sand (SSTC-S) or sand road (SSTC-N), they can also be on the soft packed sand in both areas." While federal endangered least terns may have acclimated to the presence of humans nearby, barking dogs in nesting areas does not seem prudent, particularly when exercise in the nearby hard packed sand would be much less intrusive. | As listed in Section 5 and as described in the signed Biological Opinion (July 7, 2010) from USFWS, military working dog handlers will be notified weekly of the locations of plover nests and, to the maximum extent possible, remain a minimum of 30 m (90 ft) from markers that delineate the locations of nesting plovers. Outside of the nesting season (15 Sept through end of February), training may occur unencumbered. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Recommendation:<br>The FEIS should include a mitigation measure that avoids conditioning military working dogs in least tern nesting areas (i.e. the soft packed sand of Blue 2, Orange I and Orange 2). | If physical conditioning on soft pack sand is necessary, handlers and military working dogs will run on the sand road (SSTC-N) or within 20 feet of the hard pack sand to reduce the disturbance and impact to nesting terns and plovers. At SSTC-N, military working dogs will exercise primarily between beach lanes Yellow 1 and Blue 1, where they may cross the beach to get to the sand road at the existing route immediately to the north of the demo pit. The Navy will not conduct physical conditioning using dogs in the southern three beach lanes until: a) completing a study to evaluate the effects of military working dogs on terns and plovers and b) coordinating with the USFWS to develop conservation measures to minimize any additional effects.<br><br>If military working dog training is requested as part of Platoon Over-the-Beach activities at SSTC-N, these activities will be scheduled in beach lanes Yellow 1, the northern half of Yellow 2, Green 1, or Green 2, pending the results of the Navy's study to evaluate the response of terns and plovers to military working dog presence.<br><br>The Navy will coordinate with USFWS in the development of the study to evaluate the effects of military working dogs on terns and plovers and will submit the study design and scope of work to USFWS for review and approval. The Navy will allow USFWS 30 days to submit comments and an additional 30 days to approve the final study design and scope of work. |

|---|---|---|---|
| 271. | Environmental Protection Agency, Region IX | Waste Minimization<br>EPA recognizes the Naval Region Southwest's commitment to sustainability, including renewable energy, water conservation, green buildings and more. We commend the Navy for "pumping seawater through its Offshore Petroleum Discharge System during training, instead of using petroleum products." In comparison, the DEIS does not explain whether a high level of scrutiny has been applied to the explosive training exercises, although it does identify potential munitions constituents of concern and explosives residue (on page 3A-I 0 and 11). EPA acknowledges that in many instances the success of training exercise may not be judged without using the actual amount of explosive also used in field conditions, however, that may not be the case for all explosives training exercises.<br>Recommendation:<br>The FEIS should assess the potential to reduce explosive charges in meeting its training needs. | As discussed in Section 2.1.3.3 of the FEIS, a reduction in underwater mine countermeasures was considered but eliminated because it would not support the Navy's ability to meet training requirements consistent with the Fleet Readiness Training Plan (FRTP) (criteria #2 and #6, Section 2.1.2 of the FEIS). A reduction in the types, or tempo of training activities available at SSTC would mean that local units and users would have to routinely travel to other range complexes to fulfill training requirements. As outlined in Section 2.1.3.1 of the FEIS, this is not a feasible alternative. For these reasons, this alternative has been eliminated from further consideration in the EIS. |
| 272. | Environmental Protection Agency, Region IX | Clarification of Baseline Training Tempo<br>Various sections of the DEIS provide information on baseline training tempo, including Table 2-1. EPA encourages a more thorough discussion of the development of the baseline training tempo, to clarify the concept. The FEIS should, for example, explain whether the values in Table 2-1 represent the amount of training conducted in a specific year or the amount of training that could be conducted given the current restrictions on training. Where the baseline training tempo is not reflective of recent training activities, EPA suggests the FEIS include a comparison with recent training activities. This will foster better understanding of the FEIS. EPA is not suggesting additional factors need to be used for comparison throughout the FEIS, only that it should link training tempo to recent levels of training at SSTC. | The tempo and types of training activities have fluctuated within SSTC due to changing environments, the introduction of new technologies, the dynamic nature of international events, advances in warfighting doctrine and procedures, and force structure changes. Such developments have influenced the frequency, duration, intensity, and location of required training. The factors influencing tempo and types of operations are fluid in nature, and will continue to cause year-to-year fluctuations in training activities at SSTC.<br><br>The Navy established its baseline training tempo by considering available historical usage data at SSTC, specifically, from 2001 through 2007. During this period, the U.S. military commenced operations in Afghanistan and Iraq as part of the Global War on Terror. Many of the units that would normally be training at SSTC were deployed overseas. Additionally, the focus of the individual and unit training temporarily shifted to inland (desert or mountainous) environments to prepare personnel for conditions they would encounter in combat operations overseas. As such, SSTC has experienced a temporary decrease in training usage and tempo during the period being evaluated (2001 through 2007). To |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | establish baseline training tempos, the Navy evaluated available 2001 through 2007 training data, considering year-to-year fluctuations as well as the recent progressive decline in training tempo at SSTC. For each training activity, the Navy selected 2001- 2007 data that were most reflective of the average historical training conditions over the past few decades. |
| 273. | Federal Emergency Management Agency, Region IX | Please review the current effective countywide Flood Insurance Rate Maps (FIRMs) for the County of San Diego (Community Number 060284), and Cities of Coronado (Community Number 060287) and Imperial Beach (Community Number 060291), Maps revised September 29, 2006. Please note that the Cities of Coronado and Imperial Beach, San Diego County, California are participants in the National Flood Insurance Program (NFIP). The minimum, basic NFIP floodplain management building requirements are described in Vol. 44 Code of Federal Regulations (44 CFR), Sections 59 through 65.<br>A summary of these NFIP floodplain management building requirements are as follows:<br>All buildings constructed within a riverine floodplain, (i.e., Flood Zones A, AO, AH, AE, and Al through A30 as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level in accordance with the effective Flood Insurance Rate Map.<br>If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, any development must not increase base flood elevation levels. The term development means any man-made change to improved or unimproved real estate, including but not limited to buildings, other structures, mining, dredging, filling, grading, paving, excavation or drilling operations, and storage of equipment or materials. A hydrologic and hydraulic analysis must be performed prior to the start of development, and must demonstrate that the development would not cause any rise in base flood levels. No rise is permitted within regulatory floodways.<br>All buildings constructed within a coastal high hazard area, (any of the "V" Flood Zones as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structural member, (excluding the pilings and columns), is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components.<br>Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA for a FIRM revision. In accordance with 44 CFR, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall | Thank you for the list of references that should be reviewed. Because the EIS only analyzed activities associated with training at SSTC, of which there are no development or construction activities, the information that you have provided has been forwarded to the appropriate personnel and will be consulted prior to any future construction or development activity. |

|---|---|---|---|
| | | notify FEMA of the changes by submitting technical data for a flood map revision. To obtain copies of FEMA's Flood Map Revision Application Packages, please refer to the FEMA website at http://www.fema.gov/business/ntip/forms.shtm.<br>Please Note: Many NFIP participating communities have adopted floodplain management building requirements which are more restrictive than the minimum federal standards described in 44 CFR. Please contact the local community's floodplain manager for more information on local floodplain management building requirements. | |
| 274. | San Diego County Archaeological Society, Inc. | 1. The DEIS describes actions the Navy routinely takes to avoid significant impacts to cultural resources, such as notification of restrictions prior to activities. What actions does the Navy take to audit the effectiveness of impact avoidance? Is there a periodic monitoring or inspection program, with provision for remedial action should any problems be identified?<br>2. The DEIS considers potential impacts to ground-disturbing activities "in the immediate area of an archaeological site" (see Section 3.13.2). It does not address the possibility of such activities impacting buried sites. A monitoring program is warranted for areas where previously-undisturbed subsurface areas will be subjected to excavation, grading or similar disturbances. Both archaeological and Native American monitors need to be part of such a monitoring program.<br>3. Please explain where the collections from previous archaeological investigations on the SSTC are curated. An inspection of the listing of curated collections at the San Diego Archaeological Center identified none of the sites listed (other than an apparent error for SDI-13968, which is listed for a site inventory project on Camp Pendleton). Are the collections curated at another facility meeting the requirements of 36CFR79? If not, what actions will be taken to bring their curation status into compliance with 36CFR79?<br>SDCAS appreciates the opportunity to participate in the navy's environmental review process for this important project. | 1 - Under existing management protocols of the NB Coronado Cultural Resources Management Program (CRMP), periodic inspections are conducted of all NB Coronado installations, including the SSTC, to monitor land use on areas of known archaeological sensitivity. Similarly, CRMP personnel frequently conduct project-specific inspections and joint site visits under the NB Coronado Site Approval Request (SAR) process. Both monitoring processes are prescribed under stipulations of the 2003 San Diego Metro Area Programmatic Agreement (Metro Area PA). Any problems or conflicts noted during monitoring are reported to the responsible NB Coronado command authority and addressed administratively. Professional investigations have identified eligible and potentially eligible properties within the CNRSW Metro ROI. In conjunction with ICRMP development and as future investigations, CNRSW will determine if additional properties in the Metro ROI not previously evaluated may be eligible. CNRSW will ensure that all new construction, alterations, equipment installation, structure modifications, or repairs and maintenance on land, buildings, or structures will be reviewed for potential effects to historic properties.<br><br>2 - By prescription, this EIS limits its analyses to operational training activities. Construction activities related to the |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | development of infrastructure supporting operations or other systems on the SSTC, maintenance and repair on existing infrastructure, or the demolition of facilities, will be processed separately and individually under NEPA. These supplemental NEPA reviews are processed through the NB Coronado PWO, where they will be subject to application of historic preservation review by the CRMP Archaeologist under the Metro Area PA. Stipulation 9 of the Metro Area PA provides that the CRMP "will ensure that ground-disturbing activities include appropriate measures to protect archaeological resources," including, as appropriate, "archaeological monitoring of ground disturbing activities within areas of known or provisional archaeological sensitivity."<br><br>3 - Collections deriving from SSTC sites are of limited value, in part due to the nature of the testing projects involved, but also related to the content or condition of the site areas tested. For instance, the site CA-SDI-13968 referenced in the comment is a remnant prehistoric deposit located in the southeastern quadrant of SSTC South, where its original extent has been bisected by the construction and reconstruction of SR75 beginning in the early 1940s. Archaeological testing there in 2001 was limited to the alignment for the eventual burial of overhead power lines with the goal of assessing if any intact site deposit might lie below the incised SR75 road shoulder. The testing determined that the underlying soil was the undisturbed, sterile native geology, and no testing was applied to other, less disturbed areas of the recorded site away from the proposed trenching. Accordingly, no collections were forthcoming from testing this particular locus. Other testing conducted during the 2001 effort at sites CA-SDI-5514 and -5454/12270 produced a small volume of collections which remain in the custody of the consultant pending Navy funding to archive these at the SDAC. Such funding has become available in FY10, and these materials are expected to be moved to the SDAC in Summer 2010. Site eligibility evaluation testing conducted in 2006 on recorded sites CA-SDI-57, CA-SDI-13964, CA-SDI-13966, CA-SDI-13969, and CA-SDI-13972 produced a minimal quality of materials which were determined to derive from very disturbed contexts and lacked any integrity of their origin. These were not added to any collections. |

| 275. | San Diego Audubon Society | The San Diego Audubon Society is very concerned with the proposed project. We greatly appreciate the current efforts of the Navy to protect and enhance the safe nesting of California Least Terns and Western Snowy Plovers on the Silver Strand. Section 5.11.1 is a very interesting history of Navy environmental responsibility and leadership. We also appreciate the expanded training needs for the Navy because of our Nation's current high level of military activity. However, we think that the plan needs to be more protective than the current Alternative 1 or 2. Therefore we support the No Project alternative unless Alternate 1 can be improved substantially. We strongly urge that Alternative 2 not be selected because of its large and irresponsible impact on least terns and snowy plovers. The San Diego Audubon Society also supports the Bay Council letter to which we are a cosigner. | The models developed to assess impacts to the California least tern and western snowy plover from proposed military training have been improved, in response to the Audubon Society and other public comments that have been received (see Sections 3.12.3.1 and 3.12.3.2 of the FEIS). The models and analysis now also consider historical take levels and estimate average future take levels, in addition to overly-conservative take levels. The improved models anticipate that impacts to the California least tern and western snowy plover will be minimal under both the No Action Alternative and Alternative 1, and will be mitigated through the Navy's extensive management program. |
| 276. | San Diego Audubon Society | IMPACTS ON LEAST TERNS<br>The population of Least Terns has risen substantially over the last 15 years, as the EIS shows. But, the reproduction of Least Terns has generally been declining over the last decade as the EIS also shows. This suggests that the species is not doing nearly as well as it looks. It is also thought that the average age of the birds is increasing, which could reduce future reproductive success. This is clearly not a good time to increase the take of the species, particularly when that take is avoidable. We will be more specific in the following subheadings.<br><br>CUMULATIVE IMPACTS NOT ADDRESSED, LEAST TERNS<br>The EIS provided a long list of likely activities for which the cumulative impacts have been addressed. We are concerned that several very relevant activities were not addressed that, when combined with Alternative 1 or 2 could help put the recovery, and perhaps even the survival of the species in jeopardy.<br><br>The U.S. Fish and Wildlife Service has proposed downlisting the least terns from Endangered to Threatened. This would reduce the priority for funds, for priority for other resources such as locations for new nesting areas, negotiating site management agreements, predator management, protection and enhancement of the fish needed for foraging, research, monitoring, planning, analysis, site maintenance, etc. This reduction in resources and priorities will take a toll on the species, in both predictable and unpredictable ways.<br><br>Global Climate Change appears to be making the quantity and timing of the supply of small fish for least tern consumption more variable and more uncertain. This affects the likelihood that chicks will survive. Changes are happening very quickly which could leave the entire population more vulnerable.<br><br>The impacts of Gull-bill terns on tern reproductive have been significant and appear to be increasing. There appears to be no real progress toward identifying how to manage the two | Downlisting the least tern does not affect Navy funding priorities in its INRMPs - Endangered and Threatened species are classified with the same funding priority. The Navy is contributing to research on climate change and least tern foraging habits in San Diego Bay. Gull-billed tern predation studies are also underway by the Navy and other funders (including USFWS), and the Navy has requested approval from USFWS to relocate Gull-billed terns, without success. A species viability analysis is under consideration for funding. The USFWS has not officially proposed the California least tern for downlisting. If and when it does, the proposal will be published in the Federal Register and will be open for public comment before a final decision is made.<br><br>The Navy is working closely with the USFWS to assist it in addressing gull billed tern predation and impacts to western snowy plover and California least tern. The Navy has submitted an application for a depredation permit to the USFWS Division of Migratory Bird Management annually since 2005, and has continued to document the impacts of this species. The Navy is supporting a radio-telemetry study by SDSU and USFWS during the 2010 nesting season. This study will research movements of gull billed terns around San |

|---|---|---|---|
| | | species to assure the recovery of least terns. This lack of resolution is likely to result in a large and unmanaged take of least terns for at least several years while regulations are developed, reviewed, and finally implemented.<br><br>The Recovery Plan for least terns is almost three decades old and is based on outdated information. As a result, there is no effective comprehensive and broadly accepted plan for the recovery of least terns. This deficiency in planning and management means that there is no valid way to conclude that the additional take proposed by Alternatives 1 or 2 will not help put the species in jeopardy.<br><br>We urge that the EIS acknowledge each of the additional cumulative impacts mentioned above and incorporate their effects into its analysis. | Diego Bay and analyze diet.<br><br>The Navy agrees that the California Least Tern Recovery Plan needs to be updated to address current concerns facing California least tern recovery efforts. As listed in the FEIS and in the signed USFWS Biological Opinion (July 7, 2010), the Navy supports the USFWS with annual site specific data and monitoring of the least tern on Navy property. The Navy also encourages the USFWS to update the Plan so that the Navy, as an agency responsible for working towards recovery, can understand how to best attain this important goal. The Navy intends to continue vigilant and adaptive management of least terns, and as well as monitor take. Take will be monitored and course adjustments made. |
| 277. | San Diego Audubon Society | SPECIES VIABILITY ANALYSIS, LEAST TERNS<br>The Species Viability Analysis is based on reproduction rates measured in 1981 to 1984, according to page 3.12-21. At this time the productivity was 0.62 fledgling per nest in good years and 0.27 for years dominated by El Nino/Southern Oscillation (ENSO). The ENSO influence was expected about one out of seven years.<br><br>According to a figure in the handout from the public presentation, in the last 8, the good years have had productivity around 0.15 for the good years and 0.05 for the bad ones. It appears that we have had 8 bad years in a row vs. the one bad year in seven anticipated in the Species Viability Analysis.<br><br>As mentioned above the Species Viability analysis assumes one ENSO year for every 7 normal years. However, some climate models now suggest that with global warming the average may become more like the ENSO state which will make least tern reproduction more difficult.<br><br>The model also does not address other trends that could increase the risk to the food supply for least tern recovery such ocean warming, reduced oxygen levels in the ocean, and ocean acidification. Each of these issues suggests that the Species Viability Model is probably wildly optimistic.<br><br>We urge that this EIS not conclude that a lower population of least terns will not jeopardize the recovery of the species unless that conclusion can be substantiated with current and relevant data and the best analysis of future trends. Such an analysis should also incorporate the effects of the cumulative impacts listed previously in this letter. Any model used should include the | The Navy understands the problems with the model. Efforts to model least tern population viability have been frustrated by incomplete information about the species' demography, effects of environmental stochasticity, and wintering habitat location. An update of the Species Viability Model is needed; however, it is currently the best available science. The Navy sees its responsibility as contributing to recovery. The FEIS attempts to quantify the benefit provided by the Navy of its personnel dedicated primarily to this program and onsite maintenance and monitoring. The Navy is no longer relying solely on the model to conclude that minimal additional impacts to California least tern and western snowy plover are expected under the Proposed Action. The Navy may be required under the Biological Opinion to re-initiate consultation with USFWS if the population of California least tern or Western snowy plover on NBC decline below 2005-2009 baseline nesting levels and Navy and USFWS evaluations determine that the decline is due to the impacts from of military training. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | uncertainty range of the input information, the uncertainties of the assumptions the model is based on, how the uncertainties propagate through the model, and the uncertainty of the results. A model that produces a number without clear quantification of the uncertainty of that number will probably be more misleading than useful.<br><br>The species viability analysis only appears to address keeping the species from declining to extinction. The purpose of the Endangered Species Act is recovery. This analysis needs to be redirected to identify a population and population growth rate that will lead to a high probability of recovery of CA least terns in a reasonable period of time. | |
| 278. | San Diego Audubon Society | IMPACTS ON WESTERN SNOWY PLOVERS<br>The EIS proposes a maximum number of 22 Snowy Plover nests that will be marked for protection. Other nests, eggs, and chicks will be unmarked. As they are very well camouflaged the destruction of a large number of chicks and eggs appears likely. The EIS fails to provide any analysis to quantify the likely number of unmarked nests, eggs, and chicks in the lanes would be destroyed accidentally. But it concludes that this will not be a significant impact with no data or analysis to support this conclusion.<br><br>From 2005 to 2009, Snowy Plover population on the West Coast has declined about 13%. The Recovery Plan emphasizes the need for increased protection of nesting areas to allow recovery. Backing off on protection of these nests appears to be a significant risk to the viability of this species and directly contradicts the recommendations of the Recovery Plan.<br><br>EIS also fails to provide any direct mitigation for the losses of Western Snowy Plovers that will be caused by this project as is required by NEPA. Ironically the protection of these three lanes during nesting season was provided as mitigation for the losses that were anticipated for the other 11 lanes. In view of this, If this project is implemented, we strongly urge that the EIS provide estimates of anticipated losses of WSPs from the training operations on all of the 14 Silver Strand project area and provide adequate mitigation to directly offset those losses in all 14 lanes. | The Navy does analyze expected take of chicks in worst case and No Action scenarios. The numbers are not a population-level effect, and so they will not affect the viability of the species. Measures are in place to ensure long-term viability of Navy sites for nesting, and for adaptive management. Mitigation for any losses is provided through management, including predator control and site enhancement. It is true that most of the western snowy plover benefit has occurred incidental to California least tern protection. The Navy has conducted an additional impact analysis for western snowy plover. The analysis found that the likelihood of unbuffered western snowy plover nests being impacted by military training is low even though they are well camouflaged (Section 3.12.3.2 of the FEIS). The Navy has provided additional information about its proposed mitigation. Proposed mitigation is expected to well-compensate for the few nests that could be lost under the revised buffering criteria. The Navy is working closely with the USFWS to assist it in addressing gull billed tern predation and impacts to western snowy plover and California least tern. The Navy has submitted an application for a depredation permit to the USFWS Division of Migratory Bird Management annually since 2005 and has continued to document the impacts of this species. The Navy is supporting a radio-telemetry study by SDSU and USFWS during the 2010 nesting season. This study will research movements of gull billed terns around San Diego Bay and analyze diet. |

| 279. | San Diego Audubon Society | BIOLOGICAL OPINION NOT AVAILABLE<br>The Biological Opinion from the US Fish and Wildlife Service will have an important impact on the future of this project. It is inappropriate that the public must review this EIS without seeing the final Biological Opinion for the project. The BO would provide additional information and the opinion of the FWS. It is essential that reviewers be able to review this opinion and its background information and see how the Navy intends to deal with that opinion.<br><br>We strongly urge that the DEIS be re-circulated for comment after the BO is received, its results are integrated into the project, and the mitigation is identified. This transparency is especially important for this project in view of its large potential impacts on two very important at-risk species. If the public is only allowed to see this information in the FEIS, there will be no formal comment period, and the public will have been denied the intended benefits of the NEPA process. | The information and mitigation measures from the signed Biological Opinion (July 7, 2010) have been incorporated into the appropriate sections of the EIS, including the conclusion. |
| 280. | San Diego Audubon Society | IMPACT OF NOISE AND DISTURBANCE ON LEAST TERNS AND SNOWY PLOVERS<br>We were pleased to see the substantial analysis of the average and peak noise resulting from the project in Section 3.6, ACOUSTIC ENVIRONMENT. But we were extremely disappointed to discover that the noise analysis was only related to "sensitive receptors" of the human kind. The EIS provides no analysis to determine if the increases in average noise or peak noise from the increases in gunfire, flares, and detonation would result in a take, or a reduction of reproductive success, of least terns or snowy plovers. This loss could result from either least terns or snowy plovers being deterred from nesting or abandoning eggs or chicks because of the additional noise, either on the ocean side or the bay side of the Silver Strand.<br><br>We strongly urge that the EIS include analysis of the indirect take of chicks and eggs that will result from permanent nest abandonment that is likely to result from the increase in noise, both average and peak. We also urge that the EIS include analysis of the indirect take of chicks and eggs that is likely to result from temporary abandonment that would make the eggs and chicks more vulnerable to death from heat, cold, predators, and starvation. | The Navy agrees that the California Least Tern Recovery Plan needs to be updated to address current concerns facing California least tern recovery efforts. The Navy supports the USFWS with annual site-specific data and monitoring of the California least tern on Navy property. The Navy also encourages the USFWS to update the Plan so that the Navy, as an agency responsible for working towards recovery, can understand how to best attain this important goal.<br>This is a high ambient noise environment in which nesting persists. The Navy has achieved nesting success adjacent to the North Island airfield, which is a very high noise environment. The FEIS addresses noise and its effects on the least tern and snowy plover. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 281. | San Diego Audubon Society | ALTERNATIVES<br>The limited range of alternatives that are presented in the EIS do not provide a reasonable starting point for a productive process to resolve the project's operational and environmental problems. The lack of meaningful alternatives is not consistent with the letter or intent of NEPA. We urge that the EIS alternatives be expanded to lead to a reasonable solution to the Navy's training issues.<br><br>The EIS needs to provide an alternative that identifies scheduling efficiencies that will preserve the land portion of blue 2, orange 1, and orange 2 during nesting season. A very large portion of the use of the training area is for physical fitness training which provides considerable opportunities for more efficient use of the area. The EIS's allegation that expanding operations into those three lanes is essential to the mission is not supported by any specific information provided in the EIS.<br><br>Many of the missions that are proposed can be accomplished in the water section of the lanes, with virtually no beach access. We urge that the uses of lanes blue 2, orange 1, and orange 2 be limited to those water-only missions during nesting season. Needed access for them could be by boat vs. land. If emergency access is occasionally needed over the beach, that could be considered valid unavoidable "incidental take." Such an alternative should be developed and analyzed.<br><br>We also urge that an alternative be analyzed that allows lanes at Camp Pendleton to be used to relieve some of the scheduling pressure on the Silver Strand Beach Lanes without destroying least tern and snowy plover eggs and chicks.<br><br>We strongly urge that a set if meaningful alternatives be identified that will address the Navy's training needs in a much more environmentally protective manner. Such an alternative is essential to satisfy the letter and the intent of NEPA. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3 of the FEIS. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. Alternative locations for training, such as Camp Pendleton were analyzed, and found not to meet the military training needs (Section 2.1.3.1 of the FEIS). Additionally, alternatives were eliminated that investigated the distribution of military activities to different locations within SSTC.<br><br>While the Navy appreciates your recommendation for public assistance in rehearsals, the general public is prohibited from participating in these training activities for both military security and public safety. An explanation of why the Navy needs to use Lanes 8, 9, and 10 is provided in Sections 1.5.1.1, 1.5.1.2, 1.5.1.3, and 3.12.3.1 of the FEIS.<br><br>All alternatives in the EIS propose scheduling efficiencies that reduce the potential for take of listed species. As discussed in Section 3.12.1.5.3 of the FEIS, beach scheduling procedures bias activities with heavier beach usage towards beach lanes with fewer nests, when it does not impact the realism of training or training needs. This means that heavy impact training would be preferentially scheduled in the Yellow and Green beach lanes where nest numbers are low. Water-borne activities that have no beach requirements or impacts would be preferentially scheduled in Lanes 8, 9, and 10. Even if a beach activity were to be scheduled in Lanes 8, 9, and/or 10, it would be expected to be an activity with a small footprint and low impact on nesting birds. Section 3.12.3.1.2 of the FEIS further discusses these mitigative effects of this scheduling efficiency. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | Also, while not explicitly stated, physical fitness activities are typically planned for areas with minimal nesting: in the obstacle course on Yellow 2, on the sand road paralleling Highway 75, paralleling the ocean along the high tide line, and in designated crossing lanes between the sand road and the tide line. As stated in the EIS, these activities can typically work around nests. For these and other reasons discussed in Section 3.12.3.1.2 of the FEIS, impacts to nesting birds in Lanes 8, 9, and 10 are expected to be minimal. |
| 282. | San Diego Audubon Society | MITIGATION FOR LEAST TERNS AND SNOWY PLOVERS<br>The mitigation measures for the impacts of this project are defined in section 12.4.1: "Develop a site enhancement plan that includes establishing dunes on the windward edges of Delta North and South that would enhance this area for plovers, create a source of sand for the least tern nesting area, and establish a better visual barrier between SR-75 and the nesting colony."<br><br>It is not clear what is meant by "Develop a site enhancement plan" Does that mean that the enhancement would actually be built? How big? When would it be built? Would it be in place and functioning before Alternative 1 or 2 would be implemented? Would it be maintained in perpetuity, or just constructed? This sort of information about the scale and viability of the mitigation should have been a major element of the EIS.<br>We would appreciate habitat enhancements. But, is it anticipated that these measures would result in an improvement in productivity in terns and plovers that would offset the anticipated direct and indirect take that would result from Alternative 1 or 2? It appears very doubtful that it would. One of the purposes of the EIS is to identify the net impact of the project with the mitigation. This EIS does not identify the impact and it does not identify how much of that impact is offset by the mitigation. It fails to provide the fundamental elements of an EIS.<br><br>A better visual barrier between SR-75 and the nesting colony will also mean a better approach path for avian predators to approach the tern colony without being detected. We doubt that will improve the productivity of the colony. Thus it does not appear to have any value as mitigation.<br>Section 12.4.2 states: "Vehicle patrolling and LARC V operator training will not occur in Red, Blue, or Orange Beach Lanes." How many least terns of snowy plovers will this save? Will the terns and plovers that are saved by this measure survive the other activities that will occur in these lanes under Alternatives 1 and 2? It does not appear that they would. Again, the EIS fails to identify the impacts of this measure, which is one of its main purposes.<br><br>The two mitigation measures in the EIS may tend to reduce or offset the take a little, but they do not appear to minimize or to offset the impacts of the Project. If Alternatives 1 or 2 are adopted in spite of their inappropriate impacts, we urge that mitigation be provided that will actually offset the take that results from those actions. | The addition of sand is contemplated as a principal element of the site enhancement plan to make the historically designated nesting areas more attractive for nesting terns and more secluded from the road. Vegetation management of the dunes (removal of iceplant with some replacement by native species) will increase the carrying capacity for terns and plovers. Accounting will take place through monitoring of take and reproductive success. The Long Term Site Enhancement Plan which is part of the Proposed Action could increase the carrying capacity for terns by hundreds of nests. For snowy plovers, the long-term site enhancement plan is estimated to realistically mitigate for an estimated 34 nests annually. The FEIS quantitatively estimates the amount of benefit provided by Navy management above and beyond that required by past projects, and that can be considered avoidance, minimization, and offsetting measures related to training.<br><br>Besides setting aside real estate, the most important mitigation measure is probably predator control. The Navy has a number of predator management and control measures that it implements throughout the breeding season to minimize impacts of predators, including avian predators, ants, and mammals (see Section 3.12.1.5.3 of the FEIS for more detail). Predator control is considered by many species experts to be one of the most crucial management strategies for reproductive success (Foster 2006; USFWS 2006c). Without the Navy's predator control program, the SSTC nesting sites would likely |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | have substantial reproductive failure. This predator control program has allowed for and is expected to continue to promote over one thousand nests that are annually found on SSTC-N. |
| 283. | San Diego Audubon Society | The EIS does not indicated that any accounting will be done to identify how much of the environmental impact of the project is expected to be offset by the mitigation. How would a regulator or decision maker be able to identify how much environmental impact has occurred and how much has been offset by the mitigation over time? We urge that the EIS provide how such an ongoing net impact assessment will be accomplished to facilitate the adaptive management process that is mentioned.<br><br>If the project results in a substantial increase in a net take, or if the viability of the terns and plovers begins to diminish, will the project include additional specific mitigation measures to restore protection of the nesting at the three lanes or more to offset the loss? Though adaptive management is suggested, there are no specifics of what is meant by it for this project.<br><br>It appears that there are areas in the SSTC South area that could be used to mitigate for the impacts of this project that would be difficult and costly to use for training. We urge that the Final version of this document explore that possibility. | The Navy has proactively prepared for the expected take through site enhancement, management of lane usage, nest protection, monitoring, and decades of adaptive management. In response to this and other comments received, the Navy has revised the EIS analysis on the California least tern (Section 3.12.3.1) and the western snowy plover (Section 3.12.3.2) to provide a more in-depth analysis of impacts that training is expected to have on the species. Mitigation measures have been added to the Proposed Action. The benefits of current and proposed mitigation are also described and quantified as far as practicable. As discussed in the analysis, the benefits of mitigation are expected to outweigh potential adverse impacts of training. The Navy works each year on site-maintenance and monitoring, plus periodic site enhancement or management approaches to manage terns, and to increase attractiveness of Delta beaches. The discussion originally presented in the DEIS has been updated in the FEIS (Section 3.12.3.1) to explain the level of loss anticipated under the No Action Alternative compared to that under Alternative 1, estimated to be an increase of seven nests, on average, in a typical year for least terns. The difference in incidental take for snowy plover between the No Action Alternative and Alternative 1 is one nest, on average, in a typical year. The Navy will ensure that biological monitors look for and document the locations of least tern or snowy plover nests, eggs, and chicks prior to and after all military training exercises, to allow for the assessment of take associated with training activities.<br><br>The Navy believes it has already fully mitigated for training impacts. The Navy, in response to your and other comments, has attempted to analyze the beneficial impacts of proposed |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | mitigation. Some of the mitigation has impacts that are interconnected with many other factors, and can only be discussed qualitatively. Where possible, the Navy attempted to quantify the beneficial impacts of the proposed mitigation. The Navy has determined (see Sections 3.12.3.1 and 3.12.3.2 of the FEIS), that the proposed mitigation will well offset the anticipated take of listed bird species on SSTC associated with military training.<br><br>The Navy conducts frequent and routine monitoring of the nesting sites and regular dialogue with the USFWS on the status of listed birds nesting on SSTC. If changes in the population of nesting listed bird species occur on SSTC, the Navy and USFWS will work together to determine the reason for the change in population, and will reinitiate consultation if appropriate.<br><br>There are no areas on SSTC-S that are not used for training, except for the vernal pools and the area leased to Camp Surf. All of these areas will continue to be needed under all three Alternatives. |
| 284. | San Diego Audubon Society | IMPACTS ON DIVING BIRDS<br>We appreciate the analysis that was performed relating to the impacts of underwater detonations on diving birds and marine mammals. However, we have not had the resources to verify the data, rationale, or conclusions at this time. We also appreciate the plan to discourage diving birds from the exercise area to prevent injuries or death to them. | Your comment has been noted. |

| 285. | | | |
| 286. | San Diego Audubon Society | PROTECTION OF SENSITIVE PLANT SPECIES<br>We do not think that the protection of sensitive dune and upland species proposed by the EIS is adequate, but have not had the resources to comment specifically on them at this time. Volunteer from our chapter spend many hundreds of hours removing invasive vegetation to provide habitat for some of these sensitive plant species. It is disappointing to hear that there will be no protection for these sensitive species in this project. | Rare plant surveys for all plants identified in the EIS, and others, have been completed. The Navy has an invasive species control program that directly benefits sensitive plant species. The naturally disturbed dune environment and the plants adapted to it benefit from Navy invasive species control. Upland rare plants are locally relatively abundant, and benefit from annual invasive species control and monitoring. Some benefit occurs through restoration that primarily involves weed control. Avoidance and minimization measures are implemented at the Delta beaches for plants identified as rare by the California Native Plant Society as List 1B or higher. The Navy conducts annual surveys and treatment for invasive plants and, in recent years, has been expanding treatment of iceplant. The Navy conducts annual surveys for and treatment of invasive plants and, in the near future, will be expanding treatment of iceplant. A vegetation management plan is under development to support terns and plovers. Focused rare plant management includes *Phacelia stellaris*, *Dudleya variegata*, among other rare plants that are less abundant on Silver |

| | | | Strand. |
| 287. | San Diego Audubon Society | IMPACTS ON VERNAL POOLS<br>Vernal pools are one of the most endangered habitat types in all of California. These pools house a vast array of life forms, including endangered species like the San Diego Fairy Shrimp. Trails running through the vernal pools will disturb the sensitive hydrology of the pools, even if they are only used during the dry season. Cysts can be crushed and damaged even in the dry season. There is no way to predict the damage that could be caused to the vernal pools by crossing through them, even limited to just the dry season. The complex ecology of vernal pools is easily disturbed. We urge that the vernal pools be fenced, and that crossing of vernal pools be prohibited.<br><br>Paragraph 3.11.1.1.1, Regulatory Framework, states that the Fish and Wildlife service may issue a Biological Opinion that will state measures that will avoid or minimize the take of any listed species. Table 3.11-3 acknowledges that Alternatives 1 and 2 could adversely impact individual fairy shrimp. The foot traffic will have direct and indirect impact on the vernal pools, even if the foot traffic through the pools is limited to dry seasons. The direct impact is that cysts will be damaged or destroyed by the foot traffic. This is addressed in the EIS. When people walk through an area that contains weedy species, the seeds of the weeds often attach themselves to the shoes, clothes, and equipment of the people. These seeds drop off as the people walk elsewhere, helping to disburse the weed seeds. The invasion of these weeds can have many negative impacts on the pools, including shadowing, increasing evaporation and transpiration rates, degrading the hardpan, etc. There is no way to minimize this impact. Foot traffic could also wear depressions in the containment mounds of the pools eventually changing the hydrology of the pools, preventing the pooling from occurring. Foot traffic could also change land contours separating a pool from its immediate watershed. The EIS does not address any of these significant impacts as it needs to. Clearly these impacts will progressively degrade the pools and will reduce the likelihood that fairy shrimp will be able to recover. | To the maximum extent consistent with training needs, off-road foot traffic will avoid the vernal pools occupied by San Diego fairy shrimp and their watersheds. Avoidance may be accomplished using markers, maps, global positioning coordinates, or any other means consistent with training needs. The Navy agrees that cysts will be crushed and damaged in the dry season. However, there are tens of thousands if not millions of cysts, and the take of some during training on foot is not expected to be a population-level effect. The low number of personnel walking in a dispersed manner in the training area is not a large effect, considering the percent of the training area occupied by the pools. The nature and level of expected take have been addressed in a BA, and the Navy has completed consultation with USFWS on this (Biological Opinion signed July 7, 2010).<br><br>The Navy believes that the potential impact is sufficiently low that it can be managed on site. The nature and level of expected take have been addressed in a Biological Opinion from the USFWS. No violation of the Endangered Species Act will occur because the Navy has requested and received USFWS approval for any impacts to fairy shrimp. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Clearly, allowing foot traffic through the vernal pools will not "minimize" (as stated several times in the EIS, including Table 3.11-3) the take of fairy shrimp in any sense and is a violation of the Endangered Species Act. Limiting the access to foot traffic in dry weather may slightly reduce it, but that is very far from minimizing it in either a legal or practical sense. Pinocchio got a very long nose when he said things like that.<br><br>Unfortunately the EIS does not address the conservation of the pools that are not occupied by fairy shrimp. The objective of the Endangered Species Act is Recovery, not just hanging on, or not facilitating the incremental decline of the species. For recovery to occur, a reasonable amount of unoccupied habitat must be protected to accommodate more populations. We urge that a significant portion of unoccupied and restorable pools be protected as well as occupied pools.<br><br>The survey for fairy shrimp, on which this document is based, was conducted in 2001 and 2003. A more recent survey is required to know how many pools are currently occupied. We urge that decisions be based on a more timely survey.<br><br>We strongly urge that the Project require that all occupied, and all unoccupied pools with a reasonable chance of being restored for future occupation, be fully fenced and that regulations be implemented that forbid entry at any time of the year except for needed maintenance or emergencies. We also urge that the watershed of these pools also be protected so the hydrology of these pools and their necessary watersheds will be viable.<br><br>If the Project intends to use vernal pools for foot traffic in spite of the potentially serious impacts, we urge that a multi-year experiment be conducted to assess the impacts on a single test pool, and that all other pools be fully fenced and protected until the potential impacts are fully understood and disclosed. | The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |

|---|---|---|---|
| 288. | San Diego Audubon Society | WHEN THE CURRENT DEMAND FOR BEACH TRAINING RELAXES<br>The EIS addresses the need for additional training capability because of the additional deployments to war zones. It does not address returning to the current protection of nesting birds in the three lanes when the need for training is relaxed. If Alternative 1 is adopted, will it be a temporary measure? If Alternative 1 or 2 are implemented, we urge that the EIS contain a commitment that it will revert to the No Project configuration when the need for additional training is reduced in the future. | The EIS identifies alternatives, including the Navy's preferred alternative, and the decision-maker selects one of those alternatives in the ROD. The purpose of the Proposed Action is to enable the Navy to perform realistic training in a variety of environments to achieve full operational readiness. With the mitigation measures presented in the EIS (and brought forward from the USFWS Biological Opinion) and maintenance of preferential training areas outside of nesting areas, the activities listed under Alternative 1 should not need to be decreased in the future if the training regime shifts.<br><br>The Navy is proposing to amend its current management of nesting birds for several reasons. Most of those reasons are unrelated to the additional deployments to war zones (Sections 1.5.1.1, 1.5.1.2, and 1.5.1.3). The Navy is not anticipating that the need for training is going to be relaxed. The Navy anticipates that the need for training will increase after the current conflicts are over (see Section 2.2.1). Also, the needs for better quality training and more flexible usage of the training range are not dictated by wartime situations. The Navy needs to maintain the highest level of force readiness at all times to prepare for combat, and needs high quality training to ensure this readiness.<br><br>However, the Navy does have several measures that will further reduce impacts to nesting birds if training were to be reduced in the future. As discussed above, and in Section 3.12.1.5.3 of the FEIS, beach scheduling procedures bias activities with heavier beach use towards beach lanes with fewer nests, when it does not impact the realism of training or training needs. This means that heavy impact training would be preferentially scheduled in the Yellow and Green beach lanes where nest numbers are low. If training lanes are available, there is a reduced need to enter into Lanes 8, 9, and 10. Only a few beach activities need to use Lanes 8, 9, or 10, and are activities with small footprints and low impact on nesting birds. Section 3.12.3.1.2 further discusses the mitigative effects of this scheduling efficiency. |

|---|---|---|---|
| 289. | San Diego Audubon Society | CONCLUSION<br>This document does not satisfy the letter or the intent of NEPA. We strongly urge that the "No Project" Alternative be adopted. However, it appears that a more thoughtful alternative, with real mitigation measures, could be put together that would allow an increase in the training capacity of the Silver Strand while protecting or even enhancing its extremely valuable natural resources. We encourage the Navy to move in that direction in a future Draft of the EIS.<br><br>The Navy has had laudable success in its well conceived and well managed mitigation projects for past impacts to terns and plovers on Silver Stand. It is regrettable that this project will seek to significantly dismantle some of that success.<br><br>If the Navy decides to move ahead with the current alternatives, we strongly urge that the next Draft quantify what impacts of the project will and will not be offset by the mitigation proposed. We urge that the Navy then identify mitigation that will fully offset the deficit.<br><br>We strongly urge that the Species Viability Model used in this Draft be substantially updated or not used. It is not the least bit certain that the current population of least terns is viable in view of our environmental and climate uncertainties. That model clearly does not provide credible justification to the assertion the species will do just fine with a drop of a couple thousand birds. | As discussed in other responses to your comments, thoughtful alternatives have been presented in this EIS. As described in Section 2 of the FEIS, the Navy considered, but rejected, alternatives that included moving exercises to other locations. Such alternatives fail to meet the purpose of and need for the Proposed Action. Additionally, alternatives were eliminated that investigated the distribution of military activities to different locations within SSTC.<br><br>In response to this and other comments received, the Navy has revised the EIS analysis on the California least tern (Section 3.12.3.1) and the western snowy plover (Section 3.12.3.2) to provide a more in-depth analysis of impacts that training is expected to have on the species. Additional analysis has been provided on the indirect and direct impacts of current and proposed military training, to include both an average anticipated impact as well as a high-intensity anticipated impact. New mitigation measures have been added to the Proposed Action. The benefits of current and proposed mitigation are also described and quantified, to the extent practicable. As discussed in the analysis, the benefits of mitigation are expected to outweigh potential adverse impacts of training. The Navy has consulted with the USFWS, and received a Biological Opinion (July 7, 2010) for take of the listed species associated with military training. An update of the Species Viability Model is needed; however, it is currently the best available science. The Navy sees its responsibility as contributing to recovery. The Navy works each year on site-maintenance and monitoring, plus periodic site enhancement or management approaches to manage terns, and to increase attractiveness of Delta beaches. |

|---|---|---|---|
| 290. | San Diego Audubon Society | The San Diego Audubon Society is very concerned with the proposed project. We appreciate the current efforts of the Navy to protect and enhance the safe nesting of California Least Terns and Western Snowy Plovers on the Silver Strand. Section 5.11.1. is a very interesting history of Navy environmental responsibility and leadership. We also appreciate the expanded training needs for the Navy because of our Nation's current high level of military activity. However, we do not think that the plan needs to be more protective than the current Alternative 1 or 2. Therefore we support the No Project alternative unless Alternate 1 can be improved substantially. We strongly urge that Alternative 2 not be selected because of its large and irresponsible impact on least terns and snowy plovers.<br>IMPACTS ON LEAST TERNS AND SNOWY PLOVERS<br>The population of Least Terns has risen substantially over the last 15 years, as the EIS shows. But, the reproduction of Least Terns has generally been declining over the last decade as the EIS also shows. This suggests that the species is not doing nearly as well as it looks. It is also thought that the average age of the birds is increasing, which could cause less reproductive success. This is clearly not a good time to increase the take of the species, particularly when that take is avoidable. We will be more specific in the following subheadings. | Local declines in reproductivity are disproportionately related to predation by gull-billed terns. The discussion in the EIS has been amended to explain the level of loss anticipated under the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year. The difference in incidental take for the snowy plover between the No Action Alternative and Alternative 1 is one nest, on average, in a typical year. The Navy will implement a mitigation measure to schedule training in areas where less nesting occurs when possible and still meet training needs. In addition, the Navy will schedule training activities that could be conducted on the hardpack portion of the beach during low tides, when it is consistent with training needs. The Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that does not encumber training activities. Such a marking strategy may entail signage affixed to existing beach lane sign posts and a limited number of additional markers, as determined appropriate by Navy staff.<br>Finally, the Navy's Proposed Action includes: ongoing nesting site preparation at the Delta Beaches; predator management; population monitoring; a Long Term Habitat Enhancement Plan; and measures to eliminate unauthorized recreational trespass, which are all conservation measures that support the recovery of the least tern. The Navy expects that implementation of these conservation measures will maintain the suitability of least tern habitat within the action area over the long term. The Navy's actions will increase the capacity of oceanside beaches and the Delta beaches to accommodate least terns and snowy plovers. Historical takes between 2005 and 2009 averaged 38 nests being directly impacted annually, potentially due to military training on SSTC-N Beach Lanes 1-7 (see Section 3.12.3.1). Modeling for the highly intense training scenario of the No Action Alternative conservatively estimated that 88 California least tern nests would be directly impacted annually (see Section 3.12.3.1 for modeling methodology). All birds present would be potentially subject to disturbance. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | Nesting activity has increased despite the average historical annual loss of 38 nests (Figure 3.12-9), indicating a capability of the species to not only continue to persist on SSTC, but also to increase, with training occurring in the nesting beaches during the nesting season. Much of this has to do with the Navy's mitigation measures and management practices discussed below. |
| 291. | San Diego Audubon Society | CUMULATIVE IMPACTS NOT ADDRESSED, LEAST TERNS<br>The EIS provided a long list of likely activities for which the cumulative impacts have been addressed. We are concerned that several very relevant activities were not addressed that, when combined with Alternative 1 or 2 could help put the recovery, and perhaps even the survival of the species in jeopardy.<br>The U.S. Fish and Wildlife Service has proposed downlisting the least terns from Endangered to Threatened. This would reduce the priority for funds, for priority for other resources such as locations for new nesting areas, negotiating site management agreements, predator management, protection and enhancement of the fish needed for foraging, research, monitoring, planning, analysis, site maintenance, etc. This reduction in resources and priorities will take a toll on the species, in both predictable and unpredictable ways.<br>Global Climate Change appears to be making the quantity and timing of the supply of small fish for least tern consumption more variable and more uncertain. This affects the laying of eggs and the likelihood that chicks will survive. Changes are happening very quickly which could leave the entire population more vulnerable.<br>The impacts of Gull-bill terns on tern reproductive have been significant and appear to be increasing. There appears to be no real progress toward identifying how to manage the two species to assure the recovery of least terns. This lack of resolution is likely to result in a large and unmanaged take of least terns for at least several years while regulations are developed, reviewed, and finally implemented.<br>The Recovery Plan for least terns is almost three decades old and is based on outdated information. As a result, there is no effective comprehensive and broadly accepted plan for the recovery of least terns. This deficiency in planning and management means that there is no valid way to conclude that the additional take proposed by Alternatives 1 or 2 will not help put the species in jeopardy. We urge that the EIS discuss each of the additional cumulative impacts mentioned above and incorporate their effects into a realistic Species Viability Analysis. | Downlisting the least tern does not affect Navy funding priorities in its INRMPs - Endangered and Threatened species are classified with the same funding priority. Navy is contributing to research on climate change and least tern foraging habits in San Diego Bay. Gull-billed tern predation studies are also underway by the Navy and other funders (including USFWS).<br><br>The Navy agrees that the USFWS Recovery Plan is outdated, and concerns about an inadequate PVA population viability assessment are acknowledged. A species viability analysis is under consideration for funding.<br><br>Gull-billed tern predation studies are also underway by the Navy and other funders (including USFWS), and the Navy has requested approval from USFWS to relocate Gull-billed terns, without success. A species viability analysis is under consideration for funding. The USFWS has not officially proposed the California least tern for downlisting. If and when it does, the proposal will be published in the Fed Register and will be open for public comment before a final decision is made.<br><br>The Navy is working closely with the USFWS to assist it in addressing gull-billed tern predation and impacts to western snowy plover and California least tern. The Navy has submitted an application for a depredation permit to the USFWS Division of Migratory Bird Management annually since 2005, and has continued to document the impacts of this |

|---|---|---|---|
| 292. | San Diego Audubon Society | SPECIES VIABILITY ANALYSIS, LEAST TERNS<br>The Species Viability Analysis is based on reproduction rates measured in 1981 to 1984, page 3.12-21. At this time the productivity was 0.62 fledgling per nest in good years and 0.27 for years dominated by El Nino/Southern Oscillation (ENSO). The ENSO influence was expected about one out of seven years.<br>According to a figure in the handout from the public presentation, in the last 8, the good years have had productivity around 0.15 for the good years and 0.05 for the bad ones. It appears that we have had 8 bad years in a row vs. the one bad year anticipated in the Species Viability Analysis. As mentioned above the analysis assumes one ENSO year for every 7 normal years. However, some climate models now suggest that with global warming the average may become more like the ENSO state.<br>The model also does not address other trends that could increase the risk to the food supply for least tern recovery such ocean warming, reduced oxygen levels in the ocean, and ocean acidification. Each of these issues suggests that the Species Viability Model is probably wildly optimistic. We urge that this EIS not conclude that a lower population of least terns will not jeopardize the recovery of the species unless it can be based on current and relevant data and the best analysis of future trends. Such an analysis should also incorporate the effects of the cumulative impacts listed previously in this letter. Any model used should include the uncertainty range of the input information, the uncertainties of the assumptions the model is based on, how the uncertainties propagate through the model, and the uncertainty of the results. A model that produces a number without clear quantification of the uncertainty of that number will probably be more misleading than useful.<br>The species viability analysis only appears to address keeping the species from declining to extinction. The purpose of the Endangered Species Act is recovery. This analysis needs to be redirected to identify a population and population growth rate that will lead to reliable recovery of each species in a reasonable period of time. | The USFWS is responsible for such a viability assessment, while the Navy is responsible for management and contributions to least tern recovery. The take estimates are a worst-case scenario; the birds actually tend to redistribute to safer areas. The Navy will be increasing the carrying capacity for terns and plovers through its Long Term Site Enhancement Plan.<br><br>The Navy is proposing to develop and implement a long-term site enhancement plan for SSTC-N, including both the oceanside and the bayside beaches. The long-term site enhancement plan is estimated to more realistically mitigate for an estimated 360 nests annually. This site enhancement plan will work to control and, where possible, remove invasive non-native vegetation on the beaches and, if appropriate, replace it with native vegetation. SSTC-N oceanside training lanes contain over 16 acres of overgrown invasive vegetation (Table 3.12-13), mostly towards the back one-third of the beach. While this additional depth of beach is needed for several reasons, including providing separation from the highway, most training has a minimal footprint on this area. Training is most heavily concentrated in areas closest to the tide line. Removal or replacement of invasive overgrown vegetation in the back beach area will open these safer areas up to nesting activity. |

|---|---|---|---|
| 293. | San Diego Audubon Society | IMPACT OF NOISE AND DISTURBANCE ON LEAST TERNS AND SNOWY PLOVERS<br>We were pleased to see the substantial analysis of the average and peak noise resulting from the project in Section 3.6, ACOUSTIC ENVIRONMENT. But we were extremely disappointed to discover that the noise analysis was only related to "sensitive receptors" of the human kind. The EIS provides no analysis to determine if the increases in average noise or peak noise from the increases in gunfire, flares, and detonation would result in a take of least terns or snowy plovers. This take could result from either least terns or snowy plovers abandoning eggs or chicks because of the additional noise, either on the ocean side or the bay side of the Silver Strand.<br>We strongly urge that the EIS include analysis of the indirect take of chicks and eggs that will result from permanent nest abandonment that is likely to result from the increase in noise, both average and peak. We also urge that the EIS include analysis of the indirect take of chicks and eggs that is likely to result 3 from temporary abandonment that would make the eggs and chicks more vulnerable to death from heat, cold, predators, and starvation. | The EIS does analyze noise and its effect on wildlife (see FEIS Sections 3.11.2 Terrestrial Biological Resources Environmental Consequences; 3.12.2.2.1 Air Activities; 3.12.2.2.2 Pyrotechnics, Simunitions, and Blanks; and 3.12.2.2.4 Amphibious and Beach Activities, and parallel sections under the other Alternatives). Existing noise levels do not appear to cause nest abandonment, and projected received noise levels are not very different considering the noise source location and the location of nesting avian species. |
| 294. | San Diego Audubon Society | ALTERNATIVES<br>The limited range of alternatives that are presented do not provide a good starting point for a productive process to resolve the project's operational and environmental problems. We urge that the EIS alternatives be expanded to lead to a reasonable solution to the Navy's training problem. Many of the missions that are proposed can be accomplished with virtually no beach access. We urge that the uses of lanes blue 2, orange 1, and orange 2 be limited to those missions. Needed access for them could be by boat vs. land. If emergency access is occasionally needed over the beach in case of an accident, that could be considered valid unavoidable "incidental take". Such an alternative should be developed and analyzed.<br>We also urge that an alternative be analyzed that allows the lanes at Camp Pendleton to be used to relieve some of the scheduling pressure on the Silver Strand Beach Lanes without taking out least tern and snowy plover eggs and chicks. | As stated in Section 2.3.5 of the FEIS, the three training lanes are only used if one of two criteria are met. The Navy preferentially schedules activities for other beach training lanes unless all training lanes are being used, or there are attributes of those lanes that make training there more suitable.<br><br>The Navy preferentially schedules water-only training activities in Lanes 8, 9, and 10 because of the distance those lanes are located from NAB. As stated in Section 2.3.5 of the FEIS and the criterion that has been established for the lanes, the Navy does not anticipate heavy use of Lanes 8, 9, and 10.<br><br>As described in Section 2.1.3 of the EIS, the Navy considered, but rejected, alternatives that included moving these exercises to other locations. Such alternatives fail to meet the purpose of |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | and need for the Proposed Action. |
| 295. | San Diego Audubon Society | MITIGATION FOR LEAST TERNS AND SNOWY PLOVERS<br>The mitigation measures for the impacts of this project are defined in section 12.4.1: "Develop a site enhancement plan that includes establishing dunes on the windward edges of Delta North and South that would enhance this area for plovers, create a source of sand for the least tern nesting area, and establish a better visual barrier between SR-75 and the nesting colony."<br>It is not clear what is meant by "Develop a site enhancement plan…" Does that mean that the enhancement would actually be built? How big? When would it be built? Would it be in place and functioning before Alternative 1 or 2 would be implemented? Would it be maintained in perpetuity, or just constructed? This sort of information should have been a major element of the EIS.<br>We would appreciate habitat enhancements. But, is it anticipated that these measures would result in an improvement in productivity in terns and plovers that would offset the anticipated direct and indirect take that would result from Alternative 1 or 2? It appears very doubtful that it would. But one of the purposes of the EIS is to identify the net impact of the project with the mitigation. It does not. A better visual barrier between SR-75 and the nesting colony will also mean a better approach path for avian predators to approach the tern colony without being detected. We strongly doubt that will improve the productivity of the colony.<br>Section 12.4.2 states: "Vehicle patrolling and LARC V operator training will not occur in Red, Blue,<br>or Orange Beach Lanes." How many least terns of snowy plovers will this save? Will the terns and plovers that are saved by this measure survive the other activities that will occur in these lanes under Alternatives 1 and 2? It does not appear that it would. Again, the EIS fails to discuss or answer this question, which is one of its main purposes.<br>The two mitigation measures in the EIS may tend to reduce or offset the take to some extent, but they do not appear to minimize or to offset the impacts of the Project. If Alternatives 1 or 2 are adopted in spite of their inappropriate impacts, we urge that mitigation be provided that will actually offset the take that results from those actions.<br>The EIS does not indicated that any accounting will be done to identify how much of the environmental impact of the project is expected to be offset by the mitigation. How would a regulator or decision maker be able to identify how much environmental impact has occurred and how much has been offset by the mitigation over time? We urge that the EIS provide how such an ongoing net impact assessment will be accomplished to facilitate the adaptive management process that is mentioned. If the project results in a substantial increase in a net take, or if the viability of the terns and plovers begins to diminish, will the project include additional specific mitigation measures to restore protection of the nesting at the three lanes or more to offset the loss? Though adaptive management is suggested, there are no specifics of it.<br>It appears that there are areas in the SSTC South area that could be used to mitigate for the impacts of this project that would be difficult and costly to use for training. We urge that the Final version of this document explore that possibility. | The addition of sand is contemplated as a principal element of the site enhancement plan to make the historically designated nesting areas more attractive for nesting terns and more secluded from the road. Accounting will take place through monitoring of take and reproductive success. In addition, the Long Term Site Enhancement Plan, which is part of the Proposed Action, could increase the carrying capacity for terns by hundreds of nests. For snowy plovers, the long-term site enhancement plan is estimated to realistically mitigate for an estimated 34 nests annually.<br><br>The FEIS quantitatively estimates the amount of benefit provided by Navy management above and beyond that required by past projects, and that can be considered avoidance, minimization, and offsetting measures related to training. Besides setting aside real estate, the most important mitigation measure is probably predator control. The Navy has a number of predator management and control measures that it implements throughout the breeding season to minimize impacts from predators, including avian predators, ants, and mammals (see Section 3.12.1.5.3 for more detail). In 2009, 512 individual predators were managed (either lethally removed or freed away from the nesting sites). During that same year, there were 32 documented predation incidents on California least terns and western snowy plovers other than by gulled-billed terns. Predator control has beneficial impacts beyond protecting individual eggs or chicks from loss to predation. The presence of predators can cause disturbance, flushing, or even nest abandonment, potentially leading to overall habitat degradation or loss. As discussed in Section 3.12.1.3.1 of the FEIS, because California least terns are colony breeders, they are particularly susceptible to predation and disturbance. Predator control is considered by many species experts to be one of the most crucial management strategies for reproductive success (Foster 2006; USFWS |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | 2006c). On Camp Pendleton, a rough tripling of nesting California least tern adult pairs from 1995 to 2001 was considered to be associated with the active removal of predators (Shwiff et al. 2004). Without the Navy's predator control program, the SSTC nesting sites would likely have substantial reproductive failure. This predator control program has allowed for and is expected to continue to promote over one thousand nests that are annually found on SSTC-N.<br><br>All of SSTC-S is either used to support training or set aside for conservation of the species, or used by Camp Surf. There is no location for additional mitigation. |
| 296. | San Diego Audubon Society | IMPACTS ON DIVING BIRDS<br>We appreciate the analysis that was performed relating to the impacts of underwater detonations on diving birds and marine mammals. However, we have not had the resources to verify the data, rationale, or conclusions at this time. We also appreciate the plan to discourage diving birds from the exercise area to prevent injuries or death to them.\ | As indicated in Section 3.12 of the FEIS and in the signed Biological Opinion (July 7, 2010), the Navy has a mitigation measure to look for diving birds and marine mammals prior to detonation and to halt the detonations until the animals have voluntarily left the area. |
| 297. | San Diego Audubon Society | PROTECTION OF SENSITIVE PLANT SPECIES<br>We do not think that the protection of sensitive dune and upland species proposed by the EIS is adequate, but have not had the resources to comment specifically on it at this time. | The Navy has an invasive species control program that directly benefits sensitive plant species. Upland rare plants are locally relatively abundant, and benefit from annual invasive species control and monitoring. Some benefit occurs through restoration that primarily involves weed control. Avoidance and minimization measures are implemented at the Delta beaches for plants identified as rare by the California Native Plant Society as List 1B or higher. The Navy conducts annual surveys for and treatment of invasive plants and, in recent years, has been expanding treatment of iceplant. A vegetation management plan under development to support terns and plovers also benefits sensitive plant species. Focused rare plant management includes *Phacelia stellaris, Dudleya variegata*, among other rare plants that are less abundant on Silver Strand. |

|---|---|---|---|
| 298. | San Diego Audubon Society | IMPACTS ON VERNAL POOLS<br>Vernal pools are one of the most endangered habitat types in all of California. These pools house a vast array of life forms, including endangered species like the San Diego Fairy Shrimp. Trails running through the vernal pools will disturb the sensitive hydrology of the pools, even if they are only used during the dry season. Cysts can be crushed and damaged even in the dry season. There is no way to predict the damage that could be caused to the vernal pools by crossing through them, even limited to just the dry season. The complex ecology of vernal pools is easily disturbed. We urge that the vernal pools be fenced, and that crossing of vernal pools be prohibited.<br>Paragraph 3.11.1.1.1, Regulatory Framework, states that the Fish and Wildlife service may issue a Biological Opinion that will state measures that will avoid or minimize the take of any listed species. Table 3.11-3 acknowledges that Alternatives 1 and 2 could adversely impact individual fairy shrimp. The foot traffic will have direct and indirect impact on the vernal pools, even if the foot traffic through the pools is limited to dry seasons. The direct impact is that cysts will be damaged or destroyed by the foot traffic. This is addressed in the EIS. When people walk through an area that contains weedy species, the seeds of the weeds often attach themselves to the shoes, clothes, and equipment of the people. These seeds drop off as the people walk elsewhere, helping to disburse the weed seeds. The invasion of these weeds can have many negative impacts on the pools, including shadowing, increasing evaporation and transpiration rates, degrading the hardpan, etc. There is no way to minimize this impact. Foot traffic could also wear depressions in the containment mounds of the pools eventually changing the hydrology of the pools, preventing the pooling to occur. Foot traffic could also change land contours separating a pool from its immediate watershed. The EIS does not address any of these important but significant impacts as it needs to. Clearly these impacts will progressively degrade the pools and put the current fairy shrimp or the possibility of recovery of the species in jeopardy.<br>Clearly, allowing foot traffic through the vernal pools will not "minimize" (as stated several times in the EIS, including Table 3.11-3) the take of fairy shrimp in any sense and is a violation of the Endangered Species Act. Limiting the access to foot traffic in dry weather may slightly reduce it, but that is very far from minimizing it in either a legal or practical sense. Pinocchio got a very long nose when he said things like that.<br>Unfortunately the EIS does not address the conservation of the pools that are not occupied by fairy shrimp. The objective of the Endangered Species Act is Recovery, not just hanging on, or not facilitating incremental decline of the species. For recovery to occur, a reasonable amount of unoccupied habitat must be protected to accommodate more populations. We urge that a significant portion of unoccupied and restorable pools be protected as well as occupied pools.<br>The survey for fairy shrimp, on which this document is based, was conducted in 2001 and 2003. A more recent survey is required to know how many pools are currently occupied. We urge that decisions be based on a more timely survey.<br>We strongly urge that the Project require that all occupied, and all unoccupied pools with a reasonable chance of being occupied, be fully fenced and the regulations be implemented that forbid entry at any time of the year except for needed maintenance or emergencies. We also urge | Foot traffic entering the pool, as described in the EIS, does not mean troops of people walking back and forth over the pools. The nature of these training activities is dispersed. Each event is more likely to be one traverse over one pool, with a different path each time. The size of these pools varies, but they are large relative to the foot traffic, covering 3.2 acres. While harm to cysts is expected and analyzed, the order of magnitude is expected to be a few cysts, compared to an estimated population of tens of thousands if not millions of cysts in these pools.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to *the extirpation of fairy shrimp from* |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | that the watershed of these pools also be protected so the hydrology of these pools and their necessary watersheds will be viable.<br>If the Project intends to use vernal pools for foot traffic in spite of the potentially serious impacts, we urge that a multi-year experiment be conducted to assess the impacts on a single test pool, and that all other pools be fully fenced and protected until the potential impacts are fully understood and disclosed. | *any individual pool, the*n the Navy will reinitiate consultation with the USFWS.<br><br>The Proposed Action will not all occur immediately, but slowly scale up over time, and only after the baseline condition of the vernal pools has been established, and Vernal Pool Management and Monitoring Plan has been developed and approved by the USFWS. This deliberate process will allow the Navy to evaluate the potential impacts and to take corrective action, as necessary. |
| 299. | San Diego Audubon Society | WHEN THE CURRENT DEMAND FOR BEACH TRAINING RELAXES<br>The EIS addresses the need for additional training capability because of the additional deployments to war zones. It does not address returning to the current protection of nesting birds in the three lanes when the need for training is relaxed. If Alternative 1 is adopted, will it be a temporary measure? If Alternative 1 or 2 are implemented, we urge that the EIS contain a commitment that returning to the No Project configuration when the need for additional training is reduced in the future.<br>CONCLUSION<br>As it stands we strongly urge that the "No Project" Alternative be adopted. However, it appears that a more thoughtful alternative, with real mitigation measures, could be put together that would allow an increase in the training capacity of the Silver Strand while protecting or even enhancing its extremely valuable natural resources. We encourage the Navy to move in that direction in a future Draft of the EIS. If the Navy decides to move ahead with the current alternatives, we strongly urge that the next Draft quantify what impacts of the project will and what will not be offset by the mitigation proposed. And we strongly urge that the Species Viability Model used in this Draft be substantially updated or not used. It is not certain that the current population of least terns is viable in view of our environmental and climate uncertainties. That model clearly does not provide a credible justification to think the species will do just fine with a drop of a couple thousand birds. | The EIS identifies alternatives, including the Navy's preferred alternative, and the decision-maker selects one of those alternatives in the ROD. With the mitigation measures presented in the EIS (and brought forward from the Biological Opinion and USFWS consultation), and maintenance of preferential training areas outside of nesting areas, the activities listed under Alternative 1 should not need to be decreased in the future if the training regime shifts.<br><br>The Navy is proposing to amend its current management of nesting birds for several reasons. Most of those reasons are unrelated to the additional deployments to war zones (Sections 1.5.1.1, 1.5.1.2, and 1.5.1.3). The Navy is not anticipating that the need for training is going to be relaxed. The Navy anticipates that the need for training will increase after the current conflicts are over (see Section 2.2.1). Also, the need for better quality training and more flexible usage of the training range is not dictated by wartime situations. The Navy needs to maintain the highest level of force readiness at all times to prepare for combat, and needs high quality training to ensure this readiness. The Long Term Site Enhancement Plan, which is part of the Proposed Action, could increase the carrying capacity for terns by hundreds of nests. For snowy plovers, the long-term site enhancement plan is estimated to realistically mitigate for an estimated 34 nests annually. |

|---|---|---|---|
| 300. | San Diego Bay Council | Despite the voluminous Draft Environmental Impact Statement, the Navy has not taken a hard look at the direct, indirect, and cumulative impacts this increased training will have on the community and the environment. The heart of the National Environmental Policy Act is for the Navy to fully analyze and weigh the consequences of each of its possible project alternatives, before selecting one. As part of this process, the Navy must inform members of the public of the burdens the Navy is expecting it and the environment it uses and enjoys" to bear as a result of the project, before the project is approved and an alternative selected. Here, the Navy's conclusory "analysis" and lack of meaningful alternatives makes NEPA nothing more than a meaningless exercise and deprives the public of the important information it is entitled to under the law.<br><br>While the San Diego Bay Council has a multitude of serious concerns about the Navy's proposed training increased activities and frequencies, this letter focuses on only three of our main concerns. We appreciate the extension the Navy granted so that we could submit these comments, but even with the extension, we were unable to delve into all our concerns in detail. We reserve the right to rely on other comments submitted during the public comment process, and we fully adopt here all comments submitted by the San Diego Audubon Society | As described in Section 2 of the FEIS, the Navy considered, but rejected, alternatives that included moving exercises to other locations. Such alternatives fail to meet the purpose of and need for the Proposed Action. Additionally, alternatives were eliminated that investigated the distribution of military activities to different locations within SSTC. Only those analyses that remained were selected for analysis. |
| 301. | San Diego Bay Council | I. The Draft EIS Fails to Analyze Anticipated Water Quality Impacts From Increased Smoke Grenades, Flares, and Surface and Underwater Detonations.<br><br>The Navy's proposed ramp-up in training at the Silver Strand Training Complex involves a significant increase in the amount of hazardous ordinance the Navy will be using. For example, the Navy plans to increase the use of smoke grenades and flares from 2,990 pounds to 4,410 pounds. See SSTC DEIS at 3.4-13. The smoke grenades and flares may contain aluminum, magnesium, zinc, strontium, barium, cadmium, nickel, and perchlorates. See SSTC DEIS at 3.4-11. The Draft EIS states that these hazardous pollutants will not cause any problems because "most of them are present in small amounts or low concentrations." See SSTC DEIS at 3.4-11. The Draft EIS summarily concluded that the "low concentrations of leachable metals" in the No Action Alternatives do not rise to the level of hazardous materials. See SSTC DEIS at 3.4-11.<br><br>The Draft EIS then deferred to the "Hazardous Waste" analysis in its water quality impacts analysis. See SSTC DEIS at 3.5-21. Specifically, the Draft EIS states that the "Hazardous Waste" analysis "concluded that only trace amounts of these residues are deposited on the ranges, and they are not expected to affect surrounding biological or physical resources." See SSTC DEIS at 3.5-21. But nowhere does the Navy actually analyze the impact of nearly doubling the amount of pollutants it plans to deposit during training. Instead, the Draft EIS characterizes the pollutants as "trace" amounts and summarily dismisses their potential | While the SSTC FEIS discusses a cumulative increase in the quantity of smoke grenades and flares used in training events, the increase is quantified in terms of individual grenades and flares, and not necessarily the small quantities of potentially hazardous substances. There will be little use of smoke grenades and flares directly in or over water. Use per training event in which smoke and flares apply is also small (2-11 items). In addition, this use is spread throughout the year and at various locations within SSTC, so there hot spots on the ranges.<br><br>Smoke grenade filler has approximately 11 ounces of a colored smoke mixture (white, red, yellow, green and violet). The smoke mixture is composed of a mixture of potassium chlorate, sodium bicarbonate, lactose and a dye, all of which have—in the amounts or quantities specified in the EIS—no significant environment effect. In addition, most of the filler is |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | environmental impact. Even at low concentrations, pollutants can cause serious problems. Because the Navy plans to almost double the amount of pollutants from smoke grenades and flares, it needs to take a hard look at the potential environmental impacts of such a drastic increase in pollution.<br><br>Likewise, the Navy plans to double its surface and underwater detonations. See SSTC DEIS at 3.5-22, tbl 3.5-7; 3.5-25, tbl 3.5-8. Yet the Draft EIS assumes there will be no measurable impact on water quality, even though "combustion is less than 100 percent and residues of these hazardous materials may remain in the water and sediment." See SSTC DEIS at 3.5-25. The Draft EIS provides no support or justification for this conclusion.<br><br>The Draft EIS also fails to examine the cumulative, long-term impacts of increasing the amount of pollutants released into the ocean and bay. Under NEPA, the Navy must examine the direct, indirect, and cumulative impacts of its proposed action. Here, the Navy has failed to examine the cumulative impacts of doubling the amount of hazardous pollutants it puts into our waters each year. To satisfy its NEPA requirements, the Navy must fully examine the cumulative impacts of increased water pollution. | consumed during use. Chemical composition of military flares can be a combination of magnesium, boron, potassium perchlorate, and barium chromate (USAF 1994) or, in some cases red phosphorus. Red phosphorus is a common ignition compound used for instance in matches. Red phosphorus is a relatively non-toxicity compound, although highly flammable, and subject to environmental degradation in marine systems (Spanggord et al. 1985, EFRB 2010). In an analysis of military flares, the US Air Force found that most of the common flare constituents were consumed during flare ignition. Residual ash from flares contained small quantities of magnesium and boron (USAF 1994). Measured values of magnesium in flare ash [86 part per million (ppm)] were found to be below the natural seawater composition of magnesium (1,290 ppm).<br><br>Potassium perchlorate was not a substantial residue, and was not detected in the ash samples measured. In the rare instance that any perchlorate were to remain, perchlorates are highly soluble, and the ions have a limited tendency to interact with other dissolved chemical species or to adsorb to aquifer materials under typical environmental conditions (Clausen et al 2007). Pechlorate in marine aquatic systems would be subject to environmentally significant bacterial degradation (Urbansky 1998, Logan et al. 2001, Brown and Gu 2006, Petrisor 2006, Wilkin et al. 2007).<br><br>Therefore, given the limited, short-term potential for smoke grenade and flare residuals to fall into San Diego Bay and the ocean, the relatively low levels of actual constituent released, and the natural environmental degradation of these compounds, the relative risk from use of these items is not substantial.<br><br>A comparison to related pyrotechnics with substantially more constituents can be made within the San Diego region. For example, the San Diego Regional Water Quality Control Board required water and sediment monitoring by Sea World |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | due to daily firework displays over Mission Bay. On average, Sea World conducts 100-120 shows per year, with each show using up to 250 shells, and up to 1,750 shells for special holidays (SDRWQCB 2007). In support of the concern for potential environmental contamination from fireworks residue, water and sediment samples were taken from 2001 through 2006 as part of a Coastal Commission permit requirement. Samples were analyzed for various constituents found in fireworks, including oxidizers (ammonium perchlorate and potassium perchlorate), metals (antimony, barium, copper, strontium) and salts (magnesium, sodium, etc.). The final monitoring report concluded that there were no substantial spatial or temporal patterns in concentrations of critical metals in sea water or sediments in the small area of Mission Bay subject to repeated large scale fireworks displays (SDRWQCB 2007)<br><br>Under the No Action Alternative, SSTC training activities require the detonation of small amounts of explosives on the water surface and underwater. While up to 1,610 pounds of explosives are used each year for underwater detonations (Table 3.5-7), the majority of these training events occur on the open ocean side of SSTC.<br><br>As discussed in Section 3.4.2.1.1 through 3.4.2.1.3 of the FEIS, high-order combustion of typical military explosives used at SSTC such as Royal Demolition Explosive (RDX) and pentaerythritol tetranitrate (PETN) consumes over 99.997 percent of the original explosive material during detonation, with by-products of common inert gases and relatively inert inorganic salts. For example, exploding 10 pounds of Composition (C)-4, which is 91 percent RDX, produces about 3.7 pounds of nitrogen, 25 pounds of $CO_2$, 1.6 pounds of water, 1.8 pounds of carbon monoxide, 0.2 pound of ethane, 0.03 pound of hydrogen, 0.02 pound of propane, 0.09 pound of ammonia, and 0.02 pound of methane. The major products of combustion-nitrogen, $CO_2$, and water-are all common natural |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | components of the atmosphere and water. Any explosive residue (<0.003 percent) would be relatively insignificant and would be either quickly dispersed by local ocean currents (Section 3.5.1.3.4) , or buried in ocean sediment. Field studies conducted by the US Army indicate that explosives residue includes 0.003 percent or less of the original quantity of material detonated, although the amounts of explosives residues vary among different types of ordnance. Land-based studies show that, for large ordnance items such as bombs, high-order detonations may spread residual particles in the micron and submicron-sized range over hundreds of square meters. However, individual quantities of explosives used at SSTC are substantially smaller than those tested by the Army, which means smaller amount of original detonation material and less explosive velocity. In addition, SSTC explosive events occur in water rather than on land, and would be subject to substantially less dispersion due to the non-compressibility of water. Given the nature of training events at SSTC, low order detonations, while possible, are not the desired training outcome, and any remnants are retrieved to the greatest extent practical to diagnose what may have caused the low-order detonation.<br><br>The environmental fate and effect of military munitions constituents including RDX have been subject to a number of scientific studies to determine if these compounds represent a risk in the marine environment including water and sediment (Hawari 2000, Belden et al. 2005, Lotufo and Lydy 2005, Houston and Lotufo 2005, Rosen and Lotufo 2005, Juhasz and Naidu 2007, Rosen and Lotufo 2007a, 2007b, Boyd et al. 2008, Monteil-Rivera et al. 2008, Mukhi et al. 2008, Weber 2008, Lotufo et al. 2009, Lotufo et al. 2010, Rosen and Lotufo 2010, Zhao et al. 2010).<br><br>As a compound in the environment, RDX is subject to natural processes in marine systems that break down (i.e., degrade) the parent molecule to inert nitrogen compounds. Processes |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | include hydrolysis in marine water, photodegradation from light, uptake and metabolism from marine plants, and bacterial degradation in water and sediment (Hawari 2000, Juhasz and Naidu 2007, Boyd et al. 2008, Monteil-Rivera et al. 2008, Lotufo et al. 2009, Weber 2008, Zhao et al. 2010). Based on both laboratory toxicity testing and more realistic environmental exposure scenarios, RDX has also shown low to no toxicity and no potential for bioaccumulation to a variety of marine species including amphipods, mussels, and fish (Belden et al. 2005, Lotufo and Lydy 2005, Houston and Lotufo 2005, Rosen and Lotufo 2005, Rosen and Lotufo 2007a, 2007b, Mukhi et al. 2008, Lotufo et al. 2009, Lotufo et al. 2010, Rosen and Lotufo 2010).<br><br>Therefore, based on the limited amount of explosive residue actual deposited during SSTC training events, dispersion and natural degradation of any small amount of residue, and limited toxicity to marine organisms, the overall effect on the environment from in-water explosives use would be insignificant. |
| 302. | San Diego Bay Council | II. The Navy's Proposed Plan Will Interfere With Public Access to the Ocean and Bay.<br><br>The Draft EIS states that in total, "training would require closure of portions of the ocean or bay for about 7,500 hours per year " or 312 days per year. See SSTC DEIS at 3.5-25. This would mean that portions of the ocean or bay would be closed "for about 85 percent of the year if no training were conducted currently. " See SSTC DEIS at 3.5-25. The Draft EIS suggests that training will "likely overlap in time in an unpredictable way, which would result in multiple areas being closed for a shorter percentage of the year." See SSTC DEIS at 3.5-25.<br><br>What the Draft EIS does not address is how many of those hours of closure and training activity would occur during the daylight hours when the public is most likely to use the ocean or bay. If San Diego receives, on average, between seven and ten hours of sunlight per day, that can add up to only around 3,000 hours of sunlight per year (Based on San Diego's average conditions, it is estimated that San Diego receives approximately 3,012 hours per year of sunlight. See http://www.bbc.co.uk/weather/world/city_guides/results.shtml?tt=TT001510). If the Navy plans to close the ocean and bay 7,500 hours per year, it is possible to have the bay and ocean closed during all hours of sunlight in a given year.<br><br>Disturbingly, the Draft EIS includes -but completely disregards- the City of Imperial Beach's | It is very difficult to indicate, due to scheduling flexibility and changes, the exact overlap in training activities. The EIS indicates that training activities would close portions of the ocean or the bay. Table 2-2 in Chapter 2 indicates not only the number of each activity, but also the possible area in which it could take place. The listing of areas does not indicate that each activity occurs in this entire area.<br><br>It is possible, and quite reasonable to assume, that there may be an activity that occurs in Boat Lane 1 at the same time as a training activity is occurring at Beach Lane 6 as well as an activity occurring in Echo. Further, these are all discrete areas which the public can circumvent. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | annual estimates of use for shore and nearshore recreation. See SSTC DEIS at 3.5-18. Those estimates show that along Imperial Beach's 3.5 miles of beach front, there were 1.8 million beachgoers, 8,000 beach anglers, and 400 fishing boats providing an estimated 10,000 fishing trips. See SSTC DEIS at 3.5-18. The Draft EIS ignores the data, claiming it is not "quantitative information on the actual use of ocean waters off Imperial Beach, and may not be representative of other beach areas, such as Silver Strand State Beach or Coronado Municipal Beach. " See SSTC DEIS at 3.5-18.<br><br>By ignoring the best information available on ocean use and recreation, the Draft EIS downplays the impact the proposed project will have on public access to the ocean and bay. The Draft EIS actually suggests that the impact will be negligible because "the size of the water area that would be closed for each training activity is relatively small when compared to the total bay and ocean waters available for the uses described in the Basin Plan." SSTC DEIS at 3.5-26. But the Draft EIS fails to look at the cumulative impact of all the training activities on the waters' designated uses, including recreation. This lack of analysis fails to meet the necessary hard look the National Environmental Policy Act requires. | |
| 303. | San Diego Bay Council | III. The Navy Fails to Take a Hard Look at the Impacts of Increased Training on Endangered Species.<br><br>The Navy's plan to expand training activities and increase training frequency will have negative impacts on several endangered species, including the western snowy plover, the California least tern, and the San Diego fairy shrimp. The San Diego Audubon Society has already articulated several concerns we have about the proposed project's impact on endangered species. Among these concerns are cumulative impacts, lack of meaningful alternatives, noise impacts, mitigation, and lack of analysis of the indirect impacts on chicks and eggs abandoned because of increased training activities. We are also seriously concerned about the decline in the number of lest tern fledglings over the past several years. The Navy's analysis fails to address how the increased training will not further exacerbate this serious decline in fledglings. Also, the Navy fails to articulate a well-reasoned, scientifically-based justification for protecting only 22 western snowy plover nests and how that alternative will protect the species. The Navy must take a hard look at the direct, indirect, and cumulative impacts on the western snowy plover and California least tern in order to satisfy its NEPA requirements. Also, the Navy must satisfy its requirements under the Endangered Species Act to protect these endangered birds.<br><br>In addition to the snowy plover and the California least tern, the San Diego fairy shrimp also calls Silver Strand Training Complex home. See Silver Strand Training Complex Draft EIS (SSTC Draft EIS) at 3.11-13, Fig. 3.11-4. The San Diego fairy shrimp is among the most endangered species in the country; on a scale of 1-18, with one being the highest, the San Diego fairy shrimp ranks as a "2 " on the recovery priority scale. See SSTC Draft EIS at 3.11-12.<br><br>So far, the Navy has taken important steps to protect the San Diego fairy shrimp. Under the current management plan, the Navy "restricts all activities from the [vernal] pools at all times." | In response to this and other comments received, the Navy has revised the EIS analysis on the California least tern (Section 3.12.3.1 of the FEIS) and the western snowy plover (Section 3.12.3.2 of the FEIS) to provide a more in-depth analysis of impacts that training is expected to have on the species. Additional analysis has been provided on the indirect and direct impacts of current and proposed military training, to include both an average anticipated impact as well as a high-intensity anticipated impact. Noise impacts are analyzed for the listed avian species. Additional mitigation measures have been added to the Proposed Action. The benefits of current and proposed mitigation are also described. As discussed in the analysis, the benefits of mitigation are expected to outweigh potential adverse impacts of training. The Navy has consulted with the USFWS, and received a Biological Opinion which indicates that proposed training activities will not jeopardize the continued existence ESA-listed species. The EIS does analyze noise and its effect on wildlife. Existing noise levels do not appear to cause nest abandonment, and projected noise levels are not very different, considering the noise source location and the location of nesting avian species.<br><br>Vernal pools - The Navy will avoid the occupied vernal pools |

|---|---|---|---|
| | | See SSTC Draft EIS at 3.11-33. But now the Navy plans to roll back protections for the San Diego fairy shrimp and "allow foot traffic associated with training activities in vernal pools when conditions are dry." See SSTC Draft EIS at 3.11-41. The Navy has failed to explain why it needs to allow foot traffic in vernal pools that house a critically endangered species or how allowing foot traffic in the pool when the Navy deems the pools "dry " protects the San Diego fairy shrimp. By failing to provide this information and analysis, the Navy has failed to take a hard look at the environmental impacts of its proposed increased training. | and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |
| 304. | San Diego Bay Council | A. The Navy Fails to Explain Why It Needs to Allow Foot Traffic in the San Diego Fairy Shrimp's Vernal Pools to Meet the Project's Basic Purpose of Improved Training.<br><br>The Navy suggests that it needs to allow foot traffic in the vernal pools because some training activities require space to maneuver. See SSTC Draft EIS at 3.11-43. But the Silver Strand Training Complex—South is 548 acres of land, and the San Diego fairy shrimp has been found in vernal pools taking up only around 4 acres of land. See SSTC Draft EIS at 1-3; 3.11-13, Fig. 3.11-4. The Navy does not explain why walking in those very small, ecologically fragile areas is fundamental to providing better training. Further, the Navy suggests that allowing foot traffic in the vernal pools is "needed " if "other areas are scheduled and no other training areas are available " See SSTC Draft EIS at 3.11-43. In other words, the Navy wants to trade protection of a critically endangered species for added scheduling convenience—for only 11 of the 78 different activities the Navy schedules. See SSTC Draft EIS at 3.11-43, 2-26. The Navy also suggests that walking in the vernal pools might be "needed " for "training diversity " without | Information on the necessity of realistic training activities at SSTC-S has been added to Section 3.11.2.3.3. Some vernal pools will need to be used for training. Restricting training to other areas would decrease the efficacy of training activities.<br><br>The Navy will use scheduling and planning measures to minimize the potential for incidental take of San Diego fairy shrimp. The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As |

| | | explaining what "training diversity " walking in the vernal pools would provide—other than trampling a fragile ecosystem.<br><br>B. The Navy Fails to Analyze the Impacts to the San Diego Fairy Shrimp of Allowing Foot Traffic in the Vernal Pools When the Pools are "Dry"<br><br>The Navy proposes to allow people to tramp through the vernal pools the San Diego fairy shrimp call home when a botanist or wildlife biologist determines that the pools are "dry. " See SSTC Draft EIS at 3.11-43. The Navy has not analyzed the environmental impacts of this plan to the existing fairy shrimp populations or to the ongoing viability of the fairy shrimp population at Silver Strand Training Complex—South. | presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |
| 305. | San Diego Bay Council | 1. The Navy May Determine the Vernal Pools are "Dry" when Fairy Shrimp are Maturing or Adult Shrimp are Present.<br>The Navy anticipates that the vernal pools will be deemed "dry" "50 to 95 percent of the year", which could also include "intermittent times during the rainy season, rather than during a defined dry period. " See SSTC Draft EIS at 3.11-43. The Draft EIS does not explain how the "qualified person" overseen by a Navy botanist or wildlife biologist will determine when the vernal pools are wet or dry. See SSTC Draft EIS at 3.11-43. The fact the Navy anticipates that or Endangered Species Act Section 7 consultation on green sea turtle at SSTC.□National<br><br>The Draft EIS recognizes that "[a]dult San Diego fairy shrimp are observed from January to March" but "in years with early or late rainfall, the hatching period may be extended. " See SSTC Draft EIS at 3.11-12. The Navy's 2002 Integrated Natural Resource Management Plan for the Naval Base Coronado (the "2002 Plan") also acknowledges that San Diego fairy shrimp "may appear after late fall, winter, or spring rains sufficiently fill their small, shallow pools (<30 cm deep)" and "[o]nce hatched, the fairy shrimp will mature in 10-20 days...and can live for over | As listed in the FEIS and in the signed Biological Opinion (July 7, 2010), the Vernal Pool Management and Monitoring Plan will list: 1) what criteria are used to determine that the pools are dry, and 2) who makes the "dry" determination, i.e., the qualifications of the person responsible for determining wet and dry conditions. The person overseeing the determination will have a USFWS fairy shrimp permit.<br><br>The estimate that the pools could be dry 50-95 percent of the time was based on a much drier than average year. The intent was not to plan to train in the pools that much of the year unless they were actually dry, but, rather, to attempt to |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | a month." See 2002 Plan at 3-76, citing Eriksen and Belk 1999. But the Draft EIS provides no explanation of how the vernal pools could be dry up to 95% of the year when adult shrimp can be observed for at least 25% of the year and possibly in late fall, winter, or spring. Either this means that the Navy anticipates determining the vernal pools are "dry " when there are still adult fairy shrimp present, or the Navy has serious flaws in its analysis. | determine the maximum number of people who might cross the vernal pools on foot in any given year so the Navy could avoid underestimating impacts. |
| 306. | San Diego Bay Council | 2. The Navy Cites No Scientific Evidence That Allowing Foot Traffic Through the Vernal Pools When "Dry " Will Protect the Fairy Shrimp Population.<br><br>The Navy attempts to justify purposely scheduling foot traffic in the vernal pools when the pools are "dry " because "[t]his is the time when the shrimp are least vulnerable because they are encased in hard cysts at or near the soil surface-awaiting the return of wet conditions. " See SSTC Draft EIS at 3.11-44. But the Navy provides no evidence that the force of foot traffic through the vernal pools will not crush the fairy shrimp cysts.<br><br>On the contrary, it is well-settled that human encroachment into San Diego fairy shrimp habitat on foot or on motorized or non-motorized vehicles affects the species by crushing San Diego fairy shrimp cysts. See San Diego Fairy Shrimp 5-Year Review, U.S. Fish and Wildlife Service, 2008 ( "5-Year Review") at 28. Scientists have demonstrated that San Diego fairy shrimp cysts can be crushed under minimal weight-less than 100 grams, or 0.2 pounds, of force—when dry. See 5-Year Review at 28, citing Hathaway et al. (1996). Because cysts are so fragile, even when the vernal pools are dry, allowing people to walk or run through the vernal pools will crush and destroy the fairy shrimp cysts.( The American Academy of Podiatric Sports Medicine estimates that, while running, the feet strike at a force of three to four times the body's weight. See http://www.aapsm.org/running.html)<br><br>The Navy has not analyzed the short-term or long term impacts of allowing foot traffic in the vernal pools when they are "dry. " The Navy "conservatively " estimates that "10 percent of the people conducting training activity would enter into the vernal pools. " See SSTC Draft EIS at 3.11-43. The Navy provides no explanation of why this estimate is conservative other than "each activity is dispersed across the vernal pool area. " See SSTC Draft EIS at 3.11-43. And even under the conservative estimate, the Navy still anticipates that 207 people could enter the vernal pools each year. See SSTC Draft EIS at 3.11-43. | The Navy has analyzed for take of fairy shrimp cysts, and acknowledged that fairy shrimp cysts will be crushed and otherwise harmed, such as by displacement into areas they cannot survive. For this reason, the USFWS has issued a take allowance for the training activity as listed in the signed Biological Opinion (July 7, 2010). The conservative estimate of the number of people that would enter the pools each year was estimated by considering the percent of the training area occupied by pools, and overlaying the footprint of each of the different activities that could enter the pools. The Biological Opinion also concludes that the Proposed Action is not likely to jeopardize the continued existence of this species. |

|---|---|---|---|
| 307. | San Diego Bay Council | The Navy has not analyzed what effect moving from no foot traffic to over 200 people tramping through the vernal pools each year will have on the short-term and long-term viability of the San Diego fairy shrimp population. The Navy acknowledges that the fairy shrimp could be negatively impacted by being moved to unsuitable locations or by changing the topography or water quality in the vernal pools, but never acknowledges that foot traffic can and will crush fairy shrimp cysts. See SSTC Draft EIS at 3.11-44. Because the Navy ignores the reality that foot traffic in the vernal pools will crush cysts, it never analyzes how devastating foot traffic will be to the long-term viability of the fairy shrimp.<br><br>San Diego fairy shrimp cyst "banks " develop in pool soils that are composed of cysts from several years of breeding. See 5-Year Plan at 5. This partial hatching of cysts allows the San Diego fairy shrimp to persist in its extremely variable environment, since pools commonly fill and dry before hatched individuals can reproduce, and if all cysts hatched during an insufficient filling the species could be extirpated from a pool. See 5-Year Plan at 28, citing Philippi et al. 2001, Simovich 2005a, Simovich and Hathaway 1997. The U.S. Fish and Wildlife Service has emphasized that the ability of San Diego fairy shrimp to develop and maintain cyst banks is vital to the long-term survival of San Diego fairy shrimp populations. See 5-Year Plan at 5, citing Ripley et al. 2004, Simovich 2005a.<br><br>The Navy must take a hard look at the long-term impacts of foot traffic on the fairy shrimp. The U.S. Fish and Wildlife Service has cautioned that cyst-crushing impacts, like foot traffic, may accumulate over time, leading to a decline of cysts below a number necessary to support a viable population. See 5-Year Plan at 17. The Navy must do a thorough analysis of the impact of its proposed plan on the critically endangered San Diego fairy shrimp. The Navy must at least address the following questions:<br><br>Which vernal pools at Silver Strand Training Complex-South have cysts in them?<br>How many steps will be taken in each vernal pool each year?<br>How many cysts will be crushed by each footstep in the vernal pool?<br>How many cysts are in each vernal pool?<br>How many cysts need to survive in order to ensure a long-term viable population of fairy shrimp?<br>How will the foot traffic in the vernal pools impact fairy shrimp breeding?<br>What impact will long-term foot traffic through the vernal pools have on the fairy shrimp population at Silver Strand Training Complex—South?<br><br>Answering these questions is crucial not only to comply with the Endangered Species Act, but to meet the National Environmental Policy Act's requirements that the Navy take a hard look at the environmental impacts of its proposed project. Without answering these questions, the Navy cannot meet its National Environmental Policy Act obligations. | The Navy has made educated assumptions to base its estimate of impact to vernal pools, and has requested a take allowance from the USFWS for the impact, which is expected to be low. The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |

|---|---|---|---|
| 308. | San Diego Bay Council | 3. The Navy Must Survey Existing Fairy Shrimp Populations in Order to Analyze the Impacts of the Proposed Action on the Fairy Shrimp.<br><br>The Navy's analysis in the Draft EIS is based on a study from 2003 of whether or not the San Diego fairy shrimp was present in a vernal pool. See SSTC Draft EIS at 3.11-13 Fig. 3.11-4. Before taking such a drastic measure as to allow foot traffic in the vernal pools, the Navy must gather more updated information about the existing population of fairy shrimp in vernal pools at the Silver Strand Training Complex-South. The Navy should have been monitoring fairy shrimp populations under its plan set forth in the 2002 Plan, as the plan states that the Navy will "monitor the status of the fairy shrimp population." 2002 Plan Coronado at 4-29.<br><br>According to the Draft EIS, the Navy plans to start surveying for the fairy shrimp every five years. See SSTC Draft EIS at 3.11-43. But relying on 7-year old information as a baseline and then not looking at impacts to the fairy shrimp population for 5 years is insufficient to protect the critically endangered fairy shrimp. In 5 years, the Navy could potentially cause such extensive damage to the fairy shrimp as to devastate the population. This is directly contrary to the Navy's promise in the 2002 Plan to "seek opportunities to restore vernal pool habitats that have been disturbed, while considering potential impacts to the federally endangered San Diego fairy shrimp." See 2002 Plan at 4-29. | The Navy will determine the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. The Navy will report monitoring results and any observed incidental take to the USFWS annually, and will adjust management to the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. Monitoring will be conducted annually per the Biological Opinion.<br><br>Consistent with the USFWS Biological Opinion, the Navy will mark pools to facilitate monitoring, and monitor the occupied vernal pools and their watersheds at the SSTC-S Inland to determine the baseline and ongoing conditions regarding: San Diego fairy shrimp distribution and abundance; botanical resources; topography; hydrology; and water chemistry (including salinity). The Navy will submit a draft monitoring plan to UISFWS and allow USFWS at least 30 days to review and approve this plan. The plan will include a map of SSTC-S Inland training area boundaries and vernal pools, and the following provisions to establish baseline conditions: a) focused invasive plant survey including visual/photo point inspection of vernal pools and their watersheds; b) plant, topographic, hydrological and water quality surveys/data; and c) protocol fairy shrimp surveys of the vernal pools. The plan will outline the qualifications necessary for personnel that determine if all the pools in a given unit are "dry", as well as the methodology for determining that the pools are dry. The plan will include the following provisions for monitoring ongoing conditions to determine if training impacts have occurred: a) focused invasive plant monitoring and visual/photo point inspection of vernal pools and their watersheds annually; b) plant, topographic, hydrological and |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | water quality monitoring every 2 years; and c) protocol fairy shrimp surveys of the vernal pools every 3 years. Annual monitoring reports will identify management measures to minimize any training impacts detected by monitoring (e.g., spread of invasive weeds, change in pool topography). The results of each year's monitoring will be submitted to USFWS annually. Baseline monitoring will be completed prior to initiating training activities in or around the vernal pools at SSTC-S Inland."<br><br>In summary, focused invasive plant surveys, including visual/photo point inspection of vernal pools and their watersheds, will be done annually. Plant, topographic, hydrological, and water quality monitoring are to be done every two years, and protocol fairy shrimp surveys are to be done every three years. |
| 309. | San Diego Bay Council | C. The Navy's Plan to Allow Foot Traffic in the Vernal Pools is Inconsistent with the Navy's Commitments it Made to Protect the San Diego Fairy Shrimp.<br><br>The Navy's plan to reverse its prior policy of protecting the San Diego fairy shrimp at Silver Strand Training Complex-South reneges promises made to "provide a benefit to the San Diego fairy shrimp." See Designation of Critical Habitat for San Diego Fairy Shrimp, 72 Fed. Reg. 70,648, 70,678 (Dec. 12, 2007).<br><br>When the U.S. Fish and Wildlife Service designated critical habitat for the San Diego fairy shrimp, it considered designating vernal pools at the Silver Strand Training Complex-South as critical habitat (The Silver Strand Training Complex-South was referred to as the "Naval Radio Receiving Facility" in the Federal Register in 2007). But the U.S. Fish and Wildlife Service determined that conservation efforts in the 2002 Plan "provide a benefit to the San Diego fairy shrimp. " 72 Fed. Reg. 70,678. Based on those conservation measures, the U.S. Fish and Wildlife Service exempted vernal pools at Silver Strand Training Complex-South from critical habitat designation under Section 4(a)(3) of the Endangered Species Act.<br><br>Endangered Species Act §4(a)(3)(B)(i) provides that the Secretary of the U.S. Fish and Wildlife Service shall not designate lands controlled by the Department of Defense as critical habitat if the land is: (1) subject to an integrated natural resources management plan and (2) if the Secretary determines in writing that such plan provides a benefit to the species. See 16 U.S.C. § 1533(a)(3)(B)(i). In 2007, the U.S. Fish and Wildlife Service determined that the 2002 Plan protected and benefitted the San Diego fairy shrimp. | The 2002 INRMP for Naval Base Coronado is being updated revised, and will reflect the content of this EIS. The vernal pool management measures proposed are new, and the USFWS will decide if the Navy still provides a benefit to the pools, and whether critical habitat should be designated on Navy land regardless of the INRMP currently being updated. The Navy provides invasive species control, inventory, and periodic surveys. The Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys.<br><br>The Navy's analysis was based on the best available science; however, there is inherent variability and uncertainty. It is correct that the Navy does not know the impact that introducing training to this area will have on occupancy of the vernal pools. As part of the conditions of the Biological |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Specifically, the U.S. Fish and Wildlife Service determined that the Navy would protect and benefit the San Diego fairy shrimp because the Navy promised in the 2002 Plan to: (1) monitor the status of San Diego fairy shrimp populations; (2) post signs around vernal pools; (3) advise personnel to keep vehicles on the main roads while traveling through the property; and (4) seek opportunities to restore disturbed vernal pool habitats while considering potential impacts to the San Diego fairy shrimp. See 72 Fed. Reg. 70,678. | Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>With regard to critical habitat, the National Defense Authorization Act of 2004, Public Law 108-136 recognizes INRMP conservation measures and species benefit that could obviate the need for critical habitat designation on Navy lands. As mentioned above, the Navy is developing a Vernal Pool Management Plan, and is being issued approval for incidental take under the ESA (the USFWS Biological Opinion concurs that the Navy will not affect the viability of the species). |
| 310. | San Diego Bay Council | The U.S. Fish and Wildlife Service also determined in 2007 that "[a]ctivities occurring on [Silver Strand Training Complex-South] are currently being conducted in a manner that minimizes impacts to San Diego fairy shrimp habitat." 72 Fed. Reg. 70,678. In 2007, management of vernal pools under the 2002 Plan restricted "all activities from the pools at all times." SSTC Draft EIS at 3.11-33.<br><br>The Navy's plan to degrade the vernal pools by allowing foot traffic through the pools and authorizing emergency vehicles to drive through the pools is a sharp departure from its prior management. The Navy is essentially pulling a "bait and switch " on the U.S. Fish and Wildlife Service, escaping protective critical habitat designation for its land based on a management plan it is scrapping just three years later. The Navy plans to allow emergency vehicles to drive in the vernal pools, despite the fact that the U.S. Fish and Wildlife Service "consider[s] vehicle use in vernal pool habitat" a substantive threat to the San Diego fairy shrimp. " 5-Year Review at 17. And the Navy plans to allow virtually unrestricted foot traffic in the vernal pools without first surveying the extent of existing fairy shrimp populations and analyzing the impact the inevitable crushing of fairy cysts will have on the ongoing viability of the critically endangered San Diego | This is a reference to the INRMP for Naval Base Coronado, which is being revised and will incorporate the measures described in this EIS. National Defense Authorization Act of 2004, Public Law 108-136 to recognize INRMP conservation measures and species benefit that could obviate the need for critical habitat designation on Navy lands. The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the |

|---|---|---|---|
| | | fairy shrimp population at Silver Strand Training Complex-South.<br><br>The Navy's plan to allow foot traffic and emergency vehicles in the vernal pools at Silver Strand Training Complex-South could be disastrous for the critically endangered San Diego fairy shrimp. The Navy should abandon this ill-conceived and un-examined plan unless and until it can demonstrate with a thorough and honest analysis that the plan will satisfy the Navy's promise to "provide a benefit to the San Diego fairy shrimp. " See 72 Fed. Reg. 70,678. | USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. The Navy prohibits driving of vehicles off of established roads at SSTC-S Inland, There may be infrequent emergency vehicle use in emergency situations The Navy does not have a record of such use in the pools, and the Navy anticipates that such an occurrence might never happen. Yet the possibility of cyst crushing and displacement by emergency vehicles is acknowledged in the EIS. |
| 311. | San Diego Bay Council | CONCLUSION<br><br>The Navy must analyze the direct, indirect, and cumulative impacts that pollutants from grenades, flares and explosives will have on water quality. It should provide scientifically-supported analysis of those impacts in the final environmental impact statement. The Navy still needs to take a hard look at the impacts the increased training will have on public access to the ocean, bay, and beaches, air quality, traffic, and noise.<br><br>The Navy's analysis of the proposed project's impacts to endangered species such as the western snowy plover, the California least tern, and the San Diego fairy shrimp is woefully inadequate. The Navy cannot withhold serious environmental impacts analysis from the public during the NEPA process, regardless of any future plans the Navy might have to work with U.S. Fish and Wildlife Service to satisfy Endangered Species Act requirements. The National Environmental | Water Quality impacts are addressed in Section 3.5.2.3.2, Section 3.5.2.4.2, and Section 4.3.5 of the FEIS. That analysis concluded that trace amounts of training material residues – most of which are deposited on land rather than in the water – would not have a substantial direct or indirect effect on water quality. Federal and State of California water quality standards would not be violated. Discharges from regional wastewater treatment plants, other industrial facilities, and non-point source pollutant discharges affect ocean and Bay water quality; however, these pollutants generally differ in type (e.g., coliform bacteria, nitrogen, phosphorus) from the residues of |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Policy Act requires that the Navy take a hard look at all the reasonably foreseeable environmental impacts of the project-that it look before it leaps-and that the analysis be available to the public to fully vet the information. The Navy has not met its burden with regard to the San Diego fairy shrimp. | training activities, so there is no substantial cumulative effect.<br><br>The Navy has consulted with the USFWS, and the signed Biological Opinion (July 7, 2010) concluded that the Proposed Action would not jeopardize the continued existence of ESA-listed species. This Biological Opinion has been integrated into the EIS, including any additional mitigation measures (Section 5). The Navy's analysis is a matter of public record. All effects that can be anticipated by the action have been addressed. With implementation of the Proposed Action, losses in California least terns and western snowy plover nesting are expected to be minimally increased from baseline levels. The Navy and U.S. Fish and Wildlife Service (USFWS) have established mitigation measures to compensate for these losses. |
| 312. | Sierra Club, San Diego Chapter | At this time the Sierra Club is not requesting additional protective measures outside the current prevailing policy. In this regard, we strongly support the No Project alternative unless substantial improvements to the protectionist measures are made to Alternative 1. However, the Sierra Club alternatively makes its position known that Alternative 2 is highly undesirable in large part due to the reckless and permanent damage that will befall the endangered California Least Terns and Snowy Plovers in the project area. San Diego Country has more endangered species than any other county in the United States. If biodiversity indicates ecological well-being, San Diego County should be diagnosed with a near fatal disease and the only treatment is an aggressive stance for protection and conservation. The proposed increase in training operations has the catastrophic potential of affecting 13-20% of the statewide California Least Tern population as well as some of the most important Snowy Plover nesting habitats in Southern California.<br><br>If increased training operations are found to be an absolute necessity, preferential training sites must be identified. Those sites should be areas with the least possible amount of nesting and foraging. In order to properly identify these areas, the Navy must actively engage in research, data collection, and monitoring activities. Upon critical examination of the data collected, optimal nesting and foraging sites can be properly designated and military training can be conducted in accordance with all necessary precautions. | The Navy's program for more than 30 years has resulted in adaptive measures that have permitted both bird species to thrive, and further measures are proposed to minimize harm to the species. The Navy has allowed for a least tern and snowy plover haven to develop while providing protection over the last decades, to the extent that the Navy is managing an increasing percentage of the statewide populations (See Table 3.12-3 of the FEIS). The latest mitigation measures, listed in Section 3.12.1.5 of the FEIS, detail the current status of the Navy's stewardship of least terns and snowy plovers in San Diego Bay. Under the Proposed Action, the Navy will develop a Long Term Habitat Enhancement Plan for SSTC-N.<br><br>Alternative 2 will not in reality translate into full scale use of the set aside training lanes or automatic loss of western snowy plover nests. Training lanes hold different value for each type of training due to various factors, and the birds actually tend to nest in areas where less training occurs. The DEIS has been amended to explain the level of loss anticipated under the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year. The |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | difference in incidental take for snowy plover between the No Action Alternative and Alternative 1 is one nest, on average, in a typical year.<br><br>As described in the FEIS and the signed Biological Opinion (July 7, 2010), the Navy will implement a mitigation measure to schedule training in areas where less nesting occurs, when possible, and still meet training needs. In addition, the Navy will schedule training activities that could be conducted on the hardpack portion of the beach during low tides when it is consistent with training needs. The Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that do not encumber training activities. Such a marking strategy may entail signage affixed to existing beach lane sign posts and a limited number of additional markers, as determined appropriate by Navy staff.<br><br>The extensive monitoring program that the Navy implements has allowed for adaptive management to ensure avoidance and minimization of take, as well as positive contribution to recovery of both species. Nesting activity has increased despite the average historical annual loss of 38 nests (Figure 3.12-9), indicating a capability of the species to not only continue to persist on SSTC, but also to increase, with training occurring in the nesting beaches during the nesting season. Much of this has to do with the Navy's mitigation measures and management practices. Based upon the available data, training activities at historical and proposed levels appear compatible with persistence of the least tern and western snowy plover at SSTC. Nesting areas have already been set aside on the bay side of the Silver Strand that exceed the mitigation required for all past and current consultations. |

|---|---|---|---|
| 313. | Sierra Club, San Diego Chapter | Vernal Pools<br>Vernal pools are environmentally important and highly sensitive areas. Vernal pools have been around for thousands of years, at their peak there were approximately 28,500 acres of vernal pool habitat in San Diego County. By 1986, only 7% of those acres remained. A 1997 a report indicated that 70% of the remaining vernal pools were found on N.A.S. Miramar or Camp Pendleton. By 1995 95% of the vernal pools were destroyed. In 2001 it was reported that 2,400 vernal pools existed, and presently only 3% of the area's vernal pools remain.<br><br>In order to preserve this ever-diminishing vital natural resource, the Sierra Club endorses the continuation of the Navy's existing policy restricting all actives from vernal pools at all times. We appreciate the Navy's environmental intentions through the proposed wet season closures of the vernal pools. However, the limited closure is not sufficient to sustain the resource. Several species reside in this habitat, including endangered species like the San Diego Fairy Shrimp (Branchinecta Sandiegonenis). The Fairy Shrimp find the vernal pools indispensable to their lifecycle when they are inundated with water as well as when they are dry.<br><br>By the Navy's own admonition (see Table 3.11-3) both Alternatives 1 and 2, could adversely impact the Fairy Shrimp. Dry season impacts from potentially high volumes of foot traffic (12 to 207 individuals per year estimation, DEIS 3.11-43) carry with it the high probability of causing an extinction of the species. The fairy shrimp cysts (eggs) can be crushed and damaged, especially during the dry season. Foot traffic through the area would not only result in destruction of the cysts, but also allow for the introduction of invasive weeds, as soils are disturbed and changes to watershed hydrological system occur. As the soldiers traverse through the SSTC they are walking through areas that contain weedy species, and the seeds become attached to the soldier's shoes, clothing, and equipment. The seeds once transmitted to the vernal pools act as an invasive species resulting in shadowing, increased evaporation and transpiration rates, degrading the hardpan. Moreover, the USFWS has recognized that habitat degradation (and loss) is the single greatest threat to a species' survival. The Sierra Club would strongly encourage the Navy to continue working closely with the USFWS to implement the findings of their Biological Opinion when it is completed. What the plan requires is the designation of an area off-limits form training operations while data is collected and evaluated. The area would consist of all the existing and identified vernal pools. While the Navy does place a limit on the amount of activity when other shoreline areas are occupied, unavailable, or less suitable for training, this limitation merely bestows unfettered discretion and no actual limitations. An appropriate method, which should be explored as an alternative, in order to protect vital natural resources and critical habitat, is placing and maintaining, clearly designated barriers within 100 feet of the vernal pools and their functional watershed.<br><br>It is also strongly suggested that the Navy conduct new baseline studies, since those studies currently in use were conducted over seven years ago, between 2001 and 2003. Thus, the current conditions remain unknown and the only means of arriving at an adequate accounting of the pools, which currently contain Fairy Shrimp, is to conduct a more recent survey. Until such time | The Navy will use scheduling and other planning tools to minimize impacts to vernal pools, as listed in the FEIS (Section 3.12 and Section 5) and the signed Biological Opinion (July 7, 2010). The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7, marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. The Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will identify measures to minimize the potential for adverse effects to fairy shrimp from weed abatement, pool restoration, or pool augmentation. The Navy will be establishing the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. The Navy will report monitoring results and any observed incidental take to the USFWS annually, and will adjust management to the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>Dry season disturbance is not likely to result in species extinction or extirpation from the site, due to summer dormancy of the shrimp as a cyst, and the low level of foot traffic expected. The USFWS has issued a take allowance for the proposed disturbance to the pools, as described in the signed Biological Assessment (July 7, 2010).<br><br>The Navy conducts annual surveys and treatment for invasive plants, and in recent years has been expanding treatment of iceplant. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | that a sufficient and timely survey has been performed, all pools exhibiting reasonable conditions for habitability by Fairy Shrimp should be fenced for protection of the species.<br><br>It is unwise to estimate the damage that could be caused to the complex ecology of the vernal pools from increased foot traffic. The Navy should proceed with their existing policy: restricting all activities from the pools at all times. If the Navy plans to proceed with the increased training operations within areas where vernal pools are known to exist, a multiyear analysis must be performed in order to fully evaluate the adverse impacts to the fairy shrimp and to the basic hydrology of the pools.<br>The Navy must also make note that species on the threatened and endangered lists are to be protected so they may achieve such numbers as to be delisted. The only methodology capable of achieving this goal is to protect their critical habitats. In the case of the San Diego Fairy Shrimp that critical habitat is the vernal pools during both the wet and dry periods. | |

|---|---|---|---|
| 314. | Southwest Wetlands Interpretive Association | There is concern that potential additional operations could affect 13-20% of the statewide California Least Tern Population as well as some of the most important Snowy Plover nesting habitat in southern California but through cooperative effort with agencies like the USFWS this may be resolved. It is assumed the effects of training on Least Tern nesting sites at lanes 1-7 north of Silver Strand State Beach, SSSB, are compatible. Is there enough research data to support the concept of compatibility between tern nesting and training exercises at this site? This makes the important assumption that these birds are able to adapt to these activities without disruption which is important to know as training escalates. It is our hope that research and data collection will be carried out at this site and help answer these important questions about bird adaptation and military training.<br><br>We hope that there will be a high level of protection for Least Tern nesting and foraging including lanes 8 through 10.<br><br>Preferential training should be considered in lanes with the least nesting and foraging. But research, data collection and monitoring should lead to better management enhancing training and environmental protection.<br>We also want to encourage a high level of protection at Delta II North and Delta I South. These have been successful nesting and recruitment sites and we hope that they will continue to be maintained through management, and monitoring.<br><br>We hope that ongoing operations will be designed to maintain optimal nesting and foraging while carrying out the military mission. | The Delta Beaches will continue to be managed consistent with agreements with USFWS, to encourage nesting at these locations.<br><br>Preferential training will occur under Alternative 1. The criteria for using Blue 2, Orange 1, or Orange 2 are listed in Chapter 2 of the EIS<br><br>The Long Term Site Enhancement Plan, which is part of the Proposed Action, could increase the carrying capacity for terns by hundreds of nests. For snowy plovers, the long-term site enhancement plan is estimated to realistically mitigate for an estimated 34 nests annually.<br><br>The FEIS quantitatively estimates the amount of benefit provided by Navy management above and beyond that required by past projects, and that can be considered avoidance, minimization, and offsetting measures related to training. Besides setting aside real estate, the most important mitigation measure is probably predator control. The Navy has a number of predator management and control measures that it implements throughout the breeding season to minimize impacts of predators, including avian predators, ants, and mammals (see Section 3.12.1.5.3 of the FEIS for more detail). Predator control is considered by many species experts to be one of the most crucial management strategies for reproductive success (Foster 2006; USFWS 2006c). |

|---|---|---|---|
| 315. | Southwest Wetlands Interpretive Association | Other issues that must be addressed include protection of vernal pools, predation and use of military working dogs.<br><br>We believe that vernal pools should be monitored and that research data collection will enable a reasonable approach to management meeting the needs of military operations and environmental protection. These sensitive habitats should be incorporated into biological off limit areas for training while data collection is evaluated. | Military working dogs are highly trained and under constant voice or leash control of the handler. While effects of recreational dogs in nesting areas are documented in scientific literature, the effects of leashed dogs that are highly trained in obedience and avoidance of wildlife in an area that is heavily used for military training is not yet known.<br><br>As a result of the consultation with USFWS, the Navy is proposing a study to assess impacts of MWDs military working dogs on California least tern and Western snowy plover nesting such that potential effects can be better understood. In compliance with the USFWS Biological Opinion (signed July 7, 2010), the NBC Natural Resources staff will brief all dog handlers annually, or more frequently if necessary, on guidelines pertaining to the use of military working dogs on SSTC beaches. These include that military working dog handlers will be notified weekly of the locations of plover nests and, to the maximum extent possible, remain a minimum of 30 meters (90 feet) from markers that delineate the locations of nesting plovers. If physical conditioning on soft pack sand is necessary, handlers and military working dogs will run on the sand road (SSTC-N) or within 20 feet of the hardpack sand to reduce the disturbance and impact to nesting terns and plovers. At SSTC-N, military working dogs will exercise primarily between beach lanes Yellow 1 and Blue 1, where they may cross the beach to get to the sand road at the existing route immediately to the north of the demo pit. The Navy will not conduct physical conditioning using dogs in the southern three beach lanes until: a) completing a study to evaluate the effects of military working dogs on terns and plovers and b) coordinating with the USFWS to develop conservation measures to minimize any additional effects. If military working dog training is requested as part of Platoon Over-the-Beach activities at SSTC-N, these activities will be scheduled in beach lanes Yellow 1, the northern half of Yellow 2, Green 1, or Green 2, pending the results of the Navy's study to evaluate the response of terns and plovers to |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | military working dog presence. The Navy will coordinate with the USFWS in the development of the study, and will submit the study design and scope of work to the USFWS for review and approval.<br><br>In compliance with the USFWS Biological Opinion, the Navy will use scheduling and/or planning measures to minimize the potential for incidental take of San Diego fairy shrimp, will establish the baseline distribution and abundance of San Diego fairy shrimp and condition of their vernal pool habitat at SSTC-S Inland and monitor training activities to ascertain the impact of training activities on San Diego fairy shrimp distribution and abundance within the action area, will report the monitoring results and any observed incidental take to the Service annually, and will manage the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring (including fencing off several pools). The DEIS was revised to indicate these terms and conditions. |
| 316. | Southwest Wetlands Interpretive Association | Predation is a serious problem. The Gull Billed Tern presents a danger for tern and plover chicks. It is not a listed species at this date but is under consideration. Predation is exacerbated by habitat loss for all these species and this problem must also be addressed.<br><br>Using the Endangered Species Act to protect a species must be solely a decision made by qualified scientists. The decision to list or delist a species must be made by the recovery team and should never be influenced by political policy and or public pressure.<br><br>The utilization of military working dogs should be coordinated in a way that does not lead to environmental impact.<br><br>The impact on near shore habitat and the interrelationship between the marine and beach ecosystems must be taken into consideration. This is especially important concerning least tern foraging. There is also interest in looking at the impact commercial bait fishing has on least tern foraging along the Silver Strand and the barrier beach at the Tijuana Estuary. The opportunity for research at these two sites has been suggested allowing for a comparative analysis of tern foraging success. Commercial bait fishing and military operations may impact tern foraging. Both sites are important to the bait fishing industry.<br><br>The potential impact of climate change and sea level rise is of great importance to extended use of the Silver Strand for military operations and as a nesting site for terns and plovers. Sea level rise will have ecological and military impacts at this site. The rise in sea level is at least 10 cm higher than it was in 1974 which is significant. This number is with reference to the TRNERR | Predation has been discussed in FEIS Section 3.12.1.3.1; California Least Tern and Section 3.12.1.3.2; Western Snowy Plover. A least tern foraging study funded by the Navy is underway and is being conducted in full compliance with the ESA. Cumulative impacts with bait fish are discussed in Section 4.3.12 of the FEIS.<br><br>Gull-billed tern predation studies are also underway by Navy and other funders (including USFWS), and the Navy has requested approval from USFWS to relocate Gull-billed terns, without success. A species viability analysis is under consideration for funding. The USFWS has not officially proposed the California least tern for downlisting. If and when they do, the proposal will be published in the Federal Register and will be open for public comment before a final decision is made.<br><br>The Navy is working closely with the USFWS to assist it in addressing gull-billed tern predation and impacts to western snowy plover and California least tern. The Navy has submitted an application for a depredation permit to the USFWS Migratory Birds annually since 2005, and has |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | site which is relevant to the Silver Strand and the Cities of Imperial Beach and Coronado.<br><br>The SSTC-South is also an important issue. There are Western Snowy Plover nests on the beaches at this site. The Navy has not been able to control civilian recreational beach use and off leash dogs. This has been a major issue with the destruction of nests and has led to low population success. A coordinated effort should be made to control this site. The YMCA Camp Surf should be able to continue their youth program but must follow the rules. Violations would lead to potential closure of the site.<br><br>We want to encourage the Navy to work closely with the USFWS and implement the findings in the Biological Opinion when it is completed. | continued to document the impacts of this species. The Navy is supporting a radio-telemetry study by San Diego State University and USFWS during the 2010 nesting season. This study will research movements of gull-billed terns around San Diego Bay and analyze diet through stable isotopes.<br><br>As indicated in the USFWS Biological Opinion and described in the FEIS, the Navy will improve the delineation of base boundaries to facilitate improved enforcement in these areas. This delineation will include the installation of improved signage, k-rails, and a guard shack. At SSTC-N, temporary barriers and improved signage will be used to more clearly notify the public of the Navy's exclusive use of SSTC-N beach and existing restrictions on public usage of those beaches.<br><br>Military working dogs are highly trained and under constant voice or leash control of the handler. While effects of recreational dogs in nesting areas are documented in scientific literature, the effects of leashed dogs that are highly trained in obedience and avoidance of wildlife in an area that is heavily used for military training is not yet known. As a result of the consultation with USFWS, the Navy is developing a study to assess impacts of MWDs on California least tern and western snowy plover nesting such that potential effects can be better understood. |
| 317. | Southwest Wetlands Interpretive Association | The City of Imperial Beach has worked with the Navy in the past to establish a dog park near the base entry off Silver Strand Blvd. If the legal issues could be worked out between the Navy and the City this would enable people to use the dog park rather than the beach especially during the nesting season. The City and SWIA would also like to work with the Navy on completion of the Coast Trail from Oregon to Mexico. This is dependent upon the ability of the City, County and State to work with the Navy allowing this trail to cross Navy lands on the Silver Strand. The trail concept would go between the eastern Navy fence boundary and Highway 7S then continue to the area previously described as the dog park. From there it would go along Carnation Ave outside Navy land. See the included map.<br><br>The Dog Park and the coastal trail would help to mitigate recreational beach use and hence allow military operations and protection of plover nesting sites. The dune system from the Coronado/Imperial Beach City boundary to the Silver Strand State beach is in better condition than most dune systems in San Diego County but they are heavily invaded by non native species. State Parks has done a commendable job restoring the dunes along their beach. It is hoped that the Navy and state might be able to look at similar dune enhancement on the Navy lands. | NBC Navy will continue to collaborate on these issues with City of Imperial Beach staff through the established military affairs sub-committee meetings. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 318. | Southwest Wetlands Interpretive Association | The City of Imperial Beach is concerned about increased noise levels as operations are enhanced. We urge the Navy to install a 10:00 PM curfew on high decibel activities. Neighbors need their sleep in order to be ready for work the next day. This is a reasonable request in a suburban area. | The Navy considered time and location of training so as to minimize disturbances to the local community, and does its best to conduct noise-producing activities during the day. However, to train in real-world scenarios that may occur overseas, Navy personnel must train at night. Personnel need to train in these dark, late night conditions to ensure that they are prepared for real-world operations. As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website. |
| 319. | Southwest Wetlands Interpretive Association | In conclusion SWIA suggests an organization like the Management Authority that currently exists at the TRNERR be established on Silver Strand. The Navy has been a member of this body since its inception in 1982. This organizational structure has worked successfully to resolve many issues in a way conducive to carrying out the missions of international, federal, state and county agencies, NGO'S, universities, private contractors and jurisdictions including San Diego County, and the Cities of Imperial Beach and San Diego. It also serves as an important forum for public input and can solve problems in their early stages. SWIA played an important role in helping to formulate the TRNERR Management Authority and would be interested in helping to do the same at the Silver Strand site. | The Navy is a signatory to the referenced MOU for Inter-Agency Trail Coordination Committee. The purpose of the MOU is the establishment of a framework for the coordinated planning, alignment, design, and development of trails inthe Tijuana River Valley. Members of this Committee have no legislative or administrative authority, and act solely in an advisory capacity. Current and future lands owned or leased within the SSTC jurisdiction boundaries are for military purposes. |
| 320. | Sustainable Wildlands United | Vernal Pools<br>While we appreciate the proposed wet season closure of vernal pools, the closure is not sufficient to sustain the resource. The existing policy restricting all activities from vernal pools at all times should be maintained. Dry season impacts from potentially high volumes of foot traffic (12 to 207 individuals per year estimation, DEIS 3.11-43) would result in mortality of the endangered San Diego fairy shrimp. Crushing of fairy shrimp cysts, introduction of invasive weeds as soils are disturbed and changes to watershed hydrological systems would occur relative to patterns of ground impacts. The impacts associated with establishing repetitive seasonal foot traffic are likely to lead to the loss of San Diego fairy shrimp from the site. The USFWS has acknowledged that habitat degradation (and loss) is the greatest ongoing threat to species survival.<br>To achieve effective and real avoidance, please place and maintain barriers that notice and identify vernal pools and their functional watershed within 100 feet, and maintain existing | The Navy will use scheduling and other planning tools to minimize impacts to vernal pools, as listed in the FEIS (Section 3.12 and Section 5) and the signed Biological Opinion (July 7, 2010). This Biological Opinion concluded that, with mitigation measures in place, training activities associated with the Proposed Action would not jeopardize the continued existence of the San Diego Fairy Shrimp.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7, marked with flexi-stakes) year-round, to the |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | policy restricting all activities at all times.<br>For any vernal pool that absolutely cannot be avoided, annual baseline surveys should be conducted. In the event of a survey showing a decline in San Diego fairy shrimp from the previous year, activities should be halted until surveys demonstrate recovery to baseline levels. The proposed surveys in five-year intervals are too infrequent to timely detect significant decline. Annual surveys could allow implementation of protective adaptive management measures to attempt recovery. | maximum extent consistent with training needs. The Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will identify measures to minimize the potential for adverse effects to fairy shrimp from weed abatement, pool restoration, or pool augmentation. The Navy will be establishing the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. The Navy will report monitoring results and any observed incidental take to the USFWS annually, and will adjust management to the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |
| 321. | Sustainable Wetlands United | California Least Terns<br>The proposed action has the potential to adversely affect a very substantial portion of the statewide California least tern population. The federally-listed endangered least tern is a noteworthy Endangered Species Act success story in terms of breeding pairs, but it has not fully recovered, and as the DEIS indicates (3.12-18), fledgling rates have remained static or declined in recent years.<br>Unfortunately, the DEIS discusses the effects of the proposed action on least tern recovery primarily in terms of breeding pairs rather than reproductive success. Reproductive success rates should be an additional criterion for determining the significance of the action's impacts. In addition, the EIS should evaluate the potential for the action to contribute to impacts to least terns through increased predation or other indirect effects.<br>Greater noise from operations are likely to reduce nest productivity for least terns and due to temporary and permanent nest abandonment that leaves eggs and chicks vulnerable to predators. The DEIS, however, omits discussion of noise impacts to these sensitive biological receptors. The EIS should analyze and mitigate for this impact.<br>We appreciate the inclusion of avoidance measures in Alternative 1, but remain concerned that the loss of up to 105 least tern nests would represent a significant impact to the species and would impede recovery of the least tern. Additional least tern mitigation or avoidance measures should be incorporated in Alternative 1.<br>Western Snowy Plovers<br>As noted for the least tern, the EIS should evaluate the potential for the action to contribute to | Reproductive success is a metric that is routinely collected by Navy-funded monitors in the Navy's biological monitoring program. The Navy monitoring program is probably more intensive than that of any other agency. Background noise levels are sufficiently high that training activity changes results in non-detectable effects. Considering the current success of least tern and snowy plover, noise is not expected to be an issue.<br><br>The Navy's predator control program is expected to address any increasing complication with predators. Gull-billed tern predation studies are also underway by Navy and other funders (including USFWS), and the Navy has requested approval from USFWS to relocate Gull-billed terns, without success. A species viability analysis is under consideration for funding. The USFWS has not officially proposed the California least tern for downlisting. If and when it does, the proposal will be published in the Federal Register and will be open for public |

|---|---|---|---|
| 323. | United States Department of the Interior | The primary issue of concern is the U.S. Navy's proposal to significantly expand training activities utilizing helicopters at Silver Strand Training Center (SSTC) South. The U.S. Navy's SSTC South is located immediately west of the South San Diego Bay Unit. The Kaufman Drop Zone, which is located in SSTC South, would experience an increase in helicopter activities based on the DBIS. Proposed changes would result in helicopter activities increasing from 724 flights per year to l,262 flights per year with actual landings increasing from 4 lands per year to 40 landings per year.<br>It is not clear from information provided what percentage of helicopter flights and landings would occur in SSTC South as compared to SSTC North. Additionally, specific training exercises (e.g., Tactical Recovery of Aircraft and Personnel and Amphibious Raid) would employ between 5 and 16 helicopters at a given time which may fly over the South San Diego Bay Unit. When approaching from the bay side to land at the Kaufman Drop Zone, helicopters may fly low over the South San Diego Bay Unit.<br>These low-altitude flights have potential to adversely affect Refuge resources (e.g. nesting migratory birds, federally endangered California least tern, and federally endangered western snowy plover).<br>The Service is providing the following recommendations to address concerns presented in this comment letter.<br>I. The Final EIS should include a map depicting anticipated helicopter flight routes and heights at SSTC South. The Service recommends flight routes avoid flying over South San Diego Bay Unit and instead travel to SSTC South along routes that avoid important wildlife areas or via the Pacific Ocean. We believe these alternative flight routes would reduce impacts of expanded helicopter training on South San Diego Bay Unit.<br>2. The Final EIS should describe the San Diego Bay National Wildlife Refuge South San Diego Bay Unit in the Affected Environments section. While the DEIS recognizes the Refuge, significant biological resources within this Unit should be fully described. We recommend the Final EIS provide a thorough analysis of effects resulting from proposed expanded training on Refuge resources (e.g., nesting migratory birds, federally endangered California least tern, and federally threatened western snowy plover). We believe that expanded training activities may affect listed species on the South San Diego Bay Unit and recommend the Navy consult under section 7 of the Endangered Species Act with our Carlsbad Fish and Wildlife Office. | The effort put forth by the Navy to manage the least tern and snowy plover also supports other nesting birds as an incidental benefit. The Navy works each year on site-maintenance and monitoring, plus periodic site enhancement to increase the attractiveness of Delta beaches. The Navy's Proposed Action includes: ongoing nesting site preparation at the Delta Beaches; predator management; population monitoring; a Long Term Habitat Enhancement Plan; and measures to eliminate unauthorized recreational trespass, which are all conservation measures that, while they are not the focus of management, benefit other birds. The Navy expects that the implementation of these conservation measures will maintain the suitability of habitat for all birds within the action area over the long term. The Navy's actions will increase the capacity of oceanside beaches and the Delta beaches to accommodate least terns and snowy plovers, as well as other migratory birds. The South Bay Unit is more fully described in the background resource section, but due to its increased distance from training activities, it is assumed that the magnitude of impact will be less than that reported for areas directly impacted by training activities.<br><br>The Navy has consulted with the USFWS, and received a Biological Opinion (signed July 7, 2010) for take of the listed species associated with military training. Information from the signed Biological Opinion has been integrated into the resource sections, and the mitigation measures are updated as well. This Biological Opinion concluded that, with mitigation measures in place, training activities associated with the Proposed Action would not jeopardize the continued existence of the ESA-listed species.<br><br>A map presenting flight routes will not be added to the FEIS. However, helicopter overflight patterns are described in Section 3.6 for use in the acoustic analysis. |

|---|---|---|---|
| 324. | Vernal Pool Society | Specifically we've noted that present vernal pool sites will be subjected to foot-traffic only during the dry season months; such activity would eventually destroy the dry pool pan and make the necessary accumulation of rain water eventually impossible; the subject here is the survival of vemal pools. Also, vehicular and/or foot-traffic would destroy an intolerable, even though unspecified, percentage of the cyst embryos.<br>We, of course, recognize the need for trained United States Navy personnel; God bless them; however, we believe the proposed Naval Training activities within the Silver Strand Training Complex and southern near shore areas of Naval Air Station North Island expansions (the specific vernal pool subject herewith) will have a NEGATIVE impact on the endangered species which rely on these areas to at least sustain their populations. | Foot traffic entering the pool, as described in the EIS, does not mean troops of people walking back and forth over the pools. The nature of these training activities is dispersed. Each event is more likely to be one traverse over one pool, with a different path each time. The sizes of these pools vary, but they are large relative to the foot traffic, covering a total of 3.2 acres. While harm to cysts is expected and analyzed, the order of magnitude is expected to be a few cysts, compared to an estimated population of tens of thousands if not millions of cysts in these pools.<br><br>The Navy will use scheduling and other planning tools to minimize impacts to vernal pools, as listed in the FEIS (Section 3.12 and Section 5) and the signed Biological Opinion (July 7, 2010). This Biological Opinion concluded that, with mitigation measures in place, training activities associated with the Proposed Action would not jeopardize the continued existence of the San Diego Fairy Shrimp.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7, marked with flexi-stakes) year-round, to the maximum extent consistent with training need. The Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will identify measures to minimize the potential for adverse effects to fairy shrimp from weed abatement, pool restoration, or pool augmentation. The Navy will be establishing the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. The Navy will report monitoring results and any observed incidental take to the USFWS annually, and will adjust management to the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring. If impacts are more substantial than the low levels |

|---|---|---|---|
| | | | anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>The Proposed Action will not all occur immediately, but slowly scale up over time, and only after the baseline condition of the vernal pools has been established and the Vernal Pool Management and Monitoring Plan has been developed and approved by the USFWS. This gradual process will allow the Navy to evaluate the potential impacts, and take corrective action as necessary. |
| 325. | Vernal Pool Society | Under Table ES-2: Summary of Effects 3.11 Birds, there is no way that this statement in regards to "Birds" from Alternative I and/or Alternative II can be relied upon: "...Loss in California least terns nesting would not decrease the nesting total below the 5,722 annual nests to maintain a stable range wide population, and would be below the 2007 incidental take allowance issued by the USFWS...."<br><br>Unforeseen impacts will always occur and the populations will continue to be unable to sustain themselves in the long term. | The levels of impact and overall population of birds is discussed in detail in Section 3.12 of the EIS in support of this statement. The Executive Summary is meant to give a general overview of the EIS, while the detailed discussion of each resource area is provided within the individual sections of the EIS. |
| 326. | Vernal Pool Society | Nor is there any reasonable assumption that the following stated impacts from Tab~ ES-2: Summary of Effects 3.11 Terrestrial Biological Resources under Alternative I and for Alternative II, particularly to Vernal Pool species can be relied upon:<br>" ...• Foot traffic in vemal pool areas could adversely impact individual fairy shrimp. However, impacts would be minimized, due to the low levels of foot traffic that would occur in the pools, and the limitation of those activities to when the vernal pools are dry. Potential impacts to the San Diego fairy shrimp are also associated with emergency vehicle use of unpaved roads in the vernal pool area.<br>• Potential increased training on SSTC<br>•N beach lanes Blue 2, Orange I, and Orange 2 could increase impacts to special status plants and invertebrates in these areas while decreasing impacts at other locations. Some trampling of vegetation at these locations is expected, though the overall effect on non-avian biological resources is expected to be short term and oft moderate intensity due to the potential overlap of concentrated activities in the dunes and upper beach areas. These activities do not pose long term impacts, effects are expected to be temporary and cease at the termination of an activity. | Statements have been made in the Executive Summary of the EIS for the purpose of a cursory overview of the activities and the potential effects. The Executive Summary is meant to give a general overview of the EIS, with the detailed discussion of each resource area provided within the individual sections of the EIS. The detailed discussion about the levels of impact and overall population discussion can be found in Section 3.11 of the FEIS; Terrestrial Biology. New information regarding vernal pools and the restrictions placed upon them (taken from the signed USFWS Biological Opinion with Navy guidance) has been added to Section 3.11 of the FEIS. |

|---|---|---|---|
| 327. | Vernal Pool Society | There is no logical reason to assume that the proposed Mitigation measures will negate any impacts which occur despite the Navy's and US Fish & Wildlife Service' best intentions.<br><br>As to the MITIGATION pleading, we have been of the opinion that no such procedure is any longer viable and therefore not even a conceivable solution for requesting any form of vernal pool destruction permit. The vernal pools that have thus far survived the onslaught of civilization's encroachments have already left them with, we believe, less than 1% (one percent) of their original population. These vernal pool creatures are not just Endangered but CRITICALLY ENDANGERED, and ALL vernal pools are to be protected, NONE available to be offered for mitigation. Upon investigation past mitigation attempts are failures.<br><br>The species in question and their necessary, supporting ecosystems which remain today require all the protection we can afford them. They CANNOT accept any further impacts if we wish to have any hope for their continued existence let alone expectations for their Recovery. Therefore, we recommend the NO ACTION ALTERNATIVE. | The Navy will use scheduling and other planning tools to minimize impacts to vernal pools, as listed in the FEIS (Section 3.12 and Section 5) and the signed Biological Opinion (July 7, 2010). This Biological Opinion concluded that, with mitigation measures in place, training activities associated with the Proposed Action would not jeopardize the continued existence of the San Diego Fairy Shrimp. The existing analysis concludes that there will be minimal effects to the vernal pool if training only occurs with foot traffic and only when the pools are dry. However, to further reduce the take potential, the Navy will undertake certain measures. Foot traffic entering the pool, as described in the EIS, does not mean troops of people walking back and forth over the pools. The nature of these training activities is dispersed. Each event is more likely to be one traverse over one pool, with a different path each time. The sizes of these pools vary, but they are large relative to the foot traffic, covering a total of 3.2 acres.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7, marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. The Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will identify measures to minimize the potential for adverse effects to fairy shrimp from weed abatement, pool restoration, or pool augmentation. The Navy will be establishing the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. | **F.3 PUBLIC HEARING COMMENTS** | | | |
| **IMPERIAL BEACH, CALIFORNIA** | | | |
| 328. | Zeke Mazur | They were talking about having training sessions on the beach, exclusive training sessions. They don't want people around. I think it would be a good idea to have them notify the Union Tribune -- I can't tell if I'm going too fast -- notify and put that on the weather page where they have water temperatures, tide heights and polluted beaches. It would be nice if they had a notice that Silver Strand area is going to be off limits to the public during such and such times. Thank you. | Due to the necessary flexibility inherent in scheduling training activities, it would be extremely difficult to publish notifications in the local newspapers in a timely manner. However, based on your comments and those of others, the navy is investigating various methods by which to notify the public.<br><br>As stated in Section 3.1.2.2.2 and 3.1.2.3.2 of the SSTC EIS, the Navy will not preclude the public from access to public beach adjacent to active training. Active training does not typically occupy the entire stretch of stretch of beach at SSTC-S, but rather one or two training lanes. The public would be able to continue to use public beach adjacent to active training. On SSTC-N there is no public beach. All beaches, including the beach below the high tide line, is leased from the State of California to the Navy for exclusive military use. On SSTC-S, the Navy owns the beach down to the high tide line. The State of California owns the beach below the high tide line. The Navy is adding new mitigation measures for alerting the adjacent communities about events which may be considered intrusive, as well as posting signage and controls about public access to the beaches. |

| 329. | James Knox | No organization. My name is James Knox. I had submitted these already. I do have some things I'd like to read out loud. One is on 3.5.1.4.2 and 3.5.1.5.2, the Pacific Ocean, about contaminants, report states that most of the contamination of the area is caused by sewage from the river mouth and/or the South Bay ocean outfall. Storm water runoff has a relatively minor influence on local water quality, which is Table 3.5-5 -- will increase training at the south complex, cause more contaminants to reach the ocean by storm water runoff. Rain events occur mainly in the winter when ocean currents in the area are from north to south. Were seasonal changes and ocean water movement taken into account when the finding of contaminants were formulated?<br>The next is 3.5.1.5.2., Pacific Ocean. I believe that the Silver Strand State Beach does have day and overnight use numbers that were not included in this report. I request in the conclusion that the information presented is not representative of the use of the municipal beach in Coronado. The report in other sections extrapolated information that was used for conclusions without complete numbers, and I believe you could have done it for that particular part of the report. The Navy recreational areas, Gator Beach, Fiddler's Cove and so on, I don't believe should be included as recreational opportunities. They have restricted access not open to the general public. So I think you should only include those that the general public could go to. I can't read it all because we have three minutes. | Section 3.5.1.4.2 of the FEIS - For contamination to occur, the contaminants must be present at the surface during a precipitation event, and the surface must be relatively impervious. Residues from the use of flares and smoke grenades constitute the majority of contaminants from training at SSTC. These materials are widely dispersed over the training areas at very low concentrations. Wind erosion of sand and loose surface soils likely results in further dispersal of these materials. When precipitation occurs, most of the rainfall - along with any traces of these residues - infiltrates the soil and sand, and does not run off into the ocean. The potential for increased concentrations of pollutants in waters along the Silver Strand under the Proposed Action is negligible. Seasonal changes in littoral currents along the Silver Strand may affect the dispersal pattern of pollutants from the Tijuana River or from water treatment plant outfalls.<br><br>The EIS states that the use numbers for visitors to SSSB are not representative of the actual use of the ocean waters adjoining the beach. In other words, there is no known correlation between the number of visitors and: (a) the number of individuals that enter the water, (b) how far from the beach those water users travel, (c) the time those individuals spend in the water, and (d) the times of day this use occurs. |

| 330. | James Knox | 3.6.2.3.2 of .2, new training activities will increase helicopter use. That's the TRAP. It's N9 on Table 2.2. I must disagree with the conclusion the noise level will not change. Each flight is a separate event with individual consequences regarding sound. Weather, temperature, wind direction and pilot skill all contribute to each event.<br>Suggesting that the helicopters will always be in their assigned flight lanes without data is an assumption. The helicopters get out of their flight lanes many times. I've noticed this, and I think training people -- willing to tell you that. Training evolutions may have variations that are not foreseen. This fact needs to be taken into consideration when making conclusions.<br>More use equals more sound in the adjacent residential areas. Citing the ambient sound of the surf supplies no useful data without knowing the size of the surf, the direction of the swell, the direction of strength of wind and the tidal level. None of this information is contained in the table. Thank you. Skip the other ones. Good. I do have a mitigation area I think -- that I think would be nice, and that is to use the north gate if you have more than three vehicles coming to the south complex. Silver Strand is a small kind of windy-to-the-left street, and you will find that the traffic will back up pretty quickly, and they're going in and coming out. Thanks for this opportunity and the assistance of forthright answers that were given to me to my questions and concerns in the open-house portion of this event. Thank you very much. | The analysis of helicopter sound indicates that, while the number of helicopter sorties would increase substantially under Alternatives 1 and 2, the increased frequency of short-term sound exposures from increased helicopter pass-bys would not be sufficient to noticeably change the hourly average sound level at any one off-installation location. This results from the logarithmic nature of sound; a doubling of sound energy results in only a three-decibel increase, which under typical conditions is barely discernable. The analysis of helicopter sound is based upon broadly defined flight paths, consistent with a normal degree of variability introduced by pilot discretion, weather, time of day, and safety concerns such as other aircraft.<br><br>Navy is responsible for traffic on its controlled land. Once personnel leave the base, they are subject to Department of Transportation regulations. Various speed and traffic control measures would be the responsibility of the City of Imperial Beach. Due to this and similar comments, the Navy is considering implementing increased signage or message board requesting Navy personnel to obey all posted speed limits, keep radios turned down, etc., as personnel leave the base.<br><br>The reference to the ambient sound of the surf has been deleted from the FEIS. |

| 331. | Leon Campbell | Thank you. I represent the Airport Trust. It's a private trust. It has the proprietary interest as a licensee under a U.S. patent issued about a year ago, and briefly, it represents a new airport for San Diego. Not withstanding the fact we spent over 50 years and over $17 million trying to find an alternate site, this is an alternate site. It is feasible, and it will indeed work.<br>I've also met with the FAA in Washington, and they encouraged us to pursue the concept. And briefly, what it is is an airport that would be located within south San Diego Bay, and it would be analogous to an aircraft carrier. It would have a top level for aircraft operations and a lower level for parking, terminal, facilities, et cetera. It would even have an underwater tube for access to and from the shore. The advantages from an environmental standpoint is that it observes water areas completely around it. It is not invading any habitats. It will not cause any excessive noise. The airplanes will be taking off over and across the bay. It does not interfere with air traffic, military or civilian, and basically we've had a lot of good feelings about what we're trying to do.<br>Tonight, I discovered that the airport, for its location, will be invading, if you will, part of the bay area for amphibious training for the so-called quiet-water training, and that would be the delta areas and the echo area.<br>Now, logically, we should find an alternate site for our airport so we're not interfering with that area. Unfortunately, there is no alternate site. We have the only site in San Diego County that's feasible. So we would respectfully ask that an alternate site be generated for at least part of your in-bay amphibious operations.<br>And I think, somehow, we kind of balance the interest so that that can happen. And otherwise, we are very much in favor of what's being done. We think that there's no environmental complex whatsoever between us. And as an incidental benefit, we'd like to create a second entrance to San Diego Bay so that the amphibious base can go ahead and get their vehicles or vessels out into the ocean and back very easily. The airport does respect the amphibious security zones, so we're not involved there. And we're just down to an old-fashioned tradeoff where we think that the alternate site for the amphibious training in-bay, there is no alternate site for a new airport, which incidentally will be billions of dollars for the economy of the South Bay. | As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3 of the FEIS. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible.<br>Additionally, Chapter 4 of the FEIS addresses the contribution of military training activities to the cumulative impact of all past, present, and reasonably foreseeable future actions. Because this project is still in the conceptual stage, it was not addressed in the cumulative analysis section of the EIS. |

|---|---|---|---|
| 332. | Jeff Foster | I'm a resident of north IB, and so I think that this increase would affect us the most, living up in that area. The increase in activities of shotgun blasts from 150 to 1400, helo sorties from 778 to 2,220, I think. And I guess that, in general, it's a 48 percent increase in sound-generating activities. We definitely will notice that. A lot of them are at night, and it's -- we can hear it. Let's see. I -- so I -- I just implore you to choose the no action alternative. I think that us residents of IB should be considered first and foremost in this decision, because I think we're going to be affected the most. Also, we -- one of the -- one of the most coveted things about IB is the wildlife and the wildlife along the Silver Strand beach adjacent to the south training facility is -- it's really nice down there, and reading this, I can see there's a pretty good impact to that. And I just ask that you choose the no action alternative. Thank you. | The commenter's preference for the No Action Alternative is noted.<br><br>The increase in shotgun breacher training activities would be as described in the comment. Helicopter sorties would increase from 740 per year to 1,673 per year, although most of the helicopter sorties would be in support of over-water training activities rather than land-based training activities. The projected increase in activities at SSTC-S would not translate into a general 48-percent increase in sound exposure of Imperial Beach residents. While helicopter sorties, shotgun breacher training, and amphibious landing exercises on SSTC-S all would increase, they also would occur in various locations at different points in time. The distribution of these activities over time and space is such that the change in the sound environment for any individual resident cannot be quantified. Community noise levels from cumulative helicopter traffic are addressed in Section 4 of the EIS (Cumulative Impacts). |
| 333. | Normandie Trovato-Wilson | I'm Normandie Trovato-Wilson, and I'm here with San Diego Audubon. Some of the concerns Jim is going to be talking about in a little bit, my personal and biggest concern with the increased level of activities is the introduction of training within the vernal pool areas. These are highly sensitive, complex ecosystems, and I have no doubt about the Navy's commitment after speaking with Delphine last night about protecting the western snowy plovers, the Least Terns -- I'll get into that later.<br>But whereas the Navy can very easily barricade off an area around the western snowy plover nest, it's not quite so easy to determine what the impact is going to be once foot traffic is let into the vernal pool areas, and these are ecosystems of which 90 percent have been destroyed in California. An alternative for the vernal pools, since the complex ecological effects seem to be unstudied and unpredictable, would be to maybe phase in some of the training around a vernal pool that is in poor condition and track what happens in that vernal pool. You may have | Foot traffic entering the pool, as described in the EIS, does not mean troops of people walking back and forth over the pools. The nature of these training activities is dispersed. Each event is more likely to be one traverse over one pool, with a different path each time. The sizes of these pools vary, but they are large relative to the foot traffic. While harm to cysts is expected and analyzed, the order of magnitude is expected to be a few cysts, compared to an estimated population of tens of thousands if not millions of cysts in these pools. |

|---|---|---|---|
| | | unexpected results, and it may be better. It could be worse. We don't know. | The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS. |
| 334. | Normandie Trovato-Wilson | The potential down-listing of the California Least Tern presents a very bad thing in terms of Audubon perspective. We don't really know what the cumulative impact is going to be on both the western snowy plover and the Least Terns. There don't seem to be a real quantification of the sets of numbers. We heard an estimated take number on the high side. We didn't hear one on the low side. There wasn't one in the middle either, and I find that a little concerning.<br>It seems that an option could be to slowly phase in some of these alternatives, such as phasing in the one lane for six months out of the year and seeing how that goes, et cetera. And I didn't see that as part of the plan. And I think that maybe phasing in some of the alternatives and studying the effects could provide the Navy with alternatives to mitigate what may or may not happen. | Modeling was used to estimate mid-range take levels as part of the Biological Assessment on the Proposed Action submitted to the USFWS. It is also expected that a percent of these changes will be implemented over time, rather than all at once. There is no plan to immediately implement the operational changes on the military side. The proposed increases would not occur immediately, and would actually slowly occur over time, similar to the requested phasing. Coupled with the |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | Because as we've known from some of these, many, many, many of these experiments, what happens when we start dealing with these issues is very, very unpredictable. And that's all. Thank you. | Navy's intensive monitoring program, the Navy would be able to continually evaluate the impacts of the Proposed Action on the species.<br><br>The FEIS explains the level of loss anticipated under the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year for least terns. The difference in incidental take for snowy plover between the No Action Alternative and Alternative 1 is one nest, on average, in a typical year. The Navy will implement a mitigation measure to schedule training in areas where less nesting occurs, when possible, and still meet training needs. In addition, the Navy will schedule training activities that could be conducted on the hardpack during low tides when it is consistent with training needs. The Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that does not encumber training activities. Such a marking strategy may entail signage affixed to existing beach lane sign posts and a limited number of additional markers, as determined appropriate by Navy staff.<br><br>The extensive monitoring program that the Navy implements has allowed for adaptive management to ensure avoidance and minimization of take, as well as positive contribution to recovery of both species. Nesting activity has increased despite the average historical annual loss of 38 nests (Figure 3.12-9), indicating a capability of the species to not only continue to persist on SSTC, but also to increase, with training occurring in the nesting beaches during the nesting season. Much of this has to do with the Navy's mitigation measures and management practices. Based upon the available data, training activities at historical and proposed levels appear compatible with persistence of the least tern and western snowy plover at SSTC. |

|---|---|---|---|
| 335. | Richard Barck | Richard Barck, and I guess my description would be local resident. I have a couple of thoughts here. And reading through the report -- a lot to read, a lot of work went into that -- some of the things that I would look at from a statistical standpoint are sound levels, which you always describe as average. I assume that means over a 24-hour period?<br>What we're mostly interested in when we live locally and especially at night is how loud it is for very brief periods. If you dampen it out over a day, yeah, it's not very loud, but it's very loud when it happens. For us, especially if we have any doors open facing west, helicopters go by. You cannot hear the TV. In the middle of the night, if you have a few sorties -- and a sortie, as I understand it, contains more than one helicopter in a formation -- they get very loud. They're only there for a few minutes, but if it wakes you up, you don't go back to sleep immediately. And they happen throughout the night. My impression is that many of those flights can be more offshore, because I believe they're not attacking the shore or part of a mission. That would be a comment on that.<br>We have very quiet nights in this area. At night, we hear the surf. We like to hear the surf. We like to have the doors open to do that. We would not like to have to close them to shut out the noise. The second thing is that sometimes there's an offshore breeze. We hear the traffic on I-5 and the trains across the bay. It's quiet down here. We would like that to be maintained.<br>And basically, I am talking about the impact of your Lanes 11 through 14 or your white and purple. I don't know how you'd like to call them. | Time-averaged sound is not always averaged over 24 hours. As explained in Section 3.6.1.2.3 of the FEIS, the equivalent (time-averaged) sound level can be calculated for any meaningful period, but most typically is used for one-hour, eight-hour, or 24-hour periods.<br><br>The equivalent sound level is a widely used sound metric because it allows for the integration of numerous sound sources of differing intensity, duration, and quality, and studies have shown that it correlates well with community reaction to sound. As noted in the comment, however, the equivalent sound level does not adequately express the effects of short-term, or impulsive sounds. For that reason, the Acoustic Environment analysis in the EIS also addresses the effects of impulsive sounds, presenting the peak sound level (dBP) of discrete noise sources such as helicopters, landing craft, munitions, and other typical sources of noise associated with Navy training activities.<br><br>The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, as well as to and from SSTC-S, occur only over water. The only helicopters overflying residential areas at night are Department of Homeland Security |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to the SSTC EIS document in Sections 2 and 3.6 (Acoustic Environment). Community noise levels from cumulative helicopter traffic are addressed in Section 4 of the EIS (Cumulative Impacts). |
| 336. | Richard Barck | Secondly, been a big effort by local people, as well as Fish and Wildlife and the state parks, to further develop the snowy plover -- western snowy plover nesting areas. Some of those in Silver Strand State Beach south are immediately adjacent to all SSTC south. As I looked at the maps, which are very large scale or small scale that you have on there, it actually appears that you've extended into what was part of Silver Strand State Beach for some of those zones. It is an area that we had good fledglings and nests actively occupied by snowy plovers. Department of Fish and Wildlife has the statistics, and I'm sure they will make it available to you. | The Navy acknowledges the contributions of its agency partners to recover the snowy plover. At Silver Strand State Beach, at least five to nine pairs of plovers have nested each year since 2000. |

|---|---|---|---|
| 337. | John Warner | I have two very serious concerns. For the first, I'd like to go back to December of 2008. There was an F18, left the carrier offshore, developed engine problems. He was instructed by commanders to bypass the open runway at North Island Naval Air Station. He was ordered to attempt a landing at Miramar Marine Air Station. We all know the catastrophe that ensued.<br>My point is that we need hyper-efficient communication, coordination and cooperation between the Navy and the Marines. Commander Perry in the paper today stated we need a very realistic training environment. That would be afforded by the vast wide open spaces in Camp Pendleton, not an area sandwiched between two civilian populations and youth camps. Have I cut off?<br>My second major concern, anybody that's been in this area for a while knows that in the waters out here, we have viral. We have chemical. We have bacterial pollutants that contaminate this water for weeks on end. That's -- in an El Nino cycle, that's magnified. Now that's not to mention the potential catastrophe if Rodriguez Dam fails. The structural integrity of Rodriguez Dam is at question. Built in the early '30s, it would not take much of a man-made or natural event. We've been having a little movement on the earth here recently. I guarantee you it wouldn't take much for Rodriguez to pop, the waters out here to be contaminated for months. Now I've been told one SEAL team member, that's about $200,000 to train that man. That's quite an investment. That's quite a valuable asset. To put that valuable asset in an environment where he is exposed or she is exposed to hepatitis, waterborne pathogens, parasitic amoeba, that is unconscionable. It's negligent. It's reckless.<br>To expand -- yeah, give me the 30.<br>To expand this facility, it may be comfortable and convenient. You may be able to sleep in your beds at night, but I sincerely believe it's compromising the readiness of our troops. Pendleton, that vast area, would provide the opportunity. That's the resource that needs to be explored. Thank you. | San Diego Bay is at the center of a complicated airspace. The Navy has analyzed its flight tracks for safety in the area, as discussed in Section 3.16 of the FEIS. The Navy has determined that risks to the public from rotary-wing aircraft supporting SSTC training are minimal, based on past safety record, low number of flights, and over-water flight paths.<br><br>The Navy strives to be a good neighbor, and analyzed all training activities at SSTC with respect to applicable federal regulations. The location of training has also been explored through criteria that were established to aid in the determination of the feasibility and eligibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), Camp Pendleton was determined to not be a reasonable alternative location for training. As described in Section 2.1.3 of the FEIS, the Navy considered, but rejected, alternatives that included moving these exercises to other locations. Such alternatives fail to meet the purpose of and need for the Proposed Action.<br>With regard to failure of Rodriguez Dam and ocean pollution effects on trainees, effects on Navy personnel are beyond the scope of the EIS (which is intended to address effects on the public and environmental resources). |
| 338. | Jim Peugh | I'm the conservation chair of the San Diego Audubon Society. We appreciate the Navy's long-term work to protect the Least Terns and snowy plovers on the strand. And we understand, you know, the desire to have more training operations, but we think you can do it with considerably less impact to the environment.<br>And we'll mention a little bit -- our letter will try to be more specific, but it is interesting that you're working to increase the training capability where, just a few years ago, the Navy was looking to put a golf course on the same area, also in the city of Coronado, which seems ironic. The Least Terns, you know, some of your data shows that the populations are really high. It is important to notice the complementary number, that the reproduction of -- the successful reproduction has been plummeting for the last few years. So Least Terns are not the least bit, you know, in a good position for the future. The purpose of the Endangered Species Act isn't to let species hang on for decade after decade. It's for recovery, and I hope that you'll orient, you know, your actions and your plan to enable the recovery of the Least Tern, and I don't think that the way it is set up it does now. The project -- I understand that -- that -- figuring out | The Navy appreciates the thoughtful comments about modeling; however, there is as much uncertainty about the projected training tempo and locations, given changes in the world situation. Avoidance and minimization measures are proposed to prevent catastrophic losses to species recovery.<br><br>The DEIS was amended to explain the level of loss anticipated of the No Action Alternative compared to Alternative 1, estimated to be an increase of seven nests, on average, in a typical year. The difference in incidental take for snowy plover between the No Action Alternative and Alternative 1 is one nest, on average, in a typical year. The Navy will implement a mitigation measure to schedule training in areas where less nesting occurs, when possible, and still meet |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | what the -- the take impact is difficult, but it just seems like you need to have better quantification of what the take is. You run some models, apparently run worst-case models, and that's really misleading to the public and decision-makers when you're only saying this is the worst case when there's something significantly less than that.<br>You really need to say what the uncertainty intervals in the modeling is. You need to come up with a worst case, an expected value and a best case and -- so people at least know what -- you know, how precise your calculations are. And you don't have that.<br>And the same thing is true of your mitigation measures. The mitigation measures are really kind of fuzzy. They're not mitigation in the sense that I've ever seen before in any other project, and I've reviewed hundreds of EISs and EIRs. You need to be able to quantify what the benefit is going to be to the species, and you really need to show how the difference between the impact and the benefit is going to facilitate the recovery of the species, and I don't -- you know, to me, I don't think you've reached that level. And then as Ms. Wilson mentioned, the services working on -- for some strange reason is working on down-listing the Least Tern, which seems to be the most inappropriate action I've ever heard of. But you need to look to see what the cumulative impact of down-listing will be with your project. | training needs. In addition, the Navy will schedule training activities that could be conducted on the hardpack portion of the beach during low tides when it is consistent with training needs. The Navy will develop a marking strategy to delineate least tern and snowy plover nesting areas that does not encumber training activities. Such a marking strategy may entail signage affixed to existing beach lane sign posts and a limited number of additional markers, as determined appropriate by Navy staff.<br>Finally, The Navy's Proposed Action includes: ongoing nesting site preparation at the Delta Beaches; predator management; population monitoring; a Long Term Habitat Enhancement Plan; and measures to eliminate unauthorized recreational trespass, which are all conservation measures that support the recovery of the least tern. The Navy expects that implementation of these conservation measures will maintain the suitability of least tern habitat within the action area over the long term. The Navy's actions will increase the capacity of oceanside beaches and the Delta beaches to accommodate least terns and snowy plovers. |
| 339. | Jim Peugh | We're really concerned also with the vernal pools. I don't know if you ever had to do trail maintenance, but trails are an increasingly degrading thing. They just go deeper and deeper the more years it's used. I don't know what's going to happen to the contours of vernal pools, but I think that you need to take up a pool, as Ms. Wilson said, and do a lot of experiment over a lot of years before you actually start manipulating.<br>That's the most endangered habitat type in our entire region. And so I just hope that you'll work hard -- and another thing, too, is that the staff so far in their command has been very serious about the environment. But people change, and I want this project to be so they really will protect the environment, not just depending on the personality of who's in charge. | Foot traffic entering the pool, as described in the EIS, does not mean troops of people walking back and forth over the pools. The nature of these training activities is dispersed. Each event is more likely to be one traverse over one pool, with a different path each time. The sizes of these pools vary, but they are large relative to the foot traffic, covering a total of about 3.2 acres. While harm to cysts is expected and analyzed, the order of magnitude is expected to be a few cysts, compared to an estimated population of tens of thousands if not millions of cysts in these pools.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation |

|---|---|---|---|
| | | | with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>The Proposed Action will not all occur immediately, but will slowly scale up over time, and only after the baseline condition of the vernal pools has been established, and Vernal Pool Management and Monitoring Plan has been developed and approved by the USFWS. This gradual process will allow the Navy to evaluate the potential impacts, and take corrective action as necessary.<br><br>The Navy has established programs to address turn-over in personnel. Any new proposals that may affect listed species would need to be consulted on separately with the USFWS. |

| 340. | Rina Kelley | I'm not a snowy plover or a fairy shrimp. However, I am an inhabitant. I don't feel also that you have mitigated enough sufficiently for me, being north of Imperial Beach, your mitigation of what you intend to do.<br>I would like to inform you at this time about your lack of attention and the dangerous disregard of your property in Imperial Beach that has put the inhabitants of my city into a dangerous, threatening activity -- subject -- being subjected to your dangerous, threatening activity for years.<br>I would like to put you on notice first that your steel wall outside the Camp Surf fence at the beach has huge holes, serves no purpose except to attract children, has become a serious hazard to the safety of us. Jagged, rusted steel rim and bottom are hazardous on a daily basis. It is an accident waiting to happen for children.<br>Anyway, okay. It's a hazard, anyway. And it's -- for about ten years, it's been a hazard there with holes jagged. So would you have us wait another ten years to remediate and remove it? Hopefully not, that you are now formally put on legal notice with legal effect.<br><br>Camp Surf -- Camp Surf opened onto the street in a residential area for years. You did nothing about it. It ran over the animals on our street, one animal in particular. I called the Navy Chaplin, and the people were distraught. And hit a child in front of my home. It was not -- you did nothing. We are the ones that had to make that camp in the same manner that I just served you with a notice to move that gate to the other end.<br>I want to tell you that this EIS in and of itself is like the nose's camel -- the camel's nose in the tent's door. On SSTC northeast, you do a little bit more -- you could request more activity, permission for an EIS. Then you do it at NASNI. Then you do it in the south where the Navy SEALs are. It's an aggregate effect. The aggregate effect is that, gentlemen, we live in a war zone. I live in a war zone in the summer where Navy SEALs shoot guns and explode munitions outside all night. I can't sleep. Could you please put a time limit on this activity. Your EIS specifically addresses the intensity, the intervals and another thing -- the intervals, the intensity of the activity.<br>We'd like to know the intervals. I'd like to have a -- you know, a timetable so that I can leave town. Also, in addition, the planes that NASNI fly overhead doing these endless, mindlessly seeming exercises -- I was an Air Force officer. I was on Air Force bases. I don't understand how the Navy can destroy a city like this.<br>You shouldn't even be here. This is property that is coveted south shore property in the south -- Southern California, and, you know, I really hope that you could provide us with some timetables at least in mitigation of this. And, you know, go to the Philippines. General MacArthur took care of the Japanese. You don't have to worry about them over there, unless you drive a Toyota | Regarding Camp Surf: issues about Camp Surf are outside of the scope of the EIS, which addresses the Proposed Action. Camp Surf is an area leased by the YMCA from the Navy. Any safety issues regarding the Camp should be brought by the YMCA (the lessee) to the Navy (the lessor). Thank you for alerting Navy to your concern about condition of Camp Surf fence. NBC Planning has prepared a 1391, dated 28 May 2009, for FY 2010 Special Projects Program for repair seawall near Camp Surf.<br><br>With regard to suggestion for timetable, the Navy does not train during a particular time of year or season. As stated in Chapter 1 of the EIS; SSTC is a critical Navy range for west coast naval amphibious, special warfare, and mine countermeasure training activities, and has been used by the Navy for military training for over 60 years. |

|---|---|---|---|
| 341. | Ed Sorrels | I can tell already I'm not going to be a happy speaker for you folks. The captain mentioned -- oh, my name is Ed Sorrels. I'm a Marine veteran. I've lived in Imperial Beach almost 40 years, two different places, one over on Hemlock next to the auxiliary landing field, and now I live on the north side of Imperial Beach. I've heard floating airports. I've heard "I can't sleep at night." I've heard birds and vernal pools and one thing and another. The one thing I haven't heard addressed was, the captain, when he gave his introduction, talked about the importance of realistic training and surviving a combat situation. And there's nobody here yet in this whole group that has addressed the improvement of training, proportioned it to the survival abilities of a marine or a sailor in combat situations.<br>Now, I'm sorry you can't sleep at night. Neither can I. But damn it, that's the sound of freedom. And to -- I'm for option one. There's a sign down here at MCRD over the door of the drill instructor's training facility, and what that sign says is "Let no man's ghost say to me 'If only you had done your job,'" and that applies to all of us now. And that's all I have to say. | As expressed in Chapter 1 of the EIS; the Navy needs to implement its Proposed Action to provide a training environment, with the capacity and capabilities to fully support required training tasks for operational units and military schools—to achieve and maintain the required levels of operational readiness as mandated by Title 10 of the United States Code (USC) 5062. Title 10 requires the Navy to organize, train, equip, and maintain combat-ready naval forces capable of winning wars, deterring aggression, and maintaining freedom of the seas |
| 342. | Van Collinsworth | I'm the conservation -- actually vernal pool conservation director for a coalition of environmental groups. Those include the San Diego Chapter of Sierra Club, the San Diego Audubon Society, Center for Biological Diversity, the California Chaparral Institute, and I'm most known if it involves Santee. I actually live out in Santee. The issue I wanted to most focus on is the vernal pool impacts. And, first, let me say I appreciate the fact you've already acknowledged there's not going to be any activity during the wet seasons. But I am still concerned that the impacts -- the foot traffic during the dry periods would result in mortality of endangered -- the endangered San Diego fairy shrimp.<br>So the best, I guess, opportunity or best route is actually to avoid those vernal pools possibly with some fencing or signage to identify the resource and so there aren't any impacts there whatsoever.<br>Now, the previous speaker made an excellent point about readiness and the importance of training, and we certainly appreciate that. And so if you were to find in your analysis that there couldn't be avoided -- even though we still feel that that foot traffic will create a significant impact, we'd like to see that mitigated elsewhere. Now one of the things I have with me tonight is a map of vernal pools actually that are directly adjacent to Marine Corps Air Station Miramar on Fanuita Ranch. That property is for sale. It has a wealth of vernal pool resources. It's a perfect candidate for the readiness and environmental protection initiative that the military has the buffer program. So I would like to see that given some serious consideration in this EIS and see if that might actually meet the needs for mitigation.<br>Thank you very much. And if I could leave the map? | Foot traffic entering the pool, as described in the EIS, does not mean troops of people walking back and forth over the pools. The nature of these training activities is dispersed. Each event is more likely to be one traverse over one pool, with a different path each time. The sizes of these pools vary, but they are large relative to the foot traffic, covering a total of 3.2 acres. The Navy will use scheduling and other planning tools to minimize avoid impacts to vernal pools, as listed in the FEIS (Section 3.12 and Section 5) and the signed Biological Opinion (July 7, 2010). This Biological Opinion concluded that, with mitigation measures in place, training activities associated with the Proposed Action would not jeopardize the continued existence of the San Diego Fairy Shrimp.<br><br>The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7, marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. The Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will identify measures to minimize the potential for adverse effects to fairy shrimp from weed abatement, pool restoration, or pool augmentation. The Navy will be establishing the baseline distribution and abundance of San Diego fairy shrimp and the condition of the vernal pool habitat prior to initiating training |

|---|---|---|---|
| | | | activities in or around the vernal pools at SSTC-S Inland. The Navy will report monitoring results and any observed incidental take to the USFWS annually, and will adjust management to the vernal pools occupied by San Diego fairy shrimp to minimize any training impacts detected by monitoring. If impacts are more substantial than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>The Proposed Action will not all occur immediately, but will slowly scale up over time, and only after the baseline condition of the vernal pools has been established, and Vernal Pool Management and Monitoring Plan has been developed and approved by the USFWS. This gradual process will allow us to evaluate the potential impacts, and take corrective action as necessary. |
| 343. | R.G. Head | I'm a resident of Coronado Cays. I've spent a lot of time in Imperial Beach. I have a Bachelor of Science degree in engineering and a Ph.D. in public policy. For the past 20 years, I've worked in the environmental planning industry, and now I'm a private citizen.<br>I've observed tonight's comments are mostly negative with the exception of Ed Sorrels', and I would like to add a few to provide some balance. First of all, naval training is critical. It's absolutely critical to our survival as a country just like it is for the Olympics.<br>In fact, the phases are very similar. Basic training is physical conditioning just like for a ski jumper. Pre-deployment training for combat is indispensable to train young men and women before they go to Iraq and Afghanistan. And thirdly, training between deployments is very important to get new technology, new ideas constantly improved communications. Secondly, training area environmental impact statements are very unique. Training areas, you can't move the area. The area is where it is. I think the 60-year experience of the Navy in this area states for itself that if the training could have been moved to Miramar or to Camp Pendleton, it would have been done so long ago.<br>I'll say something about the ease of which you throw off "use Camp Pendleton." Camp Pendleton's 17 miles of beach are so critically inhabited by endangered species that less than five miles are available for continuous Marine Corps training. They're not going to walk them another 5,000 operations up there. There is no better place for this type of training in the bay and in the ocean than this location.<br>Thirdly, the constraints that are put upon the Navy and the Marine Corps in their training are already immense. Yes, there are environmental issues. Yes, there's public concern over noise and economic impact. But most of the -- some of the speakers that you have seen are single- | Your comment has been noted. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | issue advocates. They're worried about a vernal pool, or they're worried about the snowy plover. The Navy does not have the luxury to be a single-issue advocate. It is like the rest of us. We are multi-facetted. We have to deal with all the issues at the same time and make tradeoffs. As the Supreme Court -- as the United States Supreme Court ruled in 2008 in "NRDC versus the U.S. Navy," we and the citizens must give adequate attention to the common defense, and that's what I see done in this EIS.<br>Training and environmental stewardship are compatible, and I believe the Navy has achieved a good balance in this set of analysis. Thank you very much. | |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 344. | Cindy Buxton | Some of you know me from Mountains and Waterfalls. I've made some observations for stuff. I cannot know all of your point of view. I think that's obvious, so thank you very much for the Navy keeping the good communication over the years. And with all due respect, and I most definitely do, I'm going to make a few observations from my point of view since I have a hard time seeing all of yours. The training has already been very, very effective, and I think we're all very grateful since World War II and Vietnam and Korea and Desert Storm. So I look at the two miles up there as I drive to work every day, and I look at the half mile of particularly critical areas down here, and I go "Why do we really need this?" I don't -- I haven't yet really seen the compelling argument to do some of the things that they want to do. And they talk about the criticality of training and the unique area that -- that area up in Coronado seems to me to be very similar as a beach to this one, the one difference being is that this beach has natural dunes, and it's one of the few places in Southern California where you have a long wide swept area of natural dunes.<br>I moved down here, believe it or not, to Silver Strand and to Imperial Beach specifically because that was such a gorgeous, gorgeous beach. And I certainly do think that we should share our beach where we can or they with us, as you guys are Navy.<br>This town has worked very hard, I've noticed. I thought it was pretty wonderful anyway, though they've worked very, very hard to improve it and improve property values, and I think a lot of heavy artillery will probably compromise that considerably.<br>The one thing I noticed in the EIS was that the camp, Camp Surf, apparently hosts 10,000 children in a year, and I don't think when they originally leased that that they were thinking of a lot of blasting. So what I saw in there was that the Navy holds that property in a fee simple, and I looked this up and noticed that fee simple can be fee differential or circumstantial subsequent, and I'm wondering if there are any extra contingencies on that. The blasting does affect people and children. This is where my dog went through a window one night when she got scared, and I think children would, too. So I would ask you to consider that and modify and attenuate for the birds and the blasting in this area. Thank you. | The Navy must remain committed to training for the safety and security of our country. To do that, the Navy's highest priority is in the protection of our men and women overseas performing their job in defense of our nation. The mission of the SSTC ..." to achieve and maintain the highest level of operational readiness" is discussed in Section 1.4.1 of the EIS and Section 1.5 of the EIS highlights the purpose of and need for training at SSTC. There are many reasons why the Navy needs the SSTC land and nearshore areas to train and why other locations do not fill the need. These alternate locations and training tempos are discussed in Section 2.1.3.<br><br>As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3 of the FEIS. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible.<br><br>Regarding Camp Surf and SSTC-S, there is no "blasting" at or near Camp Surf and there is no "artillery" use at SSTC. Section 3.12.2.2.4 and Section 3.12.2.3.4 of the FEIS discuss simunition and blank usage at SSTC. The use of live fire is not permitted at SSTC. The simunition and blank usage takes place mostly within SSTC-S bunkers therefore, noise from these activities is considered negligible. |

| 345. | Shannon Davis | What's on my mind is the fact this is an environmental impact statement. It's a draft. And we're focusing on the environmental issues and NEPA compliance. This is not about patriotism. This is not about being -- protecting our freedom. This is about saving endangered species on critical habitat that maybe apparently should have been paid more attention to by U.S. Fish and Wildlife. And possibly some of these areas should have been sanctioned as refuge, study areas by U.S. Fish and Wildlife to be held under their jurisdiction, not in cooperation with the U.S. Navy. | With implementation of the Proposed Action, losses in California least terns and western snowy plover nesting are expected to be minimally increased from baseline levels. The Navy and U.S. Fish and Wildlife Service (USFWS) have established mitigation measures to compensate for these losses. The Navy has consulted with the USFWS under Section 7 of ESA for the Proposed Action, and received a Biological Opinion (signed July 7, 2010), which concluded that proposed training activities would not jeopardize the continued existence of ESA-listed species. |

| 346. | Edward Feltis | I'm a resident of Imperial Beach. I've been coming down here since 1960 walking the strand, and this is a single -- single-case issue. I'm not sure exactly how you put it, but single-person issue.<br>Upon reading the impact statement, I noticed that the tide flats are public, and I'm a pretty regular walker. My wife takes me down to Silver Strand. I walk up to the IB pier. I have no problems with -- and according to the statement, most of the training that's going to take place will take place for an hour or two hours, eight hours at the most, things will be posted. I have no problem with walking the beach, running up to a sign that says "Restricted area for the next 48 hours. We're going to be doing this. We're going to be doing that," turn around, walk right back to IB. But my concern is that in 11 through 14, we'll get a sign put up like we had put up two years ago that said "Nobody past this point. This is naval property. You can't walk down to the Silver Strand," and what everybody did was ignore it. If they didn't see anything going on, they ignored it.<br>Readiness training, all part of that. I've got two kids that work -- or live down the hall from me that are in SEAL Team 3, and I want those guys ready, professional and able to do their job whatever it takes. I just want a little assurance that -- on those days when nothing's going on, I want to walk the Silver Strand between the state park and here -- I won't be in any kind of jeopardy or I won't be in the way of any activities. Thank you very much. | As indicated in Section 3.1 of the EIS, restriction of SSTC-S beach areas above the high tide line will continue. Access below the high-tide line would only be restricted during some training activities for either safety or mission security reasons.<br><br>Signs will be revised to clarify that restrictions are only above the high tide line. Personnel will be stationed on either side of training activities to notify recreationists when areas below the high tide line need to be restricted for public safety or security reasons.<br><br>As listed in NBCINST 3502-1, the Navy does notify local public safety agencies and city governments about specific upcoming hazardous or high-visibility night training events so that the local governments may disseminate the information to their communities. Because of this and similar comments, the Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website. |

| 347. | Ed Sorrels | Okay. Summer of 1957, I was flown in from Hawaii to Camp Pendleton, and I worked all that summer as a lifeguard on the beaches there by Del Mar where they do the Amtrak and rubber boat training for the Marines. And I can assure you of one thing: The environment here on the strand is entirely different than the beach approach environment in Camp Pendleton.<br>You go from water to a very small beach, and then you start inland, and it goes uphill. You don't go from water to beach to water. And it is -- to compare the Silver Strand to Camp Pendleton training areas is apples and oranges. The two don't compare at all. | Your comment has been noted. |
| **CORONADO, CALIFORNIA** | | | |
| 348. | Bill Adams | I'm primarily interested in -- I'm a shore fisherman. I've been shore fishing Coronado beaches since 1949. As a matter of fact, when I was ten years old -- my dad was in the Marine Corps -- I was fishing off the Coronado jetty in front of the hotel in 1943 at age ten. So I know a little bit about shore fishing.<br>Now I'm particularly interested in your Section 3.8, quote, fish. And I'm going to be talking mostly about what we shore fisherman use as bait. Those are called, especially in the summertime, sand crabs. That's the backbone of shore fishing in this area here. On your section references, you talk about -- you have 75 references on 15 -- 15 pages, I think it is.<br>I wrote reports for the Navy for over 30 years. So I was a little surprised when I opened up this document -- a young man earlier explained to me why you're not doing it, but usually when you have a reference, you would have -- if I went to the reference section, it would say in the report what page this came from, or pages. All right. That's not done.<br>It's almost impossible to go through that report and find out where you're talking about. For example, you've got one report dated 1892, some author who wrote something in 1892. I'd like to know what was so important that was required to be in the reference -- 75 references.<br>The other thing that many of us shore fishermen are concerned about, and both the lifeguards in Coronado are well aware of the situation, especially shore fishermen, and that is wheeled vehicles on the beaches. Okay? Now, years ago, when I was on the city council in Coronado, we managed to talk the Navy into getting off the wet part of the sand. That's where the sand crabs are at.<br>But I noticed just recently they're still driving those vehicles on the wet sand, especially at low tide. That's almost a no-no. You're killing the sand crabs. Now, you say there's no long-term effect. Well, I can tell you, as a fisherman, there is. There are no sand crabs on Coronado beach right now. If I go down to Silver Strand, there are sand crabs. If I go down to Imperial Beach by the pier, there are sand crabs.<br>Oh, my God. I guess I'm going to be cut off real short here. Amazing. I don't see how you can have a real impact on a discussion when you only have three minutes. I mean, that's ridiculous. And then tell us, "Oh, by the way, we've got a thick document here," and you want us to respond by March 9th. That is ridiculous, too. And there's only one copy of that report in the Coronado | The reference that you refer to is "Eigenmann, C.M. 1892. The fishes of San Diego, California." This is a reference that speaks towards the long term documentation of fish species that occur in the SSTC area, and is an important baseline for comparison. Considering the sand crab (*Emerita analoga*) has a long planktonic larval phase that implies a high dispersal potential, and coastal water transport is an important factor in determining its local and latitudinal distribution. Extended larval duration allows individuals to colonize new areas with suitable habitats, and is a mechanism to annually restock already existing populations (Tam et al., 1996). Factors such as regional oceanographic dynamics, variations in long shore transport, and local circulation patterns that determine sediment grain size and food supply (they are filter feeders) are what is likely regulating sand crab populations along SSTC beaches.<br><br>The Navy appreciates the public involvement in the NEPA process. In response to requests by the cities of Imperial Beach and Coronado and citizens, the public and agency comment period for the FEIS was extended to March 30th. |

| | | library.<br>Yeah. Well, I've said my peace. | |
| 349. | Jennifer Blair | My question -- I noticed in the agencies that the California Environmental Quality Act really was not addressed in there, and my specific question is related to noise, and the helicopter noise is the main problem that I'm seeing. I live in the Cays, and I understand we're not talking about the helicopters that are going from -- transporting from Miramar and down to the south end in IB, but you're considering -- I forgot how many sorties that you want to have in addition of the helicopters, and how is that addressing the environmental noise act? That's just a question I have. | The Navy, as the federal action proponent, examines environmental impacts to resources under NEPA. CEQA would not apply, it is only required by a California State public agency when making discretionary decisions.<br><br>With regard to the environmental noise act referenced in the comment, USEPA has authority under the federal Noise Control Act to establish low-noise design standards for commercial aircraft. However, military aircraft are exempted from this federal statute.<br><br>As proposed for Alternatives 1 and 2, up to 1,643 helicopters may be involved with SSTC training events. Approximately 150-200 helicopters per year would fly into SSTC-S inland under Alternatives 1 and 2. The remaining 1,450 to 1,500 helicopter operations would occur offshore in the boat lanes or bay training areas. The most substantial increase in helicopter operations from baseline to Alternatives 1 and 2 would occur with the 386 new MH-60 mine hunting operations, in the western portions of boat lanes.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopter overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to the SSTC EIS document in Sections 2 and 3.6 (Acoustic Environment). |

| 350. | Beverly Dyer | I think it's ludicrous that the Navy has suddenly thrown this upon our public. I want to know how long they have been studying this, why we haven't heard about it before. I know they've been saying they're going to get all this money, and they can do all these things, but did they ever tell any of us that they were going down the strand? None. I have never seen it released until last night, and I didn't have time to write up all of my questions that I have, all the comments that I have.<br>But I have been jotting down different things as you've gone along. But it just doesn't seem right that suddenly we know -- we read about it in the paper, and a lot of people didn't see it in the paper, and there has been very, very little about it on the television. Now that isn't fair. It isn't fair for the Navy to suddenly come in to say "We're doing all these things, and we've done all these things and we've looked up all the environmental necessities and for the project."<br>But why haven't we known? Why haven't they told us if we live here? I live in the Cays. I've lived there 40 years, and I've watched things. I haven't seen any kind of action in that area. In fact, at one time they were going to build a golf course up where you now have buildings on the hill. We used to walk there. There wasn't anything going on there. So -- and suddenly, you've done all these things. You're going to take it over, and there has been very little going on even north of the -- of Silver Strand park where people park right up -- up to the Navy property.<br>But I haven't seen actions going on that far down, and perhaps I missed a few, but I doubt it, because I drive there all the time. And that's another thing that you did not bring up, and that is traffic. The traffic has gotten absolutely horrible because of the Navy, because of North Island. They've been working on that tunnel for North Island, and that's ridiculous because we have -- already have all this traffic coming up from the -- the helicopter base down in Imperial Beach, coming up the strand. They're just continual already.<br>Now you want to do all these other things. You want to save the Navy from having to go far away from their homes. Well, what about the people that live here, that have -- live in Imperial Beach or live in the Cays or live in Coronado? You just add that much more to the people that are here. Even though you keep your people from driving, there are other people that live here, too, and the people that work for the Navy.<br>Thank you. I'm going to also include a letter, so -- later on. Also -- and I agree with the noise and the pollution, you have -- nothing has been said about the pollution in the air that we breathe from the planes going over anything that's on the beach that we get from any of their -- their vehicles and any of the pollution that's in the water. They have the Silver Strand beach there where public comes in and uses up all summer, even in the wintertime, and they use that beach as do the surfers. | Regarding the current activities at SSTC; the southern nearshore areas of NASNI are very large areas, much of them out of the sight of the public. It's very likely that most training activities currently being conducted would not be noticed.<br><br>The Navy is very interested in the contribution of the public to the SSTC EIS. The Navy scoping began at the inception of the SSTC NEPA process in 2001 to open communication with surrounding neighborhoods. The public hearing dates on the Draft EIS were published in local papers, and the Navy requested comments on the document with an extended period for comment on the document. The Navy has remained in contact with the public through the SSTC website as well: www.silverstrandtrainingcomplexeis.com<br><br>As described in Section 2.1.3 of the EIS, the Navy considered, but rejected, alternatives that included moving these exercises to other locations. Such alternatives fail to meet the purpose of and need for the Proposed Action.<br><br>The Navy is aware of the diverse biological community in the area, and has conducted a thorough analysis of potential effects in Chapter 3 of the Draft EIS. The Navy does not dump toxic pollutants into marine areas. Please see Chapter 3 of the FEIS for the description and analysis of potential effects. Chapter 4 includes cumulative analysis of all past, present, and reasonably foreseen future projects by the Navy and non-Navy activities. The Navy has a comprehensive air quality management program. Mitigation measures that are part of the Navy's air quality management practices are implemented at SSTC. Aircraft, marine vessels, ground vehicles, and military equipment are well-maintained, and meet applicable emission standards (such as smog certification for on-road vehicles) in accordance with State requirements.<br><br>The Tunnel Study is known as "State Route 75/282 Transportation Corridor Study" which includes a tunnel |

| | | | alternative. This study is funded by the City of Coronado. Under Federal transportation authority, Caltrans District 11 has assumed the role of federal Lead Agency for the Draft Environmental Impact Statement (Draft EIS) being developed for the State Route 75/282 Transportation Corridor Study/Project. This local transportation proposal is "owned" by CalTrans and the City of Coronado. The Navy is not the action proponent for the proposal and is participating solely as a Cooperating Agency under the National Environmental Policy Act (NEPA), supplying special expertise on the Draft EIS on federal land use issues affecting NASNI. The scope of this study does not include the portion of State Route 75 south of Naval Amphibious Base.<br><br>A related issue is the implementation of the DoN's Record of Decision (RoD) for the USS VINSON CVN Homeporting Final Supplemental Environmental Impact Statement (Final SEIS). The cumulative Navy traffic impacts studied in this Final SEIS are the same traffic impacts of concern in the State Route 75/282 Transportation Corridor Project Draft EIS as commuters travel on and off NASNI during peak hours each weekday. The RoD proposes to work cooperatively with Caltrans and the City of Coronado. Once a local government agrees to use its jurisdictional authority to take the studied improvements forward, the RoD commits to seek federal funding to implement a series of traffic improvements. These recommended traffic improvements are a suite of local intersection upgrades with the City of Coronado, "Village". |

|---|---|---|---|
| 351. | Normandie Trovato-Wilson | I'm with the San Diego Audubon. I want to thank Captain Lindsey and Delphine and Lewis for hosting again tonight. I have just a few things that didn't come up last night.<br>The first thing was we know that there is anticipated projection in -- an increase in levels of recruitment, and we completely understand that with the level of new recruits that are needed to maintain the fleet readiness. However, if levels drop in the future, we would be interested in including a provision that indicates if for some reason there is complete peace everywhere on earth, for instance, and training levels dropped dramatically, that certain training lanes which are not currently used, if they are used in this future Alternative 1, that they might be phased back.<br>It was brought up last night about peak noise events and how peak noise events might be a helpful statistic to include in the second draft of the EIS as opposed to average noise levels, because if we're talking about peak noise, we can have one really loud peak noise, and then the rest of the day could be quiet, and that would be an average noise level, but that wouldn't analyze the data of the peak noise and how loud it would be. | The increase in training activities is not the only driver for the Navy's proposed training, but also the changes in types of training and platforms, as well as a need for diversity in training. If there is a decrease in training, many of the conditions will tend towards current use because of the natural tendency of training towards training lanes 1-7 and 11-14 (vs. 8-10) as well as a natural tendency towards the northern developed area of SSTC-S (vs. the undeveloped southern areas of SSTC-S).<br><br>Both time-averaged sound levels and peak sound levels are addressed in Section 3.6 of the EIS (Acoustic Environment). For each type of noise event, the appropriate noise metric is used. |
| 352. | Normandie Trovato-Wilson | The other thing that I want to repeat from last night is that the California Least Tern is currently in limbo of being down-listed by the U.S. Fish and Wildlife Service, and that would have a big effect on what would be going on at the SSTC. And just as a side, recovery efforts are often unpredictable and hard to predict what's going on. And there is a commitment, clear commitment by the Navy to maintain the environmental integrity of the SSTC.<br>And it's my personal opinion, not necessarily Audubon's, that maybe some phasing in could be added into the -- the use -- the plans, so maybe trying something, if you see a negative impact, phasing it out. I don't know exactly what the protocol is for that. And it is our hope, from Audubon, that these steps are not towards general reduced protection of wildlife in general, but maintaining of the Navy's commitment to the environmental integrity of the SSTC. | Implementation of increased training tempo and additions of new activities is expected to be phased. The level of protection provided by the Navy is the same for a species listed as Threatened, as opposed to Endangered. Navy programming for natural resources conservation on the Silver Strand will continue. |
| 353. | Gary Trump | Are you going to have an independent study to corroborate what your positions are? Because I think without that, nobody's going to believe you, at least the skeptics won't.<br>The other thing is, we live at the very bottom of the Cays. There's a lot of unburnt fuel from the helicopter passages. There is a lot, and it's all over the patio furniture. It's not thick, but it's there. And if you increase your level of helicopter flights, you're going to increase that, too. | Many of the Navy's actions require regulatory permits from other governmental agencies. As part of the permitting process these agencies conduct independent reviews of the Navy's actions.<br><br>In addition, the Navy has outreached to other organizations throughout the public comment period (e.g., CalTrans and environmental NGOs) to get their feedback on the Navy's assessment.<br><br>The Navy has a comprehensive air quality management program. Mitigation measures that are part of the Navy's air quality management practices are implemented at SSTC. |

|---|---|---|---|
| | | | Aircraft, marine vessels, ground vehicles, and military equipment are well-maintained, and meet applicable emission standards (such as smog certification for on-road vehicles) in accordance with state requirements. |
| 354. | Gary Trump | The other thing is we sit out on the patio quite a bit, and there are times, with your helicopter noise, that we have to stop talking. And I'm quite sure that you don't really want to have that happen in this environment. It's a lovely environment.<br>We came from Los Angeles, and we've never known you people before. We live in the Cays, and there are a lot of people in the Navy there. We love you very much. We're worried about you, and yet I think there are some things about your proposition which probably is not -- I don't think withstand a peer review. So maybe you can think about that. | The typical flight pattern in support of SSTC-S inland training consists of an approach along the San Diego Bay flight corridor, turning west on the southern side on Emory Cove, and beginning a descent into SSTC-S, targeting the drop zone to the west of Bunker 99 on the northern end of SSTC-S. Once established in this approach, the helicopters remain at 500 feet over residential neighborhoods and do not reduce their elevation to 150 feet until they are over SSTC-S. On departure, the helicopters ascend to the west over the Pacific Ocean.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopter overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to the SSTC EIS document in Sections 2 and 3.6 (Acoustic Environment). |

| 355. | Marilyn Field | I'm a Coronado resident, and I'm very concerned about this project. I'm very concerned about the noise impacts and the pollution impacts. The newspaper said there was going to be live fire. I was told tonight there wasn't, but I think it would be good if we understood exactly what was going on. | Chapter 2 of the FEIS describes the components of the activities. The Tables and text in Chapter 2 describe all risks and potential impacts of the activities. No live fire is performed at SSTC. Activities consist of piloting vessels, amphibious vessels, helicopter activities, underwater detonation/mine neutralization activities, BUDs/SEAL training, and physical conditioning training. Activities involving the firing of blanks and pyrotechnics are mostly conducted within SSTC-S. |
| 356. | Marilyn Field | As far as the noise impact, it simply defies credibility that there's going to be no significant increase in noise. It may -- you can do all kinds of things with statistics. You can average it out over a long period, and somebody said you could play all kinds of games with it, but it's simply not credible that this is not going to add to noise in Coronado.<br>This is a small residential community, and you just cannot keep using this as though this is your only training facility. You have other places where people can train. And, yes, it's more convenient here, but you have to balance that against the needs of the small community, and you are very definitely going to be impacting the quality of life here.<br>Already, we have serious impacts of helicopter noise. We live on the other side. We live on the San Diego Bay side, and yet we are constantly, in the summers particularly, affected by helicopter noise so that we can't watch the evening news. We can't have telephone conversations. We can't conduct conversations around the dinner table because the helicopters will come in fleets going south or north on the bay. And they're supposed to stay offshore, but they don't. | Helicopter noise is addressed in Sections 3.6.2.2.1 and 3.6.2.3.2 of the FEIS. The analysis of helicopter sound indicates that, while the number of helicopter sorties would increase substantially under Alternatives 1 and 2, the increased frequency of short-term sound exposures from increased helicopter pass-bys would not be sufficient to noticeably change the hourly average sound level at any one off-installation location. This results from the logarithmic nature of sound; a doubling of sound energy results in only a three-decibel increase, which under typical conditions is barely discernable. The analysis of helicopter sound is based upon broadly defined flight paths, consistent with a normal degree of variability introduced by pilot discretion, weather, time of day, and safety concerns such as other aircraft.<br><br>As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopter overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to the SSTC EIS document in Sections 2 and 3.6 (Acoustic Environment). |

|---|---|---|---|
| 357. | Marilyn Field | Now, I'm told that this project did not analyze the helicopters going to and from the training areas. Now that seems to me it's probably a violation of NEPA. Under the National Environmental Policy Act, you're supposed to consider all of the environmental impacts, whether they're remote or anything that's affected by this project.<br>You said you've been working on this since 2001, and yet you've chosen to analyze the helicopter traffic patterns and noise to and from the training area separately. Now that's called segmentation. It's illegal under NEPA. You're supposed to analyze the whole thing, and the public is supposed to have an opportunity to understand and comment on the total effects of the project, not chopped up into little pieces so that it looks benign, but the entire impact of the project. That needs to be done before you proceed here.<br>Secondly, I think the gentleman who just spoke made an excellent idea. I think we do need some independent analysis of your conclusions, because they're simply not credible. And I think it's important to consider the quality of life here and the human element, as well as the wildlife. So I'd like you to think about what you're doing to Coronado. It's not just about the Navy. This is a small community, and we really need to be very aware that you cannot simply continue to load Navy operations here without ruining this small town. | Helicopter noise from the activities of the Proposed Action is addressed in Sections 3.6.2.2.1 and 3.6.2.3.2 of the FEIS. As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Nighttime helicopter transits from NOLF and NASNI, and to and from SSTC-S, occur only over water. The only helicopter overflying residential areas at night are Department of Homeland Security or U.S. Coast Guard. Information on these flight patterns, as well as the percentage of sorties associated with training at SSTC, has been added to the SSTC EIS document in Sections 2 and 3.6 (Acoustic Environment). Community noise levels from cumulative helicopter traffic are addressed in Section 4 of the EIS (Cumulative Impacts).<br><br>Many of the Navy's actions require regulatory permits from other governmental agencies. As part of the permitting process these agencies conduct independent reviews of the Navy's actions. |
| 358. | Steve Cohan | I just wanted to make sort of a summary statement about my impression of the project. People have talked and brought up some very good points. The impression is that there's going to be a really significant change of impact on the beach. The fact that this process was started in 2001, that now you're -- it was ten years ago and you're now having public hearings, I think that the presentation has tended to minimize what the likelihood is of the impact that it's going to be significant.<br>The people have mentioned these really important areas that really haven't been fully addressed, the impact on wildlife, the noise impact, the possibility of future cutbacks of these operations, legal compliance with preparation of the report.<br>All of these things can't be dealt with, of course, in three minutes, and I'm not prepared to make any technical statement about it, but I think you should take into consideration that the impression of the community is -- is that this is going to be a significant degradation of what is a very beautiful beach, very unusual beach condition in Southern California.<br>There aren't many white-sand beaches that are left that are in the quality condition that it's in. I would just make one further statement that this isn't entirely a problem that I would attribute to the Navy. Having lived around the Navy and watched its operations, including the helicopter operations, the Navy's done a good job, I think, of trying to concern itself with public impact. This isn't entirely the Navy's doing.<br>It has to do, perhaps, with what really is a long-term problem of our poor political leadership out | The Navy is equally concerned with the future of the natural resources, wildlife, and quality of life for all areas of the world the Navy trains. The Navy has analyzed the potential impacts of their training within the SSTC EIS to ensure the future health and beauty of the Silver Strand and surrounding resources. |

| | | of Washington. Nevertheless, it looks like a very significant degradation of the community. | |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| 359. | Ron Short | I live in Imperial Beach about a block south of Camp Surf, which is the southern border of your training complex. My concerns are basically the -- sort of like the infringement on our quality of life down there. One is noise. You know, my wife and I were awakened in the middle of the night by live machine gunfire, and I suspect this sort of activity will continue to go on.<br>I would appreciate a heads-up if that's going to be the case. At least we know what to expect. I know when they filmed Transformers II at that complex; they gave everybody in the community some heads-up, so we knew the pyrotechnics and stuff like that was coming.<br>Another concern is the -- perhaps the increase in traffic on Silver Strand Boulevard going to the gate there at the southern end of the complex. You know, I would be -- I would like to know if you anticipate an increase in traffic, because that would also impact the quality of life down there. | The Navy is evaluating the possibility of extending advanced notification to the neighborhoods of Imperial Beach and Coronado through contact with City offices or the Naval Base Coronado website.<br><br>With regard to traffic concerns at SSTC-S; the ADT of Silver Strand Boulevard was taken from the County of San Diego Department of Public Works, 1999. Public Road Standards. Adopted July 14, 1999. This is a public road, and the ADT was calculated for all traffic, which would include any military traffic. The FEIS used these ADT amounts to determine the contribution to overall traffic on public roads from military activities. In lieu of funding an additional ADT study, this was assumed to be an appropriate method for determining military contribution to overall traffic.<br><br>As previously discussed, traffic volumes were not available for Silver Strand, the roadway that provides access into SSTC-S; however, based on the County of San Diego Public Road Standards, typical roadway capacity for a residential street operating at a LOS C is 1,500. The assumption is that without an ADT, the roadway is operating at this typical capacity. Section 3.14.2.2.1 states that the current level of trips associated with military activities is 147 into SSTC-S. As stated in Section 3.14.2.3.1, the increase in ADT from the NAA and the PA will be 102 (147 to 249). This will increase the overall ADT (assuming operation at normal capacity for a residential street at "C") to 1602, which represents a 6.8 percent increase in ADT. |

|---|---|---|---|
| 360. | Judy Haims | I agree with the noise. That is a tremendous issue. You have no idea how much noise is generated down there. I've been there for 18 years. You -- the paper says that you have like 150 -- 150 sessions, and they're going to go up to 700-and-something. That's not a small increase.<br>And they talk about the decibel level. It's ingenuous to say the decibel level may stay the same. It may stay the same, but the amount and time and duration for the extra 550 sorties that you're going to have is tremendous, and that needs to be addressed.<br>And also, the strand -- the Silver Strand is used tremendously all year long by campers. It's going to affect these people who don't have the opportunity that we do to live in Coronado. And this has just been too fast and too soon. You may have known about it, but the people who live here and enjoy this way of life are not aware or have not been until now. | Helicopter noise is addressed in Sections 3.6.2.2.1 and 3.6.2.3.2 of the FEIS. As described in the EIS, approximately 80 percent of the helicopter flight time associated with training activities at SSTC occur over water rather than over land, and because these aircraft fly offshore during transits between NASNI and SSTC, very little of this helicopter activity occurs over developed urban areas. As described in Section 3.6.1 of the FEIS (Affected Environment), a substantial amount of daytime and nighttime helicopter activity occurs in the vicinity of SSTC that is not associated with SSTC training activities. Community noise levels from cumulative helicopter traffic are addressed in Section 4 of the EIS (Cumulative Impacts).<br><br>The FEIS addresses noise impacts on Silver Strand State Beach in Sections 3.6.2.2.1, 3.6.2.2.2, 3.6.2.2.3, 3.6.2.2.4, 3.6.2.2.6, and 3.6.2.3.7. Noise effects on public use of the beach are specifically addressed. |
| 361. | Shannon Davis | One issue that has not been addressed on the south end of the project at Radio Receiving Facility is ambient lighting. I have driven down the strand in the middle of the night and seen lights on that were way too bright, and I have concern for the endangered species there and how that ambient lighting would affect the birds.<br>And I'm also very concerned about the fact that you mentioned that you may want to take 200 men in a year's time of foot traffic through the vernal pools when they're dry. And you must understand that that is a very delicate ecotone. Some of it -- some of the vernal pools took thousands of years to come into the making, and there are sediments there that can be irrevocably destroyed.<br>The eggs, though they are dormant and dry, come alive when the rain season comes. But they can be there for years without any activity there. And I'm concerned as to why you wouldn't fence those vernal pools and keep them in and the foot traffic out of there. So that's very much a concern.<br>Also, I would have liked to have seen some studies included from U.S. Fish and Wildlife and from your biologist on the populations of the San Diego fairy shrimp. I would like to see if there are any other species in the vernal pools, if there is any possible genetic corruption from another species there.<br>There was a study done by a Dr. Marie Sinedich S-i-n-e-d-i-c-h. She got her doctorate. In 2004, she did a study in all the vernal pools here in San Diego County, and she did it in cooperation with U.S. Fish and Wildlife, and the vernal pools at the Radio Receiving Facility were not included. And I -- my question is: Did the Navy not cooperate in those studies, and why wasn't that included in that inventory and in that study? | Ambient lighting impacts are not known, except to say that many of the nests are below the crest of the beach so car lights may not reach nesting birds. Lighting from facilities is set back and points away from beaches. The success of nesting fledging points to a potentially negligible effect of lighting. The Navy routine cooperates with local universities in research by way of cooperative agreement.<br><br>The potential loss of vernal pool fairy shrimp will be minimized by avoiding the pools while they are dry. The nature of foot traffic entering the vernal pool area is dispersed. Each event is more likely to be one traverse over one pool, with a different path each time. The sizes of these pools vary, but they are large relative to the foot traffic, covering a total of 3.2 acres. While harm to cysts is expected and analyzed, the order of magnitude is expected to be a few cysts, compared to an estimated population of tens of thousands if not millions of cysts in these pools. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | And also, I would like to alert you to the fact that there is a steady decline in the endangered fairy shrimp and that they could go extinct if you have foot traffic in there. You could do irrevocable damage. | The Navy will avoid the occupied vernal pools and their watersheds adjacent to the road at SSTC-S Inland (i.e., pools 1 through 7 marked with flexi-stakes) year-round, to the maximum extent consistent with training needs. Foot traffic when the pools are dry consists primarily of small groups. As presented in Section 3.11 of the FEIS, trail forming and soil compaction are unlikely, resulting in no impact to population viability. Additionally, the Navy has completed consultation with the USFWS, and has received a signed Biological Opinion which concludes that proposed training activities will not jeopardize the continued existence of San Diego fairy shrimp.<br><br>As part of the conditions of the Biological Opinion, the Navy will be completing a Vernal Pool Management and Monitoring Plan to help determine whether the impacts identified in the EIS remain at the low levels expected. The Plan will include a focused invasive plant inspection survey in the pools and their watersheds; plant, topographic, hydrological, and water quality surveys (including salinity); and protocol fairy shrimp surveys. In addition, the Navy will be determining the baseline distribution and abundance of San Diego fairy shrimp and condition of the vernal pool habitat prior to initiating training activities in or around the vernal pools at SSTC-S Inland. If impacts are more than the low levels anticipated or if impacts could lead to the extirpation of fairy shrimp from any individual pool, then the Navy will reinitiate consultation with the USFWS.<br><br>The Proposed Actions will not all occur immediately, but will slowly scale up over time, and only after the baseline condition of the vernal pools has been established, and Vernal Pool Management and Monitoring Plan has been developed and approved by the USFWS. This gradual process will allow the Navy to evaluate the potential impacts, and take corrective action as necessary. |

| # | Name or Organization | Comment | Response |
|---|---|---|---|
| | | | The Navy has established programs to address turn-over in personnel. Any new proposals that may affect listed species would need to be consulted on separately with the USFWS. |
| 362. | Vicki Lambert | I'm a resident here in Coronado. We've talked a little bit about traffic mainly on the strand, but I live here in the village. And I can only see -- or foresee that traffic across the bridge and down Orange on 75 is going to increase with the number of people that are going to come from their homes in the San Diego area to do their training here. And I don't know if that has actually been -- that level of increase has been taken into account in the city planning. And with the tunnel discussions that we've been having, we need to also look at how we would deal with that increase along with our new carriers coming in. So thank you. | Proposed increases in training would not result in a direct increase in traffic on the bridge or on Orange Avenue. Future traffic increases have been accounted for, and are analyzed in the Transportation Section. |

|---|---|---|---|
| 363. | Judy Haims | What other sites could you use, and have you thought of other sites to use? Has there been a choice, or you just haven't told us that there was choices? And the thing that comes to my mind is what about using Camp Pendleton or renting the area from Pendleton or doing some kind of a swap or something, because you're going to have your beaches, you're going to have your landings, and you don't have the city with the quality of Coronado right in the middle of Pendleton. | The Navy strives to be a good neighbor, and analyzed all training activities at SSTC with respect to applicable air and water regulations. As described in Section 2.1 of the EIS, possible alternate locations for training have been explored through criteria that were established to aid in the determination of the feasibility of a site or range for training. Due to a number of factors (training area availability, environmental constraints, proximity to base, etc.), other sites were determined to not be reasonable locations for training; please see Section 2.1.3. A specific example (for Camp Pendleton) is now provided in the EIS to illustrate why alternate locations are not feasible. |

# Agency Consultation

# APPENDIX G
# AGENCY CONSULTATION

The Navy has consulted with regulatory agencies as appropriate during the National Environmental Policy Act (NEPA) process and prior to implementation of the Proposed Action to ensure requirements have been met. The following is a list of the Silver Strand Training Complex (SSTC) regulatory agency consultation documentation. Agency correspondence and supporting documentation can be found on the SSTC EIS website at www.silverstrandtrainingcomplexeis.com.

California Coastal Commission, Coastal Zone Management Act

- U.S. Navy, May 2010. Final Silver Strand Training Complex Consistency Determination.
- California Coastal Commission, August 17, 2010. Coastal Consistency Determination Conditional Concurrence Letter.
- U.S. Navy, November 23, 2010. Final Coastal Consistency Determination Notification Response Letter.

National Oceanic and Atmospheric Administration - National Marine Fisheries Service, Magnuson-Stevens Fishery Conservation and Management Act

- U.S. Navy, March 2010. Essential Fish Habitat Assessment for the Silver Strand Training Complex Environmental Impact Statement.
- National Marine Fisheries Service, October 13, 2010. Essential Fish Habitat Assessment consultation letter.
- U.S. Navy, November 10, 2010. Essential Fish Habitat Assessment consultation response letter.

U.S. Fish and Wildlife Service, Endangered Species Act

- U.S. Navy, September 2008. Programmatic Biological Assessment for the Silver Strand Training Complex.
- U.S. Fish and Wildlife, July 7, 2010. Biological Opinion (FWS-SDG-08B0503-09F0517) on the U.S. Navy's Silver Strand Training Complex Operations, Naval Base Coronado, San Diego, CA.

National Oceanic and Atmospheric Administration - National Marine Fisheries Service (Endangered Species Act

- U.S. Navy, March 2010. Request for Endangered Species Act Section 7 consultation on green sea turtle at SSTC.
- National Marine Fisheries Service, November 19, 2010. ESA informal consultation concurrence letter for the green sea turtle.

RECORD OF DECISION

ISSUANCE OF A MARINE MAMMAL PROTECTION ACT (MMPA) AUTHORIZATION TO TAKE MARINE MAMMALS INCIDENTAL TO U.S. NAVY TRAINING ACTIVITIES IN THE SILVER STRAND TRAINING COMPLEX

Supported by: U.S. Navy Silver Strand Training Complex Final
Environmental Impact Statement
National Oceanic and Atmospheric Administration
National Marine Fisheries Service
Office of Protected Resources
Silver Spring, Maryland

In accordance with the National Environmental Policy Act (NEPA) and its implementing regulations and NOAA's Administrative Order 216-6 Environmental Review Procedures for Implementing the National Environmental Policy Act, this document comprises the National Oceanic and Atmospheric Administration's (NOAA) National Marine Fisheries Service's (NMFS) Record of Decision (ROD) for issuance of an incidental harassment authorization (IHA) pursuant to section 101(a)(5)(D) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1361 *et seq.*) to the U.S. Navy (Navy) for the taking of marine mammals incidental to the conduct of specified activities in the Silver Strand Training Complex (SSTC).

## I. INTRODUCTION

On March 3, 2010, NMFS received an application for an IHA under the MMPA from the Navy to take California sea lions (*Zalophus californianus*), Pacific harbor seals (*Phoca vitulina richardsi*), bottlenose dolphins (*Tursiops truncates*), and gray whales (*Eschrichtius robustus*) incidental to its proposed training activities at SSTC in Southern California. After addressing comments from NMFS, the Navy modified its application and submitted a revised application on September 13, 2010. Further revisions of the IHA application were made by the Navy on November 4, 2010, to clarify issues concerning zones of influence calculation resulting from underwater detonation and pile driving during the comment period; and on December 28, 2010, in response to the Marine Mammal Commission's recommendation of post-pile driving monitoring after the comment period. No changes were made for the Navy's proposed action and no changes of potential impacts to marine mammals from what were initially analyzed.

NMFS' issuance of MMPA authorization to the Navy governing the incidental take of marine mammals is a Federal action for which NMFS is responsible for analyzing the effects on the human environment pursuant to NMFS' NEPA procedures. NMFS participated as a cooperating agency in the development of the Navy's Environmental Impact Statement (EIS), which contained an analysis of the effects of the Navy's activities on the human environment. NMFS worked closely with the Navy to provide information in NMFS' area of expertise to support the EIS' effects analyses for endangered species, marine mammals, and other marine resources. In accordance with the NEPA regulations at 40 CFR 1506.3, NMFS analyzed the Final EIS and concluded that NMFS' comments and suggestions on the EIS have been addressed. NMFS adopted the Navy's EIS in February 2011.

A. NAVY PROPOSED ACTION

The Navy has prepared a final Environmental Impact Statement (EIS), titled, "*Silver Strand Training Complex Environmental Impact Statement*" (hereinafter, "EIS"), for the proposed training activities. As the lead agency, the Navy proposes to support and conduct training exercises at the SSTC. As described in the EIS, the purpose of the Navy's proposed action is to improve the availability and quality of training opportunities at SSTC – to achieve required levels of operational readiness. In order to meet training requirements, the Navy proposes to continue current training activities, increase training tempo and types of training, conduct existing routine training at additional locations within SSTC's established training areas, and increase access to and availability of existing beach and inland training areas.

The Navy states that the proposed action is needed to provide a training environment consisting of training areas and range facilities with the capacity and capabilities to fully support required training tasks for operational units and military training units / schoolhouses and meet the operational readiness requirements of Title 10 of the United States Code (USC) 5062. The Navy needs to

- continue current training and increase the number of existing training activities and introduce new training activities and platforms in support of Fleet Readiness Training Plan (FRTP) and surge requirements;

- provide assured year-round access and unencumbered use of training areas to meet current and future training needs per the Navy Tactical Task List;

- provide a training range and training facilities that afford operational commands the flexibility to achieve diverse and realistic training at SSTC.

The Navy has been training and operating in the SSTC for over 60 years. The land, air, and sea spaces of the SSTC have provided, and continue to provide, a safe and realistic training environment for naval forces charged with defense of the Nation.

The following discussion describes the underwater detonation training and pile driving conducted at SSTC. Other training events conducted at SSTC, which are not anticipated to rise to the level of harassment to marine mammals as defined under the MMPA, are more completely described in the SSTC Final EIS.

*Underwater Detonations*

Underwater detonations are conducted by Explosive Ordnance Disposal (EOD) units, Naval Special Warfare (NSW) units, MH-60S Mine Countermeasure helicopter squadrons, and Mobile

Diving and Salvage units at the SSTC. The training provides Navy personnel with hands-on experience with the design, deployment, and detonation of underwater clearance devices of the general type and size that they are required to understand and utilize in combat. EOD groups conduct most of the underwater detonation training at SSTC as part of their training in the detection, avoidance, and neutralization of mines to protect Navy ships and submarines, and offensive mine laying in naval operations.
For safety reasons, underwater detonation training only occurs during daylight and can only be conducted in sea-states of up to Beaufort 3 (presence of large wavelets, crests beginning to break, presence of glassy foam, and/or perhaps scattered whitecaps).

*Elevated Causeway System (ELCAS) Training*

Elevated Causeway System (ELCAS) is a modular pre-fabricated causeway pier. ELCAS provides a link between offshore amphibious supply ships with associated lighterage (i.e., small cargo boats and barges) and the shore by bridging the surf zone. Offloaded vehicles and supplies can be driven on the causeway to and from shore. During ELCAS training events, 24-inch wide hollow steel piles are driven into the sand in the surf zone with an impact hammer. At the end of all the ELCAS training, a vibratory hammer attached to the pile head will be used to remove piles by applying a rapidly alternating force to the pile by rotating eccentric weights about shafts, resulting in an upward vibratory force on the pile.

B. NMFS' MMPA DECISION AUTHORITIES

Sections 101(a)(5)(A) and (D) of the MMPA direct the Secretary of Commerce (Secretary) to allow, upon request, the incidental, but not intentional taking of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) during periods of not more than five consecutive years if certain findings are made and regulations are issued or, if the taking is limited to harassment and of no more than one year, the Secretary shall issue a notice of proposed authorization for public review.

As described in the Navy's March 3, 2010, application and associated November 4 and December 28, 2010, updates to that request, the specified Navy activities to be conducted in the SSTC are expected to take marine mammals as defined by the MMPA, and the Navy requested incidental take authorization in accordance with Section 101(a)(5)(D) of the MMPA. In order to issue the IHA under this section, NMFS must make the determination that the specified activities will result in a negligible impact on the affected species or stocks and not result in an unmitigable adverse impact on the availability of marine mammal species or stocks for taking for subsistence uses (note that no subsistence use issues have been identified in the SSTC). In addition, NMFS, as part of its regulatory process, is required to prescribe the permissible methods of taking, the means of effecting the least practicable adverse impact on the species or stock and its habitat (i.e., mitigation) and to set forth requirements pertaining to monitoring and reporting of such taking.

NMFS has defined "negligible impact" as "an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival." (50 C.F.R § 216.103).

The National Defense Authorization Act (NDAA) (Public Law 108-136) amended the MMPA, removing the "small numbers" and "specified geographical region" limitations and amending the definition of "harassment" as it applies to a "military readiness activity" to read as follows (Section 3(18)(B) of the MMPA):

(i) any act that injures or has the significant potential to injure a marine mammal or marine mammal stock in the wild [Level A Harassment]; or

(ii) any act that disturbs or is likely to disturb a marine mammal or marine mammal stock in the wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering, to a point where such behavioral patterns are abandoned or significantly altered [Level B Harassment].

The MMPA also contains a provision related to "military readiness activities" that requires NMFS, when making a determination of "least practicable adverse impact on such species or stock" to consider personnel safety, practicality of implementation and impact on the effectiveness of the military readiness activity. Before making the required determination, NMFS must consult with the Department of Defense regarding the mitigation measures and their effect on the aforementioned factors.

## II. NMFS' DECISION AND FACTORS CONSIDERED IN THE DECISION

Alternative 1 of the Navy's EIS fully meets the purpose and need of the Proposed Action as this Alternative provides the Navy the ability to support U.S. Navy and Marine Corps amphibious, special warfare, and mine countermeasure training by providing local land, sea, and airspace support services; material; and training facilities that will help Naval and Marine Corps forces achieve and maintain the highest level of operational readiness. Therefore, NMFS selected Alternative 1 as the Preferred Alternative.

### A. The Decision

NMFS' decision is to issue a one-year IHA for the take of marine mammals incidental to specified activities described in Alternative 1 (preferred alternative) of the Final EIS, and the action presented to NMFS in the Navy's March 2010 application and November and December 2010 updates. The IHA will allow the take of marine mammals incidental to the Navy's training activities conducted at the SSTC for the period of March 2011 through March 2012. Alternative 1 of the Final EIS includes an analysis of all of the activities for which the Navy has requested incidental take authorization pursuant to the MMPA. The IHA will prescribe the permissible methods of taking, the means of effecting the least practicable adverse impact on the species or stock and its habitat (i.e., mitigation), and will set forth requirements pertaining to monitoring and reporting of such taking for the specified activities, as described in Alternative 1.

The Navy will be authorized to take individuals of 4 species of marine mammals by Level B harassment incidental to training activities in the SSTC. NMFS will issue an IHA that authorize the takes.

B. FACTORS CONSIDERED IN REACHING THE DECISION

The EIS discusses the affected environment and environmental consequences in Chapter 3, within subsections arranged by Resource type, including: land use and recreation; geology and soils; air quality; hazardous materials and waste; water resources; acoustic environment (terrestrial); marine biological resources; fish; marine mammals; sea turtles; terrestrial biological resources; birds; cultural resources; transportation and circulation; socioeconomics, environmental justice, and protection of children; and public health and safety. The Marine Mammals subchapter (3.9) contains the majority of the analyses that relates to NMFS' action of issuing the IHA. Other sections of the EIS contain analyses related to potential impacts on marine mammal habitat and further support NMFS' proposed issuance of the IHA. In addition, Chapter 4 provides an assessment of potential cumulative impacts, including analyzing the potential for cumulatively significant impacts to the marine environment and marine mammals.

Within the Environmental Consequences chapter (Chapters 3), the Navy's EIS addresses potential impacts from underwater detonation and pile driving and removal. The sections in the chapter describe in detail the acoustic thresholds that NMFS uses to indicate at what received sound levels marine mammals will be considered taken pursuant to the MMPA. The EIS also describes in detail the analytical framework and model that the Navy uses to estimate take, based on NMFS' acoustic thresholds. Last, the Navy presents estimates (for each alternative) of the number of each species of marine mammal that will be exposed to levels of sound that NMFS has determined will result in Level A and Level B harassment. The Navy uses these take estimates, combined with the other information included in Chapter 3 to conclude that none of the alternatives will result in any adverse population level effects on any of the affected species or stocks. The take estimates for the Navy's preferred alternative are the subject of the Navy's request to NMFS for MMPA Section 101(a)(5)(D) authorization.

As described above, the environmental consequences to the marine environment are of particular importance for NMFS' evaluation in reaching the decision to issue MMPA incidental take authorizations. In particular, because NMFS' action is specific to authorizing unintentional take of marine mammals, the key factors considered in the decision are related to NMFS' statutory missions under the MMPA. The primary documents supporting this decision are the Navy's Silver Strand Training Complex Final EIS.

As a cooperating agency, NMFS assisted the Navy by providing technical information to evaluate the effects of the training activities on marine mammals and their habitat. Via the MMPA process, NMFS reviewed the Navy's request to determine whether the total taking resulting from the activities would have a negligible impact on the affected species or stocks of marine mammals, would not have an unmitigable adverse impact on the availability of those species or stocks of marine mammals intended for subsistence uses, and that the permissible methods of taking and requirements pertaining to the mitigation, monitoring and reporting of such takings are set forth. As supported by the Final EIS, NMFS has made the requisite findings under the MMPA and will include these findings in a final rule.

Key relevant factors considered by NMFS in this decision include:

- Mitigation and Monitoring. As noted above, for military readiness activities, NMFS is required to consider personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity when it makes its determination of "least practicable adverse impact". Chapter 5 of the EIS discusses the Navy's approach to mitigation and monitoring and describes specific mitigation measures that would be implemented to protect marine mammals, sea turtles, and other resources during training activities.

- Approach to assessments. NEPA and MMPA involve differing approaches to assessing effects on those resources considered under each statute, and this combination of analyses provides a robust basis for the decision on this action. The Final EIS and IHA for the SSTC activities present the assessments in detail, but a few salient issues and difference are highlighted here. First, the EIS includes analysis of the significance of the Navy activities on marine mammals. In the EIS, the term "significance" is as commonly used in NEPA, without additional definition of significance related to marine mammals. As described earlier, the MMPA uses the term "negligible impact" (defined above). For this ROD, the EIS evaluation of the significance of impacts to species was considered as input to NMFS' MMPA assessments; this decision is supported by the EIS and also reached based on NMFS statutory responsibilities under the MMPA.

## III. OTHER ALTERNATIVES CONSIDERED

The alternatives analyzed in the Navy's EIS and their relationship to the NMFS' alternatives are described below. NMFS' proposed action (issuance of an IHA) would authorize take of marine mammals incidental to a subset of the activities analyzed in the Navy's SSTC EIS that are anticipated to result in the take of marine mammals, i.e., those activities that involve underwater detonations. Thus, these activities are the subject of NMFS' proposed MMPA regulatory action. The Navy's EIS contains a thorough analysis of the environmental consequences of their proposed action (with specific sections underwater detonations) on the human environment, including a specific section on marine mammals.

### A. Summary of the Alternatives Considered by the Navy

The alternatives were developed by the Navy after careful assessment by subject-matter experts, including units and commands that utilize SSTC, Navy environmental managers and scientists, and the consideration of public comments received during scoping. The Navy has developed a set of criteria for use in assessing whether a possible alternative meets the purpose of and need for the proposed action:

1. Must meet the requirements of individual and unit-level training;

2. Must have sufficient available and suitable training space to simultaneously accommodate the training needs of all of the operational users so that they can achieve training tempo requirements based on Fleet deployment schedules;

3. Must meet future training requirements with year-round, assured access to San Diego Bay, ocean, beach, and inland training areas;

4. Must provide a realistic training environment that simulates real world littoral combat conditions and is free of man-made restrictions/objects that interfere with preparing servicemen for operations in real-world conditions;

5. Must complete the full range of required training elements at SSTC;

6. Must provide co-location with commands, equipment, facilities, and infrastructure on Naval Amphibious Base (NAB) Coronado that support existing and future training and meet training and personnel tempo requirements.

Three alternatives are analyzed in the EIS: (1) The No Action Alternative, (2) Alternative 1, and (3) Alternative 2.

<u>No Action Alternative</u> – The No Action Alternative would continue baseline training activities. Approximately 3,926 activities are conducted. The Navy would also continue to operate under existing access restrictions. These include the restriction of training within some beach lanes of the SSTC during the nesting season, except for designated beach crossing lanes. In addition, training is not permitted inside buffer zones that are established around all western snowy plover nests.

<u>Alternative 1 (Preferred Alternative)</u> – Alternative 1 would increase training tempo from baseline conditions, conduct existing routine training at additional locations within SSTC established training areas, introduce new platforms and equipment into training, and increase access and availability to existing beach and inland training areas. Training would be allowed in additional beach lanes of the SSTC during the nesting season if other similar lanes are occupied or otherwise unavailable for use, or if attributes of these lanes make them more suitable for training than other similar lanes. The Navy would restrict training from occurring in buffer zones surrounding up to 22 western snowy plover nests at one time, not all western snowy plover nests. Also, the Navy would conduct training involving foot traffic, but not vehicle traffic, in the vernal pools when conditions are determined to be dry.

<u>Alternative 2</u> – Alternative 2 is identical to Alternative 1, except that the Navy would utilize all 7,000 yards of ocean beaches along SSTC-N and SSTC-S, and all bayside training beaches, except the Delta North and South nesting habitat for continuous, year-round training. Similar to the No Action Alternative and Alternative 1, the Navy would continue to conduct existing management practices on these lanes, including, nest relocation, predator management and control, habitat modification, site preparation for maintenance, nest substrate enhancement,

signage and education, recreational use restrictions, and rearing of collected eggs, injured and sick individuals.

Other approaches that were considered but eliminated because they did not meet the purpose and need included:

- Alternate training complex locations;
- Training relocation to SSTC-S;
- Training reductions;
- Simulated training;
- Allow unrestricted usage of training lanes 8, 9, and 10 if California least tern nesting threshold is reached;
- Creating more than or less than 22 concurrent buffered and marked avoidance areas for western snowy plovers.

## B. Summary of Alternatives Considered by NMFS

For the three alternatives previously identified, the Navy includes an associated list of standard protective measures specifically developed to minimize adverse impacts on marine mammals. As a cooperating agency, NMFS worked with the Navy during the development of the EIS to identify a series of mitigation measures (for marine mammals) that the Navy should consider in their analysis.

NMFS' alternatives are not enumerated in the Navy EIS, but are supported by the analyses in that EIS, and consist of:

<u>No Action Alternative</u>: The Navy's training operations would continue at current levels. The Navy would not request, and NMFS would not issue, an incidental take authorization for an increased level of activity.

<u>Preferred Alternative</u>: NMFS issues an IHA authorizing take of marine mammals incidental to the subset of the Navy training activities (i.e., those proposed activities listed in the Alternative 1 of the Navy's EIS) presented to NMFS as the specified activities described in the Navy's request for MMPA authorization and including the mitigation, monitoring and reporting analyzed as part of the proposed action in Chapter 5 of the EIS.

<u>Non-preferred Action Alternative:</u> NMFS issues an IHA authorizing take of marine mammals incidental to a subset of the Navy training activities (i.e., those proposed activities listed in the Alternative 1 of the Navy's EIS) presented to NMFS as the specified activities described in the Navy's request for MMPA authorization (activities included within Navy's preferred alternative), but with additional mitigation requirements for marine mammals to include measures considered but eliminated by Navy in section 5.9.3 of the EIS.

C. THE ENVIRONMENTALLY PREFERRED ALTERNATIVE

NMFS has identified the Navy's Action Alternative 1 as the Environmentally Preferred Alternative because it fully meets the Navy and Department of Defense current and near-term training and test and evaluation requirements while also implementing mitigation and management measures to protect the environment.

## IV. PUBLIC INVOLVEMENT

Public opportunities for review and comment have occurred throughout the development of the Navy's EIS and NMFS' proposed issuance of the IHA. Detailed information on the publications in which the Notice of Intent to prepare an EIS and the Draft EIS were noticed are provided in the FEIS, and the Final EIS was similarly made available in January 2011. The distribution list for the EIS is presented in Chapter 9 of the Final EIS.

During the public review process for the Draft EIS (DEIS), the Navy received comments from 108 individuals and 22 agencies and organizations. The Final EIS addressed all oral and written comments received during the Draft EIS comment period. As a cooperating agency, NMFS assisted in the analysis and consideration of public comments in NMFS' areas of jurisdiction and expertise to support the development of the Final EIS. Navy ensured the Final EIS was mailed to all individuals, agencies, and organizations that requested a copy of the final document, and that Final EIS remains available on the website at: www.silverstrandtrainingcomplexeis.com.

The Navy received comment letters from the Environmental Protection Agency (EPA), the California Parks and Recreation, and 14 private citizens and organization during the FEIS wait period, which NMFS were provided with and reviewed. EPA's primary concern was on the sediment quality and recommended a reduction on underwater explosive activities. None of the comments on the SSTC FEIS is related to NMFS' action (the issuance of an MMPA authorization).

Substantial public involvement occurred in association with NMFS' proposed IHA. On October 19, 2010 (75 FR 64276), NMFS published a notice of receipt of the application for the U.S. Navy's SSTC training activities and the proposed IHA, with a request for comments and information open through November 18, 2010. During the 30-day public comment period, NMFS received comments from the Marine Mammal Commission. The comments were considered in developing the final IHA and are fully addressed for making the determination in the issuance of the IHA.

## V. MITIGATION, MONITORING AND REPORTING MEASURES

The IHA includes detailed mitigation measures that must be implemented by Navy when conducting specified activities in the SSTC. In addition, the IHA requires the Navy to implement extensive monitoring and reporting. Inclusion of these requirements ensures that

NMFS' action of issuing the IHA specifies and requires all practicable means to avoid or minimize environmental harm from the selection of EIS Alternative 1.

## VI. CONCLUSIONS

Through the Final EIS and as documented in this ROD, NMFS has considered the goals and objectives of the NMFS proposed action and has analyzed a reasonable range of alternatives that adequately address the objective of the proposed action. Furthermore, NMFS has analyzed the associated environmental consequences of the identified alternatives and the mitigation measures and monitoring requirements needing to be analyzed and required under IHA. NMFS has also considered the public comments addressed to the Navy in the EIS and the comments addressed to NMFS during the proposed IHA comment period. Consequently, NMFS has selected the alternative of issuing the IHA authorizing the unintentional harassment of marine mammals incidental to Navy activities in the SSTC in accordance with Alternative 1 of the Final EIS for the period March 2011 through March 2012, including in that IHA specified requirements for mitigation, monitoring and reporting.
